PARIS, LOUIS PHILIPPE ALBERT D’ORLÉANS, COMTE DE (1838–1894), son of the duc d’Orléans, the eldest son of King Louis Philippe, was born on the 24th of August 1838. His mother was the princess Helen of Mecklenburg-Schwerin, a Protestant. By the death of his father through a carriage accident in 1842, the count, who was then only four years of age, became heir-apparent to the French throne. On the deposition of Louis Philippe in 1848, the duchess of Orleans struggled to secure the succession to her son, and bore him, through an anxious populace to the chamber of deputies. The chamber itself was soon invaded by the duc d’Orléans, and the Orléanists were driven into exile, and the duchess proceeded with her two sons, the comte de Paris and the duc de Chartres, first to Eisenach in Saxony, and then to Claremont in Surrey. After his mother’s death in 1858 the count made a long foreign tour. In 1861 he and his brother accompanied their uncle, the prince de Joinville, to the United States. The brothers were attached to the staff of General McClellan, commanding the "Army of the Potomac." In April 1862 the count took part in the siege of Yorktown, and was present at the action of Williamsburg on the 5th of May. He was also with McClellan at the battle of Fair Ochow, and was personally engaged in the sanguinary battle at Gaines Mill on the 27th of June. When difficulties arose between France and the United States with regard to the affairs of Mexico, the Orléans princes withdrew from the American army and returned to Europe. During the winter of 1862–1863 the count took a special interest in the organization of the Lancashire Cotton Famine Fund, and contributed an article to the Revue des deux mondes entitled "Christmas Week in Lancashire." On the 30th of May 1864 he married his cousin, the princess Marie Isabelle, daughter of the duc de Montpensier; and his wife, however, like the duc d’Orléans, was driven from Europe. In December 1865 the count refused to serve in the Franco-Prussian War, but after the fall of Napoleon III, he returned to France. Abstaining from putting himself forward, he lived quietly on his estates, which had been restored to him by a vote of the Assembly. In August 1873 there was an important political conference at Frohsdorf, the result of which was that a fusion was effected, by which the comte de Paris agreed to waive his claims to the throne in favour of those of the comte de Chambord. By the death of the latter in 1883 the count became undisputed head of the house of Bourbon; but he did not show himself disposed to push his claims. The popularity of the Orléans family, however, was shown on the occasion of the marriage of the comte de Paris’s eldest daughter with the duke of Braganza, son of the king of Portugal, in May 1886. This so alarmed the French government that it led to a new law of expulsion, by which direct claimants to the French throne and their heirs were banished from France (June 11, 1886). The comte de Paris again retired to England, taking up his abode at Sheen House, near Richmond Park. Here he devoted his leisure to his favourite studies. In addition to his work Les Associations secrètes en Angleterre, which was published in 1869 and translated into English, the count edited the letters of his father, and published at intervals in eight volumes his Histoire de la guerre civile en Amérique. In his later years the count seriously compromised the prospects of the Royalist party by the relations into which he entered with General Boulanger. He died on the 8th of September 1894.

PARIS, the capital of France and the department of Seine, situated on both banks of the Seine, 233 m. from its mouth and 285 m. S.S.E. of London by rail and steamer via Dover and Calais, in 48° 56’ 14”. N., 2° 20’ 14”. E. (observatory). It occupies the centre of the so-called Paris basin, which is traversed by the Seine from south-east to north-west, open towards the west, and surrounded by a line of Jurassic heights. The granitic substratum is covered by Jurassic, Cretaceous and Tertiary formations; and at several points building materials—freestone, limestone or gypsum—have been laid bare by erosion. It is partly, indeed, to the existence of such quarries in its neighbourhood, and to the vicinity of the grain-bearing regions of the Beauce and Brie that the city owes its development. Still more important is its position at the meeting-place of the great natural highways leading from the Mediterranean to the ocean by way of the Rhone valley and from Spain northwards over the lowlands of western France. The altitude of Paris varies between 80 ft. (at the Point du Jour, the exit of the Seine from the fortifications) and 420 ft. at the hill of Montmartre in the north of the city; the other chief eminence is the hill of St Genevieve, on the left bank. Since 1840 Paris has been completely surrounded by a wall, which since 1856 has served also as the limit for the collection of municipal customs dues (octroi). The wall is 22 ft. 6 in. high, and 17 ft. 9 in. wide—which, with its talus, is circumscribed by a broad and deep ditch—either entirely or at least from the Point du Jour, where the Seine intersects the wall below the city, to Pantin, so as to extend the limits of the city as far as the Seine, which runs almost parallel with the wall for that distance. Within the wall the area of the city is 10,279 acres; the river runs through it from east to west in a broad curve for a distance of nearly 8 m.

Climate.—Paris has a fairly uniform climate. The mean temperatures, as deduced from the observations at the observatory (1841–1881), are 49°5 F. The highest reading (observed in July 1874 and again in July 1881) is 101° F., the lowest (in December 1879) is 14° F. The monthly means for the fifty years 1841–1890 were: January 35°9; February 32°5; March 40°4; April 58°6; May 75°6; June 67°1; July 64°6; August 63°5; September 58°8; October 49°8; November 40°2; December 35°6. The Seine freezes when the temperature falls below 18°. It was frozen in nearly its whole extent, it being covered with a layer of ice, from 30th January to 20th March, 1859, 1879–1880 and 1890–1891. Rain falls, on an average, on about 290 days, the average quantity in a year being between 22 and 23 in. The rainfall from December to April inclusive is less than the average, while the rainfall from May to November exceeds the average for the whole year. The driest month is February, the rainiest June—the rainfall for these months being respectively 1½ in. and 2½ in. The orographical wind is from the south, south-west and west. The general character of the climate, somewhat continental in winter and oceanic in summer, has been more closely observed since the three observatories at different heights on the Eiffel Tower were added in 1887. The observations of these observatories and the observatory at Meudon have been recorded by the astronomer M. de Brébisson.1

The observatory at the old church-tower St Jacques (16th century) in the centre of the city, and since 1896 a municipal establishment of some 30 in. the study made there of the transparency and purity of the air. There are barely 100 days in the year when the air is very clear. Generally the city is covered by floating mists, possibly 1500 ft. in thickness. During the prevalence of north-easterlies winds the sky is most obscured, and on that side lies the greatest number of factories with smoking chimneys.

Defences.—Paris, described in a recent German account as the greatest fortress in the world, possesses three perfectly distinct rings of defences. The two inner, the enciente and the circle of detached forts around it, are of the bastioned type which French engineers of the Noizet school favoured; they were built in the time of Louis Philippe, and with very few additions sustained the siege of 1870–71. The outer works, of more modern type, forming an entrenched camp which in area is rivalled only by the Antwerp system of defences, were built after the Franco-German War.

The enciente ("the fortifications" of the guide-books) is of plain bastion trace, without ravelins but with a deep dry ditch (escarp, but not counterscarp revetted). It is nearly 22 m. in perimeter and has 93 bastions, 67 gates and 9 railway passages. The greater part of the enciente has, however, been given up, and a larger one projected—as at Antwerp—by connecting up the old detached forts.

1 The observatories of the Tour St Jacques and of Montsouris belong to the municipality of Paris; that of St Maur depends on the Central Bureau of Meteorology, a national institution.
These forts, which endured the siege in 1870-71, have a perimeter of about 34 m. Each is designed as a miniature fortress with ample casemates and high cavaliers, the ténailles and ravelins, however, being as a rule omitted. On the north side three forts (connected by a plain parapet) around St Denis, one of these being arranged to control an inundation. Next, to the right, or eastward, comes Fort Aubervilliers, which commands the approaches north of the wood of Bondy. These four works lie in relatively low ground. The eastern works are situated on higher ground (300-350 ft.); they consist of four forts and various small redoubts, and command the approaches from the great wood of Bondy. In low ground again at the narrowest point of the great loop of the Marne (near St Maur-les-Fosses) there are two redoubts connected by a parapet, and between the Seine and the Marne, in advance of their confluence, Fort de Valerien. On the south side of the city, hardly more than a mile from the enceinte, is a row of forts, Ivry, Bicêtre, Montrouge, Vanves and Issy, solidly constructed works in themselves but, as was shown in 1870, nearly useless for the defences of the city against rifle guns, as (with the exception of Bicêtre) they are overlooked by the plateau of Châtillon. On the west side of Paris is the famous fortress of Mont Valérien, standing 356 ft. above the sea and about 450 above the river. This completes the catalogue of the inner fort-line. It is strengthened by two groups of works which were erected in “provisional” form during the siege, and afterwards reconstructed as permanent forts—Hautes Bruyères on the plateau of Villejail, 1 m. south of Fort Bicêtre, and the Châtillon fort and batteries which now prevent access to the celebrated plateau that overlooks Paris from a height of 600 ft., and of which the rear batteries sweep almost the whole of the ground between Bicêtre and Mont Valérien.

The new works are 11 m. from the Louvre and 8 from the enceinte. They form a circle of 75 m. circumference, and an army which attempted to invest Paris to-day would have to be at least 500,000 strong, irrespective of all field and covering forces. The actual defence of the works, apart from troops temporarily collected in the fortified area, would need some 170,000 men only.

The entrenched camp falls into three sections—the north, the east and the south-west. The forts (of the general 1874-1875 French type, see FORTIFICATION and SIEGECRAFT) have from 24 to 60 heavy guns and 600 to 1200 men each, the redoubts, batteries and annexe-batteries generally 200 men and 6 guns. In the northern section a ridge crosses the northern extremities of the St Germain-Argenteuil loop of the Seine after the fashion of the armature of a horse-shoe magnet; on this ridge (about 350 ft.) is a group of works, named after the village of Cormeilles, commanding the lower Seine, the Argenteuil peninsula and the lower ground towards the Oise. At an average distance of 5 m. from St Denis lie the works of the Montlignon-Domont position (about 600-670 ft.), which sweep all ground to the north, cross their fire with the Cormeilles works, and deny the plateau of Montereau-Argenteuil-Sur-Oise to an enemy. At Écouen, on an isolated hill, there is a fort and a redoubt, and to the right near these Fort Stains and two batteries on the crete railway. The important eastern section consists of the Vaux-le-Vicomte position, the salient of the whole fortress, which commands the countryside to the north as far as Dammartin and Claye, crosses its fire with Stains on the one hand and Villiers on the other, and itself lies on a steep hill at the outer edge of the forest of Bondy which allows free and concealed communication between the fort and the inner line of works. The Vaux-le-Vicomte works are armoured. Three miles to the right of Vaux-le-Vicomte is Fort Chelles, which bars the roads and railways of the Marne valley.

On the other side of the Marne, on ground made historic by the events of 1870, are forts Villiers and Champigny, designed as a bridgehead to enable the defenders to assemble in front of the Marne. To the right of these is a fort near Boissy-St-Leger, and on the right of the whole section are the armoured works of the Oise.

The plateau of Mont Avron on the east side, which was provisionally fortified in 1870, is not now defended.
of the finest shops in Paris; the Rue St Honoré running parallel with the Rue de Rivoli, from the Rue Royale to the Central Markets; the Rue de Lafayette, one of the longest streets of Paris, traversing the town from the Opera to the Bassin de la Villette; the Boulevard Magenta, from Montmartre to the Place de la Bastille; the Place de la Concorde and the Rue de Rivoli, a place to the Halles Centrales. On the left side of the river the main thoroughfare is the Boulevard St Germain, beginning at the Pont Sully, skirting the Quartier Latin, the educational quarter on the north, and terminating at the Pont de la Concorde after traversing a quarter mainly devoted to ministries, embassies and other official buildings and to the residences of the noblesse.

Squares. — Some of the chief squares have already been mentioned. The Place de la Bastille, with its colonnades, is one of the most curious constructions of the period under J. A. Gabriel and noted as the scene of the execution of Louis XVI., Marie Antoinette and many other victims of the Revolution. The central decoration consists of an obelisk from the great temple at Luxor in Upper Egypt, presented to Louis Philippe, as 351 by Mehmet Ali, and flanked by two monumental fountains. The formation of the Place Vendôme was begun towards the end of the 17th century. In the middle there is a column surmounted by sculptured scenes from the campaign of 1805. The Place de l’Etoile is the centre of twelve avenues radiating from it in all directions. The Place de l’Observatoire, designed by J. M. Olive and J. L. Sulpice, forms an elliptical basin which connects it with the Place de la Concorde; while on the other side the Avenue de la Grande Armée leads to the fortifications, and is forming a section of the main artery of Paris; the well-wooded Avenue des Champs-Élysées, a reminder of the open space of the great park of that name. In the centre of the Place, the Arc de Triomphe de l’Etoile, the largest triumphal arch in the world (162 ft. high by 147 ft. wide), commemorates the military triumphs of the great French armies of the 19th century. Between these two avenues, the Place de la Madeleine, with its façade that is representing the departure of the volunteers in 1792 by François Rude. The Place de la République, in which stands a huge equestrian statue of Louis XVIII., in an open space, is one of the present forms of the Place de la Bastille stands a little to the east of the site of the famous state prison. It contains the Colonne de Juillet erected in memory of those who fell in the revolution of July 1830. The Place du Châtelet, between the wings of the Louvre and so named from a revet given there by Louis XIV., was enlarged about the middle of the 19th century. The triumphal arch on its west side commemorates the victories of 1805 and formed the main entrance to the Tuileries palace; below it the arch is a pyramid forming the background to a statue of Cambetta. Other squares are the Place des Victoires, dating from 1859, with the equestrian statue of Louis XIV., the Place des Vosges, formerly Place Royale, formed by Henry IV., on the site of the old Tournelles Palace and containing the equestrian statue of Louis XIII.; the Place de l’Hôtel de Ville, once the Place de Grève and the scene of many violent outbreaks, in 1830; the Place du Châtelet, at the site of the prison of the Grand Châtelet, pulled down in 1802, with a fountain and a column commemorating the victories of Napoleon, and the Place de la Nation, designed by the architect and artist, who designed the triumphal arch of the Triumph of the Republic, and with two columns of 1788 surmounted by statues of St Louis and Philip, Augustus, corresponding at the east of the city to the Place de la Concorde.

Suburbs outside Paris.

The Seine.—The Seine flows for nearly 8 m. through the city. As it enters and as it leaves the city it is crossed by a viaduct used by the circular railway and for ordinary traffic; that of Pont du Jour has two storeys of arches. Three bridges—the Passerelle de l’Estacade, between the Île St Louis and the right bank, the Pont des Arts and the Pont de la Défense (both called the Trocadéro)—are for foot passengers only; all the others are for carriages as well. The most famous, and in its actual state the oldest, is the Pont Neuf, begun in 1578, the two portions of which rest on the extremity of the island called La Cité, the point at which the river is at its widest (863 ft.). On the embankment below the Pont Neuf stands the equestrian statue of Henry IV. Between La Cité and the left bank the width of the lesser channel is reduced to 95 ft. The river has a width of 540 ft. as it enters Paris and of 440 ft. as it leaves it. After its entrance to the city it passes under the bridges of Tobiac, Bercy and Austerlitz, that of Sully, those of Marie and Louis Philippe between the Île St Louis and the right bank; that of La Tournelle between the Île St Louis and the left bank; that of St Louis between the Île St Louis and La Cité. The Cité communicates with the right bank by the Pont d’Arcole, the Pont Notre-Dame, built on foundations of the 15th century, and the Pont au Change, owing its name to the shops of the money-changers and goldsmiths which bordered its medieval predecessor; with the left bank by that of the Archevêché, the so-called Pont au Double, the Petit Pont and the Pont St Michel, the original of which was built towards the end of the 14th century. Below the Pont Neuf and the Pont du Carrousel, Pont d’Oval (a stone structure leading to the Tuileries), and those of Solférino, La Concorde, Alexandre III. (the finest and most modern bridge in Paris, its foundation-stone having been laid by the czar Nicholas II. in 1896), Invalides, Alma, Ín (opposite the Champs de Mars), Passy, Grenelle and Mirabeau. The Seine has at times caused disastrous floods in the city, as in January 1910. (See SEINE.)

The houses of Paris nowhere abut directly on the river banks, which in their whole extent from the bridge of Austerlitz to Passy are protected by broad embankments or quais. At the foot of these lie several ports for the unloading and loading of goods, &c.—on the right side Bercy for wines, La Râpée for timber, Port Mazas, the Port de l’Arsenal at the mouth of the St Martin canal, the Port Henry IV., of the Celestins, St Paul, des Ormes, de l’Hôtel de Ville (the two last for fruit) and the Port St Nicolas (foreign vessels); on the left bank the Port de la Gare for petroleum, St Bernard for wines and the embarcation of sewage, and the ports of La Tournelle (old iron), Orsay (building material), the Invalides, Gros Caillou, the Cygnes, Grenelle and Javel (refuse). Besides the river ports, the port of Paris also includes the canals of St Martin and the portions of the river St Martin, the Seine Vivant below the St Denis bridge, the walkway debouching in the busy and extensive basin of La Villette in the north-east of the city. The traffic of the port is chiefly in coal, building materials and stone, manure and fertilizers, agricultural produce and food-stuffs.

Promenades and Parks.—In the heart of Paris are situated the gardens of the Tuileries (56 acres), designed by André Le Notre under Louis XIV. Though added to and altered afterwards they retain the main outlines of the original plan. They are laid out in parterres and bosquets, planted with chestnut trees, lindens and plane trees, and adorned with playing fountains and basins, and numerous statues mostly antique in subject. From the terrace along the river-side a fine view is to be had over the Seine to the park and palace of the Trocadéro.

1 This canal (3 m. long) leaving the Seine below Austerlitz bridge, passes by a tunnel under the Place de la Bastille and Boulevard Voltaire, and joins the Seine at the Concorde, at the Pont de la Concorde. 2 These gardens are the property of the state, the other areas mentioned being the property of the town.
from the terraces along the Place de la Concorde the eye takes in the Place and the Avenue of the Champs Élysées. The gardens of the Luxembourg, planned by S. Debrosse (17th century) and situated in front of the palace occupied by the senate, are about the same size as those of the Tuileries; with less regularity of form they present greater variety of appearance. In the line of the main entrance extends the beautiful Observatory Walk, terminating in the monumental fountain mentioned above. Beside the gardens lay large compared to other French taste, with straight walks and regular beds, there are several in what the French designate the English style. The finest and most extensive of these, the Buttes-Chaumont Gardens, in the north-east of the city, occupy 57 acres of very irregular ground, which up to 1866 was occupied by plaster-warehouses, limekilns and brickworks. The "butes" or knolls are now covered with turf, flowers and shrubbery. Advantage has been taken of the varying relief of the site to form a fine lake and a cascade with picturesque rocks. The Montsouris Park, in the south of the city, 38 acres in extent, also consists of broken ground; in the middle stands the meteorological observatory, built after the model of the Tunisian palace of Bardo, and it also contains a monument in memory of the Flatters expedition to the Sahara in 1881. The small Monceau Park, in the aristocratic quarter to the north of the Boulevard Haussmann, is a portion of the old park belonging to King Louis Philippe, and contains monuments to Chopin, Gounod, Guy de Maupassant and others.

The Jardin des Plantes (founded in the first half of the 17th century) is the most important of the parks in Paris, second in extent, and situated in the heart of natural history (1793), with its zoological gardens, its hothouses, its nursery and naturalization gardens, its museums of zoology, anatomy, anthropology, botany, mineralogy and geology, its laboratories, and its courses of lectures by the most distinguished professors in all branches of natural science, make it an institution of universally acknowledged eminence.

Other open spaces worthy of mention are the Champs Élysées (which are the Place de la Concorde), begun at the end of the 17th century but only established in their present form since 1858; the Trocadéro Park, laid out for the exhibition of 1878, with its lakes, cascade and aquarium; the Champ de Mars (laid out about 1770 as a military training ground for the École Militaire), containing the Eiffel Tower (q.v.); the gardens of the Palais Royal, surrounded by galleries; and the Ranelagh in Passy.

The Bois de Boulogne and Bois de Vincennes situated outside the fortifications are on a far larger scale than the parks within them. The Bois de Boulogne, commonly called the "Bois," is reached by the wide avenue of the Champs Élysées as far as the Arc de Triomphe du Carrousel and then by a broad avenue of the Grande Armée. The first of these, with its side walks for foot passengers and equestrians, grass-plots, flower-beds and elegant buildings, affords a wide prospect over the Bois and the hills of St Cloud, the Parc de Bagatelle, and the Bois de Vincennes. The Bois de Boulogne covers an area of 2100 acres, is occupied by turf, clumps of trees, sheets of water or running streams. Here are two race-courses of Longchamp (flat races) and Autenil (steeplechases), the park of the small château of St Cloud, the École Militaire, and the Ecluse Club and the gardens of the Acclimatization Society, which, with their menageries, conservatories and aquarium, are largely visited by pleisure-seekers. Trees for the public parks and squares are grown in the principal nurseries situated on the south border of the Bois. On the east it is joined by the Park of La Muette, with the old royal château. The Bois de Vincennes (see VINCENNES) is 2500 acres in area and is similarly adorned with streams, lakes and cascades.

Churches.—The most important church in Paris is the cathedral of Notre-Dame, founded in 1163, completed about 1240. Measuring 130 yds. in length and 52 yds. in breadth, the church consists of a choir and apse, a short transept, and a nave with double aisles which are continued round the choir and are flanked by square chapels added after the completion of the rest of the church. The central aisle, 14 ft. in height, was erected in the 13th century; a capital was carried between 1834-1837 under the direction of Viollet le Duc. Two massive square towers crown the principal façade. Its three doors are decorated with fine early Gothic carving and surmounted by a row of figures representing twenty-eight kings of Israel and Judah. Above the central door is a rose window, above which is a third storey consisting of a graceful gallery of pointed arches supported on slender columns. The transept has two façades, also richly decorated with chimæral work and containing rose windows. Of the elaborate decoration of the interior all that is medieval is a part of the screen of the choir (the first half of the 14th century), with sculptures representing scenes from the life of Christ, and the stained glass of the rose windows (13th century). The woodwork in the choir (early 18th century), and a marble group called the "Vow of Louis XIII." (17th century) by Coustou and Coypus, are other noticeable works of art. The choirs contain the tombs of St Louis and a fragment of the Cross, which attract numerous pilgrims.

Paris is poor in Romanesque architecture, which is represented chiefly in the nave and transept of St Germain-des-Prés, the choir of which is Gothic in tendency. The church, which once belonged to an order of abbots, was founded in the 6th century, contains fine modern frescoes by Hippolyte Flandrin and the position of style is also exemplified in St Pierre-de-Montmartre (12th century). Besides the cathedral there are several churches of the Gothic period, the most important being St Julien-le-Pauvre, now serving as a Greek church, which is St Germain-l'Auxerrois (13th to 16th centuries), whose arcade is a graceful work of 1335; St Séverin (mainly of the 13th and 16th centuries); St Gervais, largely in the Flamboyant Gothic style with an interesting façade by S. Debrosse in the classical manner; and St Merry (1520-1612), almost wholly Gothic in architecture. St Gervais, St Merry and St Germain all contain valuable tombs, the stained glass of the two former being especially noteworthy.

St Etienne-du-Mont combines the Gothic and Renaissance styles in its nave and transept, while its choir is of Gothic, its façade of Renaissance; the church stands on the top of the Butte Montmartre, once the most beautiful in the city, there is a fine reader-loft (1600-1609) by Pierre Bard and a splendid collection of stained windows of the 16th and early 17th centuries; a chapel contains part of the sarcophagus of St Denis with which, in 1260, a votive offering was presented to the statue of St Denis (1532-c. 1650), though its construction displays many Gothic characteristics, belongs wholly, with the exception of a Classical style of the 18th century, to the Renaissance period. Its unique feature is the nave, not of the more important French churches, and the church contains the sarcophagus and statue (by A. Coypus) of Colbert and the tombs of other eminent men.

Bed in the mid of the 18th century, are St Sulpice (1655-1777), almost equalling Notre-Dame in dimensions and possessing a façade by J. N. Survandoni ranking among the finest of its period; St Roch (1683-1740), which contains numerous works of art, the 17th and 18th centuries; St Font-St Louis (1672-1671); and the church (1645-1665) of the former nunnery of Val-de-Grace (now a military hospital and medical school), which has a dome built after the model of St Peter's at Rome. All these churches are in the Paris style.

Of the churches of the 16th century, the most remarkable is that of the Sacré-Coeur, an important resort of pilgrims, begun in 1876 and overlooking Paris from the heights of Montmartre. The Sacré-Cœur, at the top of the Romanesque basilica Monsieur, a small tower behind which rises a lofty belfry. The base presented by the dioceses of Savoy and known as la Savoyarde "weighs between 4000 and 5000 tons, the stone is of a light color, the windows are the most magnificent in France, the Madeleine, built under Napoleon I. by Pierre Vignon on the foundations of a church of the 18th century and finished in 1842. It was intended by the emperor as a "temple of glory" and is built on the lines of a Roman temple with a fine colonnade surrounding it. The interior, consisting of a single nave bordered by chapels and roofed with cupolas, is decorated with sculptures and painting by eminent modern artists. Notre-Dame-de-Lorette (1825-1836) and St Augustin (1825-1874) are similar types of church. St Sulpice, the most important representation of modern Gothic; the church from the beginning of the 19th century, the Sartrouville and La Trinité in the Renaissance style were both built between 1860 and 1870. With the exception of Ste Clotilde in the St Germain quarter and the Madeleine, the modern churches above mentioned are in the northern quarters of Paris.

Civil Buildings.—The most important of the civil buildings of Paris is the palace of the Louvre (Lapage), the south front of which extends along the Seine for about half a mile. It owes its origin to Philip Augustus, who erected a huge keep defended by a rectangle of fortifications in what is now the south-west corner of the quadrangle, where its plan is traced on the pavement. The fortress was demolished by Francis I. and under that monarch and his successors Pierre Lescot built the portions of the wings to the south and west of the courtyard, which rank among the finest examples of Renaissance architecture. The rest
of the buildings surrounding the courtyard date from the reigns of Louis XIII. and XIV., the most noteworthy feature being the colonnade (1666-1670) of the east façade designed by Claude Perrault. The two wings projecting westwards from the corners of the quadrangle, each consisting of two parallel galleries with pavilions at intervals, were built under Napoleon III., with the exception of the Grande Galerie and at right angles to it the Pavillon Henry IV., containing the Apollo gallery, which were erected on the river front by Catherine de Medici and Henry IV. Of these two wings that on the north is occupied by the minister of finance. The history of the palace of the Tuileries (so called in allusion to the tile kilns which occupied its site) is intimately connected with that of the Louvre, its origin being due to Catherine de Medici and Henry IV. The latter built the wing, rebuilt under Napoleon III., which united it with the Grande Galerie, the corresponding wing on the north side dating from various periods of the 19th century. The palace itself was burnt by the Communards in 1871, with the exception of the terminal pavilion on the south (Pavillon de Flore); only the northern terminal pavilion (Pavillon de Marsan, now occupied by the museum of decorative arts) was rebuilt.

Next in importance to the Louvre is the Palais de Justice (now Conseil d'Etat), a rectangular building occupying the greater part of the Ile de la Cité to the west of the Boulevard du Palais. During the Gallo-Roman period the site was occupied by a citadel which became the palace of the Merovingian kings and afterwards the Capitole. The present palace dates from the 11th and 12th centuries, its central building having been destroyed by fire, and in its present state is in great part the outcome of a systematic reconstruction begun in 1840. In the interior the only medieval remains are the Sainte-Chapelle, the Conciergerie, and the tower of the Conciergerie. In the latter, a window still remains of the Revolution were confined, and some halls and kitchens of the 13th century. All these are on the ground floor, a portion of which is assigned to the police. The courts, which include the Cour de la Conciergerie in the north, the Cour de la Conciergerie in the south, and the Court of First Instance, are on the first floor, the chief feature of which is the fine Salle des Pas Perdus, the successor of the Grand' Salle, a hall originally built by Philip the Fair and rebuilt after fires in 1618 and 1781. The Sainte-Chapelle, one of the most perfect specimens of Gothic art, was erected from 1245 to 1248 by St Louis as a shrine for the crown of thorns and other relics now at Notre-Dame, and was restored in the 19th century. It comprises a lower portion for the use of the servitors and retainers and the upper portion or royal chapel, the latter richly decorated and lighted by lofty windows set close together and filled with beautiful stained glass. The façade of the Sainte-Chapelle is designed by J. L. Duc (d. 1870), which is reckoned among the finest achievements of modern art. The façade towards the Seine embodies four stories, the upper two partakes of the richness of its style and is in part of the Capetian dynasty. That at the east angle (the Tour de l'Horloge) contains a clock of 1736, said to be the oldest public clock in France. A handsome iron railing of 1757 separates the courtyard on the east side of the Palais.

About a quarter of a mile south of the Palais de Justice adjoining the Jardin de Clunys the Hôtel de Cluny, acquired in 1833 by the antiquarian A. du Sommerard as a repository for his collections and now belonging to the state, is a graceful and well-preserved building in late Gothic style distinguished for the beautiful carving of the doors, dormer windows and open-work parapet. The mansion, which contains a rich Gothic chapel, was erected at the end of the 15th century by Jacques d'Amboise, abbot of Cluny. It stands on the site of a Roman palace said to have been built by the emperor Constantius Chlorus (d. 306), and ruins of the baths are still to be seen inside.

The other civil buildings of Paris are inferior in interest and attraction. The Hôtel des Invalides on the left bank of the Seine opposite the Champs Elysées dates from the reign of Louis XIV. of whom it was founded as a retreat for wounded and invalid soldiers. The site, like much of the place, is justly connected with the entrance to this opens into the Cour de l'Honneur, a courtyard enclosed by a moat above which is a battery of cannon used for salutes or important occasions. On either side of the Cour de l'Honneur rises a long range of buildings, the top storey of which is crowned with dormers sheltering another church, the Église royale, built by J. H. Mansart from 1693 to 1706. The central crypt of this church contains a fine sarcophagus of red porphyry in which lie the remains of Napoleon I., brought from St Helena in 1840, while close by are the tombs of his friends Dorat and Bertrand.

The Palais, on the left bank near the Luxembourg garden, was formerly the palace of the Dukes of Bourbon in the last half of the 18th century under the name of Ste Geneviève, the name by which it is replaced. In the 17th century the constituent Assembly decreed that it should be no longer a church but a seapath for great Frenchmen. The French Revolution entirely destroyed the palace, and in 1808 it was rebuilt as a residence for the President and Senate of the Republic, which as it then came to be called. Reconstituted and rescaled more than once during the 19th century, the building finally regained its present name in 1885, when Victor Hugo was buried there. The building takes its name from the Luxembourg, the site on which it now stands. The inscription above the portico by David d'Anvers and, in the interior, paintings of the Ste Geneviève by Puvis de Chavanne, are noteworthy features of its artistic decoration.

Various public offices and palaces built under the ancient régime. The Palais Royal, built by Richelieu about 1630 and afterwards inhabited by Anne of Austria, the regent Philip II. of Orleans and Philippe Egalité, is now occupied by the Council of State and the Théâtre Français. The Palais stands on the site of a mansion belonging to Duke Francis of Luxembourg, which was rebuilt by Marie de Medici, wife of Henry IV. The architect, Salomon de Brosse, was ordered to take the Ffit Palace at his model, but notwithstanding the general plan of the building is French. The building was rebuilt in the original style under Louis Philippe. The Palais Royal, built originally by Charles V. and altered in the 19th century, became during the revolutionary period the palace of the Directory and later of the Consulate. In the 19th century it was occupied by the senate of Napoleon I., and the latter, although it has undergone various alterations and restorations, the to the end of the 19th century was held by the Communards in 1871. It is a splendid palace, the interior of which was designed by b. G. F. P. J. Lequesne (1783-1882), on the right bank of the Seine opposite the Ile de la Cité, stands on the site of a town hall built from 1553 to 1628, much enlarged towards 1830, and destroyed by the Communards in 1871. It is an isolated building in the French Renaissance style, the façade with its statues, pilasters, high-pitched roofs and dormer windows being specially elaborate. The interior has been decorated by several prominent artists.

Of the schools and museums of Paris occupy buildings of architectural interest. The Conservatoire des Arts et Métiers, a technical school and museum of machinery, &c., founded by the engineer Vaucanson in 1775, is established in the old Clunia priory (1480), the church, now the Music Conservatory, being in the next building. The Bibliothèque nationale is a fine hall of the 13th century; the church is very dignified, its interior being in the style of the École des Beaux-Arts and of the Bureau des Longitudes, the great national astronomical council. The Military School overlooking the Champs Elysées is a fine building of the 18th century. The huge structure of the military museum, the Palais de l'Étoile, takes the exception of the church, which belonged to the college as reconstructed by Richelieu. The astronomical observatory, through the building of the Centre of the Académie des Sciences, is a splendidly equipped building erected under Louis XIV. The École d'Équitation of Claude Perrault. The École des Beaux-Arts (facing the Louvre on the left bank of the Seine), with its interesting collections, partly in the Jardin des Tuileries, and partly in the Centre of the École des Beaux-Arts, is a fine building of the 18th century. The building of the Palais des Beaux-Arts, which contains art collections belonging to the city, date from 1897-
PARIS

1900. Both buildings stand close to the north end of the Pont Alexandre III.

The Louvre, built in imitation of an ancient temple, dates from the 12th century. The central tower, or the Palais du Trocadéro, built for the exhibition of 1878, are both imposing buildings of the latter half of that period, to which also belongs the Hôtel des Postes et Télégraphes.

