Of the above, A, D, E, G and H, probably belong to true Ferns; F is the male fructification of a Pteridosperm (Leyiodendron); the rest are of Carboniferous affinity, ranging throughout the Carboniferous, the elongated sporangia individually resemble those of Marattiacous, but they are completely isolated, the characteristic grouping in sori being absent; the same remark applies to the Sphenopteroid Renaudia of Zeiller (fig. 15, B); the foliage of Sphenopteris, one of the most extensive of Palaeozoic frond-genera, with many different types of fructification, resembled that of various species of Asplenium or Davallia. In many fern-like plants of this period the fronds were dimorphic, the fertile leaves or pinnule having a form quite different from that of the vegetative portions. This was the case in Urnatopteris (Kidston), with Sphenopteroid sterile foliage; the sporangia, borne on the blimmer pinnules of the fertile rachis, appear to have dehisced by an apical pore (fig. 15, J). The magnificent Devonian Fern Archopteris hibernica, with a somewhat Adiantiform habit, bore special fertile pinnules; the fructification is still imperfectly understood, but the presence of stipules, observed by Kidston, has been adduced in support of Marattiacous affinities. In all these cases there is reason to suspect that the plants may have been Pteridosperms, rather than Ferns.
Other Families.—The Marattiaceae are the only recent family of Ferns which can be supposed to have existed in anything like its present form in Palaeozoic times. Of other recent orders the indications are meagre and dubious, and there can be no doubt that a large proportion of Ferns from the older rocks (in so far as they were Ferns at all) belonged to families quite distinct from any which we recognize in the flora of our own day. Little or nothing is known of Palaeozoic Ophioglossaceae. Certain fructifications have been referred to Gleicheniaceae (Oligocarpha, fig. 13, E), Schizaeaceae (Sempferberga, fig. 18, G), Hymenophyllaceae and Osmundaceae, and on good grounds, so far as the external characters of the sporangia are concerned; our knowledge of most of the Ferns in question is, however, far too incomplete to justify us in asserting that they actually belonged to the families indicated. In the case of the Osmundaceae there is good evidence, from anatomical characters, for tracing the family back to the Palaeozoic; their oldest members show a distinct relationship to the Botryopteridaceae, described in this work, and of which the spore-bearing parts and fern-sporangia occur in the petrified material of the Carboniferous formation; the presence of an annulus is a frequent character among these specimens, while syngamy so rare; it is thus certain that families remote from the Marattiaceae were abundantly represented during this period.

Botryopteridaceae.—The family Botryopteridaceae, first discovered by Renault, stands out with striking clearness among the Palaeozoic Ferns, and differs widely from any group now in existence. The Botryopteridaceae are chiefly known from the petrified specimens; in the genus Botryopteris and certain species of Zygopteris we have a fairly complete knowledge of all parts of the plant. The type-genus Botryopteris, represented in the Permio-Carboniferous of France and in both the Lower and Upper Carboniferous of Great Britain, had a rhizome, with a very simple monostele structure, bearing spirally arranged compound leaves, with lobed pinnules, probably of a somewhat fleshy texture. In the French species, B. forestis, the plant was covered with characteristic jointed hairs, which have served to identify the various organs on which they occur. The sporangia were large pyriform sacs, stalked, and borne in tufts on the branches of the fertile rachis, which developed no lamina. Each sporangium had, on one side only, a longitudinal or slightly oblique annulus, several cells in width; the numerous spores were all of the same size; certain differences among them, which have been interpreted as indicating heterospory, have now proved to depend merely on the state of preservation. The genus Zygopteris, of which numerous Carboniferous and Permian species are known, likewise had a monostelic stem, but the structure of its vascular cylinder was somewhat complex, resembling that of the most highly differentiated Hymenophyllaceae, with which some species of Zygopteris also agreed in the presence of axialy shoots. There is evidence that the stem in some species was a climbing one; the pinnate leaves, arranged on the stem in a two-fifths spiral, were dimorphic, the sterile fronds resembling some forms of the petiolar structure. It is characteristic of Zygopteris and its near allies that two rows of pinnule were borne on each side of the rachis, at least in the fertile fronds. On the fertile rachis the sporangia were borne in tufts, much as in the preceding genus; they were still larger, reaching 2.5 mm. in length, and had a multiserous wall, extending, however, to both sides of the sporangium (see fig. 16, A and B). In Stauropteris, a genus showing some affinity with Zygopteris, the branched rachis of the fertile frond terminates in line branches, each bearing a single, spherical sporangium, without any differentiated annulus (fig. 17). The spores in the sporangia have been found in a recent moist condition; the stages of germination correspond closely with those observed in recent homosporous ferns (fig. 18). This fact strongly confirms the conclusion, drawn from morphological and anatomical characters, that the Botryopteridaceae were true Ferns. The genus Corynopteris of Baily is interesting from the fact that its sporangia, while individually similar to those of Zygopteris, were grouped in sort or syngangia, resembling those of an Asterotritoe. The family Botryopteridaceae appears to have included a number of other genera, though in most cases the evidence from vegetative structure is alone available. The genus Diplolabas of Renault, shows much in common with Zygopteris as regards anatomical structure, but resembles Corynopteris in possessing a synganic fructification. The genus Asterochlaena of Corda with a deeply lobed stele, goes back to the Devonian. The family as a whole is of great interest, as presenting points of contact with various recent orders, especially Hymenophyllaceae, Osmundaceae and Ophioglossaceae; the group appears to have been a synthetic one, belonging to a primitive stock (the Primofilices of A. B. Al), from which the later Fern families may have sprung.

A number of genera of Palaeozoic "fern-fronds" have been described, of the fructification of which nothing is known. This is the case, for example, with Diplophema, a genus only differing from Sphenopteris in the dichotomy of the primary pinnate, and with Mariopteris, which bears a similar relation to Pecopteris. The same holds good of the Pecopterid Ferns included under Callipteris and Callipterinum. In such cases, as will be explained below, there is a strong presumption that the fronds were not those of Ferns, but of seed-bearing plants of the new class Pteridospermae.

On the present evidence it appears that the class Filicales was well represented in the Palaeozoic flora, though by no means so dominant as was formerly supposed. The simpler Ferns (Primofilices) of the period are for the most part referred to the remarkable family Botryopteridaceae, a group very distinct from any of the modern families, though showing analogies with them in various directions. On the other hand there was the type, strikingly similar in both vegetative and reproductive characters to the recent family of the palm. Although doubts have lately been cast on the authenticity of Palaeozoic Marattiaceae owing to the difficulty in distinguishing between their fructifications and the pollen-bearing organs of Pteridosperms, the anatomical evidence (stem of Psaronius) strongly confirms the opinion that a considerable group of these Ferns existed.

Spermophyta.—The Pteridospermeae, for which Ponicki’s name Cycadofilices is still sometimes used, include all the fern-like plants which, on the evidence available, appear to
have been reproduced by means of seeds. The cases in which such evidence is decisive are but few, namely, *Lyginodendron oldhamium*, *Neuropteris heterophylla*, *Pecopteris Pluckert*, *Pteridospermaeae*, *Gnetaeae*, *Ancites fertilis* and *Ancites tenuifolius*. In the first-named plant the structure, both of the vegetative and reproductive organs, is known, and the evidence, from comparison and association, is sufficiently strong. In the other cases there is direct proof of continuity between seed and plant, but only the external characters are known. In a great number of forms, amounting to a majority of the Palaeozoic plants of fern-like habit, the indirect evidence is in favour of their having possessed seeds. We will begin with the *Lyginodendraceae*, a group in which the anatomical characters indicated a systematic position between Ferns and Cycads, long before the reproductive organs were discovered.

*Lyginodendraceae*.—Of the genus *Heterangium*, which still stands very near the true Ferns, several species are known, the oldest being *H. Grievii*, of Williamson, from the Lower Carboniferous of Scotland. This plant had a long, somewhat slender, ridged stem, the ridges corresponding to the decurrent bases of the spirally arranged leaves (fig. 19). The specimens on which the genus was founded are petrified, showing structure rather than habit, but conclusive evidence has now been obtained that the foliage of *H. Grievii* was of the type of *Sphenopteris* (Diplomema) *elegans* (fig. 20), and was thus in appearance altogether that of a Fern, with somewhat the habit of an *Asplenum*. The stem has a single stele, resembling in general primary structure that of one of the simpler species of *Gleichenia*; there is no pith, the wood extending to the centre of the stele. The leaf-traces, where they traverse the cortex, have the structure of the foliar bundles in Cycads, for they are of the collateral type, and their xylem is mesarch, the spiral elements lying in the interior of the ligneous strand. The leaf-traces can be distinguished as distinct strands at the periphery of the stem, as shown in fig. 21. Most of the specimens had formed a zone of secondary wood and phloem, resembling the corresponding tissues in a recent Cycad; the similarity extended to minute histological details, as is shown especially in *H. hleaeodes*, a Coal Measures species, where the preservation is remarkably perfect. The cortex was strongly constructed mechanically; in addition to the strands of fibres at the periphery, horizontal plates of stone-cells were present in the inner cortex, giving both stem and petiole a transversely striated appearance, which has served to identify the different parts of the plant, even in the carbonized condition (cf. figs. 19 and 20). The single vascular bundle which traversed the petiole and its branches was concentric, the leaves resembling those of Ferns in structure as well as in habit. *Heterangium* shows, on the whole, a decided preponderance of Filicinian vegetative characters, though in the leaf-traces and the secondary tissues the Cycads are approached. The organs of reproduction are not yet known, though there is a probability that an associated seed allied to *Lagenostoma* (see below) belonged to *Heterangium*. In the Coal Measure genus *Megaloxylon*, of Seward, which in structure bears a general resemblance to *Heterangium*, the primary wood consists for the most part of short wide tracheides; probably, as the secondary tissues increased, it had become superfluous for conducting purposes, and was adapted rather for water-storage. In the genus *Lyginodendron*, of which *L. oldhamium*, from the

![Figure 21: Heterangium Grievii. Part of the stele of the stem in transverse section, showing a primary xylem-strand and adjacent tissues. (X 1.35.)](image3)
Coal Measures, is now the best-known of all Palaeozoic plants, the central wood has disappeared altogether and is replaced by pith; the primary wood is only represented in the leaf-trace strands, which form a ring of distinct collateral bundles around the pith;

The first definite evidence of the mode of reproduction of *Lyginodendron oldhamium* was due to F. W. Oliver, who in 1903 identified the seed, *Lagenostoma Lomaxii*, by means of the galls on its cupule, which agree exactly with those on the associated leaves and stems of the plant (cf. figs. 24 and 25). No similar galls are known on any other Palaeozoic plant. *Lagenostoma Lomaxii* is a small barrel-shaped seed (5.5 by 4.25 mm, when mature) enclosed in a husk or cupule, which completely enveloped it when young, but was ultimately open (figs. 23 and 26 and fig. 27 from another species). The seed was stalked, and there is an exact agreement in structure between the vascular strands of the stalk and cupule of the seed, and those of the rachis and leaves of *Lyginodendron*, thus confirming the evidence from the galls. The seed itself is of a Cycadean type, and radially symmetrical. The single integument is united to the nucellus, except at the top, and is traversed by about nine vascular strands. In the apex of the nucellus, as in most Palaeozoic seeds and in recent Cycads, a pollen-chamber, for the reception of the pollen-grains or microspores, is excavated (fig. 26). In *Lagenostoma* the pollen-chamber has a peculiar structure, a solid column of tissue rising up in the middle, leaving only a narrow annular crevice, in which pollen-grains are found. The neck of the flask-shaped pollen-chamber projected a little from the micropyre and no doubt received the pollen directly. The seed, which need not be described in further detail, was a highly organized structure, showing little trace of the cryptogamic megasporangium from which we must suppose it to have been derived. From the structure of the seed-bearing stalk, and from the analogy of the similar form *Lagenostoma Sinclairii* (fig. 27) it appears that the seed was borne on a leaf, or part of a leaf, reduced to a branched rachis.

The male organs of *Lyginodendron* were discovered by Kidston, a year or two after the seeds were identified. They are of the type known as *Crossotheca*, formerly regarded as a Marattiaceous fructification. The genus is characterized by the arrangement of the sporangia, which hang down from the lower surface of the little oval fertile leaflets, the whole resembling an epaulet with its fringe (fig. 15, F; fig. 28). In the case of *Lyginodendron* the *Crossotheca* occurs in connexion with the vegetative parts of the frond. Each fertile pinnule bore six, or rarely seven, bifurcate microsporangia, described as bilocular: not improbably each may represent a synangium. The microspores are tetrahedral. This is the first case in which the pollen-bearing organs of a Pteridosperm have been identified with certainty.

It will be seen that, while the seeds of *Lyginodendron* were of an
advanced Cycadean type, the microsporangiate organs were more like those of a Fern, the reproductive organs thus showing the same combination of characters which appears in the vegetative

Cycadoxyleae.—A few Coal Measure and Permian stems (Cycadoxylon and Ptychoxylon) resemble Lyginodendron in the general character of their tissues, but show a marked reduction of the primary wood, together with an extensive development of anomalous wood and bast around the pith, a peculiarity which appears as an individual variation in some specimens of Lyginodendron olhadum. It is probable that these stems belonged to plants with the phloem of passage and foliage of Cycads, taking that group in the widest sense. It is only quite at the close of the Palaeozoic period that Cycads begin to appear. The Lyginodendreae are of structure, however, appears to have formed the transition not only to the Cycadales, but also to the extinct family Cordaitaceae, the characteristic Palaeozoic Gymnosperms (see p. 107).

Medullosae.—In some respects the most remarkable family of the Cycad-Fern alliance is that of the Medullosae, seed-bearing plants often of great size, with a fern-like foliage, and a singularly complex anatomical structure without parallel among recent plants. Some of the Medullosae must have had a habit not unlike that of tree-ferns, with compound leaves of enormous dimensions, belonging to various frond-genera—especially, as has now been proved, to Alethopteris and Neuropteris; these are among the most abundant of the Carboniferous fronds commonly attributed to Ferns, and extend back to the Devonian. In habit some species of Alethopteris resembled the recent Angiopteris, while the Neuropteris foliage may be compared with that of an Osmunda. The Medullosae have been found chiefly in the Permo-Carboniferous of France and Germany, but a Coal Measures species (M. anglica) has been discovered in Lancashire. The great anatomical characteristic of the stem of the Medullosa is its polystelic structure with secondary development of wood and bast around each stele. In M. anglica, the simplest species known, the stelae are uniform, and usually only three in number; the structure of the stem is essentially that of a polystelic Carboniferous species, such as M. stellata and M. Lemkerti, the arrangements being more complicated, the stelae showing a differentiation into a central and a peripheral system; the secondary growth was extensive and unequal, usually attaining its maximum on the outer side of the peripheral steles. In certain cases the structure was further complicated by the appearance of extrascular zones exterior to the main steles. The spirally arranged petioles (Myeloxylon) were of great size, and their decurrent bases clothed the surface of the stem; their structure is closely similar to that of recent Cycadean petioles; in fact, the leaves generally, like those of Stangeria at the present day, while fern-like in habit, were Cycadean in structure. In the case of Medullosa anglica we have an almost complete knowledge of the vegetative organs—stem, leaf and root; Cycadean characters no doubt predominated, but the primary organization of the stem was that of a polystelic Fern. In the new genus Satellitia, also from the Coal Measures of Lancashire, the stem had a single, large central stele, from which smaller strands were given off, forming a kind of network, which gave rise to the numerous concentric leaf-traces which entered the petioles. This plant may be regarded as anatomically the most primitive of the Medullosae.

Petioles of the Medullossae, there is direct evidence of reproduction by seeds, for in Neuropteris heterophylla Kidston has demonstrated that large seeds, of the size of a hazel-nut, were borne on the frond (fig. 29). In this case the internal structure is no known, but another species, Tri Gonocarpus Parkinsoni, associated with, and probably belonging to, the Alethopterid species, Medullosa anglica, occurs in the petrified condition and has been fully investigated. This is a large seed, with a very long micropyle, it has a beaked pollen-chamber, and a complex integument made up of hard and fleshy layers, closely resembling the seed of a modern Cycad; the nucellus, however, was free from the integument, each

(After Kidston. Scott, Studies.)

Fig. 29.—Neuropteris heterophylla. Seed, attached to a branch of the rachis bearing two vegetative leaflets. (X 2.)
having its own vascular system. Various other seeds of the same type are known, and in a great number of instances Grand' Eury has found the fronds of Neuropteridae (Medullocystis) in close association with the seeds of the Cycadean of the latter group; it is more probable, however, that they formed a short divergent phylum, distinct, though not remote, from the Cycadean stock.

Pecopteris—It has now been established that the form-genus *Pecopteris*, once regarded as representing the typical Marattiaceae foliage, was in part made up of seed-bearing plants. In 1905 Grand' Eury discovered the seeds of *Plagiopetalum*, a genus of Marattia, in the same beds as the Cordaites, that he had regarded them as being on the direct line of descent of the latter group; it is more probable, however, that they formed a short divergent phylum, distinct, though not remote, from the Cycadean stock.

*Anastomites*—The genus *Anastomites*, resembling the Maidenhair Ferns in habit, has now been transferred to the Pteridosperms, the seeds having been discovered in 1912 by David White. In *A. fritillaris*, from the Pottsville beds (Millstone Grit) of West Virginia, the rhomboidal seeds, flattened and winged like those of Cordaites, are borne terminally on the lateral pinnae of a frond, which elsewise resembles the characteristic cuneiform leaves. Continuity between seeds and frond was also demonstrated in another species, *A. tenuifolius*. The allied genus *Ernepopteris* occurs in association with seeds of a similar pteridospermous type.

The Pteridosperms, of which only a few examples have been collected, evidently constituted a group of vast extent in Palaeozoic times. In a large majority of the Fern-like fossils of that period the evidence is in favour of reproduction by seeds, rather than by the cryptogamic methods of the true Ferns. The class, though clearly allied to the typical Gymnosperms, may be kept distinct for the present on account of the relatively primitive characters shown in the anatomy and morphology, and may be provisionally defined as follows: plants resembling Ferns in habit and in many anatomical characters, but bearing seeds of a Cycadean type; seeds and microsporangia borne on fronds only slightly modified as compared with the vegetative leaves.

Gymnospermous remains are common in Palaeozoic strata from the Devonian onwards. The investigations of the last forty years have shown that the earliest representatives of the class did not, as a rule, belong to any of its existing families, but formed for the most part a distinct group, that of the Cordaitales, which has long since died out. Specimens of true Cycads or Conifers are rare or doubtful until we come to the latest Palaeozoic rocks. Our knowledge of the Cordaitales (the typical family of the class Cordaitales) is chiefly due to the French investigators, Grand' Eury and Renault, who successfully brought into connexion the various fragmentary remains, and made known their exact structure.

Cordaitales—The discovery of the fossil trunks and of their rooted bases has shown that the Cordaites were large trees, reaching 30 metres or more in height; the leafy shoot bore a dense crown of branches, clothed with long simple leaves, spirally arranged. Fig. 30, founded on one of Grand' Eury's restorations, gives an idea of the habit and anatomy of the genus *Dorycordaites*, characterized by its longate acute leaves; in the typical *Cordaites* they were of a blunter shape, while in *Pecopteris* they were narrow and grass-like, as also in *Mesarchitex* as a rule far exceeded in size those any of the Cordaites, attaining in some species a length of a metre. Of living genera, *Agathis* (to which the Kauri Pine of New Zealand belongs) probably comes nearest to the extinct family in habit, though at a long interval. The stem resembled that of Cycads in having a large pith, sometimes as much as 4 in. in diameter; the wood, however, was dense, and had the structure of that of an Araucaria Conifer; specimens of the wood have accordingly been commonly referred to as *Araucarioxylon*. At one time it was even considered that wood of this type indicated actual affinity with Araucariaceae. Other characters, however, prove that the Cordaitae were remote from that family, and the name *Araucarioxylon* is best reserved for wood from later horizons, where a near relationship to Araucariaceae is more probable. In some cases the external tissues of the Cordaitae are well preserved; the cortex possessed a system of hypodermal strands of fibres, comparable to those found in the Lycopodiaceae. In most cases the leaf-traces pass out from the stem in pairs, as in the recent *Ginkgo*; dividing up further as they entered the leaf-base. In many Cordaitae the pith was discoid, i.e. flatular and partitioned by frequent diaphragms, as in some species of *Pitys* and other plants at the present day. The curious, transversely-ribbed fossils known as *Stearnbergia* or *Artisia* have proved to be casts of the medullary cavity of Cordaitae; their true nature was first demonstrated by Williamson in 1850, and in those stems which have been referred with certainty to the Cordaitae there is no centripetal wood; the spiral elements are adjacent to the pith, as in a recent Conifer or Cycad; certain stems, however, are known which connect this type of structure with that of the Lycopodiaceae; this, for example, is the case in the Permian genus *Poroxylon*, investigated by Bertrand and Renault, which in general structure has much in common with Cordaitae, but possesses strands of primary wood, mainly centripetal, at the boundary of the pith, as in the Lycopodiaceae. Stems (*Mesoxylon*) intermediate in structure between *Poroxylon* and Cordaitae have lately been discovered in the English Coal Measures. Corresponding strands of primary xylem have been observed in stems of the genus *Pitys* (Witham), of Lower Carboniferous age, which consisted of large trees, probably closely allied to Cordaitae. There appears, in fact, so far as stem-structure is concerned, to have been no sharp break between the typical Palaeozoic Gymnosperms and pronounced Pteridosperms such as *Lycopodiadendron*. The long, parallel-veined leaves of the Cordaitae, which were commonly referred to Monocotyledons before their structure or connexion with other parts of the plant was known, have been shown by Renault to have essentially the same anatomy as a single leaflet of a Cycad such as *Zamia*. The vascular bundles, in particular, show precisely the characteristic collateral maral structure of the root or exarch structure which is so constant in the recent family (see Anatomy of Plants). In fact, if the foliage alone were taken into account, the Cordaitae might be described as simple-leaved Cycads. The reproductive organs, however, show that the two groups were
in reality very distinct. Both male and female inflorescences
have frequently been found in connexion with leaf-bearing branches
(see restoration, fig. 30). The inflorescence is usually a spike
bearing lateral cones or catkins, arranged sometimes distichously,
sometimes in a spiral order. The investigation of silicified
specimens has, in the hands of Renault, yielded striking results.
A longitudinal section of a male Cordaitanthus (the name applied to
isolated fructifications) is shown in fig. 31, A. Plate. The organ
figured is one of the catkins (about a centimetre in length) which
were borne laterally on the spike. Some of the stamens are inserted
between the bracts, in an apparently axillary position, while others
are grouped about the apex of the axis. Each stamen consists of
a long filament, bearing several erect, cylindrical pollen-sacs at
its summit (cf. fig. 31, B, Plate). Some of the pollen-sacs had
dehisced, while others still retained their pollen. The stamens are
probably best compared with those of Ginkgo, but they have also
been interpreted as corresponding to the male "flowers" of the
Gnetaceae. In any case the morphology of the male Cordaitan
duction is very closely related to that of the Cycads or

made the exceedingly interesting discovery that each pollen-grain contains a group of cells, presumably representing an antheridium
(fig. 32, C). Recent observations have completely confirmed
Renault's interpretation of the facts; on which some doubt had been
expressed, especially in the case of the Cycads and ferns. In Cordaites and
Gnetaceae, pollen-grains are often found within the pollen-chamber, and the
pulverulent structure of these pollen-grains has been repeatedly
shown by Renault, Cordaites, to be of a very similar nature, and it may be doubted whether any pollen-tube was formed. The
morphology of the female inflorescence of Cordaites, however, has not yet
been cleared up, but Taxus and Ginkgo among recent plants appear
to be the nearest analogies. Much further work will be needed before the homologies between Cordaitan cones and the
fructifications of the higher Cryptogams can be established.
Anatomically the connection of the family with the Pteridosperms (and
through them, presumably, with some primitive Ferns) seems clear; but we have as yet no indications of the stages in the
evolution of their reproductive organs. The class Cordaitales extends back to the Devonian, and it must be borne in mind that
our knowledge of their fructifications is practically limited to
representatives from the latest Palaeozoic horizons.

Isolated fossil seeds are common in the Carboniferous and Permian
strata; in all cases they are of the orthotropous type, and resemble
the seeds of Cycads or Ginkgo. They occur more nearly than the modern
living plants. Their internal structure is sometimes admirably preserved,
so that the endospore with its archeogonia is clearly shown (fig. 32, D).
It is a curious fact that in no case has an emasculation been found in any of these seeds; probably no such operation
took place after they were shed, and was followed immediately by
germination. There is good evidence that many of the seeds belonged to Cordaites, especially those seeds which had a flattened
form, such as Cordaites, Cycadinaoecus, &c. Seeds of this kind have been found in connexion with the Cordai-
anthus inflorescences; the winged seeds of Samurapipis, borne on long pedicles, are attributed by Grand' Eury to the genus
Deinocordaites. Many other forms of seed, and especially those which show radial symmetry, as for example Trigonocarpus,
Stephanosperma and Lagenostoma, have been found, as we have seen, to some of the plants grouped under Pteridosperms,
though other Pteridosperms and flattened seeds not as yet distinguishable from those of Cordaitales.
The abundance and variety of Palaeozoic seeds, still so often of undetermined nature, indicate the vast extent of the sporophytic
flora of this period.

The modern Gymnospermous orders have but few authentic
representatives in Palaeozoic rocks. The history of the Ginkgoales
will be found in the Mesozoic section of this article (see also
GYMNOSPERMS); their nearest Palaeozoic representatives were probably members of the Cordaitales, an extinct stock with which the
Ginkgoaceae are closely connected ("Seward"). Remains referable to Cycadophyta, so extraordinarily abundant in the suc-
ceeding period, are unknown. The curious genus Noeggerathia
(Saporta) may be mentioned in this connexion. This genus, from the Perm.-Carboniferous of Autun, is represented by large, fleshy,
reiniform leaves or leaflets, with radiating dichotomous venation;
these are borne in detached groups of two or more. The structure
of the seeds of Cycads or Corditeae. The male sporophytes are similar
in form to the vegetative leaves, but smaller; sunk in their paren-
chyma are numerous tubular loculi, containing large pollen-grains,
which are phrullate like those of Cordaites; the female (pappoa-
chyma had not yet been identified with certainty. The curious male
sporophytes may perhaps be remotely comparable to those recently
discovered in Mesozoic Cycadophyta, of the group Bennettitellae.
Some features of the structure of the genus (Bennettites) occur
in the Coal Measures and Permian, and it is possible that the
obscure Coal Measure genus Noggerathia may have Cycadean
affinities. A fructification from the Permian of Autun, named
Cycadophyta milleriensis by Renault, appears to belong to this
family.

Now that the numerous specimens of wood formerly referred to
Cordaites and known to have belonged to distinct orders, but few
true Palaeozoic Conifers remain to be considered. The most
important are the upper Coal Measure or Permian genera Walchia,
Ulmannia and Pagothyphllum, all of which resembled certain
Araucariae in habit. In the case of Walchia there is some evidence
as to the fructifications, which in one species (W. filiformis)
appear to be comparable to female Araucarian cones. There
are also some anatomical points of agreement with that family;
but the problem of proving whether these same genera as
same heterogeneous plants have been confounded. In the
case of Ulmannia the anatomical structure of the leaf,
investigated by Solms-Laubach, proves at any rate that the tree
was not a conifer.

There is no proof of the existence of Gnetaceae in Palaeozoic
times. The very remarkable plumose seeds described by Renault under the
name Gnetopsis are of uncertain affinity, but have much in common
with Lagenostoma, the seed of Lycinodon.
Succesion of Floras.

Our knowledge of vegetation older than the Carboniferous is still far too scanty for any satisfactory history of the Palaeozoic Floras to be even attempted; a few, however, of the facts may be advantageously recapitulated in chronological order.

No recognizable plant-remains, if we accept one or two doubtful Algal specimens, have so far been yielded by the Cambrian. From the Ordovician onwards, however, the number of authentic remains of Algae (among many that are questionable) have been investigated; they are for the most part either verticillate Siphonae, or the large—possibly Laminariae—Algae named *Nematosphys*, with the problematical but perhaps allied *Pachytes*. The evidence for terrestrial Silurian vegetation is still dubious; apart from some obscure North American specimens, the true nature of which is not established, Potonié has described well-characterized Pteridophytes (such as the fern-like *Sphenopteridium* and *Bothrodonstern*) among Lycopods) from supposed Silurian strata in North Germany; the horizon, however, appears to be open to much doubt, and the specimens agree so nearly with some from the Lower Carboniferous as to render their Silurian age difficult of credence. The high development of the terrestrial flora in Devonian times renders it probable that land-plants existed far back in the Silurian ages, or still earlier. Even in the Lower Devonian, Ferns and Lepidodendrae have been recognized; the Middle and Upper Devonian beds contain a flora in which all the chief groups of Carboniferous plants are already represented.

Considering the comparative meagreness of the Devonian record, we can scarcely doubt that the vegetation of that period, if adequately known, would prove to have been practically as rich as that of the succeeding age. Among Devonian plants, Equisetales, including not only *Archoequsamites*, but forms referred to *Asterophyllites* and *Amnodia*, occur; *Sphenopteridium* is known from Devonian strata in North America and Bear Island, and *Pseudebora* from the latter; Lycopods are represented by *Bothrodonstern* and *Lepidodendra*, a typical *Lepidostrobas*, with structure preserved, has lately been found in the Upper Devonian of Kentucky. Fern-like plants such as *Sphenopterideae*, *Archopteridium* and *Aneimites*, with occasional arborescent Pecopterideae, are frequent; many of the genera, including *Alkhotops*, *Neopteris* and *Megalopteris*, probably belonged, not to true Ferns, but to Pteridosperms; although our knowledge of internal structure is still comparatively scanty, there is evidence to prove that such plants were already present, as for example, the genus *Calamospia*. The presence of Cordaitean leaves indicates that Gymnosperms of high organization already existed, a striking fact, showing the immense antiquity of this class compared with the angiospermous flowering plants.

Any detailed account of the horizons of Carboniferous plants would carry us much too far. For our present purpose we may divide the formation into Lower Carboniferous and Lower and Upper Coal Measures. In the Lower Carboniferous (Cufl of Continental authors) many Devonian types survive—e.g. *Archoequsamites*, *Bothrodonstern*, *Archopteridium*, *Megalopteris*, &c. Among fern-like fronds *Diplotbema* and *Rhcopteris* are characteristic. Some of the Lepidodendrae appear to approach *Sigillariae* in external characters. Sphenophytes are still rare; it is to this horizon that the isolated type *Chiroptostebos* belongs. Many specimens with structure preserved are known from the Lower Carboniferous, and among them Pteridosperms (*Heterospermium*, *Calamospia*, *Cdehydeon*, *Proptoptera*) are well represented, if we may judge by the anatomical characters. Of Gymnosperms we have Cordaitean leaves, and these may be known as *Pitys*, which probably belonged to the same family.

The Lower Coal Measures (Westphalian) have an enormously rich flora, embracing most of the types referred to in our systematic description. Calamariae with the *Archopterys* type of stem-structure abound, and Sphenophyte are now well represented. *Bothrodonstern* still survives, but *Lepidodendra*, *Lepidophtelos*, and the ribbed Sigillariae are the characteristic Lycopods. The heterogeneous "Ferns" grouped under *Spheno-

pteridae are especially abundant. Ferns of the genera referred to Marattiaceae are common, but arborescent stems of the *Paxonius* type are still comparatively rare. Numerous fronds such as *Alkhotops*, *Neopteris*, *Margopteris*, &c., belonged to Pteridosperms, of which specimens showing structure are frequent in certain beds, and the stems and rhizomes and many stems of the *Mesosylon* type represent Gymnosperms; the seeds of Pteridosperms and Cordaitae begin to be common. The Upper Coal Measures (Stephanian) are characterized among the Calamariae, now more than ever abundant, by the prevalence of the Calamodendreae; new species of *Sphenophyllum* make their appearance; among the Lycopods, *Lepidodendra* and its immediate allies diminish, and smooth-barked Sigillariae are the characteristic representatives. "Ferns" and Pteridosperms are even more strongly represented than before, and this is the age in which the supposed Marattiaceous trees-were founds their maximum development. Among Pteridosperms it is the family Medullosae which is especially characteristic. Cordaitae still increase, and Gymnospermous seeds become extraordinarily abundant. In the Upper Coal Measures the first Cycadophyta and Coniferae make their appearance. The Permian, so far as its lower beds are concerned, shows little change from the Stephanian; Conifers of the *Walchia* type are especially characteristic. The remarkable Permo-Carboniferous flora of India and the southern hemisphere is described in the next section of this article. During the earlier part of the Carboniferous epoch the vegetation of the world appears to have been remarkably uniform; while the deposition of the Coal Measures, however, was in progress, a differentiation of floral regions began.

The sketch given above extends, for the later periods, to the vegetation of the Northern hemisphere only.

**II.**—MESOZOIC

The period dealt with in this section does not strictly correspond with that which it is customary to include within the limits of the Mesozoic system. The Mesozoic era, as defined in geological textbooks, includes the Triassic, Jurassic and Cretaceous epochs; but from the point of view of the evolution of plants and the succession of floras, this division is not the most natural or most convenient. Our aim is not simply to give a summary of the most striking botanical features of the several floras that have left traces in the sedimentary rocks, but rather to attempt to follow the different phases in the development of the vegetation of the world, as expressed in the contrasts exhibited by a comparison of the vegetation of the Coal period forests with that of the succeeding Mesozoic era up to the close of the Wealden period.

Towards the close of the Palaeozoic era, as represented by the Upper Carboniferous and Permian plant-bearing strata, the vegetation of the northern hemisphere and that of several regions in the southern hemisphere, consisted of numerous types of Vascular Cryptograms, with some members of the Gymnospermae, and several genera referred to the Pteridospermae and Cycadofilices (see section I. PALAEZOIC). In the succeeding Permian period the vegetation retained for the most part the same general character; some of the Carboniferous genera died out, but a few new types made their appearance. The Upper Carboniferous and Permian plants may be grouped together as constituting a Permo-Carboniferous flora characterized by an abundance of arborescent Vascular Cryptograms and of an extinct class of plants to which the name Pteridosperms has recently been assigned—plants exhibiting a combination of Cycadean and filicinaceous characters and distinguished by the production of true gymnospermous seeds of a complex type. This flora had a wide distribution in North America, Europe and parts of
Asia; it extended to China and to the Zambezi region of tropical Africa (Map A, 1. and II.).

On the other hand, the plant-beds of the Permo-Carboniferous age in South Africa, South America, India and Australia demonstrate the existence of a widely distributed vegetation which, although of the Lower Carboniferous stage, may be regarded as the Upper Carboniferous. The Permian vegetation of the north, but differs from it to such an extent as to constitute a distinct flora. We must begin by briefly considering this southern Palaeozoic province if we would trace the Mesozoic floras to their origin, and obtain a connected view of the vegetation of the globe as it existed in late Palaeozoic times and at the beginning of the succeeding era.

In Australia, South America and South Africa a few plants have been found which agree closely with Lower Carboniferous types of the northern hemisphere. In New South Wales, for example, we have such genera as *Rhacopteris* and *Lepidodendron* represented by species very similar to those recorded from Lower Carboniferous of Central America, India, and South Africa, and in South Wales overlying Devonian and Lower Carboniferous rocks certain plants were discovered in the early part of the 19th century which were compared with European Jurassic genera, and for several years were supposed to belong to the Jurassic-Mesozoic period. These supposed Mesozoic plants include certain genera which are of special interest. Foremost among these is the genus *Glossopteris* (fig. 1), applied by Bronn in 1828 to subsulcatae or tongue-shaped leaves from India and Australia, which have generally been regarded as the fronds of ferns characterized by a central midrib giving off lateral veins which repeatedly anastomose and form a network, like that in the leaves of *Arthrophyllum*, an existing member of the Poly podiaceae. The stems, long known from Australia and India as *Clossopteris*, but the recent years have proved to be the rhizomes of *Glossopteris*. It is only recently that undoubted sporangia have been found in close association with *Glossopteris* leaves. The genus possessed small broadly oval or triangular leaves, only slightly differentiated from each other, the base being triangular. *Glossopteris* bodies represent a somewhat unusual type of fern sporangium or whether they are microsporangia: if the latter supposition is correct the plant must have been heterosporous; but we are still without evidence on this point. Associated with *Glossopteris* occurs another fern, *Gangamoecopteris*, usually recognized by the absence of a well marked midrib, though this character does not afford a satisfactory distinguishing feature. In view of recent discoveries which have demonstrated the Pteridosperm nature of many supposed ferns of Palaeozoic age, we must admit the possibility that the fern as applied to *Glossopteris* and *Gangamoecopteris* may be incorrect. An Equisetaceous plant, which Bronn identified as *Phyllotheca* in 1828, is another member of the same flora; this type bears a close resemblance to *Equisetum* in the long internodes and the wooled leaves encircling the nodes, but differs in the looser leaf-sheaths and in the long spreading fronds. Unlike *Phyllotheca* it has not been discovered as an ordinary fossil, but the plant, which *Phyllotheca* has been recognized in Europe in strata of Palaeozoic age, and Professor Zeiller has discovered a new species—*P. Kallii*—in Upper Carboniferous rocks in Asia Minor (Map A, VII.), which resembles *Phyllotheca* in many of the principal points. *Phyllotheca* occurs also in Jurassic rocks in India, and in a strata originally described as Jurassic, but which Zeiller has shown are no doubt of Permian age. Some examples of this genus, described by Etheridge from Permo-Carboniferous beds in New South Wales, differ in some respects from the ordinary form, and bear a superficial resemblance to the Equisetaceous genus *Gundelaria* from the Coal Measures of Germany. Other examples of the same characteristic of this stratum may be found later. The extraordinary abundance of *Glossopteris* in Permo-Carboniferous rocks of Australia, and in strata of the same age in India and South Africa, gave rise to the term "Glossopteris flora" for the assemblage of plants which inhabited the trees overlying beds containing Devonian and Lower Carboniferous fossils. The Glossopteris flora of Australia occurs in certain regions in association with deposits which are now recognized as true boulder-clays, and the same flora occurs in a thick series of fresh-water sediments, known as the Lower Gondwana system, including basal boulder-beds like those of Australia. Similar glacial deposits occur also in South America and South Africa, and the former is represented in Brazil and elsewhere.

In South Africa, *Glossopteris*, *Gangamoecopteris* and other genera, identical with those from Australia and India, are abundantly represented, and here again, as in India and Australia, certain genera, notably *Clossopteris*, *Sphenophyllum*, *Phyllotheca*, *Phylothecites*, and *Sigillaria*, are characteristic of the deposits of undoubted glacial origin. To state the case in a few words: there is in South Africa, South America, Australia and India an extensive series of sediments containing *Glossopteris*, *Gangamoecopteris* and other genera, including beds full of re- scratched boulders. These strata are homotaxial with Permo-Carboniferous rocks in Europe and North America, as determined by the order of succession of the rocks, and by the occurrence of typical Palaeozoic shells in associated marine deposits. The most important evidence on which this conclusion is based is afforded by the occurrence of European forms of Carboniferous shells in strata in South Africa, which are intercalated between Coal Measures containing members of *Glossopteris* flora, and by the discovery of similar shells, many of which are identical with the Australian species, in strata in South America and in the mouth of the Zambesi river. Another point in which the *Glossopteris* flora is identical with the Palaeozoic of South Africa (Ecca boulder-beds), Australia and Tasmania (Bacchus Marsh boulder-beds, &c.), and South America, which are associated with *Glossopteris*-bearing strata. We have a flora of wide distribution in South Africa, South America, Australia, Tasmania and India which is clearly of Permo-Carboniferous age, but which differs in its composition from the flora of the same age in other parts of the world. This flora appears to have already extended itself in Australia and elsewhere, which was precisely similar to that of Lower Carboniferous age in the northern hemisphere. The frequent occurrence of ice-formed deposits at the base of the beds in which *Glossopteris* and other genera make their appearance, almost necessitates the conclusion that the change in the character of the vegetation was connected with a lowering of temperature and the prevalence of glacial conditions over a considerable part of the northern hemisphere. There can be little doubt that the Indian Lower Gondwana rocks, in which the boulder-beds and the *Glossopteris* flora occur, must be regarded as belonging to a vast continental floras of the northern hemisphere, which occupied parts of South America and South Africa. This continental area has been described as the "Gondwana Land," a tract of enormous extent occupying an area, part of which has since given place to a southern ocean, while the other parts of the continent have been buried in marine deposits. These continental floras, which have enabled us to read in their fossil plants and ice-scratched boulders the records of a lost continent in which the Mesozoic flora of the northern hemisphere had its birth. Of the rocks of this southern continent those of the Indian Gondwana are the richest in fossil plants; the most prominent types recorded from these Permo-Carboniferous strata are *Glossopteris*, *Gangamoecopteris*, *Sphenophyllum*, referred to *Sphenopteris* and *Phylothecom*, *Cycas*, *Sigillaria*, *Euryphyllum*, *Phyllotheca*, and other Ferns; *Schizoneura* (fig. 2) and *Phyllothecoidea* among the Equisetales, *Nagegeriatheopsis* and *Euryphyllum*, probably members of the Cordaitales (see section I. PALAEOBOTANY); *Glossozamites* and *Pterodendron* of the Cordaitales, are also recorded from these deposits; a most interesting fact to the geologists in the middle of the Jurassic series, *Clossopteris*, *Sphenophyllum* spicatum (fig. 3), and a doubtful species from *Clossopteris* and *Cycas*, other common northern genera, is recorded from Australia, and the closely allied *Phyllotheca* constitutes another link between the two Permo-Carboniferous floras. The floral Cordaitales may be compared, and indeed is probably identical with, certain forms recorded from India, South America, South Africa, and other Cordaitales.
and Australia. While a few similar or even identical types may be recognized in both floras, there can be no doubt that, during a considerable period subsequent to that represented by the Lower Carboniferous or Cretaceous rocks, there existed two distinct floras, one of which had its headquarters in the northern hemisphere, while the other flourished in a vast continental area in the south. Recent discoveries have shown that representatives of the two floras coexisted in certain regions; there was, in fact, a dovetailing between strata in Europe. In the Tongking area, therefore, a flora existed during the Rhaetic period consisting in part of genera which are abundant in the older Glossopteris beds of the south, and in part of well-known constituents of European Rhaetic floras. A characteristic member of the southern botanical province, *Schizoneura gondwanensis* (fig. 2) of India, is represented also by a closely allied if not an identical species—*S. paradoxum*—in the Lower Trias (Bunter) sandstones of the Vosges Mountains, associated with European

the northern and southern botanical provinces. In 1885 Professor Zeiller described several plants from the province of Rio Grande do Sul in South America (Map A, G4), including a few typical members of the Glossopteris flora associated with a European species, *Lepidophloios laricinus*, one of the characteristic types of the Coal period, and with certain ferns resembling some species from European Pernian rocks. A similar association was found also in Argentine rocks by Kurtz (Map A, G4), and from South Africa Sigillariinae Bracta, *Psypnophyllum, Botryocradleon* and other northern types are recorded in company with Glossopteris, *Lepidophloios laricinus* and *Naeggeraltoptisia*.

The Coal-bearing strata which occupy a considerable area in China (Map A, II), contain abundant samples of a vegetation which has been agreed in other main features with the Perno-Carboniferous floras of the northern hemisphere. In his account of some plants from the Coal Measures of Kansu (Map A, IV.) Dr. Krasser has drawn attention to the apparent identity of certain leaf-fragments with those of *Naeggeraltoptisia Hilgbe*, a typical member of the Glossopteris flora; but this plant, so far as the evidence species which do not occur in the Glossopteris flora. Another plant found in the Vosges sandstones—*Neuropteridium granulifolium*—is also closely allied to species of the same "fern" recorded from the

Lower Gondwana strata of India (fig. 4), South America and South Africa. These two instances—the Tongking beds of Rhaetic age and the Bunter sandstones of the Vosges—afford evidence of a
northern extension of Glossopteris types and their association with European species. In this an unmarked discovery Professor Amalitzky, which carries us a step further in our search for a connection between the northern and southern floras. Amalitzky found in beds of Permian age in the province of Vologda (Russia) (Map A, V.) species of Glossopteris and Naeggeratheriopsis typical members of the Glossopteris floras, meeting of Trias, Taeniopteris, Callipteris and Sphenopteris, a striking instance of a conningling in the far north of the northern hemisphere Permian species with migrants from "Gondwana Land." This association of types clearly points to a penetration of representatives of the Glossopteris flora to the northern hemisphere towards the end of the Permain period. Evidence of the same northern extension is supplied by floras described by Schmalhausen from Permian rocks in the Pechora valley (Map A, VI), the Siberian genus Rhizocarpos very similar to, and probably generically identical with, Naeggerathiospis of the Glossopteris flora. The Perm.-Carboniferous beds of South Africa, India and Australia are succeeded by other plant-bearing strata, containing numerous species agreeing closely with members of the Rhaetic and Jurassic floras of the northern hemisphere. These Perm.-Permain floras, as represented by the Upper Gondwana beds of India and corresponding strata in Australia, South Africa, and South America, differ but slightly from the northern floras, and point to a uniformity in the Rhaetic and Jurassic vegetation which is in contrast to the existence of two botanical provinces during the latter part of the Palaeozoic period. A few plants described by Potonicz from German and Portuguese East Africa demonstrate the occurrence of Glossopteris and a few other genera, referred to a Perm.-Triassic horizon, in a region slightly to the north of Tete in the Zambesi district (Map A, I.), where typical European plants agree, and where, according toamping, were discovered several years ago, and described by Zeller in 1882 and 1901. The existence of Upper Gondwana plants, resembling Jurassic species from the Rajmahal beds of India, has been demonstrated in the Argentine by Dr. Kurtz.

Having seen how the Glossopteris flora of the south gradually spread to the north in the Permain period, we may now take a brief survey of the succession of floras in the northern hemisphere, which have left traces in Mesozoic rocks of North America, Europe and Asia. Our knowledge of the Triassic vegetation is far from extensive; this is no doubt due in part to the fact that the conditions under which the Triassic rocks were formed were not favourable to the existence of a luxuriant vegetation. Moreover, the Triassic rocks of southern Europe and other regions are typical marine sediments. The Bunter sandstones of the Volge have afforded several species of Lower Triassic plants; these include the Equisetiform genus Schizoneura—a member also of the Glossopteris flora—bipinnate fern fronds referred to the genus Anomopteris, another fern, described originally as Neuropteris grandifolia, which agrees very closely with a southern hemisphere type (Neuropteris validum, fig. 4), some large Equisetiform stems apparently identical, except in size, with modern Horsetails. With these occur several Conifers, among others Volkia heterophylla and some twigs referred to the genus Albertia, bearing large leaves like those of Agathis australis and some of the Araucarias, also a few representatives of the Cycadales. Among plants from Lower Triassic strata there are a few which form connecting links with the older Permo-Carboniferous flora; of these we have a species, described by Blankenhon as Sigillaria oculina, which may be correctly referred to that genus, although an inspection of a plaster-cast of the type-specimen in the Berlin Bergakademie left some doubt as to the sufficiency of the evidence for adopting the generic name Sigillaria. Another Triassic genus, Pteropteris, is of interest as exhibiting, on the one hand, a striking resemblance to the recent genus Isoetes, from which it differs in its much larger stem, and on the other as

(After Feistmantel.)

![Fig. 4.—Neuropteris validum. From Lower Gondwana rocks, India.](image)

**Mesozoic Floras.**

Under the head of Algae there is little of primary importance to record, but it is of interest to notice the occurrence of certain forms which throw light on the antiquity of existing families of Algae. Species referred on good evidence to the Charophyta are represented by a few casts of oogonia and stem fragments, found in Jurassic and Wealden beds, which bear a striking resemblance to existing species. There is some evidence for the occurrence of similar Chara "fruits" in middle Triassic rocks; some doubtless fossils from the much older Devonian rocks have also been quoted as possible examples of the Charophyta. The oldest Diatoms are represented by some specimens found entangled in the spines of a Liasic sponge, and identified by Rothpletz as species of the recent genus Pysidesia. The calcareous Sphénes are represented by several forms, identified as species of Diploloma, Triplolopora, Neomeris and other genera, from strata ranging from the Lower Lias to the top of the Oolitic lime-stones of the Malm, and possibly even further back to the Cretaceous. It is probable that the Jurassic Conostoma, described from French localities, and other genera which need not be mentioned, may also be reckoned among the Mesozoic Siphonées. A genus Zanarichthes, compared with species of Cyanophyceæ, has been described as a Centric alga from Liasic limestones of Silesia. The geological history of Mosses and Liverworts is at present very incomplete, and founded on few and generally unsatisfactory fragments. It is hardly too much to say that absolutely trustworthy examples of Mosses have so far been found in Mesozoic strata. Of Liverworts there are a few species, such as Palaeohepatica Rotafssinii from the Lower Jurassic
rocks of Cracow, Marchantia erecta from the Inferior Oolite rocks of Yorkshire, and M. Zelleri from the Wealden beds of Sussex. These fossil Hepaticae are unfortunately found only on sterile fragments, and placed in genera they do not exactly resemble the thallas of Marchantia and other recent genera.

The Palaeozoic Calamites were succeeded in the Triassic period by large Equisetites, differing, so far as we know, in no essential respect from those of Jurassic age, which in the form of the frond, bearing long and relatively short rachises, exhibits a striking agreement with the sterile portion of the fronds of Aneidites rotundifolia, a member of the fern family Schizaeaceae. Again, another species of the same type, Equisetites aubryanus (fig. 5, B), suggests a comparison with fern fronds like that of the recent species Nepheleopsis Drue. The leafy ramenta which occur in abundance on the leaf-stalk bases of fossil Cycads constitute another fern character surviving in Mesozoic Cycadales, and which is essentially due to the fact that the reproductive organs, we are compelled to speak of some of the Mesozoic plants as possibly Ferns or possibly Cycads, and not referable with certainty to one or other class. It has been found useful to distinguish a group of Mesozoic Ferns, as Lycopodiaceae, or more generally as Lycopsidae, as in a recent paper by Sollas, which has been referred to by Pressler, as Lycopsidae, or less closely related to living Club-Mosses and Selaginellas, but lacking the more important reproductive organs.

Nolt, Schmitz has recently described a new type of Lycopodium, Ctenis, Lycostrobus, and Thinnfeldia, as the first known representative of a monotypic genus, a sort of Monocotyledon, as some writers have supposed. One of the best-known European species is Lycopodium peltatum, originally described by Lindley and Hurton from the Inferior Oolite of Yorkshire.

Among the large number of Mesozoic Ferns there are several species, including one which has been defined as a new genus, Thinnfeldia, characteristic of the Jurassic and Lower Lycopsidae, represented by some exceptionally fine specimens, Dicrhopides, represented by some exceptionally fine specimens, Dicrhopides, etc. The first genus, Thinnfeldia, and other Mesozoic genera,

In the Wealden strata there are many more species of Lycopsidae, such as Calamites, Cycadean, and other genera, which are known to be the most characteristic of this group, as well as those which are known to be the most characteristic of this group, as well as those which are known to be the most characteristic of this group. The characteristic of the Jurassic and Lower Calamites, represented by a few forms of Palaeozoic age, played a more prominent part in the Jurassic world.

Cycads—persisted into the Mesozoic era; but without more anatomical knowledge of them we at present possess, it is impossible to do more than to point to a few indications afforded by external, and possibly slight extent by internal structure, of the survival of Cycadofilicaceae. The flora of Otozamites, which is customary, and probably correct to include in the Cycads, is represented by certain species, such as Otozamites Beenu (fig. 5, A), a characteristic species of the genus Otozamites, in which the form of the frond, bearing a broad and relatively short rachis, exhibits a striking agreement with the Recent Cycads, such as Equisetites aubryanus, as well as with the recent Cycads, and is very similar to the Recent Cycads. The leafy ramenta which occur in abundance on the leaf-stalk bases of fossil Cycads constitute another fern character surviving in Mesozoic Cycadales, and which is essentially due to the fact that the reproductive organs, we are compelled to speak of some of the Mesozoic plants as possibly Ferns or possibly Cycads, and not referable with certainty to one or other class. It has been found useful to distinguish a group of Mesozoic Ferns, as Lycopodiaceae, or more generally as Lycopsidae, as in a recent paper by Sollas, which has been referred to by Pressler, as Lycopsidae, or less closely related to living Club-Mosses and Selaginellas, but lacking the more important reproductive organs.

the leaves of *Dipietes*, a genus which may often be recognized by the broad and relatively short blunt-topped pinnules. The Jurassic species *Cladophlebus denticulatus* (fig. 6), recorded from several European localities, as well as from North America, Japan, China, Australia, India and Persia, affords an interesting example of the occurrence of similar types of fossil Osmundaceae. 

The Schizaeaceae include a widely spread species, originally named *Peperoces exilis*, and subsequently in a new genus, *Klukia*, which is characterized by tripinnate fronds with short linear ultimate segments, bearing a single row of sporangiophores with an apical annulus ("monopodial sorti" of Prantl) on either side of the midrib. This type occurs in the Coligny and Lower Jurassic of England, and also in the Rhine valley. Some exceptions to the rule are represented in species having the sporangia borne on short fronds, which have been described from the Rhine valley, and modern genera, such as *Pteridium* and *Polypodium*, represent the majority of the representatives in this family. The Schizaeaceae have been considered by many botanists to be the earliest of the ferns, and it has been thought that they were the ancestors of the later ferns. This view is no longer held, and it is now generally agreed that the Schizaeaceae are a distinct group of ferns, and that they are not the ancestors of the later ferns.

The recent genus *Dipeteris*, with its four existing species, occurring chiefly in the Indo-Malayan region (Map B, Dipeteris), is also a modern survival of several early Mesozoic types represented by such genera as *Dipteris* and *Camptopteris*, which were abundant during the Rhacit and Jurassic periods in England, Germany, Sweden and elsewhere in Europe (Map B, D). Important additions to our knowledge of the fertile leaves and rhizomes of certain Fern species have been made by Professor Nathorst of Stockholm, and Professor Richter of Dorpat, who have recently published a work on the British flora of the Jurassic period. Some of these species are represented by the fossils of the genus *Hausmannia*, a genus which is probably identical with *Prolepis*, which is abundant in Lower Cretaceous and other strata in various European localities. The *Dipteris* of the Mesozoic Flora of the Alps have been described by other writers, and have been recognized as representing the majority of the genera of the Schizaeaceae. The fossil Schizaeaceae of England and other European localities, and of a very general distribution, have been described by other writers, and have been recognized as representing the majority of the genera of the Schizaeaceae.

Our knowledge of the Mesozoic flora of the Alps has been greatly extended by the work of other writers, and has been recognized as representing the majority of the genera of the Schizaeaceae. The fossil Schizaeaceae of England and other European localities, and of a very general distribution, have been described by other writers, and have been recognized as representing the majority of the genera of the Schizaeaceae.

Our knowledge of the Mesozoic flora of the Alps has been greatly extended by the work of other writers, and has been recognized as representing the majority of the genera of the Schizaeaceae. The fossil Schizaeaceae of England and other European localities, and of a very general distribution, have been described by other writers, and have been recognized as representing the majority of the genera of the Schizaeaceae.
Sphenozamites, chiefly from French localities, which are referred to the Cycads because of their similarity to the pinnate fronds of modern Cycadaeaceae. In the succeeding Triassic system Cycadean fronds, which there is good reason to refer to the Cycadales in Upper Triassic, Rhaetic, Jurassic and Wealden rocks in India, Australia, Japan, China and elsewhere in the southern hemisphere, as well as North America, Greenland, and other Arctic lands and throughout Europe. It is noteworthy that Tertiary plant-beds have yielded hardly any specimens that can be recognized as Cycads.

A more important question is, What knowledge have we of the reproductive organs and stems of these fossil Cycads? Cycadean stems have recently been found in great abundance in Jurassic and possibly higher strata in Wyoming, South Dakota, and other parts of the United States. Cycadean stems have been found also in the uppermost Jurassic, Wealden and Lower Cretaceous rocks of England, India and other parts of the world. An example of an Indian Cycadean stem from Upper Gondwana rocks is represented in fig. 13; the surface of the trunk is covered with persistent bases (fig. 15, A) of the fronds known as Phyllopitys cutchensis, which are practically the same as the European species Willianumia pecien (fig. 17). In a section of the stem (fig. 13, B) a large pith is seen to occupy the axial region, and this is surrounded by a zone of secondary wood, which appears to differ from the characteristic wood of modern Cycads (see Gymnosperms) in having a more compact structure. It is interesting to find that G. R. Wieland of the Wealden, England.
Yale University has noticed in some of the Cycadalean stems from the Black Hills of Dakota and Wyoming that the wood appears to possess a similar structure, differing in its narrower medullary rays from the wood of modern Cycads. The lozenge-shaped areas external to the axis of the stem represent the sections of perichous sori, some of which are shown in fig. 13, A, attached to the stem. The majority of Mesozoic stems agree in external appearance with those of recent species of Encephalartos, Macrozamia, and some other genera; the trunk is encased in a mass of persistent petiole bases, the scales separated from one another by a persistent band and the internal surface of the same is scaly. The structure of the leaf-stalks is like that of modern Cycads, but the ramenta, instead of having the form of long uniseriil hairs like that of the petioles and bud-scales of existing species, are exactly like the naked Paleozoic forms characteristic of the majority of ferns. This form-like character affords an interesting survival of the close relationship between Cycads and Ferns. Some examples of Jurassic Cycadalean stems from Wyoming are characterized by an unusually rich development of ramental scales; the ramenta from the old leaf-bases form an almost complete covering over the surface of the trunk. Professor Lester Ward has instituted a new generic name, Cycadilla, for these woody forms. In a few cases the fossil stems show no trace of any lateral flowering shoots, and in that respect agree with modern forms; an instance of this is afforded by a large Cycadalean trunk discovered some years ago in one of the Portland quarries, and named Cycadeoidea gigantea (fig. 14). In this stem the flowers may have been terminal, as in existing Cycads. As a rule, however, the fossil stems show a marked difference from modern forms in the possession of lateral shoots given off from the axis of leaves, and terminating in a flower of complex structure containing numerous orthotropous seeds. These reproductive shoots differ in many important respects from the flowers of recent Cycads, and chiefly on this account it is customary to include the plants in a separate genus, Bennettites, and in a separate group—the Bennettitales—distinct from that of the Cycadales including the existing Cycads. The best preserved specimens of the true Bennettites type are far described are from the Lower Greensand and Wealden of England, and from Upper Mesozoic strata in North America, Italy, and France. A study of the anatomical structure of the vegetative stem, which on the whole is very similar to that of recent Cycads, leaves no doubt of the identity of certain characters which are not met with in modern Cycads. The chief distinguishing feature is in recent species (see Gymnosperms) these pursue a somewhat complicated course as they pass from the petiole towards the vascular cylinder of the stem, but in Bennettites the vascular bundles from the leaves followed a more direct course through the cortex of the stem (fig. 15, 7). The exact method of the arrangement appears to show the nearest approach to this simpler structure in the leaf-traces. In a Florida species of Zamia the leaf-traces are described as characterized by a more direct course from the point of the leaf to the longitudinal veins, agreeing more closely with the extinct Bennettites. The typical Bennettites female flower (fig. 15, 4 and 7), as investigated in English, French, Italian, and American species, may be briefly described as a short lateral shoot or peduncle, arising and terminating in a bluntly rounded apex, bearing numerous linear bracts enclosing a central group of appendages, some of which consist of slender pedicels traversed by a vascular strand and bearing a single terminal, with a felted ovule enclosed in a distal canal or micropyte. Associated with these seminiferous pedicels occur sterile appendages consisting of slender, stalks, terminating in dilated expansions, which form a fleshy covering over the receptacle, and enclose the micropyles for the entrance of the pollen-grains. It has been suggested by some authors that the almost complete investment of the small Bennettites seeds by the surrounding swollen ends of the interseminal scales (fig. 15, 7) represents an approach to the angiospermy ovary. In Bennettites the ovules are left exposed at the apex, but they are by no means so distinctly gymnospermous as in recent Cycads and Conifers. The ovules have been preserved in wonderful perfection, enabling one to make out the structure of the embryo, with its bluntly conical radicle and two fleshy cotyledons filling the exalabuminous seed (fig. 15, 11). One additional peculiarity of the taxaceeae has until recently been confined to the female flowers, as described by Carruthers, Solms-Laubach, Lignier, and others. The fortunate discovery of several hundred Cycadalean stems in the United States, of Lower Cretaceous and Lower Palaeozoic age, is material which has largely been investigated and is still receiving attention at the hands of Mr. Wieland. This investigator has already published a well-illustrated account of his discoveries, which give reliable information with regard to the reproductive organs, and lead us to expect additional results in the future of the greatest importance and interest. On some of the American stems flowers have been found, borne at the apex of lateral shoots, which are attached to the receptacle. The flowers are of the type with spores (pollen-grains), surrounding a conical central receptacle bearing numerous small and probably functionless or immature ovules (fig. 15, 10). The structure of this type of flower may be briefly described as follows. In shape and size the flower is similar to that long known as the female flower of Bennettites and Williamsonia. A number of hairy linear bracts enclose the whole; internal to these occur 12 to 20 crowded planate leaves (sporophylls), with their apical portions bent over towards the axis of the flower, the bases of the petioles being fused laterally into a disk surrounding the base of the conical receptacle. Numerous pairs of pinnules are attached to the sides of each sporophyll. The ovules bear 20 to 30 synangia (sori or plurilocular sporangia) (fig. 15, 8 and 9). The synangium consists of a stout wall composed of thick-walled cells, succeeded by a layer of more delicate and smaller elements; and internal to this the ovules occur two rows in the lining microspores. When the synangium are ripe dehiscence takes place along a median line between the two rows of loculi. In size, position, arrangement, and manner of dehiscence the sporangium bear a striking resemblance to those of Marattia and Dadox among the present Marattiaceae. The most important point elucidated by this discovery is the very close correspondence of the male organs of the Bennettites flower with the sporophylls and synangia of Marattia and Dadox. It furnishes another further link between Cycads and Ferns. It remains to be seen if the ovuliferous cone in the centre of the flower represents simply a functionless gynoecium, as in Welwitschia and abnormal cones of certain Conifers, or if the flowers themselves are hermaphrodite, with both functions fully developed. We have a combination in the same flower of stalked ovules, the structure of which has already been described, and interseminal scales constituting a complex gynoecium, which exhibits in certain features an approach to the angiospermous type, and differs in structure from other Gymnospermae flowers, associated with male organs constructed on a plan almost identical with that of the sporophyll. Mr. Wieland has described in Mr. Wieland's researches have, however, demonstrated the existence in flowers of this type of a definite receptacle, between the receptacle and the surrounding bracts, to which staminate leaves were originally attached. The flowers hitherto regarded as female were in some cases at least hermaphroditic,
but the male organs had been thrown off before the complete development of the gynoecium. This fact suggests the possibility that the flowers described by Mr. Wieland, in which the male organs are mature and the gynoecium is composed of very short and immature ovuliferous stalks and interseminal scales, are not essentially distinct from those which have lost the staminate leaves that one at least of the flowers, that originally described by Mr. Carruthers from the Inferior Oolite of Yorkshire as Beania gracilis, may have been borne by a member of the Ginkgoaceae. From Jurassic rocks of France and Italy a few imperfect specimens have been found, resembling as closely as possible those described as Eusporites, like those of the recent genus Cycas (see Gymnosperms); while a few of these may have been correctly identified, an inspection of some of the original examples in the Paris collections leads one to express the opinion that others are nothing but imperfect to determine. Fronds of the Cycas type, characterized by the presence of a midrib and no lateral veins in the linear pinnate, are recorded from Rhaetic rocks of Germany, from Wealden strata in England (fig. 11) and Portugal, and from Liassic beds in Devonshire. One large specimen is figured by Professor Natherst, as the result of a more recent examination of Heer's specimen, found that the segments of the frond are characterized by the presence of two parallel veins instead of a single midrib, with a row of stoma between them: for this type of Cycadean leaf he proposed the generic name Pseudo-

and possess mature seeds. It is probable that the flowers of Bennettites were normally hermaphroditic, and they may have been markedly protandrous. We cannot decide at present whether the gynoecium in a flower, such as that represented in fig. 15, 7, has partially aborted or whether it would have matured later after the fall of the male organs.

It is clear that Bennettites differed in many essential respects from the few modern survivors of the Cycadophyta. Fossil flowers of a type more like that of modern Cycads are few in number, and it is not by any means certain that all of those described as Cycadean flowers and seeds were borne by plants which should be included in the Cycadophyta; a few female flowers have been described from Rhaetic rocks of Scania and elsewhere under the name Zamites-striphilus—these consist of an axis with slender pedicels or carpophylls given off at a wide angle and bearing two ovules at the distal end; the structure is in fact similar to that of a Zamites female flower, in which the internodes of the peduncle have been elongated so as to give a looser arrangement to the carpels. It has been suggested
by Brongniart. The flowers, or some of them, were originally described by Nathorst as *Williamsonia angustifolia*. This form of stem, of a habit entirely different from that of recent Cycads and extinct *Bennettites*, points to the existence in the Mesozoic era of another type of Ginkgoaerum allied to the Bennettites of the Jurassic and Cretaceous periods by its flowers, but possessing a distinct character in its vegetative organs. There is no doubt that the Cycadophyta, using the term suggested by Nathorst in 1902, was represented in the Mesozoic period by several distinct families or classes which played a dominant part in the floras of the world before the advent of the Angiosperms. In addition to the bisporangiate reproductive shoots of *Bennettites*, distinguished by many important features from the flowers of recent Cycads, a few specimens of flowers have been discovered exhibiting a much closer resemblance to those of existing Cycads, e.g. *Andros- trobus Balduini* from Bathonian rocks of France; *Zamites* *feminiarum*, described many years ago by Corda, from Lower Cretaceous rocks of Bohemia, and *Androstrobus Nathorstii*, from Wealden beds in Sussex. The majority of the species were, however, characterized by flowers of a different type known as *Bennettites* and *Williamsonia*. The living Maidenhair-tree (*Ginkgo biloba*) (see Gyn-

The regions from which significant examples of Ginkgoales (*Baiera* or *Ginkgo*) have been recorded are shown in Map B (G–G*). Both Tertiary and Mesozoic localities are indicated in the map. An adequate chart of fossil Mesozoic Conifers is impossible within the limits of this article. Coniferous twigs are very common in Mesozoic strata, but in most cases we are compelled to refer them to provisional genera, as the evidence of vegetative shoots alone is not sufficient to enable us to determine their position within the Coniferae. There are, however, several forms which it is reasonable to include in the Araucariae; that this family was to the fore in the vegetation of the Jurassic period is unquestionable. We have not merely the striking resemblance of vegetative shoots to those of recent species of *Araucaria* and *Agathis*, e.g. species of *Nagiopetis*, abundantly represented in the Upper Jurassic beds of the Putomac area in North America, species of *Pagiophyllum* and other genera of Jurassic and Wealden age, but an abundance of fossil wood (*Araucarioxylon*) from Jurassic and Cretaceous strata in Europe, North America, Madagascar and elsewhere agreeing with that of recent *Araucaria*, in addition to several well-preserved female flowers. C. A. Hollick and E. C. Jeffrey have recently shown that some Lower Cretaceous specimens of the well-known genus *Brachypodium* obtained from Gatun Island, N. Y., possess wood of the Araucarian type. This genus has long been known as a common and widely spread Jurassic and Cretaceous conifer, but owing to the absence of petrified specimens and of well-preserved cones, it has been impossible to refer to a definite position in the Coniferae. It is now clear that some at least of the species of *Brachypodium* must be referred to the Araucarieae. In a recently published paper Seward and Ford have given a general account of the Araucarieae, recent and extinct, to which reference may be made for further details as to the geological history of this ancient section of the Coniferae. Some of the fossils referred to the genus *Kaidocarpus*, and originally described as monotypodendron inflorescences, are undoubtedly Araucarian cones; other cones of the same type have been placed in the genus *Cycadostrobus* and referred to Cycads. *Araucarites Hadestonii*, described by Mr Carruthers from the Coralline Oolite rocks of Malton in Yorkshire; *Araucarites sphaerocarpus* from the Lower Cretaceous of Somme, and *Cycadostrobus Sphaerocarpus* from the Portland Sand, Bempton, have also been confused with *Araucarites* by Carruthers, *Kaidocarpus oolithicus*, afford good illustrations of British Araucarian flowers. A flower of a rather different type, *Pseudaraucaria major*, exhibiting the occurrence of two seeds in each scale, is the only known example of an Araucarian wood. Among the more abundant Conifers of Jurassic age may be mentioned such genera as *Thyoides* and *Cupressites*, which agree in their vegetative characters with members of the Cupressinae, but our knowledge of the cones is far from satisfactory. Many of the small female flowers borne on shoots with foliage of the *Cupressites* type consist of spirally disposed and not verticillate scales, e.g. *Sphacodytus*, a common Jurassic species.

Fossil wood, described under the name *Cupressoxylon*, has been recorded from several Mesozoic horizons in Europe and elsewhere, but this term has been employed in a wide sense as a designation for a type of structure met with not only in the Cupressinae, but in members of other families of Coniferae. The Abietinae do not appear to have played a prominent part before the Wealden period; various other species, e.g. *Rhaetia* species from Scania, are recorded, but it is not until we come to the Upper Jurassic and Wealden periods that this modern family was abundantly represented. Fossil wood of the *Pinites type* (*Pityoxylon*) has been described from England, France, Germany, Sweden, Spitsbergen, North America and elsewhere; some of the best British examples have been obtained from the so-called Pine-raft, the remains of water-logged and petrified wood of Lower Greensand age, seen at low water near Brook Point in the Isle of Wight. Well-preserved female flowers have been obtained from the Wealden rocks of England and Belgium, e.g. *Pinites Dunkeri*, *P. Solmsi*, &c.; specimens of seeds and vegetative shoots are recorded also from Spitsbergen and other regions. Hollick and Jeffrey have recently added to our knowledge of the anatomy of Cretaceous
species of *Pinus*, and Miss Stopes and Dr Fuji have made important contributions on the structure of Cretaceous plants from Japan. Copies of Lower Cretaceous age, referred to *Cedrus*, afford an illusion of the persistence of an old type, but unfortunately most of the Mesoic species referred to this genus do not possess sufficiently perfect cones to confirm their identification as examples of *Sequoia*. Some of the best examples of cones and twigs referred to *Sequoia* are those described by Heer from Crete (Professor D. P. Penhallow of Montreal has described the anatomical structure of the stem of *Sequoia Lanphordii*, a Tertiary species occurring in Europe and North America).

There are a few points suggested by a general survey of the Mesoic floras, which may be briefly touched on in conclusion. In the following process of plant-life through those periods in the history of the earth of which records are left in ancient sediments, seams of coal or old land-surfaces, we recognize at certain stages a want of continuity between the floras of successive ages. The imperfection of the geological record, considered from the point of view of evolution, has been rendered familiar by Darwin's remarkable chapter in the *Origin of Species*. Breaks in the chain of life, as represented by gaps in the blurred and incomplete documents afforded by fragmentary fossils, are a necessary consequence of the general plan of geological evolution; they mark missing chapters rather than sudden breaks in an evolutionary procession. The record of past ages tends to the conviction that too much stress may be laid on the imperfection of the geological record as a factor in the interpretation of palaeontological data. The doctrine of Uniformitarianism, as propounded by Lyell, served to establish geology on a firmer and more rational basis than it had previously possessed; but latterly the tendency has been to modify the Lyellian view by an admission of the probability of a more intense action of groups of forces at certain stages of the earth's history. As a definite instance a short review may be given of the evidence of palaeobotanical records as regards their bearing on plant-evolution. Starting with the Permo-Carboniferous vegetation, and omitting for the moment the Glossopetris flora, we find a comparatively homogeneous flora of wide geographical range, consisting to a large extent of arborescent lycopsids, calamites, and other vascular cryptogams, plants which occupied a place comparable with that of Gymnosperms and Angiosperms in our modern forests; with these were other types of the greatest phylogenetic importance, which serve as finger-posts pointing to lines of evolution of which we have but the faintest signs among existing plants. Other types, again, which may be referred to the Gymnosperms, played a not unimportant part in the Palaeozoic vegetation. No conclusive proof has so far been adduced of the existence in those days of the Cycads, nor is there more than partial evidence of the occurrence of genera which can be placed with confidence in any of the existing families of Conifers. There are, moreover, no facts furnished by fossil plants in support of the view that Angiosperms were represented either in the low-lying forests or on the slopes of the mountains of the Coal period. Passing higher up the geological series, we find but scanty records of the vegetation that existed during the closing ages of the Permian period, and of the plants which witnessed the beginning of the Triassic period we have to be content with the most fragmentary relics. It is in rocks of Upper Triassic and Rhaetic age that abundant remains of rich floras are met with, and an examination of the general features of the vegetation reveals a striking contrast between the Lower Mesoic floras and those of the Palaeozoic period. Arborescent Pteridophytes are barely represented, and such dominant types as *Lepidodendron, Sigillaria, Calamites* and *Sphenophyllum* are practically unknown. Calamites had assumed the leading role, and the still luxuriant fern vegetation has put on a different aspect. This description applies almost equally to the floras of the succeeding Jurassic and Wealden periods. The change to this newer type of vegetation was no doubt less sudden than it appears as read from palaeobotanical records, but the transition period between the Palaeozoic type of vegetation and that which flourished in the Lower Mesoic era, and continued to the close of the Wealden age, was probably characterized by rapid or almost sudden changes. In the southern hemisphere the Glossopetris flora succeeded a Lower Carboniferous vegetation with a rapidity similar to that which marked the passage in the north from Palaeozoic to Mesoic floras. This apparently rapid alteration in the character of the southern vegetation took place at an earlier period than that of the northern hemisphere, and the closing stages of the Triassic period, which are characterized by the appearance of a new type of vegetation in India and the southern hemisphere was probably connected with a widespread lowering of temperature, to which reference has already been made. It was from this Glossopetris flora that several types gradually migrated across the equator, where they formed part of the vegetation of more northern regions. The difference between the Glossopetris flora and those which have left traces in the Upper Gondwanas rocks of India, in the Wianamatta and Hawkesbury beds of Australia, and in the Stormberg series of South Africa is much less marked than that between the Permo-Carboniferous flora of the northern hemisphere and the succeeding Mesoic vegetation. In other words, the change took place at an earlier period in the south than in the north. To return to the northern hemisphere, it is clear that the Wealden flora, as represented by plants recorded from England, France, Belgium, Portugal, Russia, Germany and other European regions, as also from Japan and elsewhere, carries on, with minor differences, the facies of the older Jurassic floras. It was at the close of the Wealden period that a second evolutionary wave swept over the vegetation of the world. This change is most strikingly illustrated by the inrush of Angiosperms, in the equally marked decrease in the Cycads, and in the altered character of the ferns. It would appear that in this case the new influence, supplied by the advent of Angiosperms, had its origin in the north. Unfortunately, our knowledge of the later floras in the southern hemisphere is very incomplete, but a similar transformation appears to have been characteristic of the vegetation in the northern hemisphere. As to the nature of the chief factors concerned in the two revolutions in the vegetable kingdom, if it is admissible to use so strong a term, only a guess can be hazarded. Physical conditions no doubt played an important part, but whatever cause may have had the greatest share in disturbing the equilibrium of evolutionary forces, it would seem that the apparently sudden appearance of Cycads and other types at the close of the Palaeozoic period made a widespread and sudden impression on the whole character of the vegetation. At a later stage—in post-Wealden days—it was the appearance of Angiosperms, probably in northern latitudes, that formed the chief motive power in accelerating the transition in the facies of plant-life from that which marked what we have called the Mesoic floras, to the condition of the Northern Hemisphere at the end of the Cretaceous period.

With the advent of Angiosperms began, as the late marquis of Saporta expressed it, "Une révolution, ainsi rapide dans sa marche qu'universelle dans ses effets." From the floras of the Tertiary age we pass by gradual stages to those which characterize the present phase of evolutionary progress. Among modern floras we find here and there isolated types, such as *Ginkgo, Sequoia, Matonia, Dipetis* and the Cycads, persisting as more successful survivals which have held their own through the course of ages; these plants remain as vestiges from a remote past, and as links connecting the vegetation of to-day with that of the Mesoic era.

lower Cretaceous. A flora consisting entirely, with a single doubtful exception, of Gymnosperms and Palaeophytophores, of one containing many flowering plants; and these increase so rapidly that before long they seem to have crowded out many of the earlier types, and to have themselves become the dominant forms. Not only do Angiosperms suddenly become dominant in all known plant-bearing deposits of upper Cretaceous age, but strangely enough the earliest found seem to belong to living orders, and commonly have been referred to existing genera. From Cretaceous times onwards local distribution may change; yet the successive floras can be analysed in the same way as, and compared with, the living floras of different regions. World-wide floras, such as seem to characterize some of the older periods, have ceased to be, and plants are distributed more markedly according to geographical provinces and in climatic zones. This being the case, it will be most convenient to discuss the Tertiary floras in successive order of appearance, since the main interest no longer lies in the occurrence of strange extinct plants or of transitional forms connecting orders now completely isolated.

The accurate correlation in time of the various scattered plant-bearing deposits is a matter of considerable difficulty, for plant-remains are preserved principally in lacustrine strata laid down in separate basins of small extent. This it is obvious must commonly be the case, as most leaves and fruits are not calculated to drift far in the sea without injury or in abundance; nor are they likely as a rule to be associated with marine organisms. Deposits containing fossils of the plant-remains are often separated, for the ocean is continuous and many marine species are world-wide. Plants, on the other hand, like land and fresh-water animals, occupied areas which may or may not have been continuous. Therefore, without a knowledge of the physical geography of any particular period, we cannot know whether like or unlike floras might be expected in neighbouring areas during that period. If, however, we discover plant-bearing strata interstratified with deposits containing marine fossils, we can fix the period to which the plants belong, and may be able to correlate them in distinct areas, even though the floras be unlike. This clear stratigraphical evidence is, however, so rarely found that much uncertainty still remains as to the true age of several of the floras now to be described; precisely, with widely separated, for the ocean is continuous and many marine species are world-wide. Plants, on the other hand, like land and fresh-water animals, occupied areas which may or may not have been continuous. Therefore, without a knowledge of the physical geography of any particular period, we cannot know whether like or unlike floras might be expected in neighbouring areas during that period. If, however, we discover plant-bearing strata interstratified with deposits containing marine fossils, we can fix the period to which the plants belong, and may be able to correlate them in distinct areas, even though the floras be unlike. This clear stratigraphical evidence is, however, so rarely found that much uncertainty still remains as to the true age of several of the floras now to be described.

In rocks approximately equivalent to the Lower Greensand of England, or slightly earlier, Angiosperms make their first appearance; but as the only strata of this age in Britain are of marine origin, we have to turn to other countries for the evidence.

The earliest Angiosperm yet found in Europe is a single monocotyledonous leaf of doubtful affinities, named by Saporta Angio-spermes primaires (fig. 1) and found in the Valengian strata of Portugal. These deposits seem to be equivalent to British Wealden rocks, though in the latter, even in their upper part, no trace of Angiosperms has been discovered. No other undoubted Angiosperm has yet been discovered in Europe in strata of this age, but Heer records a poplar-like leaf from Urgonian strata, a stage newer than the Valengian, in Greenland, and Saporta has described from strata of the same date in Portugal a Euphorbiaceous plant apparently closely allied to the living genus Ceiba, named by him Choffatia Francheti (fig. 2). We must turn to North America for a fuller knowledge of the earlist flowering-plants.

In S. Dakota a remarkable series has been discovered, lying unmistakably between marine Upper Jurassic rocks below and Upper Cretaceous above. There has been a certain amount of confusion as to the exact strata in which the plants occur, but this has now been cleared up by the researches of Lester F. Ward, who has shown how the Secondary flora gives place to one of Tertiary character.

The lower strata—i.e. these most allied to the Jurassic—contain only Gymnosperms and Cryptogams. The next division (Dakota No. 2 of Meek and Worthen) contains Gymnosperms and Ferns of Neocomian types, or even of Neocomian species; but all that can be said is that one of the forms may be allied to oak, another to fig, a third to Sapindus, and the fourth may perhaps be Sycamorus. "Potomac Formation" of Virginia and Maryland is doubtless also mainly of Neocomian age, for though it rests unconformably on much older strata, the successive floras found in it are so allied to those of S. Dakota as to leave little doubt as to the geographical status of the series. Lester Ward records no fewer than 737 distinct forms, consisting mainly of Cretaceous Conifers and Dicotyledons, the Ferns and Cycads being confined mainly to the Older Potomac. Monocotyledons are here especially represented in the Newer Potomac, though occurring more rarely even down to the base of the series. Six successive stages have been defined in the Potomac formation. The Mount Vernon beds, which occur about the middle of the series, have as yet yielded only a small number of species, though these include the most interesting early Angiosperms. Among them are recorded a Casuarina, a leaf of Sagittaria (which however, as observed by Zeller, may belong to Smilax), two species of Cypripedium, and a number of cordate bases, Montia pericoma (possibly a water-lylly) and Callastrion (perhaps allied to Calasistrum). Protokophylum, found in the same bed, and also in the Intra-Cretaceous of Portugal, seems to have belonged to a Protea ceous plant, though its leaves without fruits have yet been discovered in deposits of this early date. Whatever doubt may be left as to the exact botanical position of these early Lower Cretaceous Angiosperms, it is clear that both Monocotyledons and Dicotyledons are represented by several types of leaves, and that the flora extended over wide areas in North America and Greenland, and is found again at a few points in Europe. There is yet no clear evidence either of the affinities of the Dicotyledons or of the existence of geographical provinces during this period.

The next strata, the Aquila Creek series, contain a well-marked dicotyledonous flora, in which both the form and nervation of the leaves begin to approach that of recent times. The leading characteristic of this Middle Potomac flora is the proportion of Dicotyledons. Notwithstanding this apparent passage-bed, there is a marked difference between the Older and the Newer Potomac floras, very few species passing from the one to the other. Only 15 out of 405 plants in the older series occur in the beds above,
the imperfect and want of continuity of the records in Europe have made it necessary in dealing with the Cretaceous floras for us to give the first place to America. But it is now advisable to return to Europe, where Upper Cretaceous floras are not uncommon, and the position of the deposits in the Cretaceous series can often be fixed accurately by their close association with marine strata not forming subdivisions. As these divisions of Cretaceous time will have to be referred to more than once, it will be useful to tabulate them, thus showing which plant-beds seem to be referable to each, and what are the British strata of like age. It has not yet been found possible so closely to correlate the strata of Europe with those of America, where distance has allowed geographical differences in both fauna and flora to come into play; therefore, beyond the references to Lower or Upper Cretaceous, no classification of the American Cretaceous strata has here been given. In Europe the most commonly accepted divisions of the Cretaceous period are as follows:

**England.**
- Wanting
- Upper Chalk
- Middle Chalk
- Lower Chalk
- Upper Green-sand
- Gault
- Lower Green-sand
- Wealden

In the continental classification the deposits from the Gault downwards are grouped as Lower Cretaceous; but in Great Britain there is a strong break below the Gault and zone above; and the Gault is therefore classed as Upper Cretaceous. The limits of the divisions in other places do not correspond, the British and continental strata often being so unlike that it is almost impossible to compare them. The doubt as to the exact British equivalent of the Valanginian strata of Portugal, which yield the earliest Dicotyledon, has already been alluded to.

The plant-bearing deposits next in age, which have yielded Angiosperms, appear to belong to the Cenomanian, though from Westphalia a few species belonging to the Cryptogams and Gymnosperms, found in deposits correlated with the Gault, have been described by Hoslus and von der Mark.

In Great Britain the whole of the Upper Cretaceous strata are of marine origin, and have yielded no land-plants beyond a few fir-cones, drift-wood and rare Dicotyledonous leaves in the Lower Chalk. Most of the deposits which have yielded Angiosperms of the Cretaceous are referred to the **Proteaceae**. Among the older plants found in the Upper Chalk are 2 species, **Cretaria**, 2 laurels, 1 **Aralia**, and 1 **Chondrophyllum** (of uncertain affinities), 2 magnolias, 2 species of **Myrtaceous** and 3 species of walnut. Saxonys yields from strata of this period at Niedersechon 42 species, described by Eitingshausen. This small flora is most remarkable, for no fewer than 6 genera, containing 4 species, referable to the **Proteaceae**. The Cenomanian flora of Bohemia is larger and equally peculiar, and among the older plants described by Veleneisky the following: **Credneria** (5 species), **Aralia** (4 species), **Myrica** (2 species), **Ficus** (5 species), **Quercus** (2 species), **Magnolias** (3 species), **Bosca** (3 species), **Laurnae** (2 species), **Verbenaes** (2 species), **Calebastrea** (2 species), **Copadaea** (2 species), **Camelliae** (2 species), **Ampelides** (2 species), **Mimosae** (2 species), **Cetcalystia** (5 species), **Eucalyptus** (2 species), **Pisania**, **Phillyrea**, **Rhus**, **Prunus**, **Bignonia**,
The British Eocene and Oligocene strata yield so large a flora, and contain plant-beds belonging to so many different stages, that it is unfortunately we have still no monograph on the subject, the one commenced by Ettingshausen and Gardner in 1879 having reached no farther than the Ferns and Gymnosperms. This deficiency makes it impossible to deal adequately with the British Eocene plants, most of the material being either unpublished or needing re-examination.

In the earliest Eocene plant-beds, in the Woolwich and Reading series, a small but interesting flora is found, which suggests a temperate climate less warm than that of earlier or of later periods. Leaves of the ginkgo are found, as in the earliest Miocene, and two figs, a laurel, a Grevillea and a palm. Ferns are scarce. Ettingshausen and Gardner recording only Anemis suberecta and Pieris (Pteris) Pretzschelli. The only Gymnosperms determined are Laurus, Cupaniaceae, and Taxodium europaeum. A few plants have been found in the next stage, the Oldhaven beds, and among these are fig and cinnamon. Gardner considers the plants to point to subtropical conditions. The London Clay has yielded a large number of plants, but most of the species are represented by fruits alone, not by leaves. This circumstance makes it difficult to compare the flora with that of other formations, for not only is it uncertain which leaves belong to the ferns, but the great number of imperfectly known genera and species, and the fact that the floras include the same genera and species in the same proportion, suggest, that different elements of the same flora may be represented at different localities. Of some plants only the delicious leaves are likely to be preserved, whilst other succulent-leaved genera will be missing. It is probable that about the 200 plants of the London Clay are no Ferns, but 6 genera of Gymnosperms—viz. Callicthus (2 species), Sequoia, Athrotaxis (1), Thuco, Podocarpus, and Taxodium—belonging to the London Clay. Among the others being fan-palms of the genera Sabal and Chamaeops. The Dicotyledons need further study. Among the fruits Ettingshausen records Quercus, Liquidambar, Laurus, Nyssa, Diospyros, Symlocos, Magnolia, Victoria, Hippocastanum, Cupana, Eugenia, Eucalyptus, Amygdalus; he suggests that the fruits of the London Clay of Sheppey may belong to the same families. The leaves of the oaks, especially withial, the leaves of the laurels, and the fruits of the oaks, especially the fruits of the oaks, are abundant, and these latter Gardner thinks may be of the same age, and not earlier, as is generally supposed. The total number of species found at Alum Bay, according to this author, is only about 50 or 60.

Dried plant-beds are frequently found in the Bagshot and Oolite Beds, and intercalated between these and the London Clay. Each bed yields peculiar forms, the total number of species amounting to many hundreds, most of them differing from those occurring in the strata below. The plants suggest a comparison of the vegetative flora of the Bagshot and Oolite Beds, and forests with those of the Malay Archipelago and tropical America. At one place we find drifted fruits of Nipa, at another Magnolia and Annona. Other beds yield principally palms, willows, laurels, Eucalyptus or Ferns; but there seems to be a deficiency in the richness of this flora, we may mention that in the only orders which have yet been monographed, Ferns are represented by 17 genera, Gymnosperms by 15, and Dicotyledons by 7. Of the latter Gardner best represented. Gardner speaks of the Bournmouth flora as appearing to consist principally of trees or hard-wooded shrubs, comparatively few remains of the herbaceous vegetation being preserved. The higher Eocene strata of England—those above the Bournmouth Beds—are of marine origin, and yield only drifted fruits, principally fir-cones.

In the volcanic districts of the south-west of Scotland and the northeast of Ireland plant-beds are found intercalated between the lava-flows. These also, like the lignites of Bovey Tracey, have been referred to the Miocene period, on the supposed evidence of the plants; but more recent discoveries by Gardner tend to throw doubt on this view. Now, the Miocene strata of these districts are of two ages, the first-formed of these deposits may date back to early Eocene times. The flora found in Mull points distinctly to temperate conditions; but it is not yet clear whether this indicates a different period or is due to local circumstances. The Miocene flora, as already stated, is more numerous, but the difference depends on latitude or local conditions. The plants include a Fern, Onoclea hebecata, close to a living American form; four Gymnosperms belonging to the genera Cryptomeria, Taxus,
Taxus and Podocarpus; Dicotyledons of about 30 species, several of which have been figured. Among the Dicotyledons may be mentioned Platanus, Acer (3), Quercus (5), Fagus (2), Dilleniaceae, Corylus (1), Castanea (1), Zizyphus, Populus and the nettle-like Boehmeria antiqua. The absence of the so-called cinnamon-leaves and the Smithaceae was considered of special importance at the Miocene stage. The occurrence of Middle Eocene and Oligocene floras, is noticeable. The Irish strata yield two ferns; 7 Gymnosperms, Cupressus, Podocarpus and Sequoia; Taxus (2 species), Tsuga; and leaves of about 25 Dicotyledons. The most abundant leaf, according to Gardiner, does not seem represented in the Palaeotaxidendron Benedicti; but that of the Palaeostraca of Celaeniodon. A water-lily, Nelumbo Buchii, occurs also in Oligocene beds on the Continent; the species of Alnus which has been found both in the Miocene and in the Arctic floras and at Gelinden. Among the other plants are an alder, an oak and a doubtful cinnamon.

Leaving these Scottish and Irish deposits of doubtful age, we find in the Hampshire Basin a series of fluvialite, lacustrine and marine deposits undoubtedly of Lower and Middle Miocene date. Their flora is still a singularly poor one, though plants have been obtained at many different levels; they perhaps indicate a somewhat colder climate than that of the Recent period. Among the more abundant plants are nuculaceous of several species of Chara, and drifted fruits and seed of water-lilies, of Ficicites (now generally referred to Potamogeton) and of Limnaceae (allied to Potamogeton); there is little else mixed with these. Other leaves are common of the two conical and of Alnus, a Conifer now confined to Tasmania. Ferns are represented by Gleichenia, Lycopodium and Chrysidiun Lanzanum, which last has a very wide and numerous distribution, but not in Saxony, though a similar genus, being Andromeda, Cinnamomum, Zizyphus, Rhus, Viburnum.

The lignite deposits and pipe-clays of Bovey Tracey in Devon, referred to Heer and Pencelly to the Miocene period, were considered by Gardiner to be of the same age as the Bourneacre beds (Middle Eocene). Recent researches show, however, that Heer’s view was more nearly correct. The flora of Bovey is like that of the lignite of the Wetterau, which is either highest Oligocene or lowest Miocene. Some of the richest fossiliferous deposits are in two districts, as are a climbing palm, two vines, a magnetol, &c. The common tree at Bovey is Sequoia Coutsiaceae, which probably grew in profusion in the sheltered valleys of Dartmoor, close to the lake. Above these strata in Great Britain there is a complete break, no species of plant ranging upwards into the next fossiliferous division.

Space will not allow us to deal with the numerous scattered deposits which have yielded Tertiary plants. It will be more to the purpose to take distant areas, where the order of the strata is clear, and compare the succession of the floras with that met with in other geographical regions and in other latitudes. For this study it will be most convenient to take next south and central France, for in that area can be found a series of plant-bearing strata in which is preserved a nearly continuous history of the vegetation, from Upper Eocene down to Pliocene. The account is taken mainly from the writings of Saporta.

The gypsum-deposit of Upper Eocene date at Aix in Provence commences this series, and is remarkable for the variety and perfect preservation of its organic remains. Among its Gymnosperms are numerous Cephalotaxaceae, Taxodium, Calliclitis and Widdringtonia, and a juniper close to one indigenous in Greece. Fan-palms, several species of dragon-tree and a banana, like one living in Abyssinia, represent the more peculiar Monocotyledons. Among the Angiosperms are the plant Chenopodium, Protocaceae, Laurinaeae, Bonbax, the Judas-tree, Acacia, Alkannahus, and the most plentiful forms are the Araliaceae. Willows and poplars, with a few other plants of more temperate regions, are found rarely at Aix, and seemingly point to casual introduction from surrounding mountains. In a general way, spiny plants, with still branches and dry and coriaceous leaves, dominate the flora, as they now do in Central Africa, to which region on the whole Saporta considers the flora to be most allied.

The succeeding Oligocene flora appears to be more characterized by a gradual replacement of the Eocene species by allied forms, than by any marked change in the assemblage or in the climatic conditions. It forms a perfectly gradual transition to the still newer Miocene period, the latter species slowly appearing and increasing in number. Saporta considers that the flora of Europe the alternate dry and moist heat of the Eocene period gave place to a climate more equally and more universally humid, and then to a period without material change into the succeeding Miocene stage. Among the types of vegetation which make their appearance in Europe during the Oligocene period may be mentioned the Comifers Libecotus salicornioides, several species of Chamaecyparis and Sequoia, Taxodium distichum and Glyptostrobus europaeus. The palms include Sabal coerengiana, S. major and Flabellaria. Among the Myricaceae several species of Complionia are common. These new-comers are all of American origin.

Plants in Amber.

XX. 18a
sweeping change of generic type, such as took place among the marine invertebrates. It may appear absurd to a geologist that any one could mistake a Cretaceous flora for one of Miocene date, since the marine animals are completely different and the differences are striking. In the case of the plants, however, the Tertiary generic types in large part appeared in Upper Cretaceous times. Few or no extinct types are recognized in the Miocene plants, although plants equivalent to the unmistakably extinct Ammonites, Belonites, and a hundred other groups, and we only meet with constant variations in the same genus or family, these variations having seldom any obvious relation to phylogeny.

The Miocene period is unrepresented by any deposits in Great Britain, unless the Bovey lignite should belong to its earliest stage; we will therefore commence with the best known region—that of central Europe and specially of Switzerland. Here, the Miocene lacustrine deposits are contained in a number of tilted-up lake-basins, which were successively formed and obliterated during the course of the Alps and the continuous folding and bending of the earth's crust which was so striking a feature of the period. These undulations tended to transform valleys into chains of lakes, into which the plants and animals of the surrounding area fell or were washed. The Miocene deposits of Switzerland, which are not a large flora than is known from any other period of similar length; in fact, an analysis of its composition suggests that the Miocene flora of Switzerland must have been both small and continuous—was studied by a number of naturalists in the country. The best known locality for the Upper Miocene plants is Oleningen, on the Lake of Constance, where have been collected near 500 species of plants, the total number of Miocene plants found in the Lake of Constance being over 1300. Here the characteristics of this Miocene flora are the large number of families represented, the marked increase in the deciduous-leaved plants, the gradual decrease in the number of palms and of tropical plants; the trees resemble more those of Europe than of America. According to Heer, the tropical forms in the Miocene flora agree rather with Asiatie types, while the more northern forms resemble those of the Mediterranean. In general, the temperature zone in North America. Of the 929 species described by Heer, 114 are Cryptogams and 806 flowering plants. Mosses are extremely rare, Heer only describing 3 species. Vascular Cryptogams occur for two large horptelia of genera over an inch thick, and also 37 species of Fern, amongst the most interesting of which are 5 species belonging to the climbing Lygodium, a genus now living in Java. The number of Ferns is just equal to that now found in Switzerland. Cycads are only represented by fragments of two species, and this seems to be the last appearance of Cycads in Europe. The Coniferae include no fewer than 94 species of Cupressinae and 17 of Abietinae, including several large species. Many of these are tree-like forms of the known Miocene flora, 25 of them being grasses and 39 sedges; but most of these need further study, and are very insufficiently characterized. Heer records one species of rice and four species of Millet. Mosses, ferns, and fern allies are also relatively rare. Among them is an Iris, a Bromelia and a ginger. Smilax, as in earlier times, was common. Palms, referred to 11 species, are found, though they seem to have decreased in abundance; of these 7 are fan-palms, the others including Phoenix—forms allied to the date—and a trailing palm, Calamus, allied to the canes and rattans. Among the Dicotyledons, the Leguminosae take the first place with 131 species, including Acacia, Cassia, each represented by several forms. The occurrence of 99 species of Amaranthaceae shows that, as the climate became less tropical, the relative proportion of this group to the total flora increased. The point is further characterized by the fact that, more than half the Swiss species being allied to living American forms. Fig-trees referred to 17 species occur, all with univalved keel-leaves; one is close to the banyan, another to the Indiana palm. The Lauraceae are represented by various laurels, camphor-trees, cinnamon, Persea and Sassafras. The Proteaceae, according to Heer, are still common, the Australian genera Hakea, Dryandra, Grevillea and Banksia, being represented. Among the Monocotyledons there are several large species, including Campanulaceae, Labiate, Solanaceae and Primulaceae, are still missing; and of Boraginaceae, Scrophulariaceae, Gentianaceae and Caprifoliaceae there are only faint and doubtful indications. The families of flowering plants, with their characteristic species and genera, are represented by each a number of species and genera, often being entirely known by the species of the genus Symphylus and Nymphoides. These plants are still abundant in Europe, Water-lilies of the genera Nymphaea and Nymphoides occur. Malus were still plentiful, 20 species having been described. Rosaceae are rare, Crataegus, Prunus and Amygdalus (which are being more generally recorded. It is obvious that many of these Swiss Miocene plants will need more than one study before their specific characters, or even their general position, can be accepted as thoroughly made out; still, this will not affect the general distribution of the flora, with its large proportion of deciduous trees and evergreens, and its noticeable deficiency in many of our largest living families.

From Europe it will be convenient to pass to a distant region of similar latitude, so that we may see to what extent botanical provinces existed in Eocene and Oligocene times. It so happens that the interior of temperate North America is almost the only region outside Europe in which a series of plant-bearing strata give a connected history of these periods, and in which the plants have been collected and studied. It is the whole of this area which, with the strata on the two sides of the Atlantic, and there is great doubt as to what strata belong to each division of the Tertiary period even in different parts of North America. This difficulty will disappear as the strata become better known; but at present each of the tilted-up lakes has to be studied separately, for we cannot expect so close a correspondence in their faunas and floras as is found in the more crowded and smaller basins in central Europe.

Perhaps the most striking characteristic of the Tertiary floras of North America, as distinguished from those of Europe, is the great increase in the number of trees and the enormous increase of the existing flora of the same regions. This difference is readily explained when we remember that in Europe the main barriers which stop migration, such as the Alps and the Mediterranean, ran east and west, while in America the only barriers of any importance ran north and south. In consequence of this peculiarity, climatic or orographic changes in Europe tend to drive animals and plants into a "cule de sac," from which there is no escape; but in America similar climatic waves merely cause the species alternately to retreat and advance. This difficulty in migration is probably the reason why the existing European flora is so poor in large-fruited trees as compared with what it was in Miocene times or with the existing flora in Africa and Asia. It would perhaps be true to say that the Eocene forests and those now living is much less striking, and this fact has led to the wrong assumption that the present American flora is less highly developed than the ancient. This is by no means warranted by the facts, for in Tertiary times, as we have seen, the European flora had a distinctly American facies. Therefore the so-called American floras may have originated in the Old World, or more probably, as Saporta suggests, in the polar regions, whence they were driven by the increase of cold southwards into Europe and into America. The American Tertiary flora is so large, and the geology of the deposits is so intricate, that it is out of the question to carry out any such reconstruction of the flora as has been attempted in this article. We may point out, however, that the early Tertiary floras seem to indicate a much closer connexion and a greater community of species than is found between the existing plants of Europe and America. We should perhaps say that ancient floras suggest recent dispersal from the place of origin, and less time in which to vary and become modified by the loss of different groups in the two continents. Geographical provinces are certainly indicated by the Eocene flora of Europe and America, but these are less marked than those now existing.

If we turn to a more isolated region, like Australia, we find a Lower Eocene flora distinctly related to the existing flora of Australia and not to that of other continents. Australasia had then as now a peculiarity of its own, though the former wide dispersal of the Proteaceae and Myrtaceae, and also the large number of Amaranthaceae then found in Australia, make the Eocene plants of Europe and Australia much less unlike than are the present floras.

Within the Arctic circle a large number of Tertiary plants have been collected. These are described by Heer, who referred them to the Miocene period; he recognized, in fact, two periods during which Angiosperms flourished within the Arctic regions, the one Upper Cretaceous, the other Miocene. To this view of the Miocene age of the plant-bearing strata in Greenland and Spitsbergen there are serious objections, which we will again refer to when the flora has been described.

The Tertiary flora of Greenland is of great interest, from the extremely high latitude at which the plants flourished, thirty of the species having been collected so far. Among the more common trees are mainly herbaceous plants with fruits of moderate hardness, they may have decayed and left no trace. The American Liriodendron still thrives in Europe, Water-lilies of the genera Nymphaea and Nymphoides occur. Malus were still plentiful, 20 species being...
Palaearctic, a lesser extent in Boreal regions. The plants

plants may be mentioned Betula (3 species), Alnus (2 species), Carpinus, Fagus (4 species), Sorbus (4 species), Populus (2 species), Platanus, Liquidambar, Platanus, Ulmus (2 species), Ficus (2 species), Persoonia, Laurus (5 species), Persoon, Saragassum, Cinnamomum (5 species), Phyllocladus (2 species), and Rododendron, Magnolia (3 species), Sapium, Celastrus (2 species), Ilex (4 species), Rhamnus (3 species), Jugland (5 species), Carya (2 species), Rhus (3 species), Aesculus (1 species). These plants suggest a colder climate than that indicated by the flora of the Miocene. They might, therefore, be thought to belong to a later period. The difference, however, is probably fully accounted for when we take into consideration the fact that the Arctic region at the time of the Pliocene was far from being the same as it is at the present day. For instance, the Arcto-Siberian, a region whose flora is known to have been completely different from that of the Boreal region.

A somewhat later Pliocene flora is represented by the plants found at Tegelen, near Venlo, on the borders of the Netherlands and Germany. This deposit is of especial interest for the light it throws on the origin of the existing flora of Britain. The Tegelen flora is...
climate and the reappearance of a flora almost identical with that now living in the same regions. This "interglacial" flora, though so like that of the Pleistocene, has interests peculiar to itself. In England, for instance, it includes Acer macrophyllum, a southern maple which does not now extend nearer than central Europe, and Colocotronis pyraultha; also Najas granitica and N. minor, both southern forms not now native of Britain. Brassocis peltata, a water-lily found in the warmer regions almost throughout the world, except in Europe, occurs abundantly in north Germany, but not in Great Britain. Similar inter-Glacial deposits in Tirol contain leaves of Rhododendron ponticum.

Space will not permit us to enter into any full discussion of the recurrence of Glacial and inter-Glacial periods and the influence they may have had on the flora. It is evident, however, that if climatic affairs in such as in fossils, are part of the normal routine that has gone on through all geologic periods, and are not merely confined to the latest, then such changes must evidently have had great influence on the evolution and geographical distribution of both species and of floras. Whether this was so is a question still to be decided, for in dealing with extinct floras it is difficult to decide, except in the most general way, to what climatic conditions they point. We seem to find indications of long-period climatic oscillations in Tertiary times, but none of the sudden invasion of an Arctic flora, like that which occurred during more recent times. It should not be forgotten, however, that an Arctic flora is mainly distinguishable from a temperate one by its poverty and dwarf vegetation. The later periods are denoted by the occurrence of any characteristic genera or families. Careful and long-continued work would therefore be needed before we could say of any extinct dwarfed flora that it included only plants which could withstand Arctic conditions.

PALAEOGRAPHY (Gr. παλαιός, ancient, and γραφέω, to write), the science of ancient handwriting acquired from studying epigraphical documents which deals with inscriptions (γράφαι) engraved on stone or metal or other enduring material as memorials for future ages, palaeography takes cognisance of writings of a literary, economic, or legal nature written generally with still, reed or pen, on tablets, rolls or codices. The boundary, however, between the two sciences is not always to be exactly defined. The fact that an inscription occurs upon a hard material in a fixed position does not necessarily bring it under the head of epigraphy. Such specimens of writing as the graffiti or wall-scribblings of Pompeii and ancient Rome belong as much to the one science as to the other; for they neither occupy the position of inscriptions set up with special design as epigraphical monuments, nor are they the written documents of which we connect the idea of palaeography. But such exceptions only slightly affect the broad distinction just specified.

The scope of this article is to trace the history of Greek and Latin palaeography from the earliest written documents in those languages which have survived. In Greek palaeography we have a subject which is self-contained. The Greek character, in its pure form, was used for one language only; but the universal study of that language throughout Europe and the wide diffusion of its literature have been the cause of the accumulation of Greek MSS. in every centre of learning. The field of Latin palaeography is much wider, for the Roman alphabet has made its way into every country of western Europe, and the study of its various developments and changes is essential for a proper understanding of the character which we write.

Handwriting, like every other art, has its different phases of growth, perfection and decay. A particular form of writing is gradually developed, then takes a finished or calligraphic style and becomes the hand of its period, then deteriorates, breaks up and disappears, or only drags on an artificial existence, being meanwhile superseded by another style which, either developed from the older hand or introduced independently, runs the same course, and in its turn is displaced by a younger rival. Thus in the history of Greek writing we see the literary uncial style declining from early forms into the calligraphic stage, and then driven out by the minuscule, which again goes through a series of important changes. In Latin, the literary uncial and uncial hands give place to the smaller character; and this, after running its course and developing national characteristics in the different countries of the West, deteriorates and is superseded almost universally by the Italian hand of the Renaissance. Bearing in mind these natural changes, it is evident that a style of writing, once developed, is best at the period when it is in general use, and that the oldest examples of that period are the simplest, in which vigour and naturalness of handwriting are predominant. On the other hand, the fine execution of a MSS. after the best period of the style has passed cannot conceal deterioration. The imitative nature of the calligraphy is detected both by the general impression on the eye, and by uncertainty and inconsistencies in the forms of letters. It is from a failure to keep in mind the natural laws of development and change that early dates, to which they have no title, have been given to imitative MSS.; and, on the other
hand, even very ancient examples have been post-dated in an incredible manner.

Down to the time of the introduction of printing, writing ran in two lines—the natural cursive, and the set book-hand which was evolved from it. Cursive writing was essential for the ordinary business of life. MSS. written in the set book-hand filled the place now occupied by prints, apportioning to the writing being regular, the lines generally kept even by ruling or other guides, and the texts provided with regular margins. The set book-hand disappeared before the printing press; cursive writing necessarily remains.

In the study of handwriting it is difficult to exaggerate the great and enduring influence which the character of the material employed for receiving the script has had upon the formation of the written letters. The original use of clay by the Babylonians and Assyrians as their writing material was the primary cause of the wedge-shaped symbols which were produced by the natural process of puncturing so stiff and sluggish a substance. The clinging waxen surface of the tablets of the Greeks and Romans superinduced a broken and disconnected style of writing. The comparatively frail surface of papyrus called for a light touch and slenderly built characters. With the introduction of the smooth and hard-surfaced vellum, firmer and heavier letters, with marked contrasts of fine and thick strokes, became possible, and thence became the fashion. In the task which lies before us we shall have to deal mainly with MSS. written on the two very different materials, papyrus and vellum, and we shall find to how great an extent the general character and the detailed development of Greek and Latin writing, particularly for literary purposes, has been affected by the two materials.

The history of the ancient papyrus roll and of its successor, the medieval vellum codex, and the particulars of the mechanical arrangement of texts and other details appertaining to the writing, are generally kept even by ruling or other guides, and the texts provided with regular margins. The set book-hand disappeared before the printing press; cursive writing necessarily remains.

In the case of non-literary documents, written in cursive handwriting, the papyrus period covers a still wider field. These documents range from the 5th century B.C. down to the 7th century, and a certain number of examples even extend into the 8th century. The survival of cursive papyrus documents in large numbers is due to the fact that they are chiefly written in Egypt, where papyrus was the common writing material and where climatic conditions ensured their preservation. On the other hand, early cursive documents on vellum are scarcer, for it must be borne in mind that, even allowing for the loss of such documents attributable to the perishable nature of that material in the humid climates of Europe, papyrus and waxen tablets were also the usual writing materials of the Greeks and Romans. The importance of the survival of Greek cursive papyrus to so late a period is very great, for it enables us to trace the development of the Greek literate minuscule handwriting of the 9th century in a direct line from the cursive script of the papyri centuries earlier.

GREEK WRITING. I.—THE PAPYRI

In no branch of our subject has so great a development been
effecte since about 1875 as in that of the paleography of Greek papyri. Before that time our knowledge was very limited. The material was comparatively meagre; and, though its increase was certainly only a matter of time, yet the most sanguine would hardly have dared to foretell the remarkable abundance of documents which the excavations of a few years would bring to light.

The practice of Greek writing on papyrus can now be followed with more or less fullness of material for a thousand years. Actual dated examples range from the late years of the 4th century B.C. to the 7th century A.D. We have a fair knowledge of the leading features of the writing of the 3rd and 2nd centuries B.C.; a less perfect acquaintance with those of the 1st century B.C. For the first four centuries of the Christian era there is a fairly continuous series of documents; of the 5th century only a few examples have as yet been recovered, but there is an abundance of material for the 6th and early 7th centuries. Thus it will be seen that, while for some periods we may be justified in drawing certain conclusions and laying down certain rules, for others we are still in an imperfect state of knowledge. But our knowledge will no doubt almost yearly become more exact, as fresh material is brought to light from the excavations which are now continually proceeding; and those periods in which the lack of papyri breaks the chain of evidence will sooner or later be as fully represented as the rest. The material certainly lies buried in the sands; it is our misfortune that the exact sites have not yet been struck.

The first discovery of Greek papyri was made in Europe in 1752, when the excavations on the site of Herculaneum yielded a number of charred rolls, which proved to be of a literary character. All subsequent discoveries we owe to Egypt; and it is to be observed that the papyri which are found in that country have come down to us under different conditions. Some, generally of a literary nature, were carefully deposited with the bodies of their owners in the tomb with the express intention of being preserved; hence such MSS. in several instances have come to our hands in fairly perfect condition. On the other hand, by far the larger number of those recently brought to light have been found on the sites of towns and villages, particularly in the district of the Fayum, where they had been either accidentally lost or purposely thrown aside as of no value, or had even been used up as material for other purposes besides their original one. These are consequently for the most part in an imperfect and even fragmentary condition, although not a few of them have proved to be of the highest palaeographical and literary importance.

The date of the first find of Greek papyri in Egypt was in 1778, when some were accidentally discovered by some native diggers, who, however, kept only one of them. After this scarcely anything appeared until the year 1820, when was found on the site of the Serapeum at Memphis, as it was reported, a group of documents of the 2nd century B.C. Then followed a fruitful period, when several important literary papyri were secured: in 1821, the Bankes Homer, containing the last book of the Iliad; in 1827, the roll containing the Lycephon and other orations of Hypereides; in 1840 and 1850, the Harris Homer, bk. xvin. of the Iliad, and a MS. of bks. ii. iv.; and, in 1856, the Funeral Oration of Hypereides.

But the great bulk of the Greek papyri from Egypt is the result of excavations undertaken during the last quarter of the 19th century and down to the present day. Within this time four very important discoveries of documents in large quantities have taken place. In 1877 a great mass of papyri was found on the site of Arsinoë in the Fayum, being chiefly of a non-literary nature, and unfortunately in a very fragmentary state; they are also late in date, being of the Byzantine period. The greater number passed into the possession of the Archduke Rainer, and are now at Vienna; the rest are divided between London, Oxford, Paris and Berlin. After an interval this find was followed by the recovery in 1892, in the same neighbourhood, and chiefly on the site of a village named Scolopi Nepos, of an extensive series of documents of the Roman period,

GREEK PAPYRI PALAEOGRAPHY
ranging from the 1st century to the middle of the 3rd century. These papyri, being of an earlier date and in better condition than the Arsinote collection, are consequently of greater palaeographical value. Most of them are now in Berlin; many are in the British Museum; and some are at Vienna, Geneva and elsewhere. The third and fourth great finds, and the most important of all, were made by Misses Grenfell and D. in 1892, when excavating, in the season 1892-1893 and 1905-1906, for the Egypt Exploration Fund, at Beheesa, the ancient Oxyrhynchus. Thousands of papyri were here recovered, including, among the non-literary material, a number of rolls in good condition, and comprising also a great store of fragments of literary works, among which occur the now well-known "Logia," or "Sayings of Our Lord," and fragments of the Scriptures, and in some instances of not inconsiderable portions of the writings of various classical authors. This great collection ranges in date from the 2nd century B.C. to the 7th century A.D.; but in what proportion the documents fall to the several centuries cannot be definitely stated in two series of volumes in which they are to be described for the Graeco-Roman branch of the Egypt Exploration Fund shall have made some substantial progress.

These four great collections of miscellaneous documents have been supplemented by finds of other groups, which fit into them and serve to make more complete the chronological series. Such are the correspondence of a Roman officer named Abinaeus, of the middle of the 4th century, shared between the British Museum and the library of Geneva in the year 1822; a miscellaneous collection, ranging from the 2nd century B.C. to the 3rd or 4th century A.D., acquired for the Egypt Exploration Fund and published by that society (Fayum Towns and their Papyri, 1900); another collection obtained for the same society from the cartonnage of the pyramid of Mentuhotep, dating back to the 3rd century B.C. (The Hibeh Papyri, 1906); and a series recovered from excavations at Tuthmosis for the University of California (The Theban Papyri, 1902, 1906), generally of the 2nd century B.C. But of these lesser groups by far the most interesting is that which Mr. Flinders Petrie extracted, in 1889-1890, from a set of mummy-cases found in the necropolis of the village of Gurob in the Fayum. In the manufacture of these coffins numbers of inscribed papyri were employed. The fragments thus recovered proved to be some of the most valuable documents for the history of Greek palaeography hitherto found, supplying us with examples of writing of the 3rd century B.C. in fairly ample numbers, and thus carrying back fuller knowledge of the subject to a period which up to that time had remained almost a blank. Besides miscellaneous documents, there are included the remains of registers of wills entered up from time to time by different scribes, and thus affording a variety of handwritings for study; and, further, the value of the collection is enhanced by the presence of fragments of the Phaedo and Laches of Plato, and of the lost Antiope of Euripides and of other classical works.

The last decade of the 19th century was also distinguished by the recovery of several literary works of the first importance, inscribed on papyri which had been deposited with the dead, and had thus remained in a fairly perfect condition. In 1889 the trustee of the British Museum acquired a copy of the lost Aphrodisia of Homer, of the 4th century B.C., and a portion of the oration of Hyperides against Phrygiphanes; and in 1890 they had the further good fortune to secure a papyrus containing considerable portions of the odes of Bacchylides, the contemporary of Pindar. And to the series of the orations of Hyperides the Louvre was enabled to add, in 1892, a MS. of the greater part of the oration against Atenogenes.

But the most valuable discovery, from a palaeographical point of view, took place in the present century. In 1902 a papyrus roll containing the greater portion of the Persae, a lyrical composition of Timotheus of Mileitus, was found at Athenaeum, and is now at Berlin. It is then in a large hand of a style which had hitherto been known from a document at Vienna entitled the "Curse of Artemisia," and assigned to the early part of the 3rd century B.C.; and from one or two other insignificant scraps. The new papyrus, however, appears to be even older, and may certainly be placed in the later years of the 4th century B.C. the most ancient extant literary MS. in the Greek tongue. The ascription of this papyrus to the 4th century B.C. has received confirmation from the welcome discovery, in 1900, of a document (a marriage contract) of the year 311-310 B.C., which is written in the same style of book-hand characters (Aegypt. Urkunden d. kgl. Musen in Berlin, Elephantine Papyri, 1907). Of quite recent date also is the recovery of a considerable part of a commentary on the Theocritos of Plato, written in a fine uncial hand of the 2nd century, now in Berlin. Considerable fragments also of the Paeans of Pindar of the 1st or 2nd century; a papyrus containing an historical work attributed to Thucydides or Cratippus, perhaps of the early 3rd century; a copy of Plato's Symposium of the same period; and a portion of the Panegyricus of Isocrates, written in an uncial hand of the 2nd century, are preserved in Part V. of the Oxyrhynchus Papyri. Further, many leaves of a papyrus codex containing fragments of four comedies of Menander were found in 1905 at Kom Ishkou, the ancient Aphrodisopolis. The recovery of so many great classical works within a few years may be accepted as an earnest of further finds of the same nature, now that excavations are being carried on systematically in Egypt.

From a study of the material thus placed at our disposal certain conclusions have been arrived at which satisfy us that the periodical changes which passed over the character of Greek writing as practised in Egypt coincide pretty nearly with the changes in the political administration of the country. The period of the rule of the Ptolemies from 323 to 30 B.C. has, in greece, its own style of writing, which we recognize at the Ptolemaic; the period of Roman supremacy, beginning with the conquest of Augustus and ending with the reorganization of the empire by Dioctetian in A.D. 284, is accompanied by a characteristic Roman hand; and with the change of administration which placed Egypt under the Byzantine division of the empire, and lasted down to the time of the Arab conquest in A.D. 640, there is a corresponding change to the Byzantine class of writing. These changes must obviously be attributed to the influence of the official handwritings of the time. A change of government naturally led to a change of the officials employed, and with the change of officials would naturally follow a change in the style of production of official documents. In illustration of this, for instance, we have seen enough to call in mind the instances of different variations to be met with in the history of the palaeography of medieval Europe, due in the same way to political causes. It is interesting, too, to observe that in our own time the teaching in schools of a particular style of handwriting which finds favour in clerical examinations for the public service has not been without its influence on the general handwriting of the people.

Classifying, then, the writing of the papyri into the three groups—the Ptolemaic, the Roman, and the Byzantine—the next step is to determine, by a closer examination of the documents, the changes which characterize the several centuries traversed by those groups. In doing this, we cannot apply the exact terms which are employed in describing the M.E., of the middle ages, for we are not enough to call in mind the instances of the formal styles being converted into the formal literary moulds of the later times; and it has therefore been found necessary, as well as convenient, to divide the papyri simply into two series, representative of their contents and not of their style of production—namely literary papyri and non-literary papyri. Neither series, however, it is to be remembered, has a style of writing peculiar to itself. While the extant literary works are, as a rule, written with more or less formality, no doubt by professional scribes for the book-market, not a few of even the more valuable of them are copies in the ordinary cursive hands of the day. Conversely, while we find non-literary documents generally written in ordinary cursive hands, whether by official scribes or by private individuals, yet occasionally we meet with one produced in the formal style more proper to literary examples. Again, while appealing to
particular letters in papyri such technical terms as capitals, or uncials, or minuscules, we cannot convey by those terms the exact ideas which we convey when thus describing the individual letters of medieval manuscripts. For the letters of the papyrus period were not cast in finished moulds, while the uncial writing and the miniscule writing of the middle ages were settled literary hands. As will presently be seen, the early medieval uncial hand of the vellum codices developed directly from the literary writing of the papyri; the minuscule book-hand of the 9th century was a new type moulded from the cursive into a fixed literary style.

Necessarily, the non-literary papyri are much more numerous than the literary documents, and present a much greater variety of handwriting, being in fact the result of the daily transactions of ordinary life; and how very widespread was the knowledge of writing among the Greek-speaking population of Egypt is sufficiently testified by the surviving examples, coming as they do from the hands of all sorts and conditions of men. We will first examine these specimens of the current handwriting of the day before passing to the review of the more or less artificial book-writing of the literary papyri.

Non-Literary, Cursive, Hands.—As already stated, the oldest material for the study of Greek cursive writing is chiefly contributed by the papyri discovered at Gurob. Among them are not only the fragments of official registers, which have been mentioned, but also a variety of miscellaneous documents relating to private affairs, and in various hands of the 3rd century and early 2nd century B.C. The non-literary cursive papyri bear actual dates ranging from 270 to 186 B.C. But the discovery (1906) of papyri at Elephantine takes our dated series of cursive documents back to 285-284 B.C.; and in this collection also is the oldest dated Greek document yet found—the marriage contract of the year 311-310 B.C., already mentioned. In this instance, however, the writing is not cursive, but of the literary type.

The leading characteristic of Greek cursive writing of the 3rd century B.C. is its strength and facility. While it may not compare with some later styles in the precise formation of particular letters, yet its freedom and spontaneous air lend it a particular charm and please the eye, very much in the same way that a scholar’s practised and unconscious handwriting of a good type is more attractive than the more exact formality of a clerk’s hand. The letters generally are widely spread and essay, and, particularly in the official hands, they are linked together with horizontal connecting strokes to such an extent that the text has almost the appearance of depending on a continuous horizontal line. The extreme shallowness or flatness of many of the letters is very striking. A significant indication of the antiquity of Greek cursive writing is found in connexion with the letter alpha, which is, even at this early period, in one of its forms reduced to a mere angle or wedge.

A few lines from an official order (fig. 1) of the year 250 B.C. will serve to convey an idea of the trained cursive style of this century:

![Fig. 1.—Official Order, 250 B.C.](image)

As a contrast to this excellent hand, we give a facsimile of a section from a roughly written letter from a land steward to his employer, of about the same date:

![Fig. 2.—Letter of a Land Steward, 3rd century B.C.](image)

Here there is none of the linking of the letters which is seen in the other example: every letter stands distinct. But while the individual letters are clumsily written, the same laws govern their formation as in the other document. The shallow, wide-spread nu, the cursive nu, the small theta, omikron, and rho, are repeated. Here also is seen the tau, with its horizontal stroke confined to the left of the vertical instead of crossing it, and the undeveloped omega, which has the appearance of being clipped—both forms being characteristic of the 3rd century B.C.

The trained clerical hands of the 2nd century B.C. (fig. 3) differ generally from those of the earlier century in a more perfect and less cursive formation, the older shallow type gradually disappearing, and the linking of letters by horizontal strokes being less continuous. But the Ptolemaic character marks the handwriting well through the century; and it is only towards the close of that period and as the next century is entered, that the hand begins to give way and to lose altogether its linked style and the peculiar crispness of the strokes which give it its distinctive appearance. The cursive hand in its best style (e.g. N. et Extr. pls. xxviii., xxix.) is very graceful and exact:

![Fig. 3.—Petition, 165-162 B.C.](image)

Towards the end of the Ptolemaic period material greatly fails. There are very few extant cursive documents between the years 80 and 20 B.C. But marks of decadence already appear in the examples of the beginning of the 1st century B.C. The general character of the writing becomes slacker, and the forms of individual letters are less exact. These imperfections prepare us for the great change which was to follow. With the Roman period comes roundness of style, in strong contrast to the stiffness and rigid linking of the Ptolemaic hand. Curves take the place of straight strokes in the individual letters, and even ligatures are formed in piant sweeps of the pen. This transition from the stiff to the flexible finds something of a parallel in the development of the curving and flexible English charterhand of the 14th century from the rigid hand of the 13th century; following, it would seem, the natural law
of relaxation. Roundness of style, then, characterizes Greek cursive writing in the papyri of the first three centuries of the Christian era, however much individual hands, or groups of hands, might vary among themselves.

A specimen (fig. 4) of cursive writing of the general Roman type is selected from a papyrus (Brit. Mus. No. cxxxi.) which is of more than usual interest, as it is on the verso side of the rolls of which it is composed that the text of Aristotle's Constitution of Athens has been transcribed. It contains the farming accounts of the bailiff of Epimachus, son of Polydeuces, the owner of an estate in the nome of Hermopolis in the 6th and 10th years of the reign of Vespasian, that is A.D. 78-79—

![Image of papyrus text](image)

In the second half of the 1st century two styles of handwriting predominate in the cursive papyri. There is the clear and flowing hand, which may be termed the ordinary writing hand; and there is also a small and very cursive style which appears in private correspondence and in legal contracts. The 2nd century follows on the same lines as the 1st century; but with the 3rd century decadence sets in; the writing begins to slope, and grows larger and rougher and tends to exaggeration.

This exaggeration of the writing of the later Roman period leads the way to the pedantic exaggeration and formalism characteristic of the Byzantine period. In this period the general style of writing is on a larger scale than in the Roman period; exaggeration in the size of certain letters marks the progress of the 4th century. Material is wanting for full illustration of the changes effected in the 5th century; but the papyri of the 6th century show a further advance in formalism, the common style being upright and compressed and full of flourishes. In the 7th century the hand assumes a sloping style, which always seems to accompany decadence, and grows very irregular and straggling. A specimen of the fully developed Byzantine hand of a legal type is here shown in a few lines from a lease of a farm (fig. 5) in the 6th century (Brit. Mus. pap. cxiii 3)—

![Image of lease of a farm](image)

In the long range covered by the Greek papyri the formation of individual letters necessarily varied under different influences; but in not a few instances the original shapes were remarkably maintained. From those which thus remained conservative it is rash to attempt to draw conclusions as to the precise age of the several documents in which they occur. On the other hand, there are some which at certain periods adopted shapes which were in vogue for a limited time and then disappeared, never to be resumed. Such forms can very properly be regarded as sure guides to the palaeographer in assigning dates. We may therefore take a brief survey of the Greek cursive alphabet of the papyri and note some of the peculiarities of individual letters. The incipient form of the alpha which gradually developed into the minuscule letter of the middle ages may be traced back to the Ptolemaic documents of the 2nd century B.C., but the more cursive letter, which was a simple acute angle, representing only two of the three strokes of which the primitive letter was composed, was characteristic of the 3rd century B.C., and seems to have gone out of use within the Ptolemaic period. The development of the cursive beta is interesting. At the very beginning we find two forms in use: the primitive capital letter and a cursive shape somewhat resembling a small η, being in fact an imperfectly written Β in which the bows are slurred. This form lasted through the Ptolemaic period. Then arose the natural tendency to reverse the strokes and to form the letter on the principle of η; but still the capital letter also continued in use, so that through the Roman and Byzantine periods the η-shape and the B-shape run on side by side. Analogously the letter kappa, formed on somewhat the same lines as the beta, runs a similar course in developing a cursive η-shaped form by the side of the primitive capital. Delta remained fairly true to its primitive form until the Byzantine period, when the elongation of the head into a flourish led on to the minuscule letter which is familiar to us in the medieval and modern alphabet. Epsilon, the most frequently recurring letter in Greek texts, departs less from its original rounded uncial form that might have been expected. Frequent and varied as its cursive formations are, yet the original shape is seldom quite disguised, the variations almost in all instances arising from the devices of the scribe to dispose swiftly and conveniently of the cross-bar by incorporating it with the rest of the letter. The tendency to curtail the second vertical limb of eta, leading eventually to the r-shape, is in evidence from the first. But in the development of this letter we have one of the instances of temporary forms which lasted only within a fixed period. In the 1st century, side by side with the more usual form, there appears a modification of it, somewhat resembling the contemporary upsilon, consisting of a shallow horizontal curve with a vertical limb slightly turned in at the foot. Its development from the original Η is evident: the first vertical limb is slurred, and survives only in the beginning of the horizontal curve, while the cross-bar and the second vertical are combined in the rest of the letter. This form was in general use from the middle of the 1st to the middle of the 2nd century, becoming less common after about A.D. 160, and practically disappearing about A.D. 200. The letters formed wholly or in part by circles or loops, theta, omicron, rho, phi, in the earlier centuries have such circles or loops of a small size. Just as there is an analogy between beta and kappa in their developments, so already noticed, so also do mu and pi advance on somewhat similar lines. From the earliest time there is a resemblance between the broad shallow forms of the two letters in the 3rd century B.C., and particularly when they adopt the form of a convex stroke the likeness is very close; and again, in both Roman and Byzantine periods an η-shaped development appears among the forms of both letters. There is also one phase in the development of sigma which affords a useful criterion for
The general breadth of the square letters, the smallness of the letters composed of circles and loops, and the particular formation of such letters as π and the clipped omega, are repeated. But the approach also of many of the letters to the lapidary capital forms, like those in the papyrus of Timotheus, is to be remarked, such as the precisely shaped alpha, and the epsilon in many instances made square with a long head-stroke. This mixture of forms seems to indicate an advance in the development of the book-hand of the 3rd century B.C., as contrasted with the archaic style of the older Timotheus.

Of the 2nd century B.C. there are extant only two papyri of literary works written in the formal book-hand, and both are now preserved in the Louvre. The one, a dialectical treatise containing quotations from classical authors, has long been known. The other is the oration of Hyperides against Athenogenes, which is an acquisition of comparatively recent date. The dialectical treatise must belong to the first half of the century, as there is on the verso side of the papyrus writing subsequently added in the year 176 B.C. The period of the Hyperides cannot be so closely defined; but the existence on the verso of later demotic writing, said to be of the Ptolemaic time, affords a limit, and the MS. has been accordingly placed in the second half of the century. While the writing of the earlier papyrus is of a light and rather sloping character, that of the Hyperides is firm and square and upright.

Passing to the 1st century B.C., the papyri which have been recovered from the ashes of Herculaneum come into account.
Many of them, the texts of which are of a philosophical nature, are written in literary hands, and are conjectured to have possibly formed part of the library of their author, the philosopher Philodemus; they are therefore placed about the middle of the century. To the same time are assigned the remains of a roll containing the oration of Hyperides against Philippides and the third Epistle of Demosthenes (Brit. Mus. papp. cxxvii., cxxxiv.). But the most important addition to the period is the handsomely written papyrus containing the poems of Bacchylides (fig. 8), which retains in the forms of the letters much of the character of the Ptolemaic style, although for other reasons it can hardly be placed earlier than about the middle of the century:

\[
\begin{align*}
\text{Fig. 8.—Bacchylides, 1st century B.C.} \\
\end{align*}
\]

With the latter half of the 1st century B.C. we quit the Ptolemaic period and pass to the consideration of the literary papyri of the Roman period; and it is especially in this latter period that our extended knowledge, acquired from recent discoveries, has led to the modification of views formerly held with regard to the dates to be attributed to certain important literary MSS. As in the case of non-literary documents, the literary writing of the Roman period differs from that of the Ptolemaic in adopting rounded forms and greater uniformity in the size of the letters.

Just on the threshold of the Roman period, near the end of the 1st century B.C., stands a fragmentary papyrus of the last two books of the Iliad, now in the British Museum (pap. cxxvii.), which is of sufficient extent to be noted. Then, emerging on the Christian era, we come upon a fine surviving specimen of literary writing, which we have satisfactory reason for placing near the beginning of the 1st century B.C. It is a fragment of the third book of the Odyssey (fig. 9), the writing of which closely resembles that of an official document (Brit. Mus. pap. ccciv.), which happens to be written in a formal literary hand, and which from internal evidence can be dated within a few years of the close of the 1st century B.C. There can be no hesitation, therefore, in grouping the Odyssey with that document. The contrast between the round Roman style and the still and firm Ptolemaic hands is here well shown in the facsimiles from this papyrus (fig. 9) and the Phaedo and Bacchylides:

\[
\begin{align*}
\text{Fig. 9.—The Odyssey, beginning of 1st century.}
\end{align*}
\]

In a similar style of writing are two fragments of Hesiodic poems recently published, with facsimiles, in the Sitzungsberichte (1900, p. 830) of the Berlin Academy. The earliest of the two, now at Strassburg, may be assigned to the first half of the 1st century; the other, at Berlin, appears to be of the 2nd century.

At this point two MSS. come into the series, in regard to which there is now held to be reason for revising views formerly entertained. The papyrus known as the Harris Homer (Brit. Mus. pap. cxxvii.), containing portions of the eighteenth book of the Iliad, which was formerly placed in the 1st century B.C., it is thought should be now brought down to a later date, and should be rather assigned to the 1st century of the Christian era. The great papyrus, too, of Hyperides, containing his orations against Demosthenes and for Lycophron and Euxenippus, which has been commonly placed also in the 1st century B.C., and by some even earlier, is now adjudged to belong to the latter part of the 1st century A.D.

Within the 1st century also is placed a papyrus of great literary interest, containing the mimes of the Alexandrian writer Herodas, which was discovered a few years ago and is now in the British Museum. The writing of this MS. differs from the usual type of literary hand, being a rough and ill-formed uncial, inscribed on narrow, and therefore inexpensive, papyrus; and if the roll were written for the market, it was a cheap copy, if indeed it was not made for private use. Of the same period is a papyrus of Isocrates, De pace (Brit. Mus. pap. cxxvi.), written in two hands, the one more clerical than the other; and two papyri of Homer, Iliad, iii.—iv. (Brit. Mus. pap. cxxvii.), and Iliad, vii.—xv. (Brit. Mus. pap. dxxvii.), the first in a rough uneducated hand, but the latter a fine specimen of uncial writing. To about this period also is the Oxyrhynchus Pindar to be attributed, that is to the close of the 1st or beginning of the 2nd century; and two MSS. contain the famous papyrus, the Bankes Homer, containing the last book of the Iliad, which belongs to the 2nd century and is also written in a careful style of uncial writing. To these is to be added the beautiful papyrus at Berlin, containing a commentary on the Theaetetus of Plato, written in delicately formed uncials of excellent type of the 2nd century; and of the same age is the Panegyricus of Isocrates from Oxyrhynchus, in a round uncial hand. Three important papyri of the Iliad, written in large round uncials, of the 2nd century, are noticed below.

With regard to the later literary works on papyrus that have been recovered, the period which they occupy is somewhat uncertain. The following are, however, placed in the 3rd century, during which a sloping literary hand seems to have been developed, curiously anticipating a similar change which took place in the course of development of the uncial writing of the vellum MSS., the upright hand of the 4th to 6th centuries being followed by a sloping hand in the 7th and 8th centuries: a MS., now in the British Museum, of portions of bks. ii.—iv. of the Iliad, written on eighteen leaves of papyrus, put together in book-form, but inscribed on only one side; on the verso of some of the leaves is a short grammatical treatise attributed to Tryphon: portion of Iliad v., among the Oxyrhynchus papyri (No. cxxxii.); a fragment of Plato’s Laws (Ox. pap. xxii.): a papyrus of Isocrates, in Nicomach, now at Marseilles: a fragment of Ezekiel, in book-form, in the Bodleian Library; a fragment of the “Shepherd” of Hermas at Berlin; and a fragment of Julius Africanus, the Hellenica of Theopompos or Cratippus, and the Symposium of Plato, all found at Oxyrhynchus.
Of the 3rd century also are some fragments which are palaeographically of interest, as they are written neither in the recognized literary hand nor in simple cursive, but in cursive characters moulded and adapted in a set form for literary use—thus anticipating the early stages of the development of the minuscule book-hand of the 9th century from the cursive writing of that time.

With the 3rd century the literary hand on papyrus appears to lose most of its importance. We are within measurable distance of the age of vellum, and of the formal uncial writing of the vellum MSS., which is found in some existing examples of the 4th century and in more abundant numbers of the 5th century. We have no need to see how the connexion can be established between the literary handwriting of the papyri and the former and heavier literary uncial writing of the vellum codices. The literary hands on papyrus which have been reviewed above are distinctly of the style inscribed with a light touch most suitable to the comparatively frail material of papyrus. In the Bankes Homer, however, one may detect some indication of the fullness that characterizes the vellum uncial writing. But it now appears that a larger and rounder hand was also employed on papyrus at least as early as the 1st century. In proof of this we are able to cite a non-literary document (fig. 10) bearing an actual date, which happens to be written in characters that, exclusive of certain less formally-made letters, are of a large uncial literary type. This writing, though not actually of the finished style familiar to us in the early vellum MSS., yet resembles it so generally that it may be assumed, almost as a certainty, that there was in the 1st century a full literary uncial hand formed on this pattern, which was the direct ancestor of the vellum uncial. The tendency to employ at this period a calligraphic style, as seen in the fragments of the Odyssey and one of the Homeric poems mentioned above, supports this assumption. The document now referred to is a deed of sale written in the seventh year of Domitian, A.D. 88 (Brit. Mus. pap. cxil.). The letters still retaining a cursive element are *alpha, upsilon*, and in some instances *epsilon*.

As evidence in support of this view that the uncial hand of the vellum MSS. is to be traced back to the period of the document just quoted, we have the important papyrus found by Mr. Flinders Petrie at Hawara in Egypt, and now in the Bodleian Library, which contains a portion of the second book of the *Iliad*. The writing is of the large uncial type under consideration; and there is now full reason for assigning it to the 2nd century at latest. Before the discovery of the document of the year 88 there was nothing to give a clue to the real period of the Homer; and now the date which has been suggested is corroborated by a fragment of papyrus from Oxyrhynchus inscribed with some lines from the same book of the *Iliad* (fig. 11) in the same large uncial type (Ox. Pap. vol. i. no. 20, pl. v.). In this latter instance there can be no question of the early date of the writing as on the verso of the papyrus accounts of the end of the 2nd century or of the beginning of the 3rd century have been subsequently added. Yet a third example of the same character has more recently been found at Tebtunis (Tebt. Pap. vol. ii. no. 265, pl. ii); again a considerable fragment of the second book of the *Iliad*.

Thus, then, in the 1st and 2nd centuries there was in use a large uncial hand which was evidently the forerunner of the literary uncial hand of the early vellum codices. It is also to be noted that the literary examples just mentioned are MSS. of Homer; and hence one is tempted to suggest that, as in the production of sumphtuous copies on papyrus of a work of such universal popularity and veneration as the *Iliad* this large and handsome uncial was specially employed, so also the use of a similar type for the early vellum copies of the sacred text of the Scriptures naturally followed.

**Greeck Writing. II.—The Vellum Codices**

**Uncial Writing.**—It has been shown above how a round uncial hand had been developing in Greek writing on papyrus during the early centuries of the Christian era, and how even as early as the 2nd century a well-formed uncial script was in use, at least for sumptuous copies of so great and popular an author as Homer. We have now to describe the uncial hand as it appears in Greek MSS. written on vellum. This harder and firmer and smoother material afforded to the scribes a better scope for a calligraphic style hardly possible on papyrus. With the ascendancy of the vellum codex as the vehicle for literature, the characters received the fixed and settled forms to which the name of uncial is more exactly attached than to the fluctuating letters of the early papyri. The term uncial has been borrowed from the nomenclature of Latin palaeography and applied to Greek writing of the larger type, to distinguish it from the minuscule or smaller character which succeeded it in vellum MSS. of the 9th century. In Latin majuscule writing there exist both capitals and uncials, each class distinct. In Greek MSS. pure capital-letter writing was never employed (except occasionally for ornamental titles at a late time). As distinguished from the square capitals of inscriptions, Greek uncial writing has certain rounded letters, as a, e, o, ω, modifications in others, and some letters extending above or below the line.

It is not probable that vellum codices were in ordinary use earlier than the 4th century; and it is in codices of that age that the handsome calligraphic uncial above referred to was developed. A few years ago the 4th century was the earliest limit to which palaeographers had dared to carry back any ancient vellum codex inscribed in uncials. But the recovery of the Homeric papyri written in the large uncials of the 2nd century has led to a revision of former views on the date of some early vellum MS. in particular. This MS. is the fragmentary Homer of the Ambrosian Library at Milan, consisting of some fifty pieces of vellum cut out of the original codex for the sake of the pictures which they contain; and all of the text that has survived is that which happened to be on the back of the pictures. The Ambrosian Homer has hitherto been generally placed in the 5th century, and the difference of the style of the writing from that of the usual calligraphic type of uncial MSS. of that time, which had been remarked, was thought rather to indicate inferiority in age. But the similarity of the character of the writing (taller and more slender than is usual in vellum codices) to that of the large uncials of the papyri Homers of the 2nd century from Hawara and Oxyrhynchus and Tebtunis is so striking that the

---

1 St Jerome's often quoted words, "uncialibus, ut vulgo aient, litteras" in his preface to the book of Job, have never been explained satisfactorily. Of the character referred to as "uncial" there is no question; but the derivation of the term is not settled.
Ambrosian Homer must be classed with them. Hence it is now held that that MS. may certainly be as early as the 3rd century. But, as that century was still within the period when papyrus was the general vehicle for Greek literature, it may be asked why that material should not in this instance also have been used. The answer may fairly be ventured that vellum was certainly a better material to receive the abstruse and difficult, account was employed. The Ambrosian Homer may therefore be regarded as a most interesting link between the papyrus uncial of the 2nd century and the vellum uncial of the 4th and 5th centuries.

With the introduction, then, of vellum as the general writing material, the uncial characters entered on a new phase. The light touch and delicate forms so characteristic of calligraphy on papyrus gave place to a rounder and stronger hand, in which the contrast of fine hair-lines and thickened down-strokes adds so conspicuously to the beauty of the writing of early MSS. on vellum. And here it may be remarked, with respect to the attribution to particular periods of these early examples, that we are not altogether on firm ground. Internal evidence, such, for example, as the presence of the Eusebian Canons in a MS. of the Gospel, assists us in fixing a limit of age, but when there is no such support the dating of these early MSS. must be more or less conjectural. It is not till the beginning of the 6th century that we meet with an uncial MS., which can be approximately dated; and, taking this as a standard of comparison, we are enabled to distinguish those which undoubtedly have the appearance of greater age and to arrange them in some sort of chronological order. But these codices are too few in number to afford material in sufficient quantity for training the eye by familiarity with a variety of hands of any one period—the only method which can give entirely trustworthy results.

Among the earliest examples of vellum uncial MSS. are the three famous codices of the Bible. Of these, the most ancient, the Codex Vaticanus, is probably of the 4th century. The writing must, in its original condition, have been very perfect as a specimen of penmanship; but nearly the whole of the text has been traced over by a later hand, perhaps in the 10th or 11th century, and only such words or letters as were rejected as readings have been left untouched. Written in triple columns, in letters of uniform size, without enlarged initial letters to mark even the beginnings of books, the MS. has all the simplicity of extreme antiquity (Pal. Soc. pl. 104). The Codex Sinaiticus (Pal. Soc. pl. 105) has also the same marks of age, and is judged by its discoverer, Tischendorf, to be even more ancient than the Vatican MS. In this, however, a comparison of the writing of the two MSS. leads to the conclusion that he was mistaken. The writing of the Codex Sinaiticus is not so pure as that of the other MS., and, if that is a criterion of age, the Vatican MS. holds the first place. In one particular the Codex Sinaiticus has been thought to approach in form to its possible archetype on papyrus. It is written with four columns to a page, the open book thus presenting eight columns in sequence, and recalling the long line of columns on an open roll. With regard to such general outward resemblances between the later papyrus literary rolls and the early vellum uncial MSS., we may cite such papyri as the Berolin commentary on the Theocritus of Plato of the 2nd century; and the Oxyrhynchus fragment of Julins Africans of the 3rd century as forerunners of the style in which the two great codices here mentioned were cast.

The Codex Alexandrinus (fig. 12) is placed in the middle of the 5th century. Here we have an advance on the style of the other two codices. The MS. is written in double columns only, and enlarged letters stand at the beginning of paragraphs. But yet the writing is generally more elegant than that of the Codex Sinaiticus. Examining these MSS. with a view to ascertain the rules which guided the scribes in their work, we find simplicity and regularity the leading features; the round letters formed in symmetrical curves; C and S, &c., finishing off in a half-line sometimes thickened at the end into a dot; horizontal strokes fine, those of A, H, and O being either in the middle or high in the letter; the base of A and the cross-stroke of II also fine, and, as a rule, kept within the limits of the letters and not projecting beyond. Here also may be noticed the occurrence in the Codex Alexandrinus of Coptic forms of letters (e.g. \( \Delta \), \( \Upsilon \), \( \alpha \) and \( \mu \)) in the titles of books, &c., confirmatory, of the tradition of the Egyptian origin of the MS.

![Fig. 12.—The Bible (Cod. Alex.), 5th century.](image)

To the 6th century may also belong the palimpsest MS. of the Bible, known from the upper text as the Codex Ephraemi, at Paris (ed. Tischendorf, 1843), and the Octateuch (Codex Sarasinavans), whose extant leaves are divided between Paris, Leiden and St Petersburg—both of which MSS. are probably of Egyptian origin. Perhaps of the end of the 5th or beginning of the 6th century is the Illustrated Genesis of the Cottonian Library, now unfortunately reduced to fragmentary exists by fire, but once the finest example of its kind (Cat. Anc. MSS. i. pl. 8). And to about the same time belong the Dios Cassius of the Vatican (Silvestre, pl. 60) and the Pentateuch of the Bibliotheque Nationale (ibid. pl. 61).

In the writing of uncial MSS. of the 6th century there is a marked degeneration. The letters, though still round, are generally of a larger character, more heavily formed, and not so compactly written as in the preceding century. Horizontal strokes (e.g. in \( \Delta \), \( \Pi \), \( \Upsilon \)) are lengthened and finished off with heavy points or finials. The earliest example of this period which has to be noticed is the Dioscorides of Vienna (fig. 13), which is of particular value for the study of the palaeography of early MSS. and its rules, which extend to a fragmentary MS. to which an approximate date can be given. There is good evidence to show that it was written early in the 6th century for Julian Anicia, daughter of Flavius Anicius Olybrius, emperor of the West in 472. Here we already notice the characteristics of uncial writings of the 6th century, to which reference has been made. To this century also belong the palimpsest Homer under a Syriac text in the British Museum (Cat. Anc. MSS., i. pl. 9); its companion volume, used by the same Syriac scribe, in which are fragments of St Luke's Gospel (ibid., pl. 10); the Dublin palimpsest fragments of St Matthew and Isaiah (T. K. Abbot, Par Palimpsest, DUBL., written in Egypt; the fragments of the Pauline Epistles from Mount Athos, some of which are at Paris and others at Moscow (Silvestre, pls. 63, 64; Sabas, pl. A), of which, however, the writing has been disfigured by retracing at a later period; the Gospels (Cod. N.) written in silver and gold on palimpsest paper, which have been scattered in London (Cott. MS., Titus C. xxv.), Rome, Vienna, St Petersburg, and its native home, Patmos; the fragmentary Eusebian Canons written on gilt vellum and highly ornamented, the sole remains
of some sumptuous volume (Cat. Anc. MSS. i. pl. 16); the Codex Sinopensis of the Gospels, instances of the very few early illus. MSS. which are taken under review in the present paper, is the Codex Claromontanus of the Prophet, which, written in Egypt, follows in its style the Coptic form of uncial.

Reference may here be made to certain early bilingual Graeco-Latin uncial MSS., written in the 6th and 7th centuries, which, however, have rather to be studied apart, or in connexion with Latin palaeography; for the Greek letters of these MSS. run more or less upon the lines of the Latin forms. The best known of these examples are the Codex-Bezae of the New Testament, at Cambridge (Pal. Soc. pl. 14, 15), and the Codex Claromontanus of the Pauline Epistles, at Paris (Pal. Soc. pl. 63, 64), attributed to the 6th or 7th century; and the Laudian MS. of the Acts of the Apostles (Pal. Soc. pl. 86) of the 7th century. To these may be added the Harleian Glossary (Cat. Anc. MSS. i. pl. 13), also of the 7th century. A later example, of the 8th century, is the Graeco-Latin Psalter, at Paris, MS. Coislin 186 (Omont, Fac. des plus anciens MSS. grecs, p. vii.).

An offshoot of early Greek uncial writing on vellum is seen in the Mosco-Gothic alphabet which Ulphilas used for the use of his countrymen in the 4th century, mainly from the Greek letters. Of the few extant remains of Gothic MSS. the oldest and most perfect is the Codex Argenteus of the Gospels, at Upsala, of the 6th century (Pal. Soc. pl. 118), written in characters which compare with purely written Greek MSS. of the same period. Other Gothic fragments appear in the sloping uncial hand seen in Greek MSS. of the 7th and following centuries.

At the year 600 Greek uncial writing passes into a new stage. We leave the period of the round character on that of the oval character. The letters π, ο, ο, ο, instead of being symmetrically formed on the lines of a circle, are made oval; and other letters are laterally compressed into a narrow shape. In the 7th century also the writing begins to slope to the right, and accents are introduced and afterwards systematically applied. This slanting style of uncials continues in use through the 8th and 9th and into the 10th centuries, becoming heavier as time goes on. In this class of writing there is again the same dearth of dated MSS. as in the round uncial, to serve as standards for the assignment of dates. We have to reach the 9th century before finding a single dated MS. in this kind of writing. It is true that sloping Greek uncial writing is found in a few scattered notes and colaces in Syriac MSS. which are assignable on that of the 7th century, and they are so far useful as showing that this hand was firmly established at that time; but they do not afford sufficient material in quantity to be of really practical use for comparison (see the tablets of alphabets in Gardthausen's Griech. Palaeogr.). Of more value are a few palimpsest fragments of the Elements of Euclid and of Gospel Lectionaries which occur also in the Syriac collection in the British Museum, and are written in the 7th and 8th centuries. There is also in the Vatican a MS. (Reg. 866) of the Theodosian code, which can be assigned with fair accuracy to the close of the 7th century (Gardth. Gr. Pal. p. 158), which, however, being calligraphically written, retains some of the earlier rounder forms. This MS. may be taken as an example of transitional style. In the fragment of a mathematical treatise (fig. 14) from Bobio, forming part of a MS. rewritten in the 8th century and assignable to the previous century, the sloping writing is fully developed. The formation of the letters is good, and conveys the impression that the scribe was writing a hand quite natural to him—

[Diagram of a scribe writing in a book]

It should be also noticed that in this MS.—a secular one—there are numerous abbreviations (Wattenbach, Script. gr. specim. tab. 8). An important document of this time is also the fragment of papyrus in the Imperial Library at Vienna, which bears the signatures of bishops and others to the acts of the Council of Constantinople of 669. Some of the signatures are in slanting uncials (Wattenb., Script. gr. specim., tabls. 12, 13; Gardth., Gr. Pal. tab. 1). Of the 8th century is the collection of hymns (Brit. Mus., Add. MS. 26, 135) written without breathings or accents (Cat. Anc. MSS. i. pl. 14). To the same century belongs the Codex Marcianus, the Venetian MS. of the Old Testament, which is marked with breathings and accents. The plate reproduced from this MS. (Watten. Script. gr. specim., tab. 10) contains in the second column a few lines written in round uncials, but in such a laboured style that nothing could more clearly prove the discontinuance of that form of writing as an ordinary hand. In the middle of the 9th century at length we find a MS. with a date in the Psalter of Bishop Uspensky of the year 862 (Wattenb. Script. gr. specim., tab. 10). A little later in date is the MS. of Gregory of Nazianzen, written between 867 and 886 (Silvestre, pl. 71); and at the end of the 9th or beginning of the 10th century stands a lectionary in the Harleian collection (Cat. Anc. MSS. i. pl. 17). A valuable series of examples is also given by Omont (Facsimiles des plus anciens MSS. grecs, de la Bibl. Nat.). But by this time minuscule writing was well established, and the use of the more inconvenient uncial was henceforth almost entirely confined to church-service books. Owing to this limitation uncial writing now underwent a further calligraphic change. As the 10th century advances the sloping characters by degrees become more upright, and with this resumption of their old position they begin in the next century to cast off the compressed formation and again become rounder. At this time only there is seen the truly modern, a combination of the rounder form with the calligraphic characteristics. Bibles and service-books have always been the MSS. in particular on which finely formed writing has been lavished; and it was but natural that, when a style of writing fell into general disuse, its continuance, where it did continue, should become more and more traditional, and a work of copying rather than of writing. In the 10th century there are a few examples bearing dates. There are facsimiles from three of them, viz. a copy of the Gospels (fig. 15), in the Vatican, of 949 (New Pal. Soc. pl. 103), the Curzon Lectionary of 980, and the Harleian Lectionary of 963 (Pal. Soc. pl. 124, 26, 27). The Bodian commentary on the Psalter (D. 4, 1) is likewise of great palaeographic value, being written partly in uncial and partly in rounder form. At the middle of the 10th century (Gardth., Gr. Pal. p. 159, tab. 2, 2) MSS. with a few of uncial writing appears to still have lasted to about the middle of the 12th century. (Omont. Facs. pl. xxii.) From it was formed the Slavonic writing in use at the present day—

[Diagrams of Slavonic characters]

Fig. 15.—The Gospels (Vatican), a.d. 949. (ΣΟΚΟΝΑΣΙΟΝ-ΙΟΝΟΣΙΟΝ)
bastard kind of uncial in the west of Europe. This writing follows, wherever the shapes of the letters permit, the formation of corresponding Latin characters—the purely Greek forms being imitated in a clumsy fashion. Such MSS are the Codex Augiensis of Trinity College, Cambridge, of the end of the 9th century (Pal. Soc. pl. 127) and the Psalter of St Nicholas of Cusa (pl. 138) and the Codex Sungallenensis and Boernerianus of the 12th century (pl. 179). The same imitative characters are used in quotations of Greek words in Latin MSS of the same periods.

Minuscule Writing.—The beautifully formed minuscule book-hand, which practically superseded the uncial book-hand in the 9th century, did not spring into existence all at once. Its formation had been the work of centuries. It was the direct descendant of the cursive Greek writing of the papyri. It has been shown above, in tracing the progress of the non-literate, cursive writing on papyri, how the original forms of the letters of the Greek alphabet went through various modifications, always tending towards the creation of the forms which eventually settled down into the recognized minuscules or small letters of the middle ages and modern times. The development of these modifications is apparent from the first; but it was in the Byzantine period especially that the changes became more marked and more rapid. All the minuscule forms, as we know them in medieval literature, had been practically evolved by the end of the 5th century, and in the course of the next two hundred years those forms became more and more confirmed. In the large formal cursive writing of the documents of the 6th and 7th centuries we can pick out the minuscule alphabet in the rough. It only needed to be cast in a calligraphic mould to become the book-hand miniscule, the later development of which we have now to trace. This calligraphic mould seems to have been found in the imperial chancery, from whence issued documents written in a fine round minuscule hand on an ample scale, as appears from one or two rare surviving examples attributed to the 8th and 9th centuries (see the facsimile of an imperial letter, dated variously a.d. 750 or 839, in Wattenbach, Script. gr. specim., pls. xiv., xv., and in Omont, Facs. des plus anc. MSS, gr. pl. xxvi., xxvii.; and Brit. Mus., papyrus xxxiii.). The line hand only needed to be reduced in scale to become the calligraphic minuscule book-hand of the velum MSS.

Thus then, in the 9th century, the minuscule book-hand came into general use for literature, and, with the finely prepared vellum of the time ready to receive it, it assumed under the pens of expert calligraphers the requisite cast, upright, regular and symmetrical, which renders it in its earliest stages one of the most beautiful forms of writing ever created.

Greek MSS. written in minuscule have been classed as follows: (1) codices vetustissimi, of the 9th century and to the middle of the 10th century; (2) vetusti, from the middle of the 10th to the middle of the 13th century; (3) recentiores, from the middle of the 13th century to the fall of Constantinople, 1453; (4) novelli, all after that date.

Of dated minuscule MSS. there is a not inconceivable number scattered among the different libraries of Europe. Gardthausen (Gr. Pal. S. 344 seqq.) gives a list of some thousand, ending at A.D. 1500. But, as might be expected, the majority belong to the later classes.1 Of the 9th century there are not ten which actually bear dates and of these all but one belong to the latter half of the century. In the 10th century, however, the number rises to nearly fifty, in the 11th to more than a hundred.

In the period of codices vetustissimi the minuscule hand is distinguished by its simplicity and purity. The period has been well described as the classic age of minuscules. The letters are symmetrically formed; the writing is compact and upright, or has even a slight tendency to slope to the left. In a word, the beauty of this class of minuscule writing is unsurpassed. But in addition to these general characteristics there are special distinctions which belong to it. The minuscule character is maintained intact, without intrusion of larger or uncial-formed letters. With its cessation as the ordinary literary hand the uncial character had not died out. We have seen that it was still used for liturgical books. It likewise continued to survive in a modified or half-uncial form for scholiæ, rubrics, titles, and special purposes—as, for example, in the Bodleian Euclid (fig. 16)—in minuscule written MSS of the 9th and 10th centuries. These uses of the older character sufficed to keep it in remembrance, and it is therefore not a matter for surprise that some of its forms should reappear and commingle with the simple minuscule. This afterwards actually took place. But in the period now under consideration, when the minuscule had been cast into a new mould, and was, so to say, in the full vigour of youth, extraneous forms were rigorously excluded.

---

1 In Omont’s Facs. des MSS. grecs daits de la Bibl. Nat. will be found a useful list of upwards of 300 facsimiles of dated Greek MSS. (including uncial).
less compact. The letters, so to say, open their ranks; and, from this circumstance alone, MSS. of the second half of the century may generally be distinguished from those fifty years earlier. But alterations also take place in the shapes of the letters. Side by side with the purely minuscule forms those of the uncial begin to reappear, the cause of which innovation has already been explained. These uncial forms first show

The gradual rounding of the rectangular breathings takes place in this period. In the 11th century the smooth breathing, which would most readily lend itself to this modification, first appears in the new form. In the course of the 12th century both breathings have lost the old square shape; and about the same time contractions become more numerous, having been at first confined to the end of the line.

When the period of codices recensitores commences, the Greek minuscule hand undergoes extensive changes. The contrast between MSS. of the 13th and those of a hundred years earlier is very marked. In the later examples the hand is generally more staggling, there is a greater number of exaggerated forms of letters, and marks of contraction and accents are dashed on more freely. There is altogether a sense of greater activity and haste. The increasing demand for books created a larger supply. Greater freedom and more variety appear in the examples of this class, together with an increasing use of ligatures and contractions. The general introduction of paper likewise assisted to break up the formal minuscule hand. To this rougher material a rougher style of writing was suited. Through the 14th and 15th centuries the decline of the set minuscule rapidly advances. The writing becomes even more involved and intricate, marks of contraction and accents are combined with the letters in a single action of the pen, and the general result is the production of a thoroughly cursive hand.

In some respects, however, the change was not so rapid. Church books were still ordinarily written on vellum, which, as it became scarcer in the market (owing to the injury done to the trade by the competition of paper), was supplied from ancient codices which lay ready to hand on the shelves of libraries; and in these liturgical MSS. the more formal style of the minuscule was still maintained. In the 14th century there even appears a partial Renaissance in the writing of Church MSS. modelled to some extent on the lines of the writing of the 12th century. The resemblance, however, is only superficial; for no writer can entirely disguise the character of the writing of his own time. And lastly there was yet another check upon the absolute disintegration of the minuscule book-hand in the 15th century exercised by the professional scribes who worked in Italy, and who in their calligraphical productions reverted again to the older style. The influence of the Renaissance is evident in many of the MSS. of the Italian Greeks, which served as models for the first Greek printing types.

The Greek minuscule book-hand had, then, by the end of the 15th century, become a cursive hand, from which the modern current hand is directly derived. We last saw the ancient cursive in use in the documents prior to the formation of the set minuscule book-hand, and no doubt it continued in use concurrently with the book-hand. But, as the latter passed through the transformations which have been traced, and gradually assumed a more current style, it may not unreasonably be supposed that it absorbed the cursive hand of the period, and with it whatever elements may have survived of the old cursive hand.

Latin Writing.

The course of Latin palaeography runs on the same lines as that of Greek palaeography. In regard to the former, as in regard to the latter, the documents fall into two main divisions: those which are written in the ordinary cursive hand of everyday life, and those which are written in the formal book-hand of literature. But Latin palaeography covers a wider ground than Greek. Greek writing being limited to the expression of the one
PALAEOGRAPHY

The half-uncial. These course the comparatively blend of Roman will of is also the natural mixture of Pompeii, and in the Roman catacombs, upon the wall-scribblings which have been laid bare, and upon the waxen tablets and the few papyri which have thence been recovered.

At the time when we come into touch with the first extant examples of Roman writing, we find a few instances of a literary or book-hand as well as a fairly extensive variety of cursive hands. It will be convenient in the first place to examine the Roman cursive writing during the early centuries of our era. Then, for the moment suspending further research in this branch of our subject, we shall proceed to describe the literary script and to trace the development of the large form of book-hand, or majuscule writing, in its two divisions of capitals and uncials, and of the intermediate styles composed of a mixture of large and small letters, or consisting of a blend of the two classes of letters which have received the name of half-uncial. Then we shall turn to follow the development of the national hands, when it will be necessary to come into touch again with the Roman cursive, whence the western continental scripts were derived; and so we shall proceed to the formation of the minuscule writing of the middle ages.

The materials for the study of the early Roman cursive hand have been found in the wall-scribblings, or graffiti, of Pompeii and Herculaneum and Rome (collected in the Corp. inscr. lat., vol. iv.); in the series of 127 libelli or waxen tablets, consisting of perscriptions and other deeds connected with sales by auction and tax receipts discovered in the house of the banker C. Cassius Iunianus at Pompeii, and bearing dates of A.D. 15, 27, and 53-62 (published in C.I.L. iv., supplement); in a few scattered papyri from Egypt; and in a set of four-and-twenty waxen tablets bearing dates ranging from A.D. 13 to 167, which were found in ancient mining works in the neighbourhood of Albunus Major (the modern Verespatak) in Dacia (C. I. L. iii.).

It will have been observed that in the case of the above documents there are three different kinds of material on which they have been inscribed: the plaster surface of walls, the waxen coatings of tablets, and the smooth surface of papyrus. The two former may be classed together as being of a nature which would offer a certain resistance to the free movement of the stylus; while in the case of papyrus the writing-reed or pen would run without impediment. Hence, in writing on the former materials there was a natural tendency to form the letters in disconnected strokes, to make them upright or even inclined to the left, and to employ vertical strokes in preference. The three following specimens from the graffiti and the two sets of tablets will demonstrate the conservative character of this kind of writing, covering as they do about a century and a half. This conservativeness may suggest the probability that the hand seen in the graffiti and the Pompeian tablets had not changed very materially from that practised a century or more earlier, and that it is practically the hand in which the Roman classical writers composed their works. When examining the alphabet of this early Roman cursive hand, we find (as we found in the early Greek cursive) the first beginnings of the minuscule writing of the middle ages. The slurring of the strokes, whereby the bows of the capital letters were lost and their more exact forms modified, led the way to the gradual development of the small letters. With regard to the particular forms of letters employed in the waxen tablets, compare the tables in Corp. inscr. lat., vol. iii., iv. The letter A is formed by a main stroke supporting an oblique stroke above it and the cross bar is either omitted, or is indicated by a small vertical stroke dropping, as it were, out of the letter.

The main stroke of B dwindles to a slight curve, and the two bows are transformed into a long bent stroke so that the letter takes the shape of a stilted a or of a d. The D is chiefly like the uncial δ; the E is generally represented by the old form | of inscriptions and in the Faliscan alphabet. In the modified form of G the first outline of the flat-headed g of later times appears; H, by losing half of its second upright limb in the haste of writing, comes near to being the small h. In the Pompeian tablets M has the four-stroke form ||||; as in the graffiti; in the Dacian tablets it is a rustic capital, sometimes almost an uncial Ϗ. The hastily written O is formed by two strokes both convex, almost like a. As to the general character of the writing, it is close and compressed, and has an inclination to the left. There is also much combination or linking together of letters (Corp. inscr. lat. iii. tab. A). These peculiarities may, in some measure, be ascribed to the material and to the confined space at the command of the writer. The same character of cursive writing has also been found on a few tiles and potsherds inscribed with alphabets or short sentences—the exercises of children at school (Corp. inscr. lat. iii. 962).

In writing with the pen upon the smooth and unresisting surface of papyrus, the scribe would naturally write a more fluent hand. The disjointed writing of the graffiti and the tablets was changed for one which gradually became more consecutive and which naturally tended in course of time to
slope to the right in the effort to be more current and to write letters in connexion without lifting the pen. One of the earliest available examples of Latin writing on papyrus to which an approximate date can be assigned is a fragment at Berolin containing portions of speeches delivered in the senate, said to be of the reign of Claudius, A.D. 41–54 (Steffens, Lat. Pal. taf. 101). The writing, though still somewhat restrained and admitting but little linking of the letters, is yet of a more flowing character than that of the contemporary tablets and graffiti.

We have to pass into the second century before finding the most perfect Latin document on papyrus as yet discovered (fig. 23). This is now in the British Museum, and records the purchase of a slave-boy by an officer in the Roman fleet of Misenum stationed on the Syrian coast, A.D. 166 (Pal. Soc. i. 100; Archæologia liv. p. 433). The writing of the body of the document is in a formal cursive, generally of the same formation as the inscriptions on the Dacian waxen tablets of the 2nd century, as will be seen from the accompanying facsimile of a few lines (fig. 23).

With this example of legal handwriting of the 2nd century it is interesting to compare two specimens of more ordinary cursive in different styles found in private letters of about the same time. The first (fig. 24) is taken from a fragmentary letter of the year 167 (Grenfell and Hunt, Greek Papyri, 2nd series, civii.) and is a typical example of a hurried style.

The second (fig. 25) is from a letter written by one Aurelius Archelaus to Julius Domitius, tribunus militum, recommending a friend named Theon, of the 2nd century (Oxyrhynchus Papyri, i., xxvii.), an instance apparently of slow and imperfect penmanship, every letter painfully and separately formed, yet not in the detached strokes characteristic of the writing of the graffiti and the tablets.

In the examples above we recognize practically the same alphabet as in the graffiti and tablets, but with certain exceptions, particularly in the shape of the letter E, which is either normal or written very cursorily as an acute-angled tick, and in the reversion of other letters to the more normal capital forms.

There is not sufficient material to trace step by step the development of the Roman cursive hand between the 2nd and the 5th centuries; but still, with the few scattered examples at hand, there seems to be reason for conjecture that Latin writing on papyrus passed through phases not very dissimilar to those of Greek writing on the same material. For, when we emerge from the 3rd century, we find an enlarged flowing hand, as in the Latin translation of the tables of Babrius in a fragmentary papyrus of the Amherst collection (No. xxvi.), ascribed to the 3rd or 4th century, and in a letter of recommendation from an Egyptian official of the 4th century, now at Strassburg (Archiv für Papyrforschung, iii. 2. 168); the handwriting of the latter recalling the large style of the Greek cursive of the Byzantine period (fig. 26). That there should be an affinity between the writing of Greek and that of Latin papyri emanating from Egypt is naturally to be expected.
followed by M. de Wailly, who published the whole of the fragments (Mém. de l'Institut (1842), xv. 390). Later, Mommens and Jaffé have dealt with the text of the documents (Jahrbuch der ges. deut. Rechts (1863), vi. 308), and compared in a table the forms of the letters with those of the Dacian tablets.

The characters are large, the line of writing being about three-fourths of an inch deep, and the heads and tails of the long letters are flourished; but the even slope of the strokes imparts to the writing a certain uniform and graceful appearance. As to the actual shape of the letters, as will be seen from the reduced facsimile here given, there may be recognized in many of them only a more current form of those which have been described above. The A and R may be distinguished by noticing the different angle at which the top strokes are applied; the B, to suit the requirements of the more current style, is no longer the closed d-shaped letter of the tablets, but is open at the bow and more nearly resembles a reversed 8; the tall letters f, h, l, and long 8 have developed loops; O and U-shaped U are very small, and written high in the line. The letters which seem to differ essentially from those of the tablets are E, M, N. The first of these is probably explained correctly by Jaffé as a development of the earlier || quickly written and looped, and may be compared with the tick-shaped letter noticed above. The M and N have been compared with the minuscule forms of the Greek mu and nu, as though the latter had been adopted; but they may with better reason be explained as merely cursive forms of the Latin capitals M and N. That this hand should have retained so much of the older formation of the Roman cursive is no doubt to be attributed to the fact of its being an official style of writing which would conform to tradition.

To continue the development which we saw attained in the letter of the 4th century above (fig. 26) we turn to the documents on papyrus from Ravenna, Naples, and other places in Italy, which date from the 5th century and are written in a looser and more straggling hand (fig. 28). Examples of this hand will be found in largest numbers in Marin's work specially treating of these documents (Papiri diplomatici), and also in the publications of Mabillon (De re diplomatica) Champollion-Figeac (Charter et MSS. sur papyrus), Massmann (Urknuben in Ncapel und Aerezza), Gloria (Palaeographia), as well as in Faccis of Ancient Charters in the British Museum, pt. ii., 1878, Nos. 45-46, and in the Faccis of the Palaeographical Society.

The letter a has now lost all trace of the capital; it is the open u-shaped miniscule, developed from the looped u-neck (\(\Delta\), \(\Lambda\)); the b, throwing off the loop or curve on the left which gave it the appearance of d, has at length developed one on the right, and appears in the form familiar in modern writing; minuscule m, n, and u are fully formed (the last never joining a following letter, and thus always distinguishable from a); p, g, and r approach to the long minuscules, and s, having acquired an incipient tag, has taken the form \(\gamma\) which it keeps long after.

This form of writing was widely used, and was not confined to legal documents. It is found in grammatical works, as in the second hand of the palimpsest MS. of Licinius (Cat. Auct. MSS., pt. ii., pl. 1, 2) of the 6th century, and in such volumes as the Josephus of the Ambrosian Library of the 7th century (Pal. Soc. pl. 59), and in the St Avitus of the 6th century and other MSS. written in France. It is indeed only natural to suppose that this, the most convenient, because cursive, hand, should have been employed for ordinary working MSS. which were in daily use. That so few of such MSS. should have survived is no doubt owing to the destruction of the greater number by the wear and tear to which they were subjected.

Latin Writing II. — Literary Hands

We have now to return to the 1st century, the date from which we started in the investigation of the Roman cursive writing, and take up the thread of the history of the book-hand of literature, a few rare examples of which have survived from the ruins of Herculaneum. That a Roman book-hand existed at a still earlier period is quite certain. The analogy of the survival of very ancient examples of a Greek literary hand is a sufficient proof; and it is a mere truism to say that as soon as there was a literature, there was likewise a book-hand for its vehicle. No work could be submitted for sale in the market that was not written in a style legible; copies were essential, and the creation of a formal kind of writing fitted for the purpose naturally resulted. Such formal script must, however, be always more or less artificial as compared with the natural hand of the time, and there must always be an antagonism between the two styles of script; and, as we have seen in Greek palaeography, the book-hand is always subject to the invading influence of the natural hand.

Capital Writing. Among the Herculaneum fragmentary papyri, then, we find our earliest examples of the Roman literary hand, which must be earlier than A.D. 79, the year of the destruction of the city; and those examples prove to us that the usual literary hand was written in capital letters. Of these letters there are two kinds—the square to all the neatly written capitals may be defined as those which have their horizontal lines at right angles with the vertical strokes; rustic letters are not less accurately formed, nor, as their title would seem to imply, are they rough in character, but, being without the exact finish of the square letters, and being more readily written, they have the appearance of greater simplicity. In capital writing the letters are not all of equal height; F and L, and in the rustic sometimes others, as B and R, overtop the rest. In the rustic alphabet the forms are generally lighter and more slender, with short horizontal strokes more or less oblique and wavy. Both styles of capital writing were obviously borrowed from the capital alphabets employed under the emperors. Both styles were used for public notices and on the wafers of Pompeii and other places. But it has been observed that scribes with a natural conservatism would perpetuate a style some time longer in books than it might be used in inscriptions. We should therefore be prepared to allow for this in ascribing a date to a capital written MS., which might resemble an inscription older by a century or more. Rustic capitals, on account of their more convenient shape, came into more general use; and the greater number of the early MSS. in capitals which have survived are consequently found to be in this character. In the Exempla cadum latino situ (Ratio magistrate and Wattenbach are collected specimens of capital writing.

The literary fragments of papyri from Herculaneum are written generally in rustic capitals, either of the firm, solid character used in inscriptions, or of the lighter style employed in the fragments of a poem on the battle of Actium (fig. 29). As this poem is the earliest literary work in Latin, of any extent, written in the book-hand, a specimen of the writing is here given. Its period must necessarily lie between the years 31 B.C. the date of the battle and A.D. 79; and therefore we may place it at least early in the 1st century.

That the rustic capital hand was generally adopted for finely written literary MSS., from the period of our earliest examples onwards through the centuries immediately following may be
assumed from the fact of that character being found so widely in favour when we come to the period of thevellum MSS. Unfortunately no examples have survived to fill the gap between the first century and the oldest of the vellum codices written in rustic capitals of the 4th century. Of the three great MSS. of Virgil preserved in the Vatican Library, which are written in

this character, the first in date is that known as the Schedae Vaticanae (Exempla, tab. 13; Pal. Soc. pl. 116, 117), a MS. famous for its series of well-illustrated paintings in classical style; it is ascribed to the 4th century. The other two MSS. are known as the Codex Romanus and the Codex Palatinus (Exempla, tab. 11, 12; Pal. Soc. pl. 113-115), and are now generally assigned to the 5th century. All three MSS. have doubt must always have been regarded as work; and the large scale of the writing employed, particularly in the case of the Romanus and the Palatinus, and the consequently magnificent size of the MSS. when complete, must indicate an unusual importance attaching to them. They were éditions de luxe of the great Roman poet. The writing of the Codex Palatinus (Fig. 30) especially is most exact, and is manifestly modelled on the best type of the rustic hand as seen in the inscriptions.

Fig. 30.—Virgil (Cod. Palatinus) 5th century. (Testaturque deus iterum se ad proelia cogit
Bis iam hostis haec altera foedera)

In assigning dates to the earliest MSS. of capital-writing, one feels the greatest hesitation, none of them bearing any internal evidence to assist the process. It is not indeed until the close of the 5th century that we reach firm ground—the Medicean Virgil of Florence having in it sufficient proof of having been written before the year 404. The writing is in delicately formed letters, rather more spaced out than in the earlier examples (Exempla, tab. 10; Pal. Soc. pl. 86). Another ancient MS. in rustic capitals is the Codex Rambinius of Terence of the 4th or 5th century (Exempla, tab. 8, 9; Pal. Soc., pl. 135), a volume which is also of particular interest on account of its marginal annotations, written in an early form of small hand. Among pallimpsests the most notable is that of the Cicero In Verrem of the Vatican (Exempla, tab. 4).

Of vellum MSS. in square capitals the examples are not so early as those in the rustic character. Portions of a MS. of Virgil in the square letter are preserved in the Vatican, and other leaves of the same are at Berlin (Exempla, tab. 14). Each page, however, begins with a large coloured initial, a style of ornamentation which is never found in the very earliest MSS. The date assigned to this MS. is therefore the end of the 4th century. In very similar writing, but not quite so exact, are some fragments of another MS. of Virgil in the library of St Gall, probably of a rather later time (Exempla, tab. 147; Pal. Soc. p. 208).

In the 6th century capital-writing enters on its period of decadence, and the examples of which it become imitative. Of this period is the Paris Prudentius (Exempla, tab. 155; Pal. Soc. pls. 29, 30) in rustic letters modelled on the old pattern of early inscriptions, but with a very different result from that obtained by the early scribes. A comparison of this volume with such MSS. as the Codex Romanus and the Codex Palatinus shows the later date of the Prudentius in its widespread writing and in certain inconsistencies in forms. Of the 7th century is the Turin Sedulius (Exempla, tab. 16), a MS. in which uncial writing also appears—the tough and misspelled letters being evidences of the cessation of capital writing as a hand in common use. The latest imitative example of an entire MS. in rustic capitals is in the Utrecht Psalter, written in triple columns and carefully indicated by all appearance, from an ancient example, and illustrated with pen drawings. This MS. may be assigned to the beginning of the 9th century. If there were no other internal evidence of late date in the MS. the mixture of uncial letters with the capitals would decide it. In the Psalter of St Augustine's Canterbury, in the Cottonian Library (Pal. Soc. pl. 10; Cat. Anc. MSS. ii. pls. 12, 13), some leaves at the beginning are written in this imitative style early in the 8th century; and again it is found in the Benedictional of Bishop Aethelwold (Pal. Soc. pl. 143) of the 10th century. In the sumptuous MSS. of the Carolingian school it was continually used; and it survived for such purposes as titles and colophons for some centuries, usually in a degenerate form of the rustic letter.

Uncial Writing.—There was also another majuscule form of writing, besides capitals, employed as a literary book-hand at an early date, but not coeval with the early period of capital writing. This second book-hand was the so-called Uncial hand, a modification of the capital form of writing, in which the square angles of the original letters were rounded off and certain new curved shapes were introduced, the characteristic letters of the uncial alphabet being a, δ, ε, ξ, ψ. The origin of some of these rounded letters may be traced in certain forms of the Roman cursive letters of the graffiti and the tablets. But a considerable length of time elapsed before the fully developed uncial alphabet was evolved from these incipient forms. In fact it was not until the vellum MSS. of the 8th century that the uncial hand had progressed so far as to acquire a type of literary uncial hand in perfect form. No doubt the new material, vellum, with its smooth hard surface, immediately afforded the means for the calligraphic perfection with which we find the uncial writing inscribed in these codices.

From the occurrence of isolated uncial forms in inscriptions, the actual period of growth of the finished literary hand has been determined to lie between the later part of the 2nd century and the 4th century. Uncial letters are especially prevalent in Roman-African inscriptions of the 3rd century; but certain letters of the uncial alphabet are not as yet therein matured; minuscule forms of a few letters, particularly b and d, are employed. The discovery also, at Oxyrhynchus, of a fragmentary papyrus of the 3rd century, containing a portion of an epitome of Livy, presents us with an example of the uncial hand in progress of inscriptions, the text being composed mainly of letters of the uncial type, but including a certain proportion of letters, as b, d, m, n, r, of the minuscule or small character. At length in the 4th century, as already stated, the perfected uncial literary alphabet is found in the vellum codices.

There are still extant a very large number of Latin uncial MSS., a proof of the wide use of this form of literary writing in the early middle ages.

The Exempla of Zangemeister and Wattenbach, so often quoted above, contains a series of facsimiles which illustrate its progress through its career. The letter ϒ has been adopted by the editors as a test letter; in the earlier forms of which the last limb is not curved or turned in. The letter Ω also in its earlier and purer form has the cross stroke placed high. But, as in every style of writing, when once developed, the earliest examples are the best, being written with a free hand and natural stroke. The Gospels of Vercelli (Exempla, tab. 26), said to have been written by the hand of Eusebius himself, and which may indeed be of his time, is one of the most ancient uncial MSS. Its narrow columns and pure forms of letters have the stamp of antiquity. To the 4th century also is assigned the pallimpsest Cicero De republica in the Vatican (Exempla, tab. 17; Pal. Soc.
pl. 160), a MS. written in fine large characters of the best type; and a very ancient fragment of a commentary on an ante-Hieronymian text, in three columns, has also survived at Fulda (Exempla, tab. 21). Among the uncial MSS. of the 5th century of which good photographic facsimiles are available are the two famous codices of Livy, at Vienna (fig. 31) and Paris (Exempla, tab. 18, 19; Pal. Soc. pl. 31, 32, 185).

To distinguish between uncial MSS. of the 5th and 6th centuries is not very easy, for the character of the writing changes but little, and is free from sign of weakness or wavering. It may, however, be noticed that MSS. which are assigned to the latter century there is rather less compactness, and occasionally, as the century advances, there is a slight tendency to artificiality.

When the 7th century is reached there is evidence that uncial writing has entered on a new stage. The letters are more roughly and carelessly formed, and the compactness of the earlier style is altogether wanting. From this time down to the age of Charlemagne there is a continual deterioration, the writing of the 8th century being altogether missapen. A more exact but imitative hand was, however, at the same time employed, when occasion required, for the production of calligraphic MSS., such as Biblical and liturgical books. Under the encouragement given by Charlemagne to such works, splendid uncial volumes were written in ornamental style, often in gold, several of which have survived to this day.

Mixed and Half-uncial Writing. It is obvious that the majuscule styles of literary writing, viz. the square capital, the rustic capital and the uncial, were of too elaborate and too stately a character to serve all the many requirements of literature. The capital hands, as we have seen, appear to have been employed, at least in many instances, for codices produced on a grand scale, and presumably for special occasions; and if the uncial hand had a longer and wider career, yet in this case also there must often have been a sense that the employment of this fine character gave a special importance and value to the MS. It is not improbable that the survival of so large a number of uncial MSS. is due to the special care that they received at the hands of their owners. Other more manageable styles of writing were necessary, and concurrently with the majuscule hands other forms were developing. The hand which bears the name of Half-uncial was finally evolved, and had itself an important career as a book-hand as well as exercising a large influence on the medieval minuscule hand of literature.

From the first, as we have seen in the case of the graffiti and the tablets, a mingling of capital forms and minuscule forms was prevalent in the non-literary style of writing. There are indications that the same mingling of the two streams was allowed in writing of a literary character. It appears in a rudimentary state in a papyrus fragment from Herculanenum (Exempla, tab. 12 b); and it appears in the epitome of Livy of the 3rd century found at Oxyrhynchus, in which minuscule letters are interspersed among the uncial text. From the regularity and ease with which this MS. is written, it is to be assumed that the mixed hand was ordinarily practised at that time. It is often employed for marginal notes in the early vellum codices. It is used for the text of the Verona Gaius (Exempla, tab. 24) of the 6th century, in which, beside the ordinary uncial shapes, d is also found as a minuscule, r as the transitional r, and s as the tall letter v. Again, in the uncial Florentine Pandects of the 6th century appears a hand which contains a large admixture of minuscule forms (Exempla, tab. 24). From these and other instances it is seen that in uncial MSS. of a secular nature, as in works relating to law and grammar, the scribe did not feel himself restricted to a uniform use of the larger letters, as he would be in producing a church book or calligraphic MS.

But the mixed hand, although partaking something of the nature of the Half-uncial, was not actually that form of writing. The Half-uncial hand was not only a mingling of uncial and minuscule forms, but also a blending of them, the uncial element yielding more or less to the minuscule influence, while the minuscule element was reacted upon by the uncial sentiment of roundness and sweeping curves. In its full development the Half-uncial, or Roman Half-uncial as it is also called, were it not for a few lingering pure uncial forms, might equally well be described as a large-type minuscule hand. It has, in fact, been sometimes styled the pre-Carolingian minuscule. An early form of this writing is found in the papyrus fragment of Sallust's Catiline, perhaps of the early 5th century, recently recovered at Oxyrhynchus. In vellum codices of the 5th, 6th and 7th centuries Half-uncial writing of a very fine type is not uncommon. It is used for the marginal scholia of the Bembine Terence, of the 5th century. The MS. of the Fasti consularum at Verona, brought down to 404 a.d. (Exempla, tab. 30), is also in this hand. But the earliest MS. of this class to which a more approximate date can be given is the Hilary of St Peter's at Rome (MS. 23), which was written in or before the year 500 or 510 (Exempla, tab. 52; Pal. Soc. pl. 136); the next is the Sulpicius Severus of Verona, of 517 (Exempla, tab. 32); and of the year 569 a beautifully written MS. at Monte Cassino containing a Biblical commentary (Exempla, tab. 3).

Other examples, of which good facsimiles may be consulted, are the Corbie MS. of Canons, at Paris (Exempla, tab. 41), the St Severianus at Milan (Pal. Soc. pl. 161, 162), the Ashburnham St Augustine (Pal. Soc. ii. 9), and the Paris St Augustine (New. Pal. Soc. pl. 80), of the 6th century; and the Cologne MS. of Canons (Exempla, tab. 44), and the Josephus (Pal. Soc. pl. 138) and St Ambrose (Pal. Soc. pl. 137) of Milan, of the 6th or 7th century.

The influence which the Half-uncial literary hand exercised upon the minuscule book-writing of the 7th and 8th centuries may be traced in greater or less degree in the continental MSS. of that period. We shall find that it formed the basis for the beautiful national handwritings of Ireland and Britain; and it played an important part in the Carolingian reform of the book-hand of the Frankish Empire.

Latin Writing. III.—THE NATIONAL HANDS

We have now to follow the rise and development of the national handwritings of western Europe, all of which were derived from the Roman hand, but from different phases of it. While the Roman Empire was the central power controlling its colonies and conquests, the Roman handwriting, however far apart might be the several countries in which it was current, remained practically one and the same. But, when the empire was broken up and when independent nationalities arose upon its ruins and advanced upon independent paths of civilization, the handwriting inherited from Rome gradually assumed distinctive characters and took the complexes of the several countries, unless from some accident the continuity of the effects of the Roman occupation was disturbed, as it was in Britain by the Saxon invasion. On the continent of western Europe, in Italy, in Spain, in Gaul, the Roman cursive hand had become the common form of writing, and it remained the framework on which the national hands of those countries developed. Thus
grew the Lombardic hand of Italy, the Visigothic hand of Spain, and the Merovingian and, later, the Carolingian hand of the Frankish Empire. The earliest charters of the three national divisions, written in cursive hands directly descending from the Roman cursive, and dating generally from the 7th century, still remained related in their general style. It was in the book-hands, elaborated from the cursive character, that the lines of national demarcation became more clearly defined, although naturally there occur also many examples in mixed styles which it is difficult to assign to one or another country.

Lombardic Writing.—The national handwriting of Italy did not follow one and the same lines of development throughout the peninsula. In ordinary documents the cursive hand which is seen in the Ravenna deeds, the direct descendant of the Roman cursive, continued in use, growing, in course of time, more and more intricate and difficult to read, the earliest examples, down to the middle of the 9th century, being in the large straggling character of their prototype. The illegible scrawl into which the hand finally degenerated in notarial instruments of southern Italy was at length suppressed by order of Frederick II. (A.D. 1216-1250). But at an early date the Lombardic book-hand was being formed out of this material. In northern Italy new influences were brought into action by Charlemagne’s conquest, the independent growth of the native hand was checked, and a mixed style in which the Merovingian type was interwoven with the Italian was produced, to which the name of Franco-Lombardic has been given (see below, fig. 39). But in the Lombardic duchies of the south the native Lombardic book-hand had an unimpeded growth. In such centres as the monasteries of Monte Cassino near Naples and La Cava near Salerno, it took in the 9th century a very exact and uniform shape. From this date the attention which it received as a calligraphic form of writing, accompanied with accessory ornamentation of initial letters, brought it to a high state of perfection in the 11th century, when by the peculiar treatment of the letters, they assume that strong contrast of light and heavy strokes which when exaggerated, as it finally became, gave the name of broken Lombardic. This style of hand lasted to the 13th century.

Papal Documents.—A word must be said in this place regarding the independent development of the hands used in the papal peculiar to itself, such as the letter $a$ made almost like a Greek omega, $t$ in the form of a loop, and $e$ as a circle with a knot at the top.

This hand may be followed in examples from A.D. 788 through the 9th century (Fac. de chartes et diplomae, 1866; Ch. Figeac, Chartes et doc. sur papryrus, i-xii.; Letronne, Dipl. merov. atat., pl. 48. In a bull of Silvester II., dated in 999 (Bibl. l’Ec. des chartes, vol. xxxvii.), we find the hand becoming less round; and at the end of the next century, under Urban II., in 1097 (Mabillon, De re dipl. suppl. p. 115) and 1098 (Sickel, Mon. graph. v.), it is in a curious angular style, which, however, then disappears. During the 11th and 12th centuries the imperial chancery hand was also used for papal documents, and was in turn displaced by the exact and calligraphic papal Italian hand of the later middle ages.

Visigothic Writing.—The Visigothic writing of Spain ran a course of development not unlike that of the Lombardic. In the cursive hand attributed to the 7th century the Roman cursive has undergone little change in form; but another century developed a most distinctive character. In the 8th century appears the set book-hand in an even and not difficult character, marked by breadth of style and a good firm stroke. This style is maintained through the 9th century with little change, except that there is a growing tendency to calligraphy. In the 10th century the writing deteriorates; the letters are not so uniform, and, when calligraphically written, are generally thinner in stroke. The same changes which are discernible in all the handwriting of western Europe in the 11th century are also to be traced in the Visigothic hand—particularly as regards the rather rigid character which it assumes. It continued in use down to the beginning of the 12th century. Perhaps the most characteristic letter of the book-hand is the $q$-shaped $g$.

The following specimens (figs. 35, 36) illustrate the Visigothic as written in a large heavy hand of the 9th century (Cat. Anc. MSS. ii. Plate 37), and in a calligraphic example of 1109 (Pal. Soc. Plate 48).

Fig. 34.—Bull of Pope John VIII. (much reduced, A.D. 876).

(Dei generis mariae filii—

haec igitur omnia quae huius praecedit)

chancery, that great centre which had so wide an influence by setting the pattern for the handsome round-hand writing which became so characteristic of the Italian script. Specimens of a special style of writing, founded on the Lombardic and called littera romana (fig. 34) are to be seen in the early papal documents on papyrus dating from the latter part of the 8th century. In the earliest examples it appears on a large scale, and has rounded forms and sweeping strokes of a very bold character. Derived from the official Roman hand, it has certain letters
century, the character is large and at first not so intricate as it becomes later in this period. The writing then grows into a more regular form, and in the 9th century a small hand is established, which, however, still retains the exaggerated heads and tails of letters. The direct course of this chancery hand may then be followed in the imperial documents, which from the second half of the 9th century are written in a hand more set and evidently influenced by the Carolingian minuscule. This form of writing, still accompanied by the lengthened strokes already referred to, continued in force, subject, however, to the varying changes which affected it in common with other hands, into the 12th century. Its influence was felt as well in France as in Germany and Italy; and certain of its characteristics also appear in the court-hand which the Normans brought with them into England.

The book-hand immediately derived from the early Merovingian diplomatic hand is seen in MSS. of the 7th and 8th centuries in a very neatly written but not very easy hand (Cat. Anc. MSS. ii. Plates 26, 30; Arndt, Schriftst. 28).

But other varieties of the literary hand as written in France are seen to be more closely allied to the Roman cursive. The earliest example is found in the papyrus fragments of writings of St. Avitus and St. Augustine of the 6th century (Études paléogr. sur des papyrius du VIe siècle, Geneva, 1860); and other later MSS. by their diversity of writing show a development independent of the cursive hand of the Merovingian charters. It is among these MSS. that those examples already referred to occur which more nearly resemble the Lombardic type.

itam sed una eundem filium. Unicum dem)

The uncial and half-uncial hands had also their influence in the evolution of these Merovingian book-hands; and the mixture of so many different forms accounts for the variety to be found in the examples of the 7th and 8th centuries. In the Notice sur un MS. Mérovingien d’Eugyppia (1875) and the Notice sur un MS. Mérovingien de la Bibl. d’Épinal (1878), Delisle has given many valuable facsimiles in illustration of the different hands in these two MSS. of the early part of the 8th century. See also Exempla Cod. Lat. (tab. 57), and autotypes in Cat. anc. MSS. ii. There was, however, through all this period a general progress towards a settled minuscule writing which only required a master-hand to fix it in a purified and calligraphic form. How this was effected will be described below, after disposing of the early national writing of our own islands.

**Irish Writing.**—The early history of the palaeography of the British Isles stands apart from that of the continental schools. As was noticed above, the Roman handwriting which was used by the Roman settlers in Britain and was imparted by them to the native Britons was swept out of existence when the Saxon invasion abruptly destroyed the continuity of Roman civilization in these islands. Britain had to wait a long time for the reappearance of Roman writing in the country; but it was destined to reappear, though in a different phase, in book-form, not in cursive form; and not directly, but through another channel. That channel was Ireland.

It is evident that the civilization and learning which accompanied the establishment of an ancient Church in Ireland could not exist without a written literature. The Roman missionaries who certainly in the first place had imported copies of the Gospels and other books, and it cannot be supposed that through intercourse with England the Irish would obtain continental MSS. in sufficient numbers to serve as models for their scribes. From geographical and political conditions, however, no continuous intimacy with foreign countries was possible; and we are consequently prepared to find a form of writing borrowed in the first instance from a foreign school, but developed under an independent national system. In Ireland we have an instance how conservative writing may become, and how it will hand on old forms of letters from one generation to another when there is no exterior influence to act upon it. After once obtaining its models, the Irish school of writing was left to work out its own ideas and continued to follow one direct line for centuries. The subsequent English influence had no effect on the national handwriting. Both peoples in the island pursued their own course. In MSS., in the Irish language the Irish character of writing was naturally employed; and the liturgical books produced in Irish monasteries by Irish monks were written in the same way. The grants and other deeds of the English settlers were, on the other hand, drawn up by English scribes in their own national writing. The Irish handwriting went on its even uninterrupted course; and its consequent unchanging form makes it so difficult a matter to assign accurate dates to Irish MSS.

The early Irish handwriting is of two classes—the round and the lozenge. The round hand is found in the earliest examples; the pointed hand, which also was developed at an early period, became the general hand of the country, and survives in the native writing of the present day. Of the earliest surviving MSS. written in Ireland none are found to be in pure uncial letters. That uncial MSS. were introduced into the country by the early missionaries can hardly be doubted, if we consider that character was so commonly employed as a bookhand, and especially for sacred texts. Nor is it impossible that Irish scribes may have practised this hand. The copy of the Gospels in uncials, found in the tomb of St. Kilian, and preserved at Würzburg, has been quoted as an instance of Irish uncial. The writing, however, is the ordinary uncial, and bears no marks of Irish nationality (Exempla, tab. 58). The most ancient examples are in half-uncial letters, so similar in character to the continental half-uncial MSS. of Roman type noticed above, that there can be no hesitation in deriving the Irish from the Roman writing. We have only to compare the Irish MSS. of the round type with the continental MSS. to be convinced of the identity of their styles of writing. There are unfortunately no means of ascertaining the exact period when this style of hand was first adopted in Ireland. Among the very earliest surviving examples none bears a fixed date; and it is impossible to accept the traditional ascription of certain of them to particular saints of
Ireland, as St Patrick and St Columba. Such traditions are notoriously unsubstantial ground upon which to take up a position. But an examination of certain examples will enable the palaeographer to arrive at certain conclusions. In Trinity College, Dublin, is preserved a fragmentary copy of the Gospels (Nat. MSS. Ireland, i. pl. ii.) vaguely assigned to a period from the 5th to the 7th century, and written in a round half-uncial hand very closely resembling the continental hand, but bearing the general impress of its Irish origin. This MS. may perhaps be of the early part of the 7th century.