One of the most celebrated features of Paris a few demand special mention. The so-called Maison de François I. (on the Cours de la Reine overlooking the Seine) is a small but beautifully decorated building erected at Moret in 1527 for François I. It was eventually transferred from the Rue Le Peletier to the present opera-house, the building, which covers 24 acres, is one of the finest theatres in the world. The process of creation, directed by Charles Garnier, was begun in 1861 and finished by Auguste Magne. The front is decorated on the ground storey with allegorical groups (Music by Guillaume; Lyrical Poetry by Jouffroy; Lyrical Drama by Perraud; and Dancing by Carpeaux) and allegorical statues. South of the opera house is the Musée des arts décoratifs, containing 12 collections, amounting in all to 51,000 per annum. The Opéra (entitled the National Academy of Music) was originally founded in 1671 by Pierre Perrin, from whom the management was taken over in 1770 by the King. Of the old Opéra, which was eventually destroyed, a part of the façade is preserved. The façade erected in the 19th century under the name of the Opéra Comique, founded in 1860 under the latter name of the union of Molière's company with two other theatrical companies of the time. The name Théâtre Français was added in 1881. In the theatre, built to the design of the tragedian Tuléa, who, in 1799, has since occupied. The Théâtre Français and the less important Odéon, a building of the 17th century; a number of more recent and magnificent buildings of the kind are designed by Jean-Baptiste Laffitte, who, in the 17th century; a number of more recent and magnificent buildings of the kind are designed by Jean-Baptiste Laffitte. The Théâtre de la Porte Saint-Martin, which was opened in 1851, and the Théâtre de l'Odéon, which was opened in 1861, are the most important theatres. Among other notables contained in the collection of paintings is the beautiful L'Immaculé Conseillé by Guillaume de Klerc, and the celebrated Portrait of Marie de Medici by Rubens.

The Musée des Arts Décoratifs is a museum of furniture, pictures, costumes, and works of art. It contains a large collection of old master paintings and a fine collection of French furniture.

The museum of the Luxembourg, installed in a building near the Rue de l'Université, is devoted to works of living painters and sculptors acquired by the state. They remain there for ten years after the death of the artists, that the finest may be selected for the collection. The Cluny museum owns the old mansion of the abbots of the order (see above). It contains about 11,000 examples of medieval and Renaissance art-sculptures in marble, wood and stone, ivories, enamels, illuminated manuscripts, and porcelain. Among the most beautiful objects are the collection of goldsmith's work, both religious and civil, including a collection of gold and silver in the collection of the 12th, 13th, and 14th centuries,

The Carnavalet museum comprises a collection illustrating the history of Paris. The Petit Palais des Beaux-Arts contains art collections belonging to the City (especially the Dutch collection). The house of Gustave Moreau, Rue Rochefoucauld, is now a museum of his paintings, and that of Victor Hugo, Place des Vosges, contains a collection of objects relating to the poet.

The Musée des Arts et Traditions populaires is a museum of casts illustrating the progress of sculpture, chiefly that of France, from the 11th to the 18th century, it also possesses a collection of Khmer antiquities from Cambodia and an ethnographical museum. In the same neighbourhood, the Musée du Luxembourg contains a collection of tapestries, embroideries, and pottery, of objects relating to the Oriental religions and of antiquities presented to the state in 1885 by Emile Guimet of Lyons; and the Gallica museum, erected by the duchess of Galliera and containing a great number of manuscripts and other objects relating to the history of the city of Paris.

The Cernuschi Oriental museum, close to the Monceau Park, was bequeathed to the city in 1895 by M. Cernuschi. The collection of MSS., engravings, medals and antiquities in the Bibliothèque Nationale are important, as also are the industrial and machineries exhibits of the Conservatoire des Arts et Métiers.

For libraries see Libraries.

Population.—Paris is divided into twenty arrondissements. Only the first twelve belonged to it previous to 1860; the others correspond to the old suburban communes then annexed. The first four arrondissements occupy the space on the right of the river, extending from the Place de la Concorde to the Bastille, and from the Seine to the line of the Grands Boulevards; the 5th, 6th and 7th arrondissements lie opposite them on the left side; the 8th, 9th, 10th, 11th and 12th surround the first four arrondissements on the north; the 13th, 14th and 15th are formed out of the old suburban communes of the left side; and the 16th, 17th, 18th, 19th and 20th out of the old suburban communes of the right side.

The growth of the population during the 19th century is shown in the following table, which gives the population present on the census day, including the population complète à partir, i.e. troops, inmates of hospitals, prisons, schools, &c.
Below is shown the population of the arrondissements separately (in 1906), together with the comparative density of population therein. The most thickly populated region of Paris comprises a zone stretching northwards from the Ile de la Cite and the Ile St Louis to the fortifications, and including the central quarters of St Gervais with 400 inhabitants to the acre. Ste Avoine with 351 inhabitants to the acre, and Bonne-Nouvelle with 456 inhabitants to the acre. The central arrondissements on the north bank, which (with the exception of I., the Louvre) are among the most densely populated, tended in the latter part of the 19th century to decrease in density, while the outlying arrondissements (XII-XX), which with the exception of Batignolles and Monceau, were comparatively thinly populated, increased in density, and this tendency continued in the early years of the 20th century.

</table>

The birth-rate, which diminished steadily in the 19th century, is low—on an average 54,000 births per annum (1901–1905) or 292 per 1000 inhabitants as compared with 311 in 1811–1855. The death-rate also is low, 48,000 deaths per annum (1901–1905), averaging 179 deaths per 1000 inhabitants. This is accounted for by the fact that Paris is pre-eminently a town of adults, as the following figures, referring to the year 1905, show:

Inhabitants under 1 year of age 44,107
1 to 19 years of age 67,995
20 to 39 1,105,340
40 to 59 605,145
60 years and over 228,836
Unknown age 9,018

In these circumstances there is nothing remarkable in the annual number of marriages in Paris (30,000) a high marriage rate (69 per 1000) for the total number of inhabitants, but a low one (28 4 per 1000) compared with the number of marriageable persons.

A large number of the inhabitants (on an average 63% out of every 1000) are not Parisians by birth. The foreign nationalities chiefly represented are Belgians, Germans, Swiss, Italians, Luxembourgers, English, Russians, Americans, Austrians, Dutch, Spaniards, The Belgians, Germans and Italians, mostly artisans, live chiefly in the industrial districts in the north and east of the city. The English and Americans, on the other hand, congregate in the wealthy districts of the Champs Elysées and Passy.

Municipal Administration.—Each arrondissement is divided into four quarters, each of which nominates a member of the municipal council. These 80 councillors, together with 21 additional councillors elected by the cantons of the rest of the department, form the departmental council. The chief functions of the arrondissement are a mayor and his deputies (adjoints) appointed by the president. The mayors act as registrars, draw up electoral and recruiting lists and superintend the poor-relief of their arrondissement. There is a justice of the peace (juge de paix) nominated by the government in each arrondissement. There is no elective mayor of Paris: the president of the municipal council, who is nominated by his colleagues, merely acts as chairman of their meetings. When occasion requires, the function of mayor of Paris is discharged by the prefect of Seine. The municipal council discusses and votes the budget of the city, scrutinizes the administrative measures of the two prefects and deliberates on all public affairs in general. The prefect of Seine and the prefect of police (both magistrates named by the government, but each with a quite distinct sphere of action) represent the executive authority as opposed to the municipal council, which latter has no power, by refusing a vote of credit, to stop any public service the maintenance of which legally devolves on the city; in case of such refusal the minister of the interior may officially insert the credit in the budget. In like manner he may appeal to the head of the state to cancel any decision in which the council has exceeded its legal functions.

The prefecture of Seine comprises the following departments (directions), subdivided into bureaux:

1. Municipal affairs, including bureaux for the supervision of city property, of provision, of cemeteries, of public buildings, etc.
2. Departmental affairs (including the bureau concerned with the care of lunatics and foundlings).
3. Primary education.
4. Streets and public works, including the bureau of water, canals and sewers, and the bureau of public thoroughfares, promenades and lighting.
5. Finance.

The administrative functions of the prefect necessitate a large technical staff of engineers, inspectors, &c., who are divided among the various services attached to the departments. There are also a number of councils and committees on special branches of public work attached to the prefecture (commission des logements insalubres, de statistique municipale, &c.). The administration of the three important departments of the octroi, poor-relief (assistance publique) and pawnbroking (le mont-de-piété) is also under the control of the prefect.

The purpose of police includes, in the whole department of Seine and the neighbouring communes of the department of Seine-et-Oise—Meudon, St Cloud, Sèvres and Enghien. Its sphere embraces the apprehension and punishment of criminals (police judiciaire), general police-work (including political service) and municipal policing. The state, in view of the non-municipal functions of the Paris police, repays a proportion of the annual
budget which this prefecture receives from the city. The budget of the prefect of police is voted en bloc by the municipal council.

Besides numerous duties consequent on the maintenance of order, the inspection of weights and measures, authority over public spectacles, surveillance of markets and a wide hygienic and sanitary authority belong to the sphere of this prefect. In the last connexion mention may be made of an important body attached to the prefecture of police - the commission hygiénique Publique et de Salubrité of the department of the Seine, composed of 24 members nominated by the prefect of police and 17 members called to it in virtue of their office. To it are referred proceedings and references to which, from the obtain drinking-water for the town, the sanitary measures to be taken during important works, the work connected with the main sewers for the cleaning of the Seine and the utilization of the sewage water, the health of workpeople employed in factories, the sanitary condition of the occupants of schools and prisons, questions relating to the disinfection of infected districts, the heating of public vehicles and dwellings, the conveyance of infected persons, night shelters, &c. Board of health (commission d'hygiène) in each of the twenty arrondissements act in co-operation with this control council. The price paid in return for a payment of 900 per de la paix are divided among the arrondissements in each of which there is an officier de paix in command. There are besides six brigades in reserve, one attached to the central markets, another entrusted with the surveillance of cabs, while the others are held in readiness for exceptional duties, e.g. to reinforce the arrondissements brigades at public ceremonies or in times of disorder. In nearly every quarter there is a commissaire de police, whose duties are of a semi-legal nature; the police require his sanction before they can commit an arrested individual to prison, and he also fulfils magisterial functions in matters of delinquency.

Finance.—The chief item of ordinary expenditure is the service of the municipal debt, the total of which in 1905 was nearly £125,000,000. Its annual cost rose from £722,000 in 1860 to £3,583,000 in 1875 and £4,256,000 in 1905. In the latter year the other chief items of expenditure were:

The total ordinary revenue was £1,4,351,000, and of all revenue, ordinary and extraordinary, £5,412,000.

Communications.—Passenger-transport is in the hands of companies. The ordinary omnibuses are the property of the Compagnie Générale des Omnibus, founded in 1855. Its charter allows it to have a monopoly on the routes it chooses in return for a payment of 6,000 per annum for each vehicle. The organization of the omnibus service is under the supervision of the prefect of the Seine. Since 1905 motor-driven omnibuses have been in use. The Compagnie Générale owns a number of tramways, and there are several other tramway companies. The cab companies, the chief of which are the Compagnie Générale des Voitures and the Compagnie Urbaine, have no monopoly. The use of the taximeter is general and motor-cabs are mainly used by members of the Press. To run a licence fee and are under the supervision of the prefect of the Seine as regards tariff and the concession of stands. The steameurs (bateaux-omnibus) of the Compagnie Générale des Tramways Parisiens ply on the Seine between Charenton and Suresnes.

The great railways of France, with the exception of the Midi railway, have terminal stations in Paris. The principal stations of the eastern, southern, and western systems (that of, in latter case, an existing Paris railway) lie near the central boulevards in the north of the city; the terminus of the Paris-Lyon-Mediterranée railway is in the south-east, close to the right bank of the Seine; opposite to it, on the left bank, is the station du Quai d'Austerlitz, and on the Quai d'Orsay the Gare du Quai d'Orsay, both belonging to the Orléans railway. The Gare Montparnasse, to the south-west of the Luxembourg, is used by the western and the state railways. Gare de l'Est, the principal railroad station, is the Gare de l'Est (line of the eastern railroad to Vincennes), the Gares du Luxembourg and de Paris-Denfert (line of the Orient railroad to Sceaux and Limours), and the Gare des Invalides (line of western railroad to Versailles).

Disinfection works, the organization for the extermination of the rats and mice of Paris, and a line following the outer boulevards; within the ring formed by the latter there are transverse lines. The total of the thoroughfares of Paris exceeds 600 m. For the most part, and especially in the business and industrial quarters where traffic is heavy and incessant, they are paved with stone. Yvette sandstone from the neighbourhood of Paris is the chief material. Wood and macadam come next in importance to stone, and there is a small proportion of asphalt roadways.

The upkeep and cleansing is under the supervision of a branch of the department of public works (service technique de la voirie publique et souiré Park). The springs of the Lézignan and Lumiére, company, in the Montparnasse railway itself, produce an excess of £80,000, which is divided into sections, each comprising two or three arrondissements. All streets having a width of 25 ft. or more are planted with rows of trees, chestnuts and planes being chiefly used for this purpose, and in many of the wide thoroughfares there are planted trees in the middle of the roadway.

The upkeep (exclusive of cleansing) of the thoroughfares cost about £500,000, towards which the state, as usual, contributed £120,000. The upkeep of the sidewalks cost about £40,000, and for the upkeep of the roads about £450,000. The original cost of paving a street is borne by the owners of the property bordering it; but in the case of avenues of exceptional width they bear only a proportion of the outlay. The upkeep of the streets is divided among the city, for the public use of the kiosks, &c., to place chairs and tables on the footways and similar concessions.

Water.—The water and sewage system of Paris is supervised by a local board of public water and sewerage (bureau de l'eau et des eaux et assainissement). The water supply comprises a domestic supply of spring water and a supply for industrial and street cleansing purposes, which is gathered from artesian wells and distributed to the town by some 4,000 miles of sewers. The domestic supply, which averaged 5,500,000 gallons daily in 1905, has three sources of origin:

1. The springs of the DHIUS, to the east of Paris, whence the water is supplied by a main of 82 m. in length to a reservoir in the quarter of Ménilmontant.
2. The springs of the Vanne, south-east of Paris, whence the water comes by an aqueduct 108 m. in length to a reservoir near Montparnasse and Ville-en-l'Isle, whence the water comes to Montsouris reservoir.
3. The springs of the Aire, north of Meulan, to the west of the city, the aqueduct from which is 63 m. in length and ends at the St Cloud Reservoir.

In addition, filtering installations at the pumping station of Ivry, St Maur and elsewhere make it possible to supplement the domestic supply from other water in hot seasons.

Water for public and industrial purposes is obtained (1) from pumping stations at Ivry and other points on the banks of the Seine, and at St Maur on the Marne; (2) from the Ourcq canal, which starts at Chastres, near the Ourcq, and is continued by the Ourcq river to the outskirts of Paris, where a part of it is utilized for industrial, and another part for the supply of the MSS. This latter being of trifling importance. The water is stored in reservoirs in the higher localities of the city, for the purposes of distribution, which is divided into zones of altitude; thus the water from the Vanne stored at the Montsouris reservoir at an altitude of only 260 ft. is supplied to the central and lowest part of the city. The upper part of the waters of Montmartre, Belleville and Montorgueil, being too high to be of use, is supplied from the ordinary reservoirs, and is supplied from elevated reservoirs, to which the water is pumped by special works.

In addition to its distribution throughout the city by two systems: the low or variable pressure, carrying the river water for use in the streets, courts and industrial premises; the high pressure, taking the spring water to the various floors of buildings, and supplying water for the flushing of privies; the main line of pipes is nearly 1600 m. The water arrives in all cases from two different directions, so that in case of accident the interruptions of the supply may be reduced to a minimum. Consumers are supplied by means of a collecting agent and receives a commission on the takings. Each collector expires at the end of 1910. In 1905, for the first time, the gross takings reached £800,000. The main supply of Paris comprises four main collectors, with a length of in all of nearly 20 m.; 27 m. of secondary collectors and several hundred miles of ordinary sewers. Its capacity is such that the Seine (except in certain cases of exceptional pressure, such as sudden and violent storms) is kept free from sewage
water, which is utilized on sewage farms. The larger sewers, which vary between 9 and 20 ft. in width, are bordered by ledges, between which the water runs, and are cleansed by means of slides exactly fitting the channel and mounted on wagons or boats propelled by the power of the current. Of the 360 km. of this system, the north-eastern quarter of the city and the district of St. Denis is the longest (7 km.). The other main sewers converge at Clichy, on the right bank of the Seine, where a powerful elevator forces the sewage towards the river by a tunnel. The sewage is also conveyed between the two banks by means of conveyors, one going north and the other south, acting as a syphon below the river-level, to the left bank. Then, part of it is distributed over the estate of Gennevilliers, from which it returns purified, after having fertilized the plots of the commune. The remaining effluent is turned into a second channel, with an outfall to the Seine in Argenteuil (right bank), where the irrigation fields of Carrières-sous-Poissy (right bank), and finally those of Mureaux, opposite Meulan. Certain parts of Paris lie too low for their drains to run into the main sewers, and special elevators are required to raise the sewage of the districts of Bercy, Javel and the Cité. The sewers are used as conduits for water-pipes, gas-pipes, telegraph and telephone wires and pneumatic tubes. One chamber of the gas-lighting company in Paris is in the hands of a company whose operations are supervised and directed by municipal engineers. The company pays to the municipality an annual sum of 200,000 francs and is allowed in addition to charge 2 centimes for every cubic metre of gas consumed; in addition, the profits of the company, after a fixed dividend has been paid on the stock, are divided with the municipality. The company is bound to the municipality to turn over to it any sewers belonging to consumers and at half that price for public services. In 1905 the total sum paid by the company amounted to nearly 1,000,000 francs. It was provided that on the expiration of its charter the plant be returned to the municipality, the right to the area being distributed by a number of companies, to each of which in return for certain payments a segment (secteur électrique) of the city is assigned, though the concessions for the different monopolies of electricity has an electrical station of its own beneath the central markets.

Law and Justice (see France: Justice, for an account of the judicial system of the country as a whole).—Paris is the seat of four central courts and assembly halls of the kingdom (1) the Tribunals des Conflits, for settling disputes between the judicial and administrative authorities on questions as to their respective jurisdiction; (2) the Council of State, which includes a section for cases coming under the royal office; (3) the Cour des Comptes; and (4) the Cour de Cassation. The first three sit in the Palais Royal, the fourth in the Palais de Justice, which is also the seat of the Palais de Justice, is composed of (1) a tribunal of appeal for the correctional police, one chamber for preliminary proceedings; (2) a tribunal des assises; (3) a tribunal of first instance for the department of Seine, comprising seven chambers for the Seine department; (4) the Conseil des Prud'hommes, or a court where each judge of the court is assisted by a commissaire de justice. Litigations between the departmental or municipal administration and the private persons are decided by the Conseil des Prud'hommes, or a tribunal of commerce. The Conseils des Prud'hommes settle differences between workmen and workmen, or between workmen and masters; the Advisory Board ofpiar for Aged Persons hears cases in which the appeal is lodged. The sword plays a role in Paris. In the by-laws of this city (in the metal trades, the chemical trades, the textile trades and building industries), composed of an equal number of masters and men. The tribunal of commerce, sitting in a building opposite the Palais de Justice, is composed of business men elected by the "notables" of order, and deals with cases arising out of commercial transactions; declarations of bankruptcy are made before it; it also acts as registrar of trade marks and of articles of association of companies; and acts as court of appeal to the Conseils des Prud'hommes.

Prisons. — There are three places of detention in Paris. The Dépôt of the prefecture of police which is situated near the Prefecture of police is sometimes closed, and released by the commissioners of police are temporarily confined, the Conciergerie or maison de justice, for the reception of prisoners accused of crimes, who are subjected to a preliminary examination at the inquest before the magistrates of the district, and the Santé (near the Place Denfert-Rochereau), for prisoners awaiting trial and for remanded prisoners. The old prisons of Maza, St. Péleché and La Grand Farge are now used for the detention of criminals and the female prisoners. The new prison of Fresnes-Rungis for condemned prisoners. The prisoners, kept in solitary confinement, are divided into three groups; those undergoing short sentences, those awaiting transfer to other institutions, and those awaiting sentence. The command of the prison, kept in solitary confinement, is to the command of the place of detention or to sentences over a year, and sick prisoners occupying the central infirmary of the prison. The Petit Roquette (occupied by children) was replaced by the agricultural establishment of St. Cyprien in Argenteuil. The prison of Fresnes-Rungis was inaugurated in 1906. TheInstruction of the young is left to the State. Education (see also France).—In 1905 there were 170 public écoles maternelles (kindergartens) with 57,000 pupils, and 48 private schools of the kind with 7600 pupils, besides a certain number of écoles infantiles; exclusively managed, as are the écoles maternelles, by women, and serving as a link between the latter and the écoles primaires, for timid and backward children of from 6 to 8 years of age. There were 374 public primary schools with 173,000 pupils, while over 63,000 children were educated in private primary schools. Subsequently, the increase of the number of children and the difficulty of taking classes, led to the establishment of the écoles des nations (school treasuries), which give clothing, &c., to indigent children and maintain the cantines scolaires for the provision of hot mid-day meals; the classes de garde and the garderies, which look after children beyond the school age; and the classes préparatoires, which, up to the age of 12, prepare children for admission to the public school for children during the holidays; and the internats primaires, which for a small payment board and lodge children who wish to be pendant to school in the evenings. The higher primary schools (écoles primaires supérieures), which give a course of 3 or 4 years, number 86 for boys (Collège Chapital, École de Commerce, École des Arts et Métiers, etc.) and 10 for girls (Collège de la Madeleine, Collège de la Madeleine de l'Ecluse, etc.). The place of these schools for children who can afford two years at most for schooling after leaving the primary school. Side by side with the higher primary school, the teaching in which has a commercial character, there is the école de commerce, technical schools for the training of craftsmen. The École Diderot trains pupils in wood- and iron-working; the École German Paley teaches mechanical engineering, and the École des Arts et Métiers photographic and technical schools for the training of craftsmen. 1 The Collège Chapital has a wider scope than the higher primary schools; it has in view general culture rather than commercial aptitude, and also prepares students for the great scientific schools (École des mines, École polytechnique, &c.).
both of natives of French colonies and of colonial functionaries, on the ministry of the colonies. The École nationale des ponts et chaussées for the training of government engineers, and the École nationale supérieure des mines for mining engineers, are under the ministry of the public works. Among the most prominent are the Catholic Institute, with faculties of law and theology and schools of advanced literary and scientific studies, the School of Fine Arts, founded in 1889, for the treatment of hydrophobia, and for its research-laboratories, and the School of political science which prepares candidates for political and governmental careers. The two latter state subventions. The Church of the Sacred Heart of Jesus, the most important being the Philotechnic Association, the Polytechnic School and the Union française de la jeunesse.

Among the numerous learned societies of Paris the first in importance is the Société de géographie (founded in 1826) for the promotion and coordination of research in geography. The second in importance is the French Academy, for the advancement of the sciences, founded in 1635, is based on the model of the older British Society, and, like it, meets every Tuesday.

In art Paris has long held a leading place. The Société des Artistes français holds an annual salon or exhibition in May and June at the Palace of Industry. It is open to artists of all nationalities. Works are selected and awarded (including the Prix de Rome) by a jury of experts selected by the exhibitors. The society was founded in 1872, but the salon takes its name from the academy exhibitions, which, first held in the Palais Royal in 1867, were transferred to the Salon Carré in the Louvre in 1874. As a result of dissatisfaction over the awards of 1880, the society of fine arts (Société nationale des beaux-arts) established a separate salon, in the Champ de Mars, in May, June and July. There is also a Société des beaux-arts.

Charity.—The administration of public charity is entrusted to a responsible director, under the authority of the Seine prefect, and assisted by the board of health. The supplies are paid out according to the list of charitable foundations established by the law of 1886 and regulated by the president. The funds at his disposal are derived (1) from the revenue of certain estates, houses, farms, woods, stocks, shares; (2) from taxes on the theatres (one-tenth of the price), on marriage and burial services, and on the cemeteries; (3) from the municipal subsidy; (4) from other sources (including voluntary donations). The charges on the administration consist of (1) the treatment of the sick in the hospitals; (2) the lodging of orphans and children incurable in the hospitals; (3) the support of charity children; (4) the distribution of outdoor relief (secours à domicile) by the bureaux de bienfaisance; (5) the dispensation of medical assistance and medical treatment.

The doctors, surgeons, chemists, both resident and non-resident, connected with the numerous hospitals, are all examined by competitive examination. They are assisted by three grade of students, internes (who receive a salary), externes, and stagiaires (probationers) appointed by the president.

The following establishments in or near Paris belong to the Ministry of Interior and are dependent on the ministry of the interior. The Quinze-Vingts gives shelter to the 300 blind for whom it was founded by St Louis, and gives outdoor assistance besides. The blind asylum for the 1500 who are not yet legally classified is also supervised by the prefect of the 15th arrondissement. The Lycée des filles (fondation lycée de la配件), founded by the 14th arrondissement and the 15th arrondissement in 1865, has 1500 pupil girls. Of the 2000 more than 600 are in the hospitals or undergoing imprisonment. This institution is not intended as a permanent home. Infects are not kept in the institution, but are boarded out with nurses in the country; the older ones are boarded out with families or placed in technical schools. Up to thirteen years of age the children are kept at the expense of the department of Seine, after which they are apprenticed.

from time to time visited the coasts of Britain. So few were its inhabitants that they early put themselves under the protection of their powerful neighbours, the Senones, and this vassalship was the source of the political dependence of Paris on Sens throughout the Roman period, and of a religious subordination which lasted till the 17th century. The capital did not at once take the name of the Parisii, with which it was, but long kept that of Lucetia, Lucetotia or Lutetia, of which Lutetia is the generally recognized French form.

During the War of Gallic Independence, after being subjugated by Caesar, who even in 53 B.C. made their territory the meeting-place of deputies from all Gaul, the Parisii took part in the great rising of the year 52, at the same time separating their cause from that of the Senones, who were held in check by Caesar’s lieutenant, Labienus. They joined their forces to the army commanded by an Aureliac, the old Camulogenus, which in turn was to unite with the Bellovaci to crush Labienus advancing from Sens to attack the Parisians. Having marched along the right bank of the river till opposite Lutetia, Labienus learned that the Bellovaci were in arms, and, fearing to find himself between two armies at a distance from his headquarters, he sought to get rid of Camulogenus, who, posted on the left bank, endeavoured to bar his way. The bridges had been cut and the town burned by order of the Gallic chief. By means of a strata-gem Labienus drew his opponent up the river to the district now occupied by the Jardin des Plantes, and quietly by night crossed the Seine lower down in the neighbourhood of Grenelle, near a place which Caesar calls Metcosedium, identified, but not conclusively, with Meudon. The Gauls, retracing their steps a little, met the Romans and allowed themselves to be routed and dispersed; their leader fell in the fore-front of the battle. Still unsubdued, the Parisii were called upon by the general council assembled in Alesia to furnish eight thousand men to help in raising the siege of that city. It is doubtful whether they were able to contribute the whole of this contingent, when their powerful neighbours the Bellovaci managed to send only two thousand of the ten thousand demanded of them. This was their last effort, and after the check at Alesia they took no part in the desperate resistance offered by the Belgae.

Lutetia was somewhat neglected under the Roman emperors of the first centuries. Its inhabitants continued quietly carrying on their river traffic, and devoted part of their wealth to the maintenance of a great temple to Jupiter built on the site of the present cathedral of Notre Dame. It is not known at what date Christianity was introduced into the future capital of France; but it is probable, judging by the use of the title of “city,” that Lutetia was the see of one of the earliest of the bishoprics of Gallia Céltica. The name of the founder of the church is known, but a keen controversy, not yet settled, has recently been raised with regard to the date when the first Roman missionary, St Dionysius or Denis, reached the banks of the Seine, along with his two deacons, Rusticus and Eleutherius. A pious belief, which, in spite of its antiquity, has its origin in nothing better than parochial vanity, identifies the first-named with Dionysius the Areopagite, who was converted by St Paul at Athens, and thus takes us back to the middle of the 1st century of the Christian era. Better founded in the opinion which dates the evangelization of the city two centuries later; the regular list of bishops, of whom, after Denis, the most famous was St Marcel, begins about 250.

Lutetia was in some sort the cradle of Christian liberty, having been the capital, from 292 to 306, of the mild Constantius Chlorus, who put an end to persecution in Britannia, Gaul and Spain, over which he ruled. This emperor fixed his residence on the banks of the Seine, doubtless for the purpose of watching the Germans without losing sight of Britannia, where the Roman authority was always unstable; perhaps he also felt something of the same fancy for Lutetia which Julian afterwards expressed in his works and his letters. Be that as it may, the fact that these two princes chose to live there naturally drew attention to the city, where several buildings now rose on the left side of the river which could not have been reared within the narrow boundaries of the island. There was the imperial palace, the remains of which, a magnificent vaulted chamber, beside the Hôtel de Cluny, are now known, probably correctly, as Julian’s Baths. At some distance up the river, in the quarter of St Victor, excavations in 1870 and in 1883 laid bare the foundations of the amphitheatre, which was capable of holding about 10,000 spectators, and this suggests the existence of a population of 20,000 to 25,000 souls. Dwelling-houses, villas, and probably also an extensive cemetery, occupied the slope of the hill of St Geneviève.

It was at Lutetia that, in 356, Julian, already Caesar, was cast in spite of himself proclaimed Augustus by the legions he had more than once led to victory in Germany. The troops invaded his palace, which, to judge by various circumstances of the mutiny, must have been of great extent. As for the city itself, it was as yet but a little town (τοιχα&piota) according to the imperial author in his Histories. The successive sojourns of Valentinian I. and Gratian scarcely increased its importance. The latest emperors preferred Trèves, Arles, and Vienne in Gaul, and, besides, allowed Paris, about 410, to be absorbed by the powerful Armorician league. When the patricians, Aetius, Aegidius and Syagrius, held almost independent sway over the small portion of Gaul which still held together, they dwelt at Soissons, and it was there that Clovis fixed himself during the ten or eleven years between the defeat of Syagrius (486) and the surrender of Paris (497), which opened its gates, at the advice of St Geneviève, only after the conversion of the Frankish king. In 508, at the return of his victorious expedition against the south, Clovis made Paris the official capital of his realm—Cathedram regum constitutam licebat Gregory of Tours. He chose as his residence the palace of the Thermæ, and lost no time in erecting on the summit of the hill, as his future place of interment, the basilica of St Peter and St Paul, which became not long afterwards the church and abbey of St Geneviève. After the death of Clovis, in spite of the supremacy granted to the kingdom of Austrasia, or Metz, Paris remained the true political centre of the various Frankish states, insomuch that the four sons of Clothaire, feasting the prestige which would attach to whoever of them might possess it, made it a sort of national town, although after all it was in the middle of the empire of Childebert, king of Neustria (who managed to keep possession for some time, and repaired the amphitheatre), and Guntram, king of Burgundy. The last sovereign had to defend himself in 585 against the pretender Gondovald, whose ambition aspired to uniting the whole of Gaul under his dominion, and marching on Paris to make it the seat of the half-barbarian half-Roman administration of the kingdom of which he had dreamed.

Numerous calamities befell Paris from 586, when a terrible conflagration took place, to the close of the Merovingian dynasty. During a severe famine Bishop Landry sold the church plate to alleviate the distress of the people, and it was probably he who, in company with St Eloi (Eliugius), founded the Hôtel Dieu. The kings in the long run almost abandoned the town, especially when the Austrasian influence under the mayors of the palace tended to shift the centre of the Frankish power towards the Rhine.

Though the Merovingian period was for art a time of the deepest decadence, Paris was nevertheless adorned and enriched by pious foundations. Mention has already been made of the abbey of St Peter, which became after the death of Clovis the abbey of St Geneviève. On the same side of the river, but in the valley, Childebert, with the assistance of Bishop St Germain, founded St Vincent, known a little later as St Germain-des-Prés, which was the necropolis of the Frankish kings before St Denis. On the right bank the same king built St Vincent le Rond (afterwards St Germain l’Auxerrois), and in La Cité, beside the cathedral of St Etienne, the basilica of Notre Dame, which excited the admiration of his contemporaries, and in the 12th century obtained the title of cathedral. Various monasteries were erected on both sides of the river, and served to group in thickly-peopled suburbs the population, which had grown too large for the island.
PARIS

The first Carolingian, Pippin the Short, occasionally lived at Paris, sometimes in the palace of Julia, sometimes in the old palace of the Roman governors of the town, at the lower end of the island; the latter ultimately became the usual residence. Under Charlemagne Paris ceased to be capital; and under Charles the Bad it became the seat of more courts. But the invasions of the Northmen attracted general attention to the town, and showed that its political importance could no longer be neglected. When the suburbs were pillaged and burned by the pirates, and the city regularly besieged in 885, Paris was heroically defended by its "lords," and the emperor Charles the Fat felt bound to hasten from Germany to its relief. The pusillanimity which he showed in purchasing the retreat of the Normans was the main cause of his deposition in 887, while the courage displayed by Count Odo, or Eudes, procured him the crown of France; Robert, Odo's brother, succeeded him; and, although Robert's son, Hugh the Great, was only duke of France and count of Paris, his power counterbalanced that of the last of the Carolingsians, shut up in Laon as their capital.