The earliest examples of the continental half-uncial date back, as has been seen above, to the 5th century. Now the likeness between the earliest foreign and Irish MSS. forbids us to assume anything like collateral descent from a common and remote stock. Two different national hands, although derived from the same source, would not independently develop in the same way, and it may accordingly be granted that the point of contact, or the period at which the Irish scribes copied Continental half-uncials, was very long comparatively, before the date of the now earliest surviving examples. This would take us back at least to the 6th century, in which period there is sufficient evidence of literary activity in Ireland. The beautiful Irish calligraphy, ornamented with designs of marvellous intricacy and brilliant colouring, which is seen in full vigour at the end of the 7th century, indicates no small amount of labour bestowed upon the cultivation of writing as an ornamental art. It is indeed surprising that such excellence was so quickly developed. The Book of Kells has been justly acknowledged as the culmination of Irish calligraphy (Nat. MSS. Ireland, i. pl. vii.-viii.; Pat. Soc. pl. 55, 56). The text is written in the large solid half-uncial hand which is again seen in the Gospel of St. John at Lichfield (Pat. Soc. pl. 20, 21, 15) and, in a smaller form, in the English-written Lindisfarne Gospels (see below). Having arrived at the calligraphic excellence just referred to, the round hand appears to have been soon afterwards superseded, for general use, by the pointed; for the character of the large half-uncial writing of the Gospels of MacRegol, of about the year 800 (Nat. MSS. Ireland, i. pl. xxii.-xxiv.; Pat. Soc. pls. 99, 91), shows a very great deterioration from the vigorous writing of the Book of Kells, indicative of want of practice.

Traces of the existence of the pointed hand are early. It is found in a fully developed stage in the Book of Kells itself (Pat. Soc. pl. 88). This form of writing, which may be termed the round hand of the 9th and 10th centuries, is closely modelled by the national cursive hands of the Continent. In the latter the old Roman cursive has been shown to be the foundation. The Irish pointed hand, on the contrary, had nothing to do with the Roman cursive, but was simply a modification of the round hand, using the same forms of letters, but subjecting them to a lateral compression and drawing their limbs into points or hair-lines. As this process is found developed in the Book of Kells, its beginning may be fairly assigned to as early a time as the first half of the 7th century; but for positive date there is the same uncertainty as in regard to the first beginning of the round hand. The Book of Dimma (Nat. MSS. Ireland, i. pl. xvii., xix.) has been attributed to a scribe of about A.D. 600; but it appears rather to be a matter of uncertainty whether the style of English MSS. written in a similar hand. It is not in fact until we reach the period of the Book of Armagh (Nat. MSS. Ireland, pl. xxv.-xxxii.), a MS. containing books of the New Testament and other matter, and written by Ferdomannach, a scribe who died in the year 817, that we are on safe ground. Here is clearly a pointed hand of the early part of the 9th century, very similar to the English pointed hand of Mercian charters of the same time. The MS. of the Gospels of MacDomna, in the Lambeth Library (Nat. MSS. Ireland, i. pl. xxx., xxxi.) is an example of writing of the end of the 9th or beginning of the 10th century, showing a tendency to become more narrow and cramped. But coming down to the MSS. of the 11th or 12th centuries we find a change. The pointed hand by this time has become moulded into the angular and stereotyped form peculiar to Irish MSS. of the later middle ages. From the 12th to the 17th centuries there is a very gradual change. Indeed, a carefully written MS. of late date may very well pass for an example older by a century or two. A book of hymns of the 12th century (Nat. MSS. Ireland, i. pl. xxxii.-xxxvii.) may be referred to as a good typical specimen of the Irish hand of that period; and the Gospels of MacAnntuille, of A.D. 1178 (Nat. MSS. Ireland, i. pl. xl.-xli.; Pat. Soc. pl. 212), as a calligraphic one.

In Irish MSS. of the later period, the ink is black, and the vellum, as a general rule, is coarse and discoloured, a defect which may be attributed to inexperience in the art of preparing the skins and to the effects of climate.

When a school of writing attained to the perfection which marked that of Ireland at an early date, so far in advance of other countries, it naturally followed that its influence should be felt beyond its own borders. How the influence of the Irish school asserted itself in England will be presently considered. But on the Continent Romano-Germanic hands carried their civilizing power into different countries, and continued their native style of writing in the monasteries which they founded. At such centres as Luxeuil in France, Wurzburg in Germany, St Gall in Switzerland, and Bobbio in Italy, they were as busy in the production of MSS. as they had been at home. At first such MSS. were no doubt as distinctly Irish in their character as if written in Ireland itself; but, after a time, as the bonds of connexion with that country were weakened, the form of writing would become rather traditional, and lose the elasticity of a native hand. As the national styles also which were practised around them became more perfected, the writing of the Irish houses would in turn be reacted on; and it is thus that the later MSS. produced in those houses can be distinguished. Archaiic forms are traditionally retained, but the spirit of the hand dies and the writing becomes merely imitative.

English Writing.—In England there were two sources whence a national hand could be derived. From St Columba's foundation in Iona the Irish monks established monasteries in the northern parts of Britain; and in the year 635 the Irish missionary Aidan founded the see of Lindisfarne or Holy Isle, where there was established a school of writing destined to become famous. In the south of England the Roman missionaries had also brought into the country their own style of writing directed from Rome, and taught it in the newly founded monasteries. But their writing never became a national hand. Such a MS. as the Canterbury Charter (Pet. Soc. pl. 18) shows what could be done by English scribes in imitation of Roman uncialis; and the existence of so few early charters in the same letters (Fac. of Anc. Charters, pt. i., Nos. 1, 2, 7) among the large number which have survived, goes to prove how limited was the influence of that form of writing. The famous MS. of the Bible known as the Codex Amiatinus, now at Florence, which was written in uncials at Jarrow in Northumbria, about the year 700, was almost certainly the work of foreign scribes. On the other hand, the Irish style made progress throughout England, and was adopted as the national hand, developing in course of time certain local peculiarities, and lasting as a distinct form of writing down to the time of the Norman Conquest. But, while English scribes at first copied their Irish models, they soon learned to give to their writing the stamp of a national character, and imparted to it the elegance and strength which individualized the English hand for many centuries to come.
As in Ireland, so here we have to follow the course of the round hand as distinct from the pointed character. The earliest and most beautiful MS. of the former class is the Lindisfarne Gospels (fig. 41) or "Durham Book" in the Cottonian Library (Pal. Soc. pls. 3-6, 22; Cat. Anc. MSS. pt. ii. pls. 8-11), said to have been written by Eadfrith, bishop of Lindisfarne, about the year 700. The text is in very exactly formed half-uncials, differing but slightly from the same characters in Irish MSS., and is glossed in the Northumbrian dialect by Aelfred, a writer of the 10th century.

![Fig. 41.—Lindisfarne Gospels, C. A.D. 700.](image)

MSS. in the same solid half-uncial hand are still to be seen in the Chapter Library of Durham, this style of writing having been practised more especially in the north of England. But in addition to this calligraphic book-writing, there was also a lighter form of the round letters which was used for less sumptuous MSS. or for more ordinary occasions. Specimens of this hand are found in the Durham Cassiodorus (Pal. Soc. pl. 164), in the Canterbury Gospels (Pal. Soc. pl. 7; Cat. Anc. MSS. pt. ii., pls. 17, 18), the Epinal Glossary (E. Eng. Text Soc.), and in a few charters (Facs. Anc. Charters, pt. i., 15; ii., 2, 3; Pal. Soc. 19), one of which, of A.D. 778, written in Wessex, is interesting as showing the extension of the round hand to the southern parts of England. The examples here enumerated are of the 8th and 9th centuries—the earlier ones being written in a free natural hand, and those of later date bearing evidence of decadence. Indeed the round hand was being rapidly displaced by the more convenient pointed hand, which was in full use in England in the middle of the 8th century. How late, however, the more calligraphic round hand could be continued under favouring circumstances is seen in the Liber Vitae or list of benefactors of Durham (Cat. Anc. MSS. pt. ii., pl. 23; Pal. Soc. pl. 238), the writing of which would, from its beautiful execution, be taken for that of the 8th century, did not internal evidence prove it to be of about the year 850. The pointed hand ran its course through the 8th, 9th, and 10th centuries, until English writing came under the influence of the foreign minuscule. The leading characteristics of this hand in the 8th century are regularity and breadth in the formation of the letters and a calligraphic contrast of heavy and light strokes—the hand being then at its best. In the 9th century there is greater lateral compression, although regularity and correct formation are maintained. But in the 10th century there are signs of decadence. New forms are introduced, and there is a disposition to be imitative. A test letter of this latter century is found in the letter a with obliquely cut top, [\(\ldots\)]

The course of the progressive changes in the pointed hand may be followed in the Facsimiles of Ancient Charters in the British Museum and in the Facsimiles of Anglo-Saxon MSS. of the Rolls Series. The charters reproduced in these works have survived in sufficient numbers to enable us not only to form a fairly accurate knowledge of the criteria of their age, but also to recognize local peculiarities of writing. The Mercian scribes appear to have been very excellent penmen, writing a very graceful hand with much delicate play in the strokes. On the other hand the writing of Wessex was heavier and more staggering and is in such strong contrast to the Mercian hand that its examples may be easily detected with a little practice. Turning to books in which the pointed hand was employed, a very beautiful specimen, of the 8th century, is a copy of Bede's Ecclesiastical

**History** (fig. 42) in the University Library at Cambridge (Pal. Soc. pls. 139, 140), which has in a marked degree that breadth of style which has been referred to. Not much later is another copy of the same work in the Cottonian Library (Pal. Soc. pl. 141; Cat. Anc. MSS. pt. ii., pl. 19), from which the following facsimile is taken.

![Fig. 42.—Bede, 8th century.](image)

For an example of the beginning of the 9th century, a MS. of miscellaneous, of A.D. 811-814, also in the Cottonian Library, may be referred to (Pal. Soc. pl. 165; Cat. Anc. MSS. pt. ii. Plate 24); and a very interesting MS. written in the Wessex style is the Digby MS. 65 of the middle of the century (Pal. Soc. pl. 168). As seen in the charters, the pointed writing of the 10th century assumes generally a larger size, and is rather more artificial and calligraphic. A very beautiful example of the book-hand of this period is found in the volume known as the Durham Ritual (Pal. Soc. pl. 240), which, owing to the care bestowed on the writing and the archaism of the style, might at first sight pass for a MS. of higher antiquity.

In the latter part of the 10th century the foreign set minuscule hand began to make its way into England, consequent on increased intercourse with the Continent and political changes which followed. In the charters we find the foreign and native hands on the same page: the body of the document, in Latin, in Carolingian minuscules; the boundaries of the land conveyed, in the English hand. The latter remained throughout the 10th century, until English writing came under the influence of the foreign minuscule. The leading characteristics of this hand in the 8th century are regularity and breadth in the formation of the letters and a calligraphic contrast of heavy and light strokes—the hand being then at its best. In the 9th century there is greater lateral compression, although regularity and correct formation are maintained. But in the 10th century there are signs of decadence. New forms are introduced, and there is a disposition to be imitative. A test letter of this latter century is found in the letter a with obliquely cut top, [\(\ldots\)]

The course of the progressive changes in the pointed hand may be followed in the Facsimiles of Ancient Charters in the British Museum and in the Facsimiles of Anglo-Saxon MSS. of the Rolls Series. The charters reproduced in these works have survived in sufficient numbers to enable us not only to form a fairly accurate knowledge of the criteria of their age, but also to recognize local peculiarities of writing. The Mercian scribes appear to have been very excellent penmen, writing a very graceful hand with much delicate play in the strokes. On the other hand the writing of Wessex was heavier and more staggering and is in such strong contrast to the Mercian hand that its examples may be easily detected with a little practice. Turning to books in which the pointed hand was employed, a very beautiful specimen, of the 8th century, is a copy of Bede's Ecclesiastical

**History** (fig. 42) in the University Library at Cambridge (Pal. Soc. pls. 139, 140), which has in a marked degree that breadth of style which has been referred to. Not much later is another copy of the same work in the Cottonian Library (Pal. Soc. pl. 141; Cat. Anc. MSS. pt. ii., pl. 19), from which the following facsimile is taken.

![Fig. 42.—Bede, 8th century.](image)

For an example of the beginning of the 9th century, a MS. of miscellaneous, of A.D. 811-814, also in the Cottonian Library, may be referred to (Pal. Soc. pl. 165; Cat. Anc. MSS. pt. ii. Plate 24); and a very interesting MS. written in the Wessex style is the Digby MS. 65 of the middle of the century (Pal. Soc. pl. 168). As seen in the charters, the pointed writing of the 10th century assumes generally a larger size, and is rather more artificial and calligraphic. A very beautiful example of the book-hand of this period is found in the volume known as the Durham Ritual (Pal. Soc. pl. 240), which, owing to the care bestowed on the writing and the archaism of the style, might at first sight pass for a MS. of higher antiquity.

In the latter part of the 10th century the foreign set minuscule hand began to make its way into England, consequent on increased intercourse with the Continent and political changes which followed. In the charters we find the foreign and native hands on the same page: the body of the document, in Latin, in Carolingian minuscules; the boundaries of the land conveyed, in the English hand. The latter remained throughout the 10th century, until English writing came under the influence of the foreign minuscule. The leading characteristics of this hand in the 8th century are regularity and breadth in the formation of the letters and a calligraphic contrast of heavy and light strokes—the hand being then at its best. In the 9th century there is greater lateral compression, although regularity and correct formation are maintained. But in the 10th century there are signs of decadence. New forms are introduced, and there is a disposition to be imitative. A test letter of this latter century is found in the letter a with obliquely cut top, [\(\ldots\)]

The course of the progressive changes in the pointed hand may be followed in the Facsimiles of Ancient Charters in the British Museum and in the Facsimiles of Anglo-Saxon MSS. of the Rolls Series. The charters reproduced in these works have survived in sufficient numbers to enable us not only to form a fairly accurate knowledge of the criteria of their age, but also to recognize local peculiarities of writing. The Mercian scribes appear to have been very excellent penmen, writing a very graceful hand with much delicate play in the strokes. On the other hand the writing of Wessex was heavier and more staggering and is in such strong contrast to the Mercian hand that its examples may be easily detected with a little practice. Turning to books in which the pointed hand was employed, a very beautiful specimen, of the 8th century, is a copy of Bede's *Ecclesiastical*
Latin Writing, IV.—The Carolingian Reform and the Medieval Minuscule Hand

It has been stated above that in the Merovingian MSS. of the 8th century there was evident progress towards a settled minuscule book-hand which only required a master hand to fix it in a purified and calligraphic form. This was effected under Charlemagne, in whose reign the revival of learning naturally led to a reform in handwriting. An ordinance of the year 789 required the revision of Church books; and a more correct orthography and style of writing was the consequence. The abbey of St Martin of Tours was one of the principal centres from whence the reformation of the book-hand spread. Here, from the year 796 to 864, Alcuin of York presided as abbot; and it was specially under his direction that the Carolingian minuscule writing was brought to a simplicity and graceful form which was gradually adopted to the exclusion of all other hands. In carrying out this reformation we may well assume that Alcuin brought to bear the results of the training which he had received in his youth in the English school of writing, which had attained to such proficiency, and that he was also beneficially influenced by the fine examples of the Lombard school which he had seen in Italy. In the new Carolingian minuscule all the uncouthness of the later Merovingian hand disappears, and the simpler forms of many of the letters found in the old Roman half-uncial and minuscule hands are adopted. The character of Carolingian writing through the 9th and early part of the 10th century is one of general uniformity, with a contrast of light and heavy strokes, the limbs of tall letters being clubbed or thickened at the head by pressure of the pen to fix the characteristie letters (fig. 44) the a, following the old type, is, in the 9th century, still frequently open, in the form of n; the bows of g are open, the letter somewhat resembling the numeral 3; and there is little turning of the ends of letters, as m and n.

Fig. 44.—Gospels, 9th century.

(Scapera mariam coniugem tuam quod enm exaequaeuris de spiro saevo est. Pariet autem filium et sociabes nomen eius Iesum.)

In the 10th century the clubbing of the tall letters becomes less pronounced, and the writing generally assumes, so to say, a thinner appearance. But a great change is noticeable in the writing of the 11th century. By this time the Carolingian minuscule may be said to have put off its archaic form and to develop into the more modern character of small letter. It takes a more finished and accurate and more upright form, the individual letters being drawn with much exactness, and generally on a rather larger scale than before. This style continues to improve, and is reduced to a still more exact form of calligraphy in the 12th century, which for absolute beauty of writing is unsurpassed. In England especially (fig. 45) the writing of this century is particularly fine.

Fig. 45.—Leviticus, a.d. 1176.

(culos ex arumulis fini addente super altare uruli ci pelle et carnibus et fano crentis ex extra sic ipset dist.)

As, however, the demand for written works increased, a fine round-hand of the 12th century could not be maintained. Economy of material became necessary, and a smaller hand with more frequent contractions was the result. The larger and more distinct writing of the 11th and 12th centuries is now replaced by a more cramped though still distinct hand, in which the letters are more linked together by connecting strokes, and are more laterally compressed. This style of writing is characteristic of the 13th century. But, while the book-hand of this period is a great advance upon that of a hundred years earlier, there is no tendency to a cursive style. Every letter is clearly formed, and generally on the old shapes. The particular letters which show weakness are those made of a succession of vertical strokes, as m, n, u. The new method of connecting these strokes, by turning the ends and running on, made the distinction of such letters difficult, as, for example, in such a word as missio. The ambiguity thus arising was partly obviated by the use of a small oblique stroke over the letter t, which, to mark the double letter, had been introduced as early as the 11th century. The dot on the letter came into fashion in the 14th century.

Fig. 46.—Bible, 13th century.

(Elligite populis placet cui seruiisse populi debent. Utrumque quisque inter se servatrt in mesopotamia, an disii amercorum in quaerat terra habitat. Ego autem et dominus mea servium dominie. Respon- dite populis et ait, Abat a nobis ut reliquias dominum.)

In MSS. of the 14th century minuscule writing becomes slacker, and the consistency of formation of letters falters. There is a tendency to write more cursively and without raising the pen, as may be seen in the form of the letter a, of which the characteristic shape at this time is æ, with both bows closed, in contrast with the earlier a. In this century, however, the hand still remains fairly stiff and upright. In the 15th century it becomes very angular and more and more cursive, but is at first kept within bounds. In the course of the century, however, it grows more slack and deformed, and the letters become continually more cursive and misshaped. An exception, however, to this disintegration of minuscule writing in the later centuries is to be observed in church books. In these the old set hand of the 12th and 13th centuries was imitated and continued to be the liturgical style of writing.

It is impossible to describe within limited space, and without the aid of plentiful illustrations, all the varieties of handwriting which were developed in the different countries of Western Europe, where the Carolingian minuscule was finally adopted to the exclusion of the earlier national hands. In each country, however, it acquired, in a greater or less degree, an individual national stamp which can generally be recognized and which serves to distinguish MSS. written in different localities. A broad line of distinction may be drawn between the writing of northern and southern Europe from the 12th to the 15th century. In the earlier part of this period the MSS. of England, northern France and the Netherlands are closely connected. Indeed, in the 12th and 13th centuries it is not always easy to decide as to which of the three countries a particular MS. may belong. As a rule, perhaps, English MSS. are written with more sense of gracefulness; those of the Netherlands in darker ink. From the latter part of the 13th century, however, national character begins to assert itself more distinctly. In Southern Europe the influence of the Italian school of writing is manifest in the MSS. of the south of France in the 13th and 14th centuries, and also, though later, in those of Spain. That elegant roundness of letter which the Italian scribes seem to have inherited from the bold characters of the early papal chancery, and more recently from Lombardic models, was generally adopted in the book-hand of those districts. It is especially noticeable in calligraphic specimens, as in church books—the writing of Spanish MSS. in this style being distinguished by the blackness of the ink. The medieval minuscule writing of Germany stands apart. It never attained to the beauty of the hands of either the north or
the south which have been just noticed; and from its ruggedness and slow development German MSS. have the appearance of being older than they really are. The writing has also been very commonly submitted to a certain slope in the letters which causes it unfavourably with the upright and elegant hands of other countries. In western Europe generally the minuscule hand thus nationalized ran its course down to the time of the invention of printing, when the so-called black letter, or set hand of the 15th century in Germany and other countries, furnished models for the types. But in Italy, with the revival of learning, a more refined taste set in in the production of MSS., and scribes went back to an earlier time in search of a better standard of writing. Hence, in the first quarter of the 15th century, MSS. written on the lines of the Italian hand of the early 12th century begin to appear, and become continually more numerous. This revived hand was brought to perfection soon after the middle of the century, just at the right moment to be adopted by the early Italian printers, and to be perpetuated by them in their types.

_English Cursive Charter-Hands._—It must also not be forgotten that by the side of the book-hand of the later middle ages there was the cursive hand of everyday use. This is represented in abundance in the large mass of charters and legal or domestic documents which remains. Some notice has already been taken of the development of the national cursive hands in the earliest times. From the 12th century downwards these hands settled into well-defined and distinct styles peculiar to different countries, and passed through systematic changes which can be recognized as characteristic of particular periods. But, while the cursive hand thus followed out its own course, it was still subject to the same laws of change which governed the book-hand; and the letters of the two styles did not differ at any period in their organic formation. Confining our attention to the charter-hand, or court-hand, practised in England, a few specimens may be taken to show the principal changes which it developed. In the 12th century the official hand which had been introduced after the Norman Conquest is characterized by exaggeration in the strokes above and below the line, a legacy of the old Roman cursive, as already noted. There is also a tendency to form the tops of tall vertical strokes, as in b, h, l, with a notch or cleft. The letters are well made and vigorous, though often rugged.

"...—Amidst hails ful frivo..."

**Fig. 47.** Charter of Stephen, A.D. 1136—1139.

( _et ministeris et omnibus fidellis suis Franciscus et—_ Regina uxoris mee et Eustachi filii—_ mei dedi ei concessi ecclesie Beate Marie"

As the century advances, the long limbs are brought into better proportion; and early in the 13th century a very delicate fine-stroked hand comes into use, the cleaving of the tops being now a regular system, and the branches formed by the cleft falling in a curve on either side. This style remains the writing of the reigns of John and Henry III.

"...—Amidst hails ful frivo..."

PALAEONTOLOGY

580

each of which, such as palaeogeography or palaeoclimatology, is the more fascinating because of the large element of the unknown, the need for constructive imagination, the appeal to other branches of biological and physical investigation for supplementary evidence, and the necessity of constant comparison with the present aspects of nature. The task of the palaeontologist thus begins with the appearance of life on the globe, and ends in close relation to the studies of the archaeologist and historian as well as of the zoologist and botanist. That wealth of evidence which the zoologist enjoys, including environment in all its aspects and anatomy in its perfection of organs and tissues, the palaeontologist finds partially or wholly destroyed, and his highest art is that of complete restoration of both the past forms and past environments of life (see Plates I. and II.; figs. 1–4). The degree of accuracy in such anatomical and physiographic restorations from relatively imperfect evidence will always represent the state of the science and the degree of its approach toward being exact or complete. Progress in the science also depends upon the pursuit of palaeontology as zoology and not as geology, because it was a mere accident of birth which connected palaeontology so closely with geology.

In order to illustrate the grateful services which palaeontology through restoration may render to the related earth sciences let us imagine a vast continent of the past wholly unknown to us, its physical features, elevation, climate, configuration, etc., richly represented by fossil remains. All the seed plants and animals of every kind are brought from this continent into a great museum; the latitude, longitude and relative elevation of each specimen are precisely recorded; a corps of investigators, having the most exact and thorough training in zoology and botany, and gifted with imagination, will soon begin to restore the geographic and physiographic outlines of the continent, its new, brackish and salt-water confines, its seas, rivers and lakes, its forests, uplands, plains, meadows and swamps, also to a certain extent the cosmic relations of this continent, the amount and duration of its sunshine, as well as something of the chemical constitution of its atmosphere and the waters of its rivers and seas; they will trace the progressive changes which took place in the outlines of the continent and its surrounding oceans, following the invasions of the land by the sea and the re-emergence of the land and retreatal of the seasshore; they will outline the shools and deeps of its border seas, and trace the barriers which prevented intermingling of the inhabitants of the various provinces of the continent and the surrounding seas. From a study of remains of the mollusca, brachiopoda and other marine organisms they will determine the shallow water (littoral) and deep water (abyssal) regions of the surrounding oceans, and the clear or muddy, salt, brackish or fresh character of its inland and marginal seas; and even the physical conditions of the open sea at the time will be ascertained.

In such manner Johannes Walther (Die Fossilien der Selenozoen Fuhrer Kolke Blasiusisch betrachtet. Festschrift zum 70ten Geburtstage von Ernst Haeckel, 1904) has restored the conditions existing in the lagoons and atoll reefs of the Jurassic sea of Solnhoven in Bavaria; he has traced the process of gradual accumulation of the coral mud now constituting the fine lithographic stones in the inter-reef region, and has recognized the periodic laying bare of the mud surfaces thus formed; he has determined the winds which carried the dust particles from the not far distant land and brought the insects from the adjacent Jurassic forests. Finally the presence of the flying lizards (Pterydactylus, Rhamphorkynchos) and the ancient birds (Archaeopteryx) is determined from remains in a most wonderful state of preservation in these ancient deposits.

Still another example of restoration, relating to the surface of a continent, may be cited. It has been discovered that at the beginning of the Eocene the lake of Rilly occupied a vast area east of the present site of Paris; a water-course fell there in cascades, and Munier-Chalmas has reconstructed all the details of that singular locality; plants which loved moist places, such as Marchantia, Asplenium, the covered banks overshadowed by lindens, laurels, magnolias and palms; there also were found the vine and the ivy; mosses (Fontinalis) and Chara sheltered the crayfish (Astacus); insects and even flowers have left their delicate impressions in the travertine which formed the borders of this lake. The Oligocene lake basin of Florissant, Colorado, has been reconstructed similarly by Samuel Hubbard Scudder and T. D. A. Cockerill, including the plants of its shores, the insects which lived upon them, the fluctuations of its level, and many other characteristics of this extinct water body, now in the heart of the arid region of the Rocky Mountains.

Such restorations are possible because of the intimate fitness of animals and plants to their environment, and because such fitness has distinguished certain forms of life from the Cambrian to the present time; the species have altogether changed, but the laws governing the life of certain kinds of organisms have remained exactly the same for the whole period of time assigned to the duration of life; in fact, we read the conditions of the past in a mirror of adaptation, often sadly tarnished and incomplete owing to breaks in the palaeontological record, but constantly becoming more polished by discoveries which increase the understanding of life and its all-pervading relations to the non-life. Therefore adaptation is the central principle of modern palaeontology in its most comprehensive sense.

This conception of the science and its possibilities is the result of the approach that all the physical sciences, including palaeontology, are branches of a single science, the sciences of life and nature.

To set forth how best to do our thinking, rather than to follow the triumphs achieved in any particular line of exploration, and to present the point we have now reached in the method or principles of palaeontology, is the chief purpose of this article. The illustrations will be drawn both from vertebrate and invertebrate palaeontology. In the latter branch the author is wholly indebted to Professor Amadeus W. Graham of Columbia University. The subject will be treated in its biological aspects, because the relations of palaeontology to historical and stratigraphic geology are more appropriately considered under the article Geology. See also, for botany, the article Palaeobotany. We may first trace in outline the history of the birth of palaeontological ideas, from the time of their first adumbration. But for full details reference must be made to the treatises on the history of the science cited in the bibliography at the end of the article.

I.—First Historic Period

The scientific recognition of fossils as connected with the past history of the earth, from Aristotle (384–322 B.C.) to the beginning of the 19th century, in connexion with the rise of comparative anatomy and geology.—The dawn of the science covers the first observation of facts and the rudiments of true interpretation. Among the Greeks, Aristotle (384–322 B.C.) Xenophon (430–357 B.C.) and Strabo (63 B.C.–A.D. 24) knew of the existence of fossils and surmised in a crude way their relation to earth history. Similar prophetic views are found among certain Roman
Fig. 1.—An ichthyosaur (*I. quadriscissus*) containing in the body cavity the partially preserved skeletons of seven young, proving that the young of the animal developed within the maternal body and were brought forth alive; *i.e.* that the ichthyosaur was a viviparous animal. (*Specimen presented to the American Museum of Natural History by the Royal Museum of Stuttgart through Professor Eberhard Fraas.*)

Fig. 2.—A hypothetical pictorial restoration of the mother ichthyosaur accompanied by five of its newly born young, from the information furnished by actual fossils.

(*From a drawing by Charles R. Knight made under the direction of Professor Osborn.*)

Fig. 3.—One of the most perfect of the many specimens discovered and prepared by Herr Bernard Hauff, and showing the extraordinary preservation of the epidermis of the ichthyosaur, which gives the complete contour of the body in silhouetted, the outlines of the paddles, of the remarkably fish-like tail, into the lower lobe of which the vertebral column extends, and the great integumentary dorsal fin.

*Materials for the Restoration of Ichthyosaurs.*—This plate illustrates the exceptional opportunity afforded the palaeontologist through the remarkably preserved remains of Ichthyosaurs in the quarries of Holzmaden near Stuttgart, Wurttemberg, excavated for many years by Herr Bernard Hauff. (*Illustrations reproduced by permission from specimens in the American Museum of Natural History, New York.*)
Materials for the Restoration of Dinosaurs.—Carnivorous dinosaur (Allosaurus) of the Upper Jurassic period of North America, an animal closely related to the Megalosaurus type of England. The skeleton (fig. 4) was found nearly complete in the beds of the Morrison formation, Upper Jurassic of central Wyoming, U.S.A. Near it was discovered the posterior portion of the skeleton of a giant herbivorous dinosaur (Brontosaurus Marsh). It was observed that ten of the caudal vertebrae of the latter skeleton bore tooth marks and grooves corresponding exactly with the sharp pointed teeth in the jaw of the carnivorous dinosaur. This proved that the great herbivorous dinosaur had been preyed upon by its smaller carnivorous contemporary. Teeth of the carnivorous dinosaur scattered among the bones of the herbivorous dinosaur completed the line of circumstantial evidence. Upon this testimony the restoration (fig. 5) of the Megalosaurus has been drawn by Charles R. Knight under the direction of Professor Osborn.

(Originals reproduced by permission of the American Museum of Natural History.)
The 18th century witnessed the development of these suggestions and the birth of many additional theories. Sir A. Geikie assigns high rank to Jean Étienne Guettard (1715-1780) for his treatises on fossils, although admitting that he had no clear idea of the sequence of formations. The theory of successive formations was soundly developing in the treatises of John Woodward (1665-1728) in England, of Antonio Vallisneri (1661-1736) in Italy, and of Johann Gottlob Lehmann (d. 1767) in Germany, who distinguished between the primary, or unfossiliferous, and secondary or fossiliferous, formations. The beginnings of palaeogeography followed those of palaeometeorology. The Italian geologist Soldani distinguished (1758) between the fossil fauna of the deep sea and of the shore-lines. In the same year Johann Gesner (1700-1779) set forth the theory of a great period of time, which he estimated at 80,000 years, for the elevation of the shell-bearing levels of the Apenines to their present height above the sea. The brilliant French naturalist Georges Louis Leclerc, comte de Buffon (1707-1788), in Les Époques de la nature, included in his vast speculations the theory of unilineate succession and the emergence of the continents. Abraham Gottlob Werner (1750-1817), the famous exponent of the aqueous theory of earth formation, observed in successive geological formations the gradual approach to the forms of existing species.

II.—Second Historic Period

Invertebrate palaeontology founded by Lamarck, vertebrate palaeontology by Cuvier. Palaeontology connected with comparative anatomy by Cuvier. Invertebrate fossils employed for the definite division of all the great periods of time.—Although pre-evolutionary, this was the heroic period of the science, extending from the close of the 16th century to the publication of Darwin's Origin of Species in 1859. Among the pioneers of this period were the vertebrate palaeontologists and comparative anatomists Peter Simon Pallas, Pieter Camper and Johann Friedrich Blumenbach. Pallas (1741-1812) in his great journey (1768-1774) through Siberia discovered the vast deposits of extinct mammoths and rhinoceroses. Camper (1722-1789) contrasted (1772) the Pleistocene and recent species of elephants and Blumenbach (1752-1842) separated (1780) the mammoth from the existing species as Elephas primigenius. In 1789 Thomas Pennant (1726-1798) distinguished the American mastodon as Elephas americana.

Political troubles and the dominating influence of Wettin's speculations checked palaeontology in Germany, while under the leadership of Lamarck and Cuvier France came to the fore. J. B. Lamarck (1744-1829) was the founder of invertebrate palaeontology. The treatise which laid the foundation for all subsequent invertebrate palaeontology was his memoir, Sur les fossiles des environs de Paris . . . (1802-1806). Beginning in 1793 he boldly advocated evolution, and further elaborated five great principles—namely, the method of comparison of the existing animals, the organic remains of the Apenines and the succession of epochs, the correlation of geological horizons by means of fossils, the climatic or environmental changes as influencing the development of species, the inheritance of the bodily modifications caused by change of habit and habitat. As a natural philosopher he radically opposed Cuvier and was distinctly a precursor of uniformitarianism, advocating the hypothesis of slow changes and variations, both in living forms and in their environment. His speculations on phylogeny, or the descent of invertebrates and vertebrates, were, however, most fantastic and bore no relation to palaeontological evidence.

It is most interesting to note that William Smith (1760-1839), now known as the “father of historical geology,” was born in the same year in Oxfordshire as Cuvier. In the 1790s, observing the stratigraphic value of fossils, he began to distinguish the great Mesozoic formations of England (1801). Cuvier (1769-1832) is famous as the founder of vertebrate palaeontology, and with Alexandre Brongniart (1770-1847) as the author of the first exact contribution to stratigraphical geology. Early trained as a comparative anatomist, the discovery of Upper Eocene mammals in the gypsum quarries of Montmartre found him fully prepared (1768), and in 1812 appeared his Recherches sur les ossements fossiles, brilliantly written and constituting the foundation of the modern study of the extinct vertebrates. Invulnerable in exact anatomical description and comparison, he failed in all his philosophical generalizations, even in those strictly within the domain of anatomy. His famous “law of correlation,” which by its apparent brilliancy added enormously to his prestige, is not supported by modern philosophical anatomy, and his services to stratigraphy were diminished by his generalizations as to a succession of sudden extinctions and renewals of life. His joint memoirs with Brongniart, Essai sur la géographie minéralogique des environs de Paris avec une carte géologique et des coupes de terrain (1808) and Description géologique des environs de Paris (1835) were based on the wonderful succession of Tertiary faunas in the rocks of the Paris basin.

In Cuvier's defence Charles Deprès maintains that the extreme theory of successive extinctions followed by a succession of creations is attributable to Cuvier's followers rather than to the master himself. Deprès points also that we owe to Cuvier the first clear expression of the idea of the increasing organic perfection of all forms of life from the lower to the higher, and that, while he believed that extinctions were due to sudden revolutions on the surface of the earth, he also set forth the ancient and various land routes between great continents and islands. Thus Cuvier, following Buffon, clearly anticipated the modern doctrine of faunal migrations. His reactionary and retard ing ideas as a special creationist and his advocacy of the catastrophistic theory of change exerted a baneful influence until overthrown by the uniformitarianism of James Hutton (1726-1797) and Charles Lyell (1797-1875) and the evolutionism of Charles Darwin (1809–1882). The chief contributions of Cuvier's great philosophical opponent, Étienne Geoffroy St Hilaire (1772-1844), are to be found in his maintenance with Lamarck of the doctrine of the mutability of species. In this connexion he developed his
special theory of saltations, or of sudden modifications of structure through changes of environment, especially through the direct influences of temperature and atmosphere. He clearly set forth also the phenomena of analogous or parallel adaptation.

It was Alcide Desseilles d’Orbigny (1802–1857) who pushed to an extreme Cuvier’s ideas of the fixity of species and of successive extinctions, and finally developed the wild hypothesis of twenty-seven distinct creations. While these views were current in France, exaggerating and surpassing the thought of Cuvier, they were strongly opposed in Germany by such authors as Ernst Friedrich von Schlotho (1764–1832) and Heinrich Georg Brom (1800–1862); and the latter demonstrated that certain species actually pass from one formation to another.

In the meantime the foundations of palaeontology were being laid (1804) by Ernst Friedrich von Schlotho (1764–1832), (1821) by Kaspar Maria Sternberg (1761–1858) and (1838) by Theophile Brongniart (1792–1862).

Following Cuvier’s Recherches sur les ossemens fossiles, the rich succession of Tertiary mammalian life was gradually revealed to France through the explorations and descriptions of such authors as Croizet, Jobert, de Cristol, Eymar, Pomel and Lartet, during a period of rather dry, systematic work, which included, however, the broader generalizations of Henri Marie Ducrotay de Blainville (1778–1850), and culminated in the comprehensive treatises on Tertiary palaeontology of Paul Gervais (1816–1879). Extending the knowledge of the extinct mammals of Germany, the principal contributors were Georg August Goldfuss (1782–1848), Georg Friedrich von Jaeger (1785–1866), Felix P. Piininger (1867–1873) and Johann Jacob Kulp (1803–1873). As Cuvier founded the palaeontology of mammals and reptiles, so Louis Agassiz’s epoch-making works Recherches sur les poissons fossiles (1833–1853) laid the secure foundations of palaeichthyology, and were followed by Christian Heinrich Pander’s (1794–1865) classic memoirs on the fossil fishes of Russia. In philosophy Agassiz was distinctly a disciple of Cuvier and supporter of the doctrine of special creation, and to a more limited extent of cataclysmic extinctions. Animals of the next higher order, the amphibians of the coal measures and the Permian, were first comprehensively treated in the masterly memoirs of Christian Erich Hermann von Meyer (1801–1860) beginning in 1829, especially in his Beiträge zur Petrefaktenkunde (1829–1836) and his Zur Fauna der Vorwelt (4 vols. 1835). Meyer laid the foundations of the world of extinct Reptilia; in 1821 Charles König (1784–1853), the first keeper of the mineralogical collection in the British Museum, described Ichthyosaurus from the Jurassic; in the same year William Daniel Conybeare (1827–1837) described Plesiosaurus; and a year later (1822) Mosasaurus; in 1824 William Buckland described the great carnivorous dinosaur Megalosaurus; while Gideon Algernon Mantell (1790–1852) in 1838 announced the discovery of Iguanodon. Some of the fossil reptilia of France were made known through St Hilaire’s researches on the Crocodilia (1831), and those of J. A. Deslongchamps (1794–1867) and his son on the telesauras, or long-snouted crocodiles. Materials accumulated far more rapidly, however, in 1839–41, when of the great excavation gradually dwindled. Able as von Meyer was, his classification of the Reptilia failed because based upon the single adaptive characters of foot structure. The reptiles awaited a great classifier, and such a one appeared in England in the person of Sir Richard Owen (1804–1892), the direct successor of Cuvier and a comparative anatomist of the first rank. Non-committal as regards evolution, he vasted broaden the field of vertebrate palaeontology by his descriptions of the extinct fauna of England, of South America (including especially the great edentates revealed by the voyage of the Beagle), of Australia (the ancient and modern marsupials) and of New Zealand (the great struthious birds). His contributions on the Mesoic reptiles of Great Britain culminated in his complete rearrangement and classification of this group, one of his greatest services to palaeontology.

Meanwhile the researches of Hugh Falconer (1808–1865) and of Proby Thomas Cautley (1802–1871) in the sub-Himalayas brought to light the marvellous fauna of the Siwalik hills of India, published in Fauna antiqua Sivalensis (London, 1845) and in the volumes of Falconer’s individual researches. The ancient life of the Atlantic border of North America was also becoming known through the work of the pioneer vertebrate palaeontologists Thomas Jefferson (1743–1826), Richard Harlan (1796–1843), Jeffries Wyman (1814–1874) and Joseph Leidy (1823–1891). This was followed by the revelation of the vast ancient life of the western half of the American continent, which was destined to revolutionize the science. The master works of Joseph Leidy began with the first-fruits of western exploration in 1837 and extended through a series of grand memoirs, culminating in 1874. Leidy adhered strictly to Cuvier’s exact descriptive methods, and while an evolutionist and recognizing clearly the genetic relationships of the horses and other groups, he never indulged in speculation.

The changes of invertebrate palaeontology during the second period is more closely connected with the rise of historic geology and stratigraphy, especially with the settlement of the great and minor time divisions of the earth’s history. The path-breaking works of Lamarck were soon followed by the monumental treatise of Gérard Paul Deshayes (1795–1875) entitled Descriptions des coquilles fossiles des environs de Paris (1824–1837), the first of a series of great contributions by this and other authors. These and other early monographs on the Tertiary shells of the Paris basin, of the environs of Bordeaux, and of the sub-Apennine formations of Italy, brought out the striking distinctness of these faunas from each other and from other molluscan faunas. Recognition of this threefold character led Lyell to establish a threefold division of the Tertiary based on the percentage of molluscs belonging to types now living found in each. To these divisions Lyell gave in 1833 the names Eocene, Miocene and Pliocene.

James Hutton (1726–1797) had set forth (1781) the principle that during all geological time there has been no essential change in the character of events, and that uniformity of law is perfectly consistent with mutability in the results. Lyell marshalled all the observations he could collect in support of this principle, teaching that the present is the key to the past, and arraying all obtainable evidence against the catastrophist theories of Cuvier. He thus exerted a potent influence on palaeontology through his persistent advocacy of uniformitarianism and stratigraphic doctrine. The later work of Lamarck should also be credited. As among the vertebrates, materials were accumulating rapidly for the great generalizations which were to follow in the third period. De Blainville added to the knowledge of the shells of the Paris basin; Giovanni Battista Brochi (1772–1826) in 1814, and Luigi Bellardi (1818–1889) and Giovanni Micheloti (born 1812) in 1849, described the Pliocene molluscs of the sub-Apennine formation of Italy; from Germany and Austria appeared the epoch-making works of Heinrich Ernst Beyrich (1815–1856) and of Moritz Hoernes (1815–1868).

We shall pass over here the labours of Adam Sedgwick (1785–1873) and Sir Roderick Murchison (1792–1871) in the Palaeozoic of England, which because of their close relation to stratigraphic doctrine Cuvier’s ideas should not be credited.

The grand contributions of Joachim Barrande (1799–1883), published in his Système silurien du centre de la Bohème, the first volume of which appeared in 1832. While establishing the historic divisions of the Silurian in Bohemia, Barrande also propounded his famous theory of “colonies,” by which he attempted to explain the aberrant occurrence of strata containing animals of a more advanced stage among strata containing earlier and more primitive faunas; his assumption was that the second fauna had migrated from an unknown neighbouring region. It is proved that the specific instances on which Barrande’s generalizations were founded were due to his misinterpretation of the overturned and faulted strata, but his conception of the simultaneous existence of two faunas, one of more ancient and one of more modern type, and of their alternation in a given area, was based on sound philosophical principles and has been confirmed by more recent work.
The greatest generalization of this second period, however, was that partly prepared for by d’Orbigny, as will be more fully explained later in this article, and clearly expressed by Agassiz—namely, the law of repetition of ancestral stages of life in the course of the successive stages of individual development. This law of recapitulation, subsequently termed the “biogenetic law” by Ernst Haeckel, was the greatest philosophic contribution of this period, and proved to be not only one of the bulwarks of the evolution theory but one of the most important principles in the method of palaeontology.

On the whole, as in the case of vertebrate palaeontology, the pre-Darwinian period of invertebrate palaeontology was one of rather dry systematic description, in which, however, the applications of the science gradually extended to many regions of the world and to all divisions of the kingdom of invertebrates.

III.—THIRD HISTORIC PERIOD

Beginning with the publication of Darwin’s great works, “Narrative of the Surveying Voyages of H.M.S. ‘Adventure’ and ‘Beagle’” (1839), and “On the Origin of Species by Means of Natural Selection” (1859)—A review of the two first classic works of Charles Robert Darwin (1809-1882) and of their influence proves that he was the founder of modern palaeontology. Principles of descent and other applications of uniformitarianism which had been struggling for expression in the writings of Lamarck, St. Hilaire and de Blainville here found their true interpretation, because the geological succession, the rates of the migrations, the extinctions, were all connected with the grand central idea of evolution from primordial forms.

A close study of the exact modes of evolution and of the philosophy of evolution is the distinguishing feature of this period. It appears from comparison of the work in the two great divisions of vertebrate and invertebrate palaeontology made for the first time in this article that in accuracy of observation and in close philosophic analysis of facts the students of invertebrate palaeontology led the way. This was due to the much greater completeness and abundance of material afforded among invertebrate fossils, and it was manifested in the demonstrative power of two great principles or laws: first, the law of recapitulation, which is found in its most ideal expression in the shells of invertebrates; second, in the law of direct genetic succession through vertical modification. It is singular that the second law is still ignored by many zoologists. Both laws were of paramount importance, as direct evidence of Darwin’s theory of descent, which, it will be remembered, was at the time regarded merely as a hypothesis. Nevertheless, the tracing of phylogeny, or direct lines of descent, suddenly began to attract far more interest than the naming and description of species.

The Law of Recapitulation. Acceleration. Retardation.—This law, that in the stages of growth of individual development (ontogeny), an animal repeats the stages of its ancestral evolution (phylogeny), was, as we have stated, anticipated by d’Orbigny. He recognized the fact that the shells of molluscs, which grow by successive layers of calcareous matter, were the stages of their individual development, so that each shell of a Cretaceous ammonite, for example, represents five stages of progressive modification as follows: the first is the période embryonnaire, during which the shell is smooth; the second and third represent periods of elaboration and ornamentation; the fourth is a period of initial degeneration; the fifth and last a period of degeneration when ornamentation becomes obsolete and the exterior smooth again, as in the young. D’Orbigny, being a special creationist, failed to recognize the bearing of these individual stages on evolution. Alpheus Hyatt (1838-1902) was the first to discover (1866) that these changes in the form of the ammonite shell agreed closely with those which had been passed through in the ancestral history of the ammonites. In an epoch-making essay, On the Parallelism between the Different stages of Life in the individual and those in the entire group of the Molluscan Order Tetragonocerata (1866), and in a number of subsequent memoirs, among which Genesis of the Arietidae (1889) and Phylogeny of an Acquired Characteristic (1894) should be mentioned, he laid the foundations, by methods of the most exact analysis, for all future recapitulation work of invertebrate palaeontologists. He showed that from each individual shell of an ammonite the entire ancestral series may be reconstructed, and that, while the earlier shell-whorls retain the characters of the adults of preceding members of the series, a shell in its own adult stage adds a new character, which in turn becomes the pre-adult character of the types which will succeed it; finally, that this comparison between the revolutions of the life of an individual and the life of the entire order of ammonites is wonderfully harmonious and precise. Moreover, the last stages of individual life are prophetic not only of future rising and progressing derivatives, but in the case of senile individuals of future declining and degradational series.

Thus the recapitulation law, which had been built up independently from the observations and speculations on vertebrates by Lorenz Oken (1779-1851), Johann Friedrich Meckel (1781-1833), St. Hilaire, Karl Ernst von Baer (1792-1876) and others, and had been applied (1842-1843) by Karl Vogt (1817-1895) and Agassiz, in their respective fields of observation, to comparison of individual stages with the adults of the same group in preceding geologic periods, furnished the key to the determination of the ancestry of the invertebrates generally.

Hyatt went further and demonstrated that ancestral characters are passed through by successive descendants at a more and more accelerated rate in each generation, thus giving time for the appearance of new characters in the adult. His “law of acceleration” together with the complementary “law of retardation,” or the slowing up in the development of certain characters (first propounded by E. D. Cope), was also a philo-

FIG. 6.

(sophistication of the first importance (see fig. 6 and Plate III., fig. 7).

In the same year, 1866, Franz Martin Hilgendorf (1839-1900) studied the shells of Planorbis from the Miocene lake basin underlying the present village of Steinheim in Württemberg, and introduced the method of examination of large numbers of individual specimens, a method which has become of prime importance in the science. He discovered the actual transmutations in direct genetic series of species on the successive deposition levels of the old lake basin. This study of direct genetic series marked another great advance, and became possible in invertebrate palaeontology long before it was introduced among the vertebrates. Hyatt, in a re-examination of the Steinheim deposits, proved that successive modifications occur at the same level as well as in vertical succession. Melchior Neumayr (1813-1890) and C. M. Paul similarly demonstrated genetically Psalidina (Vivipara) in the Pliocene lakes of Slavonia (1873).

The Mutations of Waagen. Orthogenesis.—In 1869 Wilhelm Heinrich Waagen (1841-1900) entered the field with the study of ammonites subradatus. He proposed the term “mutations” for the minute progressive changes of single characters in definite directions as observed in successive stratigraphic levels. Even when seen in minute features only he recognized them as constant progressive characters or “chronologic varieties” in...
contrast with contemporaneous or "geographic varieties," which he considered inconstant and of slight systematic value. More recent analysis has shown, however, that certain modifications observed within the same stratigraphic level are really grades of mutations which show divergences comparable to those found in successive levels. The collective term "mutation," as now employed by paleoentologists, signifies a type modified to a slight degree in one or more of its characters along a progressive or definite line of phyletic development. The term "mutation" also applies to a single new character and for distinction may be known as "the mutation of Wagner." This definitely directed evolution, or development in a few determinable directions, has since been termed "orthogenetic evolution," and is recognized by all workers in invertebrate paleontology and phylogeny as fundamental because the facts of invertebrate paleontology admit of no other interpretation. Among the many who followed the method of attack first outlined by Hyatt, or who independently discovered his method, only a few can be mentioned here—namely, Wagner (1869), Neumayr (1871), Württemberger (1880), Branco (1880), Mojsisovics (1882), Buckman (1885), Karpinsky (1880), Jackson (1889), Beecher (1890), Perrin-Smith (1897), Clarke (1898) and Grabau (1904). Melchior Neumayr, the great Austrian paleontologist, especially extended the philosophic foundations of modern invertebrate paleontology, and traced a number of continuous genetic series (sornerneicht) in successive horizons. He also demonstrated that mutations have this special or distinct character, that they repeat in the same direction without oscillation or retrogression. He expressed great reserve as to the causes of these mutations. He was the first to attempt a comprehensive treatment of all the diverse aspects of the subject; and his reserve point of view; but unfortunately his great work, entitled Die Stämme des Thierreichs (Vienna and Prague, 1859), was uncompleted.

The absolute agreement in the results independently obtained by these various investigators, the interpretation of individual development as the guide to phyletic development, the demonstration of continuous genetic series, each mutation falling into its proper place and all showing a definite direction, constitute contributions to biological philosophy of the first importance, which have been little known or appreciated by zoologists because of their publication in monographs of very specialized character.

Vertebrate Paleontology after Darwin.—The impulse which Darwin gave to vertebrate paleontology was immediate and unabated, finding expression especially in the writings of Thomas Henry Huxley (1825–1893) in England, of Jean Albert Gaudry (b. 1827) in France, in America of Edward Drinker Cope (1840–1897) and Othniel Charles Marsh (1831–1899). Fine examples of the spirit of the period as applied to extinct Mammalia are Gaudry's Animaux fossiles et géologie de l'Alittque (1862) on the Upper Miocene fauna of Pikermi near Athens, and the remarkable memoirs of Vladimir Onufrievich Kowalevsky (1842–1893), published in 1873. These works swept aside the dry traditional fossil lore which had been accumulating in France and Germany. They breathed the new spirit of the recognition of adaptation and descent. In 1867–1877 Marsh and Cope, in his memoirs on the Miocene birds of central France, Huxley's development of the method of paleontology should be studied in his collected memoirs (Scientific Memoirs of Thomas Henry Huxley, 4 vols., 1868). In Kowalevsky's Versuch einer naturalichen Classification der Fossilien Haithieres (1875) we find a model union of detailed inductive study with theory and working hypothesis. All these writers attacked the problem of descent, and published preliminary phylogenies of such animals as the horse, rhinoceros and elephant, which time has proved to be of only general value and not at all comparable to the exact phylogenetic series which were being established by invertebrate paleontologists. Phylogenetic gaps began to be filled in this general way, however, by discovery, especially through remarkable discoveries in North America by Leidy, Cope and Marsh, and the ensuing phylogenies gave enormous prestige to paleontology.

Cope's philosophic contributions to paleontology began in 1868 (see essays in The Origin of the Fittest, New York, 1887, and The Primal Factors of Organic Evolution, Chicago, 1869) with the independent discovery and demonstration among vertebrates of the laws of acceleration and retardation. To the law of "recapitulation" he unfortunately applied Hyatt's term "parallelism," a term which is used now in another sense. He especially pointed out the laws of the "extinction of the specialized" and "survival of the non-specialized" forms of life, and challenged Darwin's principle of selection as an explanation of the origin of adaptations by saying that the "survival of the fittest" does not explain the "origin of the fittest." He personally sought to demonstrate such origin, first, in the existence of a specific internal growth force, which he termed bathic force, and second in the direct inheritance of acquired mechanical modifications of the nervous system. He thus revived Lamark's views and helped to found the so-called neo-Lamarckian school in America. To this school A. Hyatt, W. H. Dall and many other invertebrate paleontologists subscribed. History of Discovery. Vertebrates.—In discovery the theatre of interest has shifted from continent to continent, often in a sensational manner. After a long period of gradual revelation of the ancient life of Europe, extending eastward to Greece, eastern Asia and to Australia, attention became centred on North America, especially on Rocky Mountain exploration. New and unheard-of orders of amphibians, reptiles and mammals came to the surface of knowledge, revolutionizing thought, demonstrating the evolution theory, and solving some of the most important problems of the diapause of the earth's history was the discovery of birds with teeth both in Europe (Archaeopteryx) and in North America (Hesperornis), of Eocene stages in the history of the horse, and of the giant dinosauria of the Jurassic and Cretaceous in North America. Then the stage of novelty suddenly shifted to South America, where after the pioneer labours of Darwin, Owen and Barmesteirr, the field of our knowledge was suddenly and vastly extended by explorations by the brothers Ameghino (Carlos and Florentino). We were in the midst of more thorough examination of the ancient world of Patagonia, of the Pampean region and of its submerged sister continent Antarctica, when the scene shifted to North Africa through the discoveries of Hugh J. L. Beadnell and Charles W. Andrews. These latter discoveries showed the close affinity of the Cretaceous mammals of North America to the Miocene mammals of Europe. They round out our knowledge of Tertiary history, but leave the problems of the Cretaceous mammals and of their relations to Tertiary mammals still unsolved. Similarly, the Mesozoic reptiles have been traced successively to various parts of the world from France, Germany, England, to North America and South America, to Australia and New Zealand and to northern Russia, from Cretaceous times back into the Permian, and by latest reports into the Carboniferous.

Discovery of Invertebrates.—The most striking feature of exploration for invertebrates, next to the world-wide extent to which exploration has been carried on and results applied, is the early appearance of life. Until comparatively recent times the breathing the new spirit of the recognition of adaptation and descent. In 1867–1877 Marsh and Cope, in his memoirs on the Miocene birds of central France, Huxley's development of the method of paleontology should be studied in his collected memoirs (Scientific Memoirs of Thomas Henry Huxley, 4 vols., 1868). In Kowalevsky's Versuch einer naturalichen Classification der Fossilien Haithieres (1875) we find a model union of detailed inductive study with theory and working hypothesis. All these writers attacked the problem of descent, and published preliminary phylogenies of such animals as the horse, rhinoceros and elephant, which time has proved to be of only general value and not at all comparable to the exact phylogenetic series which were being established by invertebrate paleontologists. Phylogenetic gaps began to be filled in this general way, however, by discovery, especially through remarkable discoveries in North America by Leidy, Cope and Marsh, and the ensuing phylogenies gave enormous prestige to paleontology.

Cope's philosophic contributions to paleontology began in 1868 (see essays in The Origin of the Fittest, New York, 1887, and The Primal Factors of Organic Evolution, Chicago, 1869) with the independent discovery and demonstration among vertebrates of the laws of acceleration and retardation. To the law of "recapitulation" he unfortunately applied Hyatt's term "parallelism," a term which is used now in another sense. He especially pointed out the laws of the "extinction of the specialized" and "survival of the non-specialized" forms of life, and challenged Darwin's principle of selection as an explanation of the origin of adaptations by saying that the "survival of the fittest" does not explain the "origin of the fittest." He personally sought to demonstrate such origin, first, in the existence of a specific internal growth force, which he termed bathic force, and second in the direct inheritance of acquired mechanical modifications of the nervous system. He thus revived Lamark's views and helped to found the so-called neo-Lamarckian school in America. To this school A. Hyatt, W. H. Dall and many other invertebrate paleontologists subscribed. History of Discovery. Vertebrates.—In discovery the theatre of interest has shifted from continent to continent, often in a sensational manner. After a long period of gradual revelation of the ancient life of Europe, extending eastward to Greece, eastern Asia and to Australia, attention became centred on North America, especially on Rocky Mountain exploration. New and unheard-of orders of amphibians, reptiles and mammals came to the surface of knowledge, revolutionizing thought, demonstrating the evolution theory, and solving some of the most important problems of the diapause of the earth's history was the discovery of birds with teeth both in Europe (Archaeopteryx) and in North America (Hesperornis), of Eocene stages in the history of the horse, and of the giant dinosauria of the Jurassic and Cretaceous in North America. Then the stage of novelty suddenly shifted to South America, where after the pioneer labours of Darwin, Owen and Barmesteirr, the field of our knowledge was suddenly and vastly extended by explorations by the brothers Ameghino (Carlos and Florentino). We were in the midst of more thorough examination of the ancient world of Patagonia, of the Pampean region and of its submerged sistercontinent Antarctica, when the scene shifted to North Africa through the discoveries of Hugh J. L. Beadnell and Charles W. Andrews. These latter discoveries showed the close affinity of the Cretaceous mammals of North America to the Miocene mammals of Europe. Discovery of Invertebrates.—The most striking feature of exploration for invertebrates, next to the world-wide extent to which exploration has been carried on and results applied, is the early appearance of life. Until comparatively recent times the
This series of feet represents the evolutionary succession from the Eocene Hypohippus (1) to the modern Equus (6) seen in front and in side view. The top bone is the os calcis, or hock bone, to which the tendon Achilles is attached. The bottom bone is the terminal phalanx which is inserted in the heart of the hoof.

The stages are as follows:

1. Hypohippus, Lower Eocene.
3. Parahippus, Lower Miocene.
4. Protohippus, Upper Miocene.
5. Neohippus, Upper Miocene.
6. Equus, Pleistocene and recent.

The evolution consists first in progressive increase in size; second, in the acceleration of the median digit and retardation of the lateral digits, the latter becoming more and more elevated from the ground until finally in Equus (6) they are the lateral splints, which in the embryonic condition have vestigial cartilages attached representing the last traces of the lateral phalanges.

ancient chordates in the Cambrian or even pre-Cambrian. Thus all recent discovery tends to carry the centres of origin and of dispersal of all animal types farther and farther back in geological time.

IV. RELATIONS OF PALEONTOLOGY TO OTHER PHYSICAL EARTH SCIENCES

Geology and Palaeophysoiogy.—Fossils are not absolute timekeepers, because we have little idea of the rate of evolution; they are only relative timekeepers, which enable us to check off the period of deposition of one formation with that of another. Huxley questioned the time value of fossils, but recent research has tended to show that identity of species and of mutations is, on the whole, a guide to synchrony, though the general range of vertebrate and invertebrate life as well as of plant life is generally necessary for the establishment of approximate synchronism. Since fossils afford an immediate and generally a decisive clue to the mode of deposition of rocks, whether marine, lacustrine, fluvial, flood plain or acolian, they lead us naturally into palaeophysoiogy. Instances of marine and lacustrine analysis have been cited above. The analysis of continental faunas into those inhabiting rivers, lowlands, forests, plains or uplands, affords a key to physiographic conditions all through the Tertiary. For example, the famous bone-beds of the Oligocene of South Dakota have been analysed by W. D. Matthew, and are shown to contain fluvial or channel beds with water and river-living forms, and neighbouring flood-plain sediments containing remains of plains-living forms. Thus we may complete the former physiographic picture of a vast flood plain east of the Rocky Mountains, traversed by slowly meandering streams.

As already intimated, our knowledge of palaoeometeorology, or of past climates, is derivable chiefly from fossils. Suggested two centuries ago by Robert Hooke, the use of fossils has in the hands of Barrande, Neumayr, the marquis de Saporta (1805), Oswald Heer (1809-1883), and an army of followers developed into a sub-science of vast importance and interest. It is true that a great variety of evidence is afforded by the composition of the rocks, that glaciers have left their traces in glacial scratchings and transported boulders, also that proofs of arid or semi-arid conditions are found in the reddish colour of rocks in certain portions of the Palaeozoic, Trias and Eocene; but fossils afford the most precise and conclusive evidence as to the past history of climate, because of the fact that adaptations to temperature have remained constant for millions of years. All conclusions derived from the various forms of animal and plant life should be compared with each other and compared. The brilliant theories of the palaeobotanist, Oswald Heer, as to the extension of a sub-tropical climate to Europe and even to extreme northern latitudes in Tertiary time, which have appealed to the imagination and found their way so widely into literature, are now challenged by J. W. Grégoire (Climatic Variations, their Extent and Causes, International Geological Congress, Mexico, 1900), who holds that the extent of climatic changes in past times has been greatly exaggerated.

It is to palaeoecography and zoogeography in their reciprocal relations that palaeontology has rendered the most unique services. Geographers are practically helpless as historians, and problems of the former elevation and distribution of the land and sea masses depend for their solution chiefly upon the palaeontologist. With good reason geographers have given reluctant consent to some of the bold restorations of ancient continental outlines by palaeontologists; yet some of the greatest achievements of recent science have been in this field. The concurrence of botanical (Hooker, 1847), zoological, and finally of palaeontological evidence for the reconstruction of the continent of Antarctica, is one of the greatest triumphs of biological investigation. To the evidence advanced by a great number of authors comes the clinching testimony of the existence of a number of varieties of Australian marsupials in Patagonia, as originally discovered by Ameghino and more exactly described by members of the Princeton Patagonian expedition staff; while the fossil shells of the Eocene of Patagonia as analysed by Ortmann give evidence of the existence of a continuous shoreline, or at least of shallow-water areas, between Australia, New Zealand and South America. This line of hypothesis and demonstration is typical of the palaeogeographic methods generally—namely, that vertebrate palaeontologists, impressed by the sudden appearance of extinct forms of continental life, demand land connexion or migration tracts from common parent and derivative islands, while the invertebrate palaeontologist alone is able to restore ancient coast-lines and determine the extent and width of these tracts. Thus has been built up a distinct and most important branch. The great contributors to the palaeogeography of Europe are Neumayr and Eduard Suess (b. 1831), followed by Fretz, Canu, de Lapparent and others. Neumayr was the first to attempt to restore the grander earth outlines of the earth as a whole in Jurassic times. Suess outlined the ancient relations of Africa and Asia through his “Gondwana Land,” a land mass practically identical with the “Lemuria” of zoologists. South American palaeogeography has been traced by von Hefring into a northern land mass, “Archeiplaca,” and a southern mass, “Archipala,” the latter at times united with an Arctic continent. Following the pioneer studies of Dana, the American palaeontologists and stratigraphers Bailey Willis, John M. Clarke, Charles Schuchert and others have re-entered the study of the palaeozoic geography of the North American continent with work of astonishing precision.

Zoogeography.—Closely connected with palaeogeography is zoogeography, the animal distribution of past periods. The science of zoogeography, founded by Humboldt, Edward Forbes, Huxley, P. L. Sclater, Alfred Russel Wallace and others, largely upon the present distribution of animal life, is now encountering through palaeontolology a new and fascinating series of problems. In brief, it must connect living distribution with distribution in past time, and develop a system which will be in harmony with the main facts of zoological geography. The theory that past migrations from continent to continent are to be proved by Cuvier to explain the replacement of the animal life which had become extinct through sudden geologic changes, was prophetic of one of the chief features of modern method—namely, the tracing of migrations. With this has been connected the theory of “centres of origin” or of the geographic regions where the chief characters of great groups have been established. Among invertebrates Barrande’s doctrine of centres of origin was applied by Hyatt to the genesis of the Arietidae (1889); after studying thousands of individuals from the principal deposits of Europe he decided that the cradles of the various branches of this family were the basins of origin and all of the fresh-water Crawfish genera Cambarus, Potamonius and Cambarius of eastern Asia, where their common ancestors lived in Cretaceous time. Similarly, among vertebrates the method of restoring past centres of origin, largely originating with Edward Forbes, has developed into a most distinct and important branch of historical work. This branch of the science has reached the highest development in its application to the history of the extinct mammals of the Tertiary through the original work of Cope and Henri Filhol, which has been brought to a much higher degree of exactness recently through the studies of H. F. Osborn, Charles Deyer, W. D. Matthew and H. G. Stehlin.

V. RELATIONS OF PALEONTOLOGY TO OTHER ZOOLOGICAL METHODS

Systematic Zoology.—It is obvious that the Linnaean binomial terminology and its subsequent trinomial refinement for species, sub-species, and varieties was adapted to express the differences between animals as they exist to-day, distributed contemporaneously over the surface of the earth, and that it is wholly inadapted to express either the minute gradations of successive generic series or the branchings of a genetically connected chain of life. Such gradations, termed “mutations” by Waagen, are up distinguished, as observed, in single characters; they are the
nences, or grades of difference, which are the more gradual the more finely we dissect the geologic column, while the terms species, sub-species and variety are generally based upon a sum of changes in several characters. Thus palaeontology has brought to light an entirely new nomenclatural problem, which can only be solved by resolutely adopting an entirely different principle.

which is essentially based on a theory of interrupted or discontinuous characters, is inapplicable.

Embryology and Ontogeny.—In following the discovery of the law of recapitulation among palaeontologists we have clearly stated the chief contribution of palaeontology to the science of ontogeny—namely, the correspondences and differences between

![Fig. 9.](image)

This revolution may be accomplished by adding the term "mutation ascending" or "mutation descending" for the minute steps of transformation, and the term phyllum, as employed in Germany, for the minor and major branches of genetic series. Bit by bit mutations are added to each other in different single characters until a sum or degree of mutations is reached which no zoologist would hesitate to place in a separate species or in a separate genus.

The minute gradations observed by Hyatt, Waagen and all invertebrate palaeontologists, in the hard parts (shells) of molluscs, &c., are analogous to the equally minute gradations observed by vertebrate palaeontologists in the hard parts of reptiles and mammals. The mutations of Waagen may possibly, in fact, prove to be identical with the "definite variations" or "rectigration" observed by Osborn in the teeth of mammals. For example, in the grinders of Eocene horses (see Plate III., fig. 8; also fig. 6) in a lower horizon a cusp is adumbrated in shadowy form, in a slightly higher horizon it is visible, in a still higher horizon it is full-grown; and we honour this final stage by assigning to the animal which bears it a new specific name. When a number of such characters accumulate, we further honour them by assigning a new generic name. This is exactly the nomenclature system laid down by Owen, Cope, Marsh and others, although established without any understanding of the law of mutation. But besides the innumerable characters which are visible and measurable, there are probably thousands which we cannot measure or which have not been discovered, since every part of the organism enjoys its gradual and independent evolution. In the face of the continuous series of characters and types revealed by palaeontology, the Linnaean terminology, the individual order of development and the ancestral order of evolution. The mutual relations of palaeontology and embryology and comparative anatomy as means of determining the ancestry of animals are most interesting. In tracing the phylogeny, or ancestral history of organs, palaeontology affords the only absolute criterion on the successive evolution of organs in time as well as of (progressive) evolution in form. From comparative anatomy alone it is possible to arrange a series of living forms which, although structurally a convincing array because placed in a graded series, may be, nevertheless, in an order inverse to that of the actual historical succession. The most marked case of such inversion in comparative anatomy is that of Carl Gegenbaur (1826-1903), who in arranging the fins of fishes in support of his theory that the fin of the Australian lung-fish (Ceratodus) was the most primitive (or Archipterygium), placed as the primordial type a fin which palaeontology has proved to be one of the latest types if not the last. It is equally true that palaeontological evidence has frequently failed where we most sorely needed it. The student must therefore resort to what may be called a tripod of evidence, derived from the available facts of embryology, comparative anatomy and palaeontology.

VI.—The Palaeontologist as Historian

The modes of change among animals, and methods of analyzing them.—As historian the palaeontologist always has before him as one of his most fascinating problems phylogeny, or the restoration of the great tree of animal descent. Were the geologic record complete he would be able to trace the ancestry of man and of all other animals back to their very beginnings.
in the primordial protoplasm. Dealing with interrupted evidence, however, it becomes necessary to exercise the closest analysis and synthesis as part of his general art as a restorer.

The most fundamental distinction in analysis is that which must be made between homology, or true hereditary resemblance, and those multiple forms of "adaptive resemblance" which are variously known as cases of "analogies," "parallelism," "convergence," and "homoplasies." Of these two kinds of genetic and adaptive resemblance, homology is the warp composed of the vertical, hereditary strands, which connect animals with their ancestors and their successors, while analogy is the woof, composed of the horizontal strands which tie animals together by their superficial resemblances. This wide distinction between similarity of descent and similarity of adaptation applies to every organ, to all groups of organs, to animals as a whole, and to all groups of animals. It is the old distinction between homology and analogy on a grand scale.

Analogy, in its power of transforming unlike and unrelated animals or unlike and unrelated parts of animals into likeness, has done such miracles that the inference of kinship is often almost irresistible. During the past century it was and even now is the very "will-o'-the-wisp" of evolution, always tending to lead the phylelogist astray. It is the first characteristic of analogy that it is superficial. Thus the shark, the ichthyosaur,

mimics the independently evolved collective fauna of North America, the collective fauna of modern Australia mimics the collective fauna of the Lower Eocene of North America. Exactly the same principles have developed on even a vaster scale among the Invertebrata. Among the annomites of the Jurassic and Cretaceous periods types occur which in their external appearance closely resemble each other that they could be taken for members of a single series, and not infrequently have been taken for species of the same genus and even for the same species; but their early stages of development and, in fact, their entire individual history prove them to be distinct and not infrequently to belong to widely separated genetic series.

Homology, in contrast, the "special homology" of Owen, is the supreme test of kinship or of hereditary relationship, and thus the basis of all sound reasoning in phylogeny. The two points of the thumb, for example, are homogenous throughout the whole series of the pentadactylate, or five-fingered animals, from the most primitive amphibian to man.

The conclusion is that the sum of homogenous parts, which may be similar or dissimilar in external form according to their similarity or diversity of function, and the recognition of former similarities of adaptation (see below) are the true bases for the critical determination of kinship and phylogeny.

**Adaptation and the Independent Evolution of Parts.**—Step by step there have been established in palaeontology a number of laws relating to the evolution of the parts of animals which closely coincide with similar laws discovered by zoologists. All are contained in the broad generalization that every part of an animal, however minute, has its separate and independent basis in the hereditary condition of the germ cells from which it is derived and may enjoy consequently a separate and independent history. The conclusions of this principle when applied to the adaptations of animals bring us to the very antithesis of Cuvier's supposed "law of correlation," for we find that, while the end results of adaptation are such that all parts of an animal conspire to make the whole adaptive, there is no fixed correlation either in the form or rate of development of parts, and that it is therefore impossible for the palaeontologist to predict the anatomy of an unknown animal from one of its parts only, unless the animal happens to belong to a type generally familiar. For example, among the land vertebrates the feet (associated with the structure of the limbs and trunk) may take one of many lines of adaptation to different media or habitat, either aquatic, terrestrial, arboreal or aerial; while the teeth (associated with the structure of the skull and jaws) also may take one of many lines of adaptation to different kinds of food, whether herbivorous, insectivorous or carnivorous. Through this independent adaptation of different parts to their specific ends there has been an almost unlimited number of combinations of foot and tooth structure, the possibilities of which are illustrated in the accompanying diagram (see fig. 11; also Plate III., fig. 8). As instances of such combinations, some of the (probably herbivorous) Eocene monkeys with arboreal limbs have teeth so difficult to distinguish from those of the herbivorous ground-living Eocene horses with cursorial limbs that at first in France and also in America they were both classed with the humped animals. Again, directly opposed to Cuvier's principle, we have discovered carnivores with hoofs, such as Mononyx, and herbivores with sloth-like claws, such as Chalicothereum. This latter animal is closely related to one which Cuvier termed Pongolin giganteus, and had he restored it according to the "law of correlation," he would have pictured a giant "scaly anteater," a type as wide as the poles from the actual form of Chalicothereum, which in body, limbs and teeth is a modified ungulate herbivore, related remotely to the tapirs. In its claws alone does it resemble the giant sloths.

This independence of adaptation applies to every detail of structure; the six cusps of a grinding tooth may all evolve alike, or each may evolve independently and differently. Independent evolution of parts is well shown among invertebrates, where the shell of an ammonite, for example, may change markedly in form without a corresponding change in stature, or vice versa.

(After a drawing by Charles R. Knight, made under the direction of Professor Osborn.)

**Fig. 10.**—Analogous or convergent evolution in Fish, Reptile and Mammal.

The external similarity in the fore paddle and back fin of these three marine animals is absolute, although they are totally unrelated to each other, and have a totally different internal or skeletal structure. It is one of the most striking cases known of the law of analogous evolution.

A. Shark (Lamna cornubia), with long lobe of tail upturned.
B. Ichthyosaur (Ichthyosaurus quadriscissus), with fin-like paddles, long lobe of tail down-turned.
C. Dolphin (Sotalia fluviatilis), with horizontal tail, fin or fluke.

and the dolphin (fig. 10) superficially resemble each other, but if the outer form be removed this resemblance proves to be a mere veneer of adaptation, because their internal skeletal parts are as radically different as are their genetic relations, founded on heredity. Analogy also produces equally remarkable internal or skeletal transformations. The ingenuity of nature, however, in adapting animals is not infinite, because the same devices are repeatedly employed by her to accomplish the same adaptive ends whether in fishes, reptiles, birds or mammals; thus she has repeated herself at least twenty-four times in the evolution of long-snouted rapacious swimming types of animals. The grandest application of analogy is that observed in the adaptations of groups of animals evolving on different continents, by which their various divisions tend to mimic those on other continents. Thus the collective fauna of ancient South America...
Similarly, there is no correlation in the rate of evolution either of adjoining or of separated parts; the middle digit of the foot of the three-toed horse is accelerated in development, while the lateral digits on either side are retarded. Many examples might be cited among invertebrates also.

**LAW OF THE INDEPENDENT ADAPTIVE EVOLUTION OF PARTS.**

**Fig. 11.**—Diagram demonstrating that there are an indefinite number of combinations of various adaptive types of limbs and feet with various adaptive types of teeth, and that there is no fixed law of correlation between the two series of adaptations.

All these principles are consistent with Francis Galton's law of particulate inheritance in heredity, and with the modern doctrine of "unity of characters" held by students of Mendelian phenomena.

**Sudden versus Gradual Evolution of Parts.**—There is a broad and most interesting analogy between the evolution of parts of animals and of groups of animals studied as a whole. Thus we observe persistent organs and persistent types of animals, analogous organs and analogous types of animals, and this analogy applies still further to the radial and more or less contradictory hypotheses of the sudden as distinguished from the gradual appearance of new parts or organs of animals, and the sudden appearance of new types of animals. The first exponent of the theory of sudden appearance of new parts and new types, to our knowledge, was Geoffroy St Hilaire, who suggested saltatory evolution through the direct action of the environment on development, as explaining the abrupt transitions in the Mesozoic Crocodilia and the origin of the birds from the reptiles.

Waagen’s law of mutation, or the appearance of new parts or organs so gradually that they can be perceived only by following them through successive geologic time stages, appears to be directly contradictory to the saltation principle; it is certainly one of the most firmly established principles of palaeontology, and it constitutes the contribution par excellence of this branch of zoology to the law of evolution, since it is obvious that it could not possibly have been deduced from comparison of living animals but only through the long perspective gained by comparison of animals succeeding each other in time. The essence of Waagen’s law is orthogenesis, or evolution in a definite direction, and, if there does exist an internal hereditary principle controlling such orthogenetic evolution, there does not appear to be any essential contradiction between its gradual operation in the "mutations of Waagen" and its occasional hurried operation in the "mutations of de Vries," which are by their definition discontinuous or saltatory (Osborn, 1907).

**VII.**—MODES OF CHANGE IN ANIMALS AS A WHOLE OR IN GROUPS OF ANIMALS, AND METHODS OF ANALYSING THEM.

1. Origin from Primitive or Stem Forms.—As already observed, the same principles apply to groups of animals as to organs and groups of organs; an organ originates in a primitive and un-specialized stage, a group of animals originates in a primitive or stem form. It was early perceived by Huxley, Cope and many others that Cuvier’s broad belief in a universal progression was erroneous, and there developed the distinction between "persistent primitive types" (Huxley) and "progressive types." The theoretical existence of primitive or stem forms was clearly perceived by Darwin, but the steps by which the stem form might be restored were first clearly enunciated by Huxley in 1860 ("On the Application of Evolution to the Arrangement of the Vertebrata and more particularly of the Mammalia," *Sci. Mem.* iv. 457) namely, by sharp separation of the primary or stem characters from the secondary or adaptive characters in all the known descendants or branches of a theoretical original form. The sum of the primitive characters approximately restores the primitive form; and the gaps in palaeontological evidence are supplied by analysis of the available zoological, embryological and anatomical evidence. Thus Huxley, with true prophetic instinct, found that the sum of primitive characters of all the higher placental mammals points to a stem form of a generalized insectivore type, a prophecy which has been fully confirmed by the latest research. On the other hand, Huxley’s summation of the primitive characters of all the mammals led him to an amphibian stem type, a prophecy which has proved faulty because based on erroneous analysis and comparison. More or less independently, Huxley, Kowalevsky and Cope restored the stem ancestor of the hoofed animals, or ungulates, a restoration which has been nearly fulfilled by the discovery, in 1873, of the generalized type *Phenacodus* of northern Wyoming. Similar anticipations and verifications among the invertebrates have been made by Hyatt, Beecher, Jackson and others.

In certain cases the character stem forms actually survive in unmodified species. Thus the analysis of George Baur of the ancestral form of the lizards, mosasaurs, dinosaurs, crocodiles and phytosaurs led both to the generalized *Poloeothalhia* of the Permain and indirectly to the surviving *Tuatera* lizard of New Zealand.

2. Adaptations to Alterations of Habitat. Law of Irreversibility of Evolution.—In the long vicissitudes of time and procession of continental changes, animals have been subjected to alternations of habitat either through their own migrations or through the "migration of the environment itself," to employ Van den Broeck’s epigrammatic description of the profound and sometimes sudden environmental changes which may take place in a single locality. The traces of alternations of adaptations corresponding to these alternations of habitat are recorded both in palaeontology and anatomy, although often after the obscure analogy of the earlier and later writings of a palimpsest. Huxley admirably suggested the primordial tree-habitat of all the marsupials, a suggestion abundantly confirmed by the detailed studies of Dollo and of Bensley, according to which we may imagine the marsupials to have passed through (1) a former terrestrial phase, followed by (2) a primary arboreal phase—illustrated in the tree phalangers—followed by (3) a secondary terrestrial phase—illustrated in the kangaroos and wallabies—followed by (4) a secondary arboreal phase—illustrated in the tree kangaroos. Louis Dollo especially has...
contributed most brilliant discussions of the theory of alternations of habitat as applied to the interpretation of the anatomy of the marsupials, of many kinds of fishes, of such reptiles as the herbivorous dinosaurs of the Upper Cretaceous. He has applied the theory with especial ingenuity to the interpretation of the circular bony plates in the carapace of the aberrant leather-back sea-turtles (Sphagnetidae) by prefacing an initial land phase, in which the typical armature of land tortoises was acquired, a first marine or pelagic phase, in which this armature was lost, a third littoral or seashore phase, in which a new polygonal armature was acquired, and a fourth resumed or secondary marine phase, in which this polygonal armature began to degenerate.

Each of these alternate life phases may leave some profound modification; which is partially obscured but seldom wholly lost; the presence of certain features of the former adaptations is of great importance in phylogenetic study.

A very important evolutionary principle is that in such secondary returns to primary phases lost organs are never recovered, but new organs are acquired; hence the force of Dollo's dictum that evolution is irreversible from the point of view of structure, while frequently reversible, or recurrent, in point of view of the conditions of environment and adaptation.

3. Adaptive Radiations of Groups, Continental and Local.—Starting with the stem forms the descendants of which have passed through either persistent or changed habitats, we reach the underlying idea of the branching law of Lamark or the law of divergence of Darwin, and find it perhaps most clearly expressed in the words "adaptive radiation" (Oschorn), which convey the idea of radii in many directions. Among extinct Tertiary mammals we can actually trace the giving off of these radii in all directions, for taking advantage of every possibility to secure food, to escape enemies and to reproduce kind; further, among such well-known quadrupeds as the horses, rhinoceroses and tianotheres, the modifications involved in these radiations can be clearly traced. Thus the history of continental life presents a picture of contemporaneous radiations in different parts of the world and of a succession of radiations in the same parts. We observe the contemporaneous and largely independent radiations of the hoofed animals in South America, in Africa and in the great ancient continent comprising Europe, Asia and North America; we observe the Cretaceous radiation of hoofed animals in the northern hemisphere, followed by a second radiation of hoofed animals in the same region, in some cases one surviving spur of an old radiation becoming the centre of a new one. As a rule, the larger the geographic theatre the grander the radiation. Successive discoveries have revealed certain grand centres, such as (1) the marsupial radiation of Australia, (2) the little-known Cretaceous radiation of placental mammals in the northern hemisphere, which was probably connected in part with the peopling of South America, (3) the Tertiary placental radiation in the northern hemisphere, partly connected with Africa, (4) the main Tertiary radiation in South America. Each of these radiations produced a greater or less number of analogous groups, and while originally independent the animals thus evolving as autochthonous types finally mingled together as migrant or invading types. We are thus working out gradually the separate contributions of the land masses of North America, South America, Europe, Asia, Africa, and of Australia to the mammalian fauna of the world, a result which can be obtained through palaeontology only.

4. Adaptive Local Radiation.—On a smaller scale are the local adaptive radiations which occur through segregation of habitat and local isolation in the same general geographic region wherever physiographic and climatic differences are sufficient to produce local differences in food supply or other local factors of change. This local divergence may proceed as rapidly as through wide geographical segregation or isolation. This principle has been demonstrated recently among Tertiary rhinoceroses and tianotheres, in which remains of four or five genetic series in the same geologic epochs have been discovered. We have proof that in the Upper Miocene of Colorado there existed a forest-living horse, or more persistent primitive type, which was contemporaneous with and is found in the same deposits with the plains-living horse (Neohippus) of the most advanced or specialized desert (see Plate IV., figs. 12, 13, 14, 15). In times of drought these animals undoubtedly returned to the same water-courses for drink, and thus their fossilized remains are found associated.

5. The Law of Polyphyletic Evolution. The Sequence of Phyla or Genetic Series.—There results from continental and local adaptive radiations the presence in the same geographical region of numerous distinct lines in a given group of animals. The polyphyletic law was early demonstrated among invertebrates by Neumayr (1850) when he showed that the amonite genus Phylloceras follows not one but five distinct lines of evolution of unequal duration. The brachiopods, generally classed among the "Radiolaria," and especially Spiriferidae, also exhibit five lines of evolution in the Middle Devonian of North America, while more than twenty divergent lines have been observed by Grabau among the species of the gastropod genus Fusus in Tertiary and recent times. Vertebrate palaeontologists were slow to grasp this principle; while the early speculative phylogenies of the horse of Huxley and Marsh, for example, were mostly displayed monophyletically, or in single lines of descent, it is now recognized that the horses which were placed by Marsh in a single series are really to be ranged in a great number of contemporaneous but separate series, each but partially known, and that the direct radiation which leads to the modern horse has become a matter of far more difficult search. As early as 1862 Gaudry set forth this very polyphyletic principle in his tabular phylogenies, but failed to carry it to its logical application. It is now applied throughout the Vertebrata of both Mesozoic and Cenozoic times. Among marine Mesozoic reptiles, each of the groups broadly known as ichthyosaurs, plesiosaurs, mosasaurs and crocodiles were polyphyletic in a marked degree. Among land animals striking illustrations of this local polyphyletic law are found in the existence of seven or eight contemporary series of rhinoceroses, five or six contemporary series of horses, and an equally numerous contemporary series of American Miocene and Pliocene camels; in short, the polyphyletic condition is the rule rather than the exception. It is displayed to-day among the antelopes and to a limited degree among the zebras and rhinoceroses of Africa, a continent which exhibits a survival of the Miocene and Pliocene conditions of the northern hemisphere.

6. Development of Analogous Progressive and Retrogressive Groups.—Because of the repetition of analogous physiographic and climatic conditions in regions widely separated both in time and in space, we discover that continental and local adaptive radiations result in the creation of analogous groups of radii among all the vertebrates and invertebrates. Illustrations of this law were set forth by Cope as early as 1861 (see "Origin of Genera," reprinted in the Origin of the Fittest, pp. 95-106) in pointing out the extraordinary parallelisms between unrelated groups of amphibians, reptiles and mammals. In the Jurassic period there were no less than six orders of reptiles which independently abandoned terrestrial life and acquired more or less perfect adaptation to sea life. Nature, limited in her resources for adaptation, fashioned so many of these animals in like form that we have learned only recently to distinguish similarities of analogous habit from the similitudes of real kinship. From whatever order of Mammalia or Reptilia an animal may be derived, prolonged aquatic adaptation will model its outer, and finally its inner, structure according to certain advantageous designs. The requirements of an elongate body moving through the resistant medium of water are met by the evolution of similar entrant and exit curves, and the moulds of most swiftly moving aquatic animals evolve into forms resembling the hulls of modern sailing yachts (Bashford Dean). We owe especially to Willy Kükenthal, Eberhard Fraas, S.W. Williston and R. C. Osborn a summary of those modifications of form to which aquatic life invariably leads.

The law of analogy also operates in retrogression. A. Smith Woodward has observed that the decline of many groups of
fishes is heralded by the tendency to assume elongate and finally eel-shaped forms, as seen independently, for example, among the declining Acanthodians or palaeozoic sharks, among the modern crossopterygian Polypterus and Calamoichthys of the Nile, in the modern dipnoan Lepidosiren and Protopterus, in the Triassic chondrostean Belonorhynchus, as well as in the bow-fin (Amia) and the garpike (Lepidosteus).

Among invertebrates similar analogous groups also develop. This is especially marked in retrogressive, though also well-known in progressive series. The loss of the power to coil, observed in the terminals of many declining series of gastropods from the Cambrian to the present time, and the similar loss of power among Natiloidea and Ammonoidea of many genetic series, as well as the ostreaen form assumed by various declining series of pelecypods and by some brachiopods, may be cited as examples.

7. Periods of Gradual Evolution of Groups.—It is certainly a very striking fact that wherever we have been able to trace genetic series, either of invertebrates or vertebrates, in closely sequential geological horizons, or life zones, we find strong proof of evolution through extremely gradual mutation simultaneously affecting many parts of each organism, as set forth above. This proof has been reached quite independently by a very large number of observers studying a still greater variety of animals. Such diverse organisms as brachiopods, ammonites, horses and rhinoceroses absolutely conform to this law in all those rare localities where we have been able to observe closely sequential stages. The inference is almost irresistible that the law of gradual transformation through minute continuous change is by far the most universal; but many palaeontologists as well as zoologists and botanists hold a contrary opinion.

8. Periods of Rapid Evolution of Groups.—The above law of gradual evolution is consistently consistent with a second principle, namely, that at certain times evolution is much more rapid than at others, and that organisms are accelerated or retarded in development in a manner broadly analogous to the acceleration or retardation of separate organs. Thus H. S. Williams observes (Geological Biology, p. 268) that the evolution of those fundamental characters which mark differences between separate classes, orders, sub-orders, and even families of organisms, took place in relatively short periods of time. Among the brachiopods the chief expansion of each type is at a relatively early period in their life-history. Hyatt (1883) observed of the ammonites that each group originated suddenly and spread out with great rapidity. Déperet notes that the genus Neumayria, an ammonite of the Kimmeridgian, suddenly branches out into an explosion of forms. Déperet also observes the contrast between periods of quiescence and limited variability and periods of sudden efflorescence. A. Smith Woodward ("Relations of Palaeontology to Biology," Annals and Mag. Natural Hist., 1906, p. 317) notes that the fundamental advances in the growth of fish life have always been sudden, beginning with excessive vigour at the end of long periods of apparent stagnation; while each advance has been marked by the perfectly definite acquisition of some new anatomical character or "expression point," a term first used by Cope. One of the causes of these sudden advances is undoubtedly to be found in the acquisition of a new and extremely useful character. Thus the perfect jaw and the perfect pair of lateral fins when first acquired among the fishes favoured a very rapid and for a time unchecked development. It by no means follows, however, from this incontrovertible evidence that the acquisition either of the jaw or of the lateral fins had not been in itself an extremely gradual process.

Thus both invertebrate and vertebrate palaeontologists have reached independently the conclusion that the evolution of groups is not continuously but at a uniform rate, but that there are, especially in the beginnings of new phyla or at the time of acquisition of new organs, sudden variations in the rate of evolution which have been termed variously "rhythmic," "pulsating," "efflorescent," "intermittent" and even "explosive" (Déperet). This varying rate of evolution has (illogically, we believe) been compared with and advanced in support of the "mutation law of De Vries," or the theory of saltatory evolution, which we may next consider.

9. Hypothesis of the Sudden Appearance of New Parts or Organs.—The rarity of really continuous series has naturally led palaeontologists to support the hypothesis of brusque transitions of structure. As we have seen, this hypothesis was fathered by Geoffroy St Hilaire in 1830 from his studies of Mesozoic Crocodilia, was sustained by Haldemann, and quite recently has been revived by such eminent palaeontologists as Louis Dollo and A. Smith Woodward. The evidence for it is not to be found in the sudden invasion of a new type or new organ which has gradually evolved elsewhere. The rapid variation of certain groups of animals or the acceleration of certain organs is also not evidence of the sudden appearance of new adaptive characters. Such sudden appearances may be demonstrated possibly in zoology and embryology but never can be demonstrated by palaeontology, because of the incompleteness of the geological record.

10. Decline or Senescence of Groups.—Periods of gradual evolution and of efflorescence may be followed by stationary or senescent conditions. In his history of the Articidae Hyatt points out that toward the close of the Cretaceous this entire group of ammonites seems to have been affected with some gummaty; the unrolled forms multiply, the septa are simplified, the ornamentation becomes heavy, thick, and finally disappears in the adult; the entire group ends by dying out and leaving no descendants. This is not due to environmental conditions solely, because senescent branches of normal progressive groups are found in all geologic horizons, beginning, for gastropods, in the Lower Cambrian. Among the ammonites the loss of power to coil the shell is one feature of racial old age, and in others old age is accompanied by closer coiling and loss of surface ornamentation, such as spines, ribs, spirals; while in other forms an entirely different loss of variability appears to have been brought about. Thus, when we consider the ammonite genus Ammonites, we find that if we find a species breeding periodically we can conceive it to have reached the end of its racial life period. Brocchi and Daniel Rosa (1899) have developed the hypothesis of the progressive reduction of variability. Such decline is by no means a universal law of life, however, because among many of the continental vertebrates at least we observe extinctions repeatedly occurring during the expression of maximum variability. Whereas among many ammonites and gastropods smoothness of the shell, following upon an ornamental youthful condition, is generally a symptom of decline, among many other invertebrates and vertebrates, as C. E. Beecher (1876-1909) has pointed out (1898), many animals possessing hard parts tend toward the close of their racial history to produce a superfluity of dead matter, which accumulates in the form of spines among invertebrates, and of horns among the land vertebrates, reaching a maximum when the animals are really on the down-grade of development.

11. The Extinction of Groups.—We have seen that different lines vary in vitality and in longevity, that from the earliest times senescent branches are given off, that different lines vary in the rate of evolution, that extinction is often heralded by symptoms of racial old age, which, however, vary widely in different groups. In general we find an analogy between the development of groups and of organs; we discover that each phylectic branch of certain organisms traverses a geologic career comparable to the life of an individual, that we may often distinguish, especially among invertebrates, a phase of youth, a phase of maturity, a phase of senility or degeneration, and the extinction of a type.
Internal causes of extinction are to be found in exaggeration of body size, in the hypertrophy or over-specialization of certain organs, in the irreversibility of evolution, and possibly, although this has not been demonstrated, in a progressive reduction of variability. In a full analysis of this problem of internal and external causes in relation to the Tertiary Mammalia, H. F. Osborn ("Causes of Extinction of the Mammalia," Amer. Naturalist, 1906, pp. 760-795, 829-859) finds that foremost in the long series of causes which lead to extinction are the grander environmental changes, such as physiographic changes, diminished or contracted land areas, substitution of insular for continental conditions; changes of climate and secular lowering of temperature accompanied by deforestation and checking of the food supply; changes influencing the mating period as well as fertility; changes causing increased humidity, which in turn favours enemies among insect life. Similarly secular elevations of temperature, either accompanied by moisture or desiccation, by increasing droughts or by disturbance of the balance of nature, have been followed by great waves of extinction of the Mammalia. In the sphere of living environment, the varied evolution of plant life, the periods of forestation and deforestation, the introduction of deleterious plants simultaneously with harsher conditions of life and enforced migration, as well as of mechanically dangerous plants, are among the well-ascertained causes of diminution and extinction. The evolution of insect life in driving animals from feeding ranges and in the spread of disease probably has been a prime cause of extinction. Food competition among mammals, especially intensified on islands, and the introduction of Carnivora constitute another class of causes. Great waves of extinction have followed the long periods of the slow evolution of relatively inadaptive types of tooth and foot structure, as first demonstrated by Waldemar Kowalevsky; thus mammals are repeatedly observed in a cul-de-sac of structure from which there is no escape in an adaptive direction. Among still other causes are great bulk, which proves fatal under certain new conditions; relatively slow breeding; extreme specialization and development of dominant organs, such as horns and tusks, on which for a time selection centres to the detriment of more useful characters. Little proof is afforded among the mammals of extinction through arrested evolution or through the limiting of variation, although such laws undoubtedly exist. One of the chief deductions is that there are special dangers in numerical diminution of herds, which may arise from a chief or original cause and be increased by the species becoming one-sided in its nature and character. This survey of the phenomena of extinction in one great class of animals certainly establishes the existence of an almost infinite variety of causes, some of which are internal, some external in origin, operating on animals of different kinds.

VIII.—Underlying Biological Principles as they appear to the Palaeontologist

It follows from the above brief summary that palaeontology affords a distinct and highly suggestive field of purely biological research; that is, of the causes of evolution underlying the observable modes which we have been describing. The net result of observation is not favourable to the essentially Darwinian view that the adaptive arises out of the fortuitous by selection, but is rather favourable to the hypothesis of the existence of some quite unknown intrinsic law of life which we are at present totally unable to comprehend or even conceive. We have shown that the direct observation of the origin of new characters in palaeontology brings them within that domain of natural law and order to which the evolution of the physical universe conforms. The nature of this law, which, upon the whole, appears to be purposive or teleological in its operations, is altogether a mystery which may or may not be illumined by future research. In other words, the origin, or first appearance of new characters, which is the essence of evolution, is an orderly process so far as the vertebrate and invertebrate palaeontologist observes it. The selection of organisms through the crucial test of fitness and the shaping of the organic world is an orderly process when contemplated on a grand scale, but of another kind; here the test of fitness is supreme. The only inkling of possible underlying principles in this orderly process is that there appears to be in respect to certain characters a potentiality or a predisposition through hereditary kinship to evolve in certain definite directions. Yet there is strong evidence against the existence of any law in the nature of an internal perfecting tendency which would operate independently of external conditions. In other words, a balance appears to be always sustained between the internal (hereditary and ontogenetic) and the external (environmental and selective) factors of evolution.
studied in detail in 1903 by Professor and Miss Sollas, who succeeded in making enlarged models of the fossil in wax. The skeleton as preserved is carbonized, and indicates an el-shaped animal from 3 to 5 cm., in length. The skull, which must have consisted of hardened cartilage, exhibits pairs of nasal and auditory capsules, with a gill-apparatus below its hinder part, but no indications of ordinary jaws. The anterior opening of the brain-case is surrounded by a ring of hard cirri. A pair of "post-branchial plates" projects backwards from the head. The vertebral axis shows a series of broad rings, with distinct neural arches, but no ribs. Towards the end of the body, both neural and haemal arches are continued into forked radial cartilages, which support a median fin. There are no traces either of paired fins or of dermal armour. The affinities of Palaeoepispondylus are doubtful, but it is probably related to the contemporaneous armed Ostrocodermes.

PALAEOTHERIUM (i.e. ancient animal), a name applied by Cuvier to the remains of ungulate mammals recalling tapirs in general appearance, from the Lower Oligocene gipsan quarries of Paris. These were the first indications of the occurrence in the fossil state of perissodactyl ungulates allied to the horse, although it was long before the relationship was recognized. The palaotheres, which range in size from that of a pig to that of a small rhinoceros, are now regarded as representing a family, Palaeotheriidae, nearly related to the horse-tribe, and having, in fact, probably originated from the same ancestral stock, namely, Hyracotherium of the Lower Eocene (see Equidae). The connecting link with Hyracotherium was formed by Pachyodus (Prepalaeotherium), and the line apparently terminated in Palaeotherium, which is also Oligocene. Representatives of the family occur in many parts of Europe, but the typical genus is unknown in North America, where, however, other forms occur.

Although palaeotheres resemble tapirs in general appearance, they differ in having only three toes on the fore as well as on the hind foot. The dentition normally comprises the typical series of 44 teeth, although in some instances the first premolar is wanting. The cheek-teeth are short-crowned, generally with no cement, the upper molars having a W-shaped outer wall, from which proceed two oblique transverse crests, while the lower ones carry two crescents. Unlike the early horses, the lower premolars are as complex as the molars; and although there is a well-marked gap between the canine and the premolars, there is only a very short one between the former and the incisors. The orbit is completely open behind. In other respects the palaeothere resembles the ancestral horses. They were, however, essentially marsh-dwelling animals, and exhibit no tendency to the cursorial type of limb so characteristic of the horse-line. They were, in fact, essentially inadaptive creatures, and hence readily died out.

(R.L.*)

PALAEOZOIC ERA. in geology, the oldest of the great time divisions in which organic remains have left any clear record. The three broad divisions—Palaeozoic, Mesozoic, Cainozoic—

which are employed by geologists to mark three stages in the development of life on the earth, are based primarily upon the fossil contents of the strata which, at one point or another, have been continuously forming since the very earliest times. The precise line in the "record of the rocks" where the chronicle of the Palaeozoic era closes and that of the Mesozoic era opens—is in more recent historical documents—is a matter for editorial caprice. The early geologists took the most natural dividing lines that came within their knowledge, namely, the line of change in general petrological characters, e.g. the "Transition Series" (Übergangsgalge) given to rocks approximately of Palaeozoic age by A. G. Werner because they exhibited a transitional stage between the older crystalline rocks and the younger non-crystalline; later in Germany these same rocks were said to have been formed in the "Kohlenperiode" by H. G. Bronn and others, while in England H. T. de la Beche classed them as a Carbonaceous and Greywacke group. Finally, the divisional time separating the Palaeozoic record from that of the Mesozoic was made to coincide with a great natural break or unconformity of the strata. This was the most obvious course, for where such a break occurred there would be the most marked differences between the fossils found below and those found above in the physical discordance. The divisions in the fossil record having been thus established, they must for convenience remain, but their artificiality cannot be too strongly emphasized, for the broad stratigraphical gaps and lithological groups which made the divisions sharp and clear to the earlier geologists are proved to be absent in other regions, and fossils which were formerly deemed characteristic of the Palaeozoic era are found in some places to commingle with forms of strongly marked Mesozoic type. In short, the record is more neatly complete than was originally supposed.

The Palaeozoic or Primary era is divided into the following periods or epochs: Cambrian, Ordovician, Silurian, Devonian, Carboniferous and Permian. The fact that fossils found in the rocks of the three earlier epochs—Cambrian, Ordovician, Silurian—have features in common, as distinguished from those in the three later epochs has led certain authors to divide this era into an earlier, Protozoic (Protozoic) and a later Deuterozoic time. The rocks of Palaeozoic age are mainly sandy and muddy sediments with a considerable development of limestone in places. These sediments have been altered to shales, slates, quartzites, &c., and frequently they are found in a highly metamorphosed condition. The greater part of North America and in north-east Europe they still maintain their horizontality and primitive texture over large areas. The fossils of the earlier Palaeozoic rocks are characterized by the abundance of trilobites, graptolites, brachiopods, and the absence of all vertebrates except in the upper strata; the lower rocks of the era are distinguished by the absence of graptolites, the gradual failing of the trilobites, the continued predominance of brachiopods and tabulate corals, the abundance of crinoids and the rapid development of placoderm and heterocercal ganoid fishes and amphibians. The land plants were all cryptogams, Lepidodendron, Sigillaria, followed by Conifers and Cycads. It is obvious from the advanced stage of development of the organisms found in the earliest of these Palaeozoic rocks that the beginnings of life must go much farther back, and indeed organic remains have been found in rocks older than the Cambrian; for convenience, therefore, the base of the Cambrian is usually placed at the zone of the trilobite Olenellus.

(J. A. H.)

PALAEPHATUS, the author of a small extant treatise, entitled Περὶ Ἀριστων (On "Incredible Things"). It consists of a series of rationalizing explanations of Greek legends, without any attempt at arrangement or plan, and is probably an epistle, composed in the Byzantine age, of some larger work, perhaps the Λείτου τῶν μερίσθων εἰρημένων, mentioned by Suidas as the work of a grammarian of Egypt or Athens. Suidas himself ascribes a Περὶ Ἀριστων, in five books, to Palaeaphatus of Paros or Priene. The author was perhaps a contemporary of Euhemerus (3rd century B.C.). Suidas mentions two other writers of the name: (1) an epic poet of Athens, who lived before the time of
Homer; (2) an historian of Abydos, an intimate friend of Aristotle.

See edition by N. Festa, in Mythographi graeci (1902), in the "Teulerar series, with valuable prolegomena supplementary to Intorno all'opuscolo di Paleofte di incredibilisits (1890), by the same writer.

PALAESTRA (Gr. παλαιστήριον), the name apparently applied by the Greeks to two kinds of places used for gymnastic and athletic exercises. In the one case it seems confined to the places where boys and youths received a general gymnastic training, in the other to a part of a gymnasium where the athlētai, the competitors in the public games, were trained in wrestling (παλαιστήριον) and boxing. The boys' palaestrae were private institutions and generally bore the name of the manager or of the founder; thus at Athens there was a palaestra of Taurerns (Plato, Charmides). The Romans used the terms gymnasiwm and palaestra indiscriminately for any place where gymnastic exercises were carried on.

Palafox de Mendoza, Juan de (1600-1660), Spanish bishop, was born in Aragon. He was appointed in 1639 bishop of Angelopolis (Puebla de los Angeles) in Mexico, and there honourably distinguished himself by his efforts to protect the interests of the province against recommendations of the native clergy, by protecting those of his clergy who were victims of viciousness or of persons of corrupt disposition.

In 1642 Charles II. of Spain petitioned for his canonization; but though this passed through the preliminary stages, securing for Palafox the title of "Venerable," it was ultimately defeated, under Pius VII. by the intervention of the Jesuits.

See Antonio Gonzalez de Resende, Vie de Palafox (French trans., Paris, 1890).

Palafox y Melzi, Jose de (1782-1847), duke of Saragossa, was the youngest son of an old Aragonese family. Brought up at the Spanish court, he entered the guards at an early age, and in 1806 as a sub-lieutenant accompanied Ferdinand to Bayonne; but after vainly attempting, in company with others, to secure Ferdinand's escape, he fled to Spain, and after a short period of retirement placed himself at the head of the patriot movement in Aragon. He was proclaimed by the populace governor of Saragossa and captain-general of Aragon (May 25, 1808). But the want of money and of regular troops, he lost no time in declaring war against the French, who had already overrun the neighbouring provinces of Catalonia and Navarre, and soon afterwards the attack he had provoked began. Saragossa as a fortress was both antiquated in design and scantily provided with munitions and supplies, and the defence resisted but a short time. But it was at that point that the real resistance began. A week's street fighting made the assailants masters of half the town, but Palafox's brother succeeded in forcing a passage into the city with 3000 troops. Supported by the appeal of Palafox and of the fierce and resolute democrats, whom he ruled the mob, the inhabitants resolved to contest possession of the remaining quarters of Saragossa inch by inch, and if necessary to retire to the suburb across the Ebro, destroying the bridge. The struggle, which was prolonged for nine days longer, resulted in the withdrawal of the French (Aug. 14), after a siege which had lasted 67 days in all. Palafox then attempted a short campaign in the open country, but when Napoleon's own army entered Spain, and destroyed one hostile army after another in a few weeks, Palafox was forced back into Saragossa, where he sustained a still more Democracies (trans., Madrid, 1838), the last two numbers of which were published in London. The work contains an account of the effects of the war on the political and social life of the country, and of the resistance made by the people to the oppression of the French. It was written in a clear and concise style, and was well received by the public. Palafox was one of the chief defenders of Saragossa, and was appointed governor of the province by the French, who, on their return to Spain, appointed him governor of Aragon. He died at Madrid on the 15th of February, 1817.

A biographical notice of Palafox appeared in the Spanish translation of Thierry's Hist. des consuls de l'Empire, by P. de Madrago. For the two sieges of Saragossa, see C. W. C. Oman, Peninsula War, vol. i; this account is both more accurate and more just than Napier's.

Palamas, Gregorius (c. 1296-1353), Greek mystic and chief apologist of the Hesychastics (q.v.), belonged to a distinguished Anatolian family, and his father held an important position at Constantinople. Palamas at an early age retired to Mt Athos, where he became acquainted with the mystical theories of the Hesychasts. In 1326 he went to Skete near Beroea, where he spent some years in isolation in a cell specially built for him. His health having broken down, he returned to Mt Athos, but, finding little relief, removed to Thessalonica. About this time Barlaam, the Cyprian monk, began his attacks on the doctrines of the Hesychasts, and the monks of Palafox became Barlaam's chief后台 as their champion. In 1341 and 1351 he took part in the two synods at Constantinople, which definitively secured the victory of the Palamites. During the civil war between John Cantacuzene and the Palaeologi, Palamas remained in prison. After Cantacuzene's victory in 1347, Palamas was released and appointed archbishop of Thessalonica; being refused admittance by the inhabitants, he retired to the island of Lemnos, but subsequently obtained his see. Palamas endeavoured to justify the mysticism of the Hesychastics on dogmatic grounds. The chief objects of his attack were Barlaam, Gregorius Acindynus and Nicephorus Gregoras.

Palamas was a prolific writer, but only a few of his works have been published, most of which will be found in J. P. Migne, Patrologia graecae (cl., cl.). They consist of polemics against the Latins and their doctrine of the Procession of the Holy Ghost; Hesychastic and mystic homilies; a life of Peter of Athos; and a rhetorical essay Prosopepeia (ed. A. Jahn, 1884), containing the accusations brought against the body by the soul, the defence made by the body, and the final pronouncement of the judges in favour of the body, on the ground that its sins are the result of inadequate teaching.

See the historical works of John Cantacuzene and Nicephorus Gregoras, the Via Palamae de Philotheus, and the encomium by the Patriarch John Palaeologus (1341). Also C. Krummacher, Geschichte der byzantinischen Literatur (1897).

Palamau, a district of British India, in the Chota-Nagpur division of Bengal. It was formed out of Lohardaga, in 1804, and takes its name from a former state or chieftainship. The administrative headquarters are at Daltonganj; pop. (1901), 5937. It consists of the lower spurs of the Chota-Nagpur plateau, sloping north to the valley of the Son. Area 4074 sq. m.; pop. (1901), 616,606, showing an increase of 38.8% in the decade; average density, 126 persons per sq. m., being the lowest in all Bengal. Palamau suffered severely from drought in 1897. A branch of the East Indian railway from the valley of the Son to the valuable coalfield near Daltonganj was opened in 1902. The only articles of export are jungle produce, such as lac and tussor silk. The forests are unprofitable.

See Palamau District Gazetteer (Calcutta, 1907).

Palamcottah, a town of British India, in the Tinnevelly district of Madras, on the opposite bank of the Tambraparni river to Tinnevelly town, with which it shares a station on the South Indian railway, 444 m. south of Madras. Pop. (1901), 130,545. It is also the chief town of the Tinnevelly irrigation division.

Among many educational institutions may be mentioned the Sarah Tucker College for Women, founded in 1895.
PALAMEDES, in Greek legend, son of Nauplius king of Euboea, one of the heroes of the Trojan War, belonging to the post-Iliomachean cycle of legends. During the siege of Troy, Agamemnon, Diomedes and Odysseus (who had been detected by Palamedes in an attempt to escape going to Troy by shaming means), caused a letter containing money and purporting to come from Priam to be concealed in his tent. They then accused Palamedes of treasonable correspondence with the enemy, and he was ordered to be stoned to death. His father exacted a fearful vengeance from the Greeks on their way home, by placing false lights on the promontory of Capeareus. The story of Palamedes was first handled in the Cypria of Stasinus, and formed the subject of lost plays by Aeschylus (Palamedes), Sophocles (Nauplius), Euripides (Palamedes), of which some fragments remain. Sophists and rhetoricians, such as Gorgias and Aelidas, amused themselves by perpetrating favours for, or against, him. Palamedes was regarded as the inventor of the alphabet, lighthouses, weights and measures, dice, backgammon and the discus.

Jahn (Hamburg, 1836).

PALANPUR, a native state of India, in the Gujarat division of Bombay, on the southern border of Rajputana. Area, 1766 sq. m.; pop. (1901), 222,627, showing a decrease of 19% in the decade. The country is mountainous, with much forest towards the north, but undulating and open in the south and west. The principal rivers are Saragasti and Banas. The estimated gross revenue is £50,000; tribute to the garrison of Baroda, £2,654. The chief, whose title is diwan, is an Afghan by descent. The state is traversed by the main line of the Rajputana-Malwa railway, and contains the British cantonment of Deesa. Wheat, rice, sugar-cane are the chief products. The state has suffered severely of recent years from plague. The town of Palanpur is a railway junction for Deesa, 18 m. distant. Pop. (1901), 17,799.

Palanpur also gives its name to a political agency, or collection of native states; total area, 6,903 sq. m.; pop. (1901), 467,271, showing a decrease of 28% in the decade, due to the effects of famine.

PALANQUIN (pronounced palan keen, a form in which it is sometimes spelled), a covered litter used in India and other Eastern countries. It is usually some eight feet long by four feet in width and depth, fitted with movable blinds or shutters, and slung on poles carried by four bearers. Indian and Chinese women of rank always travelled in palanquin, and they were largely used by European residents in India before the railways. The minamoto of Japan and the kisan of China differ from the Indian palanquin only in the method of attaching the poles to the body of the conveyance. The word came into European use through Port. palanquin, which represents an East Indian word seen in several forms, e.g. Malay and Javanese palangki, Hindostani palki, Pali palanko, &c., all in the sense of litter, couch, bed. The Sansk. paryanka, couch, bed, the source of all these words, is derived from pari, round, about, and anka, hook. The New English Dictionary points out the curious resemblance of these words with the Latin use of phalangia (Gr. ἕξαχνεβ) for a bearing or carrying pole, whence the Spanish palanza and palangina, a bear.

PALATE (Lat. palatum, possibly from the root of passere, to feed), the roof of the mouth in man and vertebrate animals. The palate is divided into two parts, the anterior bony "hard palate" (see MOUTH), and the posterior fleshy "soft palate" (see PHARYNX). For the malformation consisting in a longitudinal fissure in the roof of the mouth, see CLEFT PALATE.

PALATINATE (Ger. Pfalz), a name given generally to any district ruled by a count palatine, but particularly to a district of Germany, a province of the kingdom of Bavaria, lying west of the Rhine. It is bounded on the N. by the Frussian Rhine province and the Hessian province of Rhein-Hessen; on the E. by Baden, from which it is separated by the Rhine; on the S. by the imperial province of Alsace-Lorraine, from which it is divided by the Lauter; and on the W. by the administrative districts of Trier and Coblenz, belonging to the Prussian Rhine province. It has an area of 2288 sq. m., and a population (1905) of 885,280, showing a density of 3869 to the square mile. As regards religion, the inhabitants are fairly equally distributed into Roman Catholics and Protestants.

The rivers in this fertile tract of country are the Rhine, Lauter, Queich, Speirbach, Glan and Blies. The Vosges, and their continuation the Hardt, run through the land from south to north and divide it into the fertile and mild plain of the Rhine, together with the slope of the Hardt range, on the east, and the rather inclement district on the west, which, running between the Saarbruck carboniferous mountains and the northern slopes of the Hardt range, ends in a porphyrous cluster of hills, the highest point of which is the Donnersberg (2254 ft.). The country on the east side and on the slopes of the Hardt yield a number of the most varied products, such as wine, fruit, corn, vegetables, flax and tobacco. Cattle are reared in great quantity and are of excellent quality. The mines yield iron, coal, quicksilver and salt. The industries are very active, especially in iron, machinery, paper, chemicals, shoes, woolen goods, beer, leather and tobacco. The province is well served by railway communication and, for purposes of administration, is divided into the following 17 districts: Bergzabern, Durlach, Frankenthal, Kaiserslautern, Neustadt, Rhein-Hunsrück, Saarbrücken, Kirchenimholanden, Kusel, Landau, Ludwigswagen, Neustadt, Pfirmsens, Rockhausen, St. Ingbert, Spies and Zweibrücken. Spies (Spay) is the seat of government, and the chief industrial centres are Ludwigswagen on the Rhine, which is the principal river port, Landau, and Neustadt, the seat of the wine trade.

See A. Becker, Die Pfalz und die Pfalzen (Leipzig, 1897); Mehlin, Fahrten durch die Pfalz (Augsburg, 1877); Krane, Handbuch der Pfalz (Spies, 1902); Hensen, Pfalzfahrt (Neustadt, 1905); and Näher, Die Burgen der rheinischen Pfalz (Strassburg, 1887).

History.—The count palatine of the Rhine was a royal official who is first mentioned in the 10th century. The first count was Hermann I., who ruled from 915 to 956, and although the office was hereditary it appears to have been held mainly by his descendants until the death of Count Hermann III. in 1155. These counts had gradually extended their powers, had obtained the right of advocacy over the archbishop of Trier and the bishopric of Julich, and ruled various isolated districts along the Rhine. In 1155 the German king, Frederick I., appointed his step-brother Conrad as count palatine. Conrad took up his residence at the castle of Juttenbath, near Heidelberg, which became the capital of the Palatinate. In 1193 Conrad was succeeded by his son-in-law Henry, son of Henry the Lion, duke of Saxony, who was regent of France on the death of King Philip VI. After the latter's death in 1217 he assisted his own brother Otto, afterwards the emperor Otto IV., in his attempts to gain the German throne. Otto refused to reward Henry for this support, so in 1204 he assisted his rival, the German king Philip, but returned to Otto's side after Philip's murder in 1208. In 1211 Henry abdicated in favour of his son Henry, who died in 1224, when the Palatinate was given by the German king Frederick II. to Otto, the infant son of Louis, duke of Bavaria, a member of the Wittelsbach family, who was betrothed to Agnes, sister of the late count, Henry. The French crown had increased the influence of the count palatine of the Rhine, and the importance of his position among the princes of the empire is shown by Roger of Hoveden, who, writing of the election to the German throne in 1208, singles out four princes as chief electors, among whom is the count palatine of the Rhine. In the Sachsenspiegel, a collection of German laws which was written before 1235, the count is given as the butler (dipleur) of the emperor, the first place among the lay electors.

The Palatinate was ruled by Louis of Bavaria on behalf of his son until 1228, when it passed to Otto who ruled until his death in 1255. Otto's possessions were soon afterwards divided,
He was the founder and head of the Evangelical Union established to combat the aggressive tendencies of the Roman Catholics. His son, Frederick V., accepted the throne of Bohemia and thus brought on the Thirty Years' War. He was quickly driven from that country, and his own electorate was devastated by the Bavarians and Spaniards. At the peace of Westphalia in 1648 the Palatinate was restored to Frederick's son, Charles Louis, but it was shorn of the upper Palatinate, which Bavaria retained as the prize of war.

Scurcly had the Palatinate begun to recover when it was attacked by Louis XIV. For six years (1673-79) the electorate was devastated by the French troops, and even after the Treaty of Nijmegen it suffered from the aggressive policy of Louis. In August 1688 Frederick V. died, and when his son and successor, Charles, followed him to his death five years later the ruling family became extinct in the senior line. Mention has already been made of a division of this family into two lines after 1450, and of a further division of the Zweibrücken line in 1514, when again two lines were founded.

The junior of these, that of Veldenz, became extinct in 1694, but the senior, that of Zweibrücken proper, was still very flourishing. Under Count Wolfgang (d. 1560) it had purchased Sulzbach and Neuburg in 1557, and in the person of his grandson, Wolfgang William (d. 1653) it had secured the coveted duchies of Juliers and Berg. It was Philip William of Neuburg, however, who became elector palatine in succession to Charles in 1685.

The French king's brother, Philip, duke of Orleans, had married Charlotte Elizabeth, a sister of the late elector Charles, and consequently the French king claimed a part of Charles's lands in 1680. His troops took Heidelberg and devastated the Palatinate, while Philip William took refuge in Vienna, where he died in 1690. Then in 1697, by the Treaty of Ryswick, Louis abandoned his claim in return for a sum of money. Just before this date the Palatinate began to be disturbed by troubles about religion. The great majority of the inhabitants were Calvinists, but the new electorate was that of the Roman Catholic Church. Philip William, however, gave equal rights to all his subjects, but under his son and successor, the elector John William, the Protestants were deprived of various civil rights until the intervention of Prussia and of Brunswick in 1705 gave them some redress. The next elector, a brother of the last one, was Charles Philip, who removed his capital from Heidelberg to Mannheim in 1720. He died without male issue in December 1742. His successor was his kinsman, Charles Theodore, count palatine of Sulzbach, a cadet of the Zweibrücken-Neuburg line, and now with the exception of one or two small pieces the whole of the Palatinate came under French control.

Charles of Zweibrücken was a prince of refined and educated tastes and during his long reign his country enjoyed prosperity. In 1777 on the extinction of the other branch of the house of Wittelsbach, he became elector of Bavaria, and the Palatinate was henceforward united with Bavaria, the elector's capital being Munich. Charles Theodore died without legitimate sons in 1790, and his successor was Maximilian Joseph, a member of the Birkenfeld branch of the Zweibrücken family, who later became king of Bavaria as Maximilian I.

In 1802 the elector was obliged to cede the portion of the Palatinate lying on the left bank of the Rhine to France, and other portions to Baden and to Hesse-Darmstadt. Much of this, however, was regained in 1815, and since that date the Palatinate has formed part of the kingdom of Bavaria.

See Wilder, "Versuch einer vollständigen geographisch-historischen Beschreibung der Kurfürstlichen Pfalz" (Frankfort, 1756-1788); L. Häusser, Geschichte der Rheinischen Pfalz (Heidelberg, 1843); N. von Hase, Geschichte der protestantischen Kirche der Pfalz (Kaiserslautern, 1888); Regeiten der Pfalzgrafen am Rhein, 1214-1508, edited by Koch and Wild, Bilderatlas zur bodenpfälzischen Geschichte (Heidelberg, 1901).

**Pälätin** (from Lat. *palatum*, a palace,) pertaining to the palace and therefore to the emperor, king or other sovereign

and his elder son Louis II. received the Palatinate and Upper Bavaria. Louis died in 1720 when these districts passed to his son Rudolph I. (d. 1709), and subsequently to his grandson Louis, afterwards the emperor Louis IV. By the Treaty of Pavia in 1720, Louis granted the Palatinate to his nephews Rudolph II. and Rupert I., who received from him at the same time a portion of the duchy of Upper Bavaria, which was called the upper Palatinate to distinguish it from the Rhenish, or lower Palatinate. Rudolph died in 1753, after which Rupert ruled alone until his death in 1790. In 1755 he had sold a portion of the upper Palatinate to the emperor Charles IV., but by various purchases he increased the area of the Rhenish Palatinate. His successor was his nephew Rupert II., who bought from the German king Wenceslaus a portion of the territory of which the uncle had sold to Charles IV. He died in 1708 and was succeeded by his son Rupert III. In 1740 Rupert was elected German king, and when he died in 1750 his possessions were divided among his four sons: the eldest, Louis III., received the Rhenish Palatinate proper; the second son, John, obtained the upper Palatinate; while the outlying districts of Zweibrücken and Simmern passed to Stephen, and that of Mosbach to Otto.

When the possessions of the house of Wittelsbach were divided in 1235 and the branches of Bavaria and the Palatinate were founded, a dispute arose over the exercise of the electoral vote, and the question was not settled until 1356, when the Golden Bull bestowed the privilege upon the count palatine of the Rhine, who exercised it until 1623. The part played by Count Frederick V., titular king of Bohemia, during the Thirty Years' War induced the emperor Ferdinand II. to deprive him of his vote and to transfer it to the duke of Bavaria, Maximilian I. By the Peace of Westphalia in 1648 an eighth electorate was created for the count palatine, to which was added the office of treasurer. In 1777, however, the count resumed the ancient position of his family in the electoral college, and regained the office of steward which he retained until the formal dissolved the electorate in 1802.

To return to the history of the Palatinate as divided into four parts among the sons of the German king Rupert in 1410. John, the second of these brothers, died in 1443 and, his son Christopher, having become king of Denmark in 1440, did not inherit the upper Palatinate, which was again united with the Rhenish Palatinate. Otto, the son of Otto (d. 1461), Rupert's fourth son, who had obtained Mosbach, died without sons in 1499, and this line became extinct, leaving only the two remaining lines with interests in the Rhenish Palatinate. After Rupert's death this was governed by his eldest son, the Elector Louis III. (d. 1496), and then by the latter's sons, Louis IV. (d. 1499) and Frederick I. The elector Frederick, called the Victorious, was one of the foremost princes of his time. His nephew and successor, the elector Philip, carried on a war for the possession of the duchy of Bavaria-Landschut, which had been bequeathed to his son Rupert (d. 1504), but, when in 1507 an end was put to this struggle, Rupert's son, Otto Henry, only received Neuburg and Sulzbach. Louis V. and then Frederick II. succeeded Philip, but both died without sons and Otto Henry became elector. He too died without sons in 1550, when the senior branch became extinct, leaving only the branch descended from Rupert's third son, Stephen.

Already on Stephen's death in 1450 this family had been divided into two branches, those of Simmern and of Zweibrücken, and in 1514 the latter branch had been divided into the lines of Zweibrücken proper and of Veldenz. It was Frederick, count palatine of Simmern, who succeeded to the Palatinate on Otto Henry's death, becoming the elector Frederick III. The new elector, a keen but not a very bigoted Calvinist, was one of the most active of the Protestant princes. His son and successor, Louis VI. (d. 1583), was a Lutheran, but another son, John Casimir, who ruled the electorate on behalf of his young nephew, Frederick IV., from 1583 to 1592, gave every encouragement to the Calvinists. A similar line of action was followed by Frederick IV. himself after 1592.
ruler. In the later Roman Empire certain officials attending on the emperor, or discharging other duties at his court, were called palatinus; from the time of Constantine the Great the term was also applied to the soldiers stationed in or around the capital to distinguish them from those stationed on the frontier of the empire. In the East Roman Empire the word was used to designate officials concerned with the administration of the diocese and the imperial lands.

This use of the word palatine was adopted by the Frankish kings of the Merovingian dynasty. They employed a high official, the comes palatinus, who at first assisted the king in his judicial duties and at a later date discharged many of these himself. Other counts palatine were employed on military and administrative work, and the system was maintained by the Carolingian sovereigns. The word paladin, used to describe the followers of Charlemagne, is a variant of palatine. A Frankish caputal of 882 and Hincmar, archbishop of Reims, writing about the same time, testify to the extent to which the judicial work of the Frankish Empire had passed into their hands, and one grant of power was followed by another. Instead of remaining near the person of the king, some of the counts palatine were sent to various parts of his empire to act as judges and governors, the districts ruled by them being called palatinates. Being in a special sense the representatives of the sovereign they were entrusted with more extended power than the ordinary counts. Thus comes the later and more general use of the word palatine, its application as an adjective to persons entrusted with special powers and also to the districts over which these powers were exercised. By Henry the Fowler and especially by Otto the Great, they were sent into all parts of the country to support the royal authority by checking the independent tendencies of the great tribal dukes. We hear of a count palatine in Saxony, and of others in Lorraine, in Bavaria and in Swabia, their duties being to administer the royal estates in these duchies. The count palatine in Bavaria, an office held by the family of Wittelsbach, became duke of this land, the lower title being then merged in the higher one; and with one other exception the German counts palatine soon became insignificantly small, the office having become hereditary.

Palatine Counts were in existence until the dissolution of the Holy Roman Empire in 1806. The exception was the count palatine of the Rhine, who became one of the four lay electors and the most important lay official of the empire. In the empire the word count palatine was also used to designate the officials who assisted the emperor to exercise the rights which were reserved for his personal consideration. They were called comites palatini caesarii, or comites sacri palati; in German, Hofpfalzgrafen.

From Germany the term palatine passed into England and Scotland, and into Hungary and Poland. It appears in England about the end of the 11th century, being applied by Ordericus Vitalis, to Odo, bishop of Bayeux and earl of Kent. The word palatine came in England to be applied to the ears, or rulers, of certain counties, men who enjoyed exceptional powers. Their exceptional position is thus described by Stubbs (Const. Hist. vol. i.): They were “earldoms in which the earls were endowed with the superiority of whole counties, so that all the landholders held feudally of them, in which they received the whole profits of the courts and exercised all the regalia or royal rights, nominated the sheriffs, held their own courts, and acted as independent princes except in the owing of homage and fealty to the king.” The most important of the counties palatine were Durham and Chester, the bishop of the one and the earl of the other receiving special privileges from William I. Chester had its own parliament, consisting of barons of the county, and was not represented in the national assembly until 1351, while it retained some of its special privileges until 1330. The bishop of Durham retained temporal jurisdiction over the county until 1836. Lancashire was made a county, or duchy, palatine in 1351, and kept some of its special judicial privileges until 1879. Thus for several centuries the king’s writs did not run in these three palatine counties, and at present day Lancashire and Durham have their own courts of chancery. Owing to the ambiguous application of the word palatine to Odo of Bayeux, it is doubtful whether Kent was ever a palatine county; if so, it was one only for a few years during the 11th century. Other palatine counties, which only retained their exceptional position for a short time, were Shropshire, the Isle of Ely, Hexhamshire in Northumbria, and Pembrokeshire in Wales. In Ireland there were palatine districts, and the seven original earldoms of Scotland occupied positions somewhat analogous to that of the English palatine counties.

In Hungary the important office of palatine (Magyar Nador) owes its inception to St Stephen. At first the head of the judicial system, the palatine undertook other duties, and became after the king the most important person in the realm. At one time he was chosen by the king from among four candidates named by the Diet. Under the later Habsburg rulers of Hungary the office was several times held by a member of this family, one of the palatines being the archduke Joseph. The office was abolished after the revolution of 1848.

In Poland the governors of the provinces of the kingdom were called palatines, and the provinces were sometimes called palatinates.

In America certain districts colonized by English settlers were treated as palatine provinces. In 1632 Cecilius Calvert, 2nd Lord Baltimore, received a charter from Charles I. giving him palatine rights in Maryland. In 1639 Sir Ferdinando Gorges, the lord of Maine, obtained one granting him as large and ample prerogatives as were enjoyed by the bishop of Durham. Carolina was another instance of a palatine province.

In addition to the authorities mentioned, see R. Schröder, Lehrbuch der deutschen Rechtsgeschichte (Leipzig, 1902); C. Paff, Geschichte des Pfalzgraftum (Halle, 1847); G. T. Lapsley, The County Palatine of Durham (New York, 1900), and D. J. Medley, English Constitutional History (1907).

PALATKA, a city and the county-seat of Putnam county, Florida, U.S.A., in the N.E. part of the state, on the W. bank of the St John’s river, about 100 m. from its mouth, and at the head of deep-water navigation. Pop. (1905, estimate, 3930. Palatka is served by the Georgia Southern & Florida (of which it is the southern terminal), the Atlantic Coast Line, and the Florida East Coast railways, and also has connexion by water with Baltimore, New York and Boston. Palatka is situated in a rich agricultural, orange-growing and timber region, for which it is the distributing centre. Large quantities of cypress lumber are shipped from Palatka. Palatka was incorporated as a town in 1853, and in 1872 was chartered as a city.

PALAVER (an adaptation of Port. palavra, a word or speech; Ital. parola; Fr. parole, from the Low Lat. parabola, a parable, story, talk; Gr. parabole, to talk,” gives Fr. parler, “to speak,” whence “parley,” “parliament,” &c.), the name used by the Portuguese traders on the African coast for their conversations and bargaining with the natives. It was introduced into English in the 18th century through English sailors frequenting the Guinea coast. It has now passed into general use among the negroes of West and West Central Africa for any conference, either among themselves or with foreigners. From the amount of unnecessary talk characteristic of such meetings with natives, the word is used of any idle or callicing talk.

PALAZZOLO ACREIDE, a town of Sicily, in the province of Syracuse, 28 m. by road W. of it, 285 ft. above sea-level. Pop. (1901), 14,645. The town occupies the site of the ancient Acrae, founded by Syracuse about 664 B.C. It followed in the main the fortunes of the mother city. In the treaty between the Carthaginians and the Romans (241 B.C.), it was assigned to the latter. The ancient city lay on the hill above the modern town, the
approach to it being defended by quarries, in which tombs of all periods have been discovered. The auditorium of the small theatre is well preserved, though nothing of the stage remains. Close to it are ruins of other buildings, which, but for justification, the names Naumachia, Odeum (perhaps a bath establishment) and Palace of Hiero. The water supply was obtained by subterranean aqueducts. In the cliffs of the Monte Pineta to the south are other tomb chambers, and to the south again are the curious bas-reliefs called Santoni or Saccicelli, mutilated in the 19th century by a peasant proprietor, which appear to be sepulchral also. Near here too is the necropolis of the Acrocoro della Torre, where many sarcophagi have been found. Five miles north lies Buscemi, near which a great hollow grove has been discovered; and also a church cut in the rock and connected with a crypt.

See G. Judica, Antichità di Acre (Messina, 1819). (Baron Judica's collection of antiquities was dispersed after his death.) J. Schübler, Jahrbuch für Philologie, Suppl. IV., 662-672.

PALE (through Fr. pal, from Lat. palus, a stake, for pales, from the stem pag- of pangere, to fix; "pale" is from the same original source), a stake, particularly one of a closely set series driven into the ground to form the defensive work known as a "palisade"; also one of the lighter laths or strips of wood set vertically in the ground to form a "fence." Used as an historical term, a pale is a district marked off from the surrounding country by a different system of government and law or by definite boundaries. The best known of these districts was the "English Pale" in Ireland, dating from the reign of Henry II., although the word "pale" was not used in this connexion until the latter part of the 14th century. The Pale varied considerably, according to the strength or weakness of the English authorities, and in the time of Henry VIII. was bounded by a line drawn from Dundalk to Kells, thence to Naas, and from Naas E. to Delly, embracing, that is, part of the modern counties of Dublin, Louth, Meath, and Kildare. The Pale existed until the complete subjugation of Ireland under Elizabeth; the use of the word is frequent in Tudor times. There was an "English Pale" or "Calais Pale" also in France until 1558, extending from Gravelines to Wissant, and for a short time under the Tudors an English Pale in Scotland.

In heraldry a "pale" is a band placed vertically in the centre of a shield, hence "in pale" or "to impale" is used of the marshalling of two coats side by side on a shield divided vertically. "Pale" in the sense of colourless, whitish, of a shade of colour lighter than the normal, is derived through O. Fr. pale, mod. pâle, from Lat. pallidus, pallor, pallere; and in that of a baker's shovell, or "poud" as it is sometimes called, from Lat. palea, spade, probably connected with the root of pandere, to spread out.

PALEARIO, Aonio (c. 1500–1570), Italian humanist and reformer, was born about 1500 at Veroli, in the Roman Campagna. Other forms of his name are Antonio Della Paglia, A. Dei Pagliaricci. In 1520 he went to Rome, where he entered the brilliant literary circle of Leo X. When Charles of Bourbon stormed Rome in 1527 Paleario went first to Perugia and then to Siena, where he settled as a teacher. In 1536 his didactic poem in Latin hexameters, De immortalitate animarum, was published at Lyons. It is divided into three books, the first containing his proofs of the divine existence, and the remaining two the theological and philosophical arguments for immortalitv based on that postulate. The whole concludes with a rhetorical description of the occurrences of the Second Advent.

In 1542 a tract, written by him and entitled Della Pienenezza, sufficiente, et satisfazione della passione di Christo, or Libellus de morte Christi, was made by the Inquisition the basis of a charge of heresy, from which, however, he successfully defended himself. In Siena he wrote his Actio in pontifices romanos et eorum asseclas, a vigorous indictment, in twenty "testimonia," against what he now believed to be the fundamental error of the Roman Church in subordinating Scripture to tradition, as was done in various particular doctrines, such as that of purgatory; it was not, however, printed until after his death (Leipzig, 1606). In 1546 he accepted a professorial chair at Lucca, which he exchanged in 1555 for that of Greek and Latin literature at Milan. Here he lived in 1556 his entire life, and during his last years devoted much of his time to the study of the Latin language and literature. In 1567 he was formally accused by Fra Angelo the inquisitor of Milan. He was tried at Rome, condemned to death in October 1569, and executed in July 1570.

An edition of his works (Ant. Palearii Verulani Opera), including four books of Epistolas and twelve Oraciones besides the De immortalitate, was published at Lyons in 1552: this was followed by a new edition at Basel, in 1554, of the Orationes. His other works include a book on the Art of Printing, entitled Beneficio di Christo ("The Benefit of Christ's Death"), has been attributed to Paleario on insufficient grounds. Lives by Grullitt (Hamburg, 1805); Young (2 vols., London, 1860); Bonnet (Paris, 1862).

PALENCIA, an inland province of Spain, one of the eight into which Old Castile was divided in 1833; bounded on the N. by Santander, E. by Burgos, S. by Valladolid, and W. by Valladolid and Leon, Pop. (1900), 192,172; area, 3,250 sq. m. The surface of the province slopes gradually S. to the Duero (Douro) valley. The principal rivers are the Pisuerga and the Carrion, which unite at Dueñas and flow into the Duero at Valladolid. The chief tributaries of the Pisuerga within the province are the Arlanzon, the Burejo, the Cioza, and the united streams of the Buedo and Abanades; the Carrion is joined on the right by the Cueva. The north is traversed by the Cantabrian Mountains, the highest summit being the culminating point of the Sierra del Brezo (6,315 ft.). There are extensive forests in this region and the valleys afford good pasturage. The remainder of the province is known as the "Tinenza" and "Campos de Campos," belongs to the Castilian table-land. In the south is a marsh or lake, known as La Laguna de la Nava. The mountainous district abounds in minerals, but only coal and small quantities of copper are worked. The province is crossed in the south-east by the trunk railway connecting Madrid with France via Irun, while the line to Santander traverses it throughout from north to south; there are also railways from the city of Palencia to Leon, and across the north from Matapozuelas in Santander to La Robla in Leon. A branch of the Santander line gives access to the Orho coal-fields. The main highways are good; the other roads often bad. The Canal de Castilla, begun in 1753, and completed in 1832, connects Alar del Rey with Valladolid. Wheat and other cereals, vegetables, hemp and flax are extensively grown, except in the mountainous districts. Flour and wine are made in large quantities, and there are manufactures of linen and woollen stuffs, oil, porcelain, leather, paper and rags. Palencia rugs are in great demand throughout Spain. The only town with more than 5,000 inhabitants is Palencia (q.v.).

For the history, inhabitants, &c., see CASTILE.

PALENCIA, an episcopal city, and the capital of the Spanish province of Palencia; on the left bank of the river Carrion, on the Canal de Castilla, at the junction of railways from Leon and Santander, and 7 m. N. by W. of Venta de Baños on the Madrid-Irun line. Pop. (1900), 15,940. Palencia is built in the midst of the level plains called the Tierra de Campos, 2,600 ft. above sea-level. Three bridges across the Carrion afford access to the town at sub-level on the right bank. The older and by far the more important part of the city is protected on the west by the river; on the other sides the old machicolated walls, 36 ft. high by 9 ft. in thickness, are in fairly good preservation, and beautified by alamedas or promenades, which were laid out in 1778. The cathedral was begun in 1321, finished in 1504, and dedicated to St Antolin; it is a large building in the later and florid Gothic style of Spain. The site was previously occupied by a church erected by Sancho III. of Navarre and Carile (1026–1053) opposite the site of St Antolin, which is still shown. The cathedral contains some valuable paintings, old Flemish tapestry, and beautiful carved woodwork and stonework. The church of San Miguel is a good and fairly well-preserved example of 15th-century work; that of San Francisco, of the same date, is inferior and has suffered more from modernization. The
hospital of San Lazaro is said to date in part from the time of the Cid (q.v.), who here married Ximena in 1074.

Much has been done for education. Palencia has also hospitals, a foundling refuge, barracks and a bull-ring. Local industries include iron-founding, and the making of rugs, alcohol, leather, soap, porcelain, linen, cotton, wool, machinery and matches.

Palencia, the Palantia of Strabo and Ptolemy, was the chief town of the Valley of the Duero. Its history during the Gothic and Moorish periods is obscure; but it was a Castilian town of some importance in the 12th and 13th centuries. The university founded here in 1268 by Alphonso IX. was removed in 1299 to Salamanca.

**PALENQUE**—the modern name of a deserted city in Mexico, in the narrow valley of the Otolum, in the north part of the state of Chiapas, 80 m. S. of the Gulf port of Carmen. About 30 m. away, on the left bank of the Usumacinta river, stand the ruins of Men-ché or Lorillard city. The original name of Palenque has been lost, and its present name is taken from the neighbouring village, Santo Domingo del Palenque. Unlike the dead cities of the Yucatan plains, Palenque is surrounded by wooded hills and overgrown by tropical vegetation.

There is less stone carving on the exterior walls, door jambs and pillars of the buildings than on those of the Yucatan Peninsula; this is due to the harder and more uneven character of the limestone. Probably owing to the same cause, there is less cut stone in the walls, the Palenque builders using plaster to obtain smooth surfaces. There is, however, considerable carving on the interior walls, the best specimens being on the tablets, affixed to the walls with plaster. Modelling in stucco was extensively used. A few terra-cotta images have been found. Paint and coloured washes were liberally used to cover plastered surfaces and for ornamentation, and paints seem to have been used to bind plastered surfaces. The Palenque builders apparently used nothing but stone tools in their work.

The so-called Great Palace consists of a group of detached buildings, apparently ten in number, standing on two platforms of different elevations. Some of the interior structures and the detached one on the lower southern terrace are in a fair state of preservation. The plan of construction shows three parallel walls enclosing two corridors covered with the peculiar pointed arches or vaults characteristic of Palenque. The buildings appear to have been erected at different periods. A square tower rises from a central part of the platform to a height of about 40 ft., divided into a solid masonry base and three storeys connected by interior stairways. The Temple of Inscriptions, one of the largest and best preserved, is distinguished chiefly for its tablets, which contain only hieroglyphics. Sculptured slabs form balustrades to the steps leading up to the temple, and its exterior is ornamented with figures in stucco, the outer faces of the four pillars in front having life-size figures of women with children in their arms. The small Temple of Beau Relief stands on a narrow ledge of rock against the steep slope of the mountain. Its most important feature is a large stucco bas-relief, occupying a central position on the back wall of the sanctuary. It consists of a single figure, seated on a throne, beautifully modelled both in form, drapery and ornaments, with the face turned to one side and the arms outstretched, and is reproduced by H. H. Bancroft. The temples on the east side of the Otolum are distinguished by tall narrow vaults, perforated by numerous square openings giving the appearance of coarse lattice work. The Temple of the Sun stands upon a comparatively low pyramidal foundation. The interior consists of the usual pair of vaulted cells, the cell of the sacred tablet being in the rear wall of the cell at the right. The structure is covered in low relief in limestone, and consists of two figures, apparently a priest and his assistant making offerings. There are rows of hieroglyphics on the sides and over the central design. The Temple of the Cross is a larger structure of similar design and construction. The tablet belonging to this temple has excited controversy, because the design contains a representation of a Latin cross. The Temple of the Cerro, called that of the Cross No. 2, because its tablet is very similar to that just mentioned, stands back against the slope of the mountain, and is in great part a ruin. (For history and further details see Central America; § Archaeology.)

**PALERMO** (Greek, Πάληρος; Latin, Palennum, Panormum), a city of Sicily, capital of a province of the same name, in the kingdom of Italy, and the seat of an archbishop. Pop. (1900), town 264,006, commune 323,747. The city stands on a point of land, which by its position and looking E., coast forming the chord of a semicircle of mountains which hem in the campagna of Palermo, called the Conca d’Oro. The most striking point is the mountain of Hierette, now called Pellegrino (from the grotto of Santa Rosalia, a favourite place of pilgrimage) at the N. of this semicircle; at the S.E. is the promontory of Zafferano, on which stood Soluntum (q.v.).

A neolithic settlement and necropolis were discovered in 1807 at the foot of Monte Pellegrino, on the N.E. side (E. Salinas in Notizie degli Scavi, 1901, 307). Palermo has been commonly thought to be an original Phoenician settlement of unknown date (though its true Phoenician name is unknown), but Holm (Architettura storica siciliana, 1856, iv. 421) has suggested that the settlement was originally Greek. There is no record of any Greek colonies in that part of Sicily, and Panormus certainly was Phoenician as far back as history can carry us. According to Thucydides (vi. 2), as the Greeks colonized the E. of the island, the Phoenicians withdrew to the N.W., and concentrated themselves at Panormus, Motye, and Soluntum. Like the other Phoenician colonies in the west, Panormus came under the power of Carthage, and became the head of the Carthaginian dominion in Sicily. As such it became the centre of that strife between Europe and Africa, between Aryan and Semitic man, in its later stages between Christianity and Islam, which forms the great interest of Sicilian history. As the Semitic head of Sicily, it stands opposed to Syracuse, the Greek head. Under the Carthaginian it was the head of the Semitic part of Sicily; when, under the Saracens all Sicily came under Semitic rule, it was the chief seat of that rule. It was thrice won for Europe, by Greek, Roman and Norman conquerors—in 766 B.C. by the Epipolion king Pyrrhus, in 254 B.C. by the Roman consul Aulus Attilus and Gnaeus Cornelius Scipio, and in A.D. 1071 by Robert Guiscard and his brother Roger, the first count of Sicily. After the conquest by Pyrrhus the city was soon recovered by Carthage, but this first Greek occupation was the beginning of a connexion with western Greece and its islands which was revived under various forms in later times. After the Roman conquest an attempt to recover the city for Carthage was made in 250 B.C., which led only to a great Roman victory (see Punic Wars). Later, in the First Punic War, Hamilcar Barca was encamped for three years on Hierette or Pellegrino, but the Roman possession of the city was not disturbed. Panormus received the privileges of autonomy and immunity from taxation. It seems probable that at the end of the republic the coinage for the west of Sicily was struck here (Mommesen, Griechische Münzen, 1880, p. 166). A colony was sent here by Augustus, and the place remained of considerable importance, though inferior to Catana. A fortunate chance has preserved to us a larger number of the inscriptions set up in the Forum (Mommesen, Corpus inscr. lat. x. 755). The town was taken by the Vandal Genseric in A.D. 440. It afterwards became a part of the East-Gothic dominion, and was recovered for the empire by Belisarius in 555. It again remained a Roman possession for exactly three hundred years, till it was taken by the Saracens in 835. Panormus now became the Moslem capital. In 1062 the Pisan fleet took possession of the town. In 1122 a Genoese fleet partly destroyed the fortress, which was sent upon the building of the great church of Pisa. After the Norman conquest the city remained for a short time in the hands of the dukes of Apulia. But in 1093 half the city was ceded to Count Roger, and in 1122 the rest was ceded to the second Roger. When he took the kingly title in 1130 it became "Prima sedes, corona regis, et regni caput."

The coins bearing the name of Panormus are no longer assigned to Panormus; but certain coins with the name Primo (Zit. about 1100 B.C.) belong to it.
During the Norman reigns Palermo was the main centre of Sicilian history, especially during the disturbances in the reign of William the Bad (1154-1166). The emperor Henry VI. of Palermo in 1194, and it was the chief scene of his cruelties. In 1168 his son Frederick, afterwards emperor, was crowned there. After his death Palermo was for a moment a commonwealth. It passed under the domination of Charles of Anjou in 1266. In the next year, when the greater part of Sicily revolted on behalf of Conradin, Palermo was one of the few towns which was held for Charles; but the famous Vespers of 1282 put an end to the Angevin dominion. From that time Palermo shared in the many changes of the Sicilian kingdom. In 1335 Charles V. landed there on his return from Tunis. The last kings crowned at Palermo were Victor Amadeus of Savoy, in 1733, and Charles III. of Bourbon, in 1735. The loss of Naples by the Bourbons in 1708, and again in 1806, made Palermo once more the seat of a separate Sicilian kingdom. The city rose against Bourbon rule in 1820 and in 1838. In 1860 came the final deliverance, at the hands of Garibaldi; but with it came also the yet fuller loss of the position of Palermo as the capital of a kingdom of Sicily.

Site.—The original city was built on a tongue of land between two inlets of the sea. There is no doubt that the present main street, the Cassaro (Roman castrum, Arabic Ksar), Via Marmorea or Via Toledo (Via Vittorio Emmanuelne), represents the line of the ancient town, with water on each side of it. Another peninsula with one side to the open sea, meeting as it were the main city at right angles, formed in Polybius' time the Neapolis, or new town, in Saracen times Khalesa, a name which still survives in that of Cala. But the two ancient harbours have been filled up, the two peninsulas have met; but long street has been extended to the present coast-line; a small inlet, called the Cala, alone represents the old haven. The city kept its ancient shape till after the time of the Norman kings. The old state of things fully explains the name Παλέρμος.

There are not many early remains in Palermo. The Phoenician and Greek antiquities in the museum do not belong to the city itself. The earliest existing buildings date from the time of the Norman kings, whose palaces and churches were built in the Saracenic and Byzantine styles prevalent in the island. Of Saracen works actually belonging to the time of Saracen occupation there are no whole buildings remaining, but many inscriptions and a good many columns, often inscribed with passages from the Koran, which have been used up again in later buildings, specially in the porch of the metropolitan church. This last was built by Archbishop Walter (fl. 1170)—an Englishman sent by Henry II. of England as tutor to William II. of Sicily—and consecrated in 1185, on the site of an ancient basilica, which on the Saracen conquest became a mosque, and on the Norman conquest became a church again, first of the Greek and then of the Latin rite. What remains of Walter's building is a rich example of the Christian-Saracen style, disfigured, unfortunately, by the addition of a totally unsuitable cloister by Ferdinand Fuga in 1781-1801. This church contains the tombs of the emperor Frederick II. and his parents—massive sarcophagi of red porphyry with canopies above them—and also the royal throne, higher than that of the archbishop: for the king of Sicily, as hereditary legate of the see of Rome, was the highest ecclesiastical officer of the two. But the best example of the style is the chapel of the king's palace (cappella palatina), at the west end of the city. This is earlier than Walter's church, being the work of King Roger in 1143. The wonderful mosaics, the wooden roof, elaborately fretted and painted, and the marble incrustation of the lower part of the walls and the floor are very fine. Of the palace itself the greater part was rebuilt and added in Spanish times, but there are some other parts of Roger's work left, specially the hall called Sala Normanna.

Alongside of the churches of this Christian-Saracen type, there is another class which follows the Byzantine type. Of these the most perfect is the very small church of San Cataldo. But the best, much altered, but now largely restored to its former state, is the adjoining church of La Martorana, the work of George of Antioch, King Roger's admiral. This is rich with mosaics, among them the portraits of the king and the founder. Both these and the royal chapel have several small cupolas, and there is still greater display in that way in the church of San Giovanni degli Eremiti, which it is hard to believe never was a mosque. It is the only church in Palermo with a bell-tower, itself crowned with a cupola.

Most of these buildings are witnesses in different ways to the peculiar position of Palermo in the 12th century as the "city of the threefold tongue," Greek, Arabic, and Latin. King Roger's sun-dial in the palace is commemorated in all three, and it is to be noticed that the three inscriptions do not translate one another. In private inscriptions a fourth tongue, the Hebrew, is also often found. For in Palermo under the Norman kings Christians of both rites, Mahomedians and Jews were all allowed to flourish after their several fashions. In Saracen times there was a Slavonic quarter on the southern side of the city, and there is still a colony of United Greeks, or more strictly Albanians.

The series of Christian-Saracen buildings is continued in the country houses of the kings which surround the city, La Favara and Minnemo, the works of Roger, and the better known Ziza and Cubo, the works severally of William the Bad and William the Good. The Saracenic architecture and Arabic inscriptions of these buildings have often caused them to be taken for works of the ancient amirs; but the inscriptions of
themselves prove their date. All these buildings are the genuine work of Sicilian art, the art which had grown up in the island through the presence of the two most civilized races of the age, the Greek and the Saracen. Later in the 12th century the Cistercians brought in a type of church which, without any great change of mere style, has a very different effect, a high choir taking in some sort the place of the cupola. The greatest example of this is the neighbouring metropolitan church of Monreale (q.v.); more closely connected with Palermo is the church of San Spirito, outside the city on the south side, the scene of the Vespers.

Domestic and civil buildings from the 12th century to the 15th abound in Palermo, and they present types of genuine national art, quite unlike anything in Italy. Of palaces the finest is perhaps the massive Palazzo Chiamarone, now used as the courts of justice, erected subsequently to 1307. One of the halls has interesting paintings of 1377-1380 on its wooden ceiling; and in the upper storey of the court is a splendid three-light Gothic window. The later houses employ a very flat arch, the use of which goes on in some of the houses and smaller churches of the Renaissance. S. Maria della Catena may be taken as an especially good example. But the general aspect of the streets is later still, dating from mere Spanish times. Still many of the houses are stately in their way, with remarkable heavy balconies. The most striking point in the city is the central space at the crossing of the main streets, called the Quattro Cantoni. Two of the four are formed by the ancient Via Marmorea, but the Via Macqueda, which supplies the other two, was cut through a mass of small streets in Spanish times. The city walls are now to a great extent removed. Of the gates only two remain, the Porta Nuova and the Porta Felice; both are fine examples of the baroque style, the former was erected in 1534 to commemorate the return of Charles V. fifty years earlier, the latter in 1582. Outside the walls new quarters have sprung up of recent years, and the Teatro Massimo and the Politeama Garibaldi; the former (begun by G. B. Basile and completed by his son in 1857) has room for 3,200 spectators and is the largest in Italy.

The museum of Palermo, the richest in the island, has been detached from the university to the former monastery of the Filippini. Among the most important are the objects from prehistoric tombs and the architectural fragments from Selinus, including several metopes with reliefs, which are of great importance as illustrating the development of Greek sculpture. None of the numerous Greek vases and terra-cottas is quite of the first class, though the collection is important. The bronzes are few, but include the famous ram from Syracuse. There is also the Casuccini collections of Etruscan sarcophagi, sepulchral urns and pottery. Almost the only classical antiquities from Palermo itself are Latin inscriptions of the imperial period, and two large coloured mosaics with figures found in the Piazza Vittoria in front of the royal palace in 1869; in 1906 excavations in the same square led to the discovery of a large private house, apparently of the 2nd or 3rd century A.D., to which these mosaics no doubt belonged. Of greater local interest are the medieval and Renaissance sculptures from Palermo itself, a large picture gallery, and an extensive collection of Sicilian majolica, &c.

The university, founded in 1779, rose to importance in recent years (from 300 students in 1872 to 1493 in 1897), but has slightly lost in numbers since. The city wears a prosperous and busy appearance. The Marina, or esplanade at the south of the town, affords a fine scene of the pure sea, near it are beautiful public gardens. In the immediate neighbourhood of the city are the oldest church in or near Palermo, the Lepers’ church, founded by the first conqueror or deliverer, Count Roger, and the bridge over the forsaken stream of the Orto, built in King Roger’s day by the admiral George. There are also some later medieval houses and towers of some importance. These all lie on the south of the city, towards the hill called Monte Grifone (Grifone-Greek), and the Giant’s Cave, which has furnished rich stores for the palaeontologist. On the other side, towards Pellegrino, is the new harbour of Palermo, round which a new quarter has sprung up, including a yard capable of building ships up to 475 ft. in length, and a dry dock for vessels up to 604 ft.

The steamship traffic at Palermo in 1906 amounted to 2,035 vessels, with a total tonnage of 2,903,851 tons. Palermo is one of the two headquarters (the other being Genoa) of the Navigazione Italiana’s large fleet, and handles many shipments of general merchandise and foodstuffs. The principal imports were 36,567 tons of timber (as against 1,476,366 tons in the general import figures, 21,101 tons of wheat and 151,550 tons of coal; while the chief exports were 116,900 gallons of wine, 37,815 tons of sunnachs and 122,033 tons of lemons. Amongst the many of its valuable rates hypothecated to the meeting of old debts, the municipality of Palermo has embarked upon municipal ownership and trading in various directions.

Of the ports of Palermo, the Porta Terme, and well watered by springs and streams, of the latter of which the Orto is the chief. It is planted with orange and lemon groves, the products of which are largely exported, and with mulberry-trees, the fruit of which, however, does not attain maturity. It also contains many villas of the wealthy inhabitants of Palermo, among the most beautiful of which is La Favorita, at the foot of Monte Pellegrino on the west, belonging to the Crown.

AUTHORITIES—Besides works dealing with Sicily generally, the established local work on Palermo is Descrizione di Palermo antico, by Salvatore Moro (2nd ed., Palermo, 1857). Modern research and criticism bear in mind Orfei's Del Palermo Antico, edited by Anton Springer (Bohn, 1869); Historische Topographie von Panormus, by Julius Schubring (Leipzig, 1870); Studi di storia parziali, by Paolo d'Alemandi (1880). See also "The Normans in Palermo," in the third series of Historical Essays, by E. A. Freeman (London, 1879). The description of Palermo in the second volume of Goethe's guide-book, Unter-Italien und Sicilien (Hanover, 1838), is very valuable. The works of G. A. Morosini, the Archivio storico siciliano and the series of Documents per servire alla storia della Sicilia, both published by the Societa siciliana per la storia patria, may also be consulted. (E. A. F.; T. A.)

PALE, an old Italian goddess of flocks and shepherds. The festival called Parilia (less correctly Pallia) was celebrated in her honour at Rome and in the country on the 21st of April. In this festival Pales was invoked to grant protection and increase to flocks and herds; the shepherds entreated forgiveness for any unintentional profanation of holy places of which their flocks might have been guilty, and leaped three times across bonfires of hay and straw (Ovid, Fasti, iv. 731-805). The Parilia was not only a herdsmen’s festival, but was regarded as the birthday celebration of Rome, which was supposed to have been founded on the same day. Pales plays a very subordinate part in the religion of Rome, even the sex of the divinity being uncertain. A male Pales was sometimes spoken of, corresponding in some respects to Pan; the female Pales was associated with Vesta and Anna Perenna.

PALESTINE, a geographical name of rather loose application. Etymological strictness would require it to denote exclusively the lands inhabited by the Israelites, or at least by the descendants of their immediate ancestors, from whom it is derived. It is, however, conventionally used as a name for the territory which, in the Old Testament, is claimed as the inheritance of the pre-exilic Hebrews, thus it may be said generally to denote the southern third of the province of Syria. Except in the west, where the country is bordered by the Mediterranean Sea, the limit of this territory cannot be laid down on the map as a definite line. The modern subdivisions under the jurisdiction of the Ottoman Empire are in no sense conterminous with those of antiquity, and hence do not afford a boundary by which Palestine can be separated exactly from Syria and other countries, but the name is still retained, and no change can be anticipated in the future.

The figures for 1905 (40,005 tons, almost entirely from Russia) were abnormally high, while those for 1906 are correspondingly below the average.
PALESTINE

proverbial expression "from Dan to Beersheba" (Judg. xx, 1, &c.), an indication of the normal north-and-south limits of their land; and in defining the area of the country under discussion it is this indication which is generally followed.

Taking as a guide the natural features most nearly corresponding to these outlying points, we may describe Palestine as the strip of land extending along the eastern shore of the Mediterranean Sea from the mouth of the Jordan to the mouth of the Wadi Ghuzzu; the latter joins the sea in 31° 28' N., a short distance south of Gaza, and runs thence in a south-easterly direction so as to include on its northern side the site of Beersheba. Eastward there is no such definite border. The River Jordan, it is true, marks a line of demarcation between Western and Eastern Palestine; but it is practically impossible to say where the latter ends and the Arabian desert begins. Perhaps the line of the pilgrim road from Damascus to Mecca is the most convenient possible boundary. The total length of the region is about 140 m.; its breadth, west of the Jordan ranges from about 23 m. in the north to about 80 m. in the south. According to the English engineers who surveyed the country on behalf of the Palestine Exploration Fund, the area of this part of the country is about 6040 sq. m. East of the Jordan, owing to the want of a proper survey, no figures so definite as these are available. The limits adopted are from the south border of Hermon to the mouth of the Mojh in the Arnon, a distance of about 140 m.; the whole area has been calculated to be about 3800 sq. m. The territory of Palestine, Eastern and Western, is thus equal to rather more than one-sixth the size of England (though it should be noticed that this size must be divided by some 2000 to include the whole area covered in the survey). Till the period of the Roman occupation it was subdivided into independent provinces or kingdoms, different at different times (such as Phylister, Canaan, Judah, Israel, Bashan, &c.), but never united under one collective designation. The extension of the name of Palestine beyond the limits of Phylis proper is not older than the Byzantine Period.

Physical Features. — Notwithstanding its small size, Palestine presents a variety of geographical detail so unusual as to be in itself sufficient to mark it out as a country of especial interest. The bordering regions, moreover, are as varied in character as is the country itself — sea to the west, a mountains and sandy desert to the south, a lofty steppe plateau to the east, and the great masses of Lebanon to the north. In describing the general physical features of the country, the most significant point to notice is that (though it falls westward to the sea and rises eastward to an elevation of 5000 ft. or more) the west is sharply interrupted by the deep fissure of the Ghor or Jordan valley; which, running from north to south — for the greater part of its length depressed below sea-level — forms a division in the country as well as in the course of the Jordan. In the plain we have the function of the river Jordan in Palestine offers a strange contrast, often remarked upon, to that of the Nile in Egypt. The former takes little interest in its course, sheers its banks, and is a barrier to cross which involves the labour of a considerable ascent at any point except its most northern section. The latter is at once the great fertiliser and the great highway of the country.

Western Palestine is a region intersected by groups of mountain peaks and ranges, forming a southern extension of the Lebanon system and running southward till they finally lose themselves in the desert. The watershed of this system is so placed that from two-thirds to three-fourths of the country is on its western side. This fact, taken in connexion with the great depth of the depression below the Mediterranean — already 682 ft. at the Sea of Galilee — has important consequences for the future of the country. On the west side the slope is gradual, especially in the broad plain that skirts the coast for the greater part of its length; on the other hand the mountains rise to a great height — and intersected by valleys worn to a tremendous depth by the force of the torrents that once ran down them.

This territory of Western Palestine divides naturally into two large regions, the Mediterranean coast and the Western mountain region. These it will be convenient to consider separately.

1. The Maritime Plain, which, with a few interruptions, extends also along the Mediterranean coast from Lebanon to Egypt, is a strip of land of remarkable fertility. The elevation is so low that the climate is mild, and sea-beds, ranging from the Pliocene period downwards, and resting on Upper Eocene sandstone. It varies greatly in width. At the coast it is often more than 10 m. wide; and 2 m. and 2 m. 6 f. high, while the adjacent region of the coast is low, and is marshy in the rainy season. Connected with it are other small plains unnecessary to enumerate. For the greater part the
central point above mentioned—though interrupted by many passes—to the end of the promontory which makes the harbour of Haifa, at its foot, the best on the Palestine coast. The highest mountains in the Samaria district are, however, in the neighbourhood of Nablus (Shechem). They include the rugged bare mass of Gerizim (2839 ft.), the smoother cactus-clad cone of Ebal (3077 ft.), and farther south Tell 'Asur (3318 ft.) at which point begins the Judean range. On the eastern side of the watershed the most important feature is perhaps the great valley system that connects the Muhmah (the plain south of Nablus) with the Ghor—beginning with the impressive Wadi Bital and Wadi Fara, the highest and best watered of the Wadis. west of the Wadi is the long zigzag range known as Jebel el-Kuds, named from Jerusalem (el-Kuds) the chief town built upon it. The highest point is Nebi Samwil (Mizpah), 2935 ft. above the sea, north of Jerusalem. This city itself stands at an altitude of 2500 ft. To the south of it begins the subdivision of the Judean mountains now called Jebel el-Khalil, from Hebron (el-Khalil), which stands in an elevated basin some 500 ft. above the altitude of Jerusalem; it is here that the Judean Mountains attain their greatest height. South of Hebron the ridge gradually becomes lower, and finally breaks up and loses itself in the southern desert.

On the west side of the watershed the mountainous district extends about half way to the sea, broken by deep valleys and passes. Among these the most important are the Wadi Salman (Valley of Ajalon) which seems to have been the principal route to Jerusalem in ancient times; the Wadi Isma'an south of this, along which runs the modern carriage road from Jaffa to Jerusalem; and the Wadi es-Suf, a higher section of the bed of the Naher Rubin, along which now runs the railway line; farther to the south we may mention the Wadi es-Sunt, which drains up the country from Tell es-Safi (Gath?) eastward.

Between the mountainous country of Judea and the maritime plain is an undulating region anciently known as the Shephelah. It is composed of horizontal strata of limestone, forming groups of hills intersected by a network of small and fertile valleys. In this region, which is of great historical importance, are the remains of many ancient cities. The adjacent part of the mountainous plain is composed of a rich light brown loamy soil. Although cultivated with most primitive appliances, and with little or no attempt at irrigation or artificial fertilization, the average yield is eight- to twelve-fold annually. This part of the plain is (in European nomenclature) divided into two at about the latitude of Jaffa, that to the north being the plain of Sharon (Sharon), the southern half being the plain of the Philistines.

On the east side of the watershed the ground slopes rapidly from its height of 2500 ft. above sea-level to a maximum depth of 1300 ft. below sea-level, within a distance of about 20 m. It is a waste, destitute of water and with but scanty vegetation. It has never been brought into cultivation; but in the first Christian centuries the caves in its valleys were the chosen refuge of Christian monasticism. It descends to the level of the Ghor by terraces, deep cut through by profound ravines such as the Wadi es-Suwaimit, Wadi Kelt, Wadi ed-Dabir, Wadi en-Nar (Kedron), and Wadi el 'Ariejeh.

The southern district, which includes the white marl regions of Beer-sheba, was in ancient times called the Negeb. It is a wide steppe region which (though it contains many remains of ancient towns and settlements and was evidently at one time a territory of great importance) is now almost entirely inhabited by nomads. It should, however, be mentioned that the Turkish government has developed a town at Beer-sheba, under the jurisdiction of a kadi (lieutenant-governor), since the beginning of the 20th century.

The Ghor or Jordan valley is treated in a separate article (see JORDAN). There has been no systematic survey of Eastern Palestine such as was carried out in Western Palestine between 1875 and 1880.
PALESTINE

Climate.—Palestine belongs to the sub-tropical zone; at the summer solstice the sun is ten degrees south of the zenith. The length of the dry season is about 320 days, and the average rainfall ranges from 140 to 250 mm. The temperature varies with the elevation of altitude and of surface characteristics gives rise to a considerable number of local climatic peculiarities. On the maritime-plain the temperature extends from about 5°C to about 40°C, extremes being about 90°C to about 90°C. The harvest ripens about a month earlier than among the mountains. Citrons and oranges flourish, as do melons and pears; the latter do not fruit abundantly, but some of the best peaches of the east are cultivated in the lowlands.

The rainfall is rather lower than among the mountains. In the mountainous regions the mean annual temperature is about 62°F, but there is a great range of variation. In winter there are often very low temperatures, sometimes falling below the freezing point for several days at a time.

Rainfall is usually about 10 in. or less, and in exceptional years as much as 10 in. Excess of this figure has been registered. The vine, fig, and olive grow well in this region. The climate of the Ghor, again, is different. Here the thermometer may rise as high as 130°F. The rainfall is scanty, but no civilized person inhabits the southern end of the Jordan valley throughout the year, and it has hitherto proved impossible to establish self-registering instruments, no systematic meteorological observations have been taken. In Eastern Palestine there is even a greater range of temperature; the lofier heights are covered in winter with snow. The thermometer may range within twenty-four hours from 50°F to 30°F.

The rainy season begins about the end of November, usually with a heavy thunderstorm; the rain at this part of the year is generally accompanied by a high temperature; the thermometer may rise to 90°F, exceeding by far the maximum induced by the summer heat, is thus softened, and ploughing begins at once. The wettest month, as indicated by meteorological observation, is January; February is second to it, and December third; March, contrary to the idea that this is a very dry month, is fourth. October is the driest month; March (the 'latter rains') and the winter crops receive their final fertilization. The winter crops (barley and wheat) are harvested from April to June. The summer crops (melon, sesame, figs, and grapes) are normally harvested later. Such crops which are one of the most remarkable climatic features of the country and to a large extent are due to the total lack of rain for most of the year. These crops are harvested from August to October.

Water Supply.—Notwithstanding the long drought, it must not be supposed that Palestine is a waterless country, except in certain districts. There are few large streams where the snow melt is sufficient to reach the sea, for the annual rainfall is very limited; and the streams are either too small, too dry, or too far apart to be navigable. The rainfall is probably insufficient to penetrate the limestone and sandstone, and the shallow reservoirs which are fed by the rivers and springs, though they supply water for the needs of the country, are not large enough to be relied upon. The supply is limited to the sea, but the rainwater is generally insufficient for the needs of the country. The rainfall is usually about 10 in. or less, and in exceptional years as much as 10 in. Excess of this figure has been registered. The vine, fig, and olive grow well in this region. The climate of the Ghor, again, is different. Here the thermometer may rise as high as 130°F. The rainfall is scanty, but no civilized person inhabits the southern end of the Jordan valley throughout the year, and it has hitherto proved impossible to establish self-registering instruments, no systematic meteorological observations have been taken. Geology and Geography of Arabia Petraea, Palestine and adjoining districts (London, 1886).

¹See Loriet, La Mer Morte (Paris, 1877); E. Hull, Mount SEIR, Sinai and Western Palestine (London, 1885); and Memoir on the
is eaten by the poorer classes, as is also occasionally that of the second. The dogs, which prowl in large numbers round the streets of towns and villages, are scarcely domesticated; much the same is true of the cats. Wild cats, cheetahs and leopards are found, but they are exceptional rarities. The fox, which inhabited the country in the time of the Hebrews, is now extinct. The most important wild animals are the hyena, wolf (now comparatively rare), fox and jackal. Bats, various species of rodents, and gazelles are very common, as is the ibex in the valleys of the Dead Sea. Among the most characteristic birds may be mentioned eagles, vultures, owls, partridges, bee-eaters and hoopoes; singing birds are on the whole uncommon. Snakes—notably of them venomous—are numerous, and there are many varieties of lizards. The crocodile is seen (but now very rarely) in the Nahr ez-Zerka. Scorpions and large spiders are a universal pest.

Palestine has a considerable range and variety, owing to the variation in local climatic conditions. In the Jordan valley the vegetation has a semi-tropical character, consonant with the great heat, which here is normal. The coast-plain has another character due to the cool reception of the sea-breeze. The mountains of the interior, on the other hand, are higher and more snow-clad; and here the flora is, naturally, scantier than in these two more favoured regions, but even here there is a rich variety. In all parts of the country the contrast between the landscape in early spring and late, when the cessation of rains and the increase of heat has burnt up the vegetation, is very remarkable.

Population.—The inhabitants of Palestine are composed of a large number of elements, differing widely in ethnological affinities, language and religion. It may be interesting to mention, as an illustration of their heterogeneity, that early in the 20th century a list of more than fifty languages, spoken in Jerusalem as vernaculars, was there drawn up by a party of men whose various official positions enabled them to possess access to the most diverse parts of the city. In the same way, the mountains the flora is, naturally, scantier than in these two more favoured regions, but even here there is a rich variety. The vilayet or province of Beirut. South of this point is the sanjak of Jerusalem, to which Nazareth with its hot, hilly, reedy neighborhood is added. The 13th-century Holy Place and the Holy Land are again under a single jurisdiction. East of the Jordan the country forms part of the large vilayet of Syria, whose centre is at Damascus.

Commerce has been almost entirely by caravan, and this primitive method is still followed over the greater part of its area. On the 26th of September of that year a railway between Jaffa and Jerusalem, with five intermediate stations, was opened. It extends for 53 miles, joining the coast and the mountains of Judaea. A railway from Haifa to Damascus was opened in 1905; it runs across the Plain of Esdraelon, enters the Ghur at Beisan, then, turning northwards, impinges on the railway running from the Yarmuk to join, at ed-Der'a, the line of the third railway. This was undertaken in 1901 to connect Damascus with Mecca; in 1906 it was extended to Hebron, and a section to Jerusalem was completed. Carriage-roads also began to be constructed during the last decade of the 19th century. They are on the whole carelessly made and maintained, and are liable to go badly and more or less impassable out of repair in heavy rain. Of course, the roads most important are from Jaffa to Haifa, Jaffa to Nablus, Jaffa to Jerusalem, Jaffa to Gaza; Jerusalem to Jericho, Jerusalem to Bethlehem with a branch to Hebron, Jerusalem to Khan Labban—ultimately to be extended to Nablus; and Gaza to Beersheba. Other roads have been begun in Galilee (e.g. Haifa to Tiberias and to Jenin); but in this respect the northern province is far behind the southern. For the whole of Palestine is a network of tracks, all practically similarly constructed with light European vehicles, connecting the country and connecting the towns and villages one with another.

Industries.—There are no mines and few manufactures of importance. The country is almost wholly agricultural; the processes are primitive and improvements are discouraged, both by the policy of the government and by an indolence and suspicion of innovation natural to the people themselves, since the best of their work has often been the laziest of the borderers of Hauman. Besides wheat, the following crops are to a greater or less extent cultivated—barley, millet, sesame, maize, beans, peas, lentils, kensami (a species of vetch used as camel-food) and, in some parts of the eastern highlands, the potato. Other important agricultural products are cucumbers, cucumbers, dates, apricots, beans, and, especially in the south, oranges and lemons. Rice is now grown in the Jezirah. A sanjak is usually a subordinate division of a vilayet, but that of Jerusalem has been independent ever since the Crimean War. The change has been made an account of the trouble involved in referring all consular and financial relations with the Tripolitans and important political authorities to the same office. 3 There was a branch facilitated transit between the coast and the interior of Mesopotamia, and some of the most celebrated of the national manufactures and the sale of souvenirs (carved toys and trinkets in mother-of-pearl and olive-wood, forged antiquities and the like), and the analogous trade in objets de piété (rosaries, crosses, crude religious pictures) is much fostered by the good nature of the people, who sell their merchandise no money recklessly, and these trades, at once easy and lucrative, are thus fatally attractive to the indolent Syrian and prejudicial to the best interests of the country. (R. A. S. M.)

History

1.—Old Testament History.

Palestine is essentially a land of small divisions, and its configuration does not fit it to form a separate entity; it has never belonged to one nation and probably never will. Its position gives the key to its history. Along the west coast ran the great road for traders and for the campaigns which have made the land famous. The seaports (especially in Syria, including Phoenicia), were well known to the pirates, traders and sea-powers of the Levant. The southernmost, Gaza, was joined by a road to the mixed peoples of the Egyptian Delta, and was also the port of the Arabian caravans. Arabia, in its turn, opens out into both Babylonia and Palestine, and a familiar route skirted the desert east of the Jordan into Syria to Damascus and Hamath. Damascus is closely connected with Galilee and Gilead, and has always been in contact with Mesopotamia, Assyria, Asia Minor and Armenia. Thus Palestine lay at the gate of Arabia and Egypt, and at the tail end of a number of small states stretching up into Asia Minor; it was encircled by the famous ancient civilizations of Babylonia, Assyria, South Arabia and Egypt, of the Hittites of Asia Minor, and of the Aegean peoples. Consequently its history cannot be isolated from that of the surrounding lands. Recent research in bringing to light considerable portions of long-forgotten ages is revolutionizing those impressions which were based upon the Old Testament—the sacred writings of a small fraction of this great area; and a broad survey of the vicissitudes of this area furnishes a truer perspective of the few centuries which concern the biblical student. The history of the Israelites is only one aspect of the history of Palestine, and this part of the history of a very closely interrelated portion of a world sharing many influencing periods of those around it that is necessary here to approach the subject from a point of view less familiar to the biblical student, and to treat Palestine not merely as the land of the Bible, but as a land which has played a part in history for certainly more than 4500 years. The close of Old Testament history (the book of Nehemiah) in the Persian age forms a convenient division between ancient Palestine and the career of the land under non-oriental influence during the Greek and Roman ages. It also marks the culmination of a lengthy historical and religious development in the establishment of Judaism and its inveterate rival Samaritanism. The Jewish historian, disdaining any earlier historical data bearing upon the first great period are given elsewhere in this work, and it is proposed to offer here a more general survey.

To the prehistoric ages belong the palaeolithic and neolithic flints, from the distribution of which an attempt might be made to give a synthetic sketch of early Palestinian man. A burial cave at Gezer has revealed the existence of a race of slight build and stature, muscular, with elongated crania, and thick and heavy skull-bones. The Beginning of history.

The change has been made an account of the trouble involved in referring all consular and financial relations with the Tripolitans and important political authorities to the same office. 3 There was a branch facilitated transit between the coast and the interior of Mesopotamia, and some of the most celebrated of the national manufactures and the sale of souvenirs (carved toys and trinkets in mother-of-pearl and olive-wood, forged antiquities and the like), and the analogous trade in objets de piété (rosaries, crosses, crude religious pictures) is much fostered by the good nature of the people, who sell their merchandise no money recklessly, and these trades, at once easy and lucrative, are thus fatally attractive to the indolent Syrian and prejudicial to the best interests of the country. (R. A. S. M.)

people lived in caves or rude huts, and had domesticated animals (sheep, cow, pig, goat), the bones of which they fashioned into various implements. Physically they are quite distinct from the normal type, also found at Gezer, which was taller, of stronger build, with well-developed skulls, and is akin both to the Sinaic and Palestinian type illustrated upon Egyptian monuments from c. 3000 B.C. and to the modern native. The study of Oriental ethnology in the light of history is still very incomplete, but the regular trend of events points to a mixture of races from the south (the home of the Semites) and the north. At what period Palestine first became the "Semitic" land, which it has always remained, is uncertain; nor can one decide whether the characteristic megalithic monuments, especially to the east of the Jordan, are due to the first wave which introduced the Semitic (Canaanitic) dialect and the place-names. At all events during the last centuries of the third millennium B.C., remarkable for the high state of civilization in Babylonia, Egypt and Crete, Palestine shares in the active life and intercourse of the age; and while its fertile fields are visited by Egypt, Babylonia (under Gilim-Sin, Gudea and Sargon) claims some supremacy over the west as far as the Mediterranean.

A more definite stage is reached in the period of the Hyksos (c. 1700), the invaders of Egypt, whose Asiatic origin is suggested by the toponyms which include Egyptian "Jacob" and "Anath" as deities. After their expulsion it is very significant to find that Egypt forthwith enters upon a series of campaigns in Palestine and Syria as far as the Euphrates, and its successes over a district whose political fate was bound up with Assyria and Asia Minor laid the foundation of a policy which became traditional. Apart from rather disconnected details which belong properly to the history of Babylonia and Egypt, it is not until about the 16th century B.C. that Palestine appears in the clear light of history, and henceforth its course can be traced with some sort of continuity. Of fundamental importance are the Amarna cuneiform tablets discovered in 1887, containing some of the political correspondence between Western Asia and Egypt for a few years of the reigns of Amenophis III. and IV. (c. 1414-1360). The first Babylonian dynasty, now well known for its Khummurabi, belonged to the past, but the cuneiform script and language are still used among the Hittites of Asia Minor (centring at Boghaz-keui) and the kings of Syria and Palestine. Egypt itself was now passing from its greatness, and the Hittites (q.e.),—the term is open to some criticism,—were its rivals for the possession of the intervening lands. Peoples (apparently Iranian) of Hittite connexion from the powerful state of Mitanni (Northern Syria and Mesopotamia) had already left their mark as far south as Jerusalem, as may be inferred from the personal names, and to the intercourse with (apparently) Aegorean culture revealed by excavation, the letters add references to mercenaries and bands from Meluhha (viz. Arabia), Mesopotamia and the Levant. The diminutive cities of this cosmopolitan Palestine were ruled by kings, not necessarily of the native stock; some were appointed—and even anointed—by the Egyptian king, and the small extent of these city-states is obvious from the references to the kings of such near-lying sites as Jerusalem, Gezer, Askelon, Beth-shan, etc., in the documents showing jealousy and intrigue, and forming little confederations among themselves, they were united by their common recognition of the Egyptian suzerain, their court of appeal, or in some short-lived attempts to maintain them. Apart from Jerash, Palestine, and a few towns on the coast, the real weight lay to the north, and especially in the state of Amor. It is an age of internal disorganization and of heavy pressure by land and by sea from Northern Syria and Asia Minor. The land seethes with excitement, and Palestine, wavering between allegiance to Egypt and intrigues with the great movements at its north, is unable to take any independent line of action. The letters vividly describe the approach of the enemy, and, in appealing to Egypt, abound in protestations of loyalty, complaints of the disloyalty of other kings, and excuses for the want of co-operation. Of particular exceptional interest are the letters from Jerusalem describing the hostility of the maritime coast and the disturbances of the Habiru ("allies"), a name which, though often equated with that of the Hebrews, may have no ethnological or historical significance. But Egypt was unable to help the loyalists, even ancient Mitanni lost its political independence, and the supremacy of the Hittites was assured. The history of the age illustrated by the Amarna letters is continued in the tablets found at Boghaz-keui, the capital of the old Hittite Empire. Subsequent Egyptian evidence records that Seti I. (c. 1320) of the 19th Dynasty had an expedition into Palestine, but the struggles with the Hittites continued until Rameses II. (c. 1300) concluded with them an elaborate treaty which left them little more than Palestine. Even this province was with difficulty maintained: the disturbances in the Levant and in Asia Minor (which belong to Aegaeon and Hittite history) and the revival of Assyria were reshap ing the political history of Western Asia.

Under Rameses III. (c. 1260-1200) we may recognize another age of disorganization in Palestine, in the movements with which the Philistines (q.v.) were concerned. Nevertheless, Egypt seems to have enjoyed a fresh spell of extended supremacy, and the Amarna tablets show that Egypt was able to maintain and extend her control over some part of Syria. But it was the close of a lengthy period during which Egypt had endeavoured to keep Palestine detached from Asia, and Palestine had realized the significance of a powerful empire at its south-western border. Somewhat later Tglath-Pileser (c. 1100) pushed the limits of Assyrian suzerainty westwards over the lands formerly held by the great Hittite Empire. It is at this age, when the external evidence becomes extremely fragmentary, that new political movements were inaugurated and new confederations of states sprang into existence. Palestine had been politically part of Egypt or of the Hittite Empire; we now reach the stage where it becomes more closely identified with Israelite history.

Palestine had not as yet been absorbed by any of the great powers with whose history and culture it had been so closely bound up for so many centuries. In the "Amarna" age the little kingdoms had a certain measure of independence, provided they guarded the royal caravan routes, paid tribute, refrained from conspiracy, and generally supported their suzerain and his agents. However profound the influence of Babylonia may have been, excavation has revealed few specific traces of it. Although cuneiform was used, the Palestinian letters show that the native language, as in the case of earlier proper-names, was most nearly akin to the later "Canaanite" (Hebrew, Moabite and Phoenician). In view of the relations subsisting among Palestine, Mitanni and the Hittites, it is evident that Babylonian influence was already considerable.

Amor (Ass. Amurrur, Bibl. Amorite), lay north of Lebanon and behind Phoenicia; but the term fluctuates (Weber, op. cit., 1132 sqq.). See art. AMORITES, and A. T. Clay, Amurru (Philol. Quart., 1908). Amor is also known in theophoric names and place-names, e.g. Amurru, Amuru, Amor, Amurru, etc.

3 See H. Winckler, Altert. Forschung, iii. 227; W. M. Müller in I. Benzinger, Heb. Archäol. (1907), p. 445; B. Eeckmann, Altesi Stud. (1908), ii. 61 sqq.; Dhorme, op. cit. (1909), p. 677 sqq. The Amorite movement of the Habiru cannot be isolated from that represented in other letters (where the enemy are not described by this term), and their steps do not agree with those of the invading Israelites in the book of Joshua (q.v.).

influence could have entered indirectly; and until one can determine how much is specifically Babylonian the analogies and parallels cannot be made the ground for sweeping assertions. The influence of a superior power upon the culture of a people cannot of course be denied; but history proves that it depends upon the resemblance between the two peoples and their respective levels of thought, and that it is not necessarily either deep or lasting. A better guard against the misconception of H. Gresswell's translation in H. Gresswell, "Abeggabnen in Pal. u. d. A. T." (Tiibingen, 1908), p. 19 seq. The title "lord of heaven"—whether the Sun or Addu, there was a Nebo, Nergal, &c.), there were the closely-related goddesses Ashira and Ištah-Ashtar (the Old Testament Asheerah and Ashtoreth). Possibly the name Yahweh (see Jehovan) had already entered Palestine, but it is not prominent, and if, as in the case of certain other deities, the extension of the name and cult went hand-in-hand with political circumstances, these must be sought in the problems of the Hebrew monarchy.

At an early stage, perhaps about the middle of the thirteenth century B.C., when the Hebrews were under Egyptian control Palestine the Hebrew monarchy arose and claimed a premier place amid its neighbours (c. 1000). How the small tribal districts with their petty kings were united into a kingdom under a single head is a disputed question; the stages from the half-Hittite, half-Egyptian land to the independent Hebrew state with its national god are an unsolved problem. Biblical tradition quite plausibly represents a mighty invasion of tribes who had come from Southern Palestine and Northern Arabia (Elath, Ezion-geber)—but primarily from Egypt—and, after a series of national "judges," established the kingdom. But no place can be found for this conquest, as it is described, either before the "Amarna" age (the date, following 1 Kings vi. 1) or about the time of Rameses II. and Mineptah (see Exod. i. 11); and if the latter king (c. 1244) records the subjugation of the people (? or land) "Israel," the complicated history of names does not guarantee the absolute identity of this "Israel" either with the pure Israelite tribes which invaded the land or with the intermixed people after this event (see Jews: §§ 6-8). Whatever may have been the extent of this invasion and the sequel, the rise and persistence of an independent Palestinian kingdom was an event which concerned the neighbouring states. Its stability and the necessary furtherance of commerce, usual among Oriental kings, depended upon the attitude of the maritime coast (Philistia and Phoenicia), Edom, Moab, Ammon, Gilead and the Syrian states; and the biblical and external records for the next four centuries (to 586) frequently illustrate situations growing out of this interrelation. The evidence of the course of these crucial years is unequal and often sadly fragmentary, and is more conveniently noticed in connexion with the biblical history (see Jews: §§ 9-17).

A conspicuous feature is the difficulty of maintaining this single monarchy, which, however it originated, speedily became two rival states (Judah and Israel). These are separated by a very ambiguous frontier, and have their geographical and political links to the south and north respectively. The balance of power moves now to Israel and now to Judah, and tendencies to internal disintegration are illustrated by the dynastic changes in Israel and by the revolts and intrigues in both states. As the power of the surrounding empires revived, these entered again into Palestinian history. As regards Egypt, apart from a few references in biblical history (e.g. to its interference in Philistia and friendliness to Judah, see Philistine), the chief event was the great invasion by Shoshon (Shishak) in the latter part of the 10th century; but although it appears to be a confused campaign, contact with Egypt, to judge from the archaeological results of the excavations, was never intermittent. The next definite stage is the dynasty of the Israelite Omri (p.q.), to whom is ascribed the founding of the city of Samaria. The dynasty lasted nearly half a century, and is contemporary with the expansion of Phoenicia, and presumably therefore with some prominence of the south maritime coast. The royal houses of Phoenicia, Israel and Judah were united by intermarriage, and the last two by joint undertakings in trade and war (note also 1 Kings ix. 26 seq.). Meanwhile Assyria was gradually establishing itself westwards, and a remarkable concentration of the heirs of the old Hittite kingdom, the "kings of the land of the Hittites" (see Diplomatic Appraoch of Assyria. Of the Hittites) was formed to oppose it. Southern Asia Minor, Phoenicia, Ammon, the Syrian desert and Israel (under Omri's son "Ahab the Israelite") sent their troops to support Damascus which, in spite of the repeated efforts of tendency to identify them—was perhaps known in Palestine, as it certainly was in Egypt and among the Hittites.
Palestine

Shalmaneser,1 was evidently able to hold its own from 854 to 839. The anti-Assyrian alliance was, as often in west Asia, a temporary one, and the inveterate rivalries of the small states are illustrated, in a striking manner, in the downfall of Omri's dynasty and the rise of that of Jehu (842-c. 745); in the bitter onslaughts of Damascus upon Israel, leading nearly to its annihilation; in an unsuccessful attack upon the king of Hamath by Damascus, Cilicia and small states in north Syria; in an Israelite expedition against Judah and Jerusalem (2 Kings xiv. 13 seq.); and finally in the recovery and extension of Israelite power—perhaps to Damascus—under Jeroambo II.

In such vicissitudes as these Palestinian history proceeds upon a much larger scale than the national biblical records relate, and the external evidence is of the greatest importance for the light it throws upon the military situations. Syria could control the situation, and it in turn was influenced by the ambitions of Assyria, to whose advantage it was when the small states were rent by mutual suspicion and hostility. It is possible, too, that, as the states did not scruple to take advantage of the difficulties of their rivals, Assyria played a more prominent part in keeping these jealousies alive than the evidence actually states. Moreover, in the light of these moves and counter-moves one must interpret the isolated or incomplete narratives of Hebrew history.2 The repeated blows of Assyria did not prevent the necessity of fresh expeditions, and later, Adad-Nirari III, (812-783) claims as tributary and the land of Hatli, Amor. Tyre, Sidon, "the land of Omri" (Israel), Edom and Philistia. Israel at the death of Jeroambo was rent by divided factions, whereas Judah (under Uzziah) has now become a powerful kingdom, controlling both Philistia and the Edomite port of Elath on the gulf of 'Akaba. The dependence of Judaean sovereignty upon these districts was inevitable; the resources of Jerusalem obviously did not rely upon the small district of Judah alone. If Ammon also was tributary (2 Chron. xxvii. 8, xxviii.), dealings with Israel and perhaps Damascus could probably have been more extensive.

A later period begins with Tiglath-Pileser IV. (745-728); pro- and anti-Assyrian parties now make themselves felt, and when north Syria was taken in 738, Tyre, Sidon, Damascus (under Resin), "Samaria" (under Assyria. Menahem) and a queen of Arabi were among the tributaries. It is possible that Judah (under Uzziah and Jotham) had come to an understanding with Assyria; at all events Ahaz was at once encircled by fierce attacks, and was only saved by Tiglath-Pileser's campaign against Philistia, north Israel and Damascus. With the siege and fall of Damascus (733-32) Assyria gained as tributary and the land of Hatli, Amor. Tyre, the tribes of the Syrian desert and Arabia (Arabi, Tema, Sheba).

In 722 Samaria, though under an Assyrian vassal (Hoshea the last king), joined with Philistia in revolt; in 720 it was allied with Gaza and Damascus, and the persistence of unrest is evident when Sargon in 715 found it necessary to transport into Samaria various peoples of the desert. Judah itself was next involved in an anti-Assyrian league (with Edom, Moab and Philistia), but apparently submitted in time; nevertheless a decade later (701), after the change of dynasty in Assyria, it participated in a great but unsuccessful effort from Phoenicia to overthrow Egypt, and toיש in the yoke, and suffered disastrously. With the crushing blows upon Syria and Samaria the centre of interest moves southwards and the history is influenced by Assyria's rival Babylonia (under Marduk-baladhan and his successors), by north Arabia and by Egypt. Henceforth there is little Samaritan history, and of Judah, for nearly a century, few political events are recorded (Jews; § 16). Judah was under Assyrian supremacy, and, although it was involved with Arabians in the revolt planned by Babylonian

1 Recently found to be the third of that name (H. W. Hogg, The Interpreter, 1910, p. 329).

2 See e.g. in references to Ammon, Damascus and Hamath, and in Judaean relations with Philistia, Moab and Edom.

3 See art. Hezekiah. A recently published inscription of Senacherib (of 604 B.C.) mentions enslaved peoples from Philistia and Tyre, but does not name Judah (against Assurbanipal), it appears to have been generally quiescent.

At this stage disturbances, now by Aramaean tribes, now by Arabia, combine with the new rise of Egypt, and the weakness of Assyria to mark a turning-point in the world's history. Psmetichus (Psamtek) I. (665-660) with his Greeks, Carians, Ionians and soldiers from Palestine and Syria, re-established once more an Egyptian Empire, and replaced the fluctuating relations between Palestine and the small dynasties of the Delta by a settled policy. Trading intercommunication in the Levant and the constant passage to and fro of merchants brought Egypt to the front, and, in an age of archaic revival, the effort was made to re-establish the ancient supremacy over Palestine and Syria. The precise methods and their results are hidden by the disconnected and only incompletely perceived evidence, and the signification of the great Scythian invasion and of the greater movements with which it was connected is uncertain (see Scythia). At all events, Egypt (under Necho, 690-593) prepared to take advantage of the decay of Assyria, and marched into Asia. Judah (under Josiah) was overthrown at Megiddo, where about nine centuries previously the victory of Tethmoses (Thutmose) III. had made Egypt supreme over Palestine and Syria. But Egypt was now at once confronted by the Neo-Babylonian or Chaldean Empire (under Nabopolassar), which, after annihilating Assyria with the help of the Medians, naturally claimed a right to the Mediterranean coast-lands. The defeat of Necho by Nebuchadnezzar at Carchemish (605) is one of the world-famous battles. Although Syria and Palestine now became Babylonian, this revival of the Egyptian Empire aroused hopes in Judah of deliverance and led to revolts (under Jehoachin and Zedekiah), in which Judah was apparently not alone.4 They culminated in the fall of this kingdom in 586. Henceforth the history of Palestine is disconnected and fragmentary, and the few known events of political importance are the return of the Babylonians and the current of the movements of Egypt, Phœnicia or Philistia, or from the Old Testament. According to the Chaldean Nabonius (553) all the kings from Gaza to the Euphrates assisted in his buildings, and the Chaldean policy generally appears to have been favourable towards faithful vassals. Cyrus meanwhile was rising to lead the Persians against Media. After a career of success he captured Babylonia (539) and forthwith claimed, in his famous inscription, the submission of Amor. For the next 200 years Palestine remained part of the new Persian Empire which, with all its ramifications on land and sea, brought the civilized world from the Himalayas to the Levant, until the advent of Alexander the Great (see Jews; § 19).

Very gradually the face of history underwent a complete change. Egypt had resumed its earlier connexions with the Levantine heirs of the ancient Aegeans, the old empires of the Near East had practically exhausted themselves, and Palestine passed into the fresh life and thought of the Greeks. In any consideration of the internal conditions in Palestine it must be observed that there is a continuity of thought, custom and culture which is independent of political changes and vicissitudes of names. With the establishment of the independent monarchy Palestine did not enter into a new world. Whatever internal changes ensued between the "Amarna" age and 1000 B.C., they have not left their mark upon the course of culture illustrated by the excavations. These still indicate communication with Egypt and the north (Syria, Asia Minor; Assyria and the Levant not excluded), and even when a novel culture presents itself, as in certain graves at Gezer, the affinities are with Cyprus and Asia Minor (Caria) of about the 11th or 10th century. The use of

4 Cf. Jer. xxvii. 2 seq., and the history of the Egyptian Hophra (Achebes, 888-669).

5 At present it is difficult as regards Palestine to distinguish Aegean influence (direct and indirect) from that of Asia Minor generally. Only after the old Cretan (Minooan) culture had passed its zenith and was already decadent does it suddenly appear in Cyprus (H. R. Hall, Proc. Soc. Bibl. Arch. xxi. 227).
Palestine

Iron came in about this time, perhaps from the north, and biblical history (1 Kings x. 28 seq., see the commentaries) even ascribes to Solomon the import of horses from Kue and Musri (Cilicia and Cappadocia). The cuneiform script, which continued in Egypt during the XXIst and XXIInd Dynasties, was perhaps still used in Palestine; it was doubtless familiar at least during the Assyrian supremacy. But in the meanwhile the “North Semitic” alphabet appears (from 850) with almost identical forms in extreme north Syria (e.g. Sam‘al), in Cyprus, Gezer, and in Moab. The type is very closely related to the oldest European (Etruscan) forms and, in a less degree, to the “South Semitic” (old Minyan and Sabaean); and since it at once begins (c. 700) to develop along separate paths (Canaanite and Aramaean), it may be inferred that the common ancestor was not of long derivation. This alphabet stands in tax between Semitic and varying types of the Aegean and Asia Minor area and can hardly be of local origin. Under what historical circumstances it was first distributed over Palestine and Syria is uncertain; it is a plausible conjecture that once more the north is responsible. Too little is known of the north as a factor in Palestinian development to allow hasty inferences, but it is certainly noteworthy, at all events, that the names Amor and Hatti appear to move downwards, and that “Hittite” is applied to Palestine and Phylisia by the Assyrians, and to Hebron in the Old Testament, and that Ezekiel (xvi. 3) calls Canaanite Jerusalem the offspring of an Amorite and a Hittite. It is to be observed, however, that the meaning of geographical and ethnical terms for culture in general must be properly tested—the term “Phoenician” is a conspicuous case in point. Thus, in north Syria the art has Assyrian and Hittite affinities, but is provincial and sometimes rough. Some of the personal names are foreign and find analogues in Asia Minor; but even as the Philistines appear in biblical history as a “Semitic” people, so inscriptions from north Syria (c. 800–700) are in Canaanite and early Aramaean dialects, and are in entire agreement with “Semitic” thought and ideas. The deities too generally bear familiar names. In Sam‘al the kings Panamnu and Qadowa bear non-Semitic names (Carian), but the gods include Hadad, El (God par excellence), Resheph and the Sun-deity. In Hamath we meet with the Baal of Heaven, Sun and Moon deities, gods of heaven and earth, and others. A god “Most High” (‘elyon) was perhaps already known in Hamath. The “Baal of Heaven,” reminiscent of the Egyptian title “lord of heaven,” given long before to Resheph, appears in the pantheon of Tyre (c. 677). The reference here is probably to the inveterate Hadad who, in his Aramaean form Ramman (Kimmon), is found in Palestine. Among the Hebrews, Yahweh, some of whose features associate him with the Baal of Palestine, as king of the gods and ruler of the earth, has now become the national god, like the Moabite Chemosh or the Ammonite Milcom. (For the Edomite gods, see Eom.) The name is known in the form Ya‘u in north Syria (5th century), and, so far as the Israelite kings are concerned, appears first in the family of Ahab. No images of Yahweh or of earlier Canaanite deities have been unearthed; but images belong to a relatively advanced stage in the development of religion, and the aniconic stage may be represented by the sacred pillars and posts, by the small models of heads of bulls, and by the evidence for calf-cults in the Old Testament. Yahweh was by no means the only god. Inter-

course and alliance introduced the cults of Chemosh, Milcom, the Baal of Tyre and the Astarte of Sidon. Excavation has brought to light images of the Egyptian Osiris, Isis, Ptah, Anubis and especially Bes. Assyrian conquest and domination introduced all events outside Judah and Israel, and when Sargon sent skilled men to teach “the fear of God and the king” (cyl. inscr. 72–74) the spread of Assyrian religious ideas among the Hebrews themselves is to be expected. Certainly about 600 the Queen of Heaven, who has Assyrian traits, was a favourite object of veneration (Jer. vii. 18, xiv. 17–10, 25); yet already a century earlier the goddess “Ishtar of heaven” was worshipped by a desert tribe (see Ismael), and the titles “lady of heaven,” “bride of the king of heaven,” had been applied centuries before to west Asiatic goddesses (Anath, Kadesh, Ashira, &c.). Although no goddeess is associated with the usual god Yahweh, female deities abounded, as is amply shown by the numerous plaques of the great mother-godess found in course of excavation. The picture which the evidence furnishes is as fundamental for our conception of Palestine during the monarchical ages as were the Amarna tablets for the age before they arose. The external evidence does not point to any intervening hiatus, and the archaeological data from the excavations do not reveal any dislocation of earlier conditions; earlier forms have simply developed and the evolution is a progressive one. Down to and at the time of the Assyrian supremacy, Palestine in religion and history was merely part of the greater area of mingled peoples sharing the same characteristics of custom and belief. It is noteworthy, that the religion had no ethical traits—ethical motives are frequently found in the old Oriental religions—but they were bound up with certain naturalistic conceptions of the relation between deities and men, and herein lay their weakness.