With Hugh Capet in 987 the capital of the duchy of France definitively became the capital of the kingdom, and in spite of the frequent absence of the kings, several of whom preferred to reside at Orleans, the town continued to increase in size and population, and saw the development of those institutions which were destined to secure its greatness. Henry I. founded the abbey of St Martin-des-Champs, Louis VI. that of St Victor, the mother-house of an order, and a nursery of literature and theology. St Germain-des-Prés, the royal dwelling in the Île Saint-Louis, was one of the greatest administrative buildings; and the Romanesque style of architecture was exchanged for the Pointed or Gothic, of which Suger, in his reconstruction of the basilica of St Denis, exhibited the earliest type. The capital could not remain aloof from this movement; several sumptuous buildings were erected; the Romanesque choir of St Germain-des-Prés was thrown down to give place to another more spacious and elegant; and when, in 1163, Pope Alexander III. had solemnly consecrated it, he was invited by Bishop Maurice de Sully to lay the first stone of Notre Dame de Paris, a cathedral on a grander scale than any previously undertaken. Paris still possesses the Romanesque naves of St Germain-des-Prés, preserved when the building was rebuilt in the 12th century; the Pointed choir, consecrated in 1163; and the entire cathedral of Notre Dame, which, completed sixty years later, underwent various modifications down to the beginning of the 14th century. The sacristy is modern; the site previous to 1331 was occupied by the episcopal palace, also built by Maurice de Sully, who by a new street had opened up this part of the island. It was Louis VII. who granted to the Templars the piece of marshland on the left bank of the Seine on which the Paris Temple, the headquarters of the order in France, was built (see Templars).

Philip Augustus may be considered the second founder of Paris. He seldom quitted it save for his military expeditions, and he there built for himself, near St Germain l'Auxerrois, the Louvre, the royal dwelling par excellence, whose keep was the official centre of feudalism. He created or organized a regular system of administration, with its headquarters at Paris; and under his patronage the public lectures delivered at Pré-aux-Clercs were regulated and grouped under the title of a university in 1200.

This university, the most famous and flourishing in Christendom, considerably augmented the local population, and formed as it were a new town on the left side of the river, where the great fortified precincts of the Templars, the important abbey of Ste Geneviève, St Germain-des-Prés and St Victor, and a vast Carthusian monastery already stood. Colleges were erected to receive the students of the different countries, and became the great meeting-place of the studious youth of all Europe.

The right side of the river, where commerce and industry had taken up their abode, and where the Louvre, the abbey of St Martin, and a large number of secondary religious establishments were already erected, became a centre of activity at least as important as that on the left. The old suburbs, too, were now incorporated with the town and enclosed in the new line of fortifications constructed by Philip Augustus, which, however, did not take in the great abbeys on the left side of the river, and thus obliged them to build defensive works of their own.

Philip Augustus issued from the Louvre a celebrated order, that the streets of the town should be paved. Not far from his palace, on the site of the present Hales Centrales, he laid out an extensive cemetery and a market-place, which both took their name from the Church of St Hilaire, a building of the same reign, destroyed at the Revolution. Fountains were placed in all the quarters. As for the lighting of the town, till the close of the 16th century the only lamps were those in front of the madonnas at the street corners. But the first "illumination" of Paris occurred under Philip Augustus: on his return from a victorious expedition to Flanders in 1214 he was welcomed by the Parisians as a conqueror; and the public rejoicings lasted for seven days, "interrupted by no night," says the chronicler, alluding to the torches and lamps with which the citizens lighted up the fronts of their houses. Ferrand, count of Flanders, the traitor vassal, was dragged behind the king to the dungeons of the Louvre.

In 1226 there was held at Paris a council which, by excommunicating Raymond VII., count of Toulouse, helped to prepare the way for the most important treaty which had as yet been signed in the capital. By this treaty (April 12, 1226) the regent, Blanche of Castile, the widow of Louis VIII., obtained from Raymond VII. a great part of his possessions, while the remainder was secured to the house of Capet through the marriage of Alphonse of Poitiers, brother of St Louis with Jeanne, the heiress of Languedoc.

In affection for his capital St Louis equalled, or even surpassed, his grandfather Philip, and Paris reciprocated his goodwill. The head of the administration was at that time the provost of Paris, a judicary magistrate and police functionary whose extensive powers had given rise to the most flagrant abuses. Louis IX. reformed this office and filled it with the judge of greatest integrity to be found in his kingdom. This was the famous Étienne Boileau, who showed such vigilance and uprightness that the capital was completely purged of evildoers; the sense of security thus produced attracted a certain number of new inhabitants, and, to the advantage of the public revenue, increased the value of the trade. It was Étienne Boileau who, by the king's express command, drew up those statutes of the commercial and industrial gilds of Paris which, modified by the necessities of new times and the caprice of princes, remained in force till the Revolution.

St Louis caused a partial restoration of St Germain l'Auxerrois, his parish church (completed in the 13th century, and deplorably altered under Louis XV.); and besides preferring the palace of La Cité to the Louvre, he entirely rebuilt it, and rendered it one of the most comfortable residences of his time. Of this edifice there still remain, among the buildings of the present Palais de Justice, the great guard-room, the kitchens with their four enormous chimneys, three round towers on the quay, and one of the marvels of the middle ages, the Sainte Chapelle, erected in 1248 to receive the crown of thorns sent from Constantinople. This church, often imitated during the 13th and 14th centuries, is like an immense shrine in open work; its large windows contain admirable stained glass of its own date, and its paintings and sculptures (restored in the 19th century by Viollet-le-Duc) give a vivid picture of the religious beliefs of the middle ages. It has a lower storey ingeniously arranged, which served as a chapel for the palace servants. The Sainte Chapelle was designed by Pierre de Montereau, one of the most
The last of the direct descendants of Capet, and the first two Valois kings did little for their capital. Philip the Fair, however, increased its political importance by making it the seat of the highest court in the kingdom, the parlement, which he organized between 1302 and 1304, and to which he surrendered a part of his cité palace. Under the three sons of Philip the Fair, the Tour de Nesle, which stood opposite, on the site now occupied by the building of the Institute, was the scene of frightful orgies, equally celebrated in history and romance. One of the queens, who, if the chronicles are to be trusted, took part in these expiated her crimes in Château-Gaillard, where she was strangled in 1315 by order of her husband, Louis X. During the first part of the War of the Hundred Years, Paris escaped being taken by the English, but felt the effects of the national misfortunes. Whilst destitution existed in the country the revolt of the Jacquerie, in the city the miseries of the time were attributed to the vices of the feudal system, struck first the liberty of the merchants. Étienne Marcel, equally endowed with courage and intellect, sought to turn this double movement to account in the interest of the municipal liberties of Paris and of constitutional guarantees. The cause which he supported was lost through the violence of his own acts. Not content with having massacred two ministers under the very eyes of the dauphin Charles, who was regent whilst his father John lay captive in London, he joined the Jacquerie, and was not afraid to call into Paris the king of Navarre, Charles the Bad, a notorious firebrand, who at that time was making common cause with the English. Public sentiment, at first favourable to Marcel's schemes, shrank from open treason. A watch was set on him, and, at the moment when, having the keys of the town in his possession in virtue of his office, he was preparing to open one of the gates, he was assassinated by order of Jean Maillard, one of the heads of the milice, on the night of the 31st of July 1358. Marcel had endeavoured Augustus line of fortifications on the right side of the river, and had begun a new one.

When he became king in 1364, Charles V. forgot the outrages he had suffered at the hands of the Parisians during his regency. He robbed the Louvre to some extent of its military equipment, in order to make it a convenient and sumptuous residence; his open-work staircases and his galleries are mentioned in terms of the highest praise by writers of the time. This did not, however, remain always his favourite palace; having built or rebuilt in the St Antoine quarter the mansion of St Paul or St Pol, he was particularly fond of living in it during the latter part of his life, and it was there that he died in 1380. It was Charles V. who, in conjunction with the provost of Paris, Hugues Aubriot, erected the famous Bastille to protect the St Antoine gate as part of an enlarged scheme of fortification. A library which he founded—a rich one for the times—became the nucleus of the national library. With the exception of some of the upper portions of the Sainte Chapelle, which were altered or reconstructed by this prince or his son Charles VI., there are no remains of the buildings of Charles V.

The reign of Charles VI. was as disastrous for the city as that of his father had been prosperous. From the very accession of the new king, the citizens, who had for some time been relieved by a great reduction of the taxes, and had received a promise of further alleviation, found themselves subjected to the most odious fiscal exactions on the part of the king's uncle, who was not satisfied with the well-stored treasury of Charles V., which he had unscrupulously pillaged. In March 1382 occurred what is called the revolt of the "Maillotins" (i.e. men with mallets). Occupied with his expedition against the Flemings, Charles VI. delayed putting down the revolt, and for the moment remitted the new taxes. On his victorious return on the 30th of May 1382, the mayor and councilers found in front of the town gates under the pretext of showing their sovereign what aid they might derive from them, but really in order to intimidate them. They were ordered to retire within the walls and to lay down their arms, and they obeyed. The king and his uncles, having destroyed the gates, made their way into Paris as into a besieged city; and with the decapitation of Desmaretz, one of the most faithful servants of the Crown, began a series of bloody executions. Ostenibly through the intercession of the regents an end was put to that species of severities, a heavy fine being substituted, much larger in amount than the annual value of the abolished taxes. The municipal administration was suspended for several years, and its functions bestowed on the provost of Paris, a magistrate nominated by the Crown.

The calamities which followed were due to the weakness and incapacity of the government, given over, because of the madness of Charles VI., to the intrigues of a wicked queen and of princes who brought the most bloodthirsty passions to the service of their boundless ambition. First came the rivalry between the dukes of Orleans and Burgundy, brought to an end in 1409 by assassination of the Burgundian prince, for supremacy between two hostile parties: the Armagnacs on one side, commanded by Count Bernard of Armagnac (who for a brief period had the title of constable), and supported by the nobles and burgesses; and on the other side the Burgundians, depending on the common people, and recognizing John the Fearless, duke of Burgundy, as their head. The mob was headed by a skinner at the Hôtel Dieu called Simon Caboche, and hence the name Cabochiens was given to the Burgundian party in Paris. They became masters of Paris
in 1412 and 1413; but so violent were their excesses that the most timid rose in revolt, and the decimated bourgeoisie managed by a bold stroke to recover possession of the town. The Armagnacs again entered Paris, but their intrigues with England and their tyranny rendered them odious in their turn; the Burgundians were recalled in 1418, and returned with Cauchebo and a formidable band of pillagers and assassins. Perronc Leclerc, son of a bourgeois guard, secretly opened the gates to them one night in May. The king resided in the Hôtel St Paul, an unconscious spectator of those savage scenes which the princes Louis and John, successively dauphins, were helpless to control.

The third dauphin, Charles, afterwards Charles VII., managed to put an end to the civil war, but it was by a crime as base as it was infamous—the assassination of John the Fearless on the bridge of Montreouer in 1419. Next year a treaty, from the ignominy of which Paris happily escaped, gave a daughter of Charles VI. to Henry V. of England, and along with her, in spite of the Salic law, the crown of France. The king of England made his entry into Paris in December 1420, and was there received with a solemnity which ill concealed the misery and real consternation of the poor people crushed by fifteen years of murders, pillage and famine. Charles VI. remained almost abandoned at the Hôtel St Paul, where he died in 1422, whilst his son-in-law went to hold a brilliant court at the Louvre and Vincennes. Henry V. of England also died in 1422. His son Henry VI., then one year old, came to Paris nine years later to be crowned at Notre Dame, and the city continued under the government of the duke of Bedford till his death in 1435.

The English rule was a mild one, but it was not signalized by the execution of any of those works of utility or ornament so characteristic of the kings of France. The choir of St Severin, however, shows a style of architecture peculiarly English, and Sauval relates that the duke of Bedford erected in the Louvre a fine gallery decorated with paintings. Without assuming the mission of delivering Paris, Joan of Arc, remaining with Charles VII. after his coronation at Reims, led him towards the capital; but the badly conducted and abortive enterprise almost proved fatal to the Maid of Orleans, who was severely wounded at the assault of the gate of St Honoré on the 8th of September 1429. The siege having been raised, Charles awaited the invitation of the Parisians themselves upon the defection of the Burgundians and the surrender of St Denis. The St Jacques gate was opened by the citizens of the guard to the constable de Remi at the 15th of April 1426; but the solemn entry of the king did not take place till November of the following year; subsequently occupied by his various expeditions or attracted by his residences in Berry or Touraine, he spent but little time in Paris, where he retired either to the Hôtel St Paul or to a neighbouring palace, Les Tournelles, which had been acquired by his father.

Louis XI. made equal use of St Paul and Les Tournelles, but towards the close of his life he immured himself at Plessis-les-Tours. It was in his reign, in 1469, that the first French printing-press was imported into France, at the Sorbonne. Charles VIII. scarcely left Plessis-les-Tours and Amboise except to go to Italy; Louis XII. alternated between the castle at Blois and the palace of Les Tournelles, where he died on the 1st of January 1515. Francis I. lived at Chambord, at Fontainebleau, at St Germain, and at Villers-Cotterets; but he proposed to form at Paris a residence in keeping with the taste of the Renaissance. Paris had remained for more than thirty years almost to the artistic movement begun between 1498 and 1500, after the Italian expedition. Previous to 1533, the date of the commencement of the Hôtel de Ville and the church of St Eustache, Paris did not possess, apart from the "Court of Accounts," any important building in the new style. Between 1527 and 1540 Francis I. demolished the old Louvre, and in 1541 Pierre Lescot began a new palace four times as large, which was not finished till the reign of Louis XIV. The buildings were not sufficiently advanced under Henry II. to allow of his leaving Les Tournelles, where in 1559 he died from a wound received at a tournament. His widow, Catherine de' Medici, immediately caused this palace to be demolished, and sent her three sons—Francis II., Charles IX., and Henry III.—to the unfinished Louvre. Outside the line of the fortifications she laid the foundations of the Château des Tuileries as a residence for herself.

Of the three brothers, it was Charles IX. who resided most at the Louvre; it was there that in 1572 he signed the order for the assassination of St Bartholomew. Henry III. remained for the most part at Blois, and hardly came to Paris except to witness the power of his enemies, the Guises.

Taking advantage of the absence of the kings, the League had made Paris a centre of opposition. The municipal militia were restored and reorganized; each of the 16 quarters or arrondissements had to elect a deputy for the central council, which became the council, or rather faction, of The Sixteen, and for four years, from 1557 to 1561, held the city under a yoke of iron. Henry III., having come to the Louvre in 1558, unwillingly received there the duke of Guise, and while endeavouring to relieve the several cities that had been attacked, marked the Day of the Barricades (May 13). It was with difficulty that he escaped from his palace, which at that time had no communication with the country, and which Henry IV. afterwards proposed to unite with the Tuileries in order to provide a sure means of escape in case of need.

When, after the murder of the duke of Guise at Blois at the close of 1588, Henry III. desired to return to Paris, he was not yet master of the city, and was obliged to besiege it in concert with his presumptive heir, the king of Navarre. The operations were suddenly interrupted on the 1st of August 1589, by the assassination of the king, and Henry IV. carried his arms elsewhere. He returned with his victorious forces in 1590. This second siege lasted more than four years, and was marked by terrible suffering, produced by famine and the tyranny of The Sixteen, who were supported by the intrigues of the king of Spain and the violent harangues of the preachers. Even the conversion of the king did not allay the spirit of fanaticism, for the king's sincerity was suspected, and the words (which history, however, fails to substantiate), "Paris is surely worth a mass," were attributed to him. But after the coronation of the king at Chartres the commonalty of Paris, weary of intriguing with strangers and Leaguers, gave such decided expression to its feelings that those of St Bartholomew, who had kept aloof, or broken off from the faction of The Sixteen attached themselves to the parlement, which had already evaded the ambitious designs of the king of Spain; and after various negotiations the provost of the merchants, L'Huiller, offered the keys of the city to Henry IV. on the 22nd of March 1594. The king met no resistance except on the part of a company of German landsknechts, which was cut in pieces, and the students of the university, who, steeped in the doctrines of the League, tried to hold their quarter against the royal troops, but were dispersed. The Spanish soldiers who had remained in the town decamped to the south of the city.

Henry IV., who carried on the building of the Louvre, was the last monarch who occupied it as a regular residence. Attempts on his life were made from time to time, and at last, on the 14th of May 1610, he fell under Ravaillac's knife near the market-house in Rue de la Feronnerie.

Whether royalty gave it the benefit of its presence or not, Paris continued all the same to increase in political importance and in population. Here is the picture of the city presented about 1560 by Michel de Castelnau, one of the most celebrated chroniclers of the 16th century—"Paris is the capital of all the kingdom, and one of the most famous in the world, as well for the splendour of its parlement (which is an illustrious company of thirty judges attended by three hundred advocates and more, who have reputation in all Christendom of being the best seen in human laws and acquainted with justice) as for its faculty of theology and for the other tongues and sciences. 

1 Arthur, earl of Richmond, afterwards Arthur III. (q.v.), duke of Brittany.
which shine more in this town than in any other in the world, besides the mechanic arts and the marvellous traffic which render it very populous and opulent; in such sort that the other towns of France and all the magistrates and subjects have their eyes directed thither as to the model of their decisions and their political administrations."

Castelnau spoke rather as a statesman and a magistrate, and did not look close enough to see that the university was beginning to decline. The progress of the sciences was somewhat lessened by the order of St. Francis Xavier, especially devoted to theology and literature; the eyes of men were turned towards Italy, which was then considered the greatest centre of intellectual advance; the colleges of the Jesuits were formidable rivals; the triumphs of Protestantism deprived it of most of the students, who used to flock to it from England, Germany and Scandinavia; and finally the unfortunate part it played in political affairs weakened its influence so much that, after the reign of Henry IV, it no longer sent its deputies to the states-general.

If the city on the left side of the river neither extended its circuit nor increased its population, it began in the 17th century to be filled with large mansions (hotels), and its communications with the right bank were rendered easier and more direct when Henry IV. constructed across the lower end of the island of La Cité the Pont Neuf, which, though retaining its original name, is now the oldest bridge in Paris. On the right side of the river commerce and the progress of centralization continued to attract new inhabitants, and old villages became suburbs were enclosed within the line of a bastioned first enceinte, the ramparts of Étienne Marcel being, however, still left untouched. Although Louis XIII., except during his minority, was so far on this side of Paris, he was seldom long absent from it. His mother, Mary de' Medici, built the palace of the Luxembourg, which, after being extended under Louis Philippe, became the seat of the senate.

Louis XIII. finished, with the exception of the eastern front, the buildings enclosing the square court of the Louvre, and carried on the wing which was to join the palace to the Tuileries, Queen Anne of Austria founded the Val de Grâce, the dome of which, afterwards painted on the interior by Mignard, remains one of the finest in Paris. Richelieu built for himself the Palais Royal, since restored, and rebuilt the Sorbonne, where now stands his magnificent tomb by Girardon. The island of St. Louis above La Cité, till then occupied by gardens and meadows, became a populous parish, whose streets were laid out in straight lines, and whose finest houses still date from the 17th century. Building also went on in the Quartier du Marais (quarter of the marsh); and the whole of the Place Royale (now Place des Vosges), with its curious arcaded galleries, belongs to this period. The church of St. Paul and St. Louis was built by the Jesuits beside the ruins of the old Hôtel St. Paul; the church of St. Gervais received a façade which has become in our time too famous. St. Étienne du Mont and St. Eustache were completed (in the latter case with the exception of the front). The beautiful Salle des Pas-Perdus (Hall of Lost Footsteps) was added to the Palais de Justice. Besides these buildings and extensions Paris was indebted to Louis XIII. and his minister Richelieu for three important institutions—the royal printing press in 1620, the Jardin des Plantes in 1662, and the French Academy in 1635. The bishopric of Paris was separated from that of Sens and erected into an archbishopric in 1633.

As memorials of Mazarin Paris still possesses the Collège des Quatre-Nations, erected with one of his legacies immediately after his death, and appropriated to the Institute, and the palace which, enlarged in the 19th century, now accommodates the national library.

The stormy minority of Louis XIV. was spent at St. Germain and Paris, where the court was held at the Palais Royal. The intrigues of the prince of Condé, Cardinal de Retz, and (for a brief space) Turenne resulted in a siege of Paris, during which more epigrams than balls were fired; but the cannon of the Bastille, discharged by order of Madame de Montpensier, enabled Condé to enter the city. Bloody riots followed, and came to an end only with the exhaustion of the populace and its voluntary submission to the king. Though Louis XIV. ceased to stay in Paris after he grew up, he did not neglect the work of embellishment. On the site of the fortifications of Étienne Marcel, which during the previous hundred years had been gradually disappearing, he laid out the line of boulevards connecting the quarter of the Bastille with that of the Madeleine. Though he no longer inhabited the Louvre (and it never was again the seat of royalty), he caused the great colonnade to be constructed after the plans of Claude Perrault. To this immense and imposing façade, 545 ft. long, has the defect of being quite out of harmony with the rest of the building, which it hides instead of introducing. The same desire for effect, altogether irrespective of congruity, appears again in the observatory erected by the same Perrault, without the smallest consideration of the wise suggestions made by Cassini. The Place Vendôme, the Place des Victoires, the triumphal gates of St Denis and St Martin and several fountains, are also productions of the reign of Louis XIV. The hospital of La Salpêtrière, with its majestically simple dome, was finished by Libéral Bruant. The Hôtel des Invalides, one of the finest institutions of the kind monarque, was also erected, with its chapel, between 1671 and 1675, by Bruant; but it was reserved for the architect Hardouin Mansart to give to this imposing edifice a complement worthy of itself: it was he who raised the dome, admirable alike for its proportions, for the excellent distribution of its ornaments, and for its gilded lantern, which rises 344 ft. above the ground. "Private persons," says Voltaire, "in imitation of their king, raised a thousand splendid edifices. The number increased so greatly that from the neighbourhood of the Palais Royal and of St. Sulpice, more or less remarkable edifices, were reared, which, though inferior in general effect to those of the upper part of the town, were much finer than the old one." All the aristocracy had not thought fit to take up their residence at Versailles, and the great geniuses of the century, Corneille, Racine, La Fontaine, Molière, Madame de Sévigné, had their houses in Paris; there also was the Hôtel de Rambouillet, so famous in the literary history of the 17th century.

The halls of the Palais Royal during the minority of Louis XV. were the scene of the excesses of the regency; later on the king from time to time resided at the Tuileries, which henceforward came to be customarily regarded as the official seat of the monarchy. To the reign of Louis XIV. are due the rebuilding of the Palais Royal, the "Place" now called De la Concorde, the military school, the greater part of the church of Ste Geneviève, or Panthéon (a masterpiece of the architect Soufflot), the church of St. Roch, the palace of the Élysée (now the residence of the president of the republic), the Palais Bourbon (with the exception of the façade), now occupied by the chamber of deputies, and the mint, a majestic and scholarly work by the architect Antoine, as well as the rebuilding of the Collège de France.

Louis XVI. finished or vigorously carried on the works begun by his grandfather. He did not come to live in Paris till compelled by the Revolution. That historical movement began indeed at Versailles on the 17th of June 1789, when the states-general were transformed into a constituent assembly; but the first act of violence which proved the starting-point of all its excesses was performed in Paris on the 14th of July 1789, when Paris inaugurated, with the capture of the Bastille, its "national guard," organized and then commanded by the celebrated La Fayette. At the same time the assassination of the last provost of the merchants, Jacques de Flesselles, gave the opportunity of establishing, with more extended powers, the assembly of St. Lukas (now the National Convention), which was first occupied by Bailly, and soon became, under the title of commune, a political power capable of effectively counterbalancing the central authority.1

Paris had at that time once more outgrown its limits. The quarter on the left side of the river had more than doubled its extent by the accession of the great monasteries, the faubourgs of St Germain and St Marceau, the Jardin des Plantes, and...

1 Owing to the armed and organized revolutionary elements in the assemblies of the Sections, which enabled the revolutionary commune to direct and control popular émeutes.
the whole of Mont Ste Geneviève. The line of the new encinte is still marked by a circuit of boulevards passing from the Champs de Mars at Pont d'Austerlitz by Place de l'Enfer and Place d'Italie. Similar enlargements, also marked out by a series of boulevards, incorporated with the town on the right side of the faubourgs of St Antoine and Poissonnière and the quarters of La Chaussée d'Antin and Chaillot. In 1784 was begun, instead of a line of fortifications, a Greek cross, and the second storey lighted by low arcades supported by columns of the Paestum type. None of these works were completed till the time of the empire. It was also in the latter part of the reign of Louis XIV., and under the first republic, that the quarter of La Chaussée d'Antin was built.

The history of Paris during the Revolutionary period is the history rather of France, and to a certain extent of the whole world (see France: History; French Revolution; and the articles on the Jacobins and other clubs). During the Consulate hardly anything of note took place at Paris except the explosion of the infernal machine directed against Bonaparte on the 24th of December 1800.

The coronation of Napoleon by Pope Pius VII. was celebrated in Notre Dame on the 2nd of December 1804. Eight years later, during the Russian campaign, the conspiracy of General Malet, happily suppressed, was on the point of letting loose on all France a dreadful civil war. The empire, however, was then on the wane, and Paris was witness of its fall when, after a battle on the heights of Montmartre and at the barricade of Clichy, the city was obliged to surrender to the allies on the 30th of March 1814.

For the next two months the city was in the occupation of the allies and witnessed a hitherto unique assembly of sovereigns and statesmen. Their deliberations issued on the 30th of May 1814 in the first treaty of Paris (see Paris, Treaties of, below). So far as the city itself was concerned, the only permanent loss that it suffered through the occupation was that of the art treasures with which Napoleon had enriched it at the expense of other capitals; among these were many paintings and pieces of statuary from the Louvre, and the famous bronze horses from Venice, which were taken down from the triumphal arch of the Carrousel and restored to the façade of St Mark's. The expressed determination of Bliicher and his Prussians to blow up the Pont de Jena, built to commemorate Napoleon's crushing victory of 1806, was frustrated by the vigorous intervention of Wellington and of the emperor Alexander I.

Paris under the Restoration witnessed the revival of religious ceremonials to which it had long been unaccustomed, notably the great Corpus Christi procession, in which the king himself carried a candle. Then came Napoleon's return from Elba (March 1815) and the interlude of the Hundred Days. After Waterloo, though there was fighting round Paris, there was no effort to defend the city against the allied armies; for the Parisians had grown thoroughly weary of Napoleon, and Louis XVIII., though he 'in the baggage train of the enemy,' was received by the populace with rapturous acclamation (see Louis XVIII.). The second treaty of Paris was signed on the 20th of November of the same year (see below). It left France in the occupation of 150,000 foreign troops, and the crown and government under the tutelage of a committee of representatives of the foreign great powers in Paris.

Paris now became the centre of the royalist reaction, and of a political proscription which reflected, though without its popular excesses, the White Terror of the South. The most conspicuous event of this time was the tragedy of the trial and execution of Marshal Ney (q.v.). For the rest, the only event of note that occurred in Paris under Louis XVIII. was the assassination of the duke of Berry by Louvel on the 13th of February 1820. Ten years later the revolution of 1830, sparked off by a manifesto issued by the Column of July in Place de la Bastille, put Charles X. to flight and inaugurated the reign of Louis Philippe, a troublous period which was closed by the revolution of 1848 and a new republic. It was this reign, however, that surrounded Paris with hastened fortifications with ditches and detached forts, the outcome of the warlike fever aroused by the exclusion of France from the treaty of London of 1840 (see MEHÉMET Ali). The republic of 1848 brought no greater quiet to the city than did the reign of Louis Philippe. The most terrible insurrection was that of the 23rd-24th of June 1848, distinguished by the devotion and heroic death of the Archbishop Affre. It was quelled by General Cavaignac, who then for some months held the executive power. Prince Louis Napoleon next became president of the republic, and after dissolving the chamber of deputies on the 2nd of December 1851, caused himself to be proclaimed emperor just a year later.

The second empire completed that material transformation of Paris which had already been begun at the fall of the ancient monarchy. First came numerous cases of destruction and demolition caused by the suppression of the old monasteries and of many parish churches. A number of medieval buildings, civil or military, were cleared away for the sake of regularity of plan and improvements in the public streets, or to satisfy the taste of the owners, who thought more of their comfort or profit than of the historic interest of their old mansions or houses.

It was under the first empire that the new series of improvements were inaugurated which have made Paris a modern city. Napoleon began the Rue de Rivoli, built along this street the wing intended to connect the Tuileries with the Louvre, erected in front of the court of the Tuileries the triumphal arch of the Carrousel, in imitation of that of Septimius Severus at Rome. In the middle of the Place Vendôme was reared, on the model of Trajan's column, the column of the Grand Army, surmounted by the statue of the emperor. To commemorate this same Grand Army he ordered from the architect Pierre Vignon a Temple of Victory, which without changing the form of its Corinthian peristyle has become the church of the Madeleine; the entrance to the avenue of the Champs Élysées was spanned by the vast triumphal arch De l'Étoile (of the star), which owes its celebrity not only to its colossal dimensions and its magnificent situation, but also to one of the four subjects sculptured upon its faces —the Chant du départ or Marseillaise, one of the masterpiece of Rude and of modern sculpture. Another masterpiece was executed by David of Angers—the pediment of the Panthéon, not less famous than Soufflot's dome. The museum of the Louvre, founded by decree of the Convention on the 27th of July 1793, was organized and considerably enlarged; that of the Luxembourg was created in 1805, but was not appropriated exclusively to modern artists till under the Restoration. The Conservatoire des Arts et Métiers, due to the Convention, received also considerable additions in the old priory or abbey of St Martin des Champs, where the council of the Five Hundred had installed it in 1798.

Under the Restoration and under the government of July many new buildings were erected; but, with the exception of the Bourse, constructed by the architectes Brongniart and Labarre, and the colonnade of the Chamber of Deputies, these are of interest not so much for their size as for the new artistic tendencies affected in their architecture. People had grown weary of the eternal Graeco-Roman compilations rendered

1 Notable in the history of the city for the discovery by the populace of the effectiveness of barricades against regular troops. These had been last used in the Fronde.
fashionable by the Renaissance, and reduced under the empire to mere imitations, in producing which all inspiration was repressed. The necessity of being rational in architecture, and of taking full account of practical wants, was recognised; and more suggestive and plastic models were sought in the past. These were to be found, it was believed, in Greece; and in consequence the government under Louis Philippe saw itself obliged to found the French school at Athens, in order to allow young artists to study their favourite types on the spot. In the case of churches it was deemed judicious to revive the Christian basilicas of the first centuries, as at Notre Dame de Lorette and St. Vincent de Paul; and a little later to bring in again the styles of the middle ages, as in the ogival church of St. Clotilde.

Old buildings were also the object of labours more or less important. The Plaideau de la Concorde was altered in various ways, and adorned with eight statues of towns and with two fountains; on the 25th of October 1836 the Egyptian obelisk, brought at great expense from Luxor, was erected in the centre. The general restoration of the cathedral of Notre Dame was voted by the Chamber in 1845, and entrusted to Viollet-le-Duc; and the palace of the Luxembourg and the Hôtel de Ville were considerably enlarged at the same time, in the style of the existing edifices.

But the great transformer of Paris in modern times was Napoleon III. To him or to his reign we owe the Opéra, the masterpiece of the architect Garnier; the new Hôtel-Dieu; the finishing of the galleries which complete the Louvre and connect it with the Tuileries; the extension of the Palais de Justice and its new front on the Place Dauphine; the tribunal of commerce; the central markets; several of the finest railway stations; the viaduct at Auteuil; the churches of La Trinité, St. Augustin, St. Amboise, St. François Xavier, Belleville, Ménilmontant, &c. For the first international Paris exhibition (that of 1855) was constructed the "palace of industry"; the enlargement of the national library was commenced; the museum of French antiquities was created by the savant Du Sommerard; and installed in the old church built at the end of the 15th century for the abbots of Cluny.

All this is the smallest part of the memorials which Napoleon III. left of his presence. Not only was the city traversed in all directions by new thoroughfares, and sumptuous houses raised or restored in every quarter, but the line of the fortifications was made in 1859, as far as the limits of the city. The area was thus doubled, extending to 7,340 hectares or 18,410 acres, instead of 3,402 hectares or 8407 acres. It was otherwise with the population; to the 1,300,000 inhabitants which Paris possessed in 1858 the incorporation of the suburban zone only added 600,000.

Paris had to pay dear for its growth and prosperity under the second empire. This government, which, by straightening and widening the streets, thought it had effectually guarded against the attempts of its internal enemies, had not sufficiently defended itself from external attack, and at the first reverses of 1870 Paris found itself prepared to overthrow the empire, but by no means able to hold out against the approaching Prussians.

The two sieges of Paris in 1870-71 are among the most dramatic episodes of its history. The first siege began on the 16th of September 1870, with the occupation by the Germans of the heights on the left side of the river and the capture of the unfinished redoubt of Châlions. Two days later the investment was complete. General Trochu, head of the French Government and governor of the city, had under his command 400,000 men—a force which ought to have been able to hold out against the 240,000 Germans by whom it was besieged, had it not been composed for the most part of hurried levies of raw soldiers with inexperienced officers, and of national guards who, never having been subjected to strict military discipline, were a source of weakness rather than of strength. The guards, it is true, displayed a certain warlike spirit, but it was for the sole purpose of exciting disorder. Open revolt broke out on the 31st of October; it was suppressed, but increased the demoralization of the besieged and the demands of the Prussians. The partial successes which the French obtained in engagements on both sides of the river were rendered useless by the Germans capturing all the best positions; the severity of winter told heavily on the garrison, and the armies in the provinces which were to have co-operated with it were held in check by the Germans in the west and south. In obedience to public opinion a great sortie was undertaken; this, in fact, was the only alternative to a surrender; for, the empire having organised everything in expectation of victory and not of disaster, Paris, insufficiently provisioned for the increase of population caused by the influx of refugees, was already suffering the horrors of famine. Accidental circumstances combined with the indecision of the leaders to render the enterprise a failure. Despatches might have been sent by balloon, but the men of the Châlions, however, reached their destination too late; the bridge of Championny over the Marne could not be constructed in time; the most advantageous positions remained in the hands of the Germans; and on the 2nd and 3rd of December the French abandoned the positions they had seized on the 29th and 30th of November. Another sortie made towards the north on the 21st of December was repulsed, and the besieged lost the Avron plateau, the key to the positions which they still held on that side. The bombardment began on the 17th of December, and great damage was done to the forts on the left of the Seine, especially those at Vanves and Issy, the forts on the right side being still to be held by some time by the Germans. Mont Valérien happily remained in the hands of the government and became the pivot of the attack during the second siege. All the sorties made by the insurgents in the direction of Versailles (where the National Assembly was in session from the 20th of March) proved unsuccessful, and cost them two of their improvised leaders—Generals Flournois and Duval. The incapacity and mutual hatred of their chiefs rendered all organization and durable resistance impossible. On Sunday the 21st of May the government forces, commanded by Marshal MacMahon, having already captured the forts on the right side of the river, made their way within the walls; but they had still to fight hard from barricade to barricade before they were masters of the city; Belleville, the special Red Republican quarter, was not assaulted and taken till Friday. Meanwhile the communists were committing the most horrible excesses: the archbishop of Paris (Georges Darboy, &c.), President Bonjol, priests, magistrates, journalists and private individuals, whom they had seized as hostages, were shot in batches in the prisons; and a scheme of destruction was ruthlessly carried into effect by men and women with cases of petroleum (pétroleurs and pétroleuses). The Hôtel de Ville, the Palais de Justice, the Tuileries, the Ministry of Finance, the palace of the Legion of Honour, that of the Council of State, part of the Rue de Rivioli, &c., were ravaged by the flames; barrels of gunpowder
were placed in Notre Dame and the Pantheon, ready to blow up the buildings; and the whole city would have been involved in ruin if the national troops had not gained a last and crowning victory in the neighbourhood of La Roquette and Père-la-Chaise on the 8th of May. Besides the large number of insurgents who were taken in arms, were pitilessly shut up; others were afterwards condemned to death, to penal servitude, to transportation; and the survivors only obtained their liberty by the decree of 1879.

From this double trial Paris emerged diminished and almost robbed of its dignity as capital; for the parliamentary assemblies and the government went to sit at Versailles. For a little it was thought that the city would not recover from the blow which had fallen on it. All came back, however—confidence, prosperity, and, along with that, increasing growth of population and the execution of great public works. The Hôtel de Ville was rebuilt; an imposing edifice adorned with statues of Napoleon and his marshals. A vast school of pharmacy established in the old gardens of the Luxembourg, and boulevards completed. The exhibition of 1878 was more marvellous than those of 1855 and 1867, and left a lasting memorial—the palace of the Trocadéro. And the chambers in 1879 considered quiet sufficiently restored to take possession of their customary quarters in the Palais Bourbon and the Luxembourg.

The Universal Exhibition of 1878, destined to show Europe that France had recovered her material prosperity and moral power, attracted a large concourse. The number of admissions was about 13,000,000. A grand fête, full of gaiety and enthusiasm, was held on the 30th of June. This was the first public rejoicing since the war. The terrible winter of 1879-1880 was the severest of the century; the Seine, entirely frozen, resembled a sea of ice. The 14th of July, the anniversary of the taking of the Bastille, was adopted as the French national holiday and celebrated for the first time in 1880. A grand military review was held in the Bois de Boulogne, at which President Grévy distributed flags to all the regiments of the army. On the 17th of March 1881 a national loan of a thousand million francs was issued for the purpose of executing important public works. This loan was covered fifteen times; Paris alone subscribing for ten thousand millions. At the time of the legislative elections, on the 21st of August and the 4th of September 1881, several tumults occurred in the Belleville district, Gambetta, who was a candidate in the two wards of that district vainly tried to address the electors. The great orator died in the following year, on the 21st of December, from the effects of an accident, and his funeral, celebrated in Paris at the expense of the State, was attended by an immense gathering. A slight Legitimist agitation followed Gambetta’s death. An unfortunate event occurred on the 20th of September 1883, the day when the king opened the exhibition, a grand fête, full of gaiety and enthusiasm. The crowd was composed of the 15th regiment of Prussian Uhlan, of which he was the honorary colonel. The cries of “Down with the Ulhans!” with which he was greeted by the Paris crowd, gave rise to serious diplomatic incidents. On the 26th of May 1883 the following decree was rendered: “The Pantheon is restored to its primitive and legal destination. The remains of the great men who have merited national recognition will be disposed therein.” But it was only on the 4th of August 1899 that the ashes of Lazare Carnot, Hoche, Marceau, Latour d’Auvergne and Baudin were solemnly transported to the Pantheon. Victor Hugo’s funeral was celebrated on the 1st of June 1885, and by an urgent vote they were made national obsequies. It was decided that the corpse should be exposed one day and one night under the Arc de Triomphe, veiled with an immense crape. A few days before, upon the occasion of the anniversary of the fall of the Commune, a tumultuous political manifestation had been made in front of the tomb of the Communists buried in Père Lachaise cemetery.

In 1886 the Monarchists renewed their political demonstrations; the most important was the reception given by the Count of Paris at the Galleria mansion on the occasion of the marriage of his son and the King of Portugal. The Count of Paris had invited to this reception all the foreign ambassadors, and some disturbance having taken place, the Chamber of Deputies, on the 11th of June 1886, voted a law interdicting sojourn upon French territory to the Orleanist and Bonapartist pretenders to the throne of France, and also to their direct heirs. At that epoch Paris was in a state of precision and discontent, and various catastrophes occurred. First of all came the disastrous bankruptcy of a large financial concern called the Union Générale; then the scandal concerning the traffic in decorations, in which M. Wilson, son-in-law of M. Jules Grévy, was compromised, and which eventually led to the resignation of the President; finally the deplorable Panama affair profoundly enervated the Parisians, and made them feel the necessity of shouting for a military master, some adventurer who would promise them a revenge. All this led to Boulangism. It was by wild acclamations and frantic shouts that the general Boulangere was greeted, first at the review of the army on the 14th of July, then two days later at the opening of the Military Club, afterwards at the Winter Circus, where the Patriots’ League held a mass meeting under the presidency of Paul Déroulède, and finally, on the 8th of July, at an immense demonstration at the Lyons railway station, when “Le bravo Général” left Paris to take command of the 13th army corps at Clermont Ferrand. Popular refrains were sung in the streets in the midst of immense excitement on the 27th of January 1889 at the time of the election of General Boulangere as deputy for the Seine department. A majority of 80,000 votes had been invested by him with an immense moral authority, and he appeared as though elected by the whole of the country; but he lacked the necessary audacity to complete his triumph, and the Government having decided to prosecute him for conspiracy against the security of the state, before the Senate acting as a High Court of Justice, he fled with his accomplices, Rochefort and Dillon. All three were condemned by default, on the 14th of August, to imprisonment in a fortified enclosure.

Other events had also troubled this astonishing interlude of Boulangism. On the 23rd of February 1887 a terrible fire destroyed the Opéra Comique during a performance, and a great many of the audience perished in the flames. The first performance of Lobengrin, which took place at the Eden Theatre on the 1st of May 1887, was also the cause of street rioting. In 1888 there were several strikes. That of the day labourers, which lasted more than a month, occasioned violent scenes, owing to the sudden death of Émile Eudes, a Communist, while he was speaking in favour of the strike at a public meeting. On the 2nd of December there were manifestations in memory of Baudin, a representative of the people, killed upon the barricades in 1831 while fighting in the defence of the Republic. But a calm finally came, and then the Parisians thought only of celebrating the centenary of the Revolution of 1789 by an universal exhibition. This exhibition maintained a profusion of marvels such as had never before been seen, and indicated what enormous industrial progress had been accomplished. Sadi Carnot, who had succeeded M. Jules Grévy as President of the Republic on the 3rd of December 1887, officially opened the exhibition on the 6th of May 1889. Numerous fêtes were held in the grounds while the exhibition lasted. The Eiffel Tower and the illuminated fountains enraptured the crowd of visitors, while the Rue du Caire, with its Egyptian donkey-drivers, obtained a prodigious success. Most of the nations were represented at this exhibition, and Germany, which had allied itself with the French government, confided its co-operation to the display of some paintings. The Shah of Persia, in honour of whom splendid fêtes were organized, and the King of Greece, the Prince of Wales, the Lord Mayor of London, several Russian grand dukes, Annamite, Tunisian, Moorish, Egyptian and African princes successively visited the Exhibition. There were 30,000,000 visitors. On the 18th of August a banquet was given in the Palais de l’Industrie by the Paris Municipal Council to all the mayors in France, and 15,000 of these officials were present.

In 1896 the duke of Orleans, having attained his majority, came to Paris to draw for military service the youngest conscripts of his class. He was arrested, and placed, far in
PARIS, TREATIES OF

...the Conciergerie, and later in the prison at Clairvaux, but was released after a few months' incarceration. The following years were remarkable for more strikes and several demonstrations by the students, which led in 1803 to conflicts with the police, in one of which a student was killed. On the 16th of October an enthusiastic welcome was extended to Admiral Avon and the Russian sailors upon their arrival in Paris. It was about this time that dynamite began to be used by the Anarchists. After Ravachol, who commenced the sinister exploits of the "propaganda by acts," it was Vaillant who threw a bomb into the "Temple of the Laws" on the 9th of December 1893, and wounded forty-six deputies. Then there was a succession of these attacks during the two following months, for Ravachol and Vaillant had found emulators. Henry scattered fright and death among the peaceable customers of a brasserie, while bombs were thrown into the staircases of houses inhabited by wealthy people. Upon the steps of the Madeleine Church, Parvels, who was already the author of two dynamite plots, was struck down by the destructive machine that he was about to throw into the body of the church. Laurent Tailhade himself, who had celebrated with his pen the beauty of Vaillant's gesture, was subsequently wounded by dynamite thrown into the Café Foy, where he was lunching.

The visit of the emperor and empress of Russia, on the 9th, 6th and 7th of October 1896, was celebrated by innumerable fêtes. The Rue de la Paix was decorated with ropes and sails stretched across the street like the rigging of a vast vessel, in honour of the Russian sailors. Nothing could be seen anywhere except flags, cockades and badges formed of the colours of the two friendly nations. In the evening there were open-air balls, with farandoles and orchestras at all the street corners. Popular enthusiasm was again manifested on the 31st of August, when President Faure returned from his visit to the Russian court. On the 4th of May 1897 the terrible conflagration at the Charity Bazaar in the Rue Jean Jouvin threw into mourning one hundred and forty families of the nobility, Chancery, and brevet official among the class always considerate in its benevolence. Then all minds were again troubled and disturbances occurred in the streets for more than two years over the Dreyfus case, dividing the French people into two camps.

President Faure died suddenly on the 18th of February 1899. The very day of his funeral, Paul Déroulede and Marcel Habert tried to make a coup d'État by urging General Roget to lead his troops, which had formed part of the guard of honour at the obsequies, against the Elysée. Immediately arrested and put on trial, Déroulede and Habert were acquitted by a majority jury.

M. Émile Loubet, President of the Senate, was chosen successor to M. Félix Faure. Upon his return to Paris from the Versailles Congress, where he had been elected President of the French Republic, he was greeted by hisses and cries of "Panama!" cries in no wise justifiable. Some time afterwards, Jules Guérin, by a desperate resistance against a summons of the police to give himself up, made the public believe for two months in the existence of an impregnable fortress in the Rue Chabrol, in the very centre of Paris. On the 4th of June there was a great holiday at the Autel Races, which President Loubet had been, according to custom, invited to attend. He was insulted and struck by Baron de Christiani, who was encouraged by the young royalists of the "Gillets Blancs" Association. A week later, the extraordinary and excessive police measures taken to prevent a disturbance at the Grand Prix occasioned the downfall of the Dupuy ministry. M. Waldeck-Rousseau then formed a cabinet, himself becoming president of the council. The new premier immediately took energetic measures against the enemies of the Republic. Compromising documents found in various domiciliary searches made among the Monarchists and Nationalists formed the basis of prosecutions before the High Court of Justice. The trial resulted in the condemnation of Jules Guérin to a term of imprisonment, and the banishment of Paul Déroulede, Marcel Habert, André Buffet and the Marquis de Lur Saluces, thereby ridding France of all these promoters of disorder, and opening a new era of peace, which lasted throughout the Universal Exhibition of 1900.

The Exhibition of 1900, including the slope of the Trocadéro, the Champ de Mars, the Esplanade of the Invalides and both sides of the Seine bordered by the Rue de Paris and the Rue des Nations. Seen from the new Alexandre III. bridge, the spectacle was as fairy-like as a stage setting. Close beside, at the left, were the palaces of the different nations, each one showing its characteristic architecture, and all being of an astonishing diversity. To the right were the pavilion of the city of Paris and the enormous greenhouses, and in the distance Old Paris, so picturesquely constructed by Robida. In short, exotic edifices and scintillating cupolas arose with unparalleled profusion, treating in 1900 Paris a veritable city of dreams and illusion. The most distant countries sent their art treasures or the marvels of their industry. The number of visitors was 75,000,000, and the personages of mark included the Shah of Persia, the King of Sweden, the King of the Belgians and the King of Greece, all of whom were successively the guests of France. On the 22nd of September 22,000 mayors accepted the invitation to the banquet offered in their honour by President Loubet, and thus solemnly affirmed their Republican faith. This admirably organized banquet was accepted with splendid enthusiasm. A proclamation of 1801, a brilliant epilogue of the closing century, was a grand manifestation of universal concord, of the union of peoples by art, science, industry, all branches of human genius. (De B.)

The bibliography of the history of Paris is immense, and it must suffice here, so far as authorities on the medieval period are concerned, to refer to the long list of works, &c., given by Ulysse Chevalier, Répertoire des sources historiques du moyen âge, topographie (Montbéliard, 1903), pp. 2267–2290. See also Lacome, Bibliographie parisiense, tableaux de mœurs, 1600–1850 (Paris, 1856), and Pesard, Nouvelles des histo. de Paris (1904). Of general value are the works of Habert, A. de Mornay et les célébrités du troisième siècle (1879); new ed. continued by Leynadier and Roquette, 1874; Paul Robiquet, Hist. municipale de Paris, up to Henry IV. (1889–1904); J. Lebeuf, Hist. de la ville et du diocèse de Paris (1874–1878); new ed. revised and enlarged, by H. Cochieri, 1863–1867; and the Hist. générale de Paris, published under the authority of the municipality, of which vol. xxxii. was issued in 1900. Important special works on later periods are W. A. Schmidt, Paris unter Léopold I. während der Revolutionen, 1789–1800 (Jena, 1874–1876); French trans., Paris pendant la révolution, by P. Viollet, 1880–1904); and Tableaux de la révolution française (Paris, 1893). Of particular note are the volumes relatifs à l'hist. de Paris pendant la révolution (1809–1903); Lanzac de Laborde, Paris sous Napoléon (1901); Simond, Paris de 1810 à 1800 (1902); Cailleux, Hist. de l'administration parisienne au xixe siècle (1900).

PARIS, TREATIES OF (1814–1815). Among the very many treaties and conventions signed at Paris those which bear the title of "treaties of Paris" par excellence are the two sets of treaties, both of the highest importance in the history of the international politics of Europe and the formation of its public law, signed in Paris on the 30th of May 1814 and the 20th of November 1815. The first embodied the abortive attempt made by the Allies and Louis XVIII. of France to re-establish lasting peace in Europe after the first abdication of Napoleon at Fontainebleau on the 11th of April 1814. The second contained the penal and cautionary measures which the Allies found it necessary to impose when the practically unopposed return of Napoleon from Elba, and his resumption of power, had proved the weakness of the Bourbon monarchy. (See Europe: History.)

The treaty of the 30th of May 1814 and the secret treaty which accompanied it, were signed by Talleyrand for France; by Lords Castlereagh, Aberdeen and Cathcart for Great Britain; by Counts Rasumovski and Nesselrode for Russia; by Prince Metternich and Count Stadion for Austria; and by Baron Hardenberg and W. von Humboldt for Prussia. Sweden and Portugal deferred later, and Spain adhered on the 26th of July to the public treaty, to which there were in all eight signatories. It is this public treaty which is known as the first treaty of Paris.
It was signed in eight instruments identical in substance. The Allies, who appear as acting in the most friendly co-operation with Louis XVIII., declare that their aim is to establish a lasting peace based on a just distribution of forces among the powers, and that as France has returned to "the paternal government of her kings" they no longer think it necessary to exact those guarantees which they had been reluctantly compelled to insist on from her late government. The preamble is more than a flourish of diplomatic humanity; for the treaty is extraordinarily favourable to France. Putting aside as much of the treaty as is common form, and minute details for which the text must be consulted, it secured her in the possession of all the territory she held in Europe on the 1st of January 1792 (Art. II.); it restored her colonies, except Tobago, Santa Lucia, Ile de France (Mauritius), Rodriguez, and the Seychelles, surrendered to England and the Dutch (Art. IV.); it provided for the cessation of the war, and the return to war (Art. VIII.). Sweden resigned her claim on Guadaloupe (Art. IX.); Portugal resigned French Guiana (Art. X.). The rectifications of the European frontier of France are detailed in the eighth subsections of Art. III. They were valuable.

France obtained (1) a piece of territory south of Mons; (2 and 3) a larger piece around Philadelphia, on the Sambre and Meuse; (4) a rectification including Sarrelobou; (5) a piece of land to connect the formerly isolated fortress of Landau with her own dominions; (6) a better frontier on the east at Doubs; (7) a better frontier as against Geneva; (8) the subprefectures of Annecy and Chambéry (Savoy). By the same article she secured all the German enclaves in Alsace, Avignon, the Venaisin and Montbéliard. Art. VI. secured Holland to the house of Nassau, with an addition of territory, not defined in this instrument; asserted the independence, and right to federate of the German states, and the full sovereignty of all the states of Italy outside of the Italian dominions of Austria. Art. VII. gave Malta to Great Britain. By Art. XV. France was to retain two-thirds of all warships and naval stores existing in ports which had belonged to the empire of Napoleon, but were outside the borders of France, with exception of the Dutch ships. Arts. XVIII. to XXXI. dealt with pecuniary claims, return of documents, renunciation of all claims for compensation, &c. By Art. XXXII. the powers bind themselves to meet at Vienna within two months to arrange a final settlement of Europe. Additional articles provided for the settlement of pecuniary claims in the late grand-duchy of Warsaw, for the abrogation of treaties signed with Prussia since the Peace of Basel. By her additional article with Great Britain, France undertook to suppress the slave trade within five years, and to help to bring about its general suppression.

The separate and secret articles of the treaty (or "Secret Treaty" as they are commonly called), were meant to bind France to agree in principle to the readjustments and allotments of territory and population to be made at the approaching Congress of Vienna (q.v.).

The treaties of the 20th of November 1815 and their dependent instruments, were signed in very different circumstances. The representative of France was the duc de Richelieu; Great Britain was represented by Castlereagh and Wellington; Austria by Metternich and Count Wessenberg; Prussia by Hardenberg and W. von Humboldt; Russia by Rasumovski and Capo d'lstria. The preamble stated the altered spirit and purpose of the Allies. It insisted that, as the power had saved France and Europe from Napoleon's last adventure, they were entitled to compensation and security for the future. They had decided to exact indemnities, partly pecuniary and partly territorial, such as could be exacted without injuring the essential interest of France. The territorial penalty imposed was moderate. France retained the enclaves she had secured by the previous treaty. She had to resign her gains on the north and eastern frontier, to surrender Philadelphia, Marienburg, Bouillon, Sarrelois and Landau, to cede certain territories to Geneva, and she lost Annecy and Chambéry. The standard taken was the frontier of 1792 (Art. I.). By Art. III. she agreed to dismantle the fortress of Hulinning near Basel. The most grievous articles of the treaty are those which imposed the payment of an indemnity, and the occupation of a part of French territory as security for payment. Art. IV. fixed the indemnity at 900,000,000 frs. Art. V. fixed the strength of the army of occupation at 150,000 under a commander-in-chief to be named by the powers, and specified the fortresses it was to hold in the north and north-east of France. The period of occupation was limited to five years, but might be reduced to three. All provisions of the treaty of the 30th of May 1814, and of the Final Act of the Congress of Vienna not expressly revoked were to remain in force. By an additional article the powers agreed to join Great Britain in suppressing the slave trade. Certain complimentary instruments were attached to the treaty. (1) A separate article with Russia in regard to pecuniary claims in Poland. (2) A convention as to payment of indemnity under Art. IV. (3) Convention as to the occupation and the furnishing of the fortified ports. (4) A convention as to settlement of claims of British bondholders. The retrocession of the colonies was made dependent on the partial settlement of these claims. (5) A convention to arrange for settlement of claims under Art. XIX., &c., of the treaty of the 30th of May 1814.

On the day of the signing of the second treaty of Paris, a treaty of alliance, commonly spoken of as the treaty of the 20th of November 1815, was signed in Paris by Great Britain, Austria, Russia and Prussia. It contained six articles. The first declared the determination of the Allies to enforce the treaty signed with France; the second, third and fourth confirmed the determination to exclude the Bonaparte family from the throne, and specified the measures they were prepared to take to support one another. The fifth declared that the alliance for the purposes stated would continue when the five years' occupation of France was ended. The sixth article stated that in order to facilitate and assure the execution of the present treaty, the High Contracting Parties had decided to hold periodical meetings of the sovereigns or their ministers, for the examination of such measures as appeared to be salutary for the repose and prosperity of their peoples and the maintenance of the peace of Europe. It was in accordance with the last article that the congresses of Aix-la-Chapelle (1818), Troppau (1850), Leipzig (1871), and Verona (1822) were held (see EUROPE: History).

BIBLIOGRAPHY.—See Sir E. Hertzel, The Map of Europe by Treaty, i. (London, 1875), and Martens, Nouveau recueil de traités, &c., ii. (Göttingen, 1818).

PARIS, a city and the county seat of Edgar county, Illinois, U.S.A., in the E. part of the state, about 19 m. N.W. of Terre Haute, Ind. Pop. (1890), 4906; (1900), 6105, of whom 179 were foreign born and 277 negroes; (1910), 7664. Paris is served by the Vandalia, and the Cleveland, Cincinnati, Chicago & St Louis (New York Central system) railways; the main line and the Cairo division of the latter intersect here, and the city is the transfer point for traffic from the E. and W. to the N. and S., and vice versa. It is in a rich farming region, of which Indian corn and oats are important products, and has a large trade. Paris was founded about 1825, was incorporated in 1853, and was re-incorporated in 1873.

PARIS, a city and the county-seat of Lamar county, Texas, U.S.A., about 93 m. N.E. of Dallas. Pop. (1890), 8254; (1900), 9338, of whom 3061 were negroes; (1900 estimate), 10,015. It is the seat of the Sam Houston State Normal School (terminus), the Gulf, Colorado & Santa Fé, the Texas & Pacific, and the Texas Midland railways. The city has cotton gins and a cotton compress, and various manufactures. In 1905 its factory products were valued at $844,030. Paris was settled in 1841, incorporated as a town in 1874, and chartered as a city in 1905.

PARISH (Gr. παρεια, district, neighbourhood; παροικία, one dwelling near or beside, from παρά, oikos, house; Lat. paroecia, Late Lat. parochia; cf. Fr. paroisse), originally an episcopal district or diocese. In the early Christian Church each district was administered by a bishop and his attendant presbyters and deacons, and the word parochia was frequently applied to such a district (Du Cange, sub. ill.). Scattered congregations or
churches within the parochia were served by itinerant presbyters. Towards the close of the 4th century it had become usual for the bishop to appoint resident presbyters to define districts or territories, to which the term “parish” came gradually to be applied (see also Diocese). Parish, in English ecclesiastical law, may be defined as the township or cluster of townships which was assigned to the ministration of a single priest, to whom its tithes and other ecclesiastical patronage was yielded and was paid; but the word has now several distinct meanings.

The Old Ecclesiastical Parish.—In the absence of evidence to the contrary, the ecclesiastical parish is presumed to be composed of a single township or vill, and to be conterminous with the manor within the ambit of which it is comprised. Before the process of subinfeudation became prevalent, the most ancient manors were the districts which we call by that name when speaking of the tenants, or “townships” when we regard the inhabitants, or “parishes” as to matters ecclesiastical. The parish as an institution is in reality later in date than the township. The latter has been in fact the unit of local administration ever since England was settled in its several states and kingdoms; the beginnings of the parochial system in England are attributed to Theodore of Tarsus, who was archbishop of Canterbury towards the close of the 7th century. The system was extended in the reign of Edgar, and it appears not to have been complete until the reign of Edward III. It has been considered that the intimate connexion of church and state militates against the view that the parochial system was founded as a national institution, since any legislation on the subject of the township and parochial systems would probably have resulted in the merging of one into the other. “The fact that the two systems, the parish and the township, have existed for more than a thousand years side by side, identical in area and administered by the same persons, and yet separate in character and machinery, is a sufficient proof that no legislative act could have been needed in the first place; nor was there any lay council of the whole nation which could have sanctioned such a measure” (Stubbs, Const. Hist. i. 227). The boundaries of the old ecclesiastical parishes are usually identical with those of the township or townships comprised within its precinct; they are determined by usage, in the absence of charters or records, and are evidenced by perambulations, which formerly took place on the “gang-days” in Rogation week, but are now, where they still survive, for the most part held triennially, the Poor-Law Act of 1844 permitting the parish officers to charge the expense on the poor-rate, “provided the perambulations do not occur more than once in three years.” The expense of preserving the boundary by land-marks or bound-stones is chargeable to the same rate. Many parishes contain more than one township, and this is especially the case in the northern counties, where the separate townships are organized for administrative purposes under an act passed in 1662. In the southern and midland districts the parishes are for the most part subdivided into hamlets or other local divisions known as “tythings,” “boroughs,” and the like; the distinction between a parish and a subordinate district lies chiefly in the fact that the latter will be found to have never had a church or a constable to itself. The select committee of 1873, appointed to inquire into parochial boundaries, reported to the effect that the parish bears no definite relation to any other administrative area, except indeed to the poor-law union. It may be situated in different counties or hundreds, and in many instances it contains, in addition to its principal district, several outlying portions intermixed with the lands in other parishes.

After the abolition of compulsory church rates in 1868 the old ecclesiastical parish ceased to be of importance as an instrument of local government. Its officers, however, have still important duties to perform. The rector, vicar or incumbent is a corporation sole, in whom is vested the freehold of the church and churchyard, subject to the parishioners’ rights of use; their rights of burial have been enlarged by various acts. The churchwardens are the principal lay officers. Their duties consist in keeping the church and churchyard in repair and in raising a voluntary rate for the purpose to the best of their power; they have also the duty of keeping order in church during divine service. The other officials are the parish clerk and sexton. They have freeholds in their offices and are paid by customary fees. The office of the clerk is regulated by an act of 1844, enabling a curate to undertake its duties, and providing facilities for the office in case of misconduct. The only civil functions of the churchwardens are the probating of wills and the administration of the estates of deceased persons. A new duty, arising out of the enactment of 1845, was the custody of maps and documents, required to be deposited with him under standing orders of parliament before certain public works were begun. By the Local Government Act 1894 they are now deposited with the chairman or clerk of a parish council.

The New Ecclesiastical Parish.—Under the powers given by the Church Building Acts, and acts for making new parishes, many populous parishes have been subdivided into smaller ecclesiastical parishes. This division has not affected the parish in its civil aspect.

The Civil Parish.—For purposes of civil government the term “parish” means a district for which a separate poor-rate is or can be made, or for which a separate overseer is or can be appointed; and by the Interpretation Act 1886 this definition is to be used in interpreting all statutes subsequent to 1866, except where the context is inconsistent therewith. This district may of itself constitute a poor law union; but in the great majority of cases the unions, or areas under the jurisdiction of boards of guardians according to the Poor-Law Amendment Act of 1834, are made up of aggregated poor-law parishes. Each of these poor-law parishes may represent the extent of an old ecclesiastical parish, or a township separately rated by the poor-law authorities; this practice was stayed in 1850 or shortly after, and was discontinued from a large parish under the act of 1862, or it may represent a chancelry, tything, borough, ward, quarter or hamlet, or other subdivision of the ancient parish, or, under various acts, an area formed by the merger of an extra-parochial place with an adjoining district by the union of detached portions with adjoining parishes, or by the subdivision of a large parish for the better administration of the relief of the poor. The civil importance of the poor-law parishes may be dated from the introduction of the poor law by the statute of 43 Elizabeth, which directed overseers of the poor to be appointed in every parish, and made the churchwardens into ex-officio overseers. The statute was preceded by tentative provisions of the same kind enacted in the reigns of Edward VI. and Mary and in the fifth year of Elizabeth, and after several renewals was made perpetual in the reign of Charles I. The chief part of the parochial organization was the vestry-meeting. It derived its name from the old place of assembly, the vestry room attached to the church or chapel. The vestry represented the old assembly of the township, and retained so much of its business as had not been insensibly transferred to the court-baron and court-leet. The freemen, now appearing as the ratepayers, elected the “parish officers,” as the churchwardens and waywardens, the assessors, the overseers, and (if required) paid assistant-overseers, a secretary or vestry-clerk, and a collector of rates if the guardians applied for his appointment. Common vestries were meetings of all the ratepayers assembled on a three days’ notice; select vestries were regulated by local custom, or derived their power from the Vestries Act 1831 (Hobhouse’s Act). The vestries could adopt various acts, and appoint persons to carry those acts into execution. The Local Government Act 1894 restored the parish to its position as the unit of local government by establishing parish councils. (See England, Local Government.)

The Parish in Scotland.—There can be little doubt that about the beginning of the 13th century the whole, or almost the whole, of the kingdom of Scotland was parochially divided. It seems probable, though the point is obscure, that the bishops presided at the first formation of the parishes, the parish being a subdivision of the diocese—and at any rate down to the date of the Reformation they exercised the power of creating new parishes within the diocese. The parishes remaining in 1563 was the custody of the Reformation the power of altering parishes was assumed by the legislature. The existing parochial districts being found unsuited to the ecclesiastical requirements of the time, a general
act was passed in 1581, which made provision for the parochial clergy, and, after this, directed that "a sufficient and competent" district should be appropriated to each church as a parish (1581, cap. 100). Thereafter, by a series of special acts in the 16th and 17th centuries, and by parliamentary commissions, the creation of suitable parochial districts was proceeded with. In the year 1707 the powers exercised by the commissioners were transferred to the court of session, and the judges were appointed to act in future as "commissioners for the Plantation of Kirts and Valuation of Teinds" (Act, 1707, cap. 9). Under this statute the areas of parishes continued to be altered at the will of the commissioners, and in 1802, when Graham's Act was passed (7 & 8 Vict. c. 44), this act, which applied to the disjunction and creation of parishes, introduced a simpler form of procedure, and to some extent dispensed with the consent of the kirk session, except in regard to the division of the church lands.

The main division of parishes in Scotland was into civil and ecclesiastical, or, to speak more accurately, into parishes proper (i.e. for all ecclesiastical purposes) and the ecclesiastical parishes. This division is expressed in legal language by the terms, parishes quoad omnia (i.e. quoad civilia et sacra) and parishes quoad sacra—civilia being such matters as church rates, education, poor law and sanitary purposes.

The ecclesiastical or quoad sacra parish is a modern creation. Under Graham's Act, above mentioned, a parish may be disjoined and erected quoad sacra tontum on the application of persons who have built a church, and all the ecclesiastical purposes of which the church is the means. The boundaries of the old ecclesiastical parish were evidenced in the descriptions of the titles of private properties which appeared in the courts, while the extractive industry was noted by the manse and glebe, to be held by the minister and his successors in office, and along with the kirk-session he administers church ordinances and exercises church discipline. The oldest governing authority was the meeting of the kirk-sessions of the eight parishes of the parish. Gradually shorn of much of its old importance, the kirk-sessions retained the power of imposing an assessment for parochial use, and a parish was assessed to a church yard and a manse and glebe for the minister. It also possessed power to assess under the Parochial Buildings Acts of 1862 and 1866. Kirk-sessions and kirk-buildings were the educational authority until the reformation of school boards in 1872.

The Parishes, whether ecclesiastical or not, were districts which were transferred to the court of session, statute, order in council, or decree of commission of or court of teinds. The parishes proper vary to a great degree both in size and population. For ecclesiastical purposes, the minister and kirk-sessions are the ecclesiastical authorities. The minister is vested with the manse and glebe, to be held by him for himself and his successors in office, and along with the kirk-session he administers church ordinances and exercises church discipline. The oldest governing authority was the meeting of the kirk-sessions of the eight parishes of the parish. Though gradually shorn of much of its old importance, the kirk-sessions retained the power of imposing an assessment for parochial use, and a parish was assessed to a church yard and a manse and glebe for the minister. It also possessed power to assess under the Parochial Buildings Acts of 1862 and 1866.