In the age of the Assyrian supremacy Palestine entered upon a series of changes, lasting for about three centuries (from about 740), which were of the greatest significance for its internal development. The sweeping conquests of Assyria were “as critical for religious as for civil history.” The brutal methods of warfare, the cruel treatment of vanquished districts or cities, and the redistribution of bodies of inhabitants, broke the old bonds uniting deities, people and land. The framework of society was shattered, communal life and religion were disorganized. As the flood poured over Syria and flowed south, Israel (Samaria) suffered grievously, and the gaps caused by war and deportation were filled up by the introduction of new settlers by Sargon, and by his successors in the 7th century. Unfortunately, there is very little evidence in the biblical history for the subsequent career of Samaria, but it is clear that the old Israel of the dynasties of Omri and Jehu received crushing blows. The king who succeeded the last of the Israel throne, the level tribes, suggests the introduction, not merely of a simpler religion, but also of simpler groups of ideas. In the nature of the case, as time elapsed the new population must have taken root as securely as—one must conclude—the invading Israelites had done some centuries earlier. As a matter of fact the prophets Jeremiah and Ezekiel by no means regarded the population lying to the north of Judah as strangers, and the latter in turn were ready to share the Judaean distress at the fall of Jerusalem (Jer. xlii. 5), and in later years offered to assist in rebuilding Yahweh’s temple. Indeed, since the Samaritans subsequently accepted the Pentateuch, and claimed to inherit the ancestral traditions of the Israelitish tribes, it is of no little value in the study of Palestinian history to observe the manner in which this people of singularly mixed origin so thoroughly assimilated itself to the land and at first was virtually a Jewish sect. But Samaria was not the only land to suffer. Judah, towards the close of the 8th century, was obviously very closely bound up with Philistia, Edom and Egypt; and this and Hezekiah’s dealings with the anti-Assyrian party at Ekron do not indicate that any feeling of national exclusiveness, or any abhorrence of the
uncircumcised Philistines predominated. From the description of Sennacherib's invasion it is clear that social and economic conditions must have been seriously, perhaps radically disturbed, and the quiescence of Judah during the next few decades implies an internal weakness and a submission to Assyrian supremacy. During the 7th century new movements were coming from Arabia, and tribes growing ever more restless made an invasion east of the Jordan through Edom, Moab and Ammon. Although they were repulsed, this awakening of a land which has so often fed Palestine and Syria, when viewed with the increasing weakness of Assyria, and subsequent vicissitudes in the history of the Edomites, Nabataeans and East Jordan tribes, forbids us to treat the invasion as an isolated raid. Later, the fall of the Judean kingdom and the deportation of the leading classes brought a new social upheaval. The land was not denuded, and the fact that "some scores of thousands of Jews remained in Judah through all the period of the exile," even though they were "the poorest of the land," revolutionizes ordinary notions of this period. (See Josh: ch. 8.) But the Judean historians have successfully concealed the course of events, although, as has long been recognized, there was some movement of the groups closest related to Edomite and kindred peoples of South Palestine and Northern Arabia. The immigrants, like the new occupants of Samaria, gradually assimilated themselves to the new soil; but the circumstances can hardly be recovered, and even the relations between Judah and Samaria can only be inferred. In the latter part of the 6th century we find some restoration, some revival of the old monarchy in the person of Zerubbabel (520 B.C.); but again the course of events is problematical (Josh: ch. 20). 1 Not until the middle of the 5th century do the biblical records (book of Nehemiah) furnish a foundation for any reconstruction. Here Jerusalem is in some distress and in urgent need of reorganization. Zerubbabel's age is of the past, and any attempt to revive political aspirations is considered detrimental to the interests of the surrounding peoples and of the Persian Empire. Scattered evidence suggests that the Edomites were responsible for a new catastrophe. Amid internal and external difficulties Nehemiah proceeds to repair religious and social abuses, and there is an important return of exiles from Babylonia. The ruling classes are related partly to the southern groups already mentioned and partly to Samaria; but the kingship of old is replaced by a high-priest, and, under the influence of Babylonian Jews of the Euphrates and Tigris, a branch was made between Judah and Samaria which has never been healed (Josh: ch. 21 seq.). Biblical history itself recognizes in the times of Artaxerxes, Nehemiah and Ezra the commencement of a new era, and although only too much remains obscure we have in these centuries a series of vicissitudes which separate the old Palestine of Egyptian, Hititite, Babylonian and Assyrian supremacy from the land which was about to enter the circle of Greek and Roman civilization. This division, it may be added, also seems to leave its mark upon the lengthy archaeological history of Palestine from the earliest times to the Byzantine age. There is a clear break, marked from the 6th to the 3rd century B.C., in the development of civilization and a decline in the shape and decoration of pottery which seems to exhibit signs of derivation from skin prototypes elsewhere associated with desert peoples. This phase comes at a stage which seems to usher the later phases (including the "Amarna age") from which are very closely connected

1 See G. A. Smith, Jerusalem, ii, 160, 196 seq.

3 G. A. Smith, op. cit., ii, 260.

4 On ordinary historical grounds it is probable that there was a widow and a reorganization and a welding of the diverse elements throughout the land (J. A. Montgomery, The Samaritans, Philadelphiæ, 1880). The text is fraught with linguistic difficulties, and in the criticism of Deuteronomy (which appears to have in view a comprehensive Israel and Judah at this period), and of various passages evidently earlier than Nehemiah's time (see R. H. Kennett, Jour. of Theol. Stud., 1905, pp. 175-181; 1906, pp. 486, 498).

5 With Seleucid and later times. Its appearance has been associated with the invasion of the Israelites or with the establishment of the independent monarchy, but on very inadequate grounds; and since it has been independently placed at the latter part of the monarchy, its historical explanation may presumably be found in that break in the career of Palestine when peoples were changed and new organizations slowly grew up. The great significance of these vicissitudes for the course of internal conditions in Palestine is evident when it is observed that the subsequent cleavage between Judah and Samaria, not earlier than the 5th century, presupposes an antecedent common foundation which, in view of the history of these monarchies, can hardly be earlier than the 7th century. These centuries represent an age which the Jewish historians have partly ignored (as regards Samaria) and partly obscured (as regards the return from exile and the reconstruction of Judah); but since this age stands at the head of an historical development which leads on to Christianity and Rabbinical Judaism, it is necessary to turn from Palestine as a land in order to notice more particularly certain features of the Old Testament upon which the foregoing evidence directly bears.

The Old Testament is essentially Palestinian, an Oriental, work, and is entirely in accord with Oriental thought and custom. Yet, in its characteristic religion and legislation there are essential spiritual and ethical peculiarities which give it a uniqueness and a permanent value, the reality of which becomes more impressive when the Old Testament is viewed, not merely from a Christian or a Jewish teleology, but in the light of ancient, medieval and modern Palestine. The ideas which characterize the Old Testament are planted upon lower levels of thought, and they appear in different aspects (legal, prophetical, historical) and with certain developments both within its pages and in subsequent literature. To ignore or to obscure the features which are opposed to these ideas would be to ignore the witness of external evidence and to obscure the old Testament itself. The books were compiled and preserved for definite aims, and their teaching is directed now to the needs of the people as a whole—as in the ever popular stories of Genesis—now to the elucidation of the lessons of the past, and now to matters of ritual. They are addressed to a people whose mental processes and philosophy were primitive; and since teaching, in order to be communicable, must adapt itself to current beliefs of God, man and nature—and the invertebrate conservatism of man must be born in mind—the trend of ideas must not be confused with the average standard of thought. The teaching was not necessarily presented in the form of an over-elaborated moral lesson, but was associated with conceptions familiar to the land; and when these conceptions are examined from the anthropological standpoint, they are found to contain much that is strange and even abhorrent to modern convictions of a purely spiritual deity. There are moreover many traces of conflicting ideas and ideals, of cruder beliefs and customs, and of attempts to remove or elevate them. In Genesis and elsewhere there are examples of popular thought which have not the character of literal truth. To ignore or to obscure the features which are gradually purified. The notion of a Yahweh scarcely less limited in power than man, the naïve views of supernatural beings and their nearness to man, and the persistence of features which stand relatively low in the scale of mental culture, only serve to enhance the reality of the spirit which inspired the endeavour to reform. There were rites and customs which only after lapse of time were considered inequitable. Magical practices and forms of sacred prostitution and human sacrifice were familiar, and the denunciations of the prophets and the
lawgivers show very vividly the persistence of what was current religion but was hostile to their teaching. There is an astonishing boisterousness (cf. Lam ii. 7), joviality and sensuality, all in striking contrast to the austerity of nomad asceticism. There is a ferocity and fanaticism which manifests itself in the belief that war was the highest form of religious duty and was regarded as the manifestation of deity. Even if the account of the “ban” (utter destruction) at the Israelite conquest be unhistorical, it represents current ideas (cf. Josh. vi. 17 seq.; 1 Sam. xv. 3; 2 Kings xv. 16; 2 Chron. xix. 12 seq.), and implies imperfect views of the Godhead at a more advanced stage of religion and morality.

There are conflicting ideas of death and the dead, and among them the belief in the very human feelings and needs of the dead and in their influence for good or evil. Moreover, the proximity of burial-place and sanctuary and the belief in the kindly care of the famous dead for their descendants reflect the “primitive” belief in the “ heroes in the holy tombs of religious or secular heroes in modern Palestine, and exemplify the firmness of the link uniting local groups with local "numens." The permanence of religion at holy places in the East is one of the most important features in the relation between popular and national religion. The local centres will survive history and political vicissitudes and the changes of national cults and sects, and may outlive the national deities. The supernatural beings may change their name and may vary externally under Greek, Roman, Mahomedan or Christian influence, but the gentle being who is spiritually always the same, although there is no regression to earlier organic connections. The inveterate local, one may perhaps say immediate, powers are felt to be nearer at hand than the national deity, who is more closely bound up with the changing national fortunes and with current philosophy. These smaller deities are, as it were, telluric, and the territory of each is virtually hereditary—as also its traditions—and even as to-day the saints or patrons enjoy a more real veneration among the peasants than does the Allah of the orthodox, the long-established worship of the ancient local beings always hampered the reformers of Yahwism (cf. Jer. ii. 28, xl. 13). Whether they could be regarded as so many manifestations of a single deity or as really distinct entities, there were at all events similar and well understood relations between each and its group; and although the cult was nature-worship and was attended with a licentiousness which drew forth the denunciations of the prophets, this is only one aspect of the local deity's place in the religious conceptions of his circle. The excavations (at Gezer, Megiddo, Jericho, &c.) indicate a persisting gross and cruel idolatry, utterly opposed to the demands of the law and the prophets. Jerusalem and the surrounding district has omitting those associations. Jerusalem itself lay off

2 See generally E. Meyer, Gesch. d. Alterthums (Berlin, 1900), i. §§ 342 sqq. Ceremonial licentiousness was perhaps of northern origin (Meyer § 345), and as a preliminary to marriage seems to have been known not only in Assyria (Herod. i. 199), but also in Palestine ("a law of the Amorites": Test. of Judah, ed. ii. ii. Charles, 2); cf. E. S. Hartland, Anthropol. Essays .. E. B. Tylor (Oslo, 1907), pp. 189-202. (For miscellaneous notes, see E. G. Frazer, ibid. pp. 101-174: "Folk-lore in the Old Testament,")

4 The title of an instructive essay by Sir W. M. Ramsay in the Expositor, Nov. 1906, pp. 453 sqq. The whole subject involves also the various forms and developments of hero- and saint-cults, on which cf. E. Lucas, Anfange d. Heiligtums, &c. (Tübingen, 1901); P. Sastriyaya, Saints successore dei dèi (Paris, 1901).

6 Vincent, Conann, p. 204; cf. S. R. Driver, Modern Research as Illustrating the Bible (London, 1909), pp. 60 seq. 90.

7 To see the "hymn" to Yahweh of Sidon (1 Kings xi. 1-8; 2 Kings xi. 18, xxiii.); the valley of Hinnom (see J. A. Montgomery, Journ. Bibl. Lit. xxvii. i. 24-47); and the place-names Anatoth ("Anaths"), Nob (Nebo?), Beth-shemeh, Beth-shemer. The name Jerusalem may be compounded with the main line of intercourse and one may look for a certain conservatism in its famous Temple. Temples, shrines and holy places were no novelty in Palestine, and the inauguration of the great centre of Judaism is ascribed to Solomon the son of the great conqueror David. See, as far as the theories of Egyptian analogies to the construction accord with the known influence of Egypt upon Phoenician art. It is the dwelling-place of the deity, the centre of the nation and of the national hopes; the fall of the Temple follows after Yahweh left it, it is rebuilt and he returns (Zech. viii. 3). The Temple is merely part of the royal palace and the government buildings (cf. Ezck. xxiii., 7 seq.), and this is as significant as the king's position in its management. It is in keeping with the old conceptions of the divine kingship, which, though they survive only in isolated biblical references, live on in the ideals of the Talmud, and find an echo in the popular respect for the king's safety and his high price. The Temple is built, ornamented and furnished on lines which are quite incompatible with a spiritual religion. Mythical features abound in the cherubim and scarpas, the pillars of Jachin and Boaz, the mysterious Nehushtan, the bronze-sea and the lavers. These agree with the more or less clear allusions in the Old Testament to myths of creation, Eden, deluge, mountain of gods, Titan folk, world-dragons, heavenly hosts, &c., and also with the unearthed seals, tablets, altars, &c., representing mythical ideas. The ideas occur in varying forms from Egypt to Babylon and point to Oriental influences. It is remarkable that while the whole body of the temple took a short time to build, when one takes into account the instances in the Old Testament where myths have been rationalized, elevated, or otherwise removed from their older forms (e.g. the story of the birth of Moses, accounts of creation and deluge, &c.), or when one observes the subsequent uncompromising objection to a display of artistic meaning, implying that it aroused definite conceptions. To reinterpret all these features as mere symbols, the lumer of ancient days, is to avoid the problem of their introduction into the Temple, and to assume an advance of popular thought which is not confirmed by the retention and fresh developments of the old ideas both in the pseudepigraphical literature and in the literature of Rabbinical Judaism. The horses of the sun-god (2 Kings xxii. 10), too, belong to a group of ideas which may perhaps be associated with the plan of the Temple and with the old hymn of dedication (1 Kings viii. 12 seq.). At all events, when one considers the Babylonian-Assyrian conceptions of Shamash as the supreme and righteous judge, god of truth and justice, or the monochromism of Amenoph IV. and his fine hymn to the sun-god, it is certain that a corresponding Palestinian deity would not necessarily be without ethical and elevated associations. In short, the place which the Temple held in the life of a deity (Winckler, Keil. u. A.T. 224 sqq.; G. A. Smith, The Jerusalem, ii. 25 sqq.), and the deity Jehovah is curiously associated with

8 For examples of the persistence of the interrelated ideas—whether of astral significance or not is another question—see A. Jeremias, Babylon im Neuen Test. (Leipzig, 1905), Das Alte Test. im Orient. (Berlin and New York, 1903; Eng. trans. 1905), pp. 250 sqq.

9 For an excellent example of oriental religious thought, the funeral hymn of A. Sihh in the archives of Mari, which is not lessтип. Seven Tablets of Creation (London, 1907), pp. 222-237, and the specimens in R. W. Rogers, Rel. of Bab. and Ass. in its Relations to Israel (London, 1908), pp. 142-184. On ethical conceptions of heathen deities, see J. King, Development of Religion (New York, 1910), pp. 208-286.
PALESTINE

The uniqueness of the Old Testament religion is stamped upon the Mosaic legislation, which combines an archaic manner of ritual, ethical and civil enactments. As a whole, the economic conditions implied are pastoral and agricultural, and are relatively primitive; and the general rudimentary character of the legal ideas appears in the death penalty for the going ox (Exod. xxi. 28), resort to ordeal (Num. v. 11-31), and in the treatment of murder, family, marriage, slaves and property. The use of writing is once contemplated (the "bill of divorce," Deut. xxiv. 3), but not in ordinary business; oaths and symbols are used instead of written contracts, and the commercial law is notably scanty. The simplicity of the legislation is also manifest in the land-system of Lev. xxv., which is a modification of the readjustment of earlier laws. In property succession there is a feeling of tribal aloofness which would not be favourable to a central authority; and in fact the legal machinery is rude, and the carrying out of the law depends not so much upon courts and officials as upon religious considerations. If there is a supreme court, it is priestly (Deut. xvii. 8-13), and the legislation is bound up with the worship of Yahweh, who avenges wrong. This legislation appears as that of the Israelites, newly escaped from bondage in Egypt, joined by an ethno-religious element, the Canaanites, and living in the desert to enter and conquer the land of their ancestors. But it is remarkable that, although within the Old Testament itself there are certain different backgrounds, important variations and developments of law, these are relatively insignificant when we consider the profound changes from the 15th-13th centuries (apparent by the period of the conquest) to the close of Old Testament history. Yet, the conditions in Palestine during the monarchy reveal grave and complex social problems, marked class distinctions, and constant intercourse and commercial enterprise. There was no place for tribal exclusiveness, and the upkeep of a monarchy (the Old Testament) required in them a constant readiness of law to be made or revived, in which the result that antiquity of ideas is no criterion of date, and modern desert custom is more archaic than the great code of the Babylonian king Khammurabi (c. 2000 B.C.). Common law is merely part of the national life, and where it is implicated with religion there is no uniformity over an area comprising different groups of people. In such a case there is resort to a controlling authority, whether self-imposed (like the divine Pharaoh of the Amarna age), or mutually agreed (as Mahomet and the Arabian clans). It cannot be definitely said that the Old Testament code is the forerunner of modern law in Palestine. Of the three, indeed, it is known that it was being diligently copied by Assur-bani-pal's scribes (7th century b.c.), and in view of the circumstances of the Assyrian domination, it is probable that, so far as Palestinian economic conditions permitted, a legislation more progressive than the Pentateuch

Biblical Law.

Social Evolution.

Babylonian Law.
was in use. The discovery at Gezer of Assyrian contract-tablets (651 and 648 b.c.)—one relating to the sale of land by a certain Nathaniah—at least suggests the prevalence of Assyrian custom, and this is confirmed by the technical business methods illustrated in Jer. xxxii. Moreover, among the Jewish families settled in the 5th century B.C. in Egypt (Elephantine) and Babylonia (Nippur), the Babylonian-Assyrian principles are in vogue, and the presumptions are therefore not without some force. In Palestine is strengthened further by the otherwise uncountable appearance of Babylonian-Assyrian elements later in the Talmudic law. The denunciations in the prophetical writings of gross injustice, oppression and maladministration seem to presuppose definite laws, which either were ignored or which fell with severity upon the poor and unfortunate. They point to a considerable amount of written law, which was evidently class-legislation of an oppressive character. The Babylonian code is essentially class-legislation, and from the point of view of the idealism of the Old Testament prophets, which raises the rights of humanity above everything else, the steps which the code takes to safeguard the rights of property (slaves included therein) would naturally seem harsh. The code also regulates wages and prices, and shows a certain humanity towards debtors; and here any failure to carry out these laws would obviously be denounced. While the code, according to its own lights, aims at strict justice rather than charity, the Old Testament has reforming aims, and the religious, legislative, and social ideals are characterized by the insistence upon a lofty moral and ethical standard. These ideals are more religious than democratic. The appeal of the prophets, "is not for better institutions but for better men, not for the abolition of aristocratic privileges but for an honest and godly use of them." The writers have in view a people with individual and collective rights and responsibilities, united by feelings of the deepest loyalty and kindliness and by common adherence to their only God. There is a marked growth of refinement and of ideas of morality, and a condemnation of the shameless vice and oppression which went on amid a punctilious and splendid worship. It is extremely significant that between the teaching of the prophetical writings and the spirit of the Mosaic legislation there is an unmistakable bond. The Mosaic law, in its reforming aspect, is characterized by the denunciation of heathenism and heathenish usages which belong to the old religion. There is an insistence upon individual responsibility (Deut. xxxi. 9; xxxii. 16; 2 Kings iv. 6; cf. Jrr. xxxi. 20 seq.; Ezek. xvii., xxxii.), the more noteworthy when one considers the tenacity of the savage "tallio and its retention, though with some modifications, in the Babylonian code. There is a tendency to mitigate slavery, and the law of fugitive slaves is a particularly instructive innovation (Deut. xix. 15 seq., successively confined to the slave from outside). Corporal punishment is kept within limits (xxv. 3), but its very existence points to state-life rather than to the desert. Some attempt is made to diminish the destructiveness of war (xx. 10-26), but the passage is a remarkable illustration of a barbarous age. The endeavor is also made to improve the monarchy of the future (xvii. 14 seq.), but mainly on religious grounds, in order to diminish foreign intercourse. Note-worthy, again, is the appeal to religious and ethical considerations in order to prevent injustice to the widow and fatherless and to unhappy debtors; statutory laws are either unknown, or, more probably, are presupposed. The pentateuchal legislation as a whole is placed at the very beginning of Israelite national history. Amid constant periods of apostasy two epoch-making events stand out: (a) the rediscovery of Josiah concerning the Law (Deuteronomy is meant) in the time of Josiah (2 Kings xxii.), followed by a reform in sundry religious abuses dating from the foundation of the temple, and (b) the promulgation by Ezra of the Law of Yahweh, the law of Moses (Ezra. vii. 10, 14; Neh. vii. 1), in the age of Nehemiah, at the very close of biblical history. This legislation, endorsing (in certain well-defined portions) priestly authority, excludes a monarchy and stands at the head of a lengthy development in the way of expansion and interpretation. Its true place in biblical history has been the problem of generations of scholars, and the discovery (Dec. 1901-Jan. 1902) of the Babylonian code has brought new problems of relationship and of external influence. Although it is not beyond the bounds of strong probability that the code of Hammurabi must have been known in Palestine at some period, the Old Testament does not manifest such traces of the influence as might have been expected. Pentateuchal law is relatively unprogressive, it is marked by a characteristic simplicity, and by a spirit of reform, and the persisting primitive social conditions implied do not harmonize with other internal and external data. The existence of other laws, however, is to be presupposed, and there appear to be cases where the Babylonian code lies in the background. An independent authority concludes that "the co-existing likeness and differences argue for an independent reconstruction of ancient custom deeply influenced by Babylonian law." The questions are involved with the reforming spirit in biblical religion and history. On literary-historical grounds the Pentateuch in its present form is post-exilic, posterior to the old monarchies and to the ideals of the earlier prophetical writings. The laws are (a) partly contemporary collections (chiefly of a ritual and ceremonial character) and (b) partly collections of older and different origin, though now in post-exilic frames. The antiquity of certain principles and details is undeniable—as also in the Talmud—but since one must start from the organic connexions of the composite sources, the problems necessitate proper attention to the relation between the stages in the literary growth (backwards) and the vicissitudes which culminate in the post-exilic age. The simplicity of the legislation (traditionally associated with Melchizedek and Sinaim and with Kadesh in South Palestine), the humanitarian and reforming spirit, the condemnation of abuses and customs are features which, in view of the background and scope of Deuteronomy, can hardly be severed from the internal events which connect Palestine of the Assyrian supremacy with the time of Nehemiah. The introduction, spread and prominence of the name Yahweh, with the development of conceptions concerning his nature, his supremacy over other gods and the lofty monotheism which denied a plurality of gods, are questions which, like the biblical legislative ideas, cannot be adequately examined within the narrow compass of the Old Testament alone.

The biblical history is a "canonical" history which looks back to the patriarchs, the exodus from Egypt, the law-giving and the covenant with Yahweh at Sinai, the conquest of Palestine by the Israelite tribes, the monarchy, the rival kingdoms, the fall and exile of the northern tribes, and, later, of the southern (Judah), and the reconstructions of Judah in the times of Cyrus, Darius and Artaxerxes. It is the first known example of continuous historical writing (Genesis to Kings, Chronicles-Ezra-Nehemiah), and represents a deliberate effort to go back from 8 See Bible: Old Test. Criticis; Jews, §§ 16, 23.
9 C. H. W. Johns, Hastings’s Dict. Bible, v. 611 seq., who points out that the intrusiveness of priestly power into the law courts is a recurrance under changed conditions of a state of things from which the Pentateuch code of Israel is nearly free. The view formerly maintained by the present writer (Laws of Moses and Code of Hammurabi, 1903, pp. 203 sqq., 270 seq.) relies upon the view of social connexion between the exilic or post-exile section which unmistakably reflect Babylonian and related ideas, and the absence in other biblical sources of the features which an earlier comprehensive Babylonian influence would have produced, and it incorrectly assumed that the explanation might be found in the ordinary reconstructions of Israelite history. Cf. above, p. 182, n. 1.
10 On the later history of the canonical law (Mishnah, Gemara, &c.) see Talmud. The Talmud embodies law, which is related to the Pentateuch, not only in connexion but also in spirit; see L. N. Dembitz, Jews, Quart. Rev. xix. (1906), pp. 109 seq. For the efforts of the Rabbis to improve the legal principles in Galilee in 2nd and 3rd centuries A.D. see A. Böckler, "Publication No. 1, Jews’ Collectiv. Revival in Arabia from Palestine and internal social changes the archaic primitive law reappeared, now improved, however, by Mahomedan legislation.

Mosaic Code: Problems. 

O. C. Whitehouse, Century Bible, on Isa. x. 1 seq.

the days when the Judaeans separated from the Samaritans to the very beginning of the world. A characteristic tone pervades the history, even of the antediluvian age, from the creation of Adam; or rather, the history of the earliest times has been written under its influence. It reveals itself in the days of the Patriarchs, before the "Amarna" age—or rather in the narratives relating to these remote ancestors. It will be perceived that an objective attitude to the subjective writings must be adopted, the starting-point is the writings themselves and not individual preconceptions of the authentic history which they embody. Although there are various points of contact with Palestinian external history, there is a failure to deal with some events of obvious importance, and an emphasis upon others which are less conspicuous in any broad survey of the lands. The question to be asked is whether the sources from which unite to prove that various sources have been used, and that the structure of the compilation is a very intricate one, the steps in its growth being extremely obscure. In studying the internal peculiarities and the different circles of thought involved, it is found that they often imply written traditions which have a perspective different from that in which they are now placed. As regards the pre-monarchical period, some evidence points to a settlement (apparently from Aramaean localities) of the patriarchal arches, and of Israel (Jacob) and his sons, i.e. the children of Israel. It ignores the invasion into Egypt and the subsequent invasion of Canaan and the conquest of Judah. In the book of Joshua the entrance of the "children of Israel" is, in its present form, the sequel to the journey of the people along the coast of Edom and Moab after the escape from Egypt, and after a sojourn at Kadesh (Exodus-Deuteronomy). But other evidence also points to an entrance from Kadesh into Judah, and associates the kin of Moses, Kenites, Calebites and others. Thus, the tradition of a residence in Egypt, implied also in the stories of Joseph, has certainly become the "canonical" view, but the recollection was not shared by all the mixed peoples of Palestine and its environs and the background in the traditions must be added divergent traditions of the earlier population. Traditions, oral and written, with widely differing standpoints have been brought together and merged. Moreover, the elaborate account of the vast invasion and conquest, the expulsion, extermination and subjugation of earlier inhabitants, and the occupation of cities and fields, combine to form a picture which cannot be placed in Palestine during the 15th-12th centuries. It must not be denied that the recollection of some invasion may have been greatly idealized by late writers, but it happens that there were important immigrations and internal movements in the 8th-6th centuries, only preceding the post-exilic age, when this composite account in the Pentateuch and Joshua reached its present form. An enormous gap severs the pre-monarchical period from this age, and while the tribal schemes and tribal traditions can hardly be traced during the monarchs, the inclusion of Judah among the "sons" of Israel would not have originated when Judah and Israel were rival kingdoms. Yet the tribes survive in post-exilic literature and their traditions develop henceforth in Jubilees, Testament of the XII Patriarchs, etc. During the changes from the 8th century onwards, the non-monarchical constitution of the kingdom was largely preserved first in the north and then in the south, and while in the north the mingled peoples of Samaria came to regard themselves as Israelite, the southern portion, the tribe of Judah, proves in 1 Chron. ii. & iv. to be largely of half-Edomite blood. A common ground previous to the Samaritan schism is ignored; it is found only in the period before the rival kingdoms. The political history of these

1 In the art. JEWS, §§ 1-24, the biblical history is taken as the foundation, and the internal historical difficulties are noticed from stage to stage. In the present state of biblical historical criticism this plan seemed more advisable than any attempt to reconstruct the history; the necessity for some reconstruction will, however, be clear to the reader on the grounds of both the internal intricacies and the external evidence.

2 See, in the first instance, E. Meyer (and B. Luther), Die Israeliten und ihre Nachbarstämme (Halle, 1905); also art. GENESIS.

monarchies in the book of Kings is singularly slight considering the extensive body of tradition which may be pre-supposed, e.g. for the reigns of Jeroboam II. and Uzziah, or which may be inferred from the evidence for durations dealing with other periods. The scanty political data in the annalistic notices of the north kingdom are supplemented by more detailed narratives of a few years leading up to the rise of the last dynasty, that of Jehu. The historical problems involved point to a loss of perspective (JEWS, § 11), and the particular interest in the stories of Elijah and Elisha in an historical work suggests that the political records passed through the hands of communities whose interest lay in these figures. Old tradition suggests the "schools of the prophets" at Jericho, Gilgal and Bethel, and in fact the proximity of these places, Gilgal, Bethel, and Jericho, may be connected with a friendly and sometimes markedly favourable attitude to Judah in these narratives. The rise of the kingdom of Israel under Saul is treated at length, but more prominence is given to the influence of the prophet Samuel; and not only is Saul's history written from a didactic and prophetical standpoint (cf. similarly Ahab), but the great hero and ruler is handled locally as a petty king at Gibeah in Benjamin. The interest of the narratives clings around north Judah and Benjamin, and more attention is given to the rise of the Judaean dynasty, the holiness of Saul, and the romantic friendship between a son Jonathan and the Hebrew David. The history of the northern and southern kingdoms is handled separately in Kings; but in Samuel the rise of each is closely interwoven, and to the greater glory of David. The account of his steps contains details touching Judah and its relation to Israel which cannot be reconciled with certain traditions of Saul and the Ephraimitic Joshua. It combines amid diverse material a hero a Bethel and rival of Saul with India of a conqueror of this district; it introduces peculiar traditions of the ark and sanctuary, and it associates David with Ephraim, Calebites and the W Thương. It is evident that Samuel and Kings have become, in process of compilation, the natural sequel to the preceding books, but the conflicting features and the perplexing differences of standpoint recur elsewhere, and the relationship between them suggests that similar causes have been operative upon the compilation. The history of Judah is, broadly speaking, that of the Davidic dynasty and the Temple, and it begins at the time of the first king of the rival north. Care is taken to record the transference of secular power and of Yahweh's favour from Saul to David, and David accomplishes more successfully or on a larger scale the achievements of Jehovah to Saul. The religious history of Beersheba, which over the idyllost north and over the "high places" is the main theme, and with it is the supremacy of the native Zadokite priests of Jerusalem over others (e.g. of Shiloh), who are connected with the desert traditions. The political history is relatively slight and uneven, and the framework is rehearsed in Chronicles upon more developed lines and from a later ecclesiastical standpoint, which suggests that many traditions of the monarchy were extant in a late dress. Both books represent the same general trend of political events, even where the "canonical" representation is most open to criticism. Chronicles, with the exception of Ezra and Nehemiah, presents a continuity between the old Judah which fell in 586 and the "Ezra-Nehemiah". Historical material after 586 is scanty in the extreme, and, apart from the records of Nehemiah and a few other passages, the interest lies in the religious history of the communities and reformers who returned from Babylon. The late and composite book of Chronicles places at the head of the Israelite divisions, which ignore the exodus (1 Chron. vii. 1-14). Whence the theory that David was of S. Judaean and S. Palestinian origin (Marqart, Winckel, Cheyne, Encyc. Bibl. cols. 1020, 2618 seq.), and, also, that he knelt together the southern non-Judaean clans (see DAVID, JUDEA). But it is preferable to recognize different traditions of distinct origin and to inquire what genuine elements of history each may contain.

On the names, see Genealogy: Biblical; Levites, § 2, end, and Encyclopedia: Biblical. W. R. Harper (Amos and Hosea, 1905, p. liv.) observes: "Every year since the work of W. R. Smith brings Israel into closer relationship with Amurru (see *Ammon*. 2 Kings 7, 5; Gen. 19, 30)." Further, the *Journal of Biblical Literature*, (1908, p. 342), and the *Jahrbuch* of T. K. Cheyne, which writes (Decline and Fall of the Kingdom of Judah, London, 1908, p. xxviii): "... by far the greater part of the extant literary monuments of ancient Israel are precisely those monuments whose producers was most concerned with the problem of Amurru."

In the Old Testament popular feeling knows of two phases: Edom, the more powerful brother of Jacob (or Israel)—both could share in the traditions of Abraham, Isaac and Jacob—and the hatred of the treacherous Edom in the prophetic writings. Earlier phases have not survived, and the last-mentioned is relatively late, after the southern influence had left itself upon history, legend, the Temple and the ecclesiastical bodies. On these grounds, then, it would seem that among the vicissitudes of the 8th and following centuries may be placed a movement of the greatest importance for the history and for the growth of the Old Testament.
PALAESTINE  
OLD TESTAMENT HISTORY

fide divergences of tradition and to assume that more rudimentary or primitive thought than is actually the case. At least 6 the oldest nucleus of historical

2 A Samaritan (or Ephraimitic or N. Isr.ite) nucleus may be recognized in the books of Joshua—Kings; see the articles on these books in the Encyclopaedia Biblica (1906), §§ 502 seq., and G. Kittel, Die Antike Bibel Literaturgeschichte (Berlin, 1906), pp. 173-176; C. C. Torrey, Ezra Studies (Chicago, 1910), pp. 321 sqq. Old priestly rivalry between Judah and Babylon may explain why the mixed Samaritans became known as Cuthians; according to the prevailing theory their predecessors, the "ten tribes" had been exiled in the 8th century.

The term "written history" is applied to literature and history after the return of exiles and the religious reconstruction of Judah. This, on the traditional view, would be in 537, if there were then any prominent return. Failing this, one must descend to the time of Nehemiah, while the historical narrative in the book of Chronicles of the period between the mixed Samaritans became known as Cuthians; according to the prevailing theory their predecessors, the "ten tribes" had been exiled in the 8th century.

preserved is a problem in itself. It is very noteworthy, however, that, while no care was taken to preserve the history of the Chaldean and Babylonian periods, the records of the contemporaneous — and most contemporaneous — periods subsequently arose—the days of the Assyrian supremacy leave a much clearer imprint (cf. even the apocryphal book of Tobit). It may perhaps be no mere chance that with the dynasties of Oni and Jehu, the period of the Old Testament, we have the first indication that the structure of prophetic narrative is preserved (the times from Ahaz to Jecha), and that to the reign of the great Jeroboam (first half of the 8th century B.C.) we may historically trace the earliest of the extant prophetic writings (Amos and Hosea).

External evidence for Palestine, in emphasizing the necessity for a reconsideration of the serious difficulties in the Old Testament,-has led to a recognition of the phenomenon that the history of the land, its inhabitants, and its civilization, is impossible to trace. The land has been attended by the inscription of divine imprints on it. It is the heritage of the ancient and modern history of the world, and in the world of the spirit of mankind, a more striking proof of its uniqueness and of its permanent value. The Old Testament preserves traces of forgotten history and of that portion of the Oriental past which lay beyond the confines of the semi-heathen past. "Canonical" history—legislation and religion—assumed their present forms, and, while the earlier stages can only incompletely be traced, the book stands at the head of subsequent literature, paving the way for Christianity and Rabbinical Judaism, and influencing the growth of Mahommedanism. In leaving the land of its birth it has been taken as a whole, and for many centuries has been regarded as an infallible record of divinely granted knowledge and of divinely shaped history. During what relatively a very brief period deeper inquiry and newer knowledge have forced a slow, painful, but steady readjustment of religious conceptions and ideas, and the forms of the Old Testament have always struck a responsive chord, scientific knowledge of the evolution of man, of the world's history and of man's place in the universe, constantly reveals the distance between the value of facts and events for its own sake and to the life of mankind and the unessential character of that which has had inevitably to be relinquished. Yet, wonderful as the Old Testament has been, it is the very nature of the growth of a great human phenomenon when it is viewed, not in its own perspective of the unity of history—from the time of Adam, but in the history of Palestine and of the old Oriental area. It enshrines the result of centuries of the fashioning of a great idea and of great persons, of new conceptions of the relations between man and man, and man and God. Man's primary religious feeling seeks to bring him into association with the events and persons of his race, and that in which the greater part of the Presbyterians and most of the Old Testament is to be found, and which is subjected to the most rigorous intellectual criticism, was necessary in order to adapt new teaching to the commonly accepted beliefs of a bygone and primitive people. The place of the Old Testament in the general education of the world is at the close of one era and at the beginning of another. After a long and fruitful history in the development of the human race a definite stage seems to have been reached about 1500 B.C. which step by step led to those great religious traditions (Egyptian, Hebraic, Babylonian) which surrounded Palestine. These have influenced all subsequent civilization, and it is impossible that ancient Palestine could have been isolated from contemporary phenomena of the ancient Near East. The rise of a new idea of height (roughly 2500-1500 B.C.) these civilizations powerfully decayed, and we reach the middle of the first millennium B.C.—the age which is associated with the 4th-Deuter-Isaiah (Is. XI-xiv.), with Hesiod (Odisseus) and Homer (Iliad, Odyssey), and with Phociides and Socrates. This age, which gives midway between the second Egyptian dynasty (c. 3000 B.C.) and the present day, corresponds with the historical period of Old Thebes, and the rise of the Persians, Greeks, and Romans. In both Babylonian and Egypt it was an age of revival, but there was no longer any vitality in the old soil. In Palestine, on the other hand, the downfall of the old monarchies and the infusion of new blood gave fresh life to the land. There had indeed been previous immigrations, but the passage from the desert into the midst of Palestinian culture led to the adoption of the old semi-heathenism of the land, a declension, and a descent from the relative simplicity of tribal life. Now, however, the political conditions were favourable, and for a time Palestine could work out its own development. In these vicissitudes which led to the growth of the Old Testament in its preservation among a devoted people, the time is ripe for the consideration of the religious traditions of the land, the development of which has been-discussed, and the possibilities not to believe that the history of the past, with its manifold evolutions of thought and action, points the way to the religion of the future. (S. C. A.)

II.—From Alexander the Great to A.D. 70.

After the taking of Tyre Alexander decided to advance upon Egypt. With the exception of Gaza, the whole of Syria-Palestine (as it was called) had made its submission. That—in summary form—is the narrative of the Greek historian Arrian (Anabasis, ii. 25). Apart from the facts contained in this statement, the phrastic is of some importance, as the district of "Palestinian Syria" clearly includes more than the territory of the Phœlethes, which the adjectival properly denotes (Josephus, Antiquities, i. 6. 2, vili. 10). From the military point of view—and Arrian drew upon the memoirs of two of Alexander's lieutenants—the significant thing was that not merely was the coast route from Tyre to Gaza open, but also there was no danger of a flank attack as the expedient force proceeded. Palestinian Syria, in fact, is here synonymous with what is commonly called Palestine. Similarly Josephus quotes from Herodotus the statement that the Syriâns in Palestine are circumcised and profess to have learned the practice from the Egyptians (C. Apionem, i. 22, §§ 169, 171, Niese); and he comments that the Jews are the only inhabitants of Palestine who do so. These two examples of the wider use of the adjective and noun seem to testify to the forgotten predominance of the Phœlethes in the land of Canaan.

But, in spite of the statement and silence of Arrian, Jewish tradition, as reported by Josephus (Ant. xi. 8, 3 sqq.), represents the high priest at Jerusalem as refusing Alexander's offered alliance and request for supplies. The Samaritans—the Jews ignored in their records all other inhabitants of Palestine—counted his favour, but the Jews kept faith with Darius so long as he lived. Consequently a visit to Jerusalem is interpolated in the journey from Tyre to Gaza; and, Alexander, contrary to all expectation, is made to respect the high priest's passive resistance. He had seen his figure in a dream; and so he sacrificed to God according to his direction, inspected the book of Daniel, and gave them—and at their request the Jews of Babylon and Media—leave to follow their own laws. The Samaritans were prompt to claim like privileges, but were forced to confess that, though they were Hebrews, they were called the Sidonians of Shechem and were not Jews. The whole story seems to be merely a dramatic setting of the fact that in the new age inaugurated by Alexander the Jews enjoyed religious liberty. The Samaritans are the villains of the piece. But it is possible that all those in Palestine who accommodated the expedition as guides or exerted their influence with Jews of the Dispersion on behalf of Alexander.

It appears from this tradition that the Jews of Palestine occupied little more than Jerusalem. There were kings of Syria in the train of Alexander who thought he was mad when he bowed before the high priest. We may draw the inference that they formed an insignificant item in the population of a small province of the Persian Empire, and yet doubt whether they did actually refuse—alone of all the inhabitants of Palestine—to submit to the conqueror of the whole. At any rate they came into line with the rest of Syria and were included in the province of Coele-Syria, which extended from the Taurus and Lebanon range to Egypt. The province was entrusted first of all to Parmenio (Curitius iv. 1, 4) and by him handed over to Andromachus (Curitius iv. 5, 6). In 331 B.C. the Samaritans rebelled and burned Andromachus alive (Curitius iv. 8, 9); Alexander came up from Egypt, punished the rebels, and settled Macedonians in their city. The loyalty of the Jews he rewarded by granting them Samaritan territory free of tribute—according to a statement attributed by Josephus (c. Apionem, ii. 43, Niese) to Hecataenus.

Here the death of Alexander (323 B.C.) Poltomy Logi, who became satrap and then king of Egypt by right of conquest (Diodorus xviii. 39), invaded Coele-Syria in 320 B.C.

Poltomy I. Then or after the battle of Gaza in 312 B.C. Poltomy was opposed by the Jews and entered Jerusalem by taking advantage of the Sabbath rest (Agatharchides ap. Jos. c. Apionem i. 22, §§ 209 sqq.; cf. Ant. xii. 1, 1). Whenever this occupation
took place, Ptolemy became master of Palestine in 312 B.C., and through, as Josephus explains, he may have disgraced his title, Soter, by exemplary severity at the outset, later he created in the minds of the Jews the impression that in Palestine or in Egypt he was—in deed as well as in name—their preserver. Since 315 B.C. Palestine had been occupied by the forces of Antigonus. Ptolemy's successful forward movement was undertaken by the advice of Seleucus (Diodorus xix. 80 sqq.), who followed it up by regaining possession of Babylonia. So the Seleucid era began in 312 B.C. (cf. Maccabees, i. 10) and the dynasty of Seleucids justified the "prophecy" of Daniel (xi. 2): "And the king of the south (Ptolemy) shall be strong, but one of his captains (Seleucus) shall be strong above him and have dominion over him" (see Seleucid Dynasty).

Abandoned by his captain and future rival, Seleucus, Ptolemy retired and left Palestine to Antigonus for ten years. In 302 B.C., by terms of his alliance with Seleucus, Lysimachus and Cassander, he set out with a considerable force and subdued all the cities of Coele-Syria (Diodorus xx. 113). A rumour of the defeat of his allies sent him back from the siege of Sidon into Egypt, and in the partition of the empire, which followed their victory over Antigonus at Issus, he was ignored. But when Seleucus came to claim Palestine as part of his share, he found his position there already committed to another. From 301 B.C.—306 B.C. Palestine remained, with short interruptions, in the hands of the Ptolemies.

Of Palestine, as it was during this century of Egyptian domina tion, there is much to be learned from the traditions, reported by Josephus (Ant. xii. 4), in which the career of Joseph, the son of Tobiah, is glorified as the means whereby the national misfortunes were rectified. This Joseph was the nephew of Onias, son of Simon the Righteous, and high priest. Onias is described—in order to enhance the glory of Joseph—as a man of small intelligence and deficient in wealth. In consequence of this deficiency he failed to pay the tribute due from the people to Ptolemy, as his fathers had done, and is set down by Josephus as a miser who cared nothing for the protest of Ptolemy's special ambassador. Considering the character of Joseph as it was revealed by prosperity, one is tempted to find other explanations of his conduct than avarice. It is clearly indicated that the Jews as a whole were poor, and it is admitted that Onias was not wealthy. Perhaps it was the Sabbatical year, when no tribute was due. Perhaps Onias would not draw upon the sacred treasure in order to pay tribute to Ptolemy. In any case Joseph borrowed money from his friends in Samaria; and this point in the story proves that the Jews were disposed to have dealings with the Samari tans at the time and could require of them the last proof of friendship. Armed with his borrowed money, Joseph betook himself to Egypt; and there outbid the magnates of Syria when the taxes of the province were put up to auction. He had gained the ear of the king by entertaining his ambassador, and the representatives of the cities—the Greek cities of Syria—were discomfited. The king gave him troops and he borrowed more money from the king's friends. When he began to collect taxes he was met with refusal and insult at Ascalon and Scythopolis, but performed in each city and sent them the taxes to the king. Warned by these examples, the Syrians opened their gates to him and paid their taxes. For twenty-two years he held his office and was to all intents and purposes governor of Syria, Phoenicia and Samaria—"A good man" (Josephus calls him) "and a man of mind, who rescued the people of the Jews from poverty and weakness, and set them on the way to comparative splendour" (Ant. xii. 4, 10).

The story illustrates the rise of a wealthy class among the Jews of Palestine, to whom the tolerant and distant rule of the Ptolemies afforded wider opportunities. At the beginning it is said that the Samarians were prosperous and persecuted the Jews, but this Jewish hero embracing his opportunities reversed the situation and presumably paid the tribute due from the Jews by exacting more from the non-Jewish inhabitants of his province. He is a type of the Jews who embraced the Greek way of life as it was lived at Alexandria; but his influence in Palestine was insidious rather than actively subversive of Judaism. It was different when the Jews who wished to be men of the world took their Hellenism from the Seleucid court and courted the favour of Antiochus Epiphanes.

Halfway through this century (249 B.C.) the desultory warfare between Egypt and the Seleucid power came to a temporary end (Dan. xi. 6). Ptolemy II. Philadelphus gave his daughter Berenice with a great dowry to Antiochus II. Theos. When Ptolemy died (247 B.C.), Antiochus' divorced wife Laodice was restored to favour, and Antiochus died suddenly in order that she might regain her power. Berenice and her son were likewise removed from the path of the young Seleucus. In the vain hope of protecting his sister Berenice, the new king of Egypt, Ptolemy III. Euergetes I., invaded the Seleucid territory, "entered the fortress of the king of the north" (Dan. xi. 7 sqq.), and only returned—laden with spoils, images captured from Egypt by Cambyses, and captives (Jerome on Daniel loc. cit.)—to put down a domestic rebellion. Seleucus reconquered northern Syria without much difficulty (Justin xxxvii. 2, 1), but on an attempt to seize Palestine he was signalily defeated by Ptolemy (Justin xxvii. 2, 4).

In 223 B.C. Antiochus III. the Great came to the throne of the Seleucid Empire and set about extending its boundaries in all directions. A direct attempt on the part of Antiochus (221 B.C.) failed: the second succeeded by the treachery of Ptolemy's lieutenant, who had been recalled to Alexandria in consequence of his successful resistance to the earlier invasion. But in spite of this assistance the conquest of Coele-Syria was not quickly achieved; and when Antiochus advanced in 218 B.C. he was opposed by the Egyptians on land and sea. Nevertheless he made his way into Palestine, planted garrisons at Philothera on the Sea of Galilee and Scythopolis, and finally stormed Rabbath-ammon (Philippopolis) which was held by partisans of Egypt. Early in 217 B.C. Ptolemy Philopater led his forces towards Raphia, which with Gaza was now in the hands of Antiochus, and drove the invaders back.

The great multitude was given into his hand, but he was not to be strengthened permanently by his triumph (Dan. xi. 11 sqq.). Polybius describes his triumphal progress (v. 86): "All the cities vied with one another in returning to their allegiance. The inhabitants of those parts are always ready to accommodate themselves to the situation of the moment and prompt to pay the courtesies required by the occasion. And in this case it was natural enough because of their deep-seated affection for the royal house of Alexandria." When Ptolemy Philopater died in 205 B.C., Antiochus and Philip of Macedon, his nominal friends, made a secret compact for the division of his possessions outside Egypt. The time had come of which Daniel (xi. 13 sqq.) says: "The king of the north shall return after certain years with a great army and with much riches. And in those times there shall many stand up against the king of the south; also the robbers of thy people shall exalt themselves to establish the vision; but they shall fall." Palestine was apparently allotted to Antiochus and he came to take it, while Philip created a diversion in Thrace. In 215 B.C. P. and Asa the Jewish king, and if Daniel is to be trusted, there were other Jews who rose up to shake off the yoke of foreign supremacy, Seleucid or Egyptian, and succeeded only in rendering the triumph of Antiochus easier of achievement. But in the year 200 B.C. Rome intervened with an embassy, which declared war upon Philip and directed Antiochus and Ptolemy to make peace (Polyb. xvi. 27). And in 198 B.C. Antiochus heard that Scopas, Ptolemy's hired commander-in-chief had retained Coele-Syria (Polyb. xvi. 39) and had subdued the nation of the Jews in the winter. For these sufficient reasons Antiochus hurried back and defeated Scopas at Paneria, which was known later as Caesarea Philippi (Polyb. xvi. 18 sqq.). After his victory he took formal possession of Batanea, Samaria, Abila and Gadara; and after a little the Jews who dwelt round about the shrine called Jerusalem came over to him" (Polyb. xvi. 39). Only Gaza withstood him, as it withstood Alexander; and Polybius (xvi. 39) goes to
praise their fidelity to Ptolemy. The siege of Gaza was famous; but in the end the city was taken by storm, and Antiochus, secure at last of the province, which his ancestors had so long coveted, was at peace with Ptolemy, as the Roman embassy directed. From Palestine Antiochus turned to the Greek cities of Asia Minor, and by 196 B.C. he was in Thrace. There he was confronted by the ambassadors of Rome, who expressed their surprise at his action. Antiochus replied that he was recovering the territory won by Seleucus his ancestor, and inquired by what right did the Romans dispute with him about the free cities in Asia (Polyb. xviii. 33 sqq.). The conference was broken off by a false report of Ptolemy’s death, but war between Rome and Antiochus was clearly inevitable—and Antiochus was joined by Hannibal. After much diplomacy, Antiochus advanced into Greece and Rome declared war upon him in 191 B.C. (Livy xxvii. 1). He was defeated on the sea and driven first out of Greece and then out of Asia Minor. His army was practically destroyed at Magnesia, and he was forced to accept the terms of peace, which the Romans had offered and he had refused before the battle. By the peace of Apamea (188 B.C.) he abandoned all territory beyond the Taurus and agreed to pay the whole cost of the war. He had stood in the beautiful land—the land of Israel—with destruction in his hand. He had made agreement with Ptolemy. He had turned his face unto the isles and had taken many. But now a commander had put an end to his defiance and had even returned his reproach unto him (Dan. xi. 16—18). After Magnesia men said “King Antiochus the Great was” (Appian, Syr. 37); and the byword was soon justified in fact, for he plundered a temple of Bel at Elymais to replenish his exhausted treasury and met the fitting punishment from the gods at the hands of the inhabitants (Diodorus xxix. 15). He stumbled and fell and was not found (Dan. xi. 10).

The need which drove Antiochus to this sacrilege rested heavily upon his successor Seleucus IV. (reigned 187—175 B.C.).

Seleucus IV. The indemnity still had to be paid and Daniel designates Seleucus as “one that shall cause an exactor to pass through the glory of the kingdom” (xi. 20). A tradition preserved in 2 Macc. iii. describes the attempt of Heliodorus, the Seleucid prime minister, to plunder the temple at Jerusalem. The holy city lay in perfect peace and the laws were very well kept because of the piety of Onias the high priest. But one Simon, a Benjamite, who had become guardian of the temple, quarrelled with Onias about the city market, and reported to the governor of Coele-Syria and Phoenicia that the treasury was full of untold sums of money. The priests and people besought Heliodorus to leave this sacred treasure untouched, but he persisted and—in answer to their prayers—was overthrown by a horse with a terrible rider and scourged by two youths. Onias, fearful of the consequences, offered a sacrifice for his restoration, and the two youths appeared to him with the message that he was restored for the sake of Onias. The description of the previous tranquility may be exaggerated, though it is clear that the Jews, like the other inhabitants of Palestine, must have been left very much to themselves; but the enmity between the adherents of Simon and the pious Jews, who supported and venerated Onias, seems to be a necessary precondition of the state of affairs soon to be revealed. There were already Jews who wished to make terms with their overlords at all costs.

When Antiochus IV, Epiphanes (175—164 B.C.) succeeded to the throne, Jason whose name betrays a leaning towards Hellenism—the brother of Onias, offered the king a bribe for the high priesthood and another for leave to convert Jerusalem into a Greek city (2 Macc. iv. 7 sqq.). Antiochus had spent his youth at Rome as a hostage, and the death of Seleucus found him filling the office of war minister at Athens. The Hellenistic Jews were, therefore, his natural allies, and allies were very necessary to him if he was to establish himself in Syria. Onias had proceeded to Antioch to explain the disorder and bloodshed due to Jason’s followers, and so Jason, high priest of the Jews by grace of Antiochus, had his way. The existing privileges, which the Jews owed to their ambassador to Rome, were thrust aside. In defiance of the law a gymnasium was set up under the shadow of the citadel. The young men of the upper classes assumed the Greek hat, and were banded together into a guild of ephebi on the Greek model. In fact Jason established in Jerusalem the institutions which Strabo expressly describes as visible signs of the Greek way of life—“gymnasia and associations of ephebi and clans and Greek names borne by Romans” (v. p. 264, referring to Ncapolis)—and that on his own initiative. The party who wished to make a covenant with the heathen (1 Macc. i. 11 sqq.) were in the majority; and so far and so long as they were in the ascendant Antiochus was rid of his chief danger in Palestine, the debatable land between Syria and Egypt. At first Egypt was well disposed to him, as Cleopatra his sister was regent. But she died in 173 B.C. There was no occasion for the possession of Palestine began in 175 B.C., when Rome was preoccupied with the war against Perseus of Macedonia. Antiochus sent an ambassador to Rome to protest that Ptolemy, contrary to all law and equity, was attacking him (Polyb. xxvii. 17). In self defence, therefore, Antiochus advanced through Palestine and defeated the Egyptian army near Pelusium on the frontier. At the news the young king, Ptolemy Philometor, fled by sea, only to fall into his uncle’s hands; but his younger brother, Ptolemy Euergetes II., was proclaimed king by the people of Alexandria (Polyb. xxix. 8). Thus Antiochus entered Egypt as the champion of the rightful king and laid siege to Alexandria, which was held by the usurper. When he abandoned the siege and returned to Syria, Philometor, whom he had established at Memphis, was reconciled with his brother, being convinced of his protector’s duplicity by the fact that he left a Syrian garrison in Pelusium. In 168 B.C. Antiochus returned and found that the pretext for his presence there was gone. Moreover the defeat of Perseus at Pydna set Rome free to take a strong line in Egypt. As he approached Alexandria Antiochus met the Roman ambassador, and, after a brief attempt at evasion, accepted his ultimatum on the spot. He evacuated Egypt and returned home cowed (Dan. xi. 30; cf. Polyb. xxix. 11). Later he could attend the celebration of the Roman triumph over Macedonia, and surpass it by a festival at Antioch in honour of his conquest of Egypt (Polyb. xxxi. 3—5); but the loss of Pelusium made it imperative that he should be sure of Palestine. His friends the Hellenizing Jews had split up into factions. Menelaus, the brother of Simon the Benjamite, had bought the high-priesthood over the head of Jason, who fled into the country of the Ammonites, in 172 B.C. (2 Macc. iv. 23 sqq.). To secure his position (for he was not even of the priestly tribe) Menelaus persuaded the deputy of Antiochus, who was dealing with a revolt at Tarsus, to put Onias to death. Antiochus, on his return, had his deputy executed and kept for the dead Onias. But Menelaus managed to retain his position, and his accusers were put to death. Antiochus could pity Onias, who had been tempted from the sanctuary at Daphne, but he needed an ally in Jerusalem—and money. Then, during the first or second invasion of Egypt, Jason, hearing that Antiochus was dead, returned suddenly and massacred all the followers of Menelaus who did not take refuge in the citadel. He had some claim to the loyalty of such pious Jews as remained, because he was of the tribe of Levi—in spite of the means he, like Menelaus, had employed to get the high-priesthood. His party was composed of the strength of the party who wished to adopt the Greek way of life without consenting to the complete substitution of the authority of Antiochus for the prescriptions of the Mosaic Law. It was also a warning to Antiochus, who returned to exact a bloody vengeance and to loot the Temple (160 or 168 B.C.). After the evacuation of Egypt, Antiochus followed out the policy which Jason had suggested to him at the first. Jerusalem was suddenly occupied by one of his captains, and a garrison was planted in a new fortress on Mount Zion. Then to coerce the Jews into conformity, the Law was outraged in the Holy Place. The worship of Zeus Olympius replaced the worship of Yahweh, and swive
were offered as in the Eleusinian mysteries. At the same time the Samaritan temple at Shechem was made over to Zeus Xensus; it is probable that the Samaritans were, like the Jews, divided into two parties. The practice of Judaism was prohibited by a royal edict (1 Macc. 1. 41-63; 2 Macc. vii. 42)), and some of the Jews died rather than disobey the law of Moses. It is legitimate to suppose that this attitude would have surprised Antiochus if he had heard of it. His Jewish friends, first Jason and then Menelaus, had been enlightened enough to throw off their prejudices, and, so far as he could know, they represented the majority of the Jews. Zeus was for him the supreme god of the Greek pantheon, and the syncretism, which he suggested for the sake of uniformity in his empire, assuredly involved no indignity to the only God of the Jews. At Athens, Antiochus began to build a vast temple of Zeus Olympius in place of one begun by Peisistratus; but it was only finished by Hadrian in a.d. 136. Zeus Olympius was figured on his coins, and he erected a statue of Zeus Olympius in the Temple of Apollo at Daphne. More, he identified himself—Epiphanes, God Manifest—with Zeus, when he magnified himself above all other gods (Dan. xi. 37). To the minority of strict Jews he was therefore "the abomination of desolation standing where he ought not"; but the majority he carried with him, and, when he was dying (163 B.C.) during his eastern campaigns, he wrote to the loyal Jews as their fellow citizen and general, exhorting them to preserve their religion ands their language, and his son, on the ground that his son would continue his policy in gentleness and kindness, and so maintain friendly relations with them (2 Macc. ix.).

For the Jews who still desired the name the policy of Antiochus wore a very different aspect. Many of them became martyrs for the Law, and for a time none would raise his hand to defend himself on the Sabbath if at all. No record remains of the success of the Athenian missionary whom Antiochus sent to preach the new Catholicism; but Jews of Antiochus' own time and work thoroughly. At last a priestly family at a village called Modeia committed themselves to active resistance; and, when they suspended the Sabbath law for purposes of self-defence, they were joined by the Hasidaeans (Assidaeans), who seem to have been the spiritual ancestors of the Pharisees. The situation was plain enough: unless the particular law of the Sabbath was suspended there would soon have been none to keep the Law at all in Palestine. Jerusalem had apostatized, but the country so far as it was populated by Jews was faithful. Under Judas Maccabaeus the outlaws wandered up and down re-establishing by force their proscribed religion. In 163 B.C. he formed, with some of their enemies, a council which condemned the measure of toleration they required with the approval of Rome, and in 162 B.C. the temple was purged of its desecration. But Judas did not lay down his arms, and added to his resources by rescuing the Jews of Galilee and Gilead and settling them in Judaea (1 Macc. v.). The Nabataean Arabs and the Greeks of Scythopolis befriended them, but the province generally was hostile. In spite of their hostility Judas more than held his own until the regent defeated him at Bethzachariah. The rebels were driven back on Mount Zion and were there besieged (162 B.C.). The rumour of a pretender to the throne saved them from destruction, and they capitulated, exchanging the strongholds they had for their lives. At any rate the time of compulsory fusion with the Greeks was ended once for all. In 162 B.C. Demetrius, the son of Scleucus, escaped from Rome and was proclaimed king. Like Antiochus Epiphanes, who also had spent his youth as a hostage in Rome, he was inclined to listen to the Hellenizing Jews, whom he found assembled in full force at Antioch, and to support them against Judas, who was now supreme in Judaea. But he dealt more subtly with them; instead of a pagan missionary he sent them Alcimus, a legitimate high-priest, who detached the Hasidaeans from Judas. Indeed, Alcimus and his company did more mischief among the Israelites than the heathen (1 Macc. vii. 25) and Judas took vengeance on those who deserted from him. Nicanor was appointed governor and prevailed upon Judas to settle down like an ordinary citizen. But Alcimus complained to the king and Judas fled just in time to escape being sent to Antioch as a prisoner. In the battle of Adasa, which soon followed, Nicanor was defeated and his forces annihilated, thanks to the Jews who came out from all the villages of Judaea (1 Macc. vii. 46). At this point (162 B.C.) Judas sent an embassy to Rome and an alliance was concluded (1 Macc. viii.), too late to save Judas from the determined and victorious attack of Demetrius. The death of Judas at Elasa left the field open to the apostates, and his followers were reduced to the level of roving brigands. The Syrian general made fruitless attempts to capture them, and build forts in Judaea whose garrisons should harass Israel (1 Macc. ix. 59-55), but Jonathan and Simon, brothers of Judas, found their power increase until Jonathan ruled at Michmash as judge and destroyed the godless out of Israel (1 Macc. ix. 73).

In 153 B.C. there appeared another of the series of pretenders to the Syrian throne, to whose rivalry Jonathan, and Simon after him, owed the position they acquired for themselves and their nation. Jonathan was recognized as the head of the Jews, and his prestige and power were such that the charges of the Hellenizing Jews received scant attention. As the years went on he became Stratagus and the Syrian garrisons were withdrawn from all the strongholds except Jerusalem and Bethzur. In 152 B.C. he defeated the governor of Coe-Syria in another civil war and received Ekrhon as his personal reward—as it was said in the name of the prophet Zachariah (ix. 7), "and Ekrhon shall be as a Jebusite." The king for whom he fought was defeated; but his successor acceded to the demands of Jonathan, added three districts of Samaria to Judaea and freed the whole from tribute. The next king confirmed this and appointed Simon military commander of the district stretching from Tyre to Egypt. So with Syrian as well as Jewish troops the brothers set about subduing Palestine; and Jonathan sent ambassadors in the name of the high-priest and people of the Jews to Rome (151 B.C.). In spite of the treacherous murder of Jonathan by the Syrian general, the prosperity of the Jews was more than maintained by Simon. The port of Joppa, which was already occupied by a Jewish garrison, was cleared of its inhabitants and populated by Jews. Finally, in 141 B.C., the new era began: the yoke of the heathen was taken away from Israel and Simon was declared high-priest and general and ruler of the Jews for ever until there should arise a faithful prophet (1 Macc. xiii. 41, 41. 41).

In 145 B.C. the political ambitions of the Jews were rudely checked: a new king of Syria, Antiochus Sidetes, resented their exclusion from allies at Joppa and Gazer and drove them back into Jerusalem. In 134 famine compelled John Hyrcanus, who had succeeded his father Simon, to a belated compliance with the king's demands. The Jews laid down their arms, dismantled Jerusalem, and agreed to pay rent for Joppa and Gazer. But in 129 B.C. Antiochus died fighting in the East and for sixty-five years the Jews enjoyed independence. John Hyrcanus was not slow to take advantage of his opportunities. He conquered the Samaritans and destroyed the temple on Mount Gerizim. He subjugated the Edomites and compelled them to submit to Judaea and Gazer and drove them back into Jona. In 122 Jonathan and Simon, who had won the nucleus of the Hasmonaean race, called himself king and followed his father's example by compelling the Ituraeans to become Jews, and so creating the Galilee of New Testament times. In this case, as in that of the Edomites, it is natural to suppose that there existed already a nucleus of professing Jews which made the wholesale conversion possible. By this time (105 B.C.) it was clear that the Hasmonaeans were—or from the point of view of a purist—practically indistinguishable, except that they did not abandon the formal observances of Judaism, and even enforced them upon foreigners. Consequently the Jews were divided into two parties—Pharisees and Sadducees—of whom the Pharisees cared only for doing or
enduring the will of God as revealed in Scripture or in the events of history. This division bore bitter fruit in the reign of
Pharisees Alexander Jannaeus (104–78 B.C.), who by a standing
army achieved a territorial expansion which was little
to the mind of the Pharisees. At first his attack upon
Ptolemais brought him into conflict with Egypt, in which he was
worsted, but the Jewish general who commanded the Egyptian
army persuaded the queen to evacuate Palestine. Then he
turned to the country east of the Jordan, and then to Phœnicia.
Later he was utterly defeated by a king of Arabia and fled to
Jerusalem, only to find that the Pharisees had raised his people
against him and would only be satisfied by his death. The
rebels’ appeal to the Seleucid governor of part of Syria (88 B.C.)
caused a revulsion in his favour, and finally he made peace by
more than Roman methods. Aretas, the Arabian king, pressed
him hard on the south and the east, but he was able to make
some conquests still on the east of the Jordan. In spite of his
squarre with the Pharisees, he seems to have offered the cities
he conquered the choice—between Judaism and destruction
(Jos. Ant. xiii. 15, 4). Under Alexander, his widow (78–66 B.C.),
the Pharisees ruled the Jews and no expansion of the kingdom was
attempted. It was threatened by Tigranes, king of Armenia,
who then held the Syrian Empire, but a bribe and the imminence
(Jos. Ant. xiii. 16, 4; War i. 5, 3) saved it. At
her death a civil war began between her sons, which left the
way open for Rome. Pompey’s lieutenant Scarrus
entered Syria in 65 B.C., after the final defeat of
Mithradates, and Pompey soon followed to take command of
the situation. Three parties pleaded before him, the
representatives of the rival kings and a deputation from the people
who wished to obey no king, but only the priests of their God
(Jos. Ant. xiv. 3, 2.) Pompey finally decided in favour of Hyrcanus,
and entered Jerusalem by the aid of his party. The adherents
of Aristobulus seized and held the temple mount against the
Romans, but on the Day of Atonement of the year 63 B.C.
their position was stormed and the priests were cut down at
the altars (Jos. Ant. xiv. 4, 2–4; War i. 7). Hyrcanus was left
as high-priest—not king of the Jews—and his territory was
curtailed. The coast towns and the Decapolis, together with
Samaria and Scythopolis, were incorporated in the new Roman
province of Syria.
In 61 B.C. Pompey celebrated the third of a series of triumphs
over Africa, Europe and Asia, and in his train, among the
prisoners of war, was Aristobulus, king of Judea. Palestine
meanwhile remained quiet until 57 B.C., when Alexander, the
son of Aristobulus, escaped from his Roman captivity and attempted
to make himself master of his father’s kingdom. Anlus Gabinius, the new proconsul of Syria, defeated his hastily
gathered forces, besieged him in one of the fortresses he had
managed to acquire, and induced him to abandon his attempt
in return for his life. The impotence of Hyrcanus was so
obvious that Gabinius proceeded to deprive him of all political
power by dividing the country into five cantons, having Judæa-
lem, Gazara, Amathus, Jericho, and Sepphoris, as their authorities.
Other raids, headed by Aristobulus, or his son, or his adherent
Peitholus, disturbed Palestine during the interval between
57 and 51 B.C. and served to create a prejudice against the Jews
in the mind of their masters. But with the civil wars which
began in 40 B.C. there came opportunities which Hyrcanus, at
the instance of Antipater, used to ingratiate himself with Caesar.
Once more, as in the days of Simon, the suzerain power was
divided against itself, and, though Rome was as strong as the
Seleucids had been weak, Caesar was grateful. For timely
help in the Syrian War of 47 B.C. Hyrcanus was rewarded
by the title of Ethnarch, and Antipater with the Roman citizen-
ship and the office of procurator of Judæa. The sons of Antipater
became deputies for their father; and it appears that Galilee,
which was entrusted to Herod, fell within his jurisdiction.
The power of this Idumaean family provoked popular
risings and Antipater was poisoned. But Herod held
his ground as governor of Coele-Syria and retained the
favour of Cassius and Mark Antony in turn, despite the
complaints of the Jewish nobility. In 42 B.C., however, the
tyrant of Tyre encroached upon Galilean territory and in 40 B.C.
Herod had to fly for his life before the Parthians. Even as a
handless fugitive Herod could count upon Roman support. At
the instance of Mark Antony, and with the assent of Octavian,
the senate declared him king of Judæa, and after two years’
fighting he made his title good. Antigonus, whom the Parthians
had set upon his throne, was bellicose by his Roman allies
(37 B.C.). As king of the Jews (37–4 B.C.) Herod was completely
subject and eagerly subservient to his Roman masters. In
34 B.C. (for example) or earlier, Mark Antony gave Cleopatra
the whole of Phœnicia and the coast of the Phœnicians south of
Eleusines, with the exception only of Tyre and Sidon, part of the
Arabian territory and the district of Jericho. Herod acquired
and leased Jericho, the most fertile part of his kingdom, from
Cleopatra. In the war between Antony and Octavian Cleopatra
prevented Herod from joining Antony and so left him free to
pay court to Octavian after Actium (31 B.C.). A year later
Octavian restored to the Jewish kingdom Jericho, Gadara,
Hippos, Samaria, Gaza and Anthedon, Joppa and Straton’s Tower
(Caesarea). Secure of his position, Herod began to build temples
and palaces and whole cities up and down Palestine as visible
embellishments of the Greek civilization which was to distinguish
the Roman Empire from barbarian lands. A sedulous courtier,
he was rewarded with the confidence of Augustus, who ordered
the procurators of Syria to do nothing without taking his advice.
But with the establishment of (relatively) universal peace
Palaestate ceased to be a factor in general history. Herod the Great
enlarged his borders and fostered the Greek civilization of the
cities under his sway. After his death his kingdom was dis-
membered and divided among his four sons under the direct rule of Rome.
Herod Agrippa I. (A.D. 41–44) revived the glories of the reign
of Alexander and won the favour of the Pharisees; but his attempt
to form a confederacy of client-princes was nipped in the bud.
Even the war which ended with the destruction of Jerusalem
in A.D. 70, and the rebellion under Hadrian, which led to the
eject forbidding the Jews to enter Jerusalem, are matters
proper to the history of the Jews.
References to authorities other than Josephus are given in the
course of the article: his Antiquities and Wars are the chief source
for the period. All modern authorities are given by J. H. A. H.

III.—From A.D. 70 to the Present Day.
Owing to the peculiar conditions of the land and the varied
interests involved in it, the later history may best be treated
in four sections. In the first the general political history will
be set forth; in the second a sketch will be given of the cult
of the “ holy places”; the third will contain some particulars
regarding the history of modern colonization by foreigners,
which, while it has not affected the political status of the country,
has produced very considerable modifications in its population
and life; and the fourth will consist of a brief notice of the
progress of exploration and scientific research whereby our
knowledge of the past and the present of the land has been
systematized.

1. Political History from A.D. 70.—The destruction of Jerusalem
was followed by the dispersal of the Jews, of whom till then
it had been the religious and political centre. The
first seat of the sanhedrin was at Jamnia (Yebna),
The Dispersion.
where the Rabbinic system began to be formulated.
This extraordinary spiritual tyranny, for it seems little else,
acquired a wonderful hold and exercised a singularly unifying
power over the scattered nation. The sharp contrasts between
its compulsory religious observances and those of the rest
of the world prevented such an absorption of the Jewish people
into the Roman Empire as had caused the disappearance
of the ten tribes of Israel by their merging with the Assyrians.
It would appear that at first, after the destruction of the
city, no specially repressive measures were contemplated by the
conquering Romans, who rather attempted to reconcile the Jews
to their subject state by a leniency which had proved successful
in the case of other tribes brought by conquest within the empire.
But they had reckoned without the isolating influence of Rabbinism. Here and there small insurrections took place, in themselves easily suppressed, but showing the Romans that they had a turbulent and troublesome people to deal with. At last Hadrian determined to stamp out this aggressive Jewish nationalism. He issued an edict forbidding the reading of the law, the observance of the Sabbath, and the rite of circumcision; and determined to convert the still half-ruined Jerusalem into a Roman colony.

The consequence of this edict was the meteor-like outbreak of Bar-Cochebas (q.v.) A.D. 132-135. The origin of this person and the history of his rise to power are unknown. Nor is it certain whether he himself at first made a personal claim to be the promised Messiah; but it was his claim that took such a hold on the distinguished Rabbi Akiba, then the most influential Jew alive, which placed him in the command of the insurrection, with 200,000 men at his command.

Jerusalem was captured, as well as a large number of strongholds and villages throughout the country. Julius Severus, sent with an immense army by Hadrian, came to quell the insurrection. He recaptured Jerusalem, at the siege of which Bar-Cochebas himself was slain. The rebels fled to Betheer—the modern Bittir, near Jerusalem, where the fortress garrisoned by them still remains, under the name Khurbet el-Yahud, or “Ruin of the Jews” and were there defeated and slaughtered in a singularly encounter. It is said that as many as 580,000 men were slain. Hadrian then turned Jerusalem into a Roman colony, changed its name to Aelia Capitolina, built a temple of Jupiter on the site of the Jewish temple and (it is alleged) a temple of Venus on the site of the Holy Sepulchre, and forbade any Jew, on pain of death, to appear within sight of the city.

This disaster was the death-blow to hopes of a Jewish national independence, and the leaders of the people devoted themselves henceforth to legal and religious study in the Rabbinical schools, which from A.D. 135 (the year of the suppression of the revolt) had developed in various towns in the hinterland desolated province of Galilee. Shefa 'Amir (Sha'irum), Sha'arah (Sha'araim) and especially Tiberiya (Tibersia) became centres of this learning; and the remains of synagogues of the 2nd or 3rd century which still exist in Galilee attest the strength of Judaism in that district during the years following the abortive attempt of Bar-Cochebas.

Palestine thus continued directly under Roman rule. In A.D. 105, under Trajan, Cornelius Palma added Gilead and Moab to the empire. In 295 Auranitis, Batanea and Trachonitis were added to the province.

The pilgrimage of the Empress Helena properly belongs to the section into which we have divided this history; we therefore pass it over for the present. The conversion of Constantine to Christianity—or rather the profession of Christianity by Constantine—seemed likely to result in another Jewish persecution, foreshadowed by severe repressive edicts. This, however, was averted by the emperor's death.

The progress of the corrupt Christianity of the empire of Byzantium was checked for a while under Julian the Apostate, who, among other indications of his opposition to Christianity, rescinded the edicts against the Jews on his coming to the throne in 361, and granted them the right to enter the sanctuary of the Jewish temple. The latter work was interrupted almost as soon as begun by an extraordinary phenomenon—the outburst of flames and loud detonations, easily explained at the time as a divine judgment on this direct attempt to falsify the prophecy of Christ. It has been ingeniously suggested in this more scientific generation that the explosion was due to the ignition of some forgotten store of oil or naphtha, such as was said to have been stored in the temple (2 Macc. i. 19-23, 36), and similar to a store discovered, with less disastrous consequences, in another part of the city early in the 10th century. 1

On the partition of the empire in A.D. 395 Palestine naturally fell to the share of the emperor of the East. From this onward for more than two hundred years there is a period of comparative quiet in Palestine, with no external political interference. The country was nominally Christian; the only history it displays being that of the development of pilgrimage and of the cult of holy places and relics, varied by occasional persecutions of the Jews. The elaborate building operations of Justinian (527-565) must not be forgotten. The “Golden Gate” of the Temple area and part of the church which is now the El-Aksa Mosque at Jerusalem, are due to him.

Not till 611 do we find any event of importance in the uninteresting record of Byzantine sovereignty. But this and the following years were signalized by a series of catastrophes of the first magnitude. Chosroes II. (q.v.), king of Persia, made an inroad into Syria: joined by the Jews anxious to avenge the captivity of the priests, swept over the country, carrying plunder and destruction wherever he went. Monasteries and churches were burnt and sacked, and Jerusalem was taken; the Holy Sepulchre church was destroyed and its treasures carried off; the other churches were likewise razed to the ground; the patriarch was taken prisoner. It is alleged that 90,000 persons were massacred. Thus for a time the province of Syria with Palestine was lost to the empire of Byzantium.

The Emperor Heraclius reconquered the lost territory in 629. But his triumph was short-lived. A formidable enemy was already on the way, and the final wresting of Syria from the feble relics of the Roman Empire was imminent.

The separate tribal units of Arabia, more or less impotent when divided and at war with one another, received for the first time an indissoluble bond of union from the prophet Mahomet, whose perfect knowledge of human nature (at least of Arab human nature) enabled him to formulate a religious system that was calculated to command an enthusiastic acceptance by the tribes to which it was primarily addressed. His successor, Abu Bekr, called the Arabian nation to unite and avenge the mistery of conquest of Syria from the Christians. Heraclius had not sufficient time to prepare to meet this new foe, and was defeated in his first engagement with Abu Bekr. (For the general history of this period see CALIPHATE). The latter seized Bosra and proceeded to march to Damascus. He died, however, before carrying out his design (A.D. 634), and was succeeded by Omar, who, after a siege of seventy days entered the city. Other towns fell in turn, such as Caesarea, Schusich (Samaria), Nablus (Shechem), Lydda, Jaffa.

Meanwhile Heracles was not idle. He collected a huge army and invaded in 636 the marchades against the Arabs. The latter retreated to the Yarmuk River, where the Byzantines met them. Betrayed, it is said, by a Christian who had suffered personal wrongs at the hands of certain of the Byzantine generals, the army of Heraclius was utterly defeated, and with it fell the Byzantine Empire in Syria and Palestine.

After this victory Omar's army marched against Jerusalem, which after a feble resistance capitulated. The terms of peace, though on the whole moderate, were of a galling and humiliating nature, being ingeniously contrived to make the Christians ever conscious of their own inferiority. Restrictions in church-building, in dress, in the use of beasts of burden, in social intercourse with Moslems, and in the use of bells and of the sign of the cross were enforced. When these terms were agreed upon and signed Omar, under the leadership of the Christian patriarch Sophronius, visited the Holy Rock (the prayer-place of David and the site of the Jewish temple). This he found to be defiled with filth, spread upon it by the Christians in despite of the Jews. Omar and his followers in person cleaned it, and established the place of prayer which, though later rebuilt, has borne his name ever since.

Disensions and rivalries soon broke out among the Moslem leaders, and in 661 Muawiya, the first caliph of the Omayyad dynasty, transferred the seat of the caliphate from Mecca to Damascus, where it remained till the Abbasids seized the sovereignty and transferred it to Bagdad.

1 See Palestine Expl. Fund Quarterly Statement, 1902, p. 389.
PALESTINE

(750). Rivals sprang up from time to time. In 684 Caliph Abdalmalik (‘Abd el-Melek), in order to weaken the prestige of Mecca, set himself to beautify the holy shrine of Jerusalem, and built the Kubbat es-Sakhrah, or Dome of the Rock, which still remains one of the most beautiful buildings in the world (CALIPHATE: B 5). In 831 the Church of the Holy Sepulchre was restored; but about a hundred years later it was again destroyed, and its new construction was accomplished (893), who in 930 pillaged Mecca. This produced a Moslem exodus to Jerusalem, with the consequence mentioned. The Carmathian revolt, one of the first of the great splits in the Moslem world, was followed by others; in 936 Egypt declared its independence, under a line of caliphs which claimed descent from Fatima, daughter of the prophet (see FATIMITES); and in 966 Hakim Bi-amrillah mounted the Egyptian throne. This madman caused the church of the Holy Sepulchre to be entirely destroyed: and giving himself out to be the incarnation of Deity, his cult was founded by two Persians, Daraži and Hamza ibn Ali, in the Lebanon; where among the Druses it still persists (see DRUSES).

The contentions between the Abbasid and Fatimite caliphs continued till 972, when Palestine suffered its next invasion. This was that of the Seljuk Turkmans from Khurasan. On behalf of their king, the Khwarizmian general Atsiz invaded Palestine and captured Jerusalem and Damascus, and then marched on Egypt to carry out his original purpose of destroying the Fatimites. The Egyptians, however, repulsed the invaders and drove them back, retaking the captured Syrian cities.

The sufferings of the Christians and the desecrations of their sacred buildings during these troubled times created wide-spread indignation through the west; and this indignation was inflamed into fury by Peter the Hermit, a native of Picardy, who in early life had been a soldier. In 1093 he went in pilgrimage to Jerusalem, and in his wrath at the miseries of the pilgrims he returned to Europe and preached the duty of the Church to rescue the “holy places” from the infidel. The Church responded, and under Peter’s leadership a motley crowd, principally of French origin, set out in 1096 for the Holy Land. Others, under better generalship, followed; but of the 600,000 that started from their homes only about 40,000 succeeded in reaching Jerusalem, ill-discipline, famine and battles by the way having reduced their ranks. They captured Jerusalem, however, in July 1099, and the leader of the assault, Godfrey of Boulogne, was made king of Jerusalem.

So was founded the Latin kingdom of Jerusalem, whose history is one of the most painful ever penned (see CRUSADES). The Crusades

The Frankish Kingdom. It is a record of almost unredemed “envy, hatred, and malice,” and of vice with its consequent diseases, all rendered the more repulsive in that its transactions were carried on in the name of religion. For 88 turbulent years this feudal kingdom was imposed on the country, and then it disappeared as suddenly as it came, leaving no trace but the ruins of castles and churches, a few place-names, and an undying hereditary hatred of Christianity among the native population.

The abortive Second Crusade (1147), led by the kings of France and Germany, came to aid the rapidly weakening Latin kingdom after their failure to hold Edessa against Nureddin, the ruler of northern Syria.

In 1173 Nureddin died, and his kingdom was seized by Saladin (Sulayman ibn Ayyub), a man of Kurdish origin, who had previously distinguished himself by capturing Egypt in company with Shirkuh, the general of Nureddin. Saladin almost immediately set himself to drive the Franks from the country. The Frankish king was the boy Baldwin IV., who had paid for the errors of his fathers by being afflicted with leprosy. After being defeated by Saladin at Banias, the Franks were compelled to make a treaty with the Moslem leader. The treaty was broken, and Saladin proceeded to take action. The wretched leper king meanwhile died, his successor, Baldwin V. also a young boy, was poisoned, and the kingdom passed to the worthless Guy de Lusignan, who in the following year (1187) was crushed by Saladin at the battle of Hattin, which restored the whole of Palestine to the Moslems.

The Third Crusade (1189) to recover Jerusalem was led by Frederick I. of Germany. Acre was captured, but quarrels among the chiefs of the expedition made the enterprise precarious. In 1191 Richard the Lionheart was especially distinguished among the Frankish warriors.

Saladin died in 1193. In 1198 and 1204 took place the Fourth and Fifth Crusades—mere expeditions, as abortive as the third. And as though it were foreordained that no element of horror should be wanting from the history of the crusades, in 1212 there took place one of the most ghastly tragedies that has ever happened in the world—the Crusade of the Children. Fifty thousand boys and girls were persuaded by some pestilent dreamers that their childish innocence would effect what their immortal fathers had failed to accomplish, and so left their homes on an expedition to capture the Holy Land. The vast majority never returned; the happiest of them were shipwrecked and drowned in the Mediterranean. This event is of some historical importance in that it indicates how obvious to their contemporaries was the evil character of those engaged in the more serious expeditions.

The other four crusades which took place from time to time down to 1272 are of no special importance, though there is a certain amount of interest in the fact that after the sixth crusade, in 1229, emperor Frederick II. was permitted to occupy Jerusalem for ten years. But a new element, the Mongolians of Central Asia, now bursts in on the scene. The tribes from east of the Caspian had conquered Persia in 1218. They were driven westward by pressure of the Tatars, and in 1228 had been called by the ruler of Damascus to his aid. In 1240, however, they transferred their alliance to the sultan of Egypt, and pillaged Northern Syria. Driven downward through Gallilee they seized Jerusalem, massacred its inhabitants and plundered its churches. They then marched on to Gaza, where the Egyptians joined them, and together inflicted a crushing defeat on the Christians and Moslems of Syria, for once compelled to unite by the common danger. The Khwarizmians and Egyptians afterwards quarrelled, and the former were compelled to retire, leaving Palestine under the rule of the Mameluks of Egypt. Shortly afterwards however, another Central Asiatic invasion—that of the Tatar tribes, took place. Under their leader Hülagü these tribes came by way of Bagdad, which they captured in 1258, and in 1260 they attacked and captured Damascus and ravaged Syria. Bibars (Beibars, Baibars), general of the Egyptian sultan Koutz, met and drove them back; and having murdered his master, became sultan in his stead. He then proceeded to attack and destroy the relics of Christian possession in Palestine. One after another—Caesarea, Safed, Jaffa, Antioch—they fell, leaving at last Acre (Akka) only. Bibars died in 1277, and in 1291 Acre itself was captured by Khatun, daughter of Kala‘un, who thus put a final end to Frankish domination.

During the 14th century there is little of interest in the history of Palestine. The Christians made efforts to creep back to their former possessions and churches were rebuilt in Jerusalem, Bethlehem and Nazareth; but another devastation was the result of the ferocious inroads of the Mongolian Timur (Tamerlane) in 1400.

The last stage of the history of Palestine was reached in 1516, when the war between the Ottoman sultan and the Mamelukes of Egypt resulted in the transference of the country to the dominion of the Turks. This change of rulers did not produce much change in the administration or condition of the country. Local governors were appointed from headquarters; revenues were annually sent to Constantinople; various public works were undertaken, such as the

Turkish Domination.

This story is probably the historic basis of the legend of the "Pied Piper of Hamelin."
rebuilding of the walls of Jerusalem by Suleiman the Magnificent (1537); but on the whole Palestine ceases for nearly three hundred years from this point to have a history, save the dreary record of the sanguinary quarrels of local shaikhs and of oppression of the peasants by the various government officials. Few names or events stand out in the history of this period: perhaps the most interesting personality is that of the Druse prince Fakhr ud-Din (1505-1634), whose expulsion of the Arabs from the coast as far south as Acre and establishment of his own kingdom, in defiance of Ottoman authority—to say nothing of his dilletante cultivation of art, the result of a temporary sojourn in Italy—make him worth a passing notice. The German botanist, Leonhard Rauwolf (d. 1596 or 1660), who visited Palestine in 1575, has left a vivid description of the difficulties that then beset even so simple a journey as that from Jaffa to Jerusalem. The former town he found in ruins. A safe conduction had to be obtained from the governor of Ramleh before the party could proceed. At Vazur they were stopped by an official who extorted heavy blackmail on the ground that the sultan had given him charge of the "holy places" and had forbidden him to admit anyone to them without payment (1). Further on they had a scuffle with certain "Arabians"; and at last, after successfully accomplishing the passage of the "rough and stony" road that led to Jerusalem, they were obliged to dismount before the gate of the city till they should receive license from the governor to enter.

Towards the close of the 18th century a chief of the family of Zaidan, named Daher el-Amir, rose to power in Acre. To el-Jazzar, who (from the expertise with which he had been wont to carry out his master's orders to get rid of inconvenient rivals) bore the surname el-Jazzar, "the butcher," he had, however, incurred punishment for refusing to obey a command of his master, Mahomed Bey, and so took refuge with the Palestinian sheik. After five years Mahomed Bey died and el-Jazzar returned to Egypt. Daher revolting against his father was given the government of Acre, el-Jazzar was commissioned to quell the rising; his long residence with Daher having given him knowledge which marked him out as the most suitable for the purpose. He was successful in his enterprise, and was installed as governor in Daher's place. He was a man of barbaric aesthetic tastes, and Acre owes some of its public buildings to him: but he was also capricious and tyrannical, and well lived up to his surname. Till 1791 the French had had factories and business establishments at Acre; el-Jazzar ordered them in that year summarily to leave the town. In 1798 Napoleon, returning from his unsuccessful attempt at founding an empire on the Nile, came to stir up a Syrian rising against the Turkish authorities. He attacked el-Jazzar in Acre, after capturing Jaffa, Ramleh and Lydd. A detachment of troops was sent under General Jean Baptiste Kléber across the plain of Esdraelon to take Nazareth and Tiberias, and defeated the Arabs between Fuleh and Afulah. Napoleon was however compelled by the English to raise the siege. El-Jazzar died in 1806 and was succeeded by his elder adopted son, Suleiman, who on his death in 1814 was followed by the fanatic Abdulah. This bigotized Moslem caused the Jewish secretary of his office to be murdered. The local authorities ordered just such an event, and had secretly arranged that after his death an inventory of Abdulah's property should fall into the hands of the government—knowing that the latter had claims on the estates of el-Jazzar and Suleiman. The government accordingly pressed their claims: Abdulah refused to pay and was besieged in Acre. He called for the intervention of Mehemet Ali, governor of Egypt; the latter settled the dispute, but Abdulah then refused to discharge the claims of Mehemet Ali. The latter accordingly sent 25,000 men under the command of his son Ibrahim Pasha, who besieged Acre in 1831 and entered and plundered it. So began the short-lived Egyptian domination of Palestine. Mehemet Ali proved no less a tyrannical master than the Turks and the shiekh; the country revolted in 1834, but the insurrection was quelled. In 1840 Lebanon revolted; and in the same year the Turks, with the aid of France, England and Austria, regained Palestine and expelled the Egyptian governor.

From 1830 onwards the Ottoman government gradually strengthened its hold on Palestine. The power of the local sheikhs was step by step reduced, till it at last became evanescent—to the unmixed advantage of the whole country; and the increase of European interests has led to the establishment of consulates and vice-consulates of the great powers in Jerusalem and in the ports.

The battle of religions still continued. In 1847 the dispute in the Church of the Nativity at Bethlehem about the right to mark the spot that the church called the birthplace of Christ as the prime causes of the Crimean war. In 1860 occurred a sudden anti-Christian outbreak in Damascus and the Lebanon, in which 14,000 Christians were massacred. On the other hand it may be mentioned that on the 30th of June 1855 the cross was for the first time since the crusades borne aloft through the streets of Jerusalem on the occasion of the visit of a European prince; and that in 1858 the sacred area of the Haramesh-Sherif—the mosque on the site of the Temple of Jerusalem—was for the first time thrown open to Christian visitors. The latter half of the 19th century is mainly occupied with the record of a very remarkable process of colonization and settlement—French and Russian monastic and other establishments, some of them semi-religious and semi-political; German colonies; pan-Arabian communities; Jewish agricultural settlements—all, so to speak, "nibbling" at the country, and each so intent upon gaining a step on its rivals as to be forgetful of the gathering storm.

For in the background of all is the vast peninsula of Arabia, which at long intervals falls with its wild, untamable humanity to a point beyond which it cannot support them. This has been the origin of the long succession of Semitic waves—Babylonian, Assyrian, Canaanite, Hebrew, Nabataean, Moslem, that have flowed over Mesopotamia and Palestine; there is every reason to suppose that they will be followed by others, and that the Arab will remain master at the end, as he was in the beginning.  

In 1866 Herzl (q.v.) issued his proposal for the establishment of a Jewish state in Palestine and in 1886 he came to the country to investigate its possibilities. The same year was signalized by the picturesque visit of the German emperor, William II., which gave a great stimulus to German interests in the Holy Land.

In 1902 Palestine was devastated by a severe epidemic of cholera. In 1906 arose a dispute between the British and Turkish governments about the boundary between Turkish and Egyptian territory, as the Turks had interfered with some of the landmarks. A joint commission was appointed, which marked out the boundary from Rafah, about midway between Gaza and El-Arish, in an almost straight line S.S.W. to Tabah in 25° 30' on the west side of the gulf of Akaba. A map of the boundary will be found in the Geographical Journal (1907), xxix. 88.

2. The Holy Places.—To the vast majority of civilized humanity, Jewish, Christian and Moslem, the religious interest of the associations of Palestine predominates over every other, and at all ages has attracted pilgrims to its shrines. We need here not do more than allude to the centralization of Jewish ideas and aspirations in Jerusalem, especially in the holy rock on which tradition (and probably textual corruption) have placed the scene of Abraham's sacrifice of Isaac, and over which the Most Holy Place of the Temple stood. The same associations are those of the Moslem, whose religion has so strangely absorbed the prophets and traditions of the older faiths. Other shrines, such as the alleged tomb of Moses, and the mosque of Hebron over the cave of Machpelah, are the centres of Moslem pilgrimage. Christianity is however responsible for the greatest development of the cult of holy places, and it is to the sacred shrines of christendom that we propose to confine our attention.  

When this French colony was established is uncertain; Maundrell found them there at the end of the 17th century.
There is no evidence that the earliest Christians were imbued with the archaeological spirit that interested itself in sites which the Risen Lord had vacated. The site of Golgotha and of the Holy Sepulchre, of the manger or of the home at Bethany, were to them of no special moment in comparison with the one all-important fact that “Christ was risen.” It was not till the clear-cut impress of the events of Christ’s life, death and resurrection had with the lapse of years faded from human recollection, that there arose a desire to “seek the living among the dead.” The story begins with Helena, mother of Constantine the Great, who became fired with zeal to fix definitely the spots where the great events of Christianity had taken place, and in A.D. 326 visited Palestine for the purpose. Helen’s pilgrimage was, as might be expected, attended with complete success. The True Cross was discovered; and by excavation conducted under Constantine’s auspices, the Holy Sepulchre, “contrary to all expectation” as Eusebius naïvely says, was discovered also (see Jerusalem; and Sepulchre, The Holy). The seed thus sown rapidly germinated and multiplied. The stream of pilgrimage to the Holy Land began immediately, and has been flowing ever since. Onwards from A.D. 333, when an anonymous pilgrim from Bordeaux visited the “holy places” and left a succinct account of his route and of the sights which came under his notice, we possess a continuous chain of testimony written by pilgrims relating what they heard and saw.

It is a pathetic record. No site, no legend, is too impossible for the unquestioning faith of these simple-minded men and women. Indeed, it is an almost never-ending source of astonishment that we can follow the multiplication of “holy places,” and sometimes can even see them being shifted from one spot to another, as the centuries pass. Not one of these devout souls had any shadow of suspicion that, except natural features (such as the Mount of Olives, the Jordan, Ebal, Gerizim, &c.) and possibly a very few individual sites (such as Jacob’s well at Shechem), there was not a single spot in the whole elaborate system that could show even the flimsiest evidence of authenticity! The growth and development of “holy sites” can best be illustrated in an article like the present, by a few figures. The account of the “holy places” seen in Palestine by the Bordeaux pilgrim, just mentioned, occupies twelve pages in the translation of the Palestine Pilgrims’ Text Society (in whose publications the records of these early travellers can most conveniently be studied); and those twelve pages may be reduced to seven or eight as they are printed with wide margins, and have many footnotes added by the editor. On the other hand the experiences and observations of Felix Fabri, a Dominican monk who came to Palestine about A.D. 1480, occupies in the same series two large volumes of over 600 pages each.

This process of development has been illustrated in our own time—a single instance will suffice. In the so-called “Via Dolorosa” is a cave which was opened and planned about 1870. It subsequently became closed and forgotten, houses covering its entrance. In 1906 it was re-opened, the houses being cleared away, and a hospice for Greek pilgrims erected in place of them. During these works some local archaeologists attempted to penetrate the cave but were driven away by the labourers with curses. At last the hospice was finished and the cave opened for inspection. A pair of stocks was then shown beautifully cut in the rock, where no stocks appeared in the plan of 1870; with a crude painting suspended on the wall above, blasphemously representing the Messiah confined in them.

The Franciscans were nominated custodians of the “holy places” by Pope Gregory IX, in 1230. Certain sites have, however, always been held by the Oriental sects, and since 1868, when the Holy Sepulchre church was destroyed by fire, the number of these has greatly increased. Indeed the 19th century was disgraced, in Palestine, by a feverish “scramble” for sacred sites, in which the most rudimentary ethics of Christianity were forgotten in the all-mastering desire to own rival sects and orders. Bribery, fraud, even violence, have in turn been employed to serve the end in view: and churches, chapels and monasteries, most of them in the worst architectual taste, have sprung up like weeds over the surface of the country, and are perpetuating the memory of their predecessors which from every point of view were best relegated to oblivion. The zeal and self-sacrificing devotion which some of these establishments, and their inmates, display, and their noble labours on behalf of the country, its people and its history throw into yet more painful relief the actions and attitudes of some of their fellow-Christs.

The authenticity of the “holy places” was first attacked seriously in the 18th century by a bookseller of Altona named Korte; and since he led the way, a steady tide of criticism has been poured at this huge mass of invention. The process of manufacturing new sites, however, continues unchecked. Even the Protestant churches are not exempt from blame in the matter; a small tomb near the Damascus Gate of Jerusalem has been fixed upon by a number of English enthusiasts as the true “Holy Sepulchre,” an identification for which there is nothing to be said.

The monasteries of the Roman communion and their residents were under French protection until the disturbance between Greek and Franciscan monks in the Holy Sepulchre church (Nov. 4, 1901), which arose over the question as to the right to sweep a certain flight of stairs. Stones and other weapons were thrown with such violence that several of the French companions were seriously injured. As one result of the subsequent investigations, Latin monasteries of other countries were assigned to the protection of the consuls of those countries.

3. Colonization.—Down to the time of Mehemet Ali the only foreigners permanently resident in the country were the members of various monastic orders, and a few traders, such as the French merchants of Acre. The first protestant missionaries (those under the London Society for the Promotion of Christianity among the Jews), settled in Jerusalem in 1823; to them is due the inception of the trade in olive-wood articles, invented for the support of their converts. In 1826–1828 a remarkable religious brotherhood (the Biederhaus, founded by Spitzer of Basel) settled in Jerusalem; it was originally intended to be a settlement of celibate mechanics that would form a nucleus of mission work to evangelize the world. One of this community was Dr C. Schick, who lived over 50 years in Jerusalem, and made many valuable contributions to its archaeology. In 1849 came the first of several examples that have appeared in Palestine from time to time of that curious product of American religious life—a community of dupes or visionaries led by a prophet or prophetess with claims to divine guidance. The leader in this case was one Mrs Minor, who came to prepare the land for the expected Second Advent. Her followers quarrelled and separated in 1853. This event of importance, as it had much to do with the remarkable development of Jewish colonization which is a special feature of the latter part of the history of the 19th century in Palestine. For Mrs Minor, having an interest in the Jewish people, was befriended by Sir Moses Montefiore; after her death her property was placed in charge of a Jew, and later passed into the hands of the Alliance Israelite Universelle. This body in 1870 established an agricultural colony for Jews on the road from Jaffa to Jerusalem (“Mikweh Israel”). Two other visionary American colonies, led by a Mr Adams, came in 1866. They brought with them framed houses from America, which are still standing at Jaffa. But the Adamsites suffered from disease and poverty, and lost heart in a couple of years: returning to America, they sold their property to a German community, the Tempelgemeinde, a Unitarian sect led by Messrs Hoffmann and Hardeg who established themselves in Jaffa in 1868. Unlike the ill-fated American communities, these hardy Württemberg peasants have flourished in Palestine, and their three colonies—at Jaffa, Haifa, and Jerusalem—are the most important European communities now in the country.
Since 1870 there has been a steady development of Jewish immigration, consisting principally of refugees from countries where anti-Semitism is an important element in politics. Baron de Rothschild has invested large sums in Jewish colonies, at the commencement of the present century he succeeded over their administration to the Jewish Colonization Association. Time alone can show how far these colonies are likely to be permanently successful, or how the subtly energizing influence of the climate will affect later generations.

4. Exploration.—Previous to the 19th century the turbulent condition of the country made exploration difficult, and, off the beaten track, impossible. There are many books written by early pilgrims and by more secular travellers who visited the country, which,—when they are not devoted to the setting forth of valueless traditions, as is too often the case,—give very useful and interesting pictures of the conditions of life and travel in the country. Scientific exploration does not begin before Edward Robinson, an American clergyman, who, after devoting many years to study to fit himself for the work, made a series of journeys through the country, and under the title of Biblical Researches in Palestine (1841–1850) published his itineraries and observations. His work is marred by the hastiness of his visits and consequent superficiality of his descriptions of sites, and by some rash and untenable identifications: but it is at once a standard and the foundation of all subsequent topographical work in the country. He was followed by Titus Bulloch in 1852, and later years have been especially devoted, under the auspices of the Deutscher Orientfund and the Palestine Exploration Fund, to the publication of such work in exact observation; and by V. Guérin, whose Description géographique, historique et archéologique de la Palestine, in 7 vols. (1868–1889), contains a mass of material collected in personal travel through the country.

In 1864 was founded the Palestine Exploration Fund, under the auspices of which an ordnance survey map of the country was completed (published 1881), and accompanied by volumes containing memoirs on the topography, orography, hydrography, archaeology, fauna and flora, and other details. A similar work, of Tell el-Hesi, was begun but (1882) stopped by the Ottoman government. The same society initiated the scientific exploration of the mounds of Palestine. In 1881 it excavated Tell el-Hesi (Lachish); in 1886–1888 the south wall of Jerusalem; in 1888–1890 Tell el-Safi (Gath) and some smaller mounds in the Shephelah; all under the direction of Dr F. J. Bliss. In 1902 it began the excavation of Gezer under the direction of R. A. S. Macalister (see GEZER).

The example thus set has been followed by French, German and American explorers. The Deutscher Palästina-Verein was founded in 1873, and under its auspices important surveys have been carried out, especially those of G. Schumacher east of the Jordan; Tell el-Mutesellim (Megiddo) has also been excavated. The Austrian Dr E. Sellin, working independently, has excavated Tell Ta‘anach (Taannah), and in 1907 began work upon the mound of Jericho. An admirable biblical and archaeological school, under the control of the Dominican order, exists at Jerusalem; and German and American archaeological institutions, educational in purpose, are also there established. Valuable work in exploration is annually done by the directors of these schools and by their pupils. Under this head we must not omit to mention A. Musil’s investigations of some remote periods of Eastern Palestine, and E. Brunnow’s great survey of Petra, with part of Moab and Edom.

BIBLIOGRAPHY.—The literature relating to Palestine is very abundant; we especially note, P. Thomsen, Systemat. Biblioth. j. Palestino-Literatur, i., 1895–1904 (Leipzig, 1908). A large collection of works will be found in K. Röhrich, Bibliotheca geographica Palestinensis (1890). A comprehensive bibliography, T. Tobler, Bibliographie geographica Palestinensis (1869), with a supplement in Petzholdt’s Neuer Anzeiger für Bibliographie und Bibliothekswissen-
schaft (1878).

PALESTINE, a city and the county-seat of Anderson county, Texas, U.S.A., about 90 m. E. by N. of Waco. Pop. (1910 cen-
sus) 10,432. It is served by two lines of the International & Great Northern railway, and by the Texas State railway. Palestine is the trade centre of a district which produces cotton, timber, fruit (especially peaches), an excellent grade of wrapper tobacco, petroleum, iron-ore and salt. It has various manufac-
tures, including cotton gins, cotton-seed oil, cigars, lumber and brick. Its factory products were valued at $7,512,150 in 1893. The 2 to 3 m. of Palestine by the Anderson county (the first in the present Anderson county) was made in 1837, and there Fort Houston, a stockade fort, was built to protect the settlers from the Indians. Palestine was laid out and was
PALESTRINA

PALESTRINA, GIOVANNI PIERLUIGI DA (1526-1594), Italian composer, was born in Palestrina (the ancient Praeneste) at the foot of the Sabine mountains, in 1526. The various versions of his name make an interesting record. He appears as Palestina, Pellestrino, Gio. Palestina, Gianetto Palestrina, Gianetto da Palestrina, Gian Pietr de Palestrina, Joh. Petrus Aliseus, Jo. Petralyos, Gianetto, Giov. Prenestini, Joannes Prenestinus, Johannes Petralyosius Prenestinus.

Palestrina seems to have been at Rome from 1540 to 1541, when he studied possibly under Gaudio Bell, but not under Goudins as has erroneously been assumed. On the 12th of June 1547 he married Lucrezia de Goris. In 1551, by favour of Pope Julius III., he was elected Magister Cappellae and Magister Puerorum at the Cappella Giulia, S. Pietro in Vaticano, with a salary of six scudi per month, and a house. Three years later he published his First Book of Masses, dedicated to Pope Julius III., and beginning with the Missa "Ettec sacerdos magnus." On the 13th of January 1555, Palestrina was enrolled, by command of Pope Julius III., among the singers of the Cappella Sistina. This honour involved the resignation of his office at the Cappella Giulia, which was accordingly bestowed upon his friend Aniuccia. But the legality of the new appointment was disputed on the ground that Palestrina was married, and the father of four children, his wife, Lucrezia, being still alive; and, though, for the moment, the pope's will was law, the case assumed a different complexion after his death, which took place only five weeks afterwards. The next pope, Marcellus II., was succeeded after a reign of 23 days, by Paul IV.; and within less than a year (July 30, 1555) that stern reformer dismissed Palestrina, together with two other married singers, A. Ferrabosco and Bari, with a consolatory pension of six scudi per month to each. This cruel disappointment caused Palestrina a dangerous illness; but in October 1555 he was appointed maestro di cappella at the Lateran, without forfeiting his pension; and in February 1561 he exchanged this preferment for a similar one, with an allowance of 16 scudi per month, at Santa Maria Maggiore.

Palestrina remained in office at this celebrated basilica for ten years, and to this period is assigned an important chapter in the life of the composer. Many circumstantial details of this chapter are undoubtedly legends, due to the pious imagination of Bainsi and others. In 1562 the council of Trent censured the prevalent style of ecclesiastical music with extreme severity. In 1564 Pope Pius IV. commissioned eight cardinals to investigate the causes of complaint; and these proved to be so well founded that it was seriously proposed to forbid the use of all music in the services of the Church, except unisonous and unaccompanied plain-chant. In these circumstances Palestrina is said to have been invited by two of the most active members of the commission to come to the rescue. He accordingly submitted three masses to Cardinal Carlo Borromeo for approval. These were privately rehearsed, in presence of the commissioners, at the palace of Cardinal Vitelozzi; and the judges were unanimous in deciding that the third mass fulfilled, in the highest possible degree, all the conditions demanded. The private trial took place in June 1562, and on the 10th of that month the mass was publicly sung at the Sistine Chapel, in presence of Pope Pius IV., who compared its music to that heard by St John in his vision of the New Jerusalem. Parvi transcribed it, for the library of the choir, in characters of extraordinary size and beauty; and Palestrina was appointed by the pope composer to the Sistine Chapel, an office created expressly in his honour and confirmed to him by seven latter pontiffs, though with the very insufficient honorarium of three scudi per month, in addition to the six which formed his pension.

In 1567 this mass was printed in Palestrina's Liber secundus missarum. The volume was dedicated to Philip II. of Spain, but the mass was called the Missa Papae Marcelli. This title, clearly given in honour of the short-lived pope Marcellus II., has given rise to an absurd story, told by Pellegrini and others, to the effect that the mass was composed by Pope Marcellus I., martyred early in the 4th century, and was only discovered by Palestrina. Of course in the 4th century such music was inconceivable. The Missa Papae Marcelli is now almost certainly known to have been composed in 1562, two years before Paul IV.'s commission. Its ineffable beauty had often been described in glowing terms by those who heard it; but it was only first heard in England in 1882, when the Bach choir, consisting of 200 unaccompanied voices, sang it at St James's Hall, under the direction of Mr Otto Goldschmidt.

Upon the death of Aniuccia in 1571 Palestrina was re-elected to his appointment at the Cappella Giulia. He also succeeded Aniuccia as maestro di cappella at the oratory of Philip Neri; but these appointments were far from lucrative, and he still remained a very poor man. A letter of thanks for 100 scudi, written on the 21st of March 1579 to the duke of Mantua, illustrates this situation. In 1586 he was much distressed by the death of his wife; and the loss of three promising sons, Angelo, Ridolfo and Silla, left him with one child only—Ignino—a very unworthy descendant. In February 1581 he married the rich widow Virginia Dornuli. In 1586 Pope Sixtus V. wished to appoint him maestro to the pontifical choir, as successor to Antonio Boccapadula, then about to resign, and commissioned Boccapadula to prepare the choir for the change. Boccapadula, however, managed so clumsily that Palestrina was accused of having meanly plotted for his own advancement. The Pope was very angry, and punished the calumniators very severely; but Palestrina lost the appointment. These troubles, however, did not hinder his work, which he continued without interruption until the end of February 1594, when he breathed his last in the arms of his friend, Filippo Neri. (W. S. R.)

In the articles, Music, Counterpoint, Contrapuntal Forms, Harmony, Mass, Motet, and that portion of Instrumentation which deals with vocal music, the reader will find information as to many features of Palestrina's style and its relation to that of the 16th century in general. So simple are the materials of 16th-century music, and so close its limitations, that the difference between great and small artists, and still more the difference between one great artist and another, can be detected only by long and familiar experience. A great artist, working within limits so narrow and yet so natural, is fortunately apt to take exceptional opportunities for acquiring the right kind of experience of his art, since his genius becomes far more prolific than a genius with a wider field for its energies. Yet all 16th-century masters seem to be illuminated by the infallibility of the normal musical technical of their time. This technique is no longer so familiar to us that its euphony and vivid tone can fail to impress us wherever we meet it. There is probably no respectable school piece of the 16th century, which, if properly performed in a Roman Catholic church, would be quickly distinguishable by ear from the style of Palestrina. But when we find that every addition to our acquaintance with Palestrina's works is an acquisition, not to our notions of the progressive possibilities of 16th-century music, but to our whole sense of style, we may then recognize that we are in the presence of one of the greatest artists of all time.

Palestrina's work has many styles. Within its narrow range there can be no such glaring contrasts as those of the "three styles " of Beethoven; yet the distinctions are as real as they are delicate. His early, or Flemish style, was apt to lead him into the notorious Flemish disregard of proportion. Yet in some of his greatest works, such as the Missa brevis, we find unmistakably Flemish features so organized as to produce brave and charming music (Missa Assumpta est Maria, Missa Credo). Yet in the Missa Requiem (Missa Deo gratias), remarkably modern firmness of form (libel. subdiv. Kyrie), and close canon and sequence carried to surprising length resulting in natural unexpectedness of harmony and subtle swing of cross rhythm (Amen of Credo). If we find it convenient to divide Palestrina's work roughly into three types, we shall be able to take the Missa Papae Marcelli as the crowning representative of his first style. It is probably his greatest work; at all events it continues to make
that impression whenever it is read after a long course of his other works; yet there are many masses, too numerous to mention, which cannot easily be considered inferior to it. Indeed F. X. Haberl, the editor of the complete critical edition ofPalestrina's works, prefers the Missa Ecce ego Joannes, first published by him, to the seven volumes of som edition in 1887.

Palestrina's scholars will hardly think us singular for placing on the same plane as the Missa Papae Marcelli at least 16 of Palestrina's 94 extant masses: Missa brevis, bk. 3, no. 35; Dies sanctificatus, bk. 6, no. 1; Dilexi quomion, bk. 6, no. 51; O admirabile commercium, bk. 8, no. 3; Dum complerem, bk. 8, no. 35; Veni sponsa Christi, bk. 9, no. 27; Quinti toni, bk. 10, no. 52; Octavi toni, bk. 11, no. 4; Alma Redemptoris, bk. 11, no. 55; Ascendo ad Patrem, bk. 12, no. 3; Tu es Petrus, bk. 12, no. 35; Hodie Christus natus est, bk. 13, no. 2; Beatus Laurentinus, bk. 14, vol. 3; Assumpta est Maria, bk. 14, no. 5; Tu es Petrus, bk. 15, no. 51; Ecce ego Joannes, bk. 15, no. 6.

The third and most distinctive phase of Palestrina's style is that in which he relies entirely upon the beauty of simple masses of harmony without any polyphonic elaboration whatever. Sometimes, as in his four-part litanies, this simplicity is mainly a practical necessity; but it is more often used for the purpose of his profoundest expressions of sacramental or penitential devotion, as for instance in the motet Fretes ego enim accepi, the Stabat Mater and the first, really the latest, book of Lamentations.

Besides these main styles there are numerous cross-currents. There is the interaction between the madrigal and ecclesiastical style, which Palestrina sometimes carried into performances without confusion or degradation, as in the mass Vestita i colli. There is the style of the madrigali spirituali, including Le Vergini of Petrarca; which again distinguishes itself into a broader and a slimmer manner. And there is lastly an astounding absorption of the wildest freaks of Flemish ingenuity into the loftiest polyphonic ecclesiastical style; the great example of which is the Missa L'Homme armé, a work much maligned by writers who know only its title and the part played by it in its secular theme in modern music.

The works published in Palestrina's lifetime naturally contain a large proportion of his earlier compositions. After his death the publication of his works continued for some years. We are apt to read the musical history of the 17th century in the light of the works of his composers. But a somewhat different view of that time is suggested by the continual pouring out by influential publishers of posthumous works of Palestrina, in far greater quantities than Palestrina had either the influence or resource to publish in his lifetime. We regard the 17th-century monodists as triumphant iconoclasts; but it was not until their primitive efforts had been buried beneath the entirely new arts to which they led, that the style of Palestrina ceased to be upheld as the one-true ideal. Moreover the posthumous works of Palestrina belong almost entirely to his latest and finest period; so that a study of Palestrina confined to the works which he himself was able to publish gives no adequate idea of the proportion which his greater works bear to the rest. It was not, then, the rise of monody that crowded 16th-century art out into a long oblivion. On the contrary, the Palestrina tradition was the one thing which gave 17th-century composers a practical basis for their technical training. Only in the 18th century did the new art, before coming to maturity under Bach and Handel, reduce the Palestrina style to a dead language.

In the middle of the 19th century that dead language revived in a renascence which has steadily spread throughout Europe. The Musica divina of Canon K. Proske of Regensburg, begun in 1833, was perhaps the first decisive step towards the restoration of Roman Catholic church music. The St Cecilia Verein, with Dr F. X. Haberl as its president, has carried on the publication and use of such music with the greatest energy in every civilized country. The difficulties of reintroducing it in its native home, Italy, were so enormous that it is arguable that they might not yet have been surmounted but for the adoption of less purely ecclesiastical methods by Don Lorenzo Perosi, who succeeded in bowing the Italian churches by the performance of compositions written in an artless manner which, by its mere negation of display, was fitted to produce upon unsophisticated listeners such devout impressions as might greatly weaken them from the taste for theatrical modern church music. The pope's bull has now inculcated the use of Gregorian and 16th-century music by all Roman Catholic churches, and the effect has been astonishing. Within eighteen months of Pius X.'s decree on church music, the choir of Cologne Cathedral, previously far less accustomed to a pure polyphonic style than most German Protestant choirs, at Easter of 1905 gave a very satisfactory performance of the Missa Papae Marcelli. The influence of what is henceforth an inevitable and continual familiarity of Palestrina's style, at least among Roman Catholics, cannot fail to have the profoundest effect upon modern musical culture.

Palestrina's works, as contained in the complete edition published by Breitkopf and Härtel, comprise 256 motets in 7 vols., the last two consisting largely of pieces hitherto unpublished, with one or two wrongly or doubtfully ascribed to Palestrina; 15 books of masses, of which only 6 were published in Palestrina's lifetime, the 7th being incompletely projected by him, the 15th and 17th first collected by Haberl in 1887 and 1888; 3 books of magnificats, on all the customary tones; 1 vol. of hymns; 1 vol. (2 books) of offertories for the whole year; a volume of 25 miscellaneous books of motets; and several books of laments; a very large volume of madrigals containing 2 early books and 20 later madrigals collected from mixed publications of Madrigali spirituali, many of them composed by Palestrina's works, newly discovered, imperfectly preserved and doubtful. The fourth book of motets is not, like the third, a collection of works written at different times, but a single scheme, being a setting of the Song of Solomon; and the fifth volume is, like the offertories, designed for use throughout the church year.

(D. F. T.)

PALETTE (the Fr. diminutive of pale, spade, blade of an oar, from Lat. pale, spade, baker's shovel or peel; cf. pandore, to spread), a term applied to many objects which are flat and thin, and specifically to a thin tablet made of wood, porcelain, or other material on which artists place their colours. The term is also used of the shallow box, with partitions for the different coloured tessere, used by mosaic workers. By transference the colours which an individual artist employs are known as his "palette." The "palette-knife" is a thin flexible knife used for arranging the colours on the palette, &c., and also for the application of colour on the canvas in large masses.

PALEY, FREDERICK APHTHORP (1815-1888), English classical scholar, was born at Easingwold in Yorkshire on the 14th of January 1815. He was the grandson of William Paley, and was educated at Shrewsbury school and St John's College, Cambridge (B.A. 1838). His conversion to Roman Catholicism forced him to leave Cambridge in 1846, but he returned in 1860 and resumed his work as "coach," until in 1874 he was appointed professor of classical literature at the newly founded Roman Catholic University at Kensington. This institution was closed in 1877 for lack of funds, and Paley removed to Boscombe, where he died on the 8th of December 1888. His most important editions are: Aeschylus, with Latin notes (1842-1847), the work by which he first attracted attention; Aeschylus (4th ed., 1870), Euripides (2nd ed., 1872), Hesiod (2nd ed., 1883), Homer's Iliod (2nd ed., 1884), Sophocles, Philoctetes, Electra, Trenchia, Ajax (1860)—all with English commentary and forming part of the Bibliotheca classica; select private orations of Demosthenes (3rd ed., 1866-1868); Theocritus (2nd ed., 1860), with brief Latin notes, one of his minor works. He possessed considerable knowledge of architecture, and published a Manual of Gothic Architecture (1846) and Manual of Gothic Mouldings (6th ed., 1902).

PALEY, WILLIAM (1743-1805), English divine and philosopher, was born at Peterborough. He was educated at Giggleswick school, of which his father was head master, and at Christ's College, Cambridge. He graduated in 1763 as senior wrangler, became fellow in 1766, and in 1768 tutor of his college. He lectured on Clarke, Butler and Locke, and also delivered a systematic course on moral philosophy, which subsequently formed the basis of his well-known treatise. The subscription
Palfrey—Palgrave, Sir F.

controversy was then agitating the university, and Palfrey published an anonymous 

DEFENSE of a pamphlet in which 

Bishop Law had advocated the retention and simplification of the Thirty-nine Articles; he did not, however, sign the petition (called the "Feathers" petition from being drawn up at a meeting at the Feathers tavern) for a relaxation of the terms of subscription. In 1776 Palfrey was presented to the rectory of 

Musgrave in Westmorland, supplemented at the end of the year by the vicarage of Dalston, and presently exchanged for 

that of Appleby. In 1776 the foundation of the Bishopwearmouth 

College at the suggestion of his friend John Law (son of Edward 

Law, bishop of Carlisle and formerly his colleague at Cam-

bridge), Palfrey published (1782) his lectures, revised and 

enlarged, under the title of The Principles of Moral and 

Political Philosophy. The book at once became the ethical 

text-book of the University of Cambridge, and passed through 

fifteen editions in the author's lifetime. He strenuously 

supported the abolition of the slave trade, and in 1780 

wrote a paper on the subject. The Principles was followed 

in 1790 by his first essay in the field of Christian apolo-

getics, Horse Paulinae, or the Truth of the Scripture History 

of St Paul evinced by a Comparison of the Epistles which bear 

his Name with the Acts of the Apostles and with one another, probably 

the most original of its author's works. It was followed in 

1794 by the celebrated View of the Evidences of Christianity. 

Paley's latitudinarian views are said to have debauched him from 

the highest positions in the Church. But for his services in 

defence of the faith the bishop of London gave him a stall 

in St Paul's; the bishop of Lincoln made him subdean of that 

cathedral, and the bishop of Durham conferred upon him the 

rectory of Bishopwearmouth. During the remainder of his life 

his time was divided between Bishopwearmouth and Lincoln. 

In 1802 he published Natural Theology, or Evidences of the 

Existence and Attributes of the Deity collected from the 

Appearances of Nature, its last, and, in some respects, his most 

remarkable book. In this he endeavoured, as he says in the 

dedication to the bishop of Durham, to repair in the study 

his deficiencies in the church. He died on the 25th of May 

1805.

In the dedication just referred to, Paley claims a systematic 

unity for his works. It is true that "they have been written in 

an order the very reverse of that in which they ought to be read "; nevertheless the Natural Theology forms "the completion of a revolution in the study of this subject". Of this it is 

apparent if it is considered that the Moral and Political Philosophy 

admittedly embodies two presuppositions: (1) that "God Almighty 
wills and wishes the happiness of His creatures," and (2) that 
adversaries of natural morality are "led on by a tendency of 

reward and punishment". Now the second presupposition depends 

according to Paley, on the credibility of the Christian religion 

(which he treats almost exclusively as the revolution of these 

new sanctions" of morality). The Evidences and the Horae 

Paulinae were intended as a demonstration of this credibility. 

The argument of these books, however, depends in turn upon the 

assumption of a benevolent Creator desirous of communicating 

His creatures for their good; and the Natural Theology, by 

putting the argument from design to prove the existence of such a Deity, 

becomes the foundation of the argumentative edifice.

In his Natural Theology Paley has argued with consummate 

skill the argument which Ray (1661) and Durham (1711) and 

Nieuwentyt (1730) had already made familiar to Englishmen. 

For my part," he says, "I take my stand in human anatomy"; 

and the argument which he opposes to the "the necessity, in each 

particular case, of an intelligent designing mind for the contriving 

and determining of the forms which organized bodies bear". 

This is the whole argument, and the book consists of a mass of 

1 Bernard Nieuwentyt (1653-1718) was a Dutch disciple of Deism, and his Dutch work, De Goddelijk Bijbelboek, published in 1716, was translated into English in 1730 by J. Chamberlayne under the title of The Religious Philosopher. A charge of wholesale plagiarism from this book was brought against Paley in 1825. Paley refers specifically to Nieuwentyt, who uses the famous illustration of the watch. But the illustration is not peculiar to Nieuwentyt, and had been appropriated by many others before Paley. The germ of the idea is to be found in Cicero, De Divinatione, iii. 38 (102-103), and in Horace, Odes, vi. 385, note. In the case of a writer whose chief merit is the way in which he has worked up existing material, a general charge of plagiarism is almost irrelevant.

chosen instances marshalled in support of it. But by placing 
Paley's facts in a new light, the theory of evolution has deprived 
the argument of its force, and it applies the idea of special 

1825. The idea that the world was created by any other method than a step-by-step development from the simplest forms to the most complex is widely accepted in modern science.
to a firm of solicitors, but was called to the bar at the Middle Temple in 1827. On his marriage in 1823 with Elizabeth, daughter of Dawson Turner of Great Yarmouth, he had become a Christian, and had changed his name to Palgrave, the maiden name of his wife's mother. His work as a barrister was chiefly concerned with pedigree cases before the House of Lords. He

served on several parliamentary committees, including the Record Committee, the Joint Committee on Parliamentary Warrants (1827–1834); Rotuli curiae regis (London, 1835); The antiqua kalendars and inventories of the treasury of his majesty's exchequer (London, 1839); and Documents and records illustrating the history of Scotland (London, 1837), which contains an elaborate introduction. In 1831 he published his History of England, Anglo-Saxon Period, later editions of which were published as History of the Anglo-Saxons; in 1832, his Rise and Progress of the English Commonwealth, pronounced by Freeman a "memorable book"; and in 1834 his Essay upon the original authority of the king's council. In 1837 he was knighted, and after serving as one of the municipal corporations commissioners, became deputy-keeper of the public records in 1838, holding this office until his death at Hampstead on the 6th of July 1861. Palgrave's most important work is his History of Normandy and England, which appeared in four volumes (London 1851–1864), and deals with the history of the two countries down to 1066.

He also wrote Truths and Fictions of the Middle Ages (London, 1852); The Lord and the Vassal (London, 1844); and Handbook for Travellers in Northern Italy (London, 1843, and subsequent editions).

Palgrave's four sons were: Francis Turner Palgrave (q.v.), sometime professor of poetry at Oxford; William Gifford Palgrave; Sir Robert Harry Inglis Palgrave (b. 1827), an authority on banking and economics; and Sir Reginald Francis Don Palgrave.

William Gifford Palgrave (1826–1888) went to India as a soldier after a brilliant career at Charterhouse School and Trinity College, Oxford; but, having become a Roman Catholic, he was ordained priest and served as a Jesuit missionary in India, Syria, and Arabia. Forsaking the priesthood about 1864, he was employed as a diplomatist by the British government in Egypt, Asia Minor, the West Indies, and Bulgaria, being appointed resident minister in Uruguay in 1883; he died at Montevideo on the 30th of September 1888. He wrote a romance, Hermann Agiba (London, 1872), A Narrative of a Year's Journey through Central and Eastern Arabia (London, 1853), Essays on Eastern Questions (London, 1872), and other works.

Sir Reginald Palgrave (1829–1904) became a solicitor in 1851; but two years later was appointed a clerk in the House of Commons, becoming clerk of the House on the retirement of Sir Erskine May in 1856. He was made a K.C.B. in 1892, retired from his office in 1899, and died at Salisbury on the 13th of July 1904. Sir Reginald wrote The Chairman's Handbook; The House of Commons: Illustrations of its History and Practice (London, 1886); and Crowell: an appreciation based on contemporary evidence (London, 1900). He also assisted to edit the tenth edition of Erskine May's Law, Privileges, Proceedings and Usage of Parliament (London, 1896).

Palgrave, Francis Turner (1824–1897), English critic and poet, eldest son of Sir Francis Palgrave, the historian, was born at Great Yarmouth, on the 28th of September 1824. His childhood was spent at Yarmouth and at his father's house in Hampstead. At fourteen he was sent as a day-boy to Charterhouse; and in 1843, having in the meanwhile travelled extensively in Italy and other parts of the continent, he proceeded to Oxford, where he won a scholarship at Balliol. In 1849 he interrupted his university career to serve as assistant private secretary to Gladstone, but returned to Oxford the next year, and took a first class in Literae Humaniores. From 1847 to 1862 he was fellow of Exeter College, and in 1849 entered the Education Department at Whitehall. In 1850 he accepted the vice-principalship of Kneller Hall Training College at Twickenham. There he came into contact with Tennyson, and laid the foundation of a lifelong friendship. When the training college was abandoned, Palgrave returned to Whitehall in 1855, becoming examiner in the Education Department, and eventually assistant secretary. He married, in 1862, Cecil Grinnell Milnes, daughter of James Milnes-Gaskell. In 1884 he resigned his position at the Education Department, and in the following year succeeded John Campbell Sharpe as professor of poetry at Oxford. He died in London on the 24th of October 1897, and was buried in the churchyard at Lorne near Cononbridge. He published both criticism and poetry, but his work as a critic was by far the more important. His Visions of England (1880–1881) has dignity and lucidity, but little of the "natural magic" which the greatest of his predecessors in the Oxford chair considered rightly to be the test of inspiration. His last volume of poetry, Amenapthip, appeared in 1892. On the other hand, his criticism was always marked by fine and sensitive tact, quick intuitive perception, and generally sound judgment.

His Handbook to the Fine Arts Collection, International Exhibition, 1882, and his Essays on Art (1886), though not free from dogmatism and over-emphasis, were sincere contributions to art criticism, full of striking judgments strikingly expressed. His Landscape in Poetry (1887) showed wide knowledge and critical appreciation of one of the most attractive aspects of poetic interpretation. But Palgrave's principal contribution to the development of literary taste was contained in his Golden Treasury of English Songs and Lyrics (1861), an anthology of the best poetry in the language constructed upon a plan sound and spacious, and followed out with a delicacy of feeling which could scarcely be surpassed. Palgrave followed it with a Treasury of Sacred Song (1886), and a second series of the Golden Treasury (1897), including the work of later poets, but in neither of these was quite the same exquisiteness of judgment preserved. Among his other works were The Passionate Pilgrim (1838), a volume of selections from Herrick entitled Chrysomela (1877), a memoir of Clough (1862) and a critical essay on Scott (1866) prefixed to an edition of his poems.

See Gwendolin F. Palgrave, P. T. Palgrave (1879).

Pali, the language used in daily intercourse between cultivated people in the north of India from the 7th century B.C. It continued to be used throughout India and its confines as a literary language for about a thousand years, and is still, though in a continually decreasing degree, the literary language of Burman, Sinh, and Ceylon. Two factors combined to give Pali its importance as one of the few great literary languages of the world: the one political, the other religious. The political factor was the rise during the 7th century B.C. of the Kosala power. Previous to this the Aryan settlements, along the three routes they followed in their penetration into India, had remained isolated, independent and small communities. Their language bore the same relation to the Vedic speech as the various Italian dialects bore to Latin. The welding together of the great Kosala kingdom, more than twice the size of England, in the very centre of the settled country, led insensibly but irresistibly to the establishment of a standard of speech, and the standard followed was the language used at the court at Savatthi in the Nepalese hills, the capital of Kosala. When Gotama the Buddha, himself a Kosalan by birth, determined on the use, for the propagation of his religious reforms, of the living tongue of the people, he and his followers naturally made full use of the advantages already gained by the form of speech current through the wide extent of his own country. A result followed somewhat similar to the effect, on the German language, of the Lutheran reformation. When in the generations after the Buddha's death, his disciples compiled the documents of the faith, the form they adopted became dominant. But local varieties of speech continued to exist.

The etymology of the word Pali is uncertain. It probably means "row, line, canon," and is used, in its exact technical sense, of the language of the canon, containing the documents of the Buddhist faith. But when Pali first became known to Europeans it was already used also, by those who wrote in Pali, of the language of the later writings, which bear the same relation to the standard literary Pali of the canonical texts as medieval
The canonical texts are divided into three collections called Pītakas, i.e., baskets. This figure of speech refers, not to a box or box in which things can be stored, but to the baskets, used in India in excavations, as a means of handling on the earth from one worker to another. The first Pītaka contains the Vinaya— that is, Rules of the Order; the second, the Sutta, giving the doctrine, and the third the Abhidhamma, analytical exercises in the psychological system on which the doctrine is based. These have now nearly all, mainly through the work of the Pali Text Society, been published in Pali.

The Vinaya was edited in 5 vols. by H. Oldenberg; and the more important parts of it have been translated into English by Rhys Davids and Oldenberg in their Vinaya Texts.

The Sutta Pītaka consists of five Nikāyas, four principal and one supplementary. The four principal ones have been published for the Pali Text Society, and some volumes have been translated into English by Rhys Davids and Oldenberg in their Sutta Texts. The Kanravaka and the Aṅgika are the main authorities for the doctrines of early Buddhism. The fifth Nikāya is a miscellaneous collection of treaties, mostly very short, on a variety of subjects. It contains lyrical and ballad poetry, specimens of early exegesis and commentary, lives of the saints, collections of edifying anecdotes and of the now well-known Jātakas or Birth Stories. Of these, eleven volumes had by 1910 been edited for the Pali Text Society by various scholars, the Jātakas and two other treatises had appeared elsewhere, and two works (one a selection of lives of distinguished early Buddhists, and the other an ancient commentary), were still in MS.

The Pītakas were traditionally divided into the Adhyayan suttas, the Vinaya and the Abhidhamma. The Pītaka five, and one-third of the sixth, had by 1910 been published by the Pali Text Society; and one, the Dhamma Sanga, had been translated by Mrs Rhys Davids. A description of the contents of all these books in the canon is given in Rhys Davids's American Lectures, pp. 44–86.

A certain amount of progress has been made in the historical criticism of these books. Out of the twenty-nine works contained in the three Pītakas only one claims to have an author. That one is the Kathā Vattaka, ascribed to Tissa the son of Mogallā, who presided over the third council held under Asoka. It is the latest book of the third Pītaka. All the rest of the canonical works grew up in the schools of the Order, and most of them appear to contain documents, or passages, of different dates. In his masterly analysis of the Vinaya, sixteen volumes in all, which are at least three strata in the existing presentation of the Rules of the Order, the oldest portions going back probably to the time of the Buddha himself. Professor Rhys Davids has put forward similar views with respect to the Jātakas and the Sutta Nipāta in his Buddhist India, and with respect to the Nikāyas in general in the introduction to his Dialogues of the Buddha. And Professor Windisch has discussed the legends of the temptation in his Māra und Buddha, and those relating to the Buddha's birth in his Buddha's Geburt. It seems probable that the books themselves were developed substantially into the shape in which we now have them before the fourth century B.C. a hundred years after the Buddha's death; that slight alterations and additions were made in them, and the miscellaneous Nikāya and the Abhidhamma books compiled, at various times down to the third council under Asoka; and that the canon was then considered closed. No evidence has yet been found of any alterations made, after that time, in Ceylon; but there were probably before that time, in India, other books, now lost, and other recensions of some of the above.

Of classical Pali in northern India subsequent to the canon there is but little evidence. These works only have survived. These are the Mīlinda-pañha edited by E. H. Westergaard, and translated by Rhys Davids under the title Questions of King Milinda; the Nettī Pakaraya, edited by E. Hardy for the Pali Text Society in 1902; and the Pātaka Upadesa. The former belongs to the north-west, the others to the centre of India, and all three may be dated vaguely in the first or second centuries A.D. The first, a religious romance of remarkable interest, may owe its preservation to the charm of its style, the others to the accident that they were attributed by mistake to a famous ancestor. In any case they are the sole survivors of what must

---

2 Westergaard, Über den ältesten Ursprung der indischen Geschichte, p. 87; Rhys Davids, Transactions of the Philological Society (1875), p. 70; Kuhn, Beiträge zur Pali Grammatik, 7–9.
have been a vast and varied literature. Professor Takakusu has shown the possibility of several complete books belonging to it being still extant in Chinese translations, \(^1\) and we may yet hope to recover original fragments in central Asia, Tibet, or Nepal.

At p. 66 of the *Gandha Vamsa*, a modern catalogue of Pali books and authors, written in Pali, there is given a list of ten authors who wrote Pali books in India, probably southern India. We may conclude that these books are still extant in Burma, where the catalogue was drawn up. Two only of these ten authors are otherwise known. The first is Dhammapala, who wrote in Kācīputra, the modern Conjevaram in South India, in A.D. 1859. His principal work is on the various commentaries on the *Vastu Pātikā* included in the miscellaneous Nikāya. Three of these have been published by the Pali Text Society; and Professor E. Hardy has discussed in the *Zeitschrift der deutschen morgenländischen Gesellschaft* (1867), pp. 165-177, all that is known about him. Dhammapala wrote also a commentary on the Netti mentioned above. The second is Buddhaddāta, who wrote the *Jindānākārā* in the 5th century a.D. It has been edited and translated by Professor J. Gray. It is a poem, of no great interest, on the life of the Buddha.

The two other Pali books mentioned by Dhammapala in India have been lost there. They have been preserved for us by the unbroken succession of Pali scholars in Ceylon and Burma. These scholars (most of them members of the Buddhist Order, but many of them laymen) not only copied and recopied the Indian Pali books, but wrote a very large number themselves. We are thus beginning to know something of the history of this literature. Two departments have been subjected to critical study: the Ceylon chronicles by Professor W. Geiger in his *Mahāvamsa und Dipavaṃsa*, and the earlier grammatical works by Professor O. Franke in two articles in the *Journal of the Pali Text Society* for 1903, and in his *Geschichte und Kritik der einheimischen Pali Grammatik*. Dr Forchhammer in his *Jardine Prize Essay*, and Dr Mabel Bode in the introduction to her edition of the *Sāsana-vamsa*, have collected many details as to the Pali literature in Burma.

The results of these investigations show that in Ceylon from the 3rd century B.C. onwards there has been a continuous succession of teachers and scholars. Many of them lived in the various viharas or residences situated throughout the island, but the main centre of intellectual effort, down to the 5th century, was the vihara of Pāvamane. A very excellent edition of the twenty-seven canonical books has been recently printed there, and there exist in our European libraries a number of Pali MSS. written in Sans.

It would be too early to attempt any estimate of the value of this secondary Pali literature. Only a few volumes, out of several hundreds known to be extant in MS., have yet been published. But the department of the chronicles, the only one so far at all adequately treated, has thrown so much light on many points of the history of India that we may reasonably expect results equally valuable from the publication and study of the remainder. The works on religion and philosophy especially will be of as much service for the history of ideas as in the later periods as the publication of the canonical books has already been for the earlier period to which they refer. The Pali books written in Ceylon, Burma and Siam will be our best and oldest, and in many respects our only authorities, for the sociology and politics, literature and the religion, of their respective countries.

**PALIKAO, CHARLES GUILLAUME MARIE APPOLINAIRE ANTOINE COUSIN MONTAUBAN, COMTE DE (1796 1878), French general and statesman, was born in Paris on the 24th of June 1796. As a cavalry officer young Montauban saw much service in Algeria, but he was still only a colonel when in 1847 he effected the capture of Abd-el-Kader. After rising to the rank of general of division and commanding the province of Constantine, he was appointed in 1858 to a command at home, and at the close of 1859 was selected to lead the French troops in the joint French and British expedition against Egypt. He directed the operations of this expedition, but did not escape criticism, although he was a far better soldier than politician. After 1861 he was appointed governor of Siam, and in 1864 served under General Beauregard in the American Civil War. He died at Versailles on the 8th of January 1878.**

\(^1\) *Journal of the Pali Text Society* (1908), pp. 72, 86.
PALIMPSEST. The custom of removing writing from the surface of the material on which it had been inscribed, and thus preparing that surface for the reception of another text, has been practised from early times. The term palimpsest (from Gr. παλιμπέστ, again, and γραφα, I scrape) is used by Catullus, apparently with reference to papyrus; by Cicero, in a passage wherein he is evidently speaking of waxen tablets; and by Plutarch, when he narrates that Plato compared Dionysius a of a sxoiv παλιμπέστ in that his tyrant nature, being δισεκατούρως, showed itself like the imperfectly erased writing of a palimpsest MS. In this passage reference is clearly made to the washing off of writing from papyrus. The word παλιμπέστ can only in its first use have been applied to MSS. which were actually scraped or rubbed, and which were, therefore, composed of a material of sufficient strength to bear the process. In the first instance, then, it might be applied to waxen tablets; secondly, to vellum books. There are still to be seen, among the surviving waxen tablets, some which contain traces of an earlier writing under a fresh layer of wax. Papyrus could not be scraped or rubbed; the writing was washed from it with the sponge. This, however, could not be so thoroughly done as to leave a perfectly clean surface, and the material was accordingly only used a second time for documents of an ephemeral or common nature. To apply, therefore, the title of palimpsest to a MS. of this substance was not strictly correct; the fact that it was so applied proves that the term was a common expression. Traces of earlier writing are very rarely to be detected in extant papyri. Indeed, the supply of that material must have so been abundant that it was hardly necessary to go to the trouble of preparing a papyrus, already used, for a second writing.

In the early period of palimpsests, vellum MSS. were no doubt also washed rather than scraped. The original surface of the material, at all events, was not so thoroughly defaced as was afterwards the case. In course of time, by atmospheric action or other chemical causes, the original writing would to some extent reappear; and it is thus that so many of the capital and uncial palimpsests have been successfully deciphered. In the later middle ages the surface of the vellum was scraped away and the writing with it. The reading of the later examples is therefore very difficult or altogether impossible. Besides actual rasure, various recipes for effacing the writing have been found, such as to soften the surface with milk and meal, and then to rub with pumice. In the case of such a process being used, total obliteration must almost inevitably have been the result.

To intensify the traces of the original writing, when such exist, various chemical reagents have been tried with more or less success. The old method of smearing the vellum with tincture of gall restored the writing, but did irremovable damage by blackening the surface, and, as the stain grew darker in course of time, by rendering the text altogether illegible. Of modern reagents the most harmless appears to be hydrosulphate of ammonia; but this also must be used with caution.

The primary cause of the destruction of vellum MSS. by willful obliteration was, it need hardly be said, the dearth of material. In the case of Greek MSS., so great was the consumption of old codices for the sake of the material, that a synodal decree of the year 691 forbade the destruction of MSS. of the Scriptures or the church fathers—imperfect or injured volumes excepted. The decline of the vellum trade also on the introduction of paper caused a scarcity which was only to be made good by recourse to material already once used. Vast destruction of the broad quarto of the early centuries of our era took place in the period following the fall of the empire, and the most valuable Latin palimpsests are accordingly found in the volumes which were remade from the 7th to the 8th centuries, a period during which the large volumes referred to must have been still fairly numerous. Late Latin palimpsests rarely yield anything of value. It has been remarked that no entire work has been found in any instance in the original text of a palimpsest, but that portions of many works have been taken to make up a single volume. These facts prove that scribes were indiscriminate in supplying themselves with material from any old volumes that happened to be at hand.

An enumeration of the different palimpsests of value is not here possible (see Wattenbach, Schriftenwesen, 3rd ed., pp. 299-317); but a few may be mentioned of which facsimiles are accessible. The MS. in the Bibliothèque nationale, Paris, known as the Codex Ephraemi, containing portions of the Old and New Testaments in Greek, attributed to the 5th century, is covered with works of Ephraem Syrus in a hand of the 12th century (ed. Tischendorf, 1843, 1845). Among the Syriac MSS. obtained from the Nisibin desert in Egypt, and now deposited in the British Museum, some important Greek texts have been recovered. A volume containing a work of Severus of Antioch of the beginning of the 9th century is written on palimpsest leaves taken from MSS. of the Illiad of Homer and the Gospel of St Luke, both of the 6th century (Cat. Anc. MSS., vol. i., p. 9, 10), and the Elements of Euclid of the 7th or 8th century. To the same direction belongs the double palimpsest, in which a text of St John Chrysostom, in Syriac, of the 9th or 10th century, covers a Latin grammatical treatise in a cursive hand of the 6th century, which in its turn has displaced the Latin annals of the historian Gratus Licinius, of the 5th century (Cat. Anc. MSS., ii., pl. 1, 2). Among Latin palimpsests also may be noticed those which have been reproduced in the Exempla of Zangemeister and Wattenbach. These are— the Ambrosian Platinum, in rustic capitals, of the 4th or 5th century, re-written with portions of the Bible in the 9th century (pl. 6); the Cicero De republica of the Vatican, in uncial, of the 3rd century, covered by St Augustine on the Psalms, of the 7th century (pl. 17; Pal. Soc., pi. 10); the Codex Theodosianus of Turin, of the 5th or 6th century (pl. 25); the Fasti Consulares of Verona, of A.D. 486 (pl. 20); and the Arrian fragment of the Vatican, of the 4th century (pl. 31). Most of them originally belonged to the monastery of Bobbio, a fact which gives some indication of the great literary wealth of that house. By using skill and judgment, with a favouring light, photography may be often made a useful agent in the decipherment of obscure palimpsest texts.

PALINDROME (Gr. παλινδρόμος, again, and δρόμος, a course), a verse or sentence which runs the same when read either backwards or forwards. Such is the verse—

Roma tibi subito motibus ibit amor;

or

Σίγας, θαλάσσας, πεπληγμένη τοις ἀγίοις

Some have refined upon the palindromic, and composed verses each word of which is the same read backwards as forwards:

For instance, that of Camden—

Odo tenet mulum, maediman mappam tenet Anna,

Anna tenet mappam maedidum, mulum tenet Odo.

The following is still more complicated, as reading in four ways—upwards and downwards as well as backwards and forwards:—

S A T O R
A P E N I T
T E N E R
O P E R A
R O T A S

PALINGENESIS (Gr. παλίγενθος, again, δεῖναι, becoming, birth), a term used in philosophy, theology and biology. In philosophy it denotes in its broadest sense the theory (e.g. of the Pythagoreans) that the human soul does not die with the body but is "born again" in new incarnations. It is thus the equivalent of metempsychosis (q.v.). The term has a narrower and more specific use in the system of Schopenhauer, who applies it to his doctrine that the will does not die but manifests itself afresh in new individuals. He thus repudiates the primitive metempsychosis doctrine which maintains the re-incarnation of the particular soul. The word "palingenesis" or rather "paligenesis" may be traced back to the Stoics, who used the term for the continual re-creation of the universe by the Logos (Creator) after 184 centuries, and in the early Ptolemaic process of Noah and his sons as leaders of a "renovation" or "re-birth" of the earth. Josephus uses the term of the national restoration of the Jews, Plutarch of the transmigration of souls, and Cicero of his own return from exile. In the New Testament the properly theological sense of spiritual regeneration is found, though the word itself occurs only twice; and it is used by the church fathers, e.g. for the rite of baptism or for the state of repentance. In modern biology (e.g. Haeckel and Fritz Muller)
PALISSY

"palingenesis" has been used for the exact reproduction of ancestral features by inheritance, as opposed to "kenogenesis" (Gr. καὶ νεοῦσιν), in which the inherited characteristics are modified by environment.

PALISSY, BERNARD (1510-1589), French potter (see CERAMICS), is said to have been born about 1510, either at Saintes or Agen, but both date and locality are uncertain. It has been stated, on insufficient authority, that his father was a glass-painter and that he served as his father's apprentice. He tells us that he was apprenticed to a glass-painter and that he also acquired in his youth the elements of land-surveying. At the end of his apprenticeship he followed the general custom and became a travelling workman; acquiring fresh knowledge in many parts of France and the Low Countries, perhaps even in the Rhone Provinces of Germany and in Italy.

About 1539 it appears that he returned to his native district and, having married, took up his abode at Saintes. How he lived during the first years of his married life we have little record except when he tells us, in his autobiography, that he practised the arts of a portrait-painter, glass-painter and land-surveyor as a means of livelihood. It is known for instance that he was commissioned to survey and prepare a plan of the salt marshes in the neighbourhood of Saintes when the council of Francis I. determined to establish a salt tax in the Saintonge. It is not quite clear, from his own account, whether it was during his Wanderjahre or after he settled at Saintes that he was shown a white enamelled cup, which caused him a surprise, that he determined to spend his life—to use his own expressive phrase—"like a man who gropes in the dark"—in order to discover the secrets of its manufacture. Most writers have supposed that this piece of fine white pottery was a piece of the enameled majolica of Italy, but such a theory will hardly bear examination. In Palissy's time pottery covered with beautiful white tin-enamel was manufactured at many centres in Italy, Spain, Germany and the South of France, and it is inconceivable that a man so travelled and so acute should not have been well acquainted with its appearance and properties. What is much more probable is that Palissy saw, among the treasures of some nobleman, a specimen of Chinese porcelain, then one of the wonders of the European world, and, knowing nothing of its nature, substance or manufacture, he set himself to work to discover the secrets for himself. At the neighbouring village of La Chapelle-des-Pots he mastered the rudiments of peasant pottery as it was practised in the 16th century. Other equipment he had none, except such indefinite information as he presumably had acquired during his travels of the manufacture of European tin-enamelled pottery.

For nearly sixteen years Palissy laboured on in these wild endeavours, though a succession of utter failures, working with the utmost diligence and constancy but, for the most part, without a gleam of hope. The story is a most tragic one; for at times he and his family were reduced to the bitterest poverty; he burned his furniture and even, it is said, the floor boards of his house to feed the fires of his furnaces; susteining meanwhile the reproaches of his wife, who, with her little family clamouring for food, evidently regarded these proceedings as little short of insanity. All these struggles and failures are most faithfully recorded by Palissy himself in one of the simplest and most interesting pieces of autobiography ever written. The tragedy of it all is that Palissy not only failed to discover the secret of Chinese porcelain, which we assume him to have been searching for, but that when he did succeed in making the special type of pottery that will always be associated with his name it should have been inferior in artistic merit to the contemporary productions of Spain and Italy. His first successes can only have been a superior kind of "peasant pottery" decorated with modelled or applied reliefs coloured naturalistically with glazes and enamels. These works had already attracted attention locally when, in 1568, the constable de Montmorency was sent into the Saintonge to suppress the revolution there. Montmorency protected the potter and found him employment in decorating with his glazed terra-cottas the château d'Ecouen. The patronage of such an influential noble soon brought Palissy into fame at the French court, and although he was an avowed Protestant, he was protected by these nobles from the ordinances of the parliament of Bordeaux when, in 1563, the property of all the Protestants in this district was seized. Palissy's workshops and kilns were destroyed, but he himself was saved, and, by the interposition of the all-powerful constable, he was appointed "inventor of rustic pottery to the king and the queen-mother"; about 1563, under royal protection, he was allowed to establish a fresh pottery works in Paris in the vicinity of the royal palace of the Louvre. The site of his kilns indeed became afterwards a portion of the gardens of the Tuileries. For about twenty-five years from this date Palissy lived and worked in Paris. He appears to have been a personal favourite of Catherine de Médicis, and of her sons, in spite of his profession of the reformed religion.

Working for the court, his productions passed through many phases, for besides continuing his "rustic figurines" he made a large number of dishes and plaques ornamented with scriptural or mythological subjects in relief, and in many cases he appears to have made reproductions of the pewter dishes of François Briot and other metal workers of the period. During this period too he gave several series of public lectures on natural history—the entrance fee being one crown, a large fee for those days—in which he poured forth all the ideas of his second mind. His ideas of springs and underground waters were far in advance of the general knowledge of his time, and he was one of the first men in Europe to enunciate the correct theory of fossils.

The close of Palissy's life was quite in keeping with his active and stormy youth. Like Ambroise Paré, and some other notable men of his time, he was protected against ecclesiastical persecution by the court and some of the great nobles, but in the fanatical outburst of 1568 he was thrown into the Bastille, and although Henry III. offered him his freedom if he would recant, Palissy refused to save his life on any such terms. He was condemned to death when nearly eighty years of age, but he died in one of the dungeons of the Bastille in 1580.

Palissy's Pottery.—The technique of the various wares he made shows their derivation from the ordinary peasant pottery of the period, though Palissy's productions are, of course, vastly superior to anything of their kind previously made in Europe. It appears almost certain that he never used the potter's wheel, as all his best known pieces have evidently been pressed into a mould and then finished by modelling or by the application of ornament moulded in relief. His most characteristic productions are the large plates, ewers, oval dishes and vases to which he applied realistic figures of reptiles, fish, shells, plants and other objects. This is, however, not the work of an artist, but that of a highly gifted naturalist at the dawn of modern science, who delighted to copy, with faithful accuracy, all the details of reptiles, fishes, plants or shells. We may be sure that his fossil shells were not forgotten, and it has been suggested, with great probability, that these pieces of Palissy's were only
manufactured after his removal to Paris, as the shells are always well-known forms from the Eocene deposits of the Paris basin. Casts from these objects were fixed on to a metal dish or vase of the shape required, and a fresh cast of the whole formed a mould from which Palissy could reproduce many articles of the same kind. The various parts of each piece were painted in realistic colours, or as nearly so as could be reached with the pigments Palissy was able to make. These colours were mostly various shades of blue from indigo to ultramarine, some rather vivid greens, several tints of browns and greys, and, more rarely, yellow. A careful examination of the most authentic Palissy productions shows that they excel in the sharpness of their modelling, in a perfect neatness of manufacture and, above all, in the subdued richness of their general tone of colour. The crude greens, bright purples and yellows are only found in the works of his imitators; whilst in the marbled colours on the back of the dishes Palissy's work is soft and well fused, in the imitations it is generally dry, even harsh and uneven. Other pieces, such as dishes and platters, were ornamented by figure subjects treated after the same fashion, generally sculptural scenes or subjects from classical mythology, copied, in many cases, from works in sculpture by contemporary artists.

Another class of designs used by Palissy were plates, basin and the like, with geometrical patterns moulded in relief and pierced through, forming a sort of open network. Perhaps the most successful, as works of art, were those plates and ewers which Palissy moulded in exact facsimile of the rich and delicate works in pewter for which Francois Briot and other Swiss metal-workers were so celebrated. These are in very slight relief, executed with cameo-like finish, and are mostly of good design belonging to the school of metal-working developed by the Italian goldsmiths of the 16th century. Palissy's ceramic reproductions of these metal plates were not improved by the colours with which he picked out the designs.

Some few enamelled earthenware statuettes, full of vigour and expression, have been attributed to Palissy; but it is doubtful whether he ever worked in the round. On the whole his productions cannot be assigned a high rank as works of art, though they have always been highly valued, and in the 17th century attempts were made, both at Delft and Lambeth, to adapt his "rustic" dishes with the rest of animalia domestici of after the same fashion, generally sculptural scenes or subjects from classical mythology, copied, in many cases, from works in sculpture by contemporary artists.

PALITANA, a native state of India in the Kathiawar agency of the Bombay presidency. Area, 280 sq. m.; pop. (1901), 52,856, showing a decrease of 15%, in the decade. The chief is a Gohel Rajput, with the title of Thakur Sahib. Gross revenue, £42,000; tribute jointly to the gaekwar of Baroda and the nawab of Junagrah, 1700. The capital of the state is Palitana; pop. 12,500. Above the town to the west rises the hill of Satrunjuka, sacred to the Jains. On this hill, which is truly a city of temples, all of peculiar beauty, in an architectural style found in a marked degree. Some of the temples are as old as the 11th century, and they are spread over the intervening period down to the present. The hill is visited by crowds of pilgrims every year.

See J. Burgess, Notes of a Visit to Satrunjuka Hill (Bombay, 1869).

PALK STRAITS, the channel lying between the mainland of India and the island of Ceylon. It is named after Robert Palk, governor of Madras (1755-1756). The strait lies north of the line of reefs called Adam's Bridge, while the Gulf of Mannar lies south of it. The two channels are connected by the Pamban passage.

PALL, a word the various meanings of which can be traced to the Latin word *pallium*, that is, a piece of cloth used either as a covering or as a garment. In the last sense the *pallium* was the *ibatros*, the square or oblong-shaped outer garment of the Greeks. In the sense of a garment the English usage of "pall" is confined to the ecclesiastical vestment (see PALLUM) and to the supernicia or dalmatic, the *pallium regale* or imperial mantle, one of the principal coronation vestments of British sovereigns. The heraldic bearing known as a "pall" takes the form of the Y of the ecclesiastical vestment. The chief applications of the word, in the sense of a covering, are to an altar frontal, to a linen cloth used to veil the chalice in the Catholic service of the Eucharist, and to a heavy black or purple veil covering for a coffin or hearse. The livery companies of London possessed sumptuous state palls for the funerals of their members, of which some are still in existence. The Merchant Taylors' company have two examples of Italian workmanship. The so-called "Walworth pall" of the Fishmongers' company probably dates from the 16th century. The Vintners' pall is of cloth of gold and purple velvet, with a figure of St Martin of Tours, the company's patron saint.

An entirely different word is "to pall," to become or make stale, insipid or tasteless, hence to cease to impress from constant repetition; this is a shortened term of "appall" (O. Fr. *appaller*; to become pale; Lat. *palidus*).

PALLA, PALA, or IMPALA, the native name of a red South African antelope of the size of a fallow-deer, characterized by the large black lyre horns of the bucks, and the presence in both sexes of a pair of glands on the back of the hind feet bearing a tuft of black hairs. On the east side the palla (*Aepyceros melampus*) ranges as far north as the southern Sudan; but in Angola it is replaced by a species or race (*Ae. petesi*) with a black "blaze" down the face. Pallas associate in large herds on open country in the neighbourhood of water. (See ANTELOPE.)

PALLADIAN, the term given in English architecture to one of the phases of the Italian Renaissance, introduced into England in 1620 by Inigo Jones, a great admirer of the works of Andrea Palladio (q.v.). In 1716, Richard Boyle, 3rd earl of Burlington, who also admired the works of Palladio, copied some of them, the front of old Burlington House being more or less a reproduction of the Palazzo Porto at Vicenza, and the villa at Chiswick a copy of the Villa Capra near Vicenza. It is probably due to Lord Burlington that the title Palladian is the designation for the Italian style as practised in England. In 1863 Sir Gilbert Scott published his "Palladian" designs, and the use of the term Palladian for the work of the Palladian office was rejected and Lord Palmerston selected in preference the Palladian style. In France and America, Barozzi Vignole (1507-1573), another Italian architect, holds a similar position as the chief authority on the Italian Renaissance.

PALLADIO, ANDREA (1508-1580), Italian architect, was born in Vicenza on the 30th of November 1518. The works of Vitruvius and Alberti were studied by him at an early period, and his student life was spent in Rome, where he was taken by
PALLADIUM

his patron Count Trissino. In 1547 he returned to Vicenza, where he designed a very large number of fine buildings—among the chief being the Palazzo della Ragione, with two storeys of open arcades of the Tuscan and Ionic orders, and the Rotonda, Porte and Chiaregati palaces. Most of these buildings look better on paper than in reality, as they are mainly built of brick, covered with stucco, now in a very dilapidated condition; but this does not affect the merit of their design, as Palladio intended them to have been executed in stone. Pope Paul III. sent for him to Rome to report upon the state of St Peter's. In Venice, too, Palladio built many stately churches and palaces, such as S. Giorgio Maggiore, the Capuchin church, and some large palaces on the Grand Canal. His last great work was the Teatro Olimpico at Vicenza, which was finished, though not altogether after the original design, by his pupil and fellow citizen Scamozzi.

In addition to his town buildings Palladio designed many country villas in various parts of northern Italy. The villa of Capra is perhaps the finest of these, and has frequently been imitated. Palladio was a great student of classical literature, and published in 1575 an edition of Caesar's Commentaries with notes. His I quattro libri dell'architettura, first published at Venice in 1570, has passed into countless editions, and been translated into every European language. The original edition is a small folio, richly illustrated with well-executed full-page woodcuts of plans, elevations, and details of buildings—chiefly either ancient Roman temples or else palaces designed and built by himself. Among many others, an edition with notes was published in England by Inigo Jones, most of whose works, and especially the palace of Whitehall, of which only the banqueting room remains, owed much to Palladio's inspiration. The style adopted and partially invented by Palladio expressed a kind of revolt against the extreme licence both of composition and ornament into which the architecture of his time had fallen. He was fascinated by the stateliness and proportion of some of the buildings of ancient Rome, and did not reflect that reproductions of these, however great their archaeological accuracy, could not but be lifeless and unsuited to the wants of the 16th century. Palladio's carefully measured drawings of ancient buildings are now of great value, as in many cases the buildings have altogether or in part ceased to exist.

PALLADIUM (Gr. παλάδιον), an archaic wooden image (ξιθωρ) of Pallas Athena, preserved in the citadel of Troy as a pledge of the safety of the city. It represented the goddess, standing in the stiff archaic style, holding a spear in her right hand, in her left a distaff and spindle or a shield. According to Apollodorus (iii. 12, 3) it was made by order of Athena, and was intended as an image of Pallas, the daughter of Triton, whom she had accidentally slain, Pallas and Athena being thus regarded as two distinct beings. It was said that Zeus threw it down from heaven when Ilus was founding the city of Ithum, Olba, and gave it to Sheba, to be used as a landmark and made thus the capital of Troy practicable. According to some accounts, there was a second Palladium at Troy, which was taken to Italy by Aeneas and kept in the temple of Vesta at Rome. Many cities in Greece and Italy claimed to possess the genuine Trojan Palladium. Its theft is a frequent subject in Greek art, especially of the earlier time.

PALLADIUM [symbol Pd, atomic weight 106.7 (0.16)], in chemistry, a metallic element associated with the platinum group. It is found in platinum ores, and also in the native condition and associated with gold and silver in Brazilian gold-bearing sand. Many methods have been devised for the isolation of the metal from platinum ore. R. Bunsen (Ann., 1868, 146, p. 265), after removing most of the platinum as ammonium platinocloride, precipitates the residual metals of the group by iron; the resulting precipitate is then heated with ammonium chloride and evaporated with fuming nitric acid, the residue taken up in water, and the palladium precipitated as potassium palladium chloride. This is purified by dissolving it in hot water and evaporating the solution with oxalic acid, taking up the residue in potassium chromate, and filtering off any potassium chromate formed. The filtrate deposits potassium palladium chloride, which, on heating in a current of hydrogen leaves a residue of the metal. Roessler (Zeit. f. chemie, 1866, p. 175) precipitates both platinum and palladium as double chlorides, the resulting mixed chlorides being reduced to the metals by ignition in hydrogen, taken up in aqua regia, the solution neutralized, and the palladium precipitated by mercuric cyanide. See also T. Wilm (Ber., 1882, 15, p. 1168; 1881, 14, p. 630; 1882, 15, p. 241) on its separation as palladichloride with hydrofluoric acid, and (J. Viole, Comptes rendus, 1879, 80, p. 709) on the separation of palladium from Brazilian gold by a combination of sand. Pure palladium may be obtained by the reduction of the double chloride (NH₄)₂PdCl₄ in a current of hydrogen, or of palladium chloride with formic acid.

It is a ductile metal of silvery lustre, with a specific gravity of 10.97 (0°C). It is the most easily fusible of the metals of the platinum group, its melting-point being about 1350-1355°C. (L. Holborn and F. Henning, Sitzb. Akad. Berlin, 1905, p. 311.) It readily distills when heated in the electric furnace. Its mean dissociation temperature of the metal when heated directly to 3000°C is 0.058 ± 0.002. When heated in the electric furnace it melts at 2000°C. (J. Viole, Comptes rendus, 1879, 80, p. 709.) Palladium finds application in the form of alloys for astronomical instruments, in dentistry, and in the construction of springs and movements of clocks. Native palladium is dimorphous. It is soluble in nitric acid, more especially if the acid contains oxides of nitrogen, and when obtained in the finely divided condition by reduction of its salts, it is to some extent soluble in hydrochloric acid. It also dissolves in boiling concentrated sulphuric acid and in hydrobromic acid. It oxidizes when fused with caustic alkalis. It combines with fluorine and with chlorine at a dull red heat, the metal being red and shiny. With iodine, palladium forms the element PdI₂. Palladium is dissolved by hydrochloric acid with the formation of palladium chloride and hydrogen, but is only slowly decomposed by nitric acid, this action being accelerated by the addition of sodium iodide. Palladium combines with palladium salts a precipitate of palladium sulphide which is insoluble in ammonium sulphide; mercuric chloride gives the characteristic yellowish precipitate of palladichloride, and potassium iodide with the metal in an excess of the metal compounds indicated by 1894 volumes of hydrogen, or in the atomic proportion PD/H = 1:98.

Two series of salts are known, namely, palladous and palladous salts, corresponding to the two oxides PdO and PdO₂. Of these the palladous salts only are stable, the palladous salts readily passing into the palladous form on boiling with water. The palladous compounds show a complete analogy with the corresponding compounds of platinum, rhodium, and iridium. The palladous salts are more volatile and less soluble than the corresponding platinum salts and leave a residue of the metal; the metal may also be obtained from solutions of the salts by the addition of zinc, iron, formic acid, or hydrochloric acid. Palladous chlorosulphate and palladous perchlorate are formed by heating the chlorides and other gases, the heat of occlusion being 4640 calories per gram of hydrogen. The occluded hydrogen is strongly bound to the specific heat of the gas being given off in a vacuum, but it is easily removed when heated to 160°C. T. Graham (Phil. Mag., 1866-1869) was of the opinion that the occluded hydrogen underwent great condensation and behaved as a quasi-metal (to which he gives the name of the "metallogenium"), forming a compound with the palladium; but L. Troost and P. Hautefeuille (Ann. chim. phys., 1874, 4, p. 279) considered that a definite compound of composition PD₂H was formed. The more recent work of C. Hoesemann and H. B. Pfeiffer (Ann. phys., 1874, 177, p. 467) shows, however, that the formation of a definite compound (see also J. Dewar, Phil. Mag., 1874, 4, 47, pp. 324, 342). A palladous hydride was obtained by F. W. Vetlger (Comptes rendus, 1890, 116, p. 394) by reducing palladium trichloride in hypophosphite. It is an unstable black powder, which readily loses hydrogen at 0°C. C. Paal and J. Gerum (Ber., 1908, 41, p. 818) have shown that when palladium black is suspended in water, it is precipitated with the formation of 1904 volumes of hydrogen, or in the atomic proportion PD/H = 1:98.
Palladium oxide, $\text{PdO}$, is a black powder formed by heating spongy palladium to a dull red heat in a current of oxygen or by heating in air. It is obtained in small reduced vols., and decomposes when heated. Palladic oxide, $\text{PdO}_2$, is obtained in the hydrated condition, $\text{PdO}_2\cdot\text{H}_2\text{O}$, by the action of oxygen on palladous oxide. The oxide is readily soluble in acetic acid solution (L. Wöhler); and by the action of caustic potash on potassium palladico-chloride, the liquid being neutralized with acetic acid (F. Bolluci, Zeit. anorg. Chem., 1895, 472). In the current semicircle of the formed dark water, when boiled with water it passes into the lower oxide. It is an energetic oxidizing agent, and when freshly prepared is soluble in dilute mineral acids. A hydrated form of the oxide with the composition $\text{PdO}_2\cdot\text{H}_2\text{O}$ is obtained by the action of caustic potash on the potassium oxide. The action of a slight excess of caustic soda on the double chloride, $\text{K}_2\text{PdCl}_4$, is a dark brown powder which loses its color when dried in air, and in the dry condition is fairly soluble in acids. By the electrolytic oxidation of palladous nitrate L. Wöhler and F. Martin (ib., 1898, p. 398), obtained a hydrated oxide, $\text{Pd}_2\text{O}_3\cdot\text{H}_2\text{O}$, as a dark brown powder which dissolves in hydrochloric acid, forming an unstable chloride.

Palladous chloride, $\text{PdCl}_2$, is obtained as a deliquescent crystalline mass when spongy palladium is heated to dull redness in a current of dry chlorine, which is obtained in small reduced vols., by yellowish smoke. When the current has been passed for several hours, the condensed fumes of chlorine will have formed a dark yellowish-brown powder, which, if heated, is reduced to the chloride. When the current is applied to palladium in an open vessel, the formed dark water, when boiled with water it passes into the lower oxide. It is an energetic oxidizing agent, and when freshly prepared is soluble in dilute mineral acids. A hydrated form of the oxide, $\text{PdO}_2\cdot\text{H}_2\text{O}$, is obtained by the action of caustic potash on potassium palladico-chloride, the liquid being neutralized with acetic acid (L. Wöhler, Zeit. anorg. Chem., 1895, 472). In the current semicircle of the formed dark water, when boiled with water it passes into the lower oxide. It is an energetic oxidizing agent, and when freshly prepared is soluble in dilute mineral acids. A hydrated form of the oxide, $\text{PdO}_2\cdot\text{H}_2\text{O}$, is obtained by the action of caustic potash on potassium palladico-chloride, the liquid being neutralized with acetic acid (L. Wöhler, Zeit. anorg. Chem., 1895, 472). In the current semicircle of the formed dark water, when boiled with water it passes into the lower oxide. It is an energetic oxidizing agent, and when freshly prepared is soluble in dilute mineral acids. A hydrated form of the oxide, $\text{PdO}_2\cdot\text{H}_2\text{O}$, is obtained by the action of caustic potash on potassium palladico-chloride, the liquid being neutralized with acetic acid (L. Wöhler, Zeit. anorg. Chem., 1895, 472). In the current semicircle of the formed dark water, when boiled with water it passes into the lower oxide. It is an energetic oxidizing agent, and when freshly prepared is soluble in dilute mineral acids. A hydrated form of the oxide, $\text{PdO}_2\cdot\text{H}_2\text{O}$, is obtained by the action of caustic potash on potassium palladico-chloride, the liquid being neutralized with acetic acid (L. Wöhler, Zeit. anorg. Chem., 1895, 472). In the current semicircle of the formed dark water, when boiled with water it passes into the lower oxide. It is an energetic oxidizing agent, and when freshly prepared is soluble in dilute mineral acids. A hydrated form of the oxide, $\text{PdO}_2\cdot\text{H}_2\text{O}$, is obtained by the action of caustic potash on potassium palladico-chloride, the liquid being neutralized with acetic acid (L. Wöhler, Zeit. anorg. Chem., 1895, 472).

Numerous determinations of the atomic weight of palladium have been made, the values obtained varying from 106.5 to 107.290 (see Amer. Chem. Jour., 1893, 21, p. 941; Ann., 1905, 341, p. 135; Jour. Chem. Soc., 1894, 65, p. 20). The International Commission on Atomic Weights, 1890, recount several new determinations: Haas (Dissertation, Erlangen, 1898) from the reduction of palladous bromide obtained the value 106.7; Kommerer (Phen. Pennsylvania, 1898), from reduction of the corresponding chloride and cyanide obtained a mean value of 106.3; whilst A. Guthier and his co-workers (Wiener Ber., 1889) from the reduction of palladous bromide, obtained the values 106.64 ± 0.02 and 106.55 ± 0.02 from the chloride, and 106.65 ± 0.03 from the bromide (Jour. pr. chem., 1899, ii. 79, p. 235-237).

PALLADIUS, Rutilius Taurinus Aemilianus, a Roman author of the 4th century A.D. He wrote a poem on agriculture (De re rustica) in fourteen books, the material being derived from Columella and other earlier writers. The work is conveniently arranged, but far inferior in every other respect to that of Columella.

There is a modern German edition by Schmitt (Leipzig, 1898).
of this great journey may be mentioned Sammlungen historischer Nachrichten über die mongolischen Völkerverwahrungen (2 vols., St Petersburg, 1776–1802); Novae species quadrupedum, 1778–1779; Pallavicino’s contributions to the dictionary of languages of the Russian empire, 1786–1789; Icones insectarum, praelitum Rossiae Sibericoque peculiarium, 1781–1806; Zoographia rassicaxistica (3 vols., 1831); besides many special papers in the Transactions of the academies of St Petersburg and Berlin. 

The empress bought Pallavicino’s natural history collections for 20,000 roubles, 5000 more than he asked for them, and allowed him to keep them for life. He spent a considerable time in 1793–1794 in visiting the southern provinces of Russia, and was so greatly attracted by the Crimea that he determined to take up his residence there. The empress gave him a large estate at Simpheropol and 10,000 roubles to assist in equipping a house. Though disappointed with the Crimea as a place of residence, Pallavicino continued to live there, devoted to constant research, especially in botany, till the death of his second wife in 1816, when he removed to Berlin, where he died on the 8th of September 1811. The results of his journey in southern Russia were given in his Bemerkungen auf einer Reise durch die südlichen Staatsolternschaften des russischen Reiches (Leipzig, 1790–1801; English translation by Blagdon, vols. v.–viii. of Modern Discoveries, 1802, and another in 2 vols., 1812). Pallavicino also edited and contributed to Neue nordsiche Beiträge zur physisch sozialen Entwicklung der Völker in Deutschland und in den nördlichen Ländern, 1819–1823.

His works include the following:

**PALLAVICINO, F.—PALLUM**

**PALLAVICINO, FERRANTE** (1618–1644), Italian writer of pasquinades, a member of the old Italian family of Pallavicini, was born at Piacenza in 1618. He received a good education at Padua and elsewhere, and early in life entered the Augustinian order, residing chiefly in Venice. For a year he accompanied Oattio Piccolomini, duke of Amalfi, in his German campaigns as field chaplain, and shortly after his return he published a number of clever but exceedingly scurrilous satires on the Roman curia and on the powerful house of the Barberini, which was so keenly resented at Rome that a price was set on his head. A Frenchman, Charles de Breche, decoyed him from Venice to the neighbourhood of Avignon, and there betrayed him. After fourteen months’ imprisonment he was beheaded at Avignon on the 6th of March, 1644.

His *Opere peregrine* was published at Venice in 1653, but being as may be imagined inferior in scurrility and grossness (Pallavicino’s specialties), are much less prized by the curious than the *Opere sacre* (Geneva, 1669), which were more than once reprinted in Holland, and were translated into German in 1663.

**PALLAVICINO (or Pallavicini), PIETRO SFORZA** (1607–1667), Italian cardinal and historian, son of the Marquis Alexander Pallavicino of Parma, was born at Rome in 1607. Having taken holy orders in 1630, and joined the Society of Jesus in 1638, he successively taught philosophy and theology in the Collegium Romanae; as professor of theology he was a member of the congregation appointed by Innocent X. to investigate the Janus issue. In 1659 he was made a cardinal by Alexander VII. He died at Rome on the 3th of June 1667. Pallavicino is chiefly known by his history of the council of Trent, written in Italian, and published at Rome in two folio volumes in 1636–1657 (2nd ed., considerably modified, in 1666). In this he continued the task begun by Terenzio Alciati, who had been commissioned by Urban VIII. to correct and supersede the very damaging work of Sarpi on the same subject. Alciati and Pallavicino had access to many important sources from the use of which Sarpi had been precluded; the containing parties, however, are far from agreed as to the completeness of the refutation. The work was translated into Latin by a Jesuit named Giattinus (Antwerp, 1670–1673). There is a good edition of the original by Zaccharia (6 vols., Faenza, 1792–1790). It was translated into German by Klitsche in 1835–1837. He also wrote a life of Alexander VII. and a tragedy (*Ermengilde*, 1644), &c.

His collected *Opere* were published in Rome in 1844–1848.

**PALLUM** or Pall (derived, so far as the name is concerned, from the Roman *pallium* or *palla*, a woolen cloak), an ecclesiastical vestment in the Roman Catholic Church, originally peculiar to the pope, but for many centuries past bestowed by him on all metropolitans, primates and archbishops as a symbol of the jurisdiction delegated to them by the Holy See. The pallium, in its present form, is a narrow band, “three fingers broad,” woven of white lamb’s wool, with a loop in the centre resting on the shoulders over the chasuble, and two dependent lappets, before and behind; so that when seen from front or back the ornament resembles the letter Y. It is decorated with six purple crosses, one on each tail and four on the loop, is doubled on the left shoulder, and is garnished, back and front, with three jewelled gold pins. The two latter characteristics seem to be survivals of the time when the Roman *pallium*, like the Greek *epaphron* was a simple scarf doubled and pinned on the left shoulder.

The origin of the pallium as an ecclesiastical vestment is lost in antiquity. The theory that explains it in connexion with the figure of the Good Shepherd carrying the lamb on his shoulders, so common in early Christian art, is obviously an explanation post hoc. The ceremonial connected with the preparation of the pallium and its bestowal upon the pope at his coronation, however, suggests some such symbolism. The lamb’s wool is destined for the making of the *pallia* are solemnly presented at the altar by the nuns of the convent of St Agnes at Rome through the roses on St Agnes’ day, during the singing of the *Agnes Dei*. They are received by the canons of the Lateran church and handed over by them to the apostolic subdeacons, by whom they are put out to pasture till the time of shearing. The *pallium* fashioned of their wool are carried by the subdeacons to St Peter’s, where they are placed by the canons on the bodies of St Peter and St Paul, under the high altar, for a night, then committed to the subdeacons for safe custody. A pallium thus consecrated is placed by the archdeacon over the shoulders of the pope at his coronation, with the words “Receive the pallium,” i.e. the plentitude of the pontifical office, “to the glory of God, and of the most glorious Virgin His Mother, and of the blessed apostles St Peter and St Paul, and of the Holy Roman Church.”
PALL-MALL—PALM

The elaborate ceremonial might suggest an effort to symbolize the command “Feed My lambs!” given to St. Peter, and its transference to Peter’s successors. Some idea underlies the developed ceremonial; but the pallium itself was in its origin no more than an ensign of the episcopal dignity, as it remains in the East, where—under the name of ἐξωφρέας (ἐξω-, shoulder, φρέας, to carry)—it is worn by all bishops. Moreover, whatever symbolism may be evolved from the lambs’ wool is vitiated by the knowledge that the fact that the pallium was at one time made of white linen (see Johannes Diaconus, Vita S. Gregorii M., lib. IV., cap. 8, pallium ejus byssae candente contextum).

The right to wear the pallium scems, in the first instance, to have been conceded by the popes merely as a mark of honour. The first recorded example of the bestowal by the popes is the grant of Pope Symmachus in 513 to Caecearius of Arles, as pallium vicar. By the time of Gregory I. it was given not only to vicars but as a mark of honour to distinguish bishops, and it is still conferred on the bishops of Autun, Bamberg, Dol, Lucca, Osuna, Pavia and Verona. St Boniface caused a charming synod, between 840 and 850, to decree that in future all metropolitan bishops must seek their pallium at Rome (see Boniface’s letter to Cuthbert, 78, Monastica Germaniae, episcopalia, III.); and though this rule was not universally followed even until the 15th century, it is now canonical for an archbishop to exercise the functions proper to his office until the pallium has been received. Every archbishop must apply for it, personally or by deputy, within three months after his consecration, and it is burred with him at his death (see Archimandrite).

The pallium is never granted until after payment of considerable dues. This payment, originally supposed to be voluntary, became one of the great abuses of the papacy, especially during the period of the Renaissance, and it was the large amount (raised largely by indulgences) which was paid by Albert, archbishop of Mainz, to the papacy that roused Luther to protest. Though the pallium is thus a vestment distinctive of bishops having metropolitan jurisdiction, it may only be worn by them within their jurisdiction, and then only on certain solemn occasions. The pope alone has the right to wear everywhere and at all times a vestment which is held to symbolize the plenitude of ecclesiastical power.

See P. Hirschhus, Kirchenrecht, II. 23 sqq.: Grosser, „Das römische Pallium und die ältesten liturgischen Schärpen“ (in Festschrift zum eifürdjetjähirn Jubiläum des campo santo in Rom, Freiburg, 1895, Du Cange, Glossarium s.v. „Pallium“; Joseph Braun, Die liturgische Gewänder im Orient und Frankreich (Berlin, 1907).

PALL-MALL, an obsolete English game of French origin, called in France paille-maille (from palla, ball, and mailles, maillet), Sir Robert Dallington, in his Method for Travel (1588), says: Among all the exercises of France, I prefer none better than the Paille-Maille. James I., in his Bellllion donon, recommended it as a proper game for Prince Henry, and it was actually introduced into England in the reign of Charles I., or perhaps a few years earlier. Thomas Blount’s Glossographia (ed. 1670) describes it as follows: "Pale Maille, a game wherein a round bowle is with a maillet struck through a high arch of iron (standing at either end of an alley), which he that do at the firste blows, or at the number agreed on, wins. This game was heretofore used in the long alley near St James’s, and vulgarly called Pell-Mell." The pronounciation here described as "vulgar afterwards became classic. A maillet and balls used in the game were found in graves and are now in the British Museum. The maillet resembles that used in croquet, but its head is curved and its ends sloped towards the shaft. The balls are of boxwood and about one foot in circumference. Pepys describes the alley as of hard sand "dressed with powdered cockle-shells." The length of the alley varied, that at St James’s being about 800 yds. Some alleys had side walls.

1 Father Joseph Braun, S.J., holds that the pallium, unlike other vestments, had a liturgical origin, and that it was akin to the capes of office worn by priests and priestesses in pagan rites. See Die pontificalen Gewänder des Abendlandes, p. 174 (Freiburg-B., 1898).

PALLONE (Italian for "large ball," from pallia, ball), the national ball game of Italy. It is descended, as are all other court games, such as tennis and pelota, from the two ball games played by the Romans, in one of which a large inflated ball, called pallio, was used. The other, probably the immediate ancestor of pallone, was played with a smaller ball, the pila. Pallone was played in Tuscany as early as the 14th century, and was transferred to the court of central Italy. It is played in a court (pietristero), usually 100 yds. long and 17 yds. wide. A white line crosses the middle of the court, which is bounded on one side by a high wall, the spectators sitting round the other three sides, usually protected by wire screens. One end of the court is called the battuta and the other the ribattuta. At the end of the battuta is placed a spring-board, upon which stands the player who receives the service. The implements of the game are the pallone (ball) and the bracciale (bat). The pallone is an inflated ball covered with leather, about 48 in. in diameter. The bracciale is an oak gauntlet, tubular in shape, and covered with long spike-like protruberances. It weighs between five and six pounds and is provided with a grip for the hand. The game is played by two sides—blues and reds—of three men each, the battitore (batter), spalla (back) and terzino (third). At the beginning of a game the battitore stands on the spring-board and receives the ball thrown to him on the bound by a seventh player, the mandarino, who does duty for both sides. The batter may ignore the ball until it comes to him to his liking, when he runs down the spring-board and strikes it with his bracciale over the centre line towards his opponents. The game then proceeds until a player fails to return the ball correctly, or hits it out of bounds, or it touches his person. This counts a point for the adversary. Four points make a game, counting 15, 30, 40 and 50.

See Il Gioco del pallone, by G. Franceschini (Milan, 1903).

PALM, JOHANN PHILIPP (1768–1856), German bookseller, a victim of Napoleonic tyranny in Germany, was born at Schorn, near Lauterbronn, in Baden, on the 17th of November 1768. Having been apprenticed to his uncle, the publisher Johann Jakob Palm (1750–1826), in Erlangen, he married the daughter of the bookseller Stein in Nuremberg, and in course of time became proprietor of his father-in-law’s business. In the spring of 1806 the firm of Stein sent to the bookselling establishment of Stage in Augsburg a pamphlet (presumably written by Philipp Christian Yelin in Ansbach) entitled Deutschland in seiner tiefen Erniedrigung ("Germany in her deep humiliation"), which strongly attacked Napoleon and the behaviour of the French troops in Bavaria. Napoleon, on being apprised of the violent attack, proceeded to Bavaria and finding the actual author, had Palm arrested and handed over to a military commission at Braunaun on the Bavarian-Austrian frontier, with peremptory instructions to try and execute the prisoner within twenty-four hours. Palm was denied the right of defence, and after a mock trial on the 25th of August 1806 he was shot on the following day. A life-size bronze statue was erected to his memory in Braunaun in 1866, and on the centenary of his death numerous patriotic meetings were held in Bavaria.

See F. Schultheis, Johann Philipp Palm (Nuremberg, 1860); and J. Raedel, Der nürnbergischer Buchhändler Johann Philipp Palm (Nuremberg, 1906).

PALM (Lat. palma, Gr. παλάμα), originally the flat of the hand, in which sense it is still used; from this sense the word was transferred as a name of the trees described below. The etymological use of the word (= prize, honour) represents a further transference from the employment of the palm-leaves as symbols of victory.

The palms (Palmaceae) have been termed the princes of the vegetable kingdom. Neither the anatomy of their stems nor the conformation of their flowers, however, entitles them to any such high position in the vegetable hierarchy. Their stems are not more complicated in structure than those of the common butcher’s broom (Rhusus); their flowers are for the most part as simple as those of a rush (Juncus). The order Palmaceae
Palm

is characterized among monocotyledonous plants by the presence of an unbranched stem bearing a tuft of leaves at the extremity only, or with the leaves scattered; these leaves, often gigantic in size, being usually firm in texture and branching in a pinnate or palmate fashion. The flowers are borne on simple or branching spikes, very generally protected by a spathole or spathes, and each consists typically of a perianth of six greenish, somewhat inconspicuous segments in two rows, with six stamens, or pistil of 1-3 carpels, each with a single ovule and a succulent or dry fruit, never dehiscent (fig. 1, A and B). The seed consists almost exclusively of endosperm or albumen in a cavity in which is lodged the relatively very minute embryo (fig. 1, C). These are the general characteristics by which this very well-defined order may be discriminated, but, in a group containing considerably more than a thousand species, deviations from the general plan of structure occur with some frequency. As the characteristic appearances of palms depend to a large extent upon these modifications, some of the more important among them may briefly be noticed.

Taking the stem first, we may mention that it is in very many palms relatively tall, erect, unbranched, regularly cylindrical, or dilated below so as to form an elongated cone, either smooth, or covered with the projecting remnants of the former leaves, or marked with circular scars indicating the position of those leaves which have now fallen away. It varies in diameter from the thickness of a reed (as in Chamaedorea) to a sturdy pillar-like structure as seen in the date-palm, Palmyra palm (fig. 7) or Talipot. In other cases the very slender stem is prostrate, or

or

scandent by means of formidable hooked prickles which, by enabling the plant to support itself on the branches of neighbouring trees, also permit the stem to grow to a very great length and so to expose the foliage to the light and air above the tree-tops of the dense forests these palms grow in, as in the genus Calamus, the Rattan or Cane palms. In some few instances the trunk, or that portion of it which is above ground, is so short that the plant is in a loose way called "stemless" or "acaulescent," as in Geonoma, and as happens sometimes in the only species found in a wild state in Europe, Chamaerops humilis. The vegetable ivory (Pityelephas) of equatorial America has a very short thick stem bearing a tall cluster of leaves which appears to rise from the ground. In many species the trunk is covered with a dense network of stiff fibres, often compacted together at the base ends into spines. This fibrous material, which is so valuable for cordage, consists of the fibrous tissue of the leaf-stalk, which in these cases persists after the decay of the softer portions. It is very characteristic of some palms to produce from the base of the stem a series of adventitious roots which gradually thrust themselves into the soil and serve to steady the tree and prevent its overthrow by the wind. The underground stem of some species, e.g. of Calamus, is a rhizome, or root-stock, lengthening in a more or less horizontal manner by the development of the terminal bud, and sending up lateral branches like suckers from the root-stock, which form dense thickets of cane-like stems. The branching of the stem above ground is unusual, except in the case of the Doum palm of Egypt (Hyphaene), where the stem forks, often repeatedly; this is due to the development of a branch to an equal strength with the main stem. In other
cases branching, when present, is probably the result of some injury to the terminal bud at the top of the stem, in consequence of which buds sprout out from below the damaged part.

The internal structure of the stem does not differ fundamentally from that of a typical monocotyledonous stem, the taller, harder trunks owing their hardness not only to the fibrous or woody skeleton but also to the fact that, as growth goes on, the originally soft cellular ground tissue through which the fibres run becomes hardened by the deposit of woody matter within the cells, so that ultimately the cellular portions become as hard as the woody fibrous tissue.

The leaves of palms are either arranged at more or less distant intervals along the stem, as in the canes (Calamus, Daemonorops, fig. 2, &c.), or are approximated in tufts at the end of the stem, thus forming those noble crowns of foliage (figs. 5, 6, 7) which are so closely associated with the general idea of a palm. In the young condition, while still unfolded, these leaves, with the succulent end of the stem from which they arise, form "the cabbage," which in some species is highly esteemed as an article of food.

The adult leaf very generally presents a sheathing base tapering upwards into the stalk or petiole, and this again bearing the lamina or blade. The sheath and the petiole very often bear stout spines, as in the rattan palms (see fig. 2); and when, in course of time, the upper parts of the leaf decay and fall off, the base of the leaf-stalk and sheath often remain, either entirely or in their fibrous portions only, which latter constitute the investment to the stem already mentioned. In size the leaves vary within very wide limits, some being only a few inches in extent, while those of the noble Caryota may be measured in tens of feet. In form the leaves of palms are very rarely simple; usually they are more or less divided, sometimes, as in Caryota, extremely so. In species of Geonoma, Verschaffeltia and some others, the leaf splits into two divisions at the apex and not elsewhere; but more usually the leaves branch regularly in a palmate fashion as in the fan-palms Latania, Borassus (fig. 7), Chamaerops, Sabal, &c., or in a pinnate fashion as in the feather-palms, Areca (fig. 3), Koomia, Calamus, Daemonorops (fig. 2), &c. The form of the segmentation is generally more or less linear, but a very distinct appearance is given by the broad wedge-shaped leaflets of such palms as Caryota, Martinschia or Mauritia. These forms run one into another by transitional gradations; and even in the same palm the form of the leaf is often very different at different stages of its growth, so that it is a difficult matter to name correctly seedling or juvenile palms in the condition in which we generally meet with them in the nurseries, or even to foresee what the future development of the plant is likely to be. Like the other parts of the plant, the leaves are sometimes invested with hairs or spines; and, in some instances, as in the magnificent Ceroxylon andicola, the under surface is of a glaucous white or bluish colour, from a coating of wax.

The inflorescence of palms consists generally of a fleshy spike, either simple or much branched, studded with numerous, sometimes extremely numerous, flowers, and enveloped by one or more sheathing bracts called "spathe" (fig. 5). These parts may be small, or they may attain relatively enormous dimensions, hanging down from amid the crown of foliage like huge tresses, and adding greatly to the noble effect of the leaves. In some cases, as in the Talipot palm, the tree only flowers once; it grows for many years until it has become a large tree then develops a huge inflorescence, and after the fruit has ripened, dies.

The individual flowers are usually small (figs. 3, 6), greenish and insignificant; their general structure has been mentioned already. Modifications from the typical structure arise from difference of texture, and specially from suppression of parts, in consequence of which the flowers are very generally unisexual (figs. 1, 3, 6), though the flowers of the two sexes are generally produced on the same tree (monoecious), not indeed always in the same season, for a tree in one year may produce all male flowers and in the next all female flowers. Sometimes the flowers are modified by an increase in the number of parts; thus the usually six stamens may be represented by 12 to 24 or even by hundreds. The carpels are usually three in number, and more or less combined; but they may be free, and their number may be reduced to two or even one. In any case each carpel contains but a single ovule.

Owing to the sexual arrangements before mentioned, the pollen has to be transported by the agency of the wind or of insects to the female flowers. This is facilitated sometimes by the elastic movements of the stamens and anthers, which liberate the pollen so freely at certain times that travellers speak of the date-palms of Egypt (Phoenix dactylifera) being at daybreak hidden in a mist of pollen grains. In other cases fertilization is effected by the agency of man, who removes the male flowers and scatters the pollen over the fruit-bearing trees. This practice has been followed in the case of the date from time immemorial; and it afforded one of the earliest and most irrefragable proofs by means of which the sexuality of plants was finally established. In the course of ripening of the fruit two of the carpels with their ovules may become absorbed, as in the coco-nut, the fruit of which contains only one seed though three carpels are indicated by the three longitudinal sutures and by the presence of three germ-pores on the hard endocarp.

The fruit is various in form, size and character; sometimes, as in the common date (fig. 4) it is a berry with a fleshy rind enclosing a hard stony kernel, the true seed; the fruit of Areca (fig. 3) is similar; sometimes it is a kind of drupe as in Acrocomia (fig. 5), or the coco-nut, Cocos nucifera, where the fibrous central portion investing the hard shell corresponds to the fleshy portion of a plum or cherry, while the shell or nut corresponds to the stone of stone-fruits, the seed being the kernel. In Borassus the three seeds are each enclosed in a separate chamber formed by the stony endocarp (fig. 7). Sometimes, as in the species of Metroxylon (fig. 6), Raphia, Daemonorops (fig. 2), &c., the fruit is covered with hard, pointed, reflexed shining scales, which give it a very remarkable appearance.

The seeds show a corresponding variety in size and shape, but
always consist of a mass of endosperm, in which is embedded a relatively very minute embryo (figs. 1, 3, 6). The hard stone of the date is the endosperm, the white oily flesh of the coconut is the same substance in a softer condition; the so-called "vegetable ivory" is derived from the endosperm of Phytelephas. In some genera the inner seed coat becomes thickened along the course of the vascular bundles and growing into the endosperm produces the characteristic appearance in section known as ruminant—this is well shown in the Areca nut (fig. 3).

The order contains 132 genera with about 1100 species mainly tropical, but with some representatives in warm temperate regions. Chamaerops humilis is a native of the Mediterranean region, and the date-palm yields fruit in southern Europe as far north as 38° N. latitude. In eastern Asia the palms, like other tropical families, extend along the coast reaching Korea and the south of Japan. In America a few small genera occur in the southern United States and California; and in South America the southern limit is reached in the Chilean genus Jubaea (the Chile coco-nut) at 37° S. latitude. The great centres of distribution are tropical America and tropical Asia; tropical Africa contains only 11 genera, though some of the species, like the Doum palm (Hyphaene thebaica) and the Deleb or Palmyra palm (Borassus flabellifer) have a wide distribution. With three exceptions Old and New World forms are distinct—the coco-nut (Cocos nucifera) is widely distributed on the coasts of tropical Africa, in India and the South Seas, the other species of the genus are confined to the western hemisphere. The oil palm (Elaeis guineensis) is a native of west tropical Africa, the other species of the genus is tropical American. Raphia has also species in both tropical Africa and tropical America.

The 132 genera of the order are ranged under seven tribes, distinguished by the nature of the foliage, the sexual conditions of the flower, the character of the seed, the position of the raphé, &c. Other characters serving to distinguish the minor groups are afforded by the habit, the position of the spathes, the "estivation" of the flower, the nature of the stigma, the ovary, fruit, &c.

It is impossible to overestimate the utility of palms. They furnish food, shelter, clothing, timber, fuel, building materials, sticks, fibre, paper, starch, sugar, oil, wax, wine, tannin, dying materials, resin and a host of minor products, which render them valuable to the natives and to European agriculturists. The Coco-nut palm, Cocos nucifera, and the Date palm Phoenix dactylifera, have been treated under separate headings. Sugar and liquids capable of becoming fermented are produced by Caryota suarens.

**Fig. 7.—Palmyra Palm (Borassus flabellifer), a female tree.**

1. Portion of female inflorescence showing young fruits. 2. Fruit cut across showing the three seeds, all much reduced.

Cocos nucifera, Borassus flabellifer, Raphis vinifera, Arenga saccharifera, Phoenix dactylifera, Mauritia vinifera, &c. Starch is procured in abundance from the stem of the Sago palm, Metroxylon (fig. 6) and others. The fleshy mesocarp of the fruit of Elaeis guineensis of western tropical Africa yields, when crushed and boiled, "palm oil." Coco-nut oil is extracted from the oily endosperm of the coconut. Wax is exuded from the stem of Ceroxylon antitoca and Copernicia cerifera. A variety of "dragons blood," a resin, is procured from Daemonorops Dracae and other species. Edible fruits are yielded by the date, the staple food of some districts of northern Africa. The coco-nut is a source of wealth to its possessors; and many of the species, e.g., Areca sapota (Cabbage-palm and others), are valued for their "cabbage" - but, as this is the terminal bud whose removal causes the destruction of the tree, this is a wasteful article of diet unless care be taken by judicious planting to avert the annihilation of the supplies. The famous "coo de mer," or double coco-nut, whose floating nuts are the objects of so many legends and superstitions, is known to science as Lodoicea maldivica. The tree is peculiar to the Seychelles, where it is used for many useful purposes. Its fruit is like a huge pumice, containing a stone or nut like two coco-nuts (in its husks) united together. These illustrations suffice to indicate the numerous economic uses of palms.

The only species that can be cultivated in the open air in England, and then only under exceptionally favourable circumstances, are the European Fan palm, Chamaerops humilis, the Chusan palm, Trachycarpus fortunei, &c., and the Chilean Jubaea spectabilis. The date palm is commonly planted along the Mediterranean coast. There are several low growing palms, such as Raphis flabelliformis, Chamaerops humilis, &c., which are suited for ordinary green-house culture, and many of which, from the thick texture of their leaves, are enabled to resist the dry and often gas-laden atmosphere of living rooms.

**PALMA, JACOPO** (c. 1480-1528), Italian painter of the Venetian school, was born at Serina near Bergamo, towards 1480, and died at the age of forty-eight in July 1528. He is currently named Palma Vecchio (Old Palma) to distinguish him from Palma Giovane, his grand-nephew, a much inferior painter. His grandfather's name was Negretto. He is reputed to have been a companion and competitor of Lorenzo Lotto, and to some extent a pupil of Titian, after arriving in Venice early in the
16th century; he may also have been the master of Bonifazio. His earlier works betray the influence of the Bellini; but modifying his style from the study of Giorgione and Titian, Palma took high rank among those painters of the distinctively Venetian type who remain a little below the leading masters. For richness of colour he is hardly to be surpassed; but neither in invention nor vigorous brushwork do his pictures remain any person. A face frequently seen in his pictures is that of his (so-called) daughter Violante, of whom Titian was said to be enamoured. Two works by Palma are more particularly celebrated. The first is a composition of six paintings in the Venetian church of S. Maria Formosa, with St Barbara in the centre, under the dead Christ, and to right and left SS. Dominic, Sebastian, John Baptist and Anthony. The second work is in the Dresden Gallery, representing three sisters seated in the open air; it is frequently named "The Three Graces." A third fine work, discovered in Venice in 1690, is a portrait supposed to represent Violante. Other leading examples are the "Last Supper," in S. Maria Mater Domini; a "Madonna," in the church of S. Stefano in Vicenza; the "Epiphany," in the Brera of Milan; the "Holy Family, with a young shepherd adoring," in the Louvre; "St Stephen and other Saints," "Christ and the Widow of Nain," and the "Assumption of the Virgin," in the Academy of Venice; and "Christ at Emmaus," in the Pitti Gallery. The beautiful portrait of the National Gallery, London, with a background of foliage, originally described as "Ariosto" and by Titian, and now reascribed to that master, was for some years assumed to be an unknown poet by Palma Vecchio. It is certainly much more like the work of Titian than by Ariosto (1503-1552). In 1907 the Staedel Institute in Frankfort acquired an important work by Palma Vecchio, identified by its director as an illustration of Ovid's second Metamorphosis, and named "Jupiter and Calisto."

Palma's grand-nephew, Palma Giovane, was also named Jacopo (1544 to about 1626). His works belong to the decline of Venetian art. (W. M. R.)

PALMA, or PALMA DE MALLORCA, the capital of the Spanish province of the Balearic Islands, the residence of a captain-general, an episcopal see, and a flourishing seaport, situated 135 m. S.S.E. of Barcelona, on the south-west coast of Majorca, at the head of the fine Bay of Palma, which stretches inland for about 10 m. between Capes Cala Figuera and Regana. Pop. (1900), 63,937, including a colony of Jews converted to Christianity (Chuetas). Palma is the meeting place of all the highways in the island, and the terminus of the railway to Inca, Manacor, and Alcudia. The ramparts, which enclose the city on all sides except towards the port (where they were demolished in 1872), have a circuit of a little more than 4 m. Though begun in 1562, they were not finished till 1836. Palma underwent considerable change in the 19th century, and the fine old-world Moorish character of the place suffered accordingly. The more conspicuous buildings are the cathedral, the exchange, the royal palace, now occupied by the captain-general, and the law courts, the episcopal palace, a handsomely Renaissance building (1636), the general hospital (1456), the town-house (end of the 16th century), the picture gallery, and the college. The church of San Francisco is interesting for the tomb of Raimon Lull, a native of Palma. The cathedral was erected and dedicated to the Virgin by King James I. of Aragon as he sailed to the conquest of Majorca; but, though founded in 1230, it was not finished till 1601. The older and more interesting portions are the royal chapel (1322), with the marble sarcophagus of James II. (d. 1311) which was erected here in 1745; and the south front with the elaborately-sculptured doorway known as del mirador (1390). The exchange (lonja), a Gothic building begun in 1426, excited the admiration of the emperor Charles V. Palma has a seminary founded in 1700, a collection of archives dating from the 14th century, a school and museum of fine arts, a nautical school and an institute founded in 1836 to replace the old university (1503).

The harbour, formed by a mole constructed to a length of 387 yds. in the 14th century and afterwards extended to more than 630 yds., has been greatly improved since 1875 by dredging and a further addition to the mole of 136 yds. Previously it was not accessible to vessels drawing more than 18 ft. Palma has frequent and regular communication by steamer with Barcelona, Valencia and Alicante. Puentop, about 2 m. south-west of the city, was once a good harbour, but is now fit only for small craft. Palma has a thriving trade in grain, wine, oil, almonds, fruit, vegetables, silk, foodstuffs and livestock. There are manufactures of alcohol, liqueurs, chocolate, starch, sugar, preserves, flour, soap, leather, earthenware, glass, matches, paper, linen, woolen goods and rugs.

Palma probably owes, if not its existence, at least its name (symbolized on the Roman coins by a palm branch), to Metellus Balearicus, who in 113 B.C. settled three thousand Roman and Spanish colonists on the island. The bishopric dates from the 13th century. About 1 m. south-west of Palma is the castle of Bellver or Belbez, the ancient residence of the kings of Majorca. Miramar, the beautiful country seat of the archduke Ludwig Salvador of Austria, is 12 m. north of Palma.

PALMA, or SAN MIGUEL DE LA PALMA, a Spanish island in the Atlantic Ocean, forming part of the Canary Islands (q.v.), Pop. (1900), 41,945; area 280 sq. m. Palma is 26 m. long, with an extreme breadth of 16 m. It lies 67 m. W.N.W. of Tenerife. It is traversed from north to south by a chain of mountains, the highest of which is 7900 ft. above sea-level. At the broadest part is a crater 9 m. in diameter, known as the Caldera (i.e. cauldron). The bottom of the crater has an elevation of 2500 ft., and it is overhung by peaks that rise more than 5000 ft. above it. Palma contains several mineral springs, but there is great want of water. The island isApproched from the sea, it is seen on the southern extremity of the island, and much damage was done. Santa Cruz de la Palma (pop. 7024) on the eastern coast is the principal town. The anchorage is good.

PALM BEACH, a winter resort on the east coast of Florida, U.S.A., in Palm Beach county, about 264 m. S. of St Augustine; served by the Florida East Coast railway. It is situated on a peninsula (about 30 m. long and 1 m. wide) separated from the mainland by Lake Worth, an arm of the Atlantic Ocean, and derives its name from the groves of coco-nut palms which fringe the lake. The coco-nut was introduced here by chance, through the wrecking, off the coast, in January 1879, of a coco-nut-laden Spanish vessel. The Gulf Stream is within about 1 m. of the shore, and the climate is mild and equable, the winter temperature normally ranging between 70° and 75°. O. F. On the Atlantic is the Breakers, a large hotel, and facing Lake Worth is the Royal Poinciana, the largest hotel in the southern states. Palm Beach has few permanent residents and is not incorporated. On the mainland just across the lake is the city of West Palm Beach (pop. in 1905, state census, 1780), a pleasure resort and the county-seat of Palm Beach county (created in 1900).

PALM-CIVET, or PARADOKTRE, the name of the members of the civet-like genus Paradoxurus, represented by several species mainly from south-east Asia. (See CARNIVORA.) Palm-civets are mostly about the size of the domestic cat, or rather larger, chiefly arboreal in habits, with dark uniform, spotted or striped fur. The common Indian palm-civet (P. niger) ranges through India, wherever there are trees, frequently taking up its abodes in roof-thatch. Its diet consists of small mammals and reptiles, birds and their eggs, fruit and vegetables. From four to six young are brought forth at a litter, and are easily tamed. Other species are the Ceylonese P. aureus, the brown P. ferdinandi, the Himalayan P. grayi and the Malayian P. Hermaphroditus. The small-toothed palm-civets, from the Malay Archipelago, Sumatra and Java, have been separated from the typical group to form the genus Arctogal. In Africa the group is represented by two species of Nandinia, which show several primitive characters.

PALMELLA, a town of Portugal, in the district of Lisbon (formerly included in the province of Estremadura); at the north-eastern extremity of the Serra da Arrabida, and on the Lisbon-Setubal railway. Pop. (1900), inclusive of the neighbouring
village of Marateca, 11,478. Palmella is an ancient and picturesque town, still surrounded by massive but ruined walls and dominated by a medieval castle. Viticulture, market-gardening and fruit-farming are important local industries. Palmella was taken from the Moors in 1147 by Alphonso I. (Afonso Henriques), and entrusted in 1186 to the knights of Santiago. The title "duke of Palmella" dates from 1354, when it was conferred on the statesman Pedro de Sousa-Holstein, count of Palmella (1781-1850).

PALMER, Sir Charles Mark, Bart. (1832-1907), English shipowner and journalist, was born at South Shields on the 3rd of November 1822. His father, originally the captain of a whaler, removed in 1828 to Newcastle-on-Tyne, where he conducted a shipowning and ship-brokering business. Charles Palmer at the age of fifteen entered a shipping business in that town, whence, after six months, he went to Marseilles, where his father had procured him a post in a large commercial house, at the same time entrusting him with the local agency of his own business. After two years' experience at Marseilles he entered his father's business at Newcastle, and in 1842 he became a partner. His business capacity attracted the attention of a leading local colliery owner, who appointed him manager of the Earl's Hill colliery, which he became a partner in 1846. Subsequently he was made one of the managers of the associated collieries north and south of the Tyne owned by Lord Ravensworth, Lord Wharncliffe, the marquess of Bute, and Lord Strathmore, and in due course he gradually purchased these properties out of the profits of the Marley Hill colliery. Simultaneously he greatly developed the then recently-established cok trade, obtaining the coke contracts for several of the large English and continental railways. About 1850 the question of coal-transport to the London market became a serious question for north-country colliery proprietors. Palmer therefore built, largely according to his own plans, the "John Boves," the first iron screw-collier, and several other steam-colliers, in a yard established by him at Jarrow, then a small Tyneside village. He then purchased iron-mines in Yorkshire, and erected along the Tyne at Jarrow large shipbuilding yards, blast-furnaces, steel-works, rolling-mills and engine-works, fitted on the most elaborate scale. The firm produced war-ships as well as merchant vessels, and their system of rolling armour plates, introduced in 1856, was generally adopted by other builders. In 1865 he turned the business into Palmer's Island Company, and he was appointed manager of the company's Earl's Hill colliery, in connexion with the settlement of the costly dispute between British ship-owners and the Suez Canal Company (of which he was then a director) were rewarded with a baronetcy. He died in London on the 4th of June 1907.

PALMER, Edward Henry (1840-1882), English orientalist, the son of a private schoolmaster, was born at Cambridge, on the 7th of August 1840. He was educated at the Perse School, and as a schoolboy showed the characteristic bent of his mind by picking up the Roman tongue and a great familiarity with the life of the gypsies. From school he was sent to London as a clerk in the city. Palmer disliked this life, and varied it by learning French and Italian, mainly by frequenting the society of foreigners wherever he could find it. In 1859 he returned to Cambridge, apparently dying of consumption. He had an almost miraculous recovery, and in 1860, while he was thinking of a new start in life, fell in with Sayyid Abdallah, teacher of Hindustani at Cambridge, under whose influence he began his Oriental studies. He matriculated at St John's College in November 1865, and in 1867 he was elected a fellow on account of his attainments as an orientalist, especially in Persian and Hindustani. During his residence at St John's he catalogued the Persian, Arabic and Turkish manuscripts in the university library, and in the libraries of King's and Trinity. In 1867 he published a treatise on Oriental Mysticism, based on the Maksod-i-Akda of Aziz ibn Mohammad Nafisai. He was engaged in 1869 to join the survey of Sinai, undertaken by the Palestine Exploration Fund, and followed up this work in the next year by exploring the desert of El-Tib in company with Charles Drake (1846-1874). They completed this journey on foot and without escort, making friends among the Bedouin, to whom Palmer was known as "Abdallah Efendi." After a visit to the Lebanon and to Damascus, where he made the acquaintance of Sir Richard Burton, then consul there, he returned to England in 1870 by way of Constantinople and Vienna. At Vienna he met Arminius Vambéry. The results of this expedition appeared in the Desert of the Exodus (1871); in a report published in the journal of the Palestine Exploration Fund (1871); and in an article on the Secret Sects of Syria in the Quarterly Review (1873). In the close of the year 1871 he became Lord Almoner's Professor of Arabic at Cambridge, and settled down to teaching. His salary was small, and his affairs were further complicated by the long illness of his wife, who died in 1878. In 1881, two years after his second marriage, he left Cambridge, and joined the staff of the Standard newspaper to write on non-political subjects. He was called to the English bar in 1874, and early in 1882 he was asked by the government to go to the East and assist the Egyptian expedition by his influence over the Arabs of the desert El-Tib. He was instructed, apparently, to prevent the Arab sheikhs from joining the Egyptian rebels and to secure their non-interference with the Suez Canal. He went to Gaza, without an escort made his way south to El-Tib, and from there he communicated with the sheikhs. He was well received, and was highly successful in his negotiations with the Bedouin. He was appointed interpreter-in-chief to the force in Egypt, and from Suez he was again sent into the desert with Captain William John Gill and Flag-Lieutenant Harold Charrington to procure camels and gain the allegiance of the sheikhs by considerable presents of money. On this journey he and his companions were led into an ambush and murdered (August 1882). Their remains, recovered after the war by the efforts of Sir Charles (then Colonel) Warren, now lie in St Paul's Cathedral.

Palmer's highest qualities appeared in his travels, especially in the heroic adventures of his last journeys. His brilliant scholarship is displayed rather in the works he wrote in Persian and other Eastern tongues than in English. Among his chief writings are: "The Desert of the Exodus" (1871), Poems of Belad ed Din (Ar. and Eng., 1876-1877), Arabic Grammar (1874), History of Jerusalem (1871), by Besant and Palmer—the latter wrote the part taken from Arabic sources; Persian Dictionary (1876) and English and Persian Dictionary (posthumous, 1883); translation of the Koran (1880) for the Sacred Book and Sword Press; the废话 series, a spirited but not very accurate rendering. He also did good service in editing the Narrative of the Palestine Exploration.

PALMER, Erastus Dow (1817-1904), American sculptor, was born at Pompey, New York, on the 2nd of April 1817. In his leisure moments as a carpenter he started by carving portraits in cameo, and then began to model in clay with much success. Among his works are: "The White Captive" (1858) in the Metropolitan Museum of Art, New York; "Peace in Bondage" (1860); "Angel at the Sepulchre" (1865), Albany, New York; a bronze statue of Chancellor Robert R. Livingston (1874), in Statuary Hall, Capitol, Washington; and many portrait busts. He died in Albany on the 9th of March 1904. His son, Walter Launt Palmer (b. 1854), who studied art under Carolus-Duran in Paris, became a member of the National Academy of Design (1897), and is best known for his painting of snow scenes.

PALMER, George (1818-1897), British biscuit-manufacturer, was born on the 18th of January 1818, at Long Sutton, Somersetshire, where his family had been yeomen-farmers for several generations. The Palmer family were Quakers, and George Palmer was educated at the school of the Society of Friends at Sidcot, Somersetshire. About 1832 he was apprenticed to a miller and confectioner at Taunton, and in 1841, in conjunction with Thomas Huntley, set up as a biscuit-manufacturer at Reading. By the application of steam-machinery to biscuit-manufacture the firm of Huntley & Palmer in a comparatively short time built up a very large business, of which on the death of Huntley in 1857 George Palmer and his two brothers, Samuel and William, Isaac Palmer, became proprietors. In the same year George
PALMER, J. McAuley—Palmerston

Palmer was elected mayor of Reading, and from 1878–1885 he was Liberal member of Parliament for the town. He died at Reading, to which he had been a most generous benefactor, on the 10th of August 1897. His sons, George William Palmer (b. 1851) and Sir Walter Palmer (b. 1858), displayed a like munificence, particularly in connexion with University College, Reading. George William Palmer, besides being mayor of Reading, represented the town in Parliament as a Liberal. Sir Walter Palmer, who was created a baronet in 1904, became Conservative member for Salisbury in 1900.

PALMER, JOHN MCAULEY (1817-1900), American soldier and political leader, was born at Eagle Creek, Kentucky, on the 13th of September 1817. In 1831 his family removed to Illinois, and in 1839 he was admitted to the bar in that state. He was a member of the state constitutional convention of 1847. In 1852-1855 he was a Democratic member of the state Senate, but joined the Republican party upon its organization and became one of its leaders in Illinois. He was a delegate to the Republican national convention in 1856 and a Republican presidential elector in 1860. In 1861 he was a delegate to the peace convention in Washington. During the Civil War he served in the Union Army, rising from the rank of colonel to that of major-general in the volunteer service and taking part in the capture of New Madrid and Island No. 10, in the battles of Stone River and Chickamauga, and, under Thomas, in the Atlanta campaign. He was governor of Illinois from 1866 to 1873. In 1872 he joined the Liberal-Republicans, and eventually returned to the Democratic party. In 1881-1897 he was a Democratic member of the United States Senate. In 1896 he was nominated for the presidency, by the "Gold-Democrats," but received no electoral votes. He died at Springfield, Illinois, on the 25th of September 1900.

PALMER, RAY (1888-1889), American clergyman and hymn-writer, was born in Little Compton, Rhode Island, on the 12th of November 1888. He graduated at Yale College in 1908, and in 1912 was licensed to preach by the New Haven West Association of Congregational Ministers. In 1893-1890 he was pastor of the Central Congregational Church of Bath, Maine, and in 1890-1866 of the First Congregational Church of Albany, New York; and from 1890 to 1897 was corresponding secretary of the American Congregational Union. He died on the 26th of March 1897 in Newark, New Jersey, where, from 1881 to 1884 he had been assistant pastor of the Belleville Avenue Congregational Church of New York. In 1890 he began the publication of a weekly paper, "The Hymn," and wrote a series of hymns for it, which after its removal to New York, was set to the tune "Olivet" by Lowell Mason, and has been translated into many languages; his hymn beginning "Jesus, these eyes have never seen" (1858) is also well-known.

Among the hymns translated by him are those beginning: "O Christ, our King, Creator, Lord" (by Gregory the Great); "Come Holy Ghost in love" (by Robert II. of France); "Jesus, thou joyful loving hearts" (by Bernard of Clairvaux); and "O, Bread to pilgrims given" (from the Latin). Other hymns (some translated from Latin) and poems were collected in his Complete Poetical Works (1856), published in 1886 by Vespers of Hope and Gladness. He also wrote Spiritual Improvement (1856), republished in 1854 as Hour Numbers; Hints on the Formation of Religious Opinions (1860), and Earnest Words on True Success in Life (1873).

PALMER, SAMUEL (1805-1881), English landscape painter and etcher, was born in London on the 27th of January 1805. He was delicate as a child, but in 1819 he exhibited both at the Royal Academy and the British Institution; and shortly afterwards he became intimate with John Linnell, who introduced him to Varley, Mulready, and, above all, to William Blake, whose strange and mystic genius had the most powerful effect on Palmer's art. An illness led to a residence of seven years at Shoreham in Kent, and the characteristics of the scenery of the district are constantly recurrent in his works. Among the more important productions of this time are the "Bright Clouds" and the "Skylark," paintings in oil, which was Palmer's usual medium in earlier life. In 1839 he married a daughter of Linnell. The wedding tour was to Italy, where he spent over two years in study. Returning to London, he was in 1843 elected an associate and in 1854 a full member of the Society of Painters in Water Colours, a method to which he afterwards adhered in his painted work. His productions are distinguished by an excellent command over the forms of landscape, and by mastery of rich, glowing and potent colouring. Among the best and most important paintings executed by Palmer during his later years was a noble series of illustrations to Milton's L'Allegro and II. Penseroso. In 1853 the artist was elected a member of the English Etching Club. Considering his reputation and success in this department of art, his plates are few in number. Their virtues are not those of a rapid and vivid sketch; they aim rather at truth and completeness of tonality, and embody many of the characteristics of other modes of engraving—of mezzotint, of line, and of woodcut. Readily accessible and sufficiently representative plates may be studied in the "Earl Ploughman," in Etching and Etchers (1st ed.), and the "Herdsman's Cottage," in the third edition of the same work. In 1861 Palmer removed to Reigate, where he died on the 24th of May 1881. One of his latest efforts was the production of a series of etchings to illustrate his English metrical version of Virgil's Eclogues, which was published in 1884, illustrated with reproductions of the artist's water-colours and with etchings, of which most were completed by his son, A. H. Palmer.

PALMER, a township of Hampden county, Massachusetts, U.S.A. Pop. (1910 U.S. census) 8810. It has an area of about 31 sq. m. of broken hill country. Its chief village, also named Palmer, about 15 m. east of Springfield, is on the Chicopee river, is served by the Boston & Albany and the Central Vermont railways, and by an electric line to Springfield, and has various manufactures; the other villages are Thorndike, Bondsville, and Three Rivers. The principal manufactures are cotton goods, carpets and wire goods. Palmer was originally settled in 1716, but received a notable accession of population from a large Scotch-Irish colony which went from Ulster to Boston in 1718. Their settlement was followed, apparently, by immigration from Ireland in 1727. In 1752 the plantation was incorporated as a "district," and under a general state law of 1775 gained the legal rights of a township. Palmer was a centre of disaffection in the time of the Shays Rebellion.

See T. H. Temple, History of the Town of Palmer...1765-1889 (1889).

PALMER, HENRY JOHN TOMPSON, 3rd Viscount (1784-1865), English statesman, was born at Broadlands, near Romsey, Hants, on the 20th of October 1784. The Irish branch of the Temple family, from which Lord Palmerston descended, was very distantly related to the great English house of the same name, but these Irish Temples were not without distinction. In the reign of Elizabeth they had furnished a secretary to Sir Philip Sidney and to Essex in Sir William Temple (1655-1627), afterwards provost of Trinity College, Dublin, whose son, Sir John Temple (1660-1717), was master of the rolls in Ireland. The latter's son, Sir William Temple (q.v.), figured as one of the ablest diplomatists of the age. From his younger brother, Sir John Temple (1632-1704), who was speaker of the Irish House of Commons, Lord Palmerston descended. The eldest son of the speaker, Henry, 1st Viscount Palmerston (c. 1673-1757), was created a peer of Ireland on the 12th of March 1723, and was
succeeded by his grandson, Henry the second viscount (1790–1862), who married Miss Mary Mce (d. 1865), a lady celebrated for her beauty.

The 2nd viscount's eldest son, Henry John, is mentioned by Lady Cottenham in her correspondence as a boy of singular vivacity and energy. These qualities adhered to him through life, and he had scarcely left Harrow, at the age of eighteen, when the death of his father (April 17, 1802) raised him to the Irish peerage. It was no doubt owing to his birth and connexions, but still more to his own talents and character, that Lord Palmerston was thrown at a very early age into the full stream of political and official life. Before he was four-and-twenty he had stood two contested elections for the university of Cambridge, at which he was defeated, and he entered parliament for a pocket borough, Newtown, Isle of Wight, in June 1802.

The interest of the family and Lord Chichester, the duke of Portland made him one of the junior lords of the Admiralty on the formation of his administration in 1807. A few months later he delivered his maiden speech in the House of Commons in defence of the expedition against Copenhagen, which he conceived to be justified by the known designs of Napoleon on the Danish court. This speech was so successful that when Perceval formed his government in 1806, he proposed to this young man of five-and-twenty to take the chancellorship of the exchequer. Lord Palmerston, however, preferred the less important office of secretary-at-war, charged exclusively with the financial business of the army, without a seat in the cabinet, and in this position he remained, without any signs of an ambitious temperament or of great political abilities, for twenty years (1809–1828). During the whole of that period Lord Palmerston was chiefly known as a man of fashion, and a subordinate minister without influence on the general policy of the cabinets he served.

Some of the most humorous poetical pieces in the New Whig Guide were from his pen, and he was entirely devoted, like his friends Peel and Croker, to the Tory party of that day. Lord Palmerston never was a Whig, still less a Radical; he was a statesman of the old English aristocratic type, liberal in his sentiments, favourable to the march of progress, but entirely opposed to the claims of democratic government.

In the later years of Lord Liverpool's administration, after the death of Lord Londonderry in 1822, strong dissensions existed in the cabinet. The Liberal section of the government was gaining ground. Canning became foreign minister and leader of the House of Commons. Huskisson began to advocate and apply the doctrines of free trade. Roman Catholic emancipation was made an open question. Although Lord Palmerston was not in the cabinet, he cordially supported the measures of Canning and his friends. Upon the death of Lord Liverpool, Canning was called on to take the head of affairs; the Tories including Peel, withdrew their support, and an alliance was formed between the Liberal members of the late ministry and the Whigs. In this combination the chancellorship of the exchequer was first offered to Lord Palmerston, who accepted it, but this appointment was frustrated by the king's intrigue with Herries, and Palmerston was content to remain secretary-at-war with a seat in the cabinet, which he now entered for the first time. The Canning administration ended in four months by the death of its illustrious chief, and was succeeded by the feeble ministry of Lord Goderich, which barely survived the year. But the "Canningites," as they were termed, and the duke of Wellington hastened to include Palmerston, Huskisson, Charles Grant, Lamb (Lord Melbourne) and Dudley in his government. A dispute between the duke and Huskisson soon led to the resignation of that minister, and his friends felt bound to share his fate. In the spring of 1828 Palmerston found himself in opposition. From that moment he appears to have directed his attention closely to foreign affairs; indeed he had already urged on the duke of Wellington a more active interference in the affairs of Greece; he had made several visits to Paris, where he foresaw with great accuracy the impending revolution; and on the 1st of June 1829 he made his first great speech on foreign affairs. Lord Palmerston was no orator; his language was unstudied, and his delivery somewhat embarrassed; but he generally found words to say the right thing at the right time, and to address the House of Commons in the language best adapted to the capacity and the temper of his audience.

An attempt was made by the duke of Wellington in September 1830 to induce Palmerston to re-enter the cabinet, which he refused to do without Lord Lansdowne and Lord Grey, and from that time forward he may be said to have associated his political fortunes with those of the Whig party. It was therefore natural that Lord Grey should place the department of foreign affairs in his hands upon the formation of the great ministry of 1830, and Palmerston entered with zeal on the duties of an office over which he continued to exert his powerful influence, both in and out of office, for twenty years.

The reversal of July 1830 had just given a strong shock to the stability of the settlement of Europe. The kingdom of the Netherlands was rent asunder by the Belgian revolution; Portugal was the scene of civil war; the Spanish succession was about to open and place an infant princess on the throne. Poland was in arms against Russia, and the northern powers formed a closer alliance, threatening to the peace and the liberties of Europe. In presence of these varied dangers, Lord Palmerston was prepared to act with spirit and resolution, and the result was a notable achievement of his diplomacy. The kings of the Netherlands had appealed to the powers who had placed him on the throne to maintain his rights; and a conference assembled accordingly to the question, which involved the independence of Belgium and the security of England. On the one hand, the northern powers were anxious to defend the king of Holland; on the other hand a party in France aspired to annex the Belgian provinces.

The policy of the British government was a close alliance with France, but an alliance based on the principle that no interests were to be promoted at variance with the just rights of others, or which could give to any other nation well-founded cause of jealousy. If the northern powers supported the king of Holland by force, they would encounter the resistance of France and England united in arms, and France might demand from England and find herself opposed by the whole continent of Europe. In the end the policy of England prevailed; numerous difficulties, both great and small, were overcome by the conference, although on the verge of war, peace was maintained; and Prince Leopold of Saxe-Coburg was placed upon the throne of Belgium.

In 1833 and 1834 the youthful queens Donna Maria of Portugal and Isabella of Spain were the representatives and the hope of the constitutional party in those countries—assailed and hard pressed by their absolutist kinsmen Don Miguel and Don Carlos, who were the representatives of the male line of succession. Lord Palmerston conceived in 1830 that concerted plan of a quadruple alliance of the constitutional states of the West to serve as a counterpoise to the northern alliance. A treaty for the pacification of the Peninsula was signed in London on the 22nd of April 1834; and, although the struggle was somewhat prolonged in Spain, it accomplished its object. France, however, had been a reluctant party to this treaty. She never executed her share in it with zeal or fidelity. Louis Philippe was accused of secretly favouring the Carlists, and he positively refused to be a party to direct interference in Spain. It is probable that the hesitation of the French crown on this question was one of the causes of the extreme personal hostility Lord Palmerston never ceased to show towards the king of the French down to the end of his life, if indeed that sentiment had not taken its origin at a much earlier period. Nevertheless, at this same time (June 1834) Lord Palmerston wrote that "Paris is the pivot of my foreign policy," M. Thiers was at that time in office. Unfortunately these differences, growing out of the opposite policies of the two countries at the court of Madrid, increased in each succeeding year; and a constant but sterile rivalry was kept up, which ended in results more or less humiliating and injurious to both nations.

The affairs of the East interested Lord Palmerston in the highest degree. During the Greek War of Independence he had strenuously supported the claims of the Hellenes against the
“Turks and the execution of the Treaty of London. But from 1836 the defence of the Ottoman Empire became one of the cardinal objects of his policy. He believed in the regeneration of Turkey. “All that we hear,” he wrote to Bulwer (Lord Dalling), “about the decay of the Turkish Empire, and its being a dead body or a sapless trunk, and so forth, is pure unadulterated nonsense.” The foreign affairs of England were dominated by the establishment of Russia on the Bosporus and of France on the Nile, and he regarded the maintenance of the authority of the Porte as the chief barrier against both these aggressions. Against Russia he had long maintained a suspicious and hostile attitude. He was a party to the publication of the “Portfolio” in 1834, and to the mission of the “Vixen” to force the blockade of Circassia about the same time. He regarded the treaty of Unkari Skelessi which Russia extorted from the Porte in 1832, when she came to the relief of the sultan after the battle of Konia, with great jealousy; and, when the power of Mehemet Ali in Egypt appeared to threaten the existence of the Ottoman dynasty, he succeeded in effecting a combination of all the powers, who signed the celebrated collective note of the 27th of July 1839, pledging them to maintain the independence and integrity of the Turkish Empire as a security for the peace of Europe. On two former occasions, in 1833 and in 1835, the policy of Lord Palmerston, who proposed to afford material aid to the Porte against the pasha of Egypt, was overruled by the cabinet; and again, in 1839, when Baron Broumow first proposed the active interference of Russia and England, the offer was rejected. But in 1834 Lord Palmerston returned to the charge again, and through the influence of Count M. Charron, who had occupied Syria and won the battle of Nazeth against the Turkish forces, and on the 1st of July 1839 the sultan Mohammed expired. The Egyptian forces occupied Syria, and threatened Turkey; and Lord Ponsonby, then British ambassador at Constantinople, vehemently urged the necessity of crushing so formidable a rebellion against the Ottoman power. But France, though her ambassador had signed the collective note in the previous year, declined to be a party to measures of coercion against the pasha of Egypt. Palmerston, irritated at her Egyptian policy, flung himself into the arms of the northern powers, and the treaty of the 15th of July 1840 was signed in London without the knowledge or concurrence of France. This measure was not taken without great hesitation, and strong opposition on the part of several members of the British cabinet. Lord Palmerston himself declared in a letter to Lord Melbourne that he should quit the ministry if his policy was not adopted; and he carried his point. The bombardment of Beirut, the fall of Acre, and the total collapse of the boasted power of Mehemet Ali followed in rapid succession, and before the close of the year Lord Palmerston’s policy, which had convulsed and terrifed Europe, was triumphant, and the author of it was regarded as one of the most powerful statesmen of the age. At the same time, though acting with Russia in the Levant, the British government engaged in the affairs of Afghanistan to defeat her intrigues in Central Asia, and a contest with China was terminated by the conquest of Chusan, afterwards exchanged for the island of Hong-Kong.

Within a few months Lord Melbourne’s administration came to an end (1841), and Lord Palmerston remained for five years out of office. The crisis was past, but the change which took place by the substitution of M. Guizot for M. Thiers in France, and of Lord Aberdeen for Lord Palmerston in England, was a fortunate event for the peace of the world. Lord Palmerston had adopted the opinion that peace with France was not to be relied on, and indeed that war between the two countries was sooner or later inevitable. Lord Aberdeen and M. Guizot inaugurated a different policy; by mutual confidence and friendly offices they entirely succeeded in restoring the most cordial understanding between the two governments, and the irritation which Lord Palmerston had inflamed gradually subsided. During the administration of Sir Robert Peel, Lord Palmerston led a retired life, but he attacked with characteristic bitterness the Ashburton treaty with the United States, which closed successfully some other questions he had long kept open. In all these transactions, whilst full justice must be done to the force and patriotic vigour which Lord Palmerston brought to bear on the questions he took in hand, it was but too apparent that he imported into them an amount of passion, of personal animosity, and imperious language which rendered him in the eyes of the sage and of his colleagues a dangerous minister. On this ground, when Lord John Russell attempted, in December 1845, to form a ministry, the combination failed because Lord Grey refused to join a government in which Lord Palmerston should resume the direction of foreign affairs. A few months later, however, this difficulty was surmounted; the Whigs returned to power, and Palmerston to the foreign office (July 1846), with a strong assurance that Lord John Russell should exercise a strict control over his proceedings. A few days sufficed to show how vain was this expectation. The French government regarded the appointment of Palmerston as a certain sign of renewed hostilities, and they availed themselves of a despatch in which Palmerston had put forward the name of a Coburg prince as a candidate for the hand of the young queen of Spain, as a justification for a departure from the engagements entered into between M. Guizot and Lord Aberdeen. However little the conduct of the French government in this transaction of the Spanish marriages can be vindicated, it is certain that it originated in the belief that in Palmerston France had a restless and subtle enemy. The efforts of the British minister to defeat the French marriages of the Spanish princesses, by an appeal to the treaty of Utrecht and the other powers of Europe, were wholly unsuccessful; France won the game, though with no small loss of honourable reputation.

The revolution of 1848 spread like a conflagration through Europe, and shook every throne on the Continent except those of Russia, Spain, and Belgium. Palmerston sympathized, or was supposed to sympathize, openly with the revolutionary party abroad. No state was regarded by him with more aversion than Austria. Yet his opposition to Austria was chiefly based upon her occupation of great part of Italy and her Italian policy, for Palmerston maintained that the existence of Austria as a great power north of the Alps was an essential element in the system of Europe. Antipathies and sympathies had a large share in the political views of Lord Palmerston, and his sympathies had ever been passionately awakened by the cause of Italian independence. He supported the Sicilians against the king of Naples, and even allowed arms to be sent them from the arsenal at Woolwich; and, although he had endeavoured to restrain the king of Sardinia from his rash attack on the superior forces of Austria, he obtained for him a reduction of the penalty of defeat. Austria, weakened by the revolution, sent an envoy to London to request the mediation of England, based on a large cession of Italian territory; Lord Palmerston rejected the terms he might have obtained for Piedmont. Ere long the reaction came; this straw-fire of revolution burnt itself out in a couple of years. In Hungary the civil war, which had thundered at the gates of Vienna, was brought to a close by Russian intervention. Prince Schwarzenberg assumed the government of the empire with dictatorial power; and, in spite of what Palmerston termed his “judicious bottle-holding,” the movement he had encouraged and applauded, but to which he could give no material aid, was everywhere subdued. The British government, or at least Palmerston as its representative, was regarded with suspicion and resentment by every power in Europe, except the French republic; and even that was shortly afterwards to be affected by Palmerston’s attack on Greece.

This state of things was rendered still more intolerable by the British court and by most of the British ministers. Palmerston had on many occasions taken important steps without their knowledge, which they disapproved. Over the Foreign Office he asserted and exercised an arbitrary dominion, which the feeble efforts of the premier could not control. The queen and the prince consort (see Victoria, Queen) did not conceal their indignation at the position in which he had placed them with all the other courts of Europe. When Kossuth, the
Hungarian leader, landed in England, Palmerston proposed to receive him at Broadlands, a design which was only prevented by a peremptory vote of the cabinet; and in 1850 he took advantage of Don Pacifico's very questionable claims on the Hellenic government to organize an attack on the little kingdom of Greece.1 Greece being a state under the joint protection of three powers, Russia and France protested against its coercion by the British fleet, and the French ambassador temporarily left London, which promptly led to the termination of the affair. But it was taken up in parliament with great warmth. After a memorable debate (June 17), Palmerston's policy was condemned by a vote of the House of Lords. The House of Commons was moved by Roebuck to reverse the sentence, which it did (June 29) by a majority of 46, after having heard from Palmerston the most eloquent and powerful speech ever delivered by him, in which he sought to vindicate, not only his claims on the Greek government for Don Pacifico, but his entire administration of foreign affairs. It was in this speech, which lasted five hours, that Palmerston made the well-known declaration that a British subject—"Civis Romanus sum"—ought everywhere to be protected by the strong arm of the British government against injustice and wrong. Yet in no instance, either in the preceding or in the subsequent triumph, there were not a few of his own colleagues and supporters who condemned the spirit in which the foreign relations of the Crown were carried on; and in that same year the queen addressed a minute to the prime minister in which she recorded her dissatisfaction at the manner in which Lord Palmerston evaded the obligation to submit his measures for the royal sanction as failing in sincerity to the Crown. This minute was communicated to Palmerston, who did not resign upon it. These various circumstances, and many more, had given rise to distrust and uneasiness in the cabinet, and these feelings reached their climax when Palmerston, on the occurrence of the coup d'état by which Louis Napoleon made himself master of France, expressed to the French ambassador in London, without the concurrence of his colleagues, his personal approval of that act. Upon this Lord John Russell advised his dismissal from office (Dec. 1851). Palmerston speedily avenged himself by turning out the government on a militia bill; but although he survived for many years, and twice filled the highest office in the state, his career as foreign minister ended for ever, and he returned to the foreign office no more. Indeed, he assured Lord Aberdeen, in 1853, that he did not wish that the pages of his department should be written with the zeal and ability which he had invariably displayed as foreign minister, it had long been felt by his colleagues that his eager and frequent interference in the affairs of foreign countries, his imperious temper, the extreme acerbity of his language abroad, of which there are ample proofs in his published correspondence, and the evasions and artifices he employed to carry his points at home, rendered him a dangerous representative of the foreign interests of the country. But the lesson of his dismissal was not altogether lost on him. Although his great reputation was chiefly earned as a foreign minister, it may be said that the last ten years of his life, in which he filled other offices, were not the least useful or dignified portion of his career.

Upon the formation of the cabinet of 1853, which was composed by the junction of the surviving followers of Sir Robert Peel with the Whigs, under the earl of Aberdeen, Lord Palmerston accepted with the best possible grace the office of secretary of state for the home office, nor was he ever chargeable with the slightest attempt to undermine that Government. At one moment he withdrew from it, because Lord John Russell persisted in presenting a project of reform which appeared to him entirely out of season; and he advocated, with reason, measures of greater energy on the approach of war, which might possibly, if they had been adopted, have averted the contest with Russia. As the difficulties of the Crimean campaign increased, it was not Lord Palmerston but Lord John Russell who broke up the government by refusing to meet Roebuck's motion of inquiry. Palmerston remained faithful and loyal to his colleagues in the hour of danger. Upon the resignation of Lord Aberdeen and the duke of Newcastle, the general sentiment of the House of Commons and the country called Palmerston to the head of affairs, and he entered, on the 9th of February 1855, upon the high office, which he retained, with one short interval, for the next day of his death. Palmerston was in the seventy-first year of his life when he became prime minister of England.

A series of fortunate events followed his accession to power. In March 1855 the death of the emperor Nicholas removed his chief antagonist. In September Sevastopol was taken. The administration of the British army was reformed by a consolidation of offices. In the following spring peace was signed in Paris. Never since Pitt had a minister enjoyed a greater share of popularity and power, and, unlike Pitt, Palmerston had the prestige of victory in war. He was assailed in parliament by eloquent orators, the sarcasms of Disraeli, and the animosity of the Manchester Radicals, but the country was with him. Defeated by a hostile combination of parties in the House of Commons on the question of the Chinese war in 1857, and the alleged insult to the British flag in the seizure of the lorcha "Arrow," he dissolved parliament and appealed to the nation. The result was the utter defeat of the extreme Radical party and the return of a more compact Liberal majority. The great events of the succeeding years, the Indian Mutiny, and the invasion of Italy by Napoleon III., belong rather to the general history of the times than to the life of Palmerston; but it was fortunate for the British government and the policy of the Conspiracy Bill. Palmerston had learnt by experience that it was wiser to conciliate an opponent than to attempt to crush him, and that the imperious tone he had sometimes adopted in the House of Commons, and his supposed obsequiousness to the emperor of the French, were the causes of the temporary reverse he had sustained. Although Palmerston approved the objects of the French invasion of Italy in so far as they went to establish Italian independence, the annexation of Savoy and Nice to France was an incident which revived his old suspicions of the good faith of the French emperor. About this time he expressed to the duke of Somerset his conviction that Napoleon III. "had at the bottom of his heart a deep and unextinguishable desire to humble and punish England," and that war with France was a contingency to be provided against. The unprotected condition of the principal British fortresses and arsenals had long attracted his attention, and he succeeded in inducing the House of Commons to vote nine millions for the fortification of those important points.

In 1856 the projects for cutting a navigable canal through the Isthmus of Suez were brought forward by M. M. Lesseps, and resisted by Palmerston with all the weight he could bring to bear against it. He did not foresee the advantages to be derived by British commerce from this great work, and he was strongly opposed to the establishment of a powerful French company on the soil of Egypt. The concession of land to the company was reduced by his intervention, but in other respects the work proceeded and was accomplished. It may here be mentioned, as a remarkable instance of his foresight, that

1 David Pacifico (1784–1851) was a Portuguese Jew, born a British subject at Gibraltar. He became a merchant at Athens, and in 1847 his house was burnt down in an anti-Semitic riot. Pacifico brought an action, laying the damages at £26,000. At the same time George Finlay, the historian, was suing his own grievances against the Greek government, and as both claims were repudiated Palmerston took them up. Eventually Pacifico received a substantial sum.
Palmerston—Palmistry

Palmerston told Lord Malmesbury, on his accession to the foreign office in 1858, that the chief reason of his opposition to the canal was this: he believed that, if the canal was made and proved successful, Great Britain, as the first mercantile state, and that most closely connected with the East, would be the power most interested in it; that England would therefore be drawn irresistibly into a more direct interference in Egypt, which it was desirable to avoid because England had already enough upon her hands, and because intervention might lead to a rupture with France. He therefore preferred that no such line of communication should be opened.

Upon the outbreak of the American Civil War in 1861, Lord Palmerston acknowledged that it was the duty of the British government to stand aloof from the fray; but his own opinion led him rather to desire than to avert the rupture of the Union, which might have been the result of a refusal on the part of England and France to recognize a blockade of the Southern ports, which was notoriously imperfect, and extremely prejudicial to the interests of Europe. The cabinet was not of this opinion, and, although the belligerent rights of the South were promptly recognized, the neutrality of the Government was strictly observed. When, however, the Southern envoys were taken by force from the "Trent," a British packet, Palmerston did not hesitate a moment to insist upon a full and complete reparation for so gross an infraction of international law. But the difficulty with the American government over the "Alabama" and other vessels, fitted out in British ports to help the Southern cause, was only settled at last (see ALABAMA ARBITRATION) by an award extremely onerous to England.

The last transaction in which Palmerston engaged arose out of the attack by the Germanic Confederation, and its leading states Austria and Prussia, on the kingdom of Denmark and the duchies of Schleswig and Holstein. There was but one feeling in the British public and the nation as to the dishonest character of that unprovoked aggression, and it was foreseen that Austria would ere long have reason to repent her share in it. Palmerston endeavoured to induce France and Russia to concur with England in maintaining the Treaty of London, which had guaranteed the integrity of the Danish dominions. But those powers, for reasons of their own, stood aloof, and the conference held in London in 1864 was without effect. A proposal to send the British fleet into the Baltic was overruled, and the threatening approach of the Danish war was left to her own resources against her formidable opponents. In the following year, on the 18th of October 1865, Lord Palmerston expired at Brocket Hall, after a short illness, in the eighty-first year of his age. His remains were laid in Westminster Abbey.

Although there was much in the official life of Lord Palmerston which inspired distrust and alarm to men of a less ardent and contentious temperament, he had a lofty conception of the strength and the duties of England, he was the irreconcilable enemy of slavery, injustice and oppression, and he laboured with inexhaustable energy for the dignity and security of the Empire. In private life his gaiety, his buoyancy, his high breeding, made even his political opponents forget their differences; and even the warmest altercations on public affairs were merged in his large hospitality and cordial social relations. In this respect he was aided with consummate ability by the tact and grace of Lady Palmerston, the widow of the 5th Earl Cowper, whom he married at the close of 1839, and who died in 1869. She devoted herself with enthusiasm to all her husband's interests and pursuits, and she made his house the most attractive centre of society in London, if not in Europe. They had no children, and the title became extinct, the property descending to Lady Palmerston's second son by Earl Cowper, W. E. Cowper-Temple, afterwards Baron Mount Temple, and then to her grandson Evelyn Ashley (1836-1909) son of her daughter, who married the 7th earl of Shaftesbury—who was Lord Palmerston's private secretary from 1858 to 1865.

The Life of Lord Palmerston, by Lord Dalling (2 vols., 1870), with valuable selections from the minister's autobiographical diaries and private correspondence, only came down to 1847, and was completed by Evelyn Ashley (vol. iii., 1874; iv., v., 1876). The whole was re-edited by Mr. Ashley, in two volumes (1879), the standard biography. The Life by Lloyd Sanders (1888) is an excellent shorter work.

PALMERSTON, the chief town of the Northern Territory of South Australia, in Palmerston county, on the E. shore of Port Darwin, 2000 m. direct N.N.W. of Adelaide. The town stands 60 ft. above the level of the sea, by which it is almost surrounded. There are a government house, a town hall, and an experimental nursery garden. Palmerston has a magnificent harbour, accessible to ocean-going vessels, and the jetty is connected by rail with Playford, 146 m. distant. Cool breezes blow almost continuously throughout the year. The mean annual rainfall is 62-21 in. Pop. (1901), 1973, mostly Chinese.

PALMETTO, in botany, a popular name for Sabal palmetto, the Palmetto palm, a native of the southern United States, especially in Florida. It has an erect stem, 20 to 80 ft. high and deeply cut fan-shaped leaves, 5 to 8 ft. long; the fruit is a black drupe ⅓ to ⅔ in. long. The trunks make good piles for wharves, &c., as the wood resists the attacks of borers; the leaves are used for thatching. The palm is grown as a pot-plant in greenhouses.

PALMYRA, (from "palmist," one who studies the palm, with a semitonic affix signifying "art"); also called CHROMANCY, from χρώμα, the hand, and διάβωσις, divination. The desire to learn what the future has in store is nearly as old as the sense of responsibility in mankind, and has been the parent of many empirical systems of fortune-telling, which profess to afford positive knowledge whereby the affairs of life may be regulated, and the dangers of failure foretold. Most of these systems come into the category of occult pursuits, as they are the interpretations of phenomena on the ground of fanciful presumptions, by an appeal to unred or at least unverifiable influences and relations.

One of the oldest of this large family of predictive systems is that of palmistry, whereby the various irregularities and flexion-folds of the skin of the hand are interpreted as being associated with mental or moral dispositions and powers, as well as with the current of future events in the life of the individual. How far back in prehistoric times this system has been practised it is impossible to say, but in China it is said to have existed 3000 years before Christ, and in Greek literature it is treated even in the most ancient writings as well-known belief. Thomas Blackwell had collected some Homeric references: a work by Melampus of Alexandria is extant in several versions. Polemon, Aristotle and Adamantius may also be named as having almost substantiated the theory. Among modern writers, the titles of W. Howitt, B. J. Hartlieb, Galen and Paulus Aegineta, and in later times the Arabian commentators on these authors. From references which can be gathered from pathetic writings it is abundantly evident that the belief in the mystical meaning of marks on the "organ of organs" was a part of the popular philosophy of their times.

After the invention of printing a very considerable mass of literature concerning this subject was produced during the 10th and 17th centuries. Praetorius, in his Lidicrum chironomiacum (Jena, 1661), has collected the titles of 77. Other works noted were the Formula of Eulogius of the século of澤; the history of philosophy and magic; altogether about 98 books on the subject published before 1700 are at present accessible. There is not very much variety among these treatises, one of the earliest, valuable on account of its rarity, is the block-book by Hartlieb, Die Kunst chiromantia, published at Augsburg about 1470 (probably, but it bears no imprint of place or date). In this there are colossal figures of hands, each of which has its regions marked out by inscriptions. Few of these works are of sufficient interest to require mention.

3. This book is worthy of note on account of the quaint and sarcastic humour of its numerous acroatic verses, and by writers on the history of philosophy and magic; altogether about 98 books on the subject published before 1700 are at present accessible. There is not very much variety among these treatises, one of the earliest, valuable on account of its rarity, is the block-book by Hartlieb, Die Kunst chiromantia, published at Augsburg about 1470 (probably, but it bears no imprint of place or date). In this there are colossal figures of hands, each of which has its regions marked out by inscriptions. Few of these works are of sufficient interest to require mention.
4. There is a copy in the Rylands Library, Manchester. See also Dibdin's Bibliographical Decameron (1817), i. 143.
The best are those by Pompeius, Robert Fludd, John de Indagine, Tassinarius, Baptista della Porta, S. Cardan, Goclenius, Coës, Frölich, Sumner, Rothmann, Ingebert, Pomponius Gaucius, and Tricassius Mantuanus. There are also early Hebrew works, of which one by Gedaliah is extant. An Indian literature is also said to exist. Some of these authors attempt to separate the physiognomical part of the subject (Chirognomia) from the astrological (Chiromatia); see especially Caspar Schott in Magia Naturalis Universalis, Banberg, 1677. Since the middle of the 19th century, in spite of the enactments of laws in Britain and elsewhere against the practice, there has been a recrudescence of belief in palmistry, and a new literature has grown up differing little from the essence of the older. The more important books of this series are K. G. Carus, Über Grund un. Beleutung der verschiedenen Formen der Hand, 1836; Landsberg, Die Handtellerei (Posen, 1861); Adolf Desbarolles, Les Mystères de la main (1859); C. S. d'Arpentigny, Chirognomie, la science de la main (1865), of which an English version has been published by Heron Allen in 1886; G. Z. Gesmann, Katakismus der Handlackkunst (Berlin, 1889); Cynznski, Die Deutung der Handlinien (Dresden, 1893); R. Beamish, The Psychomony of the Hand (1865); Frith and Allen, The Science of Palmitomy (1883); Cottom, Palmitomy and its practical uses (1890). Some of the older writers appealed to Scripture as supporting their systems. Especially the text Exodus xiii. 16; Job xxxvii. 7; and Prov. iii. 16. A considerable amount of literature pro and con was devoted to this controversy in the 17th and 18th centuries.

The present day palmistry is practised in nearly all parts of China. The criteria of judgment used are referred to in the article by Professor H. A. G. Giles, already quoted. It is also extensively practised in India, especially by one caste of Brahmins, the Joshi. In Syria and Egypt the palmist can be seen plying his trade at the cafes; and among the Arabs there are chiromantists who are consulted as to the probable success of enterprises. This is probably from their original Indian bone that the traditional dukkertwilpe (fortune-telling) of the gipsies has been derived.

This system of divination has the charm of simplicity and definiteness, as an application of the “doctrine of signatures” which formed so extensive an element in the occult writings of the past six centuries. In the course of ages every detail has been brought under a formal set of rules, which only need mechanical application. There have been in past times considerable divergences in the practice, but at present there is a fairly uniform system in vogue. One school lays special stress on the general shape and outline of the hand. Corveaú enumerates 70 varieties, Pampilhous cuts them down to 6; John de Indagine to 27, and Tricassius Mantuanus raises them to 80.

The characters of softness or hardness, dryness or moisture, &c., are taken account of in these classifications. The lines of cardinal importance are (1) the racetta or cross sulci, which isolate the hand from the forearm at the wrist, and which are the flexion folders between the looser forearm skin and that tied down to the fascia above the level of the anterior annular ligament. (2) The line which isolates the ball of the thumb, where the skin comes to be tied to the front of the palm, and is known in the line of life. (3) A line starting above the head of the second metacarpal bone and crossing the hand to the middle of its ulnar border is the line of the head. (4) The transverse line below this which passes from the ulnar border a little above the level of the head of the fifth metacarpal and ends somewhere about the root of the index finger is the line of the heart. (5) The vertical line descending from the middle of the wrist to end about the base of the middle finger is the line of fortune. (6) The oblique line which begins at the wrist end of the line of life and descends towards the ulnar end of the line of the head is the line of the liver.

These lines isolate certain swellings or monticuli, the largest of which is (1) the ball of the thumb, called the mountain of Venus; (2) that at the base of the index finger is the mountain of Jupiter; (3) at the root of the middle finger is the mountain of Saturn, while those at the bases of ring and little finger are respectively the mountains of the (4) Sun and (5) of Mercury. Above the mountain of Mercury, and between the lines of head and heart is (6) the mountain of Mars, and above the line of the heart is (7) the mountain of the Moon. The relative sizes of these mountains have assigned them to the distinct correlations with characters: the 1st with charity, love, libertinage; the 2nd with religion, ambition, love of honour, pride, superstition; the 3rd with wisdom, good fortune, prudence, or when deficient improvidence, ignorance, failure; the 4th when large makes for success, celebrity, intelligence, audacity, when small meanness or love of obscurity; the 5th indicates love of knowledge, industry, aptitude for commerce; and in its extreme form indicates one who conceals dishonesty, on the other slackness and laziness. The 6th is related to degrees of courage, resolution, rashness or timidity; the 7th indicates sensitiveness, morality, good conduct, or immorality, overbearing temper and self-will.

The swellings on the palm faces of the phalanges of the several fingers are also indicative, the 1st and 2nd of the thumb respectively, of the logical faculty and of the will; the 1st, 2nd and 3rd of the index finger, of materialism, law and order, idealism; those of the middle finger, humanity, system, intelligence; of the ring finger, truth, economy, energy; and of the little finger, goodness, prudence, reflectiveness.

Over and above these there are other marks, crosses, triangles, &c., of which more than a hundred have been described and figured by different authors, each with its interpretation; and in addition the back of the hand has its ridges. The Chinese combine palmistry and chiromancy.

To the anatomist the roughness of the palm are of considerable interest. The folds are so disposed that the thick skin shall be capable of bending in grasping, while at the same time it requires to be tightly bound down to the skeleton of the hand, for the slipping of the skin roof lead to insecurity of prehension, as the quilting or buttoning down of the covers of furniture by upholsterers keeps them from slipping. For this purpose the skin is tied by connecting fibres of white fibribal tissue to the deep layer of the demis along the lateral and lower edges of the palm fascia, and to the sheaths of the flexor tendons. The folds, therefore, which are disposed for the purpose of making the grasp secure, vary with the relative lengths of the metacarpal bones, with the mutual relations of the sheaths of the tendons, and the edge of the palmar fascia, somewhat also with the insertion of the palmaris brevis. The sulci are emphasized because the subcancial fat, which is copious in order to pad the skin for the purpose of firmness of holding, being restricted to the intervals between the lines along which the skin is tied down, makes these intervals project, and these are the monticuli. The swelling of the mountain of Venus is simply the indication of the size of the muscles of the half of the thumb, and can be increased by their exercise. Similarly the hypothenar muscles for the little finger underlying the three ulnar marginal mountains, the sizes of which depend on their development and on the prominence of the pisiform bone.

That these purely mechanical arrangements have any psychic, occult, or philosophic significance is a fantastic imagination, which seems to have a peculiar attraction for certain types of mind, and as there can be no fundamental hypothesis of correlation, its discussion does not lie within the province of reason.

(A. MA.)

PALMITIC ACID, n-Hexadecylic Acid, CH3(CH2)14CO2H, an organic acid found as a glyceride, palmitin, in all animal fats, and partly as glyceride and partly uncombined in palm oil. The cetyl ester is spermaceti, and the myricyl ester is largely present in beeswax. It is most conveniently obtained from palm oil, after removal of the oleic acid (g.e.), or from Japanese beeswax, which is its glyceride. Artificially it may be prepared by heating cetyl alcohol with soda lime to 270° or by fusing oleic acid with potassium hydrate.

PALM SUNDAY (Dominica Palmarum), the Sunday before Easter, so called from the custom, still observed in the Roman Catholic Church, of blessing palm branches and carrying them in
procession in commemoration of Christ's triumphal entry into Jerusalem. In the Western Church, Palm Sunday is counted as the first day of Holy Week, and its ceremonies usher in the series of services, culminating in those of Good Friday, which commemorate the Passion of the Lord.

The ceremonies of Palm Sunday are celebrated now in the Eastern Church in as much as they are divided in three distinct parts:

1) The solemn blessing of the palms,

2) The procession, and

3) The mass.

Branches of palm, olive or sprouting willow (hence in England known as "palm") having been placed before the altar, or at the Epistle side, after Tenebrae and the sprinkling of holy water, the procession begins. The people or choristers, each with a cross or crown, file into the church to bless them. The ceremony begins with the singing by the choir of the anthem *Hosanna Filio David*; the collect follows; then the singing of a lesson from Exodus xvi: by the subdeacon; then the Gospel is read from the Holy Chapter. A blessing is then pronounced by the bishop and Pharisæes, and concluding with Christ's prayer on Mt. Olivet, then the Gospel, sung by the deacon in the ordinary way, followed by a "continuation of the Holy Gospel" (Matt. xxvi. and xxvii). After this the priest blesses the palms in a series of prayers, that those who receive them "may be protected in soul and body," and that "into whatever place they may be brought the inhabitants of that place may obtain Thine benediction; and all adversity being removed, &c." The priest then sprinkles the palms thrice with holy water, saying the prayer *Aspergesme, &c.,* and also incenses them thrice. The principal of the clergy present then approaches and gives a palm to each child, in the language of the former times, the first to the principal of the clergy, then to the deacon and sub-deacon, and to the other clergy in order of rank, and lastly to the laity, all of whom receive the palms kneeling, and kiss the palms and the hand of the celebrant. During the distribution antiphons are sung.

The deacon now turns to the people and says *Procecdamus in pace,* and the procession begins. It is headed by a thruster carrying a smoking thurible; then comes the sub-deacon carrying the cross between two acolytes with lighted tapers; the clergy next in order, the celebrant coming last with the deacon on his left, all carrying branches and singing antiphonally, so long as the procession lasts, the account of the entry into Jerusalem, ending with "Benedictus qui venit in nomine Domino: Hosanna in excelsis." On returning to the church, two or four singers enter first and close the file, reciting antiphonally the New Masses followed by the old Mass.

The first two verses of the hymn *Gloria, laus et honor,* those outside repeating them, and so on till the hymn is finished. This done, the sub-deacon strikes the door with the staff of the cross, when immediately opened, and the procession enters singing. The mass that follows, characterized by all the outward signs of sorrow proper to Passion Week, is in striking contrast with the joyous triumph of the occasion.

In the Orthodox Eastern Church Palm Sunday (σαββάτου δικόν του βασιλείου του θεού) is not included in Holy Week, but is regarded as a joyous festival commemorating Christ's triumphal entry into Jerusalem. There is no longer a procession; but the palms (in Russia willow twigs) are blessed, and are held by the worshippers during the service.

The earliest extant account of a liturgical celebration of Palm Sunday is that given in the *Peregrinatio Silias (Eleutherias),* which dates from the 4th century and contains a detailed account of the Holy Week ceremonies at Jerusalem by a Spanish lady of rank.

The actual festival began at one o'clock with a service in the church on the Mount of Olives; at three o'clock clergy and people went in procession, singing hymns, to the scene of the Ascension; two hours of prayer, singing and reading of appropriate Scriptures followed, with an oration or prayer from one of the bishops or priests, telling how the children with olive branches and palms go to meet the Lord, and cry: "Blessed is he that cometh in the name of the Lord!" gave the signal for the crowd to break up, and, carrying branches of olive and palm, to conduct the bishop, *tut.ta typa qui tuens Dominus deducet est,* with cries of "Blessed is he that cometh in the name of the Lord!" to the Church of the Resurrection in Jerusalem, where a further service was held.

The Palm Sunday procession in the West has been long established at Jerusalem, and there is evidence that in the 4th and 5th centuries it had already been copied in other parts of the East. In the West, however, it was not introduced until much later. To Pope Leo I. (d. 461) the present *Dominica palmariarum* was known as *Dominica passionis,* Passion Sunday, and the Western Church treated it as a day, not of rejoicing, but of mourning. The earliest record in the West of the blessing of the palms and the subsequent procession is the *liber ordinum* of the West Church (published by Fétorin, Paris, 1903, pp. 178 sqq.), a work which is taken from some other source. This shows plainly that the ceremonial of the procession had been preserved from Jerusalem. As to how far, and at what period, it became common there is very little evidence. For England, the earliest record is the mention by Althing, bishop of Sherborne (d. 909), in his *Deiudias virginitatis* (cap. 30, Migne Patrol. Lat. 80, p. 128), of a *sacrosanctum palmorum solemnitas,* which probably means a procession, since he speaks of the *Benedictus qui venit,* &c., being sung antiphonally. As the middle ages advanced the procession became more and more popular and increasingly a dramatic representation of the triumphal progress of Christ, the bishop riding on an ass or horse, as in the East. Flowers, too, were blessed, as well as palms and willow, and carried in the procession (hence the name *palma floridum, dominica florum et ramorum les fäges fleuries,* etc.).

The origin of the ceremony of blessing the palms is more obscure. It is not essential to the dramatic character of the celebration and for centuries seems to have formed no usual part of it. Herr Drews (*Kirchenordnung*) has called attention to the practise of inserting palms into the palms at matins and pagan origin. It is significant that olive and willow should have been chosen for benediction together with, or as substitutes for palm, and that an exorcizing power should have been ascribed to consecrated branches: they were to heal disease, ward off devils, protect the houses where they were set up against lightning and fire, and the fields where they were planted against harm. The palm had in pagan antiquity, and in the way the willow had from time immemorial been credited by the Teutonic peoples with the possession of protective qualities. It was natural that olive and willow should have been chosen for the Palm Sunday ceremony, for they are the earliest trees to bud in the spring; their consecration, however, may be explained by the intention to Christianize a pagan belief, and it is easy to see how their mystic virtues came in this way to be applied to the palm also. When and where the custom first arose is unknown.

Of the reformed churches, the Church of England alone includes Palm Sunday in the Holy Week celebrations. The blessing of the palms and the procession were, however, abolished at the Reformation, and the name "Palm Sunday," though it survives in popular usage, is not mentioned in the Book of Common Prayer. The intention of the compilers of the Prayer-book seems to have been to restore the "Sunday of palmaris* in the Eastern Church has been restored, to its earlier Western character of Passion Sunday, the second lesson on Matt. xxvi. 3-5 and the special collect, Epistle (Phil. ii. 5) and Gospel (Matt. xxvii. 1) at the celebration of Holy Communion all dwelling on the humiliation and passion of Christ, with no reference to the triumphal entry into Jerusalem. The modern revival, in certain churches of an "advanced" type, of the ceremonies of blessing the palms and carrying them in procession has no official warrant, and is therefore without any significance as illustrating the authoritative point of view of the Church of England.

The Lutheran churches only that of Brandenburg seem to have kept the Palm Sunday procession for a while. This was prescribed by the Church order (Kirchenordnung) of 1540, but without the ceremony of blessing the palms; it was abolished by the revised Church order of 1572.

PALMYRA, the Greek and Latin name of a famous city of the East, now a mere collection of Arab hovels, but still an object of interest on account of its wonderful ruins. In 2 Chron. 

"For curious instances of the part played by the ass in medieval church festivals see the article FOOLS, BEAST OF.
PALMYRA

vii. 4, and in the native inscriptions, it is called Tadmor, and this is the name by which it is known among the Arabs at the present day (Tadmur, Tadmúr). The site of Palmyra lies 150 m. N.E. of Damascus and five days' camel journey from the Euphrates, in an oasis of the Syrian desert, 1,300 ft. above sea-level. At this point the great trade routes met in ancient times, the one crossing from the Phoenician ports to the Persian Gulf, the other coming up from Petra and south Arabia.

The earliest mention of Palmyra is in 2 Chron. viii. 4, where Solomon is said to have built "Tadmor in the wilderness"; 1 Kings ix. 18, however, from which the Chronicler derives his statement, reads "Tamar" in the Hebrew text, with "Tadmor" in the Hebrew margin; there can be no doubt that the text is right and refers to Tamar in the land of Judah (Exek. xlvii. 19; xlviii. 28). The Chronicler, we must suppose, altered the name because Tadmor was a city more familiar and renowned in his day, or possibly because he wished to increase the extent of Solomon's kingdom. The date of the Chronicler may be placed about 300 B.C. so Palmyra must have been in existence long before then. There is reason to believe that before the 6th century B.C. the caravans reached Palmyra; but it is impossible to be certain of Tadmor; probably, therefore, we may connect the origin of the city with the forward movement of the nomad Arabs which followed on the overthrow of the ancient nationalities of Syria by the Babylonian Empire (6th century B.C.). The Arabian tribes began to take possession of the partly cultivated lands east of Canaan, became masters of the Eastern trade, gradually acquired settled habits, and learned to speak and write in Aramaic, the language which was most widely current throughout the region west of the Euphrates in the time of the Persian Empire (6th-1st century B.C.). It is not till much later that Palmyra first appears in Western literature. We learn from Appian (Boll. cit. v. 9) that in a. 153 B.C. the city was richly adorned by Mark Antony, while the population was not too large to save itself by timely flight. The series of native inscriptions, written in Aramaic, begins a few years after; the earliest bears the date 304 of the Seleucid era, i.e. 9 B.C. (Cook, North-Semitic Inscriptions No. 141 = Vogüé, Syr. Crouteux No. 300); by this time Palmyra had become an important trade-post between the Roman and the Parthian states. Its characteristic civilization grew out of a mixture of various elements, Arabic, Aramaic, Greek and Roman. The bulk of the population was of Arab race, and though Aramaic was used as the written language, commerce in intercourse Arabic had by no means disappeared. The proper names and the names of deities, while partly Aramaic, are also in part unmistakably Arabic: it is suggestive that a purely Arabic term (fald, NSI. No. 136) was used for the septs into which the citizens were divided.

Originally an Arab settlement, the oasis was transformed in the course of time from a mere halting-place for caravans to a city of the first rank. The true Arab despises agriculture; but the pursuit of commerce, the organization and conduct of trading caravans, cannot be carried on without widespread connexions of blood and hospitality between the merchant and the leading sheiks on the route. An Arabian merchant city is thus necessarily aristocratic, and its chiefs can hardly be other than pure Arabs of good blood. Palmyra also possessed the character of a religious centre, with the worship of the Sun-god dominating that of inferior deities. The chief luxuries of the ancient world, silks, jewels, pearls, perfumes, incense and the like, were drawn from India, China and southern Arabia. Pliny (N. H. xii. 41) reckons the yearly import of these wares into Rome at not less than three-quarters of a million of English money. The trade followed two routes:

1 How the name Palmyra arose is obscure. The Greek for a palm is palma, and the Greek ending -era could not have affected this to the Latin palma. Schultens (Vita Sald., Index geogr.) cites Talmor as a variant of the Arabic name; this might mean "abounding in palms" (from the root tanm); otherwise Tadmor may have been originally an Arayam name. See Lagarde, Bildung der Nomina, p. 125 n.

one by the Red Sea, Egypt and Alexandria, the other from the Persian Gulf through the Syro-Arabian desert. The latter, when the Nabataean kingdom of Petra (q.v.) came to an end (A.D. 105), passed into the hands of the Palmyrene merchants. Their caravans (sawādiya) travelled right across the desert to the great entrepôts on the Euphrates, Vologesia, about 55 m. south-east of Babylon, or Forath or Charax close to the Persian Gulf (NSI. Nos. 113-115). The trade was enormously profitable, not only to the merchants but to the town, which levied a rigorous duty on all exports and imports; at the same time formidable risks had to be faced both from the desert-tribes and from the Parthians, and successively to plan or carry a great caravan came to be looked upon as a distinguished service to the state, often recognized by public monuments erected by "council and people" or by the merchants interested in the venture. These monuments, a conspicuous feature of Palmyrene architecture, took the form of statues placed on brackets projecting from the upper part of the pillars which lined the principal thoroughfares. Thus arose, beside minor streets, the imposing central avenue which, starting from a triumphal arch near the great temple of the Sun, formed the main axis of the city from south-east to north-west for a length of 1,240 yards, and had on either side a row of 652 columns of less than 6 ft. high.

Local industries do not seem to have been important. One of the chief of them was the production of salt from the deposits of the desert; 2 another was not the manufacture of leather; the inscriptions mention also a powerful gild of workers in gold and silver (NSI. No. 130); but Palmyra was not an industrial town, and the exacting fiscal system which drew profit even out of the bare necessities of life—such as water, oil, wheat, salt, wine, straw, wool, skins (see Tariff bi. b, NSI. pp. 315 sq.)—must have weighed heavily upon the artisan, the peasant and the architect and even the personal conduct of caravans, the discharge of public offices such as those of strázeugos, secretary, guardian of the wells, president of the banquet of Bel, chief of the market (see NSI. Nos. 114, 115, 121, 122), sometimes the victualing of a Roman expedition. The capable performance of these functions, which often involved considerable pecuniary sacrifices, ensured public esteem, honorary inscriptions and statues; and to these honours the head of a great house was careful to add the glory of a splendid tomb, consecrated as the "long home" of the deceased, splendidly decorated and provided with all the offices and his sons' sons for ever. These tombs, which lie outside the city and overlook it from the surrounding hills, a feature characteristically Arabic, remain the most interesting monuments of Palmyra. Some are lofty towers containing sepulchral chambers in stories; others are house-like buildings with a single chamber and a richly ornamented portico; the sides of these chambers within are adorned with the names and sculptured portraits of the dead. As a rule the buildings of Palmyra do not possess any architectural individuality, but these tombs are an exception. The style of all the ruins is late classic and highly ornate, but without refinement.

The rise of Palmyra to a position of political importance may be dated from the time when the Romans established themselves on the Syrian coast. As early as the first imperial period the city must have admitted the suzerainty of Rome, for decrees respecting its custom-dues were issued by Germanicus (A.D. 17-19) and Cn. Domitius Corbulus (A.D. 57-66). At the same time the city held by no means surrendered its independence, for even in the days of Vespasian (A.D. 69-79) the distinctive Palmyrene coinage continued. The soil of this marshy coast of Palmyra is so impregnated with salt that a trench or pit sunk in it became filled in a short time with concentrated brine, the water of which evaporates in the intense sunshine and leaves an incrustation of excellent salt. 3

1 Of these tomb-towers, called Kasr eth-Thumiyeh, is 111 ft. high, 33 ft. square at the base, 25 ft. 8 in. square above the base; it contains six stories and places for 880 bodies. Opposite the entrance within is a hall with recesses for coffins and a richly panelled ceiling; underneath is an immense vault.

2 Of one of these tombs 33j
PALMYRA

position of Palmyra as an intermediate state between the two great powers of Rome and Parthia was recognized and carefully watched. The splendid period of Palmyra (A.D. 130-270), to which the greater part of the inscribed monuments belong, started from the overthrow of Odenathus in 262, when Palmyra without a competitor for the Eastern trade. Hadrian treated the city with special favour, and on the occasion of his visit in A.D. 130, granted it the name of Hadriana Palmyra (αιτίνα Παλμύρα NSI. p. 322). Under the same emperor the customs were revised and a new tariff promulgated (April, A.D. 137), cancelling the loose system of taxation "by custom" which formerly had prevailed.1 The great fiscal inscription, which still remains where it was set up, gives the fullest picture of the life and commerce of the city. The government was vested in the council (συνόδος) and people (δῆμος), and administered by civil officers with Greek titles, the procôros (president), the grammateus (secretary), the archons, syndics and dekaplotôs (a fiscal council of ten), following the model of a Greek municipality under the Roman Empire. At a later date, probably under Septimius Severus or Caracalla (beginning of 3rd century), Palmyra received the jus italicum and the status of a colony; the executive officials of the council and people were called strateôi, equivalent to the Roman dnumeôri (NSI. Nos. 121, 127); and Palmyrenes who became Roman citizens began to take Roman names, usually Septimius or Julius Aurelius, in addition to their native names.

It was the Parthian wars of the 3rd century which brought Palmyra to the front, and for a brief period raised her to an almost dazzling position as mistress of the Roman East. A new career of ambition was opened to her citizens in the Roman honours that rewarded services to the imperial armies during their frequent expeditions in the East. One house which was thus distinguished had risen to a leading place in the city and before long played no small part in the world's history. Its members, as we learn from the inscriptions, prefixed to their Semitic names the Roman gentile name of Septimius, which shows that they received the citizenship under Septimius Severus (A.D. 193-211), presumably in recognition of their services in connexion with his Parthian expeditions. In the next generation Septimius Odainath or Odenathus, son of Hairan, had attained the rank of Roman senator (σωφρονίστας, Vogt 21. No. 21, NSI. p. 285 N.), conferred no doubt when Alexander Severus visited Palmyra in A.D. 230-231; his son again, Septimius Hairan, seems to have been the first of the family to receive the title of Rās Tadmor ("chief of Tadmor") in addition to his Roman rank (NSI. No. 125); while his son—the relationship, though nowhere stated, is practically certain—the famous Septimius Odainath, commonly known as Odenathus (γραφων), the husband of Zenobia, received even higher rank, the consular dignity (τιμία), which is given him in an inscription dated 267, but styled in the reign of Valerian (NSI. No. 136). The East was then agitated by the advance of the Parthian Empire under the Sassanidæ, and the Palmyrenes, in spite of their Roman honours and their Roman civilization, which did not really go much below the surface, were by no means prepared to commit themselves altogether to the Roman side.2 But Parthian ambitions made it necessary for the Palmyrenes to choose one side or other, and their choice leaned towards Rome, both because they dreaded interference with their religious freedom and because the Roman emperor was further off than the Parthian king. In the contests which followed there can be no doubt that the Palmyrene princes cherished the idea of an independent empire of their own, though they never threw over their allegiance to the Roman suzerain until the closing act of the drama. Their opportunity came with the disaster which befell the Roman army under Valerian (γραφων) at Edessa, a disaster, says Mommsen, which had nearly the same significance for the Roman East as the victory of the Goths at the mouth of the Danube and the fall of Decius; the emperor was captured (A.D. 260) and died in captivity. The Persians swept victoriously over his reign Minor and North Syria; not however without resistance on the part of Odenathus, who from the inscriptions on the hands returning home from the pillage of Antioch. It was probably not long after this that Odenathus, with a keen eye for his advantage, made an attempt to attach himself to Shapur I. (γραφων) the Persian king;3 his gifts and letters, however, were contemptuously rejected, and from that time, as it seems, he threw himself warmly into the Roman cause. After the capture and death of Valerian, Gallienus succeeded to a merely nominal rule in the East, and was too careless and self-indulgent to take any active measures to recover the lost provinces. Thereupon the two leading generals of the Roman army, Macrianus and Callistus, renounced their allegiance and proclaimed the two sons of the former as emperors (A.D. 261). During the crisis Odenathus remained loyal to Gallienus, and was rewarded for his fidelity by the grant of a position without parallel under ordinary circumstances; as hereditary prince of Palmyra he was appointed auxotis, a sort of vice-emperor for the East (A.D. 262). He started promptly upon the work of recovery. With his Palmyrene troops,4 strengthened by what was left of the Roman army corps, he took the offensive against Shapur, defeated him at Ctesiphon, and in a series of brilliant engagements won back the East for Rome. During his absence at the wars, we learn from the inscriptions that (262-267) that Palmyra was administered by his deputy Septimius Worod, "procurator ducernarius of Caesar our lord," also styled "commandant," as being Odenathus' viceroy (ταγανάρια. NSI. Nos. 127-129). Then in the zenith of his success Odenathus was assassinated at Ημος (Emesa) along with his eldest son Herodes (A.D. 266-267). The fortunes of Palmyra now passed into the vigorous hands of Zenobia ( γραφων), who had been actively supporting her husband in his policy. Zenobia seems to have ruled on behalf of her young son Wahab-allah or Athenodorus as the name is Graecized, who counts the years of his reign from the date of his father's death. Under Odenathus and Palmyra had extended her sway over Syria, and Arabia, perhaps also over Armenia, Cilicia and Cappadocia; but now the troops of Zenobia, numbering it is said 70,000, proceeded to occupy Egypt; the Romans under Probus resisted vigorously but without avail, and by the beginning of A.D. 270, when Aurelian succeeded Claudius as emperor, Wahab-allah was governing Egypt with the title of "king." His coins of 270 struck at Alexandria bear the legend vij (caput) (onsernaris) R(omanorum) im(perator) d(ux) R(omanorum) and display his head beside that of Aurelian, but the latter alone is styled Rex (King). Meanwhile the Persians were pushing their influence not only in Egypt but in Asia Minor; they contrived to establish garrisons as far west as Ancyra and even Chalcodon opposite Byzantium, while still professing to act under the terms of the joint rule conferred by Gallienus. Then in the course of the year A.D. 270-271 came the inevitable and open breach. In Palmyra Zenobia is still called "queen" (Βασιλισσα, NSI. No. 131; cf. Wadd. 2628), but in distant quarters, such as Egypt, she and her son claim the dignity of Augustus; 5

4 The Palmyrene archers were especially famous. Appian mentions them in connexion with M. Antonius in 41 B.C. (Bell. civ. v. 9). Later on a contingent served with the Roman army in Africa, Britain, Italy, Hungary, where grave-stones with Palmyrene and Latin inscriptions have been found (see Lidszbarski, Nordsem eingr. p. 481 seq.; Ephemeris, ii. 92 (a Latin inscription of the time of Marcus Aurelius), and NSI. p. 312. The South Guards inscription, now in the Free Library of the town, was found in the adjoining province of Syria: it is given by Wadd. 2629. In the Pahlavi inscription, which set up it was no doubt an archer. Jewish tradition had reason to remember these formidable Palmyrenes in the Roman armies; according to the Talmud 80,000 of them assisted at the destruction of the temple; but it is given by Wadd. 2628. In the Talmud, Taanith, fol. 68 a, Midrash Ebkha. ii. 2. For other references to Palmyra (called Tarmod) in the Talmud see Neubauer Geogr. du Talm. 301 sqq.

1 The full text, both Greek and Palmyrene, with an English translation, is given in NSI. pp. 313-340. The tariff should be compared with the Greek Tariff of Coptos A.D. 90 (Finders Petrie, Koplo, pp. 27 sqq.) and the Latin Tariff of Zara (Corp. inscr. lat. viii. 4508).

2 For the general history of the Period see PERSIA; History, A. § viii., "The Sassanid Empire."
Wahab-allah (5th year) begins to issue coins at Alexandria without the head of Aurelian and bearing the imperial title; and Zenobia’s coins bear the same. It was at this time (A.D. 271) that the two chief Palmyrene generals Zabda and Zabbai, set up a statue to the deceased Odenathus and gave him the sounding designation of “king of kings and restorer of the whole city” (NSI. No. 130). These assumptions marked a definite rejection of all allegiance to Rome. Aurelian, the true Augustus of the eastern Roman empire, was compelled to deal with it. At the close of A.D. 270 Probus brought back Egypt into the empire, not without a considerable struggle; then in 271 Aurelian made preparations for a great campaign against the seat of the mischief itself. He approached by way of Capadocia, where he reduced the Palmyrene garrisons, and thence through Cilicia he entered Syria. At Antioch the Palmyrene forces under Zabda attempted to resist his advances, but they were compelled to fall back upon the great route which leads from Antioch through Emesa (mod. Homs) to their native city. At Emesa the Palmyrenes were defeated in a stiffly contested battle. At length Aurelian arrived before the walls of Palmyra, which was captured probably in the spring of A.D. 272. In accordance with the judicious policy which he had observed in Asia Minor and at Antioch, he granted full pardon to the citizens; only the chief officials and advisers were put to death; Zenobia and her son were captured and reserved for his triumph when he returned to Rome. But the final stage in the conquest of the city was yet to come. A few months later, in the autumn of 272—the latest inscription is dated August 272 (Vougé, No. 116)—the Palmyrenes revolted, killed the Roman garrison, barricaded the city, and proclaimed one Anechus as their chief. Aurelian heard of it just when he had crossed the Hellespont on his way home. He returned instantly before any one expected him, and took the city by surprise. Palmyra was destroyed and the population put to the sword. Aurelian restored the walls and the great Temple of the Sun (A.D. 273); but the city never recovered its splendour or importance.

Language.—The language spoken at Palmyra was a dialect of western Arabic, related to the language of the Nabataeans and the Aramaic spoken in Egypt. In some important points, however, the dialect was related to the eastern Aramaic or Syrian (e.g. the plural ending in -δ, the dropping of the final i of the non-masculine ending of the third pers. pl. of the verb; the infin. ending ά, &c.). But the relation to western Arabic is closer; specially characteristic are the following features, which are absent in the Aramaic dialects of Egypt and in the eastern dialects with ο or ι; the plural ending -σσ, the forms of the demonstrative pronouns, &c. As the bulk of the population was of Arab race, it is not surprising that many of the proper names are Arabic in origin, and that Arabic elements are found in the Aramaic words. The technical terms of municipal government are mostly Greek, translated into Palmyrene; a few Latin words occur, of course, in Aramaic forms. For further characteristics of the language, see Mosler. To-day Palmyrene is a modified form of the old Arabic character, and especially interesting because it represents almost the last stage through which the ancient alphabet passed before it developed into the Hebrew square character.

The names of the months were the same as those used by the Nabataeans, Syrians and later Jews, viz. the Babylonian. The calendar was the Syro-Macedonian, a solar, as distinct from the primitive lunar, calendar, which Roman influence disseminated throughout Syria; it was practically a reproduction of the Julian calendar. Dates were reckoned by the Seleucid era, which began in 312 B.C.

Religion.—The religion of Palmyra did not differ in essentials from that of the north Syrians and the Arab tribes of the eastern desert. The chief god of the Palmyrenes was a solar deity, called Samas or Shemesh, and, or Malak-she, or Malak-bel, was still the most imposing feature among the ruins of Palmyra. Both Bel and Malak-bel were of Babylonian origin. Sometimes associated with the Sun-god was “Agil-bel, the Moon-god who is repeated in every Inscription in a warlike attitude, and sometimes even with his shoulders (Rom. 1, and Vogé, p. xii. No. 141). The great goddess of the Aramaeans, “Athar-‘atheh, in Greek Artemis

1 Transcribed Μαλακαζίων, Malakbelus, &c., and in the Palm. inscr. given in NSI. p. 268, translated Sol sanctissimus; he was often—e.g. Zera, Zera-she—called Αυστρικος, a term which has been misinterpreted as “messeger of Bel”; but more probably Malak is the common Babylonian epithet μαλικ given to various gods, and means “counselor”; Malak-bel will then be the sun as the visible representative of Bel.

PALNI HILLS—PALO ALTO

PALNI HILLS, a range of hills in south India, in the Madura district of Madras. They are an offshoot from the Western Ghats, and, while distinct from the adjacent Anamalai Hills, form part of the same system. They contain the hill station of Kodaikanal (7200 ft.), which has a milder and more equable climate than Ootacamund in the Nilgiri Hills. There is some coffee cultivation on the lower slopes.

PALO ALTO, a city in Santa Clara county, California, U.S.A., between two of the coast ranges, about 28 m. S. of San Francisco,
and about 18 m. from the sea. Pop. (1906) 4,515. It is served by the coast division of the Southern Pacific railway, and is the railway station for Leland Stanford Jr. University (q.v.), which is about 1 m. south-west of the city. At Menlo Park is St Patrick's Theological Seminary (Roman Catholic). By all real estate deeds the sale of intoxicating liquors is for ever prohibited in the city; and an act of the state legislature in 1909 prohibited the sale of intoxicating liquor within 15 m. of the grounds of the university ("tail truck") was derived from a solitary redwood tree standing in the outskirts of the city. Palo Alto was laid out in 1891, but had no real existence before 1893. It was incorporated as a town in 1894, having previously been a part of Mayfield township; in 1909 it was chartered as a city. Palo Alto suffered severely in the earthquake of 1906.

PALOMINO DE CASTRO Y VELASCO, ACISGIO ANTONIO (1653-1726), Spanish painter and writer on art, was born of good family at Bujalance, near Cordoba, in 1653, and studied philosophy, theology and law at that capital, receiving also lessons in painting from Valles Lachó who visited Cordoba in 1672, and afterwards from Alfaro (1675). After taking minor orders he removed to Madrid in 1678, where he associated with Alfaro, Cuello and Careño, and executed some indifferent frescoes. He soon afterwards married a lady of rank, and, having been appointed alcalde of the mesta, was himself ennobled; and in 1688 he was appointed painter to the king. He visited Valencia in 1697, and remained there three or four years, again devoting himself with but poor success to fresco painting. Between 1705 and 1715 he resided for considerable periods at Salamanca, Granada and Cordoba; in the latter year the first volume of his work on art appeared in Madrid. After the death of Charles I 1729, Palomino took priest's orders. He died on the 13th of August 1726.

His work, in 3 vols. folio (1715-1724), entitled El Museo pintoresco y escultura, consists of three parts, of which the first two, on the theory and practice of the art of painting, are without interest or value. It is, however, with the subtitle El Parnaso español pintoresco laureado, no mine of important biographical material relating to Spanish artists, which, notwithstanding its faulty style, has procured for the author the not altogether undeserved honour of being called the "Spanish Vasari." It was partially translated into English in 1739; an abridgment of the original (Las Vidas de los pintores y escultores españoles) was published in London in 1742, and afterwards appeared in a French translation in 1749. A German version was published at Dresden in 1791, and a reprint of the entire work at Madrid in 1797.

PALTOCK, ROBERT (1607-1707), English writer, the only son of Thomas Paltock of St James's, Westminster, was born in 1607. He became an attorney and lived for some time in Clement's Inn, whence he removed, before 1750, to Back Lane, Lambeth. He married Anna Skinner, through whom his son, also named Robert, inherited a small property at Ryme Intrinseca, Dorset. The Robert Paltock, who died in London on the 20th of March 1767, was buried. Paltock owes his fame to his romantic Life and Adventures of Peter Wilkins (1751), which excited the admiration of men like Coleridge, Southey, Charles Lamb, Sir Walter Scott and Leigh Hunt. It has been several times reprinted, notably with an introduction by Mr A. H. Bullen in 1884. It was translated into French (1765) and into German (1767).

PALUDAN-MÜLLER, FREDERIK (1809-1879), Danish poet, was the second son of Jens Paludan-Müller, from 1830 to 1845 bishop of Aarhus, and born at Kjereminde in Fünen, on the 7th of February 1809. In 1831 his father was transferred to Odense, and Frederik began to attend the Latin school there. In 1829 he passed to the university of Copenhagen. In 1832 he opened his poetical career with Four Romances, and a romantic comedy entitled Kjærlighed ved hoffet ("Love at Court"). This enjoyed a considerable success, and was succeeded in 1833 by Dauerserinden ("The Dancing Girl"). Paludan-Müller was accepted by criticism without a struggle, and few writers have enjoyed less hostility than he. He was not, however, well inspired in his lyrical drama of Amor and Psyche in 1834 nor in his Oriental tale of Zuleïmas fligt ("Zuleima's Flight") in 1835, in each of which he was too vividly influenced by Byron. But he regained all that he had lost by his two volumes of poems in 1836 and 1838. From 1838 to 1840 Paludan-Müller was making the grand tour in Europe and his genius greatly expanded; in Italy he wrote Venus, a lyrical poem of extreme beauty. In the same year, 1841, he began to publish a great work on which he had long been engaged, and which he did not conclude until 1849; this was Adam Homo, a narrative epic, satirical, moral and descriptive, into which Paludan-Müller wove all his variegated impressions of Denmark and of love. This remains the typical classic of Danish poetical literature. In 1845 he composed three enchanting idyls, Dryadens bryllup ("The Dryad's Wedding") and Abelis død ("The Death of Abel"). From 1850 a certain decline in the poet's physical energy became manifest and he wrote less. His majestic drama of Kolonos belongs to 1854. Then for seven years he kept silence. Paradiset ("Paradise") 1861; and Benedict fra Nuncia ("Benedict of Nuncia") 1864; bear evidence of malady, both physical and mental. Paludan-Müller wrote considerably after this, but never recovered his early raptures, except in the very latest of all his poems, the enchanting welcome to death, entitled Adonis. The poet lived a very retired life, first in Copenhagen, then for many years in a cottage on the outskirts of the royal park of Fredensborg, and finally in a house in Ny Adelgade, Copenhagen, where he died on the 27th of December 1876.

(P. G.)

PALWAL, a town of British India, in Gurgaon district, Punjab. Pop. (1901) 12,830. It is a place of great antiquity, supposed to have been founded in the earliest Aryan traditions under the name of Apalava, part of the Pandava kingdom of Indraprastha. It was made an extensive rice-producing station by the British, and is now a market in the rich alluvial region of the Yamuna, and a station on the Delhi-Agra branch of the Great Indian Peninsula railway.

PAMIRS, a town of south-western France, capital of an arrondissement in the department of Ariège, 40 m. S. by E. of Toulouse on the railway to Foix. Pop. (1906) town, 7,728; commune, 10,440. Pamiers is the seat of a bishopric dating from the end of the 13th century. The cathedral (chiefly of the 17th century) with an octagonal Gothic tower, is a bizarre mixture of the Graeco-Roman and Gothic styles; the church of Notre-Dame-du-Camp (17th and 18th centuries) is noticeable for its crenelated and machicolated façade of the 14th century. Pamiers has a suburb, a tribunal of first instance, a communal college and a school of commerce and industry. Iron and steel of excellent quality, chains and carriage-springs are among its products. It has also tanneries and wool, flour, paper and saw mills, brickworks and lime-kilns, and commerce in grain, flour, fodder, fruit and vegetables. There are stone quarries and nursery gardens in the vicinity, and the white wine of the district is well known.

Pamiers was originally a castle built in the beginning of the 14th century by Roger II., count of Foix, on lands belonging to the abbey of St Antonin de Frédelac. The abbots of St Antonin, and afterwards the bishops, shared the authority over the town with the counts. This gave rise to numerous disputes between monks, counts, sovereigns, bishops and the consuls of the town. Pamiers was sacked by Jean de Foix in 1482, again during the religious wars, when the abbey of St Antonin was destroyed, and finally, in 1628, by Henry II. of Bourbon prince of Conde.

PAMIRS, a mountainous region of central Asia, lying on the north-west border of India. Since 1875 the Pamirs have probably been the best explored region in High Asia. Not only have many travellers of many nationalities directed their steps towards the Bam-i-dunya ("the Roof of the World") in search of adventure or of scientific information, but the government surveys of Russia and India have met in these high altitudes, and there effected a connexion which will help to solve many of the geodetic problems which beset the superficial survey of Asia. Since Wood first discovered a source of the Oxus in Lake Victoria in 1837, and left us a somewhat erroneous conception of the physiography of the Pamirs, the gradual approach of Russia from the north stimulated the processes of exploration from the side of India. Native explorers from India first began to be
busied in the Pamirs about 1860, and continued their investigations for the following fifteen years. In 1874 the mission of Sir D. Forsyth to Yarkand led to the first systematic geographical exploration of the Pamir country. In 1885 Ney Elias made his famous journey across the Pamirs from east to west, identifying the Rang Kuli as the Dragon Lake of Chinese geographers—a distinction which has also been claimed by some geographers for Lake Victoria. Then Luckhart and Woodhouse in 1886 passed along the Wakhsh tributary of the Oxus from its head to Ishkashim in Badakshan, and completed an enduring record of most excellent geographical research. Bonapart in 1887, Littledale in 1888, Cunningham, Bower and Duvernge, followed by Younghusband in succeeding years, extending to 1890; Dunmore in 1892 and Sven Hedin in 1894-1895; have all contributed more or less to Pamir geography; but the honours of successful inquiry in those high altitudes still fall to Lord Curzon, whose researches in 1894 led to a singularly clear and comprehensive description of Pamir geography, as well as to the best map compilation of the term (which is advanced Russian explorers and Russian topographers had been equally busy from the north. The famous soldier Skobelev was probably the first European to visit the Great Kula Kul. He was followed by scientific missions systematically organized by the Russian government. In 1883 Puttata’s mission started south. Gronchevksky was hard at work from 1888 to 1892. Yanov began again in 1891, after a short spell of rest, and has left his mark as a permanent record in the valley of Sarhad (or Wakhkan), between the Baghgil pass and Bozai Gumbaz. Finally, in 1895, the Russian mission under General Gerard led by Tschikovsky met the British mission under General Gerard on the banks of Lake Victoria, and from that point to the Chinese frontier eastward demarcated the line which therefrom was to divide Russian from British interests in highest Asia. Since then other travellers have visited the Pamirs, but the junction of the Russian and British surveys (the latter based on triangulation carried across the Hindu Kush from India) dispenses of any further claim to the honours of geographical exploration.

Our estimate of the extent of Pamir conformation depends much on the significance of the word Pamir. If we accept the definition given by Curzon as being perhaps the most plausible), "Pamir Conformation," or "foot of mountain peaks," we have a definition which is by no means an inapt illustration of the actual facts of configuration. It has been too often assumed that the plateau of Tibet and the uplands of the Pamirs are analogous in physiography, and that they merge into each other. This is hardly the case. Littledale points out (K. G. S. Journ., vol. vi.) that the high-level valleys of glacial formation which distinguish the Pamirs have no real counterpart in the Chang or plains of Tibet. The latter are 2000 ft. higher; they are intersected by narrow ranges, and are drained by no rivers of importance. They form a region of salt lakes and stagnant marshes, relieved by wide flat spaces of open plateau country. The absence of any vegetation beyond grass or scrub is a striking feature common to both Pamir and Chang, but there the resemblance ceases, and the physical conformation of mountain and valley to the east and to the west of the upper sources of the Zarafshan is radically distinct.

The axis, or backbone, of Pamir formation is the great meridional mountain chain of Sarikoi—the ancient Taurus of tradition and history—in which stands the highest peak north of the Himalayas, the Mountaght Ate (25,000 ft.). This chain divides off the high-level sources of the Oxus on the west from the streams which sweep downwards into the Turkestan depression of Kashgar on the east. There are the true Pamirs (i.e. valleys reaching up in long slopes to the foot of mountain peaks) on either side, and the Pamirs on the west differ in some essential respects from those on the east. On the west the following are generally recognized as distinct Pamirs: (1) the Great Pamir, of which the dominant feature is Lake Victoria; (2) the Little Pamir, separated from the Great Pamir in the north by what is now known as the Nicolas range; (3) the Pamir-i-Wakhan, which is the narrow trough of the Wakhshan tributary of the Oxus, the term Pamir applying to its upper reaches only; (4) the Alichur—the Pamir of the Yeshil Kul and Ghund—immediately to the north of the Great Pamir; (5) the Sarez Pamir, which forms the valley of the Murghab river, which has here found its way round the east of the Great Pamir and the Alichur from the Little Pamir, and now makes its way to Lake Kheyrn; (6) the Pamir of the Yarkand and the Sairon, which is formed by many geographers as the main Oxus stream, and Lake Chobari; and, at its head, was by them regarded as the Oxus source. At the foot of the Sarez Pamir stands the most advanced Russian outpost of Murghab. To the north-east of the Alichur are the Rang Kuli and the Kara Kuli (or Kargosh) Pamirs. Rang Kuli Lake occupies a central basin or depression; but the Kara Kuli drains away north-eastwards through the Sarikol (as the latter, bending westwards, merges into the Trans-Alai) to Kashgar and the Turkestan plains. Similar characteristics distinguish all these Pamirs. They are hemmed in and separated by snow-capped mountain ranges, which are intersected with glaciers terminating in moraines and shingle slopes at the base of the foot-hills. Long sweeps of grassy upland bestrewn with boulders lead from the stream beds up to the snowfields, yellow, grey or vivid green, according to the season and the measure of sunlight, fold upon fold in interminable succession, their bleak monotony being only relieved by the grace of flowers for a short space during the summer months.

To the east of the Sarikol chain is the Taghduzbash Pamir, which claims many of the characteristics of the western Pamirs at its upper or western extremity, where the Karachukar, watered by a chain of lakes, is a comparatively small stream. But where the Karachukar, joining forces with the Kunjerab, stretches out northwards for a comparatively straight run to Tashkurgan, dividing asunder the two parallel ranges of Sarikol and Kandar, which together form the Sarikol chain, the appellation Pamir can hardly be maintained. This is the richest portion of the Sarikol province. Here are stone-built houses collected in scattered detachments, with a spread of cultivation reaching down to the river. Here are water-mills and many permanent appliances of civilization suited to the lower altitude (11,500 ft.), the average height of the upper Pamirs being (13,500), and here we are no longer near the sources of the river at the foot of the mountain peaks. One other so-called Pamir exists to the east of Sarikol, separated therefrom by the eastern range (the Kandar) of the Sarikol, which is known as Mariom or Marion. But this Pamir is situated nowhere near the sources of the Zarashan or Raskam river, which it borders, and possesses little in common with the Pamirs of the west. The Mariom Pamir defines the western extremity of the Kuen Lun, which stretches eastwards for 300 m. before it becomes the political boundary of northern Tibet.

The Mutaght chain, which holds within its grasp the mightiest system of glaciers in the world, forms a junction with the Sarikol at the head of the Taghduzbash, where also another great system (that of the Hindu Kush) has its eastern roots. The political boundary between the extreme north of the footed Kashmir dependencies and the extreme south of Chinese Turkestan is the Kuen Lun, which is divided by the Kuen Lun which runs parallel to the Muztaght at its northern foot, forming an extension of the Kuen Lun range. But the chain therefrom is a point in about 79°29’ E., where it is transferred to the watershed of the Kuen Lun. Within the limits of these partially explored highlands, lying between the Pamirs and the Tibetan table-land, exact geographical definition is impossible. But we may follow Godwin-Austen in accepting the main chain of the Muztaght as merging into the central mountain system of the Tibetan Chang, its axis being defined and divided by the transverse stream of the Shyok at its westward bend, whilst the Karakoram range, in which the Shyok rises, is a subsidiary northern branch. The pass over the Karakoram (18,900 ft.) is the most formidable obstacle on the main track between the Kara Chit and the Balkh.

The Taghduzbash Pamir occupies a geographical position of some political significance. One important pass (the Byekul, 15,100 ft.) connects the Taghduzbash Pamir with the Russian Turkestan, and the northern border. A second pass (the Wakhtr, 16,150 ft.) connects the head of the Wakhkan valley of Afghanistan with the Sarikol province across its western head, whilst a third (the Kilik, 15,600 ft.) leads into the head of the Hunza river.
and opens a difficult and dangerous route to Gilgit. The Taghdum-
bdush is claimed both by China and Kanju (or Hunza), and there is
clearly an overland boundary question at this corner of the Pamirs.

From Lake Taghdusbush, a little north of the Taghdumsh, the
clearly defined strip of Afghanistan which runs out to the head-

of the Taghdumsh from Badakshan north of the Hindu
Kush is to be traced westwards, in the Lake Victoria of
the whole range, dividing the Great and Little Pamirs, till it over-
looks a point on the Aksu (or Murghab) river in about

74° E. Here it diverges southwards to the Sirakul
range, north of the Taghdumsh. The Aksu valley is the

easternmost, that between the rivers Pajudz and the

Pamir Boundary Commission of 1895. All the head of the

Pamir, with the Wakhan valley, is consequently Afghani
territory, but no military posts have been established so far. The

Alicak and the school of Zaldak, to the north of the Taghdumsh,

Great Pamir have all been claimed as indicating the true

source of the Oxus. But detailed examination of their

hydrographical conditions proves that neither of the

two lakes, Victoria (500 ft.) or Chichik (3000 ft.), during the summer

months in these dreary altitudes is entirely
Kirghiz, and we may take it for granted that it will soon be entirely

Russian. The non-Russian population during the summer of

the 1895-1896 season was one-third Russian and one-third Kirghiz.

The measure of the veracity of Chinese pilgrims and geographers in the

earby centuries of our era must not be balanced on such points as these.

There is no evidence that the Pamirs were ever the support

of permanent settlements. The few mud-built buildings which once

existed at Chakmatkin and at Langar only decay.

and

Grain.

Rutab.

The

Kirghiz are Sunni Mahomedans by faith, but amongst

them there is the same indubitable racial and cultural

origin as is to be traced to those Nestorian Christian

communities of Central Asia which existed in the

middle ages. A Christian bishopric existed at Yarkand

in Marco Polo's time, and is supposed to have survived

for another century (1350). The last Gurkhan of

the Kara Khitai Empire in the early part of the 13th

century (the legendary Prester John) was a member of a Christian

tribe called Naiman, which is one of the four chief tribal divisions

mentioned by N. Elias. The Naiman tribe claim kinship with the

Kipchaks. It is curious that the same survival of Christian

culture at Yarkand is found at Taghdumsh, and around

a settlement of Aryan descent akin to the Tajiks of Badakshan, as may

be traced amongst the Kirghiz. Christian symbols have been discovered

in the southern towns of Chinese Turkestan by Sven Hedin.

The total length of the Oxus and eastwards on the Nicolaus

von Omeiser trail is about 150 m. long by 150 m. broad, of which about one-tenth is grass

pasture land and the rest mountainous. All of it once

formed part of the ancient kingdom of Bolor, itself a

province of the empire of the

Tochkistan; and across it, in spite of its bleak inhospitality,

there have been one or two recognized trade routes from east

to west through it.

The most

important route

was that which passed north-west via Tashkurgan and
Rang Kul, from Chinese Turkestan to the khanates

north of the Oxus; but the route via Tashkurgan and

Lake Victoria was less well

known. The

pilgrim route of Buddha's days was that which connects the

ancient Buddhist cities of the Takla Makan in Chinese Turkestan

with Chikal (Kashkai), by the Baroghil Pass across the Hindu

Kush. This was but one link in a chain of devout pilgrimage

which stretched from China to India, and which included every

intervening Buddhist centre of note which existed in the early

centuries of our era.

In the first four months of the year (November to April) the

Pamirs are covered with snow, the lakes are frozen, and the passes

nearly impracticable. The mean temperature during the

month of January recorded by Russian observers at

the two chief stations is

July this rises to 62°F, the elevation of the station being

12,150 ft. During the spring and summer months the prevalence of

fierce cutting winds, which are shaped by the conformation of the

valleys into bluffs as through a funnel, following the

route of the valleys either up or down, makes travelling painful and

existence in camp most unpleasant. In the absence of wind

the valley has often bright and exhilarating, but there is a

constant tendency to the wind cutting thickly, which either stops

as quickly as they gather. The most settled record of the Pamir

Boundary Commission of 1895 lasted from the 19th of August to

the 7th of September. This point was on the Murghab river near

Khitai, at 77° on the 21st of August at Kizil Kabat (12,570 ft.); and yet on

the 16th of August snow had fallen to the depth of 6 in. and the

Beylik Pass was blocked. There were records that monsoon

influences extended as far north as least as the Great Pamir, and a

definite analogy was established between the record of barometric

pressure on the Pamirs and that of the outer ranges of the Himalaya.

PAMPA, La. a territory of the southern pampa region of

Argentina, bounded N. by Mendoza, San Luis and Cordoba,

E. by Buenos Aires, S. by the territory of Rio Negro, from which it

is separated by the river Colorado, and W. by Mendoza.

Pop. (1894, official estimate), 5,150. It belongs geographically
to the southern part of the great Argentine pampas, from which its

name is derived, but in reality only a part of its surface belongs
to the plain region. The western and southern part (perhaps
the larger) is much broken by hills, swamps and sandy wastes,

with occasional stretches of wooded country. The western half

is crossed by a broad depression, extending from Mendoza south-

east to an intersection with the valley of the Colorado, which

was once the outlet of the closed drainage basin occupied by

the provinces of Mendoza, San Juan and San Luis. This depression

is partly filled by Lake Pampas and Lake Intag, which

the rivers Atuel and Salado. An obscure continuation of these

rivers, called the Chadi-lebhu, flows south-east from the

great swamps into the large lake of Ureleauquen, about 60 m. north

of the Colorado. There are a great number of lakes in La Pampa,

especially in the south-east. The eastern half is described

as fertile and well adapted for grazing, although the rainfall

is very light. Since the closing years of the 19th century there

has been a large emigration of stock-raisers and agriculturists

into La Pampa, and the territory has become an important

protection to the cattle and sheep, wheat, Indian corn, linseed, barley

and alfalfa. The climate is excessively dry, and the temperature

ranges from the severe frosts of winter to an extreme of 104°F in

summer. Strong, constant winds are characteristic of this region.

Railways have been extended into the territory from

Buenos Aires and Bahia Blanca, the latter being the nearest

seaport. There is connexion also with the Transandine railway

line on the north. The capital is General Acha (pop. about

2,000 in 1905), and the only other places of importance are Santa

Rosa de Toay and Victoria, both small, uninteresting "camp"

villages.

PAMPAS (Span. La Pampa, from a Quechua word signifying a

level open space or terrace), an extensive plain of Argentina,

extending from the Rio Colorado north to the Gran Chaco, and

from the foothills of the Andes east to the Paraná and Atlantic

coast. It consists of a great calcareo-argilaceous sheet, once

1 There are other pampas in South America, such as the Pampas of

Aullagas, in Bolivia, the Pampas del Sacramento between the

Huallaga and Uayali rivers in eastern Peru, and others less well

known, but when the word Pampas is used alone the great

Argentine plain is meant.
the bed of an ancient sea, covered on the west by shingle and sand, and on the east by deposits of estuaries of irregular thickness brought down from the northern highlands. Its western and northern limits, formed by the foothills and talus slopes of the Andes, and by the south of the great forested depression of the Gran Chaco, cannot be accurately defined, but its area is estimated at 200,000 to 300,000 sq. m. Its greatest breadth is across the south, between the 36th and 37th parallels, and its least in the north, where the eastern ranges of the Andes project deeply into its north-western angle. Its surface is broken in the north-west by the sierras of Tucuman, Catamarca, San Luis, and Cordoba, the latter rising from the midst of the plain, and along which there are sierra and hills on the south. It has a gradual slope from north-west to south-east, from an elevation above sea-level of 2320 ft. at Mendoza to 20 ft. at Buenos Aires on the La Plata—the distance across (between Mendoza and Buenos Aires) being about 635 m. There are other slight irregularities in its surface, such as the longitudinal depression on the west, the saline, arid depression west of the Cordoba sierras, the Mar de Chiquita depression N.E. of Cordoba, and some smaller areas elsewhere. Apart from these the plain appears perfectly level. The east, which is humid, fertile and grassy, is slightly elevated above the plain; the west, to except in Cordoba and in the north, where argalolas and some of the Chaco species are to be found. In the extreme south some species of low, thorny bushes cover considerable areas in the vicinity of the hill-ranges, otherwise the plain is destitute of native trees. Since the arrival of Europeans several species have been introduced successfully, such as the eucalyptus, poplar, paraiso (Melia Azedarach), peach, willow, umba (Pirunia) and others.

The distinctive vegetation of the grassy pampas is the tall, coarse-leaved "pampas grass" (Gymnorhiza argentea) whose feathery spikes often reach a height of eight or nine feet. It covers large areas to the exclusion of all other species except the trefoils and herbs that grow between its tussocks. The natural grasses of the pampas are popularly divided into pasto dura (hard pastureage), which includes the large, tussock-forming species, and pasto molle (soft pastureage), the tender undergrowth. Since the advent of Europeans other forage plants have been introduced, the most successful and profitable being alfalfa or lucerne (Medicago sativa), which is widely cultivated both for hay and for green pastureage for the fattening of market stock.

West of this region is a dry, sandy, semi-barren plain called the "biscacha" plains. It has large saline areas, brackish streams and lakes, and immense sandy deserts, and in singular contrast to the fertile, treeless region of the east it supports large areas of stunted trees and thorny bushes. Most prominent in this hardy but unattractive growth is the "chafar" (Gurliaca or Gourliaca decorticans), which is characteristic of the whole area, and led Professor Griesbach to suggest the substitution of "formacion del chafar" for "formacion del monte," the designation adopted by botanists for this particular region. The chafar is thorny and of low, irregular growth, and furnishes a strong durable wood and a sweet fruit.

The grassy plains are well watered by streams flowing to the Paraná, the Plata and coast, though some of these are brackish. There are large saline areas in northern Santa Fé, Santiago del Estero and Cordoba provinces, and throughout the greater part of the pampas plain wells cannot be sunk lower than 18 or 20 ft. without encountering brackish water. On the sterile pampas these conditions are still more common, the drainage southward through the Desaguadero and Salado being charged with saline matter. There are many saline lakes scattered over the pampas, the largest being the Mar de Chiquita, and Lake Porongos in Cordoba, the great swamps and lagoon on the lower Salado in Mendoza, and Lake Bebedero in San Juan.

The fauna of the pampas is limited to comparatively few species, all of which are found beyond its limits, also. These include the vizcacha (Lagostomus tricuspitatus), Patagonian hare (Dolichotis patagonica), coyot (Montopomys coyot), cuo (Cavia aquatica), tucu (Ctenomys magellanica), jaguar (Felis onca), puma (Felis concolor), grass-cat (resembling Felis catu), wood-cat (Felis Geoffreyi), a fox-like dog (Felis pajaroza, Azara), aguará (akin to Canis jubatus), skunk, weasel (Galictis barbarica), dear (Cervus caprestris), four species of armadillo, and two of the opossum. Hudson considers the hunting of the Patagonian recollections of the "ancient far-off land of the ancients," and only a few of the species are in danger of extermination. The ocellated parakeet (Polyborus spilopterus) is entirely confined to the pampas, though the large yellow opossum (Didelphis erassus-cordata) seems to be singularly adapted to life on the level grassy plain. The avi fauna is apparently richer, owing to migration. Hudson makes enumeration of 90 species of ducks, geese and swans, 10 or 12 of the railines, including the graceful spizica or dancing bird, and 25 of the Limicole (15 of which are visitors from North America). Land birds are not numerous. Vultures and hawks are common, and there are a few owls, the best known of which is the "merina" (Geositta caucalcatia), which inhabits the burrow of the vizcacha. Among other birds of land birds, some 40 in number, are the military starling (Sturnella) of a red breast makes it a conspicuous object on the pampas, the white-banded mocking-bird, the chakar or "crested screamer" (Chauna chawari), the tinamous, and the rheas. In the Chaco is the ranamou—the rufous and spotted—which are called partridges and are often hunted with snares by horsemen. The rhea, once very numerous, is now found farther inland than formerly, and is steadily diminishing in number.

Civilized occupation is working many changes in the character and appearance of the pampas. The first change was in the introduction of cattle and horses. Cattle were pastured on the open pampas and were guarded by men called gauchos or mestizos, who became celebrated for their horsemanship, their hardihood and their lawlessness. Attention was then turned to sheep-breeding, which developed under the better pastureage of pampas plains, and the shepherds. The sheep were supplemented by flocks of guanaco, and when these became rare the picturesque guacho is slowly disappearing in the eastern provinces, and the herds and flocks are being driven farther inland. The rural population of the pampas is still sparse and the estancias are very large.

See W. H. Hudson, The Naturalist in La Plata (London, 1895); Charles Darwin, Voyage of the Beagle (London, 1839 and 1860); and Richard Napp, La republica Argentina (Buenos Aires, 1870; also in German).

PAMPERO, the cold south-west wind which blows over the great plains of southern Argentina. The term is somewhat loosely applied to any strong south-west wind in that region, but more strictly to a rain squall or thunderstorm arising suddenly in the prevailing currents from north and north-east. Pamperos are experienced at Buenos Aires on an average about a dozen times in the year, chiefly during October, November and January.

PAMPILHUS (1st century a.d.), a Greek grammarians, of the school of Aristarchus. He was the author of a comprehensive lexicon, in which he collected obscure words (words that had been lost by the compilers of the earlier works), and the idea of which was credited to another grammarians, Zopyrion, himself the compiler of the first four books. The work itself is lost, but an epitome by Digenianus (2nd century) formed the basis of the lexicon of Hesychius. A similar compilation, called Ἠσυχίας ἐν τῷ ἑαυτῷ ("in his own words"; cf. the Prata of Suentonius) from its varied contents, dealing chiefly with mythological marvels, was probably a supplement to the lexicon, although some scholars identify them. Pampilhus was one of the chief authorities used by Athenaeus in the Deipnosophists. Suidas assigns to another Pampilhus, simply described as "a philologist," a number of works, some of which were probably by Pampilus the grammarian.

PAMPILHUS, an eminent promoter of learning in the early church, is said to have been born, of good family, in Phocaenia (Berytos?) in the latter half of the 3rd century. After studying at Alexandria under Pierius, the disciple of Origen, he was sent by the bishop of Caesarea in Palestine to Rome, where he established a theological school, and warmly encouraged students; he also founded, or at least largely extended, the great library to which Eusebius and Jerome were afterwards so much indebted. He was very zealous in the transcription and distribution of copies of Scripture and of the works of various Christian writers, especially of Origen; the copy of the complete works of the last named in the library of Caesarea was chiefly in the handwriting
of Pamphilus himself. At the outbreak of the persecution under Maximin, Pamphilus was thrown into prison (A.D. 307) and there, along with his attached friend and pupil Eusebius (sometimes distinguished as Eusebius Pamphilus), he composed an Apology for Origen, in five books, to which a sixth was afterwards added by Eusebius. He was put to death in 309 by Firmilian, prefect of Caesarea.

Only the first book of the Apology of Pamphilus is extant, and that book, as we have seen, was wrongly attributed to him and published under another name. It is printed in Lommatzsch's edition of Origen, vol. xiv., and in Kloth, Hist. sac. iv. 339 (cf. iii. 457-500, fragments). Photios (Codex 118) gives a short survey of the whole. Jerome mentions Letters to Theodol and others, which have been known to be composed in times of persecution. Of his orations, however, nothing has survived. See E. Preußen in Herzog-Haack's Real-encyklopädie, and A. Harnack, Altechristl. Literaturgesch. i. 543.

Pamphilus, a Greek painter of the 4th century, of the school of Sicyon. He was an academic artist, noted for accurate drawing, and obtained such a reputation that not only could he charge his pupils great sums, but he was also successful in introducing drawing in Greece as a necessary part of liberal education.

Pamphlets. The earliest appearance of the word is in the Philobiblon (1344) of Richard de Bury, who speaks of "pamphletos exiguous" (ch. viii.). In English we have "this lead pamphlet" (Test. of Love, bk. iii.), Occleve's "Though that this pamphlet" (Reg. of Pr. 2060), Lydgate's "Which is a pamphlet" (Minor Poems, 138) and Caxton's "pamfilet and bookys" (Book of Eydes, 1400, Prologue). In all these examples pamphlet is used to indicate the extent of the production, and in contradistinction to book. A short codicil in a will of 1495 is called "this pamphlet" (Test. Ebor. iv. 26). In the 17th century the word was used for single plays, poems, newspapers and news letters (Murray's New English Dict. vii. 410).

Not till the 18th century did pamphlet begin to assume its modern meaning of prose controversial tract. "Pamphlet" and "pamphiltaire" are of comparatively recent introduction into French from the English, and generally indicate futile criticism of a more severe, not to say libellous, character than with us. The derivation of the word is a subject of contention among etymologists. The supposed origin from the amatory poem of "Pamphilus," and a certain Pamphila, an author of the 1st century, may be dismissed as fanciful. The experts are also undecided as to what is actually understood by a pamphlet. Some bibliographers apply the term to everything, except periodicals, of quarto size and under, if not more than fifty pages, while others would limit its application to two or three sheets of printed matter which have first appeared in an unbound condition. These are merely physical peculiarities, and include academical dissertations, chap-books and broadsides, which from their special subjects belong to a separate class from the pamphlet proper. As regards its literary characteristics, the chief note of a pamphlet are brevity and spontaneity. It has a distinct aim, and relates to some matter of current interest, whether personal, religious, political or literary. Usually intended to support a particular line of argument, it may be descriptive, critical, didactic or satirical. It is not so much a class, as a form of literature, and from its ephemeral character represents the changeful currents of public opinion more clearly than the bulky volume published after the formation of that opinion. The history of pamphlets being the entire record of popular feeling, all that is necessary here is to briefly indicate the chief families of political and religious pamphlets which have exercised marked influence, and more particularly in those countries—England and France—where pamphlets have made so large a figure in influencing thoughts and events. It is difficult to point out much in ancient literature which precisely answers to our modern view of the pamphlet. The Ilielli famosi of the Romans were simply abusive pasquinades. Some of the small treatises of Lucian, the lost Anti-Cato of Caesar, Seneca's Apocolocyntosis written against Claudius, Julian's Kaisares or symposion and Αριστοκράτος ο ημιοπόιος, from their general application, just escape the charge of being mere satires, and may therefore claim to rank as early specimens of the pamphlet.

At the end of the 14th century the Lollard doctrines were widely circulated by means of the tracts and leaflets of Wycliff and his followers. The Ploughman's Prayer and Lamtorne of Light, which appeared about the time of Oldcastle's martyrdom, were extremely popular, and similar brief vernacular pieces became so common that it was thought necessary in 1418 to enact that persons in authority should search out and apprehend all persons owning English books. The printers of the 15th century produced many controversial tracts, and Caxton and Wynken de Worde printed in the latter form. It was in France that the printing-press first began to supply reading for the common people. During the last twenty years of the 15th century there arose an extensive popular literature of fables, tales in verse and prose, satires, almanacs, &c., extending to a few leaves a piece, and circulated by the itinerant booksellers still known as colporteurs. These folk-books soon spread from France to Italy and Spain, and were introduced into England at the beginning of the 16th century, doubtless from the same quarter, as most of our early chap-books are translations or adaptations from the French. Another form of literature even more transient was the broadside, or single sheet printed on one side only, which appears to have flourished principally in England, but which had been in use from the first invention of printing for papal indulgences, royal proclamations and similar documents. Throughout western Europe, about the middle of the 16th century, the broadside made a considerable figure in times of political agitation. In England it was chiefly used for ballads, which soon became so extremely popular that during the first ten years of the reign of Elizabeth the names of no less than forty ballad printers appear in the Stationers' registers.

The humanist movement at the beginning of the 16th century produced the famous Epistolæ obscurorum virorum, and the leading spirits of the Reformation period—Erasmus, Hutten, Luther, Melancthon, Francowitz, Vergerio, Curio and Calvin—found in tracts a ready method of widely circulating their opinions. The course of ecclesiastical events was precipitated in England by the Supplication for the Beggars (1528) of Simon Fish, answered by Sir Thomas More's Supplication of Poor Souly. In the time of Edward VI. brief tracts were largely used as a propagandist instrument in favour of the Reformed religion. The licensing of the press by Mary greatly hindered the production of this kind of literature. From about 1570 there came an unceasing flow of Puritan pamphlets, many of which more than forty were reprinted under the title of A parte of a register (London, Waldegrave, 410). In 1584 was published a tract entitled A briefe and plaine Declaration concerning the desires of all those faithful ministers that have and do secke for the discipline and reformation of the Church of Englande, believed to have been written by W. Fulke D.D. Against this John Bridges, dean of Sarum, preached at Paul's Cross, and expanded his sermon into what he called A defence of the government established in the church of England (1587), which gave rise to 0h road over D. John Bridges ... Printed at the cost and charges of M. Marprelate gentleman (1588), which first gave the name to the famous Martin Marprelate tracts, whose titles sufficiently indicate their opposition to priestly orders and episcopacy. Bishop Cooper's Admonition to the People of England (1589) came next, followed on the other side by Hay any worke for Cooper ... by Martin the Metropolitane, and by others from both parties to the number of about thirty-two. The controversy lasted ten years, and ended in the discomfiture of the Puritans and the seizure of their secret press. The writers on the Marprelate side are generally supposed to have been Penry, Thynemorton, Udall and Fenner, and their opponents Bishop Cooper, John Lilly and Nash.

As early as the middle of the 17th century we find ballads of news; and in the reigns of Elizabeth and James I. small pamphlets, translated from the German and French, and known as "news-books," were circulated by the so-called "Mercury-women." These were the immediate predecessors of weekly newspapers, and continued to the end of the 17th century. A proclamation
was issued by Charles II., on the 12th of May 1668, “for supplying the printing and publishing of unlicensed news-books and pamphlets of news.”

In the 17th century pamphlets began to contribute more than ever to the formation of public opinion. Nearly one hundred were written by or about the restless John Lilburne, but still more numerous were those of the undaunted Pryne, who himself published above one hundred and sixty, besides many weighty folios and quartos. Charles I. found energetic supporters in Peter Heylin and Sir Roger L’Estrange, the latter noted for the coarseness of his pen. The most distinguished pamphleteer of the period was John Milton, who began his career by five pamphlets now considered tracts (1642-1644) during the Sempnynus quartet. In 1643 his wife’s desertion caused him to publish anonymously Doctrine and discipline of divorce, followed by several others on the same subject. He printed Of Education; to Mr. Samuel Hartlib in 1644, and, unlicensed and unregistered, his famous Areopagitica—a speech for the liberty of unlicensed printing. He defended the trial and execution of the king in Tenure of kings and magistrates (1648). The Eikon Basilike dispute was conducted with more ponderous weapons than the king we are now discussing. When Monk held supreme power Milton addressed to him The present means of a free commonwealth and Readie and easy way (1660), both pleading for a commonwealth in preference to a monarchy. John Goodwin, the author of Abstractors of justice (1649), John Phillips, the nephew of Milton, and Abiezzer Coppe were violent and prolific partisan writers, the last-named specially known for his extreme Presbyterian principles. The tract Killing no murder (1657), aimed at Cromwell, and attributed to Colonel Titus or Colonel Sexby, excited more attention than any other political effusion of the time. The history of the Civil War period is told day by day in the well-known collection made by George Thomason the bookseller, now preserved in the British Museum. It includes pamphlets, books, newspapers and MSS. relating to the Civil War, the Commonwealth and Restoration, and numbers 22,255 pieces ranging from 1640 to 1661, and is bound in 2008 volumes. Each article was dated by Thomas at the time of acquisition. William Miller was another bookseller famous for his collection of pamphlets (1600-1710), which were catalogued by Tooker. William Laycock printed a Proposal for raising a fund for buying them up for the nation.

The Catholic controversy during the reign of James II. gave rise to a multitude of books and pamphlets, which have been described by Peck (Catalogue, 1735) and by Jones (Catalogue, Chetham Society, 2 vols., 1789-1865). Politics were naturally the chief feature of the floating literature connected with the Revolution of 1688. The political tracts of Lord Halifax are interesting both in matter and manner. He wrote The character of a trimmer (1688), circulated in MS. as early as 1685. About the middle of the reign Defoe was introduced to William III., and produced the first of his pamphlets on occasional conformity. He issued in 1697 his two defences of standing armies in support of the government, and published sets of tracts on the partition treaty, the union with Scotland, and many other subjects. His Shortest Way with the Dissenters (1702) placed him in the pillory.

Under Queen Anne pamphlets arrived at a remarkable degree of importance. Never before or since has this method of publication been used by such masters of thought and language. Political writing of any degree of authority was almost entirely confined to pamphlets. If the Whigs were able to command the services of Addison and Steele, the Tories fought with the terrible pen of Swift. In second power if not in literary ability were Bolingbroke, Somers, Atterbury, Prior and Pulteney. The government viewed with a jealous eye the rise of this powerful instrument, and St John seized upon fourteen booksellers and publishers in one day for “libels” upon the administration (see Annals of Queen Anne, Oct. 23, 1711). In 1712 a duty was laid upon newspapers and pamphlets, displeasing all parties, and soon falling into disuse. Bishop Hoadly’s sermon on the kingdom of Christ (1717), denying that there was any such thing as a visible Church of Christ, occasioned the Bangorian controversy, which produced nearly two hundred pamphlets. Soon after this period party-writing declined from its comparatively high standard and fell into meander and venal hands. Under George III. Bute took Dr Shebbeare from Newgate in order to employ his pen. The court party received the support of a few able pamphlets, among which may be mentioned The consideration of the German War against the policy of Pitt, and The prerogative droit de Roy (1764) vindicating the prerogative. We must not forget that although Samuel Johnson has for an excuse that his political tracts are his worst performances, Edmund Burke, on the other hand, has produced in this form some of his most valued writings. The troubles in America and the union between Ireland and Great Britain are subjects which are abundantly illustrated in pamphlet literature.

Early in the 19th century the rise of the quarterly reviews threw open a new channel of publicity to those who had previously used pamphlets to spread their opinions, and later on the rapid growth of monthly magazines and weekly reviews afforded controversialists a much more certain and extensive circulation than was the case with the isolated publication. Although pamphlets are no longer the sole or most important factor of public opinion, the minor literature of great events is never likely to be entirely confined to periodicals. The following topics, which might be largely increased in number, have each been discussed by a multitude of pamphlets, most of which, however, are likely to have been hopeless aspirants for a more certain means of preservation: the Bullion Question (1816), the Poor Laws (1828-1834), Tracts for the Times and the ensuing controversy (1833-1843), Dr Hampden (1836), the Canadian Reform (1857-1858), the Corn Laws (1841-1848), Gorham Controversy (1847-1848), the Free Trade Question (1849-1850), Schleswig-Holstein (1856-1864), Ireland (1868-1890), the Franco-German War, with D’urn Europe’s School and its imitators (1870-1871), Vaticanism, occasioned by Mr Gladstone’s Vatican Decrees (1874), the Eastern Question (1877-1880), the Irish Land Laws (1880-1882), Ireland and Home Rule (1885-1886), South African War (1899-1902) and Tariff Reform (1903).

France.—The activity of the French press in putting forth small tracts in favour of the Reformed religion caused the Sorbonne in 1533 to petition the king to abolish the diabolical art of printing. Even one or two isolated publications were found too cumbersome, and single leaves or placards were issued in such numbers that they were the subject of a special edict on the 28th of September 1553. An ordonnace of February 1566 was specially directed against libellous pamphlets and those who wrote, printed or even possessed them. The rivalry between Francis I. and Charles V. gave rise to many political pamphlets, and under Francis II. the Guises were attacked by similar means. Fr. Hotman directed his Epistre envoyée au tyre de France against the Cardinal de Lorraine. The Valois and Henry III. in particular were severely handled in Les Hermaprho-
draty (1596-1607), which was followed by a long series of imitations. Between Francis I. and Charles IX. the general tone of the pamphlet-literature was grave and pedantic. From the latter period to the death of Henry IV. it became more cruel and dangerous.

The Satyre Myniphe (1594), one of the most perfect models of the pamphlet in the language, did infinite harm to the League. The pamphlets against the Jesuits were many and violent. Père Richomme defended the order in Chasse du renard Pasquer (1603), the latter throning his vigorous opponent Etienne Pasquier. On the death of the king the country was filled with appeals for revenge against the Jesuits for his murder; the best known of them was the Anti-Colon (1611), generally attributed to César de Plais. During the regency of Mary de Medici the pamphlet changed its severer form to a more facetious type. In spite of the danger of such proceeding under the uncompromising ministry of Richelieu, there was no lack of libels upon him, which were widely read in most towns in France. These largely increased during the Fronde, but it was Mazarin who was the subject of more of this literature than any other historical
PAMPHLETS
661
personage. It has been calculated that from the Parisian press alone there came sufficient Mazarinodes to fill 150 quarto volumes each of 400 pages. Eighty appeared during the last week of March (1619). A collection of satirical pieces was entitled Tableau du gouvernement de Richelieu, Mazarin, Fouquet, et Colbert (1639). Pamphlets dealing with the amours of the queen and the future king were extremely powerful. The most caustic of them being the Carte géographique de la cour (1668) of Bussy-Rabutin. The presses of Holland and the Low Countries teamed with attacks against Colbert, Le Tellier, Louvois and the Jesuits, whose anti-English propaganda was ably displayed on the 23rd of January 1656, under the title of Lettre de Louis de Montalembert à un provincial de ses amis, and the remaining eighteen came out at regular intervals. The Jesuits naturally drew the attention of the Bourbon press, and, appearing in 1859, was again, at the end of 1862, when the issue of libelous pamphlets was forbidden by order of the diet of Nuremberg in 1824, and again by the diets of Spires in 1829, of Augsburg in 1830 and of Regensburg in 1841, while in 1859 the emperor Napoleon II. intervened in their favor.

The usual method of selling these pamphlets was by means of hawkers. J. Sax (History of the German People, Eng. trans., 1833) says these men were engaged in printing caricatures and lampoons for sale; in the larger towns vendors of every description of printed matter jostled each other in the streets.

The controversies of the earlier period of the Thirty Years' War, when this struggle was German rather than international, produced a second flood of pamphlets, which possessed the same characteristics as the earlier one. In the disturbed years also which preceded the third epoch, and again in the 18th century, French pamphlets were almost always the foremost to use pamphlets in this connexion, especially Maximilian of Bavaria and Christian of Anhalt.

LITERATURE.—An excellent catalogue by W. Olyks of the pamphlets in the Harleian Collection of the British Museum has appeared in the 3rd edition of the Miscellany by T. Park; and in the Bibliothèque volante di G. Cinni (2nd ed. 4 vols. 1734-1747) may be seen a bibliography of pamphlet-literature, chiefly Italian and Latin, with many important references. The Catalogue of the Mazarin Library, in the British Museum on the French Rev., 1699; Catalogue of the Thomson books, pamphlets, &c., 1809, 2 vols. A few of the more representative collections of English pamphlets are:

1. Blagden's Collection of Pamphlets in English literature (1864-1879);
2. Sir R. M. Jones, Anciennes Mazarinades (1859-1862);
5. Sir W. Scott, Catalogue of the British Museum Pamphlets (2 vols., 1859-1868), giving examples of political, religious and literary pamphlets from Wyclif to Newman, with historical essays.

Germany.—In Germany, the cradle of printing, the pamphlet (Flugschrift) was soon a recognized and popular vehicle of thought, and the fierce religious controversies of the Reformation period afforded a unique opportunity for its use. The employment of the pamphlet in this connexion was characteristic of the new age. In coarse and violent language the pamphlets appealed directly to the people, whose sympathy the leaders of the Reformation could hardly count upon. Here their issue on an enormous scale was undoubtedly one of the most potent influences in rousing the German people against the pope and the Roman Catholic Church. In general their tone was extremely intemperate, and they formed, as one authority has described those of a century later, "a mass of panegyric, admonition, invective, controversy and scurillity." Luther was one of the earliest and most effective writers of the polemical pamphlet. His adherents quickly followed his example, and his opponents also were not slow to avail themselves of a weapon which was proving itself so powerful. So intense at this time did this pamphlet war become that Erasmus wrote "apud Germanos, vi quicumque vendible est praeter Lutheranae ac anti Lutheranae."

A remarkable feature was the coarseness of many of these pamphlets. No sect or individual was immune from this abuse, and writers in dealing either with sacred or with secular subjects, and who attracted the notice of the imperial authorities, who were also alarmed by the remarkable growth of disorder, attributable in part to the volumes of pamphlet literature, were dragged into the fray. The issue of libellous pamphlets was forbidden by order of the diet of Nuremberg in 1524, and again by the diets of Spires in 1529, of Augsburg in 1550 and of Regensburg in 1541, while in 1589 the emperor Charles V. forbade them.

The controversies of the earlier period of the Thirty Years' War, when this struggle was German rather than international, produced a second flood of pamphlets, which possessed the same characteristics as the earlier one. In the disturbed years also which preceded the third epoch, and again in the 18th century, French pamphlets were almost always the foremost to use pamphlets in this connexion, especially Maximilian of Bavaria and Christian of Anhalt.
PAMPHYLIA, in ancient geography, the region in the south of Asia Minor, between Lycia and Cilicia, extending from the Mediterranean to Mt Taurus. It was bounded on the N. by Pisidia and was therefore a country of small extent, having a coast-line of only about 75 m. with a breadth of about 30 m. There can be little doubt that the Pamphylians and Pisidians were the same people, though the former had received colonies from Greece and other lands, and from this cause, combined with the greater fertility of their territory, had become more civilized than their neighbours in the interior. But the distinction between the two seems to have been established at an early period. Herodotus, who does not mention the Pisidians, enumerates the Pamphylians among the nations of Asia Minor, while Ephorus mentions them both correctly and in the one among the inhabitants of the coast, the other among those of the interior. The early Pamphylians, like the Lyceans, had an alphabet of their own, partly Greek, partly "Asiatic," which a few inscriptions on marble and coins preserve. Under the Roman administration the term Pamphylia was extended so as to include Pisidia and the whole tract up to the frontiers of Phrygia and Lycocnaea, and in this wider sense it is employed by Ptolemy.

Pamphylia consists almost entirely of a plain, extending from the slopes of Taurus to the sea, but this plain, though presenting an unbroken level to a country of small extent, is united in its form, as it were, in part of traveine. "The rivers pouring out of the caverns at the base of the Lycean and Pisidian ranges of the Taurus come forth from their subterranean courses charged with carbonate of lime, and are continually adding to the Pamphylian plain. They build up natural aqueducts of limestone, and after flowing for a time on these elevated beds burst their walls and take a new course. Consequently it is very difficult to reconcile the accounts of this district, as transmitted by ancient authors, with its present aspect and the distribution of the streams which water it. By the sea-side in the west of the district the Aspendus flows through the centre of the island, but is formed by a number of smaller streams of limestone, and continually adding to its thickness, bursts through the rocks, and forms a great overflow of a lofty cliff. This is the cataract near Adalia. East of Adalia is the Cestrus, and beyond that again the Eurymedon, both of which were considerable streams, navigable in antiquity for some little distance from the sea. Near the mouth of the latter was a lake called Caprius, mentioned by Strabo; but it is now a mere salt marsh.

The chief towns on the coast are: Olbia, the first town in Pamphylia, near the Lycian frontier; Argives, the capital of the district, and Side (q.v.), on the coast; and the brothers Aspendus and Cestrus. The town of Aspendus stood Aspendus (q.v.), and the river Cestrus was Periga (q.v.). Between the two rivers, but somewhat farther inland, stood Syleneum, a strong fortress, which even ventured to defy the arms of Alexander. These towns are not known to have been Greek colonies; but the foundation of Aspendus was traditionally ascribed to the Argives, and Side was said to be a colony from Cyme in Aecus. The story related by Herodotus and Strabo, which ascribed the origin of the Pamphylians to a colony led into their country by Amphipholis and Calchas after the Trojan War, is merely a characteristic myth. The remains of Aspendus, though of Greek character, bear legends in a barbarous dialect; and probably the Pamphylians were of Asiatic origin and mixed race. They became largely hellenized in Roman times, and have left magnificent memorials of their civilization at Perga, Aspendus and Side. The district is now largely peopled with recent settlers from Greece, Crete and the Balkans.

The Pamphylians are first mentioned among the nations subdued by the Mermnad kings of Lydia, and afterwards passed in succession under the dominion of the Persian and Macedonian monarchs. After the defeat of Antiochus III. in 194 B.C. they were included among the provinces annexed by the Romans to the dominions of Eumenes of Pergamum; but somewhat later they joined with the Pisidians and Cilicians in piratical ravages, and Side became the chief centre and slave mart of these freebooters. Pamphylia was for a short time included in the dominions of Amyntas, king of Galatia, but after his death lapsed into a district of a Roman province, and its name is not again mentioned in history.

See C. Luneckomski, Les Villes de la Pamphylie et de la Pisidie (1890).

D. G. H.

PAMPLONA, or PAMPELUNA, the capital of the Spanish province of Navarre, and an episcopal see; situated 1378 ft. above sea-level, on the left bank of the Arga, a tributary of the Ebro. Pop. (1900), 28,886. Pamplona has a station on the Ebro railway connecting Aalsaua with Saragossa. From its position it has always been the principal fortress of Navarre. The old works have been partly demolished and replaced by modern forts, while suburbs have grown up round the inner walls and fortifications. The citadel, south-west of the city, was constructed by order of Philip II. (1556-1558), and was modelled on that of Antwerp. The streets of the city are regular and broad; there are three fine squares or plazas. The most attractive of these is the arched Plaza del Castillo, flanked by the hall of the provincial council and by the theatre. The cathedral is a late Gothic structure begun in 1397 by Charles III. (El Noble) of Navarre, who is buried within its walls; of the older Romanesque cathedral only a small portion of the cloisters remains. The fine interior is remarkable for the peculiar structure of its spires, and for the choir-stalls carved by the renowned Ancheta, a native artist (1530). The principal façade is Corinthian, from designs of Ventura Rodriguez (1785). The same architect designed the superb aqueduct by which the city is supplied with water from Monte Francao, some nine miles off. The beautiful cloisters on the south side of the cathedral, and the chaper-house beyond them, as well as the old churches of San Saturnino (Gothic) and San Nicolás (Romanesque), are also of interest to the student of architecture. There are also the bull-ring, capable of accommodating 8000 spectators, the pelota court (el Trinquet), and several parks or gardens. The city is well provided with schools for both sexes; it has also a large hospital.

Pamplona has a flourishing agricultural trade, besides manufactures of cloth, linen stuffs, flax, soap, leather, cards, paper, earthenware, iron and nails. The yearly fair in connexion with the feast of San Fermin (July 7), the patron saint of the city, attracts a large concourse from all parts of northern Spain.

Originally a town of the Vascones, Pamplona was rebuilt in 68 B.C. by Pompey the Great, whence the name Pompaelo or Pompelo (Strabo). It was captured by Eurius the Goth in 466 and by the Franks under Childebert in 544. It was taken by Charles the Simple in 978, but repulsed the emir of Saragossa in 907. In the 14th century it was greatly strengthened and beautified by Charles III., who built a citadel on the site now occupied by the Plaza de Toros and by the Basilica of S. Ignacio, the church marking the spot where Ignatius de Loyola received his wound in defending the place against André de Foix in 1521. From 1585 to 1608 it was occupied by the French under station by Wellington in 1813. In the Carlit War of 1836-40 it was held by the Cristinaos, and in 1875-76 it was more than once attacked, but never taken, by the Carlitists.

PAN ("pasturer"), in Greek mythology, son of Hermes and one of the daughters of Dryops ("oak-man"), or of Zeus and the nymph Callisto, god of shepherds, flocks and forests. He is not mentioned in Homer or Hesiod. The most poetical account of his birth and life is given in the so-called Homeric hymn To Pen. He was born with horns, a goat's beard and feet and a tall, his person being completely covered with hair. His mother was so alarmed at his appearance that she fled; but Hermes took him to Olympus, where he became the favourite of the gods, especially Dionysus. His life and characteristics are typical of the old shepherds and goatherds. He was essentially a rustic god, "a wood-spirit conceived in the form of a goat," living in woods and caves, and traversing the tops of the mountains; he protected and gave fertility to flocks; he hunted and fished; and sported and danced with the mountain nymphs. A lover of music, he invented the shepherd's pipe, said to have been made from the reed into which the nymph Syrinx was transformed
The Hindostani pan is the betel-leaf, which, mixed with areca-nut, lime, &c., is chewed by the natives of the East Indies.

The common prefix "pan," signifying universal, all-embracing (Gr. πᾶς, all), is often combined with the names of races, nationalities and religions, conveying an aspiration for the political or spiritual union of all the units of the nation or creed; familiar examples are Pan-Slavonic, Pan-German, Pan-Islamism, Pan-Anglican, Pan-American.

It is in the Illinois coal region, and coal-mining is the most important industry; the city is also a shipping point for hay and grain grown in the vicinity. Pana was incorporated in 1857, and was reincorporated in 1877. Its name is said to be a corrupted form of "Pani" (Pawnee), the name of a tribe of Indians.

**Panaea** (Gr. παναία, all-healing, from πᾶς, all, and ἄκαιρος, to heal), a universal remedy, or cure for all diseases, a term applied in the middle ages to a mythical herb supposed to possess this quality. Many herbs have had the power of curing all diseases attributed to them, and have hence had the name of "all-heal," such as have been, among others, the mistletoe, the woundwort (Stachys palustris), the yarrow or milfoil, and the great valerian.

**Panache,** a French word adapted from Ital. pennacchio, Lat. penna, feather, for a plume of feathers on a helmet or hat; the "panache" should be properly distinguished from the "plume," as being a large cluster of feathers. The French used the "plume" at the side or front. The word "panache" is often used figuratively in French of a flamboyant piece of ornamentation, a "purple patch" in literature, or any exaggerated form of decoration.

**Panaenus,** brother of Phedias, a Greek painter who worked in conjunction with Polygnotus and Micon at Athens. He also painted the marble sides of the throne of the statue of Zeus erected by his brother at Olympia.

**Panaetius** (c. 185–180 to 110–108 B.C.), Greek Stoic philosopher, belonged to a Rhodian family but was probably educated partly in Pergamum under Crates of Mallus and afterwards in Athens, where he attended the lectures of Diogenes the Babylonian, Critolaus and Carneades. He subsequently went to Rome, where he became the friend of Laelius and of Scipio the Younger. He lived as a guest in the house of the latter, and accompanied him on his mission to Egypt and Asia (143 or 141). He returned with Scipio to Rome, where he did much to introduce Stoic doctrines and Greek philosophy. He had a number of distinguished Romans as pupils, amongst them Q. Mucius Scaevola the augur and Q. Aelius Tubero. After the murder of Scipio in 129, he resided by turns in Athens and Rome, but chiefly in Athens, where he succeeded Antipater of Tarsus as head of the Stoic school. The right of citizenship was offered him by the Athenians, but he refused it. His chief pupil in philosophy was Posidonius of Apamea. In his teaching he laid stress on ethics; and his most important works, of which only insignificant fragments are preserved, were on this subject. They are as follows: Ὑπὸ τοῦ καθηγοῦσαν (On Duty), in three books, the original of the first two books of Cicero's De officiis; Ὑπὸ τοῦ καθηγοῦσαν (On Prudence), used by Cicero in his De divinatione (ii.) and probably in part of the second book of the De Doctrum natura; De locis politicis, used by Cicero in his De republica; Ὑπὸ τοῦ καθηγοῦσαν (On Cheerfulness); Ὑπὸ τοῦ καθηγοῦσαν (On Philosophical Schools); a letter to Q. Aelius Tubero, De dolore patiendio (Cicero, De futilibus, iv. 9, 23).

Edition of the fragments by H. N. Fowler (Bonn, 1885), and in F. van Lynden's monograph (Leiden, 1802). See also A. Schmeckel, Die Philosophie der mittleren Stoa (1892); F. Susenelli, Geschichte der griechischen Literatur (2d ed., 1874); E. Zeller, "Beiträge zur Kenntniss des Stokers Panathìus" in Commentationes philologicae in honorem Th. Mommseni (1877); on the use
made of him by Cicero, R. Hrizel, Untersuchungen zu Ciceros philosophischen Schriften (1877-1883). For his importance in the Spanish-American War and the subsequent developments in the Caribbean, he is often referred to as the "Father of the Panama Canal." The canal, completed in 1914, links the Atlantic and Pacific Oceans and has been an important feature of world trade. Panama is a Central American republic, occupying the Isthmus of Panama, and lying approximately between 9° 15' and 8° 30' N. and between 79° 15' and 83° 30' W. It is bounded N. by the Caribbean Sea, E. by Colombia, of which it was formerly a part, S. by the Gulf (or Bay) of Panama, an arm of the Pacific, and W. by Costa Rica. Its area is estimated at from 31,500 to 33,800 sq. m.; its greatest width is 118 m. and its greatest length 430 m.; its land frontier is only about 330 m., but on the Caribbean it has a coast of 478 m. and on the Pacific a coast of 767 m.

**Physical Features.**—The Isthmus of Panama, coextensive with the republic, is the isthmus of land between the American continents; in another term the term "Isthmus of Panama" is applied to the narrow crossing between the cities of Colon and Panama, the other narrow crossings, further east, being the Isthmus of San Blas (31 m.) and the Isthmus of Darien (46 m.). The use of the term "Isthmus of Panama" to include the whole country is becoming more common. The Caribbean coast-line is concave, the Pacific deeply convex. The Mesquite Gulf is to the N.W., the Gulf of Darien to the N.E., and on the N. coast are several bays. Almirante Bay, near the Costa Rican boundary, is 2-3 m. wide, with many islands and good anchorage, protected by Cape John, about 24 m. long. Panama Bay, which extends from Cape John to Cape Hiram, is connected with it, is Chiquita lagoon (area about 320 sq. m.), 32 m. long, 12 m. wide at the widest point, with a maximum depth of 120 ft., protected on the sea side by Chiquita Archipelago; immediately east of Colon, at the narrowest part of the isthmus, is the Gulf of San Blas, 20 m. long and 10 m. wide, protected by a peninsula and by the Mulatas Archipelago—low, sandy islands stretching about 80 m. along the coast—and having the excellent harbour of Maningida in the south-west; still farther east is Cadecola Bay with another good harbour. On the north coast there are about 630 islands with a total area of about 150 sq. m. The Pacific coast is more complicated; the Panama Roads, 80 m. wide, extends from Cape Hiram to Cape Blanco, 100 m. wide between Cape Garachico and Cape Malo, and has the Bay of Porta (20 m. wide at its mouth) on its west side, north of Cape Malo, and the Gulf of San Miguel (15 m. wide at its mouth) on its east side, north of Cape Garachico. Darien Harbour, formed by the Tura and Savannah rivers, is a part of the Gulf of San Miguel and is 11 m. long, 2-4 m. wide, and nearly landlocked. In the Gulf of Panama there are 16 large and about 100 smaller islands (the Pearl Islands), with a total area of 450 sq. m., the largest being Rey or San Miguel (15 m. long and 7 m. wide), and San José (25 sq. m.); both are well wooded. The westernmost island of the Archipelago, the islet of Coiba, is 200 m. west of Cape San Miguel. The Azuero Peninsula is the Gulf of Montijo, 20 m. long and 14 m. wide at its mouth, which stretches Cebaco Island, 133 m. long and 3 m. wide; west of Cebaco is Coiba, the largest island of the republic, 21 m. long and 4-12 m. wide.

The country has no lakes; the apparent exceptions are the artificial lakes, Bohio (or Gatun) and Soia, of the Canal Zone. There are a few swamps, especially on the northern shore. But the drainage is good; about 150 streams empty into the Caribbean, and some 325 into the Pacific. In the eastern part are three complicated drainage systems of rivers very largely tidal. The largest is that of the Tiera (formerly called Rio Darien), whose headwaters are near the Caribbean, and which empties into the Pacific in the Gulf of San Miguel. The Chepo (or Bayano) also is a large system, with a drainage area reaching from the Caribbean to the Pacific; it is navigable for about 120 m. by small boats. The Chagres flows from a source near the Pacific south-west and then north to the Caribbean, is a little more than 100 m. long and is navigable for about half that distance; it varies greatly in depth, sometimes rising 35 ft., it contains numerous small islands and dikes, and through the mud the course of these three rivers is simpler and comparatively uninertious water systems, rising near the centre of the isthmus. Orogenographically the country is remarkable. The exceedingly irregularly rounded, hilly surface, and flat tops, covered by dense forest (Hills are Antillean, not Andean, and lie at right angles to the axes of the systems of North and South America. The only regular ranges in Panama are in the extreme western part of the country. The Cordillera Central, immediately north of this and parallel to it, the Cordillera of San Blas, or Sierra de Chiriqui, where the highest peaks are Chiriqui (11,265 ft.) and, on the Costa Rican

1 Christoval, the port of Colon, and Balboa, the port of Panama, lie within the canal zone and are under the jurisdiction of the United States.
United States government. The line of railway is very nearly that of the canal, and the work of the railway engineers was of great value to the French engineers of the canal. There are several telegraphic and telephone systems; a wireless telegraph station at Colon, and telegraph lines to all important points, with a cable across the isthmus, give an "all-cable" service to South America, to the United States, and to Europe. There are two old wagon roads from Panama City, one, now little used, north to Porto Bello, called the "road of the Captains," (road real) 12 m. north-west to Cerros at the head of navigation on the Chagres River. Other roads are mere rough trails.

Inhabitants and Towns.—The population in 1909 was about 361,000. The inhabitants exhibit various degrees of admixture of Indian, negro and Spanish blood, with an increasing proportion of foreigners. The Indians are most numerous in the western part. The negroes, largely from Jamaica, are the oldest of the races. In 1904 it was reported that there were 10,000 negroes over white. Spanish, Italians, and Greeks came to work on the canal, but this is not a permanent population. As elsewhere in Spanish America, there has been German colonization, notably in Colon province, where a large tropical estate was established in 1894.

The principal cities in Panama are: Colon (q.v.), at the Caribbean end of the canal; Panama (q.v.), at the Pacific end of the canal, and the capital of the Republic of Panama; Cartago; and Panama Viejo, on the canal, which, with a cable across the isthmus, is the head of navigation in the canal, is the head of navigation

the name, Indies, which captured by the English (notably by Admiral Edward Vernon (1713), and by buccaneers, and is the terminus of an old paved road to Panama, whence gold was brought to Porto Bello for shipment; Chagres (pop. about 2500), also in Colon province, formerly an important port, and now a fishing place; Agua Dulce, formerly called Trinidad (pop. about 2000), in Colon province, on Portia Bay, the centre of the salt industry; and San Miguel, on an island of the same name in the Gulf of Panama, the principal pearl fishery. The larger fisheries are in the province of Veragua, 12 m. from the Pacific, 60 m. east of the Costa Rican boundary, with a trade in cattle; Los Santos (pop. about 7200), the capital of Los Santos province; Santiago de Veragua (pop. about 7000), 300 ft. above the sea, with various manufactories, gold, silver and copper mines, and mineral springs and baths near the city; Las Tablas (pop. about 6500) and Pese (pop. about 5600) in Los Santos province; Pessomene (pop. about 3000), on the river of that name in Colon province (of which it is the capital), with a trade in straw hats, tobacco, cacao, coffee, cotton, rubber, cedar, and cattle; and in the Canal Zone Gorgona (3000) and Obispo (2500), each a small city.

Administration.—By the constitution promulgated on the 13th of February 1904 the government is a highly centralized republic. All male citizens over 21 years of age have the right to vote, except those under judicial interdiction and those judicially institutionalized by reason of crime. The president, who must be at least 35 years old, is elected by popular vote for four years, is ineligible to succeed himself and appoints cabinet members (secretaries of foreign affairs, government and justice, treasury, interior ["fomento"] and public instruction); five supreme court judges (who decide on the constitutionality of a bill vetoed by the president on constitutional grounds—their action, if favourable to the constitutionality of such a bill, makes the president's signature mandatory); diplomatic representatives; and the governors (annually) of the provinces, who are responsible only to him. The president's salary is $18,000 a year. There is no vice-president, but the National Assembly elects two years three designados, the first of whom would succeed the president if he should die. The National Assembly is a single chamber, whose deputies (each at least 25 years old) are elected for four years by popular vote on the basis of 1 to every 10,000 inhabitants (or fraction over 9000); it meets biennially, by a two-thirds vote it may pass any bill over the president's veto—the president has the right to veto to the length of the bill, in which to veto any act of the legislature. At the head of the judiciary is the Supreme Court already referred to; the superior court and the circuit courts are composed of judges appointed for four years by the members of the Supreme Court. The municipal court justices are appointed by the Supreme Court judges for one year.

The province, which has an administrative division, are: Panama, with most of the territory east of the canal and a little (on the Pacific side) west of the canal; Colon, on either side of the canal, along the Caribbean; Colón, west and south; Los Santos, south of the main river; the canal, south-west; Veraguas, to the north-west, crossing to the Mosquito Gulf; and Chiriqui, farthest west, on the Pacific, and Bocas del Toro on the Caribbean. The provinces are divided into municipal districts (concejos de municipio), which has a head of government (concejal municipal), publicly elected for two years, and an alcalde, who is the agent of the governor of the province and is appointed annually. The treaty of the 19th of November 1908 Panama ceded to the United States the "Fall Zone," a strip of land, 5 m. on either side of the canal and including certain islands in the Gulf of Panama; from this cession were excluded the cities of Colon and Panama, and the latter received jurisdiction only as regards sanitation and water-supply.

Education.—The system of public education dates from the independence of Panama only and has not been developed. But primary instruction has been greatly improved; there is a school of arts and trades at the capital, in which there are endowed scholarships for pupils from different provinces; a normal school has been established to train teachers for the Indians; high schools and training schools have been opened; and the government pays the expenses of several students in Europe.

Coinage and Finance.—In June 1904, under the terms of an agreement between Panama and the United States, 25 cents of Panama dollars were replaced by 10 cents of United States silver, making Panama a full member of the half-dollar standard, that is, a gold standard with the balboa, equivalent to an American gold dollar, as an American bond; and promised to keep in a bank in the United States a deposit of American dollar equal to 15% of its issue of fractional currency. The treaty of 1908 Panama ceded to the United States the "Fall Zone," a strip of land, 5 m. on either side of the canal and including certain islands in the Gulf of Panama; from this cession were excluded the cities of Colon and Panama, and the latter received jurisdiction only as regards sanitation and water-supply. This agreement put an end to the fluctuations of the paper currency previously used. Currency of Panama is legal tender in the Canal Zone, and that of the United States in the Republic of Panama. The republic has no debt: it refused to accept responsibility for a part of the Colombian debt; and it has no standing army. On the 30th of June 1908 the total cash assets of the government were $6,700,000, of which $6,000,000 was invested in New York City real estate, and more than $1,500,000 was in deposits in New York. In the six months ending with that date the receipts were $2,259,574 (largely from interest and export duties, and taxes on liquors, tobacco, manufactured goods and electric light and water, the latter based on the Cuba law), and the cash balance for the six months was $105,307.

History.—The Isthmus of Panama was probably visited by Alonso de Ojeda in 1499. In 1501 Rodrigo Bastidas sailed along from the Gulf of Venezuela to the present Porto Bello. Colon was in 1502 on nearby Bocas del Toro, by which he planted a colony (Republic of Panama) in November; the Indians destroyed it almost immediately; it was re-established in 1510, by Diego de Nicuesa, governor of the newly established province of Castilla del Oro, which included what is now Colombia, Costa Rica, Panama, and Ecuador. Eloy Fernandez de Enciso, following Alonso de Ojeda to the New World, took the survivors of Ojeda's colony of Nueva Andalucia (near the present Cartagena and east of Panama) and founded on the Tuira river the colony of Santa Maria la Antigua del Darien (commonly called Darien). An insurrection against Enciso in December 1510 put in command Vasco Nuñez de Balboa, who had accompanied Rodrigo de Bastidas in the voyage of 1501. In September 1513 Nuñez crossed the isthmus and (on the 25th or 26th) discovered the Pacific. Immediately afterwards he was succeeded by Pedro Arias de Avila, but whom in 1514, under the name of Tierra Firma, and who founded in 1519 the city of Panama, now the oldest European settlement on the mainland in America. The portage between the two oceans was of great commercial importance, especially in the 16th century, when treasure from Peru (and treasure was the raison d'être of the Spanish settlements in Panama) was carried across the isthmus from Panama City. A Scotch settlement under letters patent from the Scotch Parliament was made by William Paterson (q.v.) in 1569 on the site of the present Porto Escoies (in the north-eastern part of the republic), but in 1570 the Spanish garrison had expelled them. Panama was a part of the viceroyalty of New Granada created in 1718, and in 1810 became a part of the independent nation of Colombia and in 1831 of New Granada, from which in 1841 Panama and Veraguas provinces seceded as the state (short-lived) of the Isthmus of Panama.
The constitution of the Granadine Confederation of 1853 gave the states the right to withdraw, and in 1852 Panama again seceded, soon to return. When Nuñez in 1885 disregarded the constitution of 1884, which made the component states severally sovereign, he was strongly opposed by the people of Panama, who had no actual representation in the convention which made the constitution of 1886, an instrument allowing Panama (which it made a department and not a state) no local government. The large expenditures of the French canal company made the department singularly alluring to corrupt officials of the central government, and Panama suffered severely before the liquidation of the company's property. There were risings in 1895 and in 1898-1902, the latter ensuing with American interposition.

The treaty of the United States in 1846 with New Granada, granting transportation facilities on the Isthmus to the United States, then preparing for war with Mexico, and guaranteeing on the part of the United States the sovereignty of New Granada in the Isthmus, has been considered the first step toward the establishment of an American protectorate over the Isthmus. In 1901 by the negotiation of the Hay-Pauncefote Treaty it became possible for the United States alone to build and control an interoceanic canal. The Hay-Herran Treaty of 1903 provided for the transfer of sovereignty to the United States at the Isthmus. The Panama Canal was not ratified by the Colombian Congress, possibly because it was hoped that settlement might be delayed until the concession to the company expired, and that then the payment from the United States would come directly to the Colombian government; and the Congress, which had been specially called for the purpose—there was no regular legislative government in Bogotá in 1869-1860—adjourned on the 31st of October. Three days later, on the 3rd of November, the independence of Panama was declared. Commander John F. Hubbard of the United States gunboat "Nashville" at Colon forbad the transportation of Colombian troops across the Isthmus, and landed 42 marines to prevent the occupation of Colon by the Colombian force; the diplomatic excuse for his action was that by the treaty of 1846 the United States had promised to keep the Isthmus open, and that a civil war would have closed it. On the 7th of November Panama was virtually recognized by the United States, when her diplomatic representative was received; and on the 18th of November a treaty was signed between the United States and Panama, ceding to the United States the "Canal Zone," for which and for the canal concession the United States promised to pay $10,000,000 immediately and $3,000,000 annually as rental, the first payment to be made nine years after the ratification of the treaty. On the 4th of January 1904, two months after the declaration of independence, a constitutional assembly was elected, which met on the 15th of January, adopted the constitution described above, and chose as president Manuel Amador Guerrero (1834-1906). He was succeeded in October 1906 by Domingo de Obaldia. In 1905 a treaty was made with Costa Rica for the demarcation of the boundary line between the two countries.

PANAMA, the capital and the chief Pacific port of the republic of Panama, and the capital of the province of the same name, in the south-central part of the country, at the head of the Gulf of Panama, and at the south terminus of the Panama railway, 47 5 m. from Colon, and of the Panama Canal. Pop. (1910), about 30,000, of whom nearly one-half were foreign-born or of foreign parentage. Panama is served by regular steamers to San Francisco, Yokohama and other Pacific ports.

1 The capital of Panama, with boundaries nearly corresponding to those of the present republic, and including the province of Panama and other provinces, was created in 1855 by legislative enactment.

is built on a rocky peninsula jutting out to the east, near the mouth of the Rio Grande and at the foot of Mt Ancon (560 ft.). The harbour is good and is enclosed at the south by several rugged islands, the largest being Perico and Flamenco (belonging to the United States) and Taboga (35 ft.), which is a place of country residence for wealthy citizens. The main streets run north and south and are cut by the Avenida Central; nearly all the streets are narrow and crooked. The principal squares are Cathedral, Santa Ana, Bolivar and Lesses. The city proper is almost entirely enclosed by the remains of a great granite wall (built in 1673, when the new city was established), the majority of which still stands over the original fortifications. The city is divided into three parts by the promenade. The public buildings include the cathedral (1760), the government palace, the municipal palace, the episcopal palace, the church of Santa Ana, a national theatre, a school of arts and trades, a foreign hospital, the former administration building of the Canal Company, Santo Tomas Hospital, the pesthouse of Punta Mala and various asylums. The houses are mostly of stone, with red tile roofs, two or three storeys high, built in the Spanish style around central patios, or courts, and with balconies projecting far over the narrow streets; in such houses the lowest floor is often rented to a poorer family. In 1889 the streets were lighted with electricity; and there are electric street railways and telephones in the city. The water supply and drainage systems were introduced by the United States government, which controls the sanitation of the city, but has no other jurisdiction over it. Two miles inland is Ancon, in the Canal Zone, in which are the hospitals of the Isthmian Canal Commission and the largest hotel on the isthmus. The city of Panama was formerly a stronghold of yellow fever and malaria, which American sanitary measures have practically eradicated. Panama has had an important trade; its imports, about twice as valuable as its exports, include cotton goods, haberdashery, coal, flour, silk goods and rice; the most valuable exports are gold, India-rubber, mother of pearl and cocobolo wood. As Balboa (3 m. west of the city, connected with it by railway, and formerly called La Boca), the port of Panama and the actual terminus of the canal, is in the Canal Zone and is a port under the jurisdiction of the United States, the commercial future of Panama is dependent upon American tariffs and the degree to which Panama and Balboa may be identified. At Balboa there are three wharves, one 585 ft. long and another 1000 ft. long, but their capacity is so insufficient that lighterage is still necessary. In the city there is one small dock which can be used only at full tide. Small vessels may coal at Naos, an island in the Gulf of Panama, which is owned by the United States. Soap and chocolate are manufactured. Founded in 1519 by Pedro Arias de Avila, Panama is the oldest European town on the mainland of America. In the 16th century the city was the strongest Spanish fortress in the New World, excepting Cartagena, and gold and silver were brought hither by ship from Peru and were carried across the Isthmus to Chagres, but as Spain's fleets even in the Pacific were more and more often attacked in the 17th century, Panama became less important, though it was still the chief Spanish port on the Pacific. In 1671 the city was destroyed by Henry Morgan, the buccaneer; it was rebuilt in 1673 by Alfonso Mercado de Villacorta about five miles west of the old site and nearer the roadstead. The city has often been visited by earthquakes. In the city in June 1826 the Panama Congress met (see PAN-AMERICAN CONFERENCES).

PANAMA CANAL. When he crossed the Atlantic, the object Columbus had in view was to find a western passage from Europe to Cathay. It was with the greatest reluctance, and only after a generation of unmitigating toil that the explorers who succeeded him became convinced that the American continent was continuous, and formed a barrier of enormous extent to the passage of vessels. The question of cutting a canal through this barrier at some suitable point was immediately raised. In 1550 the Portuguese navigator Antonio Galvao published a book to demonstrate that a canal could be cut at Tehuantepec,
By the Clayton-Bulwer Treaty of 1850 with Great Britain, by the treaty of 1840 with New Granada (Colombia), Article XXXV, and by the treaty of 1867 with Nicaragua, Article XV., the United States, guaranteed that the projects undertaken, whether the Panama or the Nicaraguan, should be neutral, and, furthermore, that it be used and enjoyed upon equal terms by the citizens of both countries in each case. A modification of the Clayton-Bulwer Treaty being necessary to enable the United States to build the canal, a treaty making such modifications, but preserving the principle of neutrality, known as the Hay-Pauncefote Treaty, was negotiated with Great Britain in 1903; it was amended by the United States Senate, and the amendments not proving acceptable to Great Britain, the treaty lapsed in March 1901. A new treaty, however, was negotiated in 1907. It was not till 1908 that the Panama Canal had been prosecuted. Its first builders did no work of construction.

In May 1879 an International Congress composed of 135 delegates from various nations—some from Great Britain, United States and Germany, but the majority from France—was convened in Paris under the auspices of Ferdinand de Lesseps, to consider the best situation for, and the plan of, a canal. After a session of two weeks the Congress decided that the canal should be at the sea-level, and at Panama. Immediately after the adjournment of the Congress the Panama Canal Company was organized under a general law of France, with Lesseps as president, and it purchased the Wyse Concession at the price of 10,000,000 francs. An attempt to float this company in August 1879 failed, but a second attempt, made in December 1888, was fully successful, 6,000,000 shares of 500 francs each being sold. The next two years were devoted to surveys and examinations and preliminary work upon the canal. The plan adopted was for a sea-level canal having a depth of 30 ft. and bottom width of 72 ft., involving excavation estimated at 157,000,000 cub. yds. The cost was estimated by Lesseps in 1880 at 658,000,000 francs, and the time required at eight years. The PanamaCanal was opened in December 1913 by the U. S. Secretary of State at Colon, and that on the Pacific side by the anchorage at Panama. Leaving Colon, the canal was to pass through low ground by a direct line for a distance of 6 m. to Gatun, where it intersected the valley of the Chagres river; pass up that valley for a distance of 21 m. to Obispo, where it left the Chagres and ascended the valley of a tributary, the Cumacho; cut through the watershed at Culebra, and thence descend by the valley of the Rio Grande to Panama Bay. Its total length from deep water in the Atlantic to deep water in the Pacific was about 47 m. It was laid out in such a way as to give easy curves everywhere; the shallowest curve, of which there was but one, had a radius of 6200 ft., four others had a radius of 3200 ft., and all others had a radius of 9000 ft. or more. To secure this it was necessary to select a point for crossing the watershed where the height was somewhat greater than that of the lowest pass. The line was essentially the same as that followed by the Panama railroad, the concession for which granted a monopoly of that route; the Wyse Concession, therefore, was applicable only upon condition that the canal company could come to an amicable agreement with the railroad company.

The principal difficulties to be encountered in carrying out this plan consisted in the enormous dimensions of the cut to be made at Culebra, and in the control of the Chagres river, the valley of which...
is occupied by the canal for a large part of its length. This stream is of torrential character, its discharge varying from a minimum of about 350 cu. ft. to a maximum of over 100,000 cu. ft. per second. In the last heavy rainstorm of 1887 its time of concentration was from 2 hours to 3 hours, its volume increasing from 15,600 cu. ft. to 57,800 cu. ft. per second at the same time; and similar violent changes are not uncommon. To admit a moderate velocity stream the canal must be wide and of shallow depth to navigation unless space could be provided for its waters to spread out. For a canal with locks the remedy is simple, but for a sea-level canal the problem is much more difficult, and the practical solution of the question was ever reached under the Esceps plan.

Work under this plan continued until the latter part of 1887; the management being characterized by a degree of extravagance and illudicrousness rarely if ever equaled in the history of the world. By that time it had become evident that the canal could not be completed at the sea-level with the resources of time and money then available. It was announced that the locks were excavated and that work was pushed on with vigour until 1886, when, the company, becoming bankrupt, was dissolved by a judgment of the Tribunal Civil de la Seine, dated the 4th of February 1889, a liquidator being appointed by the court to take charge of its affairs. One of the more important duties assigned to this official was to keep the property together and the concession alive, with a view to the formation of a new company for the completion of the canal. He gradually reduced the number of men employed, and finally suspended the works on the 15th of May 1889. He then proceeded to satisfy himself that the canal project was feasible, a question acknowledged by the opposition to be one of great difficulty, and to this end caused an inquiry to be held by a commission of French and foreign engineers. This commission reported on the 9th of May 1890 that a canal with locks, for which they submitted a plan, could be built in eight years at a cost of 580,000,000 francs for the works, which sum should be increased to 900,000,000 francs to include administration and financing. They reported that the plant in hand was in good condition and would probably suffice for finishing the canal, and they estimated the value of the work done and of the plant in hand at 450,000,000 francs.

The time within which the canal was to be completed under the Esceps plan having nearly expired, the liquidators were appointed to obtain from the Colombian government an extension of ten years. Twice subsequently the time was extended by the Colombian government, the date ultimately fixed for the completion of the canal being 31st December 1898. For these extensions the Colombian government exacted heavy subsidies.

The liquidator finally secured the organization of a new company on the 20th of October 1894. The old company and the liquidator had raised by the sale of stock and bonds the sum of 1,271,682,637 francs. The securities issued to raise this money had a par value of 2,241,515,100 francs, held by about 200,000 persons. In all about 72,000,000 cu. yds. had been excavated, and an enormous quantity of machinery and other plant had been purchased and transported to the isthmus at an estimated cost of 150,000,000 francs. Nearly all of the stock of the Panama railroad—68,531 of the 70,000 shares existing—had also been purchased, at a cost of 93,268,186 francs.

The new company was regularly incorporated under French law and is known as the Second Panama Company. It was technically a private corporation, but the great number of persons interested in the securities of the old company, and the special legislation of the French Chambers, gave it a semi-national character. By the law of the 8th of June 1888, all machinery and tools used in the work must be of French manufacture, and raw material must be of French origin. Its capital stock consisted of 550,000 shares of 100 francs each, of which 350,000 shares belonged to Colombia. It succeeded to all the rights of the Oyse Concession having nearly expired, which included plans, plans, profiles, sections, maps, drawings, &c., and shares of the Panama railroad. For the contingency that the canal should not be completed, special conditions were made as to the Panama railroad shares. These were to revert to the liquidator, but the company had the privilege of purchasing them for 20,000,000 francs in cash and half the net annual profits of the road. The Panama railroad retained its separate organization as an American corporation.

Immediately after its organization in 1894 the new company took possession of the property (except the Panama railroad stock which was with the liquidator), and made a new study of the entire subject of the canal in its engineering and commercial aspects. It resumed the work of excavation, with a moderate number of men sufficient to comply with the terms of the concession, in a part of the line—the Emperador and Culebra cuttings. Such excavation must contribute to the enterprise if completed under the Concesionario Esceps, if 25,000,000 francs had been collected, and since that time the work progressed continuously, the number of workmen varying between 1900 and 3000. The total estimated cost of the works was about 5,000,000 cubic yards. The amount expended to the 30th of June 1899 was about 35,000,000 francs, besides about 6,500,000 francs advanced to the Panama Railroad Company for building a pier in the harbor of Boca Grande.

The charter provided for the appointment by the company and the liquidator of a special engineering commission of five members, to act upon the plans of the old company and draw new plans from thereon. This report to be rendered when the amounts expended by the new company should have reached about one-half its capital. The report was to be made public, and a special meeting of the stockholders was to be held to determine whether the canal should be completed, and to provide ways and means. The time for this report and special meeting arrived in 1898. In the meanwhile the company had called to its aid a technical committee composed of fourteen engineers, European and American, some of them among the most eminent in their profession. After a study of all the data available, and of such additional surveys and examinations as it considered should be made, this committee rendered an elaborate report dated the 16th of November 1898. This report was referred to the statutory commission of five, who reported in 1899 that the canal could be built according to that project, but that the old company was not in a position to proceed with the work. A change of course had been decided on, in order to avoid the expediency of completing the canal as or to providing ways and means. The engineering questions had been solved to the satisfaction of the company, but to the Panama Canal Company it was extremely difficult to become insolvent, by the appearance of the United States government in the field as a probable builder of an isthmian canal. The company continued to conduct its operations in a provisional way, without according to the public the capital.

The plan adopted by the company involved two levels above the sea-level—one of them an artificial lake to be created by a dam at Bolio, to be reached from the Atlantic by a flight of two locks, and the other summit-level, to be reached from the Pacific by a flight of four locks from the preceding. The summit-level was to have its surface at high water 102 ft. above the sea, and to be supplied with water by a large artificial lake, artificially constructed at Alajuela in the upper Chagres valley; the ascent on the Pacific side to be likewise by four locks. The canal was to have a depth of 29 ft. and a bottom width of about 98 ft., with an increased width in certain specified parts. Its general plan was the same as that adopted by the old company. The locks were to be double, or twin locks, the chambers to have a serviceable length in the clear of 738 ft., with a width of 82 ft. and a depth of 32 ft. 10 in., and the height of the lift was to be 26.5 ft. with limits of 20 ft. above and below the canal for freezing and stage of water. The time required to build the canal was estimated at ten years, and its cost at 525,000,000 francs for the works, not including administration and financing.

The occupation of the Panama route by Europeans, and the prospect of a canal there under foreign control, was not a pleasing spectacle to the people of the United States. The favour with which the Nicaragua Scrutiny Commission had considered the Panama route had been considered since 1876 began to assume a character and the movement to construct a canal on that line to assume a practical shape. In 1884, a treaty, known as the Frelinghuysen-Zarate Treaty, was negotiated with Nicaragua, by the terms of which the United States Government was to build the canal without cost to Nicaragua, and after completion it was to be owned and managed jointly by the two governments. The treaty was submitted to the United States Senate, and in the vote for ratification, on the 20th of January 1885, received thirty-two votes in its favour against twenty-three. The necessary two-thirds vote not having been obtained, the treaty was not ratified, and it was subsequently referred to further consideration. This failure led to the formation in New York by private citizens in 1886 of the Nicaragua Canal Association, for the purpose of obtaining the necessary concessions, making surveys, laying out the route, and organizing such corporations as should be required to construct the canal. They obtained a concession from Nicaragua in April 1887, and from Costa Rica in August 1888, and sent parties to survey the canal. An act for the incorporation of an association to
be known as the Maritime Canal Company of Nicaragua passed Congress and was approved on the 20th of February 1889, and on the 4th of May 1889 the company was organized. It took over the concessions and, acting through a construction company, began work upon the canal in June 1889. Operations upon a moderate scale and man of the preliminary character were continued until 1893, when the financial disturbances of that period drove the construction company into bankruptcy and compelled a suspension of the work. It has not since been resumed. At that time the canal had been excavated to a depth of 17 ft. and a width of 280 ft. for a distance of about 3000 ft. inland from Greytown; the canal line had been cleared of timber for a distance of about 20 m.; a railroad had been constructed for a distance of about 11 m. inland from Greytown; a pier had been built for the improvement of Greytown harbour and other works undertaken. In all, about $4,500,000 had been expended.

Congress continued to take an interest in the enterprise, and in 1895 provided for a board of engineers to inquire into the possibility, permanence, and cost of the canal as projected by the Maritime Canal Company. The report of this board, dated April 1895, severely criticized the plans and estimates of the company, and led to the appointment in 1897 of another board, to make additional surveys and examinations, and to prepare new plans and estimates. The second board recommended some radical changes in the plans, and especially in the estimates, but its report was not completed when the revival of the Panama scheme arose upon the outbreak of the Spanish-American war and led to the creation in 1899 of the Isthmian Canal Commission. In the meanwhile the property of the Maritime Canal Company has become nearly worthless through decay, and its concession has been declared forfeited by the Nicaraguan government.

The interest of the United States in an isthmian canal was not essentially different from that of other maritime nations down to about the middle of the 19th century, but it assumed great strength when California was acquired, and it has steadily grown as the importance of the Pacific States has developed. In 1848 and again in 1884, treaties were negotiated with Nicaragua authorizing the United States to build the canal, but in neither case was the treaty ratified. The Spanish War of 1898 gave a tremendous impetus to popular interest in the matter, and it seemed an article of the national faith that the canal must be built, and, furthermore, that it must be under American control. To the American people the canal appears to be not merely a business enterprise from which a direct revenue is to be obtained, but rather a means of unifying and strengthening their national political interests, and of developing their industries, particularly in the Pacific States; in short, a plan essential to their national growth. The Isthmian Canal Commission created by Congress in 1899 to examine all practicable routes, and to report which was the most practicable and most feasible for a canal under the control, management and ownership of the United States, reported that there was no route which did not present greater disadvantages than those of Panama and Nicaragua. It recommended that the canal at Panama have a depth of 35 ft. and a bottom width 150 ft., the locks to be double, the lock chambers to have a length 720 ft., width 84 ft. and depth 35 ft. in the clear. The cost of a canal with these dimensions, built essentially upon the French plans, was estimated at $370,750,258. A plan was recommended in which the height of the Bohio dam was increased about 20 ft., the level of Lake Bohio raised by that amount, the lake made the summit-level, and the Alajuela dam omitted. The cost upon this plan was estimated at $143,071,127.

According to the plan recommended by the Commission for Nicaragua the line began at Greytown on the Caribbean Sea, where an artificial harbour was to be constructed and follow the valley of the San Juan for 100 m. to Lake Nicaragua; thence across the lake about 70 m. to the mouth of Las Lajas river; then up the valley of that stream through the watershed, and down the valley of the Rio Grande, 17 m. to Brito on the Pacific, where also an artificial harbour was to be constructed. The distance from ocean to ocean is 187 m. About midway between the lake and the Caribbean the San Juan receives its most important affluent, the San Carlos, and undergoes a radical change. It is a clear water stream, capable of improvement by locks and dams. Below, it is choked with sand, and not available for slack-water navigation. A dam across the San Juan above the mouth of the San Carlos was to maintain the water of the river above that point on a level with the lake. The line of the canal occupied essentially the bed of the river from the lake to the dam; from the dam to the Caribbean it followed the left bank of the river, keeping at a safe distance from it, and occasionally cutting through a high projecting ridge. The lake and the river above the dam constitute the summit-level, which was 110 ft. above mean sea-level. It would have been reached from the Caribbean side by five locks, the first having a lift of 36 ft., and the others a uniform lift of 18½ ft. each, making a total lift of 110 ft. from low tide in the Caribbean to high tide in the lake. From the Pacific side the summit would have been reached by four locks having a uniform lift of 28½ ft. each, or a total lift of 114 ft. from low tide in the Pacific to high tide in the lake. The time required to build the canal was estimated at ten years, and its cost at $200,530,000.

The report of the commission, transmitted to Congress at the end of 1900, ended thus:—

The Panama Canal, after completion, would be shorter, have four locks, and less cost that the Nicaragua Canal. The measure of these advantages is the time required for a vessel to pass through, which is estimated for a canal to be 12 hours for Panama and 33 hours for Nicaragua; the other water was from San Francisco to New York is 1777 ft. to New Orleans 579 m. and to Liverpool 386 m. greater via Panama than via Nicaragua. The time required to pass over these distances is greater in the one case, and the greater time would be lost through the canals, the Nicaragua line, after completion, would be somewhat more the advantages of the two to the United States, notwithstanding the greater cost of maintaining the longer canal.

The government of Colombia, in which lies the Panama Canal, has granted an exclusive concession, which still has many years to run. It is not free to grant the necessary rights to the United States, except upon condition that an agreement be reached with the New Panama Canal Company. The Commission believes that such agreement is impracticable. So far as can be ascertained, the concession is not subject to the limitation of time, but the United States to become the owner of part of its stock. The Commission considers such an arrangement inadmissible. The Governments of Nicaragua and Costa Rica, on the other hand, are bound by convention and are free to grant to the United States such privileges as may be mutually agreed upon.

In view of all the facts, and particularly in view of all the difficulties of obtaining the necessary rights, privileges and franchises necessary for a Panama route, and assuming that Nicaragua and Costa Rica recognize the value of the canal to themselves, and are prepared to grant concessions on terms which are reasonable and acceptable to the United States, the Commission is of the opinion that "the most practicable and feasible route for an isthmian canal, to be under the control, management and ownership of the United States," is that known as the Nicaragua route.

This report caused the New Panama Canal Company to view the question of selling its property in a new light, and in the spring of 1901 it obtained permission from the Panamanian government to dispose of it to the United States. It showed itself, however, somewhat reluctant to name a price to the Canal Commission, and it was not till January 1902 that it definitely offered to accept $90,000,000. In consequence of this offer, the commission in a supplementary report issued on the 18th of January 1902 reversed the conclusion it had stated in its main report, and advised the adoption of the Panama route, with purchase of the works, &c., of the French company. A few days previous to this report the Hepburn bill authorizing the Nicaragua canal at a cost of $180,000,000, had been carried in the House of Representatives by a large majority, but when it reached the Senate an amendment—the so-called Spooner bill—was moved and finally became law on the 28th of June 1902. This authorized the president to acquire
all the property of the Panama Canal Company, including not less than 68,880 shares of the Panama Railroad Company, for a sum not exceeding $40,000,000, and to obtain from Colombia perpetual control of a strip of land 6 m. wide; while if he failed to come to terms with the company and with Colombia in a reasonable time and on reasonable terms, he was by treaty to obtain from Costa Rica and Nicaragua the territory necessary for the Nicaragua canal.

Negotiations were forthwith opened with Colombia, and ultimately a treaty (the Hay-Herran treaty) was signed in January 1903. The Colombian Senate, however, refused ratification, and it seemed as if the Panama scheme would have to be abandoned when the complexion of affairs was changed by Panama revolting from Colombia and declaring itself independent in November 1903. Within a month the new republic, by the Hay-Bunau-Varilla treaty, granted the United States the use, occupation and control of a strip of land 10 m. wide for the purposes of the canal. A few days after the ratification of this treaty by the United States Senate in February 1904—the concession of the French company having been purchased—a commission was appointed to undertake the organization and management of the enterprise, and in June Mr J. F. Wallace was chosen chief engineer. Work was begun without delay, but the commission's methods of administration and control soon proved unsatisfactory, and in April 1905 it was reorganized, three of its members being constituted an executive committee which was to be at Panama continuously. Shortly afterwards, at the end of June, Mr Wallace resigned his position as chief engineer, and was succeeded by Mr John F. Stevens.

In connexion with the reorganization of the commission a board of consulting engineers, five being nominated by European governments, was appointed in June 1905 to consider the question, which so far had not been settled, whether the canal should be made at sea-level, without locks (at least except tidal regulating locks at or near the Pacific terminus), or should rise to some elevation above sea-level, with locks. The board reported in January 1906. The majority (eight members out of thirteen) declared in favour of a sea-level canal as the only plan "giving reasonable assurance of safe and uninterrupted navigation;", and they considered that such a canal could be constructed in twelve or thirteen years' time, that the cost would be less than $250,000,000, and that it would endure for all time. The minority recommended a lock canal, rising to an elevation of 85 ft. above mean sea-level, on the grounds that it would cost about $100,000,000 less than the proposed sea-level canal, that it could be built in much less time, that it would afford a better navigation, that it would be adequate for all its uses for a longer time, and that it could be enlarged if need should arise with greater facility and less cost. The chief engineer, Mr Stevens, also favoured the lock or high-level scheme for the reasons, among others, that it would provide as safe and a quicker passage for ships, and therefore would be of greater capacity; that it would provide, beyond question, the best solution of the vital problem how safely to care for the flood waters of the Chagres and other streams, that provision was made for enlarging its capacity to almost any extent at very much less expense of time and money than could be provided for by any sea-level plan; that its cost of operation, maintenance and fixed charges would be very much less than those of any sea-level canal; and that the time and cost of its construction would be not more than one-half of that of a canal of the sea-level type. These conflicting reports were then submitted to the Isthmian Canal Commission for consideration, with the result that on the 5th of February, it reported, one member only dissenting, in favour of the lock canal recommended by the minority of the board of consulting engineers. Finally this plan was adopted by Congress in June 1906. Later in the same year tenders were invited from contractors who were prepared to undertake the construction of the canal. These were opened in January 1907, but none of them was regarded as entirely satisfactory, and
President Roosevelt decided that it would be best for the government to continue the work, which was placed under the more immediate control of the U.S.A. Corps of Engineers. At the same time the Isthmian Canal Commission was reorganized, Major G. W. Goethals, of the Corps of Engineers, becoming engineer in chief and chairman, in succession to Mr. J. F. Stevens who, after succeeding Mr. T. P. Shonts as chairman, himself resigned on the 1st of April.

The following are the leading particulars of the canal, the course of which is shown on the accompanying map. The length from deep water in the Atlantic to deep water in the Pacific will be about 50 m., or, since the distance from shore to shore is just over 41 m. in Limon Bay and about 5 m. at Panama, approximately 401 m. from shore to shore. The summit level, regulated between 82 and 85 ft. above tide level, will lead, for about 1 m., from a large dam at Gatun to a smaller one at Pedro Miguel, and is to be reached by a flight of 3 locks at the former point. The Gatun dam will be 7200 ft. long along the crest including the spillway, will have a maximum width at its base of 2000 ft., and will be uniformly 100 ft. wide at its top, which will rise 115 ft. above sea-level. The lake (Lake Gatun) enclosed by these dams will be 1644 sq. m., and will constitute a reservoir for receiving the flow from the Utria Cisterns and for supplying water for joclague. A smaller lake (Lake Miraflores), with a surface elevation of 55 ft. and an area of about 2 sq. m., will extend from a lock at Pedro Miguel to Miraflores, where it forms the Canal mouth.

Corps of Engineers, will cut the earthwork from the west and a concrete dam with spillway on the east, and the canal is to descend to sea-level by a flight of two locks. All the locks are to be in duplicate, each lock having a capacity of 1000 tons, and are to be reached by a middle gate. The channel leading from deep water in the Caribbean sea to Gatun will be about 7 m. long and 500 ft. broad, increasing to 1000 ft. north of the locks in order to accommodate the passage for ships. From Gatun locks, 60 m., in length, the channel is to be 1000 ft. or more in width for a distance of nearly 16 m. to San Pablo. Thence it narrows first to 800 ft., and then for a short distance to 700 ft., for 44 m. to mile 27 near Juan Grande, and to 500 ft. for 44 m. from Juan Grande to Obispo (mile 31). From this point through the Caldera cut to Pedro Miguel lock, it will be only 300 ft. wide, but will widen again to 500 ft. through Miraflores lake, 7½ m. long, to Miraflores locks. The total length of which including approaches will be nearly a mile, and will thence maintain the same width for the remaining 8 m. to deep water on the Pacific. The minimum bottom width of the canal will thus be 500 ft. at the average being 609 ft., while the minimum depth will be 41 ft.

In 1909 it was estimated that the construction of the canal would be completed by the 1st of January 1915, and that the total cost to the United States would be $50,000,000, paid to the French Canal Company and the Republic of Panama, $7,217,000 for civil administration, and $20,005,000 for sanitation. The labor was one of the least necessary expenditures of the kind, as it was considered that these works would have greatly retarded the work or perhaps prevented it altogether.

PAN-AMERICAN CONFERENCES. At intervals delegates from the independent countries of North, Central and South America have met in the interests of peace and for the improvement of commercial relations and for the discussion of various other matters of common interest. A movement for some form of union among the Spanish colonies of Central and South America was inaugurated by Simon Bolivar while those colonies were still under the dominion of Spain. The United States, which in May 1822 had recognized their independence and in December 1823 had promulgated the Monroe Doctrine, was invited by the governments of Mexico and Colombia to send commissioners to a congress to be held at Panama in the following year. Henry Clay, the secretary of state, hoped the congress might be the means of establishing a league of American republics under the hegemony of the United States, and under his influence President J. Q. Adams accepted the invitation, giving notice however that the commissioners from the United States would not be authorized to vote on any of the resolutions, and that the United States would not attach itself to any other country toward Spain and her revolting colonies. The principal objects of the Spanish-Americans in calling the congress were, in fact, to form a league of states to resist Spain or any other European power that might attempt to interfere in America and to consider the expediency of freeing Cuba and Porto Rico from Spanish rule; but in his message to the Senate asking that body to approve his appointment of commissioners Adams declared that his object in appointing them was to manifest a friendly interest in the young republics, give them some advice, promote commercial reciprocity, obtain from the congress satisfactory definitions of the terms "blockade" and "neutral rights" and encourage religious liberty. In the Senate the proposed mission provoked a spirited attack on the administration. Some senators feared that it might be the means of dragging the United States into entangling alliances; others charged the President with having created the Monroe Doctrine to pledge to the southern republics that if the powers of Europe joined against them the United States would come to their assistance with arms and men; and a few from the slave-holding states wished to have nothing to do with the republics because they proposed to make Cuba and Porto Rico independent and liberate the slaves on those islands. The Senate finally, after a delay of more than ten weeks, confirmed the appointments. There was further delay in the House of Representatives, which was asked to make an appropriation for the mission; one of the commissioners, Richard C. Anderson (1789-1826), died on the journey. Fort Carre, on July 24, and in the other, Lieut. Sergeant (1770-1852), reached Panama the congress, consisting of representatives from Colombia, Guatemala, Mexico, Peru, and Bolivia, had met (June 22), concluded and signed a "treaty of union, league and perpetual confederation" and adjourned to meet again at Tacubaya, near the City of Mexico. The governments of Guatemala, Mexico and Peru refused to ratify the treaty and the Panama congress or conference was a failure. The meeting at Tacubaya was never held.

Mexico proposed another conference in 1837, and repeated the proposal in 1838, 1840 and 1846, but each time without result. In December 1847, while Mexico and the United States were at war, a conference of representatives from Bolivia, Chile, Ecuador, New Granada and Peru met at Lima, gave the other American republics the privilege of joining in its deliberations or becoming parties to its agreements, continued to deliberate until the 1st of March 1848, and concluded a treaty of confederation, a treaty of commerce and navigation, a postal treaty and a consular convention; but with the exception of the ratification of the consular convention by New Granada its work was rejected. Representatives from Peru, Chile and Ecuador met at Santiago in September 1856 and signed the "Continental Treaty," designed to promote the union of the Latin-American nations and to establish a system of the confederation under agreements as a consequence of the filibustering expeditions of William Walker (1824-1860); it never became effective. In response to an invitation from the government of Peru to each of the Latin-American countries, representatives from Colombia, Guatemala, Venezuela, Ecuador, Peru and Bolivia met in a conference at Lima in November 1864 to form a "union." Colombia was opposed to extending the invitation to the United States lest that country should "embrace the action of the Congress"; the conference itself accomplished little. In 1877-1878 jurists from Peru, Bolivia, Cuba, Chile, Ecuador, Honduras, Argentina, Venezuela and Costa Rica met at Lima and concluded a treaty of extradition and a treaty on private international law, and Uruguay and Guatemala agreed to adhere to them. War among the South American states prevented the holding of a conference which had been called by the government of Colombia to meet at Panama in September 1851 and of another which had been called by the government of the United States to meet at Washington in November 1882. In 1888-1889 jurists from Argentina, Bolivia, Brazil, Chile, Paraguay, Peru and Uruguay met at Montevideo and concluded treaties on international civil law, international commercial law, international penal law, international law of procedure, literary and artistic property, trade-marks and patents, several of which were subsequently ratified by the South American countries.
In May 1888 the Congress of the United States had passed an Act authorizing the President to invite the several Latin-American governments to a conference in Washington to consider measures for preserving the peace, the formation of a customs union, the establishment of better communication between ports, the adoption of a common silver coin, a uniform system of weights, measures, patent-rights, copyrights and trade-marks, the subject of sanitation of ships and quarantine, &c. All the governments except Santo Domingo accepted the invitation and this conference is commonly known as the first Pan-American Conference. It met on the 2nd of October 1889, was presided over by James G. Blaine, the American secretary of state, who had been instrumental in having the conference called, and continued its sessions until the 19th of April 1890. A majority of its members voted for compulsory arbitration, and recommended the establishment of an international system of courts, customs regulations, port duties, the free navigation of American rivers, sanitary regulations, a monetary union, weights and measures, patents and trade-marks, an international American bank, an intercontinental railway, the extradition of criminals, and several other matters. Nothing came of its recommendations, however, except the establishment in Washington of an International Bureau of American Republics for the collection and publication of information relating to the commerce, products, laws and customs of the countries represented. At the suggestion of President McKinley the government of Mexico called the second Pan-American Conference, a constitutional assembly of the City of Mexico on the 22nd of October 1901. There was a full representation and the sessions were continued until the 31st of January 1902. The chief subject of discussion was arbitration, and after much wrangling between those who insisted upon compulsory arbitration and those opposed to it a majority of the delegations signed a project whereby their countries should become parties to the Hague conventions of 1899, which provide for voluntary arbitration. At the same time ten delegations signed a project for a treaty providing for compulsory arbitration. The conference also approved a project for a treaty whereby controversies arising from pecuniary claims of individuals on one country against the government of another should be submitted to the arbitration court established by the Hague conference. The conference ratified a resolution of the first conference recommending the construction of complementary lines of the proposed Pan-American railroad.

At this conference, too, the International Bureau of American Republics was organized under a governing board of diplomatists with the secretary of state of the United States as chairman; it was directed to publish a monthly bulletin, and in several other respects was made a much more important institution. Its governing board was directed to arrange for the third Pan-American Conference, and this body was in session at Rio de Janeiro from the 21st of July to the 26th of August 1906. Delegates attended from the United States, Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, San Domingo, Ecuador, Guatemala, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, Salvador and Uruguay; Haiti and Venezuela were not represented. The secretary of state of the United States, Elihu Root, though not a delegate, addressed the conference. The subjects considered were much the same as at the two preceding conferences. With respect to arbitration this conference passed a resolution that the delegations from the American republics to the second conference at the Hague be instructed to endeavour to secure there "the celebration of a general arbitration convention so effective and definite that, merit[ing] the approval of the civilized world, it shall be accepted and put in force by every nation." With respect to copyrights, patents and trademarks this conference re-affirmed the conventions of the second conference, with some modifications; with respect to naturalization it recommended that whenever a native of one country who has been naturalized in another again takes up his residence in his native country without intending to return to his adopted country he should be considered as having re-assumed his original citizenship; and with respect to the forcible collection of public debts to which the "Drago Doctrine" is opposed, the conference recommended that "the Governments represented therein consider the point of inviting the Second Peace Conference at the Hague to consider the question of the compulsory collection of public debts, and, in general, means tending to diminish between nations conflicts having to do with diplomatic immunity." The fourth Conference met in Buenos Aires in July—August 1910, agreed to submit to arbitration such money claims as cannot be amicably settled by diplomacy, and renamed the Bureau the Bureau of Pan-American Union.²

The first Pan-American scientific congress met at Santiago, Chile, on the 25th of December 1908 for the consideration of distinctly American problems. It continued in session until the 5th of January 1909, and resolved that a second congress for the same purpose should meet at Washington in 1912.