Kirk-sessions and kirk-buildings were the educational authority until the reformation of school boards in 1872. Though gradually shorn of much of its old importance, the kirk-sessions retained the power of imposing an assessment for parochial use, and a parish was assessed to a church yard and a manse and glebe for the minister. It also possessed power to assess under the Parochial Buildings Acts of 1862 and 1866.

Kirk-sessions and kirk-buildings were the educational authority until the reformation of school boards in 1872.
was the cause of a long and bitter controversy, metaphysical
rather than doctrinal, with Charles Hodge. Some of Park's
sermons were published in 1835, under the title *Discourses on
Some Theological Doctrines as Related to the Religious Character.
With Austin Phelps and Lowell Mason he prepared *The Sabbath
Hymn Book* (1838).

See Professor Park and His Pupils (Boston, 1899), a memorial
to his 90th birthday, with articles by R. S. Storr, G. R. W. Scott,
Joseph Cook, G. Frederick Wright and others.

**PARK, MUNGO** (1771–1806), Scottish explorer of the Niger,
born in Selkirkshire, Scotland, on the 20th of September
1771, at Foulshiels on the Yarrow—the farm which his father
rented from the duke of Buccleuch. He was the seventh in a
family of thirteen. Having received a good education, he
was appointed a captain by Lieutenants Anderson and
Selkirk, and then attended the university of Edinburgh for
three sessions (1789–1791), obtaining the surgical diploma. By
his brother-in-law, James Dickson, a botanist of repute, he
was introduced to Sir Joseph Banks, then president of the
Royal Society, and through his good offices obtained the post
of assistant-surgeon on board the "Worcester" East Indiaman.
In this capacity he made the voyage in 1792 to Benkulen,
Sumatra, and on his return in 1793 he contributed a description
of eight new Sumatran fishes to the *Transactions of the Linnean
Society.*

Park in 1794 offered his services to the African Association,
then looking out for a successor to Major Daniel Houghton,
who had been sent out in 1790 to discover the course of the
Niger and had perished in the Sahara. Supported by the
influence of Sir Joseph Banks, Park was successful in his
application. On the 21st of June 1795 he reached the Gambia
and ascended that river 200 miles to a British trading station
called Pisania. On the 2nd of December, accompanied by
two negro servants, he started for the unknown interior. He
chose the route crossing the upper Senegal basin and through
the centre of the kingdom of Kara. The journey was full of
difficulties, and at Ludumara he was imprisoned by a Moorish
chief for four months. He escaped, alone and with nothing
save his horse and a pocket compass, on the 1st of July 1796,
and on the 21st of the same month reached the long-sought
Niger at Segu, being the first European to gaze on its waters.
He followed the river down stream 80 m. to Silla, where he
was obliged to turn back, being without means and utterly
exhausted. On his return journey, begun on the 30th of July,
he took a route more to the south than that originally followed,
keeping close to the Niger as far as Bamako, thus tracing the
course of that stream in all for some 300 miles. On the 21st
he fell ill, and owed his life to the kindness of a negro in whose
house he lived for seven months. Eventually he reached Pisania
again on the 10th of June 1797, returning to England by way
of America on the 22nd of December. He had been thought
to be dead, and his return home with the news of the discovery
of the Niger evoked great public enthusiasm. An account
of his journey was at once drawn up for the African Association
by Bryan Edwards, and a detailed narrative from his own pen
appeared in 1799 (*Travels in the Interior of Africa*). Abundance
of adventure and an unaffected style rendered the work extremely
popular, and it still holds its place as an acknowledged classic
in this department of literature.

Settling at Foulshiel, Park in August 1799 married a daughter
of his old master, Thomas Anderson. Two offers made to him
to go to New South Wales in some official capacity came to
nothing, and in October 1801 Park removed to Peebles, where
he practised as a doctor. In the autumn of 1803 he was invited
by the government to lead another expedition to the Niger.
Park, who chafed at the hardness and monotony of life at
Peebles, accepted the offer, but the starting of the expedition
was delayed. Part of the waiting time was occupied in the
perfecting of his Arabic—his teacher being Sidi Ambak Bulbul,
a native of Mogador; whose vagaries both amused and alarmed
the people of Peebles. In May 1804 Park went back to Foul-
shiel, where he made the acquaintance of Sir Walter Scott,
then living near by at Ashesell, with whom he soon became
on terms of warm friendship. In September he was summoned
to London to leave on the new expedition; he parted from Sir
Walter with the hopeful proverb on his lips, "Freits (cups)
follow those that look to them." Park had at that time adopted
the theory that the Niger and the Congo were one, and in
a memorandum drawn up before he left England he wrote: "My
hopes of returning by the Congo are not altogether fanciful."
He sailed from Portsmouth for the Gambia on the 31st of
January 1805, having been given a captain's commission as
head of the government expedition. Alexander Anderson,
his brother-in-law, was second in command, and on him he
was bestowed a lieutenancy. George Scott, a fellow Borderer,
was draughtsman, and the party included four or five artificers.
They arrived in the British colony on the 21st of January
under the command of Lieutenant Martyn, R.A., thirty-five privates
and two seamen. The expedition did not reach the Niger until the middle
of August, when only eleven Europeans were left alive; the rest
had succumbed to fever or dysentery. From Bamako the
journey to Segu was made by canoe. Having received a
permission from the ruler of that town to proceed, at Sansandig,
a little below Segu, Park made ready for his journey down the
still unknown part of the river. Park, helped by one soldier,
the only one left capable of work, converted two canoes into
one tolerably good boat, 20 ft. long and 6 ft. broad. The
boat, christened H.M. schooner "Joliba" (the native name for the Niger), and in it, with
the surviving members of his party, he set sail down stream on the 10th of November. At Sansandig,
the 28th of October, Anderson had died, and in him Park
lost the only member of the party—except Scott, already dead—
who had been of real use. Those who embarked in the "Joliba"
were Park, Martyn, three European soldiers (one mad), a guide
and three slaves. Before his departure Park gave to Isaaco,
a Mandingo guide who had been with him thus far, letters to
take back to the Gambia for transmission to England. The
spirit which Park began the final stage of his enterprise
is well illustrated by his letter to the head of the Colonial
Office:

"I shall," he wrote, "set sail for the east with the fixed resolution
to discover the termination of the Niger or perish in the attempt.
Though all the Europeans who are with me should die,
and though I were myself half dead, I would still persevere,
and if I could not succeed in the object of my journey, I would at
least die on the Niger."

To his wife he wrote stating his intention not to stop nor land
anywhere till he reached the coast, where he expected to arrive
about the end of January 1806. These were the last communica-
tions from the Joliba, for it was not heard of again for some
three months. Further reports of disaster reached the settlements
on the Gambia. At length the British government engaged Isaaco
to go to the Niger to ascertain the fate of the explorer. At
Sansandig Isaaco found the guide who had gone down stream
with Park, and the substantial accuracy of the story he told
was later confirmed by the investigations of Hugh Clapperton
and Richard Lander. This guide (Amadi) stated that Park's
canoe descended the river to Yauri, where he (the guide) landed.
In this long journey of about 1000 miles Park, who had plenty
of provisions, stuck to his resolution of keeping alive. From
the natives below Joliba, came Timbuktu, and at various other
places the natives came out in canoes and attacked his boat.
These attacks were all repulsed, Park and his party having
plenty of firearms and ammunition and the natives having
none. The boat also escaped the many perils attendant on the
navigation of an unknown stream strewn with many rapids—
Park had built the "Joliba" so that it drew only a foot of water.
But at the Bussa rapids, not far below Yauri, the boat
struck on a rock and remained fast. On the bank were gathered
hostile natives, who attacked the party with bow and arrow
and throwing spears. Their position being untenable, Park,
Martyn, and the two soldiers who still survived, sprang into
the river and were drowned. The sole survivor was one of
the slaves, from whom was obtained the story of the final scene.
Isaaco, and later Lander, obtained some of Park's effects, but
his journal was never recovered. In 1827 his second son, Thomas, landed on the Guiana coast, intending to make his way to Bussa, where he thought his father might be detained a prisoner, but after demonstrating some little distance inland he died of fever. Park's widow died in 1840.

J. Thomson's *Mungo Park and the Niger* (London, 1890) contains the best critical estimate of the explorer and his work. See also the Life (by Wishaw) prefixed to *Journal of a Mission into the Interior of Africa in 1805* (London, 1815); H. B., *Life of Mungo Park* (Edinburgh, 1895); and an interesting passage in Lockhart's *Life of Sir Walter Scott*, vol. II.

PARK (Fr. parc; Ital. parco; Sp. parque; O.Eng. parcor; connected with Ger. pferch, fold, and pferrei, district, translating med. Lat. porrochiae, parish), a word ordinarily used in two senses:

(a) an enclosed tract of ground, consisting of grass-land, and surrounded by trees and shrubs, and surrounding a large country house;

(b) a similar space in or near a town, laid out ornamentally, and used by the public as an "open space" for health or recreation.

The term "park" first occurs in English as a term of the forest law of England for a tract of ground enclosed and privileged for beasts of the chase, the distinguishing characteristics of which were "vert," i.e. the green leaves of trees, "venison," i.e. deer, and "enclosure." A "park" was a franchise obtained by prescription or by grant from the crown (see Forest Law; also Deer Park).

The word has had a technical military significance since the early part of the 17th century. Originally meaning the space occupied by the artillery, baggage and supply vehicles of an army when at rest, it came to be used of the mass of vehicles itself. From this mass first of all the artillery, becoming more mobile, separated itself; then as the mobility of armies in general became greater they outpaced their heavy vehicles, with the result that faster moving transport units had to be created to keep up communication. A "park" is thus at the present day a large unit consisting of several hundred vehicles carrying stores; it moves several days' marches in rear of the army, and forms a reservoir from whence the mobile armies draw the supplies and stores required for the army's needs. "Parking" vehicles is massing them for a halt. The word "park" is still used to mean that portion of an artillery or administrative troops' camp or bivouac in which the vehicles are placed.

PARKER, SIR GILBERT (1862— ), British novelist and politician, was born at Camden East, Addington, Ontario, on the 23rd of November 1862, the son of Captain J. Parker, R.A. He was educated at Ottawa and at Trinity University, Toronto. In 1886 he went to Australia, and became for a while associate-editor of the *Sydney Morning Herald*. He also travelled extensively in the Pacific, and subsequently in northern Canada; and in the early nineties he began to make a growing reputation in London as a writer of romantic fiction. The best of his novels are those in which he first took for his subject the history and life of the French Canadians; and his permanent literary reputation rests on the fine quality, descriptive and dramatic, of his Canadian stories. *Pierre and his People* (1892) was followed by *Mrs Felton* (1893), *The Trail of the Sword* (1894), when *Valmond came to Pontiac* (1893), *An Adventurer of the North* (1896), *Forest Law* (1896, dramatized in 1897), *The Lane that had no Turnings* (1900) contains some of his best work. In *The Battle of the Strong* (1898) he broke new ground, laying his scene in the Channel Islands. His chief later books were *The Right of Way* (1901), Donovan Pasha (1902), *The Ladder of Swords* (1904), *The Weavers* (1907) and *Northern Lights* (1909).

In 1805 he married Miss Van Tine of New York, a wealthy heiress. His Canadian connexion and his experience in Australia and elsewhere had made him a strong Imperialist in politics, and from that time he began to devote himself in large measure to a political career. He still kept up his literary work, but some of the books last mentioned cannot compare with those by which he made his name. He was elected to parliament in 1909 (re-elected 1910 and 1910) as Conservative member for Gravesend and soon made his mark in the House of Commons. He was knighted in 1907, and in succeeding years continually strengthened his position in the party, particularly by his energetic work on behalf of Tariff Reform and Imperial Preference. He had given up to public life what at one time seemed to be due to literature, he gave it for enthusiasm in the Imperialist movement; and with the progress of that cause he came to rank by 1910 as one of the foremost men in the Unionist party outside those who had held office.

PARKER, SIR HYDE, BART. (1714-1782), British vice-admiral, was born at Tredington, Worcestershire, on the 25th of February, 1714, his father, a clergyman, being a son of Sir Henry Parker, Bart. His paternal grandfather had married a daughter of Bishop Alexander Hyde, of Salisbury. He began his career as a seaman in the merchant service. Entering the royal navy at the age of twenty-four, he was made lieutenant in 1744, and in 1748 he was made post-captain. During the latter part of the Seven Years' War he served in the East Indies, taking part in the capture of Pondicherry (1761) and of Manila (1762). In the latter year Parker with two ships captured one of the valuable Spanish plate ships in her voyage between Acapulco and Manila. In 1778 he became rear-admiral, and went to North American waters as second-in-command. For some time before Rodney's arrival he was in command on the Leeward Islands station, and conducted a skilful campaign against the French at Martinique. In 1781, having returned home and become vice-admiral, he fell in with a Dutch fleet of about his own force, though far better equipped, near the Dogger Bank (Aug. 5). After a fiercely contested battle, in which neither combatant gained any advantage, both sides drew off. Parker considered that he had not been properly equipped for his task, and insisted on resigning his command. In 1782 he accepted the East Indies command, though he had just succeeded to the family baronetcy. On the outward voyage his flagship, the "Cato" (60), was lost with all on board.

His second son, Admiral Sir Hyde Parker (1739-1807), entered the navy at an early age, and became lieutenant in 1758, having passed most of his early service in his father's ships. Five years later he became a post-captain, and from 1766 onwards for many years he served in the West Indies and in North American waters, particularly distinguishing himself in breaking the defences of the North river (New York) in 1776. His services on this occasion earned him a knighthood in 1779. In 1782 he was engaged in the Savannah expedition, and in the following year his ship was wrecked on the hostile Cuban coast. His men, however, entrenched themselves, and were in the end brought off safely. Parker was with his father at the Dogger Bank, and with Howe in the two actions in the Straits of Gibraltar. In 1793, having just become rear-admiral, he served under Lord Hood at Toulon and in Corseca, and two years later, now a vice-admiral, he took part, under Hotham, in the indecisive fleet actions of the 13th of March and the 13th of July 1795. From 1796 to 1800 he was in command at Jamaica and ably conducted the operations in the West Indies. In 1801 he was appointed to command the fleet destined to break up the northern armed neutrality, with Nelson as his second-in-command. Copenhagen, the first objective of the expedition, fell on the 2nd of April to the fierce attack of Nelson's squadron. Parker with the heavier ships took part. Subsequently Parker hesitated to advance up the Baltic after his victory, a decision which was severely criticised. Soon afterwards he was recalled and Nelson succeeded him. He died in 1807.

The family name was continued in the navy in his eldest son, who became vice-admiral and was First Sea Lord of the Admiralty in 1853 (dying in 1854); and also in that son's son, who as a captain in the Black Sea was killed in 1854 when storming a Russian fort.

PARKER, JOHN HENRY (1806-1884), English writer on architecture, the son of a London merchant, was born on the 1st of March 1806. He was educated at Manor House School, Chiswick, and in 1821 entered business as a bookseller. Succeeding his uncle, Joseph Parker, as a bookseller at Oxford in 1832,
he conducted the business with great success, the most important of the firm's publications being perhaps the series of the "Oxford Pocket Classics." In 1836 he brought out his *Glossary of Architecture*, which, published in the earlier years of the Gothic revival in England, had considerable influence in extending the movement, and supplied a valuable help to young architects. In 1838 he edited the fifth edition of Rickman's *Gothic Architecture*, and in 1840 he published a handbook based on his earlier volume and entitled *Introduction to the Study of Gothic Architecture*. The completion of Hudson Turner's *Domestic Architecture of the Middle Ages* next engaged his attention, three volumes being published (1853-1856). In 1858 he published *Medieval Architecture of Chester*. Parker was one of the chief advocates of the "restoration" of ecclesiastical buildings, and published in 1866 *Architectural Antiquities of the City of Wells*. Latterly he devoted much attention to explorations of the history of Roman by means of excavations, and succeeded in satisfying himself of the historical truth of much usually regarded as legendary. Two volumes of his *Archaeology of Rome* were published at Oxford in 1874 and 1876. In recognition of his labours he was decorated by the king of Italy, and received a medal from Pope Pius IX. In 1886 he endowed the keepership of the Ashmolean Museum with a sum yielding £250 a year, and under the new arrangement he was appointed the first keeper. In 1887 he was nominated C.B. He died at Oxford on the 31st of January 1884.

PARKER, JOSEPH (1839-1902), English Nonconformist divine, was born at Hexham-on-Tyne on the 9th of April 1839, his father being a joiner. He was educated at Hexham school, and was provided with a sound classical education which in after-life he constantly supplemented. In the revolutionary years from 1835 to 1850 young Parker as a local preacher and temperance orator gained a reputation for vigorous utterance. He was influenced by Thomas Cooper, the Chartist, and Edward Miall, the Liberalist, and was much associated with Joseph Cowen, afterwards M. P. for Newcastle. In the spring of 1852 he wrote to Dr John Campbell, minister of Whitefield Tabernacle, Moorfields, London, for advice as to entering the Congregational ministry, and after a short probation he became minister at Campbell's church, in which he held positions of considerable dignity. In 1853 and 1858 he was pastor at Banbury. His next charge was at Cavendish Street, Manchester, where he rapidly made himself felt as a power in English Nonconformity. While here he published a volume of lectures entitled *Church Questions*, and, anonymously, *Ecce Deus* (1868), a work provoked by Seeley's *Ecce Homo*. The university of Chicago conferred on him the degree of D.D. In 1869 he returned to London as minister of the Poultry church, founded by Thomas Goodwin. Almost at once he began the scheme which resulted in the erection of the great Queen's College at Dover, of which he was adjudged to be the principal architect. He had been appointed Dean of Dover on the 19th of May 1874. From this centre his influence spread far and wide. His stimulating and original sermons, with their notable leaning towards the use of a racy vernacular, made him one of the best known personalities of his time. Dr Parker was twice chairman of the London Congregational Board and twice of the Congregational Union of England and Wales. The death of his second wife in 1890 was a blow from which he never fully recovered, and he died on the 28th of November 1902.

Parker was pre-eminently a preacher, and his published works are a mine of church history and expositions, chief among them being *City Temple Sermons* (1869-1879) and *The People's Bible*, in 25 vols. (1885-1895). Other volumes include the autobiographical *Springdale Abbey* (1869), *The Inner Life of Christ* (1881), *Apocalypse* (1884), *Tyne Chaldie: My Life and Teaching* (1885; new ed., 1889), *A Preacher's Life* (1890).

See E. C. Pike, *Dr Parker and His Friends* (1908); *Congregational Year-Book* (1904).

PARKER, MARTIN (c. 1600-c. 1656), English ballad writer, was probably a London taverne-keeper. About 1625 he seems to have begun publishing ballads, a large number of which bearing his signature or his initials, "M.P." are preserved in the British Museum. Dryden considered him the best ballad writer of his time. His sympathies were with the Royalist cause during the Civil War, and it was in support of the declining fortunes of Charles I. that he wrote the best known of his ballads, "When the King enjoys his own again," which he first published in 1643, and which, after enjoying great popularity at the Restoration, became a favourite Jacobite song in the 18th century. Parker also wrote a nautical ballad, "Sailors for my Money," which in a revised version survives as "When the stormy winds do blow." It is not known when he died, but the appearance in 1656 of a "funeral elegy," in which the ballad writer was satirically celebrated is perhaps a correct indication of the date of his death.

PARKER, MATTHEW (1504-1575), archbishop of Canterbury, was the eldest son of William Parker, a citizen of Norwich, where he was born, in St Saviour's parish, on the 6th of August 1504. His mother's maiden name was Alice Monins, and a John Monins married Cranmer's sister Jane, but no definite relationship between the two archbishops has been traced. William Parker died about 1516, and his widow married a certain John Baker. Matthew was sent in 1522 to Corpus Christi College, Cambridge, where he is said by most of his biographers, including the latest, to have been contemporary with Cecil but in 1522, when Parker was admitted to Cambridge, he was only two years old when Parker went to Cambridge. He graduated B.A. in 1528, was ordained deacon in April of that year, and was elected fellow of Corpus in the following September. He commenced M.A. in 1528, and was one of the Cambridge scholars whom Wolsey wished to transplant to his newly founded Cardinal College at Oxford. Parker, like Cranmer, declined the invitation. He had come under the influence of the Cambridge reformers, and after Anne Boleyn's recognition as queen he was made her chaplain. Through her he was appointed dean of the college of secular canons at Stoke-By-Clare in 1535. Latimer wrote to him in that year urging him not to fall short of the expectations which had been formed of his ability. In 1537 he was appointed chaplain to Henry VIII., and in 1538 he was threatened with prosecution by the reactionary party. The bishop of Dover, however, reported to Cromwell that Parker "had ever been of a good judgment and set forth the Word of God after a good manner. For this he suffers some grudge." He graduated D.D. in that year, and in 1541 he was appointed to the second prebend in the reconstituted cathedral church of Ely. In 1544 on Henry VIII.'s recommendation he was elected master of Corpus Christi College, and in 1545 vice-chancellor of the university. He was ambassador to the Netherlands, and was succeeded by a German. After much influence over a ribald play, "Pammachus," performed by the students, deriding the old ecclesiastical system, though Bonner wrote to Parker of the assured affection he bore him. On the passing of the act of parliament in 1545 enabling the king to dissolve chantries and colleges, Parker was appointed one of the commissioners for Cambridge, and their report saved its colleges, if there had ever been any intention to destroy them. Stoke, however, was dissolved in the following reign, and Parker received a pension equivalent to £400 a year in modern currency. He took advantage of the new reign to make himself known. In 1547, before clerical marriages had been legalized by parliament and convocation, Margaret, daughter of Robert Harlestone, a Norfolk squire. During Kett's rebellion he was allowed to preach in the rebels' camp on Mousehold Hill, but without much effect; and later on he encouraged his chaplain, Alexander Neville, to write his history of the rising. His Protestantism advanced with the times, and he received higher promotion under Northumberland than under the moderate Somerset. Bucer was his friend at Cambridge, and he preached Bucer's funeral sermon in 1531. In 1532 he was promoted to the rich deanship of Lincoln, and in July 1533 he was appointed with Northumberland at Cambridge, when the duke marched north on his hopeless campaign against Mary.
PARKER, S.—PARKER, T.

As a supporter of Northumberland and a married man, Parker was naturally deprived of his deanship, his mastership of Corpus, and his other preferments. But he found means to live in England throughout Mary's reign with creditable modesty. He was not cast in the diplomatic mould, and he had no desire to figure at the stake; like Cecil, and Elizabeth herself, he had a great respect for authority, and when his time came he could consistently impose authority on others. He was not eager to assume this task, and he made great efforts to avoid promotion to the archbishopric of Canterbury, which Elizabeth designed for him as soon as she had succeeded to the throne. He was elected on the 1st of August 1559; but it was difficult to find the requisite four bishops willing and qualified to consecrate him, and not until the 17th of December did Barlow, Scory, Coverdale and Hodgkins perform that ceremony at which he was actually consecrated. Paget's Head tavern in Fleet Street seems first to have been printed by the Jesuit, Christopher Holywood, in 1604; and it has long been abandoned by reputable controversiasts. Parker's consecration was, however, only made legally valid by the plentitude of the royal supremacy; for the Edwardeine Ordinal, which was used, had been repealed by Mary and not re-enacted by the parliament of 1559.

Parker owes his fame to circumstances rather than to personal qualifications. This wise moderation of the Elizabethan settlement, which had been anticipated by his appointment, was obviously not due to him; and Elizabeth could have placed Knox or Bonner in the chair of St Augustine if she had been so minded. But she wanted a moderate man, and so she chose Parker. He possessed all the qualifications she expected from an archbishop except celibacy. He distrusted popular enthusiasm, and he wrote in horror of the idea that "the people" should be the reformers of the Church. He was not inspiring as a leader of religion; and no dogma, no original theory of church government, no prayer-book, not even a tract or a hymn is associated with his name. The 56 volumes published by the Parker Society include only one by his eponymous hero, and that is a volume of correspondence. He was a disciplinarian, a scholar, a modest and moderate man of genuine piety and irreproachable morals. His historical research was exemplified in his De antiquitate ecclesiae, and his editions of Asser, Matthew Paris, Walsingham, and the compiler known as Matthew of Westminster; his liturgical skill was shown in his version of the psalter and in the occasional prayers and thanksgivings which he was called upon to compose; and he left a priceless collection of manuscripts to his college at Cambridge.

He was happier in these pursuits than in the exercise of his jurisdiction. Secular politics he had little to do, and he was never under Elizabeth's council. But ecclesiastical politics gave him an infinity of trouble. Many of the reformers wanted no bishops at all, while the Catholics wanted those of the old dispensation, and the queen herself grudged episcopal privilege until she discovered in it one of the chief bulwarks of the royal supremacy. Parker was therefore left to stem the rising tide of Puritan feeling with little support from parliament, convocation or the Crown. The bishops' Interpretations and Further Considerations, issued in 1566, tolerated a lower vestiarian standard than was prescribed by the rubric of 1559; but accepted before, which Parker published in 1566, to check the Puritan descent had to appear without specific royal sanction; and the Reformatio legum ecclesiasticarum, which Foxe published with Parker's approval, received neither royal, parliamentary nor synodical authorization. Parliament even contested the claim of the bishops to determine matters of faith. "Surely," said Parker to Peter Wentworth, "you will refer yourselves wholly to us therein." "No, by the faith I bear to God," retorted Wentworth; "we will pass nothing before we understand what it is; for that were but to make you popes." Make you popes who list, for we will make you nones." Disputes about vestments had expanded into a controversy over the whole field of Church government and authority, and Parker died on the 17th of May, 1575, lamenting that Puritan ideas of "governance" would "in conclusion undo the queen and all others that depended upon her." By his personal conduct he had set an ideal example for Anglican priests, and it was not fault that he failed to crush the individualistic tendencies of the Protestant Reformation.

John Strype's Life of Parker, originally published in 1711, and re-called for the Clarendon Press in 1821 (3 vols.), is the principal source for Parker's life. A biographical sketch written from a different point of view was published by W. M. Kennedy in 1908. He was also J. Buss Mullinger's scholarly life in Diet. Nat. Brit. W. H. Freese's volume in Stephens and Hunt's Church History; Strype's Works (General Index); Gough's Index to Parker Soc. Publ. Fuller, Burnet, Collier and R. W. Dixon's Histories of the Early History of Parker's Episcopacy, the Ecclesiastical Settlements in England (1868); Froude's Hist. of England; and vol. vi. in Longman's Political History.

(A. F. P.)

PARKER, SAMUEL (1640-1688), English bishop, was born at Northampton, and educated at Wadham College, Oxford. His Presbyterian views caused him to move to Trinity College, where, however, the influence of the senior fellow induced him to join the Church of England, and he was ordained in 1664. In 1665 he published an essay entitled Tentamina physico-theologica de Deo, dedicated to Archbishop Sheldon, who in 1667 appointed him one of his chaplains. He succeeded his father, John Parker, archdeacon of Charnham, Kent, in the same year. In 1670 he became archdeacon of Canterbury, and two years after he was appointed rector of Ickham, Kent. In 1673 he was elected master of Edenbridge Hospital. His Discourse of Ecclesiastical Policie (London, 1670), advocating state regulation of religious affairs, led him into controversy with Andrew Marvell (1621-1725). James IL appointed him to the bishopric of Oxford in 1686, and he in turn forwarded the king's policy, especially by defending the right to appoint Roman Catholics to office. In 1687 he was able to install him as president of Magdalen College, Oxford, the fellows having refused to elect any of the king's nominees. He was commonly regarded as a Roman Catholic, but he would appear to have been no more than an extreme exponent of the High Church doctrine of passive obedience. After he became president the action of the king in replacing the expelled fellows with Roman Catholics agitated him to such a degree as to hasten his end; and the priests sent to him on his death-bed to be received into the Roman Church he declared that he "never had been and never would be of that religion," and he died in the communion of the Church of England.

A second son, Samuel Parker (1681-1730), was the author of Bibliotheca biblica, or Patristic Commentary on the Scriptures (1720-1731), an abridged translation of Eusebius, and other works. He was also responsible during 1728 and 1729 for a monthly periodical entitled Censura temporum, or Good and Ill Tendencies of Books. He passed most of his life in retirement at Oxford. His younger son Richard founded the well-known publishing firm in Oxford.

See Magdalen College and James II. 1686-1688, by the Rev. J. R. Bloxam (Oxford Historical Society, 1886).

PARKER, THEODORE (1810-1866), American preacher and social reformer, was born at Lexington, Massachusetts, on the 24th of August 1810, the youngest of eleven children. His father, John Parker, a small farmer and skillful mechanic, was a typical New England yeoman. His mother took great pains with the religious education of her children, "earing, however, but little for doctrines," and making religion to consist of love and good works. His paternal grand-father, Captain John Parker (1729-1775), was the leader of the Lexington minute-men in the skirmish at Lexington. Theodore obtained the elements of knowledge in the schools of the district, which were open during the winter months only. During the rest of the year he worked on his father's farm. At the age of seventeen he became himself a winter schoolmaster, and in his twentieth year he entered himself at Harvard, working out his costs as "roomer," and devoting himself to studies and going over to Cambridge for the examinations only. For the theological course he took up in 1834 his
residence in the college, meeting his expenses by a small sum amassed by school-keeping and by help from a poor students' fund, and graduating in 1836. At the close of his college career he began his translation (published in 1843) of Wilhelm M. L. De Wette's Beiträge zur Erleuchtung des Alten Testamentes der Vielen Evangelisten. His journal and letters show that he had made acquaintance with a large number of languages, including Hebrew, Chaldee, Syriac, Arabic, Coptic, Ethiopic, as well as the classical and the principal modern European languages. When he entered the divinity school he was an orthodox Unitarian; when he left it, he entertained strong doubts about the infallibility of the Bible, the possibility of miracles, and the exclusive claims of Christianity and the Church. Emerson's transcendentalism greatly influenced him, and Strauss's Leben Jesu left its mark upon his thought. His first ministerial charge was a small German church in New York city, a few miles from Boston; he was ordained as a Unitarian clergyman in June 1837 and here he preached until January 1846. His views were slowly assuming the form which subsequently found such vigorous expression in his writing; but the progress was slow, and the cautious reserve of his first rationalistic utterances was in striking contrast with his subsequent rashness. But on the 19th of May 1841 he preached at Boston a sermon on "the transient and permanent in Christianity," which presented in embryo the main principles and ideas of his final theological position, and the preaching of which determined him to lay aside his former opinions, and return to the church with which he was connected and to the whole ecclesiastical world. The Boston Unitarian clergy denounced the preacher, and declared that the "young man must be silenced." No Unitarian publisher could be found for his sermon, and nearly all the pulpits of the city were closed against him. A number of gentlemen in Boston, however, invited him to give a series of lectures there. The result was that he delivered in the Masonic Hall, in the winter of 1841-1842, as lectures, substantially the volume afterwards published as the Discourse of Matters pertaining to Religion. The lectures in their published form made his name famous throughout America and Europe, and confirmed the stricter Unitarians in America in their attitude towards him and his supporters. His friends, however, resolved that he should be heard in Boston, and there, beginning with 1845, he preached regularly for fourteen years. Previous to his removal from West Roxbury to Boston Parker spent a year in Europe, calling in Germany upon Paulus, Gervinus, De Wette and Ewald, and preaching in Liverpool in the pulpits of James Martineau and J. H. Thom. After January 1846 he devoted himself exclusively to his work in Boston. In addition to his Sunday labours he lectured throughout the States, and prosecuted his wide studies, collecting particularly the materials for an opus magnum on the development of religion in mankind. Above all he took up the question of the emancipation of the slaves, and fearlessly advocated in Boston and elsewhere, from the platform and through the press, the cause of the negroes. He made his influence felt also by correspondence with political leaders and by able political speeches, one of which, delivered in 1856, contained the sentence, "Democracy is direct self-government, over all the people, by all the people, for all the people," which probably suggested Abraham Lincoln's oft-quoted variatio. Parker was avowedly in the escape of fugitive slaves, and for trying to prevent the rendition of perhaps the most famous of them, Anthony Burns, was indicted, but the indictment was quashed. He also gave his aid to John Brown (q.v.). By his voice, his pen, and his utterly fearless action in social and political matters he became a great power in Boston and America generally. But his days were numbered. His mother had suffered from phthisis; and he himself now fell a victim to the same disease. In January 1850 he suffered a violent haemorrhage of the lungs, and sought relief by retracing first to the West Indies and afterwards to Europe. He died at Florence on the 10th of May 1850.

The fundamental articles of Parker's religious faith were the three "instinctive intuitions" of God, of a moral law, and of immortality. His own mind, heart and life were undoubtedly pervaded, sustained and ruled by the feelings, convictions and hopes which he formulated in these three articles; and he rationalized his own religious conceptions in a number of expositions which do credit to his sincerity and courage. But he was a preacher rather than a thinker, a reformer rather than a philosopher.

Parker's principal works are: A Discourse of Matters pertaining to Religion (1842); Ten Sermons of Religion (1853); and Sermons of Theism, Atheism and the Popular Theology (1853). A collected edition of his works was published in England by Frances Power Cobbe (vols., 1881-1890), and another—the Centenary edition in Boston, Mass., by the American Unitarian Association (14 vols., 1907-1911); a volume of Theodore Parker's Prayers, edited by Rufus W. Robinson and W. M. Martineau, in The American Review (1846), and a volume of Parker's West Roxbury Sermons, with a biographical sketch by Frank B. Sanborn, was published in Boston, Mass., in 1892. A German translation of part of his works was made by Ziegenkamp (1895).