See International American Conference, Reports and Recommendations (Washington, 1890), and especially the Historical Appendix.

Panathenaeus, the oldest and most important of the Athenian festivals. It was originally a religious celebration, founded by Erechtheus (Erichthonius), in honour of Athena Polias, the patron goddess of the city. It is said that when Theseus united the whole land under one government he made the festival of the city-goddess common to the entire country, and changed the older name Athena to Panathenaea (Plutarch, Theseas, 24). The union (Synoeism) itself was celebrated by a distinct festival, called Synoeia or Synoeceia, which had no connection with the great Panathenaeum, or with the Ionic Panathenaeum. In the latter there is said to have been a chariot race from the earliest times, in which Erechtheus himself won the prize. Considerable alterations were introduced into the proceedings by Peisistratus (q.v.) and his sons. It is probable that the distinction of Greater and Lesser Panathenaea dates from this period, the latter being a shorter and simpler festival held every year. Every fourth year the festival was celebrated with peculiar magnificence; gymnastic sports were added to the horse races; and there is little doubt that Peisistratus aimed at making the pentetic Panathenaea the great Ionian festival in rivalry to the Dorian Olympia. The pentetic festival was celebrated in the third year of each Olympiad. The annual festival, probably held on the 28th and 29th of Hecatomboeion (about the middle of August), consisted solely of the sacrifices and rites proper to this season in the cult of Athena. One of these rites originally consisted in carrying a new peplos (the state robe of Athena) through the streets to the Acropolis to clothe the ancient carved image of the goddess, a ceremonial known in other cities and represented by the writer of the IIiad (vi. 87) as being in use at Troy; but it is probable that this rite was afterwards restricted to the great Ionic Panathenaeum. In addition to the religious rites there is said to have been a chariot race from the battle between the gods and giants, in which Athena had taken part. At least as early as the 3rd century b.c. the custom was introduced of spreading the peplos like a sail on the mast of a ship, which was rolled on a machine in the procession. Even the religious rites were celebrated with much greater splendour at the greater Panathenaea. The whole empire shared in the great sacrifice; every colony and every subject state sent a deputation and sacrificial animals. On the great day of the feast there was a procession of the priests, the sacrificial assistants of every kind, the representatives of every part of the empire with their victims, of the cavalry, in short of the population of Attica and

¹ So named from a note (1902) directed by Dr Don Louis Maria Drago, the Argentine minister of foreign affairs, to the Argentine diplomatic representative at Washington at the time of the difficulties of Venezuela incident to the collection of debts owed to foreigners by that country.

² The Bureau is supported by contributions, varying in amount according to population, of the twenty-one American republics. Andrew Carnegie contributed $75,000 and the various republics $25,000 for the erection of a permanent home for the Bureau in Washington. The Bureau has a library of some 15,000 volumes, and publishes numerous handbooks, pamphlets and maps, in addition to its monthly Bulletins. Its executive head is a director, chosen by the Governing Board.
great part of its dependencies. After the presentation of
the peplus, the hecatomb was sacrificed. The subject of the frieze of
the Parthenon is an idealized treatment of this great procession.

The festival which had been beautified by Peisistratus was
made still more imposing under the rule of Pericles. He intro-
duced a regular musical contest in place of the old recitations of
the rhapsodes, which were an old standing accomplishment of
the bards. The Parthenon and a great wing of the Erechtheum
had been built for this purpose by Pericles himself. The order of
the ages from this time onwards was—first the musical, then
the gymnastic, then the equestrian contest. Many kinds of contest,
such as the chariot race of the apobatés (said to have been
introduced by Erychthius), which were not in use at Olympia,
were practised in Athens. Apobates was the name given to
the companion of the charioteer, who showed his skill by leaping
out of the chariot and up again while the horses were going at
full speed. There were in addition several minor contests: the
Pyrrhik, or war dance, celebrating the victory of Athens
over the giants; the Eukandria, whereby a certain number of
men, distinguished for height, strength and beauty, were
chosen as leaders of the procession; the Lampsádromía, or
torch-race; the Neumáchis (Regatta), which took place on the
last day of the festival. The proceedings were under the super-
tendence of ten athlaoikae, one from each tribe, the lesser
Panathenae by managing by hieroequi. In the musical
contests, a golden crown was given as first prize; in the sports,
a garland of leaves from the sacred olive trees of Athens, and
vases filled with oil from the same. Many specimens of these
Panathenaic vases have been found; on one side is the figure of
Athens, on the other a design showing the nature of the com-
petition in which they were given as prizes. The season of the
festival was the 24th to the 29th of Hecatombaeon, and the
great day was the 28th.

Parthenon (1871), with full bibliography; P. Stengel, Die
griechischen Kultusverleger (1898); L. C. Purser in Smith’s Dic-
tionary of Antiquities (3rd ed., 1891); L. R. Farnell, Cults of the Greek
States: also article ATHENA and works quoted.

PANCH MAHALS — Five Districts, a district of British
India, in the northern division of Bombay. Arca, 1664 sq. m.,
pop. (1901), 261,020, showing a decrease of 17% in the decade,
even to famine. The administrative headquarters are at
Godhra, pop. (1901), 20,815. Though including Champaner,
the old Hindu capital of Gujarat, now a ruin, this tract has no
history of its own. It became British territory as recently as
1861, by a transfer from Sindli; and it is the only district of
Bombay proper that is administered on the non-regulation
system, the collector being also political agent for Rewa
Kantha. It consists of two separate parts, divided by the territory
of a native state. The south-western portion is for the most part
a level plain of rich soil; while the northern, although it com-
promises some fertile valleys, is generally rugged, undulating
and barren, with but little cultivation. The montane portion
of the Traps sandstone, granite and other kinds of building stone.
Mining for manganese on a large scale has been begun by a
European firm, and the iron and lead ores may possibly become
profitable. Only recently has any attempt been made to con-
serve the extensive forest tracts, and consequently little timber
of any size is to be found. The principal crops are maize,
millet, rice, pulse and oilseeds; there are manufactures of
lac bracelets and lacquered toys; the chief export is timber.
Both portions of the district are crossed by the branch of
the Bombay and Baroda railway from Anand, through Godhra
and Dharoda, to a cross road line, opened in 1904, runs from
Godhra to Baroda city. The district suffered very severely
from the famine of 1899–1900.

PANCREAS (Gr. bás, all; kpées, flesh); or sweetbread, in
anatomy, the elongated, tongue-shaped, digestive gland, of
a pinkish colour, which lies across the posterior wall of the abdomen
about the level of the first lumbar vertebra behind, and of
the transpyloric plane in front (see Anatomy: Superficial and Artis-
tic). Its right end is only a little to the right of the mid line
of the abdomen and is curved down, round the superior med-
enteric vessels, into the form of a c. This hook-like right end
is known as the head of the pancreas, and its curvature is adapted
to the concavity of the duodenum (see fig.) The first inch of
the straight limb is narrower from above downward than the
rest and forms the neck. This part lies just in front of the
beginning of the portal vein, and below the lower opening of
the stomach and just above the superior mesenteric vessels.
The next three or four inches of the pancreas, to the left of the
neck, form the body and this part lies in front of the left kidney
and adrenal body, while it helps to form the posterior wall of
the stomach chamber (see Alimentary Canal). At its
left extremity the body tapers to form the tail, which usually
touches the spleen (see Ductless Glands) just below the
hilum, and above the basal triangle of that viscus where the
splenic flexure of the colon is situated. On the upper border
of the body, a little to the left of the mid line of the abdomen, is
a convexity or hump, which is known as the tuber eminente
of the pancreas, and touches the elevation (bearing the same
name) on the liver.

The pancreas is altogether behind the peritoneum. In its
larger parts it is covered in front by the lesser sac (see C O L O M B I A N
MEMBRANES), but the lower part of the front of the head and the
very narrow lower surface of the body are in contact with the
greater sac. There is one main duct of the pancreas, which is
said to have been described by Wirsung (1871), which is
white, and runs the whole length of the organ near the back than
the front. As it reaches the head it turns downward and opens
separately at the apex into a duct, the main duct, on the one
side while they are both piercing the walls of the gut. A smaller
accessory pancreatic duct is found, which communicates with
the main duct and usually opens into the duodenum about three-
quarters of the way from the head of the gland. From the
lower part of the head, and either crosses or communicates with
the duct of Wirsung to reach its opening (see A. M. Schirmer,

In the pancreas, there is a glandular system, which has
many ramifications, these ducts are divided into two groups;
the first forms a series of lobules, which are merely held together by their ducts and by loose areolar tissue; the glands of these lobules are made up of the acinar-tubular variety (see EXOCRINE, TISSUES). Small groups of
epitheilum-like cells without ducts (i.e. Langerhans) occur
among the glandular tissue and are characteristic of the pancreas.

In cases of diabetes they sometimes degenerate. In the centre
of the pancreas the main glandular tissue of the pancreas are
often found spindle-shaped cells (centro-acinar cells of Langerhans).
For details of microscopic structure see Essentails of Histology,
by E. A. Schafer (London, 1907).

The pancreas is developed, by three diverticula from that part of the forset which will later form the duodenum. Of these diverticula the left ventral disappears early, but the right ventral, which is really an outgrowth from the lower part of the duodenum, is continued in the duct of Wirsung, which closes and turns its tail are formed from the dorsal diverticula, and the two
parts, at first separate, join one another so that the ducts communi-
icate. The right ventral part of the pancreas lies about all the secretions of the gland to the inside of the leaf on the left side of the gut, which is nearest the duodenum atrophy and forms the duct of Santorini.

The main pancreatic duct (of Wirsung) is therefore formed partly
by the ventral and partly by the dorsal diverticulum. As the diverticula grow they give off lateral branches, which branch
again and again until the terminal buds form the acini of the
gland. At first the pancreas grows upward, behind the stomach,
between the two layers of the dorsal mesogastrium (see Coelom
and Serous Membranes), but when the stomach and duodenum
turn over to the right, the gland becomes horizontal and the opening
of the right ventral diverticulum becomes more dorsal. Later,
the growth of the gland is more or less parallel with the gut on its left side where the papilla is permanently situated. After
the turning over of the pancreas to the right the peritoneum is
pushed forward from its dorsal position and the gland in its new
position are now regarded as portions of the glandular epithelium which have
been isolated by the invasion and growth round them of mesenchyme
(see Quain’s Anatomy, vol. 1, 1908).

Anatoly (Amphioous) no representative of a pancreas has been found, but in the Cystostoma
(hag and lampreys) there is a small lobular gland opening into the bile duct which probably represents it. In the Elasmobranchs
(men), there is a definite but pancreas like gland of considerable
size, in the Teleostomi, which include the true bony fish (Teleostei), the sturgeon and Polycterus, the pancreas is sometimes

1 N. W. Ingalls has shown (Archiv. f. mik. Anat. und Entwickel., Bd. 70, 1907), that in a human embryo of 4-9 mm. the two ventral buds persist and join one another below the liver bud.
a compact gland and sometimes diffuse between the layers of the mesentery; at other times it is so surrounded by the liver as to be difficult to find.

Among the Dipnoi (mud fish), Protoperus has it embedded in the walls of the stomach and intestine.

The Amphibia have a definite compact pancreas which lies in the U-shaped loop between the stomach and duodenum, and is massed round the bile duct. In the Reptilia there are sometimes several ducts, as in the crocodile and the water tortoise (Emys), and this arrangement is also found in birds (the pigeon, for instance, has three ducts opening into the duodenum at very different levels). In mammals the gland is usually compact, though

into the pancreas is of some medicolegal importance as being a cause of death. The condition is rarely recognized in time for operative interference. Acute haemorrhagic pancreatitis is a combination of inflammation with haemorrhage in which the pancreas is found enlarged and infiltrated with blood. Violent pain, vomiting and collapse, are the chief features as is also the case in pancreatic abscess in which the abscess may be single or multiple. In the latter case operation has usually followed by recovery. Haemorrhagic inflammation has been followed by gangrene of the pancreas, which usually terminates fatally. In two remarkable cases, however, reported by Chiari recovery followed on the discharge per rectum of the necrosed pancreas. Chronic pancreatitis is said by

an X-ray to occur in connexion with the symptoms of catarrhal jaundice, which he suggests is due to the pressure on the common duct by the swollen pancreatic tissue. The organ is enlarged and very hard, and the symptoms are pain, dyspepsia, jaundice, loss of weight and the presence of fat in the stools. This latter sign is common to all forms of pancreatic disease. In connexion with all pancreatic diseases small yellowish patches are found in the pancreatic tissue, mesentery, omentum and abdominal fatty tissue generally, and the tissues appear to be studded with whitish areas often not larger than a pin's head. The condition, which was

From Ambrose Birmingham, Cunningham's Text Book of Anatomy.

Fig. 1.—The Viscera and Vessels on the Posterior Abdominal Wall.

The stomach, liver and most of the intestines have been removed. The peritoneum has been preserved on the right kidney, and the fossa for the vena cava was left behind. The stomach-bed is acid injections.

Mayo Robson to occur in connexion with the symptoms of catarrhal jaundice, which he suggests is due to the pressure on the common duct by the swollen pancreatic tissue. The organ is enlarged and very hard, and the symptoms are pain, dyspepsia, jaundice, loss of weight and the presence of fat in the stools. This latter sign is common to all forms of pancreatic disease. In connexion with all pancreatic diseases small yellowish patches are found in the pancreatic tissue, mesentery, omentum and abdominal fatty tissue generally, and the tissues appear to be studded with whitish areas often not larger than a pin's head. The condition, which was
PANDA—PANDURA

...first observed by Balzer, has been termed "fat-necrosis." The pancreas like other organs, is subject to the occurrence of new growths, tumours and cysts, sphynx and tuberculosis.

PANDA (Adelirus fulgens), a carnivorous mammal of the family Procyonidae (see Carnivora). This animal, rather larger than a cat, ranges from the eastern Himalaya to north-west China. In the former area it is found at heights of from 7000 to 12,000 ft. above the sea, among rocks and trees, and chiefly feeds on fruits and other vegetable substances. Its fur is of a remarkably rich reddish-brown colour, darker below; the face is white, with the exception of a vertical stripe of red from just above the eye to the gape; there are several pale rings on the tail, the tip of which is black.

PANDARUS, in Greek legend, son of Lycaon, a Lycean, one of the heroes of the Trojan war. He is not an important figure in Homer. He breaks the truce between the Trojans and the Greeks by treacherously wounding Menelaus with an arrow, and finally he is slain by Diomedes (Homer, Iliad, ii. 827, iv. 88, v. 290). In medieval romance he became a prominent figure in the tale of Troilus and Criseida. He encouraged the armour in the Trojan prince and his niece Criseida; and the word "pander" has passed into modern language as the common title of a lover's go-between in the worst sense.

PANDECTS (Lat. pandecta, adapted from Gr. πανδέκτης, all-containing), a name given to a compendium or digest of Roman law compiled by order of the emperor Justinian in the 6th century (A.D. 530-533). The pandects were divided into fifty books, each book containing several titles, divided into laws, and the laws into several parts or paragraphs. The number of jurists from whose works extracts were made is thirty-nine, but the writings of Ulpian and Paulus make up quite half the work. The work was declared to be the sole source of non-statute law: commentaries on the compilation were forbidden, or even the citing of the original works of the jurists for the explaining of ambiguities in the text. See JUSTINIAN; and ROMAN LAW.

PANDERMA (Gr. Πανδέρμος), a town of Asia Minor, on the south shore of the Sea of Marmora, near the site of Cyzicus. It has a trade in cereals, cotton, opium, valonia and borax, and is connected by a carriage road with Balikseri. Pop. 10,000 (7,000). See HOWARD, "Modern Turkey in Pictures," 3rd Ed., p. 39.

PANDHARPUR, a town of British India, in Sholapur district of Bombay, on the right bank of the river Bhima, 38 m. W. of Sholapur town. Pop. (1901), 32,405. Pandharpur is the most popular place of pilgrimage in the Deccan, its celebrated temple being dedicated to Vithoba, a form of Vishnu. Three assemblages are held annually. In 1906 a light railway was opened to Pandharpur from Barts Road on the Great Indian Peninsula railway.

PANDORA (the "All-giving") in Greek mythology, according to Hesiod (Theog. 570-642) the first woman. After Prometheus had stolen fire from heaven and bestowed it upon mortals Zeus determined to counteract this blessing. He accordingly commissioned Hephaestus to fashion a woman out of earth, upon whom the gods bestowed their choicest gifts. Hephaestus gave her a human voice, Aphrodite beauty and powers of seduction, Hermes cunning and the art of flattery. Zeus gave her a jar (φιάλα), the so-called "Pandora's box" (see below), containing all kinds of misery and evil, and sent her, thus equipped, to Epimetheus, who, forgetting the warning of his brother Prometheus to accept no present from Zeus, made her his wife. Pandora afterwards opened the jar, from which all manner of evils flew out over the earth (for parallels in other countries, see Frazer's Pausanias, ii. 320). Hope alone remained at the bottom, the lid having been shut down before she escaped. (Hesiod, W. and D. 54-165). According to a later story, the jar contained, not evils, but blessings, which would have been preserved for the human race, had they not been lost through the opening of the jar out of curiosity by man himself (Babrius, Fab. 58).

See J. E. Harrison, "Pandora's Box," in Journal of Hellenic Studies, xx. (1900), in which the opening of the jar is explained as an aetiological myth based on the Athenian festival of the Pithoigia (part of the Anthesteria, q.v.), and P. Gardner, "A New Pandora (Pandora, 1901)." Pandora is only another name for the Earth goddess, who is conceived as releasing evil spirits from the jar, which served the purpose of a grave (cf. the removal of the lapith maenads from the maenads, a circular pit at Rome supposed to be the site of an old Roman temple, where women of the matron age, instead of passing away of their own accord on reaching the tender age, had an opportunity of revisiting earth was afforded the dead). See also O. Gruppe, Griechische Mythologie (1906), i. 94.

PANDUA, a ruined city in Malda district of Eastern Bengal and Assam, once a Mahomedan capital. It is situated 7 m. N.E. of Malda, and about 25 m. from the other great medieval city of Gaur (q.v.), from which it was largely built. It was probably originally an outpost of Gaur, and grew in importance as Gaur became unhealthy. In A.D. 1553 Haji Shamsuddin Ilyas, the first independent king of Bengal, transferred his capital from Gaur to Pandua; but the time of its prosperity was short, and in 1543 the capital was transferred back to Gaur. Its only celebrated building is the Adina Mosque, which was described by James Ferguson as the finest example of Pathan architecture in existence. This great mosque was built by Sikandar Shah in 1695 (see Indian Architecture). Pandua now, like Gaur, is almost entirely given over to the jungle.

PANDULPH [PANDOLFO] (d. 1226), Roman ecclesiastical politician, papal legate to England and bishop of Norwich, was born in Rome, and first came to England in 1211, when he was commissioned by Innocent III. to negotiate with King John. Obtaining no satisfactory concessions, he is said to have produced the papal sentence of excommunication in the very presence of the king. In May 1213 he again visited England to receive the king's submission. The ceremony took place at Dover, and on the following day John, of his own motion, formally surrendered England to the representative of Rome to receive the same again in a formal act. Pandulph repaid this act of humility by using every means to avert the threatened French invasion of England. For nearly a year he was superseded by the cardinal-legate Nicholas of Tusculum; but returning in 1215 was present at the conference of Runnymede, when the great charter was signed. He rendered valuable aid to John who rewarded him with the see of Norwich. The arrival of the cardinal-legate Guado (1216) relegated Pandulph to a secondary position; but after Guado's departure (1218) he came forward once more. As representing the pope he claimed a control over Hubert de Burgh and the other ministers of the king (Innocent III.: 1217, 1218). He was一点也不ŪŠ, and so entered in every department of the administration. His arrogance was tolerated while the regency was still in need of papal assistance; but in 1221 Hubert de Burgh and the primate Stephen Langton successfully moved the pope to recall Pandulph and to send no other legate a latere in his place. Pandulph retained the see of Norwich, but from this time drops out of English politics. He died in Rome on the 16th of September 1226 but his body was taken to Norwich for burial.

See W. Shirley, "Royal and Other Historical Letters ("Rolls series") vol. i, Miss K. Norgate, John Lutchard (1902); W. Stubbs, Constitutional History (1897) i. 47.

PANDURA (tanbura, tanbar, tanbora, mandore, pandore, bandeero, &c.), an ancient oriental stringed instrument, a member of the lute family, having a long neck, a highly-vaulted back, and originally two or three strings plucked by the fingers. There were in antiquity at least two distinct varieties of pandura, or tanbura. (1) The more or less pear-shaped type used in Assyria and Persia and introduced by way of Asia Minor into Greece, whence it passed to the Roman empire. In this type the body, when the graceful inward curves which led up gradually from base to neck were replaced by a more sloping outline, approximated to an elongated triangle with the corners rounded off. (2) The oval type, a favourite instrument of the Egyptians, also found in ancient Persia and among the Arabs of North Africa, who introduced it into Spain. Our definite knowledge of the pandura is derived from the treatise on music by Fārābī, the Arab scholar who flourished...
in the 10th century. He mentions two kinds of tanburs, devo-
ting to each a chapter, i.e. the tanbur of Khurasan, the Persian
type, and the tanbur of Bagdad, the Assyrian variety; these
differ in form, in length, and in the arrangement of the frets.
Unfortunately, Farabi does not describe the shape of the body,
being satisfied with giving the number of strings and the
number of frets. He says only that the strings are parallel to
the instrument; but means of identification are supplied by
ancient monuments. There is a tanbur on an Assyrian bas-
relief of the reign of Assur-nasir-pal, c. 880 B.C. (British Museum),
on a slab illustrating camp life; the musician is playing on a
peared-shaped tanbur with a very long slender neck, which would
have served for two strings at the most, while two men, dis-
guised in the skins of wild beasts, are dancing in front of him.

There were in Farabi’s day five frets at least, whereas on the
tanbur of Khurasan there were no fewer than eighteen, which
together with the new-shaped instrument and the frets fixed or
invariable in position, the thirteen others being interpolated between them. The fixed frets, counting from
the nut, gave an interval of one tone to the first, of a
fourth to the second, of a fifth to the third, of an octave to the
fourth, and of a major ninth to the fifth, thus providing a suc-
cession of fourths and fifths. The additional frets were placed
between these, so that the octaves generally contained seventeen
intervals of one-third tone each. The two principal accuracies
for the tanbur of Khurasan were the marriage when the strings
were in unison, and the late or accordance in fourths. Farabi
mentions that the rebab was a suitable instrument for
the strings were generally two in number but sometimes three, were attached; they rested on a bridge provided with as many notches as there were strings.

In the tanbur of Khurasan they were wound round pegs placed
opposite each other in the two sides of the head, as in the modern violin.

Pollux states that the pandura was invented by the Assyrians or
Egyptians, and had three strings. Theodore Reinach is of
opinion that pandura was a generic term for instruments of the
late Antiquity, i.e. the Byzantine and the Mohammedan period.

For the purposes of this essay it will not be the case, but from the modern standpoint we cannot in our
classification afford to disregard the invariable characteristics
observed in the modern, no less than in the ancient and medieval,
tanburs or panduras.

It is possible to identify the pandura if it is as well to bear in mind
the characteristic features of other instruments with which it might
be confused. The tanbur had a long neck resembling a section of
a cylinder and a highly vaulted back, and its strings were
plucked. In the rebab the neck was wanting or at best rudimen-
tary, consisting of the gradual narrowing of the body towards the
head, which was divided, like the rebab, into the middle ages in Europe, as rebab,
and it was always a bowed instrument. The early lutes had larger
bodies than tanburs, the neck was short compared to the length
of the body, the head was generally bent back at right angles, and
in modern times they are often vaulted like the vaulting of the
Sta. Maria del Popolo. The barbon or bass lute had a long neck also,
but wider, to take six, seven, or even nine strings, and from the back or profile view the
general appearance was that of an ornamental shaped or
characteristic long neck of the tanbur.

Under the Romans the pandura had become somewhat modified;
the long neck was preserved but was made wider to take four or five
strings, and the body was either oval or slightly broader at the base, but
without the inward curves of the pear-shaped instruments.
A striking example of the former is to be seen among the marbles of
the Townley Collection at the British Museum on a bas-relief
illustrating the marriage feast of Eros and Psyche, a Roman sculpt-
ure. The pandura (from the Greek pandoros) had the appearance of the
archaeology of music, for the instrument can be studied in full and in
profile. The arrangement of the four pegs in the back of the
head of the oriental pandora.

The Persians had a six-stringed tanbur, which they distinguished
as the sheksha, whereas a three-stringed variety was known as the
sheksha.

The tanbur survived during the middle ages and as late as the
18th century; it may be traced in the musical documents of several
countries. In England the name of pandura or banister was
given to an instrument with two strings having no characteristic shape
and no longer in use, this instrument is described and figured by Proctor, who suggests that this
invention occurred in England as banister, is probably similar
to the Greek zourakas. The banister, we learn from an entry
in Sir Philip Laycester’s index to his commonplace book of 1575,
was invented by “John Rose dwelling in Bridewell anno 410
Elizabeth, who left a son warre exceeding himselfe in making in
strumente.”

A 17th-century French MS. (Add. 35042, fol. 144) in the British
Museum, containing drawings of musical instruments, shows the
tanbura, the not the English hybrid, but a true descendant of the
Greek zourakas. The banister, we learn from an entry
in Sir Philip Laycester’s index to his commonplace book of 1575,
was invented by “John Rose dwelling in Bridewell anno 410
Elizabeth, who left a son warre exceeding himselfe in making in
strumente.”

Symmachus and Ennodius, and panegyrics in verse by Claudian, Merobaudes, Priscian, Corippus and others.

Panel (O. Fr. panneau, mod. panneau, piece of cloth, from Med. Lat. panellus, diminutive of panus, cloth), a piece of cloth, slip of parchment, or portion of a surface of wood or stone enclosed in a compartment. In the first sense the word survives in the use of "panel" or "pannel" for the cloth-stuffed lining of a saddle. From the slip of parchment on which the list of jurors is drawn up by the sheriff, "panel" in English law is applied to a jury, who are thus said to be "empanelled." In Scots law the word is used of the indictment, and of the person or persons named in the indictment; "panel" is thus the equivalent of the English "prisoner at the bar." In building and architecture (Fr. panneau, Ital. quadretto, formelio; Ger. Feld) "panel" is properly used of the piece of wood framed within the stiles and rails of a door, filling up the aperture; but it is often applied both to the whole square frame and the sinking itself, and also to the ranges of sunken compartments in cornices, corbel tables, groined vaults, ceilings, &c. In Norman work these recesses are generally shallow, and more of the nature of arcades. In Early English work the square panels are ornamented with quatrefoils, cusped circles, &c., and the larger panels are often deeply recessed, and form niches with trefoil heads and sometimes canopies. In the Decorated style the cusping and other enrichments of panels become more elaborate, and they are often filled with shields, foliages, and sometimes figures. Towards the end of this period the walls of important buildings were often entirely covered with long or square panels, the former frequently forming niches with statues. The use of panels in this way became very common in the perpendicular work, the wall frequently being entirely covered with long, short and square panels, which latter are frequently richly cusped, and filled with every species of ornament, as shields, bosses of foliage, portcullis, lilies, Tudor roses, &c. Wooden panellings very much resembled those of stone, except in the Tudor period, when the panels were enriched by a varied design, imitating the plaits of a piece of linen or a napkin folded in geometric patterns of parallel lines.

The use of panels in this way became very common in the perpendicular work, the wall frequently being entirely covered with long, short and square panels, which latter are frequently richly cusped, and filled with every species of ornament, as shields, bosses of foliage, portcullis, lilies, Tudor roses, &c. Wooden panellings very much resembled those of stone, except in the Tudor period, when the panels were enriched by a varied design, imitating the plaits of a piece of linen or a napkin folded in geometric patterns of parallel lines.

Panenthism, the name given by K. C. F. Krause (q.v.) to his philosophic theory. Krause held that all existence is one great unity, which he called Wesen (Essence). This Essence is God, and includes within itself the finite unities of man, reason and nature. God therefore includes the world in Himself and extends beyond it. The theory is a conciliation of Theism and Pantheism.

Pangolin, the Malay name for one of the species of the scaly anteaters, which belong to the order Edentata (q.v.), and typify the family Maniidae and the genus Manis. These animals, which might be taken for reptiles rather than mammals, are found in the warmer parts of Asia and throughout Africa. Pangolins range from 1 to 3 ft. in length, exclusive of the tail, which may be much shorter than or nearly twice the length of the rest of the animal. Their legs are short, so that the body is only a few inches off the ground; the ears are very small; and the skin covered with long, worm-like, and used to capture ants. Their most striking characteristic is a series of broad, overlapping horny scales, which cover the whole animal, with the exception of the under surface of the body, and in some species the lower part of the tip of the tail. Besides the scales there are generally, especially in the Indian species, a number of isolated hairs, which grow between the scales, and are scattered over the soft and flexible skin of the belly. There are five toes on each foot, the claws on the first toe rudimentary, but the others, especially the third of the forearm, long, curved, and laterally compressed. In walking the fore-claws are turned backwards and inwards, so that the weight of the animal rests on the back and outer surfaces, and the points are thus kept from becoming blunted. The skull is long, smooth and rounded, with imperfect zygomatic arches, no teeth of any sort, and, in other ant-eating mammals, with the bony palate extending unusually far backwards towards the throat. The lower jaw consists of a pair of thin rod-like bones, welded to each other at the chin, and rather loosely attached to the skull by a joint which, instead of being horizontal, is tilted up at an angle of 45°, the outwardly-twisted conodes articulating with the inner surfaces of the long glenoid processes in a manner unique among mammals.

The genus *Manis*, which contains all the pangolins, may be conveniently divided into two groups, distinguished by geographical distribution and certain convenient, though not highly important, external characters. The Asiatic pangolins are characterized by having the central series of body-scales continued to the extreme end of the tail, by having many isolated hairs growing between the scales of the back, and by their small external ears. They all have a small naked spot beneath the tip of the tail, which is said to be of service as an organ of touch. There are three species: viz. *Manis javanica*, ranging from Burma, through the Malay Peninsula and Java, to Borneo; *M. aurita*, found in China, Formosa and Nepal; and the Indian Pangolin, *M. pentadactyla*, distributed over the whole of India and Ceylon. The African species have the central series of scales suddenly interrupted and breaking into two at a point about 2 or 3 in. from the tip of the tail; they have no hair between the scales, and no external ears. The following four species belong to this group: the long-tailed pangolin (*M. maccoura*), with a tail nearly twice as long as its body, and containing as many as forty-six caudal vertebrae, nearly the largest number known among Mammals; the white-bellied pangolin (*M. tricuspis*), closely allied to the last, but with longer three-lobed scales, and white belly hairs; and the short-tailed and giant pangolins (*M. temminckii* and *gigantea*), both of which have the tail covered entirely with scales. Those species with a naked patch on the under side of the tail can climb trees. The four species of the second group are found in West Africa, although some extend into south and eastern equatorial Africa.

Panin, Nikita Ivanovich, Count (1718–1783), Russian statesman, was born at Danzig on the 15th of September 1718. He passed his childhood at Pernau, where his father was commandant. In 1730 he entered the army, and rumours had it that he was one of the favourites of the empress Elizabeth. In 1747 he was accredited to Copenhagen as Russian minister,
but a few months later was transferred to Stockholm, where for the next twelve years he played a conspicuous part as the chief opponent of the French party. It is said that during his residence in Sweden Panin, who certainly had a strong speculative bent, conceived a fondness for constitutional forms of government. Politically he was a pupil of Alexis Bestuzhev; consequently, when in the middle 'fifties Russia suddenly turned "Francophile" instead of Francophone, Panin's position became extremely difficult. However, he found a friend in Bestuzhev's supplanter, Michael Vorontsov, and when in 1760 he was unexpectedly appointed the governor of the little grand duke Paul, his influence was assured. He was on Catherine's side during the revolution of 1762, but his jealousy of the influence which the Orlovs seemed likely to obtain over the new empress predisposed him to favour the proclamation of his ward the grand duke Paul as emperor, with Catherine as regent only.

To circumscribe the influence of the ruling favourites he next suggested the formation of a cabinet council of six or eight ministers, through whom all the business of the state was to be transacted; but Catherine, suspecting in the skillfully presented novelty a subtle attempt to limit her power, rejected it after some hesitation. Nevertheless, Panin continued to be indispensable. He owed his influence partly to the fact that he was the governor of Paul, who was greatly attached to him; partly to the peculiar circumstances in which Catherine had mounted the throne, and partly to his knowledge of foreign affairs. Although acting as minister of foreign affairs he was never made chancellor; but he was the political mentor of Catherine during the first eighteen years of her reign. Panin was the inventor of the 'Northern Accord,' which aimed at opposing a combination of Russia, Prussia, Poland, Sweden, and perhaps Great Britain, against the Bourbon-Habsburg League. Such an attempt to bind together nations with such different aims and characters was doomed to failure. Great Britain, for instance, could never be persuaded that it was as much in her interests as in the interests of Russia to subsidize the anti-French party in Sweden. Yet the idea of the "Northern Accord," though never quite realized, had important political consequences and influenced the policy of Russia for many years. It explains, too, Panin's strange tenderness towards Poland. For a long time he could not endure the thought of destroying her, because he regarded her as an indispensable member of his "Accord," wherein she was to supply the place of Austria, whom circumstances had temporarily detached from the Russian alliance. Poland, 'Panin-opined,' would be especially useful in case of Oriental combinations. All the diplomatic questions concerning Russia from 1762 to 1793 are intimately associated with his name. When, in 1783, after realizing the "Northern Accord" became patent that his influence began to wane, and Russia sacrificed millions of roubles fruitlessly in the endeavour to carry out his pet scheme.

After 1772, when Gustavus III. upset Panin's plans in Sweden, Panin, whose policy hitherto had been at least original and independent, became more and more subservient to Frederick II. of Prussia. As to Poland, his views differed widely from the views of both Frederick and Catherine. He seriously questioned the integrity of Polish territory, after placing Stanislaus II. on the throne; in order that Poland, undivided and as strong as circumstances would permit, might be drawn wholly within the orbit of Russia. But he did not foresee the complications which were likely to arise from Russia's interference in the domestic affairs of Poland. Thus the confederation of Bar, and the Turkish War thereupon ensuing, took him completely by surprise and considerably weakened his position. He was forced to acquiesce in the first partition of Poland, and when Russia came off third best, Gregory Orlov declared in the council that the minister who had signed such a partition treaty was worthy of death. Panin further suffered Catherine by his inability and perhaps unwillingness to go to the grass root of the matter and by advocating a closer alliance with Prussia, whereas the empress was beginning to incline more and more towards Austria. Nevertheless, even after the second marriage of Paul Panin maintained all his old influence over her pupil, who, like himself, was now a warm admirer of the king of Prussia. There are even traditions from this period of an actual conspiracy of Paul and Panin against the empress. As the Austrian influence increased Panin found a fresh enemy in Joseph II., and the efforts of the old statesman to prevent a matrimonial alliance between the Russian and Austrian courts determined Catherine to get rid of a counsellor of whom, for some mysterious reason, she was secretly afraid. The circumstances of his disgrace are complicated and obscure. The final rupture seems to have arisen on the question of the declaration of "the armed neutrality of the North," but we know that Potemkin and the English ambassador, James Harris (afterwards 1st earl of Malmesbury), were both working against him some time before that. In May 1783 Panin was dismissed. He died in Italy on the 31st of March 1783. Panin was one of the most learned, accomplished and courteous Russians of his day. Catherine called him "her encyclopaedia." The earl of Buckinghamshire declared him to be the most amiable negotiator he had ever met. He was also of a most humane disposition and a friend of Liberal institutions. As to his honesty and kindness of heart there were never two opinions. By nature a sybarite, he took care to have the best cook in the capital, and women had for him an irresistible attraction, though he was never married.

(R. N. B.)

PANIZZI, SIR ANTHONY (1707-1879), English librarian, was born at Brescello, in the duchy of Modena, Italy, on the 16th of September 1707. After taking his degree at the university of Parma, Antonio Panizzi became an advocate. A fervent patriot, he was implicated in the movement set on foot in 1821 to overturn the government of his native duchy, and in October of that year barely escaped arrest by a precipitate flight. He first established himself at Lugano, where he published an anonymous and now excessively rare pamphlet, generally known as I Processi di Ruben, an exposure of the monstrous injustice and illegality of the Modenese government's proceedings against suspected persons. Expelled from Switzerland at the joint instance of Austria, France and Sardinia, he came to England in May 1823, in a state bordering upon destitution. His countryman, Ugo Foscolo, provided him with introductions to William Roscoe and Dr William Shepherd, a Unitarian minister in Liverpool, and he earned a living for some time by giving Italian lessons. Roscoe introduced him to Brougham, by whose influence he was made, in 1828, professor of Italian at University College, London. His chair was almost a sinecure; but his abilities rapidly gained him a footing in London; and in 1831 Brougham, then lord chancellor, used his ex officio position as a principal trustee of the British Museum to obtain for Panizzi
the post of an assistant librarian of the Printed Book department. At the same time he was working at his edition of Boiard's *Orlando innamorato*. Boiard's fame had been eclipsed for three centuries by the adaptation of Berni; and it is highly to the honour of Panizzi to have redeemed him from oblivion and restored to Italy one of the very best of her narrative poets. His edition of the *Orlando innamorato* and the *Orlando furioso* was published between 1830 and 1834, preceded by a valuable essay on the influence of Celtic legends on medieval romance. In 1835 he edited Boiard's minor poems, and was about the same time engaged in preparing a catalogue of the library of the Royal Society.

The unsatisfactory condition and illiberal management of the British Museum had long excited discontent, and at length a trivial circumstance led to the appointment of a parliamentary committee, which sat throughout the sessions of 1835-1836, and probed the condition of the institution very thoroughly. Panizzi's principal contributions to its inquiries with regard to the library were an enormous mass of statistics respecting foreign libraries, and some admirable evidence on the catalogue of printed books then in contemplation. In 1837 he was appointed keeper of printed books. The entire collection, except the King's Library, had to be removed from Montague House to the new building, the reading-room service had to be reorganized, rules for the new printed catalogue had to be prepared, and the catalogue itself undertaken. All these tasks were successfully accomplished; but, although the rules of cataloguing devised by Panizzi and his assistants have become the basis of subsequent work, progress of the catalogue itself was slow. The first volume, comprising letter A, was published in 1841, and from that time, although the catalogue was completed and compiled in MS., no attempt was made to print any more until 1881. The chief cause of this comparative failure was injurious interference with Panizzi, occasioned by the impatience of the trustees and the public. Panizzi's appointment, as that of a foreigner, had from the first been highly unpopular. He gradually broke down opposition, partly by his social influence, but far more by the sterling merits of his administration and his constant efforts to improve the library. The most remarkable of these was his report, printed in 1845, upon the museum's extraordinary deficiencies in general literature, which ultimately procured the increase of the annual grant for the purchase of books to £50,000. His friendship with Thomas Grenville (1755-1836) led to the nation being enriched by the bequest of the unique Grenville Library, valued even then at £50,000. In 1847-1849 a royal commission sat to inquire into the general state of the museum, and Panizzi was the centre of the proceedings. His administration, fiercely attacked from many quarters, was triumphantly vindicated in every point. Panizzi immediately became by far the most influential official in the museum, though he did not actually succeed to the principal librarianship until 1856. It was thus as merely keeper of printed books that he conceived and carried out the achievement by which he is probably best remembered—the erection of the new library and reading-room. Purchases had been discouraged from lack of room in which to deposit the books. Panizzi cast his eye on the empty quadrangle enclosed by the museum buildings, and conceived the daring idea of occupying it with a central cupola too distant, and adjacent galleries too low, to obstruct the inner windows of the original edifice. The cupola was to cover three hundred readers, the galleries to provide storage for a million of books. The original design, sketched by Panizzi's own hand on the 18th of April 1852, was submitted to the Board of Trustees, the cost of nearly £50,000 being sanctioned by parliament, and the building was opened in May 1857. Its construction had involved a multitude of ingenious arrangements, all of which had been contrived or inspected by Panizzi, who had a genius for minute detail and a gift for mechanical invention.

Panizzi succeeded Sir Henry Ellis as principal librarian in March 1856. During his tenure of this post a great improvement was effected in the condition of the museum staff by the recognition of the institution as a branch of the civil service, and the decision was taken to remove the natural history collections to Kensington. Of this questionable measure Panizzi was a warm advocate; he was heartily glad to be rid of the naturalists. He had small love for science and its professors, and, as his friend Macaulay said, "would at any time have given three marmalades for one Aktes." Many important additions to the collections were made, during his administration, especially the Temple bequest of antiques, and the Halicarnassian sculptures discovered at Bodrum (Halicarnassus) by C. T. Newton. Panizzi retired in July 1866, but continued to interest himself actively in the affairs of the museum until his death, on the 8th of April 1870. He had been created a K.C.B. in 1869.

Panizzi had become a naturalized Englishman, but his devotion to the British Museum was rivalled by his devotion to his native land, and his personal influence with English Liberal statesmen enabled him often to promote his cause. Throughout the revolutionary movements of 1848-1849, and again during the campaign of 1859 and the subsequent transactions due to the union of Naples to the kingdom of upper Italy, Panizzi was in constant communication with the Italian patriots and their confidential representative with the English ministers. He laboured, according to circumstances, now to excite, now to mitigate, the English jealousy of France; now to moderate their apprehensions of revolutionary excesses; now to secure encouragement or compignance for Garibaldi. The letters addressed to him by patriotic Italians, edited by his literary executor and biographer, L. Fagan, alone compose a thick volume. He was charitably to his exile countrymen in England, and, chieflv at his own expense, equipped a steamer, which was lost at sea, to rescue the Neapolitan prisoners of state on the island of Santo Stefano. His services were recognized by the offer of a senatorship and of the direction of public instruction in Italy; these offers he declined, though in his latter years he frequently visited the land of his birth.

His administrative faculty was extraordinary; to the widest grasp he united the minutest attention to matters of detail. By introducing great ideas into the management of the museum he not only redeemed it from being a mere show-place, but raised the standard of library administration all over England. His moral character was the counterpart of his intellectual: he was warm-hearted and magnanimous; extreme in love and hate—a formidable enemy, but a devoted friend. His intimate friends included Lord Palmerston, Gladstone, Roscoe, Grenville, Macaulay, Lord Langdale and his family, Rutherford (lord advocate), and, above all perhaps, Francis Haywood, the translator of Kant. His most celebrated friendship, however, is that with Prosper Mérimée, who, having begun by seeking to enlist his influence with the English government on behalf of Napoleon III., discovered a congeniality of tastes which produced a delightful correspondence. Mérimée's part has been published by Fagan; Panizzi's persisted in the conflagration kindled by the Paris commune.

**PANJABI** (properly Pañjâbî), the language of the Central Punjab (properly Panjâb). It is spoken by over 71,000,000 people between (approximately speaking) the 77th and 74th degrees of east longitude. The vernacular of this tract was originally an old form of the modern Lahnda, a member of the outer group of Indo-Aryan languages (q.v.), but it has been overlaid by the expansion of the midland Sauraseni Prakrit (see Prakrit) to its east, and now belongs to the intermediate stage of the Indo-Aryan or Lahnda language, with occasional traces of the old outer basis which become more and more prominent as we go westwards. At the 74th degree of east longitude we find it merging into the modern Lahnda. The language is fully described in the article Hindostani.

**PANJDEH**, or Pindsh, a village of Russian Turkestan, rendered famous by the "Panjdeh scare" of 1885. It is situated on the east side of the Kushk river near its junction with the
PANNONIA—PANNA

Murghab at Puli-Khishi. In March 1885 when the Russo-Afghan Boundary Commission should have been engaged in settling the boundary-line, this portion of it was in dispute between the Afghans and the Russians. A part of the Afghan force was encamped on the west bank of the Koshki, and on the 20th of March General Komarev sent an ultimatum demanding their withdrawal. On their refusal the Russians attacked them at 3 a.m. on the 23rd of March and drove them across the Puli-Khishi Bridge with a loss of some 600 men. The incident nearly give rise to war between England and Russia; but the amir Abdur-Rahman, who was present at the Rawalpindi conference with Lord Dufferin at the time, affected to regard the matter as a mere frontier scuffle. The border-line subsequently laid down gives to Russia the territory between the Koshki and Murghab rivers as far as Maruchak on the Murghab, and the Koshki post now becomes the frontier post of the Russian army of occupation.

PANNA, or Penna, a native state of Central India, in the Bundelkhand agency. Area, 2,402 sq. m.; pop. (1901), 102,986, showing a decrease of 19% in the preceding decade due to famine; tribute £33,000. The chief, whose title is maharaja, is a rajput of the Bundela clan, descended from Chhatar Sal, the champion of the independence of Bundelkhand in the 18th century. The maharaja Lokpal Singh died in 1906, leaving an only son, Madho Singh, who, in 1902, was found guilty by a special commission on the charge of poisoning his uncle, and was deposed. The diamond mines, for which the state was formerly famous, are now scarcely profitable. There are no railways, but one or two good roads. The town of Panna is 62 m. S. of Banda. Pop. (1901), 11,346. It has a fine modern palace and several handsome temples and shrines.

PANNAGE (O. Fr. pâssage, from Med. Lat. pascuum, pascuum for pascolam, pascolam, pascolam, pasco; pasco; passeer, to feed), an English legal term for the feeding of swine in a wood or forest, hence used of a right or privilege to do this. The word is also used generally of the feeding of food, such as acorns, beech-mast, &c., on which the swine feed.

PANNIER (Fr. panier, Lat. panarium, a basket for carrying bread, panis), a basket for carrying bread or other provisions; more especially a broad, flat basket, generally slung in pairs across a mule, pony or ass for transport. The term has also been applied to an overskirt in a woman's dress attached to the back of the bodice and draped so as to give a "bunchy" appearance. At various times in the history of costume this appearance has been produced by a framework of padded whalebone, steel, &c., used to support the dress, such frameworks being known as "panners." At the Inner Court, London, there was formerly a "penny" known as a "pannier man," whose duties were concerned with procuring provisions at market, blowing the horn before meals, &c. The office has been in many of the inns long obsolete, and was formally abolished at the Inner Temple in 1900. At the Inner Temple the robed wains in hall have been called "panners," and apparently were in some way connected with the officer above mentioned, but the proper duties of the two were in no way identical.

PANNONIA, in ancient geography a country bounded north and east by the Danube, conterminous westward with Noricum and upper Italy, and southward with Dalmatia and upper Moesia. It thus corresponds to the south-western part of Hungary, with portions of lower Austria, Styria, Carniola, Croatia, and Slavonia. Its original inhabitants (Pannonii, sometimes called Pannoni by the Greeks) were probably of Illyrian race. From the 4th century B.C. it was invaded by various Celtic tribes, probably survivors of the hosts of Brennus, the chief of whom were the Carni, Scordisci and Taurisci. Little is heard of Pannonia until 35 B.C., when its inhabitants, having taken up arms in support of the Dalmatians, were attacked by Augustus, who conquered and occupied Siscia (Sisak). The country was not, however, definitely subdued until 9 A.D., when it was incorporated with Illyria, the frontier of which was thus extended as far as the Danube. In A.D. 7 the Pannonians, with the Dalmatians and other Illyrian tribes, revoluted, and were overthrown by Tiberius and Germanicus, after a hard-fought campaign which lasted for two years. In A.D. 10 Pannonia was organized as a separate province—according to A. W. Zinke (Studia romana), not till A.D. 20 at least, when the three legions stationed there mutinied after the death of Augustus (A.D. 14). Juvenal Blaesus is spoken of by Tacitus (Annals, i. 16) as legate of Pannonia and commander of the legions. The proximity of dangerous barbarian tribes (Quadi, Marcomanni) necessitated the presence of a large number of troops (seven legions in later times), and numerous fortresses were built on the bank of the Danube. Some time between the years 102 and 107, which marked the termination of the first and second Dacian wars, Trajan divided the province into Pannonia superior (11,346) and Pannonia inferior (11,346). According to Ptolomy, these divisions were separated by a line drawn from Arrabona (Raab) in the north to Servitium (Gradiška) in the south; later, the boundary was placed farther east. The whole country was sometimes called the Pannonias (Pannoniae). Pannonia superior was under the consular legate, who had formerly administered the single province, and had three legions under his control; Pannonia inferior at first under a praetorian legate with a single legion as garrison, after Marcus Aurelius under a consular legate, still with only one legion. The frontier on the Danube was protected by the establishment of the two colonies Aelia Murisra (Essa) and Aelia Aquincum (Alföd, modern Buda) by Hadrian.

Under Diocletian a fourfold division of the country was made. Pannonia inferior was divided into (1) Valeria (so called from Diocletian's daughter, the wife of Galerius), extending along the Danube from Altilimn (Molais) to Brigetio (O-Szöny), and (2) Pannonia secunda, round about Sirmium (Mitrovitz) at the meeting of the valleys of the Save, Drave, and Danube. Pannonia superior was divided into (3) Pannonia prima, its northern, and (4) Savia (also called Pannonia riparia), its southern part. Valeria and Pannonia prima were under a praeses and a dux; Pannonia secunda under a consularis and a dux; Savia under a dux and, later a corrector. In the middle of the 5th century Pannonia was ceded to the Huns by Theodosius II, and after the death of Attila successively passed into the hands of the Ostrogoths, Lombards (Lombards), and Avars.

The inhabitants of Pannonia are described as brave and warlike, but cruel and treacherous. Except in the mountainous districts, the country was fairly productive, especially after the great forests had been cleared by Probus and Galerius. Before that time timber had been one of its most important exports. Its chief agricultural products were oats and barley, from which the puck was brewed a kind of beer named sabora. Vines and olive-trees were little cultivated, the former having been first introduced in the neighbourhood of Sirmium by Probus. Salinaea (Celtic, nard) was a common growth, as in Noricum. Pannonia was also famous for its breed of hunting-dogs. Although no mention is made of its mineral wealth by the ancients, it is probable that it contained iron and silver mines. Its chief rivers were the Drave (Drav, Savus, Save), and Arrabo (Raab), in addition to the Danuvius (less correctly, Danubius), into which the first three rivers flow.

A native settlement consisted of pagi (cantons) containing a number of vici (villages), the majority of the large towns being of Roman origin. In Upper Pannonia were Vindobona (Vienna), probably founded by Vespasian; Carnuntum (q.v., Petronell); Arrabona (Raab), a considerable military station; Brigetio; Savaria or Sabaria (Stein-am-Anger), founded by Claudius, a frequent residence of the later emperors, and capital of Pannonia prima; Potaio (Pettau); Siscia, a place of great importance down to the end of the empire; Emona (Liaibach), later assigned to Italy; Naupontus (Ober-Liabach). In Lower Pannonia were Sirmium, first mentioned in A.D. 6, also a frequent residence of the later emperors; Sopianae (Fünfkirchen), seat of the præses of Valeria, and an important place at the meeting of five roads; Aquincum, the residence of the dux of Valeria, the seat of legio ii adjutrix.

PANOPLY, a complete suit of armour. The word represents the Gr. παισία (παί, all, and δείκτης, the) full armour of a hoplite or heavy armed soldier, i.e. the shield, breastplate, helmet and greaves, together with the sword. In later writers, applied to armours of a lighter kind. The term "panoply" did not come into use till the end of the 16th and beginning of the 17th century, and was then used of the complete suits of plate-armour covering the whole body. The figurative use of the word is chiefly due to the phrase ἡ πάνοπλι Ἰάω τοῦ Θεοῦ, "the whole armour of God" (Eph. vi. 11).

PANORAMA (Gr. παν, all, and ὄραμα, view), the name given originally to a pictorial representation of the whole view visible from one point by an observer who in turning round looks successively to all points of the horizon. In an ordinary picture only a small part of the objects visible from one point is included, far less generally given than the whole eye of the observer can take in whilst stationary. The drawing is in this case made by projecting the objects to be represented from the point occupied by the eye on a plane. If a greater part of a landscape has to be represented, it becomes more convenient for the artist to suppose himself surrounded by a cylindrical surface in whose centre he stands, and to project the landscape from this position on the cylinder. In a panorama such a cylinder, originally of about 60 ft., but now extending to upwards of 130 ft. diameter, is covered with an accurate representation in colours of a landscape, so that an observer standing in the centre of the cylinder sees the picture like an actual landscape in nature completely surround him in all directions. This gives an effect of great reality to the picture, which is skilfully aided in various ways. The observer stands on a platform representing, say, the flat roof of a house, and the space between this platform and the picture is covered with real objects which gradually blend into the picture itself. The picture is lighted from above, but a roof is spread over the central platform so that no light but that reflected from the picture reaches the eye. To make this light appear more brilliant, the passages and staircase which are part of the platform are kept in the shade. These panoramas, suggested by a German architectural painter named Breisig, were first executed by Robert Barker, an Edinburgh artist, who exhibited one in Edinburgh in 1788, representing a view of that city. A view of London and views of sea fights and battles of the Napoleonic wars followed. Panoramas gained less favour on the continent of Europe, until, after the Franco-German War, a panorama of the siege of Paris was exhibited in Paris. Since then some notable panoramas have been on view in the cities of Europe and America.

The name panorama, or panoramic view, is also given to drawings of views from mountain tops or other points of view, such as are found in many hotels in the Alps, or, on a smaller scale, in guide-books to Switzerland and other mountainous districts. In photography a panoramic camera is one which enables a wide picture to be taken.

PANPSYCHISM (Gr. πάν, all; ψυχή, soul), a philosophical term applied to any theory of nature which recognizes the existence of a psychical element throughout the objective world. In such theories not only animals and plants but even the smallest particles of matter are regarded as having some rudimentary kind of sensation or "soul," which plays the same part in relation to their objective activities or modifications as the soul does in the case of human beings. Such theories are the modern scientific or semi-scientific counterparts of the primitive animism of savage races, and may be compared with the hylozoism of the Greek physiologists. In modern times the chief exponents of panpsychist views are Thomas Carlyle, Fechner and Paulsen: a similar idea lay at the root of the physical theories of the Stoics.

PANSY, or HEARTSEASE. This flower has been so long cultivated that its source is a matter of uncertainty. As we now see it, it is a purely artificial production, differing considerably from any wild plant known. It is generally supposed to be a cultivated form of Viola tricolor (see VIOLET), a cornfield weed, while others assert it to be the result of hybridization between V. tricolor and other species such as V. alba, V. grandiflora, &c. Some experiments of M. Carrière go to show that seeds of the wild V. tricolor will produce forms so like those of the cultivated pansy that it is reasonable to assume that this flower has originated from the wild plant by continuous selection. The changes that have been effected from the wild type are,

Wild Pansy (Viola tricolor), about half nat. size.
1. Stamen, with spur.
2. Petal, after fertilization, cut lengthwise, showing the numerous partially attached ovules.

however, more striking to the eye than really fundamental.

Increase in size, an alteration in form, by virtue of which the narrow oblong petals are converted into circular ones, and variations in the intensity and distribution of the colour—these are the changes that have been wrought by continued selection, while the more essential parts of the flower have been relatively unaffected. The modern varieties of the pansy consist of the show varieties, and the fancy varieties, obtained from Belgium, and now very much improved. Show varieties are subdivided according to the colour of the flowers into single, white grounds and yellow grounds. The fancy or Belgian pansies have various colours blended, and the petals are blotched, streaked or edged. The bedding varieties, known as violas or tufted pansies, have been raised by crossing the pale-blue Viola cornuta, and also V. lutea, with the show pansies. They are harder than the true pansies and are free-blooming sorts marked rather by effectiveness of colour in the mass than by quality in the individual flower: they are extremely useful in spring and summer flower-gardening.

The pansy flourishes in well-enriched garden soil, in an open but cool situation, a loamy soil being preferable. Cow-dung is the best manure on a light soil. The established sorts are increased by cuttings, whilst seeds are sown to procure novelties. The cuttings, which should consist by preference of the smaller non-flowering growths from the base of the plant, may be inserted early in September, in sandy soil, under a hand-light or in boxes under glass, and

XX. 22 a
as soon as rooted should be removed to a fresh bed of fine sandy soil. The seeds may be sown in July, August, or September. The bed may be prepared early in September, to be in readiness for planting, by being well manured with cow-dung and trenched up to a depth of 2 ft. ’The plants should be planted in rows at about a foot apart. In spring the short shoots, as they lengthen should be pegged down into this enriched surface to induce the formation of new roots. If the blooms show signs of decay the flowers should be dead-headed, and their collection all the flowers should be picked off, and this top-dressing and pegging-down process performed in a thorough manner, watering in dry weather, and keeping as cool as possible. Successional beds may be planted in February to March, the young plants being struck later, and wintered in cold frames. The fancy pansies require similar treatment, but are generally of a more vigorous constitution. When grown in pots in a cold frame, about half a dozen shoots fall from each pot, and these are very handsome denum. The shoots are to be be cut early in August, and the plants shifted into their blooming-pots by the middle of October; a rich loose loamy compost is necessary to success, and they must be kept free of aphides. Both the potted plants and those grown in the open beds benefit by the use of liquid manure.

Pantaenus, head of the catechetical school at Alexandria, c. A.D. 180–200, known chiefly as having been the master of Clement, who succeeded him, and of Alexander, bishop of Jerusalem. Clement speaks of him as the “Sicilian bee,” but of his birth and death nothing is known. Eusebius and Jerome speak of him as having been, originally at least, a Stoic, and as having been sent on account of his zeal and learning, as a missio- nary, to the Malabar coast. There is some reason to think that this means the Malabar coast. There was a considerable intercourse between south India and the east Mediterranean, and Clement thought possibly did something to mould the great system of Tamil philosophy known as the Saiva Siddanta. Pantaenus “expounded the treasures of divine doctrine both orally and in writing,” but only a few brief reminiscences of his teaching are extant (see Routh, Rel. soc. i. 375–383). Lightfoot suggests that the conclusion of the well-known Epistle to Diog- nesus, chs. 11, 12, may be the work of Pantaenus. Clement thought highly of his abilities, and Origen appeals to his authority in connexion with the inclusion of philosophy in the theological course.

Pantalone (Ital. pantalone), a character in the old Italian popular comedy, said to represent a Venetian, from the favourite Venetian saint San Pantalone, and transferred from it to pantomine (q.v.). The Italian pantalone was always a silly old man, with spectacles and wearing slippers, and his character was maintained in pantomime and has also made his name a synonym for a tottering dottard, as in Shakespeare’s As You Like It (11. vii. 158). From the Venetian usage the word “panta- lone” (of which pantaloons) has also been given to certain forms of garments for the legs, the exact meaning varying at different times.

Pantotechnic, an invented word, from Gr, πάντα, all, and τεχνης, of art, belonging to the arts (τεχνης), originally used as the name of a bazaar in which all kinds of artistic work was sold; it was established in Motcomb Street, Belgrave Square, London, early in the 19th century, but failed and was turned into a furniture depository, in which sense the word has now passed into general usage. The large vans used for removing furniture are hence known as pantotechnic vans or pantech- nisms.

Pantelleria, or Pantalara (ancient Casura?), an island in the Mediterranean, 62 m. S. by W. of the south-western extremity of Sicily, and 44 m. E. of the African coast, belonging to the Sicilian province of Trapani. Pop. (1901), 8683. It is entirely of volcanic origin, and about 45 sq. m. in area; the highest point, an extinct crater, is 2743 ft. above sea-level. Hot mineral springs and effusions of steam still testify to the presence of volcanic activity. The island is fertile, but lacks fresh water. The principal town (pop. about 3000) is on the north-west, upon the only freshwater lake (fit for small seamen), which is fortified. There is also a penal colony here. The island can be reached by steamer from Trapani, and lies close to the main route from cast to west through the Mediterranean. In 1905 about 300,000 gallons of wine (mostly sweet wine), and 1900 tons of dried raisins, to the value of £340,000, were exported.

On the west coast, 2 m. south-east of the harbour, a neolithic village was situated, with a rampart of small blocks of obsidian, about 35 ft. high, 33 ft. wide at the base and 16 ft. at the top, on the undefended eastern side: within it remains of houses were found, with pottery, tools of obsidian, &c. The objects discovered are in the museum at Syracuse. To the south-east, in the district known as the Cuneile, are a large number of tombs, known as seii, similar in character to the nuraghi of Sardinia, though of smaller size, consisting of round or elliptical towers with sepulchral chambers in them, built of rough blocks of lava. Fifty-seven of them can still be traced. The largest is an ellipse of about 60 by 66 ft., but most of the seii have a diameter of 25–35 ft. only. The identical character of the pottery found in the coast of the seii is, in one prehistoric and in Earlier philology to a very early stage. The former are the tombs of the inhabitants of the latter. This population came from Africa, not from Sicily, and was of Iberian or Ibero-Ligurian stock. After a considerable interval, during which the island probably remained uninhabited, the Cartha- ginians took possession of it (no doubt owing to its importance as a station on the road to Sicily) probably about the beginning of the 7th century B.C., occupying as their acropolis the twin hill of San Marco and Sta. Teresa, 1 m. south of the town of PANTHEISM

PANTHEISM (Gr. πάνθειον, all, theos, god), the doctrine which identifies the universe with God, or God with the universe. The term “pantheist” was apparently first used by John Toland in 1705, and it was at once adopted by French and English writers. Though the term is thus of recent origin, the system of thought or attitude of mind for which it stands may be traced back both to the Greek Stoic and Epicurean, and in Eastern philosophy to a very early stage. At the same time pantheism almost necessarily presupposes a more concrete and less sophisticated conception of God and the universe. It presents itself historically as an intellectual revolt against the difficulties involved in the presupposition of theistic and polytheistic systems, and in philosophy as an attempt to solve the dualism of the one and the many, unity and difference, thought and extension. Thus the pious Hindu, confronted by the impossibility of obtaining perfect knowledge by the senses or by reason, finds his sole perfection in the contemplation of the infinite God, and finds in the multiplicity of the phenomenal unity behind the plurality of phenomena was present, though vaguely, in the minds of the early physiists (see IONIAN SCHOOL), but the first thinker who focussed the problem clearly was Xeno- phanes. Unlike the Hindu, Xenophanes inclined to pantheism as a protest against the anthropomorphic polytheism of the time, which seemed to him improperly to exalt one of the many modes of finite existence into the place of the Infinite. Thus Xenophanes for the first time postulates a supreme God whose

2 Strictly, pantheism is to identify the universe with God, while the term "pancosmism" (πᾶν κόσμος, the universe) has usually been used for the identification of God with the universe. For practical purposes this refinement is of small value, the two ideas being aspects of the same thing; cf. A. M. Fairbairn, Studies in Philos. Relg. Hist. (1877), p. 39. Both "Atheism" (q.v.) and "Acosmism" are used as contradistinctions.
characteristic is primarily the negation of the Finite. A similar metaphysics from a different starting-point is found in Heraclitus, who postulates behind the perpetually changing universe of phenomena a One which remains. This attitude towards existence, expressing itself in different phraseology, has been prominent to a greater or less degree since Xenophanes and Heraclitus. Thus the metaphysic of Plato finds reality only in the "Idea," of which all phenomena are merely imperfect copies. Neoplatonism (and especially Plotinus) adopted a similar attitude. The Stoics, with the supreme object of giving to human life a definite unity and purpose, made the individual a part of the universe and sought to obliterate all differences. The universe to them is a manifestation of divine reason, while all things come from and return to (the διὸς δὲ κάτω) the κόσμος ἀκατάστατος, the ultimate matter. The same problems in a different context confronted the monotheistic religions of Judaism and Christianity. We find Philo Judaeus endeavouuring to free the concept of the Old Testament Yahweh from anthropomorphic characteristics and finite determinations. But though Philo sees the difficulties of the orthodox Judaism he cannot accept pantheism or mysticism so far as to give up the personality of God (see Logos).

With Neoplatonism we enter upon a somewhat different, though closely allied attitude of mind. To Plotinus God lies beyond sense and imagination: all the theologian can do is to point the way in which the thinker must travel. Though the spirit and the language of Plotinus is closely allied to that of pantheism, the result of his thinking is not pantheism but mysticism. This may be briefly illustrated by a comparison with the greatest of modern pantheists, Spinoza. To him God is the immanent principle of the universe—" Deus sive Natura." On the principle that everything which is determined (finite) is "negated" (determinatio est negatio), God, the ultimate reality must be entirely undetermined. To explain the universe Spinoza identifies God, and though undetermined, ab extra, is capable of infinite self-determination. Thus God, the causa sui, manifests himself in an infinite multiplicity of particular modes. Spinoza is, therefore, both pantheist and panpsychist: God exists only as realized in the cosmos: the cosmos exists only as a manifestation of God. Plotinus, on the other hand, cannot admit any realization or manifestation of the Infinite; God is necessarily above the world—he has no attributes, and is unthinkable. Such a view is not pantheism but mysticism (q.v.), and should be compared with the theology of Oriental pantheism.

The semi-Oriental mysticism of the Neoplatonists and the Logos doctrines of the Stoics alike influence early Christian doctrine, and the pantheistic view is found frequently in medieval theology (e.g. in Erigena, Meister Eckhardt, Jakob Boehme). The Albigene scholar Averroes gave Aristotle to western Europe in a pantheistic garb, and thus influenced medieval scientists. So Bruno constructed a personified nature, and the scientific and humanistic era began. The pantheism of Spinoza, combining as it did the religious and the scientific points of view, had a wide influence upon thought and culture. Schelling (in his System der transzendentalen Philosophie) both carried on the pantheistic tradition, which after Hegel reared itself into two lines of thought, the one pantheistic the other atheistic.

From the religious point of view there are two main problems. The first is to establish any real relation between the individual and God without destroying personality and with it the whole idea of human responsibility and free will: the second is to explain the influence of God without destroying his personality. In what sense can God be outside the world (see Deism)? In what sense in it (pantheism)? The great objection to pantheism is that, though ostensibly it magnifies the Creator and gets rid of the difficult dualism of Creator and Creation, it tends practically to deny his existence as a personal, Willing being.

See further: Theism; Deism; Atheism; Absolute.

PANTHEON (Lat. pantheum or pantheon; Gr. πανθεως, all-holy, from πᾶς, all, and θεός, god), the name of two buildings in Rome and Paris respectively: more generally, the name of any building in which as a mark of honour the bodies of the nation's famous men are buried, or "memorials" or monuments to them are placed. Thus Westminster Abbey is sometimes styled the British "Pantheon," and the rotunda in the Escurial where the kings of Spain are buried also bears the name. Near Regensburg (q.v.) is the pantheon of German worthies, known as the Valhalla. The first building to which the name was given was that built in Rome in B.C. 27 by Agrippa; it was burned later and the existing building was erected in the reign of Hadrian; since A.D. 609 it has been a Christian church. The Pantheon in Paris was the church built in the classical style by Soufflot; it was begun in 1764 and consecrated to the patroness of the city, Saint Genevieve. At the Revolution it was secularized under the name of Le Panthéon, and dedicated to the great men of the nation. It was re-consecrated in 1828 for worship, was again secularized in 1830, was once more a place of worship from 1851 to 1870, and was then a third time secularized. On the entablature is inscribed the words Aux Grands Hommes La Patrie Reconnaissante. The decree of 1885 finally established the present Panthéon, open to the public for who soever desires. PANTHER, another name for the leopard (q.v.), also used in America as the name of the panther (q.v.). The word is an adaptation of Lat. panthera; Gr. πανθέαρα, the supposed derivation of which from πᾶς, all, and θάνατος, animal, gave rise to many tales and fables in medieval bestiaries and later scientific works. The panther was supposed to be a distinct animal from the pardus, tard, the leopard, to which also many legends were attached. In modern times a distinction had been undecidedly drawn between a larger type of leopard to which the name panther was given, and a smaller and more graceful specimen, the PARDUS. Seine, on the Canal d'Oure, a junction of the Forks of Paris on the north-east. Pop. (1906), 9,604. The manufacture of boilers, railway wagons, machinery, oil, gas, chemicals, and perfumery, and the operations of dye-works, foundries, and distilleries, represent some of the varied branches of its industrial activity. There is also a state-manufactory of tobacco.

PANTOGRAPH, or Pantograph (from the Greek πανθέω, all, and ἄγγελος, to write), an instrument for making a reduced, an enlarged, or an exact copy of a plane figure. In its commonest form it consists of two long arms, AB and AC (fig. 1), which slide against two short arms, FD and FE, joined together at F and with the long arms at D and E; FD is made exactly equal to FE and FE to AD so that IDFE is an isosceles triangle whatever the angle at A. The instrument is supported parallel to the paper or canvas, on which it moves freely. A tube is usually fixed vertically at c, near the extremity of the long arm AC, and is connected with two more tubes which slide along the short arms BD and DF; they are intended to hold either the axe pin on a weighted fulcrum round which the instrument turns, or a steel pencil, or a pencil, interchanged. When the tube at the point 0 is used, the reproduced copy of the map under the point at 0; if the pencil and the pointer were interchanged, enlarged copy would be drawn; if the fulcrum and pencil were interchanged, and the slider set for F to intersect BC, the map would be copied exactly. Lines are traced on the arms BD and DF, to indicate the positions to which the sliders must be set for the ratios 1: 2, 1: 3, ... which are commonly required. The square pantograph of Adrian Gavard consists of two graduated arms which are pivoted about the pivot of the pantograph, and connected by a graduated bar sliding between them throughout their entire length, to be set
PANTOMIME

at any required distance from the plain bar; a sliding plate carrying a vertical tube, to hold either the axe of the fulcrum, the pencil, or the pencil on the side of the arm and on a rod beyond the other arm, and also on the graduated connecting bar; and an additional arm is provided by means of which reductions or enlargements above the scales given on the instrument shall be effected.

The *eidosgraph* (Gr. *eidos*, form) is designed to supersede the pantograph, which is somewhat unstable, having several supports and joints. It is composed of three graduated bars, one of which is held over a fulcrum and carries the others, which are lighter, one at each extremity. The three bars are movable from end to end in box-sockets, each having an index and a vernier in contact with the graduated scale. The box-socket of the principal bar turns round the pivot of the bar, and each side bar is attached to a vertical axis, which also carries a grooved wheel of large diameter and turns in a collar at either end of the principal bar. The two are connected by the bar itself and supported by a steel band fitting tightly into the grooves, so that they always turn together through identical arcs; thus the side bars over which they are respectively mounted, when once set parallel, turn with them and always remain parallel. A pointer is held at the end of one of the side bars and a pencil at the diametrically opposite end of the other. The bars may be readily set by their graduated scales to positions in which the distances of the pencil and the pointer from the fulcrum will always be in the ratio of the given and the required map scales.

Numerous other modifications have been proposed from time to time; many forms are described in G. Pelleth's *Der Panograph* (Berlin, 1813).

PANTOMIME, a term which has been employed in different senses at different times in the history of the drama. Of the Roman *pantomimus*, a spectacular kind of play in which the functions of the actor were confined to gesticulation and dancing, while occasional music was sung by a chorus or behind the scenes, some account is given: *pantomimici* or *pantomimi* were used as a term in the plays of the *pantomima* and the modern “ballet of action,” except that the latter is accompanied by instrumental music only, and that the personages appearing in it are not usually masked. The English “dumb-show,” though fulfilling a special purpose of its own, was likewise in the true sense of the word pantomimic.

The modern pantomime, as the word is still used, more especially in connection with the English stage, signifies a dramatic entertainment in which the action is carried on with the help of spectacle, music and dancing, and in which the performance of that action or of its adjuncts is conducted by certain conventional characters, originally derived from Italian “masked comedy,” itself an adaptation of the *fabulae Atticae* of ancient Italy. Were it not for this addition, it would be difficult to define modern pantomime so as to distinguish it from the masque; and the least rational of English dramatic species would have to be regarded as essentially identical with another to which English literature owes some of its choicest fruit.

The contributory elements which modern pantomime contains very speedily, though in varying proportions and manifold combinations, introduced themselves into the modern drama as it had been called into life by the Renaissance. In Italy the transition was almost imperceptible from the pastoral drama to the opera; on the Spanish stage ballets with allegorical figures and military spectacles were known towards the close of the 16th century; in France ballets were introduced in the *days of Marie de' Medici*, and the popularity of the opera was fully established in the earlier part of the reign of Louis XIV. The history of the English stage, still signifies a dramatic entertainment, though there is a special ingredient in modern pantomime of which something more has to be said. From the latter part of the 16th century (Henry III., in 1598, sought to divert the dreaded states-general at Blois by means of the celebrated Italian company of the Gelosi) professional Italian comedy (*commedia dell' arte*, called *commedia all' improvviso* only because of the skill with which the schemes of its plays were filled up by improvisation) had found its way to Paris with its merry company of characters, partly corresponding to the favourite types of regular comedy both ancient and modern, but largely borrowed from the new species of masked comedy—so called from its action being carried on by certain typical figures in masks—said to have been invented earlier in the same century by Angelo Boëco (Ruzzante) of Padua. These types, local in origin, included *Pantalone* the Venetian merchant, who survives in the uncommercial *Pantalone*, the Bolognese *Dottore*. The *Zanni* (Giovonuzzi) were the domestic servants in this species of comedy, and indeed among other varieties the *Arlecchino*. This is by far the most interesting of these types, and by far the best discussed. The *Arlecchino* was formerly supposed to have been, like the rest, of Italian origin. The very remarkable contribution (cited below) of Dr Otto Driessen to the literature of folk-lore as well as to that of the stage seems however to establish the conclusion (to which earlier conjectures pointed) that the word *Harlequin* or *Herleisin* is of French origin, and that the dramatic figure of Harlequin is an evolution from the popular tradition of the harlequin-folk, mentioned about the end of the 16th century by the Norman Ordericus Vitalis. The “damed souls” of legend became the comic demons of later centuries, the *croque-sors* with the devil's mask; they left the impress of their likeness on the hell-mouth of the religious drama, but were gradually humanized as a favourite type of the Parisian popular street-masques (*charivaris*) of the 14th and 15th centuries. Italian literature contains only a single passage before the end of the 16th century which can be brought into any connexion with this type—the *alicchino* (cat’s back) of canto xxi. of the *Inferno*. The French harlequin was, however, easily adopted into the family of Italian comedy, where he may, like his costume, have been associated with early national traditions, and where he continued to diverge from the Italian *Zanni* and the stolid sort, the *Scapin*. French comedy-farce. From the time of the performances in France of the celebrated *Fedeli* company, which played there at intervals from the beginning to the middle of the 17th century onwards, performing in a court ballet in 1666, Tristan Martinelli had been its harlequin, and the character thus preceded that of the Parisian favourite Trivelin, whose name Cardinal de Retz was fond of applying to Cardinal Mazarin. There can be no pretence here of pursuing the French harlequin through his later developments in the various species of the comic drama, including that of the marionettes, or of examining the history of his supersession by Pierrot and other extreme pantomime heroes.

Students of French comedy and, of Molière in particular, are aware of the influence of the Italian players upon the progress of French comedy, and upon the works of its incomparable master. In other countries, where the favourite types of Italian popular comedy had been less generally seen or were unknown, popular comic figures such as the English fools and clowns, the German *Hanseworst*, or the Dutch *Piekhering*, were ready to renew themselves in any and every fashion which preserved to them the gross salt favoured by their patrons. Indeed, in Germany, where the term pantomime was not used, a rude form of dramatic buffoonery, corresponding to the coarser sides of the modern English species so-called, long flourished, and threw back for centuries the progress of the regular drama. The banishment of *Hansworst* from the German stage was formally proclaimed by the famous actress Caroline Neuber at Leipzig in a play composed for the purpose in 1737. After being at last suppressed, it found a commendable substitute in the modern *Zauberposse*, the more genial Vienna counterpart of the *Paris feerie* and the modern English extravaganza.

In England, where the masque was only quite exceptionally represented by Pierrot and other extreme pantomime characters and other frivolous allurements was at first mainly met by the various forms of dramatic entertainment which went by the name of “opera.” In the preface to *Aladdin and Albatros* (1685), Dryden gives a definition of opera which would fairly apply to modern extravaganza, or to modern pantomime with the harlequinade.

1 The traditional costume of the ancient Roman *mimi* included the *centunculus* or variegated (harlequin's) jacket, the shaven head, the sooty face and the unshod feet.
left out. Character-dancing was, however, at the same time largely introduced into regular comedy; and, as the theatres vied with one another in seeking *quoniam modo* to gain the favour of the public, the English stage compassed to propagate the innovation which assisted it. Curiously enough, the long-lived but cumbrous growth called pantomime in England owes its immediate origin to the beginnings of a dramatic species which has artistically furnished congenial delight to nearly two centuries of Frenchmen. Of the early history of *roadside* it must here suffice to say that the unprivileged actors, at the fairs, who had borrowed some of the favourite character-types of Italian popular comedy, after clauding prohibitions against the use by them of dialogue and song, were at last allowed to set up a comic opera of their own. About the second quarter of the 18th century, before these performers were incorporated with the Italians, the light kind of dramatic entertainment, combining pantomime, proper with dialogue and song enjoyed high favour with the French and their visitors during this period of peace. The *roadside* was cultivated by Le Sage and other writers of mark, though it did not conquer an enduring place in dramatic literature till rather later, when it had, moreover, been completely nationalized by the extension of the Italian types.

It was this popular species of entertainment which, under the name of pantomime, was transplanted to England before in France it had attained to any fixed form, or could claim for its productions any place in dramatic literature. Colley Cibber mentions as the first example, followed by "that Succession of monstrous Medleys," a piece on the story of Mars and Venus, which was still in dumb-show; for he describes it as "form'd into a connected Presentation of Dances in Character, wherein the Passions were so happily expressed, and the whole Story so intelligibly told, by a mute Narration of Gesture only, that even thinking Spectators allow'd it both a pleasing and a rational Entertainment." There is nothing to show that Harlequin and his companions figured in this piece. Genest, who has no record of it, dates the period when such entertainments first came into vogue in England about 1723. In that year the pantomime of *Harlequin Dr Faustus* had been produced at Drury Lane—its author being John Thurmound, a dancing master, who afterwards (in 1727) published a grotesque entertainment called *The Miser, or Wagner and Abercromick* (a copy of this is in the Dyce Library). Hereupon, in December 1723, John Rich (1662-1751), then lessee of the theatre in Lincoln's Inn Fields, produced there as a rival pantomime *The Necromancer, or History of Dr Faustus*, no doubt, says Genest, "gotten up with superior splendidour." He had as early as 1717 been connected with the production of a piece called *Harlequin Executed*, and there seem traces of similar entertainments as far back as the year 1700. But it was the inspiring influence of French example that then pervaded the London houses, which in 1723 really established pantomime on the English stage. Rich was at the time fighting a difficult battle against Drury Lane, and his pantomimes at Lincoln's Inn Fields, and afterwards at Covent Garden, were extraordinarily successful. He was himself an inimitable harlequin, and from Garrick's lines in his honour it appears that his acting consisted of "frolic gestures" without words. The favourite Drury Lane harlequin was Pinkethman (Pope's "poor Pinky"); readers of the *Tatter* (No. 188) will remember the ironical notice with which his merits are weighed against those of his competitor Bullock at the other house. Colley Cibber, when described by Pope as "mounting the wind on grinning dragons" briskly denied having in his own person or otherwise encouraged such fooleries; in his *Apology*, however, he enters into an elaborate defence of himself for having allowed himself to be forced into countenancing the "gin-shops of the stage," pleading that he was justified by necessity, as Henry IV, was in changing his religion. Another butt of Pope's, Lewis Theobald, was himself the author of more than one pantomime; their titles already run in the familiar fashion, e.g. *A Dramatick Entertainment, call'd Harlequin a Sorcerer, with the Lutes of Pluto and Proserpine* (1735; the "book of the words," as it may be called, is in the Dyce Library). In another early pantomime (also in the Dyce Library) called *Percuss and Androneda, with the Rope of Columbine, or The Flying Lovers*, there are five "interludes, three serious and two comic."

This is precisely in the manner of Fielding's dramatic squibs, e.g. *Tickle-dowm Dick, or Phaeton in the Suds*, first acted in 1744, and ironically dedicated to "Sir John Lumsden" the name that Rich chose to assume as harlequin. It is a capital bit of burlesque, which seems to have been directly suggested by Pritchard's *Fall of Phaeton*, produced in 1736.

There seems no need to pursue further the history of English pantomime in detail. "Things of this nature are above criticism," as Mr Machine, the "composer" of *Phaeton*, says in Fielding's piece. The attempt was made more than once to free the stage from the incubus of entertainments to which the public persisted in flocking; in vain Colley Cibber at first laid down the rule of never giving a pantomime together with a good play; in vain his son Theophilus after him advised the return of part of the entrance money to those who would leave the house before the pantomime began. "It may be questioned," says the chronicler, "if there was a demand for the return of £20 in ten years." Pantomime carried everything before it, when there were several theatres in London, and a dearth of high dramatic talent prevailed in all; and, allowing for occasional counter-attractions of a not very dissimilar nature, pantomime continued to flourish after the Licensing Act of 1737 had restricted the number of London play-houses, and after Garrick's star had risen on the theatrical horizon. He was himself obliged to satisfy the public appetite, and to disoblige the admirers of his art, in deference to the drama's most imperious patrons—the public at large.

In France an attempt was made by Noverre (q.v.) to restore pantomime proper to the stage as an independent species, by treating mythological subjects seriously in artificial ballets. This attempt, which of course could not prove permanently successful, met in England also with great applause. In an anonymous tract of the year 1780 in the Dyce Library, attributed by Dyce to Archdeacon Nares (the author of the *Glossary*), Noverre's pantomime or ballet *Cupid and Psyche* is commended as of very extraordinary merit in the choice and execution of the subject. It seems to have been without words. The writer of the tract states that "very lately the serious pantomime has made a new advance in this country, and has gained establishment in an English theatre"; but he leaves it an open question whether the grand ballet of *Medea and Jason* (apparently produced a few years earlier, for a burlesque on the subject came out in 1781) was the first complete performance of the kind produced in England. He also notes *The Death of Captain Cook*, adapted from the Parisian stage, as possessing considerable dramatic merit, and exhibiting "a pleasing picture of savage customs and manners."  

To conclude, the chief difference between the earlier and later forms of English pantomime seems to lie in the fact that in the earlier Harlequin pervaded the action, appearing in the comic scenes which alternated throughout the piece with the serious which formed the backbone of the story. Columbine (originally in Italian comedy Harlequin's daughter) was generally a village maiden courted by her adventurous lover, whom village constables pursued, thus performing the laborious part of the policeman of the modern harlequinade. The brilliant scenic effects were of course accumulated, instead of upon the transformation scene, upon the last scene of all, which in modern pantomime follows upon the shadowy chase of the characters called the rally. The commanding influence of the clown, to whom pantaloons is attached as friend, flatterer and foil, seems to be of comparatively modern growth; the most famous of his craft was undoubtedly Joseph Grimaldi (1779-1837). His memory is above all connected with the famous pantomime of *Mother Goose*, produced at Covent Garden in 1866. The older British type of Christmas pantomime, which kept its place in London till the seventies, has been preserved from oblivion in Thackeray's *Sketches and Travels in London*. The species is not yet wholly extinct; but, by degrees, the rise of the music-halls and the
popularity of a new type of music-hall performer influenced the character of the show which was given under the name of a Christmas pantomime at the theatres, and it became more of a burlesque "variety entertainment," dovetailed into a fairy play and with the "harlequinade" part (which had formed the closing scene of the older sort) sometimes omitted. The word had really lost its meaning. The thing itself survived rather in such occasional appearances of the Pierrot "drama without words" as characterized by Louis Angélique in the early 'nineties in such pieces as L'Enfant Pieplain.

PANTON, a town of north-western Spain, in the province of Lugo; in a mountainous district, watered by the rivers Miño and Coule. Pop. (1880), 6,088. It is noted for its olive groves and large quantities of wheat, wine, oats and potatoes are produced. The other industries are distilling and linen manufacturing. The nearest railway station is 6 m. east, atMontforte.

PANTRY (O. Fr. paneterie; Med. Lat. pantarica, a bread-shop, from panis, bread), originally a room in a house used for the storage of bread, hence "pantier" or "pantler," an officer of a household in charge of the bread and stores. In the royal household of England the office was merged in that of butler. At coronations the office of "pantier" was held by the lord of the manor of Kilworthy Benchamp; it was his duty to carry the salt-cellar and carving-knives to the royal table, and he kept these as his fee. The last holder of the office was Ambrose Dudley, son of John, duke of Northumberland, at Elizabeth's coronation. At his death the manor reverted to the Crown. "Pantry" was early widened in meaning to include a room in a house used for the storing of all kinds of food; and is now restricted to the butler's or parlourmaid's room, where plate, china, glass, &c., for the use of the table is kept, and duties in connexion with the serving of the table are performed.

PANTUN (PANTOCH), a form of verse of Malay origin. An imitation of the form has been adopted in French and also in English verse, where it is known as "pantom." The Malay pantun is a quatrain, the first and second and the third and fourth lines of which rhyme. The peculiarity of the verse-form resides in the fact that the first two lines have as a rule no actual connexion, in so far as meaning is concerned, with the two last, or with one another, and have for their raison d'être a means of supplying rhymes for the concluding lines. For instance:

Snawad di-ri-ba
Bengob kiao ber-ti-sam pälch;
Sangoh di-ri-ba ter-ti-baj i-ri-ba;
Jangun di-kabap kata-nu bälch.

The rhodomelocarp is a wood of the jungle.

The strings within the framework of the loom are in a tangled knot. It is true that I sit on thy lap,

But do not thereby cherish the hope that thou canst take any other liberty.

Here, it will be seen, the first two lines have no meaning, though according to the Malayan mind, on occasion, these "rhyme-making" lines are held to contain some obscure, symbolical reference to those which follow them. The Malay is not exacting with regard to the correctness of his rhyme, and to his ear rôba and rhîb rhyme as exactly as pâch and bâch. It should also be noted that in the above example, as is not infrequently the case with the Malay pantun, there is a similar attempt at rhyme between the initial words of the lines as well as between the word with which they conclude, snawad and snigoh, benuug and jangun, and kârâb and kârâb all rhyming to the Malayan ear. There are large numbers of well-known pantun with which practically all Malays are acquainted, much as the English have learned pantun similar to us all, and it is not infrequent practice in conversation for the first line of a pantun—viz.: one of the two lines to which no real meaning attaches—to be quoted alone, the audience being supposed to possess the necessary knowledge to fit on the remaining lines for himself and thus to discover the significance of the allusion. Among cultured Malays, more especially those living in the neighbourhood of the raja's court, new pantun are constantly being composed, many of them being of a highly topical character, and these improvisations are quoted from man to man until they become current like the old well-known verses, though within a far more restricted area. Often the pantun is used in love-making, but they are then usually composed for the exclusive use of the author and for the decoration of his lady-loves, and do not find their way into the public stock of verses. "Capping" pantun is also a not uncommon pastime, and many Malays will continue such contests for hours without once repeating the same verse, and often improvising quatrains when their stock threatens to become exhausted. When this game is played by skilful versifiers, the pantun last quoted, and very frequently the second line thereof, is used as the tag on to which to hang the succeeding capping.

The "pantun" as a form of verse was introduced into French by Victor Hugo in Les Orientales (1820). It was also practised by Théodore de Banville and Lecomte de Lisle. Austin Dobson's In Town is an example of its use, in a lighter manner, in English. In the French and English imitation the verse form is in four-line stanzas, the second and fourth line of each verse forming the first and third of the next, and so on to the last stanza, where the first and third line of the first stanza form the second and fourth line.

PANYASSIL—PASQUALE (PANYASSIL, more correctly, Panyassil), of Haliçarnassus, Greek epic poet, uncle or cousin of Herodotus, flourished about 470 B.C. He was put to death by the tyrant Lygdamis (c. 454). His chief poems were the Heraclia in 13 books, describing the adventures of Heracles in various parts of the world, and the Ionica in elegies, giving an account of the founding and settlement of the Ionian colonies in Asia Minor. Although not much esteemed in his own time, which was unfavourable to epic poetry, he was highly thought of by later critics, some of whom assigned him the next place to Homer (see Quintilian, Inst. orat. x. 15). The few extant fragments show beauty and fullness of expression, and harmonious rhythm.

Fragments in G. Kinkel, Epic. poet. fragmenta (1877), ed. separately by J. P. Tschirnern (1842); F. P. Funcke, De Panyassilis vita (1837); R. Krausse, De Panyassilide (1891).

PAOLI, CESARE (1827—1902), Italian historian and palaeographer, son of senator Baldassare Paoli, was born and educated in Florence. At the age of twenty-one he was given an appointment in the record office of his native city; from 1865 to 1871 he was attached to the Archives of Sienna, but eventually returned to Florence. In 1874 he was appointed first professor of palaeography and diplomas at the Istituto di Studi Superiori in Florence, where he continued to work in the interpretation of MSS. In 1888 he became editor of the Archivio storico italiano, to which he himself contributed numerous articles. His works consist of a large number of historical essays, studies on palaeography, transcriptions of state and other papers, reviews, &c.

PAOLI, PASQUALE (1723—1827), Corsican general and patriot, was born at Stretta in the parish of Rossino. He was the son of Giacinto Paoli, who had led the Corsican rebels against Genoese tyranny. Pasquale followed his father into exile.
serving with distinction in the Neapolitan army; on his return to Corsica (1769), he was chosen commander-in-chief of the rebel forces, and after a series of successful actions he drove the Genoese from the whole island except a few coast towns. He then set to work to reorganize the government, introducing many useful reforms, and he founded a university at Corte. In 1767, he wrested the island of Caprera from the Genoese, who, despairing of ever being able to subjugate Corsica, again sold their rights over to France. For two years Paoli fought desperately against the new invaders, until in 1769 he was defeated by vastly superior forces under Count de Vaux, and obliged to take refuge in England. In 1789 he went to Paris with the permission of the constituent assembly, and was afterwards sent back to Corsica with the rank of lieutenant-general. Disgusted with the excesses of the revolutionary government and having been accused of treason by the Convention, he summoned a consulta; or assembly, at Corte in 1793; with himself as president and formally seceded from France. He then offered the suzerainty of the island to the British government, but finding no support in that quarter, he was forced to go into exile once more, and Corsica in 1796, when he obtained a pension; he died on the 5th of February 1807.

PAPACY: a term formed on the analogy of "abbacy" from Lat. papa, pope; cf. Fr. papiiste on the analogy of royaute. Florence of Worcester, a.d. 1044, quoted by Du Cange s.v. Papa, has the Latin form papate; the New Eng. Dict. quotes Gower, Conv. f. 256, as the earliest instance of the word papatie), the name now commonly applied to the office and position of the bishop or pope of Rome, in respect both of the ecclesiastical and temporal authority claimed by him, i.e. as successor of St Peter and Vicar of Christ, over the Catholic Church, and as sovereign of the former papal states. (See Pope and Roman Catholic Church.)

I.—From the Origins to 1087.

The Christian community at Rome, founded, apparently, in the time of the emperor Claudius (41-54), at once assumed great importance, as is clearly attested by the Epistle to the Romans (107). It received later the visit of Paul while a prisoner, and, according to a tradition which is now but little disputed, that of the apostle Peter. Peter died there, in 64, without doubt, among the Christians whom Nero had put to death as guilty of the burning of Rome. Paul's career was also terminated at Rome by martyrdom. Other places had been honoured by the presence and preaching of these great leaders of new-born Christianity; but it is at Rome that they had borne witness to the Gospel by the shedding of their blood; there they were buried, and their tombs were known and honoured. These facts rendered the Roman Church in the highest degree sacred. About the time that Peter and Paul died at Rome the primitive centre of Christianity—that is to say, Jerusalem—was disappearing amidst the disaster of the war of the Roman Empire with the Jews. Moreover, the Church of Jerusalem, narrowed by Jewish Christian particularism, was hardly qualified to retain the metropolis of Christianity, which was gradually gaining ground in the Graeco-Roman world. The true centre of this world was the capital of the Empire; the transference was consequently accepted as natural at an early date. The idea that the Roman Church is at the head of the other Churches, and has towards them certain duties consequent on this position, is expressed in various ways, with more or less clearness, in writings such as those of Clemens Romanus, Ignatius of Antioch and Hermas. In the 3rd century all Christendom looked to Rome; there was a constant stream of people—bishops, from distant parts, apologists or hierarchs. All that was done or taught in Rome was immediately echoed through all the other Churches; Irenaeus and Tertullian constantly lay stress upon the tradition of the Roman Church, which in those very early days was almost without rivals, save in Asia, where there were a number of flourishing Churches, also apostolic in origin, forming a compact group and conscious of their dignity. The great reception given to Polycarp on his visit to Rome in a.d. 155 and the attitude of St Irenaeus show that on the whole the traditions of Rome and of Asia harmonised quite well. They came into the question of the celebration of the festival of Easter. The bishop of Rome, Victor, desired his colleagues in the various parts of the Empire to form themselves into councils to inquire into this matter. The invitation was accepted by all; and, the consultation resulting in favour of the Roman usage, Victor thought it to exclude the recalcitrant Churches of Asia from the Catholic communion. His conduct in this dispute, though its severity may have been open to criticism, indicates a very definite conception on his part of his authority over the universal Church. In the 3rd century the same position was maintained, and the Romans were not averse to take steps to uphold the distinction of the head of their Church, as the bishop of Rome, from the jurisdiction of the others.

2 Victor's conduct in this matter was not approved by a number of bishops (including Irenaeus), who protested against it (d'après Gengembre) in the interests of peace and Christian love (Eusebius, Hist. ecc. v. 24).—[Ed.]
but the autonomy which had been denied them under Aurelius was maintained to the end, that is to say, up till the Mahommedan conquest.

During the 4th century it is to be noticed that, generally speaking, the Roman Church played a comparatively insignificant part in the West. From the time of popes Damasus and Siricius various affairs referred to Rome from Africa, Spain or Gaul. The popes were asked to give decisions, and in answer to those demands drew up their first decreets. However, side by side with the Roman see that of Milan, which was also the capital of the Western Empire. From time to time it seemed as if Milan would become to Rome what Constantinople was to Alexandria. However, any danger that menaced the prestige of Rome disappeared when the emperor Honorius removed the imperial residence to Ravenna, and still more so when the emperors were replaced in the north of Italy by barbarian sovereigns, who were Arians.

In Spain, Gaul, Brittany and the provinces of the Danube, similar political changes took place. When orthodox Christianity had gained the upper hand beyond the Alps and the Pyrenees, the episcopate of those countries grouped itself, as it had done in the East, around the metropolises of Aquileia, and York, in Spain and, in the 6th century this developed into what is called the Schism of the Three Chapters. With the exception of the Church of Rome that of Gaul and Britain preserved its independence as that of the Holy See. They always kept up relations of some kind, especially by means of pilgrimages, and it was admitted that in any disputes which might arise with the Eastern Church the pope had the right to speak as representative of the whole of the Western Church. He was, moreover, the only bishop of a great see—for Carthage had practically ceased to count—who was at that time a subject of the Roman emperor.

This was the situation when St Gregory was elected pope in 590. We may add that in peninsular Italy, which was most clearly under his ecclesiastical jurisdiction, the Lombards had spread havoc and ruin; so that nearly ninety bishoprics had been suppressed, either temporarily or definitively. The pope could act directly only on the bishoprics of the coast districts or the islands. Beyond this limited circle he had to act by means of diplomatic channels, through the governments of the Lombards, Franks and Visigoths. On the Byzantine side his hands were less tied; but here he had to reckon with the theory of the five patriarchates which had been a force since Justinian. According to Byzantine ideas, the Church was governed—under the supreme authority, of course, of the emperor—by the five patriarchs of Rome, Constantinople, Alexandria, Antioch and Jerusalem. Rome had for a long time opposed this division, but, since some kind of division was necessary, had put forward the idea of the three sees of St Peter—Rome, Alexandria and Antioch—those of Constantinople and Jerusalem being set aside, as resulting from later usurpations. But the last named were just the most important; in fact the only ones which counted at all, since the monophysite schism had reduced the number of the orthodox in Syria and Egypt practically to nothing. This dissidence Islam was to complete, and by actually suppressing the patriarchate of Jerusalem to reduce Byzantine Christendom to the two patriarchates of Rome and Constantinople.

There was no comparison between the two from the point of view of the East. The new Rome, where the emperor reigned, prevailed over the old, which was practically abandoned to the barbarians. She was still by courtesy given the precedence, but that was all; the council in Trullo (692) even claimed to impose reforms on her. When Rome, abandoned by the distant emperors, was placed under the protection of the Franks (754), relations between the Greek Church became gradually more rare, the chief occasions being the question of the images in the 8th century, the quarrel between Photius and Ignatius in the 9th, the affair of the four marriages of the emperor Leo VI. and of the patriarch Theophylact in the 10th. On these different occasions the pope, ignored in ordinary times, was made use of by the Byzantine government to ratify measures which it had found necessary to adopt in opposition to the opinion of the Greek episcopate.

These relations were obviously very different from those which had been observed originally, and it would be an injustice to the Roman Church to take them as typical of her relations with other Christian bodies. She had done all she could to defend her former position. Towards the end of the 4th century, when southern Illyricum (Macedonia, Greece, Crete) was passing under the authority of the Eastern emperor, she tried to keep him within her ecclesiastical obedience by creating the vicariate of Thessalonica. Pope Zosimus (417) made trial of a similar organization in the hope of attaching the churches of the Gauls more closely to himself. It was also he who began the struggle against the autonomy of Africa. But it was all without effect. From the 6th century onwards the apostolic vicars of Africa and Thessa- lonica were merely the titular holders of papal dignities, with no real authority over those who were nominally under their jurisdiction.

It was Gregory I. who, though with no premeditated intention, was the first to break this circle of autonomous or, dissident Churches which was restricting the influence of the apostolic see. As the result of the missions sent to England by him and his successors there arose a church which, in spite of certain Irish elements, was and remained Roman in origin, and, above all, spirit and tendency. In the West the Church found no effective check to its dwindling relations with Rome, where they had almost ceased to bear any fruit, found a new soil, in which they flourished. Theodore, Willibrord, Benedict Biscop, Bede, Boniface, Egbert, Alcuin, revived the fire of learning, which was almost extinct, and by their aid enlightenment was carried to the Continent, to decadent Gaul and barbarian Germany. The Churches of England and Germany, founded, far from all traditions of autonomy, by Roman legates, tendered their obedience voluntarily. In Gaul there was no hostility to the Holy See, but on the contrary a profound veneration for the great Christian sanctuary of the West. The Carolingian princes, when Boniface pointed them towards Rome, followed him without their clergy offering any resistance on grounds of principle. The question of reform having arisen, from the apostolic see alone could its fulfilment be expected, since in it, with the succession of St Peter, were preserved the most august traditions of Christianity.

The surprising thing is that, although Rome was then included within the empire of the Franks, so that the popes were afforded special opportunities for activity, they showed for the most part no eagerness to strengthen their authority over the clergy beyond the Alps. Appeals and other matters of detail were referred to them more often than the Merovingians. They gave answers to such questions as were submitted to them; the machinery moved when set in motion from outside; but the popes did not attempt to interfere on their own initiative. The Frankish Church was directed, in fact, by the government of Charlemagne and Louis the Pious. When this failed, as happened during the wars and partitions which followed the death of Louis, the fate of this Church, with no effective head and under no regular direction, was very uncertain. It was then that a clerk who said that there was but an uncertain prospect of help from the pope of his time, conceiving the shrewd idea of appealing to the popes of the past, so as to exhort the contemporary generation through the mouth of former popes, from Clement to Gregory. This design was
Brightened were they in circulation throughout the Frankish Empire when it happened that a pope, Nicholas I., was elected who was animated by the same spirit as that which had inspired them. There was no lack of opportunities for intervening in the affairs not only of the Western but of the Eastern part of the kingdom of heaven, and that with great decision. He staunchly supported the patriarch Ignatius against his rival, Photius, at Constantinople; he upheld the rights of Teutberga, who had been repudiated by her husband, Lothair II., of Lorraine, against that prince and his brother, the emperor Louis II.; and he combated Hincmar, the powerful metropolitan of Reims. It was in the course of this last dispute that the False Decretals found their way to Rome. Nicholas received them with some reserve; he refrained from giving them his sanction, and only borrowed from them what they had already borrowed from authentic texts, but in general he took up the same attitude as the former had ascribed to his remote predecessors. The language of his successors, Andrian II. and John VIII., still shows some trace of the energy and pride of Nicholas. But the circumstances were becoming difficult. Europe was being split up under the influence of feudalism; Christendom was assailed by the barbarians, Norsemen, Saracens and Huns; at Rome the papacy was passing into the power of the local aristocracy, with whom after Otto I. it was disputed from time to time by the sovereigns of Germany. It was still being held in strict subjection by the latter when, towards the end of the 12th century, Hildebrand (Gregory VII.) undertook its enfranchisement and began the war of the investitures (1107), from which the papacy was to issue with such an extraordinary renewal of its vitality.

In Eastern Christendom the papacy was at this period an almost forgotten institution, whose pretensions were always met by the combined opposition of the imperial authority, which was still preponderant in the Byzantine Church, and the authority of the patriarch of Constantinople, around which centred all that survived of Christianity in those regions. To complete the situation, a formal rupture had occurred in 1054 between the patriarch Michael Cerularius and Pope Leo IX.

In the West, Rome and her sanctuaries had always been held in the highest veneration, and the pilgrimage to Rome was still the most important in the West. The pope, as officiating in these holiest of all sanctuaries, as guardian of the tombs of St Peter and St Paul and the inheritor of their rank, their rights, and their traditions, was the greatest ecclesiastical figure and the highest religious authority in the West. The greatest princes bowed before him; it was he who consecrated the emperor. In virtue of the spurious donation of Constantine, forged at Rome in the time of Charlemagne, which was at first circulated in obscurity, but ended by gaining universal credit, it was believed that the first Christian emperor, in withdrawing to Constantinople, had bestowed on the pope all the provinces of the Western Empire, and that in consequence all sovereignty in the West, even that of the emperor, was derived from pontifical concessions. From all points of view, both religious and political, the pope was thus the greatest man of the West, the ideal head of all Christendom.

When it was necessary to account for this position, theologians quoted the text of the Gospels, where St Peter is represented as the rock on which the Church is built, the pastor of the sheep and shepherd of the flock, the key to heaven. The statements made in the New Testament about St Peter were applied without hesitation to all the popes, considered as his successors, the inheritors of his see (Petri sedes) and of all his prerogatives. This idea, moreover, that the bishops of Rome were the successors of St Peter was expressed very early—as far back as the 2nd century. Whatever may be said as to its historical value, it symbolizes very well the great authority of the Roman Church in the early days of Christianity; an authority which was then administered by the bishops of Rome, and came to be more and more identified with them. The councils were also quoted, and especially that of Nicaea, which does not itself mention the question, but certain texts of which contained the famous gloss: *Ecclesia romana semper habuit primatum*. But this proof was rather insufficient, as indeed it was felt to be, and, in any case, nothing could be deduced from it with the proof of precession from honours, which was never contested even by the Greeks. The Gospel and unbroken tradition offered a better argument.

In his capacity as head of the church, “and president of the Christian agape,” as St Ignatius of Antioch would have said, the pope was considered to be the supreme president and moderator of the ecclesiastical assemblies. When the episcopate met in council the bishop of Rome had to be at its head. No decisions of a general nature, whether dogmatic or disciplinary, could be made without his consent. The appeal from all patriarchal or conciliar judgments was to him; and on those occasions when he had to depose bishops of the highest standing, notably those of Alexandria and Constantinople, his judgments were carried into effect. During the religious struggles between the East and West he was on a few occasions condemned (by the Eastern council of Sardica, by Dioscorus, by Photius); but the sentences were not carried out, and were even, as in the case of Dioscorus, considered and punished as sacrilegious attacks. In the West the principle, “prima sedes a nemine judicatur,” was always recognized and applied.

In ordinary practice this theoretically wide authority had only a limited application. The apostolic see hardly ever interfered in the government of the local Churches. Practical save in its own metropolitan province, it took no part in the nomination of bishops; the provincial or regional councils were held without its authorization; their judgments and regulations were carried out without any suggestion that they should be ratified by Rome. It is only after the False Decretals that we meet with the idea that a bishop cannot be deposed and his place filled without the consent of the pope. And it should be noticed that this idea was put forward, not by the pope with the object of increasing his power, but by the opinion of the Church with a view to defending the bishops against unjust sentences, and especially those inspired by the secular authority.

It was admitted, however, throughout the whole Church that the Holy See had an appellate jurisdiction, and recourse was had to it on occasion. At the council of Sardica (343) an attempt had been made to regulate the procedure in these appeals, by recognizing as the right of the pope the reversing of judgments, and the appointment of fresh judges. In practice, appeals to the pope, when they involved the annulling of a judgment, were judged by the pope in person.

But the intervention of the Holy See in the ecclesiastical affairs of the West, which resulted from these appeals, was only of a special, sporadic and occasional nature. Nothing could have been more removed from a centralized administration than the condition in which matters stood with regard to this point. The pope was the head of the Church, but he exercised his authority only intermittently. When he did exercise it, it was far more frequently at the request of bishops or princes, or of the faithful, than of his own initiative. Nor had any administrative body for the supreme government of the Church ever been organized. The old Roman clergy, the deacons and priests of the church at Rome (presbyteri incardinati, cardinale) formed the pope’s council, and when necessary his tribunal; to them were usually added the deacons of the household. The body of ecclesiastical notaries served as the staff of the chancery.

The Roman Church had from a very early date possessed considerable wealth. Long before Constantine we find her employing it in aid of the most distant churches, as far afield as Cappadocia and Arabia. Her real property, confiscated under Diocletian, was restored by Constantine, and since then had been continually increased by gifts and bequests. In the 4th and 5th centuries,
the Roman Church possessed property in all parts of the empire; but gradually, whether because the confiscations of the barbarian emperors had curtailed its extent, or because the popes had made efforts to concentrate it nearer to themselves, the property of the Holy See came to be confined almost entirely to Italy. In the time of St Gregory there subsisted only what lay in Byzantine Italy, the Lombards having confiscated the property of the Church as well as the imperial domains. During the quarrels between the papacy and the Byzantine Empire her domains in lower Italy and Sicily also disappeared as time went on, and the territorial possessions of the Roman Church were concentrated in the Roman Curia and the near neighbourhood of Rome.

It was then, towards the middle of the 8th century, that the pope, who already exercised a great influence over the government of the city and province of Rome, defended her peacefully and with difficulty against the advancing Lombard conquests, saw that he was forsook, short of the protection of the Greek Empire, to put himself under the protection of the Frankish princes. Thus there arose a kind of sovereignty, disputed, it is true, by Constantinople, but which succeeded in maintaining itself. Rome, together with such of the Byzantine territories still subsisting in her neighbourhood, was considered as a domain sacred to the apostle Peter, and entrusted to the administration of his successor, the pope. To it were added the exarchate of Ravenna and a few other districts of central Italy, which had been recently conquered by the Lombards and retaken by the Frankish kings Pippin and Charlemagne. Such was the foundation of the papal state.

The higher places in the government were occupied by the clergy, who for matters of detail made use of the civil and military officials who had carried on the administration under the Byzantine rule. But these lay officials could not long be content with a subordinate position, and hence arose incessant friction, which called for constant intervention on the part of the Frankish sovereigns. In 824 a kind of protectorate was organized, and serious guarantees were conceded to the lay aristocracy.

Shortly afterwards, in the partition of the Carolingian Empire, Italy passed under the rule of a prince of its own, Louis II., who, with the title of emperor, made his authority felt in political matters. Shortly after his death (875) fresh upheavals reduced to nothing the power of the Carolingian prince, and Rome found itself without a protector exposed to the animosity of the lay aristocracy. The authority of the pontificate was seriously impaired by these circumstances. One of the great families of Rome, that of the vestararius Theophylact, took possession of the temporal authority, and succeeded in influencing the papal elections. After Theophylact the power passed to his daughter Marozia, a woman of the most debased character; then to her son Alberic; a serious-minded prince; and then to Alberic's son Octavius, who from 'prince of the Romans' became pope (John XII.) when yet a mere boy. After Marozia and Alberic and the rest another branch of the same noble family, the Crescentii, exercised the temporal powers of the Holy See; and after them the same régime was continued by the counts of Tusculum, who were sprung from the same stock, which sometimes provided the Roman Church with the most unlikely and least honourable pontiffs.

The pope, like all the bishops, was chosen by means of election, in which both the clergy and the laity took part. The latter were represented in the most essential functions of the election by the aristocracy: at first by the clergy of Rome, and later by the exercitus Romanus, composed of Byzantine officials. It was the latter which gave rise to the feudal aristocracy which we see appearing under the Carolingians. The new pope was chosen by the principal members of the clergy and nobles, and then set before the assembled people, who gave their decision by acclamation; and this acclamation was accepted as the vote of the assembly of the faithful. The pope-elect was then put in possession of the episcopal house, and after waiting till the next Sunday his consecration was proceeded with. This ceremony was at first celebrated in the Lateran, but from Byzantine times onwards it took place at St Peter's. It was also under the Byzantine régime that the condition was imposed that the pope should not be consecrated until the emperor had ratified his election. This had not been required under the old Latin emperors nor under the Gothic kings, and it disappeared of its own accord with the Byzantine régime. It was revived, however, by the emperor Louis the Pious, much to the disgust of the Romans, who resented on several occasions. The Roman 'princes' or 'senators' in the 10th century went still further: it was they who actually nominated the pope. The case was the same with the Saxon emperors (Otto I., II., and III.), and in the 11th century of the lords of Tusculum, the latter nominating themselves and choosing members of their own family for the pontificate. When the emperor Henry III. (1046) put an end to this oppression it was only to substitute another. The popes of Tusculum did, at least, belong to the country, while the German kings chose bishops from the other side of the Alps. Such was the state of affairs up to the time of Hildebrand.

The entry of Hildebrand into the counsels of the papacy marks the beginning of a great change in this institution. He could not, however, elude the honour of having a rival. The way in which he impelled his predecessors to follow his lead is evident even before following him himself. All good Christians were calling for reform; bishops, princes, and monks were in agreement on this point when they spoke or acted according to their convictions. Many of them had tried to effect something; but these isolated efforts were often counterbalanced by incompatible aims, and had produced no serious results. It is in the supreme head of the Church that the movement ought to have found its origin and inspiration. There was no dispute as to his possessing the authority in spiritual matters necessary to impose reforms, and therefore to regulate the conduct of the monks, who was better qualified than he to treat with the holders of the temporal power and obtain the support which was necessary from them. The Fathers of the Church had repeated times without number that the priesthood stands above even the supreme secular authority; the Bible was full of stories most aptly illustrating this doctrine; nobody questioned that, within the Church, the pope was the Vicar of Christ, and that, as such, his powers were unlimited; as proof positive could be cited councils and decreals—whether authentic or spurious; at any rate all, however, clung to the honour of being the pope. It was only an assumption of this incontestable power and use it with firmness and consistency. The example of Nicholas I., two centuries before, had shown the position which a pope could occupy in Christendom; but for a long time past the man had come short of the institution, the workman of his tool.

Under Leo IX. (1048-1054) the pope suddenly came forward as the active and indetachable champion of reform; simony and incontinence of the clergy were attacked by the one most qualified to purify the Church of them. Henceforth the way was open, and it became clear that, given good popes, the reform and overthrow of the resistance which existed was only a question of putting the pope in a position of sovereign authority, Germany, against whom the Roman feudal lords, devoted as they were to the old abuses, were in constant revolt. In the midst of the frequent changes of pope which went on during these years, and the political vicissitudes of Italy, Hildebrand took such measures as enabled him to checkmate the opposition of the Roman barons by turning against them, now the armed force of the Normans, now the influence of the German king.1

1 On the 5th of April 1053, six days after the death of Pope Stephen X., John, bishop of Velletri, the nominee of the Roman nobles, was enthroned as Pope Benedict X. Hildebrand set up Gerard, bishop of Florence, as a rival candidate, won over a part of the Romans to his cause, and secured the support of the imperial regent Agnes at the Diet of Augsburg in June. Gerard was elected pope at Siena (as Nicholas II., q.e.d.) by those cardinals who had fled from Rome on the elevation of Benedict X. A synod was held at Rome as a result of this, and the pope was excommunicated. Hildebrand then intruded Robert, bishop of Spoleto, and margrave of Tuscanv, and the chancellor Wilbrod were present. Measures were here concerted against Pope Benedict, who was driven out of Rome in January 1053, Nicholas II. being...
Side by side with the general movement towards reform, he had set himself the object of freeing the papacy, not only from its temporal oppressors but also from its protectors. He was successful at the council of 1059, the pontifical election was placed out of reach of the schemes of the local feudal lords and restored to the heads of the clergy; certain reservations were made with regard to those rights which the Holy See was content to surrender temporarily to Henry of Germany (the young king Henry IV., son of the emperor Henry III.), but nothing more. At the election of Alexander II. (1061-1073)—a rival to whom was for a long time supported by the German king—and even at the election of Hildebrand, this rule had its effect. Henceforth the elections remained entirely free from those secular influences which had hitherto been so oppressive. In 1073 Hildebrand was raised to the pontifical throne by the acclamation of the people of Rome, under the name of Gregory VII.

The work of reform was now in a good way; the freedoms of the pontifical elections had been assured, which gave some promise that the struggle against abuses would be conducted successfully. All that now remained was to go on following wisely and firmly the way that had already been opened. But this attitude was not likely to appeal to the exuberant energy of the new pope. Hitherto he had had to reckon with obstacles more powerful than those which were now left for him to conquer, and, what was more, with the fact that his authority depended upon the will of others. But now that his hands were no longer tied, he could act freely. The choice of the pope had been almost entirely removed from the sphere of secular influence, and especially from that of the German king. Gregory claimed that the same condition should apply to bishops, and these were the grounds of the dispute about investitures—a dispute which could find no solution, for it was impossible for the Teutonic sovereigns to renounce all interest in a matter of such importance in the workings of their state. Since the time of Clovis the German sovereigns had never ceased to intervene in such matters. But this question soon fell into the background. Gregory's contention was that the secular sovereigns should be entirely in the power of the head of the Church, and that he, should be able to advance them or dispose of them at will, according to the estimate which he formed of their conduct. A terrible struggle arose between these obviously exorbitant demands and the resistance which they provoked. Its details cannot be described in this place (see Investitures); we need only say that this ill-fated quarrel was not calculated to advance the reform movement, but rather to impede it, and, further, that it ended in failure. Gregory died far away from Rome, upon which he had brought incalculable evils; and not only Rome, but the papacy itself had to pay the penalty for the want of moderation of the pope. Great indeed was the difference between the state in which he received it and that in which he left it. We must not, however, let this mislead us. This struggle between spiritual and secular powers, owing to the tremendous sensation which it created throughout Christendom, showed the nations that at the head of the Church there was a great force for justice, always able to combat iniquity and oppression, and sometimes to defeat them, however powerful the evil and the tyrants might seem. The scene at Canossa, which had at the moment a merely relative importance, remained in the memories of men as a symbol which was hateful or comforting, according to the point of view from which it was considered. As to Gregory's political pretensions, zealous theorists were quick to transform them into legal principles; and though his immediate successors, some what daunted by the disturbance which they had aroused, seem to have neglected them at first, they were handed on to more distant heirs and reappeared in future struggles.

Gregory himself, in his last moments, seems to have felt that it was impossible to maintain them, for Didier, abbot of Monte Cassino (Victor III., 1068-1067), whom he nominated as his successor, was well known for his moderation. It was no longer a question of continuing the policy of Gregory VII., but of saving the work of Hildebrand.

(L. D.)

II.—Period from 1087 to 1095.

Gregory VII. had clearly revealed to the world the broad lines of the religious and political programme of the medieval papacy, and had begun to put it into execution. The Work of Gregory VII.

To reform the Church in every grade and purge the priesthood in order to shield it from feudal influences and from the domination of lay-sovereignties; to convert the Church thus regenerated, spiritualized, and detached from the world, into an organism which would be submissive to the absolute authority of the papal see, and to concentrate at Rome all its energies and jurisdictions; to establish the supremacy of the Roman see over all the Christian Churches, and win over to the Roman Church the Churches of the Byzantine Empire, Africa and Asia; to establish the temporal domain of St Peter, not only by taking possession of Rome and Italy, but also by placing all the crowns of Europe under the supreme sovereignty of the popes, or even in direct vassalage to them; to make and defend against the attacks of unbelievers, Musulmans, heretics and pagans—these were the main features of his scheme. The task, however, was so gigantic that after 150 years of strenuous effort, at the period which may be considered as the apogee of its power, that is, in the first half of the 13th century, the papacy had attained only incomplete results. At several points the work remained unfinished, for decadence followed close upon the moment of extreme greatness. It is more particularly in the part of this programme that relates to the internal policy of the papacy, to the subjection of the Church to the Curia, and to the intensive concentration of the ecclesiastical forces in the hands of the leader of Christendom, that Gregory VII. farthest in the execution of his plan and approached nearest the goal. For the rest, so formidable were the external obstacles that, without theoretically renouncing his claims, he was unable to realize them in practice in a manner satisfactory to himself.

In order to give a clear idea of the vicissitudes through which the papal institution passed between the years 1087 and 1305 and to show the measure of its success or failure at different stages in its course, it is convenient to divide this section into four periods.

1. Period from Urban II. to Calixtus II. (1087-1124).—Gregory VII.'s immediate successors accomplished the most pressing work by liberating the Church from feudal subjection, either by force or by diplomacy. This was, indeed, the indispensable condition of its internal and external progress. The great figure of this period is unquestionably the French Cluniac Urban II., who led the Hildebrandine reformation with more vehemence than Gregory himself and was the originator of the crusades. Never throughout the middle ages was pope more energetic, impetuous or industrious, more skilful at bringing great enterprises to completion and directed against the enemy within, against the simoniacal prelate and the princely usurper of the rights of the Church, and presided over the movement against the enemy without, against the infidel who held the Holy Sepulchre. Urban set his hand to reforms from which his predecessor Gregory had recoiled. He simultaneously excommunicated several sovereigns and mercilessly persecuted the archbishops and bishops who were hostile to reform. He took no pains to temper the zeal of his legates, but incited them to the struggle, and, not content with prohibiting lay investiture and simony, expressly forbade prelates and even priests to pay homage to the civil power. Disturbing the secular clergy, who were wholly sunk in the world, he looked to the regular clergy for support, and thus led the papacy into that course which it continued to pursue after his death. Henceforth the monk was to be the docile instrument of the wishes of Rome, to be
opposed to the official priesthood according to Rome's needs. Urban was the first to proclaim with emphasis the necessity of a close association of the Curia with the religious orders, and this he made the essential basis of the theocratic government. As the originator of the first crusade, Urban was entitled to the honour of the idea and its execution. There is no doubt that he wished to satisfy the complaints that emanated from the Christians dwelling in Jerusalem and from the pilgrims to the Holy Sepulchre, but it is no less certain that these dissatisfaction and the tendencies aroused throughout the Latin world by the recrudescence of Mussulman invasions, and particularly by the victory won by the Almoravides over the Christian army at Zalaca (1086). The progress of these African Mussulmans into Spain and their incessant piracies in Italy were perhaps the occasional cause that determined Urban II. to work upon the imagination of the infidels by an expedition into Syria. The papacy of that time believed in the political unity of Islam, in a solidarity—which did not exist—among the Mussulmans of Asia Minor, Syria, Egypt and the Barbary coast; and if it waited until the year 1095 to actually supervise the movement, it was because it was already engaged in other enterprises, and the Germanic Empire prevented the earlier realization of its dream. The essential reason of Urban II.'s action, and consequently the true cause of the crusade, was the ambition of the pope to unite with Rome and the Roman Church the Churches of Jerusalem, Antioch, Alexandria and even Constantinople, which the Greek schism had rendered independent. This thought had already crossed the minds of Leo IX. and Gregory VII., but circumstances had never allowed them to put it into execution. Armed with the reformation with a moral authority which made it possible to concentrate the forces of the West under a supreme direction of the Church and its leaders, Urban II. addressed himself with his customary decision to the execution of this enormous enterprise. With him, as with all his successors, the idea of a collective expedition of Europe for the recovery of the Holy Places was always associated with the sanguine hope of extinguishing the schism at Constantinople, its very centre, by the substitution of a Latin for a Byzantine domination. Of these two objects, he was only to realize the former; but the crusade may well be said to have been his own work. He created it and preached it; he organized it, dominated it; he was, in short, the true leader of the enterprise, whether personally or through his delegates, and never ceased to be the effective leader of all the feudal soldiers he enrolled under the banner of the Holy See. He corresponded regularly with his legates and with the military leaders, who kept him accurately informed of the position of the troops and the progress of the operations. He acted as intermediary between the soldiers of Christ and their brothers who remained in Europe, announcing successes, organizing fresh expeditions, and spurring the laggards to take the road to Jerusalem.

The vast conflict aroused by the Hildebrandine reformation, and particularly the investiture quarrel, continued under the settlement of three successors of Urban II.; but with them it assumed a different character, and a tendency arose to terminate it by other means. The violence and disorders provoked by the struggle brought about a reaction, which was organized by certain prelates who advocated a policy of conciliation, such as the Frenchman Ivo, bishop of Chartres (c. 1040-1106). These conciliatory prelates were sincere supporters of the reformation, and combated simony, the marriage or concubinage of priests, and the immorality of seculars with the same conviction as the most ardent followers of Gregory VII. and Urban II.; but they held that the intimate union of Church and State was indispensable to the social order, and that the rights of kings should be respected as well as the rights of priests. The text they preached was harmony between the priesthood and the state. Dividing what the irrevocable Hildebrandine party considered as an indissoluble whole, they made a sharp distinction between the property of the Church and the Church itself, between the political and territorial power of the bishops and their religious authority, and between the feudal investiture which confers lands and jurisdiction and the spiritual investiture which confers ecclesiastical rights. This doctrine gradually rallied all moderate minds, and finally inspired the directors of Christendom in Rome itself. It explains the new attitude of Paschal II. and Calixtus II., who were both sincere reformers, but who sought in a policy of compromise the solution of the difficult problem of the relations of Church and State.

History has not done sufficient justice to the Italian monk Paschal II.—Pope along with the leader of Urban in private virtues, personal disinterestedness, and religious conviction, but was surpassed by him in aridity and rigidity of conduct. Altered circumstances and tendencies of opinion called for a policy of conciliation. In France, Paschal granted absolution to Philip I.—who had many times been anathematized by his predecessors—and reconciled him solemnly with the Church, on the sole condition that he should swear to renounce his adulterous marriage. The pope could be under no delusion as to the value of this oath, which indeed was not kept; he merely regularized formally a state of affairs which the intractable king had already been able to prevent. As for the French question of the investitures, it was settled apparently without any treaty being expressly drawn up between the parties. The kings of France contemporary with Paschal II. ceased to practice spiritual investiture, or even to receive feudal homage from the bishops. They did not, however, renounce all intervention or all profit in the nominations to prelacies, but their intervention was no longer exhibited under the forms which the Hildebrandine party held to be illegal. In England, Paschal II. put an end to the long struggle between the royal government and Anne, countess of Gloucester, by accepting the Concordat of London (1107). The crown in England also abandoned investiture by the pastoral staff and ring, but, more fortunately than in France, retained the right of receiving feudal homage from the episcopate. As for Germany, the Emperor Henry V. wrung from the pope, by a display of force at Rome, concessions which provoked the indignant clamours of the most ardent reformers in France and Italy. It must not, however, be forgotten that, in the negotiations at Sutri, Paschal had pride and independence enough to propose to the emperor the only solution of the conflict that was entirely in accordance with the imperial interests, and that Pope Urban, by the Church of its temporal power and the renunciation by the lay lords of all intervention in elections and investitures—in other words, the absolute separation of the priesthood and the state. The idea was contrary to the whole evolution of medieval Catholicism, and the German bishops were the first to repudiate it. At all events, it is certain that Paschal II. prepared the way for the Concordat of Worms. On the other hand, with more acuteness than his predecessors, he realized that the papacy could not sustain the struggle against Germany unless it could rely upon the support of another Christian king of the West; and he concluded with Philip I. of France and Louis the Fat, at the Council of Troyes (1107), an alliance which was for more than a century the salvation of the court of Rome. It is from this time that we find the popes in moments of crisis transporting themselves to Capetian territory, installing their governments and convening their councils there, and from that place of refuge fulminating with impunity against the internal and external foe. Without sacrificing the essential principles of the reformation, Paschal II. practised a policy of peace and reaction in every way contrary to that of the two preceding popes, and it was through him that the struggle was once more placed upon the religious basis. He refused to retain Hugo, bishop of Die (d. 1106), as legate; like Urban and Gregory, he gave or confirmed monastic privileges without the protection he granted to the monks assuming a character of hostility towards the episcopate; and, finally, he gave an impulsion to the reformation of the chapters, and, unlike Urban II., maintained the rights of the canons against the claims of the abbots.

Guy, the archbishop of Vienne, who had been one of the
keenest to disavow the policy of Paschal II., was obliged to continue it when he assumed the tiara under the name of Calixtus II. By the Concordat of Worms, which he signed with the Emperor Henry V. in 1122, the investiture was divided between the ecclesiastical and the lay powers, the emperor investing with the sceptre, the pope with the pastoral staff and ring. The work did honour to the perseverance and ability of Calixtus, but it was merely the application of the ideas of Paschal II. and Ivo of Chartres. The understanding, however, between the two contracting parties was very far from being clear and complete, as each party still sought to attain its own aim by spreading in the Church those widely differing interpretations of the Concordat, and reducing it to many widely differing forms of reducing it to its final form. And, again, if this transaction settled the investiture question, it did not solve the problem of the reconciliation of the universal power of the popes with the claims of the emperors to the government of Europe; and the conflict subsisted—slumbering, it is true, but ever ready to awake under other forms. Nevertheless, the two great Christian agitations directed by the papacy at the end of the 11th century and the beginning of the 12th—the reformation and the crusade—were of capital importance for the foundation of the immense religious monarchy that had its centre in Rome; and it is from this period that the papal monarchy actually dates.

The entry of the Christians into Jerusalem produced an extraordinary effect upon the faithful of the West. In it they saw the most manifest sign of the divine protection and of the supernatural power of the pope, the Eastern patriarch, indeed, received a large share; but the government of the Latin principality remained lay and military, the only form of government possible for a colony surrounded by peril and and camped in a hostile country. Not only was the result of the crusade extremely favourable to the extension of the Roman power, but throughout the middle ages the papacy never ceased to derive almost incalculable political and financial advantages from the agitation produced by the preachers and the crusading expeditions. The mere fact of the crusaders being placed under the special protection of the Church and the pope, and loaded with privileges, freed them from the jurisdiction, and even, up to a certain point, from the lordship of their natural masters, to become the almost direct subjects of the papacy; and the common law was then practically suspended for the benefit of the Church and the leader who represented it.

As for the reformation, which under Urban II. and his immediate successors was aimed not only at the episcopate but also at the capularly bodies and monastic clergy; it, too, could but tend to a consideration of the power and authority of the Church. At St Peter, for it struck an irremediable blow at the ancient Christian hierarchy. The first manifest result of the change was the weakening of the metropolitans. The visible symptom of this decadence of the archiepiscopal power was the growing frequency during the Hildebrandine conflict of episcopal confirmations and consecrations made by the popes themselves or their legates. From an active instrument of the religious society, the archiepiscopate degenerated into a purely formal power; while the episcopate itself, which the sincere reformers wished to liberate and purge in order to strengthen it, emerged from the crisis sensibly weakened as well as ameliorated. The episcopate, while it gained in intelligence and morality, lost a part of its independence. It was raised above feudalism only to be abased before the two directing forces of the reformation, the papacy and the religious orders. To place itself in a better posture for combating the simoniacal and concubinarian prelates, the court of Rome had had to multiply exemptions and accelerate the movement which impelled the monks to make themselves independent of the bishops. Even in the cities, the seats of the episcopal power, the reformation encouraged the attempts at revolt or autonomy which tended everywhere to diminish that power. The cathedral chapters took advantage of this situation to oppose their jurisdiction to that of the bishops, and to encroach on their prerogatives. When war was declared on the schismatic prelates, the reforming popes supported the canons, and, unconsciously or not, helped them to form themselves into privileged bodies living their own lives, and not affected by the direct influence of a superior authority. Other adversaries of the episcopate, the burgesses and the petty nobles dwelling in the city, also profited by these frequent changes of bishops, and the disorders that ensued. It was the monarchy of the bishops of Rome that naturally benefited by these attacks on the aristocratic principle represented by the high prelates in the Church. By drawing to their side all the forces of the ecclesiastical body to combat feudalism, Urban II. and his successors, with their monks and legates, changed the constitution of that body, and changed it to their own advantage. The new situation of these popes and the growth of their authority were also manifested in the material organization of their administration and chancery. Under Urban II. the formulary of the papal bulls began to crystallize, and the letters amissed in the papal offices were differentiated clearly into great and little bulls, according to their style, arrangement and signs of validation. Under Paschal II. the type of the leaden seal affixed to the bulls (representing the heads of the apostles Peter and Paul) was fixed, and the use of Roman minuscule finally substituted for that of the Lombard script.

2. Period from Honorius II. to Celestine III. (1124-1198).—After the reformation and the crusade the papal monarchy existed, and the next step was to consolidate and extend it. This task fell to the popes of the 12th century. Two of them in particular—the two who had the longest reigns—viz., Innocent II. and Alexander III., achieved the widest extension of the power entrusted to them, and in many respects their pontificates may be regarded as a preparation for and adumbration of the pontificate of Innocent III. This period, however, is characterized not only by the thoroughgoing development of the authority of the Holy See, but also by the severe struggle the popes had to sustain against the hostile forces that were opposed to their conquests or to the mere exercise of what they regarded as their rights.

In the secular contest, Germany and the imperialist pretensions of its leaders were invariably the principal obstacle. Until the accession of Adrian IV., however, there had been considerable periods of tranquillity, years even of unbroken peace and alliance with the Germanic power. Under Honorius II. the empire, represented by Lothair III. of Supplinburg, yielded to the papacy, and Lothair, who was elected by the clergy and protected by the legates, begged the pope to confirm his election. Before his coronation he had renounced the right, so jealously guarded by Henry V., of assisting in the election of bishops and abbots, and he even undertook to refrain from exacting homage from the prelates and to content himself with fealty. This undertaking, however, did not prevent him from bringing all his influence to bear upon the ecclesiastical nominations. When the schism of 1139 broke out he endeavoured to procure the cancellation of the clauses of the Concordat of Worms and to recover lay investiture by way of compensation for the support he had given to Innocent II., one of the competing popes. This scheme, however, was frustrated by the firmness of Innocent and St Bernard, and Lothair had to resign himself to the zealous conservation of the privileges granted to the Empire by the terms of the concordat. The ardour he had displayed in securing the recognition of Innocent and defending him against his enemies, particularly the anti-pope.
Anacletus and the kingdom of the Two Sicilies, involved him in a course which was not precisely favourable to the imperial rights. Innocent II. was the virtual master of this monarch, whose championship of the papacy brought not the smallest advantage, not even that of being crowned emperor with the habitual ceremonial at the place consecrated by tradition. It may even be maintained that his elevation was due solely to his personal claims. This was a victory for Rome, and it was repeated in the case of the first Hohenstaufen, Conrad III., who owed his elevation (1155) mainly to the prerogatives of the Church and the legate of Innocent II., by whom he was crowned. He also had to submit to the consequences of his origin on the occasion of a double election not foreseen by the Concordat of Worms, when he was forced to admit the necessity of appeal to Rome and to acknowledge the supremacy of the papal decision. The situation changed in 1159 under Eugenius III., when Frederick Barbarossa was elected German king. He notified his election to the pope, but did not seek the pope’s approval. None the less, Eugenius III. felicitated the new sovereign on his election, and even signed the treaty of Constance with him (1158). The pope had need of Frederick to defend him against the revolted Romans and to help him to recover his temporal power, which had been gravely compromised. Anastasius IV. pursued the same policy, and summoned the German to Rome (1154). Frederick, however, was determined to keep the seat of the Empire for himself, to dispute Italy with the pope, and to oppose the divine right of kings to the divine right of priests. When he had taken Lombardy (1158) and had the principles of the imperial supremacy proclaimed by his jurists at the diet of Roncaglia, the court of Rome realized that war was inevitable, and two energetic popes, Adrian IV. and Alexander III., resolutely sustained the struggle, the latter for nearly twenty years. Victims of the communal claims at Rome, they constituted themselves the champions of similar claims in northern Italy, and their alliance with the Lombard communes ultimately led to success. In his duel with Barbarossa, Alexander III., one of the greatest of medieval popes, displayed extraordinary courage, address and perseverance. Although it must be admitted that the tenacity of the Lombard republics contributed powerfully to the pope’s victory, and that the triumph of the Milanese at Legnana (1176) was the determining cause of Frederick’s submission at Venice, yet we must not exaggerate the importance of the solemn act by which Barbarossa, kneeling before his conqueror, recognized the spiritual supremacy of the Holy See, and swore fidelity and respect to it. In its final form, the truce of Venice was not only unfavourable secularly to the Empire, but even granted it very extensive advantages. Nor must it be forgotten that, in the eyes of contemporaries, the scene at Venice had none of that humiliating character which later historians have attributed to it. This was the only success gained by Alexander III. over lay sovereigns. The conflict of the priesthood with the kingdoms and nations that were tending to aggrandize themselves by transcending the religious limits of the medieval theocracy took place on another theatre. Alexander III. and Henry II. of England. The affair of Thomas Becket (q.v.) involved the papacy in a quarrel with the powerful monarchy of the Angevins, whose representative, Henry II., was master of England and of the half of France. Alexander’s diplomatic skill and moral authority, reinforced by the Capetian alliance and the revulsion of feeling caused by the murder of Becket, enabled him to force the despotic Henry to yield, and even to do penance at the tomb of the marty. The Plantagenet abjured the Constitutions of Clarendon, recognized the rights of the pope over the Church of England, and augmented the privileges and domains of the archbishopric of Canterbury. Although Becket was a man of narrow sympathies and by no means of liberal views, he had died for the liberties of his caste, and the aureole that surrounded him enhanced the prestige and ascendancy of the papacy.

Unfortunately for the papacy, the successors of Alexander III. lacked vigour, and their pontificates were too brief to allow them to pursue a strong policy against the Germanic imperialism. Never were the leaders of the Church in such jeopardy as during the reign of Barbarossa’s son, Henry VI. This vigorous despot, whose ambitions were not all chimerical, had succeeded where his predecessors, including Frederick, had failed. His marriage with the heiress of the old Norman kings had made him master of Sicily and the duchy of Apulia and Calabria, and he succeeded in conquering and retaining almost all the remainder of the peninsula. Under Celestine III. the papal state was surrounded on every side by German soldiers, and but for the premature death of the emperor, whom Abbot Joachim of Floris called the “hammer of the world,” the temporal power of the popes might perhaps have been annihilated.

The Norman kingdom, which had conquered Sicily and southern Italy at the end of the 12th century, was almost as grave a source of anxiety to the popes of this period. Not only was its very existence an obstacle to the spread of their temporal power in the peninsula, but it frequently acted in concert with the pope’s enemies and thwarted the papal policy. The attempts of Honorius II. (1128) and Innocent II. (1130) to wrest Apulia and Calabria from King Roger II., and Adrian IV.’s war with William I. (1156), were one and all unsuccessful; and the papacy had to content itself with the vassalage and tribute of the Normans, and allowed them to organize the ecclesiastical government of their domains in their own fashion, to limit the right of appeal to Rome, and to curtail the power of the Normans kings. At this period, moreover, the “Norman Question” was intimately connected with the “Eastern Question.” The Norman adventurers in possession of Palermo and Naples perpetually tended to look for their aggrandizement by the Byzantine Empire. In the interests of their temporal dominion, the 12th-century popes could not suffer an Italian power to dominate on the other side of the Adriatic and instal itself at Constantinople. This contingency explains the vacillating and illogical character of the papal diplomacy with regard to the Byzantine problem, and, inaltera alia, the opposition of Eugenius III. in 1150 to Roger II.’s projected crusade, which was the direct ancestor of the Greek state. The popes were under the constant sway of two contrary influences—on the one hand, the seducing prospect of subduing the Eastern Church and triumphing over the schism, and, on the other, the apprehension of seeing the Normans of Sicily, their competitors in Italy, increasing their already formidable power by successful expeditions into the Balkan Peninsula. Dread of the Normans, too, explains the singular attitude of the Curia towards the Communi, of whom it was alternately the enemy and the protector or ally. But, as regards its temporal aims on Italy, the most inconvenient and tenacious, if not the most dangerous, adversary of the 12th-century papacy was the Roman commune.

Since the middle of the 12th century the party of the municipal autonomy and, indeed, the whole of the European middle classes, who wished to shake off the feudal yoke and secure independence, had been ranged against the successor of St Peter. The first symptoms of resistance were exhibited under Innocent II. (1143), who was unable to stem the growing revolution or prevent the establishment of a Roman senate sitting in the Capitoline, the scene of classical reminiscence and the symbol of liberty were reinforced by the support given to communal aspirations by the popular agitator and dangerous tribune, Arnold of Brescia (q.v.), whose theories arrived at an opportune moment to encourage the revolted commons. He denied the power of clerks to possess fiefs, and allowed them only religious authority and tithes. The successors of Innocent II. were even less successful in maintaining their supremacy in
PAPACY

Rome. Lucius II., when called upon to renounce all his regalian rights, fell mortally wounded in an attempt to drive the autocrats by force from the Capitol (1145). Under Eugenius III., the Romans sacked and destroyed the houses of the clerks and cardinals, besieged St Peter's and the Lateran, and massacred the pilgrims. This movement was led by the College of cardinals, to escape the necessity of recognizing the commune, and thus left the field free to Arnold of Brescia (1145). On his return to Rome, Eugenius had to treat with his rebel subjects and to acknowledge the senate they had elected, but he was unable to procure the expulsion of the agitators. The more energetic Adrian IV., refused to truce to the municipality, placed it under an interdict (1155), and allied himself with Frederick Barbarossa to quell an insurrection which respected the rights of emperors no more than the rights of popes. From the moment that Arnold of Brescia, absorbed in his chimerical project of uniting the atoms of the ancient Roman republic, discarded the imperial power and neglected to shelter himself behind the German in his conflict with the priesthood, his failure was certain and his fate foredoomed. He was hanged and burned, probably in pursuance of the secret agreement between the pope and the emperor; and Adrian IV. was reconciled with the Romans (1156). The commune, however, subsisted, and was on several occasions strong enough to eject the masters who were distasteful to it. Unfortunately for Alexander III., the Roman question was complicated during his pontificate with the desperate struggle with the Empire. The populace of the Tiber welcomed and expelled him with equal enthusiasm, and when his body was brought back from exile, the mob went before the cortege and threw mud and stones upon the funeral litter. All obeyed the pontiff of Rome—save Rome itself. Lucius III., who was pope for four years (1158-1155), remained in Rome four months, while Urban III. and Gregory VIII. never entered the city. At length the two parties grew weary of this state of revolution, and a régime of conciliation, the fruit of mutual concessions, was established under Clement III. By the act of 1188, the fundamental charter of the Roman commune, the people recognized the supremacy of the pope over the senate and the town, while the pope on his part sanctioned the legal existence of the commune and of its government and assemblies. Inasmuch as Clement was compelled to make terms with this new power which had established itself against him in the very centre of his dominion, the victory may fairly be said to have rested with the commune.

Although, among other obstacles, the popes of the 12th century had experienced some difficulty in subduing the inhabitants of the city, which was the seat and centre of the Christian world, their monarchy did not cease to gain in authority, solidity and prestige, and the work of centralization, which was gradually making them the masters of the whole ecclesiastical organism, was accomplished steadily and without serious interruption. If Rome expelled them, they always found a sure refuge in France, where Alexander III. carried on his government for several years; and the whole of Europe acknowledged their immense power. Under Honorius II., the custom prevailed of substituting legates a latere, simple priests or deacons of the Curia, for the regieratory delegates, who had grown too independent; and that excellent instrument of rule, the Roman legate, carried the papal will into the remotest courts of Europe. The episcopate and the great monastic juricules continued to lose their independence, as was shown by Honorius II., deputing a cardinal to Monte Cassino to elect an abbot of his choosing. The progress of the Roman power was especially manifested under Innocent II., who had triumphed over the schism, and was supported by the Empire and by Bernard of Clairvaux, the first moral authority of his time. He suspended an archbishop of Sens (1136) who had neglected to take into consideration the appeal to Rome, summoned an archbishop of Milan to Rome to receive the pallium from the pope's hands, lavished exemptions, and extended the right of appeal to such abnormal lengths that a Byzantine ambassador is reported to have exclaimed to Lothair III.,

"Your Pope Innocent is not a bishop, but an emperor." When the universal Church assembled at the second Lateran Council (1159), this leader of religion declared to the bishops that he was the absolute master of Christendom. "Ye know," he said, "that Rome is the capital of the world, that ye hold your dignity from the Roman pontiff as a vassal holds his fiefs of his sovereign, and that ye cannot retain them without his assent." Under Eugenius III., a Cistercian monk who was scarcely equal to his task, the papal absolutism grew sensibly weaker, and if we may credit the testimony of the usually well-informed German chronicler, Otto of Freising, there arose in the college of cardinals a kind of fermentation which was exceedingly disquieting for the personal power of the leader of the Church. In the case of a difference of opinion between Eugenius and the Sacred College, Otto relates that the cardinals addressed to the pope this astounding protest: "Thou must know that it is by thy will that it has been raised to the supreme dignity. We are the hinges (cardines) upon which the universal Church rests and moves. It is through us that from a private person thou hast become the father of all Christians. It is, then, no longer to thyself but rather to us that thou hast belonged hitherto. Thou must not sacrifice to private and recent friendships the traditional affections of the papacy. Perforce thou must consult before everything the general interest of Christendom, and must consider it as an obligation of thine office to respect the opinions of the highest dignitaries of the court of Rome." If we admit that the cardinals of Eugenius III. succeeded in restricting the omnipotence of their master for their own ends, it must nevertheles be admitted that the Church to Rome. The papacy, however, recovered its ascendency during the pontificate of Alexander III.; and seemed more powerful than ever. The recently created royalties sought, from the papacy the conservation of their titles and the benediction of their crowns, and placed themselves voluntarily in its vassalage. The practice of the nomination of bishops by the Curia and of papal recommendation to prebends and benefices of every kind grew daily more general, and the number of appeals to Rome and exemptions granted to abbots and even simple churches increased continually. The third Lateran Council (1179) was a triumph for the leader of the Church. At that council wise and urgent measures were taken against the abuses that discredited the priesthood, but the principle of appeals and exemptions and the question of the increasing abuse of the power wielded by the Roman legates remained untouched. The treatise on canon law known as the Decretum Gratiani, which was compiled towards the middle of the 12th century and had an endearing and far-reaching effect (see CANON LAW), merely gave theoretical sanction to the existing situation in the Church. It propagated doctrines in favour of the power of the Holy See, established the superiority of the popes over the councils, and gave legal force to their decrees. According to its author, "they (the popes) are above all the laws of the Church, and can use them according to their wish; they alone judge and cannot be judged."

It was by its constant reliance on monachism that the papacy of the 12th century had attained this result, and the popes of that period were especially fortunate in having for their champion the monk St Bernard, whose admirable qualities enabled him to dominate public opinion. St Bernard completed the reformation, combated heresy, and by his immense moral ascendancy gained victories by which Rome benefited. As instance of the pope's direct services, he put an end to the schism of 1130 which attached Italy and the world to the side of Innocent III. Although he had saved the papal institution from one of the gravest perils it had ever encountered, the cardinals, the court of Rome and Innocent himself could not easily pardon him for being what he had become—a private person more powerful in the Church than the pope and the bishops, and holding that power by his personal prestige. He incurred their special reproaches by his condemnation of the irresistible evolution which impelled Rome to desire exclusive dominion over Catholic Europe and to devote
her attention to earthly things. He did not condemn the temporal power of the popes in plain terms, but both his writings and his conduct proved that that power was in his opinion difficult to reconcile with the spiritual mission of the papacy, and was, moreover, a menace to the future of the institution. (See Bernard, Saint.)

At the very moment when the papacy thus attained omnipotence, symptoms of discontent and opposition arose. The bishops resisted centralization. Archbishop Hildebert of Tours protested to Honorius II. against the papal appeals to Rome, while others complained of the exactions of the legates, or, like John of Salisbury, advanced objections upon the excessive power of the papal bureaucracy at the Lateran. In the councils strange speeches were heard from the mouths of laymen, who were beginning to carry to extreme lengths the spirit of independence with regard to Rome. When a question arose at Toulouse in 1160 as to the best means of settling the papal schism, this audacious statement was made before the kings of France and England: ‘That the best course was to side with neither of the two popes; that the apostolic see had been ever a burden to the princes; that advantage must be taken of the schism to throw the pope and that, while awaiting the death of one of the competitors, the authority of the bishops was sufficient in France and England alike for the government of the churches.’ The ecclesiastics themselves, however, were the first to denounce the abuses at Rome. The treaty of Gerhoh of Reichersberg (1093–1169) abound in trenchant attacks upon the greed and venality of the Curia, the arrogance and extortion of the legates, the abuse of exemptions and appeals, and the German policy of Adrian IV. and Alexander III. In his efforts to make the papal institution entirely worthy of its mission St Bernard himself did not shrink from presenting to the papacy ‘the mirror in which it could recognize its deformities.’ In common with all enlightened opinion, he complained bitterly of the excessive multiplication of exemptions, of the exaggerated extension of appeals to Rome, of the luxury of the Roman court, of the vanity of the cardinals, and of the injury done to the traditional hierarchy by the very extent of the papal power, which was calculated to turn the strongest head. In St Bernard’s treatise De consideratione, addressed to Pope Eugenius III., the papacy receives as many reprimands and attacks as it does marks of affection and friendly counsel. To warn Eugenius against pride, Bernard reminds him in biblical terms that an insensate sovereign on a throne resembles ‘an ape upon a housetop’ and that the dignity with which he is invested does not prevent him from being a man, that is, ‘a being, naked, poor, miserable, made for toil and not for honours.’ To his thinking, poison and the dagger were less to be feared by the pope than the lust of power. Ambition and ambition were the source of the most deplorable abuses in the Roman Church. The cardinals, said Bernard, were satraps who put pomp before the truth. He was at a loss to justify the unheard-of luxury of the Roman court. ‘I do not find,’ he said, ‘that St Peter ever appeared in public loaded with gold and jewels, clad in silk, mounted on a white mule, surrounded by soldiers and followed by a brilliant retinue. In the glitter that environs thee, rather wouldst thou be taken for the successor of Constantine than for the successor of Peter.”

Rome, however, had greater dangers to cope with than the indignant reproofs of her friends the monks, and the opposition of the bishops, who were displeased at the spectacle of their authority waning day by day. It was at this period that the Catholic edifice of the middle ages began to be shaken by the boldness of philosophical speculation as applied to theological studies and also by the growth of heresy. Hitherto more tolerant of heresy than the local authorities, the papacy now felt compelled to take defensive measures against it, and especially against Albigensianism, which had made great strides in the south of France since the middle of the 12th century. Innocent II., Eugenius III. and Alexander III. excommunicated the sectaries of Languedoc and their abettors, Alexander even sending armed missions to

hurt them down and punish them. But the preaching of the papal legates, even when supported by military demonstrations, had no effect; and the Albigensian question, together with other questions vital for the future of the papacy, remained unsettled and more formidable than ever when Innocent III. was elected.

3. Period from Innocent III. to Alexander IV. (1198–1261).—Under the pontificates of Innocent III. and his five immediate successors the Roman monarchy seemed to have reached the pinnacle of its moral prestige, religious authority and temporal power, and this development was due in great measure to Innocent III. himself. Between the perhaps excessive admiration of Innocent’s biographer, Freeman, and the virulent censure of Honore Da Costa, Felix Rocquain, who, after taking into consideration Innocent’s political mistakes, lack of foresight and numerous disappointments and failures, concludes that his reputation has been much exaggerated, it is possible to steer a middle course and form a judgment that is at once impartial and conformable to the historical facts. Innocent was an eminent jurist and canonist, and never ceased to use his immense power in the service of the law. Indeed, a great part of his life was passed in hearing pleadings and pronouncing judgments, and few sovereigns have ever worked so industriously or shown such solicitude for the impartial exercise of their judicial functions. It is difficult to comprehend Innocent’s extraordinary activity. Over and above the weight of political affairs, he bore resolutely for eighteen years the overwhelming burden of the presidency of a tribunal before which the whole of Europe came to plead. To him, also, in his capacity of theologian, the whole of Europe submitted every obscure, delicate or controverted question, whether legal problem or case of conscience. This, undoubtedly, was the part of his task that Innocent preferred, and it was to this, as well as to his much overrated moral and theological talents, that he owed his enormous contemporary prestige. As a statesman, he certainly committed grave faults—through excess of diplomatic subtlety, lack of forethought, and sometimes even through ingenuousness; but it must with justice be admitted that, in spite of his reputation for pugnacity and obstinacy, he never failed, either by temperament or on principle, to exhaust every peaceful expedient in settling questions. He was averse from violence, and never resorted to bellicose acts or to the employment of force save in the last extremity. If his policy miscarried in several quarters it was eminently successful in others; and if we consider the sum of his efforts to achieve the programme of the medieval papacy, it cannot be denied that the extent of his rule and the profound influence he exerted on his times entitle him to be regarded as the most perfect type of medieval pope and one of the most powerful figures in history.

A superficial glance at Innocent’s correspondence is sufficient to convince us that he was pre-eminentely concerned for the reformation and moral welfare of the Church, and that The Fourth Lateran Council (1215) was animated by the best intentions for the re-establishment in the ecclesiastical body of order, peace and respect for the hierarchy. This was one of the principal objects of his activity, and this important work he received decisive confirmation of the decrees of the fourth Lateran Council (1215). At this council almost all the questions at issue related to reform, and many give evidence of great breadth of mind, as well as of a very acute sense of contemporary necessities. Innocent’s letters, however, not only reveal that superior wisdom which can take into account practical needs and relax severity of principle at the right moment, as well as that spirit of tolerance and equity which is opposed to the excess of zeal and intellectual narrowness of subordinates, but they also prove that, in the internal government of the Church, he was bent on gathering into his hands all the motive threads, and that he stretched the absolutist tradition to its utmost limits, intervening in the most trivial acts in the lives of the clergy, and regarding it as an obligation of his office to act and think for all. The heretic peril, which increased during his pontificate, forced him to take decisive measures against the Albigenses in the south of France, but
before proscribing them he spent ten years (1098-1108) in endeavouring to convert the misbelievers, and history should not forget the pacific character of these early efforts. It was because they did not succeed that necessity and the violence of human passions subsequently forced him into a course of action which he had not chosen and which led him further than he wished to go. When he was compelled to decree the Albigensian crusade he endeavoured more than once to discontinue the work, which had become perverted, and to curb the crusading ardour of Simon de Montfort. Failing in his attempt to maintain the religious character of the crusade, he wished to prevent it from ending secularily in its extreme consequence and logical outcome. On several occasions he defended the cause of moderation and justice against the fanatical crusaders, but he never had the energy to make it prevail. It is very doubtful whether this was possible, and an impartial historian must take into account the insuperable difficulties encountered by the medieval popes in their efforts to stem the flood of fanaticism.

It was more particularly in the definitive constitution of the temporal and political power of the papacy, in the extension of what may be called Roman imperialism, that chance favoured his efforts and enabled him to pursue his conquests farthest. This imperialism was undoubtedly of a special nature; it rested on moral authority and political and financial power rather than on material and military strength. But it is no less certain that Innocent attempted to subject the kings of Europe by making them his tributaries and vassals. He wished to acquire the mastery of souls by unifying the faith and centralizing the priesthood, but he also aspired to possess temporal supremacy, if not as direct owner, at least as suzerain, over all the national crowns, and thus to realize the idea with which he was penetrated and which he himself expressed clearly. He wished to be at once pope, king, emperor, leader of religion and universal sovereign. And, in fact, he exercised or claimed suzerain rights, together with the political and pecuniary advantages accruing, over the greater number of the lay sovereigns of his time. He was more or less effectively the supreme temporal chief of the kingdom of Sicily and Naples, Sardinia, the states of the Iberian peninsula (Castile, Leon, Navarre and Portugal), Aragon (which, under Peter II., was the type of vassal and tributary kingdom of the Roman power), the Scandinavian states, the kingdom of Hungary, the Slav states of Bohemia, Poland, Servia, Bosnia and Bulgaria, and the Christian states founded in Syria by the crusaders of the 12th century. The success of Roman imperialism was particularly remarkable in England, where Innocent was confronted by one of the principal potentates of the West, by the heir of the power that had been founded by two statesmen of the first rank, William the Conqueror and Henry II. In Richard I. and John he had exceptionally authoritative adversaries; but after one of the fiercest wars ever waged by the civil power against the Church, Innocent at length gained over John the most complete victory that has ever been won by a religious potentate over a temporal sovereign, and constrained him to make a complete submission. In 1212 the pope had become not only the nominal suzerain but, de jure and de facto, the veritable sovereign of England, and during the last years of John and the first years of Henry III. he governed England effectively by his legates. This was the most striking success of Innocent's diplomacy and the culminating point of his secular work.

The papacy, however, encountered serious obstacles, at first at the very centre of the papal empire, at Rome, where the pope had to contend with the party of communal autonomy for ten years before being able to secure the mastery at Rome. His immense authority narrowly escaped dejection at Rome and Italy, but a stone's-throw from the Lateran power.

Innocent III. the victory finally rested with him, since the Roman people could not dispense with the Roman Church, to which it owed its existence. Reared in the nurture of the pope, the populace of the Tiber renounced its stormy liberty in 1209, and accepted the peace and order that a beneficent master gave; but when Innocent attempted to extend to the whole of Italy the régime of paternal subjection that had been so successful at Rome, the difficulties of the enterprise surpassed the powers even of a leader of religion. He succeeded in imposing his will on the nobles and communes in the patrimony of St Peter, and, as guardian of Henry VI.'s son Frederick, was for some time able to conduct the government of the kingdom of the Two Sicilies, but in his claims on the rest of Italy the failure of the temporal power was manifest. He was unable, either by diplomacy or force of arms, to make Italian unity redound to the exclusive benefit of the Holy See. Nor was his failure due to lack of activity or energy, but rather to the insuperable obstacles in his path—the physical configuration of Italy, and, above all, the invincible repugnance of the Italian municipalities to submit to the mastery of a religious power.

As far as the Empire was concerned, chance at first favoured Innocent. For ten years a Germany weakened and divided by the rivalry of Philip of Swabia and Otto of Brunswick left his hands free to act in Italy, and his pontificate marks a period of comparative quiet in the ancient conflict between pope and emperor which continued throughout the middle ages. Not until 1210, when Otto of Brunswick turned against the pope to whom he owed his crown, was Innocent compelled to open hostilities; and the struggle ended in a victory for the Curia. Frederick II., the new emperor created by Innocent, began by handing over his country to Rome and sacrificing the rights of the Empire to the union of the two great authorities of the Christian world. In his dealings with Frederick, Innocent experienced grievous vicissitudes and disappointments, but finally became master of the situation. One nation only—the France of Philip Augustus—was able to remain outside the Roman vassalage. There is not a word in the documents concerning the relations of Philip Augustus with Rome, from which we may conclude that the Capetian crown submitted, or that the papacy wished to impose upon it the effective suzerainty of the Holy See. Innocent III. had been able to encroach on France at one point only, when the Albigensian crusade had enabled him to exercise over the southern fiefs conquered by Simon de Montfort a political and secular supremacy in the form of collections of moneys. Finally, Innocent III. was more fortunate than his predecessors, and, if he did not succeed in carrying out his projected crusade and in recovering the Holy Places, he had at least prevented the Franco-Venetian expedition of 1262. Europe refused to take any action against the Mussulman, but Latin feudalism, Latin Conquest of Constantinople, was apparently assembled at Venice, diverted the crusade by an act of formal disobedience, marched on Constantinople, seized the Greek Empire and founded a Latin Empire in its place; and Innocent had to accept the fait accompli. Though condemning it on principle, he turned it to the interests of the Roman Church as well as of the universal Church. With joy and pride he welcomed the Byzantine East into the circle of vassal peoples and kingdoms of Rome bound politically to the see of St Peter, and with the same emotions beheld the patriarchate of Antioch regain its ancient supremacy. But from this enormous increase of territory and influence arose a whole series of new and difficult problems. The court of Rome had to substitute for the old Greek hierarchy a hierarchy of Latin bishops; to force the remaining Greek clergy to practise the beliefs and rites of the Roman religion and bow to the supremacy of the pope; to maintain in the Greco-Latin Eastern Church the necessary order, morality and submission; to defend it against the greed and violence of the nobles and barons who had founded the Latin Empire; and to compel the leaders of the new empire to submit to the apostolic power and execute its commands. In his endeavours to carry out the whole of this programme, Innocent III. met with insuperable obstacles and many disappointments. On the one hand, the Greeks were unwilling to abandon their religion and national cult, and scarcely recognized the ecclesiastical supremacy of the papacy. On the other hand, the upstart Latin emperors, far from proving
submitive and humble tools, assumed with the purple the habits and pretensions of the sovereigns they had disposessed. Nevertheless, Innocent left his successors a much vaster and more stable political dominion than that which he had received from his predecessors, since it comprised both East and West; and his five immediate successors were able to preserve this ascendency. They even extended the limits of Roman imperialism by converting the pagans of the Baltic to Christianity, and further reinforced the work of ecclesiastical centralization by enlisting in their service a force which had recently come into existence and was rapidly becoming popular—the mendicant orders and notably the Dominicans and Franciscans. The Roman power was also increased by the formation of the universitatis—privileged corporations of masters and students, which escaped the local power of the bishop and his chancellor only to place themselves under the direction and supervision of the Holy See. Mistress of the entire Christian organism, Rome thus gained control of international education, and the mendicant monks who formed her devoted militia lost no time in monopolizing the professorial chairs. Although the ecclesiastical monarchy continued to gain strength during the reign of Innocent III, more than half of its immense power was under Gregory IX. (1227–1241) and Innocent IV. (1243–1254) the conflict between the priesthood and the Empire was revived by the enigmatic Frederick II., the polyglot and lettered emperor, the friend of Saracens, the despot who, in youth styled "king of priests," in later years personified ideas that were directly opposed to the medieval theocracy; and the struggle lasted nearly thirty years. The Hohenstaufen succumbed to it, and the papacy itself received a terrible shock, which shook its vast empire to its foundations.

Nevertheless, the first half of the 13th century may be regarded as the grand epoch of medieval papal history. Supreme in Europe, the papacy gathered into a body of doctrine and power, and promulgated its collected decrees and oracles to form the immutable law of the Christian world. Innocent III, Honorius III, and Gregory IX employed their jurists to collect the most important of their rulings, and Gregory's decrees became the definitive repository of the canon law. Besides making laws for the Christendom of the present and the future, these popes employed themselves in giving a more regular form to their principal administrative organ, the offices of the Curia. The development of the Roman chanonry is also a characteristic sign of the evolution that was taking place. From the time of Innocent III, the usages of the apostolic scribes became transformed into precise rules, which for the most part remained in force until the 15th century.

This period comprises 13 pontificates, all of short duration (three or four years at the most, and some only a few months), with the exception of that of Boniface VIII., who was pope for nine years. This accidental fact constitutes a prime difference in favour of the preceding period, in which there were only five pontificates during the first sixty years of the 13th century. Towards the end of the 13th century the directors of the Christian world occupied the throne of St Peter for too short a time to be able to make their personal views prevail or to execute their political projects at leisure after ripe meditation. Whatever the merit of a Gregory X. or a Nicholas III., the brevity of their pontificates prevented any one of these ephemeral sovereigns from being a great pope. But other and far more important differences characterize this period. Although there was no theoretical restriction to influence of the temporal supremacy and religious power of the papacy, certain historical facts of great importance contributed to the fatal diminution of their extent. The first of these was the preponderance of the French monarchy and nation in Europe. Founded by the conquests of Philip Augustus and Louis VIII., and legitimated and extended by the policy and moral influence of the crowned saint, Louis IX., the French monarchy enjoyed undisputed supremacy at the end of the 13th century and the beginning of the 14th; and this hegemony of France was manifested, not only by the extension of the direct power exercised by the French kings over all the neighbouring nationalities, but also by the establishment of Capetian dynasties in the kingdom of the Two Sicilies and in Hungary. From this time the sovereignty of Rome, like other sovereigns, had to submit to French influence. But, whereas the pope was sometimes compelled to become the instrument of the policy of the kings of France or the adventurers of their race, he was often able to utilize this new and pervading force for the realization of his own designs, although he endeavoured from time to time, but without enduring success, to shake off the overwhelming yoke of the French. In short, it was in the sphere of French interests much more than in that of the general interests of Latin Christendom that the activities of these popes were exerted. The fact of many of the popes being of French birth and France the field of their diplomacy shows that the supreme pontificate was already becoming French in character.

This change was a prelude to the more or less complete subjection of the papacy to French influence which took place in the following century at the period of the "Babylonian Captivity," or a violent reaction personified by Boniface VIII. affording a brief respite in this irresistible evolution. It was the Frenchman Urban IV. (1261–1264) who called Charles of Anjou into Italy to combat the last heirs of Frederick II. and thus paved the way for the establishment of the Angevin dynasty on the throne of Naples. Under Clement V. (1265–1268) an agreement was concluded by which Sicily was handed over to the brother of St Louis, and the victories of Benevento (1266) and Taphiazzo (1267) assured the triumph of the Guelph party and enabled the Angevins to plant themselves definitely on Neapolitan soil. Conradin's tragic and inevitable end closed the last act of the secular struggle between the Holy See and the Empire. Haunted by the recollection of that formidable conflict and lulled in the security of the Great Interregnum, which was to render Germany long powerless, the papacy thought merely of the support that France could give, and paid no heed to the dangers threatened by the extension of Charles of Anjou's monarchy in central and northern Italy. The Visconti Gregory X. (1271–1276) made an attempt to bring about a reaction against the tendency which had influenced his two immediate predecessors. He placed himself outside the theatre of French influence, and occupied himself solely with the task of carrying out the papal monarchy that character of universality and political superiority which had made the greatness of an Alexander III. or an Innocent III. He opposed the aggrandizing projects of the Angevins, intervened in Germany with a view to terminating the Great Interregnum, and sought a necessary counterpoise to Capetian predominance in an alliance with Rudolph of Habsburg, who had become an emperor without imperilling the papacy. The Orsini Nicholas III. pursued the same policy with regard to the Independence and greatness of the Roman See, but died too soon for the cause he upheld, and, at his death in 1280, the influence of the papacy diminished by the weight of any interposing force. His successor, Martin IV. (1281–1285), a prelate of Champagne, brother of several councillors of the king of France, prebendary at Rouen and Tours, and one of the most zealous in favour of the canonization of Louis IX., ascended the papal throne under the auspices of Charles of Anjou, and undertook the government of the Church with the sole intention of furthering in every way the interests of the country of his birth. A Frenchman before everything, he abused the papal power to such an extent as to excite the indignation of his contemporaries, often slavishly subordinating it to the exigencies of the domestic and foreign policy of the Angevins at Naples and the reigning house at Paris. But he was prevented from carrying out this policy by an unforeseen blow, the Sicilian Vespers (March 1282), an event important both in itself and in its results. By rejecting the Capetian sovereign that Rome wished to thrust upon it to deliver it from the dynasty of Aragon, the little island of Sicily arrested the progress of French imperialism, ruined the vast
projects of Charles of Anjou, and liberated the papacy in its own
despite from a subjection that perverted and shook its power.
Honorius IV. (1285-1287) and Nicholas IV. (1288-1292)
were able to act with greater dignity and independence than
their predecessors. Though remaining leagued with the
Angevins in southern Italy, they dared to look to Germany
and Rudolph of Habsburg to help them in their efforts to add
to their papal dominion a part of northern France and the
Papal States. But they still continued to desire the restoration
of the Angevin dynasty in Sicily and to assist the designs of France
on Aragon by preaching a crusade against the masters of
Barcelona and Palermo. The hopes of the Curia were frustrated
by the resistance of the Aragonese and Sicilians, and Charles of
Valois, to whom the Curia eventually destined the crown of
Aragon, had to resign it for that of Constantinople, which he
also failed to secure.

Boniface VIII. himself at the beginning of his pontificate
yielded to the current, and, like his predecessors, adapted his
external policy to the pretensions and interests of
Boniface VIII., the great Capetian house, which, like all his prede-
cessors, he at first countenanced. In spite of his
instincts for dominion and the ardour of his temperament, he
made no attempt to shake off the French yoke, and did not
decide on hostilities with France until Philip the Fair and his
legists attempted to change the character of the kingship,
emphasized itsazy tendencies, and exerted themselves to gratify
the desire for political and financial independence which was
shared by the French nation and many other European peoples.
The war which ensued partook of northern Italy and, in particular,
ended in the complete defeat of the papacy, which was reduced to
impotence (1303), and though the storm ceased during the
nine months’ pontificate of Benedict XI., the See of
St Peter recovered neither its normal equilibrium
nor its traditional character. The accession of the
first Avignon pope, Clement V., marks the final
subjection of the papal power to the Capetian government,
the inevitable result of the European situation created in
the preceding century.

In other respects the papacy of this period found itself in a
very inferior situation to that which it had occupied under
Innocent III. and the popes of the first half of the 13th century.
The fall of the Latin Empire and the retaking of Constantinople
by the Palaeologi freed a great part of the Eastern world from
the political and religious direction of Rome, and this fact
necessarily engaged the diplomacy of Urban IV. and his suc-
cessors in an entirely different direction. To them the Eastern
problem presented a less complex aspect. There could no
longer be any serious question of a collective expedition of
Europe for the recovery of the Holy Places. The ingenuous
faith of a Louis IX., was alone capable of giving rise to two
crusades organized privately and without the influence or even
the approval of the pope. Although all these popes, and
Gregory X. especially, never ceased theoretically to urge
the Christian world to the crusade, they were actuated by the desire
of remaining faithful to tradition, and more particularly by the
political and financial advantages accruing to the Holy See from
the preaching and the crusading expeditions. The European
state of mind no longer lent itself to such enterprises, and,
moreover, under such brief pontificates, the attenuated Roman
power could not expect to succeed where Innocent III. himself
had failed. The main preoccupation of all these popes was how
best to repair the injury done to orthodox Europe and to Rome
by the destruction of the Latin Empire. Several of them thought
of restoring the lost empire by force, and thus giving a pendant
to the fourth crusade; but the Curia finally realized
the enormous difficulties of such a project, and con-
vincing themselves that the only practical solution of
the difficulty was to come to an understanding with
the Paleologoi and realize pacifically the long-dreamed
union of the Greek and Latin Churches. The negoti-
tiations begun by Urban IV. and continued more or less actively
by his successors were at last concluded in 1274 by Gregory X.

The Council of Lyons proclaimed the union, which was destined
to be effective for a few years at least and to be prolonged
precariously in the midst of unfavourable circumstances. The
Greek mind was opposed to the union; the acquiescence of the
Byzantine emperors was but an ephemeral expedient of their
foreign policy; and the peace between the Latins and
Greeks settled on Byzantine soil could not endure for long.
The principal obstacle, however, was the incompatibility
of the popes’ Byzantine and Italian policies: but the popes
were in favour of Charles of Anjou and his dynasty; but
Charles was hostile to the union of the two Churches,
since it was his intention to seize the Byzantine Empire
and substitute himself for the Paleologoi. Almost all the
successors of Urban IV. were compelled to exert their diplomacy
against the aggravating aims of the man they had themselves
installed in southern Italy, and to protect the Greek emperor,
with whom they were negotiating the religious question. On
several occasions between the years 1271 and 1273 the Angevins
of Naples, who had great influence in Achaia and Albania
and were solidly supported by their allies in the Balkan Peninsula,
nearly carried out their project; and in 1274 the opposition
of Charles of Anjou came near to compromising the operations
of the council of Lyons and ruining the work of Gregory X.
The papacy, however, held its ground, and Nicholas III., the worthy
continue of Gregory, succeeded in preserving the union and
triumphing over the Angevin power. The Angevins took their
revenge under Martin IV., who was a staunch supporter of
the French. Three weeks after his coronation Martin excommunicated
the great emperor and all his subjects, and allied himself with
Charles of Anjou and the Venetians to effect the union. In
this case, too, the Sicilian Vespers was the rock on which the
hopes and pretensions of the sovereign of Naples suffered
shipwreck. After Martin’s death the last popes of the 13th
century, and notably Boniface VIII., in vain thought to find
in another Capetian, Charles of Valois, the man who was to
re-establish the Latin dominion at Byzantium. But the East
was lost; the union of 1274 was quickly dissolved; and the
reconciliation of the two Churches again entered into the category
of chimeras.

During this period the papal institution, considered in its
internal development, already showed symptoms of decadence.
The diminution of religious faith and sacerdotal
prestige shook it to its very foundations. The
Decay of the growth of the lay spirit continued to manifest itself
Papacy. among the burgesses of the towns as well as among the feudal
princes and sovereigns. The social factors of communism
and nationalism, against which Innocent III. and his successors
had struggled, became more powerful and more hostile to
theocratic domination. That a sovereign like St Louis
should be able to associate himself officially with the
feudalism of his realm to repress abuses of church jurisdic-
tion; that a contemporary of Philip the Fair, the lawyer
Pierre Dufois, should dare to suggest the secularization
of ecclesiastical property and the conversion of the clergy into
a class of functionaries paid out of the royal treasury; and
that Philip the Fair, the adversary of Boniface VIII., should be able
to rely in his conflict with the leader of the Church on the public
consent obtained at a meeting of the Three Estates of France—
all point to a singular demoralization of the sentiments and
principles on which were based the whole power of the pontiff
of Rome and the entire organization of medieval Catholicism.
Both by its attitude and by its governmental acts, the papacy
of the later 13th century itself contributed to increase the
discord and disaffection from which it suffered. Under Urban IV.
and his successors the great moral and religious sovereignty
of former times became a purely bureaucratic monarchy, in which
the main preoccupation of the governors appeared to be the
financial exploitation of Christendom. In the registers of these
popes, which are now being actively investigated and published,
dispensations (licences to violate the laws of the Church);
indulgences; imposts levied with increasing regularity on uni-
versal Christendom and, in particular, on the clerks; the
settlement of questions relating to church debts; the granting of lucrative benefices to Roman functionaries; the divers processes by which the Curia acquired the immediate disposal of monastic, capitulary and episcopal revenues—in short, all financial matters are of the first importance. It was in the 14th century more especially that the Apostolic Chamber spread the net of its fiscal administration wider and wider over Christian Europe; but at the close of the 13th century all the preliminary measures had been taken to procure for the papal treasury its enormous and permanent resources. The continued efforts of the popes to draft Christian gold to Rome were limited only by the fiscal resources of the lay sovereigns, and it was this financial rivalry that gave rise to the inevitable conflict between Boniface VIII. and Philip the Fair.

Abuse of the Papal Power.

By thus devoting itself to material interests, the papacy contemporary with the last Capetians lost its moral greatness and fell in the opinion of the peoples; and it did itself no less injury by the abnormal extension of the bounds of its absolutism. By its exaggerated methods of centralization the papal monarchy had absorbed within itself all the living forces of the religious world and suppressed all the liberties in which the Church of old had lived. The subjection of the secular clergy was complete, while the episcopate retained no shadow of its independence. The decree of Clement IV. (1266), empowering the papacy to dispose of all vacant bishoprics at the court of Rome, merely sanctioned a usage that had long been established. But the control exercised by the Roman Curia over the episcopate had been realized by many other means. It was seldom that an episcopal election took place without a division in the chapter, in which resided the electoral right. In such an event, the competitors appealed to the Holy See and abdicated their right, either voluntarily or under coercion in manner papal, while the pope took possession of the vacant see. Nominations directly made by the court of Rome, especially in the case of dioceses long vacant, became increasingly numerous. The principle of election by canons was repeatedly violated, and threatened to disappear; and at the end of the 13th century the spectacle was common of prelates, whether nominated or confirmed by the pope, entitling themselves "bishops by the grace of the Holy See." The custom in force required bishops established by papal authority to take an oath of fidelity to the pope and the Roman Church, and this oath bound them in a particular manner to the Curia. These bishops however, who had been elected under normal conditions, conformably to the old law, were deprived of the essential parts of their legitimate authority. They lost, for example, their jurisdiction, which they were seldom able to exercise in their own names, but in almost every case as commissaries delegated by the apostolic authority.

The regular clergy, who were almost wholly sheltered from the power of the diocesan bishops, found themselves, even more than the secular priesthood, in a state of complete dependence on the Curia. The papacy of this period completely intervened in the internal affairs of the monasteries. Not only did the monks continue to seek from the papacy the confirmation of their privileges and property, but they also referred almost all their disputes to the arbitration of the pope. Their elections gave rise to innumerable lawsuits, which all terminated at the court of Rome, and in most cases it was the pope himself who designated the monks to fill vacant posts in the abbeys. Thus the pope became the great ecclesiastical elector as well as the universal judge and supreme legislator. On this extreme concentration of the Christian power was employed throughout Europe an army of official agents or officious adherents of the Holy See, who were animated by an irresistible zeal for the aggrandizement of the papacy. These officials originally consisted of an obedient and devoted militia of mendicant friars, both Franciscans and Dominicans, who took their orders from Rome alone, and whose efforts the papacy stimulated by lavish exemptions, privileges, and full sacramental powers. Subsequently they were represented by the apostolic notaries, who were charged to exercise throughout Christendom the gracious jurisdiction of the leaders of the Church and to preside over the most important acts in the private lives of the faithful. These tools of Rome, both clerks and laymen, continued to increase in every diocese. They were not invested with their office until they had been examined by a papal chaplain, or sometimes even by the vice-chancellor of the Curia.

The sovereign direction of this enormous monarchy belonged to the pope alone, who was assisted in important affairs by the advice and collaboration of the College of Cardinals, who had become the sole electors to the papacy. Towards the close of the 13th century the necessity arose for an express ruling on the question of the exercise of this electoral right. In 1254 Gregory X., completing the measures taken by Alexander III. in the 12th century, promulgated the celebrated constitution by which the cardinal-electors were shut up in concave and, in the event of their not having designated the new pope within three days, were constrained to perform their duty by a progressive reduction of their food-allowance (see CONCLAVE).

But at the head of this vast body there existed a constant tendency which was opposed to the absorption of all the power by a single and unbridled will. In the last years of this period fresh signs appeared of a reaction that emanated from the Sacred College itself. The cardinal-electors endeavoured to derive from their electoral power a right of control over the acts of the pope. In 1294, and again in 1303, they laid themselves under an obligation, previously to the election, to subscribe to the political engagements which each promised rigorously to observe in the event of his becoming pope. In general, these engagements bore upon the limitation of the number of cardinals, the prohibition to nominate new ones without previous notification to the Sacred College, the sharing between the cardinals and the pope of certain revenues specified by a bull of Nicholas IV., and the obligatory consultation of the consistory for the principal acts of the temporal and spiritual government. It is conceivable that a pope of Boniface VIII.'s temperament would not submit kindly to any restriction of the discretionary power with which he was invested by tradition, and he endeavoured to make the cardinals dependent on him and even to dispense with their services as far as possible, only assembling them in consistory in cases of extreme necessity. This tendency of the Sacred College to convert the Roman Church into a constitutional monarchy, in which it should play the part of parliament, was a sufficiently grave symptom of the progress of the new spirit. But throughout the ecclesiastical society traditional bonds were loosened and anarchy was rife, and this at the very moment when the enemies of the priesthood and its leaders redoubled their attack. In fine, the decadence of the papal institution manifested itself in an irremediable manner when it had accomplished no more than the half of its task. The growth of national kingdoms, the anti-clerical tendencies of the emancipated middle classes, the competition of lay imperialism, and all the other elements of resistance which had been encountered by the papacy in its progress and had at first tended only to shake it, now presented an insurmountable barrier. The papacy was weakened by its contest with these adverse elements, and it was through its failure to triumph over them that its dream of European dominion, both temporal and spiritual, entered but very incompletely into the field of realities.

III.—Period from 1305 to 1590.

The accession of the Gascon Clement V. in 1305 marks the beginning of a new era in the history of the papacy; for this pope, formerly archbishop of Bordeaux, remained in France, without once crossing the threshold of the Eternal City. Clement's motive for this reso- lution was his fear that the independence of the ecclesiastical government might be endangered among the frightful dissensions and party conflicts by which Italy was then convulsed; while at the same time he yielded to the pressure
exercised on him by the French king Philip the Fair. In March 1300, Clement V transferred his residence to Avignon, a town which at that time belonged to the king of Naples, but was surrounded by the counties of Tarn and Carcassonne, where as early as 1228 he had passed into the possession of the Spanish Crown. Clement V remained at Avignon till the day of his death, so that with him begins the so-called Babylonian Exile of the popes. Through this, and his excessive submission to Philip the Fair, his reign proved the reverse of salutary to the Church. The pope's subservience was above all conspicuous in his attitude towards the proceedings brought against the order of the Templars. The trial, which was controlled by the council of Venice (see Templars), was conducted in a most unfair manner. His possession of Ferrara involved Clement in a violent struggle with the republic of Venice, in which he was ultimately victorious.

His successor John XXII. a native of Cahors, was elected as the result of very stormy negotiations, after a two years' vacancy of the see (1316). Like his predecessor, he fixed his permanent residence at Avignon, where he had formerly been bishop. But while Clement V had contented himself with the hospitality of the Dominican monastery at Avignon, John XXII. installed himself with great state in the episcopal palace, hard by the cathedral. The capital of the Avignon papacy. The original features of this new epoch in the history of the papacy, beginning with the two popes mentioned, are intimately connected with this lasting separation from the traditional seat of the papacy, and from Italian soil in general: a separation which reduced the head of the Church to a fatal dependence on the French kings.

Character of the Avignon papacy. They themselves Frenchmen, and surrounded by a College of Cardinals in which the French element predominated, the popes gave to their ecclesiastical administration a certain French character, till they stood in more and more danger of serving purely national interests, in cases where the obligations of their office demanded complete impartiality. And thus the prestige of the papacy was sensibly diminished by the view, to which the jealousy of the nations soon gave currency, that the supreme dignity of the Church was simply a convenient tool for French statecraft. The accusation might not always be supported by facts, but it tended to shake popular confidence in the head of the universal Church, and to inspire other countries with the feeling of a national opposition to an ecclesiastical regime now entirely Gallicized. The consequent loosening of the ties between the individual provinces of the Church and the papacy, combined with the capricious policy of the court at Avignon, which often regarded nothing but personal and family interests, accelerated the decay of the ecclesiastical organism, and justified the most dismal forebodings for the future. To crown all, the feud between Church and Empire broke out again with unprecedented violence. The most prominent leaders of the opposition to the papacy, whether ecclesiastical or political, joined forces with the German king, Louis of Bavaria, and offered him their aid against John XXII.

Opposition to the papacy. The clerical opposition was led by the very popular and influential Minorites who were at that time engaged in a remarkably bitter controversy with the pope as to the practical interpretation of the idea of evangelical poverty. Their influence can be clearly traced in the appeal to a general council, issued by Louis in 1324 at Sachsenhausen near Frankfurt-on-the-Main. This document, which confused the political problem with the theological, was bound to envenom the quarrel between emperor and pope beyond all remedy. Side by side with the Minorites, the spokesmen of the specifically political opposition to the papacy were the Parisian professors, Marsilius of Padua and John of Jandun, the composers of the "Defender of the Peace" (defensor pacis). In conjunction with the Minorites and the Ghibellines of Italy, Marsilius succeeded in enticing Louis to the fateful expedition to Rome and the revolutionary actions of 1328. The bringing of the imperial crown by the Roman populace, the deposition of the pope by the same body, and the election of an anti-pope in the person of the Minorite Pietro da Corvara, translated into acts the doctrines of the defensor pacis. The struggle, which still further aggravated the dependence of the pope on France, was waged on both sides with the utmost bitterness, and the end was not in sight when John XXII. died, full of years, on the 4th of December 1334.

Even the following pope, Benedict XII., a man of the strictest morality, failed, in spite of his mild and pacific disposition, to adjust the conflict with Louis of Bavaria and the Ghibellines. His successor was the eccentric Fraticelli. King Philip VI. and the car- dinals of the French party worked energetically against the projected peace with Louis; and Benedict was not endowed with sufficient strength of will to carry through his designs in the teeth of their opposition. He failed, equally, to stifle the first beginnings of the war between France and England; but it is at least to his honour that he exerted his whole influence in the cause of peace.

His efforts in the direction of reform, moreover, deserve recognition. In Avignon he began to erect himself a suitable residence, which, with considerable additions by later popes, developed into the celebrated papal castle of Avignon. This enormous edifice, founded on the cathedral rock, is an extraordinary mixture of castle and convent, palace and fortress. It was Benedict XII. also who elevated the doctrine of the beatific vision of the saints into a dogma. Benedict XII. was again succeeded, in 1342, by a Frenchman from the south, Pierre Roger de Beaufort, who was born in the castle of Maumont, in the diocese of Limoges. He assumed the title of Clement VI. in contrast with his peace-loving predecessor, and in accordance with his own more energetic character, he pursued with decision and success the traditions of John XXII. in his dealings with Louis of Bavaria. With great dexterity he turned the feud between the houses of Luxemburg and Wittelsbach to the destruction of Louis; and the death-struggle between the two seemed about to break out, when Louis met his untimely end. To all appearances the victory of the papacy was decisive: but it was a Pyrrhic victory, as events were quickly to prove. In Rome there ensued, during the pontificate of Clement, the revolutions of the visionary Cola di Rienzo (q.v.) who restored the old republic, though not for long. By his purchase of Avignon, and the creation of numerous French cardinals, the pope consolidated the close connexion of the Roman Church with France: but the interests of that Church suffered severely through the riches and patronage which Clement lavished on his relatives, and through the princely luxury of his court. His generosity—which degenerated into prodigality—compelled him to open fresh sources of revenue; and in this he succeeded, though not without serious detriment to the interests of the Church.

It was fortunate for the Church that Clement VI. was followed by a man of an entirely different temperament—Innocent VI. This strict and upright pope appears to have taken Benedict XII. for his example. He undertook, 1352-1362, though not with complete success, a reformation of ecclesiastical abuses; and it was he who assisted in restoring the dependance of the papacy on such a degree that it never again reached the turbulent condition of the earlier Avignon period.
by withdrawing it from the tumults of the Anglo-French War, and bringing within the bounds of possibility the much-needed reformation in ecclesiastical affairs. In 1367 it became an accomplished fact. Turning a deaf ear to the remonstrances of the French king and the French cardinals, the pope quitted Avignon on the 13th of April 1367; and on the 16th of October he entered Rome, now completely fallen to ruin. The ensuing year, after his return to the Eternal City, witnessed the second great landmark in the reign of Urban V.—the Roman expedition of Charles IV., and the renewal of amicable relations between the Empire and the Church. Unfortunately, the pope failed to deal satisfactorily with the highly complicated situation in Italy; and the result was, that on the 27th of September 1378, he returned to Avignon, where he remained until his death, February 25, 1378.

It was the opinion of Petrarch that, had Urban remained in Rome, he would have been entitled to rank with the most distinguished men of his era; and, if we discount this single act of weakness, he must be classed as one of the noblest and best of popes. Especial credit is due to his struggles against the moral corruptions of the day, though they proved inadequate to eliminate all traces of the prevalent disorders.

Gregory XI., though equally distinguished for his erudition and pure morals, his piety, modesty and wisdom, was fated to be the unhappy victim of his predecessor in 1370-1378. The political situation of Europe was then so abnormal in every respect, that the national spirit of Italy thoroughly aroused against a papacy turned French. The disastrous error of almost exclusively appointing Provençals, foreigners ignorant of both the country and the people, to the government of the Papal States, now found a terrible Nemesis: and there came a national upheaval, such as Italy had not yet witnessed. The feud between Italian and Frenchman broke out in a violent form; and it was in vain that St. Catherine of Siena proffered her mediation in the bloody strife betwixt the pope and the Florentines that the pontiffs on this and other occasions, are documents, which are, perhaps, unique in their kind, and of great literary beauty. It was also St Catherine who prevailed on Gregory XI., to return to Rome. On the 13th of September 1378 he left Avignon; on the 17th of January 1377 he made his entry into the city of St Peter. Thus ended the exile in France; but it left an evil legacy in the schism under Gregory's successor. Gregory, the last pope whom France has given to the Church, died on the 27th of March 1378, after taking measures to ensure a speedy and unanimous election for his successor.

The conclave, which took place in Rome, for the first time for 75 years, resulted in the election of Bartolomeo Prignano (April 8, 1378), who took the name of Pope Urban VI. (1378-1389). Canonically the election was perfectly valid; so that the only papal, to be regarded as legitimate, are the successors of Urban. It is true that his election was immediately impugned by the cardinals on frivolous grounds; but the responsibility for this rests, partially at least, with the pope himself, whose reckless and inconceivable zeal for reform was bound to excite a revolt among the wealthier cardinals still yearning for the fleshy joys of Avignon. This revolution could already be foreseen with tolerable certainty, when Urban embroiled himself even with the pope's political allies—the queen of Naples and her husband, Duke Otto of Brunswick. Similarly, he quarrelled with Count Otonor Gaceto of Fondi. The cardinals, excited to the highest pitch of irritation, now knew where they could look for support. Thirteen of them assembled at Anagni, and thence, on the 4th of August, issued a passionate manifesto, announcing the invalidity of Urban's election, on the ground that it had been forced upon the conclave by the Roman populace. As soon as the rebellious cardinals were further assured of the protection of the French king, Charles V., they elected, with the tacit consent of the three Italian cardinals, Robert of Geneva as anti-pope (Fondi, Sept. 20). Robert assumed the style of Clement VII.; and thus Christendom was brought face to face with the worst misfortune conceivable—the Great Schism (1378-1417).

The chief responsibility for this rest with the College of Cardinals, who were longing to return to France, and thence drew their inspiration. This college was a creation of the Avignon period; which must, therefore, in the last resort, be considered responsible for this appalling calamity. Severe censure, moreover, attaches to Charles V., of France. There may be room for dispute, as to the extent to which the king's share in the schism was due to the instigation of the revolted cardinals; there can be not the slightest doubt that his attitude was the decisive factor in perpetuating and widening the breach. The anti-pope was not received in France. He was regarded as the antithesis of the Empire dependent on him, by Scotland and Savoy, and finally by the Spanish dominions and Portugal. On the other hand, the emperor Charles IV., and his son Wenceslaus, the greater part of the Empire, England, Hungary, Poland, Denmark, Norway and Sweden, together with the majority of the Italian states—Naples excepted—remained loyal to the pope. Urban, in fact—who meanwhile had created a new College of Cardinals with members of different nationalities—enjoyed one great advantage; his rival failed to hold his own in Italy, with which country the actual struggle virtually lay. Unfortunately, in the scheme that followed, Urban was guilty of the grossest errors, in pursuing his personal interests, and sacrificing, all too soon, that universal point of view which ought to have governed his policy. The struggle against his powerful neighbour on the frontier, Queen Joanna of Naples, rapidly became his one guiding motive; and thus he was led into a perfect labyrinth of blunders. He excommunicated the queen as a stiff-necked adherent of the French anti-pope, and in 1381 conferred Naples on the ambitious Charles of Durazzo, with whom he was soon inextricably embroiled; while, a little later, he fell out with his new Collar of cardinals. On the 15th of October 1386, he died, with few to lament him.

After the death of Urban VI., fourteen cardinals of his obedience assembled, and after long negotiations elected the scion of a noble Neapolitan family, Cardinal Pietro BonifaceIX., Tomacelli (Nov. 2, 1389). The title which he took, 1389-1404, was that of Boniface IX. The new pope—a man of high moral character, great sagacity, eloquence, and of a kindly disposition—at once instituted an entirely different policy from that pursued by his predecessor. This was especially the case in his treatment of Naples. In May 1390 Ladislaus, the son of Charles of Durazzo, who had been assassinated, was recognized; in the February of 1396, received the royal crown at the hands of a papal legate. To his cause Boniface IX. closely attached himself; and his support of the king against the Angevins cost him enormous sums, without which Ladislaus could not have secured his victory over the French claimant. By these means, the schism was averted from Italy, and Naples won for the Roman obedience. The situation in the papal state, which Boniface found in the greatest confusion, was, at the outset, far more difficult to deal with. But here also he attained in time new Collar of cardinals of success. Although the methods employed were scarcely above criticism, his greatest success, however, was gained in the Eternal City itself; for he contrived, after many vicissitudes, to induce the Romans to annul their republican constitution and acknowledge the papal supremacy, even in municipal matters.

To give this supremacy a firmer basis, Boniface fortified the Vatican and the Capitol, and restored the castle of St. Angelo—which had previously been used as a quarry—providing it with walls and battlements, and erecting a tower in the centre. This castle, indeed, yielded a safe shelter to the pope in January 1400, when the Colonnas made their attempt to surprise Rome. However, the adventure failed; and by the aid of Ladislaus, the castles of the Colonnas in the vicinity of Rome were destroyed. In 1401 this powerful family made its submission, accepting the favourable terms which the pope had had the good sense to
offer. Henceforward quiet prevailed, and Boniface ruled as a stern master in Rome. But he was soon confronted with an extremely dangerous enemy, in the person of Duke Gian Galeazzo Visconti of Milan, who was aiming at the sovereignty of all Italy. In July 1402 he made himself master of Bologna; and his death in September of the same year was a stroke of good fortune for the pope. Bologna was now recovered for the Church (Sept. 2, 1403), and soon afterwards Perugia also surrendered.

Thus Boniface IX., as a secular prince, occupies an important position; but as pope his activity must be unfavourably judged. Even if Dietrich of Niem frequently painted him too black, there is no question that the means which Boniface employed to fill the papal treasury seriously impaired the prestige of the highest spiritual and temporal office and the reverence due to it. His asceticism, again, casts a dark shadow over his memory: but most regrettable of all was his indifference towards the ending of the schism. Yet it should be borne in mind, that, when Clement VII. died suddenly on the 16th of September 1404, and the Avignon cardinals immediately elected the Spaniard Pedro de Luna as anti-pope (under the title of Benedict XIII.), Boniface IX. was left face to face with an extraordinarily skilful, adroit, and unscrupulous antagonist.

On the death of Boniface (Oct. 1, 1404), the Roman cardinals once more elected a Neapolitan, Cosimo dei Medici, who, in the age of 65, assumed the name of Innocent VII. Innocent, who was animated by a great love for the sciences and all the arts of peace, enjoyed only a brief pontificate, but his reign is not without importance, if only as an example of the generous patronage which the papacy—even in its darkest days—has lavished on literature and science. Significant also is the footstep gained at this time in the Curia itself by the humanists—Poggio, Bruni and others. The appointment of these skilled humanist writers to the Chancery was a consequence of the difficult conditions of the time. The crisis which the Catholic Church underwent, during this terrible epoch, was the greatest in all her history: for while everything was thrown into the utmost confusion by the life and death struggles of the rival popes, while the ecclesiastical revenues and emoluments were used almost exclusively for the reward of partisan service, while everywhere the worldliness of the clergy had reached its highest pitch, heretical movements, by which the whole order of the Church was threatened with overthrow, were gaining strength in England, France, Italy, Germany and especially in Bohemia.

The crisis came to a head in the pontificate of Gregory XII. This pope, so distinguished in many respects, owed his election mainly to the circumstance that he was considered a zealous champion of the restoration of unity within the Church: and he displayed, in fact, during the earlier portion of his reign, an exalted enthusiasm for this great task. Later his attitude changed; and the protracted negotiations for a conference with Benedict XIII. remained fruitless. The result of this change in the attitude of Gregory was the formation of a strong malcontent party in the College of Cardinals; to counteract whose influence, the pope—faithless to the conditions attached to his election—resorted to the plan of creating new members. Stormy discussions at Lucca followed; but they failed to prevent Gregory from nominating four fresh cardinals (May 6, 1408). The sequel was that seven of the cardinals attached to Gregory's Roman Curia withdrew to Pisa.

At the same period, the relations of Benedict XIII. with France suffered a significant modification. In that country, it became more and more manifest that Benedict had no genuine desire to heal the schism in the Church, in spite of the ardent zeal for union which he had displayed immediately before and after his election. In May 1408 France withdrew from his obedience; and it was not long before French policy succeeded in effecting a reconciliation and understanding between the cardinals of Benedict XIII. and those who had seceded from Gregory XII. Precisely as if the Holy See were vacant, the cardinals began to act as the actual rulers of the Church, and issued formal invitations to be opened at Pisa on the Feast of the Annunciation (March 25, 1409). Both popes attempted to foil the disaffected cardinals by convening councils of their own; but their efforts were doomed to failure.

On the other hand, the council of the cardinals—though, by the strict rules of canonical law, its convocation was absolutely illegal—attained the utmost importance. But these rules, and, in fact, the whole Catholic doctrine of the primacy were almost entirely obscured by the schism. Scholars like Langenstein, Gerson and Zabarella, evolved a new theory as to eccumenical councils, which, from the point of view of Roman Catholic doctrine, proved a great stroke of the papal art. Henceforward the Roman Church, of whom Gregory attempted to deprive the members, assembled at Pisa, views of this type were in the ascendant; and, although protests were not lacking, the necessities of the time served as a pretext for ignoring all objections.

That the council was merely a tool in the hands of the ambitious and adroit Baldassare Cossa, was a fact unsuspected by its members who were animated by a fiery enthusiasm for the re-establishment of ecclesiastical unity; nor did they pause to reflect that an action against both popes could not possibly be lawful. Since whole universities and numerous scholars had pronounced in favour of the new theories, the Pisan synod dismissed all canonical scruples, and unhesitatingly laid claim to authority over both popes, one of whom was necessarily the legitimate pope. It was in vain that Carlo di Malatesta, a staunch adherent of Gregory, sought at the eleventh hour to negotiate a compromise between Gregory and the synod. It was in vain that this cultured prince, imbued with the principles of humanism, represented to the cardinals that this new path would lead quickly to the goal, but that this goal could not be unity but a triple schism. The council declared that it was canonically convened, eccumenical, and representative of the whole Catholic Church; and the Pisan synod deemed the deposition of Gregory XII. and Benedict XIII., as manifest heretics and partisans of the schism.

The next step was to elect a new pope; and on the 26th of June 1409 the choice fell on the venerable cardinal-archbishop of Milan, the Greek Petrus Filargiris, who assumed the title of Alexander V. The premature and futile character of these drastic and violent proceedings at Pisa was only too speedily evident. The powerful following which Gregory enjoyed in Italy and Germany; and Benedict in Spain and Scotland, ought to have shown from the very first that a simple decree of deposition could never suffice to overthrow the two popes. Thus as the sentence of Pisa found recognition in France and England, as well as in many parts of Germany and Italy, the synod, which was to secure the restoration of unity, proved only the cause for worse confusion—instead of two, there were now three popes.

Alexander V., the pope of the council, died on the 3rd of May 1410. The cardinals at once elected his successor—Baldassare Cossa, who took the name of John XXIII. Of all the consequences of the disastrous Pisan council, the election of this man was the most unfortunate. It cannot be demonstrated that all the fearful accusations afterwards levelled at John XXIII. were based on fact; but it is certain that this cunning politician was so far infected with
the corruption of his age that he was not in the least degree fitted to fulfil the requirements of the supreme ecclesiastical dignity. From him the welfare of the Church had nothing to hope. All eyes were consequently turned to the energetic German king, Sigismund, who was inspired by the best motives, and who succeeded in surmounting the formidable obstacles which barred the way to an international council. It was mainly due to Sigismund's indefatigable and magnificent activity, that the council of Constance met and was so numerously attended. It is remarkable how fortune seemed to assist his efforts. The capture of Rome by King Ladislaus of Naples had compelled John XXIII. to take refuge in Florence (June 1413), where that dangerous guest received a not very friendly welcome. Since John's most immediate need was now protection and assistance against his terrible opponent Ladislaus, he sent, towards the close of August 1413, Cardinals Chalot and Francesco Zabarella, together with the celebrated Greek Manuel Chrysoloras, to King Sigismund, and commissioned them to determine the time and place of the forthcoming council. The agreement was soon concluded. On the 6th of December John XXIII. signed the bull convening the council at Constance, and pledged his word to appear there in person. He might have hoped that his share in convening the synod would give him a certain right to regulate its proceedings, and that, by the aid of his numerous Italian prelates, he would be able to influence it more or less according to his views. But in this he was greatly deceived. So soon as he realized the true position of affairs, he attempted to break up the council by his flight to Schaffhausen (March 20–21, 1415)—a project in which he would doubtless have succeeded but for the sagacity and energy of Sigismund.

In spite of everything, the excitement in Constance was unbounded. In the midst of the confusion, which reigned supreme in the council, the upper hand was gained by that party which held that the only method by which the schism could be ended and a reformation of ecclesiastical discipline ensured was a drastic limitation of the papal privileges. The limitation was to be effected by the general council, and in so far as the pope was only committed to the jurisdiction of that council, and—in the opinion of many—remain under its jurisdiction for all time. Thus, in the third, fourth and fifth general sessions it was enacted, with characteristic precipitation, that an ecumenical council could not be dissolved or set aside by the pope, without its consent: the corollary to which was, that the present council, notwithstanding the flight of John XXIII., continued to exist in the full possession of its powers, and that, in matters pertaining to belief and the eradication of schism, all men—even the pope—were bound to obey the general council, whose authority extended over all Christians, including the pope himself.

By these decrees—which created as the supreme authority within the Church a power which had not been appointed as such by Christ—*the* members of the council of Constance sought to give their position a theoretical basis before proceeding to independent action against the pope. But these declarations as to the superiority of an ecumenical council never attained legal validity, in spite of their defence by Pierre d'Ailly and Gerson. Emanating from an assembly without a head, which could not possibly be an ecumenical council without the consent of one of the popes (of whom one was necessarily this legitimate pope)—enacted, in opposition to the cardinals, by a majority of persons for the most part unqualified, and in a fashion which was thus distinctly different from that of the old councils—they can only be regarded as a *coup de main*, a last resort in the universal confusion. On the 29th of May the council deposed John XXIII.

The legitimate pope, Gregory XII., now consented to resign, but under strict reservation of the legality of his pontificate.  

1 Hereof the author speaks of the papal supremacy and not of papal infallibility in matters of faith and morals—a doctrine which was formally declared a dogma of the Church only at the Vatican council in 1870. [Footnote]

By consenting to this, the synod indirectly acknowledged that its previous sessions had not possessed an eccumenical character, and also that Gregory's predecessors, up to Urban VI., had been legitimate popes. In presence of Gregory of the council, constituted by Gregory, Malatesta Angrio announced the resignation of the latter; and the grateful assembly appointed with the invariable result that they left to the cardinals of Ancona—a dignity which he was not destined to enjoy for long, as he died on the 18th of October 1417. (See Constance, Council of.)

From the abdication of Gregory XII. to the election of Martin V., the Apostolic See was vacant; and the council, newly convened and authorized by the legitimate pope, held in the Church. After the condemnation and burning of John Huss (q.v.), the reformation of the Church, both in its head and members, claimed the main attention of the fathers of the council. Among the many difficulties which beset the question, not the least obvious was the length of time during which the Church must remain without a ruler if—as Sigismund and the German nation demanded—the papal election was deferred till the completion of the internal reforms. The result was decided by the policy of the cardinals, who since May 1417 had openly devoted their whole energies to the acceleration of that election; and union was preserved by means of a compromise arranged by Bishop Henry of Winchester, the uncle of the English king. The terms of the agreement were that the Church should remain in communion with the English king, but that the work of reformation would be taken in hand immediately after the election; reforms, on which all the nations were already united, were to be published before the election; and the mode of the papal election itself was to be determined by deputics. When the last-named condition had been fulfilled on the 28th of October the concile began, on the 8th of November 1417, in the Kauffhaus of Constance; and, no later than St Martin's day, the cardinal-deacon Oddo Colonna was elected Pope Martin V.

With the accession of Martin V., unity was at last restored to the Church, and contemporary Christendom gave way to transports of joy. Any secular power—a bitter opponent of the papacy admits—would have succumbed in the schism: but so wonderful was the organization of the spiritual empire, and so indestructible the conception of the papacy itself, that this (the deepest of all cleavages) served only to prove its indissolubility (Gregorovius, Geschichte Roms v.). Martin V. appeared to possess every quality which could enable him to represent the universal Church with strength and dignity. In order to maintain his independence, he energetically opposed all offers of mediation; and, being convinced that the residence in France or Germany, and once more took up his abode in Rome. On the 30th of September 1420 he made his entry into the almost completely ruinous town. To repair the ravages of neglect, and, more especially, to restore the decayed churches, Martin at once expended large sums; while, later, he engaged famous artists, like Gentile da Fabriano and Masaccio, and encouraged all forms of art by every means within his power. Numerous humanists were appointed to the Chancery, and the Romans were loud in their praise of the papal régime. But he was not content with laying the foundations for the renovation of the Eternal City; he was the architect who rebuilt the papal monarchy, which the schism had reduced to the verge of dissolution. To this difficult problem he brought remarkable skill and aptness, energy and ability. His temporal sovereignty he attempted to strengthen through his family connections, and magnificent provision in general was made for the members of his house.

Nor was the activity of Martin V. less successful in political than in ecclesiastical reform, which latter included the combating of the Pratellii, the amendment of the clergy, the encouragement of piety by the regulation of feast-days, the recommendation of increased devotion to the sacrament of the altar, and the strengthening of the conception of the Church...
PAPACY

by the great jubilee of 1423. At the same time the crowning reward of his labours was the effacing of the last traces of the schism. He prosecuted successfully the conflict with the adherents of Benedict XIII., who, till the day of his death, clung to the remnants of his usurped authority (see Benedict XIII.). An attempt on the part of Alphonso V. of Aragon to renew the schism failed; and, in 1426, the Spaniard was compelled to give up his anti-pope, Clement VIII. Count John of Armagnac, whom Martin had excommunicated as a protector of schismatics, was also driven to make submission. Martin rendered the greatest service by his admission of a whole series of distinguished men into the College of Cardinals; but he was less fortunate in his struggles against Hussitism. His death took place on the 20th of February 1431, and the inscription on his grave—still preserved in the Lateran church—stiles him "the felicity of his age" (temporum suorum felicitas).

The Colonna pope was followed by the strict, moral and pious Gabriel Condulmaro, under the title of Eugenius IV.

Eugenius IV.

1431-1447

and the Council of Basel.

Eugenius's pontificate was not altogether happy. At the very first, his violent and premature measures against the Colonna family, which had received such unbounded favour from his predecessor, embroiled him in a new conflict, which Eugenius had to support against the Council of Basel—already dissolved on the 18th of December 1431. At the beginning, indeed, a reconciliation between the pope and council was effected by Sigismund who, on the 31st of May 1433, was crowned emperor at Rome. But, as early as the 20th of May 1434 a revolution broke out in Rome, which, on the 4th of June, drove the pope in flight to Florence; where he was obliged to remain, while Giovanni Vitelleschi restored order in the papal state.

The migration of Eugenius IV. to Florence was of extreme importance; for this town was the real home of the new art, and the intellectual focus of all the humanistic movements in Italy. At Florence the pope came into closer contact with the humanists, and to this circumstance is due the gradual dominance which they attained in the Roman Curia—a dominance which, both in itself, and even more because of the frankly pagan leanings of many in that party, was bound to awaken serious misgivings.

The Italian troubles, which had entailed the exile of Eugenius IV., were still insignificant in comparison with those conjured up by the fanatics of the Council in Basel. The decrees enacted by that body made deep inroads on the rights of the Holy See; and the conflict increased in violence. On the 31st of July 1437 the fathers of Basel summoned Eugenius IV. to appear before their tribunal. The pope retired on the 18th of September by transferring the scene of the council to Ferrara—afterwards to Florence. There, in July 1439, the union with the Greeks was effected; but it remained simply a papal agreement. On the 25th of June 1440 the synod—which had already pronounced sentence of heresy on Eugenius IV., by reason of his obstinate disobedience to the assembly of the Church—formally deposed him; and, on the 5th of November, a rival pontiff was elected in the person of the ambitious Amadeus of Savoy, who now took the title of Felix V. (See Basel, Council of, and Felix V.) Thus the assembly of Christendom at Basel had resulted, not in the reformation of the Church, but in a new schism! This, in fact, was an inevitable sequel to the attempt to overthrow the monarchical constitution of the Church. The anti-pope—the last in the history of the papacy—made no headway, although the council invested him with the power of levying annates to a greater extent than had ever been claimed by the Roman Curia.

The crime of this new schism was soon to be expiated by its perpetrators. The disindulgence of sovereigns and peoples to its divisors, of the disaster consequences of which the West had only lately had plentiful experiences, was so pronounced that 1 May 23, 1423; vide the Chronicle of Martin de Alparti, edited by Ehrlé (1900).

1

The violent proceeding of the Basel fathers alienated from them the sympathies of nearly all who, till then, had leaned to their side. While the prestige of the schismatics waned, Eugenius IV. gained new friends; and on the 28th of September 1443 his reconciliation with Alphonso of Naples enabled him to return to Rome. In consequence of the absence of the pope, the Eternal City was once more little better than a ruin; and the work of restoration was immediately begun by Eugenius.

During the chaos of the schism, France and Germany had adopted a semi-schismatic attitude: the former by the Pragmatic Sanction of Bourges (June 7, 1438); the latter by a declaration of neutrality in March 1438. The efforts of Aeneas Silvius Piccolomini brought into play the opposite power, the rival claim to the Holy See; and an understanding with Germany was reached. This consummation was soon followed by the death of Eugenius (Feb. 23, 1447). No apter estimate of his character can be found than the words of Aeneas Silvius himself: "He was a great-hearted man; but his chief error was that he was a stranger to moderation, and regulated his actions, not by his ability, but by his wishes." From the charge of nepotism he was entirely exempt; and, to the present day, the purity of his life has never been impugned even by the voice of faction. He was a father to the poor and sick, in the highest sense of the word; and he left behind him an endowment for the promotion of the arts, the amendment and regeneration, first of the religious orders, then of the clergy. Again, the patronage which he showed to art and artists was of the greatest importance. All that could be done in that cause, during this stormy epoch, was done by Eugenius. It was by his commission that Filarete prepared the still-extant bronzed work of St Peter's, and the Chapel of the Holy Sacrament in the Vatican was painted by Fiesole.

On the death of Eugenius IV., the situation was menacing enough, but, to the surprise and joy of all, Tomaso Parentucelli, cardinal of Bologna, was elected without opposition, as Pope Nicholas V. With him the Christian Renaissance ascended the papal throne. He was the son of a physician from Sarzana, who was not too well endowed with the gifts of fortune; and the boy, with all his talents, could only prosecute his studies at great personal sacrifices. He was possessed of a deep-seated enthusiasm for science and art, of a sincerely pious and idealistic temperament, and of an ardent love for the Church. After his ordination, his great learning and stainless life led him to office after office in the Church, each higher and more influential than the last. Not only did he love the studies of the humanist, but he himself was a Christian humanist. Yet among all his far-reaching plans for the encouragement of art and science, Nicholas V. had always the weal-being of the Church primarily in view; and the highest goal of his pontificate, which inaugurated the Maecenatian era of the popedom, was to enoble that Church by the works of intellect and art. It is astonishing to contemplate how much he achieved, during his brief reign, in the cause of the Renaissance in both art and literature. True, his designs were even greater, but his term of government was too short to allow of their actual execution. A simply gigantic plan was drawn out, with the idea of constructing the Ideal City, for the reconstruction of the Leonine City, the Vatican and St Peter's. The rebuilding of the last-named was rendered advisable by the precarious condition of the structure, but stopped short in the early stages. In the Vatican, however, Fiesole completed the noble frescoes, from the lives of St Stephen and St Lawrence, which are still preserved to us. Nicholas, again, left the protection and encouragement of his powerful arm to science as well as art, till the papal court became a veritable domain of the Muses. He supported all scientific enterprises with unlimited generosity, and the most famous savants of all countries flocked to Rome. Yet it is surprising—and scarcely excusable—that Nicholas, while selecting the men whom he considered necessary for his literary work, passed over much which ought to have aroused grave suspicion in his mind. Thus the active humanistic life, called into existence by the enthusiasm of the pope, was not without its dark side. Quite apart from the fact that
Rome became the scene of a *chronique scandaleuse* among these scholars, there was something unnatural in the predominance of the humanists in the Curia.

The fostering care of the science-loving pope extended also to the field of ecclesiastical literature; and the greatest importance attaches to the energy he developed as a collector of manuscripts and books. His agents travelled as far as Prussia, and even into the East. All this activity served to enrich the Vatican library, the foundation of which is for Nicholas V. an abiding title to fame. In political and ecclesiastical affairs he similarly manifested great vigour; and his extraordinarily pacific disposition did more than anything else towards diminishing the difficulties with which he had to contend on his entry upon office. An agreement was very quickly concluded with King Alphonso of Naples. In the Empire the affairs of the Church were ameliorated—though not so quickly—by the Concordat of Vienna (1448). The Council of Basel was compelled to dissolve, and the anti-pope Felix V. to abdicate: and, though even after the termination of the synod men like Jacob of Jüterbog (q. s.) were found to champion ecclesiastical parliamantarianism and the more advanced ideas of Basel, they were confronted, on the other hand, by an array of redoubtable concomitant basiliscus, who entered the lists to defend, both in speech and in writing, the privileges of the Apostolic See. Among these, Torquemada, Rodericus Sancius de Arevalo, Capistrano and Piero del Monte were especially active for the restoration of the papacy. Fortunate as Nicholas was in the *haute politique* of the Church, he was equally so in his efforts to re-establish and maintain peace in Rome and the papal state. In Poland, Bohemia, Hungary, Bosnia and Croatia—even in Cyprus itself—he was zealous for the peace of the Church.

The long-hoped cessation of civil war within the Church had now come, and Nicholas considered that the event could not be better celebrated than by the proclamation of a universal jubilee—an announcement which evoked a thrill of joy in the whole of Christendom. A special point of attraction in this jubilee of 1450 was the canonization of Bernardino of Siena; and, in spite of the plague which broke out in Rome, the celebrations ran a brilliant course.

It was the wish of the pope that the jubilee should be followed by a revival of religious life in all Christian countries. To put this project into execution, the Church opened her "treasures of grace," connected with the jubilee dispensation, for the peculiar benefit of those nations that had suffered most from the turmoil of the last few decades, or were prevented from visiting the Eternal City. Nicholas of Cusa was nominated legate for Germany, and began the work of reformation by travelling through every province in Germany dispensing blessings. It was under Nicholas V. that the last imperial coronation was solemnized at Rome. There is a touch of tragedy in the fact that, in the following year, the pope saw his temporal sovereignty—even his life—threatened by a conspiracy hatched among the adherents of the pseudo-humanism. The prime mover in the plot, Stefano Porcaro, was executed. Nicholas had scarcely recovered from the shock, when news came of the capture of Constantinople by the Turks; and his efforts to unite the Christian powers against the Moslem failed. This darkened the evening of his life, and he died in the night of the 24-25th of March 1455. From the universal standpoint of history the significance of Nicholas's pontificate lies in the fact that he put himself at the head of the artistic and literary Renaissance. By this means he introduced a new epoch in the history of the papacy and of civilization: Rome, the centre of ecclesiastical life, was now to become the centre of culture and art.

The short reign of the Spaniard, Alphonso de Borgia, as Pope Calixtus III., is almost completely filled by his heroic efforts to arm Christendom for the common defence against Islam. Unfortunately all the warnings and admonitions of the pope fell on deaf ears, though he himself parted with his mitre and plate in order to equip a fleet against the Turks. The Mahomedans, indeed, were severely punished at Belgrade (1456), and in the sea-fight of Metelino (1457): but the indolence of the European princes, who failed to push home the victory, rendered the success abortive. Bitterly disillusions, Calixtus died on the 14th of August 1455. His memory would be stainless but for the deep shadow cast on it by the advancement which he conferred upon his relatives.

When Aeneas Sylvius Piccolomini was elected pope as Pius II., the papal throne was ascended by a man whose name was famous as poet, historian, humanist and statesman, Pius II., and whose far-seeing eye and exact knowledge of affairs seemed peculiarly to fit him for his position.

On the other hand, the troubled and not improbable past of the new pontiff was bound to excite some misgiving; while, at the same time, severe bodily suffering had brought old age on a man of but 53 years. In spite of his infirmity and the brief duration of his reign, Pius II. accomplished much for the restoration of the prestige and authority of the Holy See. His indefatigable activity on behalf of Western civilization, now threatened with extinction by the Ottomans, excites admiration and adds an undying lustre to his memory. If we except the Eastern question, Pius II. was principally exercised by the opposition to papal authority which was gathering ground in the West and was foreseen by his influence. It was headed by the worldly archbishop-elector Dietrich of Mainz;1 in the latter by Louis XI., who played the autocrat in ecclesiastical matters. In full consciousness of his high-priestly dignity he set his face against these and all similar attempts; and his zeal and firmness in defending the authority and rights of the Holy See against the attacks of the conciliar and national parties within the Church deserve double recognition, in view of the eminently difficult circumstances of that period. Nor did he shrink from excursions in the direction of reform, now become an imperative necessity. His attempt to reunite Bohemia with the Church was destined to failure; but the other aim of the pope during his whole reign was the organization of a gigantic crusade—a project which showed a correct appreciation of the danger with which the Church and the West in general were menaced by the Crescent. It is profoundly affecting to contemplate this man, a mere wreck from gout, shrinking from no fatigue, no labour, and no personal sacrifices; disregarding the obstacles and difficulties thrown in his way by cardinals and temporal princes, whose fatal infatuation refused to see the peril which hung above them all; recurring time after time, with all the alluring allure of Christian zeal, and finally adopting the high-hearted resolve of placing himself at the head of the crusade. Tortured by bodily, and still more by mental suffering, the old pope reached Ancona. There he was struck down by fever; and on the 15th of August 1464 death had released him from all his afflictions—a tragic close which has thrown a halo round his memory. In the sphere of art he left an enduring monument in the Renaissance town of Fienza which he built.

The humanist Pius II. was succeeded by a splendid-loving Venetian, Pietro Barbo, the nephew of Eugenius IV., who is known as Pope Paul II. With his accession the great situation altered; for he no longer made the Turkish War the centre of his whole activity, as both his immediate predecessors had done. Nevertheless, he was far from indifferent to the Ottoman danger. Paul took energetic measures against the principle of the absolute supremacy of the state as maintained by the Venetians and by Louis XII. of France; while in Bohemia he ordered the deposition of George Poděbrad (Dec. 1466). The widely diffused view that this pope was an enemy of science and culture is unfounded. It may be traced back to Platina, who, resembling his arrows, avenged himself by a biographical caricature. What the pope actually sought to combat by his dissolution of the Roman Academy

---

1 Dietrich von Isenburg (1442-1453), second son of Count Dietrich of Isenburg-Büdingen; rector of the university of Erfurt, 1434; archbishop of Mainz, 1459. He led the movement for a reform of the Church, and opposed the papal prerogatives, supporting the theory of church government enunciated at Constance and Basel and condemed in Pius II.'s bull *Excrebroti.*—[Ed.]}
was simply the non-Christian tendency of the Renaissance, standing as it did on a purely pagan basis—"the stench of heathendom," as Dante described it. In other respects Paul II. encouraged men of learning and the art of printing, and built the magnificent palace of San Marco, in which he established a noble collection of artistic treasures.

The long pontificate of the Franciscan Francesco della Rovere, under the title of Pope Sixtus V., displays striking contrasts of light and shade; and with him begins the series of the so-called "political popes." It remains a lamentable fact that Sixtus IV., frequently subordinated the Father of Christendom to the Italian prince, that he passed all bounds in the preferment of his own family, and in many ways deviated into all too worldly pursuits. The decay of ecclesiastical discipline grew alarmingly under Sixtus. During his reigning abuses continued and grew in spite of certain reforms.

The nepotism in which the pope indulged is especially inexcusable. His feud with Lorenzo de' Medici culminated in the Pazzi conspiracy, the tragic sequel to which was the assassination of Giuliano de' Medici (April 26, 1478). That the pope himself was guiltless of any share in that atrocious deed is beyond dispute; but it is deeply to be regretted that his name plays a part in the history of this conspiracy. Sixtus was far from blind to the Turkish peril, but here also he was hampered by the indifference of the secular powers. The decay of ecclesiastical discipline grew alarmingly under Sixtus.

In the affairs of the Church he favoured the mendicant orders, and declared against the cruel and unjust proceedings of the Spanish Inquisition. His nominations to the cardinalate were not happy. The College of Cardinals, and the Curia in general, grew more and more infected with worldliness during his pontificate. On the other side, however, the pope did splendid service to art and science, while to men of letters he allowed incredible freedom. The Vatican library was enriched and thrown open for public use, Platina—the historian of the popes—receiving the post of librarian. The city of Rome was transfigured. At the papal order there arose the Ponte Sisto, the hospital of San Spirito, Santa Maria del popolo, Santa Maria della pace, and finally the Sistine Chapel, for the decoration of which the most famous Tuscan and Umbrian artists were summoned to Rome. This fresco-cycle, with its numerous allusions to contemporary history, is still preserved, and forms the noblest monument of the Rovern pope.

The reign of Innocent VIII. is mainly occupied by his troubles with the faithless Ferdinand of Naples. These sprang from his participation in the War of the Barons; but to this the pope was absolutely compelled. Innocent's bull concerning witchcraft (Dec. 5, 1484) has brought upon him many attacks. But this bull contains no sort of dogmatic decision on the nature of sorcery. The very form of the bull, which merely sums up the various items of information that had reached the pope, is enough to prove that the decree was not intended to bind anyone to belief in such things. Moreover the bull contained no essentially new regulations as to witchcraft. It is absurd to make this document responsible for the introduction of the bloody persecution of witches; for, according to the Sachsenpfleg, the civil law already punished sorcery with death. The action of Innocent VIII. was simply limited to defining the jurisdiction of the inquisitors with regard to magic. The bull merely authorized, in cases of sorcery, the procedure of the canonical inquisition, which was conducted exclusively by spiritual judges and differed entirely from that of the later witch-trials. Even if the bull encouraged the persecution of witches, in so far as it encouraged the inquisitors to take earnest action, there is still no valid ground for the accusation that Innocent VIII. introduced the trial of witches and must bear the responsibility for the terrible misery which was afterwards brought on humanity by that institution.

During the last three decades of the 15th century the Roman Curia, and the College of Cardinals in particular, became increasingly worldly. This explains how on the death of Innocent VIII. (July 25, 1492), simoniacal VI. (1492-1503), intrigues succeeded in preparing the election of Alexander VI. Cardinal Rodrigo Borgia, a man of the most abandoned morals, who did not change his mode of life when he ascended the throne as Pope Alexander VI. The beginning of his reign was not unpromising; but all too soon that nepotism began which attained its height under this Spanish pope, and dominated his whole pontificate. A long series of scandals resulted. The cardinals opposed to Alexander, headed by Giuliano della Rovere, found protection and support with Charles VIII. of France, who laid claim to Naples. In prosecution of this design the king appeared in life of superior, inclued 1495, pursuing his triumphs through Lombardy and Tuscany, and, on the 31st of December, entered Rome. Charles had the word reform perpetually on his lips; but it could deceive none who were acquainted with the man. At first he threatened Alexander with deposition; but on the 15th of January 1495 an agreement was concluded between pope and king.

While the French were marching on Naples there arose a hostile coalition which compelled them to a hasty retreat—the Holy League of March 1495. All their conquests were lost; and the pope now determined to chastise the Orsini family, whose treachery had thrown him into the hands of the French. The project miscarried, and on the 25th of January 1497 the papal forces were defeated.

In June occurred the mysterious assassination of the duke of Gandia, which appeared for a while to mark the turning-point in Alexander's life. For some time he entertained serious thoughts of reformation; but the matter was first postponed and then forgotten. The last state now became worse than the first, as Alexander fell more and more under the spell of the infamous Cesare Borgia. One scandal followed hard on the other, and opposition naturally sprang up. Unfortunately, Savonarola, the head of that opposition, transgressed all bounds in his well-meaning zeal. He refused to yield the pope that obedience to which he was doubly pledged as a priest and the member of an order. Even after his excommunication (May 12, 1497) he continued to exercise the functions of his office, under the shelter of the secular arm. In the end he demanded a council for the deposition of the pope. His fall soon followed, when he had lost all ground in Florence; and his execution on the 23rd of May 1498 freed Alexander from a formidable enemy (see SAVONAROLA). From the Catholic standpoint Savonarola must certainly be condemned: mainly because he completely forgot the doctrine of the Church that the sinful and vicious life of the superior, including the pope, is not competent to abrogate their jurisdiction.

After the death of Charles VIII. Alexander entered into an agreement and alliance with his successor Louis XII. The fruits of this compact were reaped by Cesare Borgia, who resigned his cardinal's hat, became duke of Valentinois, annihilated the minor nobles of the papal state, and made himself the true dictator of Rome. His soaring plans were destroyed by the death of Alexander VI., who met his end on the 18th of August 1503 by the Roman fever—not by poison.

The only bright pages in the dark chapter of Alexander's pontificate are his efforts on behalf of the Turkish War (1499-1500), his activity for the diffusion of Christianity in America, and his judicial awards (May 2-4, 1493) on the question of the colonial empires of Spain and Portugal, by which he avoided a bloody war. It is folly to speak of a donation of lands which did not belong to the pope, or to maintain that the freedom of the Americans was extinguished by the decision of Alexander VI. The expression "donation" simply referred to what had already been won under past titles; the decree contained a deed of gift, but it was an adjustment between the powers concerned and the other European princes, not a purloining out of the New World and its inhabitants. The monarchs on whom the privilege was conferred received a right of priority with
PAPACY

[1305–1590]

respect to the provinces first discovered by them. Precisely as to-day inventions are guarded by patents, and literary and artistic creations by the law of copyright, so, at that period, the papal gift and the patronage of the Roman Church were also an effective means for ensuring that a country should reap where she had sown and should maintain the territory she had discovered and conquered by arduous efforts; while other claimants, with predatory designs, were warned back by the ecclesiastical censorship. In the Vatican the memory of Alexander VI. is still perpetuated by the Appartamenti Borgia, decorated by Pinturichio with magnificent frescoes, and since restored by Leo XIII.

The short reign of the noble Pius III. (Sept. 22–Oct. 18, 1500) witnessed the violent end of Cesare Borgia's dominion. As early as the 1st of November Cardinal Giuliano della Rovere was elected by the conclave as Julius II. He was one of those personalities in which everything transcends the ordinary scale. He was endowed with great force of will, indomitable courage, extraordinary acumen, heroic constancy and a discriminating instinct for everything beautiful. A nature formed on great broad lines—a man of spontaneous impulses carrying away others as he himself was carried away, a genuine Latin in the whole of his being—he belongs to those whose courage never failed or, at most, but was a splendid character is summarized in contemporary literature by the word terrible, which is best translated "extraordinary" or "magnificent."

As cardinal Julius II. had been the adversary of Alexander VI., as pope he stood equally in diametrical opposition to his predecessor. The Borgias' foremost thought had been for his family; Julius devoted his effort to the Church and the papacy. His chief idea was to revive the world-dominion of the popedom, but first to secure the independence and prestige of the Holy See on the basis of a firmly established and independent temporal sovereignty.

The two problems presented themselves: the restoration of the papal state, which had been reduced to chaos by the Borgias; and the liberation of the Holy See from the onerous dependence on France—in other words, the expulsion of the French "barbarians" from Italy. His solution of the first problem entitles Julius II. to rank with Innocent III. and Cardinal Albornoz as the third founder of the papal state. His active prosecution of the second task made the Rovere pope, in the eyes of Italian patriots, the hero of the century. At the beginning of the struggle Julius had to endure many a hard blow, but his courage never failed; and for a moment—even after the French victory at Ravenna, on Easter Sunday 1512. In the end the Swiss saved the Holy See; and when Julius died the power of France had been broken in Italy, although the power of Spain had taken its place.

The conflict with France led to a schism in the College of Cardinals, which resulted in the conciliabulum of Pisa. Julius adroitly checkmated the cardinals by convening a general council, which was held in the Lateran. This assembly was also designed to deal with the question of reform, when the pope was summoned from this world (Feb. 20–21, 1513). Of his ecclesiastical achievements the bull against simony at papal elections deserves the most honourable mention. Again, by his restoration of the papal state, after the frightful era of the Borgias, Julius became the saviour of the papal power. But this does not exhaust his significance; he was, at the same time, the renewer of the papal Maccenate in the domain of art. It is to his lasting praise that he took into his service the three greatest artistic geniuses of the time—Bramante, Michelangelo and Raphael—and entrusted them with congenial tasks. Bramante drew out the plan for the new cathedral of St Peter and the reconstruction of the Vatican. On the 18th of April 1566 the foundation-stone of the new St Peter's was laid; 120 years later, on the 18th of November 1626, Urban VIII. consecrated the new cathedral of the world, on which twenty popes had laboured, in conjunction with the first architects of the day, modifying in many points the grandiose original design of Bramante, and receiving the contributions of every Christian land.

St Peter's, indeed, is a monument of the history of art, not merely within those years from the zenith of the Renaissance till the transition into Baroque—from Bramante, Raphael, Michelangelo, to Maderna and Bernini—but down to the 19th century, in which Canova and Thorwaldsen erected there the last great papal monuments. But a still more striking period of art is represented by the Vatican, with its antique collections, the papal and the Stanze. Here, too, we are everywhere confronted with the name of Julius II. It was he who inaugurated the collection of ancient statues in the Belvedere, and caused the wonderful "extraordinary" and "Cherubino stone" to be placed in the Belvedere (cf. Steinmann, Die sechs. Kapelle II., 1905). Simultaneously, on the commission of the pope, Raphael decorated the Vatican with frescoes glorifying the Church and the papacy. In the Camera della Segnatura he depicted the four intellectual powers—theology, philosophy, poetry and law. In the Stanza d'Eliodoro Julius II. was visibly extolled as the Head of the Church, sure at all times of the aid of Heaven.

As so often occurs in the history of the papacy, Julius II. was followed by a man of an entirely different type—Leo X. Though not yet 37 years of age, Giovanni de' Medici, the son of Lorenzo de' Medici, of the Lodola, was raised to the pontificate by the cardinal offspring of the Medici as an act of courtesy, was elevated to the pontifical chair by the adroit manoeuvres of the younger cardinals. His policy—though officially he declared his intention of following in the steps of his predecessor—was at first extremely reserved. His ambition was to play the rôle of peacemaker, and his conciliatory policy achieved many successes. Thus, in the very first year of his reign, he removed the schism which had broken out under Julius II. As a statesman Leo X. often walked by very crooked paths; but the reproach that he allowed his policy to be swayed exclusively by his family interests is unjustified. Michelangi-

lo, however, it may be admitted that he clung to his native Florence and to his family with warm affection; but the really decisive factor which governed his attitude throughout was his anxiety for the temporal and spiritual independence of the Holy See. The conquest of Milan by the French led to a personal interview at Bologna, where the "Concordat" with France was concluded. This document annulled the Pragmatic Sanction of Bourges, with its schismatic tendencies, but at the same time confirmed the preponderating influence of the king upon the Gallican Church. These concepts, which in spite of its many dubious aspects Leonardo da Vinci, the sovereign of the arts, and the Medici, made the sovereign the natural defender of the Church and gave him the strongest motive for remaining Catholic. The war for the duchy of Urbino (1516–17) entailed disastrous consequences, as from it dates the complete disorganization of papal finance. It was, moreover, a contributing cause of the conspiracy of Cardinal Petrucci; the suppression of which was followed (July, 1517) by the creation of 31 new cardinals in one day. This—the greatest of recorded creations—turned the scale once and for all in favour of the papal authority and against the cardinals. The efforts of Leo to promote a crusade, which fall mainly in the years 1517 and 1518, deserve all recognition, but very various opinions have been held as to the attitude of the pope towards the Imperial election consequent on the death of Maximilian I. The fundamental motive for his proceedings at that period was not nepotistic tendencies—which doubtless played their part, but only a secondary one—but his anxiety for the moral and temporal independence of the Holy See. For this reason Leo, from the very first, entertained no genuine desire for the selection either of Charles V. or Francis I. of France. By playing off one against the other he succeeded in holding both in suspense, and induced them to conclude agreements safeguarding the pope and the Medici. Of the two, Leo X.,—[Ed.]
By a wonderful dispensation the successor to this scorn of the Medici was Adrian VI.—a man who saw his noblest task, not in an artistic Maceneate, nor in the prosecution of political designs, but in the reform of the Church, in all its members. Careless of the glories of Renaissance art, a stranger to all worldly instincts, the earnest Netherlander inscribed on his banner the healing of the moral ulcers, the restoration of unity to the Church—especially in Germany—and the preservation of the West from the Turkish danger. How clearly he read the causes of religious decadence, how deeply he himself was convinced of the need of triumphant reform, is at least borne out by his instructions to Chierico, his nuncio in Germany, in which he laid the axe to the root of the tree with unblush-of freedom. Unfortunately, it was all in vain. Luther and his adherents overwhelmed the noble pope with unmeasured abuse. The two great rivals, Francis I. and Charles V., were deaf to his admonitions to make common cause against the Turks. The intrigues of Cardinal Soderini led to a breach with France and drove Adrian into the arms of the Imperial league. Soon afterwards, on the 14th of September 1523, he died. Long misunderstood and slandered, Adrian VI., the last German pope, is now by all parties ranked among the most just and meritorious of men. It is to be hoped that posterity will see that he was one of those exceptional men, who without self-seeking spend their lives in the service of a cause and fight bravely against the stream of corruption. Even though, in his all too brief pontificate, he failed to attain any definite results, he at least fulfilled the first condition of any cure by laying bare the seat of disease, gave an important impetus to the cause of the reform of the Church, and laid down the principles on which this was afterwards carried through. His activity, in fact, will always remain one of the brightest chapters in the history of the papacy.

Under Leo X. Cardinal Giulio de' Medici, the cousin of that pope, had already exercised a decisive influence upon Catholic policy; and the tiara now fell to his lot. Clement VII.—so the new pontiff styled himself—was soon to discover the weight of the crown which he had gained. The international situation was the most difficult imaginable, and altogether beyond the powers of the timorous, vacillating and irresolute Medicean pope. His determination to stand aloof from the great duel between Francis I. and Charles V. failed him at the first trial. He had not enough courage and perspicacity to await in patience the result of the race between France and Germany for the duchy of Milan—a contest which was decided at Pavia (Feb. 24, 1525). The hour of the imperial arm on Clement on the side of their opponent, and he was forced into an alliance with the emperor (April 1, 1525). The overwhelming arrogance of the Spaniards soon drove the pope back into the ranks of his enemies. On the 22nd of May 1526 Clement acceded to the League of Cognac, and joined the Italians in their struggle against the Spanish supremacy. This step he was destined bitterly to repent. The tempest descended on the pope and on Rome with a violence which cannot be paralleled, even in the days of Alaric and Genseric, or of the Norman Robert Guiscard. On the 6th of May 1527 the Eternal City was stormed by the Imperial trod and subjected to appalling devastation in the famous sack. Clement was detained for seven months a prisoner in the castle of St. Angelo. He then went into exile at Orvieto and Viterbo, and only on the 6th of October 1528 returned to his desolate residence. After the fall of the French dominion in Italy he made peace with the emperor at Barcelona (June 29, 1529); in return for which he received the assistance of Charles in re-establishing the rule of the Medici in Florence. During the Italian turmoil the schism in Germany had made such alarming progress that it now proved impossible to bridge the chasm. With regard to the question of a council the pope was so obsessed by doubts and fears that he was unable to advance a single step; nor, till the day of his death could he break off his pitiful vacillation between Charles V. and Francis I. While large portions of Germany were lost to the Church the revolt from Rome proceeded apace in Switzerland.
and the Scandinavian countries. To add to the disasters, the divorce of Henry VIII. led to the English schism. Whether another head of the Church could have prevented the defection of England is of course an idle question. But Clement VII. was far from possessing the qualities which would have enabled him to show a bold front to the ambitious Cardinal Wolsey and the masterful and passionate Henry VIII. At the death of Clement (Sept. 25, 1534), the complete disruption of the Church seemed inevitable. From henceforward lost salvation was near. Even in the reign of the two Medici popes the way which was to lead to better things had been silently paved within the Church. Under Leo X. himself there had been formed in Rome, in the Oratory of the Divine Love, a body of excellent men of strictly Catholic sentiments. It was by members of this Oratory—especially St Gaetano di Tienie, Carafa (later Paul IV.), and the great bishop of Verona, Gilberti—that the foundations of the Catholic reformation were laid. Under Clement VII. the establishment of new religious orders—Theatines, Somascanis, Barnabites and Capuchins—had sown the seeds of a new life in the ancient Church. The harvest was reaped during the long pontificate of the Farnese pope, Paul III. With his accession devotion to religion and the Church began to regain their old mystery. True, Paul III. was not a representative of the Catholic reformation, in the full sense of the words. In many points, especially his great nepotism—witness the promotion of the worthless Pier Luigi Farnese—he remained, even as pope, a true child of the Renaissance period in which he had risen to greatness. Nevertheless he possessed the necessary adaptability and acumen to enable him to do justice to the demands of the new age, which imperatively demanded that the interests of the Church should be the first consideration. Thus, in the course of his long reign he did valuable work in the cause of the Catholic reformation and prepared the way for the Catholic restoration. It was he who regeneratized the College of Cardinals by levying it with men of ability, who took in hand the reform of the Curia, confirmed the Jesuit Order, and finally brought the Council of Trent into existence (Sessions I.—X. of the council, first period, 1545–1549).

In order to check the progress of Protestantism in Italy Paul III. founded the Congregation of the Inquisition (1542). Political clergymen were reared during the long pontificate of Bologna in 1547, brought the pope into sharp collision with the emperor, who now attempted by means of the Interim to regulate the religious affairs of Germany according to his wishes—but in vain. The disobedience of his favourite Ottavio hastened the death of the old pope (Nov. 10, 1549). Under the Farnese pope art enjoyed an Indian summer. The most important work for which he was responsible is the "Last Judgment" of Michelangelo in the Sistine Chapel. In 1547 Michelangelo was further entrusted with the superintendence of the reconstruction of St Peter's. He utilized his power by rejecting the innovations of Antonio da Sangallo, saved the plan of Bramante, and left behind him sufficient drawings to serve the completion of the famous cupola. Titian painted Paul's portrait, and Guglielmo della Porta cast the bronze statue which now adorns his grave in St Peter's.

After a protracted concile Giovanni Maria del Monte was elected, on the 7th of February 1550, as Pope Julius III. He submitted to the emperor's demands and again convened the council (Sessions XI.—XVI., second period), but was obliged to suspend it on the 22nd of April 1552, in consequence of the war between Charles V. and Maurice of Saxony. Within this time towards the pope failed to exhibit requisite energy. In his beautiful villa before the Porta del Popolo he sought to banish political and ecclesiastical anxieties from his mind. Yet even now he was not wholly inactive. The religious affairs of England especially engaged his attention; and the nomination of Cardinal Pole as his legate to that country, on the death of Edward VI. (1553), was an extremely adroit step. That the measure was fruitless was not the fault of Julius III., who died on the 23rd of March 1555.

The feeble régime of Julius had made it evident that a pope of another type was necessary if the papal see were to preserve the moral and political influence which it had regained under Paul III. On the 10th of April 1555, after a concile which lasted five days, the reform party secured the election of the distinguished Marcellus II. Unfortunately, on the 1st of May, an attack of apoplexy cut short the life of this pope, who seemed peculiarly adapted for the reformation of the Church. In the third year of his pontificate, in 1555, Gian Pietro Carafa, the strictest of the strict, was elected as his successor, under the title of Paul IV. Though already 70 years of age, he was animated by the fiery zeal of youth, and he employed the most drastic methods for executing the necessary reforms and combating the advance of Protestantism. Always an opponent of the Spaniards, Paul IV., in the most violent and impolitic fashion, declared against the Habburgs. The conflict with the Colonna was soon followed by the war with Spain, which, in spite of the French alliance, ended so disastrously, in 1557, that the pope henceforward devoted himself exclusively to the last. It was obvious to him that, whatever the moral and political difficulties: yet it succeeded in effecting many notable reforms and in illuminating and crystallizing the distinctive doctrines of Catholicism. The breach with the Protestant Reformation was now final, and all Catholics felt themselves once more united and brought into intimate connexion with the centre of unity at Rome (see Trent, Council of).

The three great successors of Pius IV. inaugurated the heroic age of the Catholic reformation and restoration. All three were of humble extraction, and sprung from the people in the full sense of the phrase. Pius V., 1566–1572, formerly Michele Ghisleri and a member of the Dominican Order observed even as pope the strictest rules of the brotherhood, and was already regarded as a saint by his contemporaries. For Rome, in especial, he completed the task of reform. The Curia, once so corrupt, was completely metamorphosed, and once more became a rallying point for men of stainless character, so that it produced a profound impression even on non-Catholics; while the original methods of St Philip Neri had a profound influence on the reform of popular morals. In the rest of Italy also Pius V. put into execution the reformatory decrees of Trent. In 1566 he gave publicity to the Tridentine censures; he reformed the breviary; everywhere he insisted on strict monastic discipline, and the compulsory residence of bishops within their dioceses. At the same period Carlo Borromeo made his diocese of Milan the model of a reformed bishopric. The pope supported Mary Stuart with money; his troops assisted Charles IX. of France against the Huguenots; and he lent his aid to Philip II. against the Calvinists of the Netherlands. But his greatest joy was that he succeeded where Pius II. had failed, despite all his efforts,
by bringing to a head an enterprise against the Turks—then masters of the Mediterranean. He negotiated an alliance between the Venetians and Spaniards, contributed ships and soldiers, and secured the election of Don John of Austria to the supreme command. He was privileged to survive the victory of the Christians at Lepanto; but on the 1st of May in the following year he died, as piously as he had lived. The last pope to be canonized, his pontificate marks the zenith of the Catholic reformation.

The renewed vigour which this internal reformation had infused into the Church was now manifest in its external effects; and Pius V., the pope of reform, was followed by the same the Catholic restoration. These, without interrupting the work of reformation, endeavoured by every means to further the outward expansion of Catholicism. On the one hand missions were despatched to America, India, China and Japan; on the other, a strenuous attempt was made to reannex the conquests of Protestantism. In a word, the age of the Catholic restoration was beginning—a movement which has been misnamed the counter reformation. In this period, the newly created religious orders were the right arm of the papacy, especially the Jesuits and the Capuchins. In place of the earlier supineness, the hand now laid all along the line. Everywhere, in Germany and France, in Switzerland and the Low Countries, in Poland and Hungary, efforts were made to check the current of Protestantism and to re-establish the orthodox faith. This activity extended to wider and wider areas, and enterprises were even set on foot to regain England, Sweden and Russia for the Church. This universal outburst of energy for the restoration of Catholicism, which only came to a standstill in the middle of the 17th century, found one of its most zealous promoters in Ugo Boncompagni—Gregory XIII., 1572-1585.

Pope Gregory XIII. Though not of an ascetic turn of mind, he showed unswervingly in the path of his predecessor by consecrating his energies to the transmission of the reformatory decrees into practice. At the same time he showed himself anxious to further the cause of ecclesiastical instruction and Catholic science. He created a special Congregation to deal with episcopal affairs, and organized the Congregation of the Index, instituted by Pius V. On behalf of the diffusion of Catholicism throughout the world he spared no efforts; and wherever he was able he supported the great restoration. He was especially active in the erection and encouragement of educational institutions. In Rome he founded the splendid College of the Jesuits; and he patronized the College Germanicum of St. Ignatius; while, at the same time, he found means for the endowment of English and Swiss colleges. In fact, his generosity for the cause of education was so unbounded that he found himself in financial difficulties. Gregory did good service, moreover, by his reform of the calendar which bears his name, by his emended edition of the Corpus juris canonici and by the creation of nunciatures. That he celebrated the night of St. Bartholomew was due to the fact that, according to his information, the step was a last resort to ensure the preservation of the royal family and the Catholic religion from the attacks of the revolutionary Huguenots. In his political enterprises he was pious, firm and, at the same time, he was also powerless to check the spread of brigandage in the papal state.

On the death of Gregory XIII., Felice Peretti, cardinal of Montalto, a member of the Franciscan order, ascended the Apostolic throne as Sixtus V. (April 1585—August 1590). His first task was the extirpation of the bandits and the restoration of order within the papal state. In the course of a year, the drastic measures of this born ruler made this state the safest country by Europe. He introduced a strictly ordered administration, encouraged the sciences, and enlarged the Vatican library, housing it in a splendid building erected for the purpose in the Vatican itself. He was an active patron of agriculture and commerce: he even interested himself in the draining of the Pontine marshes. The financial system he almost completely reorganized. With a boldness worthy of Julius II., he devised the most gigantic schemes for the annihilation of the Turkish Empire and the conquest of Egypt and Palestine. Elizabeth of England he wished to restore to the Roman obedience either by conversion or by force; but these projects were shattered by the destruction of the Spanish Armada. Down to his death the pope kept a vigilant eye on the troubles in France. Here his great object was to save France for the Catholic religion, and, as far as possible, to secure her position as a power of the first rank. This fundamental axiomatic of his policy he remained faithful throughout all vicissitudes.

In Rome itself Sixtus displayed extraordinary activity. The Pincian, the Esquiline, and the south-easterly part of the Caelian hills received essentially their present form by the creation of the Via Sistina, Felice, delle Quattro Fontane, di Sta Croce in Gerusalemme, &c.; by the buildings at Sta Maria Maggiore, the Villa Montalto, the reconstruction of the Lateran, and the aqueduct of the Felice, which partially utilized the Alexandrina and cost upwards of 300,000 scudi. The erection of the obelisks of the Vatican, the Lateran, the Piazza del Popolo and the aqueduct and the trimmings of Sta Maria Maggiore lent a lustre to Rome which no other city in the world could rival. The columns of Trajan and Antoninus were restored and bedecked with gilded statues of the Apostles; nor was this the only case in which the high-minded pope made the monuments of antiquity subservient to Christian ideas. His principal architect was Domenico Fontana, who, in conjunction with Guglielmo della Porta, completed the uniquely beautiful cupola of St Peter's which had already been designed by Michelangelo in a detailed model. In Santa Maria Maggiore the pope erected the noble Sistine Chapel, in which he was laid to rest. Indeed, the monumental character of Rome dates from this era. The organizing activity of Sixtus V. was not, however, restricted to the Eternal City, but extended to the whole administration of the Church. The number of cardinals was fixed at seventy-six bishops, fifty priests and fourteen deacons. In 1588 followed the new regulations with respect to the Roman Congregations, which henceforth were to be fifteen in number. Thus the pope laid the foundations of that wonderful and silent engine of universal government by which Rome still rules the Catholics of every land on the face of the globe.

When we reflect that all this was achieved in a single pontificate of but five years' duration, the energy of Sixtus V. appears truly astounding. He was, without doubt, by far the most important of the post-Tridentine popes, and his latest biography might well say that he died overwhelmed with services to the Church and to humanity.

(L. v. P.)

IV.—Period from 1590 to 1670.

The history of the papacy from 1590 to 1670 falls into four main periods: (1) 1590—1648; territorial expansion, definitely checked by the peace of Westphalia; (2) 1648—1780; waning prestige, financial embarrassments, futile reforms; (3) 1780—1814; revolution and Napoleonic reorganization; (4) 1814—1870; restoration and centralization. The most important of the post-Tridentine popes, and his latest biography might well say that he died overwhelmed with services to the Church and to humanity.

1. 1590—1648. The keynote of the counter Reformation had been struck by the popes who immediately preceded this period. They sought to reconquer Europe for the Roman Catholic Church. In the overthrow of the Spanish Armada they had already received a great defeat; with the Peace of Westphalia the Catholic advance was baffled. Sixtus V. was succeeded in rapid succession by three popes: Urban VII., who died on the 27th of September 1590, after a papacy of only 12 days; Gregory XIV. (Dec. 1590 to Oct. 1591); Innocent IX. (Oct. to Dec. 1591).

The first noteworthy pontiff of the period was Clement VIII., who gained a vast advantage by allying the papacy with the rising power of France. Since 1550 the popes had been without exception in favour of Spain, which, firmly possessed of Milan on the north and of Naples
on the south, held the States of the Church as in a vice, and thereby dominated the politics of the peninsula. After Henry IV. had taken Paris at the price of a mass, it became possible for the popes to play off the Bourbons against the Habsburgs; but the transfer of favour was made so gradually that the opposition of the papacy to Spain did not become open till just before Clement VIII. passed off the stage. His successor, Leo XI., undisguisedly French in sympathy, reigned but twenty-seven days—a sorry return for the 300,000 ducats which his election is rumoured to have cost. Henry IV. Under Paul V. Rome was successful in some minor negotiations with Savoy, Genoa, Tuscany and Naples; but Venice, under the leadership of Paolo Sarpi (q.v.), proved unbending under ban and interdict: the state defiantly upheld its sovereign rights, kept most of the clergy at their posts, and expelled the recalcitrant Jesuits. When peace was arranged through French mediation in 1609 the papacy had lost greatly in prestige: it was evident that the once terrible interdict was antiquated, wherefore it has never since been employed against the entire territory of a state.

During the second and third decades of the 17th century the most coveted bit of Italian soil was the Valtelline. If Spain could gain this Alpine valley her territories would touch those of Austria, so that the Habsburgs north of the Alps could send troops to the aid of their Spanish cousins against Venice, and Spain in turn could help to subdue the Protestant princes of Germany in the Thirty Years’ War (1618–1648). From the Grisons, who favoured France and Venice, Spain seized the Valtelline in 1620, incrementally uprooting heresy there by the massacre of six hundred Protestants. Paul V. repeatedly lamented that he was unable to dispose such Spanish aggressions without extending protection to heretics. This scruple was, however, not shared by his successor, Gregory XV., who secured Gregory XV., the consent of the powers to the occupation of the Valtelline by papal troops, a diplomatic victory destined, however, to lead ere long to humiliation. Gregory’s brief but notable pontificate marks nevertheless the high-tide of the counter Reformation. Not for generations had the prospects for the ultimate annihilation of Protestantism been brighter. In the Empire the collapse of the Bohemian revolt led ultimately to the merciless repression of the Evangelicals in Germany, finally manifested itself in 1629, when the imperial camp of Henry IV., after Paul V’s, was checkmated by the most stringent regulation of his Roman Catholic subjects, was now dazzled by the project of Spanish marriage. The royal dupe was the last man in the world to check the advance of the papacy. That service to Protestantism was performed by Catholic powers jealous of the preponderance of the Habsburgs. In view of these antipathies the treaty of 1627 between France, Spain and the pope is but an episode: instructive, however, in that the project, originated apparently by the pope, provided that England should be dismembered, and that Ireland should be treated as a papal fief. The true tendency of affairs manifested itself in 1629, when the imperial camp of Henry IV., Alexander VII. (1647–1665), at the zenith of his fortunes, forced the Protestant princes of Germany to restore to the Roman hierarchy all the ecclesiastical territories they had secularized during the past seventy-four years. Then France, freed from the fear of domestic enemies, arose to help the heretics to harry the house of Habsburg. Arranging a truce between Poland and Sweden, she unleashed Gustavus Adolphus. Thus by diplomacy as well as by force of arms Catholic France made possible the continued existence of a Protestant Germany, and helped to create the balance of power between Catholic, Lutheran and Reformed within the Empire, that, crystallized in the Peace of Westphalia, fixed the religious boundaries of central Europe for upwards of two centuries.

If it was Richelieu and not the pope who was the real arbiter of destinies from 1624 to 1642, Urban VIII. was usually content. In Italy he supported France against Spain in the War of the Spanish Succession, and the effort of the Habsburgs by plotting for a time to carry the next imperial election in favour of Bavaria. He is said to have rejoiced privately over Swedish victories, and certainly it was unerring instinct which told him that the great European conflict was no longer religious but dynastic. Anti-Spanish to the core, he became the greatest papal militarist since Julius II.; but Tuscany, Modena and Venice checkmated him in his ambitious attempt to conquer the duchy of Parma. Like most of the papal armies of the last three centuries, Urban’s troops distinguished themselves by wretched strategy, cowardice in rank and file, and a Fabian avoidance of fighting which, discreet as it may be in the field of diplomacy, has invariably failed to save Rome on the field of battle.

The States of the Church were enlarged during this period by the reversion of two important fiefs—namely, Ferrara (1598) and Urbino (1631). Increase of territory, so far from filling the papal treasury, but postponed for the moment the progressive pauperization of the people. After annexation, the city of Ferrara sank rapidly from her perhaps artificial prosperity to the dead level, losing two-thirds of her population in the process. The financial difficulties of Italy were due to many causes, notably to a shifting of trade routes; but those of the papal states seem caused chiefly by misgovernment. Militarism may account for much of the tremendous deficit under Urban VIII.; but the real cancer was nepotism. The disease was inherent in the body politic. Each pope, confronted by the spectacle of feudal anarchy, felt he could rely truly only on those utterly dependent on himself; consequently he raised his own relations to wealth and influence. This method had helped the House of Valois to consolidate its power; but what was tonic for a dynasty was death to a state whose headship was elective. Concessions to the tax farmers, the demand for English coal by the navy, the abuse of public funds, were measures of the next and each pontiff governed at the expense of his successors. Under Clement VIII. the Allobroges, more splendidly under Paul V. the Borghesi, with canny haste under the short-lived Gregory XV., the Lodovisi, with unparalleled rapacity Urban’s Barberini enriched themselves from a chronically depleted treasury. To raise money offices were systematically sold, and issue after issue of the two kinds of monti-securities, which may be roughly described as government bonds and as life annuities, was marketed at ruinous rates. More than a score of years after the Barberini had dropped the reins of power Alexander VII. said they alone had burdened the state with the payment of 483,000 scudi of annual interest, a tremendous item in a budget where the income was perhaps but 2,000,000. For a while interest charges consumed 8% of the income of the government. Skillful refunding postponed the day of evil, but cash on hand was too often a temptation to plunder. The financial woes of the next period, which is one of decline, were largely the legacy of this age of glory.

The common people, as always, had to pay. The farming of exorbitant taxes, coupled with the too often with dishonest concessions to the tax farmer, made the over-burdened peasantry drink the doubly bitter cup of exploitation and injustice. Economic distress increased the number of highway robberies, these in turn lambed commercial intercourse.

The tale of these glories, with their attendant woes, does not exhaust the history of the papacy. Not as diplomats, not as governors, but as successive heads of a spiritual kingdom, did the popes win their grandest triumphs. At a time when the non-Catholic theologians were chiefly small fry, bent on
Controversial and Triumphant. The Papacy, as the unity of the faith in France and in the Catholic states of Germany services of transcendent merit, exceeding far in importance those of their flourishing allies, the Inquisitions of Spain, Italy, and of the Spanish Netherlands (see JESUITISM). But the position in which the mental spiritual progress of the papacy was made by its devoted missionaries. While the majority of Protestant leaders left the conversion of the heathen to some remote and inscrutable interposition of Providence, the Jesuits, Franciscans, Dominicans and kindred orders were busily engaged in making Roman Catholics of the nations brought by Oriental commerce or American colonial enterprise into contact with Spain, Portugal and France. Though many of the spectacular triumphs of the cross in Asia and Africa proved to be evanescent, nevertheless South America stands the impressive memorial of the greatest forward movement in the history of the papacy: a solidly Roman continent.

2. 1648-1789. From the close of the Thirty Years' War to the outbreak of the French Revolution the papacy suffered abroad waning political prestige; at home, progressive financial embarrassment accompanied by a series of inadequate governmental reforms; and in the world at large, gradual diminution of reverence for spiritual authority. From slow beginnings these factors kept gaining momentum until they compassed the overthrow of the mighty order of the Jesuits, and culminated in the revolutionary spoliation of the Church.

At the election of Innocent X. (1644-1655) the favour of the Curia was transferred from France, where it had rested for over forty years, to the House of Habsburg, where it remained, save for the brief reign of Clement IX. (1667-1669), for half a century. The era of tension with France coincides with the earlier years of Louis XIV. (1643-1715); its main causes were the Jansenist and the Gallican controversies (see Jansenism and Gallicanism). The French crown was willing to sacrifice the Jansenists, who disturbed that dead level of uniformity so grateful to autocrats; but Gallicanism touched its very prerogatives, and was a point of honour which could never be abandoned outright. The regular controversy, which broke out in 1673, led up to the famous declaration of the Gallican clergy of 1682; and, when aggravated by a conflict over the immunity of the palace of the French ambassador at Rome, resulted in 1688 in the suspension of diplomatic relations with Innocent XI., the imprisonment of the papal nuncio, and the seizure of Avignon and the Venaissin. So pronounced an enemy of French preponderance did Innocent become that he approved the League of Augsburg, and was not sorry to see the Catholic James II., whom he considered a tool of Louis, thrust from the throne of England by the Protestant William of Orange. Fear of the coalition, however, led the Grand Monarch to make peace with Innocent XII. (1691-1700). The good relations with France were but a truce, for the Bourbon powers became so mighty in the 18th century that they practically ignored the territorial interests of the papacy. Thus Clement XI. (1700-1721), who espoused the losing Habsburg side in the War of the Spanish Succession, saw his nuncio excluded from the negotiations leading to the Peace of Utrecht, while the lay signatories disposed of Sicily in defiance of his alleged lordship. Similarly Clement XII. (1730-1740) looked on impotently when the sudden Bourbon conquest of Naples in the War of the Polish Succession (1734-1735) brought his claims to feudal sovereignty, and established Tannucci as minister of justice, in position in which, for forty-three years he regulated the relations of church and state after a method most repugnant to Rome. No better fared Clement's medieval rights to Parma; nor could the sagacious and popular Benedict XIV. (1740-1758), who refused to press obsolete claims, either keep the foreign armies in the War of the Austrian Succession from trespassing on the States of the Church or prevent the ignoring at the Peace of Aix-la-Chapelle of the papal lordship over Parma and Piacenza. In fact, since the doctrinaire protest of Innocent X. against the Peace of Westphalia, at almost every important settlement of European boundaries the popes had been ignored or otherwise snubbed. Not for two centuries had the political prestige of the papacy been lower. Moreover, a feeling of revulsion against the Jesuits was sweeping over western Europe: they were responsible for the inauguration of the most baneful principles, political, intellectual, moral; and though Clement XIII. (1758-1769) protected them against the pressure of the Bourbon courts, his successor Clement XIV. (1769-1774) was forced in 1773 to disband the army of the Black Pope (see JESUITS). The sacrifice of these trusted soldiers failed however to stave the thirst of the new age. Pius VI. (1775-1799), was treated with scant respect by his neighbours. Naples refused him tribute; Joseph II. of Austria politely but resolutely introduced fundamental Gallican reforms ("Josephism"); in 1786 at the Synod of Pistoia (q.v.) Joseph's brother Leopold urged similar principles on Tuscany, while in Germany the very archbishops were conspiring by the Punctation of Emis to aggravize themselves like true Febronians, at the expense of the pope (see FEBRONIANISM). These aggressions of monarchy and the episcopate were rendered vain, outside the Habsburg dominions, by the revolution; and to the Habsburg dominions the clerical revolution of 1790 caused the loss of what is to-day Belgium. However, the deluge which shattered the opposition to Rome in the great national churches submerged for a time the papacy itself.

In the States of the Church, during the first part of the period the outstanding feature in the history of the Temporal Power is the overthrow of nepotism; in the second, a dull conflict with debt. The chief enemies of nepotism were Alexander VII. (1655-1667), who dignified the secretariat of state and gave it its present pre-eminence by refusing to deliver it up to one of his relations; and Innocent XIII. (1691-1700), whose bull Romanum decret potestatem ordered that no pope should make more than one nephew cardinal, and should not grant him an income over twelve thousand scudi. Thus by 1700 nepotistic plunder had practically ceased, and with the exception of the magnificent peculations of Cardinal Casia under Benedict XIII. (1724-1730), the central administration of finance has been both honest and honest. Nepotism, however, still left its scars upon the body politic, shown in the progressive decay of agriculture in the Campagna, causing Rome to starve in the midst of fertile but unyielded nepotistic latifundia. The fight against the legacy of debt was slower and more dreary. One pope, Innocent XI. (1676-1689), threatened at first with bankruptcy, managed to leave a surplus; but this condition, the product of severe economy and oppressive taxation, could not be maintained. In the 18th century it became necessary to resort to fiscal measures which were often harmful. Thus Clement XI., at war with Austria in 1708, debarred the currency; Clement XII. (1730-1740) issued paper money and set up a government factory for communicating with all subjects who put their money into the lotteries of Genoa or Naples; Benedict XIV. (1740-1758) found stamped paper a failure; and Clement XIII. (1758-1760) made a forced loan. The stoppage of payments from Bourbon countries during the Jesuit struggle brought the annual deficit to nearly 500,000 scudi. Under Pius VI. (1775-1799) the emission of paper money, followed by an unsuccessful attempt to market government securities, produced a panic. By 1783 the taxes had been farmed for years in advance and the treasury was in desperate strait. Retrenchment offered the best and wise reforms shattered the independence or corruption of officials. Grand attempts to increase the national wealth usually cost the government more in fixed charges of interest than they yielded in rentals or taxes. The States of the Church, like France, were on the brink of bankruptcy. From this disgrace they were saved by a more imminent catastrophe—the Revolution.
The revolt against spiritual authority belongs rather to the history of modern thought than to that of the papacy. The Renaissance and Protestantism had their effect in producing that Enlightenment which swept over western Europe in the 18th century. Although Descartes died in 1650 in the communion of the Church, his philosophy contained seeds of revolt; and the sensationalism of Voltaire, and still further stirred the准备的 way for revolution. In an age when Voltaire preached toleration and the great penologist Beccaria attacked the death-penalty and torture, in the States of the Church heretics were still liable to torture, the relapsed to capital punishment; and in a backward country like Spain the single reign of Philip V. (1700-1746) had witnessed the burning of over a thousand heretics. If ecclesiastical authority fostered what was commonly regarded as intolerant obscurantism, to be enlightened meant to be prepared in spirit for that reform which soon developed into the Revolution.

The Papacy and the Revolution.

In the decade previous to the outbreak of the French Revolution the foreign policy of Pius VI. had been directed chiefly against decentralization, while his chief aim at home was to avoid bankruptcy by increasing his income. From 1789 on the French situation absorbed his attention. France, like the States of the Church, was facing financial ruin; but France did what the government of priests could not: namely, saved the day by the confiscation and sale of ecclesiastical property. It was not the aim of the Constituent Assembly to pauperize or annihilate the Church; it purposed to reorganize it on a juster basis. These reforms, embodied in the Civil Constitution of the Clergy, were part of the new Fundamental Law of the kingdom. The majority of the priests and bishops refused to swear assent to what they held to be an invasion of the divine right of the hierarchy, and after some months of unfortunate indecision Pius VI. (1775-1790) formally condemned it. Thenceforward France treated the papacy as an iminenal power. The sudden toleration of the non-juring priests changed into sanguinary persecution. The harrying was halted in 1795; and soon after the directory had been succeeded by the consulate, the Catholic religion was re-established by the concordat of 1801. From 1790 on, however, the rising power of France had been directed against Rome. In September 1791 France annexed Avignon and the Vaucluse, thus removing for ever that territorial pawa with whose threatened loss the French monarchs had for centuries disciplined their popes. In 1793 Hugon de Bassville (q.v.), a diplomatic agent of France, was murdered at Rome, a deed not avenged until the Italian victories of Bonaparte. In the peace of Tolentino (Feb. 1797) the pope surrendered his claims to Avignon, the Venaisin, Bologna, Ferrara and the Romagna; he also promised to disband his worthless army, to yield up certain treasures of art, and to pay a large indemnity. Bonaparte believed that after these losses the temporal power would collapse of its own weight; but so peaceful a solution was not to be. During republican agitation at Rome the French general Duhot was killed, a French army advanced on the city, and carried the aged pontiff a prisoner of war to Valence in Dauphiné, where he died on the 20th of August 1799.

His successor Pius VII. (1800-1823), elected at Venice on the 14th of the following March, soon entered Rome and began his reign auspiciously by appointing as secretary of state Erede Consalvi (q.v.), the greatest papal diplomatist of the 19th century. The political juncture was favourable for a reconciliation with France. In the concordat of 1801 the papacy recognized the validity of the sales of Church property in France and the Vaucluse, thus removing for ever that territorial pawa with whose threatened loss the French monarchs had for centuries disciplined their popes; it provided that the government should appoint and support the archbishops and bishops, but that the pope should confirm them; and France recognized the temporal power, though shorn of Ferrara, Bologna and the Romagna. The supplementary Organic Articles of April 1802, however, centralized the administration of the Church in the hands of the First Consul; and some of these one-sided regulations were considered by Rome to be minute and oppressive; nevertheless, the Napoleonic arrangements remained in force, with but brief exceptions, till the year 1805. The indignation of the pope and his advisers was not deep enough to prevent the ratification in 1803 of a somewhat similar concordat for the Italian Republic. In 1804 Pius consented to anoint Napoleon emperor, thus casting over a conquered crown the halo of legitimacy. The aura of good feeling was, however, soon ended by friction, which arose at a number of points. At length, in 1809, Napoleon annexed the papal states; and Pius, who excommunicated the invaders of his territory, was removed to France. The capture was, however, by no means powerless; by refusing canonical institution to the French bishops he involved the ecclesiastical system of Napoleon in inextricable confusion. After the return from Moscow the emperor negotiated with his prisoner a new and more exacting concordat, but two months later the repentent pope abrogated this treaty and declared all the official acts of the new French bishops to be invalid. By this time Napoleon was tottering to his fall; shortly before the catastrophe of Elba he allowed the pope to return to the States of the Church. Pius entered Rome amid great rejoicing on the 24th of May 1814, a day which marks the beginning of a new era in the history of the papacy. In September of the same year, by the bull Sollicitudo omnium ecclesiarum, he reconstituted the Society of Jesus.

Though the relations with France dominated the papal policy during the revolutionary period, the affairs of Germany received no small share of attention. The peace of Lunéville (1801) established the French boundary at the Rhine; and the German princes who thereby lost lands west of the river were indemnified by the secularization of ecclesiastical territories to the east. The scheme of readjustments, known as the Enactment of the Delegates of 1802, was part of the Empire (Reichs:putationshauptschluss) of 1803, secularized practically all the ecclesiastical states of Germany. Thus at one stroke there was broken the age-long direct political power of the hierarchy in the Holy Roman Empire; and the ultimate heir of the bulk of these lands was Protestant Prussia.

4. 1814-1870. The foreign policy of the papacy so long as conducted by Consalvi, or in his spirit, was supremely successful. From 1814 to 1830 Europe witnessed the restoration of the papacy as the representative of legitimate monarchy. The once exiled dynasties of the last three dynasties of the remaining old European dynasties, and both conservative powers made common cause against revolutionary tendencies. Throughout Europe the governing classes regarded this "union of throne and altar" as axiomatic. For the pope, as eldest legitimate sovereign and protagonist against the Revolution, Consalvi obtained from the Congress of Vienna the restitution of the States of the Church in practically their full extent. By concluding concordats with all the important Catholic powers save Austria he made it possible to crush Jansenism, Febronianism and Gallicanism. In June 1814 the pope, supported by a large force of French troops, entered Rome. The papal States were reassigned and their Church properties restituted; the new concordat of 1850 confirmed the Canons of 1801 and the Concordat of 1803 and made concessions to the papal temporal power. The pontificate of Gregory XVI. (1831-1846) was singularly infelicitous. The controversy with Prussia about the education of children of whose parents but one was Roman Catholic led to the imprisonment of Droste-Vischers, archbishop of Cologne, and later of Dunin, archbishop of Gnesen-Posen; but the accession of the royal romanticist Frederick William IV. in 1840 brought a pacific reversal of the Prussian policy, sometimes
judged more benevolent than wise. In France agitation was directed chiefly against the Jesuits, active in the movement to displace ancient local catechisms and liturgies by the Roman texts, to enroll the laity in Roman confinements, and to induce the bishops to visit Rome more frequently. To check this ultramontane propaganda the government secured from the papacy in 1835 the promise to close the Jesuit houses and novitiates in France.

In Italy, however, lay the chief obstacles to the success of all papal undertakings. The revolution of 1836, though somewhat tardily felt in the States of the Church, compelled the Gregory to rule his duchies in a new spirit. In return he was obliged to lend an ear to the proposals of France, and above all to those of Austria. This meant opposition to all schemes for the unification of Italy. In 1815 the Italian peninsula had been divided into seven small states. Besides the government of the pope there were three kingdoms: Sardinia, Lombardo-Venetia and Naples; and three duchies: Parma, Modena, Tuscany. To these regions the Napoleonic régime had given a certain measure of unity; but Metternich, dominant after 1815, held Italy to be merely a geographical term. To its unification Austria was the chief obstacle; she owned Lombardo-Venetia; she controlled the bank which the unity of the nation should run, she upheld the autocracy of the king of Naples and that of the pope against all revolutionary movements. To the Italian patriot the papacy seemed in league with the oppressor. The pope sacrificed the national aspirations of his subjects to his international relations as head of the Church; and he sacrificed their craving for liberty to the alliance with autocracy on which rested the continued existence of the temporal power. The dual position of the pope, as supreme head of the Church on earth and as a minor Italian prince, was destined to break down through its inherent contradiction; it was the task of Pius IX. to postpone the catastrophe.

The reign of Pius IX. falls into three distinct parts. Until driven from Rome by the republican agitation of 1848 he was a popular idol, open to liberal political views. From his return in 1850 to 1870 he was the reactionary ruler of territories menaced by the movement for Italian unity, and sustained only by French bayonets; yet he was interested primarily in pointing out to an often incredulous world that most of the vaunted, intellectual and religious progress of the 19th century was but pestilent error, properly to be condemned by himself as the infallible vicegerent of God. The third division of his career, from the loss of the temporal power to his death, is destined to run the task of Pius IX. to accomplish a unification of Italy.

At the outset of his reign he faced a crisis. It was clear that he could not continue the repressive tactics of his predecessor. The Papacy, Italy and Europe were at war with the Liberal agitation, which in 1848 culminated in the series of revolutions that by which the settlement of 1815 was destined to be profoundly modified. Liberal churchmen in Italy, while rejecting Mazzini's dream of a republic, had evolved projects for attaining national unity while preserving the temporal power. The exiled abbé Vincenzo Gioberti championed an Italian confederacy under the presidency of the pope; hand in hand with his followers he directed his effort to the unification of the faith. In allusion to medieval partisans of the papacy this theory was dubbed Neo-Guelphism. Towards such a solution Pius IX. was at first not unfavourably inclined, but the revolution of 1848 cured him of his Liberal leanings. In November of that year he fled in disguise from his capital to Gaeta, in the kingdom of Naples, and when French arms had made feasible his restoration to Rome in April 1850 he returned in a temper of stubborn resistance to all reform; henceforth he was no longer open to the influence of men of the type of Rossini or Rossini, but took the inspiration of his policy from Cardinal Antonelli and the Jesuits. The same pope who had signalized his accession by carrying out a certain number of Liberal reforms set his name in 1860 to the famous Syllabus, which was in effect a declaration of war by the papacy against the leading principles of modern civilization (see Syllabus).

As from 1849 to 1870 the fate of the papacy was determined not so much by domestic conditions, which, save for certain slight ameliorations, were those of the preceding reigns, as by foreign politics, it is necessary to consider the relations of Rome with each of the powers in turn; and in so doing one must trace not merely the negotiations of kings and popes, but must seek to understand also the aims of the parliamentary parties, which from 1848 on increasingly determine ecclesiastical legislation.

The chief ally of the papacy from 1849 to 1870 was France. The policy which made Louis Napoleon dictator forced him into mortal conflict with the republican parties; and to Louis Napoleon the price of the parliamentary support of the Catholic party and the majority was high. Even before Napoleon's election as president, Falloux, the Catholic leader, had promised to secure intervention in favour of the dispossessed pope. Napoleon, however, could not forget that as a young man he himself had vainly sought to obtain from Gregory XVI. those liberties which Pius IX. still refused to grant; he therefore essayed diplomacy, not arms. Nevertheless, to forestall the rescue of the pope by Austrian troops, he sent, in August 1849, an army corps under Oudinot to Civita Vecchia. By heading off reactionary Austria Napoleon hoped to conciliate the French Liberal party; he helped Oudinot to secure concessions to be wrung both from Pius and from the Roman triumvirs, to achieve a bloodless victory. As neither party yielded, Oudinot listened to his Catholic advisers, attacked Rome, with which the French Republic was technically at peace—and was roundly repulsed by Garibaldi. To relieve their inglorious predicament the ministry hurried the Liberal diplomatist, Ferdinand de Lesseps, to Rome to prevent further conflict. At the moment when Lesseps had secured the signing of a treaty with the Roman Republic permitting peaceful occupation of the city by the French army, he was peremptorily recalled and Oudinot was as unexpectedly ordered to take the city by storm. This amazing reversal of policy was procured by the intrigues of Catholic diplomatists and German Jesuits, conveyed to Paris by Prince de la Tour d'Auvergne. For the honour of the army and the Church republican France thereupon destroyed the Roman republic. Napoleon lost 1200 in dead and wounded, actually secured not a single reform on which he had insisted, and drew upon himself the fateful obligation to mount perpetual guard over the Vatican. As the catsawp of clerical reaction he had also to acquiesce in that "Roman campaign at home" that resulted in the Falloux Act of 1850, which in the name of liberty mortally education and the training of priests by under clerical control, made it ominously easy for members of religious congregations to become instructors of youth, and cut the nerve of the communal school system. That education was delivered up to the Church was partly the result of the terror inspired in the middle classes by the socialist upheavals of 1848. The bourgeoisie sought the support of the clergy, and religion became as fashionable among them as it had been among the nobility after 1793. Religion was thought to be part of fashionable education; and the training of priests by almost exclusively into the hands of the religious orders and congregations. So long as the alliance of the autocratic empire and the clergy lasted (1852-1860), intellectual reaction reigned; the university professorships of history and philosophy were suppressed. This alliance of the empire with the clergy was shaken by the Italian War of 1859, which resulted in the loss by the pope of two-thirds of his territories. Napoleon was evidently returning to the traditions of his youth, and in the September Convention of 1861 it looked as if he would abandon Rome to its manifest destiny. This solution was spoiled by the impatience of Garibaldi and the supineness of the Romans themselves. In 1867 Napoleon made himself once more guardian of the Holy See; but the wonders wrought by the new French chasseurs at the battle of Montesta cost the friendship of Italy. Thereafter Napoleon was blindly staggering to his fall. He
PAPACY
aimed at honour in upholding the pope, in driving the Austrian tyrant from Italy, in attacking Prussia. The Austrian support on which he relied confidently in 1870 proved delusive, for he could obtain nothing from Austria unless he had Italy with him, and nothing from Italy without the evacuation of Rome. Even after the war with Prussia had actually broken out he refused Italy, and still more so the Austrian support; the price of the abandonment of the city, a step which he nevertheless eventually took, was paid far too late. With Napoleon fell the temporal power; but the French hierarchy still kept his gifts in the shape of the congregations, the pro-Catholic colonial policy, and a certain control of education. Of these privileges the Church was to be deprived a generation later. The Third Republic can never forget that it was to the support of the temporal sovereignty of the pope that Napoleon III. owed his empire and France her deepest humiliation.

On the withdrawal of the French garrison Rome was occupied by the troops of Victor Emmanuel. This monarch had always been a thorn in the side of the papacy. Under him occupation of Sardinia had adopted the Siccardi Laws of 1850, which had taken away the right of asylum and the jurisdiction of the Church over its own clergy. His reputation for sacrilege, increased five years later by the abolition of many monasteries, became notorious when the formation of the kingdom of Italy (1861) took away all the dominions of the pope except the patrimony of Peter, thereby reducing the papal provinces from twenty to five, and their population from over 3,000,000 to about 635,000. This act was followed in 1867 by the confiscation of church property, and on the 20th of September 1870 by the triumphant seizure of Rome.

If for France was the right arm and Italy the kingly arm of the papacy under Pius IX., the Spanish-speaking countries were its obedient tools. Torn by civil wars, their harassed rulers sought papal recognition at a cost which more experienced governments would have refused. Thus Isabella II. of Spain in the concordat of 1851 confirmed the exclusive privileges of the Roman religion and gave the control of all education to the Church; but after the Revolution of 1868 Spain departed for the first time from the principle of the unity of the faith by establishing liberty of worship, which was, however, a dead letter. On the Spanish model concordats were arranged with various Central and South American republics, perhaps the most ironclad being that concluded with Ecuador in 1862 (abrogated 1878).

Among the more stable governments of Europe reaction in favour of conservatism and religion after 1848 was used by clerical parties to obtain concordats more systematic and thoroughgoing than had been concluded even after 1814. Austria, for instance, although long the political mainstay of the papacy, had never abandoned the broad lines of ecclesiastical policy laid down by Joseph II.; but the young Francis Joseph, seeking the aid of Rome in curtailing heterogeneous nationalities, in 1855 negotiated a concordat whose paragraphs regarding the censorship, education and marriage were far-reaching. It was, moreover, the first document of the sort in which a first-class power recognized that the rights of the Church are based upon "divine institution and canon law," not upon governmental concession. Violated by the Liberal constitution of 1867, which granted religious liberty, depotentiated by laws setting up lay jurisdiction over matrimonial cases and state control of education, it was abrogated in 1870 by Austria, who alleged that the proclamation of papal infallibility had so altered the status of one of the contracting parties that the agreement was void only twenty days too late.

Passing over Portugal, the remaining European state which is Roman Catholic is Belgium. Torn from Austria by the clerical revolution of 1790, after many vicissitudes it was united in 1815 with Holland and placed under the rule of the Protestant William I., king of the United Netherlands. The constitutional guarantee of religious liberty had from the outset been resisted by the powerful and resolute priesthood, supported by numerous sympathizers among the nobility. As the arbitrary king alienated the Liberal Catholics, who were still more or less under the spell of the French Revolution, the Catholic provinces took advantage of the upheavals of 1830 to form the independent kingdom of Belgium. Its Fundamental Law of 1831, conceived in the spirit of the English Whigs, and later imitated in the European countries, granted liberty of worship and of education. Strangely enough, this liberty meant increase of power for the Clericals; for besides putting an end to stringent state interference in the education of future priests, it made possible a free and far-reaching Catholic school system whose crown was the episcopally controlled university of Louvain (1834). The Education Act of 1842 led to the formation of the Liberal party, whose bond of union was clericalism, whose watchword was the "independence of the civil power." The Catholics and Liberals were alternately in control until 1894, when the tenfold enlargement of the electorate broke down the Liberal party completely. The chief theme of contention, developed through many a noteworthy phase, has been the question of schools. In the half-century from 1850 to 1880 the cloisters likewise prospered and multiplied fivefold. The result of this evolution is that Belgium is to-day the most staunchly Catholic land north of the Alps.

In Holland, as in Belgium, the education question has been uppermost. Here, even after 1831 the Roman Catholics constituted three-eighths of the population. Allied with the Liberals against the orthodox Protestants, who were threatening religious liberty, the Catholics assisted in 1857 to establish a system of non-sectarian state schools, where attendance is not obligatory nor instruction gratuitous. Changing front, in 1868, in league with the orthodox, they tried to make the system international; but as the Liberals defeated their attempt, they founded schools of their own.

In the non-Catholic countries of Europe during the reign of Pius IX., and in fact during the whole 19th century, the important gains of Rome were in strategic position rather non- than in numbers. The spread of toleration, which always favours minorities, broke down between 1815 and 1873 the Lutheran exclusiveness of Norway, Denmark and Sweden; but as yet the Catholics form a disappearing fraction of the population. In European Russia, as a result of the partitions of Poland under Catherine II. (1762-1766), about one-tenth of the people are Roman Catholics. The Ruthenians had united with Rome at Brest in 1596, forming a group of Uniates distinct from the Poles, who belonged to the Latin rite. In spite of the assurances of Catherine, Russia has repeatedly persecuted the Ruthenic Uniates, in order to incorporate them into the Holy Orthodox Church; and she has occasionally taken drastic measures against the Poles, particularly after the revolts of 1830 and 1863. After more than a century of repression in 1903 the Edict of Toleration brought some relief.

The remarkable extension of the Catholic hierarchy by Pius IX. into Protestant lands, legally possible because of toleration, was in some cases made practicable because of immigration. Though this factor was perhaps not prominent in the case of Holland (1853) or Scotland (1878) it was Irish immigration which made it feasible in England (1850). For a time the Roman propagandists in England, which drew itself to High Churchmen like Newman and Manning, was viewed with apprehension; but though the Roman Catholic Church has grown greatly in influence in the country, the number of its adherents, in proportion to the growth of population, has not very greatly increased.

In the United States of America, however, the Catholic population has increased by leaps and bounds through immigration. The famines of the 'forties, with their subsequent political and economic difficulties, transferred to America millions of the Irish, whose genius for organization in politics has not fallen short of their zeal for religion. The German-speaking immigrants have also had a creditable share in the work of church extension, but the Italians have manifested no marked ardour for their faith. The losses in transplantation have been huge, but it is impossible to estimate them accurately, for even the
current figures for the Catholic population are based on detailed estimates rather than on an actual count. Summing up the history of the papacy from the Congress of Vienna to the fall of the temporal power, one finds statistical gains in Protestant countries offset perhaps by relative losses in Catholic lands, both largely due to the closely related forces of toleration and immigration. While the decline and depopulation on the State side of the papal church continued, their power, then, was steadily increasing; and the transition from autocracy to parliamentary rule accelerated this process, at least in non-Catholic territories. The unparalleled spread of ultramontane ideas (see Ultramontanism) brought about a centralization of authority at Rome such as would have appalled the 18th century. This centralization was, however, for the time not so much legal as doctrinal. In 1854 Pius IX. by his soli loci established a dogma (see Immaculate Conception); and the infallibility implied in this act was openly acknowledged in 1870 by the Council of the Vatican (see Vatican Council and Infallibility). Thus were the spiritual prerogatives of the papacy exalted in the very summer that the temporal power was brought low. (W. W. R. *)

V. — Period from 1870 to 1900.

The few months that elapsed between the 18th of July 1870 and the 18th of January 1871 witnessed four events that have been fraught with more consequence to the papacy than anything else that had affected that institution for the past three centuries. They were as follows: (1) The proclamation of the Inviolability of the Pope on the 18th of July 1870; (2) the fall of the Napoleonic empire and the establishment of the third French republic on the 4th of September 1870; (3) the occupation of Rome by the Italian forces on the 20th of September 1870, resulting in the incorporation of the remaining states of the Church in the kingdom of Italy; and (4) the foundation of the German Empire by the proclamation, on the 18th of January 1871, of the king of Prussia as hereditary German emperor. These changes, which so greatly disturbed the current of all European relations, could not fail to react upon the papal policy in various ways. They brought its existing tendencies into greater relief, set before it new aims and diverted it into new channels. Essential modifications could not, of course, be at once effected or even indicated in a power whose life-blood is tradition, and whose main strength has always lain in calmly abiding the issue of events and in temporizing. The eight years that Pius IX. was permitted to see after the loss of his temporalities entirely harmonize with this character. The veil that hides the negotiations which, during the closing months of the Franco-German War, were carried on between Bismarck and the pope, through the agency of Cardinal Bonnhose, has not yet been lifted, and perhaps never will be. According to the Prince Bismarck's own account of the matter, as given in his Gedanken und Erinnerungen, these negotiations were initiated by the chancellor, who, between the 5th and 9th of November 1870, entertained pourparlers with Archbishop Ledochowski on the question of the territorial interests of the pope. The chancellor, acting, as he himself says, in the spirit of the adage, “one hand washes the other,” proposed that prelate that the pope should give earnest of the relations subsisting between him and Germany by influencing the French clergy in the direction of the conclusion of peace. The cool reception his endeavours met with, both at the hands of the French ecclesiastics as well as in Rome, satisfied Bismarck “that the papal hierarchy lacked either the power or the good will to afford Germany assistance of sufficient value to make it worth while giving umbrage to both the German Protestants and the Italian national party, and risking a reaction of the latter upon the future relations between the two countries, which would be the inevitable result were Germany openly to espouse the papal cause in Rome.” These utterances are eminently characteristic. They show how far Bismarck was (even at the close of 1870) from comprehending the traditional policy of the papacy towards Germany and German interests, and how little he conceived it possible to employ the relations between the future empire and the Vatican as a point of departure for a successful and consistent ecclesiastical policy. Rome, in a certain sense, showed itself possessed of far greater foresight. The German politicians that the papal diplomat was accredited to Rome had worked too openly at undermining the papal hierarchy, and had veiled their sympathies for Piedmont too far lightly to lead the Vatican to expect, after the 20th of September 1870, a genuine and firm intervention on the part of Prussia on behalf of the temporal power of the Holy See. To satisfy the demands of Bismarck in November 1870 would have cost the Vatican more than it would ever have gained. It could neither afford to trifle with the sympathies of the French Catholics nor to interrupt the progress of those elements, which would naturally be a thorn in the side of the young German Empire, thus undo Bismarck's work and restore the Vatican policy to its pristine strength and vigour. It was soon to be perceived how carefully the Curia had made its calculations.

The address of the Catholic deputies to the emperor William in Versailles on the 18th of February 1871, pleading for the restoration of the States of the Church and the temporal sovereignty of the pope, and for the reconstitution of the Catholic group formed in the Prussian Landtag in 1860 as the Centrum or Centre Party in the new Reichstag (April 1871), must not be regarded as the origin but rather the immediate occasion of the Kulturkampf. The congratulations which the pope sent to the emperor William on receiving the announcement of the establishment of the German Empire (March 6, 1871) were a last exchange of civilities, and the abolition of the Catholic department in the Prussian ministry of public worship (July 8, 1871) quickly followed, together with the appointment of Falk as Kulturminister (Jan. 22, 1872), and the School Inspection Law of the 9th of February 1872.

On the 30th of January Bismarck took the opportunity of inveighing against the formation of the sectarian Centrum as being “one of the most monstrous phenomena in the world of politics,” and he left no room for doubt in the minds of his hearers that he regarded the leadership of Windthorst as constituting, in his eyes, a peril to the national unity. In his Memoirs (ii. 126) he declares that the Kulturkampf was mainly initiated by him as a Polish question. This declaration, in view of the development of affairs, must appear as strange as the chancellor’s confession (Memoirs, ii. 129 seq.) that he endeavoured to persuade the emperor of the advantage of having a nuncio accredited to Berlin (in lieu of the Catholic department of public worship). The refusal of the emperor William to entertain this project shows that in such matters his judgment was more correct than that of his counsellor, and that Bismarck’s policy was a failure. He was drifting about with no higher aim than a “hand-to-mouth” policy, whilst the Holy See could feel the superiority with which the consciousness of centuries of tradition had endowed it, and took full advantage of the mistakes of its opponent. The chancellor never realized the gravity of the onslaught which, with his Kulturkampf, he was making upon the conscience and liberty of his Catholic fellow-citizens. He dealt with the great question at issue from the standpoint of the diplomatist, rather than from that of the statesman well versed in ecclesiastical history and possessing an insight into what it implies; and by his violent, inconsiderate action he unwittingly drove into the ranks of Ultramontanism the moderate elements of the Catholic population. This conflict, moreover, brought Ultramontanism the enormous advantage that, even after the abolition of the May Laws, it had still left to it a well-disciplined press, an admirable organization, and a network of interests and interested parties; and all these combined to make the Centrum the strongest and the most influential political party in Germany for the remainder of the 19th century. Owing to these circumstances, the rise and further development of the
The PAPACY [1870-1900]

Kulturkampf were viewed in Jesuit and Vatican circles with feelings of the utmost complacency.

The purely ecclesiastical policy of Pius IX. was guided by the earnest desire to see the doctrine of Papal Infallibility brought to universal recognition. The definition of the Immaculate Conception (1854) and the proclamation of the Syllabus (1864) were finger-posts pointing the way to the Council of 1870. The pope had been persuaded that the proclamation of the new dogma would be effected without difficulty and without discussion, and when he finally concurred in opposition, he was both surprised and embittered. For a moment the idea was entertained of giving way to the opposition and deferring a decision in the matter, or, in the manner of the fathers in the Council of Trent, adjourning it to the Greek kalends. But the party that needed for its purposes an infallible pope readily persuaded Pius IX. that if the council broke up without arriving at a decision favourable to the papacy, this would be tantamount to a serious defeat of the Holy See and an open victory for the Gallican system. The consequence was the bull Pastor aeternus, which Pius IX. issued on the 15th of July. This did not, however, remove all the danger of the Jesuits, for it was couched in terms which appeared not unacceptable to the majority of the Catholics. The fact that the bishops were prepared to forego their opposition was not unknown in Rome. It was anticipated by the authorities. But in Germany, as also in France, the waves of anti-Infallibility were rolling so high, that the further development of events was viewed with no small concern. Under normal conditions, the situation could not fall to terminate favourably for the Vatican. That the Kulturkampf had followed so rapidly upon the war was the greatest piece of good fortune that could have befallen the Holy See. The war disarmed both in Germany and France the sacrifice of all available energy and public spirit; while the Kulturkampf, by bringing into relief the question of the external existence of the Church, thrust all internal dogmatic interests and problems completely into the background. The egregious blunder in the May Laws was the punitive clauses directed against the inferior clergy. Instead of enlisting them as friends, the Prussian government contrived by wild and wanton persecution to make them its enemies. The open protection it accorded to the Old Catholic movement contributed in no small measure to estrange the heart of the people to the cause of Ultramontane tendencies, desired no schism in the Church, and viewed with horror the idea of a National Church in Bismarck's sense (see OLD CATHOLICS). Thus we find that the bitter years of the Kulturkampf extricated the Vatican from one of the most difficult situations in which it had ever been placed. Pius IX. could now fold his hands, so far as the future was concerned. It is well known that he led on inspirations, and expected each day the advent of some supernatural occurrence which should bring about the triumph of the Church. In this frame of mind, on the 24th of June 1871, he addressed the German Lesevetein, and referred to the stone that would soon fall from on high and crush the feet of the Colossus. Yet the stone has not fallen from the summit of the holy hill, and the Colossus of the German Empire has not crumbled into dust, which is more than can be said for the pope's inspirations, which led him to expect the sudden withdrawal of the Italians from Rome, and a solution of the Roman question in the sense inspired by his visionary policy. The Holy See directed all its energies towards the solution of the problem; in the event of its proving to be insoluble, it would take care that it should remain a festering sore in the body of the Church. (For the Kulturkampf see further HISTORICAL HISTORY.)

The documents of the Vatican Council which have been published since 1870 leave no room for doubt that the proclamation of Papal Infallibility was intended to be followed by a further declaration, to the effect that the doctrine of the temporal power of the pope should be regarded as a revealed article of faith; yet the advantage and necessity of the temporal power were not to be regarded as a revealed dogma properly speaking, but as a truth guaranteed by the doctrinal body of the Holy Church. These articles, contained in the 4th Scheme, and zealously championed by the sectaries of the Jesuit order, reveal the immediate object for which the council of 1869-1870 was convened. The resolutions were devised to save the situation, in view of the impending loss of the temporalities. No one could expect that Pius IX. would recognize the annexation of Rome by Italy. Rome, even in the 19th century, had been a spectator of many changes in the political world. It had seen more than one kingdom rise and fall. No wonder, then, that Pius IX. did not subscribe to any illusion of anti-infallibility, and, with a passive and expectant attitude, and sanctioned not a new jott or title that could infringe its rights or be interpreted as a renunciation of its temporal sovereignty. It was quite in keeping that Pius IX. avoided himself to the full of the (for him) convenient clauses of the Italian Law of Guarantees (May 13, 1871), while refusing the civil list of three and a quarter million lire provided for his use, and inhibiting Italian Catholics from participating in the elections to the House of Deputies (ne elettori ne deputati). This step was regarded in Italy as a natural one. Although the Liberal record of the pope was a third of the Papal policy had, since Gaeta, become firmly identified with the reactionary policy of Antonelli, yet the early years of his pontificate were in such lively recollection as to allow of Pius IX.'s appearing to some extent in the light of a national hero. And rightly; for he had always had a warm heart for Italy; and had it not been for the anti-ecclesiastical policy of the house of Piedmont, he would not, in the 'sixties, have been wholly averse from reconciliation. The hitherto unpublished correspondence of the pope with Victor Emmanuel contains remarkable proofs in support of this contention, and a further corroboration can also be perceived in the conciliatory attitude of Pius IX. on the death of the king.

Pius died on the 7th of February 1878, only a few weeks later than his opponent. He had long passed the traditional years of Peter's pontificate, had reigned longer than any previous wearer of the tiara, and had seen some brilliant days—days of illusory glory. On his death he left the Church shaken to its very foundations, and in feud with almost every government. In Italy the Holy See was surrounded by a hostile force, whose 'prisoner' is the lord of the Vatican declared himself to be. In Spain and Portugal, and also in Belgium, a Liberalism inimical to the papacy was in arms against pope and episcopate. In France the Conservative Monarchical party had just shown its inability to preserve the Crown, whilst the Republic had anchored itself firmly by denouncing the clergy as its enemy. There was hardly a sovereign or a government in Christendom against which Pius IX. had not either protested or against which he had not openly declared war. Such was the heritage that devolved upon Leo XIII. on his election on the 20th of February 1878.

Leo XIII. brought to his new dignity many qualities that caused his election to be sympathetically received. In contrast to his predecessor, he was a man of slow and calm deliberation, and it was natural to suppose that he was little, if at all, accessible to impulses of the moment or to the persuasions of his entourage. He was endowed with a certain scholastic erudition, and enjoyed the reputation of being a good Latinist. As nuncio in Brussels he had become acquainted with the trans-Alpine world, and had been initiated into the working of the machinery of modern politics and modern parliamentary government. The fact that he had for so long been absent from Rome afforded ground for the belief that he was not inclined to identify himself with any of the parties at the Vatican court. These were the considerations that had caused

1 By the Law of Guarantees the pope was recognized as an independent sovereign, with jurisdiction over his own palaces and their extensive precincts and the right to receive diplomatic representatives accredited to him. He also received the right to appoint bishops, who—except in Rome and the suburban districts—were to be elected subject to his canonization; the exceptions were the superior of the congregation, the place regius, and every form of government permission for the publication and execution of acts of ecclesiastical authority were abolished. (See also ITALIAN HISTORY.)
the Moderates in the Sacred College to fix their eyes upon him. The appointment of Franchi as secretary of state was a bid for peace that was viewed by the Irreconcilables with ill-disguised vexation. The following years of Leo XIII.'s pontificate only tended to increase their dissatisfaction. The first care of the new pope was to pave the way for the restoration of peace with Russia and the German Empire, and it was owing to his patience, persistence and energy that these efforts for peace were crowned with success. In the case of Germany he made many concessions which appeared to the Zurante to be excessive, and made even still greater ones to France and Russia, to the great disgust of the Poles. But at last Leo XIII. could boast not only of having re-established diplomatic relations with most of the powers, but also of having entered into a convention with the great powers of the North, which accorded him, in conjunction with the three emperors, a leading position as champion of the conservative interests of humanity. How proud Leo XIII. was of his importance in this position is shown by the beautiful encyclical, De civitate constituione christianae ("Immortale Dei" of Nov. 1, 1883), in which he adopted the strongest attitude against the principle of the sovereignty of the people (ex tue autem Pontificia praeambulis illud omnino intelligi necesse est, ortum publica potestas a Deo ipso, non a multitudine repeti posse), refuting the notion that the principle of public power emanates from the will of the people alone (principatum non esse nisi populi voluntatem), and absolutely rejecting the sovereignty of the people as such. But this attitude was adopted by Leo XIII. not as an end but as a means. The real aims of his rule were disclosed in the second phase of his pontificate.

At its very commencement, the pope in his first encyclical (Easter 1878) proclaimed the necessity of a temporal hierarchy. This was at the time regarded merely as a formality imposed by circumstances, and one not to be seriously entertained; but it became more and more evident that the recovery of the temporalities was the real mainspring of Leo's whole policy. In the negotiations with Germany, it was clearly seen that it was from that side that the pope expected intervention in favour of restitution; and, according to all appearances, Bismarck did for a while keep alive these representations, though with more tact than candour. After peace had been concluded, Leo, by the agency of Galimberti, reminded the chancellor of the settlement of the Roman question. Bismarck replied that he was "unaware of the existence of any such question." The two visits paid by Leo to William II. in the Vatican could not fail to remove any doubts in the mind of the pope as to the fact that Germany never dreamt of giving him back Rome. The Austro-German-Italian triple alliance was a dire blow to his expectations, and Crispi's policy with its irritating and galling pin-pricks caused the cup to overflow.

Thus slowly, but yet deliberately, between 1887 and 1893, a transformation took place in Leo's spirit and policy, and with the moderate in power. The result was the policy of the Ralliement. Instructions were given to the French Catholics to break with monarchical principles, and both externally and internally to cleave to the Republic as representing the best form of constitutional government. In carrying out the régime of Rampilta, which was, in every respect, a bad imitation of that of Antonelli, the Vatican left no stone unturned in its attempt to coerce the conscience of the French royalists; it did not even stop at disgrace, as was evidenced by the case of the unhappy Mgr d'Hulst, who, in order to evade the censorship of his pamphlet on Old Testament criticism, had to abandon both his king and his principles, only to die in exile of a broken heart. The case was characteristic of the whole Catholic monarchical party, which, owing to the pope's interference in French politics, became disintegrated and dissolved, a fate that was all the more painful seeing that the Ralliement failed to influence the course of events. The 'athletic' Republic did not for one moment think of putting on sackcloth, or even of giving the Church a single proof of esteem and sympathy.

In one respect it was impossible for the papacy to continue on the path it had taken. In his first encyclical, Leo XIII. had sounded the clarion for battle against the Social Democrats; his encyclical, the "Immortale Dei" failed to devour him to the show the means to be employed, mainly in view of the condition of things in Belgium, for solving the social question on Christian lines. But the Christian Democracy, which, starting in Belgium and France, had now extended its activity to Italy, Austria and Germany, and was striving to arrive at this solution, degenerated everywhere into a political party. The leaders of this party came into close contact with the Social Democrats, and their relations became so cordial that Social Democracy everywhere declared the "Démocratie Chrétienne" to be its forerunner and pioneer. The electioneering alliances, which were everywhere in vogue, particularly in Germany, between the Catholics and popular party and the Social Democrats, throw a lurid light upon the character of a movement that certainly went far beyond the intentions of the pope, but which it was now difficult to undo or to hold in check. For it is the essence of the matter that there were further considerations going far beyond the Roman question and forcing the Curia to adhere to the sovereignty of the people.

The external rehabilitation of the Church had become, in many points, a fait accompli, but, internally, events had not kept pace. Catholicism had been driven away in France, as it had in Germany. "Liberal and Educated Middle Class," which was its offspring, had died with Montalembert, after being placed under a ban by Rome. The national religious movement, associated in Italy with the great names of Rosmini and Gioberti, had similarly been disavowed and crushed. The development of the last decade of the 19th century had clearly shown that the educated bourgeoisie, the tiers état, in whose hands the supreme power had since 1848 become vested throughout Europe, was either entirely lost to the Church or, at all events, indifferent to what is called the Catholicism. The educated bourgeoisie, which controls the fields of politics, science, finance, administration, art and literature, does not trouble itself about that great spiritual universal monarchy which Rome, as heir of the Caesars, claimed for the Vatican, and to which the Curia of to-day still cling. This bourgeoisie and the modern state that it upholds stand and fall with the motion of a constitutional state, whose magna carta is municipal and spiritual liberty, institutions with which the ideas of the Curia are in direct conflict. The more the hope of being able to regain these middle classes of society disappeared, the more decidedly did the Curia perceive that it must seek the support and the regeneration of its power in the steadily growing democracy, and endeavour through the medium of universal suffrage to secure the influence which this new alliance was able to offer.

The pontificate of Leo XIII. in its first phase aimed at preserving a certain balance of power. Whilst not openly repelling
the tendencies of the Jesuits, Leo yet showed himself well disposed towards, and even amenable to, views of a diametri-
cally opposite kind; and as soon as the Vatican
threw itself into the arms of France, and bade fare-
well to the idea of a national Italy, the policy of
further conquest, which the Papacy's
equilibrium had to be abandoned. The second phase
in Leo's policy could only be accomplished with the aid of the
Jesuits, or rather, it required the submission of the ecclesiastical
hierarchy to the mandates of the Society of Jesus. Moreover:
the ultra-Catholic excesses of all kinds were subjected to the
thralldom of the Church. The pontificate of Leo XIII. is
distinguished by the great number of persecutions, prosecutions
and injuries inflicted upon Catholic savants, from the prosecution
of Antonio Rosmini down to the proscription directed against
the heads of the American Church. Episodes, such as
the protection so long extended to the Leo Taxil affair, and to the
revelations of Diana Vaughan (the object of which last was to
bring Italian freemasonry and its ostensible work, the unity of
Italy, into discredit), together with the attitude of the Ultra-
montans for as long as possible, to the Dreyfus affair, and later towards England,
the invigoration of political agitation by the Lourdes celebration
and by anti-Semitism, were all manifestations that could not
raise the “system” in the estimation of the cultured and civilized
world. Perhaps even more dangerous was the employment of the
whole ecclesiastical organization, and of Catholicism
in general, for political purposes.

No one will be so foolish or so unjust as to hold Leo XIII.
responsible for the excesses committed by the subordinate
departments of his government, in disclosing prosecuting and
sometimes even fraudulently misusing the Society of Jesus, and the
Church. But all these details, upon which it is not necessary to dwell,
are overshadowed beyond all doubt by the one great fact that
the ecclesiastical régime had not only taken under its wing
the solution of social questions, but also claimed that political
action was within the proper scope of the Church, and, moreover,
aggravated to itself the right of interfering by means of “ Direc-
tives” with the political life of nations. This was nothing new,
for as early as 1215 the English barons protested against it.
But the weakening of the popacy had allowed this claim to
lapse for centuries. To have revived it, and to have carried it
out to completion, was the work of Leo XIII.

It would be both presumptuous and premature to pass a final
verdict upon the value and success of a policy to which, whatever
else is heard, must be accorded a certain meed of praise for its
daring. Even in 1802 Späuler, in his essay upon Lamennais,
pointed out how the latest evolution of Catholicism was taking
the course indicated by Lamennais in his Livre du peuple (1837),
and how the hermit of “La Chénace,” who departed this life
in bitter strife with Rome, declared himself to be the actual
precursor of modern Christian Socialism. He hinted that the
work of Leo XIII. was, in his eyes, merely a new attempt to
build up afresh the theocracy of the middle ages upon the ruins
of the old monarchies, utilizing to this end the incompetence of the
young and easily beguiled democracies of the dawning 20th
century. To comprehend these views aright, we must first
remember that what in the first half of the 19th century, and
also in the days of Lamennais, was understood by Democracy
was not coincident with the meaning of this expression as it was
afterwards used, and as the Christian Socialists understood it.
Down to 1848, and even still later, Democracy was used to
cover the whole mass of the people, pre-eminently represented
by the broad strata of the bourgeoisie; in 1900 the Democratic
party itself meant by this term the rule of the labouring class
organized as a nation, which, by its numerical superiority,
threaten all other classes, including the bourgeoisie, and
excluded them from participation in its rule. In like manner
it would be erroneous to confuse the sense of the expression
as it obtains on the continent of Europe with what is under-
stood under this term in England and America. In this latter
case the term “Democracy,” as applied to the historical
development of Great Britain and the United States, denotes
a constitutional state in which every citizen has rights

 proportionate to his energy and intelligence. The socialistic
idea, with which the “Démocratie Chrétienne” had identified
itself both in France and Belgium, regards numbers as the
centre of gravity of the whole state organism. As a matter
of fact it recognizes as actual citizens only the labourer, or,
in other words, the proletariat.

On surveying the situation, certain weak points in the policy
of the Vatican under Leo XIII. were manifest even to a con-
ceptual observer. They might be summed up as follows:
(1) An unmistakable decline of religious fervour in church life.
(2) The intensifying and nurturing of all the passions and
questionable practices which are so easily encouraged by practical
politics, and are incompatible in almost all points with the
priestly office. (3) An ever-increasing displacement of things which
displayed itself in France in so many instances, such as the Dreyfus case, the anti-Semitic
movement, and the campaign for and against the Amalgamators
and their newspaper, the Croix. (6) The increasing estrange-
ment of German and Anglo-Saxon feeling. As against these,
noteworthy reasons might be urged in favour of the new
development. It might well be maintained that the faults just
enumerated were only cankers inseparable from every new and
great movement, and that these excesses would disappear in
discontinuity of their life, and in their ultimate success, and form a more
tranquil path. Moreover, in the industrial districts of Germany,
for example, the Christian industrial movement, supported by
Protestants and Catholics alike, had achieved considerable
results, and proved a serviceable means of combating the
seductions of Socialism. Finally, the Church had reminded the
wealthy classes of their duties to the sick and toilers, and by
making the social question its own it had gone a long way
towards permitting all social and political conditions with
the spirit of Christianity.

VI.—Period from 1900 to 1910.

On the 3rd of March 1903 Leo XIII. celebrated his Jubilee
with more than ordinary splendour, the occasion bringing him
rich tributes of respect from all parts of the world, Catholic
and non-Catholic; on the 20th of July following he died.
The succession was expected to fall to Leo's secretary of state,
Cardinal Rampolla; but he was credited with having inspired the
French sympathies of the late pope; Austria exercised its right of
veto (see Conclave, ad fin.), and on the 8th of August, Giuseppe
Sarto, who as cardinal patriarch of Venice had shown a friendly
attitude towards the Italian government, was elected pope.
He took as his secretary of state Cardinal Raphael
Plurit X. Merry del Val, a Spaniard of English birth and educa-
tion, well versed in diplomacy, but of well-known ultramontane
tendencies. The new pope was known to be no politician,
but a simple and saintly priest, and in some quarters there were hopes
that the attitude of the papacy towards the Italian kingdom
might now be changed. But the name he assumed, Plurit X.,
was significant; and, even had he the will, it was soon clear
that he had not the power to make any material departure from
the policy of the “papal prisoner of the Vatican.” What was
more important, the new régime at the Vatican soon made
itself felt in the relations of the Holy See with the world of
modern thought and with the modern conception of the state.

The new pope's motto, it is said, was "to establish all things
in Christ" (Instruatur omnia in Christo); and since, ex hypo-
thesis, he himself was Christ's vicar on earth, the working out of this
principle meant in effect the extension and consolidation of the
papal authority, and, as far as possible, an end to the com-
promise by means of which the papacy had sought to make
friends with the Mammon of unrighteousness. It was a spirit
which informed such decrees as that on "mixed marriages."
(Ne temere) of 1907, which widened still further the social gulf between Catholics and Protestants (see Marioge: Canon Law), or the refusal to allow the French bishops to accept the Association Law passed by the French government after the denunciation of the concordat and the separation of Church and State (see France: History); better that the Church in France should sink into more than apostolic poverty than that a title of the rights of the Holy See should be surrendered. Above all it was this spirit that breathed through every line of the famous encyclical, Passendi gregis, directed against the “Modernists” (see Roman Catholic Church: History), which denounced with bitter scorn and irony those so-called Catholics who dared to attempt to reconcile the doctrine of the Church with the demands of modern thought, or who seemed to be disavowing the authority of the Holy See, maintained the absurd doctrine that would make of the laity the factor of progress in the Church.

That under Pius X. the papacy had abandoned none of its pretensions to dominate consciences, not of Catholics only, was again proved in 1910 when, at the very moment when the pope was praising the English people for the spirit of tolerance which led the British government to introduce a bill to alter the form of the Declaration made by the sovereign on his accession into a form inoffensive to Roman Catholics, he was demonstrating with the government of Spain for abrogating the law forbidding the Spanish dissident churches to display publicly the symbols of the Christian faith or to conduct their services otherwise than semi-privately.

In pursuance of the task of strengthening the Holy See, the Vatican policy under Pius X. was not merely one of defiance towards supposed hostile forces within and without the Church; it was also strenuous in pushing on the work of internal organization and reform. In 1904 a commission of cardinals was appointed to undertake the stupendous task of codifying the canon law (see Canon Law), and in 1908 an extensive reorganization of the Curia was carried out, in order to conform its machinery more nearly to present-day needs (see Curia Romana).

In taking England, the United States and other non-Catholic states from under the care of the Congregation of the Propaganda, the pope raised the status of the Roman Catholic Church in those countries. All these changes tended to consolidating the centralized authority of the papacy. Other reforms were of a different character. One of the earliest acts of the new pontificate was to forbid the use in the services of the Church of any music later than Palestrina, a drastic order justified by the extreme degradation into which church music had fallen in Italy, but in general honoured rather in the spirit than in the letter. More important was the appointment in 1907 of a commission, under the presidency of Abbot Gasquet, to attempt the restoration of the pure text of the Vulgate as St. Jerome wrote it. Such activities might well be taken as proof that the papacy at the outset of the 20th century possessed a vigour which it was far from possessing a hundred years earlier. Under Pius VI. and Pius VII. the papacy had reached the lowest depths of spiritual and political impotence since the Reformation, and the belief was even widespread that the pope of Fontainebleau would be the last of the long line of St. Peter’s successors. This weakness was due not to attacks from without—for orthodox Protestantism had long since lost its aggressive force—but to disruptive tendencies within the Church; the Enlightenment of the 18th century had sapped the foundations of the faith among the world of intellect and fashion; the development of Gallicanism and Febronianism threatened to leave the Holy See but a shadowy pre-eminence over a series of national churches, and even to obliterate the frontier line between Catholicism and Protestantism. It was the Revolution, which at one moment seemed finally to have enraped the papacy, which in fact preserved it; Febronianism, as a force to be seriously reckoned with, perished in the downfall of the ecclesiastical principalities of the old Empire; Gallicanism perished with the constitutional Church in France, and its principles fell into discredit with a generation which associated it with the Revolution and its excesses. In the reaction that followed the chaos of the Revolutionary epoch men turned to the papacy as alone giving a foothold of authority in a confused and quaking world. The Romantic movement helped, with its idealization of a past but vaguely realized and imperfectly understood, and Chateaubriand heralded in the Catholic reaction with his Génie du Christianisme (1801) a brilliant if superficial attack on the encyclopaedists and their neo-Paganism, and a glorification of the Christian Church as supreme not only in the regions of faith and morals, but also in those of intellect and art. More weighty was the Du Pape of Joseph de Maistre (1816), closely reasoned and fortified with a wealth of learning, and which had an influence upon all those who thought that they saw in the union of “altar and throne” the palladium of society. The Holy Empire was dead, in spite of the pope’s protest at Vienna against the failure to restore “the centre of political unity”; Joseph de Maistre’s idea was to set up the Holy See in its place. To many minds the papacy thus came to represent a unifying principle, as opposed to the disruptive tendencies of Liberalism and Nationalism, and the papal monarchy came to be surrounded with a new halo, as in some sort realizing that ideal of a “federation of the world” after which the age was dimly feeling. So far as politics are concerned this sentiment was practically confined to certain classes, which saw their traditional advantages threatened by the revolutionary tendencies of the times; and the alliance between the throne and the Papacy and Modern Thought.

The Papacy

The Papacy in 1900-1910

The pope is no longer a petty Italian prince who, in order to preserve his dominions, was necessarily involved in the tangle of European diplomacy; he is the monarch of a vast, admirably organized, spiritual and temporal empire, and even those of us who were deeply moved by the overthrowing of the spiritual and temporal spheres brings him into conflict with a secular power; his diplomacy is backed, wherever Catholic sentiment is strong, by a force which the secular power has much difficulty in resisting; for in spiritual matters (and the term covers a wide field) the Catholic, however loyal to his country he may be, must obey God, whose viceroy is the pope, rather than man. Even Bismarck, in the end, had to “go to Canossa.”

It is, indeed, possible to exaggerate this power. The fact that the Vatican presents a great force hostile to and obstructive of certain characteristic tendencies of modern life and thought does not necessarily raise up a powerful opposition even in countries traditionally Catholic. France no longer deserves the title of eldest daughter of the Church; the Catholicism of Italy is largely superfluous; even Spain has shown signs of restiveness. On the
other hand, the great opportunity now open to the papacy on its spiritual side, is proved by the growing respect in which it has been held since 1870 in the English-speaking countries, where Roman Catholics are in a minority and their Church is in no sense established. Without doubt, opinion has been influenced in these countries by the fact that Rome has not been sufficiently strong to exercise any disturbing influence on the general course of national affairs, while in both its conspicuous members set a high example of private and civic conduct.

1 As recorded in the registers of the Roman Church (from P. B. Gams, Series episcoporum Romanae ecclesiae).
BIBLIOGRAPHY.—The works mentioned below are for the most part not included in the separate bibliographies to the articles on the individual popes (qqq.).

Period I. To 1087.—A bibliography of the history of the papacy during the first eleven centuries would embrace all the vast number of works on the history of the Church during this period. Of these a select few will be cited here in the bibliography of the Church History. Here it must suffice to mention certain modern works bearing more particularly on this period. Harnack, Lehrbuch der Dogmengeschichte, 3rd ed. i. 400 et seq.; Hinschius, Kirchenrecht, §§ 22-25; Kroll, Kirchenrecht, vols. i. and ii.; Löning, Geschichte des deutschen Kirchenrechts (1878); Duchesne, Eglises séparées (1905), Les premiers temps de l’État pontifical (1904).

Period II. (a) From 1087 to 1124.—L. Paulin’s Un Pape français: Urbain II. (Paris, 1903), which is written with a Catholic bias, is the only biography of Urban II. that is at all full. Cf. M. F. Stern, Zur Biographie des Papstes Urban II. (Berlin, 1899). On Paschal II., see E. Franz, Papst Paschalis II. (Breisach, 1877); W. Schum, Die Politik Papst Paschalis II. gegen Kaiser Heinrich V. im Jahre 1112 (Erfurt, 1877); and the excellent “Etude des relations entre le Sacro-Sanctum et le royaume de France de 1099 à 1109,” published by Bernard Monod in the Positions des thèses des élèves de l’Ecole des Chartes (1904). The Bullarum de Calixtus II. and the History (1899) of his pontificate have been published by A. Hartmann Robert. Cf. M. Maurer, Papst Calixt II. (Munich, 1886). Besides these monographs, useful information on the history of the popes of this period will be found in the following: R. Röhrich, Geschichte des Papsttums in Jerusalem (Innsbruck, 1898) and (W. W. R. *).

(b) From 1124 to 1198.—Monographs dealing expressly with the
pontificates of this period are scarce. Mention, however, must be made of H. Reuter's Geschichte Alexanders III. und der Kirche seiner Zeit (3 vols., Berlin, 1860–1864). Much information on the policy of these popes will be found in the works of the great

personages of the age mentioned on p. 728, notably J. Jastrow's Studien zur Geschichte Papstes Nikolaus II. (1883), and W. Marx, Briefe an die Enzyklopädie der Philosophie (Berlin, 1886–1893), seq.

E. Langlois has published the registers of Nicholas IV. (1886–1893), and Otto Schiffl deals with his pontificate in his Studien zur Geschichte Papstes Nikolaus IV. (1897). On Celestine V., see H. Schulz, Peter von Murkhausen (Papst Celestini V.), Berlin, 1894. The publication of the registers of Alexander VI. is still incomplete. Among other works published are the following:

H. Winter, Le dernier supplice de Jean XXIII. (1898); and H. Winter, La vie et l'œuvre de Charles VIII. (1898). There is a good account of the policy of Martin IV. in O. Cartellieri, Peter von Aragon und die staatsmännischen Taten (Heidelberg, 1904). On Honorius IV., see introduction to the complete edition of his registers by Maurice Prou (1886–1888).

Ammon works of a more general character that throw light on the history of the papacy during the 13th and 14th centuries. The first place must be given to Walter Norden's Das Papsttum und Byzanz. Die Trennung der beiden Mächte und das Problem ihrer Wiedervereinigung bis zum Untergang des byzantinischen Reichs (Berlin, 1903), which contains an account of the question of the East in its relations with the papal policy, from the rise of the schism down to the end of the middle ages. See also Félix Rocquain, L'histoire de la partition du monde des Latins (Paris, 1895–1897); B. deul, Die pommer, Kirche in England und in der Normandie im 11. und 12. Jahrhundert (Leipzig, 1895); and A. Stapper, Habsburger und Albigenser in der von Constance, seq. (Münster, 1891).
PAPEETE—PAPER

R. de Steinheirz, La
Débâlie, L'Église catholique et l'état sous la troisième république,
paper by the empress Irene at the end of the 11th or beginning of the 12th century, in her rules for the nuns of Constantinople. It does not appear, however, to have been very extensively used in Greece before the middle of the 13th century; for, with one doubtful exception, there are no extant Greek MSS. on paper which bear date prior to that period.

The manufacture of paper in Europe was first established by the Moors in Spain in the middle of the 12th century, the headquarters of the industry being Xativa, Valencia, and Toledo. But on the fall of the Moorish power the manufacture, passing into the hands of the less skilled Christians, declined in the quality of its production. In Italy also the art of paper-making was no doubt established through the Arab occupation of Sicily. But the paper which was made both there and in Spain, was, in the first instance, of the Oriental quality. In the laws of Alphonso of 1263 it is referred to as cloth parchment, a term which well describes its st stion. The first mention of rag-paper occurs in the tracts of Peter, abbot of Cluny (A.D. 1122-1150), aduersus Judaeos, cap. 5, where, among the various kinds of books, he refers to such as are written on material made “ex rasuris veterum pannorum.”

A few words may here be said respecting MSS., written in European countries on Oriental paper or paper made in the Oriental fashion. Several which have been quoted as early instances have proved, on further examination, to be nothing but vellum. The ancient fragments of the Gospel of St Mark preserved at Venice are accused of being made of paper. A Montefiore of papyrus, and by the Benedictines of bark, are in fact written on skin. The oldest recorded document on paper was a deed of King Roger of Sicily, of the year 1102; and there are others of Sicilian kings, of the 12th century. A Visigothic paper MS. of the 12th century from Silos near Burgos is now in the Bibliothèque Nationale, Paris. A notarial register on paper, at Geneva, dates from 1154. The oldest known imperial deed on the same material is a charter of Frederick II. to the nuns of Goss in Styria, of the year 1228, now at Vienna. In 1251, however, the same emperor forbade further use of paper for public documents, which were in future to be inscribed on vellum. Transcripts of imperial acts of Frederick II. about A.D. 1241 are at Naples. In Venice the Liber plegiorum, the entries in which begin with the year 1223, is made of rough paper; and similarly the registers of the Council of Ten, beginning in 1325, and the register of the emperor Henry VII. (1308-1313) preserved at Turin, are also written on a like substance. In the British Museum there is an older example in a MS. (Arundel 268) which contains some astronomical treatises written on an excellent paper in an Italian hand of the first half of the 13th century. The autograph MS. of Albert de Bemham, 1238-1255, at Munich, is written on paper. The Public Record Office there is a letter on paper from Raymond, son of Raymond, duke of Narbonne and count of Toulouse, to Henry III. of England, written within the years 1216-1222. The letters addressed from Castle to Edward I., in 1270 and following years (Pauli in Bericht, Berl. Akad., 1854), are instances of Spanish-made paper; and other specimens in existence prove that in this latter country a rough kind of charta bombycina was manufactured to a comparatively late date.

In Italy the first place which appears to have become a great centre of the paper-making industry was Fabriano in the marquisate of Durazzof. Paper-mills were first set up there in 1275, and which rose into importance on the decline of the manufacture in Spain. The earliest known water-marks in paper from this factory are of the years 1203 and 1204. The jurist Bartolo, in his treatise De insinuatis et armis, refers to the excellent paper made therein in the middle of the 14th century, an encomium which will be supported by those who have had occasion to examine the extant MSS. on Italian paper of that period. In 1340 a factory was established at Padua; another arose later at Treviso; and others followed in the territories of Florence, Bologna, Parma, Milan, Venice and other districts. From the factories of northern Italy the want of such sheets was supplied, and they were made as late as the 15th century. As an instance the case of Göltitz has been cited, which drew its paper from Milan and Venice for the half century between 1376 and 1426. But in Germany also factories were rapidly founded. The earliest are said to have been set up between Cologne and Mainz, and in Mainz itself about 1329. At Nuremberg Ulman Stromer established a mill in 1402 with the aid of Italian workmen. The earliest factories of early manufacture were Ratisbon and Augsburg. Western Germany, as well as the Netherlands and England, is said to have obtained paper at first from France and Burgundy through the markets of Bruges, Antwerp and Cologne. France owed the establishment of her first paper-mills to Spain, whence we are told the art of paper-making was introduced, as early as the year 1180, into the district of Hérault. At a later period, in 1406, among the accounts of the church of Troyes, paper-mills appear as molina à toile. The development of the trade in France must have been very rapid. And with the progress of manufacture in France that of the Netherlands also grew.

In the second half of the 14th century the use of paper for all literary purposes had become well established in all western Europe; and in the course of the 15th century it gradually superseded vellum. In MSS. of this latter period it is not unusual to find a mixture of vellum and paper, a vellum sheet forming the outer, or the outer and inner, leaves of a quire while the rest are of paper.

With regard to the early use of paper in England, there is evidence that at the beginning of the 14th century it was a not uncommon material, particularly for registers and accounts. Under the year 1320, the records of Merton College, Oxford, show that paper was purchased “pro registro,” which Professor Rogers (Hist. Agric. and Prices, i. 642) is of opinion was probably paper of the same character as that of the Bordeaux customs register in the Public Record Office, which date from the first year of Edward II. The college register referred to, which was probably used for entering the books that the fellows borrowed from the library, has perished. There is, however, in the British Museum a paper MS. (Add. 31,223), written in England, of even earlier date than the one recorded in the Merton archives. This is a register of the husting court of Lyme Regis, the entries in which begin in the year 1306. The paper, of a rough manufacture, is similar to the kind which was used in Spain. It may have been imported direct from that country or from Bordeaux; and a seaport town on the south coast of England is exactly the place where such early relics might be looked for. Professor Rogers also mentions an early specimen of paper in the archives of Merton College, on which is written a bill of the year 1332; and some leaves of water-marked paper of 1333 exist in the Harleian collection. Only a few years later in date is the first of the registers of the King’s Hall at Cambridge, a series of which, on paper, is preserved in the library of the college. The middle of the 14th century also are many municipal books and records. The knowledge, however, which we have of the history of paper-making in England is extremely scanty. The first maker whose name is known is John Tate, who is said to have set up a mill in Hertford early in the 16th century; and Sir John Spilman, Queen Elizabeth’s jeweller, erected a paper-mill at Dartford, and in 1589 obtained a licence for ten years to make all sorts of white writing-paper and to gather, for the purpose, all manner of linen rags, scralls or scraps of parchment, old fishing nets, &c. (Dunkin, Hist. of Dartford, 305; Harl. MS. 2506, fol. 1368). But the decline in that part of the country before the time of the Tudors. The comparatively cheap rates at which it was sold in the 15th century in inland towns seem to afford ground for assuming that there was at that time a native industry in this commodity.

As far as the prices have been observed at which different kinds of paper were sold in England, it has been found that in 1355-1356 the price of a quire of small folio paper was 5d., both in Oxford and London. In the 14th century the average price seems to have ranged from 3d. to 4d. for the quire, and from 3s. 4d. to 4s. 4d. for the sheet. At the beginning of the 15th century the price of a quire of paper, and to 3s. 4d. or 3s. 6d. the sheet: but in the second half of the century, owing to the debasement
of the coinage, it rose, in common with all other commodities, to nearly 4d. the quire, and to rather more than 5s. the ream. The relatively higher price of the ream in this last period, as compared with that of the quire, seems to imply a more extensive use of the material which enabled the trader to dispose of broken bulk more quickly than formerly, and so to sell by the quire at a comparatively cheap rate.

Brown paper appears in entries of 1570-1571, and was sold in bundles at 2s. to 2s. 4d. Blotting paper is apparently of even earlier date, being mentioned under the year 1465. It was a coarse, grey, unsized paper, fragments of which have been found among the leaves of 15th-century accounts, where it had been left after being used for blotting. Early in the 16th century blotting-paper must have been in ordinary use, for it is referred to in W. Harman's Vindicia, 1516 (p. 80): "Blotting paper serveth to drye weete wyttyngye, lest there be made blotis of the dyes," and early in the 17th century may generally be recognized by its firm texture, its stoutness, and the large size of its wires. The water-marks are usually simple in design; and, being the result of the impress of thick wires, they are therefore strongly marked. In the course of the 15th century the texture gradually becomes finer and the water-marks more elaborate. While the old subjects of the latter are still continued in use, they are more neatly outlined, and, particularly in Italian paper, they are frequently enclosed in circles. The practice of inserting the full name of the maker in the water-mark came into fashion early in the 16th century. But it is interesting to know that for a very brief period in the 14th century, from about 1397 to 1320, the practice actually obtained at Fabriano, but was then abandoned in favour of simple initial letters, which had already been used even in the 13th century. The date of manufacture appears first in the water-marks of paper made in 1455. The variety of subjects of water-marks is most extensive. Animals, birds, fishes, heads, flowers, domestic and warlike implements, armorial bearings, &c., are found from the earliest times. Some of these, such as armorial bearings, and national, provincial or personal cognizances, as the imperial crown, the crossed keys or the cardinal's hat, can be attributed to particular counties or districts; and the wide diversity of opinion of the paper-bearing those marks in different countries serves to prove how long and international was the paper trade in the 14th and 15th centuries.

A study of the various water-marks has yielded some results in tracing the different channels in which the paper trade of different countries flowed. Experience also of the different kinds of paper and a knowledge of the water-marks (the earliest of which is of about the year 1382) aid the student in fixing nearly exactly the point of origin of documents. Thus, while the 14th century may generally be recognized by its firm texture, its stoutness, and the large size of its wires. The water-marks are usually simple in design; and, being the result of the impress of thick wires, they are therefore strongly marked. In the course of the 15th century the texture gradually becomes finer and the water-marks more elaborate. While the old subjects of the latter are still continued in use, they are more neatly outlined, and, particularly in Italian paper, they are frequently enclosed in circles. The practice of inserting the full name of the maker in the water-mark came into fashion early in the 16th century. But it is interesting to know that for a very brief period in the 14th century, from about 1397 to 1320, the practice actually obtained at Fabriano, but was then abandoned in favour of simple initial letters, which had already been used even in the 13th century. The date of manufacture appears first in the water-marks of paper made in 1455. The variety of subjects of water-marks is most extensive. Animals, birds, fishes, heads, flowers, domestic and warlike implements, armorial bearings, &c., are found from the earliest times. Some of these, such as armorial bearings, and national, provincial or personal cognizances, as the imperial crown, the crossed keys or the cardinal's hat, can be attributed to particular counties or districts; and the wide diversity of opinion of the paper-bearing those marks in different countries serves to prove how long and international was the paper trade in the 14th and 15th centuries.

A study of the various water-marks has yielded some results in tracing the different channels in which the paper trade of different countries flowed. Experience also of the different kinds of paper and a knowledge of the water-marks (the earliest of which is of about the year 1382) aid the student in fixing nearly exactly the point of origin of documents. Thus, while the 14th century may generally be recognized by its firm texture, its stoutness, and the large size of its wires. The water-marks are usually simple in design; and, being the result of the impress of thick wires, they are therefore strongly marked. In the course of the 15th century the texture gradually becomes finer and the water-marks more elaborate. While the old subjects of the latter are still continued in use, they are more neatly outlined, and, particularly in Italian paper, they are frequently enclosed in circles. The practice of inserting the full name of the maker in the water-mark came into fashion early in the 16th century. But it is interesting to know that for a very brief period in the 14th century, from about 1397 to 1320, the practice actually obtained at Fabriano, but was then abandoned in favour of simple initial letters, which had already been used even in the 13th century. The date of manufacture appears first in the water-marks of paper made in 1455. The variety of subjects of water-marks is most extensive. Animals, birds, fishes, heads, flowers, domestic and warlike implements, armorial bearings, &c., are found from the earliest times. Some of these, such as armorial bearings, and national, provincial or personal cognizances, as the imperial crown, the crossed keys or the cardinal's hat, can be attributed to particular counties or districts; and the wide diversity of opinion of the paper-bearing those marks in different countries serves to prove how long and international was the paper trade in the 14th and 15th centuries.
(2) the methods by which the prepared pulp or fibres are converted into paper ready for the market; this is paper-making proper, and includes the operations of beating, sizing, colouring, making the sheet or web, surfacing, cutting, &c.

Rags arrive at the mill from the rag merchants, either roughly sorted into grades or mixed in quantities and condition, and the first process is to free them from sand, dust and other impurities. To effect this they are usually passed in bulk through an ordinary revolving duster. They are then sorted into grades, and cut to a workable size about four inches square. For the best work, hand-cutting, done by women, is still preferred, but it is expensive and good machines have now been designed for this purpose. After further thrashing and dusting, the rags are ready for boiling, the object of which is not only to get rid of the dirt still remaining in them and to remove some of the colouring matter, but also to decompose a particular glutinous substance which would impair the flexibility of the fibres and render them too harsh, and stiff for readily making into paper. Various forms of vessels are used for boiling, but usually they are made to revolve by means of suitable gearing, and are either cylindrical or spherical (fig. 1).

![Fig. 1—Revolving Spherical Rag Boiler.](image)

In these the rags are boiled with an alkaline solution under a low steam pressure for six to twelve hours. The next step is that of washing and "breaking in," which takes place in an engine called the "breaker." This (fig. 2) is an oblong shallow vessel or trough with rounded ends and dished bottom, usually about 13 ft. long by 6 ft. wide, by about 2 ft. 6 in. in depth, but the size varies greatly. It is partly divided along the centre by a partition or "mid-feather," and furnished with a heavy cast-iron roller fitted round its circumference with knives or bars of steel in lenses or clamps. Underneath the roller and fixed in the bottom of the trough is the "plate," consisting of a number of parallel steel bars bedded in a wooden frame. The roller can be raised or lowered on the plate so as to increase or diminish, as desired, the cutting action of the bars and plate on the material. The duty of the roller is to cut and tease out the rags, and also to act as a lifter to cause the stuff to circulate round the trough. The breaker is half filled with water and packed with the boiled rags; an ample supply of clean water is run into the engine for washing the rags, the dirty water being withdrawn by the "drum-washer," a hollow cylinder fitted with buckets and covered with fine wire-cloth. During the washing process the roller is gradually lowered on the plate to tease out the rags into their original fibres; this operation takes from two to four hours. As soon as all signs of the textile nature of the material are destroyed, the washing water is turned off, the drum-washer lifted, and a solution of chlorine or bleach is run in to bring the pulp up to the degree of whiteness desired, after which the rag "half-stuff," as it is now called, is emptied into steps or drainers, where it is stored ready for use.

In treating esparto (the use of which for paper-making is almost confined to Great Britain) the object is to free it from all encrusting and non-cellular matter. To effect this it is digested with a strong solution of caustic soda under a high temperature, in boilers which are almost invariably stationary. The most usual liquor is that known as Sinclair's patent (fig. 3). This boiler is constructed of wrought-iron or steel plates, and holds from 23 to 3 tons of grass. It is charged through the opening at the top, and the boiled material taken out from a door B at the side; the grass rests on a false bottom of perforated plates C, through which the liquor drains, and by means of two "vomiting" pipes, D, D, at the sides of the boiler, connecting the space at the bottom with a similar space at the top, a continuous circulation of steam and liquor is maintained through the grass. The steam pressure is kept up to 30 to 40 lb. per sq. in. for three or four hours; then the strong liquor or lye, which contains all the resinous and intercellular matters dissolved by the action of the caustic soda, is run off and stored in tanks for subsequent recovery of the soda, while the grass is taken to the "potcher" or washing engine. In construction and working this is similar to the breaking engine used for rags; in it the grass is reduced to pulp, and washed for about twenty minutes to free it from the traces of soda liquor remaining after the partial washing in the boiler. As soon as the wash water is running clear it is shut off, and the necessary quantity of a solution of bleaching powder or chlorine (averaging about 6 to 8% on the raw material) is run into the potcher, and the contents are heated by steam to a temperature of about 90° F. After about four to six hours the bleaching is complete, the drum-washer is let down, fresh water run into the potcher, and the grass washed to free it from all traces of chloride, an operation generally assisted by the use of a little antiseptic or hypochlorite of soda. The esparto, as shipped in bales from the Spanish or African fields, is mixed with roots, weeds and other impurities; and as most of these do not boil or break as rapidly as the esparto they would, if not taken out of the pulp, show up in the finished paper as specks and spots. To get rid of them the esparto pulp, when washed and bleached is run from the potcher into storage chests, from which it is pumped over a long, narrow serpentine settling table or "sand-table," made of wood and fitted with divisions, or "weirs," behind which the heavy impurities or weeds fall to the bottom and are caught. The pulp is next passed over what is known as a "press-pate" (fig. 4) or "half-stuff" machine, very similar to the wet end of a paper machine, consisting of strainers fitted with coarse-cut strainer plates, a short wire and a pair of couch and press rolls. The pulp is drawn by suction through the strainers, which keep back the finer impurities that have passed the sand-table, and then flows on to the wire-cloth in the form of a thick web of pulp. After passing through the couch and press rolls, the pulp leaves the machine with about 50% of moisture, and is ready for the beating engine, the first operation of paper-making proper. This is the usual process, though various modifications are introduced in different mills and for different purposes.

Most kinds of straw can be utilized for making into paper, the varieties generally used being rye, oat, wheat and barley; of these, the two former are the most important, as they give the largest yield in fibre. Germany and France are the two principal users of straw, which closely resembles esparto in its chemical constitution, and is reduced to a pulp by a somewhat similar process.

For paper-making,

![Fig. 2—Rag-breaking Engine.](image)
owing to their possession of large forest areas. They also export large quantities of wood-pulp to other countries. In Europe the Scotch fir (Pinus sylvestris), the spruce (Picea excelsa), the aspen (Populus tremula), are the timbers principally employed; and in America the black spruce (Picea nigra), the hemlock (Tsuga canadensis), the poplar (Populus grandidentata) and the aspen (Populus tremuloides). Two kinds of wood-pulp are used for paper manufacture, one prepared mechanically and the other chemically. The former is obtained by disintegrating the wood entirely by machinery without the use of chemicals, and is, as may readily be understood, a very inferior pulp. In the manufacture of chemical wood-pulp, very great advances have been made since 1880, and wood-pulp has grown to be one of the most important fibres for paper-making purposes. Two methods are in use, known respectively as the soda or alkaline process, and the sulphite or acid process, according as soda or sulphur (or rather sulphurous acid) forms the base of the reagent employed. Trees of medium age are usually selected, varying from seventy to eighty years' growth and running from 8 to 12 in., in diameter. They are felled in winter and reach the mill in logs about 4 ft. long. After being freed from bark and the knots taken out by machinery, the logs are cut into small cubical chips about ½ to ¾ in. in size by a revolving cutter. The chips are then bruised by being passed between two heavy iron rolls to allow the boiling solution thoroughly to penetrate them, and are conveyed to the boilers over a screen of coarse wire-cloth, which separates out the fine sawdust as well as any dirt or sand. In the soda process the wood is boiled in large revolving or upright stationary boilers for about seven or eight hours, in a similar manner to esparto and straw, though it requires much severer treatment. The steam pressure varies from 90 lb. to as much as 150 lb. per sq. in., and the amount of soda required is about 10% of Na₂O, estimated on the barked and cleaned wood. The essential feature of the sulphite process is the employment of a solution of sulphurous acid combined with a certain amount of base, either magnesium or lime. As the acid reaction of the bisulphite solution would attack any exposed ironwork with which it comes in contact, the boilers in all cases should be lined with lead. The type of boiler employed varies according to the process adopted. The principal patents connected with the sulphite process are those of Tilghman, Ekman, Francke, Ritter-Kellner, Mitscherlich, and Partington. The subsequent operations, in both the acid and alkaline processes of washing, bleaching and straining the pulp, are all very similar to those described for esparto. Wood-pulp produced by the sulphite process differs in a marked degree from that made by the soda process; the fibre in the former case is harsher and stronger, and papers made from it are characterized by their hardness and transparency, whereas those made from soda pulp are softer and more mellow, corresponding in some way to the difference between linen and cotton fibres. Each class of pulp is largely used, both alone and mixed with other materials. Within recent years important modifications and improvements have been adopted in the preparation of esparto and wood half-stuff with a view to reduce the cost of manufacture and save waste of material. From the boiler to the beater the process becomes a continuous one, so that the prepared pulp requires practically no
handling till it is made into finished paper at the end of the machine; this effects a considerable saving in cost of labour and reduces the waste of material incident to a series of upright bleaching towers.

From the potter or breaking engine the esparto or wool pulp is discharged, by means of a patent circulator or pump, into the first of a series of upright bleaching towers. These towers (fig. 5) are built up of wrought-iron rods and a special kind of cement. They are usually about 16 ft. high in the parallel by 8 ft. in diameter; the bottom of the tower is conical and connected to a powerful circulator or pump, which discharges the pulp into the top of the tower and causes thereby a continuous circulation and a thorough mixing of the pulp and bleach. A special form of concentrator is fixed on the top of the first tower, which reduces the water in the pulp as it leaves the tower potter to the minimum quantity necessary for perfect circulation in the tower; by this means a considerable saving is effected in the quantity of bleach required. After the necessary concentration of the pulp in No. 1 tower, the bleaching liquor is added and the concentrator at the foot of the tower put in operation. A two-way gage in the discharge pipe allows the pulp to pass on to tower No. 2 and so on through the series. The concentrator in each tower is only put in working for a short time once in every hour and the made never more than one concentrator working in the series at one time. There is no manual labor in the working of these towers, perfect cleanliness, and a great saving in power over the system previously in use. This system, for instance, will hold about two tons of dry pulp. When the pulp is fully bleached in the last tower of the series, it is let into a tank and the water is run into it, and a second concentrator, similar to the one on the first tower, is put in motion and washed out all traces of the bleach in about 25 to 30 minutes. These concentrators effect also another purpose, taking to some extent the place of the prese-pate machine for removing roots, weeds and other impurities.

From the last tower and concentrator the bleached pulp is pumped through a line of pipes to the beater, valves being fixed in the line of pipes to discharge into whichever beater is desired. These beaters are constructed in tower-form like the bleachers, the roll and plate being fixed on the top of the tower and the circulation effected in the same way as in the bleaching towers. Fig. 6 shows the plan and elevation of such an arrangement of beaters and bleachers arranged in series. The beaters are made to hold each about two tons of dry paper, a series of four of these can make from 55 to 60 tons of paper per week.

Libre, hemp, manila, &c., are chiefly used for the manufacture of coarse papers where strength is of more importance than appearance, such as sack, wrapping and bagging forms, &c. The boiling processes for them are similar to those used for esparto and straw, thus refining liquors which, after being worked upon and other paper-making materials had been boiled were formerly run into the nearest water-course; but now, partly because it is insisted upon in England by the Rivers Pollution Acts, and partly because the obtained results by this method are made remunerative, all these liquors are preserved and the soda they contain utilized. One of the best and most economical of the simple recovery plants is that invented by Portion, a French chemist, and named after the type of evaporator he employed, the Portion evaporator consists in the boiling of the contents of a series of tubes, or coil separators, which are placed in a vessel and then heated by steam introduced to the vessel. As the liquor descends from tube to tube it becomes concentrated and reduced in volume until it is finally reduced to a solid mass of a white form, where it impinges on a plate or disk, which causes a complete separation of the liquor and liquid; each then passes to the next effect, the liquid through the second coal of tubes and the vapour to the chamber. This combination of two series of tubes, or coil, and separator constitutes a vessel or "effect," and the evaporator consists of a series, usually three or more, of these vessels, one above the other (fig. 7). The vital feature, it will be understood, is therefore that the latent heat of the original steam, after performing its function in the first effect, is passed on to the second and then to the third or more effects, in each of which it is finally reduced. In buildings in which an equal amount of work is done, the heat will be finally reduced in the last vessel, the temperature being then raised higher. When a vessel is heated, if the temperature be divided into three times, the results are a triple-effect, if four times, a quadruple-effect. Taking a gallon of water per pound of coal, a single-effect apparatus will evaporate 10 lb of water, a

1 In England, it should be stated, it is found that both for paper liquors and other liquors equally good evaporation results are obtained by treating them in a water heater by keeping them under a head of liquor, i.e., the liquor is led into the bottom row of tubes and has to ascend row by row to the top row, from which it flows to the separator.
The liquor to be concentrated is pumped from the storage tanks to the top of first-effect of the Yaryan apparatus through a series of multiple-effect heaters, corresponding to the number of effects in the machine, by means of which the liquor is heated to as near the boiling point as possible of the liquor in the tubes of the first effect.

Live steam is introduced into the chamber surrounding the tubes of the first effect, and from the separator of the last effect the concentrated liquor is pumped to the incinerator.

Any form of incinerating hearth can be used in conjunction with the multiple-effect evaporator, but one very suitable to the continuous work of, and the high degree of concentration produced by, the Yaryan machine is that known as the Warren rotary furnace. This consists of a revolving iron cylinder lined with brick, about 12 ft. long by 10 ft. in diameter. The lining being 6 in. thick at the inlet \(^1\) than at the discharge, the interior of the furnace is conical in form so that the ash gradually works forward and is eventually discharged fully burnt into trucks for storage, or on a travelling band, and so carried automatically to the dissolving or lixiviating tanks. The strong liquor runs in at one end in a slow continuous stream; by the rotation of the hearth the burning mass is carried up the sides and drops through the flame again to the bottom, much in the same manner as rags do in a revolving duster. In this way all the labour required to stir the ash of the ordinary hearth is dispensed with, and the burning material comes continuously in close contact with the flame, a complete and thorough combustion being the result. The fire-box is situated at the delivery end of the furnace, and is mounted on trucks \(^2\) so that it can be run back when cleaning or repairing the brickwork. The waste heat is utilized in raising steam in a steam boiler set behind the furnace, and often in keeping the thick liquor hot after leaving the evaporator and before entering the rotary furnace.

Paper-making proper from prepared pulp, whether of rags, esparto, wood or other raw material, may be said to begin with the operation technically known as "beating," which is carried out in one of the various forms of beating engine or "Hollander." The object of the beater is to reduce the fibres to suitable lengths and also to beat or bruise them into a stiff pulp of sufficient consistency to absorb and carry the water necessary to felt them together on the wire-

---

\(^{1}\)The figures given here are theoretical rather than actual. In practice a double effect is not capable of evaporating twice as much with 1 lb of coal as a single-effect, owing to loss of efficiency through radiation, &c.

\(^{2}\)This was the original Warren principle, but has largely been abandoned in favour of a parallel brick lining throughout; the ash gradually works forward and is discharged as described.

\(^{3}\)A later method is to build the fire-box on the descending side of the rotary furnace, while a specially constructed door and ash discharge shoot are provided at the ascending side, which gives access to the inside of the furnace and provides all the other essentials without the loss of heat which resulted from the portable fire-box, due to leakage between the box and the rotary furnace proper.

---

Cloth of the paper-machine. This operation is one of the most important and most delicate processes in the manufacture, requiring experience, skill and careful manipulation. Not only does every class of fibre demand its own special treatment, but this treatment has to be modified and varied in each case to suit the qualities and substances of the papers to be made from it.

Although there are now in use a great many forms of beating engine, they are all, more or less, modifications of the original Hollander, which in its essential details differs little from the breaking-engine already described. There are usually more bars in the roll and plate than in the breaker; the bars of the plate are set at a slight angle to the fly-bars of the roll to act as shears in a similar manner to a pair of scissors. Bars and plates of bronze are frequently used for the higher grades of paper to avoid rust and dirt and to produce a softer and less violent action on the fibres.

The time required for the beating process varies from 3 to 4 hours up to 10 and 12 and even more. Beating engines fitted with mechanical circulation by pumps or otherwise have been extensively adopted, more particularly for working esparto and the other substitutes for rags. Fig. 8 shows one of these beaters, known as the Taylor beater; the roll and plate are fixed above the trough of the beater, which has no partition or mid-feather, and from the lower end a powerful circulator or pump circulates the pulp through the beater and discharges it through a pipe in a continuous stream in front of the roll. In the pipe is fixed a two-way valve, so that when the beating operation is complete the finished pulp can be run into the stuff-chocks of the paper machine. The advantages of this form of beater are that a quicker and more thorough circulation of the pulp takes place than when the roll has to do the double duty of making the pulp travel and beating it up at the same time, and thus tends to reduce the time of the operation. Also more bars can be fixed in the roll, increasing its effect on the pulp, and less power is required than when the roll revolves in the middle of the stuff as in the ordinary form of beater.

Beating engines of quite a different construction are now largely used in American mills, and also to some extent in Great Britain. These are known as "refiners," and the most important forms are the Jordan and Kingsland beaters (so called from the names of the inventors), or modifications of them.

The first (fig. 9) consists of a conical plug or roll fixed on a shaft and revolving at a high rate of speed within an outer casing of corresponding shape; both the plug and the casing are furnished with steel bars parallel with the shaft, but set at slightly different angles, taking the place of the bars in the roll and plate of the ordinary beater. This conical plug or roll can be moved in either direction parallel to its axis and by this means the cutting action
of the two sets of bars can be increased or reduced. The pulp flows into the top of the beater at the smaller end of the cone through a pit provided with an opening in the cone and is subjected to a revolving disk of metal fitted on both sides with corresponding and similar bars. The contact between the revolving and stationary bars can be regulated, as in the Jordan engine, to give the required amount of beating action on the pulp. The refiner is essentially a finishing process as an adjunct to the beating process proper. The advantages to be derived from its use are a considerable saving in the time occupied in beating and the production of a more uniform and evenly divided pulp, particularly where a mixture of different fibres is used. By the use of the refiner the time occupied in the beater can be reduced by nearly one-half, the half-beaten pulp passing through the refiner from the beater on its way to the paper-machine. It is not, however, generally employed for the best kinds of paper.

During the operation of beating various materials and chemicals are added to the pulp for the purposes of sizing, loading, colouring, etc. Papers for writing and most of those for printing purposes must be rendered non-absorbent of ink or other liquid applied to them. To effect this some form of animal or vegetable size or glue must be applied to the paper, either as a coating on the finished web or sheet, or mixed with the pulp in the beating engine. The former, called "tub-sizing," will be described later; the latter which is known as "engine-sizing," consists in filling up the interstices of the fibres with a chemical precipitate of finely-divided resin, which, when dried and heated on the cylinders of the paper-machine, possesses the property of being with difficulty wetted with water. Except for the very best qualities of paper, it is usual to add to the pulp a certain quantity of cheap loading material, such as china-clay or kaolin, or pearl-hardening, a chemically precipitated form of sulphate of lime. The addition of such loading material to a moderate extent, say 10 to 15\%, is not entirely in the nature of an adulterant, as it serves to close up the pores of the paper, and for ordinary writing, printing and lithographic papers renders the material softer, enabling it to take a much better and more even surface or glaze. But if added in excess it is detrimental to the strength and hardness of the sheet. Most materials, however well bleached, have a more or less yellowish tinge; to produce the desired white shade in the paper certain quantities of red and blue in the form of pigments or dyes must be added to the pulp. The blues usually employed are ultramarine, smalts and the aniline blues, while the red dyes are generally preparations of either cochineal or the aniline dyes. Other colours are required in the manufacture of papers of different tints, and with one or two exceptions they must be mixed with the pulp in the beater.

There are two distinct processes of producing the finished paper from the pulp, known respectively as "hand-made" and "machine-made." The expense of manufacture of hand-made paper and the consequent high price render it too costly for ordinary use; the entire process on the machine occupies a few minutes, while in the ordinary state of the weather it could not be done by hand in less than a week.

A brief description of the hand-made process will suffice and it will at the same time facilitate the right comprehension of the machine process. Only the finest qualities of rags are used for hand-made paper; and the preparation of the half-stuff is the same as that already described under treatment of rags. The pulp after being prepared in the beating engine is run into large chests from which the vat is supplied; before reaching this it is strained as on the paper-machine (see below). The sheet of paper is made on a mould of fine wire-cloth with a removable frame of wood to keep the pulp from running off, extending slightly above the surface of the mould, called the "deckel." To form the sheet, the paper-maker dips the mould into a vat (see fig. 10) containing the prepared pulp, lifting up just so much as will make a sheet of the required thickness; as soon as the mould is removed from the vat, the water begins to drain through the wire-cloth and to leave the fibres on the surface in the form of a coherent sheet, the felting or intertwining being assisted by a lateral motion or "shake" given to the mould by the workman; the movable deckel is then taken off, and the mould is given to another workman, called the "coucher," who turns it over and presses it against a felt, by this means transferring or "couching" the sheet from the wire to the felt. A number of the sheets thus formed are piled one above another alternately with pieces of felt, and the whole is subjected to strong pressure to expel the water; the felts are then removed and the sheets are again pressed and dried, when they are ready for sizing. Any pattern or name required in the sheet is obtained by making the wire-cloth mould in such a way that it is slightly raised in those parts where the pattern is needed (fig. 11); consequently less pulp lodges there and the paper is proportionately thinner, thus showing the exact counterpart of the pattern on the mould; such are known as "watermarks." The expense of manufacturing paper in this way is very much greater than by machinery; but the gain in strength, partly owing to the time allowed to the fibres to knit together, and partly to the free expansion and contraction permitted them in drying, still maintains a steady demand for this class of paper.

The paper-machine (fig. 12) consists essentially of an endless mould of fine wire-cloth on which the pulp flows and on which a continuous sheet of paper is formed: the sheet then passes through a series of press rolls and over a number of steam-heated cylinders until it is dry. From the beating engines, the pulp is emptied
into storage tanks or stuff-chests, fitted with revolving arms or agitators; from these the pulp is pumped into a long upright supply box at a higher level, called the stuff box, which communicates with the sand trap or table by means of a regulating valve. With the pulp a certain amount of water is allowed to flow on to the sand trap so as to dilute it sufficiently to form on the wire-cloth of the pulp (so called because it can be made to give the paper any desired watermarking). The "dandy-roll" (Fig. 13) is a light skeleton cylinder covered with wire-cloth on which small pieces of wire are soldered representing the watermark to be reproduced in the paper. From the last suction-box the half-dried sheet of pulp passes between the "couch-rolls," so called from the corresponding operation of couching in hand-made paper, which, by pressing out most of the remaining moisture, impart sufficient consistency to the paper to enable it to leave the wire; both rolls are covered with a felt jacket, and the top one is provided with levers and weights to increase or diminish the pressure on the web. The paper is now fully formed, and is next carried by means of endless felt belts between two and sometimes three pairs of press-rolleres required to extract the remaining moisture, and to obliterate as much as possible the impression of the wire-cloth from the under-side of the web. The web of paper is finally dried by passing it over a series of hollow steam-heated drying cylinders driven one from the other by gearing. The slower and more gradual the drying process the better, as the change on the fibres of the web due to the rapid contraction in drying is thereby not so excessive, and the heat required at one time is not so great nor so likely to damage the quality of the paper; the heating surface should therefore be as large as possible, and a great number of cylinders is required now that the machines are driven at high speeds. The cylinders are so placed that both surfaces of the web are alternately in contact with the heating surface. All the cylinders, except the first two or three with which the moist paper comes in contact and where the greatest evaporation occurs, are encased by continuous travelling felts. The drying cylinders are generally divided into two sets between which is placed a pair of highly polished chilled iron rolls heated by steam, called "nip-rolls," or "smoothers," the purpose of which is to flatten or smooth the surface of the paper while in a partially dry condition. Before being reeled up at the end of the machine the web of paper is passed through two or more sets of "calenders," according to the degree of surface or smoothness required. These calenders consist of a vertical sack of chilled iron rolls, generally five in number, revolving one upon another, and one or more of which are bored and heated by steam; pressure can be applied to the stack as required by means of levers and screws. The web of paper is now wound up in long reels at the end of the machine.

Paper-machines are now usually driven by two separate steam engines. The first, running at a constant speed, drives the strainers, pumps, shake motion, &c., while the second, working the paper-machine, varies in speed according to the rate at which it requires

![Fig. 12.—Paper-Making Machine.](image-url)
The cheaper kinds of paper are glazed on the paper-machine in the calenders as before described. For the better class or very highly-glazed papers and those that are tub-sized, a subsequent glazing and press is required, this is effected by sheet or plate-glazing and by super-calendering or web-glazing. The plate-glazing process is adopted mainly for the best grades of writing-papers, as it gives a smoother, higher and more permanent gloss than has yet been imitated by the roll-calender.

In this method each sheet is placed by hand between two zinc or copper plates until a pile of sheets and plates has been formed sufficient to make a handful for passing through the glazing-sheets; this handful of about two quires or 48 sheets of paper, is then passed backwards and forwards between two chilled-iron rolls, the pressure on the rolls, and the number of times the hand is passed through, are varied according to the amount of gloss required on the paper. The super-calender (see fig. 14) is used to imitate the plate-glazed surface, partly as a matter of economy in cost, but principally for the high surfaces required on papers for books and periodicals to show up wood-cuts and photographic illustrations. It usually consists of a stack of chilled cast-iron rolls, alternating with rolls of compressed cotton or paper so that the web at each nip is between cotton and iron; it will be seen from the illustration that there are two cotton rolls together in the stack for the purpose of reversing the action on the paper and so making both sides alike; pressure is applied to the rolls at the top by compound levers and weights or screws. A very high surface can be quickly given to paper by friction with the assistance of heat; the process is known as "embossing" and is used for fancy writing-papers, programmes, menu-cards, &c. This embossing is usually effected on the plate-glazing machine, in the case of linen and similar finishes by enclosing each sheet of paper between two pieces of linen or other suitable material to give the desired texture or pattern on the surface of the sheet. Each sheet of paper with its two pieces of cloth is placed between zinc plates and passed backwards and forwards between the rolls of the machine as in plate-glazing.

Except for special purposes, such for example as for use in a continuous printing-machine, paper is usually sent from the mill in the form of sheets. A number of reels of paper is run through the roll-calender between two pairs of wire rolls in the cutting-machine (see fig. 15); the various webs of paper are passed through an upright slitting drum and are cut into sheets by two pairs of knives or "slitters"; they then pass between another pair of rollers, and over a long dead-knife fixed across the cutting-machine, on which they are cut into sheets by another transverse knife fastened to the dead-knife drum and acting upon a pair of shears. The cut sheets then fall upon an endless travelling felt, from which they are stacked in piles by boys. It is often necessary, as in the case of water-marked papers, that the sheets should be cut with great exactness so that the designs shall appear

Fig. 15.—Reel Paper Cutter.

in the centre of the sheet; the ordinary cutter cannot be relied upon for this purpose and in its place a machine called a "single-knife cutter" is used. In this cutter only one web of paper is cut at a time; between the circular slitters and the transverse knife is placed a measuring-drum, which receives an oscillating motion and can be adjusted by suitable mechanism to draw the exact amount of paper forward for the length of sheet required.

All that now remains to be done before the paper is ready for the market is overhauling or sheeting. This operation consists in sorting out all speckled, spotty or damaged sheets, or sheets of
Of not less importance are the qualities which belong to paper as a chemical substance or mixture, which are: (1) its actual composition, (2) the liability of change under whatever conditions of storage and use it may be subjected to. All papers to be used for any permanent purpose must, therefore, be subjected to the same physical and chemical quality as a standard. The manufacture of paper is an art in which the details of the process are as important as in any other art.

In England and Wales in 1897 there were 205 mills, using 490,000,000 and 90,000 machines and 231 mills; in Ireland, 7 mills and 11 machines. A rough estimate of the amount of capital embarked in the industry may be found on the basis that 4000 engaged mills would represent from £30,000 to £50,000,000 upwards per machine.

The table at foot of page shows the amounts and values of the British papers and imports of paper and paper-making materials in 1907.

**India Paper.**—This name is given to a very thin and light but tough and opaque kind of paper, sometimes used for printing books—especially those of which it is desirable to reduce the bulk and weight as far as possible without diminishing their durability or diminishing their type. The name was originally given in England, about the middle of the 18th century, to a soft absorbent paper of a pale buff shade, imported from China, where it was made by hand on a paper-making frame generally similar to that used in Europe. The name probably originated in the prevailing tendency, down to the end of the 18th century, to describe as "Indian" anything which came from the Far East (cf. Indian ink). This so-called India paper was used for printing the earliest and finest impressions of engravings, hence known as "India proofs."

The name of India paper is now chiefly associated with European (especially British) machine-made, thin, opaque printing papers used in the highest classes of book-printing. In 1841 an Oxford graduate brought home from the Far East a small quantity of extremely thin paper, which was manifestly more opaque and tough, for its weight, than any paper then made in Europe. He presented it to the Oxford University Press, and in 1844 Thomas Combe, printer to the University, used it in the printing of the smallest Bible then in existence—Diacon 24mo. These books were scarcely a third of the usual thickness, and were regarded with great interest; one was presented to Queen Victoria, and the rest to other persons. Combe tried

With the enormously increased production of paper and the great reduction in price within recent years, it has been found that the "science" of paper-making has scarcely advanced with the same rapid strides as the art itself. Although a sheet of paper made to-day differs little as a fabric from the papers of earlier epochs, the introduction of new and cheaper forms of vegetable fibres and the auxiliary methods of treating them have caused a great change in the quality, strength and lasting power of the manufactured article. The undue introduction of excessive quantities of mechanical or ground wood-pulp in the period 1870–1880 into the cheaper qualities of printing-papers, particularly in Germany, first drew attention to this matter, since it was noticed that books printed on paper in which much of this material had been used soon began to discolour and turn brown where exposed to the air or light, and after a time the paper became brittle. This important question began to be scientifically investigated in Germany about the year 1885 by the Imperial Testing Institute in Berlin. A scheme of testing papers has been formulated and officially adopted by which the chemical and physical properties of different papers are compared and brought to numerical expression. The result of these investigations has been the fixing of certain standards of quality for papers intended for different purposes. These qualities are grouped and defined under such heads as the following:

**Strength,** expressed in terms of the weight or strain which the paper will support.

**Elasticity and texture,** measured by elongation under strain and resistance to crumpling or rubbing.

**Bulk,** expressed in the precise terms of specific gravity or weight per unit of volume.

in vain to trace the source of this paper. In 1874 a copy of this Bible fell into the hands of Henry Frowde, and experiments were instituted at the Oxford University paper-mills at Wolvercote with the object of producing similar paper. On the 24th of August 1875 an impression of the Bible, similar in all respects to that of 1842, was placed on sale by the Oxford University Press. The fact of compression was regarded as astounding, the demand was enormous, and in a very short time 75,000 copies of "Oxford Paper" had been sold. Many other editions of the Bible, besides other books, were printed on the Oxford India paper, and the marvells of compression accomplished by its use created great interest at the Paris Exhibition of 1900. Its strength was as remarkable as its lightness; volumes of 1,500 pages were suspended for several months by a single leaf, as thin as tissue, and when they were examined at the close of the exhibition, it was found that the leaf had not started, the paper had not stretched, and the volume closed as well as ever. The paper, when subjected to severe rubbing, instead of breaking into holes like ordinary writing paper, assumed a texture resembling chamois leather, and a strip 3 in. wide was found able to support a weight of 28 lb without yielding.

The success of the Oxford India paper led to similar experiments by one manufacturer, and there were in 1910 nine mills (two each in England, Germany and Italy, one each in France, Holland and Belgium) in which India paper was being produced. India paper is mostly made upon a Fourdrinier machine in continuous lengths, in contradistinction to the sheet paper, which is made to a smaller size than the frame employed in its production. The material used in its manufacture is chiefly rag, with entire freedom from mechanical wood pulp. The opacity of modern India paper, so remarkable in view of the thinness of the sheet, is mainly due to the admixture of a large proportion of mineral matter which is retained by the fibres. The extraordinary properties of this paper are due, not to the use of special ingredients, but to the peculiar care necessary in the treatment of the fibres, which are specially "beaten" in the beating engine, so as to give strength to the paper, and a capacity for retaining a large percentage of mineral matter. The advantage gained in weight, when the use of India paper is substituted for the use of any other paper, is the saving of the bulk of a volume—usually to about one-third of those involved by the use of good ordinary printing paper—without any alteration in the size and legibility of its type and without any loss of opacity, which is an absolute necessity in all papers used for high-class book printing to prevent the type showing through. (W. E. G. F.)

PAPHLAGONIA, an ancient district of Asia Minor, situated on the Euxine Sea between Bithynia and Pontus, separated from Galatia by a prolongation to the east of the Bithynian Olympus. According to Strabo, the river Parthenius formed the western limit of the region, which was bounded on the east by the Halys. Although the Paphlagonians play scarcely any part in history, they were one of the most ancient nations of Asia Minor (Hiiod, ii. 351). They are mentioned by Herodotus among the races conquered by Croesus, and they sent an important contingent to the army of Xerxes in 480 B.C. Xenophon speaks of them as being governed by a prince of their own, without any reference to the neighbouring satraps, a freedom due, perhaps, to the nature of the country, with its lofty mountain ranges and difficult passes. At a later period Paphlagonia passed under the Macedonian kings, and after the death of Alexander the Great it was assigned, together with Cappadocia and Mysia to Eumenes. It continued, however, to be governed by native princes until it was absorbed by the encroaching power of Pontus. The rulers of that dynasty became masters of the greater part of Paphlagonia as early as the fall of Mithradates III. (302-266 B.C.), but it was not till that of Pharnaces I. that Sinope fell into the hands of the Pontic kings (283 B.C.). From this time the whole province was incorporated with the kingdom of Pontus until the fall of the great Mithradates (65 B.C.). Pompey united the coast districts of Paphlagonia with the province of Bithynia, but left the interior of the country under the native princes, until the dynasty became extinct and the whole country was incorporated in the Roman empire. All these rulers appear to have borne the name of Pylaemenes, as a token that they claimed descent from the chieftain of that name who figures in the Hiiod as leader of the Paphlagonians. Under the Roman Empire Paphlagonia, with the greater part of Pontus, was united into one province with Bithynia, as we find to have been the case in the time of the younger Pliny; but the name was still retained by geographers, though its boundaries are not distinctly defined by Ptolemy. It reappears as a separate province in the 5th century (Hieron, Synecd. c. 33).

The ethnic relations of the Paphlagonians are very uncertain. It seems perhaps most probable that they belonged to the same race as the Bithynians, and that the Paphlagonians also held the adage that Pontus was the father of Pontus, and were undoubtedly a Semitic race. Their language, however, would appear from Strabo to have been distinct. Equally obscure is the relation between the Paphlagonians and the Eneti or Heneti (mentioned in connexion with them in the Homeric catalogue) who were supposed in antiquity to be the ancestors of the Veneti, who dwelt at the head of the Adriatic. But no trace is found in historical times of any tribe of that name in Asia Minor.

The greater part of Paphlagonia is a rugged mountainous country, but it contains fertile valleys, and produces great abundance of fruit. The mountains are clothed with dense forests, which are conspicuous for the quantity of boxwood which they furnish. Hence its coasts were from an early period occupied by Greek colonies, among which the flourishing city of Sinope, founded from Miletus about 630 B.C., stood pre-eminent. Amastres, a few miles east of the Parthenius, became important under the Macedonian monarchs; while Amisus, a colony of Sinope, situated a short distance east of the Halys, and therefore not strictly in Paphlagonia as defined by Strabo, rose to be almost a rival of its parent city. The most considerable towns of the interior were Gangra, in ancient times the capital of the Paphlagonians, known afterwords as Geredma or Germe, situated near the frontier of Galatia, and Pompeia Polis, in the valley of the Ammis (a tributary of the Halys), near which were extensive mines of the mineral called by Strabo sundarake (red arsenic), which was largely exported from Sinope.

PAPHOS, an ancient city and sanctuary on the west coast of Cyprus. The sanctuary and old town (Palepaphos) lie at Kouklia, about 20 m. west of Limassol, about 10 miles inland on the left bank of the Diorizo River (anc. Bocarus), the mouth of which formed its harbour. New Paphos (Papho or Bafno), which had already superseded Old Paphos in Roman times, lies 10 m. farther west, and 1 m. south of modern Kitina, at the other end of a fertile coast-plain. Paphos was believed to have been founded either by the Arcadian Agapenor, returning from the Trojan War (c. 1180 B.C.), or by his reputed contemporary Cinyras, whose clan retained royal privileges down to the Ptolemaic conquest of Cyprus in 205 B.C., and held the Paphos priesthood till the Roman occupation in 58 B.C. The town certainly dates back to the close of the Mycenaean Bronze age, and had a king Eteandros among the allies of Assur-hani-pal of Assyria in 668 B.C. Later a king of the same name is commemorated by two inscribed bracelets of gold now in the Metropolitan Museum of New York. In Hellenic times the kingdom of Paphos was only second to Salamis in extent and influence, and bordered on those of Solt and Curium.

Paphos owes its ancient fame to the cult of the "Paphian goddess" (ἡ Παφιά ταύρασσα, or Ἡ Παφιά, in inscriptions, or simply Ἡ βασιλέα, a nature-worship of the same type as the cults of Phoenician Astarte, maintained by a college of ecstatic ministers, practising sexual excess and self-mutilation. The Greeks identified both this and a similar cult at Ascalon with their own cults of Aphrodite, and localized at Paphos the legend of her birth from the sea foam, which is in fact accumulated here, on certain winds, in masses more than a foot deep. Her grave also was

shown in this city. She was worshipped, under the form of a conical stone, in an open-air sanctuary of the usual Cypriote type (not unlike those of Mycenaean Greece), the general form of which is known from representations on late gems, and on Roman imperial coins; its ground plan was discovered by excavations in 1888. It suffered repeatedly from earthquakes, and was rebuilt more than once; in Roman times it consisted of an open court, irregularly quadrangular, with porticoes and chambers on three sides, and a gateway through them on the east. The position of the sacred stone, and the interpretation of many details shown on the gems and coins, remain uncertain. South of the main court lie the remains of what may be either an earlier temple, or the traditional tomb of Cinnyras, almost wholly destroyed except its west wall of gigantic stone slabs.

After the foundation of New Paphos and the extinction of the Cinyrad and Potlemaic dynasties, the importance of the Old Town declined rapidly. Though restored by Augustus and renamed Sebaste, after the great earthquake of 13 B.C., and visited in state by Titus before his Jewish War in 70 B.C., it was ruinous and desolate by Jerome's time; but the prestige of its priest-kings partly lingered in the exceptional privileges of the patriarch of the Cypriote Church (see CYPRUS, CHURCH OF).

New Paphos became the administrative capital of the whole island, Greek, Armenian, and Roman days, as well as the head of one of the four Roman districts; it was also the commercial and political city in the time of Strabo, and famous for its oil, and for "diamonds" of medicinal power. There was a festal procession thence annually to the ancient temple. In A.D. 69 it was attacked and destroyed by the Saracens. The site shows a Roman theatre, an amphitheatre, temple and other ruins, with part of the city wall, and the moles of the Roman harbour, with a ruined Greek cathedral and other medieval buildings. Outside the walls lies another columnar building. Some rock tombs hard by may be of earlier than Roman date.

PAPIAS, of Hierapolis in Phrygia, one of the "Apostolic Fathers" (q.v.). His Exposition of the Lord's Ovelces, the prime early authority as to the Gospels of Matthew and Mark (see GOSPELS), is known only through fragments in later writers, chiefly Eusebius of Caesarea (H. E. iii. 39). The latter had a bias against Papias on account of the influence which his work had in perpetuating, through Irenaeus and others, belief in a millenial reign of Christ upon earth. He calls him a man "dreadful and loathsome," who took the Gospels and had his name used as the basis of apologetic traditions for literal fact. This may have been to some degree; but Papias (whose name itself denotes that he was of the native Phrygian stock, and who shared the enthusiastic religious temper characteristic of Phrygia, see MONTANISM) was nearer in spirit to the actual Christianity of the sub-apostolic age, especially in western Asia, than Eusebius realized. In Papias's circle the exceptional in connexion with Christianity seemed quite normal. Eusebius quotes from him the resurrection of a dead person4 in the experience of "Philip the Apostle" — who had resided in Hierapolis, and from whose daughters Papias derived the story—and also the drinking of poison ("when put to the test by the unbelievers," says Philip of Side, by "Justus, surnamed Barsabbas") without ill effect.5 Papias

4 The mother of Manaim " (cf. Acts xiii. 1), according to the citation in Euseb. H. E. 35, 11.
5 Perhaps this is the basis of a clause in the secondary ending to Mark's Gospel (xvi. 18).

PAPIAS—PIERRE MACHÉ

737

also believed a revolting story as to the supernatural swelling of the body of Judas Iscariot. But if he was credulous of marvels, he was careful to insist on good evidence for what he accepted as Christ's own teaching, in the face of current unauthorized views. Papias was also a pioneer in the habit, later so general, of taking the work of the Six Days (Hexameron) and the account of Paradise as referring mystically to Christ and His Church (so says Anastasius of Sinai).

About this date, which is important in connexion with his witness, there is some doubt. Setting aside the exploded tradition that he was martyred along with Polycarp (c. A.D. 155), we leave the witness of Irenaeus that he was "a companion (koinonion) on the island of Cyprus," who was born not later than A.D. 60. We may waive his other statement that Papias was "a hearer of John," owing to the possibility of a false inference in this case. But the fact that Irenaeus thought of him as Polycarp's contemporary and "a man of the old time" (ἀρχαίος ἄρχαίος), together with the affinity between the religious tendencies described in Papias's Preface (as quoted by Eusebius) and those reflected in the Epistles of Polycarp and Ignatius, all point to his having flourished in the first quarter of the 2nd century. Indeed, Eusebius, who deals with him along with Clement and Ignatius (rather than Polycarp) under the reigns of Trajan and Hadrian (A.D. 96-117), suggests that he wrote6 about A.D. 115 or thereabouts, although, however, to assign his work a date c. 130-140, or even later. No fact is known inconsistent with c. 60-135 as the period of Papias's life. Eusebius (iii. 36) calls him "bishop" of Hierapolis, but whether with good ground is uncertain.

Papias uses the term "the Elders," or Fathers of the Christian community, to describe the original witnesses to Christ's teaching, i.e. his personal disciples in particular. It was their traditions as to the purport of that teaching which he was concerned to preserve. But to Irenaeus the term came to mean the primitive custodians of tradition derived from these, such as the contemporaries, whose traditions Papias committed to writing. Not a few such traditions Irenaeus has embodied in his work Against Heresies, so preserving in some cases the substance of Papias's Exposition (see Lightfoot, Apostolic Fathers, 1891, for these, as for all texts bearing on Papias).

See articles in the Dict. of Christian Biog., Dict. of Christ and the Gospels, and Hauck's Realencyclopädie, xiv., in all of which further references will be found. (J. V. B.)

PAPIER MACHÉ (French for mashed or pulped paper), a term embracing numerous manufactures in which paper pulp is employed, pressed and moulded into various forms other than uniform sheets. The art has long been practised in the East. Persian papier-maché has long been noted, and in Kashmir under the name of kar-i-kalamandi, or pen-tray work, the manufacture of small painted boxes, trays and cases of papier mâché is a characteristic industry. In Japan articles are made by gluing together a number of sheets of paper, when in a damp condition, upon moulds. China also produces elegant papier mâché articles. About the middle of the 18th century papier mâché work came into prominence in Europe in the form of trays, boxes and other small domestic articles, japanned and ornamented in imitation of Oriental manufactures of the same class, or of lacquered wood; and contemporary papier mâché snuff-boxes ornamented in vermin Martin came into favour. In 1772 Henry Clay of Birmingham patented a method of preparing this material, which he used for coach-building, for door and other panels, and for many furniture and structural purposes. In 1845 the application of the material to internal architectural decoration was patented by C. F. Bielefeld of London, and for this purpose it has come into extensive use. Under the name of carton pierre a substance which is essentially papier mâché is also largely employed as a substitute

6 See further Dict. of Christ and the Gospels, s.v. The supposition that Philip of Side implies a date under Hadrian is a mistake. For the later date, see J. B. Lightfoot, Essays on "Supernatural Religion" (1890), pp. 145-216.
for plaster in the moulded ornaments of roofs and walls, and the ordinary roofing felts, too, are very closely allied in their composition to papier mâché. Under the name of ceramic papier mâché, architectural enrichments are also made of a composition derived from paper pulp, resin, glue, a drying oil and acetate of lead. Among the other articles for which the substance is used may be enumerated masks, dolls' heads and other toys, anatomical and botanical models, artists' lay figures, milliners' and clothiers' blocks, mirror and picture-frames, tubes, &c.

The materials for the commoner classes of work are old waste and scrap paper, repulped and mixed with a strong size of glue and paste. To this very often are added large quantities of ground chalk, clay and fine sand, so that the preparation is little more than a plaster held together in a firm mass. The resulting pulp (pulverized paper) is now largely used for making papier mâché. For the finest class of work Clary's original method is retained. It consists of soaking several sheets of a specially made paper in a strong size of paste and glue, these together, and pressing the mass into the desired shape. The whole is dried in a stove, and, if necessary, further similar layers of paper are added, till the required thickness is attained. The dried object is hardened by dipping in oil, after which it is varnished and prepared for japanning and ornamentation. For very delicate relief ornaments, a pulp of scrap paper is prepared, which, after drying is ground to powder, and a powder of varnish is added. The varnish is then thoroughly incorporated into a fine smooth stiff paste. The numerous processes by which surface decoration is applied to papier mâché differ in no way from the application of like ornamentation to other surfaces, but the dense, firm mass of paper MAKES THE WORK STRONG, DURABLE, SUBSTANTIAL, and possibly not subject to war or fracture, and unaffected by damp.

See L. E. Andé, Die Fabrikation der Papiermaché- und Papierstoff-Waren (Vienna, 1900); A. Winer, Die Bereitung und Benützung der Papiermaché und ähnlicher Kompositionen (4th ed., Weimar, 1907).

PAPIN, DENIS (1647–1712), French physicist, one of the inventors of the steam-engine, was a native of Blois, where he was born on the 22nd of August 1647. In 1661 or 1662 he entered upon the study of medicine at the university of Angers, where he graduated in 1669. Some time prior to 1674 he removed to Paris and assisted Christiana Huygens in his experiments with the air-pump. The results of his work (Experiences des fluides) were published at Paris in that year, and also in the form of five papers by Huygens and Papin jointly, in the Philosophical Transactions for 1675. Shortly after the publication of the Experiences, Papin, who had crossed to London, was hospitably received by Robert Boyle, whom he assisted in his laboratory and with his writings. About this time also he introduced into the air-pump the improvement of making it with double barrels, and replacing by the two valves the turncock hitherto used; he is said, moreover, to have been the first to use the plate and receiver. Subsequently he invented the condensing-pump, and constructed, in 1676, a pump which worked by the force of steam, and which was exhibited by him at the Royal Society. In the previous year he had exhibited to the society his famous "steam digester, or engine for softening bones," afterwards described in a tract published at Paris and entitled La Manière d'amollir les os et de faire couire toute sortes de viandes en fort peu de temps et à peu de frais, avec une description de la manire, ses proprietés et ses usages. This device consisted of a vessel provided with a tightly fitting lid, so that under pressure its contents could be raised to a high temperature; a safety valve was used, for the first time, to guard against an excessive rise in the pressure. After further experiments with the digester he accepted an invitation to Venice to take part in the work of the recently founded Academy of the Philosophical and Mathematical Sciences; here he remained until 1684, when he returned to London and received from the Royal Society an appointment as "temporary curator of experiments," with a small salary. In this capacity he carried on numerous and varied investigations. He discovered a siphon acting in the same manner as the "siphon wittembergicus" (Phil. Tr., 1685), and also constructed a model of an engine for raising water from a river by means of pumps worked by a water-wheel driven by the current. In November 1687 he was appointed to the chair of mathematics in the university of Marburg, and here he remained until 1696, when he removed to Cassel. From the time of his settlement in Germany he carried on an active correspondence with Huygens and Leibnitz, which is still preserved, and in one of his letters to Leibnitz, in 1698, he mentions that he is engaged on a machine for raising water to a great height by the force of a jet. In later communication he speaks of a little carriage he has constructed to be propelled by this force. Again in 1702 he wrote about a "steam ballast," which he anticipated would "promptly compel France to make an enduring peace." In 1705 Leibnitz sent Papin a sketch of Thomas Savery's engine for raising water, and this stimulated him to further experiments, which resulted two years afterwards in the publication of the Ars nova ad aquam ignis adminiculo efficacissime elevandam (Cassel, 1707), in which his high-pressure boiler and its applications are described (see Steam Engine).

In 1709 he resolved to quit Cassel for London, and on the 24th of September of that year he sailed with his family, a vessel which he had ingeniously constructed, propelled by paddle-wheels, to be worked by the crew, with which he apparently expected to reach the mouth of the Weser. At Münden, however, the vessel was confiscated at the instance of the boatmen, who objected to the invasion of their exclusive privileges in the Weser navigation. Papin, on his arrival in London, found himself without resources and almost without friends; applications through Sir Hans Sloane to the Royal Society for grants of money were made in vain, and he died in total obscurity, probably about the beginning of 1712. His name is attached to the principal street of his native town, Blois, where he is commemorated by a bronze statue.

The published writings of Papin, besides those already referred to, consist for the most part of a large number of papers, principally on hydraulics and pneumatics, contributed to the Journal des savants, the Nouveaux de la république des lettres, the Philosophical Transactions, and the Acta eruditorum; many of them were collected by himself into a Fasciculus dissertationum (Marburg, 1695), of which he published also a translation into French, Recueil de diverses pièces touchant quelques nouvelles machines (Cassel, 1695). His correspondence with Huygens, Leibnitz, and other colleagues was published by Dr Ernst Gerland (Leibitzens et Huygens Briefwechsel mit Papin, nebst der Biographie Papins (Berlin, 1851), and also by L. de Salmayye and E. Pién, La Vie et les ouvrages de Denis Papin (Paris, 1860), and Baron Ernouf, Denis Papin, sa vie et ses ouvrages (4th ed., 1888).

PAPINEAU, LOUIS JOSEPH (1786–1851), Canadian rebel and politician, son of Joseph Papineau, royal notary and member of the house of Assembly of Lower Canada, was born at Montreal on the 7th of October 1786. He was educated at the seminary of Quebec, where he developed the gift of declamatory and persuasive oratory. He was called to the bar of Lower Canada on the 19th of May 1810. On the 18th of June 1818 he was elected a member of the House of Assembly of the province of Lower Canada, and he remained in that position until the 29th of March 1822, when the constitution of the house, being already recognized as the leader of the French Canadian party. At this time there were many grievances in the country which demanded redress; but each faction was more inclined to insist upon the exercise of its special rights than to fulfil its common responsibilities. In December 1820 Lord Dalhousie, governor of Lower Canada, appointed Papineau a member of the executive council; but Papineau, finding himself without real influence on the council, resigned in January 1823. In that year he went to England to protest on behalf of the French Canadians against the projected union of Upper and Lower Canada, a measure which he was successful. Nevertheless his opposition to the government became more and more pronounced, till in 1827 Lord Dalhousie refused to confirm his appointment to the speakership, and resigned his governorship when the house persisted in its choice. The aim of the French Canadian opposition at this time was to obtain financial and also constitutional reforms. Matters came to a head when the legislative assembly of Lower Canada refused supplies and Papineau arranged for concerted action with William Lyon Mackenzie, the leader of the reform party in Upper Canada. In 1829 Lord Grey, the new, along with Lower Canada, was instructed by the cabinet in London to inquire into the alleged grievances of the French Canadians. But the attitude
of the opposition remained no less hostile than before, and in March 1837 the governor was authorized to reject the demand for constitutional reform and to apply public funds in his control to the purposes of government. In June a warning proclamation by the governor was answered by a series of violent speeches by Papineau, who in August was deprived of his commission by the government. The latter had formerly professed a deep reverence for British institutions, and he had acquired a theoretical knowledge of the constitution, but he did not possess the qualities of a statesman, and consequently in his determination to apply the strict letter of the constitution he overlooked those elements and compensating forces and powers which, according to the tone of his speeches and the usage and practice of British institutions, and had given them permanence. In his earlier career he had voiced the aspirations of a section of the people at a time when it appeared to them that their national existence was threatened. In the course of time party strife became more bitter; real issues were lost sight of; and Papineau, falling in with the views of one O'Callaghan, who distrusted everything British, became an annexationist. Realizing that his cause was not advanced by persuasive eloquence, he adopted a threatening attitude which caused men of sober judgment to waver in their allegiance. These men denounced as traitors; but a band of youthful enthusiasts encouraged their leader in his revolutionary course. The bishop of Montreal and of Quebec, and a large number of the citizens, protested, but nothing less than bloodshed would satisfy the misguided patriots. On the 23rd of October 1837 a meeting of delegates from the six counties of Lower Canada was held at St. Charles, at which resistance to the government by force of arms was decided upon, and in which Papineau took part. In November preparations were made for a general stampede at Montreal, and on the 7th of the month Papineau's house was sacked and a fight took place between the "constitutionalists" and the "sons of liberty." Towards the middle of November Colonel Gore was ordered to arrest Papineau and his principal adherents on a charge of high treason. A few hundred armed men had assembled at Saint Denis to resist the troops, and early on the morning of the 22nd of November hostilities commenced, which were maintained for several hours and resulted in many casualties. On the eve of the fray Papineau sought safety in flight, followed by the leading spirits of the movement. On the 1st of December 1837 a proclamation was issued, declaring Papineau a rebel, and placing a price upon his head. He had found shelter in the United States, where he remained in safety throughout the whole period of the fighting. The rebellion broke out afresh in the autumn of 1838, but it was soon repressed. Those taken in open rebellion were deported by Lord Durham to save them from the scaffold; and although 90 were condemned to death only 12 were executed.

Attempts have been made to transfer the responsibility for the act of violence to O'Callaghan and other prominent leaders in the revolt; but Papineau's own words, "The patriots of this city would have avenged the massacre but they were so poor and so badly organized that they were not fit to meet the regular troops," prove that he did not disownenance recourse to arms. Writing of the events of 1837 in the year 1848 he said: "The smallest success at Montreal or Toronto would have induced the American government, in spite of its president, to support the movement." It would thus seem that he was intriguing to bring about intervention by the United States with a view to annexation; and as the independance of the French Canadian race, which he prosessed to desire, could not have been achieved under the constitution of the American republic, it is inconsistent to regard his services to his fellow-countrymen as those of a true patriot. Papineau, in pursuing towards the end a policy of blind passion, overlooked real grievances, and prevented remedial action. After the rebellion relief was accorded because the obstacle was removed, and it is evident that a broad-minded statesman, or a skilful diplomat, would have accomplished more for French Canada than the fiery eloquence and dubious methods of a leader who plunged his followers into the throes of war, and deserted them at the supreme moment. From 1839 till 1847 Papineau lived in Paris. In the latter year an amnesty was granted to those who had participated in the rebellion in Canada; and, although in June 1838 Lord Durham had issued a proclamation threatening Papineau with death if he returned to Canada, he was now induced to the benefit of the amnesty. On his return to Canada, where the two provinces were now united, he became a member of the lower house and continued to take part in public life, demanding "the independence of Canada, for the Canadians need never expect justice from England, and to submit to her would be an eternal disgrace." He unsuccessfully agitated for the re-division of upper and lower Canada, and in 1854 retired into private life. He died at Montebello, in the province of Quebec, on the 24th of September 1871.

PAPINIAN (AEMILIUS PAPINIANUS) Roman jurist, was magister liberorum and afterwards praetorian prefect of the empire and Septimus Severus. He was an intimate friend of the emperor, whom he accompanied to Britain, and before his death Severus specially commended his two sons to his charge. Papinian tried to keep peace between the brothers, but with no better result than to excite the hatred of Caracalla, to which fell a victim in the general slaughter of Geta's friends which followed the fratricide of A.D. 212. The details are variously related, and have undergone legendary embellishment, but the murder of Papinian, which took place under Caracalla's own eyes, was one of the most disgraceful crimes of that tyrant. Little more is known about Papinian. He was perhaps a Syrian by birth, for it is said to have been a kinsman of Septimus Severus' second wife, Julia Domna; that he studied law with Severus under Scaevola is asserted in an interpolated passage in Spartan (Curacaol. c. 8). Papinian's place and work as a jurist are discussed under Roman Law.

PAPPENHEIM, GOTTFRIED HENRICH, COUNT OF (1594–1632), imperial field marshal in the Thirty Years' War, was born on the 20th of May 1594 at the little town of Pappenheim on the Altmühl, now in Bavaria, the seat of a free lordship of the empire, from which the ancient family to which he belonged derived its name. He was educated at Altdorf and at Tübingen, and subsequently travelled in Southern and Central Europe, mastering the various languages, and seeking knightly adventures. His stay in these countries led him eventually to adopt the Roman Catholic faith (1614), to which he devoted the rest of his life. At the outbreak of the great war he abandoned the legal and diplomatic career on which he had embarked, and in his zeal for the faith took service in Poland and afterwards under the Catholic League. He soon became a lieutenant-colonel, and displayed brilliant courage at the battle of the White Hill near Prague (Nov. 8, 1620), where he was left for dead on the field. In the following year he fought against Mansfeld in western 1The family of Pappenheim is of great antiquity. In the 12th century they were known as the "marshals of Kalatin (Kalten)"; in the 13th they first appear as counts and marshals of Pappenheim, their right to the hereditary marshalty of the empire being confirmed to them by the emperor Louis IV. in 1334. After the Golden Bull of 1356 they held both marshalty and castle of Pappenheim as fiefs of the Saxon electorate. In the 17th century the family was represented by several lines: those of Pappenheim (which held the margraviate of Stüblingen till 1635), Treutlingen and Aletzheim, and the older branches (dating from the 13th and 14th centuries) of the marshals of Biberach and of Rechberg-Wertingen-Hohenreichen. Gottfried Heinrich, who belonged to the Treutlingen branch, was the only one of this ancient and widely-ramified family to attain a position in the state. Whether members of it played a strenuous, if subordinate, part in the history of Germany. The family, mediatised under Bavaria in 1806, survives now in the descendants of the Aletzheim branch.
Germany, and in 1623 became colonel of a regiment of cuirassiers, afterwards the famous "Pappenheimers." In the same year, as an ardent friend of Spain, the ally of his sovereign and the champion of his faith, he raised troops for the Italian war and served with the Spaniards in Lombardy and the Grisons. It was his long and heroic defence of the post of Riva on the Lake of Garda which first brought him conspicuously to the front. In 1626 Maximilian of Bavaria, the head of the League, recalled him to Germany and entrusted him with the suppression of a dangerous revolt which had broken out in the Lower Palatinate. Pappenheim swiftly carried out his task, encountering a most desperate resistance, but always successful; and in a few weeks he had crushed the rebellion with ruthless severity (actions of Effenidingen, Gnünden, Vöcklabruck and Wolssegg, 15th-30th November 1626). After this he served with Tilly against King Christian IV. of Denmark, and besieged and took Wolfenbüttel. His hope of obtaining the sovereignty and possessions of the evicted prince was, after a long intrigue, definitely disappointed. In 1628 he was made a count of the empire. The siege and storm of Magdeburg followed, and Pappenheim, like Tilly, has been described as the most vigorous and skillful of all the captains of the Thirty Years' War. It is said that, disappointed, he resigned his command and retires to Saxony, and there composed the "Collection", a mathematical encyclopaedia, which will be described later. We shall not concern ourselves with this work, for it is an imitation of Pappus of Alexandria, who wrote commentaries on the "Syntaxis mathematica", and flourished in the reign of Theodosius I. (A.D. 379-395). Suidas says that Pappus wrote a commentary upon the same work of Ptolemy. But it would seem incredible that two contemporaries should have at the same time and in the same style composed commentaries upon one and the same work, and yet neither should have been mentioned by the other, whether as friend or opponent. It is more probable that Pappus's commentary, which has disappeared, was largely assimilated by the latter, and that Suidas, through failure to disconnect the two commentaries, assigned a like date to both. A different date is given by the marginal notes to a 15th-century MS., where it is stated, in connexion with the reign of Diceloctian (A.D. 284-305), that Pappus wrote during that period; and in the absence of any other testimony it seems best to accept the date indicated by the scholiast.

The great work of Pappus, in eight books and entitled "Syntaxis or Collection", we possess only in an incomplete form, the first book being lost, and the rest having suffered considerably. Suidas enumerates it in his Commentary on Ptolemy's work is discussed by Hultsch, Pappicollecto (Berlin, 1878), vol. iii. p. xiii. seq. Pappus himself refers to another commentary of his own on the "Arithmetica of Dicodorus, of whom nothing is known. He also wrote commentaries on Euclid's Elements (of which fragments are preserved in Proclus and the Scholia, while that on the tenth Book has been found in an Arabic MS.), and on Ptolemy's "Arithmetica".

The characteristics of Pappus's Collection are that it contains an account, systematically arranged, of the most important results obtained by his predecessors, and, secondly, notes explanatory of, or extending, previous discoveries. These discoveries form, in fact, a text upon which Pappus enlarges discursively. Very valuable are the systematic introductions to the various books which set forth clearly in outline the contents and the general scope of the subjects to be treated. From these introductions we are able to judge of the style of Pappus's writing, which is excellent and even elegant. He is free from the want of a mathematical style which characterizes some of his contemporaries, and in his brief and succinct statements he eschews all unnecessary detail and expression. At the same time, his characteristic exactness makes his collection a most admirable substitute for the texts of the many valuable treatises of earlier mathematicians of which time has deprived us. We proceed to sumarize briefly the contents of that portion of the Collection which has survived, mentioning separately certain propositions which seem to be among the most important.

We can only conjecture that the lost book i. as well as book ii. was concerned with arithmetical work, and was clearly intended as the beginning of a new subject. The whole of book ii. (the former part of which is lost, the existing fragment beginning in the middle of the 14th proposition) related to a system of multiplication due to Apollonius of Perga. On this subject see Nesselmann, Algebra der Griechen (Berlin, 1842), pp. 125-134; and M. Cantor, Gesch. d. Math. i. 331.

Book iii. contains geometrical problems, plane and solid. It may be divided into five sections: (1) On the famous problem of finding two mean proportionals between two given lines, which arose from that of duplicating the cube, reduced by Hippocrates to the former. Pappus gives several solutions of this problem, including a method of making successive approximations to the solution, the significance of which he apparently failed to appreciate; he adds his own solution of the more general problem of finding geometrically the side of a cube whose content is in any given ratio to that of a given one. (2) On the arithmetic, geometric and harmonic means between two straight lines, and the problem of representing all three in one and the same geometrical figure. This serves as an introduction to a general theory of means, of which Pappus discourses in ten Kappus, and gives a table representing examples of each in whole numbers. (3) On a curious problem suggested by Eucl. i. 21. (4) On the inscribing of each of the five regular polyhedrons in a sphere, an addition by a later writer on another solution of the first problem of the book. Of book iv. the title and preface have been lost, so that the programme has to be gathered from the book itself. At the beginning
PAPUANS

M. L. II.

the well-known generalization of Eucl. i. 47, then follow various theorems on the circle, leading up to the problem of the construction of a circle which shall circumscribe three given circles, touching each other two and two. This and several other propositions on the construction of circles of equal diameter, and on the intersection of two lines, are illustrated by the figure made of three semicircles and known as αδρων (shoemaker's knife) or τρισυγκεντρωτα, a method of doubling the cube), and the curve discovered most probably by Hippasus of Elis about 420 B.C., and known by the name of μενήλαος or μουσα (the latter being the descriptive name of a kind of curve of double curvature called by Pappus the helix on a sphere; it is described by a point moving uniformly along the arc of a great circle, which itself turns about its diameter uniformly, the result being the same kind of curve as the evolute of a conchoid of a conchoid of a conic or a spiral, expressed in the same kind by means of the quadratrix and spiral. In one solution of the former problem is the first recorded use of the property of a conic (a hyperbola) with reference to the focus and directrix.