The best biographies are John Weiss's Life and Correspondence of Theodore Parker (New York, 1864); O. B. Frothingham's Theodore Parker: a Biography (Boston, 1874); and John White Chadwick's Theodore Parker, Preacher and Reformer (Boston, 1900), the last containing a good bibliography. valuable reviews of Parker's theological position and of his character and work have appeared in James Martineau, in the American Review (April 1866), and J. H. Thom, in the Theological Review (March 1864).

PARKERSON, a city and the county-seat of Wood county, West Virginia, U.S.A., on the Ohio river, at the mouth of the Little Kanawha, about 60 miles below Wheeling, and 840 miles from New York. The city is a considerable market for the region and is a manufacturing centre. It is the county-seat of an adjoining county, and is one of the most important cities of the region.

PARKES, SIR HARRY SMITH (1828-1885), English diplomatist, son of Harry Parkes, founder of the firm of Parkes, Owtoy & Co., ironmasters, was born at Birchills Hall, near Walsall, Staffordshire, May 12, 1828. He was educated at Rugby School. In 1842 his mother died and in the following year his father was killed in a carriage accident. Being thus left an orphan, he found a home with his uncle, a retired naval officer, at Birmingham. He received his education at King Edward's Grammar School. In 1837 his uncle died, and in 1841 he sailed for Macao in China, to take up his residence at the house of his cousin, Mrs Gutzlaff. At this time what was known as the "Opium War" had broken out, and Parkes eagerly prepared himself to take part in the events which were passing around him by diligently applying himself to the study of Chinese. In 1842 he received his first appointment in the consular service. Fortunately for him, he was privileged to accompany Sir Henry Pottinger in his expedition up the Yangtsze-kiang to Nanking, and after having taken part in the capture of Chinkiang and the surrender of Nanking, he witnessed the signing of the treaty on the board the "Cornwallis" in August 1842. By this treaty the five ports of Canton, Amoy, Fuchow, Ningpo and Shanghai were opened to trade. After short residences at Canton and the newly opened Amoy, Parkes was appointed to the consulate at Fuchow. Here he served under Mr (afterwards Sir) Rutherford Alcock, who was one of the men who knew how to manage the Chinese. In 1849 he returned to England on leave, and after visiting the Continent and doing some hard work for the foreign office he returned to China in 1851. After a short stay
at Amoy as interpreter he was transferred in the same capacity to Canton. In May 1854 he was promoted to be consul at Amoy, and in 1855 was chosen as secretary to the mission to Bangkok, being largely instrumental in negotiating the first European treaty with Siam. In June 1856 he returned to Canton as acting consul, a position which brought him into renewed contact with Commissioner Yeh, whose insolence and obstinacy led to the second China War. Yeh had now met a man of even greater power and determination than himself, and when, in October 1856, as a climax to many outrages, Yeh seized the British lorchas “Arrow” and made prisoners of her crew, Parkes at once closed with his enemy. In response to a strongly worded despatch from Parkes, Sir John Conington, governor of Hong-Kong, placed matters in the hands of Admiral Sir M. Seymour, who took Canton at the close of the same month but had not a sufficient force to hold it. In December 1857 Canton was again bombarded by Admiral Seymour. Parkes, who was attached to the admiral’s staff, was the first man to enter the city, and himself tracked down and arrested Commissioner Yeh. As the city was to be held, an allied commission was appointed to govern it, consisting of two Englishmen, of whom one was Parkes, and a French naval officer. Parkes virtually governed this city of a million inhabitants for three years. In 1860, the treacherous attack at Taku upon Sir Frederick Bruce led to a renewal of hostilities in the north, and Parkes was ordered up to serve as interpreter and adviser to Lord Elgin (July, 1860).

In pursuance of these duties he went in advance of the army to the city of Tunchow, near Peking, to arrange a meeting between Lord Elgin and the Chinese commissioners who had been appointed to draw up the preliminaries of peace. While thus engaged he, Mr (afterwards Lord) Loch, Mr de Norman, Lord Elgin’s secretary of legation, Mr Bowly, the Times correspondent, and others, were treacherously taken prisoners (Sept. 18, 1860). Parkes and Loch were carried off to the prison of the board of punishments at Peking, where they were separately hedged with the lowest class of criminals. After ten days’ confinement in this den of iniquity they were removed to a temple in the city, where they were comfortably housed and fed, and from which, after a further detention, they were granted their liberty. For this signal instance of treachery Lord Elgin burned down the Summer Palace of the emperor. Towards the end of 1860 Parkes returned to his post at Canton. On the restoration (Oct. 1861) of the city to the Chinese he returned to England on leave, when he was made K.C.B. for his services; he had received the companionship of the order in 1856. On his return to China he served for a short time as consul at Shanghai, and was then appointed minister in Japan (1863). For eighteen years he held this post, and throughout that time he strenuously used his influence in support of the Liberal party of Japan. So earnestly did he throw in his lot with these reformers that he became a marked man, and incurred the bitter hostility of the reactionaries, who on three separate occasions attempted to assassinate him. In 1882 he was transferred to Peking. While in Peking his health failed, and he died of malarial fever on the 21st of March 1885. In 1856 Sir H. (then Mr) Parkes married Miss Fanny Plumer, who died in 1879. The children of this marriage were, the late Miss Parkes, and Mr Robert Parkes, who now resides at 87, Park Square, London.

PARKES, SIR HENRY (1815-1890), Australian statesman, was born at Stoneleigh, in Warwickshire, on the 27th of May 1815. The son of parents in very humble circumstances, he received only a rudimentary education, and at an early age was obliged to earn his living as a common labourer. Failing to make his way in England, he emigrated to Australia in 1839, and after a time settled in Sydney as an ivory-turner. Conscious of his great powers, he worked unremittingly to repair the deficiencies of his education, and developed a genuine taste for literature, and a gift for versification which won the approval of so severe a judge as Tennyson. His first volume of poems was published in 1842, under the title of Stolen Moments. He now began to take an active part in politics, and soon showed himself the wielder of an incisive style as a leader-writer, and a popular orator of unrivalled influence. He took a prominent part in the movement against the transportation of convicts, and in 1849 started the Empire newspaper to inculcate his policy of attacking abuses while remaining loyal to the Crown. The paper at once made its mark, but owing to financial difficulties ceased to appear in 1858. One of the reforms for which Parkes fought most strenuously was the full introduction of responsible government. He was returned to the legislative council under the old constitution as member for Sydney, and on the establishment of a legislative assembly in 1856 was elected for East Sydney. His parliamentary career was twice interrupted by pecuniary embarrassments; indeed, he never acquired the art of making money, and in spite of a public subscription raised several thousand pounds in aid of the press, was forced to leave Sydney in 1859 at the first general election under the new electoral act, and sat till 1861, when he was sent to England as a commissioner for promoting emigration. He made a prolonged stay in England, and described his impressions in a series of letters to the Sydney Morning Herald, some of which were reprinted in 1860 under the title of Australian Views of England. He returned to Australia in 1863, and, re-entering the Assembly, became colonial secretary in the Martin ministry from 1866 to 1868. He succeeded in passing the Public Schools Act of 1866, which for the first time instituted an efficient system of primary education in the colony. His great chance came in 1872, when the Martin ministry resigned on the question of the sum payable by Victoria in lieu of border duties. Parkes had for several years persistently advocated free imports as a remedy for the financial distress of the colony. He now became prime minister and colonial secretary; and rising to the height of his opportunity, he removed the cause of dispute by throwing the colony open to trade. He held office till 1875, and on the fall of the Robertson ministry again became premier and colonial secretary from March till August 1877. At the end of this year he was made K.C.M.G. Finding that the state of parties did not allow of the existence of a stable ministry, he formed a coalition with Sir John Robertson, and became premier and colonial secretary for the third time from December 1878 to January 1884. In 1882 and in 1883-1884 he paid prolonged visits to England. Already distinguished among Australian statesmen for breadth of outlook and passionate devotion to the Empire, he returned with those qualities enhanced. For a time he found himself almost in a position of isolation, but in 1887 the policy of protection adopted by his successors brought him again into office. His free trade policy was once more successful. Other important measures of his administration were the reform of the civil service, the prohibition of Chinese immigration, and the railways and public works acts. He fell from office in January 1888, but in the following March became for the fifth time premier and colonial secretary. The remainder of his life was chiefly devoted to the question of Australian federation. The Federal Convention at Melbourne in 1890 was mainly his work; and he presided over the convention at Sydney in 1891, and was chiefly responsible for the draft constitution there carried. Defeated in October 1891 on his refusal to accept an eight hours’ day for coal-miners, he remained in opposition for the rest of his career, sacrificing even free trade for the sake of smoothing the way for federation. He died at Sydney on the 27th of April 1896; but though he did not live to see the realization of his efforts, he may justly be called the Father of the Australian Commonwealth.

He published, in addition to the works already named and numerous volumes of verse, a collection of speeches on the Federal Government of Australia (1890), and an autobiography, Fifty Years in the making of Australian History (1892).

PARKIN, GEORGE ROBERT (1846- ), British Canadian educationist, was born at Salisbury, New Brunswick, on the 8th of February 1846. His father had gone to Canada from Yorkshire. Parkin was the youngest of a family of thirteen, and after attending the local schools he started at an early age as a teacher. Bent on improving his own education, he then entered the University of New Brunswick, where he carried off high honours in 1866-1868. From 1868 to 1872 he was head master
of Bathurst grammar school; but he was not content with the opportunities thereby open to him in Canada, and he went to England and entered Oxford. Here the enthusiastic young Canadian was not only profoundly affected himself by entering strenuously into the life of the ancient university (he was secretary of the Union when H. H. Asquith was president), but in his turn was instrumental in bringing the possibilities of British Imperialism to the minds of some of the ablest among his contemporaries—his juniors by six or eight years. It is hardly too much to say that in his intercourse at Oxford in the early' seventies with men of influence who were then undergraduates the imperialist movement in England substantially began. On returning to Canada he became principal of the chief New Brunswick school at Fredericton (where in 1878 he married), and for fifteen years he did excellent work in this capacity. But in 1886 he was again drawn more directly into the imperialist cause. The federation movement had gone ahead in the meanwhile, and Parkin had always been associated with it; and now he became a missionary speaker for the Imperial Federation League, travelling for several years about the empire for that purpose. He also became Canadian correspondent of The Times, and in that capacity helped to make Canada better known in the mother country. In 1894 he was given the honorary degree of LL.D. by Oxford. In 1895 he returned to the scholastic work as principal of Upper Canada College, Toronto, and retained this post till 1902; but he continued in the meanwhile to support the imperialist movement by voice and pen. When in 1902 an organizer was required for the Rhodes Scholarship Trust (see Rhodes, Cecil), in order to create the machinery for working it in the countries to which it applied, he accepted the appointment; and his devotion to this task was largely responsible for the success with which Rhodes's idea was carried out at Oxford. His publications include Reorganization of the British Empire (1882), Imperial Federation (1895), Round the Empire (1892), Life of Sir John Macdonald (1907).

PARKINSON, JAMES (d. 1834), English palaeontologist, was educated for the medical profession, and practised in Hoxton, from about the year 1755. He was a Fellow of the Royal College of Surgeons, and one of the original members of the Geological Society of London (1807). He was author of numerous chemical and medical books, the most important of which were Organic Remains of a Former World (3 vols., 1804, 1808, 1811), and Outlines of Oryctology (1812). Parkinson died in London, on the 21st of December 1824. See Hist. of Collections in Brit. Mus. Nat. Hist. Dep. 1904, pp. 315-316.

PARKMAN, FRANCIS (1823-1893), American historian, was born in Boston on the 16th of September 1823. His great-grandfather, Ebenezer Parkman, a graduate of Harvard in 1721, was for nearly sixty years minister of the Congregational Church in Westborough, and was noted for his devotion to the study of history. One of this good clergyman's sons, Samuel Parkman, became an eminent merchant in Boston, and exhibited much skill in horticulture. Samuel's son, Francis Parkman, a graduate of Harvard in 1807, was one of the most eminent of the Boston clergymen, a pupil and friend of Channing, and noted among Unitarians for a broadly tolerant disposition. This Dr Parkman, a man of rare sagacity and exquisite humour, was the father of Francis Parkman, the historian. His mother was a descendant of the celebrated John Cotton. She was the daughter of Nathaniel Hall of Medford, member of a family which was represented in the convention that framed the constitution of Massachusetts in 1780.

Francis Parkman was the eldest of her six children. As a boy his health was delicate, so that it was thought best for him to spend much of his time at his grandfather Hall's home in Medford rather than in the city. That home was situated on the border of the Middlesex Fells, a rough and rocky woodland, 4000 acres in extent, as wild and savage in many places as the primeval forest. The place is within 8 m. of Boston, and it may be doubted if anywhere else can be found another such magnificent piece of wilderness so near to a great city. There young Parkman spent his leisure hours in collecting eggs, insects and reptiles, trapping squirrels and woodcocks, and shooting birds with arrows. This busy life saved him from the artificial stupidity which is too often superinduced in boys by their school training. At the age of fourteen Parkman began to show a strong taste for literary composition. In 1841, while a student at Harvard, he made a rough journey of exploration in the woods of northern New Hampshire, where he had a taste of adventure slightly spiced with hardship. About this time he made up his mind to write a history of the last French war in America, which ended in the conquest of Canada, and he even at that time planned to enlarge the plan so as to include the whole course of the American conflict between France and Great Britain; or, to use his own words, "The history of the American forest; for this was the light in which I regarded it. My theme fascinated me, and I was haunted with wilderness images day and night." The way in which true genius works could not be more happily described. In the course of 1842 an attack of illness led to his making a journey in Italy, where he spent some time in a monastery belonging to one of the strictest of all the monastic orders, the Passionists, brethren addicted to wearing hair shirts and scourging themselves without mercy to recruit Parkman's health, and by good brother were of much value as living and breathing historic material. In 1844 he graduated at Harvard with high rank. He now made up his mind to study the real wilderness in its gloom and vastness, and to meet face to face the dusky warriors of the Stone Age. To-day such a thing can hardly be done within the United States, for nowhere does the primitive wilderness exist save here and there in shreds and patches. So recently as the middle of the 19th century, however, it covered the western half of the continent, and could be reached by a journey of 1600 or 1700 miles from Boston to the plains of Nebraska. Parkman had become an adept in woodcraft, and a good brother with the rifle, and could do such things with horses, tame or wild, as civilized people never see done except in a circus. In company with his friend and classmate, Mr Quincy Shaw, he passed several months with the Ogililah band of Sioux. Knowledge, intrepidity and tact carried Parkman through these experiences uncathed, and good luck kept him clear of encounters with hostile Indians, in which these qualities might not have sufficed to avert destruction. It was a very important experience in relation to his life-work. This outdoor life, however, did not suffice to recruit Parkman's health, and by this time he had begun writing The Conspiracy of Pontiac, he had reached a truly pitiable condition. The trouble seems to have been some form of nervous exhaustion, accompanied with such hypersensitiveness of the eyes that it was impossible to keep them open except in a dark room. Against these difficulties he struggled with characteristic obstinacy. He invented a machine which so supported his hand that he could write legibly with closed eyes. Books and documents were read aloud to him, while notes were made by him with eyes shut, and were afterwards deciphered and read aloud to him till he mastered them. After half an hour his strength would give out, and in these circumstances his rate of composition for a long time averaged scarcely six lines a day. The superb historical monograph composed under such difficulties was published in 1851. It had but a small sale, as the American public was then too ignorant to feel much interest in American history.

Undeterred by this inhospitable reception, Parkman took up at the beginning his great work on France and England in the New World, to which the book just mentioned was in reality the sequel. This work obliged him to trace out, collect, arrange, and digest a great mass of incongruous material scattered on both sides of the Atlantic, a large portion of which was in manuscript, and required much tedious exploration and the employment of trained copyists. This work involved several journeys to Europe, and was performed with a thoroughness approaching finality. In 1865 the first volume of the great work appeared, under the title of Pioneers of France in the New World; and then
seven-and-twenty years more elapsed before the final volumes came out in 1892. Nowhere can we find a better illustration of the French critic's definition of a great life—a thought conceived in youth, and realized in later years. After the Pioneers the sequence is _The Jesuits in North America, La Salle and the Discovery of the Great West, The Old régime in Canada, Frontenac and New France and Louis XIV._, _Montcalm and Wolfe, A Half Century of Canada_. As one obstacle after another was surmounted, as one grand division of the work after another became an accomplished fact, the effect upon Parkman's condition seems to have been bracing, and he acquired fresh impetus as he approached the goal. There can be little doubt that his physical condition was much improved by his habit of cultivating plants in garden and conservatory. He was a horticulturist of profound attainments, and himself originated several new varieties of flowers. His work in this department made him an enthusiastic adherent of the views of Darwin. He was professor of horticulture in the agricultural school of Harvard in 1871-1872, and published a few books on the subject of gardening. He died at Jamaica Plain, near Boston, on the 8th of November 1893.

The significance of Parkman's work consists partly in the success with which he has depicted the North-American Indians, those belated children of the Stone Age, who have been so persistently misunderstood alike by romancers, such as Cooper, and by detractors like Dr Palfrey. Parkman was the first great literary author who really understood the Indian's character and motives. Against this savage background of the forest Parkman shows the rise, progress and dramatic termination of the colossal struggle between France and Great Britain for colonial empire. With true philosophic insight he shows that France failed in the struggle not because of any inferiority in the ability and character of the men to whom the work was entrusted, but chiefly by reason of her despotic and protective régime. There is no more eloquent commentary upon the whole-some results of British self-government than is to be found in Parkman's book. But while the author deals with history philosophically, he does not, like Buckle, hurl at the reader's head huge generalizations, or, like Carlyle, preach him into somnolence. With all its manifold instructiveness, his book is a narrative as entertaining as those of Macaulay or Froude. In judicial impartiality Parkman may be compared with Gardiner, and for accuracy of learning with Stubbs.

There is a good Life by G. H. Faraham (Boston, 1900). (J. F.)

**PARLA KIMEDI, a town of British India, in Ganjam district of Madras. Pop. (1901), 17,336. It is the residence of a raja, who claims descent from the ancient kings of Orissa. His estate covers an area of 614 sq. m., and pays a revenue of £7000 out of an estimated income of £26,000. He maintains a college, and has constructed a light railway (25 m.) to the station of Naupada on the East Coast railway. There is a trade in rice, and maize and other articles are woven of reeds.**

**PARLEMENT (see PARLAMENT), in O. Fr. the name given to any meeting for discussion or debate (parler, to speak), a sense in which it was still used by Joinville, but from the latter half of the 13th century employed in France in a special sense to designate the sessions of the royal court (curia regis). Finally, when the Parlement of Paris had become a permanent court of justice, having the supreme authority in cases brought before it, and especially in appeals against the sentences of the baillis and seneschals, it retained this name, which was also given to the other supreme courts of the same name, which were created after its model in the provinces.**

The early Capetian court had a number of ancient precedents, of summoning periodically to their court their principal vassals and the prelates of their kingdom. These gatherings took place on the occasion of one of the great festivals of the year, in the town in which the king was then in residence. Here they deliberated upon political matters and the vassals and prelates gave the king their advice. But the monarch also gave judgment here in those cases which were brought before him. These were few in number during the early days of the Capetian dynasty; for though the king always maintained the principle that he was judge, and even that his competence in this respect was general and unlimited, this competence was at the same time undefined and it was not compulsory to submit cases to the king. At this period, too, appeals, strictly so called, did not exist. Nevertheless when a suit was brought before the king he judged it with the assistance of his prelates and vassals, as is still the case between France and those who formed his council. This was the _curia regis_. But in law the king was sole judge of the vassals and prelates being only advisers. During the 13th and at the beginning of the 13th centuries the _curia regis_ continued to discharge these functions, except that its importance and actual competence continued to increase, and that we frequently find in it, in addition to the vassals and prelates who formed the council, _consullarii_, who are evidently men whom the king had in his entourage, as his ordinary and professional councillors. Under the reign of St Louis (which was also the period at which the name parlement began to be applied to these judicial sessions) the aspect of affairs changed. The judicial competence of the Parlement developed and became more clearly defined; the system of appeals came into existence, and appeals against the judgments of the baillis and seneschals were brought before it; cases concerning the royal towns, the _bonnes villes_, were also decided by it. Again, in the old registers of the Parlement at this period, the first _Olim_ books, we see the names of the same councillors recurring from session to session. This suggests that a sufficient number of councillors was assured beforehand, and a list drawn up for each session; the vassals and prelates still figuring as a complementary body at the council.

Next came the series of ordinances regulating the tenure of the Parlement, those of 1278, 1304, 1306 and 1368, and the institution was regularized. Not only were the persons who were to constitute each Parlement named in advance, but those who were not placed on this list, even though vassals or prelates, were excluded from judging cases. The royal _baillis_ had to attend the Parlement, in order to answer for their judgments, and at an early date was fixed the order of the different _baillages_, in which the cases coming from them were heard. The _baillis_, when not interested in the case, formed part of the council, but were afterwards excluded from it. Before the middle of the 14th century the personnel of the Parlement, both presidents and councillors, became _facto de facto_ if not _jure_ office of the _cour des pairs_. Every year a list was drawn up of those who were to hold the session, and although this list was annual, it contains the same names year after year; they are as yet, however, only annual _commissionnaires_. In 1341 they became _officials_ (officiers) fixed but not yet irremovable. At the same time the Parlement had become permanent; the number of the sessions had diminished, but their length had increased. In the course of the 14th century it became the rule for the Parlement to sit from Martinmas (Nov. 11) till the end of May; later the session was prolonged till the middle of August, the rest of the year forming the vacation. The Parlement had also become fixed at Paris, and, by a development which goes back to fairly early times, the presidents and councillors, instead of being merely the king's advisers, had acquired certain powers, though these were conferred by the monarch; they were, in fact, true magistrates. The king held his court in person less and less often, and it pronounced its decrees in his absence; we even find him pleading his cause before it as plaintiff or defendant. In the 14th century, however, we still find the Parlement referring delicate affairs to the king; but in the 15th century it had acquired a jurisdiction of its own in principle. As to its composition, it continued to preserve one notable feature which recalled its origin. It had originally been an assembly of lay vassals and prelates; when its composition became fixed and consisted of councillor-magistrates, a certain number of these offices were necessarily occupied by laymen, and others by ecclesiastics, the _consullarii lais_ and the _consullarii clerics_.

The Parlement was at the same time the court of peers (_cour des pairs_). This had as its origin the old principle according
to which every vassal had the right to be tried by his peers, i.e., by the vassals holding fiefs from the same lord, who sat in judgment with that lord as their president. This, it is well known, resulted in the formation of the ancient college of the peers of France, which consisted of six laymen and six ecclesiastics. But although in strict logic the feudal causes concerning them should have been judged by them alone, they could not maintain this right in the curia regis; the other persons sitting in it could also take part in judging causes which concerned the peers. Finally the peers of France, the number of whom was increased in course of time by fresh royal creations of peers, became ex officio members of the Parlement; they were the hereditary councillors, taking the oath as official magistrates, and, if they wished, sitting and having a deliberative function in the Parlement. In suits brought against them personally or involving the rights of their peerage they had the right of being judged by the Parlement, the other peers being present, or having been duly summoned.

While maintaining its unity, the Parlement had been subdivided into several chambers or sections. In the first place there was the Grand Chambre, which represented the primitive Parlement. To it was reserved the judgment in certain important cases, and in it a peculiar procedure was followed, known as oral, though it admitted certain written documents. Even after the offices of the Parlement had become legally saleable the councillors could only pass from the other chambers into the Grand Chambre by order of seniority. The Chambres des enquêtes and des requêtes originated at the time when it became customary to draw up lists for each session of the Parlement. The enquêteurs or auditeurs of the Parlement had at first been auxiliary staff to the parlement and were entrusted the inquests ordered by the Parlement. But later, when the institution of the appeal was fully developed, and the procedure before the various jurisdictions became a highly technical matter, above all when it admitted written evidence, the documents connected with other inquests also came before the Parlement. A new form of appeal grew up side by side with the older form, which had been mainly an oral procedure, namely the appeal by writing (appel par écrit). In order to judge these new appeals the Parlement had above all to study written documents, the inquests which had been made and written down under the jurisdiction of the court of first instance. The duty of the enquêteurs was to make an abstract of the written documents and report on them. Later the reporters (rapporteurs) were admitted to judge these questions together with a certain number of members of the Parlement, and from 1316 onwards these two kinds of member formed together a chambre des enquêtes. As yet, no doubt, the rapporteur only gave his opinion on the case which he had prepared, but after 1336 all those who formed part of the chamber were put on the same footing, taking it in turn to report and giving judgment as a whole. For a long time, however, the Grand Chambre received all cases, then sent them to the Chambre des enquêtes with directions; before it too were argued questions arising out of the inquiry made by the Chambre des enquêtes, to the decisions of which it gave effect and which it had the power to revise. But one by one it lost all these rights, and in the 16th century they are no longer heard of. Several Chambres des enquêtes were created after the first one, and it was they who had the greater part of the work.

The Chambre des requêtes was of an entirely different nature. At the beginning of the 14th century a certain number of those who were to hold the session of the Parlement were set apart to receive and also to judge the inquests of the Parlement (requêtes) in a judicial capacity, which had been presented to the king and not yet dealt with. This eventually led to the formation of a chamber, in the strict sense of the word, the Requêtes du palais. But this became purely a jurisdiction for privileged persons; before it (or before the Requêtes de l'hôtel, as the case might be) were brought the civil suits of those who enjoyed the right of committimus. The Chambre des requêtes had not supreme jurisdiction, but appeals from its decisions could be made to the Parlement proper.

The Parlement had also a criminal chamber, that of La Tournelle, which was not legally created until the 16th century, but was active long before then. It had no definite membership, but the conseillers lais served in it in turn.

Originally there was only one Parlement, that of Paris, as was indeed logical, considering that the Parlement was simply a continuation of the curia regis, which, like the king, could only be one. But the exigencies of the administration of justice led to the successive creation of a certain number of provincial parlements. Their creation, moreover, was generally dictated by political circumstances, after the incorporation of a province in the domain of the Crown. Sometimes it was a question of a province which, before its annexation, possessed a superior and sovereign jurisdiction of its own, and to which it was desired to preserve this advantage. Or else it might be a province forming part of feudal France, which before the annexation had had a superior jurisdiction from which the Crown had endeavoured to institute an appeal to the Parlement of Paris, but for which after the annexation it was no longer necessary to maintain this appeal, so that the province might now be given a supreme court, a parlement. Sometimes an intermediate régime was set up between the annexation of the province and the creation of its provincial parlement, under which delegates from the Parlement of Paris went and held assises there. Thus were created successively the parlements of Toulouse, Grenoble, Bordeaux, Dijon, Rouen, Aix, Rennes, Pau, Metz, Douai, Besançon and Nancy. From 1762 to 1771 there was even a parlement for the principality of Dombes. The provincial parlements reproduced in a smaller scale the organization of that of Paris, but they did not combine the functions of a court of appeal with those of a court of inferior jurisdiction, i.e., they each claimed to possess equal powers within their own province. There were also great judicial bodies exercising the same functions as the parlements, though without bearing the name, such as the Conseil souverain de Alsace at Colmar, the Conseil supérieur de Roussillon at Perpignan; the provincial council of Artois had not the supreme jurisdiction in all respects.

The parlements, besides their judicial functions, also possessed political rights; they claimed a share in the higher policy of the realm, and the position of guardians of its fundamental laws. In general the laws did not come into effect within their province until they had been registered by the parlement. This was the method of promulgation admitted by the ancient law of France, but the parlements verified the laws before registering them, i.e., they examined them to see whether they were in conformity with the principles of law and justice, and with the interests of the king and his subjects; if they considered that this was not the case they refused their registration and addressed remonstrances (remontrances) to the king. In acting thus they were merely conforming to the duty of counselling (devoir de conseil) which all the superior authorities had towards the king, and the text of the ordinances (ordonnances) had often invited them to do so. It was natural, however, that in the end the royal will should seek to impose itself. In order to enforce the registration of edicts the king would send letters de cachet, known as lettres de jussion, which were not, however, always obeyed. Or he could come in person to hold the parlement, and have the law registered in his presence in a lit de justice. This was explained in theory by the principle that if the king himself held his court, it lost, by the fact of his presence, all the authority which he had delegated to it; for the moment the only authority existing in it was that of the king, just as in the ancient curia regis there was the principle that apparaent regis seculis magistratus, or laymen, presided over a parlement, which maintained that only a voluntary registration, by the consent of the parlement, was valid.

The parlements also had a wide power of administration. They could make: regulations (pouvoir réglementaire) having the force of law within their province, upon all points not settled by law, when the matter with which they dealt fell within their judicial competence, and for this it was only necessary that their interference in the matter was not forbidden by law. These were what were called arrêté de règlement.
PARLIAMENT

By this means the parliaments took part in the administration, except in matters the cognizance of which was attributed to another supreme court as that of taxation was to the courts d’aides. They could also, within the same limits, address injunctions (injunctions) to officials and individuals.

See La Roche-Flavin, Trois èves des parlements de France (1617); Felix Aubert, Histoire du parlement de Paris, des origines à François I. (2 vols., 1894); Ch. V. Langlois, Textes relatifs à l’histoire des parlements, 2 vols. (1881); Guilhaumeau, Enquêtes et procès (1892); Glasson, Le Parlement de Paris, son rôle politique depuis le règne de Charles VII jusqu’à la révolution (2 vols., 1901).

PARLIAMENT (Anglo-Lat. parliamentum, Fr. parlement, from parler, to speak), the name given to the supreme legislature of the United Kingdom of Great Britain and Ireland. (For the old French parlement, see PARLEMENT; and for analogous foreign assemblies see the articles on their respective countries.)

The word is found in English from the 13th century, first for a debate, then for a formal conference, and for the great councils of the Plantagenet kings; and the modern sense has come to be applied retrospectively. William the Conqueror is said in the Chronicle to have had "very deep speech with his Witan"; this "deep speech" (in Latin colloquium, in French parlement) was the distinguishing feature of a meeting between king and people, and thus gave its name to the national assembly itself. The Statute of Westminster (1275) first uses "parlement" of the great council in England.

The British Parliament consists of the King (or Queen regnant), the Lords spiritual and temporal, and the Commons; and it meets in two houses, the House of Lords (the Upper or Second chamber) and the House of Commons.

The Crown, pre-eminent in rank and dignity, is the legal source of parliamentary authority. The sovereign virtually appoints the lords spiritual, and all the peers of the lords temporal have been created by the Crown. The King summons parliament to meet, and prescribes the time and place of its meeting, prorogues and dissolves it, and commands the issue of writs for the election of members of the House of Commons.

By several statutes, beginning with the 4 Edward III. c. 14, the annual meeting of parliament had been ordained; but these statutes, continually disregarded, were virtually repealed in the reigns of Charles II. and William and Mary (16 Ch. II. 31; 6 & 7 Will. & Mary, 32). The present statute law merely exacts the meeting of parliament once in three years; but the annual voting of supplies has long since superseded obsolete statutes. When parliament is assembled it cannot proceed to business until the king has declared the causes of summons, in person or by commission; and though the veto of the Crown on legislation has long been obsolete, bills passed by the two houses only become law on receiving the royal assent.

The House of Lords is distinguished by peculiar dignity, privileges and jurisdictions. Peers individually enjoy the rank and precedence of many other dignities, and are hereditary counsellors of the Crown. Collectively with the lords spiritual they form a permanent council of the Crown; and, when assembled in parliament, they form the highest court of judicature in the realm, and are (in constitutional theory at all events) a co-equal branch of the legislature, without whose consent no laws can be made (see below, House of Lords Question). Their judicature is of various kinds, viz. for the trial of peers; for determining claims of peerage and offices of honour, under references from the Crown; for the trial of controverted elections of Scotch and Irish peers; for the final determination of appeals from courts in England, Scotland and Ireland; and lastly, for the trial of impeachments.

The House of Commons also has its own peculiar privileges and jurisdictions. Above all, it has the paramount right of originating the imposition of all taxes, and the granting of supplies for the service of the state. It has also enjoyed, from early times, the right of determining all matters concerning the election of its own members, and their right to sit and vote in parliament. This right, however, has been greatly abridged, as, in 1685, the trial of controverted elections was transferred to the courts of law; but its jurisdiction in matters of election, not otherwise provided for by statute, is still retained intact. As part of this jurisdiction the house directs the Speaker to issue warrants to the clerk of the Crown to make out new writs for the election of members to fill up such vacancies as occur during the course of parliament.

Privileges of Parliament—Both houses are in the enjoyment of certain privileges, designed to maintain their authority, independence and dignity. These privileges are founded mainly upon the law and custom of parliament, while some have been confirmed, and others abridged, by statute. But the foundation of these rights is entirely upon their inherent right, as having "a place and voice in parliament"; but, by a custom dating from the 6th Henry VIII., the Offices of Impeachment are offered to the Crown at the commencement of every parliament, "to their ancient and unchallenged rights and privileges." Each house has its separate rights and jurisdictions; but privileges properly so-called, being founded upon the law and custom of parliament, are common to both houses.

Each house adjudges whether any breach of privilege has been committed, and punishes offenders by censure or commitment. This right of commitment is incontestably established by statute, and is exercised, though not always lawfully and properly executing its orders, who are also empowered to call in the assistance of the civil power. The causes of such commitments cannot be inquired into by courts of law, nor can privileges as such be controverted. Breaches of privilege are generally summarized as disobedience to any orders or rules of the house, indignities offered to its character or proceedings, assaults, insults, or libels upon members, or interference with officers of the house in the discharge of their duties. In either case the offences are dealt with as contempt, according to the circumstances of the respective cases, of which numerous precedents are to be found in the journals of both houses. The Lords may imprison for a fixed period, and impose fines; the Commons can only imprison generally, the commitment being concluded by the prorogation, and have long discontinued the imposition of fines.

An acknowledged privilege is no longer insisted upon by the use of the word "prerogative," it having been abandoned by the House of Commons ever since the reign of William and Mary; and modern English constitutional law is based almost entirely on the suggestion that all such privileges should be governed by modern statutory law. The only reservation is that the House of Commons is only prorogued by the King upon its own motion, and the Commons are at all times free from arrest, but otherwise they are liable to all the processes of the courts. If arrested, they will be immediately discharged, upon motion in the court whence the process issued. Formerly, if processes were served on members, their privileges of peerage, etc., were also at all times. Members of the House of Commons are free only for forty days after prorogation and forty days before the next appointed meeting; but prorogations are so arranged as to ensure a continuous session of parliament. Formerly, even suits against members were stayed, but this offensive privilege has been abolished by statute. Exemption from attending as witnesses upon subpoena, and the immunity of members from arrest under any other process, as well as the right of being protected from arrest and molestation, and from the consequences of statements made by them, or other proceedings in the course of their cases, is still claimed.

The House of Commons, in enforcing their privileges, are obliged to commit offenders or otherwise interfere with the liberty of the subject, the exercise of these privileges has naturally been called in question before the courts. For the same reason, the sole authority for the arrest of commoners and servants is found in the statute law, and, where law and privilege have seemed to be at variance, a conflict of jurisdiction has arisen between parliament and the courts. Many of the more controversial cases have, however, been decided in favor of the late years privilege has been carefully restrained within the proper limits of the law, and the courts have amply recognized the authority of parliament.

1 Or rather, the representatives of the Commons (see REPRESENTATION); but the term has long been used for the deputies themselves collectively.
Parliamentary Procedure.—It will be convenient here to sketch the general lines of procedure. On the day appointed by royal proclamation for the meeting of a new parliament both houses assemble in their respective chambers, when the Lords Commissioners for opening the parliament summon the Commons to the bar of the House of Lords, by the mouth of Black Rod, to hear the commission read. The lord chancellor states that, when the members of both houses shall be present, they shall then consider the causes of his calling this parliament; and, it being necessary that a Speaker of the House of Commons shall be first chosen, the Commons are directed to proceed to the appointment of a Speaker, and to present him, on the following day, for His Majesty's royal approbation. The Commons at once withdraw to their own house and proceed to the election of their Speaker. The next day the Speaker-elect proceeds, with the house, to the House of Lords, and, on receiving the royal approbation, lays claim, in the accustomed form, on behalf of the Commons, "to their ancient and undoubted rights and privileges. The Speaker, now fully confirmed, returns to the House of Commons, and, after repeating his acknowledgments, reminds the house that the first thing to be done is to take and subscribe the oath required by law. Having first taken the oath himself, he is followed by other members, who come to the table to be sworn. The swearing of members in both houses proceeds from day to day, until the greater number have taken the oath, or affirmation, when the causes of summonses are declared by His Majesty in person, or by commission, in "the King's speech." This speech is considered in both houses, an Address (p. 267) in answer to which is presented to His Majesty by the whole house, on "the lords with white staves" in one house and privy councillors in the other.

The debate on the Address being over, the real business of the session now commences: the committees of supply and ways and means are set up; bills are introduced; motions are made; committees are appointed; and both houses are, at once, in full activity. The Lord Chancellor presides over the deliberations of the Lords, and the Speaker over those of the Commons. A quorum of the House of Lords, including the chancellor, is three (thirty for divisions); that of the House of Commons, including the Speaker, is forty. Every matter is determined, in both houses, upon questions put from the chair, and resolved in the affirmative or negative, or otherwise disposed of by the withdrawal of the motion, by amendments, by the adjournment of the house, by referring the orders of the day, or by the previous question. Notices are required to be given of original motions; and the different stages of bills, and other matters appointed for consideration by the house, stand as orders of the day. Questions of privilege are allowed precedence of all the business on any day; but this rule, being liable to grave abuses, is guarded by strict limitations. Debates arise when a question has been proposed from the chair; and at the close of the debate (for the "closure" in the House of Commons, see below, House of Commons, Internal Reforms) the question is put, with or without amendment, as the case may be, and is determined, when necessary, by a division. No question or bill, substantially the same as one upon which the judgment of the house has already been given, may be again proposed during the same session.

Members claim to be heard in debate by rising in their places. When more than one member rises at the same time, in the Lords the member who is to speak is called by the house, in the Commons by the Speaker. Every member, when called, is bound to speak to the question before the house; and calls to order are very frequent. A member may speak once only to any question, except to explain, or upon a point of order, or to reply when a member has himself submitted a motion to the house, or when an amendment has been moved which constitutes a new question. He may not refer to past debates, nor to debates in the other house; nor may he refer to any other member by name, or use offensive and disorderly language against the king, either House of Parliament, or other members. Members offending against any of the rules of debate are called to order by the Speaker, or the attention of the chair is directed to the breach of order by another member. Order is generally enforced by the authority of the chair; but in extreme cases, and especially when obstruction is being practised, the offending member is named by the Speaker, and suspended by an order of the house, or otherwise punished at the discretion of the house.

At the conclusion of a debate, unless the motion be withdrawn, or the debate adjourned by the Speaker, a division is taken. If the motion be carried, or the debate closed, according to the will of the house, the house proceeds to a division, which effects the two-fold purpose of ascertaining the numbers supporting and opposing the question, and of recording the names of members voting on either side. On each side of the house is a division lobby; and in the Lords the "contents" and in the Commons the "ayes" are directed to go to the right, and the "not contents" or "noes" to the left. The former pass into the right lobby, at the back of the Speaker's chair, and return to the house through the bar; the latter pass into the left lobby, at the bar, and return at the back of the chair. The opposing parties are thus kept entirely cleared of one another. In each lobby there are two members acting as tellers, who count the members as they pass, and two division clerks who take down their names. After the division the four tellers advance to the table, and the numbers are reported by one of the tellers for the majority. In case of an equality of numbers, in the Lords the question is negatived in virtue of the ancient rule "semper praesumat pro negante"; in the Commons the Speaker gives the casting vote.

Committees of the Whole House.—For the sake of convenience in legislation, and out of the number of the members of both houses, it has been found necessary to form committees of the whole house. Of these the most important is a committee of the whole house, which, as it consists of the entire body of members, can scarcely be accounted a committee. It is presided over by a chairman, who sits in the chair at the table, the mace, which represents the authority of the house itself, being for the time placed under the table. In this committee are discussed the several provisions and regulations that have to be considered in the commencement of details. To facilitate discussion, members are allowed to speak any number of times to the same question; otherwise the proceedings are similar to those of the house itself. In the Lords the chair is taken by the Speaker, and by the chairman of the committee of ways and means, or in his absence by any other member. The quorum of such a committee is the same as that of the house itself. It reports from time to time to the house, and one power of each other.

Grand and Standing Committees.—In the House of Commons there were formerly four grand committees, viz. for religion, for grievances, for courts of justice, and for trade. They were founded upon the valuable principle of a distribution of labours among several bodies of members; but, having fallen into disuse, they were discontinued in 1832. The ancient committee of privileges, in which the members of both houses who compose the courts of chancery, at the commencement of every session, but is rarely called into action, as it has been found more convenient to appoint a select committee to inquire into any question of privilege as it arises. In 1852 a number of grand committees was established, each composed of two standing committees for the consideration of bills relating to law and courts of justice and to trade; and grand committees have since been considerably extended.

Select Committees.—In select committees both houses find the means of delegating inquiries, and the consideration of other matters, which could not be undertaken by the whole house. The reports of such committees have formed the groundwork of many important measures; and bills are often referred to them which receive a fuller examination than could be expected in a committee of the whole house. Power is given to such committees, when required, to send for persons and papers necessary to the subjects committed to them; to take evidence on oath; to examine witnesses upon oath has always been exercised, but it was not until 1871 that the same power was extended to the Commons, by statute.

Communications between the Two Houses.—In the course of the proceedings of parliament, frequent communications between the two houses become necessary. Of these the most usual and convenient is that by a message from one house to the other, which is received by a message, by two judges or two masters in chancery, and the Commons by a deputation of their own members; but since 1855 messages have been taken from one house to the other by the post; the form of messages in the post is regulated by a conference, in reference to amendments to bills or other matters; but this proceeding has been in great measure superseded by the more simple form of a message. The two houses are also occasionally in personal communication, either through select committees and of select committees communicating with each other.
and both Houses of Parliament. Of these the most important are the grants of public money for ordinary expenditure. Bills for raising money are laid before the House of Commons, which must have a similar provision. Both houses hold regular sessions. The

LEGISLATION.

discussion; their committee which the found fitting the serious usual is a money, the House of Lords, and other committees. A bill imposing a charge upon the people should originate in that house. On the other hand, the Lords claim that bills for restoration of a colonial title, or for the public good of the colony, or to be accomplished before the next session of Parliament, should originate in their house. An act of grace, or a bill of attainder, is not a bill of attainder, or, in the case of bills relating to religion, trade, grants of public money, or changes upon the subject, a preliminary committee may be necessary before such a bill be passed. A bill, when presented, is a first reading of the bill, and is followed by a second reading, and the bill is returned to the committee of the whole house. When the bill has been fully considered, it is reported to the house, with or without amendments, and is ready to pass through its remaining stages. Sometimes, however, the bill is first referred to a select committee; or to a grand committee and not to the committee of the whole house. When a bill has been reported from a committee of the whole house, or from a standing committee, with amendments, the bill, and inserted, is followed by a further stage, and further amendments may be made, or the bill may be recommitted. The next and last stage is the third reading, when the bill is returned to the committee of the whole house. The bill then awaits the royal assent; but if it is rejected, is returned, and otherwise adjusted by the two houses, before it can be submitted for the royal assent. The royal assent consummates the work of legislation, and converts the bill into an act of parliament.

Petitions.—Bill of Attainder, or bill of attainder, or bill of attainder, or, in some countries, a bill of attainder, which is a bill of attainder. A bill for public money, or changes upon the subject, a preliminary committee may be necessary before such a bill be passed. A bill, when presented, is a first reading of the bill, and is followed by a second reading, and the bill is returned to the committee of the whole house. When the bill has been fully considered, it is reported to the house, with or without amendments, and is ready to pass through its remaining stages. Sometimes, however, the bill is first referred to a select committee; or to a grand committee and not to the committee of the whole house. When a bill has been reported from a committee of the whole house, or from a standing committee, with amendments, the bill, and inserted, is followed by a further stage, and further amendments may be made, or the bill may be recommitted. The next and last stage is the third reading, when the bill is returned to the committee of the whole house. The bill then awaits the royal assent; but if it is rejected, is returned, and otherwise adjusted by the two houses, before it can be submitted for the royal assent. The royal assent consummates the work of legislation, and converts the bill into an act of parliament.

Petitions.—Bill of Attainder, or bill of attainder, or bill of attainder, or, in some countries, a bill of attainder, which is a bill of attainder. A bill for public money, or changes upon the subject, a preliminary committee may be necessary before such a bill be passed. A bill, when presented, is a first reading of the bill, and is followed by a second reading, and the bill is returned to the committee of the whole house. When the bill has been fully considered, it is reported to the house, with or without amendments, and is ready to pass through its remaining stages. Sometimes, however, the bill is first referred to a select committee; or to a grand committee and not to the committee of the whole house. When a bill has been reported from a committee of the whole house, or from a standing committee, with amendments, the bill, and inserted, is followed by a further stage, and further amendments may be made, or the bill may be recommitted. The next and last stage is the third reading, when the bill is returned to the committee of the whole house. The bill then awaits the royal assent; but if it is rejected, is returned, and otherwise adjusted by the two houses, before it can be submitted for the royal assent. The royal assent consummates the work of legislation, and converts the bill into an act of parliament.

Parliamentary papers.—Another source of information is found in parliamentary papers. These are of various kinds. The greater part are obtained either by a direct order of the house itself, or by an order addressed to the Crown for documents relating to matters in which the prerogatives of the Crown are concerned. Other papers, relating to foreign and colonial affairs and other public matters, are presented to both houses by command of His Majesty. Again, many papers are annually presented in pursuance of acts of parliament. The object is to grant supplies, and to originate all measures of taxation, imposes a very onerous service upon that house. This is mainly performed by two committees of the whole house—the committee of supply, and the committee of ways and means. The former is charged with all the estimates for the public service presented to the house by command of His Majesty; and the latter votes out of the Consolidated Fund such sums as are necessary to meet the supplies already
were ethelings—generally, if not exclusively, sons and brothers of the king. The ealdorman, originally a high officer, having the executive government of a shire, and a seat in the king's witan, became hereditary in certain families, and eventually attained the dignity of an earl. But centuries were to pass before the English nobility was to assume its modern character and denominations. At the head of each village was an eorl, the chief of the freemen, or ceorls—their leader in war and patron in peace.

The king's geasaths and thegns formed another privileged class. Admitted to offices in the king's household and councils, and enriched by grants of land, they gradually formed a feudal nobility.

The revival of the Christian Church, under the Anglo-Saxon rule, created another order of rulers and councillors, destined to take a leading part in the government of the state. The archbishops and bishops, having spiritual authority in their own dioceses, and exercising much local influence in temporal affairs, were also members of the national council, or witenagemót, and by their greater learning and capacity were not long in acquiring a leading part in the councils of the realm. Ecclesiastical councils were also held, comprising bishops, abbots, and clergy, in which we observe the origin of convocation. The authority thus associated with the bishops, also found a place with them in the witenagemót. By these several orders, summoned to advise the king in affairs of state, was formed a council of magnates—to be developed, in course of time, into an upper chamber, or House of Lords.

The rise of the Commons (see Representation) as a political power in the national councils, was of yet slower development: but in the Anglo-Saxon moots may be discerned the first germs of popular government in England. In the town-moot the assembled freemen and cultivators of the "folk-lands" regulated the civil affairs of their own township, tithing, village or parish. In the borough-moot the inhabitants administered their municipal business, under the presidency of a reeve. The hundred-moot assumed a more representative character, comprising the reeve and a selected number of freemen from the several townships and boroughs within the hundred. The shire-moot, or shire-gemót, was an assembly yet more important. An ealdorman was its president, and exercised a jurisdiction over a shire, or district comprising several hundreds. Attended by a reeve and four freemen from every hundred, it assumed a distinctly representative character. Its members, if not elected (in the modern sense) by the popular vote, were, in some fashion, deputed to act on behalf of those whose interests they had come to guard. The shire-moot was also the general folk-moot of the tribe, assembled in arms, to whom their leaders referred the decision of questions of peace and war.

Superior to these local institutions was the witenagemót, or assembly of wise men, with whom the king took counsel in legislation and the government of the state. This national council was the true beginning of the parliament of England. Such a council was originally held in each of the kingdoms commonly known as the Heptarchy; and after their union in a single realm, under King Edgar, the witenagemót became the deliberative and legislative assembly, or parliament, of the extended estate. The witenagemót made laws, imposed taxes, concluded treaties, advised the king as to the disposal of public lands and the appointment and removal of officers of state, and even assumed to elect and depose the king himself. The king had now attained to greater power, and more royal dignities and prerogatives. He was unquestionably the chief power in the witenagemót; but the laws were already promulgated, as in later times, as having been agreed to with the advice and consent of the witan. The witan also exercised jurisdiction as a supreme court. These ancient customs present further examples of the continuity of English constitutional forms.

The constitution of the witenagemót, however, was necessarily less popular than that of the local moots in the hundred or the shire. The king himself was generally present; and at his summons came prelates, abbots, ealdormen, the king's geasaths and thegns, officers of state and of the royal household, and leading tenants in chief of lands held from the crown. Crowds sometimes attended the meetings of the witan, and shouted their aclamations of approval or dissent; and, so far, the popular voice was associated with its deliberations; but it was at a distance from all but the inhabitants of the place in which it was assembled, and until a system of representation (q.v.) had slowly grown up there could be no further admission of the people to its deliberations. In the town-moot the whole body of freemen and cultivators of the folk-lands met freely under a spreading oak, or on the village green; in the hundred-moot, or shire-gemót, deputies from neighbouring communities could readily form a petty but all was changed in the wider council of a kingdom.

When the English kings were, in a good sense, hereditary, any general gathering of the Commons; and in the wider area of England such a gathering became impossible. Centuries were yet to pass before this obstacle was to be overcome by representation; but, in the meantime, the local institutions of the Anglo-Saxons were not without their influence upon the central council. The self-government of a free people informed the bishops, ealdormen, thegns and thegns who dwelt among them of their interests and needs, their sufferings and their wrongs; and, while the popular forces were increasing with an advancing society, they grew more powerful in the councils of their realm.

Another circumstance must not be overlooked in estimating the political influence of the people in Anglo-Saxon times. For five centuries the country was convulsed with incessant wars—wars with the Britons, whom the invaders were driving from their homes, wars between the several kingdoms, wars with the Welsh, wars with the Picts, wars with the Danes. How could the people continue to assert their civil rights amid the clash of arms and a frequent change of masters? The warrior-kings and their armed followers were rulers in the land which they had conquered. At the same time the unsettled condition of the country, repressed the social advancement of its people. Agriculture could not prosper when the farm of the husbandman too often became a battlefield. Trade could not be extended without security to property and industry. Under such conditions the great body of the people continued as peasants, handcraftsmen and slaves. The time had not yet come when they could make their voice heard in the councils of the state.

The Norman Conquest.—The Anglo-Saxon polity was suddenly overthrown by the Norman Conquest. A stern foreign king had seized the crown, and was prepared to rule his conquered realm by the sword. He brought with him the absolutist principles of continental rulers, and the advanced feudal system of France and Normandy. Feudalism had been slowly gaining ground under the Saxon kings, and now it was firmly established as a military organization. William the Conqueror at once rewarded his warlike barons and followers with enormous grants of land. The Saxon landowners and peasants were depopulated, and the invaders settled in their homesteads. The king claimed the broad lands of England as his own, by right of conquest; and when he allowed his warlike barons to share the spoil he attached the strict condition of military service in return for every grant of land. An effective army of occupation of all ranks was thus quartered upon every province throughout the realm. England was held by the sword; a foreign king, foreign nobles, and a foreign soldiery were in possession of the soil, and swore fealty to their master, from whom they held it. Saxons were usually dispossessed, and foreign prelates appointed to rule over the English Church. Instead of calling a national witenagemót, the king took counsel with the officers of his state and household, the bishops, abbots, earls, barons and knights by whom he was pleased to surround himself. Some of the forms of a national council were indeed maintained, and its counsel and consent were proclaimed in the making of laws; but, in truth, the king was absolute.

Such a revolution seemed fatal to the liberties and ancient customs of Saxon England. What power could withstand the harsh conqueror? But the indestructible elements of English society prevailed over the sword. The king grasped, in his own hands, the higher administration and judicature of the realm;
but he continued the old local courts of the hundred and the shire, which had been the basis of Saxon freedom. The Norman policy was otherwise destined to favour the liberties of the people, through agencies which had been designed to crush them. The powerful nobles, whom William and his successors exalted, became formidable rivals of the Crown itself; while ambitious barons were in their turn held in check by a jealous and exacting church. The ruling powers, if combined, would have reduced the people to slavery; but their divisions proved a continual source of weakness. In the meantime the strong rule of the Normans, bitter as it was to Englishmen, repressed intestine wars and the disorders of a divided realm. Civil justice was fairly administered. When the spoils of the conquerors had been secured, the rights of property were protected, industry and trade were left free, and the occupation of the soil by foreigners drove numbers of landowners and freemen into the towns, where they prospered as merchants, traders and artificers, and collected thriving populations of townsmen. Meanwhile, foreign rulers having brought England into closer relations with the Continent, its commerce was extended to distant lands, ports and shipping were encouraged, and English traders were at once enriched and enlightened. Hence new classes of society were growing, who were eventually to become the Commons of England.

The Crown, the Barons, the Church and the People.—While these social changes were steadily advancing, the barons were already preparing the way for the assertion of popular rights. Ambitious, turbulent and grasping, they were constantly at issue with the Crown. Enjoying vast estates and great commands, and sharing with the prelates the government of the state, as members of the king's council, they were ever ready to raise the standard of revolt. The king could always count upon barons faithful to his cause, but he also appealed for aid to the Church and the people. The baronage was thus broken by insurrections, and decimated by civil wars, while the value of popular alliances was revealed. The power of the people was ever increasing, while their oppressors were being struck down. The population of the country was still Saxon; they had been subdued, but had not been driven forth from the land, like the Britons in former invasions. The English language was still the common speech of the people; and Norman blood was being mingled with the broader stream of Saxon life. A continuous nationalism was thus preserved, and was outgrowing the foreign element.

The Crown was weakened by disputed successions and foreign wars, and the baronage by the blood-stained fields of civil warfare; while both in turn looked to the people in their troubles. Meanwhile the Church was struggling, alike against the Crown and the barons, in defence of its ecclesiastical privileges and temporal possessions. Its clergy were brought by their spiritual ministrations into close relations with the people, and their culture contributed to the intellectual growth of English society. When William Rufus was threatened by his armed barons he took counsel with Archbishop Lanfranc, and promised good laws and justice to the people. His promises were not fulfilled, and later charters, as lightly set aside, they were a recognition of the political rights of the people. By the charter of Henry I. restoring to the people the laws of Edward the Confessor, the continuity of English institutions was acknowledged; and this concession was also proclaimed through Archbishop Anselm, the church and the people being again associated with the Crown against the barons.

And throughout his reign the clergy and the English people were cordially united in support of the Crown. In the anarchic reign of Stephen—also distinguished by its futile charters—the clergy were driven into opposition to the king, while his oppressions alienated the people. Henry II. commenced his reign with another charter, which may be taken as a profession of good intentions on the part of the new king. So strong-willed a king, who could cripple his too powerful nobles, and forge shackles for the Church, was not predisposed to extend the liberties of his people; but they supported him loyally in his critical struggles; and his vigorous reforms in the administrative, judicial and financial organization of his realm promoted the prosperity and political influence of the Commons. At the same time the barons created in this and the two previous reigns, being no longer exclusively Norman in blood and connexion, associated themselves more readily with the interests and sympathies of the people. Under Richard I. the principle of representation was somewhat advanced, but it was confined to the assessment and collection of taxes in the different shires.

Magna Carta (q.v.).—It was under King John that the greatest progress was made in national liberties. The loss of Normandy served to draw the baronage closer to the English people; and the king soon united all the forces of the realm against him. He outraged the Church, the barons and the people. He could no longer play one class against another; and they combined to extort the Great Charter of their liberties at Runnymede (1215). It was there ordained that no scutage or aid, except the three regular feudal aids, should be imposed, save by the common council of the realm. To this council the archbishops, bishops, abbots, earls and greater barons were to be summoned personally by the king's letters, and tenants in chief by a general writ through the sheriff. The summons was required to appoint a certain place, to give 40 days' notice at least, and to state the cause of meeting. At length we seem to reach some approach to modern usage.

Growth of the Commons.—The improved administration of successive kings had tended to enlarge the powers of the Crown. But one hundred and fifty years had now passed since the Conquest, and great advances had been made in the condition of the people, and more particularly in the population, wealth and self-government of towns. Many had obtained royal charters, elected their own magistrates, and enjoyed various commercial privileges. They were already a power in the state, which was soon to be more distinctly recognized.

The charter of King John was again promulgated under Henry III., for the sake of a subsidy; and henceforth the Commons learned to insist upon the redress of grievances in return for a grant of money. This reign was memorable in the history of parliament. Again the king was in conflict with his barons, who rebelled against his gross misgovernment of the realm. Simon de Montfort, earl of Leicester, was a patriot in advance of his age and fought for the English people as well as for his own order. The barons, indeed, were doubtful allies of the people, and a monarch must be more than a prince to have the people for him. But the towns, the clergy, the universities and large bodies of the commonalty rallied round him, and he overthrew the king and his followers at Lewes. He was now master of the realm, and proclaimed a new constitution. Kings had made promises, and granted illusory charters; but the rebel earl called an English parliament (1265) into being. Churchmen were on his side, and a few barons; but his main reliance was upon the Commons. He summoned to a national council, or parliament, bishops, abbots, earls and barons, together with two knights from every shire and two burgesses from every borough. Knights had been summoned by the king to his court; but now the Commons decided that the counties should elect their representatives. Parliament was thus born.

In the reign of Edward I. parliament assumed substantially its present form of king, lords and commons. The irregular and unauthorized scheme of Simon de Montfort was fully adopted; and in 1295 the king summoned to a parliament two knights from each shire by royal writ. A war was going on in Gascony, and the king wanted money. He called the barons and asked if they would provide the necessary funds. The barons said that unfortunately the minor gentry were exceedingly unwilling to contribute, and the king sent to ask that two knights from each shire might be sent up to consult with him. In the result, the Commons refused to grant a subsidy, and the king had to fall back on the Church; but though the summoning of the knights of the shire was in form a small change from the previous practice of sending some members of the county to the king, the innovation is important as the first occasion on which their representatives met in a central assembly. —[H. Ch.]
every shire chosen by the freeholders at the shire court, and two burgesses from every city, borough and leading town. The rebel earl had enlarged the basis of the national council; and, to secure popular support, the petitioning was accepted; it was confirmed in the next year. To the knights and freeholders had increased in numbers and wealth; and the towns, continually advancing in population, trade and commerce, had become valuable contributors to the revenue of the state. The grant of subsidies to the Crown, by the assembled baronage and representatives of the shires and towns, was a legal and comprehensive impost upon the entire realm.

**Scession of the Clergy.**—It formed part of Edward's policy to embrace the clergy in his scheme for the representation of all orders and classes of his subjects. They were summoned to attend the parliament of 1295 and, by a leading part of their number, the churchmen have been continued until the present time; but the clergy resolutely held aloof from the national council, and insisted upon voting their subsidies in their own convocations of Canterbury and York. The bishops retained their high place among the earls and barons, and the clergy sacrificed to ecclesiastical jealousies the privilege of sharing in the political councils of the state. As yet, indeed, this privilege seemed little more than the voting of subsidies, but it was soon to embrace the redress of grievances and the framing of laws for the general welfare of the realm. This greater power was, as I have said, and the churchmen might reasonably suppose, to be held in the interest of the Church, and in the legislation of their country? They could not have withheld the Reformation; they would have been forced to yield to the power of the Crown and the heated resolution of the laity; but they might have saved a large share of the endowments of the Church, and perhaps have modified the doctrines and formularies of the reformed establishment.

**Reluctance of the Commons to Attend.**—Meanwhile the Commons, unconscious of their future power, took their humble place in the great council of the realm. The knights of the shires, the leading landowners and some of the smaller barons, could sit beside the magnates of the land without constraint; but modest traders from the towns were overawed by the power and dignity of their new associates. They knew that they were summoned for no other purpose than the taxing of themselves and their fellow townsmen; their attendance was irksome; it interrupted their own business; and their journeys exposed them to many hardships and dangers. It is not surprising that they should have shrunk from the exercise of so doubtful a privilege. Considerable numbers absent themselves from a thankless service; and their constituents, far from exacting the attendance of all, condemned those who, in modern times, begugged the small stipend of 2s. a day, paid to their representatives while on duty, and strove to evade the burden imposed upon them by the Crown. Some even purchased charters, withdrawing franchises which they had not yet learned to value. Nor, in truth, did the representation of towns at this period afford much protection to the rights and interests of the people. Towns were enfranchised at the will or caprice of the Crown and the sheriffs; they could be excluded at pleasure; and the least show of independence would be followed by the omission of another writ of

1 It now appears that substantially this was effected as early as 1275. The transition period between Simon de Montfort's parliament of 1265 and the "model parliament" of 1295 was long a puzzle to historical students, since, except for two provincial councils in 1285, no trace was found in the records, between 1265 and 1295, of the representation—of cities or boroughs, or of representation of the counties between 1275 and 1290. But in 1910 Mr. C. Hilary Jenkinson (see English Historical Review, for April) found in the Record Office some old documents which proved to be the beginning of the royal writs and other returns of members for the Easter parliament of 1275. They make it certain that knights of the shire were then present, and that burgesses and citizens were summoned (not as in 1264 through the mayors, but as since 1295 through the sheriffs). The importance of the 1295 parliament thus appears to be smaller in English constitutional history, the full returns appearing to have been adopted 20 years earlier. It is noteworthy, however, that in the writs of 1275 the instruction to the sheriff is "venire facias," not "eligi facias."—[H. Ch.]

summons. But the principle of representation (q.v.), once established, was to be developed with the expansion of society; and the despised burgesses of Edward I., not having seceded, like the freemen, were destined to become a potential class in the parliaments of England.

**Sitting of Parliament at Westminster.**—Another constitutional change during this reign was the summoning of parliament to Westminster instead of to various towns in different parts of the country. This custom invested parliament with the character of a settled institution, and constituted it a high court for the hearing of petitions and the redress of grievances. The growth of its jurisdiction, as a court of appeal, was also favoured by the fixity of its place of meeting.

**Authority of Parliament recognized by Law.**—Great was the power of the Crown, and the king himself was bold and statesmanlike; but the union of classes against him proved too strong for prerogative. In 1297, having outraged the Church, the barons, and the Commons, by illegal exactions, he was forced to confirm the Great Charter and the Charter of Forests, with further securities against the taxation of the people without their consent and, in return, obtained timely subsidies from the parliament. Henceforth the financial necessities of a succession of kings ensured the frequent assembling of parliaments. Nor were they long contented with the humble function of voting subsidies, but boldly insisted on the redress of grievances and further securities for national liberties. In 1322 it was declared by statute 15 Edw. II. that "the matters to be established for the estate of the king and of his heirs, and for the estate of the realm and of the people, should be treated, according and established in parliament, by the king, and by the assent of the prelates, earls and barons, and the commonality of the realm, according as had been before accustomed." The constitutional powers of parliament as a legislature were here amply recognized—not by royal charter, or by the occasional exercise of prerogative, but by an authoritative statute. And these powers were soon to be exercised in a striking form. Already parliament had established the principle that the redress of grievances should have precedence of the grant of subsidies; it had maintained the right of approving councillors of the Crown, and punishing them for the abuse of their powers; and in 1277 the king himself was finally deposed, and the succession of his son, Edward III., declared by parliament.

**Union of Knights of the Shire and Burgesses.**—At this period the constitution of parliament was also settling down to its later and permanent shape. Hitherto the different orders or estates had deliberated separately, and agreed upon their several grants to the Crown. The knights of the shire were naturally drawn, by social ties and class interests, into alliance with the barons; but at length they joined the citizens and burgesses, and in the first parliament of Edward III. they are found sitting together as "the Commons.

This may be taken as the turning point in the political history of England. If all the landowners of the country had become united as an order of nobles, they might have proved too strong for the development of national liberties, while the union of the country gentlemen with the burgesses formed an estate of the realm which was destined to prevail over all other powers. The withdrawal of the clergy, who would probably have been led by the bishops to take part with themselves and the barons, further strengthened the united Commons.

**Increasing Influence of Parliament.**—The reign of Edward III. witnessed further advances in the authority of parliament, and changes in its constitution. The king, being in continual need of subsidies, was forced to summon parliament every year, and in order to encourage its liberality he frequently sought its advice upon the most important issues of peace or war, and its consent to the levying of new taxes. The Commons praying for the redress of grievances. During this reign also, the advice and consent of the Commons, as well as of the Lords spiritual and temporal, was regularly recorded in the enacting part of every statute.
Separation of the Two Houses.—But a more important event is to be assigned to this reign,—the formal separation of parliament into the two houses of Lords and Commons. There is no evidence—nor is it probable—that the different estates ever voted together as a single assembly. It appears from the rolls of parliament that in the early part of this reign, the causes of summons having been declared to the assembled estates, the three estates deliberated separately, but afterwards delivered a collective answer to the king. While their deliberations were short they could be conducted apart, in the same chamber; but, in course of time, it was found convenient for the Commons to have a chamber of their own, and they adjourned their sittings to the chapter-house of the abbey of Westminster, where they continued to be held after the more formal and populous sessions of the Lords. The date of this event is generally assigned to the 17th Edward III.

The Commons as Petitioners.—Parliament had now assumed its present outward form. But it was far from enjoying the authority which it acquired in later times. The Crown was still paramount; the small body of earls and barons—not exceeding 40—were connected with the royal family, or in the service of the king, or under his influence; the prelates, once distinguished by their independence, were now seekers of royal favour; and the Commons, though often able to extort concessions in return for their contributions to the royal exchequer, as yet held inferior position among the estates of the realm. Instead of enjoying an equal share in the framing of laws, they appeared before the king in the humble guise of petitioners. Their petitions, together with the king's answers, were recorded in the rolls of parliament; but it was not until the parliament had been discharged from attendance that statutes were framed by the judges and entered on the statute rolls. Under such conditions legislation was, in truth, the prerogative of the Crown rather than of parliament. Enactments were often found in the statutes at variance with the petitions and royal answers, and neither prayed for by the Commons nor assented to by the Lords. In vain the Commons protested against so grave an abuse of royal authority; but the same practice was continued during this and succeeding reigns. Henry V., in the second year of his reign, promised "that nothing should be enacted to the petitions of the Commons, contrary to their asking, whereby they should be bound without their assent;" but, so long as the old method of framing laws was adhered to, there could be no security against abuse; and it was not until the reign of Henry VI. that the introduction of the more regular system of legislating by bill and statute ensured the thorough agreement of all the estates in the several provisions of every statute.