In book v., after an interesting preface concerning the points and polygons, and containing remarks upon the hexagonal form of the cells of honeycombs, Pappus addresses himself to the comparison of curves, in which he draws a circle, a sphere, the surface of a sphere, the surface of a cone, and the surface of a cylinder. Of these, he enumerates works of Euclid, Apollonius, Aristaeus and Eratosthenes, thirty-three books in all, the substance of which he intends to give, with the lemmas necessary for their elucidation. With the treatise of T. Ang. and the solution of more general cases of the problem of porism to theorem and problem. In the same preface is included (a) the famous problem known by Pappus's name, often enunciated thus: Having given a number of straight lines, to find the geometric locus of a point such that its distance from a given point bears a constant ratio to its distance from a given straight line on a conic; and (b) the geometrical theory of the section of Apollonius, lemmas which, closely examined, are seen to be cases of the involution of six points; (2) important lemmas on the conics of Euclid (see Porism); (3) a lemma upon the Surface Loci which states that the locus of a point such that its distance from a given point bears a constant ratio to its distance from a given straight line on a conic, and is followed by proofs that the conic is a parabola, ellipse, or hyperbola according as the constant ratio is equal to, less than or greater than 1 (the first recorded proofs of the properties, which do not appear in Apollonius).

Lastly, book v., treats principally of mechanics, the properties of the cone, the sphere, the cylinder, the ellipsoid, of the plumb bob, of the lever and balances, and some questions of pure geometry. Proposition 14 shows how to draw an ellipse through five given points, and Prop. 15 gives a simple construction for the axes of an ellipse when a pair of conjugate diameters are given.

AUTHORS.—Of the whole work of Pappus the best edition is that of Hultsch, bearing the title Pappi alexandrini collectiones mathematicae in libros octo, quae suprema in hac collecta, cum commentariis inuentis Friderici Hultsch (Berlin, 1876-1878). Previously the entire collection had been published only in a Latin translation, Pappi alexandrini mathematicae collectiones a Federico Commandino in latinum conversae, condam quatuor tractat (Pesaro, 1588) (reprinted at Venice, 1589, and Pesaro, 1602). A second (interior) edition of this work was published by Carolus Mariae Neudorff in 1700.

Of books which contain parts of Pappus's work, or treat incidentally of, it may mention the following titles: (1) Pappi alexandrini collectiones mathematicae nunc primum Graece edidit Herm. Jos. Eisenmann, libri quinque pars altera (Parisii, 1824). (2) Pappi alexandrini secundii libri mathematicae collectionem fragmentum in codice MS. editum latinitam fecit nuntius illustravt Johanns Wallis ( Oxoniis, 1688). (3) Apollonii peripatetici de sectione rationis libri duo ex arabo M. S. ibi tota literis, acuentius de sectione quarti Pseudo Apollonio (Oxonii, 1706). (4) Der Sammlung des Pappus von Alexandriae siebentes und achtes Buch griechisch und deutsch, published by C. I. Gerhardt, Halle, 1871. (5) The portions relating to Apollonius are reprinted in Heiberg's Apollonius, ii. 101 seq.

PAPUANS (Malay: papan or papan-papan, "frizzled," "woolly-haired," in reference to their characteristic hairdressing, and the name given to the people of New Guinea and the other islands of Melanesia. The pure Papuan seems to be confined to the north-western part of New Guinea, and possibly the interior. But Papuans of mixed blood are found throughout the island (unless the Karons be of Negro stock), and from Flores in the west to Fiji in the east. The ethnological affinities of the Papuans have not been satisfactorily settled. Physically they are negroid in type, and while tribes allied to the Papuans have been traced through Timor, Flores and the highlands of the Malay Peninsula to the Deccan of India, these "Oriental negroes," as they have been called, have many curious resemblances to some East African tribes. Besides the appearance of the hair, the raised cheek, and the facial expression, the Papuans are of the practices for testing the courage of youths, &c., they are equally rude, merry and boisterous, but amenable to discipline, and with decided artistic tastes and faculty. Several of the above practices are common to the Australians, who, though generally inferior, have many points of resemblance (osteological and other) with Papuans, to whom the extinct Tasmanians were still more closely allied. It may be that from an indigenous Negro stock of the Indian archipelago both negroes and Papuans sprang, and that the latter are an original cross between the Negrory and the immigrating Caucasian who passed eastward to form the great Polynesian stock. The typical Papuan is distinctly tall, far exceeding the average Malay height, and is seldom shorter, often taller, than the European. He is strongly built, somewhat "spur-heeled." He varies in colour from a sooty-brown to a black, little less intense than that of the darkest negro. He has a small dolichocephalous head, prominent nose somewhat curved and high but depressed at the tip, high narrow forehead with projecting brows, oval face and dark eyes. The jaw projects and the lips are full. His hair is black and frizzly, worn generally in a mop, often of large dimensions, but sometimes worked into plaited or braided or plaited, and the skin is rough and scarred by small bunsches, and carefully tied back are round with fine vegetable fibre from the roots up to within about two inches from the head. Dr Turner gives a good description of this process. He once counted the bunsches on a young man's head, and found them near seventy. There is usually little hair on the face, but chest, legs and arms are generally hairy, the hair short and crisp.

The constitution of society is everywhere simple. The

1 Huxley believed that the Papuans were more closely allied to the negroes of Africa than any other race. Later scientists have also favored the theory that the Negritos, the Papuans and the Semangs of the Malay Peninsula. Alfred Russel Wallace pronounced against this hypothesis in an appendix to his Malay Archipelago (1835 ed., p. 602), where he observes that the "black, woolly-haired races of the Philippines, the Malay Peninsula... have little affinity or resemblance to the Papuans.

2 Dr. A. R. Meyer, who spent several years in the Malay Archipelago and New Guinea, developed a contrary conclusion in his Die Negritos der Philippinen (1878) in which he holds that the Negritos and Papuans are identical, and that possibly, or even probably, the former are an offshoot of the latter, like some Polynesian islanders. A. C. Haddon, discussing in Nature (September 1890), a paper by Dr Meyer in English on the same subject (The Distribution of the Negritos, Dresden, 1890), practically adopted Meyer's views, after an independent examination of numerous skulls. As to how the Negritos and Papuans are the result of independent, and very much more distant islands, information is lacking.

3 Nineteen Years in Polynesia, pp. 77, 78.
people live in village communities whose members appear to be more or less inter-related. There are no priests and no hereditary chiefs, though among the more advanced tribes rank is hereditary. Totemic clans have been observed in Torres strait, and on the Finsch and west coasts. Chiefship is quite unrecognized, except on the Keiriana Islands. Possessions, such as gardens, houses, pigs, &c., belong to individuals and not to the community, and pass to the owner's heirs, who differ in relationship in different districts. The land within certain boundaries belongs to the tribe, but a mother may take possession of any unappropriated portion. There are certain degrees of relationship within which a man may not marry. In some districts he may not marry into his own village, or into his mother's tribe; in others he may select a wife from certain tribes only. Payment, or a present, is always made for a wife to her father, brother or guardian (who is generally her maternal uncle). Presents are also often made to the bride. Polygamy is practised, but not frequently, and from the wife (or wives) there comes no opposition. The child belongs sometimes to the mother's, sometimes to the father's tribe. The Papuan woman, who is, as a rule, more Nurses and midwives have the household drudge, and does the greater part of the outdoor work, but the man assists in clearing new gardens and in digging and planting the soil.

In western New Guinea, according to the Dutch missionaries, there is a vague notion of a universal spirit, practically represented by several malevolent powers, as Manoein, the most powerful of all; various evil spirits; Nakappi, a malevolent spirit, who possesses himself of the clouds above the trees, a sort of Erl-König who carries off children; Faknik, in the rocks by the sea, who raises storms. As a protection against these the people construct—having first wisely provided a seat for the spirit—out of tree trunks and paper birds. The Papuans are very superstitious. They invoke the spirits of the dead, and sometimes even to protect their имени, the karawar. They have a belief that spirits and spirits—some, it is supposed, to discover a crime. Temples (so called) are found in the north and west, built like the houses, but larger, the piles being carved into figures, and the roof-beams and other prominent points decorated with representations of crocodiles or lizards, coarse human figures, and other grotesque ornamentations; but they are not used. Neither temples nor images (except small figures worn as amulets) are carved by the people themselves. The papuan is great dread of departed spirits, especially those of the hostile inland tribes, and of a being called Vata, who causes disease and death. All Papuans believe that within them resides an invisible other self. They believe that the body is the house of sleep and death after hovers for some period at least round the scenes of its embodied life. This ghost acquires supernatural powers, which at any time it may return to exercise inimically to relations or friends among the living, and may haunt woods or forests or mountains, malevolent—never embodied—spirits love to be abroad. These are the spirits which, taking up their abode in a village, cause disease and death; and to escape from such attacks the inhabitants may fly the village for good, and, by dwelling scattered in the recesses of the forest for a time before choosing a new site, they hope to throw their enemy off their trail. Spirits of evil, but not of good, therefore require to be propitiated. The powers of nature—thunder, lightning and storm, all supposed to be caused by evil and angry spirits—are held in the greatest dread. Under the category of religious observances may perhaps come those held previously in the course of trade, or by the great trading or lascaris. Their taboo-proclaiming customs, their ceremonial and sacred initiation ceremonies for boys and girls on reaching puberty, when masks are worn and the "bull-roarer" swung, as also the feasts during which ceremonies, huge trophies and the place of field and forest are erected, preparatory to a huge feast enlivened with music and dancing. In the north and north-east of New Guinea ancestor-worship is more developed. Among the Hellsers and Wiaminwiamin, in buying, selling, hunting, fishing and in war, as well as for protection against evil. Circumcision is practised in some regions. Although some of the coast peoples are nominally Mahommedans, and some few heathen, any real community have been made, the vast majority of Papuans remain pagan.

The dead are disposed of in various ways. The spirit is supposed not to leave the body immediately, and a corpse is either buried for a day or two, or burnt; the ashes are scattered and some in or near the deceased's dwelling or in some distant cave; or the body is exposed on a platform or dried over a fire, and the mummy kept for a few years. Sometimes the head, often the jaw-bone and portions of the skeleton are preserved as relics. Little houses are frequently erected over the grave as a habitation for the spirit. In one tribe, to the spirit of the deceased is offered a little basket of food, with which she is supposed to return to her head, smear her body with black and the exudations of the corpse, and wear mourning for a long time. The dead are referred to by some roundabout phrase, never by name, for this might have the bad effect of attracting the attention of evil spirits. The ceremonies that attend exhuming the corpse of a chief are in the moon, and are particularly active at full moon. The houses which they haunt, and beneath or near which their bodies are buried, are entered from time to time, especially by a newly-married couple or by women before child-birth.

Yams, taro and sweet potatoes constitute in some districts the main food of the people, while in others sago is the staple diet. Fruits, nuts, and roots are also eaten. Manioc, which is either boiled or roasted, and rice, which are not indigenous—are eagerly sought after. The Papuan varies his vegetable diet with the flesh of the wild pig, wallabi and other small animals, which are hunted with bows and arrows. Their staple beverages are potatoes, which are ground into a coarse powder in baskets, and smoked. Tobacco is inhaled through a pipe; on some occasions it is smoked and chewed. Drums and gongs are frequently used in ceremonies, and in war-time. Tobacco is also used for the preparation of an intoxicating drink, either in the habit of a卐ottle, and in some parts of the south. The Papuans are believed to come from the south, and their language is probably of a proto-Australian type.

CLOTHING. Among the southern Papuans, who are known as the Hulsen, the Bismarck, and other similar tribes, the girdle of leaves. In the more civilized parts cotton garments are used. Papuans have usually a great dislike to rain and carry a mat of pandanus leaves as a protection against it. Except in one or two localities (in the many parts of the north-east, and west), the women are invariably decently clothed. The Papuan loves personal adornment and loses no chance of dressing himself up. His chief home-made ornaments are necklaces, of which there are several kinds; a great many earrings, often without any exception to one or two, or a flower, are worn through the septum of the nose. With his head encircled by a coronet of dogs' teeth, and hands and fingers adorned with rings, he is, to all intents and purposes, a savage. The skin is used for the covering of his body, and is usually dyed black; the hair on his head and arms is cut short, and the rest of the body is left in its natural condition. The Papuan loves personal adornment and loses no chance of dressing himself up. His chief home-made ornaments are necklaces, of which there are several kinds; a great many earrings, often without any exception to one or two, or a flower, are worn through the septum of the nose. With his head encircled by a coronet of dogs' teeth, and hands and fingers adorned with rings, he is, to all intents and purposes, a savage.

Music. The Papuans build excellent canoes and other boats, and in some districts they are also good sailors. In the northern part of New Guinea the best craft coming from East Cape and the Louisiades. These boats are either plain dug-outs, with or without outriggers, or regularly built by planks tightly laced and secured by bolts, and cotton laces. The vessel is of such material, and is covered with papyrus, and is used for carrying its cargo of provisions, and for its own crew of residents. The deck high casks are built for the reception of some thousands of pieces of pottery, and are known as the "lakatoi," composed of several capacacious dug-outs, each nearly 50 ft. long, which are strongly lashed together to a width of some 24 ft., decked and fitted with a long sail. The deck high casks are built for the reception of some thousands of pieces of pottery, and are known as the "lakatoi," composed of several capacacious dug-outs, each nearly 50 ft. long, which are strongly lashed together to a width of some 24 ft., decked and fitted with a long sail. of feet or an evolutionary march—almost invariably goes, but rarely singing. All sorts of jingling sounds also are music to the ear, especially the clattering in time of strings of beads through dry shells, and the sound of the many gongs and huge wooden hand drums, leg-hands and many of the utensils, implements and weapons.

Nearly all Papuan houses are built in Malay fashion on piles, and this not only for the protection of their occupants from the grouped boas, or the general dampness, but also to prevent the snakes and other reptiles from entering the house. In some districts the natives live together in one of these giant structures, which are divided into compartments. Communal dwellings on a much smaller scale occur at Melora, east of the Astrolabe Bay. These are built in a rude but excellent style, with a projecting roof nearly reaches the ground. Owing to the narrowness of the strips of land, the frame of the house is supported by table or bench stands, outside, by the men only, for meals and for the subsequent siesta.

In east New Guinea sometimes the houses are two-storied, the Lower part being used for stores. The ordinary house is 60 to 70 ft. long, with a passage down the centre, and stands on a platform or veranda raised on piles, with the ridge-pole projecting considerably at the gables so that the roof may cover it at each end. Under this the houses, built in high trees, are more or less peculiar to British New Guinea. On the north-east coast many of the villages are tastefully kept, their whole area being clean swept, nicely sanded, and planted with bamboos, and the clusters of these are often decorated with a checkered or striped design. The smaller houses, made of nipa and hau, are of more uniform size. The palaver places laid with flat stones, each with an erect stone pillar as a back-rest. Excellent suspension bridges span some of the larger rivers, made of interlaced rattan ropes secured to trees on opposite sides, and similar to those seen in Sumatra to suggest some Malay influence.

Papuan weapons are the bow and arrow (in the Fly River region, the north and north-western districts); a long-handled knife of a sharp segment of bamboo; a shafted stone club—rayed, nodding, or ball-headed (in use all over the island); spears of various forms, pointed and barbed; the spear-thrower (on the Flats coast); and hardwood clubs of shields, while the fish in which are cooked on the ground beneath the house, are served.

The furniture consists of earthen bowls, drinking-cups, wooden neck-rests, spoons, &c., artistically carved, mats, plaited baskets and mats, and beautiful canes, all highly decorated. In the north-east districts villages are built at a short distance off the shore, as a protection against raids by the inland tribes. The interior villages are further fortified by a stockade of the larger trees, and on the face of the ridge is difficult to access, as, though a clear view of the whole valley is had. Where such natural defences are wanting the village is protected by high palisades and by fighting platforms on the tops of the surrounding hills. The house may be built in high trees, or may be a lower structure, just sufficient to overtop the ridge of the hill and have in it their men's little huts, which are of the same kind as those seen in Sumatra as to suggest some Malay influence.

The Papuan bow and arrow is divided into two classes, one of which is larger and used only by men. The larger bow projects from the shoulder, and is a prodigious weapon, being capable of carrying with it a heavy arrow of bone as far as 70 or 80 yards. The arrows are black and are usually of sandalwood, though other materials are occasionally used. The Papuan arrows are furnished with a single barb, and are thus better than the followers imitations commonly used.

The Papuan weapons are the bow and arrow (in the Fly River region, the north and north-western districts); a long-handled knife of a sharp segment of bamboo; a shafted stone club—rayed, nodding, or ball-headed (in use all over the island); spears of various forms, pointed and barbed; the spear-thrower (on the Flats coast); and hardwood clubs of shields, while the fish in which are cooked on the ground beneath the house, are served.

**PAPYRUS**, the paper reed, the Cypserus Papyrus of Linnaeus, in ancient times widely cultivated in the Delta of Egypt, where it was used for various purposes, and especially as a writing material. The plant is now extinct in Lower Egypt, but is found in the Upper Nile regions and in Abyssinia. Theophrastus (Hist. plant. iv. 10) states that it likewise grew in Syria; and, according to Pliny, it was also a native plant of the Niger and Euphrates. Its Greek title παπυρος, Lat. *papyrus*, appears to be of Egyptian origin. By Herodotus it is usually called βῆβος. The first accurate description of the plant is given by Theophrastus, from whom we learn that it grew in shallows of 2 cubits (about 3 ft.) or less, its main root being of the thickness of a man's wrist and 10 cubits in length. From this root, which lay horizontally, smaller roots pushed down into the mud, and the stem of the plant sprang up to the height of 4 cubits, being triangular and tapering in form. The tufted head or umbel is likened by Pliny to a thyrsus.

The various uses to which the papyrus plant was applied are also enumerated by Theophrastus. Of the head nothing could be made but garlands for the shrines of the gods; but the wood of the root was employed in the manufacture of different utensils as well as for fuel. Of the stem of the plant were made boats, sails, mats, cloth, cords, and, above all, writing materials. Its pith was also a common article of food, and was eaten both raw and cooked and in its natural state. Herodotus, too, notices its consumption as food (ii. 92), and incidentally mentions that it provided the material of which the priests' sandals were made (ii. 37). He likewise refers to the use of byblus as tow for caulking the seams of ships; and the statement of Theophrastus that King Antigonus made the rigging of his fleet of the same material is illustrated by the ship's cable, ἐξ’ ἱππὸν βῆβον, wherewith the doors were fastened when Ulysses slew the suitors in his hall (Odys. xvi. 306). That the plant was itself used also as the principal material in the construction of light skiffs suitable for the navigation of the Nile, and even of the river itself, is shown by sculptures of the fourth dynasty, in which men are represented building a boat with stems cut from a neighbouring plantation of papyrus (Lepsius, *Denkm. ii. 12*). It is to boats of this description that Isaiah probably refers in the "vessels of bulrushes upon the waters" (xxvii. 2). If the Hebrew גומר (gòr�) also is to be identified with the Egyptian papyrus, something may be said in favour of the tradition that the bulrushes of which the ark was composed in which the infant Moses was laid were in fact papyrus. But
it seems hardly credible that the Cyperus papyrus could have suffered for the many uses to which it is said to have been applied and we may conclude that several plants of the genus Cyperus were comprehended under the head of byblus or papyrus—an opinion which is supported by the words of Strabo, who mentions both inferior and superior qualities. The Cyperus dives is still grown in Egypt, and is used to-day for many of the purposes named by ancient writers.

The widespread use throughout the ancient world of the writing material manufactured from the papyrus plant is attested by early writers, and by documents and sculptures. Papyrus rolls are represented in ancient Egyptian wall-paintings, and extant examples of the rolls themselves are sufficiently numerous. The most ancient Egyptian papyrus now known contains accounts of the reign of King Assa (3580-3356 B.C.). The earliest literary papyrus is that known from the name of its former owner, as the Prisse papyrus, and now preserved at Paris, containing a work composed in the reign of a king of the fifth dynasty, and computed to be itself of the age of upwards of 2500 years B.C. The papyri discovered in Egypt have often been found in tombs, and in the hands, or swallowed with the bodies, of mummies. The ritual of the dead is most frequently the subject. Besides the ritual and religious rolls, there are the hieratic, civil and literary documents, and the demotic and enchorial papyri, relating generally to sales of property. Coptic papyri mainly contain Biblical or religious texts or monastic deeds. Papyrus was also known to the Assyrians, who called it the reed of Egypt.

The early use of Papyrus among the Greeks is proved by the reference of Herodotus (v. 58) to its introduction among the Ionian Greeks, who gave it the name of διαφερα, "skins," the material to which they had already been accustomed. In Athens it was doubtless in use for literary as well as for other purposes as early as the 5th century B.C. An inscription relating to the rebuilding of the Erechtheum in 407 B.C. records the purchase of two papyrus rolls, to be used for the fair copy of the rough accounts. The very large number of classical and other Greek papyri, of the Ptolemaic and later periods, which have been recovered in Egypt, are noticed in the article on Papyrology. The rolls found in the ruins of Herculaneum contain generally the less interesting works of writers of the Epicurean school.

Papyrus also made its way into Italy, but at how early a period there is nothing to show. It may be presumed, however, that from the very first it was employed as the vehicle for Roman literature. Under the Empire its use must have been extensive, for not only was it required for the production of books, but it was universally employed for domestic purposes, correspondence and legal documents. So indispensable did it become that it is reported that in the reign of Tiberius, owing to the scarcity and dearth of the material caused by a failure of the papyrus crop, there was a danger of the ordinary business of the Empire grinding to a standstill.

The account which Pliny (N.H. iii. 11-13) has transmitted to us of the manufacture of the writing material from the papyrus plant should be taken strictly to refer to the process followed in his own time; but, with some differences in details, the same general method of treatment had doubtless been practised from some immemorial time. His text, however, is so confused, both from obscurity of style and from corruptions in the MSS., that there is much difference of opinion as to the meaning of many words and phrases employed in his narrative, and their application in particular instances of detail. In one important particular, however, affecting the primary construction of the material, there can no longer be any doubt that the old idea of there being growing between the rind and a central stalk has been abandoned, as it has been proved that the plant, like other reeds, contains only a cellular pith within the rind. The stem was in fact cut into long strips, and the stipe, or stalk, was to be cut across which another layer of shorter strips was laid at right angles. The two layers thus "woven"—Pliny uses the word tessere in describing this part of the process—formed a sheet of the material, which was then soaked in water of the Nile. The mention of a particular water has caused trouble to the commentators. Some have supposed that certain chemical properties of which the Nile water is possessed acted as a glue or cement to cause the two layers to adhere; others, with more reason, that glutinous matter contained in the material itself was solved by the action of water, whether from the Nile or any other source; and others again read in Pliny's words an implication that the Nile water was used.

The sheet was finally hammered and dried in the sun. Any roughness was levelled by polishing with ivory or a smooth shell. But the material was also subject to other defects, such as flaking between the layers, which might be detected by strokes of the mallet; spots or stains; and spongy strips (taeniotae), in which the ink would run and spoil the sheet. When such faults occurred, the papyrus must be re-made. To form a roll, the edges were united together with paste (gs being too hard), but not more than twenty sheets in a roll (scopus). As, however, there are often extant rolls consisting of more than the prescribed number of sheets for the reading of the epos corruptions, or the number was not constant in all times. The scopus seems to have been a standard length of papyrus, as sold by the stationers. The bear-sheet formed the first or outside sheet of the roll, and the others were joined on in order of quality, so that the worst sheets were in the centre of the roll. This arrangement was adopted, not for the purpose of fraudulently selling bad material under a good name, but because it was thought that the better parts of the roll should be composed of that which would best stand wear and tear. Besides, in case of the entire roll not being filled with the text, the unused and inferior sheets at the end could be better spared, and so be cut off.

The different kinds of papyrus writing material and their dimensions are also enumerated by Pliny. The best quality, formed from the fronds and strips of the plant, was named hieratica, but afterwards, in flattery of the emperor Augustus, it was called, after him, August; and the charta Latina, or second quality, was so named in honour of his wife. The hieratica thus declined to the third rank. The first two were 13 digits, or about 0.9 in. in width; the hieratica, 11 digits or 8 in. Next came the charta amphitheatrica, named after the principal place of its manufacture, the amphitheatre of Alexandria, of 9 digits or 6½ in. wide. The charta Fanumina appears to have been a kind of papyrus worked up from the amphitheatrica, by flattening and other methods was increased in width by an inch, in the factory of a certain Ludi at Rome; in which a roll of 12 digits or 12½ in. from the city of Sais, and was probably of 8 digits or 5½ in., was of a common description. The Taeniotica, named apparently from the place of its manufacture, a tongue of land (nauta) near Alexandria, was sold by width, and was of uncertain size from 4½ to 5 in. And lastly there was the common packing-paper, the charta entoporia, of 6 digits or 4½ in. Isidore (Elsomok, vi. 10) mentions yet another kind, the Corneliana, first made under C. Cornelius Gallus, prefect of Egypt, and which was the same as the amphitheatrica or Fanumina. The name of the man who had incurred the anger of Augustus may have been superseded by that of the prefect, who was a member of the family of the Fourth Georg (Birt, Anth. Buchvosen, p. 250). In the reign of the emperor Claudius also another kind was introduced and entitled Claudia. It had been found by experience that the August had been ill suited for literary use; it was accordingly reserved for correspondence only, and for other purposes was replaced by the new paper.
The *charta Claudia* was made from a composition of the first and second qualities, the *Augusta* and the *Lituus*, a layer of the former being backed with one of the latter; and the sheet was increased to nearly a foot in width. The largest of all, however, was the *markus", probably of good quality and equal to the biritonic, and a cubit or nearly 18 in. wide. It was used by Cicero (*Ep. ad Attic. xii. 25; xvi. 3*). The width, however, proved inconvenient, and the broad sheet was liable to injury by tearing.

An interesting question arises as to the accuracy of the different measurements given by Pliny. His figures regarding the width of the different kinds of papyri have generally been understood to concern the width (or height) of the rolls, as distinguished from the width of the sheet. China merchants have observed that in practice the width of extant rolls does not tally in any satisfactory degree with Pliny’s measurements; and a more plausible explanation has been offered (Birt, *Antit. Buchsen*, pp. 24 sq.) that the breadth (not height) of the individual sheets of which the rolls are composed is referred to.

The first sheet of a roll was named *παπυροβάλλων*: the last, *παπυροστίλλων*. Under the Romans, the former bore the name of the *comes largetionum*, who had control of the manufacture, with the date and name of place. It was the practice to cut out the portion thus marked; but in case of legal documents this mutilation was avoided, and all were *larentes*. In the early days of Egypt in the 7th century, the manufacture was continued, and the protocols were marked at first, as it appears, with inscriptions in both Greek and Arabic, and later in the latter language alone. There are several examples extant, some being in the British Museum, ranging between the years 670 and 715 (see facsimiles in C. H. Becker, *Papier Schrein-Reinhartd* t. (Heidelberg, 1906); and cf. *Arabischechirurgie* and *Apuliodiutomenes*, in *Zetten f. Arab. Logik* (1906), 68–104. The Arabic scripts are accompanied by curiousscraps on each side, which may be imitated from words used in the Latin inscriptions of the Roman period.

Papyri was cultivated and manufactured for writing material by the Arabs in Egypt down to the time when the growing industry of paper in the 8th and 9th centuries rendered it no longer a necessity (see *PAPIERS*). It seems to have entirely given place to vellum. It is not improbable that the Varroan century, which Varro repeated by Pliny, that papyrus was first made in Alexander’s time, should probably be taken to mean that its manufacture, which till then had been a government monopoly, was relieved from all restrictions. It is not probable, however, that it was ever manufactured from the native plant anywhere but in Egypt. At Rome there was certainly some kind of industry in papyrus, the *charta Faniana*, already referred to, being in an instance in illustration. But it seems probable that this industry was confined to the re-making of material imported into Italy, as in the case of the *charta Claudia*. This second manufacture was probably also of a different kind, perhaps a more bristle-like papyrus, as it would then have been in a dried condition requiring artificial aids, such as a more liberal use of gum or paste, in the process. The more brittle condition of the Latin papyri found at Herculanenum has been instances as the evil result of this re-making of the material.

As to cultivation of the plant in Europe, according to Strabo the Romans obtained the papyrus plant from Lake Trasimenne and other lakes of Etruria, but this statement is unsupported by any other ancient authority. At a later period, however, a papyrus was cultivated in Sicily, which has been identified by Parlatore with the Syrian variety (*Cyperus syriacus*), far exceeding in height the Egyptian plant, and having a more drooping head. It grew in the east and south of the island, where it was introduced during the Arab occupation. It was seen in the 10th century, by the Arab traveller Ibn-Haukal, in the neighbourhood of Palermo, where it thrrove luxuriantly in the pools of the Papireto, a stream to which it lent its name. From it paper was made for the sultan’s use. But in the 13th century it began to fail, and in 1391 the drying up of the Papireto caused the extinction of the plant in that district. It is still to be seen at Syracuse in the 19th century, though probably transplanted thither at a later time, and reared only as a curiosity. It is once noticed of it to be found previous to 1674. It is with this Syracusan plant that some attempts have been made in modern times to manufacture a writing material similar to ancient papyrus.

Even after the introduction of vellum as the ordinary vehicle for literature papyrus still continued to some extent in use outside Egypt, and was not entirely superseded until a late date. It is indeed, however, to be used for books sooner than for documents. In the 5th century St Augustine apologizes for sending a letter written on vellum instead of the more usual substance, papyrus (*Ep. xv.); and Cassiodorus (*Var. xii. 38*), writing in the 6th century, indulges in a high-flown panegyric on the plant and its value. Of medieval literary Greek papyri very few relics have survived, but of documents coming down to the 8th and 9th centuries an increasing number is being brought to light among the discoveries in Egypt.

Papyri in book form are still extant in different libraries of Europe, viz., the Homilies of St Avitus, of the 6th century, at Paris; Sermons and Epistles of St Augustine, of the 6th or 7th century, at Paris and Geneva; works of Hilary, of the 6th century, at Vienna; fragments of the Digests, of the 6th century, at Pommersfeld; the Antiquities of Josephus, of the 7th century, at Milan; Isidore, *De contemptu mundi*, of the 7th century, at S. Gall; and the Register of the Church of Ravenna, of the 7th century, at Munich. The employment of this material for legal purposes is sufficiently illustrated by the large number of documents in Latin which were preserved at Ravenna, and date from the 5th to the 10th century. In the papal chancery it was generally employed in the middle ages for the production of papyri rolls, and in the catalogues of the libraries and *Annali* of St Gall there are still extant several papyrus deeds, the earliest of the year 625, the latest of 692. Under Charlemagne and his successors it was not used. By the 12th century the manufacture of papyrus had entirely ceased, and appears from a note by Eustathius in his commentary on the *Odyssey* sxx, 390.

Guiana highlands, and some grassy plains on the island of Marajó and in some other places, the state is densely forested, and its lowest levels are covered with a network of rivers, lakes, and connecting channels.

The rivers of the state may be grouped under three general systems: the Amazon and its tributaries, the Tocantins and its tributaries and the rivers flowing direct to the Atlantic. The Amazon crosses the state in a general E.N.W. direction for about 930 m. Its chief tributaries, furos (arms), igarapés (creeks, or literally, "canoe paths"), by-channels and reservoir lakes form an extremely complicated hydrographic system. From the north seven large tributaries are received—the Jamundú (which forms the boundary line with Amazonas), Trombetas, Matucurá, Jauru, Pará, Jary and Anaouera-pucú. The first is, strictly speaking, a tributary of the Trombetas, though several furos connect with the Amazon before its main channel opens into the Trombetas. All these rivers have their sources on the Guiana highlands within the limits of the state, and flow southward to the Amazon over numerous rapids and falls, with comparatively short navigable channels before entering the great river. From the south two great tributaries are received—the Tapajós and Xingú—both having their sources outside the state (see Amazon). The Pará estuary, usually called the Pará river, belongs to the Tocantins, although popularly described as a mouth of the Amazon. Very little Amazon water passes through it except in times of flood. It is connected with the Amazon by navigable tidal furos, in which the current is hardly perceptible. The estuary is about 200 m. long and 5 to 30 m. wide, and receives the waters of a large number of streams, the largest of which is the Guiana and its chief tributary. A number of small rivers discharge into the Atlantic north and south of the Amazon, the largest of which are the Gurupy, which forms the boundary line with Maranhão, the Araguary, which drains a large area of the eastern slope of the Guiana highlands, and the Oiapok, which forms the boundary line with French Guiana.

Lying across the mouth of the Amazon and dividing it into three channels are the islands of Caviana and Mexiana, the first 47 m. and the second 27 m. in length, north-west to south-east, both traversed by the equator, and both devoted to cattle-raising. Somewhat different is the character of the island of Marajó, or Joannes, which lies between the Amazon and Pará estuary. It is 162 m. long by 90 m. wide, and its area is about 15,000 sq. m. This island is only partly alluvial in character, a considerable area on its eastern and southern sides having the same geological formation as the neighbouring mainland. The larger part, the north-western, belongs to the flood-plain of the Amazon, being covered with swamps, forests and open meadows, and subject to annual inundations. There are several towns and villages on the island, and stock-raising, now in a state of decadence, has long been its principal industry. Of interest to archæologists is the largest of its several lakes, called Arary, in the centre of which is a small island celebrated for its Indian antiquities, chiefly pottery. On the Atlantic coast the principal island is Maracá (lat. 2° N.), 46 m. long by 20 m. wide, which lies, in part, off the entrance to the Xama river.

Pará is crossed by the equator, and its climate is wholly tropical, but there is a wide variation in temperature and rainfall. In general, it is hot and dry on the Guiana plateau, and hot and humid throughout the forested region. In the latter, there are two recognized seasons, wet and dry, which differ only in the amount of rainfall, a strictly dry season being under normal conditions, which blow up the Amazon with much force, moderate the heat and make healthy most of the settlements on the great river itself; but the settlements along its tributaries, which are not swept by these winds, are afflicted with malaria. The population is concentrated at widely separated points on the coast and navigable rivers, except on Marajó island, where open country and pastoral pursuits have opened up inland districts. The principal occupation is the collecting and marketing of forest products such as rubber (from Hevea brasiliensis), guita-percha, or balata (Mimosops elata), Brazil nuts (Bertholletia excelsis), sarsaparilla (Smilax), cumaru or tonka beans (Dipterix odorata), copaiba (Copaeia officinarum), guarana (Paulinia sorbilis), cacao (an aromatic bark of Dicrupellum coryphellatum) and many others. In earlier days cotton, sugar-cane, rice, tobacco, cacao and even coffee were cultivated, but the demand for rubber caused their abandonment in most places. Cacao (Theobroma cacao) is still widely cultivated in some localities. Pará produces many kinds of fruits—the orange, banana, abricó, cajú, abacate (alligator pear), mango, sapotilha, fructa de Conde, grape, &c., besides a large number hardly known beyond the Amazon valley. The pastoral industries were once important in Pará, especially on the islands of Marajó, Caviana and Mexiana, and included the rearing of horses, cattle, and sheep. At present little is done in these industries, and the people depend upon importation for draft animals and fresh meat. There remain a few cattle ranges on Marajó and other islands, but the industry is apparently losing ground. Mining receives some attention on the Atlantic slope of the Guiana plateau, where gold washings of no great importance have been found in the Counani and other streams. There are no manufactures in the state outside the city of Pará (q.v.).

Transportation depends wholly on river craft, the one railway of the state, the Pará & Bragança, not being able to meet expenses from its traffic receipts. The capital of the state is Pará, or Belem do Pará, and its history is largely that of this city. Other important towns are Acremaque (pop. about 1500; of the municipio in 1890, 7539), on a by-channel of the Amazon; Breves (mun. 12,593 in 1890), a river port in the south-west part of the state; Santarém (12,666 in 1890), on the Umará river; and Bragança (mun. 16,046 in 1890), a small town in one of the few agricultural districts of the state, 574 m. by rail north-east of Pará, on the river Cateté, near the coast; Oubidos (about 1000; mun. 12,666 in 1890), on the north bank of the Amazon at a point called the Puxis narrows, a little over 1 m. wide, attractively situated on a hillside in a healthful locality; and Santarem (12,662 in 1890), on the right bank of the Tapajós, 2½ m. from the Amazon, dating from 1661, and the most prosperous and populous town between Pará and Manacás.

PARÁ (officially BELEM; sometimes BELEM DO PARÁ), a city and port of Brazil, capital of the state of Pará, and the see of a bishop, on a point of land formed by the entrance of the Guáma river into the Pará (86 m. from the Atlantic), in 5° 28' S., 48° 28' W. Pop. of the city and rural districts of the municipality (1890), 50,064; (1900, estimate), 100,000. There is a large Portuguese contingent in the population, and the foreign element, engaged in trade and transportation, is also important. The Indian admixture is strongly apparent in the Amazon valley and is noticeable in Pará. A small railway, built by the state, runs north-eastward in the direction of Bragança (112 m.), on the sea-coast. The Guáma river is enlarged at its mouth to form an estuary called the bay of Guajará, partially shut off from the Pará by several islands and forming the anchorage of the port, and the Pará is the estuary mouth of the Tocantins river. The Pará is about 20 m. wide here.

The city is built on an alluvial forested plain only a few feet above the level of the river, and its streets usually end at the margin of the impenetrable forest. The climate is hot and humid, but the temperature and diurnal changes are remarkably uniform throughout the year. The annual rainfall, according to G. L. M. Dorex, (Anais da Acad. Regia das Letras, 1895), is 128 in., of which 56 in. are credited to the rainy season (January to June). H.W. Bates gives the average temperature at 83° F., the minimum at 73°, and the maximum (2 p.m.) at 89° to 92°. These favourable climatic conditions tend to make the city healthy, but through defective drainage, insanitary habits and surroundings, and improper diet the death-rate is high. The plan of the city is regular and, owing to the density of the forest, it has no outlying suburbs. The streets are usually narrow, straight and well paved. Among the many public squares and gardens the largest are the Praça Caetano Brândão, with a
PARABLE—PARABOLA

747

The statue of the bishop of that name; the Praça da Independência, surrounded by government buildings and having an elaborate monument to General Gurjão; the Praça Visconde do Rio Branco, with a statue of José da Gama Melchior; the Praça de Baptista Campos, with artificial cascades, lake, island and winding paths; the Praça da Republica, with a monument representing the Republic; and the Praça de Prudente Moraes, named in honour of the first civilian president of Brazil. Another public outdoor resort is the Bosque, a tract of forest on the outskirts of the city. The public buildings and institutions are in great part relics of an older régime. The great cruciform cathedral, on the Praça Caetano Brândão, dates from the middle of the 18th century. In the vicinity, lying on the Praça da Independência, are the government and municipal palaces—built by order of Pombal (c. 1766), when Portugal contemplated the creation of a great empire on the Amazon. The bishop's palace and episcopal seminary, near the cathedral, were once the Jesuits' college, and the custom-house on the water-front was once the convent and church of the Mercenaries. One of the most notable buildings of the city is the Teatro da Paz (Peace Theatre), which faces upon the Praça da Republica and was built by the government during the second empire. Other noteworthy buildings are the Caridade hospital, the Misericórdia hospital (known as the "Santa Casa"), the military barracks—occupying another old convent, and the Castello fort, a relic of colonial days. Pará has a number of schools and colleges, public and private, of secondary grade, such as the Ateneo Paranense, Instituto Lauro Sodré and Lyceu Benjamin Constant. There is an exceptionally fine museum (Museu Goedil), with important collections in anthropology, ethnology, zoology and botany, drawn from the Amazon valley. The private dwellings are chiefly of the Portuguese one-storey type, with red tile roofs and thick walls of broken stone and mortar, generally plastered outside but sometimes covered with blue and white Lisbon tiles.

Pará is the entrepôt for the Amazon valley and the principal commercial city of northern Brazil. It is the headquarters of the Amazon Navigation Company, which owns a fleet of 40 river steamers, of 300 to 900 tons, and sends them up the Amazon to the Peruvian frontier, and up all the large tributaries where trading settlements have been established. Two or three coastwise companies also make regular calls at this port, and several transatlantic lines afford regular communication with Lisbon, Liverpool, Hamburg and New York. The port is accessible to large steamers, but those of light draft only can lie alongside the quays, the larger being obliged to anchor some distance out. Extensive port improvements have been undertaken, and the plans include a harbor three miles long, and a large number of minor products, such as isinglass, palm fibre, fine woods, tonka beans, deerskins, balsam copaiba, annatto, and other forest products.

Pará was founded in 1615 by Francisco Caldeira de Castello-Branco, who commanded a small expedition from Maranhão sent thither to secure possession of the country for Portugal and drive out the Dutch and English traders. The settlement, which he named Nossa Senhora de Belém (Our Lady of Bethlehem), grew to be one of the most turbulent and ungovernable towns in northern Brazil. It is the capital of the Amazon dependencies, slave-hunting, and bitter contending with the Jesuits who sought to protect the Indians from this traffic, combined to cause agitation. In 1641 it had a population of only 400, but it had four monasteries and was already largely interested in the Indian slave traffic. In 1652 the Pará territory was made a separate capitanía, with the town of Pará as the capital, but it was reannexed to Maranhão in 1654. The final settlement occurred in 1772, and Pará again became the capital, continuing as such through all the political changes that have since occurred. The bishopric of Pará dates from 1725. The popular movement in Portugal in 1820 in favour of a constitution and parliament (Cortes) had its echo in Pará, where in 1821 the populace and garrison joined in creating a government of their own and in sending a deputation to Lisbon. The declaration of Brazilian independence in 1822 and creation of an empire under Dom Pedro I. was not accepted by Pará, partly because of its influential Portuguese population, and partly through jealousy of Rio de Janeiro as the centre of political power. In 1823 a naval expedition under Lord Cochrane, then in the service of Brazil, took possession of Maranhão, from which place the small brig "Dom Miguel" under the command of Captain John Grenfell was sent to Pará. This officer conveyed the impression that the whole fleet was behind him, and on the 15th of August the junta governativa organized in the preceding year surrendered its authority and Pará became part of the newly created Brazilian empire. An uprising against the new government soon followed, which resulted in the arrest of the Jesuits and the incarceration of 253 prisoners in the hold of a small vessel, where all but four died from suffocation before morning. Conspiracies and revolts followed, and in 1835 an outbreak of the worse elements, made up chiefly of Indians and half-breeds, occurred, known as the "Revolução da Cabanagem," which was chiefly directed against the Portuguese, and then against the Freemasons. All whites were compelled to leave the city and take refuge on neighbouring islands. The Indians and half-breeds obtained the mastery, under the leadership of Antonio and Francisco Vinagres and Eduardo Angelim, and plunged the city and neighbouring towns into a state of anarchy, the population being reduced from 25,000 to 15,000. The revolt was overcome in 1836, but the city did not recover from its effects until 1848. But the opening of the Amazon to foreign trade in 1867 greatly increased the importance of the city, and its growth has gone forward steadily since that event.

(A. J. L.)

PARABLE (Gr. παραβολή, a comparison or similitude), originally the name given by Greek rhetoricians to a literary illustration avowedly introduced as such. In later Greek it came to mean a fictitious narrative or allegory (generally something that might naturally occur) by which moral or spiritual relations are typically set forth, as in the New Testament. The parable differs from the apologue in the inherent probability of the story itself, and in excluding animals or inanimate creatures from passing out of their natural sphere and assuming the powers of man, but it resembles it in the essential qualities of brevity and definiteness, and also in its Eastern origin. There are many beautiful examples of the parable in the Old Testament, that of Nathan, for instance, in 2 Sam. xii. 1-9, that of the woman of Tekoa in 2 Sam. xiv. 1-13, and others in the Prophets.

PARABOLA, a plane curve of the second degree. It may be defined as a section of a right circular cone by a plane parallel to a tangent plane to the cone, or as the locus of a point which moves so that its distances from a fixed point and a fixed line are equal. It is therefore a conic section having its eccentricity equal to unity. The parabola is the curve described by a projectile which moves in a non-resisting medium under the influence of gravity (see MECHANICS). The general relations between the parabola, ellipse and hyperbola are treated in the articles GEOMETRY, ANALYTICAL, AND CONIC SECTIONS; and various projective properties are demonstrated in the article GEOMETRY, PROJECTIVE. Here only the specific properties of the parabola will be given.

The form of the curve is shown in fig. 1, where $P$ is a point on the curve equidistant from the fixed line $AB$, known as the directrix, and the fixed point $F$ known as the focus. The line $CD$ passing through the focus and perpendicular to the directrix is the axis or principal diameter, and meets the curve in the vertex $G$. The line $FL$, perpendicular to the axis, and passing through the focus, is the semi-latus rectum, the latus rectum being the focal chord parallel to the directrix. Any line parallel to the axis is a diameter, and the parameter of any diameter is measured by the focal chord drawn parallel to the tangent at the vertex of the diameter and is equal
to four times the focal distance of the vertex. To construct the parabola when the focus and directrix are given, draw the axis CD and bisect CF at G, which gives the vertex. Any number of points on the parabola are obtained by taking any point E on the directrix, joining EG and EF and drawing FP so that the angles PFE and DFE are equal. Then EG produced meets FP in a point on the curve. By joining the points so obtained the parabola may be described. A mechanical construction, when the same conditions are given, consists in taking a rigid bar ABC bent at right angles at B (fig. 2), and fastening a string of length BC to C and F. Then if a pencil be placed along BC so as to keep the string taut, and the limb AB be slid along the directrix, the pencil will trace out the parabola.

Properties which may be readily deduced by euclidean methods from the definition include the following: the tangent at any point bisects the angle between the focal distance and the perpendicular on the directrix and is equally inclined to the focal distance and the axis; tangents at the extremities of a focal chord intersect at right angles on the directrix, and as a corollary we have that the focus of the intersection of tangents at right angles is the directrix; the circumference of a triangle circumscribing a parabola passes through the focus; the subtangent is equal to twice the abscissa of the point of contact; the subtangent is constant and equals the semilatus rectum; and the radius of curvature at a point P is 2 (FP)^3/a^2 where a is the semilatus rectum and FP the focal distance of P.

A fundamental property of the curve is that the line at infinity is a tangent (see GEOMETRY, PROJECTIVE), and it follows that the centre and the second real focus and directrix are at infinity. It also follows that a line half-way between a point and its polar parallel to the latter touches the parabola, and therefore the lines joining the middle points of the sides of a self-conjugate triangle form a circumscribing triangle, and also that the nine-point circle of a self-conjugate triangle passes through the focus. The orthocentre of a triangle circumscribing a parabola is at the focus; a deduction from this theorem is that the centre of the circle of a self-conjugate triangle is on the directrix ("Steiner's Theorem").

In the article GEOMETRY, ANALYTICAL, it is shown that the general equation of the second degree represents a parabola when the highest terms form a perfect square. This is the analytical expression of the projective property that the line at infinity is a tangent. The simplest equation to the parabola is that which is referred to its axis and the tangent at the vertex as the axes of co-ordinates, when it assumes the form y^2 = 4ax; this is a semilatus rectum; this may be deduced directly from the definition. An equation of similar form is obtained when the axes of co-ordinates are any diameter and the tangent at the vertex. The equations to the tangent and normal at the point x'y' are y'y' = 2a(x' + x) and 2a(y' - y') + y'(x' - x) = 0, and may be obtained by general methods (see GEOMETRY, ANALYTICAL, and INFINITESIMAL CALCULUS). More convenient forms in terms of a single parameter are deduced by substituting x' = am^2, y' = 2am (or on eliminating m between these relations the equation to the parabola is obtained). The tangent then becomes y' = m^2x + 2am and the directrix y = -m^2x - 2am. The envelope of this last equation is 2mxy = 4(x - 2a)^3, which shows that the evolute of a parabola is a semi-cubical parabola (see below Higher Orders).

The cartesian equation to a parabola which touches the co-ordinate axes is \( \sqrt{x+a} + \sqrt{by-1} = 1 \), and the polar equation when the focus is the pole and the axis the initial line is \( r \cos \theta = 2a \).

The equation to a parabola in triangular co-ordinates is generally derived by expressing the condition that the line at infinity is a tangent in the equation to the general conic. For example, in trilinear co-ordinates, the equation to the general conic circumscribing the triangle of reference is \( h\gamma + \alpha \eta + \alpha \beta \delta = 0 \); for this to be a parabola the line \( \alpha \beta + \beta \gamma + \gamma \alpha = 0 \) must be a tangent. Expressing this condition we obtain \( \sqrt{x+a} + \sqrt{by} + \sqrt{cz} = 0 \) as the relation which must hold between the co-efficients of the above equation and the sides of the triangle of reference for the equation to represent a parabola. Similarly, the conditions for the inscribed conic \( \sqrt{x+a} + \sqrt{by} + \sqrt{cz} = 0 \) are a parabola is \( lc+mc+nab = 0 \), and the conic for which the triangle of reference is a parabola \( la^2+mb^2 \beta_2 + \gamma c^2 = 0 \). The various forms in areal co-ordinates may be derived from the above by substituting \( \lambda a \) for \( a \), \( \mu b \) for \( b \), and \( \nu c \) for \( c \), or directly by expressing the condition for tangency of the line \( x+y+z = 0 \) to the conic expressed in areal co-ordinates. In tangential \( (p, q, r) \) co-ordinates the inscribed and circumscribed conics take the forms \( \lambda a^2 + \mu b^2 + \nu c^2 = 0 \) and \( \lambda a^2 + \mu b^2 + \nu c^2 = 0 \), these are parabolas when \( \lambda + \mu + \nu = 0 \) and \( \lambda \nu - \mu \nu = \mu \nu = 0 \) respectively.

The length of a parabolic arc may be obtained by the methods of the infinitesimal calculus; the curve is directly quadrable, the area of any portion between two ordinates being two thirds of the axis of the parabola passing parallel to the axis.

The parabola is often used to denote the curves given by the general equation \( a(x+y)^n = y^n \), thus \( ax+y = \theta \) is the parabolic or Apollonian parabola; \( ax+y = \gamma \) is the cubic parabola, \( ax+y = \alpha \) is the biquadratic parabola; \( ax+y = \beta \) is the semicubical parabola, and \( ax+y = \gamma \) is the semiquadratic parabola. These curves were investigated by René Descartes, Sir Isaac Newton, Colin Maclaurin and others. Here we shall treat only the more important forms.

The cartesian parabola is a curved line which is also known as the trident of Newton on account of its three-prolonged form. Its equation is \( xy = ax^2 + bx + c + d \), and it consists of two legs asymptotic to the axis of \( y \) and two parabolic legs (fig. 3). The simplest form is \( ax = y^3 \), in this case the serpentine position of the focus in the figure degenerates into a point of inflexion. Descartes used the curve to solve sextic equations by determining its intersections with a circle; mechanical constructions were given by Descartes (Geometry, lib. 3) and Maclaurin (Ornamental geometry).

The cubic parabola (fig. 4) is a cubic curve having the equation \( y = ax^3 + bx^2 + cx + d \). It consists of two parabolic branches tending in opposite directions. John Wallis utilized the intersection of this curve with a right line to solve cubic equations, and Edmund Halley solved sextic equations with the aid of a circle.

The parabolas are cubic curves given by the equation \( y = ax^3 + bx^2 + cx + d \). Newton discussed the five forms which arise from the relations of the roots of the cubic equation. When all the roots are real and unequal the curve consists of a closed oval and a parabolic branch (fig. 5). As the two lesser roots are made more and more equal the oval shrinks in size and ultimately becomes a real conjugate point, and the curve, the equation of which is \( y = a(x-a)(x-b)(x-c) \) consists of this point and a bell-like branch resembling the right-hand member of fig. 5. If two roots are imaginary the equation is \( y = (x-a^2)(x-b)(x-c) \) and the curve is a parabolic branch, and the curve is a parabolic branch, the two roots of which are imaginary. If the two greater roots are equal the equation is \( y = (x-a)(x-b)^2 \) (in which \( a < b \)) and the curve assumes the form shown in fig. 6, and is known as the versed parabola. Finally, if all the roots are equal, the equation becomes \( y = (x-a)^2 \); this curve is the cuspilidal or semi-cubical parabola (fig. 7). This curve, which is sometimes termed the Néllari parabola after William Néllari (1637-1707), is the evolute of the ordinary parabola, and is especially interesting as being the first...
PARACELSUS (c. 1490-1541), the famous German physician of the 16th century, was probably born near Einsiedeln, in the canton Schwyz, in 1493 or 1497 according to some, or 1493 according to others. His father, the natural son of a grandmaster of the Teutonic order, was Wilhelm von Hohenheim, who had a hard struggle to make a subsistence as a physician. His mother was the superintendent of the hospital at Einsiedeln, a post she relinquished upon her marriage. Paracelsus’s name was Theophrastus Bombast von Hohenheim; for the names Philippus and Aurelius which are sometimes added good authority is wanting, and the epithet Paracelsus, like some similar compounds, was probably one of his own making, and was meant to denote his superiority to Celsus.

Of the early years of Paracelsus’s life hardly anything is known. His father was his first teacher, and took pains to instruct him in all the learning of the time, especially in medicine. Doubtless Paracelsus learned rapidly what was put before him, but he seemed at a comparatively early age to have questioned the value of what he was expected to acquire, and to have soon struck out ways for himself. At the age of sixteen he entered the university of Basel, but probably soon abandoned the studies therein pursued. He next went to J. Trithemius, the abbot of Sponheim and afterwards of Würzburg, under whom he prosecuted chemical researches. Trithemius is the reputed author of some obscure tracts on the great elixir, and as there was no other chemistry going Paracelsus would have to devote himself to the reiterated operations so characteristic of the notions of that time. But the confection of the stone of the philosophers was too remote a possibility to gratify the fayry spirit of a youth like Paracelsus, eager to make what he knew, or could learn, at once available for practical medicine. So he left school chemistry as he had forsaken university culture, and started for the mines in Tirol owned by the wealthy family of the Fugger. The sort of knowledge he got there pleased him much more. There at least he was in contact with reality. The struggle with nature before the precious metals could be made of use impressed upon him more and more the importance of actual personal observation. He saw all the mechanical difficulties that had to be overcome in mining; he learned the nature and succession of rocks, the physical properties of minerals, ores and metals; he got a notion of mineral waters; he was an eyewitness of the accidents which befell the miners, and studied the diseases which attacked them; he had proof that positive knowledge of nature was not to be got in schools and universities, but only by going to nature herself, and to those who were constantly engaged with her. Hence came Paracelsus’s peculiar mode of study. He attached no value to mere scholarship; scholastic disputations he utterly ignored and despised—and especially the discussions on medical topics, which turned more upon theories and definitions than upon actual practice. He therefore went wandering over a great part of Europe to learn all that he could. In so doing he was one of the first physicians of modern times to profit by a mode of study which is now reckoned indispensable. The book of nature, he affirmed, is that which the physician must read, and to do so he must walk over the leaves. The humours and passions and diseases of different nations are different, and the physician must go among the nations if he will be master of his art; the more he knows of other nations, the better he will understand his own. And the commentary of his own and succeeding centuries upon these very extreme views is that Paracelsus was no scholar, but an ignorant vagabond. He himself, however, valued his method and his knowledge very differently, and argued that he knew what his predecessors were ignorant of, because he had been taught in no human school. “Whence have I all my secrets, out of what writers and authors? Ask rather how the beasts have learned their arts. If nature can instruct irrational animals, can it not much more Paracelsus?” In this new school discovered by Paracelsus and since attended with the happiest results by many others, he remained for about ten years. He had acquired great stores of facts, which it was impossible for him to have reduced to order, but which gave him an unquestionable superiority to his contemporaries. So in 1526 or 1527, on his return to Basel, he was appointed town physician, and shortly afterwards he gave a course of lectures on medicine in the university. Unfortunately for him, the lectures broke away from tradition. They were in German, not in Latin; they were expositions of his own experience, of his own views, of his own methods of curing, adapted to the diseases that afflicted the German people in the years 1527, and they were not commentaries on the text of Galen or Avicenna. They attacked, not only these great authorities, but the German graduates who followed them and disputed about them in 1527. They criticized in no measured terms the current medicine of the time, and exposed the practical ignorance, the pomposity, and the greed of those who practised it.

The truth of Paracelsus’s doctrines was apparently confirmed by his success in curing or mitigating diseases for which the regular physicians could do nothing. For about a couple of years his reputation and conduct were so great that at the end of that time people began to recover themselves. Paracelsus had burst upon the schools with such novel views and methods, with such irresistible criticism, that all opposition was at first crushed flat. Gradually the sea began to rise. His enemies watched for slips and failures; the physicians maintained that he had no degree, and insisted that he should give proof of his qualifications. Moreover, he had a pharmaceutical system of his own which did not harmonize with the commercial arrangements of the apothecaries, and he not only did not use up their drugs like the Galenists, but, in the exercise of his functions as town physician, he urged the authorities to keep a sharp eye on the purity of their wares, upon their knowledge of their art, and upon their transactions with their friends the physicians. The growing jealousy and enmity culminated in a dispute with Canon Cornelius von Lichtenfel, who, having called in Paracelsus after other physicians had given up his case, refused to pay the fee he had promised in the event of cure; and, as the judges, to their discredit, sided with the canon, Paracelsus had no alternative but to tell them his opinion of the whole case and of their notions of justice. So little doubt left he on the subject that his friends judged it prudent for him to leave Basel at once, as it had been resolved to punish him for the attack on the authorities of which he had been guilty. He departed in such haste that he carried nothing with him, and some chemical apparatus and other property were taken charge of by J. Oporinus (1505-1568), his pupil and amanuensis. He went first to Esslingen, where he remained for a brief period, but had soon to leave from absolute want. Then began his wandering life, the course of which can be traced by the dates of his
VARIOUS WRITINGS. He thus visited in succession Colmar, Nuremberg, Appenzell, Zurich, Pfullers, Augsburg, Villach, Meran, Middelheim and other places, seldom staying a twelvemonth in any of them. In this way he spent some dozen years, till 1541, when he was invited by Archbishop Ernst to settle at Salzburg, under his protection. After his endless toasting about, this seemed a promise and place of repos. It proved, however, to be the complete and final rest that he found, for after a few months he died, on the 31st of September. The cause assigned his death, like most other details in his history, is uncertain. His enemies asserted that he died in a low tavern in consequence of a drunken debauch of some days' duration. Others maintain that he was thrown down a steep place by some emissaries either of the physicians or of the apothecaries, both of whom he had during his life most grievously harassed. He was buried in the churchyard of St Sebastian, but in 1752 his bones were removed to the porch of the church, and a monument of reddish-white marble was erected to his memory.

The first book by Paracelsus was printed at Augsburg in 1529. It was "De Herbae" (Gottingen, 1887; Sudhoff, Paracelsus-Forschungen, 1887). The second book Paracelsus to appear was "De Virtutibus, Secretis, et Propriis Herbis" (Gottingen, 1887). The first collected Latin edition was printed at Augsburg in 1603, and is the best of all the editions. This third was put into print by Huser, who did not employ the early printed copies only, but collected all the manuscripts and separated them, and brought them into the following list. The only drawback is that rather than omit anything which Paracelsus may have composed, he has gone to the opposite extreme and included works with which it is pretty certain Paracelsus had nothing to do. The second collected German edition is in four volumes quarto, and is the best of all the editions. This was printed in 1603 with the first collected Latin edition was Malphenius. It is in eleven volumes quarto, and was completed in 1605. Again, in 1616-1618 appeared a four-volume Latin edition, and in 1620 and 1621 the first became the Geneva Latin version, in three volumes folio, edited by Bittiskus. These works were originally composed in Swiss-German, a vigorous speech which Paracelsus wielded with unmistakable power. The Latin versions were made or edited by Adam von Bodenstein, Gerard Dorn, Michael Toxites and Oporinus, about the middle of the 16th century. A few translations into other languages exist, as of the Chirurgia magna and some other works into French, and of one or two into Dutch, Italian and even Arabic. The translations into English amount to about a dozen, dating mostly from the middle of the 19th century. The editions of the works are getting less and less common; even the English versions are among the rarest of their class. Over and above the numerous editions of single or several of his works, the Germans have printed a large number of his works, and his followers and enemies. A good deal of it is taken up with a defence of chemical, or, they were called, "spagyric," medicines against the attacks of the papists and the apothecaries.

The aim of all Paracelsus's writing is to promote the progress of medicine, and he endeavours to put before physicians a grand ideal of their profession. In his attempts he takes the widest view of medicine. He bases it on the general relationship which man bears to nature as a whole; he cannot divorce the life of man from that of the universe; he cannot think of disease otherwise than as a phase of life. He is compelled, therefore, to rest his medical practice upon general theories of the present state of things; his medical system—if there is such a thing—is an adaptation of his cosmopoulism. It is this latter which has been the stumbling-block to many past critics of Paracelsus, and unless its character is recognized it will be the same to others in the future. Dissatisfied with the Aristotelianism of his time, Paracelsus turned with greater expecta-
tion to the Neoplatonism which was reviving. His earnestness to understand is not less, and his general mind to acquire knowledge be the results of his own personal experience and work in natural history and chemical pharmacy and practical medicine, unfettered by any speculative generalizations, and so shrewd an observer as he was, and so often did he trust his philosophy and his experience did not agree with another.

Some of his doctrines are alluded to in the article MEDICINE (q.v.), and it would serve no purpose to give even a brief sketch of his medical views. He must be judged by his influence, and it is evident that he was of interest only in their place in a general history of medicine and philosophy. Defective, however, as they may have been, and unfounded in fact, his kabbalistic doctrines led him to trace the dependence of the human body upon outer nature for its sustenance and cure. The doctrine of signatures, the supposed resemblance of the parts of a plant to the parts of the body, the very vision of the soul in the body, the belief that the very eating part of the great world of nature, was a fanciful and false exagger-
ation of this doctrine, but the idea carried in its train that of specific. This idea the soul of Paracelsus was not to be found in the bewildering and untested mixtures of the Quadem medicina, which Paracelsus had seen how bodies were purified and intensified by chemical operations, and he thought if plants and minerals could be purified, the body too could be purified. It is this attempt to employ these than the crude and unprepared originals. He had besides arrived by some kind of intuition at the conclusion that the operations in the body were of a chemical character, and that when disorders were to be put right by counter operations of the same kind. It may be claimed for Paracelsus that he embraced within the idea of chemical action something more than the mere physical, and that he was the first to form a theory of the philosopher's elixir is of very little consequence. If he did, he was like that of his age; but he troubled himself very little, if at all, about it. He did believe in the immediate use for therapeutics of the salts and other preparations which his practical skill enabled him to make. He could get potent drugs to cure disease he was content, and he worked very hard in an empirical way to make them. That he found out some new compounds is certain; but not one great and marked discovery can be ascribed to him. It is not likely that Paracelsus was so revolutionary a thinker in this wide application of chemical ideas to pharmacy and therapeutics; his indirect and possibly greater services are to be found in the stimulus, the revolutionary stimulus, of his ideas about method and materia medica and the severity with which he charged the errors and naiveté of his contemporaries and their predecessors. It may still be worth while to see how this initiated and its influence on the modern chemists. His writings and the influence which the Paracelsus's teachings had on the chemical was the work of his lifetime. He died, as is stated, a paragone, or "parapoet," a man of great ability, but more so in laying the foundation of the science of chemistry than in the practical applications that he was to be done. In the works of Paracelsus' time, he was the first to demonstrate the practicality of using the machine, though his elder brother, J. B. O. Garnerin (1766-1840), also claimed a share in the merit of perfecting it. In 1793 he was taken prisoner at Marchienne, and while in captivity at Bude (Budapest) thought out the means of descending from a balloon by means of a parachute. His first public experiment was made on the 22nd of October 1797. He ascended from the park of Monceau, at Paris, and at the height of about 11 m. he
released the parachute, which was attached to the balloon in place of a car; the balloon, relieved suddenly of so great a weight, rose very rapidly till it burst, while the parachute descended very fast, making violent oscillations all the way. Garnerin, however, reached the earth in safety. He repeated his parachute experiment in England on the 21st of September 1802. The parachute was dome-shaped, and bore a resemblance to the ancient umbrella (fig. 1). The case or dome was made of white canvas, and was 23 ft. in diameter. At the top was a truck or round piece of wood 10 in. in diameter, with a hole in its centre, fastened to the canvas by 32 short pieces of tape. The parachute was suspended from a hoop attached to the netting of the balloon, and below it was placed a cylindrical basket, 4 ft. high and 2 ft. in diameter, which contained the aeronaut. The ascent took place at about six o'clock from North Audley Street, London; and at a height of about (it is believed) 8000 ft. Garnerin separated the parachute from the balloon. For a few seconds his fate seemed certain, as the parachute retained the collapsed state in which it had originally ascended and fell very rapidly. It suddenly, however, expanded, and the rapidity of its descent was at once checked, though oscillations were so violent that the car, which was suspended 20 ft. below, was sometimes on a level with the rest of the apparatus. Some accounts state that these oscillations increased, others that they decreased as the parachute descended; the latter seems the more probable. It came to the ground in a field at the back of St Pancras Church, the descent having occupied rather more than ten minutes. Garnerin was hurt a little by the violence with which the basket containing him struck the earth; but a few cuts and a slight nausea represented all the ill effects of his fall. A few years later, Jordaki Kuparento, a Polish aeronaut, made real use of a parachute. He ascended from Warsaw on the 24th of July 1808, in a fire-balloon, which, at a considerable elevation, took fire; but he was able to effect his descent in safety by means of his parachute.

The next experiment made with a parachute resulted in the death of Robert Cocking, who as early as 1814 had become interested in the subject. The great defect of Garnerin's umbrella-shaped parachute had been its violent oscillation during descent, and Cocking considered that if the parachute were made of a conical form (vertex downwards) the whole of this oscillation would be avoided; and if it were made of sufficient size there would be resistance enough to check too rapid a descent. He therefore constructed a parachute on this principle (fig. 2), the radius of which at its widest part was about 17 ft. It was stated in the public announcements previous to the experiment that the whole weighed 223 lb.; but from the evidence at the inquest it appeared that the weight must have been over 400 lb. exclusive of Cocking's weight, which was 177 lb. On the 24th of July 1837, the Nassau balloon, with Charles Green, the aeronaut, and Edward Spencer, a solicitor, in the car, and having suspended below it the parachute, in the car of which was Cocking, rose from Vauxhall Gardens, London, at twenty-five minutes to eight in the evening. A good deal of difficulty was experienced in rising to a suitable height, partly in consequence of the resistance to the air offered by the expanded parachute, and partly owing to its weight. Cocking wished the height to be 8000 ft.; but when the balloon reached the height of 5000 ft., nearly over Greenwich, Green contented himself with Cocking that his apparatus might then be put to the test, and he was above the requisite height if the parachute was to descend in daylight. Cocking accordingly let slip the catch which was to liberate him from the balloon. The parachute for a few seconds descended very rapidly, but still unevenly, until suddenly the upper rim seemed to give way and the whole apparatus collapsed (taking a form resembling an umbrella turned inside out, and nearly closed), and the machine descended with great rapidity, oscillating very much. When about 200 or 300 ft. from the ground the basket became disengaged from the remnant of the parachute, and Cocking was found in a field at Lee, literally dashed to pieces.

Many objections were made to the form of Cocking's parachute; but there is little doubt that had it been constructed of sufficient strength, and perhaps of somewhat larger size, it would have answered its purpose. John Wise (1808-1870), the American aeronaut, made some experiments on parachutes of both forms (Garnerin's and Cocking's), and found that the latter always were much more steady, descending generally in a spiral curve. A descending balloon half-full of gas either does rise, or can with a little management be made to rise, to the top of the netting and take the form of a parachute, thus materially lessening the rapidity of descent. Wise, in fact, having noticed this, once purposely exploded his balloon when at a considerable altitude, and the resistance offered to the air by the envelope of the balloon was sufficient to enable him to reach the ground without injury. In more recent times the use of the parachute has become fairly common, but a good many serious accidents have occurred.

PARADE—PARADISE

PARADE (Fr. parade, an adaptation from Ital. parata; cf. Span. parada, from Lat. parare, to prepare, equip, furnish), a word of which the principal meanings are display, show, a military gathering of troops for a specific purpose, an assembly of people for a promenade, the place where the troops assemble, and a road or street where people may walk. In the military sense, a "parade" is a mustering of troops on the parade-ground for drill, for inspection, for the delivery of special orders, or for other purposes, either at regular stated hours or on special occasions.

PARADISE (Gr. παράδεισος), the name of a supernatural locality reserved for God and for chosen men, which occurs in the Greek Bible, both for the earthly "garden" of Eden (see Eden), and for the heavenly "garden," where true Israelites after death see the face of God (4 Esdras viii. 52; Luke xxiii. 43; 2 Cor. xii. 4 Rev. ii. 7). The Hebrew parod (are), to which παράδεισος corresponds, occurs thrice in the Old Testament in late books, in the general sense of "park, grove"; it is derived somewhat hazardously from the Zend padarista, an enclosure (once only in the Avesta), though another word (Vara) is used in the account of the mythical enclosure of Yima (see DELUGE). But what interests us most is not the name, but the conception and its imaginative vehicle. The conception is the original godliness of human nature, and the necessity of expecting a closer union between God and man in the future than is possible at present. The imaginative form in which this conception takes in that future the present condition arose man dwelt nearer to God in God's own mountain home, and that when the mischief wrought by the serpent has been undone, man—or more distinctly the true Israel—shall once more be admitted to his old privilege. According to the fullest Old Testament account (Ezek. xxviii. 12-19; see ANAX), the holy mountain was in a definite earthly region, and certainly it was appropriate for worshippers of Yahweh that it should be so (1 Kings xx. 23, 28). But there are traces in that account itself as well as in Gen. ii. that an earlier belief placed the divine
PARADOX—PARAFFIN

home in heaven. Similarly the Zoroastrians speak of their Paradise-mountain Alburz both as heavenly and as earthly (Bundahish, xx. 1, with West’s note). It appears that originally the Hebrew Paradise-mountain was placed in heaven, but that afterwards it was transferred to earth. It was of stupendous size; indeed, properly it was the earth itself. Later on each Semitic people may have chosen its own mountain, recognizing, however, perhaps, that in primeval times it was of vast dimensions than at present, just as the Jews believed that in the next age the “ mountain of Yahweh’s house ” would become far larger (Isa. ii. 2 = Mic. iv. 1; Ezek. xl. 2; Zech. xiv. 10; Rev. xxi. 10); compare the idealization of the earthly Alburz of the Iranians “ in revelation ” (Bund. v. iii. iii. 1-8).

We now return to the accounts in Ezek. xxviii. and Gen. ii. The references in the former to the precious stones and to the “ stones of fire ” may be grouped with the references in Enoch (xviii. 6-8, xxiv.) to seven supernatural mountains each composed of a different beautiful stone, and with the throne of God in the seventh. These mountains are also represented in the seven planets, each of which was symbolized by a different metal, or at least colour. Ezekiel’s mountain therefore has come to earth from heaven. And a similar result follows if we group the four rivers of Paradise in Gen. ii. with the phrase so often applied to Canaan, “ flowing with milk and honey ” (Exod. iii. 8; Num. xii. 27, &c.). For this descriptive phrase is evidently mythical, and refers to the belief in the four rivers of the heavenly Paradise which “ poured honey and milk, oil and wine ” (Slavonic Enoch, viii. 5; cf. Vision of Paul, xxiii.). In fact, the four rivers originally flowed in heavenly soil, and of Enoch’s four rivers four branches were transferred to this lower earth could mythological geographers think of determining their earthly course, and whether Havilah, or Cush, or Canaan, or Babylonia, was irrigated by one or another of them. But what happened to Paradise when the afflicted human pair left it? One view (see Euth. Enoch, xxvii. 2, 3, 3. 8, iv. vii. 3, 4, &c.) was that its site was in some nameless, inaccessible region, still guarded by “ the serpents and the cherubim ” (Euth. Enoch, xx. 7), and that in the next age its gates would be opened, and the threatening sword (Gen. iii. 24) put away by the Messianic prince (Testaments of the Twelve Patriarchs, Levi, 18). This agrees with the story in Gen. ii., iii., except that the original narrator knew the site of the garden. It is a sufficiently reasonable view, for if Paradise lay in some definite earthly region, and if no one knows “ the paths of Paradise ” (4 Esdras iv. 7), it would seem that it must have ceased to exist visibly. This idea appears to be implied by those Jewish writers, who, especially after the fall of Jerusalem (A.D. 70), dwelt so much on the hope of the heavenly Paradise, reviving, partly under emotional pressure and partly as the result of a fresh influx of mythology, the old myth of a celestial garden of God. To notice only a few leading passages. In A. Pol. Bar. iv. 3 it appears to be stated that when Adam transgressed, the vision of the city of God and the possession of Paradise were removed from him, and similarly the stress laid in 4 Esdras iv. 7, vi. 2, vii. 36, 55, viii. 52, on the heavenly Paradise seems to show that no earthly one was supposed to exist.4 Beautiful, indeed, is the use made of that form of belief in these passages, with which we may group Rev. xxi. 1, xxii. 5, where, as in 4 Esdras vii. 52, Paradise and the city of God are combined.

Some strange disclosures on this subject are made by the Slavonic Enoch (cf. xvi. 3, 3 of which there are two Paradises. The former is in the third heaven, and explains the well-known saying of St Paul in 2 Cor. xii. 2, 4;

1 It was the Babylonian “ mountain of the lands,” which meant not only mother earth, but the earth imagined to exist within the heaven; cf. Jeremias, Ahas, pp. 11, 12, 28, and Jastrow, Religion of Bab. and Ass. ii. 63.

3 See also 1 Esdras ii. 19. This explains iv. 18; Isa. lv. 1 (wine and milk).

4 See also Yama, xlii. 3 (Zedanerst); and cf. Chyney, Paraffin, p. col. 2104, and especially Lisen, Rheinisches Museum, liv. 177-192.

5 The statement in Gen. iii. 24 comes from a form of the story in which the “ garden ” was not geographically localized.

the latter is conventionally called the Paradise of Eden. In fact, the belief in an earthly Paradise never wholly died. Medieval writers loved it. The mountain of Purgatory in Dante’s poem is “ crowned by the delicious shades of the terrestrial Paradise. ”

See further The Apocalypse of Baruch and The Ethiopic and the Slavonic Enoch, both edited by R. H. Charles, and also Kautzsch’s Apocalypse, and Volz, Jüdische Eschatologie (1903), pp. 374-8, whose full references are most useful. On the Biblical references, cf. Gunkel, Genesis (2), pp. 21-35; Chyney, Encyc. Bibl., “ Paradise; ” and on Babylonian views, Jeremias, “ Holle und Paradies ” (in Deutsche Orient). The Mahomedan’s Paradise is a sensuous transformation of the Jewish; see especially Koran, Sura iv., and note the phrase “ paradisiacal mountains ” (Fire), Koran, xviii. 107. For the Koran and the Zoroastrian books see the Sacred Books of the East (Oxford Series). The doorkeeper of the mountain-Paradise of the Parsees is the Amshaspand Vohu-manî (Vendidad, xiii. 31.) (T. K. C.)

PARADOX (Fr. = back cover), a term used in fortification, expressing a work the purpose of which is to cover the defenders of a line of trenches or parapet from reverse fire, i.e. fire from the rear.

PARADOX (Gr. παράδοξον, contrary to, δέκα, opinion), a proposition or statement which appears to be at variance with generally-received opinion, or which apparently is self-contradictory, absurd or untrue, but either contains a concealed truth or may on examination be proved to be true. A “ paradox ” has been compared with a “ paradoxism ” (παράδοξος, reason), as that which is contrary to opinion only and not contrary to reason, but is frequently used in the sense of which it is really absurd or untrue.

PARAFFIN, the name given to a mineral wax and oil, and also used as a generic name of a particular series of hydrocarbons.

Commercial Paraffin.—Refined commercial paraffin is a white or bluish-white, translucent, waxy solid substance, of laminocrystalline structure, devoid of taste and smell, and characterized by chemical indiffERENCE. It consists of about 85% of carbon and 15% of hydrogen. Although the credit of having first (in 1830) investigated the properties of solid paraffin, obtained from wood-tar, belongs to Karl Reichenbach, the existence of paraffin in petroleum had been more or less hazily known for some time previous. In 1800 Fuchs found solid hydrocarbons in the Tegernsee oils, and in 1819 Büncker separated them from these oils in comparative purity. By the latter they were described as “ mountain-fats,” and they were identified with paraffin in 1835 by von Kobel. Reichenbach described the results of a series of experiments on the reactions between various substances and paraffin, and on account of the inert nature of the material gave to it its present name (from the Lat. parum, too little, and affinitas, affinity); he expressly stated that the accent should fall on the second “ a,” but usage has transferred it to the first.

Paraffin was obtained by Laurent in 1830 by the distillation of bituminous schist, and in 1835 by Dumas from coal-tar; but the product appears to have been regarded only as a curiosity, and Lord Playfair has stated that prior to 1850 he never saw a piece of more than one ounce in weight. Paraffin is asserted to have been made for sale by Reichenbach’s process from wood-tar by John Thom, of Birkacre, before 1835. In 1833 Laurent suggested the working of the Autun shale, and products manufactured from this material were exhibited by Selligue in 1830.

According to F. H. Storer, the credit of having first placed the manufacture of paraffin on a commercial basis is deservedly given to Selligue, whose patent specifications, both in France and England, sufficiently clearly show that his processes of distilling bituminous schist, &c., and of purifying the distillate, had reached considerable perfection prior to 1845. In its present form, however, the paraffin or shale-oil industry owes its existence to Dr James Young. In 1850 he applied for his celebrated patent (No. 13,292) “ for obtaining paraffin oil, or an oil containing paraffine, and paraffine from bituminous coals ” by slow distillation. The process was extensively carried out in the United States under licence from Young,
until crude petroleum was produced in that country in such abundance, and at so low a cost, that the distillation of bituminous minerals became unprofitable. The highly bituminous Boghead coal, or Torfhammill mineral, which yielded 120 to 130 gallons of crude oil per ton, was worked out in 1862, and since then the Scottish mineral oils and paraffin have been obtained from the bituminous shales of the coal-measures, the amount of such shale raised in Great Britain in 1907 being 2,690,028 tons.

The following list represents an attempt to assign a geological age to the various occurrences of oil-shale and similar substances throughout the world:

Kerosene-Shale

| Permocarboniferous | Queensland, New South Wales, Tasmania. |

**Tar-Lignite**

| Miocene           | Moravia, Lower Austria, Bavaria. |
|-------------------| Pittsburgh. |
| Oligocene         | Bohemia, Tirol. |

**Oil-Shale.**—The oil-shale of Scotland is dark grey or black, and has a laminated or horny fracture. Its specific gravity is about 1.75, and 20 cu. ft. of it weigh rather less than a ton. The richer kinds yield about 30 gallons of oil per ton of shale, and in some cases as much as 40 gallons, but the higher yield is usually obtained at the expense of the solid paraffin and of the quality of the heavy oils. The inferior shales yield about 18 gallons of oil, but a much larger amount of sulphate of ammonia. The oil consists chiefly of members of the paraffin and olefine series, and thus differs essentially from that obtained from true coal-shales, in which the hydrocarbons of the benzene group are largely represented.

A full account of the Scotch shale-oil industry, as the most important and typical, will be given later, the corresponding industries in other countries and districts being dealt with first.

In addition to the Carboniferous oil-shales of Flint and Stafford, the Kimeridge shale, a bluish-grey slaty clay, containing thin beds of highly bituminous shale, occurs in Dorsetshire, and has from time to time attracted attention as a possible source of shale-oil products. The so-called "Kerosene-shale" of New South Wales has been extensively mined, and the industry is now being developed by the Commonwealth Oil Corporation, Ltd. The French shale-oil industry is much older than that of Scotland, but has made less progress, the amount of shale distilled in 1872 being 200,000 tons, as compared with 2,250,000 tons in Scotland. The shales of New Zealand have never been extensively worked, the production having decreased instead of increased. Oil-shale of good quality occurs in Sardinia, and has been found to yield from 43 1/2 to 54 1/2 gallons of oil per ton. The production of mineral oils and paraffin by the distillation of lignite is carried on in Saxony, the mineral worked being a peculiar earthy lignite, occurring within a small portion of the Saxon-Thuringian brown-coal formation. Other occurrences of this mineral have been indicated in the list of localities above.

The Shale-Oil Industry of Scotland.—The modern development of the shale-oil industry of Scotland dates from the commencement of Robert Bell's works at Broxburn in 1862.

The oil-shales are found in the Calcariferous Sandstone series, lying between the Carboniferous Limestone and the Old Red Sandstone. They occur at several points in the belt of Carboniferous rocks across the centre of Scotland, for the most part in small synclinal basins, the largest of which is that at Pentland, where the levels are 2 m. long, without important faults. Mining is carried on, where the seams are over 4 ft. thick, by the "pillar and stall" system; seams under 4 ft. are worked by the "longwall" system. The shale is blasted down by gunpowder, and passed over a 1-in. riddle, the smalls being left underground. Before it is retorted the shale is passed through a toothed breaker, which reduces it to flat pieces 6 in. square. These fall into a shoot, and thence into iron tubs of 10 to 25 cwt. capacity, which run on rails to the tops of the retorts.

The retorts in which the shale is distilled have undergone considerable variation and improvement since the foundation of the industry. Originally horizontal retorts, like those used in the manufacture of coal-gas, were employed, and the heavy oils and paraffin were burned as fuel. When the latter product became valuable vertical retorts were adopted, as the solid hydrocarbons undergo less dissociation under these conditions. Since 1894 the employment of the oil-vapours from a vertical retort as fuel has increased, and they are now used to a very large extent.

The earliest form of vertical retort was circular (2 ft. in diameter) or oval (2 ft. by 1 ft. 4 in.) and 8 or 10 ft. long. Six or eight of these were grouped together, and the heating was so effected that the bottoms of the retorts were at the highest temperature. They were charged by means of hoppers at the top, the exhausted shale being withdrawn through a water-seal every hour and fresh added, whence this is known as the "continuous system."

In the first Henderson retort (1873) the spent shale was used as fuel. The retorts, which were oblong in cross-section, were arranged in groups of four, and had a capacity of 15 cwt. The retorts were charged at one end, the temperature having been attained in the chamber containing them, one retort was charged from the top, and in four hours the one diagonally opposite to it was charged. After eight hours the one next to the first was charged, and after twelve hours the fourth. Up to the sixteenth hour only ordinary fuel was used in the furnace, but the spent shale from the first retort was then discharged into it. The other retorts were similarly discharged in the above order at intervals of four hours, each being at once recharged. The shale was black when discharged, but soon glazed brightly. Owing to the small size of the shale in the retort the oil vapours were kept up. The outlet for the oil vapours was at the lower and less heated end of the retorts, and steam, which had been superheated by passage through pipes arranged along one side of the retort chamber, was blown in copiously through pipes to aid in the uniform heating of the shale and to continuously remove the oil vapours, dissociation from overheating being thus minimized. It was believed that a temperature of about 800° F. produced the best results. This retort was worked on what is known as the "intermittent system."

The Pentland Composite retort (1882) and the later Henderson retort (1889) were both continuous-working and gas-heated, the second being a modification of the first. The principle was to obtain a larger yield of sulphate of ammonia without detriment to the crude oil. In both the upper part of the retort was of cast iron and the lower of fire-clay. The upper portion was heated to a temperature of about 900° F. whilst the lower was maintained at about 1300° F. The charge in the retort gradually travelled down, owing to the periodical removal of spent shale at the bottom, and the descent was so regulated that no shale passed into the highly-heated part until it had parted with the oil it was capable of yielding. The shale, however, was still contained in nitrogen, which in the presence of steam produced ammonia at the higher temperature.

The three classes of retorts now employed in the distillation of shale in the Scottish oil-works are covered by the following patents:

1. In use at Pumpherton, Dalmeny and Oakbank—No. 8371 of 1894; No. 7113 of 1895; No. 121 of 1897.
2. In use by Young's Paraffin Light and Mineral Oil Company, Ltd.—No. 13,665 of 1897; No. 15,235 of 1899.
3. In use by the Broxburn Oil Company, Ltd.—No. 26,647 of 1901.

The working of the in rotation, for which patent No. 8, 577 of 1892, was granted to Bryson (of Pumpherton Oil Works), Jones (of Dalmeny Oil Works), and Fraser (of Pumpherton Oil Company, Ltd.), are described in the specification as to so construct the retort that a sufficient fluid, whereby flushing or dandeling of the substance being heated is prevented in the retorts: also to effect an intermittent, continuous, or nearly so, movement within the retort. In order to carry out these objects, the bottom of the
PARAFFIN

The vapour from these retorts, amounting to about 3000 cub. ft. per ton, is partially condensed by being passed through 70° to 75° to remove the lightest gases, whose proportions of the air and steam is necessary, and a special device is provided for this.

The important construction of retorts for which patent No. 26,647 of 1901 was granted to N. M. Henderson of the Broxburn Oil Works, Ayrshire, describes such retorts as are described in the previous patent, No. 6726 of 1889. The patentee dispenses with the chamber or space between the upper and lower retorts, the upper cast-iron retorts being carried direct on the discharge of the furthest forward of the three continuous retort from top to bottom; and instead of one toothed roller being employed for the purpose of withdrawing the exhausted residue, a pair of toothed rollers are used, one of the construction is stated to give better and larger results with less labour and expense in working and for repairs.

0.770, constitutes the crude naphtha, and that up to a density of 0.850 the burning oil. The remainder of the distillate, which solidifies at common temperatures, consists chiefly of lubricating oils and paraffin. These three fractions are delivered from the condensers into separate tanks. Although the crude-oil stills of Henderson may be employed for the continuous distillation of the once-run or other oils obtained in the process of refining, the inventor prefers another form of apparatus which he patented in 1883 (No. 540), and this is now generally used. This consists of three horizontal cylindrical stills, 7 ft. in diameter and 19 ft. in length. The oil enters through a pipe which passes through one end of the still and discharges at the opposite end, while the outlet-pipe is fitted below the inlet-pipe at the bottom of the end through which the latter passes, inlet and discharge being thus as far as possible from each other. The oil circulates as in the crude-oil stills. The burning oil is next treated with acid and alkali, and subsequently again fractionally distilled, the heavier portion yielding paraffin scale, while the residues are redistilled. The final chemical purification of the burning oil resembles that last referred to, but only half the quantity of acid is employed. The lighter products of these distillations form the crude scale naphtha, which is treated with acid and alkali, and redistilled, when the lightest fractions constitute the Scotch "gasoline" of commerce, and the remainder is known as "naphtha."

The solid paraffin, which is known in its crude state as paraffin scale, was formerly produced from the heavy oil obtained in the first, second and third distillations, that from the first giving "hard scale," while those from the second and third gave "soft scale." The hard scale was crystallized out in shallow tanks, and the contained oil driven out by compression of the paraffin in filter bags. Soft scale was obtained by refrigeration, cooled revolving drums being caused to dip into trays containing the oil, when the paraffin adhered to the drums and was scraped off by a mechanical contrivance. Later improved appliances have aimed at the slow cooling of oil in bulk, whereby large crystals of paraffin are produced. Several processes have been invented, the most generally used being that patented by Henderson (No. 5557 of 1884). His cooler consists of a jacketed trough having a curved bottom, and divided into a series of transverse casings by metal disks, each consisting of two thin plates bolted together, but with a space between, in which, as also in the jacket surrounding the trough, cold brine is circulated. The paraffin crystallizes on the cold surfaces, from which it is constantly removed by scrapers, so that successive portions of the oil are cooled. The solid paraffin accumulates in a well or channel, where it is stirred up by rotary arms, so that it may be readily drawn away by a pump to the filter-presses, whereby the solid paraffin is freed from oil. In the United States the improved process is used, and of the Oakbank Oil Company the oil to be cooled is pumped through coils submerged in the expressed oil from the filter-presses into the inner space of vertical coolers formed of two cast-iron tubes, and thence direct to the filter-presses. In the inner chamber of the coolers are fitted revolving scrapers, while in the outer annular space compressed ammonia is expanded.

The crude paraffin is then refined, for which purpose the "naphtha treatment" was formerly employed, but this has now given place almost entirely to the "swelling process." In the former the paraffin is dissolved in naphtha and then crystallized out. The swelling process consists in heating the crude wax to such a temperature that the softer portions are melted and flow away with the oil. In the process patented by N. M. Henderson (Nos. 1291 of 1887 and 17,799 of 1891), a chamber, 52 ft. by 13 ft. by 10 ft. high, heated by steam-pipes, and provided with large doors and ventilators for cooling, is fitted with a number of superimposed trays, 21 ft. by 6 ft. by 6 in. deep. These rest on transverse heating pipes, and each tray has a diaphragm of wire gauze. The bottoms communicate with short pipes fitted with swivel nozzles, worked on a vertical shaft. The diaphragms are covered with ½ in. of water, and the crude paraffin is melted and pumped through charging-pipes on to its surface. When the paraffin has solidified, the water is drawn off, leaving the cake resting on the gauze. Doors and ventilators are then closed, and the chamber is heated, whereupon the liquefied impurities are drained off until the outflowing paraffin sets on a thermometer bulb at 136° F. The residue is melted and decolorized by agitation with finely powdered charcoal. The charcoal is mainly separated by subsidence, and the paraffin drawn off into filters, whence, freed from the suspended charcoal, it runs into moulds, and is thus formed into cakes of suitable size for packing. The lubricating oils are refined by the use of sulphuric acid and alkali, substantially in the same manner as the burning oils.

The following table shows the average yield, in 1895, of the various commercial products from crude shale-oil at two of the principal refineries. The percentages are, however, often varied to suit market requirements:

From the ammoniacal liquor the ammonia is driven off by the application of heat in stills, the evolved vapour being conducted into "cracker-boxes," which are now usually of circular form, from 5 to 8 in. in diameter, and 6 to 12 in. in depth. In these boxes the ammonia is brought into contact with sulphuric acid of about 98° Tw., and is thus converted into sulphate. Wilton's form of cracker-box, which is now generally in use, is provided with an arrangement for the automatic discharge on to a drying table of the sulphate of ammonia as it is deposited in the well of the box, and the process is worked continuously. For the heating of the ammoniacal liquor the ordinary horizontal boiler-stills formerly used have been superseded by "column" stills, in which the liquor is exposed over a large area, as it passes from top to bottom of the still, to the action of a current of steam.

PARAFFIN, in chemistry, the generic name given to the hydrocarbons of the general formula C₅H₁₂. Many of these hydrocarbons exist as naturally occurring products, the lower (gaseous) members of the series being met with as exhalations from decaying organic matter, or issuing from fissures in the earth; and the higher members of the series occur in petroleum (chiefly American) and ozokerite. They may be synthesized by reducing the alkyl halides (preferably the iodides) with nascent hydrogen, using either sodium amalgam, zinc and hydrochloric acid, concentrated hydriodic acid (Berthelot, Jour. Prakt. Chem. 1868, 164, p. 103), aluminium amalgam (H. WilsASICUS, ibid., 1866 (2), 54) or the zinc-copper couple (J. H. Gladstone and A. Tribe, Ber., 1873, 6, p. 202 seq.) as reducing agents.

They may also be derived from alkyl halides with a 120-140° with aluminium chloride in the proportion of three molecules of alkyl halide to one molecule of aluminium chloride (B. Köhnen, Ber., 1885, 16, p. 560); by heating with zinc and water to 150-160° C. (E. Frankland, Ann. 1849, 71, p. 203; 1850, 74, p. 41); 2 R₂+Zn+H₂O = 2RH+ZnCl₂+OH⁻; by conversion into zinc alkyls, which are then decomposed by water, ZnR₂+2H₂O = 2RH+ZnCl₂+OH⁻; by conversion into the Grignard reagent with metallic magnesium and diethylacetic acid or preferably by ammonium chloride (J. Houben, Ber., 1905, 38, p. 3015); RMg+H₂O = RH+Mg(OH); by the action of potassium hydride (H. Moissan, Compte rendus, 1902, 134, p. 389); and by the action

They may also be obtained by the reduction of the higher fatty acids with hydrobromic acid (Kraft, Ber., 1882, 15, pp. 1687, 1711). $C_6H_{11}O_2+NaOH=C_6H_{11}OH+Na_2CO_3$; by the action of ketones into ketone chlorides by the action of phosphoric pentahydrate, these being then reduced to fatty acid.

$C_6H_{12}O_6\rightarrow C_6H_{12}O_6+CCl_4\rightarrow C_6H_{12}O_6+CHCl_3$.

The principal members of the series are shown in the following table:

</tbody>
</table>

The lowest members of the series are gaseous at ordinary temperature; those of carbon content C3 to C18 are colourless liquids, and the higher members from C19 onwards are crystalline solids. The highest members only volatilize without decomposition when distilled under diminished pressure. They are not soluble in water, although the lower and middle members of the series are readily soluble in alcohol and ether, the solubility, however, decreasing with increase of molecular weight, so that the highest members of the series are almost insoluble in these solvents. The specific gravity increases with the molecular weight but always remains below that of water. The paraffins are characterized by their great inertness towards most chemical reagents. Fuming sulphuric acid converts the middle and higher members of the series into sulphonic acids and these lower members (R. A. Worstall, Amer. Chem. Journ., 1885, 20, p. 664). Dilute nitric acid, when heated with the paraffins in a tube, converts them into secondary and tertiary nitro-derivatives (M. Konowalow, Ber., 1895, 28, p. 1832), whilst long boiling with strong nitric acid or nitro-sulphuric acid converts the middle and higher members of the series partly into primary mono- and di-nitro compounds and partly oxidizes them to carboxyl, acetic, oxalic and succinic acids (Worstall, ibid., 20, p. 202; 21, p. 211). Fuming nitric acid only reacts slowly with the normal paraffins at ordinary temperature, but with those containing a tertiary carbon atom the reaction

is very energetic, oxidation products (fatty acids and dibasic acids) and a small quantity of polynitro compounds are obtained (W. Markownikow, Centralblatt, 1889, 1, p. 1004; Ber., 1890, 32, p. 1441). Chlorine reacts with the paraffins, readily substituting hydrogen. Isomeric hydrocarbons in this series first appear with butane, the number increasing rapidly with the complexity of the molecule. For a table of denomination of isomers see E. Cayley, Ber., 1875, 8, p. 1056; F. Hermann, Ber., 1898, 31, p. 91.

For Methane see MARSH GAS. Ethane, $C_2H_6$ occurs in crude petroleum. It may be prepared by the general methods given above; by heating mercury ethyl with concentrated sulphuric acid (C. Schollemann, Ann., 1864, 132, p. 224); or by heating acetic acid hydrochloride (P. Schoenflies, Z. f. Elektrochem., 1865, p. 701), $2(C\cdot CH_2)CO+BaO=C_4H_8+Ba(CH_2)_{128}+2CO_2$. It is a colourless gas which can be liquefied at 6°C by a pressure of 46 atmospheres. By slow combustion it yields first water and acetaldehyde, which then oxides to oxides of carbon and water (W. A. Bone; see FLAME), whilst in ozonized air at 100° it gives ethyl alcohol, together with acetaldehyde and traces of formaldehyde (Breschet, Ber., 1895, 28, p. 127).

Dimitryric (hexaconate), $C_6H_{18}$, is prepared by fusing myricyl iodide with sodium (C. Hell and C. Haffke, Ber., 1889, 22, p. 502). It is only very slightly soluble in alcohol and ether.

PARAGON, a term for that which is a model of excellence or pattern of perfection, hence some person or thing which has no equal. The word was adopted from the O. Fr. paragone, Mod. paragon, Ital. paragone and Span. paragón. The Spanish has usually been taken as the source, and the word explained as from the prepositional phrase para con, in comparison with, the word first appears in Italian, meaning a "touchstone." The Italian word may be connected with the Gr. παρακόψω, to sharpen by the use of a whetstone (αιχωδή). The term has been used in several technical applications, e.g. in printing, of a large style of type between "great primer" and "double pica," now usually called "two-line long primer," of a diamond weighing more than 100 carats; and formerly of a fabric used for hangings in the 17th and 18th centuries.

PARAGUAY, an inland republic of South America, between 26° 16' 14" and 26° 31' S. and 54° 37' and 62° W. It is bounded on the N.W. by Bolivia, N. and E. by Brazil, S.E., and W. by Argentina. Pop. (1905 estimate), 631,347, including 50,000 Iguaussú Indians; area, about 97,700 sq. m.

By the treaty of 1872 the Brazilian frontier was drawn up the Paraná from the mouth of the Iguaussú or Y-Guanú (25° 36' S.) to the Salto Grande or Great Cataract of La Guayra (24° 7'), thence west along the watershed of the Sierra de Maracayú, north along the Sierra de Ambay to the source of the Apá, and down that river to its junction with the Paraguay. The Buenos Aires treaty of the 3rd of February 1876 fixed the frontier between Argentina and Paraguay, and assigned to Paraguay the portion of the Gran Chaco between Rio Verde and Bahía Negra; the appropriation of the portion between Rio Verde and the Pilcomayo was submitted to the arbitration of the president of the United States, who in 1878 assigned it to Paraguay. The frontier line towards Bolivia has long been in dispute.

Physical Features.—The river Paraguay, running from north to south, divides the republic into two sections, the eastern section, or Paraguay Oriental, being the most important. The
western section forms part of the great plain called the Gran Chaco (see Argentina), and is to a large extent unexplored. Paraguay proper, or the country between the Paraguay and the Paraná, is traversed from north to south by a broad irregular belt of highlands, which are known as the Cordilleras Ambayas, Cordillera Urcury, &c., but partake rather of the character of plateaux, and form a continuation and outwork of the great interior plateau of Brazil. The elevation nowhere much exceeds 2200 ft. On the western side these highlands terminate with a more or less sharply defined edge, the country sloping gradually up to their bases in gentle undulations with open, ill-defined valleys, on the eastern side they send down precipitous or closing deep-cut valleys, and the whole country retains more of an upland character. The tributaries that flow westward to the Paraguay are consequently to some extent navigable, while those that run eastward to the Paraná are interrupted by rapid and falls, often of a formidable description. The Pilcomayo, the largest western tributary of the Paraguay, and an important frontier river, is only navigable in its upper and lower reaches. From the Asuncion plateau southwards, near the confluence of the Paraguay and Paraná, there is a vast stretch of marshy country, draining partly into the Ypoa lagoon, and smaller tracts of the same character which are found in the Paraguayan lowlands, especially in the valley of the Paraguay. Many parts of the country sloping to the Paraguay, and comprising the greater part of the settled districts, is, in keeping with its proximity to the vast plains of Argentina, grassy and open, though the hills are usually covered with forest and clumps of trees are frequent in the lowlands. Except in the marshy regions and along the rivers, the soil is dry, porous and sandy.

**Geology.**—Little is known of the geology of Paraguay. A large part of the country is covered by Quaternary deposits, while other portions have been completely concealed by the solid foundation on which they rest. The hills and plateaux appear to be composed chiefly of the same sandstone series which in the Brazilian province of Rio Grande do Sul contains seams of coal, with plant remains similar to those of the Karharbāri series of India (Permian or Upper Carboniferous). It is probable, also, that the Palaeozoic rocks of Mata Grosso extend into the northern part of the country.

**Minerals.**—The gold mines said to have been concealed by the Jesuits may have had no existence; and though iron was worked by F. S. Lopez at Hacuy (70 m. south-east of Asuncion), and native coal occurs near the station, many of them, and salt springs, have been discovered, the real wealth of the country consists rather in the variety and value of its vegetable products.

**Climate and Fauna.**—The year in Paraguay is divided into two seasons, winter and summer, lasting from September to March, and from April to September. December, January and February are generally the hottest months, and May, June, July and August the coolest. The mean temperature for the year seems to be about 73° or 76° in summer, and 71° in winter. The annual rainfall is about 46 in., fairly well distributed throughout the year, though the heaviest precipitation occurs in August, September, and October. The prevailing winds blow from the north or south. The south wind is dry, cool and invigorating, and banishes mosquitoes for a time; the north wind is hot, moist and relaxing. Violent wind storms generally come from the south. Flora and fauna are very similar to those of Brazil. Caymans, water-hogs (capinches), several kinds of deer (Cerus paludusus the largest), oceus, opossums, armadillos, vampires, the American ostrich, the licu, the javira, various species of monkeys, the large otters, wild dogs, and the smaller ant-hills (medea cornuta), parrots and parakeets, are among the most notable forms. Insect life is peculiarly abundant; the red-stump-like ants and white ants are a common sight everywhere, and bees used to be kept in all the mission villages.

**Population.**—The great majority of the inhabitants are of Indian (Guaraní) descent, and very slight traces of foreign blood. Civilizations, however, may be traced in the habits of the people are more primitive than those in the more advanced neighbouring republics. As a general rule the Paraguayans are indolent, especially the men. Climatic conditions obviate the necessity of any superfluity of clothing. A cotton chemise, and a white manta wrapped in Moorish fashion over head and body, constitute the dress of the women; a cotton shirt and trousers that of the men. Boots and shoes are worn only by the upper classes. Goitre and leprosy are the only endemic diseases; but the natives, being underfed, are prone to diarrhoea and dyspepsia. The common language of the country is Guaraní, although in a few districts Tupi is spoken. The country people as a rule understand a little Spanish, if living near any trading centre. "New Australia" is a pastoral and agricultural settlement, originally founded in 1863 by immigrants from Australia as an experiment in communism. The colony failed at first, and was reconstituted in 1894. The settlers numbered 61 in 1898. Immigration is on a small scale (1024 in 1908), but is intended to increase, and, which seeks to divert to Paraguay some portion of the Italian labour immigrant into Brazil and Argentina. In 1908 the total foreign population numbered about 18,000, half of whom were natives of Argentina. The principal towns are Asunción, the capital (pop. 1905, 60,250), Villa Rica (25,000), Concepcion (15,000) and Villa del Pilar (10,000); these are described in separate articles. Encarnação on the Paraná has a large transit trade.

**Government.**—The constitution of the republic was voted by a constituent assembly on the 25th of November 1870. Legislative power is in the hands of a Chamber of Deputies, elected by universal manhood suffrage, in the proportion of one senator for every 12,000 inhabitants and one deputy for every 6000. Every member of Congress receives a salary of about £300. The head of the executive is the president, chosen by an electoral college for four years, and only re-eligible after eight consecutive years. He is aided by a cabinet of five ministers, responsible to Congress. Should he die during his term, or otherwise become unable to fulfil his duties, the president is succeeded by the vice-president (similarly elected), who is ex officio chairman of the Senate. The highest judicial authority is the Supreme Court, which is empowered to issue writs for the issue of habeas corpus. The validity of acts passed by Congress; its three members are appointed for four years by Congress, subject to the approval of the president. There are five courts of appeal, and inferior tribunals in all the large towns. The civil and criminal codes at Argentina have been adopted, almost without change. For purposes of local administration the republic is divided into 23 counties (partidos), which are subdivided into communes.

**Religion and Instruction.**—Roman Catholicism is the established religion, but the constitution guarantees full liberty to all other creeds. Asunción, the only bishopric in the state, is in the archiepiscopal province of Corrientes. Education is backward and long neglected. By law education is free, but in some districts the attendance of many children is impossible. In 1907 there were 554 primary schools with 41,000 pupils.

**Finance.**—In 1908 the standing army, including cavalry, infantry and artillery, numbered about 1150 men; and there were five government steamers used for transport and revenue purposes. The financial situation of Paraguay has been a source of anxiety for many years. In 1885, after interest had been unpaid for 11 years on bonds amounting to £1,505,400, an agreement was made for the issue of new scrip to the value of £350,000 in quittance of all claims for capital and arrears of interest, certain public lands being also ceded. The provisions of the new arrangement were made for a reduction of the rate of interest, for the funding of the arrears, and for the creation of a sinking fund. The government were unable to meet their obligations under the new contract, and in 1898 the outstanding amount had risen to £594,000. Provision has now been made for the service of this foreign debt, and the authorities have been able regularly to meet the service of the coupons. The total outstanding on the 31st of December 1908 was £381,680. Besides the London debt, there are many other claims on Paraguay, including (1908) about £5,000,000 due to Brazil, about £2,500,000 due to Argentina, and an internal debt of £50,000. In Truck, the paid debt due to the Paraguay Central railway exceeds £1,500,000; and the total indebtedness of the republic on the 31st of December 1908 may be estimated at £5,650,000.

The revenue is derived mainly from import duties, and the most important branches of expenditure are the salaries of public officials, the army, public instruction and debt. The estimated revenue and expenditure for the three years 1906-1908 are shown in the following table:
The budget for 1906 remained in force in 1907 and 1908. Industry.—The principal industries are the cultivation and preparation of yerba mate, a cattail-like grass; tobacco-planting and timber-cutting. Yerba mate, classed as *Ilex paraguariensis*, is a shrub. The leaves are stripped, withered, rolled and sorted, then packed in sacks and exported.Chief articles of export from Paraguay are yerba mate, tobacco, wood, cattle, uru, wool, tobacco, Timbú (a kind of timber wood), jute, coffee, and tobacco. Tobacco and yerba mate are the main exports. Tobacco is the largest contributor to the national revenue. The total value of the exports of tobacco in 1906 was $2,613,014. Tobacco, in itself, constitutes about 70% of the total export value. The price of the yerba mate (tea plantations) was formerly the property of the government, but have been acquired by private enterprise. An important feature about yerba mate is the small expense necessary for its production, and the cheap rate, notwithstanding the high tariff on its importation, at which it can be placed on the Argentine market as compared with ordinary tea or Brazilian coffee.

A cattle industry comes next in importance. The number of animals was estimated at 5,500,000 on the 31st of December 1908; an increase of about 45% since the census of 1899. The animals are small, but Durham and Hereford bulls have been introduced from Argentina to improve the breed. The increase in the herd has caused the owners of saladero establishments in Argentina and Uruguay to try the working of factories in Paraguay for the preparation of tassa (Jersey beef) and the manufacture of meat. Both grasses and climate are against sheep-farming on a large scale.

Oranges are exported to Buenos Aires, Rosario and Montevideo, and other Argentine ports. The oranges are often uncultivated, but yield abundantly; 10,000,000,000 of oranges were exported in 1908. Oranges are also exported, and sugar-cane, cotton, coffee and rum are cultivated. Tobacco, although of inferior quality, is grown to a considerable extent; the quantity exported rose from about 35 tons in 1900 to 5014 tons in 1908. Tobacco is chiefly exported to Germany. The staple diet of the Paraguayans is still, as it was in the earlier days, maize and mandioc (the chief ingredient in the excellent *chipa* or Paraguayan bread), varied, it may be, with the seeds of the *Victoria regia*, whose magnificent blossoms are the great feature of several of the lakes and rivers.

The forests abound in such timber as quebracho, cedar, cypress, lapacho and urunday. Some of these, such as the lapacho and quebracho, are of rare excellence and durabiliy, as is shown by the wonderful state of preservation in which the woodwork of early Jesuit churches still remains. Fifteen plants are known to furnish dyes, and eight are sources of fibre—the carayagua especially being employed in the manufacture of the reeep famu, or ship-cable, and the *tapioca*, or manioc. Brick, leathers, furniture, and extract of meat are manufactured.

Commerce.—The commercial situation of Paraguay has improved in recent years. The establishment of a capital city has increased the enterprise. The principal articles imported are textiles, hardware, wines, rice, flour, canned goods and general provisions; the exports are yerba mate, hides, hair, dried meat, wood, oranges, tobacco. Most of the trade is carried on with Buenos Aires or Montevideo. The values for the five years 1904-1908 were:

<table>

</tbody>
</table>

Of the imports into Paraguay, 29% came from Germany in 1908, 21% from the United Kingdom and 19% from Argentina.

Communications.—Numerous ocean-going liners, most of which fly the British or the French flag, reach the Pará, the Paraná smaller vessels ascend the tributary streams, which are also utilized for floating lumber down to the ports. Out of 1,300,000 of the imports of the years 1904 and 1906, a large part, about 40%, was of British or United States nationality. The Brazilian Lloyd S.S. Co. provides direct and regular communication between Asuncion and New York. The only railway in the republic is the Paraguay Central which was opened in 1906 between Asuncion and Pirapó (154 m.). The completion of the line to Encarnacion was then undertaken (1906-1911), a train-terry across the Paraná affording connexion with Passadas. These extensions, and the alterations in the position of the line of communication from north-west to south-east, were carried out mainly at the cost of the Argentine government, which acquired a controlling interest in the Paraguay Central. They were intended to obviate the journey between Bio-Bio and Asuncion by a 5 days to 36 hours. There are some fairly good wagon roads, and the government appropriates annually a considerable sum for their extension.

Post and Telegraph.—Paraguay entered the Universal Postal Union in 1884. Telegraph lines connect Asuncion with other towns, and two cables put the republic in communication with the rest of the world by submarine cables.

Money and Credit.—The banks open for business in 1904 were the Mercantile Bank, the Territorial Bank, the Bank of Los Rios & Co., and the Agricultural Bank: the last named has a capital of $1,000,000. Loans and advances are given by the Bank of Los Rios & Co. to farmers in agricultural and industrial classes. The Paraguayan Bank, with a capital of $600,000, was opened in 1905, and the state bank (Banco de la República), with a total authorized capital of $4,000,000, was opened on the 1st of June 1908. The Commercial Bank, which is authorized to sell or lend gold, receives a fixed revenue of $30,000 from certain import and export dues; it was reorganized in 1908 to assume the administration of the public debt. In the same year the gold and silver coins of Paraguay were legally standardized as identical with those of Argentina (5 gold dollars or pesos=1; but paper money is about the only circulating medium, and gold coins are not frequently used). The unit for dry measure is the *almud* (66 bushels); the bushel (1 bushel). The land measures are the legua (2,689 m.), the *sino* (69 yd. sq.), and the legua cuadrada (124 sq. m.).

History.—In 1527 Sebastian Cabot reached Paraguay and built a fort called Santo Espíritu. Asuncion was founded on the 15th of August 1535 by Juan de Ayolas, and his successor, Martínez de Irala, determined to make it the capital of the Spanish possessions east of the Andes. From this centre the Jesuits ventured out into the land, and the Paraguay, Guaraní, and Paraná, and west into the Gran Chaco; and before long vast numbers of the less warlike natives were reduced to serfdom. The name Paraguay was applied not only to the country between the Paraguay and the Paraná, but to the whole Spanish territory, which now comprises parts of Brazil, Uruguay and the Argentine provinces of Buenos Aires, Entre Ríos, Corrientes, Misiones, and part of Santa Fé. It was not till 1620 that Paraguay proper and Rio de la Plata or Buenos Aires were separated as distinct governments, and they were both dependent on the vice-royalty of Peru till 1776, when Buenos Aires was erected into a vice-royalty, and Paraguay placed under its jurisdiction. The first Christian missions in Paraguay were established by the Franciscans—Armenta, Lebron, Solano (who was afterwards canonized as the “Apostle of Paraguay”) and Bolanos—between 1542 and 1560; but neither they nor the first Jesuit missionaries, Salonio, Field and Ortega, were allowed to make their enterprise a permanent success. This fell to the lot of the second band of Jesuits, Cataldino, Mazeta and Lorenzana, who began work in 1653. Though they succeeded in establishing a kind of *imperium in imperio*, and were allowed to drill the natives to the use of firearms, the Jesuits were expelled under the orders of the government. Under these orders they received the transference, and it was only after several engagements that they were defeated by the combined forces of Spain and Portugal. The treaty was revoked by Spain in 1761, but the missions never recovered their prosperity, and the Jesuits were finally expelled in 1769. In 1811 Paraguay declared itself independent of Spain; by 1814 it was a despotism in the hands of Dr. José G. Francia (q.v.). On Francia’s death, in 1840, the chief power passed to his nephew, Carlos Antonio Lopez (q.v.), who in 1862 was succeeded by his son Francisco Solano Lopez. In 1864 a dispute arose between the younger Lopez and the Brazilian government, and Lopez marched an army through Argentine territory to invade southern Brazil.
This act induced the governments of Brazil, Uruguay and Argentina to combine for the purpose of suppressing Lopez. The invasion of Paraguay then took place, and a struggle involving an enormous sacrifice of life and treasure lasted for five years, only coming to a close when the Paraguayan forces were practically annihilated. Lopez himself and his wife were found dead at the water's edge of the Paraguay river at Aquidaban on the 1st of March 1870. During this warfare every male Paraguayan capable of bearing arms was forced to fight, whole regiments being formed of boys from 12 to 15 years of age. Even women were used as beasts of burden to carry ammunition and stores, and when no longer capable of work were left to die by the roadside or murdered to avoid any ill consequences occurring from their capture. When the war broke out the population of Paraguay was 1,357,439; when hostilities ceased it consisted of 28,746 men, 192,254 women above 15 years of age, and 86,970 children. During the retreat of the Paraguayans the dictator ordered every town and village passed through to be razed to the ground, and every living animal for which no use could be found to be slaughtered. When the end came the country and people were in a state of absolute prostration.

After the death of Lopez the government was administered by a triumvirate consisting of Cirio Rivarola, Carlos Loizaga and José Diaz de Bedoza, until, in November 1870, the present constitution was formulated. The policy of Brazil was for a time directed towards the annexation of Paraguay; the debt due to Brazil on account of the war was assessed at £40,000,000, and all Paraguay could never hope to pay it; and it was not until 1876 that the Brazilian army of occupation was wholly withdrawn. But the rivalry between Brazil and Argentina, and the necessity of maintaining the balance of power among the South American republics, enabled Paraguay to remain independent. No violent constitutional change took place after 1870, though there have been spasmodic outbreaks of revolution, as in 1881, in 1894, in December 1904—when a somewhat serious civil war was ended by the peace of Pilcomayo—in July 1908 and in September 1909. None of these disturbances deeply or permanently affected the welfare of the republic, nor were all of them accompanied by bloodshed. Under the presidency of J. B. Egusquiza (1864–1868) the boundary dispute with Bolivia became acute; but war was averted, largely owing to the success of the revolution, which forced the president to resign. The main interest of recent Paraguayan history is economic rather than political. In that history the gradual development of commerce, the financial reforms in 1895, and the extension of the Paraguay Central railway after 1906, were events of far greater importance than any political movement which took place between 1870 and 1910.

Paraguay (Spanish: República del Paraguay) is a country located on the Paraguay river, 11 m. above its mouth and 65 m. N. of Recife. Pop. (1890), 18,645, including several suburbs and Cabebede; (1908, estimate) 30,000. Paraguay is the starting-point of the Conde d’Eu railway, now a part of the Great Western of Brazil system, which includes a main line to Independencia, where it connects with the Natal & Nova Cruz line, and a branch runs southward to Pilar, 15 m. from its junction and 46 m. from Paraguay. Another small branch runs westward from the station of Mulungu to Alagoga Grande (1473).

The capital is Paraguay (p.n.), and other important towns, with the populations (in 1890) of their municipalities, which include large rural districts and sometimes several other towns, are: Arica (26,906); Bananeiras (20,058); Campina Grande (21,475); Guarabara (26,625); Manangauape (20,754); Pilar (10,133, town); Pombal (12,804); and Souza (11,135).

Paraguay formed part of the original grant, known as the capitanía of Itamaracá, from the Portuguese crown to Pero Lopes de Souza. It was not settled until 1584, when a fort was erected near the present port of Cabedelo under the name of São Filipe.

PARAHYBA (PARAHIBA or PARAHIBA DO NORTE), a city and port of Brazil, capital of Parahyba state, on the right bank of the Parahyba do Norte river, 11 m. above its mouth and 65 m. N. of Recife. Pop. (1890), 457,732; (1900), 490,784. Area, 28,854 sq. m. It consists of a narrow coastal zone, 30 to 40 m. wide, along the seacoast, behind which the country rises sharply to a highland region forming part of the great central plateau of Brazil. The long, dry season (April to October), together with occasional devastating droughts (séculos) lasting two or more years, prevents the development of forests and damages the agriculture and pastoral industries of the state. There is only one river of importance, the Parahyba do Norte, which crosses the southern part of the state from west to cast with a course of about 240 m. The state is poorly watered and covered with a scanty vegetation suitable for pastoral use. Stock-raising is favoured by the existence of a bromeliaceous plant, called meccambira, which is sufficiently juicy to satisfy the thirst of the animals. On the low lands and along some of the river valleys agriculture is the chief occupation of the people; cotton and sugar are largely the products of the land, and tobacco is grown. The exports include hides, skins, cotton, sugar and tobacco. Rubber of the Cecar type is also found and forms an item among the smaller exports. The eastern extremity of the state is served by a railway originally called the Conde d’Eu railway but now forming part of the Great Western of Brazil system, which runs westward and northward from Parahyba to Independencia (72 m.), where it connects with the extension of the Natal and Nova Cruz line, and a branch runs southward to Pilar, 15 m. from its junction and 46 m. from Parahyba. Another small branch runs westward from the station of Mulungu to Alagoga Grande (1473). The capital is Parahyba (p.n.), and other important towns, with the populations (in 1890) of their municipalities, which include large rural districts and sometimes several other towns, are: Arica (26,906); Bananeiras (20,058); Campina Grande (21,475); Guarabara (26,625); Manangauape (20,754); Pilar (10,133, town); Pombal (12,804); and Souza (11,135). Parahyba formed part of the original grant, known as the capitanía of Itamaracá, from the Portuguese crown to Pero Lopes de Souza. It was not settled until 1584, when a fort was erected near the present port of Cabedelo under the name of São Filipe.

PARAHYBA DO SUL, a river of Brazil, having its source on the campos of Bocaina, on the northern slope of the Serra do Mar in the western part of the state of São Paulo, and flowing at first south-westerly and then after a horse-shoe curve in the vicinity of Jacarehy in a general E.N.E. direction to the Atlantic in lat. 21° 38’ S. Its upper course for a distance of 80 m., or to the confluence of the Parahyba, is known as the Parahyba. The navigable channel from São Fidelis to the
PARALDEHYDE—PARALLAX

Atlantic is 54 m. long, and the total length of the river, including the Parahyba itself, is 540 m. Its source is about 4920 ft. above sea-level. The Parahyba passes through a fertile, long-settled country, a part of which was for many years the principal coffee-producing region of Brazil. Its lower course passes through the rich alluvial sugar-producing district of Campos. Among the towns on the Parahyba are Campos, São Fidelis, Parahyba do Sul, Juiz de Fora, Barra do Pirahy (railway junction), Rezende, Queima and Lorenó.

PARALDEHYDE, in medicine, a clear colourless liquid (for the chemistry see ALDEHYDES), soluble in 1 in 10 of water and freely in alcohol. Paraldehyde is a powerful hypnotic, giving a refreshing quiet sleep which is not followed by unpleasant after effects. As it does not depress the heart when used in medicinal doses, it may be given to patients suffering from cardiac disease. It is much used to produce sleep in the insane. As it is largely excreted by the lungs it may be found useful in bronchial asthma. When taken continuously the drug soon loses its power as a hypnotic. Its unpleasant taste usually prevents the formation of a paraldehyde habit, but it occasionally occurs with symptoms resembling delirium tremens. When taken in an overdose paraldehyde kills by producing respiratory failure.

PARALLAX (Gr. παραλλαξις, alternately), in astronomy, the apparent change in the direction of a heavenly body when viewed from two different points. Geocentric parallax is the angle between the direction of the body as seen from the surface of the earth and the direction in which it appears from the centre of the earth. Annual parallax is the angle between the direction in which a star appears from the earth and the direction in which it appears from the centre of the sun. For stellar parallaxes see STAR; the solar parallax is discussed below.

SOLAR PARALLAX.—The problem of the distance of the sun has always been regarded as the fundamental one of celestial measurement. The difficulties in the way of solving it are very great, and up to the present time the best authorities are not agreed as to the result, the effect of half a century of research having been merely to reduce the uncertainty within continually narrower limits. The mutations of opinion on the subject during the last fifty years have been remarkable. Up to about the middle of the 19th century it was supposed that transits of Venus across the disk of the sun afforded the most trustworthy method of making the determination in question; and when Encke in 1834 published his classic discussion of the transits of 1761 and 1769, it was supposed that we must wait until the transits of 1874 and 1882 had been observed and discussed before any further light would be thrown on the subject. The parallax 8.7776" found by Encke was therefore accepted without question, and was employed in the Nautical Almanac from 1834 to 1869. Doubt was first thrown on the accuracy of this number by an announcement from Hansen in 1862 that the observed parallactic inequality of the moon was irrefutably concordant with the accepted value of the solar parallax, and indicated the much larger value 8.97". This result was soon confirmed by several other researches founded both on theory and observation, and so strong did the evidence appear to be that the value 8.97" was used in the Nautical Almanac from 1870 to 1881. The most remarkable feature of the discussion since 1862 is that the successive examinations of the subject have led to a continually diminishing value, so that at the present time it seems possible that the actual parallax of the sun is almost as near to the old value of Encke as to that which first replaced it. The value of 8.847" determined by S. Newcomb, was used from 1882 to 1900; and since then the value 8.860" has been employed, having been adopted at a Paris conference in 1896.3

Five fundamentally different methods of determining the distance of the sun have been worked out and applied. They are as follows:

1. That of direct measurement.—From the measures of the parallax of either Venus or Mars the parallax of the sun can be immediately derived, because the ratio of distances in the solar system are known with the last degree of precision. Transits of Venus and observations of various kinds on Mars are all to be included in this class.

II. The second method is in principle extremely simple, consisting merely in multiplying the observed velocity of light by the time which it takes light to travel from the sun to the earth. The velocity is now well determined; the difficulty is to determine the time of passage.

III. The third method is through the determination of the mass of the earth taken as an astronomical unit. In astronomical practice the masses of the planets are commonly expressed as fractions of the mass of the sun, the latter being taken as unity. When we know the mass of the earth in gravitational measure, its product by the denominator of the fraction just mentioned gives the mass of the sun in gravitational measure. From this the distance of the sun can be at once determined by a fundamental equation of planetary motion.

IV. The fourth method is through the parallactic inequality in the moon’s motion. For the relation of this inequality to the solar parallax see §. The fifth method consists in observing the displacement in the direction of the sun, or of one of the nearer planets, due to the motion of the earth round the common centre of gravity of the earth and moon. It requires a precise knowledge of the moon’s mass. The uncertainty of this mass impairs the accuracy of the method.

V. To begin with the results of the first method. The transits of Venus observed in 1874 and 1882 might be expected to hold a leading place in the discussion. No purely astronomical enterprise was ever carried out on so large a scale or at so great an expenditure of money and labour as was devoted to the observations of these transits, and for several years before their occurrence the astronomers of every leading nation were busy in discussing methods of observation and working out the multifarious details necessary to their successful application. In the preceding century reliance was placed entirely on the observed moments at which Venus entered upon or left the limb of the sun, but in 1874 it was possible to determine the relative positions of Venus and the sun during the whole course of the transit. Two methods were devised. One was to use a heliometer to measure the distance between the limbs of Venus and the sun during the whole time that the planet was seen projected on the solar disk, and the other was to take photographs of the sun during the period of the transit and subsequently measure the negatives. The Germans laid the greatest stress on measures with the heliometer; the Americans, English, and French on the photographic method. These four nations sent out well-equipped expeditions to various quarters of the globe, both in 1874 and 1882, to make the required observations; but when the results were discussed they were found to be extremely unsatisfactory. It had been supposed that, with the greatly improved telescopes of modern times, contact observations could be made with much greater precision than in 1761 and 1769; yet, for some reason which it is not easy to explain completely, the modern observations were but little better than the older ones. Discrepancies difficult to account for were found among the estimates of even the best observers. The photographs led to no more definite result than the observations of contacts, except perhaps those taken by the Americans, who had adopted a more complete system than the Europeans; but even these were by no means satisfactory. Nor did the measures made by the Germans with heliometers come out any better. By the American photograph the distances between the centres of Venus and the sun, and the angles between the line adjoining the centres and the meridian, could be separately measured and a separate result for the parallax derived from each. The results were:

Transit of 1874: Distances; par. = 8.888.°

Pos. angles; = 8.873.°

Transit of 1882: Distances; = 8.876.°

Pos. angles; = 8.772.°
The German measures with the heliometer gave apparently concordant results, as follows:—

Transit of 1874: par. = 8.876°.
Transit of 1878: " = 8.879°.

The combined result from both these methods is 8.875°, while the combination of all the contact observations made by all the parties gave the much smaller result, 8.704°. Had the internal contacts alone been used, which many astronomers would have considered the proper course, the result would have been 8.776°.

In 1877 Sir David Gill organized an expedition to the island of Ascension to observe the parallax of Mars with the heliometer. By measurements giving the position of Mars among the neighboring stars in the morning and evening, the effect of parallax could be obtained as well as by observing from two different stations; in fact the rotation of the earth carried the observer himself round a parallel of latitude, so that the comparison of his own morning and evening observations could be used as if they had been made at different stations. The result was 8.87°. The failure of the method based on transits of Venus led to an international effort carried out on his suggestion by Sir David Gill to measure the parallax by observations on those minor planets which approach nearest the earth. The scheme of observations was organized on an extended scale. The three bodies chosen for observation were: Victoria (June 10 to Aug. 26, 1880); Iris (Oct. 12 to Dec. 10, 1888); and Sappho (Sept. 18 to Oct. 25, 1888). The distances of these bodies at the times of opposition were somewhat less than unity, though more than twice as great as that of Mars in 1877. The drawback of greater distance was, however, in Gill's opinion, more than compensated by the accuracy with which the observations could be made. The instruments used were heliometers, the construction and use of which had been greatly improved, largely through the efforts of Gill himself. The planets in question appeared in the telescope as star-like objects which could be compared with the stars with much greater accuracy than a planetary disk like that of Mars, the apparent form of which was changed by its varying phase, due to the different directions of the sun's illumination. These observations, were worked up and discussed by Gill with great elaboration in the *Annals of the Cape Observatory*, vols. vi. and vii. The results were for the solar parallax $\pi$:

From Victoria, $\pi = 8.801° = 0.005°$.
From Sappho, $\pi = 8.825° = 0.005°$.
From Iris, $\pi = 8.812° = 0.009°$.

The general mean result was $8.802°$. From the meridian observations of the same planets made for the purpose of controlling the elements of the motions of the planets Auwers found $\pi = 8.806°$.

In 1898 the remarkable minor planet Eros was discovered, which, on those rare occasions when in opposition near perihelion, would approach the earth to a distance of 0.16. On these occasions the actual parallax would be six times greater than that of the sun, and could therefore be measured with much greater precision than in the case of any other planet. Such an approach had occurred in 1892, but the planet was not then discovered. At the opposition of 1901-1902 the minimum distance was 0.32, much less than that of any other planet. Advantage was taken of the occasion to make photographic measures for parallax at various points of the earth on a very large scale. Owing to the difficulties inherent in determining the position of so faint an object among a great number of stars, the results have taken about ten years to work out. The photographic right ascensions gave the values $8.800° + 0.007° \pm 0.003°$ (Hinks) and $8.806° + 0.006° \pm 0.002°$ (Perrin); the micrometric observations gave the value $8.806° + 0.004°$ (Hinks).1

The velocity of light ($c$) has been measured with all the precision necessary for the purpose. The latest result is 299,800 kilometres per second, with a probable error of perhaps 0.3 kilometre. The present measure of the velocity is the best we have; the value of the quantity of this degree of precision is far beyond any we

In gravitational units of mass, based on the metre and second as units of length and time,

Log. earth's mass = 14,60052

" moon's " = 12,695.

The sum of the corresponding numbers multiplied by 32,000 gives

Log. sun's mass = 20.12773.

Putting $a$ for the mean distance of the earth from the sun, and $n$ for its mean motion in one second, we use the fundamental equation

$$ \frac{\sigma^2}{n^2} = M_e + M_s. $$

$M_e$ being the sun's mass, and $M_s$ the combined masses of the earth and moon, which are, however, too small to affect the result. For the mean motion of the earth in one second in circular measure, we have

$$ n = \frac{2\pi}{31558149}; \log. n = 7.29907 $$

the denominator of the fraction being the number of seconds in the sidereal year. Then, from the formula

$$ \frac{\sigma^2}{n^2} = \frac{M_e}{20.12773} = 15.59814 $$

we find

Log. $a$ in metres = \(
11.127653
\)

Log. equivat. rad. = \(6.68470\)

Sine $\circ$'s eq. hor. par. = \(5.62817\)

Sun's eq. hor. par. = \(8.702^\circ\).

IV. The determination of the solar parallax through the parallactic inequality of the moon's motion also involves two elements—one of observation, the other of purely mathematical theory. The inequality in question has its greatest negative value near the time of the moon's first quarter, and the greatest positive value near the third quarter. Meridian observations of the moon have been heretofore made by observing the transit of its illuminated limb. At first quarter its first limb is illuminated; at third quarter, its second limb. In each case the results of the observations may be systematically in error, not only from the uncertain diameter of the moon, but in a still greater degree from the varying effect of irradiation and the personal equation of the observers. The theoretical element is the ratio of the parallactic inequality to the solar parallax. The determination of this ratio is one of the most difficult problems in the lunar theory. Accepting the definitive result of the researches of E. W. Brown the value of the solar parallax derived by this method is about $8.773^"$.

V. The fifth method is, as we have said, the most uncertain of all; it will therefore suffice to quote the result, which is $\pi = 8.818^\circ$.

The following may be taken as the most probable values of the solar parallax, as derived independently by the five methods we have described.

From measures of parallax $8.80^\circ$

velocity of light $8.78^\circ$

mass of the earth $8.76^\circ$

par. ineq. of moon $8.773^\circ$

lunar equation $8.818^\circ$

The question of the possible or probable error of these results is one on which there is a marked divergence of opinion among investigators. Probably no general agreement could now be reached on a statement more definite than this; the last result may be left out of consideration, and the value of the solar parallax is probably contained between the limits $8.77^\circ$ and $8.80^\circ$. The most likely distance of the sun may be stated in round numbers as 93,000,000 miles. (S. N.)

PARALLELISM, PSYCHOPHYSICAL, in psychologv, the theory that the conscious and nervous processes vary concomitantly whether or not there be any causal connexion between them; in other words "that modifications of consciousness emerge contemporaneously with corresponding modifications of nervous process" (Stout). The theory is the third possible alternative in considering the relation between mind and body, the others being interaction and one-sided action (e.g. materialism). It should be observed that this theory is merely a statement, not an explanation. (See Psychology.)

PARALLELISM—PARALYSIS

PARALLEL MOTION, a form of link-work invented by James Watt, and used in steam-engines (see Steam-Engine, § 88), to connect the head of the piston rod, moving up and down in a vertical path, with the end of the beam, moving in the arc of a circle. An ordinary form is shown diagrammatically in figure. MN is the path in which the piston-rod head, or crosshead, as it is often called, is to be guided. ABC is the middle line of half the beam. C being the fixed centre about which the beam oscillates. A link BD connects a point in the beam with a radius link ED, which oscillates about a fixed centre at E. A point P in BD, taken so that BP : DP :: EN : CM, move in a path which coincides very closely with the straight line MPN. Any other point F in the line CP or CR produced is made to copy this motion by means of the links AF and FG, parallel to BD and AC. In the ordinary application of the parallel motion a point such as F is the point of attachment of the piston-rod, and P is used to drive a pump-rod. Other points in the line CP produced are occasionally used in conjunction with other links parallel to AC and BD. Watt's linkage gives no more than an approximation to straight-line motion, but in a well-designed example the amount of deviation need not exceed one four-thousandth of the length of stroke. It was for long believed that the production of an exact straight-line motion by pure linkage was impossible, until the problem was solved by the invention of the Peaucellier cell. (See also Mechanics: Applied Mechanics, §§ 77, 78.)

PARALLELS, in siegework, a term used to express the trenches drawn by besiegers in a generally parallel direction to the front of a fortress chosen for attack. "Parallels are employed along with "zero"-approaches" in the "formal attack" or siege proper. They are traced in short zigzag lengths (the prolongation of each length falling clear of the hostile works), in order to avoid enfilade; but their obliquity is of course made as slight as is consistent with due protection in order to save time and labour. The "first parallel" is opened at a convenient distance from the fortress, by numerous working parties, who dig (under cover of night) a continuous line of entrenchments facing the point or points of attack. Zigzags are next dug to the rear (when necessary) to give sheltered access to the parallel, and from this new zigzags are pushed out towards the defenders, to be connected by a "second parallel," and so on until finally a parallel is made sufficiently close to the fortress to permit of an assault over the open, the parallels becoming stronger and more solid as they approach to closer range. This system of parallels provides, within range of the defenders' weapons, shelter in which the besieger can safely mass men and material for the prosecution of the attack. Parallels and approaches are constructed either by ordinary "trench work," executed simultaneously by a large number of men strung out along the intended line, or by "sapping" in which one trained "sapper," as it were, burrowed a trench in the required direction, others following him to widen and improve the work.

PARALUS and SALAMINIA, the name of two ancient Athenian triremes used for sacred embassies, the conveyance of dispatches and tribute money, the transportation of state criminals, and as flagship in time of war. It is probable that a third vessel of the same kind (called Delia) was used exclusively for Delian embassies, although it has been identified some with the Salaminia.

PARALYSIS, or PALSY (from Gr. παράλυσις, to relax; Wycliffe has "palsy," and another old form of the word is "parlecy"), a term which in its wider acceptation indicates abolition of motor, sensory, sensorial or vaso-motor functions, but in medical nomenclature is usually restricted to the loss or impairment of voluntary muscular power. Paralysis is to be regarded rather as a symptom than a disease per se; it may arise (1) from injury
or disease of nervous and muscular structures, and is then termed organic paralysis; or (2) from purely dynamic disturbances in the nervous structures of the brain which preside over voluntary movement. The latter is functional motor paralysis, a symptom common in certain neuroses, especially hysteria. For general paralysis of the insane, see INSANITY.

Whether the loss of motor power be functional or organic in character, whether it be due to injury or disease of the spinal cord, or localized to one or many, the different forms of paralysis of the voluntary muscles which may arise from organic disease can be understood by a consideration of the motor path of voluntary impulses from brain to muscle. There are two neural segments in this path, an upper cerebral and a lower spinal; the former has its departure platform in the brain and its terminus in the whole of the anterior grey matter of the spinal cord, whence issues the lower spinal segment of the motor path to the muscles. The nerve fibres of the upper cerebral segment are prolongations of the large psycho-motor cells; the nerve fibres of the lower segment are prolongations by the anterior roots and motor nerves of the large cells in the grey matter of the cord. Disease or destruction of any part of the upper cerebral segment will give rise to loss of voluntary power, for the influence of the mind on the muscles is removed in proportion to the destruction of this effenter path (see diagram in NEUROPATHOLOGY). Disease or destruction of the lower spinal segment causes not only loss of voluntary power but an atrophy of the muscles themselves. Paralysis may therefore be divided into three great groups: (1) loss of voluntary power without muscular wasting except from disuse, and without electrical changes, either due to injury or disease of the upper cerebral segment of the motor path of will; (2) loss of muscular power with wasting and electrical changes in the muscles due to disease or injury of the lower spinal segment formed by the cells of the grey matter of the spinal cord, the anterior roots and the peripheral motor nerves; (3) primary wasting of the muscles.

The more common forms of paralysis will now be described.

1. Hemiplegia, or paralysis affecting one side of the body, is a frequent result of apoplexy (q.v.); there is loss of motion of the tongue, face, trunk and extremities on the side of the body opposite the lesion in the brain. In a case of severe complete hemiplegia both arm and leg are powerless; the face is paralysed chiefly in the lower part, while the upper part moves almost as well as on the unparalysed side, and the eye can be shut at will, unlike peripheral facial paralysis (Bell's palsy). The tongue when protruded deviates towards the paralysed side, and the muscles of mastication contract equally in ordinary action, although difficulty arises in eating, from food accumulating between the cheek and gums on the paralysed side. Speech is thick and indistinct, and when there is right-sided hemiplegia in a right-handed person, there may be associated various forms of aphasia (q.v.), because the speech centres are in the left hemisphere of the brain. Some muscles are completely paralysed, others are merely weakened, while others, e.g. the trunk muscles, are apparently unaffected. In many cases of even complete hemiplegia, improvement, especially in children, takes place after a few weeks or months, and is generally first indicated by return of movement in the muscles which are habitually associated in their action with those of the opposite unparalysed side; thus, movement of the leg returns first at the hip and knee joints, and of the arm at the shoulder and elbow, although the hand may remain motionless. The recovery however in the majority of cases is slight, and if the sufferer of hemiplegia is left with a permanent weakness of one side of the body, often associated with contracture and rigidity, giving rise to a characteristic gait and attitude. The patient in walking leans to the sound side and swings round the affected leg from the hip, the inner side of the toe of the boot scraping the ground as it is raised and advanced. The arm is adducted at the shoulder, flexed at the elbow, wrist and fingers, and resists all attempts at extension. According to the part of the brain damaged variations of paralytic symptoms may arise; thus occasionally the paralysis may be limited more or less to the face, the arm or the leg. In such case it is termed monoplegia, a condition sometimes arising from cerebral tumour. Occasionally the face is paralysed on one side and the arm and leg on the other side; this condition is termed alternate hemiplegia, which is due to the fact that the disease has damaged the motor path from the brain to the leg and arm before it has crossed over to the opposite side, whereas the paralysed arm and leg are damaged after it has crossed. In rare cases both leg, arm and face on one side may be paralysed—triplegia; or all four limbs—bilateral hemiplegia. Infantile spastic paralysis, infantile diplegia, or as it is sometimes called Little's disease, is a birth palsy caused by injury from protracted labour, the use of forceps or other causes. The symptoms are generally not observed until long after birth. Convulsions are common, and the child is unable to sit up or walk long after the age at which it should do so.

Paraplegia is a term applied to paralysis of the lower extremities; there are many causes, but in the great majority of instances it arises from a local or general disease or injury of the spinal cord. A localized transverse myelitis will interrupt the motor and sensory paths which connect the brain with the spinal grey matter below the lesion, and when the destruction is complete, motor and sensory paralysis in all the structures below the injury results; thus fracture, dislocation and disease of the spinal column (e.g. tubercular caries, syphilitic disease of the membranes, localized tumours and haemorrhages) may cause compression and inflammatory softening, and the result is paralysis of the voluntary muscles, loss of sensation, loss of control over the bowels and bladder, and a great tendency to contractures in the joints. The muscles do not waste except from disuse, nor undergo electrical changes unless the disease affects extensively the spinal grey matter or roots as well as the cerebral path. When it does so, as in the case of acute spreading myelitis, the symptoms are usually more severe and the outlook is more grave.

In cases of focal myelitis from injury or disease, recovery may take place and the return of power and sensation may occur to such an extent that the patient is able to walk long distances; this happy termination in cases of localized disease or injury of the spinal cord often takes place by keeping the patient on his back in bed, daily practising massage and passive movements, and so managing the case as to avoid bedsores and septic inflammation of the bladder—the two dangerous complications which are liable to arise.

2. Paralysis may result from acute inflammatory affections of the spinal cord involving the grey and white matter—myelitis (see NEUROPATHOLOGY).

Infantile or Essential Paralysis.—This is a form of spinal paralysis occurring with frequency in young children; in Scandinavian countries the disease is prevalent and sometimes assumes an epidemic form, whereby one is led to believe that it is due to an infective organism. The names infantile and essential paralysis were given before the true nature of the disease in the spinal cord was known; precisely the same affection may occasionally occur, however, in adults, and then it is termed adult spinal paralysis. The medical name for this disease is acute anterior poliomyelitis (Gr. polio, grey, and myelos, marrow), because the anterior grey matter of the spinal cord is the seat of acute inflammation, and destruction of the spinal motor nerve path to the muscles. The extent of the spinal grey matter affected and the degree of destruction of the motor nerve elements which ensues determine the extent and permanency of the paralysis. The term atrophic spinal paralysis is sometimes employed as indicating the permanent wasting of muscles that results.

Infantile paralysis often commences suddenly, and the paralysis may not be observed until a few days have elapsed; the earliest symptoms noticeable are fever, convulsions and sometimes vomiting; and, if the child is old enough, it may complain of pains or numbness or tingling in the limbs or limbs which are subsequently found to be paralysed. It is characteris-

...
in the paralysed limb. The whole of the limb is not necessarily paralysed, often it is only a group of muscles, and even if the paralysis affects both legs or the arm and leg on one side, it generally fails in the uniform distribution of the previously described paralysis, or hemiplegia. The affected muscles rapidly wax and wane, become flaccid, the electrical reactions change, and finally the muscles may cease to respond to electrical stimulation whether of the continuous or interrupted current. In the less severe cases (and they are the most common) only a group of muscles undergo complete paralysis and atrophy, and there is always hope of some return of power in a paralysed limb. Associated with the withered condition of the limb due to the muscular atrophy is an encephaloid circulation, rendering the limb cold, blue and livid; the nutrition of the bones and other parts is involved, so that a limb paralysed in early infancy does not grow after an interval of years. The result is simply failing muscular support; others due to permanent changes in the position of the limbs, for example club foot. There is absence of bladder and bowel troubles, and bed sores do not occur; the disease itself is rarely, if ever, fatal. About a month after the onset of the disease local treatment of the atrophied muscles should be commenced, and every effort should be made by massage, by suitable positions and passive movements to promote the circulation and prevent deformities in the affected limbs. Should these measures fail, surgical aid should be sought.

Sub-acute and chronic forms of atrophic and spinal paralysis have been described, but some of them were undoubtedly cases of peripheral neuritis.

Wasting Palsy. Progressive Muscular Atrophy.—This is a chronic disease characterized by slow and insidious weakness and wasting of groups of muscles due to disease of the anterior spinal grey matter. It begins mostly in adult life between 25 and 45 years of age, and affects males more than females. In the majority of cases it commences in the upper extremities, and the small muscles of the hand are especially liable to be affected. The palmar eminences of the thumb and little finger, owing to the wasting of the muscles, gradually disappear, and a flat ape-like hand is the result; in extreme cases all the small muscles of the hand are atrophied, and a claw-like hand is the result. The muscles which are next most liable to atrophy are those of the shoulder and upper arm, and the atrophy may thence spread to the muscles of the neck and trunk, and the intercostals and even the diaphragm may be affected, causing serious difficulties of respiration. The lower extremities are less often and later affected by wasting. This disease generally runs a slow and progressive course; it may however be years before it spreads from the hand to the arm, and a period of arrest may occur before other muscles become involved. A characteristic feature of the disease is fibrillary twitching of the wasting muscles. The electrical excitability of the muscles is diminished rather than changed, except where the wasting is very extreme, when a partial reaction of degeneration may be obtained. Sensation is unaffected, as the disease is limited to the motor cells of the anterior grey matter (see Neuropathology). There is no affection of the bowel or bladder. Death usually occurs from intercurrent diseases, e.g. bronchitis, pneumonia, or broncho-pneumonia. Some patients die owing to failure of the respiratory muscles; others from the disease spreading to the medulla oblongata (the bulb of the brain) and causing bulbar paralysis. The chronic morbid process leading to decay and destruction of the spinal motor cells which is the essential pathological feature of this disease is generally accompanied, and sometimes preceded, by degeneration of the path of voluntary impulses from the brain. It is then called amyotrophic lateral sclerosis, a rapid form of progressive muscular atrophy.

Bulbar Paralysis.—A number of different morbid conditions may give rise to a group of symptoms, the principal features of which are paralysis of the muscles concerned in speech, swallowing, phonation and mastication. These symptoms may arise suddenly from vascular lesions or inflammatory processes, which involve the nuclei of origin of the cranial nerves supplying the muscles of the tongue, lips, pharynx and larynx. But there is also a slow degenerative insidious progressive bulbar paralysis affecting both sexes pretty equally; it came on between 40 to 60 years of age, and the cause is unknown. Slight indistinctness of speech, especially in the utterance of consonants requiring the elevation of the tip of the tongue to the dental arch and palate, is usually the first symptom. Later the explosive lip sounds are indistinctly uttered; simultaneously, owing to paralysis of the soft palate, the speech becomes nasal in character and sooner or later, associated with this difficulty of speech, there is a difficulty of swallowing, partly because the tongue is unable to convey the food to the back of the mouth, and it accumulates between the cheeks and gums. Moreover the pharyngeal muscles are unable to seize the food and start the process of swallowing on account of the paralysis of the soft palate; liquids are apt to be aspirated through the nostrils, the patient must therefore be nourished with soft semi-solid food. As the disease proceeds, the difficulty of speech and swallowing is increased by the affection of the laryngeal muscles; the pitch of the voice is lowered and the glottis is imperfectly closed during deglutition; there is consequently a tendency for liquids and food to pass into the larynx and set up fits of coughing, which, however, are ineffectual. Later the muscles of mastication are affected and the disease may extend to the respiratory centre, giving rise to attacks of dyspnoea. The intellectual faculties are as a rule unimpaired, although the facial expression and the curious emotional mobility of the countenance, with a tendency of the patient to burst into tears or laughter, would suggest weak-mindedness. Whilst the lower half of the face is strikingly affected, the upper half retains its normal expression and power of movement. This disease is usually rapidly fatal, since it affects the vital centres, and liability to broncho-pneumonia excited by the entrance of food into the air passages is also a constant danger in the later stages.

Bulbar Paralysis without Anatomical Change.—This condition is also termed "myasthenia gravis"; it differs from acute and chronic bulbar disease by the absence of muscular atrophy, by normal electrical excitability of the muscles, by a marked development of the paralysis by fatigue, and by considerable remissions of the symptoms. The bulbar symptoms are the most prominent, but all voluntary muscles are more or less affected, especially the eye-muscles. It is a rare disease affecting both sexes equally at almost any age, the causes and pathology of which are unknown.

3. Paralysis resulting from disease or injury of the motor path to the muscles in the peripheral nervous system.

Neuritis.—Paralysis may arise in a muscle, a group of muscles, a whole limb, the lower extremities, or there may be a generalized paralysis of voluntary muscles as a result of neuritis. A typical example of neuritis giving rise to paralysis owing to inflammatory swelling and compression is afforded by the facial nerve; this pure motor nerve as it passes out of the skull through a narrow bony passage is easily compressed and its function interfered with, causing a paralysis of the whole of one side of the face and Bell's Palsy. Exposure to a cold draught in a person with rheumatic diathesis is a frequent cause. As an example of simple mechanical compression producing paralysis, crusth palsy may be cited; it is the result of continuous compression of the musculo-spiral nerve as it winds round the bone of the upper arm.

Lead poisoning may give rise to a localized neuritis affecting the posterior inter-ossaee nerve, especially in painters and in those whose occupations necessitate excessive use of the extensors of the forearm; the result is wrist drop or lead palsy.

Sciatica is a painful inflammatory condition of the sciatic nerve, in which there may be weakness of the muscles; but inability to move the limb is more on account of the pain it causes than on account of paralysis of the muscles. Exposure to cold and wet, e.g. sitting on a damp seat, may lead to sciatica in a gouty or rheumatic person.

Multiple neuritis is a painful generalized inflammation of the peripheral nervous system and arises in many toxic conditions
of the blood; among the most important are lead, arsenic and chronic alcohol poisoning. It also occurs in diabetes, diphtheria, beri-beri and other conditions (see NEUROPATHOLOGY). A short description of the commonest form will be given. It occurs in chronic alcoholism and especially in women, and is most frequently due to a combination of a septic absorption from some internal disease and the abuse of alcohol. In a marked case the patient may suffer from paraplegia, but it is distinguished from the paralysis of spinal disease by the fact that there is loss of control of the sphincters only when there is associated dementia, and that instead of the limbs being insensible they are extremely painful on deep pressure. There is wasting of the muscles, and electrical changes in them; frequently there is anaesthesia and analgesia of the skin, which takes a stocking-like distribution. In severe cases the upper limbs may be affected, and all the muscles of the body are more or less liable to be paralysed—even the heart may suffer.

The mental condition in such a severe case is usually quite characteristic; there is delirium, the patient is the subject of hallucinations and delusions; there is loss of knowledge of time and place, and illusions of personal identity. A constant symptom is the loss of memory of recent events, while those of early life are easily recollected.

Paralysis—termed medically muscular dystrophies—may arise from a primary atrophy of muscle apparently independent of any discoverable change in the nervous system, but due to a congenital developmental defect of the muscles. Heredity plays an important part in the incidence of these diseases, members of the same family being affected with the same type of disease, and at the same period of life. There may be a tendency in a family to the affection of one sex and not the other; on the other hand, children of both sexes may suffer in the same family. It is curious that the majority of cases are males, and that it is transmitted by women who are not themselves its subjects. Many different clinical types have been described based upon the age of onset, the groups of muscles first affected, and the presence or absence of apparent hypotrophy; they are however all varieties of one affection, and in a case where there is an apparent enlargement of muscles there is really atrophy of the contractile muscle fibres and overgrowth of fat and interstitial fibrous tissue; consequently this form of the disease is called pseudo-hypertrophic paralysis.

The muscular dystrophies may be divided into two groups according to the period of life in which the malady manifests itself: (1) Those occurring in childhood; (2) those occurring in youth or adult life. In the first group the muscles may be atrophied or apparently hypertrophied. A progressive atrophy of muscles associated with progressive weakness and various disabilities of movement is soon recognized in the relation of cause and effect; but the parents whose first child looks like an infant Hercules, with abnormally large calves and buttocks, cannot for some time appreciate any connection of this condition with a muscular weakness which is manifested in various ways. The child stands with its feet widely separated; it waddles along rather than walks; it falls easily and rises with difficulty, having to use the hands to push against the floor; it then rests one hand on the knee, and then the other hand on the other knee, and climbs, as it were, up its thighs in order to assume the erect posture. In this pseudo-hypertrophic form of paralysis the outlook is very grave, and there is little hope of the patient reaching adult life.

Paralysis agitans, Shaking Palsy or Parkinson’s Disease is a characteristic disease of the nervous system occurring late in life, and characterized by weakness, tremors and stiffness of the muscles associated with a peculiar attitude and gait. The first sign of the disease is weakness followed by tremor of one hand; this consists of continuous movements of the thumb and forefinger as in rolling a pill, or of movements of the hand like beating a tom-tom; then the other hand is affected, and later there is tremor at the ankle. In some cases there is a continual nodding movement of the head. These tremors are at the rate of five per second and cease during sleep. The attitude and gait are very characteristic; the head is bent forward, and the patient in beginning to walk takes slow steps, which soon become short and quick as if he were running after his centre of gravity. The intellect is clear and in marked contrast to the mask-like expression. This disease lasts for years, and but little can be done in the way of treatment, except passive movements of the limb to prevent contracture.

Treatment.—There are certain general principles in the treatment of all forms of paralysis, the following are the most important:

1. Rest in bed and attention to the vital functions of the body, the heart’s action, the respiratory functions, nutrition and excretion. The pulse is the best guide to the administration of drugs and esthetics. In general, as regard the Paralytic symptoms, the dangers of paralysis is an intercurrent pneumonia—sometimes unavoidable, often due, however, to attempts to give nourishment to a patient in an insensible state, with the result that some of the fluid enters the bronchial tubes, when either the colic protective coughing is not excited or is ineffective. Attention to the bowels and bladder is most important. A purge at the onset of paralysis is indicated when the pulse is full and of high tension, and the regular action of the bowels is necessary in all conditions. Retention of urine should be carefully avoided, if necessary by the passing of a catheter, but too much emphasis cannot be laid upon the importance of adopting aseptic precautions to avoid infection of the bladder.

Daily inspection of the back should be made of all paralysed patients, and precautions taken to keep the skin of all parts exposed to pressure clean; the back should be laved with eau-de-Cologne or spirit to keep it dry and free from the risk of irritant-redness. As an example of the paralysed side should be a warning note of the possibility of a bedsores; zinc powder or ointment should be applied and the effect of pressure on the part be removed if possible by change of position. The use of the rubber bed is desirable. It is essential to cover all warm bottles with flannel, for owing to insensibility large blisters, which heal with difficulty, may result. In cases of paraplegia the legs should be covered with warm woolen hand-knitted stockings, and the feet kept in a comfortable position. The rubber bed prevents the feet from the continuous weight of the bed-clothes, a fruitful source of foot drop.

2. As soon as the acute symptoms have passed off passive movement and massage may be employed with advantage; in some cases electrical treatment is indicated; but as a rule, especially in children, electrical treatment offers the disadvantage of being painful and not accomplishing more than can be effected by massage and the passive movements of the limbs. When the passive movements are being made the patient should be instructed by the operator to will the movement which he is performing, and thus try to re-establish the connexion of the brain with the muscles through the point of interruption or by a new path if that is not possible.

(F. W. Mo.)

PARAMARIBO, the capital of Dutch Guiana or Surinam (see GUANA), in 5° 44' 50" N., 55° 12' 54" W., 20 m. from the sea on the right bank of the Surinam, here a tidal river nearly a mile broad and 18 ft. deep. Pop. (1905), 33,821. Built on a plateau about 16 ft. above low-water level, Paramaribo is well-drained, clean and in general healthy. The straight canals running at right angles to the river, the broad, straight tree-planted streets, the spacious squares, and the solid plain public buildings would not be unworthy of a town in the Netherlands.

The Indian village of Paramaribo became the site of a French settlement probably in 1640, and in 1650 it was made the capital of the colony by Lord Willoughby of Parham. In 1683 it was still only a “cluster of twenty-seven dwellings, more than half of them grom-shops,” but by 1790 it counted more than a thousand houses. The town was partly burned down in 1821, and again in 1832.

PARAMECIUM, O. F. Müller, (often misspelt Paramaecium, Paramoeicum), a genus of aspirotrichous ciliate Infusoria (g.e.), characterized by its slipper-like shape, common in infusions, especially when they contain a little animal matter. It has two dorsal contractile vacuoles, each receiving the mouths of two contractile canals, the vacuole of the posterior canal being the larger ovoid meganucleus, and one or two micronuclei. From its abundance, the ease with which it can be cultivated and observed, its relatively simple structure and adequately large size (5\(\times\)3 in.), it is most frequently selected for elementary study and demonstration, as well as for purposes of research.

PARAMENT (Fr. parement, from Late Lat. paramentum, adornment, parare, to prepare, equip), a term applied by ancient writers to the hangings or ornaments of a room of common use.
PARAMOUNT (Anglo-Fr. paramount, up above, par à mont, up on or on top of the mountain), superior, supreme, holding the highest authority, or being of the greatest importance. The word was first used, as a term of feudal law, of the lord, the "lord paramount," who held his fief from no superior lord, and was thus opposed to "mesne lord," one who held from a superior. To those who held their fiefs from one who was not a "lord paramount" was given the correlative term "paravail," par à sol, in the valley. The word was confused by English lawyers with "avail," help, assistance, profit, and applied to the actual working tenant of the land, the lowest tenant or occupant.

P A R A N Á, a state of southern Brazil, bounded N. by São Paulo, E. by the Atlantic, S. by Santa Catharina and the republic of Argentina, and W. by Matto Grosso and the republic of Paraguay, with the Paraná river as its western boundary line. Area, 83,451 sq. m.; pop. (1890), 249,401; (1900), 327,136. It includes two dissimilar regions—a narrow coastal zone, thickly wooded, swampy, and semi-tropical in character, and a high plateau (2500 to 3000 ft.) whose precipitous, deeply eroded eastern escarpments are known as the Serra do Mar, or Serra do Cabaço. The southern part of the state is densely forested and affords large tracts of Paraná tea. The Paraná, known in Brazil as hera maté, or mate. The plateau slopes westward to the Paraná river, is well watered and moderately fertile, and has a remarkably uniform climate of a mild temperate character. The larger rivers of the state comprise the Paranapanema and its tributaries the Cinza and Tibagí, the Ivaíhy, Fiquiry, Jejuy-guassú, and the Iguaçu with its principal tributary the Rio Negro. The Paranapanema and a small tributary, the Itaráre, form the boundary line with São Paulo west of the Serra do Mar, and the Iguaçu and Negro, the boundary line with Santa Catharina and Argentina—both streams having their sources in the Serra do Mar and flowing westward to the Paraná. The other streams have shorter courses and all are obstructed by falls and rapids. Twenty miles above the mouth of the Iguaçu are the Iguaçu Falls, 215 ft. high, broken into twenty or more falls separated by rocks and islands, and surrounded by a wild, unsettled and wooded country. The falls are reached by occasional light-draught steamers on the Paraná between Posadas (Argentina) and the mouth of the Iguaçu, and thence by canoe to the vicinity of the falls. The surface of the plateau is undulating and the greater part is adapted to the growth of the light-draught Paraná tea. The Paraná has two railway systems—the Paranága to Curitiba (60 m.) with an extension to Ponta Grossa (118 m.) and branches to Rio Negro (55 m.), Porto Amazonas (6 m.) and Antonina (10 m.); and the São Paulo & Rio Grande, which crosses the state from north-east to south-west from Porto União da Victoria, on the Iguaçu, to a junction with the Sorocabana line of São Paulo at Itaráre. The upper Paraná is navigable between the Guayrá, or Sete Quedas, and the Uru-bungo Falls. The chief export of Paraná is Paraná tea (a forest product). There is a large foreign element in the population owing to the immigrant colonies established on the uplands, and considerable progress has been made in small farming and education. Besides the capital, Curitiba, the principal towns are Paranaguá; Antonina, at the head of the Bay of Paranaguá, with a population of 7730 in 1890; Campo Largo, 20 m. west of Curitiba (pop. 10,642 in 1890); Castro, N.W. of the capital on the São Paulo & Rio Grande line (pop. of the municipio, 10,316 in 1890); and Ponta Grossa (pop. of municipio, 4774 in 1890), north-west of Curitiba at the junction of the two railway systems of the state.

Paraná was settled by gold prospectors from São Paulo and founded Curitiba, its capital, on the Paraguay river in 1853, when it was made an independent province. The first missions of the Jesuits on the Paraná were situated just above the Guayrá Falls in this state and had reached a highly prosperous condition when the Indian slave hunters of São Paulo (called Mamelucos) compelled them to leave their settlements and emigrate in mass to what is now the Argentine territory of Misiones. The ruins of their principal mission, known as Ciudad Real, are overgrown with forest.

P A R A N A Ñ A, a city and port of Argentina, capital of the province of Entre Ríos, and the seat of a bishopric, situated on the left bank of the Paraná river, 410 m. by navigable channels (about 240 m. direct) N.W. of Buenos Aires. Pop. (1895), 24,261; (1904, estimate), 27,000. The city occupies a gently rolling site 120 ft. above the river and about 2 m. from its Riverside port of Bajada Grande, with which it is connected by railway, tramway and highway. It is classed as a seaport, and ocean-going vessels of over 12 ft. draught can ascend to Bajada. There is also a daily ferry service across the river to Santa Fé (61 m. distant), which is connected by railway with Rosario and Buenos Aires. Paraná is also the western terminus of a provincial railway system, which connects with Concepción and Concordia, on the Uruguay river, and with other important towns of the province. The mean annual temperature is about 66° F. and the climate is bracing and healthful. Its port of Bajada Grande, on the river shore below the bluffs, has the custom-house and a fine wharf for the accommodation of the Entre Ríos railway and river craft. Paraná was founded in 1730 by colonists from Santa Fé and was at first known as Bajada (a landing place). It was made the capital of the Argentine province of Misiones and 1851. (Concepción had previously been the capital), but in 1861 General Urquiza restored the seat of government to Concepción, where it remained until 1882, when Paraná again became the capital. Paraná was also the capital of the Argentine Confederation from 1852 to 1861.

P A R A N A G U Á, a seaport of the state of Paraná, Brazil, on the southern shore of the Bay of Paranaguá, about 9 m. from the bar of the main channel. Pop. of the municipality (1890), 11,794, of which a little more than one half belonged to the town. Paranaguá is the principal port of the state, and is a port of call for steamers in the coastwise trade. It is the coastal terminus of a railway running to Curitiba, the capital (69 m.), with extensions to other inland towns and a branch to Antonina, at the head of the bay, 101 m. west of Paranaguá by water. Its exports consist chiefly of maté, or Paraguay tea. The town was founded in 1560.

The Bay of Paranaguá opens into the Atlantic in lat. 25° 32' S. through three channels and extends westward from the bar about 19 m. It is irregular in outline, receives the waters of a large number of small streams, and is comparatively shallow. The steamer lighters are used on Paranagua; the mouth is the home of the great migratory humpback whale, the beluga, which comes at this season of the year to feed on the shoals of the bay. The broad entrance to the bay, which is the gateway to the state of Paraná is nearly filled by the large Ilha do Mel (Honey Island) on which stands an antiquated fort commanding the only practicable channel.

P A R A N D H A R, a hill fort of British India, in Poona district, Bombay, 4472 ft. above the sea, 20 m. S.E. of Poona: pop. (1901), 644. It figures repeatedly in the rising of Sivaji against the Mahomedans, and was the favourite stronghold of the Peshwas whenever the unwalled city of Poona was threatened. It gave its name to a treaty with the Maharattas, signed in 1776 but never carried into effect. It is now utilized as a sanitarium for British soldiers.

P A R A N O I A (Gr. παρα, beyond, and νοεύω, to understand), a chronic mental disease, of which systematized delusions with or without hallucinations of the senses are the prominent characteristics. The delusions may take the form of ideas of persecution or of grandeur and ambition; these may exist separately or run concurrently in the same individual, or they may become transformed in the course of the patient's life from a persecutory to anambitious character. The disease may begin during adolescence, but the great majority of the subjects manifest no symptoms of the affection until full adult life.

The prominent and distinguishing symptom of paranoia is the delusion which is gradually organized out of a mass of original but erroneous beliefs or convictions until it forms an integral part of the ordinary mental processes of the subject and becomes fused with his personality. This slow process of the growth of a false idea is technically known as "systematization,"
and the resulting delusion is then said to be "systematized." As such delusions are coherently formed there is no manifest mental confusion in their expression. Notwithstanding the fixity of the delusion it is subject in some cases to transformation which permits of the gradual substitution of delusions of grandeur for delusions of persecution. It happens also that periods of remission from the influence of the delusion may occur from time to time in individual cases, and it may even happen, though very rarely, that the delusion may permanently disappear.

It is necessary to point out that there is undoubtedly what may be called a paranoid mental constitution, in which delusions may appear without becoming fixed or in which they may never appear. The characteristics of this type of mind are not so clearly defined as those of the paranoid constitution which they do not differ from reality, combined, as the case may be, with timidity and suspicion or with vanity and pride. On such a soil it is easy to understand that, given the necessary circumstances, a systematized delusional insanity may develop.

The term paranoia appears to have been first applied by R. von Krafft-Ebing in 1879 to all forms of systematized delusional insanity. Werner in 1880 suggested its generic use to supplant Wahnissein and Verücktheits, the German equivalents of mental states which originally meant, respectively, the delusional insanity of ambition and the delusional insanity of persecution—terms which had become hopelessly confused owing to divergences in the published descriptions of various authors.

The rapid development of clinical study has now resulted in the isolation of a comparatively small group of diseases to which the term is applied and the relegation of other groups bearing more or less marked resemblances to it to their proper categories. Thus, for example, it had formerly been held that acute paranoia was frequently a curable disease. It is now proved that the so-called acute forms were not true paranoias, many of them being transitory phases of E. Kraepelin's dementia praecox, others of the terminal stages of acute melancholia, of acute confusional insanity, or even protracted cases of delirium tremens. While it removes from the paranoia group innumerable phases of delusional insanity met with in patients labouring under secondary dementia as a result of alcoholism or acute insanity, such a statement does not exclude patients who may have had, during their previous life, one or more attacks of some acute mental disease, such as mania, for the paranoid mental constitution may be, though rarely, subject to other forms of neurosis.

Attempts have been made to base a differential diagnosis of paranoia upon the presence or absence of a morbid emotional element in the mind of the subjects, with the object of referring to the group to which only such cases as manifest a purely intellectual deterioration from reality believe. Though in some cases of the disease the mental symptoms may, at the time of observation, be of a purely intellectual nature, the further back the history of any case is traced the greater is the evidence of the influence of preceding emotional disturbances in moulding the intellectual peculiarities. Indeed it may be said that the fundamental emotions of vanity or pride and of fear or suspicion are the groundwork of the disease. We are justified therefore in ascribing the intellectual aberrations which are manifested by delusions, in part at least, to the preponderating influence of morbid emotions, which alter the perceptive and apperceptive processes upon which depend the normal relation of the human mind to its environment. Although, generally speaking, paranolics manifest marked intellectual clearness and a certain amount of determination of character in the exposition of their symptoms and in their manner of reacting under the influence of their delusions, there is, without any doubt, an element of original abnormality in their mental constitution. Such a mental constitution is particularly subject to emotional disturbances which find a favourable field of operation in an innate mysticism, allied with credulity and a certain aloofness from the psychical constitution of normal individuals, who, while subject both to emotion and to mystic thought, retain the power of correcting any tendency to the predominance of these mental qualities by an appeal to reality. It is just here that the paranoia fails, and in this failure lies the key to the pathological condition. For the present the question as to whether this defect is congenital or acquired owing to some superimposed pathological condition cannot be answered. However that may be, it is frequently ascertained from the testimony of friends and relatives that the patients have always been regarded as "quarrel," strange, and different from other people in their modes of thought. It is usually stated that nervous or mental diseases occur in the family histories of over 50% of the subjects of this affection.

Paranoia is classified for clinical purposes according to the forms of delusions of ambition and manifest the same symptoms unchanged during their whole life, while other patients suffering from delusions of persecution never develop the ambitious form of the disease. Against these arguments Magnan and his disciples assert that the relative duration of the stages and the relative intensity of the symptoms vary widely; that in the first instance the persecutory stage may be so short or so indefinite in its symptoms as to escape observation; and that in the second instance the persecutory stage may be so prolonged as within the short compass of a human life to preclude the possibility of the development of an ambitious stage. As however there exist types of the disease which, admirably, do not conform to Magnan's progressive form it will be more convenient to adopt the ordinary description here.

1. Persecutory Paranoia.—This form is characterized by delusions of persecution with hallucinations of a painful and distressing character. In predisposed persons there is often observed an anomaly of character dating from early life. The subjects are of a retiring disposition, generally studious, though not brilliant or successful workers. They prefer solitude to the society of their fellows and are apt to be introspective, self-analytical or given to unusual modes of thought or literary pursuits. Towards the commencement of the insanity the patients become gloomy, the patients exhibit. Thus there are described the Persecutory, the Litigious, the Ambitious, and the Amatory types. It will be observed that these divisions depend upon the prevalence of the primary emotions of fear or suspicion, pride or vanity and love.

According to V. Magnan, the course of paranoia is progressive, and each individual passes through the stages of persecution and ambition successively. Many authorities accept Magnan's description, which has now attained to the distinction of a classic, but it is objected to by others on the ground that many cases commence with delusions of ambition and manifest the same symptoms unchanged during their whole life, while other patients suffering from delusions of persecution never develop the ambitious form of the disease. Against these arguments Magnan and his disciples assert that the relative duration of the stages and the relative intensity of the symptoms vary widely; that in the first instance the persecutory stage may be so short or so indefinite in its symptoms as to escape observation; and that in the second instance the persecutory stage may be so prolonged as within the short compass of a human life to preclude the possibility of the development of an ambitious stage. As however there exist types of the disease which, admirably, do not conform to Magnan's progressive form it will be more convenient to adopt the ordinary description here.

At this juncture, however, it generally happens that hallucinations begin to appear. These, in the great majority of instances, are auditory and usually commence with indefinite noises in the ears, such as ringing sounds, hissing or whistling. Gradually they assume a more definite form until isolated words and ultimately formed sentences are distinctly heard. There is great diversity in the completeness of the verbal hallucinations in different patients. Some patients never experience more than the subjective annoyance of isolated words generally
of an insulting character, while others are compelled to listen to regular dialogues carried on by unknown voices concerning themselves. A not uncommon form of verbal hallucination is formulated in the complaint of the patients that "all their thoughts are read and proclaimed aloud." Even more than the enforced listening to verbal hallucinations this "thought reading" distresses the patient and often leads him to acts of violence, for the privacy of his inmost thoughts is, he believes, desecrated, and he often feels helpless and desperate at a condition from which there is no possible escape.

Though some of the subjects do not develop any other form of hallucination, it is unfortunately the lot of others to suffer, in addition, from hallucinations of taste, smell or touch. The misinterpretation of subjective sensations in these sense organs leads to the formulation of delusions of poisoning, of being subjected to electric influences, of being acted on by agencies such as electricity. Such are the persons who take their food to chemists for analysis; who complain to the police that people are acting upon them injuriously; who hermatically seal every crevice that admits air to their bedrooms to prevent the entrance of poisonous fumes; or who place glass castors between the feet of their beds and the floor with the object of insulating electric currents. Such patients obtain little sleep; some of them indeed remain awake all night—for the symptoms are usually worse at night—and have to be content with such snatches of sleep as they are able to obtain at odd times during the day. It is obvious that a person tormented and distracted in the way described may at any moment lose self-control and become a danger to the community. But perhaps the most distressing and most distracting of all hallucinations are those which for want of a better name are termed "sexual." The subjects of these hallucinations, both male and female, under the belief that improper liberties are taken with them, are more clamant and threatening than any other class of paranoia.

During the course of a disease so distressing in its symptoms the patient's suspicions as to the sources of his persecutions vary much in indeterminacy. He often never fixes the direct blame upon any individual, but refers to his persecutors as "they" or a "society" or some corporate body such as "lawyers," "priests" or "friars." It not infrequently happens however, that suspicions gradually converge upon some individual or that from an early stage of the disease the patient has, generally under the influence of hallucinations, fixed the origin of his trouble upon one or two persons. When this takes place the matter is always serious from the point of view of physical danger to the inculpated person, especially if the patient is of a violent or vindictive disposition. The indeterminate period of the disease may persist for an indefinite period—even for twenty or thirty years—without any change except for the important fact that remissions in the intensity of the symptoms occur from time to time. These remissions may be so marked as to give rise to the belief that the patient has recovered, but in true paranoia this is hardly ever the case, and sooner or later the persecution begins again in all its former intensity.

2. Ambitious Paranoia.—After a long period of persecution a change in the symptoms may set in, in some cases, and the intensity of the hallucinations may become modified. At the same time delusions of grandeur begin to appear, at first faintly, but gradually they increase in force until they ultimately supplant the delusions of persecution. At the same time the hallucinations of a disagreeable nature fade away and are replaced by auditory hallucinations conformable to the new delusions of grandeur. Undoubtedly, however, this form of paranoia may commence, so far as can be observed, with delusions of grandeur, in which case there is seldom or never a transformation of the personality or of the delusions from grandeur to persecution, although delusions of persecution may engraft themselves or run side by side with the prendant ambitious delusions.

The emotional basis of ambitious paranoia is pride, and every phase of human vanity and aspiration is represented in the delusions of the patients. There is moreover considerably less logical acumen displayed in the explanations of their beliefs by such patients than in the case of the subjects of persecution. Many of them affect to be the descendants of historical personages without any regard for accurate genealogical detail. They have no compunction in disowning their natural parents or explaining that they have been "changed in their cradles" in order to account for the fact that they are of exalted or even of royal birth. Dominated by such beliefs paranoids have been known to travel all over the world in search of confirmation of their delusions. It is people of this kind who drop into the ears of confiding strangers vague hints as to their exalted origin and kindred, and who make desperate and occasionally alarming attempts to force these hypotheses upon the rulers. The sphere of religion affords an endless field for the ambitious paranoids and some of them may even aspire to divine authority, but as a rule the true paranoiae does not lose touch with earth. The more extravagant delusions of persons who call themselves by divine names and assume omnipotent attributes are usually found in patients who have passed through acute attacks of insanity such as mania or dementia praecox and are mentally enfeebled.

A not uncommon form of paranoia combining both ambition and persecution is where the subject believes that he is an outcast of unbounded wealth or power, of the rights to which he is, however, deprived by the machinations of his enemies. These patients frequently obtain the knowledge on which they base their delusions through auditory hallucinations. They are often so troublesome, threatening and persistent in their determination to obtain redress for their imagined wrongs, that they have to be forcibly detained in asylums in the public interest.

On the whole, however, the ambitious paranoia is not troublesome, but calm, dignified, self-possessed, and reserved on the subject of his delusions. He is usually capable of reasoning as correctly and of performing work as efficiently as ordinary common people. He, however, while living in society is liable to give expression to their delusions under the influence of excitement, or to behave so strangely and unconventionally on unsuitable occasions as to render their exclusion either necessary or highly desirable.

3. Anatomical Paranoia.—A distinguishing feature of this form of paranoia is that the subjects are chivalrous and idealistic in their love. Some of them believe that they have been "mysteriously" married to a person of the opposite sex usually in a prominent social position. The fact that they may have never spoken to or perhaps never seen the person in question is material. The conviction that their love is reciprocated and the relationship understood by the other party is unshakable, and is usually based upon suppositions that to a normal mind would appear either trivial or wholly unreal. The object of affection, if not mythical or of too exalted a position to be approached, is not infrequently persecuted by the admirer, who takes every opportunity of obtruding personally or by letter the evidences of an ardent adoration. The situation thus created can easily become complicated and embarrassing before it is realized that the persistent wooer is insane. People familiar with these themes or repeated repulses may, in the case of some patients, originate delusions of persecution directed, not against the object of affection, but against those who are supposed to have conspired to prevent the success of the patient's desires. Under the influence of these delusions of persecution the patient may lose self-control and resort to violence against his supposed persecutors.

The subjects of this form of paranoia are in the majority of instances unmarried women well advanced in years who have led irreproachable lives, or men of a romantic disposition who have lived their mental lives more in the region of chimeras than in the region of real facts. The delusions in this form of paranoia are never accompanied by hallucinations.

Closely allied, if not identical with amatory paranoia, is the form in which jealousy forms the basis of morbid suspicions.
PARANOIA

with or without definite delusions. The subject is usually poor in mental resource, but proud, vindictive and suspicious. It is eminently a condition which arises spontaneously in certain persons whose mental constitution is of the paranoid or, i.e., persons who are naturally credulous, mystical and suspicious. The subjects are extraordinarily assiduous in watching the objects of their jealousy, whether husbands, wives or sweethearts. Their conduct in this respect is fertile in producing domestic dispeace and unhappiness, and in the case of unmarried persons in creating complicated or delicate situations. It not infrequently happens, just as in the case of the class of amatory paranociacs, that delusions of persecution establish themselves, usually directed towards persons who are believed to have secured the affections of the object of jealousy. This disease then follows the ordinary course of the insanity of persecution but usually without hallucinations of the senses. The subjects are highly dangerous and violent. Under the influence of their delusions murder and even mutilation may be resorted to by the male, and poisoning or vitriol-throwing by the female subjects.

4. Litigious Paranoia (paranoia querulans).—The clinical form of litigious paranoia presents uniform characteristic features which are recognized in every civilized community. The basic emotion is vanity, but added to that is a strong element both of acquisitiveness and avarice. Moreover the subjects are, as regards character, persistent, opinionative and stubborn. When these qualities are superadded to a mind of the paranoid type, which as has been pointed out, is more influenced by the passions or emotions than by ordinary rational considerations, it can readily be appreciated that the subjects are capable of creating difficulties and anxieties which sooner or later may lead to their forcible seclusion in the interests of social order.

It is important to observe that the rights such people lay claim to or the wrongs they complain of may not necessarily be imaginary. But, whether imaginary or real, the statement of their case is always made to rest upon some foundation of fact, and is moreover presented, if not with ability, at any rate with forensic skill and plausibility. As the litigants are persons of one idea, and only capable of seeing one side of the case—their own—and as they are actuated by convictions which preclude feelings of delicacy or diffidence, they ultimately succeed in obtaining a hearing in a court of law under circumstances which would have discouraged any normal individual. Once in the law courts their doom is sealed. Neither the loss of the case nor the payment of heavy expenses have any effect in disheartening the litigant, who carries his suit from court to court until the methods of legal appeal are exhausted. The suit may be raised again and again on some side issue, or some different legal action may be initiated. In spite of the alienation of the sympathy of his relations and the advice of his friends and lawyers the paranoid continues his futile litigation in the firm belief that he is only defending himself from fraud or seeking to regain his just rights. After exhausting his means and perhaps those of his family and finding himself unable to continue to litigate to the same advantage as formerly, delusions of persecution begin to establish themselves. He accuses the judges and juries of being biased against his interests and imagines the existence of a conspiracy to prevent him from obtaining justice. One of two things usually happens at this stage. Though well versed in legal procedure he may one day lose self-control and resort to threats of violence. He is then probably arrested and may on examination be found insane and committed to an asylum. Another not uncommon result is that finding himself non-suited in a court of law he commits a technical assault upon it, may be, some high legal functionary, or on some person in a prominent social position, with the object of securing an opportunity of directing public attention to his grievances. The only result is, as in the former instance, his medical certification and incarceration.

Paranoia is generally a hopeless affection from the point of view of recovery. From what has been stated regarding its genesis and slow development it is apparent that no form of ordinary medical treatment can be of the least avail in modifying its symptoms. The best that can be done in the interests of the patient is to place him in surroundings where they can be shielded from influences which aggravate their delusions and in other respects to make their unfortunate lot as pleasant and as easy to endure as possible.

As has been frequently stated, the subjects of most forms of paranoia are liable to commit crime, usually of violence, which may lead to their being tried for assault or murder. The question of their responsibility before the law is therefore one of the first importance (see also Insanity: Laws). The famous case of McNaghten, tried in 1843 for the murder of Mr. Drummond, secretary to Sir Robert Peel, is, in this connection, highly important, for McNaghten was a typical paranoid labouring under delusions of persecution, and his case formed the basis of the famous delverence of the judges in the House of Lords, in the same year, on the general question of criminal responsibility in insanity. Answer 4 of the judges' deliverance contains the following statement of law: If "he labours under such partial delusion only and is not in other respects insane we think he must be considered in the same situation as to responsibility as if the facts to which the delusion exists were real. For example, if under the influence of his delusion he supposes another man to be in the act of attempting to take his life, and he kills that man, as he supposes, in self-defence, he would be exempt from punishment. If his delusion was that the deceased had inflicted a serious injury to his character and fortune, and he killed him in revenge for such supposed injury, he would be liable to punishment."

In considering this deliverance it must be remembered that it was given under the influence of the enormous public interest created by the McNaghten trial. It has also to be remembered that in a criminal court the term responsibility means liability to legal punishment. The dictum laid down in answer 4 is open to several objections. (1) It is based upon the erroneous assumption that a person may be insane on one point and sane on every other. This is a loose popular fallacy for which there is no foundation in clinical medicine. The systematization of a delusion involves, as has been pointed out, the whole personality and affects emotion, intellect and conduct. The human mind is not divided into mutually exclusive compartments, but is one indivisible whole liable to be profoundly modified in its relation to its environment according to the emotional strength of the predominant morbid concepts. (2) It does not take into account the pathological diminution of the power of self-control. The influence of continued delusion of persecution, especially if accompanied by painful hallucinations, undermines the power of self-control and tends ultimately to reduce the subject towards the condition of an automaton which reacts reflexly and blindly to the impulse of the moment. (3) The opinion is further at fault in so far as it assumes that the test of responsibility rests upon the knowledge of right and wrong, which implies the power to do right and to avoid wrong, an assumption which is very far from the truth when applied to the insane. The number of insane criminals who possess no theoretical knowledge of right and wrong is very few indeed, so that such an opinion is not supported by experience.

The true paranoid is a person of an anomalous mental constitution apart from his insanity; although he may to outward appearances be able, on occasion, to converse or to act rationally, the moment he is dominated by his delusions he becomes not partially but wholly insane; when in addition his mind is distracted by ideas of persecution or hallucinations, or both, he becomes potentially capable of committing crime, not because of any inherent vicious propensity but in virtue of his insanity. There is therefore no middle course, from the medical point of view, in respect to the criminal responsibility of the subjects of paraesthesia; they are all insane wholly, not partially, and should only be dealt with as persons of unsound mind.

PARAPET—PARASITIC DISEASES

1890); Magnan, Le Délire chronique (Paris, 1890); Stewart Paton, Psychiatry (Philadelphia, 1909); Percy Smith, "Paranoids" in Journal of Mental Science (1904), p. 207.

PARAPET (Ital. parapetè, Fr. parapet, from para, imperative of Itál. parare, to cover, defend, and pedo, breast, Lat. pectus; the German word is Brustwender), a dwarf wall along the edge of a roof, or round a lead flat, terrace walk, &c., to prevent persons from falling over, and as a protection to the defenders in case of a siege. Parapets are either plain, embattled, perforated or panelled. The last two are found in all styles except the Romanesque. Plain parapets are simply portions of the wall generally overhanging a little, with a coping at the top and corbel table below. Embattled parapets are sometimes panelled, but oftener pierced for the discharge of arrows, &c. Perforated parapets are pierced in various devices—as circles, trefoils, quatrefoils and other designs—so that the light is seen through. Panelled parapets are those ornamented by a series of panels, either oblong or square, and more or less enriched, but are not perforated. These are common in the Decorated and Perpendicular periods.

PARAPHERNALIA (Lat. paraphernalia, sc. bona, from Gr. παραφορέας; παρά, beside, and φορέω, dower), a term originally of Roman law, signifying all the property which a woman, while under the influence of the law of jure solis, held apart from her dower (dos). A husband could not deal with such except with his wife's consent. Modern systems of law, which are based on the Roman, mainly follow the same principle, and the word preserves its old meaning. In English and Scottish law the term is confined to articles of jewelry, dress and other purely personal things, for the law relating to which see Husband and Wife. The word is also used in a general sense of accessories, external equipment, cumbersome or showy trappings.

PARAPHRASE (Gr. παραφράσας, from παράφρασις, to relate in different words, παρά, beside, and φράσις, speak, tell), a rendering into other words of a passage in prose or verse, giving the sense in a fuller, simpler or cleaner fashion, also a free translation or adaptation of a passage in a foreign language. The term is specifically used in the Scottish and other Presbyterian churches of metrical versions for singing of certain passages of the Bible.

PARASCENIUM (Gr. παρασκήνιον), in a Greek theatre, the wall on either side of the stage, reaching from the back wall (σκηνή) to the orchestra.

PARASITE (From Gr. παρά, beside, στός, food), literally "nurse-mate," a term originally conveying no idea of reproach or blame, as at later times. The early parasites may be divided into two classes, religious and civil. The former were assistants of the priests, their chief duty being to collect the corn dues which were contributed by the farmers of the temple lands or which came in from other sources (Athenaeus vi. 235; Pollux vi. 35). Considerable obscurity exists as to their other functions, but they seem to have been charged with providing food for the visitors to the temples, with the care of certain offerings, and with the arrangement of the sacrificial banquets. In Attica the parasites appear to have been confined to certain deities (Acharnac, Dionysus), and were appointed by the deities to which the temple belonged. The "civil" parasites were a class of persons who received invitations to dine in the prytanèum and subsequently in the tholos as distinguished from those who had the right to dine there ex officio. An entirely different meaning ("spawner") became attached to the word from the character introduced into the Middle and New Comedy, first by Alexis, and firmly established by Diphilus. The chief object of this class of parasites was a good dinner, for which they were ready to submit to almost any humiliation. Numerous examples occur in the comedies of Plautus; and Alciphron and Athenaeus (vi. 236 sqq.) give instances of the insults they had to put up with at the hands of both host and guests. Some of them played the part of professional jesters (like the later buffoons and court fools), and kept collections of witticisms ready for use at their patrons' table; others relied upon flattery, others again condescended to the most degrading devices (Plutarch, De adulatore, 25; De educatione puerorum, 17).

The term parasite, from meaning a "hanger-on," has been transferred to any living creature which lives on another one. See Juvenal v. 170 with J. E. B. Mayor's note, and the exhaustive article by W. J. W. North in the N. E. D. (under "parasite").

PARASITIC DISEASES. It has long been recognized that various specific pathological conditions are due to the presence and action of parasites (see Parasites) in the human body, but in recent years the part played in the causation of the so-called infective diseases by various members of the Schizomycetes—fission fungi—and by Protozoan and other animal parasites has been more widely and more thoroughly investigated (see Bacteriology). The knowledge gained has not only modified our conception of the pathology of these diseases, but has had a most important influence upon our methods of treatment of sufferers, both as individuals and as members of communities. For clinical and other details of the diseases mentioned in the following classification, see the separate articles on them; the present article is concerned mainly with important modern discoveries as regards aetiology and pathology. In certain cases indeed the aetiology is still obscure. Thus, according to Guarnieri, and Councilman & Calkins, there is associated with vaccinia and with small-pox a Protozoan parasite, Cytocetes variolae, Guar. This parasite is described as present in the cytoplasm of the stratified epithelium of the skin and mucous membranes of the naso-pharynx. It is supposed that there may be a third phase of existence, not yet demonstrated, in which it occurs as minute spores or germs which are very readily carried in dust and by air currents from point to point. In certain other conditions, such as mumps, dengue, epidemic dropsy, oriental sore—with which the Leishman-Donovan bodies (Helcosoma tropicum, Wright) are supposed to be closely associated (see also Kala-azar below)—verruga, frambuesa or yaws—with which is commonly associated a spirchoæta (Castellani) and a special micrococcus (Thieric, Nicholls)—and beri-beri, the disease may be the result of the action of specific micro-organisms, though as yet has not been possible to demonstrate any aetiological relationship between any microorganisms found and the special disease. Such diseases as haemoglobinuric fever or black-water fever, which are also presumably parasitic diseases, are probably associated directly with malaria; this supposition is the more probable in that both of these are recognized as occurring specially in those patients who have been weakened by malaria.

The following classification is based partly upon the biological relations of the parasites and partly on the pathological phenomena of individual diseases:

A.—Diseases due to Vegetable Parasites.

I.—To Schizomycetes, Bacteria or Fission Fungi.

2. Caused by Specific Bacilli.

II.—To Higher Vegetable Parasites.

Actinomycosis. Madura Foot. Aspergillosis and other Mycoses.

B.—Diseases due to Animal Parasites.

I.—To Protozoa.

II.—To other Animal Parasites.

Filarisis, &c.

8.—Branched hyphal threads of the Ray fungus (Actinomyces, clubbed through thickening of the sheath.) x 1000 diam.

9.—The Trypanosoma Gambiense, seen in a blood film taken from a case of sleeping sickness. x 1000 diam.
C.—Infective Diseases in which an organism has been found, but has not finally been connected with the disease.  
Hydrophobia.  Scarlet Fever.

D.—Infective Diseases not yet proved to be due to micro-organisms.  
Meninges

A.—Diseases due to Vegetable Parasites.  
I.—To Schizomycetes, Bacteria or Fission Fungi.  
1. Caused by the Pyogenic Micrococi.  

Suppuration and Septicaemia.—It is now recognized that although nitrate of silver, turpentine, castor oil, perchloride of mercury and certain other chemical substances are capable of producing suppuration, the most common causes of this condition are undoubtedly the so-called pus-producing bacteria.  Of these the most important are the staphylococci (cocci arranged like bunches of grapes), streptococci (cocci arranged in chains), and pneumococci, though certain other organisms not usually associated with pus-formation are undoubtedly capable of setting up this condition, e.g. Bacillus pyocyaneus, Bacillus coli communis, and the typhoid bacillus.  These organisms (the products of which, by chemical irritation, stimulate the leucocytes to emigration) bring about the death and digestion of the tissues and fluids (which no longer " clot ") with which they come in contact, pus (matter) being thus formed: this accumulates in the tissues, in the serous cavities, or even on mucous surfaces; septicaemia or blood-poisoning, secondary infection of tissues and organs at a distance from the original site of infection, or pyaemia, with the formation of secondary abscesses, may thus be set up.

In septicaemia the pus-forming organisms grow at the seat of introduction, and produce special poisons or toxins, which, absorbed into the blood, give rise to symptoms of fever.  From the point of introduction, however, the organisms may be swept away either by the lymph or by the blood, and carried to positions in which they set up further inflammatory or suppurrative changes.  In the streptococcal inflammations spreading by the lymph channels appears to be specially prevalent.  In the blood the organisms, if in small numbers, are usually destroyed by the plasma, which has a powerful bactericidal action; should they escape, however, they are carried without multiplication into the capillaries of the general circulation, of the lung, or of the liver, where, being stopped, they may give rise to a second focus of infection, especially if at the point of impaction the vitality of the tissues is in any way lowered.  Unless the blood is very much impoverished, its bactericidal action is usually sufficiently powerful to bring about the destruction of anything but comparatively large masses of pyogenetic organisms.  This bactericidal power, however, may be lost; in such case the pus-forming organisms may actually multiply, a general haemorrhagic infection resulting.  Should micro-organisms be conveyed by the veins to the heart, and there be deposited on an infected valve, an infective endocarditis is the result; from such a deposit numerous organisms may be continuously poured into the circulation.  Simple thrombi or clots may also become infected with micro-organisms.  Fragments of these, washed away, may form septic plugs in the vessels and give rise to abscesses at the points where they become impacted.  A distinction must be drawn between septicaemia and septicemia.  In sepsaemia the toxic products of saprophytic organisms are absorbed from a gangrenous or necrotic mass, from an ulcerating surface, or from a large surface on which saprophytic organisms are living and feeding on dead tissues; for example, we may have such a condition in the clots that sometimes remain after childbirth on the inner surface of the wall of the womb.  So long as no micro-organisms follow the toxins, the condition is purely sepsaemic, but should any organisms make their way into and multiply in the blood, the condition becomes one of septicemia.  The term pyaemia is usually associated with the formation of fresh secondary foci of suppuration in distant parts of the body.  If the primary abscess occurs in the lungs, the secondary or metastatic abscesses usually occur in the vessels of the general or systemic circulation, and less frequently in other vessels of the lung.  When the primary abscess occurs in the systemic area, the secondary abscess occurs first in the lung, and less frequently in the systemic vessels; whilst if the primary abscess be in the portal area (the veins of the digestive tract), the secondary abscesses are usually distributed over the same area, the lungs and systemic vessels being more rarely affected.  

Injective Endocarditis.—Acute malignant or ulcerative endocarditis occurs in certain forms of sepsaemia or of pyaemia.  It is brought about by the Streptococcus pyogenes (see Plate II. fig. 2), the pneumococcus, or the Staphylococcus pyogenes aureus (see Plate I. fig. 4), or, more rarely, by the gonococcus, the typhoid bacillus or the tubercle bacillus, as they gain access to acute or chronic valvular lesions of the heart.  The aortic and mitral valves are usually affected, the pulmonary and tricuspid valves much more rarely, though Washbourn states that the injective form occurs on the right side more frequently than does simple endocarditis.  A rapid necrosis of the surface of the valve is early followed by a deposition of fibrin and leucocytes on the necrosed tissue; the bacteria, though not present in the circulating blood during life, are found in these vegetations which break down very rapidly; ulcerative lesions are thus formed, and fragments of the septic clot (i.e. the fibrinous vegetations with their enclosed bacteria) are carried in the circulating blood to different parts of the body, and, becoming impacted in the smaller vessels, give rise to septic infarcts and abscesses.  The ulceration of the valves, or in the first part of the aorta, may be so extensive that aneurysm, or even perforation, may ensue.

In certain cases of streptococcal endocarditis the use of antistreptococcal serum appears to have been attended with good results.  Sir A. Wright found that the introduction of vaccines prepared from the pus-producing organisms after first lowering the opsonic index almost invariably, after a very short interval, causes it to rise.  He found, too, that the vaccine is specially efficacious when it is prepared from the organisms associated with the special form of suppuration to be treated.  Whenever the opsonic index becomes higher under this treatment the suppurrative process gradually subsides: boils, acne, pustules, ulcers, abscesses, etc., subside, and a stronger immunity so obtained is attributed to the increased activity of the serum as the result of the presence of an increased amount of opsonins.  Further, Bier maintains that a passive congestion and oedema induced by constriction of a part by means of a ligature or by a modification of the old method of cupping without breaking the skin appears to have a similar effect in modifying localized suppurrative processes, that is processes set up by pus-producing bacteria.  Wright holds that this treatment is always more effective when the opsonic index is high and that the mere accumulation of oedematous fluid in the part is sufficient to raise the opsonic index of that fluid, and therefore to bring about a greater phagocytic activity of the leucocytes that are found in such enormous numbers in the neighbourhood of suppurrative organisms and their products.

Erysipelas.—In 1883 Fehleisen demonstrated that in all cases of active erysipelasulatoin a streptococcus or chain of micrococi (similar to those met with in certain forms of suppuration) may be found in the lymph spaces in the skin.  The multiplying streptococcus found in the lymph spaces forms an active poison, which, acting on the blood-vessels, causes them to dilate; it also " attracts " leucocytes, and usually induces proliferation of the endothelial cells lining the lymphatics.  These cells—perhaps by using up all available oxygen— interfere with the growth of the streptococcus and act as phagocytes, taking up or devouring the dead or weakened micro-organisms.  Both mild and severe phlegmonous cases of erysipelas are the result of the action of this special coccus, alone, or in
PARASITIC DISEASES

combination with other organisms. It has been observed that cancerous and other malignant tumours appear to recede under an attack of erysipelas, and certain cases have been recorded by both Fehleisen and Coley in which complete cessation of growth and degeneration of the tumour have followed such an attack. As the streptococcus of erysipelas can be isolated and grown in pure culture this result is easily understood by those observing that a subcutaneous injection of such a culture might be of value in the treatment of cancerous tumours. No difficulty was experienced in setting up erysipelas by inoculation, but in some cases the process was so acute that the remedy was more fatal than the disease. The virulence of the streptococcus of erysipelas, as pointed out by Fehleisen and Coley, is greatly exalted in the coccus is grown alongside the *Bacillus prodigiosus* and certain other saprophytic organisms which flourish at the body-temperature. It is an easier matter to control the action of a non-multiplying poison, even though exceedingly active, than of one capable, under favourable conditions, of producing an indefinite amount of even a weaker poison. The erysipelas-like virus having been raised to as high a degree of activity as possible by cultivating it along with the *Bacillus prodigiosus*—the bacillus of "bleeding" bread—in broth, is killed by heat, and the living fluid, which contains a quantity of the toxic substances that set up the characteristic erysipelas-like changes, is utilized for the production of an inflammatory process—which can now be accurately controlled, and which is said to be very beneficial in the treatment of certain malignant tumours. The accurate determination of the aetiology of erysipelas has led to the adoption of a scientific method of treatment of the disease.

The streptococcus *erysipelatis* is found, not specially in the zone in which inflammation has become evident, but in the tissues outside this zone: in fact, the streptococcus appears to be most numerous in the lymphatics of the tissues in which there is little change. Before the appearance of any redness there is a dilatation of the lymph spaces with fluid, and the tissues become slightly oedematous. As soon, however, as the distension of vessels and the emigration of leucocytes, with the accompanying swelling and redness, become marked, the streptococcus disappear or are imperfectly stained—they are undergoing degenerative changes—the inflammatory "reaction" apparently being sufficient to bring about this result.

If it were possible to set up the same reaction outside the advancing streptococci might not a barrier be raised against their advance? This theory was tested on animals, and it was found that the application of iodine, oil of mustard, cantharides and similar irritants would prevent the advance of certain malignant ulcers. This treatment was applied to erysipelas patients with the most satisfactory result; the spread of the disease being prevented whenever the influence of such stimulation was sufficient to touch the area. The mere "ringing" of the red patch by nitrate of silver or some other similar irritant, as at one time recommended, is not sufficient: it is necessary that the reaction should extend for some little distance beyond the zone to which the streptococci have already advanced.

Gonorrhoea.—A micro-organism, the gonococcus, is the cause of gonorrhoea. It is found in the pus of the urethra and in the conjunctiva lying between the epithelial cells, where it sets up considerable irritation and exudation; it occurs in the fluid of joints of patients affected with gonorrhoeal arthritis; also in the pleural effusion and in the vegetation of gonorrhoeal endocarditis. It is a small diplococcus, the elements of which are flattened or slightly concave disks apposed to one another; these, dividing transversely, sometimes form tetrads. They are found in large numbers, usually in the leucocytes, adherent to the epithelial cells or lying free. They stain readily with the basic aniline dyes, but lose this stain when treated by Gram's method. The gonococcus is best grown on human blood-serum mixed with agar (Wertheim), though it grows on ordinary solidified blood-serum or on blood-agar. Like the pneumococcus, it soon dies out, usually before the eighth or ninth day, unless re-incubations are made. It forms a semi-transparent disk-like growth, with somewhat irregular margins, or with small processes running out beyond the main colony. It acts by means of toxins, which have been found to set up irritative changes when injected, without the gonococci, into the anterior chamber of the eye of the rabbit.

2. Caused by Specific Bacilli
(a) Acute Infective Fevers

Cholera.—In 1884 Koch, in the report of the German Cholera Commission in Egypt and India, brought forward overwhelming evidence in proof of his contention that a special bacterium is the causal agent of cholera; subsequent observers in all countries in which cholera has been met with have confirmed Koch's observation. The organism described is the "comma" bacillus or vibrio, one of the spirilla, which usually occurs as a slightly curved rod 1 to 2 μ in length and 0.5 to 0.6 μ in thickness. These comma-shaped rods occur singly or in pairs; they may be joined together to form circles, half-circles, or "S"-shaped curves (see Plate II, fig. 3).

In cultivations in specially prepared media they may be so grouped as to form long wavy or spiral threads, each of which may be made up of ten, twenty, or even thirty, of the short curved vibrios; in the stools of cholera patients, especially during the earlier stages of the disease, they are found in considerable numbers; they may also be found in the lymph, urine, sputum, or in the vomitus. In the mesentery of the small intestine, especially in the crypts and in and around the epithelium lining the follicles. It is sometimes difficult, in the later stages of the disease, to obtain the bacillus in large numbers to be able to distinguish them by direct microscopic examination, but by using the Dunbar-Sehottellus method they can be detected even in the most inactive in the form of a faintly alkaline meat broth, with 2%, of peptone and 1% common salt, mixed with some of the contents of the intestine, and is placed in an incubator at a temperature of 35°C. for about twelve hours, when, if cholera bacilli are present, they will develop almost entirely of short "comma" bacilli, appear on the surface. If the growth be allowed to continue, the bacilli increase in length, but after a time the pellicle is gradually lost, the cholera organisms being overgrown, as it were, by the other organisms. In order to obtain a pure culture of the cholera bacillus, remove a small fragment of the young film, shake it up thoroughly in a little broth, and then make gelatin-plate cultivations, when most characteristic colonies appear as small greyish or white points. Each of these, when examined under a low-power lens, has a yellow tinge: the margins are wavy or cerebrated; the surface is granular and has a peculiar ground-glass appearance; around the growing colony liquefaction takes place, and the colony gradually sinks to the bottom of the liquefying area, which now appears as a clear ring. The organism grows very luxuriantly in milk, in which, however, it gives rise to no very noticeable alteration in its presence can only be recognized by a faint aromatic and sweetish smell, which can scarcely be distinguished from the aromatic smell of the milk itself, except by the most practised nose.

The cholera bacillus may remain alive in water for some time, but it appears to be less resistant than many of the putre-}

factive and saprophytic organisms. It grows better in a saline solution (brackish water) than in perfectly fresh water; it flourishes in serum and other albuminous fluids, especially when peptones are present. Its power of forming poisonous substances appears to vary directly with the amount and nature of the albumen present in the nutrient medium; and though it grows most readily in the presence of peptone, it appears to form the most virulent poison when grown in some form or other of crude albumen to which there is not too free access of oxygen. From the experiments carried out by Koch, Nicati and Rietsch, and Macleod, there appears to be no doubt that the healthy stomach and intestine are not favourable breeding-grounds for the cholera bacillus. In the first place, it requires an alkaline medium for its full and active development, and the albumen and peptone of the food are converted into a form which is bad for the bacillus. It is interesting to note what an important bearing these facts have on the personal and general spread of cholera. Large quantities of the cholera bacillus may be injected into the stomach of a guinea-pig without any intoxicating or other symptoms of cholera making their appearance. Further, healthy individuals have swallowed, without any ill effect, pills
PARASITIC DISEASES

containing the dejecta from cholera cases, although cases are recorded in which "artificial" infection of the human subject has undoubtedly taken place, whilst, as Metchnikoff demonstrated, very young rabbits, deriving milk from mothers whose gymnastic glands have been smeared with a culture of the cholera vibrio, soon succumbed, suffering from the classical symptoms of this disease.

If, however, previous to the injection of the cholera bacillus the acidity of the stomach be neutralized by an alkaline fluid, especially if at the same time the peristaltic action of the intestine be paralysed by an injection of morphia, a characteristic attack of cholera is developed, the animal is poisoned, and in the large intestine a considerable quantity of fluid faeces containing numerous cholera bacilli may be found. There appear to be slight differences in the cholera organisms found in the Various cases, especially on the floating solid parishes. In such cases, if stools are preserved throughout, and are sufficiently distinctive to mark out all these organisms as belonging to the cholera group.

Amongst the known predisposing causes of cholera are the inauspicious use of purgative medicines, the use of unripe fruit, insufficient food and intemperance. These may be all looked upon as playing the part of the alkaline solution in altering the composition of the gastric juices, and especially as setting up alkaline fermentation in the stomach and small intestine; beyond this, however, the irritation set up may bring about an accumulation of inflammatory serous fluid, from the albumens of which, as we have seen, the cholera organism has the power of producing very active toxins.

The part played by want of personal cleanliness, overcrowding and unfavourable hygienic conditions may be readily understood if it be remembered that the cholera bacillus may grow outside the body. The number of cases in which epidemics of cholera have been traced to the use of drinking-water contaminated with the discharges from cholera patients is now considerable. The more organic matter present the greater is the virulence of water so contaminated; and the addition of such water to milk has, in one instance at least, led to an outbreak.

If cholera dejecta be sprinkled on moist soil or damp linen, and kept at blood-heat, the bacillus multiplies at an enormous rate in the first twenty-four or thirty-six hours; but, as seen in the Dunbar-Schottelius method, at the end of three or four days it is gradually overcome by the other bacteria present, which, growing strongly and asserting themselves, cause it to die out.

The importance of this saprophytic growth in the propagation of the disease can scarcely be over-estimated. Water which contains an ordinary amount of organic and inorganic matter in solution does not allow of the multiplication of this organism, which may soon die out; but when organic matter is present in excess, as at the margin of stagnant pools and tanks, development occurs. The organism multiplies when the temperature is moderate and when a temperature of 30° C. on meat, eggs, vegetables and moistened bread; also on cheese, coffee, chocolate and dilute sugar solutions. In some experiments carried out by Cartwright Wood and the writer in connexion with the passage of the cholera organism through filters it remained alive in the charcoal filtering medium for a period of at least forty-two days, and probably for a couple of months. It must be remembered that cholera bacilli are gradually overcome or overgrown by other organisms, as only on this supposition can the immunity enjoyed by certain regions, even after the water and soil have been contaminated, be explained; provided that no fresh supply is brought in to "relight the torch," be explained. In most of the regions in which cholera remains endemic the wells are merely dug-out pits beneath the slightly raised houses, and are open for the reception of sewage and excreta at all times. These dejecta contain organic material which serves as a nutrient on which infective organisms, derived from the soil and ground-water, may flourish. Not only dejecta, but also the rinsings from soiled linen and utensils used by cholera-patients should be removed as soon as possible, "without allowing them to come into contact with the surface of the soil, with wells," or with vegetables and the like. The discovery of Koch's comma bacillus has so altered our conceptions of the aetiology of this disease that we now study the conditions under which the bacillus can multiply and be disseminated, instead of concerning ourselves with the cholera itself as some definite entity. Telluric agencies become merely secondary factors, the dissemination of the disease by winds from country to country is no longer regarded as being possible, whilst the spread of cholera epidemics along the lines of human intercourse and travel is now recognized. The virulent bacillus requires the human organism to carry it from those localities in which it is endemic to those in which epidemics occur. The epidemiologist has come to look upon the study of the cholera organism and the conditions under which it occurs as of more importance than mere local conditions, which are only important in so far as they contribute to the propagation and distribution of the cholera bacillus, and he knows that the only means of preventing its spread is the careful inspection of everything coming into the country. On the other hand, by passing the physician also recognizes that the herding together of people of depressed vitality, under unhygienic and often filthy conditions, in quarantine stations or ships, is one of the surest means of promoting an epidemic of the disease; that attention should be confined to the careful isolation of all patients, and to the disinfection of articles of clothing, feeding utensils, and the like; that the comma bacillus can only be driven out of rooms by means of light and fresh air; that thorough personal, culinary and household cleanliness is necessary; that all water except that known to be pure should be carefully boiled; and that all excess, both mental and physical, should be avoided. This renders the physician in such cases must be first to isolate as completely as possible all his cholera patients, and then to get rid of all predisposing causes in the patients themselves, causes which have already been indicated in connexion with the aetiology of the disease.

Attention has frequently been drawn to the fact that patients who have lived for some time in a cholera region, or who have already suffered from an attack of cholera, appear to enjoy a partial immunity against the disease. Haffkine, working on the assumption that the symptoms of cholera are produced by a toxin formed by the cholera organism, came to the conclusion that, by introducing first a modified and then a more virulent poison directly into the tissues under the skin, and not into the alimentary canal, it would be possible to obtain a certain insusceptibility to the action of this poison. He found that for this purpose the cholera bacillus, as ordinarily obtained in pure culture from the intestinal canal, is too potent for the preliminary inoculation, but is not sufficiently active for the second, if any marked protection is to be obtained. By allowing the organism to grow in a well-aerated culture the virulence is gradually diminished, and this virulence, once abolished, does not return again. So when numerous successive cultures are made on agar or other nutrient media, the choleragull bacillus successively through the peritoneal cavities of a series of about thirty guinea-pigs, he obtains a virus of great activity; this activity is soon lost on agar cultivations, and it is necessary, from time to time, again to pass the bacillus through guinea-pigs, three or four passages now being sufficient to reinforce the activity.

From these two cultures the vaccines are prepared as follows: The surface of a slain agar tube is smeared with the modified cholera organism. After this has been allowed to grow for twenty-four hours, small pieces of excrement are added to the medium, and the surface-growth is carefully scraped off and made into an emulsion in water; this is then poured off, and the process is repeated until the whole of the growth has been removed. The mixture is made up with water to a bulk of 8 c.c., so that if 1 c.c. is injected the patient receives 4 of a surface-growth; it is found that this quantity, when injected subcutaneously into a guinea-pig, causes a violent reaction, but does not cause necrosis of the tissues. If the vaccine is to be kept for any length of time, the emulsion is made with 0·5% carbolic acid solution, prepared with carefully sterilized water, and the mixture is made up to 6 c.c. instead of 8; the carbonic acid appears to interfere slightly with the activity of the virus. The stronger virus is prepared in exactly the same way. The preliminary injection, which is made in the left flank, is followed by a rise in temperature and by local reaction.
Parasitic diseases

After three or four hours there is noticeable swelling and some pain; and after ten hours a rise in temperature, usually not very marked, occurs. The disease then disappears, for several days the second injection is made, usually on the opposite side. This is also followed by a rise of temperature, by swelling, pain and local redness; these subside, however, as before, soon pass off, and leave no ill feeling behind.

A guinea-pig treated in this fashion is now immune against some eight or ten times the lethal dose of choler poison, and, from all statistics that can be obtained, a similar protection is continued up to the end of the first year.

Pfeiffer found that when a small quantity of the cholera vibrio is injected into the peritoneal cavity of a guinea-pig highly immunized against cholera by Haffkine's or a similar method, the vibrio rapidly become motionless and granular, then very much swollen and finally "dissolve." This is known as Pfeiffer's reaction. A similar reaction may be obtained when a quantity of a culture of the cholera vibrio is injected into the peritoneal cavity of a guinea-pig immunized against the cholera vibrio, or from a patient convalescent from the disease, is injected into the peritoneal cavity of a guinea-pig not subjected to any preliminary treatment; and, going a step further, it was found that the dissolution of the cholera vibrio is brought about even when the mixture of vibrio and serum is made in a test tube. On this series of experiments as a foundation, the theory of acquired immunity has been reared.

Evidence has been collected that spirilla, almost identical in appearance with the cholera bacillus, may be present in water, and in healthy stools; and that it is in many cases almost impossible to diagnose between these and the cholera bacillus; but although these spirilla may interfere with the diagnosis, they do not invalidate Koch's main contention, that a special form of the comma bacillus, which gives a complete group of reactions, is the cause of this disease, especially when these reactions are met with in an organism that comes from the human intestine.

Typhoid fever.—Our information concerning the aetiology of typhoid fever was largely increased during the last twenty years of the 19th century. In 1880 Eberth and Klebs independently, and in 1882 Coats, described a bacillus which has since been found to be intimately associated with typhoid fever. This organism (Plate II, fig. 4) usually appears in the form of a short bacillus from 2 to 34 in length and 0.3 to 0.5 in breadth; it has slightly rounded ends and is stained at the poles; it may also occur as a somewhat longer rod more equally stained throughout. Surrounding the young organisms are numerous long and well-formed flagella, which give it a very characteristic appearance under the microscope. At present there is no evidence that the typhoid bacillus forms spores. These bacilli are found in the adenoid follicles or lymphatic tissues of the intestine, in the mesenteric glands, in the spleen, liver and kidneys, and in the parts of the body which have been in contact with the affected bacilli. They may also be found in the urine in the form of a comma bacillus, and in the post-typhoid abscesses formed in the bones, kidneys, or other parts of the body; indeed, it is probable that they were first seen by von Recklinghausen in 1871 in such abscesses. They undoubtedly occur in the dejecta of patients suffering from typhoid fever, whilst in recent years it has been demonstrated that they may also be found in the urine. It is evident, therefore, that the urine, as well as the faeces, may be the vehicle by means of which the disease has been unwittingly spread in certain otherwise inexplicable outbreaks of typhoid fever, especially as the bacillus may be present in the urine without the disease having been contracted, and when it has been assumed that, as the patient is convalescent, he is no longer a focus from which the infection may be spread. Easton and Knox found typhoid bacilli in the urine of 21% of a series of their typhoid patients.

In 1890 Kayser demonstrated what had previously been suspected, that the typhoid bacilli may persist for considerable periods in the bile duct and gall bladder, whence they pass into the intestinal tract, and may be found in the stools. From the work of Pfeiffer it is evident that this is the case, and the bacilli are still found in the stools in cases of typhoid fever. In such cases the stools contain a much higher proportion of the bacilli than in the cases of typhoid fever, and they are much more frequently isolated. Pfeiffer also demonstrated that the bacilli persist in the urine for a considerable time after the disease has ceased, and that although these bacilli die very rapidly when they are desiccated, they remain alive sufficiently long to enable them to multiply and flourish when again brought into contact with moist food, milk, &c.

When inoculated on potato, careful examination will reveal the fact that certain almost invisible moist spots are present; these are made up of rapidly multiplying typhoid bacilli. The typhoid bacillus grows in gelatin, especially on the surface,

XX. 771.
somewhat like the bacillus coli communis, but with a less luxuriant growth. This organism, when taken from young broth cultures and grown on agar plates, produces typical haemolytic disks with small, delicate, transparent, and colourless flagella. The characteristic temperature range for this organism is from 18° to 24° C. It has four flagella, is motile, and produces a yellowish-brown pigment. The temperature remains high throughout the course of the attack. According to Hughes, this disease is widely distributed in the countries neighboring the Mediterranean south of latitude 46° N., and along the Red Sea littoral. Analogous forms of fever giving a "specific" serum reaction with the micrococcus of this disease are also met with in parts of India, China, Africa and America.

The Micrococcus melitensis vel Bruceti (1887), which is found most abundantly in the enlarged spleen of the patient suffering from Malta fever, is a very minute organism (0.6-3 μ) in diameter, usually arranged in doublets, or nearly round, arranged in pairs or in very short chains. If a drop of the blood taken directly from the spleen be smeared over the surface of agar nutrient medium, minute transparent colourless bacilli appear as separate individuals, and in four or five days from their first appearance they become opaque. These colonies, which flourish at the temperature of the human body, cease to grow at the room-temperature in summer, and if kept moist, soon die at anything below 60° F., though when dried they retain their vitality for some time. As the organism grows and multiplies in broth there is opacity of the medium at the end of five or six days, this being followed by precipitation, so that a comparatively clear supernatant fluid remains. It grows best on media slightly less alkaline than human blood; it is very vigorous and may resist desiccation for several weeks.

This organism is distinctly pathogenic to monkeys, and its virulence may be so increased that other animals may be affected by it. Those taught in the care of patients may be affected by it, though not to the extent of those handling patients. Hughes maintains that the "virus" leaves the body of goats and of man along with the faces and urine. The importance of this in ambulatory cases is very evident, especially when it is remembered that goats feeding on grass, &c. which has come in contact with such urine are readily infected. It seldom appears to be carried for any considerable distance. Infection is not conveyed by the sputum, sweat, breath or scraping of the skin of patients, and infected dust does not seem to play a very important part in producing the disease. Hughes divides the fever into three types. In the malignant form the onset is sudden, there are headache, shaking pain all over the body, nausea and sometimes vomiting; the tongue is foul, coated and swollen, and the breath very offensive; the temperature may continue for some time at 103° to 105° F. The stools in the diarrhoea which is sometimes present may be most offensive. At the end of a few days the lungs become congested and pneumonic, the pulse weak, hypothermia appears, and death ensues. A second type, by far the most common, is the "undulant" type, in which there is remittent pyrexia, separated by periods in which the patient appears to be improving. These pyrexial curves, from one to seven in number, average about ten days each, the first being the longest—eighteen to twenty-three days. In the third type, the temperature curve closely resembles the hectic pyrexial curve of phthisis or suppuration, the "undulatory" character is also marked. A considerable number of toxic symptoms make their appearance—localized neuritis, synovitis, anaemia, emaciation, bronchial catarrh, weakness of the heart, neuralgia, profuse night-sweats and similar conditions. Patients otherwise healthy usually recover, even after prolonged attacks of the disease, but the mortality amongst patients suffering from organic mischief of any kind may be comparatively high. The diagnosis from malaria, phthisis, rheumatic affections and pneumonia may, in most cases, be made fairly easily, but the serum agglutinating reaction (first demonstrated by Wright in 1897) with cultures of the Micrococcus melitensis, corresponding to the typhoid reaction with the typhoid bacillus, is sometimes the only trustworthy feature by which a diagnosis may be made between this fever and the above-mentioned diseases. About 50% of the goats in Malta give a positive agglutinating reaction and about 10% excrete milk which contains the micrococcus.

Sir David Bruce, in his investigations on the tsetse fly disease, pointed out that certain wild animals although apparently in good health might serve as reservoirs for, or storehouses of, the N'gana parasite. He was therefore quite prepared to find
that the Micrococcus melitensis might similarly be "stored" in the blood and, apparently, retires to the spleen. This disease, in epidemic form, follows in the footsteps of famine and destitution, specially affecting young people between the ages of fifteen and twenty; it seldom attacks children under five years of age, but when it attacks patients over thirty it assumes a very virulent form. In monkeys inoculated with blood containing the Spirillum Obermeieri the first symptoms appear between the second and sixth days. In the human subject this incubation period may last as long as three weeks; then comes an attack of fever, which continues for about a week, and is followed by a similar period of apparent convalescence, on which ensues a pyrexial relapse, continuing about half as long as the first. The spirilla, the cause of this disease, are fine spirals with pointed ends, three or four times as long as the diameter of the red corpuscle, and under high powers of the microscope can be seen to be encysted. In the monkey and under the conditions used in these experiments it was found impossible to cultivate these spirilla outside the body, human beings, and monkeys injected with blood containing them, contract the disease; and in monkeys it has been found that during the period before the relapse the spirilla have made their way into the cells of the spleen. As yet little is known as to the mode of development of these organisms, and of the method of their transmission from one patient to another, but it is thought that, as in the case of malaria and the tsetse-fly disease, they may be carried by bloodsucking insects. Relapsing fever is distinguished from typhoid fever by its sudden onset, and by the distinct and not infrequent "fashion" in which the swollen glands, by means of which the coci multiplying therein are removed. As pointed out by the Mediterranean Fever Commission, the spirilla of relapsing fever are not differently distributed in the milk of milk-fed goats and milk-fed calves, or in milk not boiled at all in the same way as ordinary ice-creams and to native cheeses, in which it appears to retain its full virulence. Monkeys are especially susceptible to this disease, contracting it readily when they are fed with milk from milk-fed goats, and also from goats in which it has been unintentionally, carried out. An official of the United States Bureau of Animal Industry visiting Malta in the summer of that year purchased a herd of 61 milk-goats and four billy goats. These were subjected to the same treatment as the goats transferred to Antwerp. The goats were transferred to a quarantine station, where they remained for five days and were then consigned by steamer to New York. On board the SS. "Joshua Nicholson," which took the goats from Malta to Antwerp, were twenty-three officers and men, ten out of the twenty-three were afterwards traced. It was found to have been infected by M. melitensis at an unknown date, and during the voyage the infected passengers infected the naval personnel with sufficient virulence to produce the conclusive evidence of infection by M. melitensis. It is interesting to note, however, that two men who boiled the milk before drinking it, and an officer and a cabin-boy who disliked the milk and did not drink it, remained free from the disease.

These cases taken by themselves might leave the question somewhat open, as there was a possibility that the men attacked back was in contact with infected patients in Malta. A far more conclusive follows from the case of a group of workers at the station at Athens, N. J., U.S.A., who ported freely of the mixed milk from several goats, over a considerable period, suffered from a typical attack of Mediterranean fever some nine or ten weeks after the goats had been landed in America. In this case the goats were transferred to a quarantine station with others of模式 of exposure to infection by human patients could all be eliminated.

It may be held that then the M. melitensis leads a more or less passive existence in the body of the Maltese goat, only exercising its full pathogenic action when it gains entrance to the human body. There is some slight evidence that the Micrococcus melitensis may perhaps be found in the presence under favorable circumstances in the mosquitoes Acanthomyia and Stegomyia, and again in the common blood-sucking fly, Stomoxys, for a short period, four or five days. It can be recovered for a longer period and still in a fairly virulent condition. In spite of this transmission of the disease by these insects, though apparently possible, does not appear to be of very frequent occurrence. Inoculation with the virulent form from infected milk may be used to exert a protective influence for a period of about four months, after which time there is a marked diminution in the immunity conferred by this vaccination.

Relapsing Fever.—The specific cause of relapsing fever (famine fever), from the Spirillum Obermeieri, an organism which occurs in the blood (during the febrile stages) of patients suffering from this disease. Between the febrile stages are periods of intermission, during which the spirillum disappears.
with the outbreak came to the conclusion that certain houses were centres of infection, it was noticed that these houses were most infective at night, and that they might actually be centres of infection although uninhabited; indeed the infection seemed to spread to houses between which and the infected house there appeared to be no intercommunication of any kind. This seemed to be inexplicable except on the assumption that the infective agent, the Bacillus pestis, was, in some way or other, carried by animals. It had already been noted that rats disappeared from plague-stricken houses, many dying before the appearance of the plague in the human population. Simond, noting these conditions, suggested that the plague bacillus might be transmitted by the flea from rat to rat and from rat to man. Although he was not able to demonstrate this connexion he indicated a line of research to other observers, who, as knowledge accumulated, were able to complete each link in the chain of infection. The plague bacillus having been found in the rat, the next step was to demonstrate its presence in the flea, and living plague germs were found in the stomachs of fleas inhabiting plague-infected houses. Several species seem to be able to transmit this germ, but in none of them does the plague bacillus appear to undergo any special development—alternation of generations or the like—as in the case of the protozoon of malaria in the mosquito. The plague agent, however, is captured and carried by some species of fleas—"it simply passes unchanged through the alimentary canal of the flea, is excreted in the faeces, and is carried into the wound made by the epipharynx-mandibles of the fly."

At least three species of animals, two rats and the human subject, and three species of fleas are involved in this chain. The rat fleas are Pulex cepos found in India, and Ceratophyllus fasciatus, the rat flea of northern Europe, and Pulex irritans, the common flea, all of which have the power of transmitting the disease. In India of course the Pulex cepos, usually solely associated with rats, seems to play the most prominent part. The two rat fleas are also the Mus domesticus, or brown rat, which is found in the sewers and develops the plague agent, and the Mitis rattus, the common black house-rat. From the sewer-rat the house-rat is infected, and from the house-rat man. Under ordinary conditions rat fleas do not attack the human subject, but, as the rats are attacked by plague and die, the infected fleas, starve out as it were, leave them and transfer their attentions to other animals and the human subject, infecting many of those they bite. Colonel Bannerman maintains that this infection takes place in the majority of cases, by this chain of transmission, and that there is no evidence that the excreta of these rats infect food or contaminate the soil. Colonel Lamb, summarizing the experimental evidence on this question, writes:

"1. Close contact of plague-infected animals with healthy animals, if fleas are excluded, does not give rise to an epizootic among the latter. As the godowns (experimental huts) were never cleaned out, close contact includes contact with faeces and urine of infected animals, and contact with and eating of food contaminated with faeces and urine of infected animals as well as with pus from open plague ulcers: (2) close contact of young, even when suckled by plague-infected mothers, did not give the disease to the former; (3) if fleas are present, then the epizootic, once started, spreads from animal to animal, the rate of progress being in direct proportion to the number of fleas present; (4) an epizootic of plague may start without direct contact to healthy animal and subject; (5) the rat flea can convey plague from rat to rat; (6) infection can take place without any contact with contaminated soil; (7) aerial infection is excluded."

The experiments lead to the conclusion that fleas and fleas alone, are the transmitting agents of infection. Bannerman gives in concise form similar evidence in relation to naturally infected native houses. Infection is carried from place to place by fleas, usually on the body or in the clothing of the human being. Such fleas, fed on infected rats, may remain alive for three weeks, and of this period, we are told, may remain infective for fifteen days. At the first opportunity these fleas forsake the human host and return to their natural host the rat. In most of the epidemics there is a definite sequence of events. First the brown rats are attacked, then the black rats, then the human subject, and Colonel Lamb suggests that after the rat disappears the flea starves for about three days and then attacks the human subject. Then comes the incubation period of plague, three days. Following this is the period of average duration of the disease, five or six days. This time-table, he says, corresponds to the period—when the epidemics are at their height—that intervenes between the maximum death-rate in rats and the maximum death-rate in man, about ten to fourteen days. This history of the connexion between the flea, the rat, and the human subject reads almost like a fairy tale, but it is now one of the well-authenticated and sober facts of modern medicine.

Indeed, where the notions of cleanliness are somewhat different from those recognized in Great Britain, most of the conditions favourable to the spread of the plague bacillus are of the most perfect character. This organism may pass into the soil with faeces; it may there remain for some time, and then be taken into the body of one of the lower animals, or of man, and give rise to a fresh outbreak. Kitasato and Yersin were both able to prove that soil and dust from infected houses contain the bacillus, that such bacillus is capable of inducing an attack of plague in the lower animals, and that flees fed on the dejecta or other bacillus-containing material, die, and in turn contain the bacillus. It is evident then that once the disease is established, the ants may carry the plague to and from rats, and so to the human being. It has already been mentioned that the organism rapidly loses its virulence when cultivated outside the body; on the other hand, on being passed through a series of animals its virulence gradually increases. Thus may be explained the fact that in most outbreaks of plague there is an early period during which the death-rate is very low; after a time the percentage mortality is enormously increased, the virulence of the disease being very great and its course rapid. There seem to be notable differences in the degree of susceptibility of different races and different individuals, and those who have passed safely through the first attack appear to have acquired a marked degree of immunity.

Two methods of treatment, both of which seem to have been attended with a certain degree of success, are now being tried. Haffkine, who was the first to produce a vaccine for the treatment of cholera, prepared a vaccine of a somewhat similar type for the treatment of plague. For this the Bacillus pestis is cultivated in flasks of bouillon; to this small drops or particles of ghee (Indian butter) are added; these form centres around which the organisms develop. As the result of this, millions of bacilli are formed in the broth, but gradually becoming fewer in number as the floating mass on the surface is left, they finally settle to a point and so come to resemble stalactites. These are broken off, from time to time, and injected into the arm of the patient, the injection being made in the lower region of the arm, near the elbow. This may go on for six weeks. The flask with its contents is then well shaken and heated in a water bath to 70° C. for from one to three hours. On testing by culture the fluid should now be sterile, i.e., no bacilli should remain alive, and the fluid, ready for use, is to be injected into the subcutaneous tissues of the arm in a dose of from 3 cc. for a man and 2 to 2 1/2 cc. for a woman, children receiving relatively small amounts. A rise of temperature, followed by malaise and headache, which pass off in about 24 hours, is soon noted and some local swelling and redness appear at the seat of injection. The Indian Plague Commission were satisfied that the use of this vaccine diminishes the incidence of attacks of plague, and that, although it does not confer a complete immunity against the disease, the case mortality is lowered. They are of opinion also that protection is not conferred at once, but Lieut.-Colonel Bannerman states that it confers protection in 75 per cent. of cases after from four to fourteen months. In the official report (Annual Report of the Sanitary Commissioner with the Government of India) for 1904 occurs the following: "That its value is great is certain, not only does it largely diminish the danger of plague being contracted, but, if it fails to prevent the attack, the probability of a fatal event is reduced by one-half."

This method of treatment, however, is of no avail in the case of patients already attacked; for such cases Yersin's serum treatment must be called in. Various other vaccines have been described, but all consist of some form of killed or attenuated bacilli, and the same remarks may be applied to all as to the danger of the needle-strucked plague bacillus also devised the method of preparing an "antiseptic serum." A horse was inoculated repeatedly, at intervals, and with gradually increasing doses of living plague bacilli. It was after three found that cultures stunted and lived for six or even twelve well for this inoculation of the horse and of course were much more much..."
easily worked with. This process of preparation may have to be considerably lengthened to allow for the slow growth of the bacteria, for from the clot the serum is separated, care being taken to determine by injecting the blood into mice so that no living bacilli have by accident made their way into, and remained in, the horse’s blood. The serum is then filtered and a half will protect the mouse against a dose of living bacilli fatal to a control mouse in from 48 to 60 hours. When this serum is injected in sufficient large doses subcutaneously in mild cases, and subcutaneously or intravenously in severe cases, the results seem to be excellent, especially when the serum is injected into the tissues around the bursa or the peritoneum (Fraenkel). The horse is then bled and the serum used in 1:2 cases in the Oporto outbreak. Amongst these there was a mortality of under 15% whereas amongst 72 patients not so treated the death-rate was over 63%. This serum kills the bacillus of the same species and not of the coccus. The result was the best obtained in that outbreak.

The best results are obtained when large doses are given, and when the serum injected subcutaneously is thrown into the area in which the lymph flows towards the bubo. As in the case of the diphtheria antitoxin serum joint pains and rashes may follow its exhibition, but no other ill effects have been noted.

**Pneumonia.**—The case in favour of acute lobar pneumonia being an infective disease was a very strong one, even before it was possible to show that a special organism bore any antigenic relation to it. In 1880, Friedländer claimed that he had isolated such an organism, but the pneumo-bacillus thus described appears to be inactive as compared with the pneumo-coccus isolated by Fraenkel and Talamon. This latter organism which is usually found in the sputum, is an encapsulated diplo-coccus. grown on serum or agar over which sterile blood has been allowed to stand red, it appears as small, crystal-like,游艇 prominent points, all like a fine spray of water or dew. When the organism is cultivated in both the capsule disappears, and chains of diplo-cocci are seen. It resembles the influenza bacillus in a most remarkable manner. It may be found, in almost every case of pneumonia, in the "rusty" or "prune-juice" sputum. Injected into rabbits, it produces death with very great certainty, and by passing the organism through these animals its virulence may be markedly increased. Like the influenza bacillus and even the diptheria bacillus, this organism may be present in the mouth and lungs of perfectly healthy individuals, and it is only when the vitality of the system is lowered by cold or other depressing influences that pneumonia is induced; two factors, the presence of the bacillus and the lowered vitality, being both necessary for the production of this disease in the human subject. It is quite possible, however, that, as in the case of cholera, a slight inflammatory exudation may supply a nutritive medium in which the bacillus rapidly acquires greatly increased virulence, and so becomes a much more active agent of infection.

It is claimed by the brothers Klemperer, by Washbourn and by others, that they have been able to produce an anti-pneumococcal serum which is active in the treatment of patients suffering from acute or chronic meningococcal disease. The serum is injected directly into the spinal canal which is affected. The results are marked and in some cases of pneumonia the cattarahtical pneumonia so frequently met with during the course of whooping-cough, measles and other specific infective fevers, is also in all probability due to the action of some organism of which the influenza bacillus and the Diplococcus pneumoniae are types.

**Infective meningitis.** is, in most of the works on medicine, divided into four forms: (1) the acute epidemic cerebro-spinal form; (2) a posterior basic form, which, however, is closely allied to the first; (3) supplicative meningitis, usually associated with pneumonia, erysipelas, and pyaemia; and (4) tubercular meningitis, due to the specific tubercle bacillus.

1. The first form, acute infective or epidemic cerebro-spinal meningitis, is usually associated with Weichsaelbaum’s Diplococcus intracellularis meningitidis (two closely appressed disks), which is found in the exudate, especially in the leukocytes, of the meninges of the brain and cord. It grows, as transparent colonies, on blood-agar at the temperature of the body, but dies out very rapidly unless reinoculated, and has little pathogenic effect on any of the lower animals, though under certain conditions it has been found to produce meningitis when injected under the dura mater.

More or less successful attempts have been made to treat acute epidemic cerebro-spinal meningitis by means of antiserum obtained from different sources. Flexner uses the serum of horses that have been killed by meningitis, and from such serum antitoxins are obtained. From the meningococcus, the process of immunization extending over four or five months, Meister, Lucas and Brünig supply Ruppel’s anti-bacterial serum derived from animals immunized against several strains of the meningococcus. Antitoxin is also occasionally used in meningitis, but it appears that the meningococcus may be looked upon as polyvalent sirv. Ivy Mackenzie and Martin, pointing out that the cerebro-spinal fluid, even of patients who have recovered from this form of meningitis, contains no anti-toxins, recommend the use of serum obtained from rabbits infected with the serum into the spinal canal. In all cases the action seems to be much the same. These sera contain immune body and complement, and are therefore capable of destroying organisms, and may even, by becoming disseminated, produce a more general infection.

As in the case of diphtheria, the cerebrospinal fluid seems to be less liable to absorption than the blood serum, and may be retained for a considerably longer period. It is less pathogenic than that organism, of which possibly it is simply a more highly saprophytic form. This is a somewhat important point, as it would account for the great resemblance that exists between the sporadic and the epidemic forms of meningitis.

2. Posterior basic meningitis, according to Dr Still, is frequently seen during the first six months of life, a period at which tuberculous and epidemic cerebro-spinal meningitis are quite uncommon. The organism found in this disease resembles the Diplococcus intracellularis meningitidis very closely, but differs from it in the virulence of the colonies, which grow for a considerably longer period. It is less pathogenic than that organism, of which possibly it is simply a more highly saprophytic form. This is a somewhat important point, as it would account for the great resemblance that exists between the sporadic and the epidemic forms of meningitis.

3. In supplicative meningitis these two organisms may still be found in a certain proportion of the cases, but their place may be taken by the pneumococcus or Diplococcus pneumoniae or Frankel’s pneumococcus—Diplococcus lanceolatus—which appears to grow in two forms. In the first it is an encapsulated organism, consisting of small oval cocci arranged in pairs or in short chains; the capsule is unstained. When the pneumococcus grows in chains—the second form—as when cultivated outside the body, on blood-serum or on agar over the surface of which a small quantity of sterile blood has been smeared, it produces very minute translucent colonies. Like Weichsaelbaum’s bacillus, it must be recultivated every three or four days, otherwise it soon dies out. Unlike the other forms previously described, it may, when passed through animals, become extremely virulent, very small quantities being sufficient to kill a rabbit.

Although the pneumococcus may be found in the majority of these cases, especially in children, supportive
meningitis may also accompany or follow the various diseases that are set up by the Streptococcus pyogenes and Streptococcus erysipelatis; whilst along with it staphylococci and the Bacillus coli communis have sometimes been found. In other cases, again, there is a mixed infection of the pneumococcus and the Streptococcus pyogenes, especially in cases of disease of the middle ear. As might be expected in meningitis occurring in connexion with the specific infective diseases, e.g., influenza and typhoid fever, the presence of the specific bacilli of these diseases may usually be demonstrated in the meningeal pus or fluid.

The fourth form, tubercular meningitis (acute hydrocephalus), is met with most frequently in young children, generally accepted that this condition is the result of the introduction of the tubercle bacillus into the blood-vessels and lymph spaces of the meninges at the base of the brain, and along the fissures of Sylvius.

Influenza.—From 1889 up to the present time, influenza has every year with unfailing regularity broken out in epidemic form in some part of the United Kingdom, and often has swept over the whole country. The fact that the period of incubation is short, and that the infective agent is extremely active at a very early stage of the disease, renders it one of the most rapidly-spreading maladies with which we have to deal. The infective agent, first observed by Pfeiffer and Canton, is a minute bacillus or diplococcus less than μ in length and 0.5μ in thickness; it is found in little groups or in pairs. Each diplococcus is stained at the poles, a clear band remaining in the middle; in this respect it resembles the plague bacillus. It is found in the blood—though here it seems to be comparatively inactive—and in enormous numbers in the bronchial mucus. It is not easily stained in a solution of carbol-fuchsin, but in some cases such numbers are present that a cover-glass preparation may show practically no other organisms. Agar, smeared with blood, and inoculated, gives an almost pure cultivation of very minute transparent colonies, similar to those of the Diplococcus pneumoniae, but as a rule somewhat smaller. This organism, found only in cases of influenza, appears to have the power of forming toxins which continue to act for some time after recovery seems to have taken place; it appears to exert such a general devitalizing effect on the tissues that micro-organisms which ordinarily are held in check are allowed to run riot, with the result that catarrh, pneumonia and similar conditions are "developed, especially when cold and other lowering conditions co-operate with the poison. This toxin produces special results in those organs which, through over-use, impaired nutrition or disease, are already only just able to work; and in many cases of influenza the cause of death is usually associated with the failure of some organ that had already been working up to its full capacity, and in which the margin of reserve power had been reduced to a minimum. It is for this reason that rest, nutrition, warmth and tonics are such important and successful factors in the treatment of this condition.

Yellow Fever, endemic in the West Indies and the north-eastern coast of South America, may become epidemic wherever the temperature and humidity are high, especially along the seashore in the tropical Atlantic coast of North America. It appears to be one of the specific infective fevers in which the liver, kidney, and gastro-intestinal systems, and especially their blood-vessels, are affected. In 1897 Sanarelli reported, in the Annales de l'Institut Pasteur, that he had found a bacillus in the blood-vessels of the liver and kidneys, and in the cells of the peritoneal fluid, but not in the alimentary tract, of yellow fever patients. These, he maintained, were perfectly distinct from the putrefactive microbes occurring in the tissues in the later stages, their colonies not growing like those of the bacillus coli communis. They grow readily on all the ordinary artificial nutrient media, as short rods with rounded ends, usually about 2 to 4μ in length and about half as broad as they are long. They are stained by Gram's method and readily by most of the antiflue dyes, and do not liquefy gelatine. They flourish specially well along moulds, in the dark; in badly-ventilated, warm, moist places, and remain alive for some time in sea-water: these facts, as Sanarelli points out, may afford an explanation of the special persistence of yellow fever in old, badly-ventilated ships, and in dark, dirty and insanitary sea-coast towns. Once the organism, whatever it may be, finds its way into the system, it soon makes its presence felt, and toxic symptoms are developed. The temperature rises; the pulse, at first rapid, gradually slows down; and after some time persistent vomiting of bile comes on. At the end of three or four days the temperature and pulse fall, and there is a period during which the patient appears comparatively well; this is followed in a few hours by icterus and scatty secretion of urine. There may be actual loss of quantity of urine passed may be loaded with casts and albumen; delirium, convulsions and haemorrhages from all the mucous surfaces may now occur, or secondary infections of various kinds, boils, abscesses, suppurations and septicemia, may result. These often prove fatal when the patient appears to be almost convalescent from the original disease. As regards prognosis, it has been found that the "lower the initial temperature the milder will the case be" (Macpherson). An initial temperature of 106°F. is an exceedingly unfavourable sign. Patients addicted to the use of alcohol are, as a rule, much more severely affected than are others. Treatment is principally directed towards prevention and towards the alleviation of symptoms, though Sanarelli has hopes that an "anti-" serum may be useful. More recently S. Flexner, working with the American Commission, isolated another organism, which, he maintains, is the pathogenetic agent in the production of yellow fever; whilst Durham and Myers maintain that a small bacillus previously observed by G. M. Sternberg and others is the true cause of this disease.

Professor Boyce, enumerating the hypotheses as to the cause of yellow fever, points out that as in the case of malaria, suspicion turned to that form of Miasm which was supposed to arise from the mixture, in a marsh or on a mud flat, of salt with fresh water. It was early recognized that yellow fever was not carried directly from person to person, but little of definite character was known as to the poison and the method of its dissemination, and Fergusson states that it "is a terrestrial poison which high atmospheric heat generates amongst the newly arrived, and without that heat it cannot exist." The following passage from Beauperthuy (see his collected papers published in 1897) is quoted by Boyce: "But rubbish! the small amount of sulphuretted hydrogen or marsh gas which might arise from a marsh could not possibly hurt a fly, much less a man. It is not that, it is a mosquito called in Cambodia, the "Zancudo bobi," the striped or domestic mosquito." Beauperthuy, recently as he wrote, then stood almost alone in this opinion. Now we know that yellow fever, in common with other specific diseases, is caused by the action of an organized virus. The search for a vegetable parasite, bacillus or micrococcus, as above indicated, has been very close and strenuous, but it may now be held that up to the present no bacillus or micrococcus, well authenticated as capable of causing yellow fever, has been discovered. Latterly a search has been made for protozoal organisms, organisms similar to those present in the blood of malarious patients and like conditions, or for spirochaetes similar to the ones found in syphilis. Boyce draws attention to the fact that a spirochaete that has recently been identified in the tissues taken from cases of yellow fever has it however been demonstrated that the virus, whatever it may be, is carried by a species of mosquito; this seems to favour the protozoan hypothesis, especially as it is found that the Stegomyia fasciata, Fab. (or S. colopus, Meig.), after taking the blood from an infected patient is not infective immediately but only becomes capable of infecting by its bite at the end of twelve days. It would appear therefore that residence in this mosquito is necessary for the material to become infective. During this period some special metamorphosis may occur, and metamorphosis essential to the development of the parasite, or, on the other hand, the time may be required for it to make its way to some position from which it may emerge from the mosquito when that insect
PARASITIC DISEASES

"strikes." In the interval between the bite of an infected Stegomyia and the appearance of the disease (5 or 6 days) the blood of the patient contains a virus which, when taken into the mosquito, may develop into the infective material; moreover, this virus persists alive and active for three days after the disease is fully developed, but at the end of this time it disappears, so far as any rate, as its infective power is concerned, from the blood, secretions and tissues of the patient. Further, there is no evidence that the infective virus is ever transmitted directly from the patient in secretions or in fact in anything but blood or blood-serum. The infective material, then, is present in the human subject for about eight days, during which the blood and even the blood-serum may serve as a vehicle for the infective agent. If during this period the patient is bitten by the Stegomyia the mosquito cannot distribute the infection for twelve days, but after this the power of transmitting reinfection persists for weeks and even months during cold weather when the insect is torpid. As soon, however, as the warm weather comes round and the mosquito becomes active and again begins to bite there is evidence that it still maintains its power of transmitting infection; indeed Boyce states that mosquitoes infected in one year are capable of transmitting infection and starting a fresh epidemic in the following warm season. When it is remembered that a mosquito by a single bite is capable of setting up an attack of the disease, we see how important is this question.

The Stegomyia, known as the domestic or house mosquito, is spoken of as the "Tiger" mosquito, "Scott Grey," or "Black and White Mosquito." From the fact that there is a "a blue-shaded pattern in white on the back of the thorax, transverse white bands on the abdomen, and white spots on the sides of the thorax; while the legs have white bands with the last hind tarsal joint also white " (Boyce). It is also spoken of as the "cistern mosquito," as it breeds in the cisterns, barrels, water butts, &c., containing the only water-supply of many houses. It may pass through its various stages of development in any small vessels, but the larvae are not usually found in natural collections of water, such as gutters, pools or wells, if the ovipositing insect can gain access to cleaner and purer water.

The egg of the Stegomyia deposited on the water develops in from 10 to 20 hours into the larval form, the so-called "wiggle-waggle." It remains in this stage for from 1 to 8 days, then becomes a pupa, and within 48 hours becomes a fully developed mosquito. The larvae can only develop if they are left in water, though a very small amount of water will serve to keep them alive. The eggs on the other hand are very resistant, and even when removed from water may continue viable for as long a period as three months. The Stegomyia affects clean water-tanks and cisterns by preference. Consequently its presence is not confined to unhygienic districts; they may, however, "seek refuge for breeding purposes in the shallow street drains and wells in the town." The Stegomyia does not announce its advent and attack by a "ping" such as that made by the Anopheles, it works perfectly noiselessly and almost ceaselessly (from 3 p.m. to early morning) so that any human beings in its neighbourhood are not safe from its attacks either afternoon or night.

The most important prophylactic measures against the Stegomyia are ample mosquito-nets in every house, a gauge of eighteen meshes to the inch " (Boyce), so arranged that the person sleeping may not come near the net; these nets should be used not only at night but at the afternoon siesta. Then the living room should be screened against the entrance of these pests, thorough ventilation should be secured; and all pools and stagnant waters, especially in the neighbourhood of houses, should be drained, water-butts and cisterns should be screened and all stagnant waters oiled with kerosene or petroluem, where drainage is impossible.

What has been done through the carrying out of these and similar measures may be gathered from the record of the Panama Canal. In 1884 the French Panama Canal Company, employing from 15,000 to 18,000 men, lost by death 60 per 1000 annually (in 1883 over 70 per 1000). In 1904, when the Americans had taken over the work of construction, Col. W. C. Gorgas undertook to clear the country of the Stegomyia, and within two or three years yellow fever had been eradicated. The death-rate from malaria was also greatly diminished, and by the end of 1907 the death-rate per annum amongst 45,000 workers was only 13 per 1000. In 1909 the insects were eradicated in many large English towns. Similar examples might be cited from other places, but the above is sufficiently striking to carry conviction that the methods employed in carrying on the warfare against tropical diseases have been attended with unexampled success. These diseases, at one time so greatly feared, are now so much under control that some one has said "ere long we shall be sending our patients to the tropics in search of a health resort."

WELL's disease, a disease which may be considered along with acute yellow atrophy and yellow fever, is one in which there is an acute febrile condition, associated with jaundice, inflammation of the kidney and enlargement of the spleen. It appears to be a toxic condition of a less acute character, however, than the other two, in which the functions and structure of the liver and kidney are specially interfered with. There is a marked affection of the gastro-intestinal system, and the nervous system is also in some cases profoundly involved. Haemorrhage into the mucous and serous membranes is a marked feature. The liver cells and kidney epithelium undergo fatty changes, though in the earlier stages there is a cloudy swelling, probably also toxic in origin. Organisms of the Pustuloid group, which appear to have the power, in these instances, of forming toxic substances in larger quantities than can be readily destroyed by the liver, and which then make their appearance in the kidney and spleen, are supposed to be the cause of this condition.

Diphtheria.—In regard to no disease has medical opinion undergone greater modification than it has in respect of diphtheria. Accurately applied, bacteriology has here gained one of its greatest triumphs. Not only have the aetiology and diagnosis of this disease been made clear, but knowledge acquired in connexion with the production of the disease has been applied to a most successful method of treatment. In 1875 Klebs described a small bacillus with rounded ends, and with, here and there, small clear unstained spaces in its substance. He, however, also described streptococci as present in certain cases of diphtheria, and concluded that there must be two kinds of diphtheria, one associated with each of these organisms.

In 1883 he again took up the question; and in the following year Loeffler gave a systematic description of what is now known as the Klebs-Loeffler bacillus, which was afterwards proved by Roux and Yersin and many other observers to be the causa causans of diphtheria. This bacillus is a slightly-curved rod with rounded, pointed, or club-shaped end or ends (see Plate II, fig. 0). It is usually from 1-2 to 54u or more in length and from 0-3 to 0-5u in breadth; rarely it may be considerably larger; it is usually branching, but otherwise it is of the great variety of form, according to the age of the culture and the nature of the medium upon which it is growing. It is stained by Gram's method if the decolorizing process be not too prolonged, and also by Loeffler's methylene-blue method. Except in the very young forms, it is readily recognizable by a series of transverse alternate stained and unstained bands. The bacillus may be wedge-shaped, spindle-shaped, comma-shaped or ovoid. In the shorter forms the polar staining is usually well marked; in the longer bacilli, the transverse striation. Very characteristic club-shaped forms or branching filaments are met with in the culture of diphtheria bacilli from the secretions of the infective material. In what may be called the handle of the club the stained appearance is specially well marked. These specific bacilli are found in large numbers on the surface of the diphtheritic membrane (Plate II, fig. 10), and may easily be detached for bacteriological examination. In certain cases they may be found by direct microscopic examination, especially when they are stained by Gram's method, but it is far more easy to demonstrate their presence by the culture method. On Loeffler's special medium the bacilli flourish so well at body-temperature about 37°, that, like the other bacilli, they outgrow the other organisms present, and may be isolated in comparatively
pure culture. Distinct colonies may often be found as early as the eighth or twelfth hour of incubation; in from eighteen to twenty-four hours they appear as rounded, elevated, moderately translucent, greyish white colonies, with a yellow tinge, the surface moist and the margins slightly irregular or scalloped. They are thicker and somewhat more opaque in the centre. When the colonies are few and widely separated, each may grow to a considerable size, 4 to 5 mm.; but when more numerous and closer together, they remain small and almost invariably discrete, with distinct intervals between them. In older growths the colonies are marked and the emulsion more distinct, the moist, shiny appearance being lost. When the surface of the serum is dry, the growth, as a rule, does not attain any very large size.

These "pure" colonies, when sown in slightly alkaline broth, grow with great vigour; and if a small amount of such a 48 hours’ culture be injected under the skin of a guinea-pig, the animal succumbs, with a marked local reaction and distinct symptoms of toxic poisoning very similar to those met with in cases of diphtheria of the human subject. Roux and Yersin demonstrated that the poison was not contained in the bodies of the bacilli, but that it was formed and thrown out by them from and into the nutrient medium. Moreover, they could produce all the toxic symptoms, the local reactions, and even the paralytic symptoms which often follows the disease in the human subject, by injecting the culture from which they had previously removed the whole of the diphtheria bacilli by filtration. This cultivation, then, contains a poisonous material, which, incapable of multiplying in the tissues, may be given in carefully graduated doses. If, therefore, there is anything in the theory that tissues may be gradually "acclimatized" to the poisons of these toxic substances, they saw that it should be possible to prove in connection with this disease. Behring, going still further, found that the tissues so acclimatized have the power of producing a substance capable of neutralizing the toxin, a substance which, at first confined to the cells, when formed in large quantities overflows into the fluids of the blood, with which it is distributed throughout the body. The bulk of this toxin-neutralizing substance remains in the blood- serum after separation of the clot. In proof of this he showed that (1) if this serum be injected into an animal before it is inoculated with even more than a lethal dose of the diphtheria bacillus or its products, the animal remains perfectly well; (2) a certain quantity of this serum, mixed with diphtheria toxin and injected into a guinea-pig, gives rise to no ill effects; and (3) that even when injected some hours after the bacillus or its toxins, the serum is still capable of neutralizing the action of these substances. In these experiments we have the germ of the present antitoxic treatment which has so materially diminished the percentage mortality in diphtheria. This serum may also be used as a prophylactic agent.

The antitoxic serum as now used is prepared by injecting into the subcutaneous tissues of a horse the products of the diphtheria bacillus. The bacillus, grown in broth containing peptone and blood-serum or blood-plasma, is filtered and heated to a temperature of 68° or 70° C. for one hour. It then contains only a small amount of active toxin, but, by the time it has been passed through the kidneys, it becomes highly susceptible to the action of strong diphtheria toxins, and even induces the production of a considerable amount of antitoxin. This production of antitoxin, however, may be accelerated by subsequent repeated injections, with increasing doses of strong diphtheria toxin, which may be so powerful that ½ to 1 of a drop, or even less, is a fatal dose for a medium-sized guinea-pig. The antitoxic serum so prepared may contain 200, 400 to even more "units" of antitoxin per c.c.—the unit being that quantity of antitoxin that will far neutralize 100 lethal doses (a lethal dose is the smallest quantity that will kill a 250-gramme guinea-pig on the fifth to seventh day after injection). The serum of the guinea-pig, therefore, continues alive on the fifth day from the injection. This, however, is a purely arbitrary standard of neutralizing power, as it is found that, owing to the complicated structure of the toxin, the neutralizing and the lethal action of antitoxins do not always go hand in hand; but as the toxin used in testing the antitoxin is always compared with the original standard, accurate results are easily obtained.

Diphtheria, though still prevalent in cities, has now lost many of its terrors. In the large hospitals under the Metropolitan Asylums Board the death-rate fell from nearly 46% in 1889 to under 10% in 1903; and if antitoxin be given as soon as the disease manifests itself, the mortality is brought down to a very insignificant figure. It has been maintained that as soon as antitoxin came into use the number of cases of paralysis increased rather than diminished. This may be readily understood when it is borne in mind that many patients recover under the use of antitoxin who would undoubtedly have succumbed in the pre-antitoxin days; and it cannot be too strongly insisted that although the antitoxin introduced neutralizes the free toxin and prevents its further action on the tissues, it cannot entirely neutralize that which is already acting on the cells, nor can it make good damage already done before it is injected. Even allowing that antitoxin is not accountable for the whole of the improvement in the percentage mortality statistics since 1896, it has undoubtedly accounted for a very large proportion of recoveries. Antitoxin often cuts short functional albuminuria, but it cannot repair damage already done to the renal epithelium before the antitoxin was given. The clinical evidence of the value of antitoxin in the relief that it affords to the patient is even more important than that derived from the consideration of statistics.

The diphtheria bacillus or its poison acts locally as a caustic and irritant, and generally or constitutionally as a proteoplastic poison, the most evident lesions produced by it being degeneration of nerves and muscles, and, in acute cases, changes in the walls of the blood-vessels. For the organism to be acclimatized in the body, it would seem that the organism, once present, may undoubtedly increase the mortality by producing secondary complications, which end in suppuration. Diphtheria bacilli may also be found in pus, as in the discharges from cases of other suppuring ulcers.

Tetanus (Lockjaw).—Although tetanus was one of the later diseases to which a definite micro-organismal origin could be assigned, it has long been looked upon as a disease typical of the "septic" group. In 1885 Nicolier described an organism multiplying outside the body and capable of setting up tetanus, but this was only obtained in pure culture by Kitasato, a Japanese, and by the Italians in 1889. It has a very characteristic series of appearances at different stages of its development. First it grows as long, very slender threads, which rapidly break up into shorter sections from 4 to 54 in length (see Plate II. fig. 11). In these shorter rods spores may appear on the second or up to the seventh day, according to the temperature at which the growth occurs. The rods then assume a very characteristic pinworm form; they are non-motile, are somewhat rounded at the ends, and at one end the spore, which is of greater diameter than the rod, causes a very considerable expansion. Before sporulation the organisms are distinctly motile, occurring in rods of different lengths, in most cases surrounded by bundles of beautiful flagella, which at a later stage are thrown off, the presence of flagella corresponding very closely with the "motile" period. The bacillus grows best at the temperature of the body; it becomes inactive at 14° C. at the one extreme, and at from 42° to 43° C. at the other; in the latter case involution forms, clubs and branching and degenerated forms, often make their appearance. It is killed by exposure for an hour to a temperature of from 60° to 65° C.; the spores however are very resistant to the action of heat, as they withstand the temperature of boiling water for several minutes. The organism has been found in garden earth, in the excrement of animals—horses—and in dust taken from the streets or from living-rooms, especially when it has been allowed to remain at rest for a considerable period. It has also been demonstrated in, and separated from the pus of wounds (see Plate II. fig. 12) in patients suffering from lockjaw, though it is then invariably found associated with the micro-organisms that give rise to suppuration.

It is important to remember that this bacillus is a strict anaerobe, and can only grow when free oxygen has been removed from the cultivation medium. It may be cultivated in gelatine to which has been added from 2 to 3% of grape-sugar, when, along the line of the stab culture, it forms a delicate growth, almost like a frizzle, the spores being observed in the small cleavage. The most luxuriant growth—evidenced by the longest branches—occurs in the depth of the gelatine away from free oxygen. After a time the
it does not give very satisfactory results when it is injected after
tetanic symptoms have made their appearance. It would
appear that in such cases the tetanus poison has become too
firmly bound up with the protoplasm of the nerve cells, and has
already done a considerable amount of damage.

(b) More Chronic Infective Diseases (Tissue Parasites).

Tuberculosis.—In no quarter of the field of preventive medicine
have more important results accrued from the discovery of a
specific infective organism than in the case of Koch's demon-
stration and separation in pure culture of the tubercle bacillus
and the association of this bacillus with the transmission of
tuberculosis. In connexion with diagnosis—both directly from
observation of the organism in the sputum and urine of tuber-
culous patients, and indirectly through the tuberculin test,
especially on animals—this discovery has been of very great
importance; and through a study of the life-history of the bacillus
and its relation to animal tissues much has been learned as to
the prevention of tuberculosis, and something even as to
methods of treatment. One of the great difficulties met with
in the earlier periods of the study of this organism was its slow,
though persistent, growth. At first cultivations in fluid media
were not kept sufficiently long under observation to allow of its
growth; it was exceedingly difficult to obtain pure cultures, and
then to keep them, and in impure cultures the tubercle bacilli
were rapidly overgrown. Taken directly from the body, they
do not grow on most of the ordinary media, and it was only
when Koch used solidified blood-serum that he succeeded in
obtaining pure cultures. Though they may now be demonstrated
by what appear to be very simple methods, before these methods
were devised it was practically impossible to obtain any satis-
factory results.

The principle involved in the staining of the tubercle bacillus is
that when once it has taken up fuchsin, or gentian violet, it
retains the stain much more firmly than do most organisms and
tissues, so that if a specimen be thoroughly stained with fuchsin
and then decolorized by a mineral acid—25% of sulphuric acid,
say—although the colour is washed out of the tissues and most
other organisms, the tubercle bacilli retain it; and even after
the section has been stained with methylene-blue, to bring the
other tissues and organisms into view, these bacilli still remain
bright red, and stand out prominently on a blue background.
If a small fragment of tuberculous tissue be pounded in a sterile
mottar and smeared over the surface of inspissated blood-serum
solidated at a comparatively low temperature, and if evaporation
be prevented, dry scaly growths make their appearance at the
end of some fourteen days. If these be re-inoculated through
several generations, they ultimately assume a more saprophytic
character, and will grow in broth containing 5% of glycerin, or
on a peptone beef-agar to which a similar quantity of glycerin
has been added. On these media the tubercle bacillus grows
more luxuriantly, though after a time its virulence appears to be
diminished. On blood-serum its virulence is preserved for long
periods if successive cultivations be made. It occurs in the
tissues or in cultivations as a delicate red or thread 1'5 to 3·5μ in
length and about 0·2 to 0·5μ in thickness (see Plate II., fig. 15).
It is usually slightly curved, and two rods may be arranged end
to end at an open angle. There is some doubt as to whether tubercle
bacilli contain spores, but little masses of deeply-stained proto-
plasm can be seen, alternating with clear spaces within the
sheath; these clear spaces have been held to be spores. This
organism is found in the lungs and sputum in various forms of
consumption; it is met with in tuberculous ulcers of the intestine,
in the lymph spaces around the vessels in tuberculous meningitis,
in tuberculous nodules in all parts of the body, and in tuberculous
disease of the skin—lupus. It is found also in the tuberculous
lesions of animals; in the throat-glands, tonsils, spleen and bones
of the pig; in the spleen of the horse; and in the lungs and pleura
of the cow. Tuberculosis may be produced artificially by inject-
ing the tubercle bacillus into animals, some being much more
susceptible than others. Milk drawn from an animal in which there
are breaking-down tuberculous foci, may contain an enormous
number of active tubercle bacilli; and pigs fed upon this milk develop a typical tuberculosis, commencing in the glands of the throat, which can be traced from point to point, with the utmost precision. It must be assumed that what takes place in the pig may also take place in the human subject; and a sufficient number of cases are now on record to show that the swallowing of tuberculous material is a cause of tuberculosis, especially amongst children, and probably also in adults. Inhaling dust or air containing bacilli is also a mode of acquiring the disease, milk derived from tuberculous udders, may set up tuberculosis of the lungs or of the alimentary tract, especially when the epithelial layer is unhealthy or imperfect. The two main causes of the prevalence of tuberculosis in the human subject are: (1) tubercle bacilli may become so modified that they can flourish saprophytically; as yet it has not been possible to trace the exact conditions under which they live, but we are gradually coming to recognize that, although when they come from the body they are almost obligate parasites, they may gradually acquire saprophytic characters. (2) Many of the domestic animals are readily infected with tuberculosis, and in turn may become additional centres from which infection may radiate.

Koch's tuberculin has been of inestimable value in the early diagnosis of tuberculosis, especially in animals.

Tuberculin, from which the tuberculin test derives its name, consists of the products of the tubercle bacillus when grown for a month or six weeks in peptone meat-broth to which a small proportion of glycerine or carbolic acid has been added. The tubercle bacilli are then killed at boiling-temperature, and are partially removed by sedimentation, and completely by filtration through a Berkefeld or Pasteur-Chamberland filter. If the filtrate is then allowed to be injected under the skin of a healthy man or brute, it is possible to produce some local swelling and to induce a rise of temperature; but in a similar patient suffering from tuberculosis a very much stronger reaction sets in. The degree of reaction (or the amount of swelling produced) is of considerable importance, the slightest degree is sufficient to bring about the characteristic swelling and rise of temperature. To obtain trustworthy results the dosage must always be carefully attended to. The reaction is only obtained when certain conditions are fulfilled. In healthy animals seldom, if ever, react properly. Cattle to be tested should be allowed to remain at rest for some time; they should be well fed, and be carefully protected from cold or draughts. After an injection of tuberculin into the subcutaneous tissues (usually in front of the shoulder or on the chest-wall) they should be kept under the same conditions and should be watched very carefully; the temperature remains at this point below 100°, but rises after about one hour, and afterwards up to the twenty-first or even twenty-fourth hour. If during this time the temperature rises to 103° F., there can be little doubt that the animal is tuberculous; but if it remains under 103°, the reaction is negative. The eighth or twelfth hour after injection of the temperature remains at this point below 100°, but rises after about one hour, and afterwards up to the twenty-first or even twenty-fourth hour. It is interesting to note that the test is not trustworthy in the case of the lap-dog, in which the body-temperature is always very high—108° F. In such cases, however, it is an easy matter to diagnose the disease by the ordinary clinical methods. It is, however, a fact that a few hours before the temperature rises to 103° or 104° F., there are some evidence, if not of the disease, then at least of some swelling and tenderness, with perhaps redness at the seat of injection, whilst there is also some evidence of a vascular congestion in the neighbourhood of any tuberculous lesion. A second method of viewing the question is, that in the healthy animal who, after diluting old tuberculin with two parts of normal saline solution and one part of 5% carbolic glycrrine, places a drop of the mixture on the conjunctiva of one eye, the glycrrine drops away from the epidermis in lines with "a small dental burr." This test may be repeated on the other eye, and other parts of the body. In the healthy animal, the glycrrine will again show a marked positive reaction, but in the tuberculous animal, the reaction will be negative. A third method is to place a piece of moist cotton wool on the conjunctiva of the eye, the cotton wool being moistened with tuberculin, and then in the tuberculous animal the cotton wool becomes reddened. This test must be applied to the eye of the patient at least two hours after the glycrrine has been placed on the conjunctiva; if the reaction is negative, it is possible that the tubercle bacilli have been killed by the glycrrine, or that the animal is not tuberculous. It is, however, of great importance to keep the glycrrine from the conjunctiva for at least two hours. In the healthy animal, the glycrrine will turn the cotton wool red.
exerts this action upon the bacillus. The opsonic index is obtained by counting the number of bacilli taken up by, say, 100 leucocytes, to which the serum from a tuberculous patient has been added, with the number of bacilli taken up by a hundred similar corpuscles to which normal serum has been added, the ratio being given as the opsonic index. Wright maintains that after the injection of small doses of tuberculin during a negative phase which first appears, i.e., whilst there is a fall in the temperature, of bacillus, the opsonic index of the patient is more susceptible than before to the attacks of the tubercule bacillus. Following this, however, there is a gradual rise in the opsonic index until it passes the normal and the patient enters a positive phase during which the liability of the bacillus is considerably diminished. When the effects of this dose are passing off a fresh injection should be made; this again induces a negative phase which may be utilized to exhibit the positive phase which should be still more marked than that first obtained. If this can be repeated systematically and regularly the patient should become immune, and the difficulties involved in the determination of the opsonic index are, however, exceedingly great, and the personal factor enters so largely into the question that some observers are very doubtful as to the practical utility of the method. In Wright's hands, however, and in the hands of those who work with him, very satisfactory results are obtained.

The tuberculin treatment, fortunately, does not stand or fall by the success of the opsonic index determination, especially when an effort is made to determine the character of the bacillus, and the effects of the tuberculin may be obtained by a study of the daily temperature chart and of the general condition of the patient. It is, however, to be hoped that in the future a negative phase will be observed more frequently than about once in 10 or 14 days, and it is well not to increase the dose too rapidly. Wherever the degree continues high, even a degree beyond normal, and where the pulse is over 100, it is not wise to give treatment until this has been lowered to normal. If the disease is making rapid headway or has become generalized, especially where there is meningitis or bleeding from the lungs.

It is interesting to note, in connexion with the diagnostic significance of the opsonic index, that in non-tuberculous subjects the administration of a small dose of tuberculin is followed by no negative phase such as is met with in the tuberculous subject. The phagocytic power of the white blood corpuscles is determined by noting the number of organisms taken up by the leucocytes when mixed with equal parts of a standard emulsion of tubercle bacilli and the number of bacilli which remain in the serum. If the organisms are more than 1 in 5, the index is determined as 1:5 or 2:5, or whatever the ratio happens to be. The phagocytic power of the normal subject is usually far greater than this; the results are irregular, whilst if the period is longer so many organisms are taken up that it becomes impossible to differentiate two sets of sera.

As an example we may adduce the following. Taking a tuberculous patient's serum + leucocytes + tubercle bacilli, let us say we have an average of 1:8 bacilli per leucocyte in 50 or 100 leucocytes counted; with normal serum + corpuscles + tubercle bacilli, the average number of bacilli per leucocyte in the same number of cells counted is 3. From these figures the opsonic index obtained is 1:8 + 3 = 0:6 = opsonic index.

Leprosy.—Armauer Hansen in 1873, and Neisser in 1887, described a bacillus corresponding in size and in certain points of staining reaction to the tubercle bacillus, and it is now generally accepted that this bacillus is the direct and specific causal agent of leprosy. The discovery of this organism paved the way for the proof that the tubercular and anaesthetic forms of leprosy are essentially the same disease, or rather are the manifestations of the action of a common organism attacking different series of tissues.

To demonstrate the presence of the leprosy bacillus, tie an indiarubber ring firmly around the base of one of the leprosy tubercles. As soon as the blood is driven out, leaving the membrane intact, put the point of a sharp knife from this puncture a clear fluid exudes; this, dried on a cover-glass, stained with carbol-fuchsin, and rapidly decolorized with a weak mineral acid, shows bacilli stained red and very like tubercle bacilli; they differ from that organism, however, in that they are somewhat shorter, and that if the acid be too strong or be allowed to act on them for too long a time, the colour is discharged from them much more readily. These organisms, which are from 4 to 6μ in length and 0-5μ in breadth, are as a rule more rigid and more pointed than are the tubercle bacilli (see Plate II., fig. 16). They are found in large numbers lying embedded in a kind of gelatinous substance in the lymphatics of the skin, in certain cells of which they appear to be taken up.

It is curious that these bacilli affect specially the skin and nerves, but rarely the lungs and serous membranes, though being in sharp contrast to the tubercle bacillus, which affects the latter very frequently and the former very rarely. They are seldom found in the blood, though they have been described as occurring there in the later stages of the disease. It is stated that leprosy has been inoculated directly into the human subject, the patient dying some five or six years after inoculation; but up to the present no pure culture of the leprosy bacillus has been obtained; it has therefore been impossible to produce the disease by the inoculation of the bacillus alone. What evidence we have at our disposal, however, is all in favour of the transmissibility of the disease from patient to patient and through the agency of the leprosy bacillus. None of the numerous non-bacillary theories of leprosy account at all satisfactorily for this transmissibility of the disease, for instance, the hypothesis that a series of histological changes that are met with in various parts and organs of the leprous body. Leprosy occurs in all climates. It is found where no fish diet can be obtained, and where pork and rice are never used, though to these substances has been assigned the power of giving rise to the disease. Locality appears to influence it but little, and with improved sanitation and increased cleanliness it is being gradually eradicated. The only factor that is common in all forms of leprosy, and is met with in every case, is the specific bacillus; and in spite of the fact that it has not yet been found in the blood, though it has been described as occurring there in the later stages of the disease, we must from what is known of the presence and action of bacilli, in other diseases, especially in tuberculosis, assign to the leprosy bacillus the rôle of leprosy-producer, until much stronger evidence than has yet been obtained can be brought forward in favour of any of the numerous other causes that have been assigned. Two cases are recorded in which people have contracted leprosy from pricking their fingers with needles whilst sewing a leper's clothes; and a man who had never been out of Dublin is said to have contracted the disease by sleeping with his brother, a soldier who had returned from India suffering from leprosy.

A great deal of work has been done with the animals, the disease experimentally produced in animals with material from a glandered animal, and as there is no pathological distinction between the two, from the aetiological standpoint, they may be considered together. If the pus from a glanders abscess be mixed with a little sterile saline solution and spread over the cut surface of a boiled potato kept at the body-temperature, bright yellow or honey-coloured, thick, moist-looking colonies grow very rapidly and luxuriantly. These colonies gradually become darker in colour, until they assume a café-au-lait, or even a chocolate, tint. On examining one of them microscopically, it is found to be a mere mass of bacillus 2 to 3 long and 1 to 2 wide of their own length broad (see Plate I., figs. 2 and 6). The bacillus is usually straight or slightly curved and rounded at one end; it appears to be non-motile. As first pointed out by Loeffer and Schütz, when a portion of a culture is inoculated subcutaneously, typical farcy, with the acute septicaemia or blood-poisoning so characteristic of certain cases of glanders and farcy, is the result. The human subject is usually inoculated through wounds or scratches, or through the application of the nasal discharge of a glandered animal to the mucous membrane of the nose or mouth. More particularly is it brought into contact with the glands virus, but as it is not known how the animal becomes infected it is not known whether the glanders virus is transmitted from man to animal or vice versa. The disease occurs more frequently in horses than in any other animal. There is no clinical indication of the nature of the disease, nor is there a shape or size recognition of the disease in progress. Horses may die from it, though it is not known how many die or how long they survive. The disease is not known to be communicable to man.
rapidly fatal form. The glanders organism soon loses its virulence and even its vitality. Dry, it dies in about ten days; placed in distilled water, in about five days; but kept moist, or on culture media, it retains its vitality for about a month, although its activity soon becomes considerably lessened. These bacilli are readily killed at a temperature of 55° C; they can pass through the kidneys, even when there is no lesion to be made out either with the naked eye or under the microscope (Sherrington and Bonome).

The glanders bacillus grows best in the presence of oxygen, but it may grow anaerobically; it then appears to have the power of forming toxin, either more in quantity or of greater activity than when it has access to a free supply of oxygen. This poison (mallein) is used for the purpose of diagnosing the presence of glanders. A cultivation is made on peptonized bouillon to which a small portion of glycerin has been added. The bacillus is allowed to grow and multiply at the temperature of the body for a month or six weeks; the organisms are then killed by heat and 0.5% carboic acid is added. The cultivation is then filtered through a porcelain filter in order to remove the bodies of the bacilli, and the resulting fluid, clear and amber-coloured, should have the power, when injected in quantities of 1 c.c., of giving the specific reaction in an animal suffering from glanders; in a healthy animal 6 c.c. will give no reaction. The suspected animal should be kept at rest and in a warm stable for twenty-four to forty-eight hours before the test is applied. The temperature should be normal, as no proper reaction is obtained in an animal in which the temperature is high. This reaction, which is a very definite one, consists in a rise of temperature of from 3° to 4° F, and the appearance of a swelling of from 3 to 4 in. in diameter and from 1 to 1½ in. in height, before the sixteenth or eighteenth hour; this swelling should continue to increase for some hours. It has been suggested that the injection of ½ to 1½ c.c. of mallein, at intervals of two or three days, may be used with advantage in the treatment of glanders. Glandered horses seem to improve under this treatment, and then certainly do not react even to much larger doses of mallein. The mallein test has revealed the fact that glanders is a far more common and more widespread disease than was at one time supposed.

II.—To Higher Vegetable Parasites

Actinomycosis.—This disease is very prevalent in certain low-lying districts, especially amongst cattle, giving rise to the condition known as "scurma," "wooden tongue," "wens," "bony growths on the jaw," &c. It is characterized by the presence of a fungus, which, at first growing in the form of long slender threads that may be broken up into short rods and cocci, ultimately, as the result of a degenerative process, assumes the form of a "ray-fungus," in which a series of club-like rays are arranged around a large central area (see Plate I., fig. 8). It is probably a streptothrix—Streptothrix Försteri. Numerous cases have been observed in the human subject. Suppuration and the formation of fistulous openings, surrounded by exuberant granulations, "proud flesh," usually supervene where it is growing and multiplying in the tissues of the human body, and in the pus discharged are yellowish green or reddish brown points, each made up of a central irregular mycelium composed of short rods and spores, along with the clubs already mentioned. The mycelial threads may reach a considerable length (20 to 1000); some of them become thicker, and are thus differentiated from the rest; the peripheral club is the result of swelling of the sheath; the filaments nearer the centre of the mycelial mass contain spores, which measure from 1 to 2µ in diameter. This fungus appears to lead a saprophytic existence, but it has the power of living in the tissues of the animal body, to which it makes its way through or around carious or loose teeth, or through abrasions of the tongue or tonsils. After the above positions, the abdomen, especially near the veriform appendix, is a special seat of election, or in some cases the thorax, the lesions being traceable downwards from the neck. Any of the abdominal organs or glands may thus be invaded. The process spreads somewhat slowly, but once started may extend in any direction, its track being marked by the formation of a large quantity of fibrous tissue, often around a long fistula. In the more recent growths, and in solid organs, cavities of some size, containing a soft semi-purulent cheesy-looking material, may be found, this mass in some cases being surrounded by dense fibrous tissue. When once the sinus is formed the diagnosis is easy; but before this the disease, where tumours of considerable size are rapidly formed, may readily be mistaken for sarcoma, or when the lungs are affected, for tuberculosis, especially as bronchitis and pleuritic effusion are frequently associated with both actinomycosis and tuberculosis.

Mycetoma, the Madura foot of India, is a disease very similar to actinomycosis, and, like that disease, is produced by a somewhat characteristic streptothrix. It usually attacks the feet and legs, however, and appears to be the result of infection through injured tissues. Under certain conditions and in long-standing cases the fungus appears to become pigmented (black) and degenerated.

Other forms of fungus disease or Mycoses are described. Aspergillosis, or pigeon-breeders' disease, is the result of infection with the Aspergillus fumigatus. Certain tumours appear to be the result of the action of a yeast, Blastomycosis or Saccharomycosis. The spores of the Penicillium glaucum, and of some of the Mucors, are also said to have the power of setting up irritation, which may end in the formation of a so-called granuloma or granulation tissue tumour. These, however, are comparatively rare.

B.—Diseases due to Animal Parasites.

L.—To Protozoa

Malaria.—Following Laveran's discovery, in 1880, of a parasite in the blood of patients suffering from malaria, our knowledge of this and similar diseases has increased by leaps and bounds, and most important questions concerning tropical diseases have now been cleared up. Numerous observations have been carried out with the object of determining the parasitic forms found in different forms of malaria—the tertian, quartan, and aestivo-autumnal fever—in each of which, in the red blood corpuscles, a series of developmental stages of the parasite from a single, the transmutable amoebiform body may be followed. This small body first becomes lobulated, nucleated and pigmented; it then, after assuming a more or less marked rosette-shape with a deeply pigmented centre, breaks up into a series of small, rounded, hyaline masses of protoplasma, each of which has a central bright point. The number of these, contained in a kind of capsule, varies from 8 to 10 in the quartan, and from 12 to 20 in the tertian and aestivo-autumnal forms. There are certain differences in the arrangement of the pigment, which is present in larger quantities and distributed over a wider area in the somewhat larger parasites that are found in the tertian and aestivo-autumnal forms. In the quartan red blood corpuscles, the pigment is usually found in minute dots, dividing near the pole at the point of division of the organism, along with it in the earlier stages (see Plate I., fig. 5). Here, too, the rosette form is not so distinct as in the parasite of tertian fever, and in the latter is not so distinct as in the quartan parasites. These dividing forms make their appearance immediately before the onset of a malarial paroxysm, and their presence is diagnostic. The process of division goes on especially in the blood-forming organs, and is therefore met with more frequently in the spleen and in bone-marrow than in any other situation. The parasites, at certain stages of their development, may escape from the red blood corpuscles, in which case (especially when exposed to the air for a few minutes) they send out long processes of protoplasma and become very active, moving about in the plasma and between the corpuscles, sometimes losing their processes, which, however, continue in active movement. In the aestivo-autumnal fever curious crescent-shaped or ovoid bodies were amongst the first of the parasitic organisms described as occurring in the blood, in the red corpuscles of which they develop. Manson maintains that from these arise the flagellate forms, all of which, he thinks, are developed in order that the life of the malarial parasite may be continued outside the organism. It is probable that most of the pigment found in the organs taken from
malarial patients is derived from red blood corpuscles broken down by the malarial parasites; many of these, in turn, are devoured by leucocytes, which in malarial blood are usually greatly increased in number, and frequently contain much pigment, which they have obtained either directly from the fluid plasma or from the pigmented parasitic organism. The work recently carried out by Bruce on the tsetse-fly parasite, by A. J. Smith on Texas fever, and by W. S. Thayer and Hewitson on the blood parasites of birds, has opened up the way for the further study of the malarial parasites outside the human body. There can be no doubt as to the close relation of the multiplication and sporulation of the malarial parasite with the ague paroxysm: the anaemia results from the breaking down of blood corpuscles. Toxic substances are present in the blood during the setting free of the spores; of this we have proof in the increased toxicity of the urine during the paroxysmal stages of the disease; moreover necrotic areas, similar to those found in acute toxic fevers produced by other micro-organisms, are met with. It is well to bear in mind that the accumulation of debris of parasites and corpuscles in the capillaries may be an additional factor in this necrosis, especially when to this is added the impairment of nutrition necessarily involved by the impoverished condition of the malarial blood. It is interesting to note that, although, as pointed out by Nuttall, the Italian and Tirolean peasantry have long been firmly of the opinion that malaria is transmitted through the mosquito, and although the American, Dr Josiah Nott, in 1838 referred to malaria as if the mosquito theory had already been advanced, little attention was given to this question by contemporaneous observers. Still earlier, Rasori (in 1816) had stated that "for many years I have held the opinion that intermittent fevers are produced by parasites, which renew the paroxysm by the act of their reproduction, which recurs more or less rapidly according to the well-constituted reference to this subject. Nuttall, who gives an excellent summary of the literature on the mosquito hypothesis of malaria, assigns to King the honour of again drawing attention to this question. Laveran in 1891, Koch in 1892, Manson in 1894, Bignami and Mendini in 1896, and Grassi in 1898, all turned their attention to this hypothesis. Manson, basing his hypothesis upon what he had observed as regards the transmission of Filaria by the mosquito, suggested a series of experiments to Major Ronald Ross. These were carried out in 1895, when it was found that in mosquitoes that had taken up blood containing ameboïd parasites, crescents, which were first described as cells, appeared in the stomach-wall after four or five days; these contained a number of stationary vacuoles and pigment granules, ten to twenty in number, bunched together or distributed in lines. Grassi, Bignami and Bastianelli confirm and supplement Ross's observations; they find that Anopheles daviger, taking the blood from a patient suffering from malaria, soon develops haemoplasmodia in the intestine. These parasites are then found between the muscular fibres of the stomach; they increase in size, become pigmented, and more and more vacuolated, until they project into the body-cavity. On the sixth day these large spheres contain an enormous number of minute bodies, refractive droplets like fat, and a diminishing amount of pigment. On the seventh day numerous filaments, arranged in rows around several foci, are seen. They are very delicate, are stained with difficulty, and appear to be perfectly independent of each other, though grouped within a capsule. After the seventh day the refractile, thread-like "sporozoites," escaping into the body-cavity, gradually make their way to and accumulate in the cells or tubules of the salivary glands, whence their passage through the proboscis into the human blood is easily understood.

Thus two phases or cycles of existence have been demonstrated—one within the human body, the second in the mosquito.

Development of the Malarial Parasite. That within the human body appears to be capable of going on almost indefinitely as long as the patient lives, but that in the mosquito appears to be an offshoot or an intermediate stage. The minute specks of protozoan, the amebobacule, which have already been described as occurring in the red blood corpuscles of the higher animals, increase in size, take up blood pigment, probably from the red corpuscles, and then become developed into sporocytes or gametocytes. The sporocyte is the form which, remaining in the body, ultimately breaks up, as already seen, into a series of minute spores or amoebacules, which in turn go through the same cycle again, increasing in size and forming spores, and so on indefinitely. Gametocytes (the true sexual form) are in certain species, to outward appearance, very similar to the sporocyte, but in others they assume the crescentic shape, and can thus be recognized. The male cell resembles the female cell very closely, except that the protoplasm is hyaline and homogeneous-looking, whilst that of the female cell is granular. It has already been noted that when the blood is withdrawn from the body certain of the malarial parasites become flagellated. These flagella may be looked upon as sperm elements, which, forming in the male gametocyte, are extruded from that cell, and, once set free, seek out the granular female gametocyte. A single flagellum becomes attached to a small projection that appears on the female cell; it then makes its way into the protoplasm of the female cell, in which rapid streaming movements are then developed. In certain species the female cell is somewhat elongated, and may be peculiarly constricted. It becomes motile, and appears to have the power of piercing the tissues. In this way the first stages of development in the mosquito are passed. The gametocytes, taken along with the blood into the stomach of this insect, pass through the various phases above mentioned, though the zygote form of the human malarial parasite has not yet been found. After the mosquito becomes infected its ordinary malarial parasite may be demonstrated without any difficulty at the end of a week or ten days, and the cycle recommences.

This theory, now no longer a hypothesis, in which the mosquito acts as an intermediary host for one stage of the parasite and transmits the parasite to man, affords an explanation of many apparently anomalous conditions associated with the transmission of malaria, whilst it harmonizes with many facts which, though frequently observed, were very difficult of explanation. Malaria was supposed to be associated with watery exhalations and with the fall of dew; but a wall or a row of trees was seemingly quite sufficient to prevent the passage of infection. It was met with on wet soils, on broken ground, in marshes, swamps and jungles; on the other hand, it was supposed to be due to the poisonous exhalations from rocks. All this is now explained by the fact that these are the positions in which mosquitoes occur: wherever there are stagnant pools, even of a temporary nature, mosquitoes may breed. It has been observed that although the malarial "miasma" never produces any ill effects in patients living at more than a few feet from the surface of the ground, malaria may be found at a height of from 7000 to 9000 ft. above sea-level; and the fact that a belt of trees or a wall will stop the passage of the poison is readily explicable on the mosquito theory. These insects are incapable, owing to their limited power of flight, of rising more than a few feet from the ground, and cannot make their way through a belt of trees of even moderate thickness. Broken ground, such as is found in connexion with railway cuttings and canals, may be a focus from which malaria may spread. In such broken ground pools are of common occurrence, and afford the conditions for the development of the mosquito, and infected tools used in one area may easily convey the ova to another. All these facts afford further support of this theory. The conditions of climate under which malaria is most rife are those which are most suitable for the development of the mosquito. The protection afforded by fires, the recognized value of mosquito curtains, the simultaneous disappearance of Anopheles and malaria on the complete draining of a neighbourhood, the coincidence of malaria and mosquitoes, and the protection afforded by large expanses of water near walls and trees are also important in this connexion.

The mosquitoes specially associated with the transmission of malaria in the human subject belong apparently to the genus...
Anopheles. Anopheles claviger (maculipennis) and Anopheles bifurcatus both are found in Great Britain; Anopheles pictus is another species found in Europe, but so far not in Great Britain. A member of the genus Culex, the grey mosquito or Culex fatigans, is the intermediate host of the protozoa of birds, on which most of the intermediate phases of the life-history of these parasites have been studied. Ross describes a dappled-wing mosquito as the one with which he performed his experiments on birds in India. Anopheles claviger is interesting in view of the former prevalence of malaria in Great Britain.

The remedy for malaria appears to be the removal or spoiling of the breeding grounds of the mosquito, thorough drainage of pools and puddles, or, where this cannot be easily effected, the throwing of a certain amount of kerosene on the surface of these pools (Nuttall).

Amoebic Dysentery.—In addition to the dysentery set up by bacteria, a form—amoebic dysentery or amoebic enteritis—has been described which is said to be due to an animal parasite, and it has been proposed to separate the various types of dysentery according to their aetiology, in which case the amoebic group is probably more specific than any other. The amoeba (Amoeba dysenteriae, Entamoeba histolytica, of Schaudinn) is supposed to give rise to this condition was first described by Lüsch in 1875. Since then this amoeba has been described either as a harmless parasite or as a cause of dysentery in Europe, Africa, the United States and in Brazil, and more recently in India. This organism, which is usually placed amongst the rhizopods, consists of a small vacuolated eukaryotic cell, the homogeneous ectoplasm, varying in size from 6 to 30μ, though, as Lefleur points out, these limits are seldom reached, the organism being usually from one and a half to three times the diameter of a leukocyte—from 12 to 26μ (see Plate II, fig. 15). Its margins are well defined, and the body appears to consist of a granular inner portion and a homogeneous outer portion, the latter being somewhat lighter in colour than the inner; in the resting stage this division cannot be made out. The organism appears to pass through at least two phases, one corresponding to a cystic, the other to an ameboid, stage. In the latter stage, if the organism is examined on a warm stage, it is seen to send out processes, and, as in other amoebae, vacuoles may be seen as clear spaces lying in the granular and darker-coloured inner protoplasm. In the small vacuoles a deeply stained point may be seen. These vacuoles may be extruded through the ectoplasm. In some cases the vacuoles are so numerous that they occupy the whole of the space usually occupied by the granular protoplasm, and are merely surrounded by a zone of variable thickness, which "has the appearance of finely granular glass of a distinctly pale green tint" (Lefleur). In the cystic stage a nucleus which appears amongst the vacuoles may be made out, usually towards one side of the amoeba. This nucleus is of considerable size, i.e. nearly as large as a red blood corpuscle, and is readily distinguishable from the surrounding protoplasm. When stained by the Bendall method (safranin and light green) a more deeply staining nucleus may be seen in the nucleus. The nucleus is perhaps best seen when stained by this method, but it is always difficult to obtain well-stained specimens of this organism. If these amoebae can be kept under observation for some time evidence of amitotic division may sometimes be seen. Red blood corpuscles are often engulfed by this amoeba, as are also micrococcii and bacillii. The movements of the amoeba are most active at a temperature of about 30° to 40° C. From the fact that pigment is contained in a small rounded portion of the history of these parasites, it is supposed that they take in the red blood corpuscles as nutritive material, and that other substances may be taken in to serve a similar purpose. Nothing is known of the method of multiplication of the amoeba, but it is supposed that it may be both by fission and by spore formation. These organisms are present in the early stage of the acute disease, and disappear at the later stages. Perhaps of some importance is the fact that the abscesses found in the liver and lung, which occur so frequently in cases of dysentery, usually contain, especially in the portions immediately adjoining the suppurating mass, a considerable number of these amoebae. In the very small abscesses the amoebae are numerous and active, and occupy the capillaries in the tissues. It is quite possible that this plugging of the capillaries with amoebae is the cause both of the haemorrhages and of the small areas of necrosed tissue, the supply of nutrition being cut off from the liver cells and from the long tissues, and that suppuration occurs only at the base of the abscess, though Councilman and Lefleur maintain that the amoeba itself is the primary cause of suppuration. It is possible, of course, that the suppuration is due to the action of pus-forming organisms conveyed along with, or following, the amoeba, as we know that the growth of suppurating organisms can go on in dead tissues when these organisms have no chance of surviving in the healthy tissues and fluids of the body. Lefleur holds that the amoeba forms a toxic substance which exerts a direct devitalizing effect on the liver cells, and that the amoeba itself causes suppuration. The amoeba is in the lung, which invariably extend directly from the liver and occur at the base of the right lung, also contain these amoebae. For these reasons this organism is looked upon as the cause of dysentery and of certain forms of dysenteric abscess.

They differ from the Entamoeba coli—often met with in the intestine—which has a more distinct nucleus containing larger chromatin masses and is surrounded by a highly refractile nuclear membrane. Further, in the Entamoeba coli the cytoplasm is of the same character throughout, there being no differentiation into ectoplasm and endoplasm. The Entamoeba histolytica is often met with in a "resting phase," in which the nucleus is less distinctly marked, and may consist of small loops or short threads of chromatin. It is almost without endoplasm, the cells being covered with small buds forming on the surface. Around each of these buds, three, four or more, a highly refractile cyst wall is formed, and the cysts becoming separated from the rest of the cell, the remnant of which undergoes disintegration. These cysts are extremely resistant, and probably maintain the continuity of the species outside the body.

In the active phase, the amoeboid form appears able by its tough membranous pseudopodia to push its way into the mucous membrane of the large intestine, especially the rectum, the lower part of the ileum and the flexures. Once it is ensconced in these tissues, small soft oedematous looking swellings soon appear on the mucous surface. Marshall points out that the amoeba probably reach the liver by the portal circulation from the dysenteric lesions in which the amoeba are found. Other observers maintain that the amoeba may pass through the walls of the intestine, through the peritoneal cavity, and so on to the liver where they give rise to typical abscesses.

Syphilis.—It has long been recognized that syphilis is a specific infective disease, but although characterized by fever, anaemia, and increased growths of tissue followed by rapid degeneration and ulceration of tissue, it is only within quite recent years that a definite parasitic organism, present in all cases of typical syphilis, has been isolated and studied. Schaudinn and Hoffmann, followed by Metchnikoff and others, have described as constant occurrence a spiral or screw-shaped organism in which are seen from half a dozen to a dozen well-defined, short, regular, almost semicircular curves. This organism, when examined fresh, in normal or physiological salt solution, exhibits active screw-like movements as it rotates along its long axis; from time to time it becomes more or less bow-shaped and then straightens out, the while moving about from point to point in the field of the microscope. It is not very strongly refractile, and can only be examined properly with the aid of special central illumination and in the presence of minute particles, by the movements of which the organism is more readily traced.

In order to obtain this organism for demonstration it is a good plan to wash the primary or secondary syphilitic sore thoroughly with alcohol; some of the clear fluid is then collected on a cover-glass; or, perhaps better still, the lymphatic gland nearest to one must be examined with a hypodermic needle, the fluid being driven out on to a slide on which some normal saline solution has been placed. When the organism has been examined alive the film may be carefully dried and then stained by Giemsa's
PARASITIC DISEASES

modification of the Romanowsky stain (see Plate I., fig. 1). This stain, which may be obtained ready prepared from Grüber, of Leipzig, under the designation "Giemsa'sche Kdla-Dzar Färber," is made as follows: Azur II.-eosin compound, 3 gms., and Azur II.-o.e. gm., are mixed and dried thoroughly in the oven. The azur is then dissolved in 10 ml. of an alcohol of 90% strength, the distilled water has been added, and the mixture is allowed to stand for twenty-four hours and filtered. The solution, now ready for use, should be kept in a yellow glass vessel and covered, and it is advisable to discard 1 drop of this stain. Stain for from a quarter to three-quarters of an hour. Wash in running water, blot, dry, and mount in Canada balsam. Longer exposure to the action of a more dilute Giemsa fluid gives better results.

The stained organisms may be seen as delicate, reddish, regular spirals with pointed extremities. They usually measure from 4 to 1 μ in length, though they may reach 18 or 22 μ; the breadth is about 0.15 μ. In a section of the liver from a case of conglutinous spilifil an enormous number of these spirochaetes may be found. Stain by Levaditi's method as follows: Fix fragments of tissue for 15 min. in 10% formalin soln. for twenty-four hours. Rinse in distilled water and harden in 96% alcohol for twenty-four hours. Then wash in distilled water for some minutes, i.e. until the pieces fall to the bottom of the vessel, and then carry on a solution of nitric acid solvent (2%, is preferable when the tissues have been obtained from the living patient). This impregnation should be carried on at a temperature of 38°C. for from three to five days, according to the nature of the tissue. "Wash" the preparation: then: rinse the tissues in alcohol, clear with xylol and enter in paraffin. The sections should not be more than 5 μ thick. In a section so stained the spirochaetes are seen as dark spirals standing out against a pale yellow background. Often many of the spirochaetes are sufficiently large to be seen actually within the liver cells. This organism may be found in the lung, spleen and other viscera, and even in the heart of a patient suffering from syphilis. It has also been found in syphilitic lesions produced experimentally in the higher apes, especially the chimpanzee. As a result of these observations it is now generally accepted as being the primary cause of syphilis in the human subject. It is also present in the lesions usually met with in cases of primary and secondary syphilis of the human subject, and by its action on the blood and tissues of the body produces an antigen, a specific (?) substance, the presence of which has been noted or proved in the diagnosis of syphilis. He uses the method of deviation of complement by the antigen substances contained in the syphilitic blood fluid or cerebro spinal fluid—by which the lytic action of a microbic fluid is prevented.

Kala-azar.—The non-malarial remittent fever, met with in China, known as dum-dum fever in India and as kala-azar in Assam, is associated with peculiar parasitic bodies described by Donovan and Leishman (Herpetomonas Donovanii (? Helicosoma troceum, Wright)). This fever is characterized by its great chronicity, associated with very profound, and ultimately fatal, bloodlessness, in which there is not only a fall in the number of red blood corpuscles, but a marked diminution in the number of white blood corpuscles. Ulceration of the skin and mucous membrane, especially of the lower parts of the small intestine and of the first part of the colon is often present, this being accompanied by dropsy and by distinct enlargement of the liver and spleen. Leonard Rogers, who has given an excellent account of this condition, points out that there is a marked increase in the number of cells in the bone-marrow. The Leishman-Donovan bodies have been found in large numbers, especially in the spleen (see Plate I., fig. 7); they may also be found in the ulcerating surfaces and wherever the cellular proliferation is marked. These organisms may be seen in sections, or they may be demonstrated in film preparations made from the material scraped from the freshly-cut surface of the spleen.

The films are best stained by Leishman's method: Solution A.—Medicinal methylene-blue (Grübler), 1 part; distilled water, 100 parts; sodium carbonate, 1.5 parts. This mixture is heated to 65°C., and kept at this temperature for two hours, when the soln. of blue colour is allowed to stand for ten days. Solution B.—Eosin extra B.A. (Grübler), 1 part; distilled water, 1000 parts. Mix equal parts of solutions A and B in large open vessels and allow to stand for from six to twelve hours, starting from a time to with glass rods, etc., and wash the precipitate which remains on the paper with a large volume of distilled water until the washings are colourless or only tinged a light violet. Collect the films by means of a warm glass slide and blot dry and paper. A film of this size and thickness can be obtained with one drop of this stain on to the prepared slide (blood, bone, marrow, &c.) and run from side to side. After about half a minute add six or eight drops of distilled water, and then give the film one or two minutes with a hand mill, and stopper the bottle. Four or five drops of this stain on to the prepared film (blood, bone, marrow, &c.) and run from side to side. After about half a minute add six or eight drops of distilled water, and then give the film one or two minutes with a hand mill, and stopper the bottle. Then there is a tendency to set for five minutes longer or, if the film be thick, for ten. Wash with distilled water, leaving a drop or two on the glass for about a minute. Examine at once or after drying without heat and mounting in xylol balsam.

These peculiar parasitic bodies appear as deeply stained points, rounded, oval or cockle-shaped, lying free or grouped in the large endothelial cells of the spleen. Examine under a magnification of 1200 diameters. They do not dissolve when heated, and they resemble by their morphology and their life-history rather those of the common house-fly. It is thought that the Leishman-Donovan bodies are the tissue parasite stage, and that the herpetomonas stage is probably to be sought for in the blood of the patient.

Tsetse-fly Disease (Trypanosomiasis).—The interesting observations carried out by Sir David Bruce have invested the tsetse-fly with an entirely new significance and importance. In 1895 Bruce first observed that in the tsetse disease—n'gora—there may be found a flagellated haematozoon closely resembling the Trypanosoma evansi found in Surra. This, like the Surra organism, is very similar in the size of the body to the tsetse fly, but is smaller than the haematozoon often found in the blood of the healthy rat. It has, however, as a rule a single flagellum only. A small quantity of blood, taken from an affected buffalo, wildebeest, koodoo, bushbuck or hyaena—in all of which animals it was found by Bruce—when inoculated into a horse, mule, donkey, cow, dog, cat, rabbit, guinea-pig, rat or mouse, produces a similar disease, the organisms being found sometimes in enormous numbers in the blood of the inoculated animal, especially in the dog and in the rat. He then found that the tsetse-fly can produce the disease in a healthy animal only when it has first charged itself with blood from a diseased animal, and he produced evidence that Glossina morsitans is not capable of producing the disease except by carrying the parasites from one animal to another in the blood that it takes through its proboscis into its stomach. The parasites taken in along with such blood may remain in the stomach and alive for a period of 118 hours, but shortly after that the stomach is found to be empty, and the parasites contained in the excrement no longer retain their vitality. The mode of multiplication of these organisms has been studied by Rose-Bradford and Plimmer, who maintain that the multiplication takes place principally in the spleen and lymphatic glands. The tsetse-fly parasite, however, is still imperfectly understood, though much attention is now being paid to its life-history and development.
PARASITIC DISEASES

Sleeping Sickness (Trypanosomiasis).—To the group of diseases caused by Trypanosomes must now be added sleeping sickness. This disease is due to the presence and action in the human body of a form known as T. gambiense (Dutton).

In order to demonstrate the parasite in the blood of a case of sleeping sickness, where they are very scanty and difficult to find, the best method is repeated centrifugation of the blood (Bruce), 10 c.c. being treated at a time; then the sediment in a number of these tubes is collected and again centrifugalized. The living trypanosome may, as a rule, be distinguished in this final sediment, even under a low power of the microscope. The organism may be found in greater numbers in the cerebro-spinal fluid of a case in which the symptoms of sleeping sickness have been present for a short time; but even then the centre of centrifugation of 0.5 c.c. of the cerebro-spinal fluid for half an hour may be necessary before they can be demonstrated. Greg and Gray, at Mott's suggestion, were able to find the organism in the fluid removed by means of a hypodermic syringe from the swollen lymph glands that appear as one of the earliest signs of infection. Examined fresh and in its native fluid or in normal saline solution it is seen as an actively mobile, highly refractile, somewhat spindle-shaped organism (see Plate I., fig. 9). The anterior end is prolonged into a pointed flagellum, the posterior end being slightly blunted or rounded. This organism darts about rapidly between the red blood corpuscles or other corpuscles or particles, and shows rapid undulations, the flagellum beating quickly and the body following the flagellum. In this body a couple of very bright points may be seen. On staining by Leishman's stain (see under Kala-azar) the general protoplasm of the body is stained blue and is somewhat granular. This trypanosome is from 15 to 25 μ in length (without the flagellum, which is from 5 to 6 μ) and from 1.5 to 2.5 μ in breadth. In the centre of the spindle-shaped mass is a very distinct reddish purple oval corpuscle corresponding to the larger of the two bright points seen in the unstained specimen; this, the nucleus or macronucleus, is slightly granular. Near the posterior extremity of the organism lies a fine filament, but much smaller, deeply stained reddish purple point, the second of the bright spots seen in the unstained specimen; this is known as the micro-nucleus or centrosome. Around the micro-nucleus is a kind of court or area of less deeply stained protoplasm, arising from or near which and running along the margin of the body is a narrow band with a very sharply defined wavy free margin. This thin band of protoplasm seems to be continuous with the large spindle-shaped body of the trypanosome, but at the free margin it takes on the red tint of the micro-nucleus instead of the blue tint of the protoplasm. The undulatory membrane, as this band is called, is narrowest at the posterior end, getting broader and broader until the micro-nucleus is reached, beyond which it tapers off irregularly until finally it merges in the flagellum. In sleeping sickness the presence of this organism is usually associated with distinct anaemia, the red cells being diminished in number and the haemoglobin in quantity. Along with this there is an increase in the number of mononuclear leucocytes.

The trypanosome is carried to the human patient by the Glossina palpalis, in the proboscis of which the organisms may be seen for some short time after the insect has sucked blood from an infected patient. These trypanosomes have been found living and active in the stomach of this insect up to 118 hours, but after 140 hours no living parasites can be demonstrated. They undergo no metamorphoses in this intermediate host and are simply discharged in the intestinal excreta. It may be readily understood that the trypanosome under these conditions soon loses its virulence, and an animal cannot be infected through the bite of the Glossina for more than 48 hours after the infected blood has been ingested by the fly. The organism may remain latent in the human body for a considerable period. It certainly sets up very tardily any changes by which its presence can be detected. The trypanosomes in the blood are excreted by the lymphatic glands, especially those behind the neck, a condition often accompanied by irregular and intermittent fever.

After a time, in from three months to three years, according to Bruce, the organism gains access to the fluid in the cerebrospinal canal. Accompanying this latter migration are language lassitude, a gradually increasing apathy, and finally profound somnolence.

The incubation period, or that between the time of infection and the appearance of the symptoms associated with trypanosomiasis may be as short as four weeks, or it may extend over several years. The inhabitants of the island of Senegal who have lived in Casamance do not consider themselves safe from the disease until at least seven years after they have left an infected area. At first, amongst negroes, according to Dutton and Todd, there is an episode of dizziness except glaucular enlargement; in mulattoes and whites an intermittent fever may be the chief sign of infection, "the temperature being raised for two to four days, then falling to normal or below normal for four or five days." In other cases the fever is of the septic type, the temperature being normal in the morning but rising in the evening to 101°-3° or 102°-2° F., rarely to 104° F., the curve differing from that characteristic of malaria in which the rise usually takes place in the morning. Moreover, in sleeping sickness there are no rigors before the rise of temperature and but slight sweating, such as there is usually occurring at the end of the rigor. Here the rigor may be recurrent, but the interval between the malarial condition and that of sleeping sickness. The respiration and the pulse rate are increased both during the febrile and the non-febrile attacks; the respiration is from 24 to 30 a minute, and the pulse rises to 90, and even up to 140, a minute, according to the degree of cardiac excitability which appears to be constantly present. The localized swelling and redness are seen as puffiness of the face, oedema of the eyelids and ankles and feet, congested cryanthematos patches on the face, trunk or limbs. Anaemia, general weakness and wasting, at first very slightly marked, gradually become prominent features, and headache is often present. The enlargement of the spleen appears to go on concurrently with enlargement of the lymphatic glands. Nanson points out that trypanosomiasis may terminate fatally without the appearance of any characteristic symptoms of sleeping sickness, but as a rule the "sleeping" or second stage supervenes. The temperature now becomes of the hectic type, rising to 102°-2° F. in the evening and falling to 98°-6° F. in the morning. Here again there are no rigors or sweating. During the last stages of the disease the rectal temperature may fall as low as 95° and for the last day or two to 62° F., the pulse and respiration falling with the temperature. The irritability of the heart is still marked. Headache in the supraorbital region, and pain in the back, and even in the feet, have been described. Activity and intelligence give place to laziness, apathy and dullness; the face loses its brightness, the eyelids approximate, and the muscles around the mouth and nose become flabby and flaccid, the patient becomes drowsy, and when questioned replies only after a marked interval. Fibrillary tremors of the tongue and shaking of the hands and arms, distinct even during rest, become increased when any voluntary movement is attempted. These tremors may extend to the lower limbs and trunk. Epileptiform convulsions, general weakness and progressive emaciation come on, and shortly before death there is incontinence of urine and faeces. "The intellectual faculties gradually become impaired, the patient has a certain amount of difficulty in understanding what is said to him, and becomes emotional, often crying for no reason whatever; delirium is usually absent, the drowsiness increases and the patient's attitude becomes characteristic, the head falls forward on the chest and the eyelids are closed. At first the patient is easily aroused from this drowsy condition, but soon he reaches a stage in which he falls sound asleep almost in any attitude and under any conditions, especially after meals. These periods of sleep, which become gradually longer and more profound, lead eventually to a comatose condition from which the patient can be aroused only with the greatest difficulty. It is at this stage that the temperature becomes normal and death occurs." Naborro points out, however, that this condition of drowsiness and sleep, leading eventually to coma, is by no means invariably present.
PARASITIC DISEASES

In the early part of the sleeping-sickness stage patients often sleep more than usual, but later do not sleep excessively. They become lethargic and indifferent to their surroundings, however, and often lie with their eyes closed. When spoken to they hear and understand what is said to them and after a longer or shorter interval give a very brief reply.

The leucocytosis that occurs during the course of this form of trypanosomiasis is due, apparently, to secondary or terminal bacteria. These are frequently found in the blood, and usually at its later stages. The first stage of the disease, that of fever, may last for several years; the second or nervous stage with tremors, &c., for from four to eight months. It is quite exceptional for the disease to be prolonged for more than a year from the time that the nervous symptoms become manifest, though a European who contracted trypanosomiasis in Uganda, having delusions and becoming drowsy within the year, did not die of sleeping sickness until more than eighteen months from the onset of the nervous symptoms.

The Glossina palpalis is not found in swamps. It affects a belt of from ten to thirty yards broad along banks bounding water shaded by scrub and underwood. It may, however, follow or be carried by the animal or human subject it is attacking for a distance of, say, three hundred yards, but unless carried it will not cross an artificial clearing of more than thirty yards made in the natural fly belt. The authorities in the plague-stricken areas recommend, therefore, the clearance of belts thirty yards in width along portions of the lake side, at fords and in such other places as are frequented by natives. No infected person should be allowed to enter a "fly area," so that they may not act as carriers from which the flies may convey infection. The provision of clothing for natives which are compelled to work in fly areas is an important precautionary measure.

There seems to be some doubt as to whether Trypanosoma gambiense of Dutton is the same organism and produces the same conditions as the trypanosome of the tsetse fly, Trypanosoma rhodesiense from Uganda, but most observers seem to think that the two species are the same and yield the same results when inoculated into animals. It is supposed that this trypanosome may pass through certain stages of metamorphosis in the human or animal body, and different drugs have been recommended as trypanocides during these various stages, an arsenic preparation (atoxyl) first being given, and then, when the organisms have disappeared, injections of bichloride of mercury, this salt appearing to prevent the relapses which occur when atoxyl only is given over a prolonged period. Ehrlich, treating animals suffering from trypanosomiasis with paraffin, followed by injections of "fuchsin-fast," found from this drug that the trypanosomes had disappeared; they soon recurred. On the exhibition of another dose of para- ffin they again disappeared. This was repeated for a considerable number of times, but after a time the paraffin lost its effect, the animal having acquired an immunity against this substance; they had in fact become "fuchsin-fast." Such fuchsin-fast organisms injected into animals still retain their immunity against paraffin and may transmit it through more than two generations. Nevertheless, they cannot withstand the action of other trypanocidal drugs. The outcome of all this is that large doses of the trypanocidal drug should be given at once, and the same drug should never be given over too long a period, a fresh drug often being effective even when the first drug has lost action.

II.—TO OTHER ANIMAL PARASITES

Filaria.—Since Bancroft and Manson first described Filaria nocturna and its relation to the common form of filariasis, the most important contribution to our knowledge has been made, at the suggestion of the younger Bancroft, by Dr G. C. Low, who has demonstrated that the embryos of the filaria may be found in the proboscis of the mosquito (Culex climaci), whence they probably find their way into the circulating blood of the human subject. It appears that the filaria embryo, after being taken, with the blood of the patient, into the stomach of the mosquito, loses its sheath; after which, leaving the stomach, it passes into the thoracic muscles of its intermediate host, and becomes more fully developed, increasing considerably in size and attaining a mouth, an alimentary canal, and the characteristic trilobed caudal appendage. It now leaves the thoracic muscles, and, passing towards the head, makes its way "into the loose cellular tissue which abounds in the prothorax in the neighbourhood of the salivary glands." Most of them then "pass along the neck, enter the lower part of the head," whence they may pass into the proboscis. Although it has never been demonstrated that the filaria is directly inoculated into the human subject from the proboscis of the mosquito, it seems impossible to doubt that when the mosquito "strikes," the filaria makes its way into the circulation directly from the proboscis. It is important to note that the mosquito, when fed on banana pulp, does not eject the filaria from its proboscis. On the contrary, it is not to be wondered at, as the filaria is apparently unable to live on the juices of the banana; moreover, the consistency of the banana is very different from that of the human skin. The importance of this observation, as affording an additional reason for taking measures to get rid of the mosquito in districts in which filariasis is rife, can scarcely be over-estimated.

C.—INFECTION DISEASES IN WHICH AN ORGANISM HAS BEEN FOUND, BUT HAS NOT YET BEEN CONNECTED WITH THE DISEASE.

Hydrophobia is usually contracted by man through inoculation of an abraded surface with the saliva of an animal affected with rabies—through the bite of a dog, the animal in which the so-called rabies of the streets occurs. The puppy is specially dangerous, as, although it may be suffering from rabies when the saliva contains an extremely exalted virus, the animal may exhibit no signs of the disease almost up to the time of its death. The other animals that may be affected naturally are wolves, cats, foxes, horses, cows and deer; but all warm-blooded animals may be successfully inoculated with the disease. The principal changes met with are found in the nervous system, and include distension of the peripheral lymphatic sheaths, congestion and oedema of the brain and spinal cord, and of the meninges.

Haemorrhages occur into the cerebral ventricles of the brain, especially in the floor of the fourth, and on the surface and in the substance of the medulla oblongata, and the spinal cord.

In addition to these small haemorrhages, collections of leucocytes are met with in hyperaemic areas in the medulla oblongata and pons, sometimes in the cortical cerebral tissue and in the spinal cord, in the peripheral lymphatics of the grey matter of the anterior horns and in the white matter of the postero-internal and postero-external columns. Here also the nerve cells are seen to be vacuolated, hyaline and granular, and often pigmented; thrombi may be present in some of the smaller vessels, and the collections of leucocytes may be so prominent, especially in the medulla, that they have been described as military abscesses. Haemorrhages are also common in the various mucous and serous membranes; hyaline changes in and around the walls of blood-vessels; proliferation of the endothelium; swelling and vacuolation of nerve cells; pericellular infiltration with leucocytes, and infiltration of the salivary glands with leucocytes (Coats). An increased number of leucocytes and microcytes in the blood has also been made out. The virus, whatever it may be, has a power of multiplying in the tissues, and of producing a toxic substance which, as in the case of tetanus toxin, appears to act specially on the central nervous system.

In recent years fresh interest has been aroused in the morbid histology of the brain and cord in hydrophobia by the appearance of Negri's description of "bodies" which he claims are found in the central nervous system only in hydrophobia or rabies (see Plate I., fig. 3). These bodies, which are rounded, oval, triangular, or slightly spindle- or sausage-shaped, when specially stained consist of a red (acidophile) basis in which stand out small blue (basophile) granules, rods and circles, often situated within vacuoles. A small central point which is surrounded by no clear space is supposed to correspond to the nucleus of a protozoan. But this can be little more than a suggestion. The Negri bodies are certainly present in the central nervous system in cases of hydrophobia, and have not been found in similar positions in any other disease. They are present in large numbers, even at an early stage of the disease, although they are then so small that they may easily escape detection, so small indeed that they may pass through the pores of a Berkfeld
filter, the filtrate in such cases being capable of acting as a rabid virus. In the more chronic cases and in the later stages of the disease the Negrí bodies may attain a considerable size and may be easily seen under the microscope. They are from 0.5 ÷ to 2μg in diameter—the longer the course of the disease the larger the bodies, these larger forms seldom if ever being met with in specially susceptible animals, which soon succumb to the disease. The Negrí bodies may be constricted in the middle, or, if some-what elongated, may have two or three constrictions which give it the appearance of a string of sausages. They may be met with in almost all the nerve cells of the central nervous system in well-developed cases of hydrophobia. They are met most frequently on the periphery of the cell bodies and are found, not only in the cells of the cornu ammonis, but also in the Purkinje cells of the cerebellum.

There are also several methods of preparing these organisms for microscopical examination, the following is perhaps the simplest. A fragment of the gray substance, say from the cornu ammonis, is taken from a section made at right angles to the surface and placed on a slide about one inch from the end. A coverslip is now “pressed upon it until it is spread out in a moderately thin layer; then the coverslip is moved slowly and evenly over the slide,” leaving the first three-quarters of an inch of the slide clear. In making the smear only slight pressure is used, the pressure beginning on the edge of the coverslip away from the end of the slide towards which the coverslip is travelling, thus driving more of the nerve tissues from the periphery into the middle of the well-stained cells.” The smears are then air-dried, placed in methyl-alcohol for one minute, and then in a freshly-prepared mixture of 10 c.c. of distilled water, three drops of a saturated alcoholic solution of methyl-alcohol, and one drop of dye, i.e. brilliant blue, which is warmed until steam rises; the stain is then poured from the specimen, which after being rinsed in water is allowed to dry and is then mounted in Canada balsam.

The nature of the disease produced by the inoculation of saliva from a rabid animal appears to depend upon (1) the quality of the rabid virus introduced; (2) the point of its introduction; (3) the activity of the virus. Thus by diluting the poison with distilled water or saline solution and injecting small quantities, the period of incubation may be prolonged. Slight wounds of the skin, of the limbs and of the back are followed by a long incubation period; but when the inoculation takes place in the tips of the fingers or in the skin of the face, where nerves are numerous, and especially where the wound is lacerated or deep, the incubation period is much shorter and the attack usually more severe. This, as in tetanus, is accounted for by the fact that the lymphatics of the nerves are much more directly con- tinuous with the central nervous system than are any other lymphatics of lymphatics. The poison appears to act directly upon the cells of the central nervous system.

Arising out of recent researches on hydrophobia, two methods of treatment—one of which, at any rate, has been attended by conspicuous success—have been put into practice. The first of these, Pasteur's, is based upon the fact that rabid virus may be intensified or attenuated at will. Pasteur found that although the virus taken from the cerebrospinal fluid of the dog always produces death in the same period when inoculated into the same animal, virus taken from other animals has not the same activity. If passed through a series of monkeys it may become so attenuated that it is no longer lethal. If either the “monkey virus,” which is not fatal to the rabbit, or the “dog virus,” which kills in twelve to fourteen days, be passed through a series of rabbits, the virulence may be so exalted that it may kill in about six days: its activity cannot be increased beyond this point by any means at present at our disposal. This intensified virus was therefore named virus fixe by Pasteur, and it forms a standard from which to work. He found, too, that under certain conditions of temperature the virus may be readily attenuated, one hour at 50° or half an hour at 60° C. completely destroying it. A 5% solution of phenolic acid acting for half an hour, or a 1% solution of bichloride of mercury or acetic acid or permanganate of potash, brings about the same result, as do also exposure to air and sunlight. The poison contained in the spinal cord of the rabbit exposed to dry air and not allowed to undergo putrefactive changes gradually loses its activity, and at the end of fourteen to fifteen days is incapable of setting up rabid symp- toms. A series of cords from rabbits inoculated with the virus fixe are cut into short segments, which, held in series by the dura mater, are suspended in sterile glass flasks plugged with cotton-wool and containing a quantity of potassium hydrate—a powerful absorbent of water. At the end of twenty-four hours the activity of the virus is found to have fallen but slightly; at the end of forty-eight hours there is a still further falling off, until on the fourteenth or fifteenth day the virus is no longer lethal. With material so prepared Pasteur treated patients who had been bitten by mad dogs. On the first day of treatment small quantities of an emulsion of the cord exposed for thirteen or fourteen days is injected subcutaneously, and the treatment is continued for from fifteen to twenty-one days, according to the severity of the bite, a stronger emulsion—it is an emulsion made of a cord that has been desiccated for a shorter period—being used for each succeeding injection, until at last the patient is injected with an emulsion which has been exposed to the air for only three days. In the human subject the period of incubation of the disease is comparatively prolonged, owing to the insusceptibility of the tissues to the action of this poison; there is therefore some chance of obtaining a complete protection or acclimatization of the tissues before the incubation period is passed. The virus introduced at the bite has then no more chance of affecting the nerve centres than has the strong virus injected in the late stages of the protective inoculation: the nerve centres, having become gradually acclimatized to the poisons of the rabid virus, are able to carry on their proper functions in its presence, until in time, as in the case of microbial poisons, the virus is gradually neutralized and eliminated from the body. Various modifications and improvements of this method have from time to time been devised, but all are based on, and are merely extensions of, Pasteur's original work and method. As soon as it was found that antitoxins were formed in the tissues in the case of an attack of tetanus, attention was drawn to the necessity of determining whether something similar might not be done in the production of an antirabic serum for the treatment of rabbits. Babes and Lepp, and then Tizzoni and his colleagues Schwartz and Centanni, starting from virus fixe, obtained a series of weaker-inoculating materials by submitting them for different periods to the action of gastric juice. Beginning with a weak virus so prepared, and from time to time injecting successively stronger emulsions (seventeen injections in twenty days) into a sheep, they succeeded in obtaining a serum of such antirabic power that if injected in the proportion of 1 c.c. of body-weight, an animal is protected against the lethal dose of virus fixe.

The activity of this serum is still further reinforced if a fresh series of injections is made at intervals varying from two to five months, according to the condition of the animal, each series occupying twelve days. This antirabic substance stored in the blood has not only the power of anticipating (neutralizing?) the action of the poison, but also of acting as a direct curative agent; as a prophylactic agent, readily kept in stock and easily and rapidly exhibited, it possesses very great advantages over the inoculation method. It must be borne in mind that the longer the period after the infection the greater must be the amount of serum used to produce success.

As regards the necessity for any treatment it may be pointed out that although the saliva of a rabid dog may be infective three days before the manifestation of any symptoms of the disease death takes place almost invariably within six days of the first symptom. If therefore the animal remains alive for ten days after the patient is bitten, there is no necessity for the antirabic treatment to be applied and the patient need fear no evil results from the bite.

There can be little doubt that hydrophobia is a specific disease due to a multiplication of some virus in the nervous system, in the elements of which it is ultimately fixed, and that it passes from the ground to the central nervous system by the lymphatics; and that, as in tetanus, the muscular spasms are the result of the action of some special poison on the central nervous system.

Scarlet Fever.—In scarlet fever recent observations have been comparatively few and unimportant. Crooke, and later Klein,
and others have, however, shown that in the glands and throats of scarlet fever patients a streptococcus, to which is assigned the chief aetiological rôle in connexion with this disease, is present. On the other hand, it is maintained by many observers that these streptococci are nothing more than the streptococci found in purpural fever, erysipelas, and similar infective conditions, and certainly the organisms described closely resemble Streptococcus pyogenes. In 1904 Mallory described certain "bodies" which he considers may be associated with scarlet fever, and which were sufficiently distinctive to justify him in suggesting that he was dealing with the "various stages in the developmental cycle of a protozoa." These bodies, which were demonstrated in four cases of scarlet fever, "occur in and between the epithelial cells of the epidermis and free in the superficial lymph vessels and spaces of the corium." They are small, varying from the size of a blood platelet to that of a red blood corpuscle, and "stained delicately but sharply with methylene blue." Well formed rosettes with numerous segments may be seen, forms which Mallory thinks may correspond to the phase of assexual development of the malarial parasite. He also describes "coarsely reticulated forms which may represent stages in sporogony or be due to degeneration of the other forms." He gives beautiful illustrations, both drawings and photographs, of these organisms, and without claiming that he has proved any aetiological relation between these bodies and scarlet fever, states that his personal opinion is that such relation exists.

D.—Infective Diseases not yet proved to be due to Micro-organisms.

Small-pox.—There have been few recent additions to our knowledge of the aetiology of small-pox, though Dr Monckton Copeman now holds that the small-pox organism, like that of vaccinia, is probably a very minute bacillus, which, from its behaviour in the presence of glycerin, is possessed of the power of forming spores. If vaccine lymph, taken from the calf, be protected from all extraneous spore-bearing organisms and treated with 90% solution of glycerin, it, in time, becomes absolutely sterile as regards ordinary non-spore-bearing organisms. Even the staphylococci and streptococci, usually found in calf lymph, cannot withstand the prolonged action of this substance, but spore-bearing organisms still remain alive and active. Moreover, the lymph still retains its power of producing vaccine vesicles, so that the vaccine organism, in its powers of resistance, resembles the spore-bearing, and not the non-spore-bearing, organisms with which we are acquainted. This vaccine organism must be very minute; it is stated that it can be cultivated only on special media, though it multiplies freely in the superficial cutaneous tissues of the calf, the monkey and the human subject. Perhaps the most important outcome of Dr Monckton Copeman's work on this subject is that he has obtained a vaccine lymph from which are eliminated all streptococci and staphylococci, and, if the lymph be taken with reasonable care, any other organisms which could possibly give rise to untoward results.

Typhus Fever.—Although it is fully recognized that typhus must be one of the specific infective fevers brought about by the action of a special micro-organism, no definite information as to the bacterial aetiology of this condition has been obtained. It is always looked upon as a "filtr" disease; and from the frequency of minute haemorrhages, and from the resemblance to the haemorrhagic septicæmias in other respects, it appears probable that the bacillus of typhus is the organism described by Mott in 1883 as an actively motile dumb-bell cococcus, and ten years later by Dublief and Brulh as the Diplococcus typhosus exanthematicus; the polar staining and general resemblance to the diplococcus of fowl cholera, the plague bacillus, the diplococcus of "Wildusche," certain forms of swine fever and hog cholera, and others of the haemorrhagic septicæmias are sufficient to suggest the generic affinity of this organism to this septicæmic group. We have as yet, however (1910), no absolute proof of the aetiological relation of the bacillus to this disease.

Measles.—In measles, as in scarlet fever, micrococci have had ascribed to them the power of setting up the specific disease. Canon and Pielckie have, however, described minute bacilli somewhat resembling those described as occurring in vaccine lymph. These are found in the blood in the early stages of the disease, and also in the profuse catarrhal secretions so characteristic of this condition. There are no records of the successful inoculation of this minute bacillus, and until such evidence is forthcoming this organism must be looked upon as being an accidental contaminant of the primary cause of measles.

Mumps.—It is generally accepted that mumps is probably caused by a specific micro-organism, the infective material making its way in the first instance through the ducts to the parotid and other salivary glands. It appears to bring about a peculiar oedematous inflammation of the intestinal tissue of the glands, but slight parenchymatous changes may also be observed. The virus is present in the tissues for some days before there is any manifestation of parotid swelling, but during this period it is extremely active, and the disease may be readily transmitted from patient to patient. The infectivity continues for some time, probably for nearly a week after naked-eye manifestations of the diseased condition have disappeared.

Whooping-Cough.—A diplococcus, a streptococcus, and various higher fungi have in turn been put down as the cause of this disease. It must, from its resemblance to the other specific infective fevers, be considered as an infective disease of microbic origin, which goes through a regular period of incubation and invasion, and in which true nervous lesions, especially of the pneumatic and superior laryngeal nerves, are somewhat common. Aflanassief, and later Koplick, have described a minute bacillus with rounded ends and bipolar staining, which occurs in the mucus discharged at the end of a paroxysm of whooping-cough. Koplick examined sixteen cases, and found this organism in thirteen of them. There can be little doubt that the infective material is contained in the excretion. It may remain active for a considerable period, but is then usually attached to solid particles. It is not readily carried by the breath, and multiplies specially in the mucous membranes, setting up inflammation, probably through its toxic products, which appear to be absorbed, and, as in the case of the tetanus poison, to travel specially along the lymphatics of the local nerves. Affections of the lung—bronchitis and broncho-pneumonia—may be directly associated with the disease, but it is much more likely that these affections are the result of secondary infection of tissues already in a weakened condition.

host and parasite must be in temporary or permanent physical contact other than the mere preying of the latter on the former; and the presence of the parasite must not be incidental, and is usually detrimental to the host.

It is obvious that within the limits of the strictest definition of parasitism that will cover the facts many degrees occur. The terms symbiosis and commensalism have been applied to conditions really outside the definition of parasitism, but closely related and usually described in the same connection. Both terms cover the physical consorting of organisms in such a fashion that mutual service is rendered.

The name symbiosis was invented by the botanist A. de Bary in 1879, and is applied to such an extraordinary communion as the thallus of a lichen, which is composed of a fungus and an alga so intimately associated, physically and physiologically, that it was not until 1868 that the dual nature of the whole was discovered. The presence of chlorophyll, which has always been associated only with vegetable organisms, was detected by Max Schultze in 1851 in the animals Hydra and Vorticella, and later on by Ray Lankester in Spongiella and by P. Geddes in some Turbellarian worms. On the theory that the chlorophyll occurs in independent vegetable cells embedded in the animal tissues, such cases form other instances of symbiosis, for the oxygen liberated by the green cells enables their animal hosts to live in foul water, whilst the hosts provide shelter and possibly nutritious food to their guests.

The term commensalism was introduced in 1876 by P. J. Van Beneden to cover a large number of cases in which "animals have established themselves on each other, and live together on a good understanding and without injury." The most familiar instance is that of fishes of the genus Ecteronotus which live in the digestive tube of sea-cucumbers (Holothuria; see Echinodermata). A variety of commensalism was termed mutualism by Van Beneden and applied to cases where there appeared to be an exchange of benefits. A well-known instance of mutualism is the relation between sea-anemones and hermit crabs. The hermit crab occupies the discarded shell of a mollusc, and anemones such as Sagartia or Adamsia are attached to the outside of the shell. The bright colours of the anemone advertise its distasteful capacity for stinging, and secure protection for the crab, whilst the anemone gains by vicarious locomotion and possibly has the benefit of floating fragments from the food of the crab.

It is plain that such terms as symbiosis, commensalism and mutualism cannot be sharply marked off from each other or from true parasitism, and must be taken as descriptive terms rather than as definite categories into which each particular association between organisms can be fitted.

R. Leuckart has made the most useful attempt to classify true parasites. Occasional, or temporary, parasites are to be distinguished from permanent, or stationary, parasites. The former seek their host chiefly to obtain food or shelter and are comparatively little modified by their habits when compared with their nearest unparasitic relatives. They may infest either animals or plants, and as they attack only the superficial surfaces of their hosts, or cavi ties easy of access from the exterior, they correspond closely with another useful term introduced by Leuckart. They are Epizoae or Ectoparasites, as distinguished from Entozoa or Endoparasites. They include such organisms as plant-lice, and caterpillars which feed on the green parts of plants, and animals such as the flea, the bed-bug and the leech, which usually abandon their hosts when they have obtained their object. Many ectoparasites, however, pass their whole lives attached to their hosts; lice, for instance, lay their eggs on the hairs or feathers or in rugosities of the skin of birds and mammals; the development of the egg, the larval stages and the adult life are all parasitic. Permanent or stationary parasites are in the most cases endoparasitic, inhabiting the internal organs; bacteria, gregarines, nematodes and tapeworms are familiar instances. But here also there are no sharp lines of demarcation. Leuckart divided endoparasites according to the nature and duration of their strictly parasitic life: (1) Some have free-living and self-supporting embryos that do not become sexually mature until they have reached their host; (2) others have embryos which are parasitic but migratory, moving either to another part of their host, to another host, or to a free life before becoming mature; (3) others again are parasitic in every stage of their lives, remaining in the same host, and being without a migratory stage.

Origin of Parasitism. Now that the theory of spontaneous generation has been superceded, the problem of parasitism is no more than detection of the various epochs in which hereditary organisms to change their environment. Every kind of parasite has relations more or less closely akin which have not acquired the parasitic habit, and every gradation exists between temporary and permanent parasites, between creatures that have been only slightly modified and those that have been profoundly modified in relation to this habit. There are many opportunities for an animal or plant in its adult or embryonic stage to be swallowed accidentally by an animal, or to gain entrance to the tissues of a plant, whilst in the case of ectoparasites there is no fundamental difference between an organism selecting a dead or a living environment for food or shelter. If the living environment in the latter case proved to have special advantages, or if the interior of the body first reached accidentally in the former case proved not too different from the normal environment and provide a better shelter, a more convenient temperature, or an easier food supply, the accident may pass into a habit. From the extent to which parasitism exists amongst animals and plants it is clear that it must have arisen independently in an enormous number of cases, and it may be supposed that there must be many cases in which the habit is of recent occurrence; E. Metchkovoff, indeed, has suggested that amongst parasites we are to look for the latest products of evolution. In any case it is impossible to suppose that parasites form a natural group; no doubt in many cases the whole of a group, as for instance the group of tapeworms, is parasitic, but indications point clearly to the tapeworms having had free-living ancestors. Parasitism is in short a physiological habit, which theoretically may be assumed by any organism, and which actually has been assumed by members of nearly every living group.

List of Parasites

Vertebrata.—These are rarely parasitic, and cases are unknown amongst mammals, birds, reptiles and amphibia. Amongst fish and cyclostomes, Myxine burrows into codfish, Remora attaches itself to the external surface of sharks; Rhodens amurus, the bitingler, a small carp-like fresh-water fish, injects its eggs into the mantle-cavity of pond-mussels, where the fry develop, whilst the mollusc reciprocates by throwing off its embryos on the parent fish; Stegophis tropicalis, a small colourless fish from Brazil and the Argentine, lives parasitically in the gill-cavity of large cat-fishes and sucks the blood in the gills of a large Silurid; Vandelia cirrhosa, the candiru of Brazil, a minute fish 60 mm. in length, enters and ascends the urethra of people bathing, being attracted by the urine; it cannot be withdrawn, owing to the erectile spines on its gill-covers. The natives in some parts of the Amazon protect themselves whilst in the water by wearing a sheet of minutely perforated coco-nut shell.

Mollusca.—Few if any are true parasites. The Gasteropods, Eulimae, Stylostereus and Entoscolecus lodge in Echinoderms, the latter are usually truly parasitic.

Protozoa and Hemichordata.—Most of these are sessile and may lodge on other animals, but are not parasitic.

Arachnida.—Mites and Ticks are Arachnids, the vast majority of which are parasitic; the species of which infest almost every vertebrate group, but there are some free-living forms. Pycnogons are parasitic in their youthful stages on Hydrozoa, whilst the Pentastomids have been so much modified by parasitism that they were formerly regarded as worms when they may occur in the case of the menoponid sensu can be lost or the body and discarding the appendages and sense-organs, whilst the male, although not so degenerate in structure, is dwarfed in size and itself becomes a parasite of the female. The Caripodes
PARASITISM

are all sessile in the adult condition. The *Lepadidae* are the most conspicuous. Some of the *Cirripedia*, a group of *Decapod* *Crustacea*, sending burrowing root-like nutritive processes into their tissues.

**Insects.**—A very large number of insects are temporary or permanent parasites of animals or plants. The adult stages being chiefly ectoparasitic, the larval stages endoparasitic. The *Hemiptera*, allies of the cicadas, are ectoparasites on rats. The *Mallophaga* or *bird-lice* are degenerate wingless insects, parasitic for the most part on birds, and frequently become embedded in the skin of whales. The *Abduminia* live as parasites buried in the shells of other Cirripedes and molluscs. The *Apoidea* live as parasites in the mantle of other ray-finned fishes. They are degenerate *Scyphobranchia* and the *Lecithostraca*.

The larvae of *Hemero抱anidae* are parasitic on *Aphides*. The saw-flies are parasitic on plants. There are over 200,000 species known of the *Hymenoptera*. *Cirripedidae* develop in the eggs, caterpillars or adults of other insects, particularly *Lepidoptera*. The clothes-moth, for instance, is known to be subject to the attack of over sixty species of *Hymenoptera*. To such an extent has parasitism been developed in this group, that the parasites themselves are attacked by other parasites, giving rise to the phenomena known as hyperparasitism. The gall-flies (see *GALLS*) are included amongst the *Terebrantia*, but in their case the early stages are parasitic, larvae being found in the bodies of other insects. The *rubies* (see *Hymenoptera Tubulifera*), in the larval condition are parasitic on the larvae of wasps and bees. The *Dendroidae* are bees that in the larval stage are parasitic on *Colletes* and *other bees*, the larvae of the parasites being deposited in the food-cells prepared for their own larvae by other bees. Many of the *fossorial* *Hymenoptera* form special nests for their young, but it is rare for any nest to be made solely for the larvae of a single species of other insects. The very large number of *Hymenoptera* which collect living larvae to be shut up as provender for their developing young are in a sense parasitic. The complex relations of insects of different orders and families are therefore of great importance.

The nests of many species are inhabited by foreign insects of various orders, such insects being termed myrmecophilous or ants’ nest insects. The relations between the ants and their guests are very complex, and the guest insect, when in the adult stage, either lives as a parasite on the plants or trees, but in return protect them from more harmful intruders. Such phenomena are on the borderline between symbiosis and true parasitism. Although most beetles live on decaying animal matter, and in the adult or larval condition on plants or trees. The curious beetle known as *Platypusulius castoris* is known only as an ectoparasite of the beaver, whilst the *Leptinea* are parasites of more than 100 species of birds. The *Mordellidae* and *Rhipiphoridae* are endoparasites of wasps and cockroaches, whilst the larvae of many of the *Cantharidae* are parasites of locusts. The almost sheer parasitism of these animals is very striking.

The habits of the *Diptera* easily pass over into parasitism, and a very large number are temporary or permanent parasites in the adult or larval stages. Most of the larvae of the *Cecidomyidae* live on the trees and feed on wood, and are often found in masses of wood-rot. The sucking habits of mosquitoes and gnats and sand-flies have not led to any special development in the direction of parasitism. The larvae of *Bombyliidae* are endoparasites of the larvae of mosquitos, and some of the *Cystidae* similarly infest spiders, whilst the *Tachinidae* deposit their larvae in other living insects, caterpillars being especially selected. The larvae of some of the *Sarcophagidae* may be deposited in the nostrils of man and other animals, whereas the larvae of the South African genus *Lucita* infest the nasal fossae and frontal sinuses of man, producing great suffering, and the larvae of the numerous kinds of *Botuphila* have been found in the eyes of men. *Papipara* live by sucking the blood of mammals and birds, and many of them are reduced to wingless permanent parasites. The single member of the family *Brachyidae* is a parasitic fly. The *beef louse* of cattle, *Bovicola*, is the larval stage of *Sarcophaga* in the adult condition; the larval stages are usually to be found in organic refuse. The larvae of most Lepidoptera are temporary ectoparasites of plants, but a few attack other insects, such as cockroaches. There are also a number of the *Cantharidae* which have some organs and the majority of them are temporary parasites of plants or other animals. Some, such as the bed-bug, have been so modified by parasitism as to be found only in human dwellings, others, such as the *Sarcophaga* and the *Ceratitis* or *Asdirina* parasites of many of them producing galls. The coccids, or scale insects, have been still further modified as plant ectoparasites. The *Pediculidae*, or *lice*, are the most completely parasitic of insects, and are degraded with plant insects found on almost any class of birder mammal, but in most cases so highly modified as to be capable of existence only on particular species of which they are the parasites. Lower *Invertebrata*—No true Chaeotops are parasitic, but a few are commensal. The lice are probably Chaeotops modified by parasitism; and Myzostomes are still more highly modified for this life. Most of the true Chaeotops are the parasites of fish and other vertebrates. A few rotifers are ecto- and endo-parasites. No Brachiopods, Polyzoa or Echinodermes are true parasites. The flat-worms and rotifers contain the most characteristic endoparasites, and parasitism is so characteristic of the phyla in question that it is discussed in the separate articles dealing with the various natural assemblages of such worms. All the Cestodes (see *TAPEWORMS*) of the Trematodes (q.v.), and a few of the *Lana* (q.v.) are parasites of animals. Most Nemertines are free-living, but *Cephalothrix golitheae* is endoparasitic in the ovaries of the *Crustacean* Galathea striosa, whilst *Eunemesurus* and *Tetraselmis* are found in the intestines of Pterasema. The degraded Mesozoa (q.v.) are endoparasites of Planarians, Nemertines and Ophiurids. The Nematoda (q.v.) or typical round-worms, exhibit every degree from absolute freelif to absolute parasitism in animals and plants. The *Echidinæa* (q.v.) are mostly free-living, but the male of *Bonellia* lives as a very degenerate parasite in the uterus and pharynx of the female. Although Coelentera and Porifera are usually sessile, very few are true parasites; young stages of the *Corallimorphariae* are parasitic in the mouth of adults of different species, whilst *Mnesta* is a degenerate medusa living on the pelagic mollusc *Polyplacophora*. The parasitism of the *Trilobitomorpha* is almost universally known. Certain of *Anomoia* such as *Anoeola calis* are associated with dysentery and kindred diseases. A very large number of the *Mastigophora* (q.v.), including such forms as the trypanosome of sleeping-sickness, are natural endoparasites of various species of mammals. The parasitism of almost any animal reveals the occasional presence of some kind of mobile protozoon, provided with a whip-like process. The enormous group of *Sporozoa* (q.v.) are entirely parasitic, and have been divided into many groups, every group of animals except possibly the Crustacea, are parasitic. *Infusoria* (q.v.) contains a considerable number of parasitic forms, some endoparasitic; others like the Suctoria, ectoparasitic.

**B.—Plants.**

**Bacteria.**—Every degree of adaptation to parasitism occurs amongst bacteria, a majority of which pass at least some stage of their lives in a parasitic condition.

**Fungi.**—As in the case of the *Bacteria*, the absence of chlorophyll from the tissues of fungi makes it necessary that they should take up carbon compounds already assimilated by other organisms, and accordingly they are either saprophytes or parasites. The mycelium is, so to say, the parasitic organ of the fungus, ramifying in the tissues of the host, and often being carried to a distance from the host, by means of spores which enter usually by wounds in the case of animal and plant hosts, but occasionally by natural apertures such as the stomata of plants. The fungi that develop in the organs of warm-blooded animals (see *Parasitic* diseases) are naturally parasitic, and are spread through the tissues where germination takes place. Many fungi, especially those that are epiphytic, reach the tissues of their host by germ-tubes which emerge from the spore and penetrate through the epidermis, or, in the case of *Botrytis* and *Helminthosporium*, through the germ-tubes or hyphae actually penetrate uninjured tissues or membranes.

The fungal parasites on animals are in most cases little known, and add little to the list, of which the pathological rather than the botanical features have been worked out, are constantly being made. A number of species of *Exobium* and *Aspergillus*, usually parasitic on the bronchial tree of the patient, are known to cause lung infections, and are exciting a disease known as mycosis or aspergillosis. They were first discussed in the disease of the human ear known as otomycosis, but they occur also in lungs and air-passages of mammals. Investigations conducted at the *Proctorium* of the *Zoological Society of London*, show that mycosis is extremely frequent and fatal in birds and reptiles, and rather less frequent in mammals. Almost any organ of the body is liable to be attacked by *Fungi* and of *Saprolegnia* and *Neosartorya* the former is a parasite to *chitin parasites* and *Proterobasidium*, whilst the latter is entirely parasitic and of *Chitinomyces* and *Dyctospora* are among the most notorious, are produced on healthy animals, by the
attacks of the fungi, or in some antecedent predisposing condition need be necessary. There are a number of well-known fungi that produce diseases of the skin in man and other vertebrates. *Achorion* *Schizorhina* produces spots on melon, alfalfa, clover, orchard trees, and many other plants. *Trichophyton tonsurans* (Malonesten), is the fungus of tinea or ringworm in man, oxen, horses, dogs and rabbits. *Sachromyces albicans* (Reess), produces thrush of the mouth in young cattle. *Arthrobotrys* *Puccinia* *Schoenleinii* (Harz) attack the roots of grasses; with swellings on the jaw-bone of cattle and kangaroos, but has been found in pigs and human beings.

The fungi parasitic on plants are much better known and are responsible for a large number of diseases. They display every gradation from occasional to complete parasitism. Amongst the *Pyrenomycetes*, the group Erysipheae contain a large number of common parasites; the members of this usually parasitic group are formerly included under *Pyrenomycetes*, but are now more usually placed in *Sclerotinioseae*. The brushes, *Puccinia* of hemp, *Cuscuta* of hops, *Phanerogams*, the parasitic fungi and *Pyrenomycetes*, are all parasites of plants and are the most destructive enemies of agriculture and horticulture. *Phytophthora infestans* (de Bary), the potato-disease fungus, is a typical example.

The parasitic fungi have been found in Haedroids and Planarians referred to in connection with symbiosis and the small green algae that infect the hairs of sloths are on the borderline of parasitism. *Cuscuta* and *Sphagneticola* are intercellular parasites of other plants; *Chlorochytrium* is found in the tissues of *Lema*, and *Phyllotisphon arisiri* (Kühn) infects the parenchyma of *Arum arisugarum*.

Species of the *Sclerotinioseae* have a considerable number of representatives which have become epiphytes and which exhibit various degrees of parasitic degeneration. The *Monotropeeae* allied to the heaths, are degenerate, with no chlorophyll and with scale-like leaves. They bear their flowers on their stem, more or less pollinated; they are possibly only saprophytic. The allied *Linaceae*, a small group also devoid of chlorophyll and with scale-leaves, are true root-parasites.

The genus *Cuscuta* of the Convulvulaceae contains a considerable number of parasites known as dodders. They are destitute of true roots and attach themselves to other plants by twining stems on which occur haustoria that penetrate the tissues of the host and absorb nutritive material. *Cuscuta campestris*, the hop dodder, is a parasite of nettles and hops; *Cuscuta epilinus* is the flax dodder; *Cuscuta epithymum* attacks a number of low-growing plants; and *Cuscuta aridia* is very destructive to clover. Several genera of the Scrophulariaceae contain parasitic species, but have degenerate roots with haustoria. *Euphorbia*, the eye-bright, attacks the roots of grasses; *Pedicularis*, the lousewort, *Rhynchosia*, the rape, *Coronilla*, the broom, and *Raphanellus* the radish, are all true root-parasites on the roots of other plants. The *Orachoceneae* or bromptons, are all destitute of chlorophyll and have scale-leaves; they are parasitic on the roots of other plants, species attacking various Leguminosae, *J. c. Momenta* and *P. capensis*. The *Cytinaceae* are true parasites devoid of chlorophyll and leaves, with deformed bodies and conspicuous flowers or inflorescences. Most of them are tropical, and the group is widely scattered throughout the world. The *Santalaceae* are all parasitic; some members like *Thesium lineaphyllum* (the bastard toad-flax), a root parasite, and *Viscum album* (the mistletoe), parasitic on branches, have chlorophyll, but are exceedingly small. *Evonymus* and *Phillyrea* are all true root-parasites on the roots of other plants. The *Ombrophilaceae*, a few genera such as *Cassyla* (the tropical "dodder-barels," are true parasites, without chlorophyll and with twining stems.

**Effect of Parasitism on Parasites.**—The phenomena of parasitism occur so generally in the animal and vegetable kingdoms and are repeated in degrees so varying that no categorical statements can be laid down as to the effects produced on the organisms concerned. All living creatures have a certain degree of *correspondence* with one another; and every form of life, as it _is_ a disturbance or change in the ordinary _physical_ conditions of the organism, to which it is only a special case of such adaptation. The widest generalization that can be made regarding it is that parasitism tends towards a rigid adaptation to a relatively limited and stable environment, whilst free life tends towards a broader correspondence with a more varying environment. The *sumnum bonum* of a parasite is to reach and maintain existence in the limited conditions afforded by its host; the goal of the free-living organism is a varying or experimental fitness for varying surrounding conditions. And, if the metaphor be continued, the danger of parasitism for the parasite, is that it become too nicely adjusted to the special conditions of its host, and fail to attain these, it will inevitably perish. The degeneration of parasites is merely a more precise adaptation; in the favourable environment the degenerate, or specialized parasite is best equipped for successful existence, but the smallest change of environment is fatal. Such a generalization as has been formulated throws very little of the peculiarities of parasitism. A change in the habits of prehension are notably developed; parasitic plants do not have twining stems, boring roots and special clinging organs; parasitic animals display hooks, suckers and boring apparatus. The normal organs of locomotion tend to disappear, whether these be wings or walking legs. Organs of sense, the chief purpose of which is to make animals react quickly to changes in the environment, become degenerate in proportion as the changes the parasite may have to encounter are diminished. The changes correlated with nutrition equally conform with the generalization. The chlorophyll of the *Cuscuta* species changes to an amorphous state, so far that it is entirely degenerate. The *Sclerotinia* is not dead, but the old form of existence disappears, and it is no longer to thrust a spreading crown of leaves into the tenuous air or groping rootlets into the soil, but absorbs already prepared nourishment from the tissues of its host through compact conduits. And so the parasitic higher plant tends to lose its division into stem and leaves and roots, and to acquire a compact and amorphous body. The animal has no longer to seek its food, and the lithic segmentation of a body adapted for locomotion becomes replaced by a squar or insinuating form. Jaws give way to sucking and piercing tubes, the alimentary canal becomes simplified, or may disappear altogether, the parasite living in the juices of its host, and absorbing them through the skin. So, also, parasites retaining protection from the tissues of their host lose their intrinsic protective mechanisms.

The reproduction of parasites offers many peculiarities, all of which are readily correlated with our generalization. A creature rigidly adapted to a special environment fails if it does not reach that environment, and hence species most successful in reproduction are able to afford the largest number of misses to secure a few hits and so to maintain existence. High reproductive capacity is still more urgent when the parasites tend to bring to an end their own environment by killing their hosts. The parasitic fungi are in particular characterized by an exuberance of activity, and an extraordinary efficiency. In parasitic flowering plants the flowers tend to be highly conspicuous, the seeds to be numerous, and specially adapted to ready diffusion. Amongst the fungi, a phenomenon known as heteroecism is developed as a special adaptation to parasitic conditions, and recalls the similar adaptations in many animal parasites. At one stage of its existence, the fungus is adapted to one host, at another stage to another host. *Puccinia graminis*, the fungus rust affecting many grasses, is a typical instance. It inhabits wheat, rye and other grasses, developing a mycelium in the tissues of young plants. During the summer, the mycelium gives rise to large numbers of simple processes which break through the tissues of the host and bud off orange-coloured *uredogondid*. These small bodies are scattered by the wind, and reach other plants on which they germinate, enter the new host through the stomata and give rise to new mycelia. Towards autumn, when the tissues of the host are becoming hard and dry, darker-coloured *telurogonid* produced, and these remain quiescent during the winter. In spring they germinate, produce
small free-living mycelia on which in due course sporidia are formed. When these, scattered by the wind, fall on the leaf of the barberry-plant, they germinate, and entering the leaf-tissue of the new host by the stomata produce a mycelium bearing reproductive organs so different from those of the plant-parasite, that it was described as a distinct fungus (Accidium berberidis), before its relation with the rust of grasses was known. The spores of the Accidium when they reach grasses give rise to the Puccinio stage again.

The reproductive processes of animal parasites are equally exuberant. In the first place, hermaphroditism is very common, and the animals in many cases are capable of self-fertilization. Parthenogenetic reproduction and various forms of vegetative budding are found in all stages of the life-history of animal parasites. The prolificness of many parasites is almost incredible. R. Lückart pointed out that a human tapeworm has an average life of two years, and produces in that time about 1,500 proglottides, each containing between fifty and sixty thousand eggs, so that the single tapeworm has over eighty million chances of successfully reproducing its kind. The devices for nourishing and protecting the eggs and embryos are numerous and elaborate, and many complex cases of larval migration and complicated cases of heterocercous oviposition. (See Vertebrates and Tapeworm.)

The physiological adaptations of parasites are notably, especially in cases where the hosts are warm-blooded. The parasites tend to become specialized to be peculiar to particular hosts; ectoparasites frequently differ from species to species of host, and the fleas of one mammal, for instance, may rapidly die if it be transferred to another although similar host. The larval and adult stages of endoparasites become similarly specialized, and although there are many cases in which the parasites that excite a disease in one kind of animal are able to infect animals of different species, the general tendency is in the direction of absolute limitation of one parasite, and indeed one stage of one parasite to one kind of host. The series of events seems to be a gradual progression from temporary or occasional parasitism to obligatory parasitism and to a further restriction of the obligatory parasite to a particular kind of host.

Effect of Parasitism on Hosts.—The intensity of the effect of parasitism on the hosts of the parasites ranges from the slightest local injury to complete destruction. Most animals and plants harbour a number of parasites, and seem to be unaffected by them. On the other hand, as special knowledge increases, the range of the direct and indirect effect of parasites is seen to be greater. It is probable that in a majority of cases, the tissues of animals and plants resist the entrance of microbes unless there is some abrasion or wound. In the case of plants the actual local damage caused by an insect or vegetable ectoparasites may be insignificant, but the wounds afford a ready entrance to the spores or hyphae of destructive endoparasites. So also in the case of animals, it is probable that few microbes can enter the skin or penetrate the walls of the alimentary canal if these be undamaged. But as knowledge advances the indirect effect of parasites is seen to be of more and more importance. Through the wounds caused by biting-insects the microbes of various skin diseases and inflammations may gain entrance subsequently, or the insects may themselves be the carriers of the dangerous endoparasites, as in the cases of mosquitoes and malaria, fleas and plague, tsetse-flies and sleeping sickness. Similarly the wounds caused by small intestinal worms may be in themselves trifling, but afford a means of entrance to microbes. It has been shown, for instance, that there is an association between appendicitis and the presence of small nematodes. The latter wound the coecum and allow the microbes that set up the subsequent inflammation to reach their nidus. It has been suggested that the presence of similar wounding parasites precedes tubercular infection of the gut.

The parasites themselves may cause direct mechanical injury, and such injury is greatly aggravated where active reproduction takes place on or in the host, with larval migrations. A tangled mass of Ascarid worms may occlude the gut; masses of eggs, larvae or adults may block bloodvessels or cause pressure on important nerves. The irritation caused by the movements or the secretions of the parasites may set up a reaction in the tissues of the host leading to abnormal growths (e.g. Gall and Dendritic) or to periparasitic adenitis and aneurism, or the parasites may cause serious or fatal damage. The anaemia and other toxic substances from the tissues of the host may be insignificant even if the parasites are numerous, but it is notable that in many cases the effect is not merely that of causing an extra drain on the food-supply of the host which might be met by increased appetite. The action is frequently selective; particular substances, such as glycogen, are absorbed in quantities, or particular organs are specially attacked, with a consequent overthrow of the metabolic balance. Serious anaemia out of all proportion to the mass of parasites present is frequently produced, and the hosts become weak and fail to thrive. A. de Candolle made a special case which he has designated as "parasitic castration" and shown to be frequent amongst animal hosts. Sometimes by direct attacks on the primary sexual organs, and sometimes by secondary disturbance of metabolism, the presence of the parasites retards or inhibits sexual maturity, with the result that the secondary sexual characters fail to appear. The most usual and serious effect on the hosts of parasites is, however, the result of toxins liberated by them. (See Parasitic Diseases.)

For practical reasons the attacks of parasites have led to the development by the hosts of a great series of protective mechanisms. Such adaptations range from the presence of thickened skin, the replacement of hairs or spines, the discharge of waxy, sticky or slimy secretions, to the most elaborate reactions of the tissues of the host to the toxins liberated by the parasites.

History and Literature of Parasitism.—The history and literature of parasitism is inextricably involved with the history and literature of zoology, botany, medicine and pathology. Phin recognized the infusoria as a parasitic plant 400 years before the discovery of its reproduction by seed. Until the 18th century little more was done. In 1755 Pfeiffer in his treatise on Fungi Meliniensis and Bacteria (Eng. ed., 1867) remains the standard work. There is in it a large special literature on bacteriology. With regard to animal parasites, the first real steps in knowledge were the refutation of spontaneous generation (see Biogenesis). Linnaeus published a present of sheep from a free-living state, and although his particular observations were erroneous, they laid the foundation on which later observers worked, and pointed the way towards discovery of larval migrations and heterogeneous generation. Pr. Müller in 1773, and L. H. Boejan in 1864, showed that the crop of the 19th century reached more nearly to a correct interpretation.

J. J. Steenstrup in his famous monograph of which an English edition was published by the Ray Society in 1852 (On the Alternation of Generations, or the Propagation and Development of Animals through Alternate Generations) interpreted many scattered observations by a clear and coherent theory. Thereafter there was a steady and consistent progress, and the literature of animal parasites emerges in that of general zoology. The two best-known names are those of T. S. Cobbold (Entozoa: an Introduction to the Study of Helminthology, 1869) and R. Lückart (The Parasites of Man, ed. L. T. Linnemann, 2nd ed. London, 1868). The former describes the different types, and the latter adding enormously to scientific knowledge of the structure and life-history. Of more modern books, G. Fleming's Eng. ed. of L. G. Neumann's Parasites and "Parasitic Diseases of the Domestic Animals" are the two best-known names, and those of Braun's Animal Parasites of Man (1906), are the most comprehensive.

PARASNATH, a hill and place of Jain pilgrimage in British India, in Hazaribagh district, Bengal; 4480 ft. above the sea; 18 m. from Giridih station on the East Indian railway. It derives its name from the last of the twenty-four Jain saints, who is believed to have here attained nirvana or beatific annihilation. It is crowded with temples, some of recent date; and the scruples of the Jains have prevented it from being utilised as a sanatorium, for which purpose it is otherwise well adapted.
PARASOL—

PARASOL (Fr., from Ital. parasole: parare, to shield, and sole, sun), a sunshade, a light or small form of umbrella, covered with coloured silk or other material. In Japan and China gaily coloured parasols of paper stretched on bamboo frames are used by all classes. The parasol of an elaborate and highly ornamented type has been the symbol of high honour and office in the East, being borne over rulers, princes and nobles. The negro chiefs of West Africa reserve to themselves the privilege of bearing parasols of considerable size and substantial construction, the size varying and depending on the rank.

PARAVICINO, ARZTEGA, HORTENSIO FELIX (1580—1633), Spanish precentor and poet, was born at Madrid on the 12th of October 1580, was educated at the Jesuit college in Ocaña, and on the 18th of April 1600 joined the Trinitarian order. A sermon pronounced before Philip III. at Salamanca in 1603 brought Paravicino into notice; he rose to high posts in his order, was entrusted with important foreign missions, became royal precentor in 1616, and on the death of Philip III. in 1621 delivered a famous funeral oration which was the subject of acute controversy. He died at Madrid on the 12th of December 1633. His Ordinaciones cantoras (1628—1644) show that he was not without a vein of profane eloquence, but he often degenerates into vapid declamation, and indulges in far-fetched tropes and metaphors. His Obras posthumas, divinas y humanas (1641) include his devout and secular poems, as well as a play entitled Gridonis; his verse, like his prose, exaggerates the characteristic defects of Gongorism.

PARAY-LE-MONIAL, a town of east-central France in the department of Saone-et-Loire, 58 m. W.N.W. of Macon by the Paris—Lyons railway, on which it is a junction for Moulins, Lozanne, Clermont and Roanne. Pop. (1906), 3382. It lies on the slope of a hill on the right bank of the Saone, and is in the departmental line and has a post station on the Canal du Centre. The chief building in the town is the priory church of St. Pierre. Erected in the 12th century in the Romanesque style of Burgundy, it closely resembles the abbey church of Cluny in the length of the transepts, the height of the vaulting and the general plan. The town is the centre of a district important for its horse-raising; bricks, tiles and mosaics are the chief manufactures of the town. In the 10th century a Benedictine priory was founded at Paray-le-Monial. In the 16th century the town was an industrial centre, but its prosperity was retarded by the wars of religion and by the reason of the edict of Nantes. In the year 1666, the visions of Marguerite Marie Alacoque, a nun of the convent of the Visitation, who believed herself to possess the Sacred Heart of Jesus, attracted religious gatherings to the town, and yearly pilgrimages to Paray-le-Monial still take place.

PARCEL (Fr. parcelle, Ital. particella, Lat. particula, diminutive of pars, part), a small part or division of anything; particularly, in the law of real property and conveyancing, a portion of a manor or estate, and so the name of that portion of a legal document, such as a conveyance or lease relating to lands, which contains a description of the estate dealt with. The word is also used of a package of goods contained in a wrapping or cover for transmission by carriage, &c., or by post; hence the term "parcel-post" for the branch of the post-office service which deals with the transmission of such packages. "Parcel" was formerly used in an adverbial or quasi-adverbial sense, meaning "partly," "to some extent," thus "parcel-Protestant," "parcel-lawyer," &c. This use survives in "parcel-gilt," i.e. partly gilt, a term applied to articles made of silver with a gilt lining.

PARCHIM (Parchem), a town of Germany, in the grand duchy of Mecklenburg-Schwerin, on the Elbe, which flows through it in two arms, 23 m. S.E. of Schwerin, on the railway from Ludwigslust to Neubrandenburg. Pop. (1905), 10,397. It was the birthplace of Molte, to whom a monument was erected in 1876. It is an ancient place surrounded with walls, and contains a Gothic town hall and two interesting churches. Founded about 1210, Parchim was during part of the 14th century the residence of one branch of the family of the dukes of Mecklenburg. It became a prosperous industrial town during the 16th century, but this prosperity was destroyed by the Thirty Years' War. A revival, however, set in during the 19th century.

See Hübbe, Zur topographischen Entwicklung der Stadt Parchim (Parchim, 1899); and Weltziehen, Zur Geschichte Parchims (Parchim, 1903).

PARCHEMENT. Skins of certain animals, prepared after particular methods, have supplied writing material on which has been inscribed the literature of centuries. Such a durable substance in most cases easily obtainable in fair abundance, would naturally suggest itself for the purpose, and we are therefore prepared for evidence of its use, and also for the survival of actual specimens, from very ancient times. The tradition of the employment of skins as writing material by the ancient Egyptians is to be traced back to the period of the Pharaohs of the IVth Dynasty; and in the British Museum and elsewhere there exist skin-rolls which date back to some 1500 years B.C. But the country which not only manufactured but also exported in abundance the writing material made from the papyrus plant (see PAUPUS) hardly needed to make use of any other material, and the fact, notes that the skins inscribed in Egypt must at all times have been rare. But in western Asia the practice of using skins as writing material must have been widespread even at a very early period. The Jews made use of them for their sacred books, and it may be presumed for other literature also; and the old tradition has been maintained by this conservative race down to our own day, requiring the synagogue rolls to be inscribed on this time-honoured material. No doubt their neighbours the Phoenicians, so ready to adapt the customs of other nations to their own advantage, would also have followed the same practice. The Persians imitated their annals on skins; and skins were employed by the Ionian Greeks, as proved by the words of Herodotus (v. 58). There is no evidence forthcoming that the same usage was followed by the western Greeks and by the Italian tribes; but it is difficult to suppose that at a remote period, before the importation of papyrus, such an obviously convenient writing material as skin was not used among the early civilized races of Greece and Italy.

The method of preparation of skins for the service of literature in those distant ages is unknown to us; but it may be assumed that any other material, and the fact, notes that the skins prepared by the ancient Egyptians and of the papyrus plant were made of the finest reed, in the river Nile, and were dried in the sun. It is not thought that skins were ever used for writing purposes, but some say that parchment was made from the skin of the opossum, a small animal found in the United States (see PARCHMENT). Parchment is the thickness of the animal and so is, or as other than a popular explanation of a great development of the manufacture of skin material for books in the reign of Eumenes. In former times the prepared skins had been known by the natural titles δέρματα, μεμορφα, the Latin membranae, and these were at first also attached to the new manufacture; but the latter soon received a special name after the place of its origin, and became known as pergamenum, charta pergamenta, a term which descends from the English term parchment through the French parchemin. The title of pergamenus actually appears first in the edict De pretios eorum of Diocletian (A.D. 301), and in a passage in one of St. Jerome's Epistles.

The principal improvement in the new manufacture was the dressing of the skins in such a way as to render them capable of receiving writing on both sides, the older methods probably treating only one side for the purpose, a practice which was sufficient in times when the roll was the ordinary form of book
and when it was not customary to write on the back as well as on the face of the material. The invention of parchment with its two surfaces, recto and verso, equally available for the scribe, ensured the development of the codex. (See MANUSCRIPT.)

The animals whose skins were found appropriate for the manufacture of the new parchment were chiefly sheep, goats and calves. But in course of time there has arisen a distinction between the thicker and finer qualities of the material; and, while parchment made from ordinary skins of sheep and goats continued to bear the name, the finer kinds of manufacture produced from the more delicate skins of the calf or kid, or of still-born or newly-born calves or lambs, came to be generally known as vellum (Fr. velin). The skin codices of the early and middle ages being for the most part composed of the finer kinds of material, it has become the custom to describe them as of vellum, although in some instances it would be more correct to call the material parchment.

The ordinary modern process of preparing the skins is by washing, liming, unhauling, scraping, washing a second time, stretching evenly on a frame, scraping a second time and paring down inequalities, dusting with sifted chalk and rubbing with pumice. Somewhat similar methods, no doubt varying in details, must have been employed from the first.

The comparatively large number of ancient and medieval MSS. that have survived enables us to gather some knowledge of the varieties of the material in different periods and in different countries. We know from references in Roman authors that parchment or vellum was entering into competition with papyrus as a writing material at least as early as the 2nd century of our era (see MANUSCRIPTS), though at that time it was probably not so skilfully prepared as to be a dangerous rival. But the surviving examples of the 3rd and 4th centuries show that a rapid improvement must almost at once have been effected, for the vellum of that age is generally of a thin and delicate texture, firm and crisp, with a smooth and glossy surface. Here it should be noticed that there was always, and in some periods and in some countries more than in others, a difference in colour between the surface of the skin from which the hair had been removed and the inner surface next to the flesh of the animal, the latter being whiter than the other. This difference is generally more noticeable in the older examples, those of a later period having usually been treated more thoroughly with chalk and pumice. To obviate any unsightly contrast, it was customary, when making up the quires for a volume, to lay hair-side next to hair-side and flesh-side to flesh-side, so that, at whatever place the codex was opened, the tint of the open pages should be uniform.

As a rule, the vellum of early MSS., down to and including the 6th century, is of good quality and well prepared. After this, the demand increasing, a greater amount of inferior material came into the market. The manufacture necessarily varied in different countries. In Ireland and England the vellum of the early MSS. is usually of stouter quality than that of foreign examples. In Italy and Greece and in the European countries generally bordering on the Mediterranean, a highly polished surface came into favour in the middle ages, with the ill effect that the hardness of the material resisted absorption, and that there was always a tendency for ink and paint to flake off. On the other hand, in western Europe a soft pliant vellum was in vogue for the better classes of MSS. from the 11th century onwards. In the period of the Italian Renaissance a material of extreme whiteness and purity was affected. Examples of uterine vellum, prepared from still-born or newly-born young, are met with in choice volumes. A remarkable instance of a codex composed of this delicate substance is the Additional MS. 23535, of the 13th and 14th centuries, in the British Museum, which is made up of as many as 579 leaves, without being a volume of abnormal bulk.

In conclusion, we must briefly notice the employment of vellum of a sumptuous character to add splendour to specially choice codices of the early middle ages. The art of dyeing the material with a rich purple colour was practised both in Constantinople and in Rome; and, at least as far back as the 3rd century, MSS., generally of the Scriptures, were produced written in silver and gold on the precious stained vellum: a useless luxury, denounced by St Jerome in a well-known passage in his preface to the Book of Job. A certain number of early examples still survive, in Italy or Greece or both as the Acts of the Apostles in the Old Latin version at Verona of the 4th or 5th century; the celebrated codex of Genesis in the Imperial Library at Vienna; the Rotssano MS. and the Patmos MS. of the Gospels in Greek; the Gothic Gospels of Uffilas at Upsala, and others, of the 6th century, besides a few somewhat later specimens. In the revival of learning under Charlemagne a further encouragement was given to the production of such codices; but soon afterwards the art of purple-staining appears to have been lost or abandoned. A last trace of it is found in a few isolated instances of stained vellum leaves inserted for ornament in MSS. of the period of the Renaissance.

AUTHORITIES.—Particulars of the early manufacture and use of parchment and vellum are to be found in most of the handbooks on palaeography and book-development, such as W. Wattenbach, Das Schriftwesen im Mittelalter (3rd ed., 1896); G. Birt, Das antike Buchwesen (1882); Sir E. M. Thompson, Handbook of Greek and Latin Palaeography (2nd ed., 1892). See also La Lande, Art de faire le parchemin (1762); G. Peignot, Essai sur l’histoire du parchemin et du velin (1812); A. Watt, The Art of Leather Manufacture (1885). (E. M. T.)

PARCLOUSE—PARDESSUS, J. M.

PARCLOUSE (from the O. Fr. parcolere, to close thoroughly; Lat. closeulare), an architectural term for a screen or railing used to enclose a chantry, tomb, chapel, &c., in a church, and for the space so enclosed.

PARDAILLAN, the name of an old French family of Armagnac, of which several members distinguished themselves in the service of the kings of France in the 16th and 17th centuries. Antoine Arnaud de Pardailhan, maréchal de camp, served Henry IV. in Franche-Comté, Picardy and Savoy, and was created marquis de Montespans in 1612 and marquis d’Antin in 1615 under Louis XIII. His grandson Louis Henri, marquis de Montespans, was the husband of Mme de Montespans, the mistress of Louis XIV. Louis Antoine de Pardaillan de Gondrin (1665—1736), legitimate son of the famous marquise, became lieutenant-general of the armies of the king in 1702, governor of the Île d’Orléans, director-general of buildings in 1708, lieutenant-general in Alsace, member of the council of regency, and minister of state. He was created duc d’Antin in 1711. The last duc d’Antin, Louis, died in 1757.

PARDESSUS, JEAN MARIE (1777—1853), French lawyer, was born at Blois on the 11th of August 1772. He was educated by the Oratorians, and then studied law, at first under his father, a lawyer at the Présidial, who was a pupil of Robert J. Pothier. In 1796, after the Terror, he married, but his wife died at the end of three years. He was thus a widower at the age of twenty-seven, but refused to remarry and so give his children a step-mother. He wrote a Traité des séances (1806), which went through eight editions, then a Traité du contrat et des lettres de change (1809), which pointed him out as fitted for the chair of commercial law recently formed at the faculty of law at Paris. The emperor, however, had insisted that the position should be open to competition. Pardessus entered (1810) and was successful over two other candidates, André M. J. J. Dupin and Persil, who afterwards became brilliant lawyers. His lectures were published under the title Cours de droit commercial (4 vols., 1823—1837). In 1815 Pardessus was elected deputy for the department of Loir-et-Cher, and from 1820 to 1829 was constantly re-elected: then, however, he refused to take the oath of allegiance to Louis Philippe, and was deprived of his office. After the publication of the first volume of his Collection des lois maritimes antérieures au xviiie siècle (1828) he was elected a member of the Académie des Inscriptions et Belles Lettres. He continued his collection of maritime laws (4 vols., 1828—1845), and published Les Us et coutumes de la mer (2 vols., 1847). He also brought out two volumes of Merovingian diplomas (Diplomia, chartae, epistolae, leges, 1843—1845); and vol. iv—vi. of the Table chronologique des diplômes; and
PARDON (through the Fr. from Late Lat. perdnone, to remit a debt or other obligation on a penalty), the remission, by the power entrusted with the execution of the laws, of the penalty attached to a crime. The right of pardoning is coextensive with the right of forgiving. In a perfect legal system, says Beccaria, pardons should be excluded, for the clemency of the prince seems a tacit disapprobation of the laws (Del Delitto e delle pene, ch. xx.).

In practice the prerogative is extremely valuable, when used with discretion, as a means of adjusting the different degrees of moral guilt in crimes or of rectifying a miscarriage of justice. By the law of England pardon is the sole prerogative of the king, and it is declared by 27 Hen. VIII. c. 24 that no other person has power to pardon or remit any treasons or felonies whatsoever. This position follows logically from the theory of English law that all offences are breaches of the king's peace. Indictments still conclude with a statement that the offence was committed "against the peace of our lord king, his crown and dignity." The Crown by pardon only remits the penalty for an attack upon itself. The prerogative is in modern times exercised by delegation, the Crown acting upon the representation of the secretary of state for the home department in Great Britain, or of the lord lieutenant in Ireland. The prerogative of the Crown is subject to some restrictions: (1) The committing of a subject of the realm to a prison out of the realm is by the Habeas Corpus Act a praemunire, unpardonable even by the king (31 Car. II. c. 2, § 12). (2) The king cannot pardon an offence in a matter of private rather than of public wrong, so as to prejudice the person injured by the offence. Thus a common nuisance cannot be pardoned while it remains unredressed, or so as to prevent an abatement of it. A fine or penalty imposed for the offence may, however, be remitted. By an act of 1830 (22 Vict. c. 32) his majesty is enabled to remit wholly or in part any sum of money imposed upon conviction, and, if the offender has been imprisoned in default of payment, to extend to him the royal mercy. There are other statutes dealing with special offences, e.g. by the Remission of Penalties Act 1875 his majesty may remit any penalty imposed under 21 Geo. III. c. 49 (an act for preventing certain abuses and profanations on the Lord's Day called Sunday). (3) The king's pardon cannot be pleaded in bar of an impeachment. This principle, first asserted by a resolution of the House of Commons in the case of Danby's case (May 5, 1679), forms one of the provisions of the Act of Settlement, 12 & 13 Will. III. c. 2. It is there enacted "that no pardon under the great seal of England shall be pleadable to an impeachment by the Commons in parliament," § 3. This proviso does not extend to abridging the prerogative after the impeachment has been heard and determined. Thus three of the rebel lords were pardoned after impeachment and attainted in 1715. (4) In the case of treason, murder or rape a pardon is ineffectual unless the offence be particularly specified therein (13 Rich. II. c. 1, § 3). Before the Bill of Rights, 29 & 30 Geo. II. c. 2, § 2, this statute seems to have been frequently evaded by a non obstante clause. But, since by the Bill of Rights no dispensation by non obstante is allowed, general words contrary to the statute of Richard II. would seem to be ineffectual.

Pardon may be actual or constructive. Actual pardon is by warrant under the great seal, or under the sign-manual countersigned by a secretary of state (7 & 8 Geo. IV. c. 28, § 13). Constructive pardon is obtained by endurance of the punishment. By 9 Geo. IV. c. 32, § 3, the endurance of a punishment on conviction of a felony not capital has the same effect as a pardon under the great seal. This principle is reaffirmed in the Larceny Act 1861, § 309, and in the Malicious Injuries to Property Act 1861, § 67. Further, pardon may be free or conditional. A conditional pardon most commonly occurs where an offender sentenced to death has his sentence commuted to penal servitude or any less punishment. The condition of his pardon is the endurance by him of the substituted punishment. The effect of pardon, whether actual or constructive, is to put the person pardoned in the position of an innocent man, so that he may have

See further, on the ethical aspect, Montesquieu, Esprit des lois, bk. vi. ch. 21; Bentham, Principles of Penal Law, bk. vi. ch. 4.
an action against any one thenceforth calling him traitor or felon. He cannot refuse to give evidence respecting the offence so as to lead to his conviction. A pardon may be granted by way of new trial, or in lieu of imprisonment, or in lieu of any other punishment. It may be unconditional or conditional upon the pardon being accepted. If accepted, it is final; if refused, the punishment must be resumed.

It is obvious that, though the Crown is invested with the right to pardon, this does not prevent pardon being granted by the higher authority of an act of parliament. Acts of indemnity and amnesties have been passed, the effect of which is the same as a pardon or remission of the Crown. Examples of acts of indemnity are two private acts passed in 1880 to relieve Lords Byron and Plunket from the disabilities and penalties to which they were liable for sitting and voting in the House of Peers without taking the oath.

Civil rights are not divested by pardon. The person injured may have a right of action against the offender in spite of the pardon of the latter, if the right of action has once vested, for the Crown cannot affect private rights. In Scotland this right is specially preserved by various statutes. Thus 1503, c. 174, provides that, if any respite or remission happen to be granted before the party griev'd be first satisfied, the same is null and of none avail. The action, or act of indemnification, due to the heirs of the person murdered from the murderer, is due if the murderer has received pardon, though not if he has suffered the penalty of the law. The pardon transmitted by the secretary of state is applied by the supreme court, who grant the necessary orders to the magistrates in whose custody the convict is

In the United States the president is empowered to pardon offences against the United States, except in cases of impeachments (U.S. Constitution, art. ii. § 2). The power of pardon is also vested in the executive authority of the different states, although in some states there are boards of pardon of which the governor is a member ex officio. Thus by the New York Code of Criminal Procedure the governor of the state of New York has power to grant reprieves, commutations and pardons, except in the case of treason, where he can only suspend the execution of the sentence until the case can be reported to the legislature, with whom the power of pardon in this case rests. The usual form of pardon in the United States is by deed under seal of the executive.

PARDUBITZ (Czech, Pardubice), a town of Bohemia, Austria, 65 m. N.E. of Prague by rail. Pop. (1900), 17,620, mostly Czech. The most interesting buildings are the old fortified chateau of the 16th century, with its Gothic church restored in 1880; the church of St Bartholomew, dating in its present form from 1538; the new town hall (1894); the Grünes Tor, also built in 1538; and the handsome new synagogue. Pardubitz has a tolerably active trade in grain and timber, and the horse-fairs attract numerous customers.

PARE, AMBROISE (1516–1590), French surgeon, was born at Laval, in the province of Maine, and died at Paris in 1590. His professional career and services to his art are described in the biographical collection of his works was published at Paris in 1575 and they were afterwards frequently reprinted. Several editions have appeared in German and Dutch, and among the English translations was that of Thomas Johnson (1665).

See J. F. Malgaigne, Œuvres complètes (Paris, 1830); Le Paulmier, Ambroise Paré d'après de nouveaux documents découverts aux archives nationales et de papiers de famille (Paris, 1885); Stephen Paget, Ambroise Paré and his Times (London, 1897).

PAREJA, JUAN DE (1606–1670), Spanish painter, was born a slave in the West Indies about 1606, and in early life passed into the service of Velázquez, who employed him in copying and grinding and other menial work of the studio. By day he closely watched his master's methods, and by night stealthily practised with his brushes until he had attained considerable manipulative skill. The story goes that, having succeeded in producing a picture satisfactory to himself, he contrived surreptitiously to place it among those on which Velázquez had been working, immediately before an expected visit of King Philip IV. The performance was duly discovered and praised, and Pareja forthwith received his freedom, which, however, he continued to devote to his former employer's service. His extant works are not very numerous; the best known, the " Calling of St. Matthew," now in the Prado, Madrid, has considerable merit as regards technique, but does not reveal much originality, insight or devotional feeling. He died in 1670.

PARENT, SIMON NAPOLEON (1855– ), Canadian politician, son of Simon Polycarpe Parent, merchant, was born in the village of Beaufort, in the province of Quebec, on the 23rd of September 1855. He was educated at Laval University, where he graduated in 1881. In the same year he was called to the bar of the province of Quebec. He married in 1877 Marie Louise Clara Gendron, of Beaufort. In 1890 Parent was elected a member of the municipal council of Quebec, and served as mayor of the city from 1894 to 1906. From the year 1890 to 1905 he represented the county of Saint-Sauveur as a Liberal in the legislature of his native province, and on the formation of the Marchand administration in 1897 he accepted the position of minister of lands, forests and fisheries. After Marchand's resignation Parent was called upon to form a cabinet, and continued in office as prime minister until his retirement from public life in August 1905. Parent proved a capable administrator of provincial and municipal affairs. Under his administration the finances of the city of Quebec were improved, an electric car service was provided, public parks were opened, a system of electric light was established and the streets were well paved. In 1905 he became chairman of the Transcontinental railway of Canada.

PARENTHESES (from Gr. παρενθέσεις, put in alongside), the grammatical term denoting the insertion (and so also the signs for such insertion) of a word, phrase or sentence between other words or in another sentence, without interfering with the construction, and serving a qualifying, explanatory or supplemen-
tary purpose. In writing or printing such parenthetical words or sentences are marked off by commas, dashes, or, more usually, by square or semi-circular brackets.

PARENZO, a seaport of Austria, in Istria, 93 m. S. by W. of Trieste by rail. Pop. (1900), 9662, mostly Italian. It is situated on the west coast of Istria, and is built on a peninsula nowhere more than 5 ft. above the sea-level; and from the fact that the pavements of the Roman period are 3 ft. below the present surface, it is inferred that this part of the coast is slowly subsiding. Parenzo has considerable historic and architectural interest, and its well-preserved cathedral of St. Mauritius, erected probably between 535 and 543, is one of the most interesting buildings in the whole of Austria. The basilica type is very pure; there are three naves; the apse is hexagonal without and round within. The total length of the church proper is only 120 ft.; but in front of the west entrance is a square atrium with three arches on each side; to the west of the atrium is a new roofless baptistery, and to the west of that rises the campanile; so that the total length from campanile to apse is about 230 ft. Mosaics, now greatly spoiled, form the chief decoration of the building. The high altar is covered with a noble baldachin, dating from 1277. The basilica is one of those churches in which the priest when celebrating mass stands behind the altar with his face to the west. An older church is referred to in the inscription of Euphrasius in the mosaic of the apse of the cathedral, and remains of its mosaic pavement and of its apse have been found under the floor of the present church; it belongs perhaps to the 5th century A.D.; while at a still lower level another pavement, perhaps of the 4th century A.D., has been discovered, belonging to the first church, which lay to the north of the present. Several inscriptions mention the name of St. Zeno. The mosaic pavement of the present church was almost entirely destroyed in 1880, when the floor-level was raised. Small portions of two temples and an inscribed stone are the only remains of the ancient Roman city that
PARGA—PARINI

readily catch the eye. Parenzo is the seat of the Provincial Diet of Istria, and is also an episcopal see.

Parenzo (Lat. Parentium), conquered by the Romans in 178 B.C., was made a colony probably by Augustus after the battle of Actium, for its title in inscriptions is Colonia Julia and not, as it has often been given, Colonia Ulpia. It grew to be a place of some note with about 6000 inhabitants within its walls and 10,000 in its suburbs. The bishopric, founded in 524, gradually acquired ecclesiastical authority over a large number of abbeys and other foundations in the surrounding country. The city, which had long been under the influence of Venice, formally recognized Venetian supremacy in 1267, and as a Venetian town it was in 1354 attacked and plundered by Paganino Doris of Genoa. The bishoprics of Pola and Parenzo were united in 1827.

See John Mason Neale, Notes on Dalmatia, Istria, &c. (London, 1861), with ground plan of cathedral; E. A. Freeman, Sketches from the Subject and Neighbour Lands of Venice (London, 1881); and Neumann, Der Dom von Parenzo (Vienna, 1902).

PARGA, a seaport of Albania, European Turkey, in the vilayet of Iannina, and on the Ionian Sea. Pop. (1905), about 500, of whom the majority are Greeks. Parga has a rock-built citadel and a harbour formed by a mole which the Venetians constructed in 1572. It exports citrons, wool, oak, bark and skins. Originally occupying the site of the ancient Tornyoe (or Palaeo-Parga), a short distance to the west, Parga was removed to its present position after the Turkish invasion in the 15th century. Under Venetian protection, freely accepted in 1401, the inhabitants maintained their municipal independence and commercial prosperity down to the destruction of the Venetian republic in 1797, though on two occasions, in 1500 and 1560, their city was burned by the Turks. The attempts of Ali Pasha of Iannina to make himself master of the place were thwarted partly by the presence of a French garrison in the citadel and partly by the heroic attitude of the Pargiotes themselves, who were anxious to have their city incorporated with the Ionian Republic. To secure their purpose they in 1814 expelled the French garrison and accepted British protection; but the British Government in 1815 determined to go back to the convention of 1800 by which Parga was to be surrendered to Turkey, though no mosque was to be built or Mussulman to settle within its territory. Rather than subject themselves to the tyranny of Ali Pasha, the Pargiotes decided to forsake their country; and accordingly in 1819, having previously exhume and burned the remains of their ancestors, they migrated to the Ionian Islands. The Turkish government was constrained to pay them £14,425 by way of compensation.

PARGETING (from O. Fr. pargerer or parjeter; par, all over, and jeter, to throw, i.e. "rough cast"); other derivations suggested have been from Lat. parare, to prepare, and from pari, at wall, the last due to writing the pariet in the form parici, a term applied to the decoration in relief of the plastering between the stuccowork on the outside of half-timber buildings, or sometimes covering the whole wall. The devices were stamped on the wet plaster. This seems generally to have been done by sticking a number of pins in a board in certain lines or curves, and then pressing on the wet plaster in various directions, so as to form geometrical figures. Sometimes these devices are in relief, and in the time of Elizabeth represent figures, birds, foliage, &c.; fine examples are to be seen at Ipswich, Maidstone, Newark, &c. See Tassie (264) &c. but the lining of the inside of smoke flues to form an even surface for the passage of the smoke.

PARIAH, a name long adopted in European usage for the "outcasts" of India. Strictly speaking the Paraiyans are the agricultural labourer caste of the Tamil country in Madras, and are by no means the lowest of the low. The majority are ploughmen, formerly adscripti glebae, but some of them are weavers, and no less than 350 subdivisions have been distinguished. The name can be traced back to inscriptions of the 11th century, and the "Parish poet," Tiruvalluvar, author of the famous Tamil poem, the Kural, probably lived at about that time. The accepted derivation of the word is from the Tamil parai, the large drum of which the Paraiyans are the hereditary beaters at festivals, &c. In 1901 the total number of Paraiyans in all India was 2½ millions, almost confined to the south of Madras. In the Telugu country their place is taken by the Malas, in the Kanarese country by the Holeyas and in the Decan by the Makkha. Some of their privileges and duties seem to show that they represent the original owners of the land, subjected by a conquering race. The Paraiyahs supplied a notable proportion of Clive’s sepoys, and are still enlisted in the Madras sappers and miners. They have always acted as domestic servants to Europeans. That they are not deficient in intelligence is proved by the high position which some of them, when converted to Christianity, have occupied in the professions. In modern official usage the "outcasts" generally are termed Panchamas in Madras, and special efforts are made for their education.

See Caldwell, Comparative Grammar of the Dravidian Languages (pp. 540-554), and the Madras Census Reports for 1891 and 1901.

PARIAH DOG, a dog of a domesticated breed that has reverted, in a greater or less degree, to a half-wild condition. Troops of such dogs are found in the towns and villages of Eastern Europe, Asia and Africa; and they probably interbreed with wolves, jackals and wild dogs. The Indian breed is near akin to the Australian dingo.

PARIAN CHRONICLE (Chronicon or Marmor Parium), a marble tablet found in the island of Paros in 1627, now among the Arundel Marbles at Oxford. It originally embraced an outline of Greek history from the legendary king of Athens, down to the archonship of Diognetus at Athens (264 B.C.). The Chronicle seems to have been set up by a private person, but, as the opening of the inscription has perished, we do not know the occasion or motives which prompted the step. The author of the Chronicle has given much attention to the festivals, and to poetry and music; thus he has recorded the dates of the establishment of festivals, of the introduction of various kinds of poetry, the births and deaths of the poets, and their victories in contests of poetic skill. On the other hand, important political and military events are often entirely omitted; thus the return of the Heraclidae, Eucrates, the wars of Messene, Draco, Solon, Cleisthenes, Pericles, the Peloponnesian War and the Thirty Tyrants are not even mentioned. The years are reckoned backwards from the archonship of Diognetus, and the dates are further specified by the kings and archons of Athens. The reckoning by Olympiads is not employed. The Chronicle consists of 93 lines, written chiefly in the Attic dialect.

PARINI, GIUSEPPE (1729-1799), Italian poet, was born at Bosio in the Milanese, on the 22nd of May 1729. His parents, who possessed a small farm on the shore of Lake Pusiano, sent him to Milan, where he studied under the Barnabites in the Archivio, maintaining himself latterly by copying manuscripts. In 1752 he published at Lugano, under the pseudonym of Ripano Eupilino, a small volume of sciolto verse which secured his election to the Accademia dei Trasformati at Milan and to that of the Arcadi at Rome. His poem, II Mattino, which was published in 1763, and which marked a distinct advance in Italian blank verse, consisted of ironical instructions to a young nobleman as to the best method of spending his mornings. It at once established Parini's popularity and influence, and two years later a continuation of the same theme was published under the title Bravi consigli. The Austrian plenipotentiary, Count Pergenzer, interested himself in procuring the poet's advance appointment, in the
PARIS—F. DE

first place, editor of the Milan Gazzette, and in 1769, in despite of the Jesuïts, to a specially created chair of belles lettres in the Palatine School. On the French occupation of Milan he was appointed magistrate by Napoleon and Saliceti, but immediately retired to resume his literary work and to complete Il Vespro and La Notte (published after his death), which with the two other poems already mentioned compose what is collectively entitled Il Giorno. Among his other poems his rather artificial Odi, composed between 1757 and 1795, have appeared in various editions. He died on the 15th of August 1799.

His works, edited by Reina, were published in 6 vols. 8vo (Milan, 1861-1864); and an excellent critical edition by G. Mazzoni appeared at Florence in 1897.

PARIS (also called Alexandria), in Greek legend, the son of Priam, king of Troy, and his niece. Before he was born his mother was threatened with death by the gods, so that she was delivered of a firebrand. The dream was interpreted that her child would ruin his country, and when Paris was born he was exposed on Mt Ida. His life was saved by the herdsman, and he grew up among them, distinguished for beauty and strength, till he was recognized and received by his parents. He was said to have been called Alexandria from his bravery in defending the herds against raiders. When the strife arose at the marriage of Peleus and Thetis between Hera, Athena and Aphrodite, each claiming the apple that should belong to the most beautiful, Paris was selected as the judge. The three gods unveiled their divine charms before a mortal judge on Mt Ida. Each tried to bribe the judge, Hera by promising power, Athena wisdom, Aphrodite the most beautiful woman in the world. Paris decided in favour of Aphrodite, and thus made Hera and Athena bitter enemies of his country (Hom. Iliad, xxiv. 25; Euripides, Troades, 925; Andromache, 284; Helena, 23). To gain the woman whom Aphrodite had promised, Paris set sail for Lacedaemon, deserting his old love Oenone, daughter of the river-god Cebren, who in vain warned him of the consequences. He was hospitably received by Menelaus, whose kindness he repaid by persuading his wife Helen to flee with him to Troy (Iliad, vi. 296). The siege of Troy by the united Greeks followed. Paris proved a lazy and backward fighter, though not wanting in actual courage when he could be roused to exert himself. Before the capture of the city he was mortally wounded by Philoctetes with an arrow (Sphocheles, Philoctetes, 1426). He then bethought him of the slighted nymph Oenone, who he knew could heal the wound. He was carried into her presence, but she refused to save him. Afterwards, when she found he was dead, she committed suicide (Apothoëus ii. 12). The judgment of Paris became a favourite subject in Greek art. Paris is represented as a beautiful young man, beardless, wearing the pointed Phrygian cap, and often holding the apple in his hand. (See Paris, Alexis Paulin.)

PARIS, ALEXIS PAULIN (1800-1881), French savant, was born at Avenay (Marne) on the 23rd of March 1800. He published in 1824 an Apologie pour l'école romantique, and took an active part in Parisian journalism. His appointment, in 1828, to the department of manuscripts in the Bibliothèque royale left him leisure to pursue his studies in medieval French literature. Paulin Paris lived before minute methods of research had been generally applied to modern literature, and his chief merit is that by his numerous editions of early French poems he continued the work begun by Dominique Méron in arousing general interest in the then little-known epics of chivalry. Admitted to the Académie des Inscriptions et Belles Lettres in 1837, he was shortly afterwards appointed on the commission entrusted with the continuation of the Histoire littéraire de la France. In 1853 a chair of medieval literature was founded at the Collège de France, and Paulin Paris became the first occupant. He retired in 1872 with the title of honorary professor, and was promoted officer of the Legion of Honour in the next year. He died on the 13th of February 1881 in Paris.

His works include: Manuscrits français de la bibliothèque du roi (7 vols., 1836-1848); Les Romains de Gaar le Loherain, précédé d'un examen des romans carolingiens (1883-1885); Les Romans de Bonte aux grands pêts (1832); Le Romancier français, histoire de quelques anciens trouvères et choix de leurs chansons (1853); an edition of the Grandes chroniques de France (1856-1860); La Chanson d'Antioche (1857); Les Aventures de maître Renart et d'Ysengrin (1861) and Les Romains de la table ronde (1868-1877), both put into modern French.

PARIS, BRUNO PAULIN GASTON (1839-1903), French scholar, son of Paulin Paris, was born at Avenay (Marne) on the 9th of August 1839. In his childhood Gaston Paris learned to appreciate the Old French romances as poems and stories, and this early impulse to the study of Romance literature was placed on a solid basis by courses of study at Bonn (1856-1857) under Friedrich Diez, at Göttingen (1857-1858) and finally at the École des Chartes (1858-1861). His first important work was an Étude sur le rôle de l'accent latin dans la langue française (1862). It was followed by a long course of lectures in his Lettre à M. Léon Gautier sur la versification latine rhymique (1866). Gaston Paris maintained that French versification was a natural development of popular Latin methods which depended on accent rather than quantity, and were as widely different from classical rules as the Low Latin was from the classical idiom. For his degree as doctor he presented a thesis on the Histoire poétique de Charlemagne (1862). He succeeded his father as professor of medieval French literature at the Collège de France in 1872; in 1876 he was admitted to the Academy of Inscriptions and in 1896 to the French Academy; and in 1895 he was appointed vacant chair of the Collège de France. Gaston Paris possessed a European reputation as a Romance scholar. He had learned the German methods of exact research, but besides being an accurate philologist he was a literary critic of great acumen and breadth of view, and brought a singularly clear mind to bear on his favourite study of medieval French literature. His Vie de Saint-Alexis (1872) broke new ground and provided a model for future editors of medieval texts. It included the original text and the variations of it dating from the 12th, 13th and 14th centuries. Gaston Paris contributed largely to the Histoire littéraire de la France, and with Paul Meyer published Romance, a journal devoted to the study of Romance literature. Among his other numerous works may be mentioned Les Plus anciens monuments de la langue française (1875); a Manuel d'ancien Français (1888); an edition of the Mystère de la passion d'Arnoul Greban (1878), in collaboration with M. Gaston Raynaud; Deux rédactions du roman des sept sages de Rome (1876); a translation of the Grammaire des langues romanes (1874-1878) of Friedrich Diez, in collaboration with MM. Brachet and Morel-Fatio. Among his works of a more popular nature are La Poésie du moyen âge (1883 and 1903); Penseurs et poètes (1897); Poèmes et légendes du moyen âge (1900); François Villon (1901), an admirable monograph contributed to the Grandes Écrivains de France; Légendes (1902). His highly compressed but very full summary of medieval French literature forms a volume of the Temple Primers. Gaston Paris endeared himself to a wide circle of scholars outside his own country by his unfailing urbanity and generosity. In France itself he trained at the École des Chartes and the Collège de France a band of disciples who continued the traditions of exact research that he established. Among them were: Léopold Pannier; Marius Sepet, the author of Le Drame chrétien au moyen âge (1878) and of the Origines catholiques du théâtre moderne (1901); Charles Joret; Alfred Morel-Fatio; Gaston Raynaud, who is responsible for various volumes of the excellent editions published by the Société des anciens textes français; Arsène Darmesteter and others. Gaston Paris died in Paris on the 6th of March 1903.

See “Hommage à Gaston Paris” (1903), the opening lecture by his successor, Joseph Bédier, in the chair of medieval literature at the Collège de France; A. Thomas, Essais de philologie française (1897); W. F. Ker, in the Forthnightly Review (July, 1904); M. Croiset, Nouvelles parisiennes; and Bédier and M. Roques, Bibliographie des travaux de Gaston Paris (1904).

PARIS, FRANÇOIS DE (1669-1727), French theologian, was born in Paris on the 3rd of June 1669. He zealously opposed the bull Unigenitus (1713), which condemned P. Quesnel's
PARIS, COMTE DE PARIS

annotated translation of the Bible. He gave further support to the Jansenists, and when he died (May 1, 1777) his grave in the cemetery of St Médard became a place of fanatic pilgrimage and wonder-working. The king ordered the churchyard to be closed in 1732, but earth which had been taken from the grave proved equally efficacious and helped to encourage the disorder which marked the close of the Jansenist struggle (see JANSENISM).