Influence of the Commons.—The Commons, however, notwithstanding these and other discouragements, were constantly growing bolder in the assertion of their rights. They now ventured to brave the displeasure of the king, without seeking to shelter themselves behind powerful barons, upon whose forwardness in the national cause they could not reckon. Notably in 1376 their stout Speaker, Peter de la Mare, inveighed, in their name, against the gross mismanagement of the war, impeached ministers of the realm, complained of the heavy burdens under which the people suffered, and even demanded that a true account should be rendered of the public expenditure. The brave Speaker was cast into prison, and a new parliament was summoned which speedily reversed the resolutions of the last. But the death of the king changed the aspect of affairs. Another parliament was called, when it was found that the spirit of the Commons was not subdued. Peter de la Mare was released from prison, and again elected to the chair. The demands of the former parliament were reiterated with greater boldness and persistence, the evil councillors of the late reign were driven out, and it was conceded that the principal officers of state should be appointed and removed, during the minority of Richard II., upon the advice of the lords. The Commons also insisted upon the annual assembling of parliament under the stringent provisions of a binding law. They claimed the right, not only of voting subsidies, but of appropriating them, and of examining public accounts. They inquired into public abuses, and impeached ministers of the Crown. Even the king himself was deposed by the parliament. Thus during this reign all the great powers of parliament were asserted and exercised. The foreign wars of Henry IV., and Henry V., by continuing the financial necessities of the Crown, maintained for a while the powers which parliament had acquired by the struggles of centuries.

Relapse of Parliamentary Influence.—But a period of civil wars and disputed successions was now at hand, which checked the further development of parliamentary liberties. The effective power of a political institution is determined, not by assertions of authority, nor even by its legal recognition, but by the external forces by which it is supported, controlled or overthrown. With the close of the War of the Roses the life of parliament seems to have well-nigh expired.

To this constitutional relapse various causes contributed at the same period. The Crown had recovered its absolute supremacy. The powerful baronage had been decimated on the battlefield and the scaffold; and vast estates had been confiscated to the Crown. Kings had no longer any dread of their prowess as defenders of their own order or party, or as leaders of the people. The royal treasury had been enriched by their ruin; while the close of a long succession of wars with France and Scotland had relieved it of that continual drain which had reduced the Crown to an unwelcome dependence upon parliament. Not only were the fortunes of the baronage laid low, but feudalism was also dying out in England as on the continent. It was no longer a force which could control the Crown; and it was being further weakened by changes in the art of war. The mailed horseman, the battle-ax and cross-bow of the burger and yeoman, could not cope with the cannon and arquebus of the royal army.

In earlier times the Church had often stood forth against the domination of kings, but now it was in passive submission to the Throne. The prelates were attracted to the court, and sought the highest dignities and preferment which had long been losing their influence over the laity by their ignorance and want of moral elevation at a period of increasing enlightenment; while the Church at large was weakened by schisms and a wider freedom of thought. Hence the Church, like the baronage, had ceased to be a check upon the Crown.

Meanwhile what had become of the ever-growing power of the Commons? It is true they had lost their stalwart leaders, the armed barons and outspoken prelates, but they had themselves advanced in numbers, riches and enlightenment; they had overspread the land as knights and freetholders, or dwelt in hundreds, boroughs and manors, and disposed their property by merchandise. Why could they not find leaders of their own? Because they had lost the liberal franchises of an early age. All freetholders, or suitors present at the county court, were formerly entitled to vote for a knight of the shire; but in the eighth year of Henry VI. (1430) an act was passed (c. 37) by which this right was confined to 40s. freetholders, resident in the county. Large numbers of electors were thus disfranchised. In the view of parliament they were "of no value," and complaints had been made that they were under the influence of the nobles and greater landowners; but a popular element had been withdrawn from the county representation, and the restricted franchise cannot have impaired the influence of the nobles.

As for the cities and boroughs, they had virtually renounced their electoral privileges. As we have seen, they had never valued them very highly; and now by royal charters, or by the usurpation of small self-elected bodies of burgesses, the choice of members had fallen into the hands of town councils and neighbouring landowners. The anomalous system of close and nomination boroughs, which had arisen thus early in English history, was suffered to continue without a check for four centuries, as a notorious blot upon a free constitution.

But the changes excited the prerogatives of the Crown. Amid the clash of arms and the strife of hostile parties the voice of parliament had been stilled; and, when peace was restored, a...
powerful king could dispense with an assembly which might prove troublesome, and from whom he rarely needed help. Hence for a period of two hundred years, from the reign of Henry VI. to that of Elizabeth, the free parliaments of England were in abeyance. The institution retained its form and constituent parts; its rights and privileges were theoretically recognized, but its freedom and national character were little more than nominal.

The Three Estates of the Realm.—This check in the fortunes of parliament afforded a fitting occasion for examining the composition of each of the three estates of the realm.

Under the Norman Conquest, the archbishops and bishops had held an eminent position in the councils of Saxon and Norman kings, and many priors and abbots were from time to time associated with them as lords spiritual, until the suppression of the monasteries by Henry VIII. The dean or archdeacon of their borough, the temporal peers, who sat with them in the same assembly.

The lords temporal comprised several dignities. Of these the baron, though now the lowest in rank, was the most ancient. The title was familiar in Saxon times, but it was not until after the Norman Conquest that it was invested with a distinct feudal dignity. Next in antiquity was the earl, whose official title was known to Danes and Saxons, and who after the Conquest obtained a dignity equivalent to that of count in foreign states. The highest dignity, that of duke, was not created until Edward III., conferred it upon Richard, Duke of York. Hence the rank of earl was first created by Richard II., with precedence after a duke. It was in the reign of Henry VI., that the rank of viscount was created, to be placed between the earl and the baron. Thus the peerages have a double descent, namely, baron, viscount and baron. During the 15th century the number of temporal peers summoned to parliament rarely exceeded fifty, and no more than twenty-nine received writs of summons to the first parliament of Henry VI. There were only fifty-nine at the death of Queen Elizabeth. At the accession of William III. this number had been increased to about one hundred and fifty.

The lords spiritual were, in general, hereditary titles, and the peerages are alike distinguished by the hereditary character of their dignities. Some life peerages, indeed, were created between the reigns of Richard II. and Henry VI., and several ladies had received life peerages between the latter and the reign of Edward IV. The recognition of a high prelate by the king of France had also held that the creation of life peerages was within the prerogative of the Crown. But four hundred years had elapsed since the creation of a life peer, entitled to sit in parliament, when Queen Victoria was advised to create Sir James Parker, an eminent judge, a baron for life, under the title of Lord Wensleydale. The object of this deviation from the accustomed practice was to strengthen the judicature of the House of Lords, without unduly enlarging the numbers of the peerage. But the Lords at once took exception to this act of the Crown, and, holding that a prerogative so long disused could not be revived, in derogation of the hereditary character of other titles, refused to recognize this new creation. Lord Wensleydale was not entitled by his letters patent and writ of summons to sit and vote in parliament. His lordship accordingly received a new patent, and took his seat as an hereditary peer. But the necessity of some provision to provide against future interference with the House of Lords could not be contested; and in 1876 three lords of appeal in ordinary were constituted by statute, enjoying the rank of baron for life, and the right of sitting and voting in the House of Lords so long as they continue in office.

The Commons.—The Commons formed a more numerous body. In the reign of Edward III., there were about 275 members, in that of Edward IV., 250, and in that of Henry VI., 300. In the reign of Henry VIII., parliament added 27 members for Wales and four for the county and city of Chester, and in the reign of Charles I. 4 for the county and city of Durham. Between the reigns of Henry VIII. and Charles I. 150 members were also added by royal charter.

Parliament under Henry VIII.—To resume the history of parliament at a later period, let us glance at the reign of Henry VIII. Never had the power of the Crown been greater than when this king succeeded to the throne, and never had a more imperious will been displayed by any king of England. Parliament was employed to fulfill his projects and their considera-
tion enormously increased his power. He had become a pope to the bishops; the old nobles who had resisted his will had perished in the field or on the scaffold; the new nobles were his creatures; and he had the vast wealth of the Church in his hands as largesses to his adherents. Such was the dependence of parliament upon the Crown and its advisers during the Reformation period that in less than thirty years four vital changes were decreed in the national faith. Each of the successive reigns inaugurated a new religion.

Queen Elizabeth and her Parliaments.—With the reign of Elizabeth commenced a new era in the life of parliament. She had received the royal prerogatives unimpaired, and her hand was strong enough to wield them. But in the long interval since Edward IV. the entire framework of English society had been changed; it was a new England that the queen was called upon to rule. The composition of the House of Commons was altered by English country gentlemen, beyond the influence of the court, and identified with all the interests and sympathies of their country neighbours. From this class were chosen nearly all the knights of the shire, and a considerable proportion of the members for cities and boroughs. They were generally distinguished by a mainl y independence, and were prepared to uphold the rights and privileges of parliament and the interests of their constituents. A change no less remarkable had occurred in other classes of society. The country was peopled with yeomen and farmers, far superior to the cultivators of the soil in feudal times; and the towns and seaports had grown into important centres of commerce and manufactures. Advances to the less striking had been made in the enlightenment and cultivation of the society. But, above all, recent religious revolutions had awakened a spirit of thought and inquiry by no means confined to questions of faith. The Puritans, hostile to the Church, and jealous of every semblance of Catholic revival, were embittered against the state, which was identified, in their eyes, with many ecclesiastical enormities; and stubborn temper was destined to become a strong motive force in restoring the authority of parliament.

The parliaments of Elizabeth, though rarely summoned, displayed an unwholesome spirit. They discussed the successions to the Crown, the marriage of the queen, and ecclesiastical abuses; they upheld the privileges of the Commons and their right to advise the Crown upon all matters of state; and they condemned the grant of monopolies. The bold words of the Wentworths and Yelvertons were such as had not been heard before in parliament. The conflicts between Elizabeth and the Commons marked the revival of the independence of parliament, and foreshadowed graver troubles at a different period.

Conflicts of James I. with the Commons.—James I., with short-sighted pedantry, provoked a succession of conflicts with the Commons, in which abuses of prerogative were stoutly resisted and the rights and privileges of parliament resolutely asserted. The "remonstrance" of 1610 and the "protestation" of 1621 would have taught a politic ruler that the Commons could no longer be trifled with; but those lessons were lost upon James and upon his ill-fated son.

Charles I. and the Commonwealth.—The momentous struggles between Charles I. and his parliaments could not be followed in this place. The earlier parliaments of this reign fairly represented the earnest and temperate judgment of the country. They were determined to obtain the redress of grievances and to restrain undue prerogatives; but there was no taint of disloyalty to the Crown; there were no dreams of revolution. But the contest at length became embittered, until there was no issue but the arbitration of the sword. The period of the Great Rebellion and the Commonwealth proved the supreme power of the Commons, when supported by popular forces. Everything gave way before them. They raised victorious armies in the field, they overthrew the Church and the House of Lords, and they brought the king himself to the scaffold. It also displayed the impotence of a parliament which has lost the support of the people by mobs, by an army, or by the strong will of a dictator.

Political Agitation of this Period.—It is to this time of fierce political passions that we trace the origin of political agitation as an organized method of influencing the deliberations of parliament. The whole country was then aroused by passionate exhortations from the pulpit and in the press. No less than thirty thousand political tracts and newspapers during this period have been preserved. Petitions to parliament were multiplied in order to strengthen the hands of the popular leaders. Glamorous meetings were held to stimulate or overawe
parliament. Such methods, restrained after the Restoration, have been revived in later times, and now form part of the acknowledged system of parliamentary government.

**Parliament after the Restoration.**—On the restoration of Charles II. parliament was at once restored to its old constitution, and its sittings were revived as if they had suffered no interruption. No outward change had been effected by the late revolution; but that a stronger spirit of resistance to abuses of prerogative had been aroused was soon to be disclosed in the deposition of James II. and the "glorious revolution" of 1688. At this time the full rights of parliament were explicitly declared, and securities taken for the maintenance of public liberties. The theory of a constitutional monarchy and a free parliament was established; but after two revolutions it is curious to observe the indirect methods by which the Commons were henceforth kept in subjection to the Crown and the territorial aristocracy. The representation had long become an illusion. The knights of the shire were the nominees of nobles and great landowners; the borough members were returned by the Crown, by noble patrons or close corporations; even the representation of cities, with greater pretensions to independence, was controlled by bribery. Nor were rulers content with their control of the representation, but, after the Revolution, the infamous system of bribing the members themselves became a recognized instrument of administration. The country gentlemen were not less attached to the principles of rational liberty than their fathers, and would have resisted further encroachments of prerogatives; but they were satisfied with the Revolution settlement and the remedial laws of William III., and no new issue had yet arisen to awaken opposition. Accordingly, they ranged themselves with one or other of the political parties into which parliament was now beginning to be divided, and bore their part in the more measured strife of the 18th century. From the Revolution till the reign of George III. the effective power of the state was wielded by the Crown, the Church and the territorial aristocracy; but the influence of public opinion since the stirring events of the 17th century had greatly increased. Both parties were constrained to defer to it; and, notwithstanding the flagrant defects in the representation, parliament generally kept itself in accord with the general sentiments of the country.

**Union of Scotland.**—On the union of Scotland in 1707 important changes were made in the constitution of parliament. The House of Lords was reinforced by the addition of sixteen peers, representing the peerage of Scotland, and elected every parliament, and the Scottish peers, the free use of the right of petition, and a turbulent spirit among the people seriously changed the relations of parliament to the country. And the publication of debates, which was fully established in 1771, at once increased the direct responsibility of parliament to the people, and ultimately brought about other results, to which we shall presently advert.

**Union of Ireland.**—In this reign another important change was effected in the constitution of parliament. Upon the union with Ireland, in 1801, four Irish bishops were added to the lords spiritual, who sat by rotation of sessions, and represented the episcopal body of the Church of Ireland. But those bishops were deprived of their seats in parliament in 1809, on the disestablishment of the Church of Ireland. Twenty-eight representative peers, elected for life by the peerage of Ireland, were admitted to the House of Lords. All the Irish peers were also entitled to the privilege of peerage. In two particulars the Irish peerage was treated in a different manner from the peerage of Scotland. The Crown was empowered to create a new Irish peerage whenever three Irish peerages in existence at the time of the Union have become extinct, or when the number of Irish peers, exclusive of those holding peerages of the United Kingdom, has been reduced to one hundred. And, further, Irish peers were permitted to sit in the House of Commons for any place in Great Britain, forfeiting, however, the privilege of peerage while sitting in the lower house.

At the same time one hundred representatives of Ireland were added to the House of Commons. This addition raised the number of members to six hundred and fifty-eight. Parliament now became the parliament of the United Kingdom.

**Schemes for Improving the Representation.**—By the union of Scotland and Ireland the electoral abuses of those countries were combined with those of England. Notwithstanding a defective representation, however, parliament generally sustained its position as fairly embodying the political sentiments of its time. Public opinion had been awakened, and could not safely be ignored by any party in the state. Under a narrow and corrupt electoral system the ablest men in the country found entrance into the House of Commons; and their rivalry and ambition ensured the acceptance of popular principles and the passing of many remedial measures. As society expanded, and new classes were called into existence, the pressure of public opinion upon the legislature was assuming a more decisive character. The grave defects of the representation were notorious, and some minor electoral abuses had been from time to time corrected. But the fundamental evils—nomination boroughs, limited rights of election, the sale of seats in parliament, the prevalence of bribery, and the enormous expense of elections—though constantly exposed, long held their ground against all assailants. So far back as 1770 Lord Chatham had denounced these flagrant abuses. "Before the end of this century," he said, "either the parliament will reform itself from within, or be reformed with a vengeance from without." In 1782, and again in 1783 and 1785, his distinguished son, William Pitt, condemned the abuses of the representation, and proposed schemes of parliamentary reform. In 1793 Mr Grey (afterwards Earl Grey) submitted a motion on the same subject: but the excesses of the French Revolution, political troubles at home, and exhausting wars abroad discouraged the supporters of reform for many years. Under more favourable conditions the question assumed greater proportions. Lord John Russell especially distinguished himself in 1820, and in several succeeding years, by the able exposure of abuses and by temperate schemes of reform. His efforts were assisted by the scandalous disclosures of bribery at Grampound, Penryn and East Retford. All moderate proposals were rejected; but the concurrence of a dissolution, on the death of George IV., with the French Revolution in 1830, and an ill-timed declaration of the duke of Wellington that the representation was perfect and could not be improved, suddenly precipitated the memorable crisis of parliamentary reform. It now fell to the lot of Earl Grey, as premier, to be the leader in a cause which he had espoused in his early youth.

**The Reform Acts of 1832.**—The result of the memorable struggle which ensued may be briefly told. By the Reform Acts of 1832 the representation of the United Kingdom was reconstructed. In England, fifty-six nomination boroughs returning one hundred and eleven members were disfranchised; thirty boroughs were each deprived of one member, and Weymouth and Melcombe Regis, which had returned four members, were now reduced to two. Means were thus found for the enfranchisement of populous places. Twenty-two large towns, including metropolitan districts, became entitled to return two members, and twenty less considerable towns acquired the right of returning one member each. The number of county members was increased from ninety-four to one hundred and fifty-nine, the larger counties being divided for the purposes of representation.
The elective franchise was also placed upon a new basis. In the boroughs a £10 household suffrage was substituted for the narrow and unequal franchises which had sprung up—the rights of freemen, in corporate towns, being alone respected. In the counties, copyholders and leaseholders for terms of years, and tenants at will paying a rent of £50 a year, were added to the list of freemen.

By the Scottish Reform Act the number of members representing Scotland was increased from forty-five, as arranged at the union, to fifty-three, of whom thirty were assigned to counties and twenty-three to cities and burghs. In counties the franchise was conferred upon owners of property of £50 a year, and certain classes of leaseholders; in burghs, upon £10 householders, as in England.

By the Irish Reform Act, no boroughs, however small, were disfranchised; but the franchise was given to £10 householders, and county constituencies were enlarged. These franchises, however, were extended in 1860, when an £8 household suffrage was given to the boroughs, and additions were made to the county franchises. The hundred members assigned to that country at the union were increased to one hundred and five. Notwithstanding these various changes, however, the total number of the House of Commons was still maintained at six hundred and fifty-eight.

The legislature was now brought into closer relations with the people, and became more sensitive to the pressure of popular forces. The immediate effects of this new spirit were perceptible in the increased legislative activity of the reformed parliament, its vigorous grappling with old abuses, and its preference of the public welfare to the narrower interests of classes. But, signal as was the regeneration of parliament, several electoral evils still needed correction. Strenuous efforts were made, with indifferent success, to overcome bribery and corruption, and proposals were often ineffectually made to restrain the undue influence of landlords and employers of labour by the ballot; improvements were made in the registration and polling of electors, and the property qualification of members was abolished. Complaints were also urged that the middle classes had been admitted to power, while the working classes were excluded from the late scheme of enfranchisement. It was not till 1867 however that any substantial advance was made.

**Increased Power of the Commons.**—Prior to the reign of Charles I, the condition of society had been such as naturally to subordinate the Commons to the Crown and the Lords. After the Revolution of 1688 society had so far advanced that, under a free representation, the Commons might have striven with both upon equal terms. But, as by far the greater part of the representation was in the hands of the king and the territorial nobles, the large constitutional powers of the Commons were held safely in check. After 1832, when the representation became a reality, a corresponding authority was asserted by the Commons. For several years, indeed, by reason of the weakness of the Liberal party, the Lords were able successfully to resist the Commons upon many important occasions; but it was soon acknowledged that they must yield whenever a decisive majority of the Commons, supported by public opinion, insisted upon the passing of any measure, however repugnant to the sentiments of the upper house. And it became a political axiom that the Commons alone determined the fate of ministries.

**Later Measures of Reform.**—In 1824, and again in 1824, Lord John Russell introduced measures of parliamentary reform; but constitutional changes were discouraged by the Crimean War. In 1850 Lord Derby’s Conservative government proposed another scheme of reform, which was defeated; and in 1860 Lord John Russell brought in another bill, which was not proceeded with; and the question of reform continued in abeyance until after the death of Lord Palmerston. Earl Russell, who succeeded him as premier, was prompt to redeem former pledges, and hastened to submit to a new parliament, in 1866, another scheme of reform. This measure, and the ministry by whom it was promoted, were overthrown by a combination of the Conservative opposition and the memorable “cave” of members of the Liberal party. But the popular sentiment in favour of reform, which had for some years been inert, was suddenly aroused by the defeat of a Liberal ministry and the triumph of the party opposed to reform. Lord Derby and his colleagues were now constrained to undertake the settlement of this embarrassing question; and by a strange concurrence of political events and party tactics, far more democratic than that of the Liberal government was accepted by the same parliament, under the auspices of a Conservative ministry.

**The Reform Acts of 1867–1868.**—By the English Reform Act of 1867 four corrupt boroughs were disfranchised, and thirty-eight boroughs returning two members were henceforth to return only one. A third member was given to Manchester, Liverpool, Birmingham and Leeds; a second member to Merthyr Tydfil and Saltford; the Tower Hamlets were divided into two boroughs, each returning two members; and ten new boroughs were created, returning one member each, with the exception of Chelsea, to which two were assigned. By these changes twenty-six seats were taken from boroughs, while a member was given to the university of London. But before this act came into operation seven other English boroughs were disfranchised by the Scottish Reform Act of 1868, these seats being given to Scotland. Thirteen new divisions of counties were erected, to which twenty-five members were assigned. In counties the franchise of copyholders and leaseholders was reduced from £10 to £5, and the occupation franchise from £50 to £12. In boroughs the franchise was extended to all occupiers of dwelling-houses rated to the poor-rates, and to lodgers occupying lodgings of the annual value of £10 unfurnished.

By the Scottish Reform Act of 1868, the number of members representing Scotland was increased from fifty-three to sixty—three new members being given to the shires, two to the universities, and two to cities and burghs. The county franchise was extended to owners of lands and heritages of £5 yearly value, and to occupiers of the rateable value of £14; and the borough franchise to all occupiers of dwelling-houses paying rates, and to tenants of lodgings of £10 annual value unfurnished.

By the Irish Reform Act of 1869 no change was made in the number of members nor in the distribution of seats; but the boroughs of Sligo and Cashel, already disfranchised, were still left without representation. The county franchise was left unchanged; but the borough franchise was extended to occupiers of houses rated at £4, and of lodgings of the annual value of £10 unfurnished.

That these changes in the representation—especially the household suffrage in boroughs—were a notable advance upon the reforms of 1832, in the direction of democracy, cannot be questioned. The enlarged constituencies speedily overthrew the ministry to whom these measures were due; and the new parliament further extended the recent scheme of reform by granting to electors the protection of the ballot (q.v.), for which advanced reformers had contended since 1832. Nor was the existing representation long suffered to continue without question. First, it was proposed, in 1872, to extend the household franchise to counties, and this proposal found favour in the country and in the House of Commons; but, the Conservative party having been restored to power in 1874, no measure of that character could be promoted with any prospect of success. At the dissolution of 1885 a more general revision of the representation was expected; but the members of the Liberal party, who were soon restored to power.

(T. E. M.; H. Ch.)

**Acts of 1884–1885.**—The Reform Act of 1884 was ultimately carried with the goodwill of both of the great political parties. The Conservatives resisted Mr Gladstone’s attempt to carry a great extension of the franchise before he had disclosed his scheme of redistribution, and the bill was thrown out by the House of Lords in August 1884. But after a conference of Mr Gladstone with Lord Salisbury, to whom the whole scheme
was confided, an agreement was reached, and the bill was passed in the autumn session. In the following session (1885) the Redistribution Act was passed.

A uniform household and lodger franchise was established in counties and boroughs. If a dwelling was held as part payment for service, the occupier was not deprived of his vote because his home was the property of his master. The obligation was thrown on the overseers of ascertaining whether any other man besides the owner was entitled to be registered as an inhabitant occupier, and the owner was bound to supply the overseers with information. The Registration Acts were otherwise widely amended. Polling-places were multiplied, so that little time need be lost in recording a vote. These and other bills when the regency of the prince was voted a grant of a vote to every one who had a decent home. By the Redistribution of Seats Act 1885 all boroughs with less than 15,000 inhabitants ceased to return a member. These small towns were merged into their counties, and the counties were subdivided into a great number of single-member constituencies, so that the inhabitants of the disfranchised boroughs voted for the member for the division of the county in which they were situated. Boroughs with less than 50,000 inhabitants returning two members were in future to return only one, and towns of over 100,000 were divided into separate constituencies, and received additional members in proportion to their population. The members for the City of London were reduced to two, but Greater London, including Croydon, returned sixty, Divided Liverpool returned nine, Glasgow seven, Edinburgh, Dublin and Belfast each four, and so on. Six additional seats were given to England and twelve to Scotland, so that, allowing for a diminution by disfranchisement for corruption, the numbers of the House of Commons were raised to 670 members.

Results of Reform since 1832.—From a constitutional standpoint it is important to recognize the results of the successive Reform Acts on the working of parliament as regards the position of the office in which it was placed, and the electorate of which it was formed. Before 1832 the functions of ministers were entirely administrative, and parliament was able to deal much as it pleased with their rare legislative proposals without thereby depriving them of office. Moreover, since before that date ministers were, generally speaking, in fact as well as in theory appointed by the king, while the general confidence of the majority in the House of Commons followed the confidence not so much of the electorate as of the Crown, that house was able on occasions to exercise an effective control over foreign policy. Pitt, after 1784, was defeated several times on foreign and domestic issues, yet his resignation was neither expected nor desired by ministers. Pitt's departure was not accompanied by any diminution of influence. Thus appeared probable, and again in 1812, it was generally assumed that it would be in his power to dismiss his father's ministers and to maintain the Whigs in office without dissolving parliament. This system, while it gave to ministers security of tenure, left much effective freedom of action to the House of Commons. But the Reform Act of 1832 introduced a new order of things. In 1835 the result of a general election was for the first time the direct cause of a change of ministry, and in 1841 a House of Commons was elected for the express purpose of bringing a particular statesman into power. The electorate voted for Sir Robert Peel, and it would have been as impossible for the house then elected to deny him their support as it would be for the college of electors in the United States to exercise their private judgment in the selection of a president. As time went on, and the party system became more closely organized in the enlarged electorate, the voting power throughout the country came to exercise an increasing influence. The premier was now a party leader who derived his power in reality neither from the Crown nor from parliament, but from the electorate, and to the electorate he could appeal if deserted by his parliamentary majority. Unless it was prepared to drive him from the office in which he had placed himself as a long <!--p-->
he proposed to add other men who had achieved distinction in a public career. He attached a high importance to the existence of a second chamber. His motion was negatived by 97 votes against 50. On the 26th of April Lord Dunraven withdrew a bill for the reform of the House of Lords on the promise of the government to deal with the matter, and on the 18th of June Lord Salisbury fulfilled this pledge. He introduced a bill on that day to provide for the creation of a limited number of life peers and for the exclusion of unworthy members from the house. Under this measure a maximum of five life-peers in any one year might be created, but the total number was never to exceed fifty. In March 1897, however, a bill was reintroduced, and three out of four of the life peers in the crown was restricted to judges, generals, admirals, ambassadors, privy councillors and ex-governors of colonies. The two additional life-peers were to be appointed in regard to some special qualification to be stated in the message to the house announcing the intention of the crown to make the appointment. Power was also to be given to the house to expel members for the period of the current parliament by an address to the crown, praying that their writs of summons might be cancelled. The bill was read a second time on the 20th of July, but it met with a cold reception and was dropped. The only outcome of all that was written and said in this year was that in 1898, after the report of a select committee set up in 1888, the Lords made a few changes in their standing orders, among which the order establishing a quorum of thirty in divisions and those for the constitution of standing committees were the most important.

The parliament which met at Westminster in August 1892 was more democratic in its tendencies than any of its predecessors. At the beginning of the session of 1893, in the course of which the House Rule Bill was passed by the House of Commons, government bills were introduced for quinquennial parliaments for the amendment of registration, and the limitation of each elector to a single vote. The introduction of these bills served merely as a declaration of government policy, and they were not further pressed. On the 24th of March a resolution in favour of payment of members was carried by 276 votes against 229, and again in 1895 by 176 to 158. But the rejection of the House Rule Bill by the House of Lords, with the apparent acquiescence of the country, combined with the retirement of Mr Gladstone to weaken the influence of this House of Commons, and small importance was attached to its abstract resolutions. In the ensuing session of 1894 an amendment to the Address condemning the hereditary principle was moved, and carried without a division. The government, however, holding that this was not the way in which a great question should be raised, withdrew the Address, and carried another without the insertion. In his last public utterance Mr Gladstone directed the attention of his supporters to the reform of the House of Lords, and Lord Rosebery endeavoured to concentrate on such a policy the energies of his supporters at the general election. But the result of the dissolution of 1895, showing, as it did, that on the chief political issue of the day the electorate had agreed with the House of Lords and had disagreed with the House of Commons, greatly strengthened the upper house, and after that date the subject was but little discussed until the Liberal party again came into power ten years later. The House of Lords claimed the right to resist changes made by the House of Commons until the will of the people had been definitely declared, and its defenders contended that its ultimate independence on the electorate, now generally acknowledged, rendered the freedom from ministerial control secured to it by its constitution a national safeguard.

In 1897, under the Radical government of Sir H. Campbell-Bannerman (q.v.), the conflict between the Commons and the Lords again became more acute. And the prime minister in May obtained a large majority in the lower house for a resolution, on which a bill was to be founded, involving a complicated method of overriding the will of the Lords when the Commons had three times passed a bill. But no further immediate step was taken. In 1908 a strong committee of the House of Lords with Lord Rosebery as chairman, which had been appointed in consequence of the introduction by Lord Newton of a bill for reforming the constitution of the upper house, presented an interesting report in favour of largely restricting the hereditary element and adopting a method of selection.

So the question stood when in 1909 matters came to a head through the introduction of Mr Lloyd George's budget. It had always been accepted as the constitutional right of the House of Lords to reject a financial measure sent up by the Commons but not to amend it, but the rejection of the budget (which was, in point of form, referred to the judgment of the electorate) now precipitated a struggle with the Liberals, who had not only rejected but finally denied a right on the part of the upper house to force a dissolution. The Liberal leaders contended that, even if constitutional, the claim of the House of Lords to reject a budget was practically obsolete, and having been revived must now be formally abolished; and they went to the country for a mandate to carry their view into law. The elections of January 1910 gave an unsatisfactory answer, since the two principal parties, the Liberals and the Unionists, returned practically equal; but the Liberal government had also on its side the Irish Nationalist and the Labour parties, which gave them a majority in the House of Commons. The Lords were now in the circumstances in a position to act, and after having introduced and carried through the House of Commons a series of resolutions defining his proposals, he had also tabled a bill which was to be sent up to the House of Lords, when the death of the king suddenly interrupted the course of the constitutional conflict, and gave a breathing-space for both sides to consider the possibility of coming to terms. In June Mr Asquith took the initiative in inviting the leaders of the Opposition to a conference with closed doors, and a series of meetings between four representatives of each side were begun. The government were represented by Mr Asquith, Mr Lloyd George, Mr Birrell and Mr Saye and Sele. The Opposition were represented by Lord Lansdowne, Mr Austin Chamberlain and Lord Coward.

The situation on the Radical side at this juncture may be best understood by setting out the resolutions passed in the House of Commons, and the text of the parliament bill of which Mr Asquith had given notice:

The Resolutions.—1. That it is expedient that the House of Lords be disabled by law from rejecting or amending a money bill, but that any such limitation by law shall not be taken to diminish or abridge the existing rights and privileges of the House of Lords.

2. For the purpose of this resolution, a bill shall be considered a money bill if in the opinion of the Speaker it contains only provisions dealing with all or any of the following subjects—namely, taxation, debt, revenue, public expenditure, revenue or expenditure in Ireland, or the Consolidated Fund or the provision of money by parliament: supply; the appropriation, control or regulation of public money; the raising or guarantee of any loan or the repayment thereof; or matters incidental to those subjects or any of them.

3. That it is expedient that the powers of the House of Lords, as respects bills other than money bills, be restricted by law, so that any such bill which has passed the House of Commons in three successive sessions and, having been sent up to the House of Lords at least one month before the end of the session, has been rejected by that house in each of those three years, shall become law without the consent of the House of Lords, on the royal assent being declared: provided that at least two years shall have elapsed between the date of the first introduction of the bill in the House of Commons and the date on which it passes the House of Commons for the third time.

4. That if the purpose of this resolution a bill shall be treated as rejected by the House of Lords if it has not been passed by the House of Lords either without amendment or with such amendments only as may be agreed upon by both houses.

The Parliament Bill, 1910.—Whereas it is expedient that provision should be made for regulating the relations between the two Houses of Parliament; And whereas it is expedient to create for the use of the Lords and Commons a new second chamber constituted on a popular instead of hereditary basis, but such substitution cannot be immediately brought into operation: And whereas provision will require hereafter to be made by legislation effecting such substitution for limiting and defining the powers of the new second-chamber, but it is expedient
to make such provision as in this act appears for restricting the
existing powers of the House of Lords: Be it therefore enacted
by the king’s most excellent majesty, by and with the consent
of the Lords spiritual and temporal, and Commons, in this
present parliament assembled, and by the authority of the
same, as follows:

1. When a money bill, having been passed by the House of
Commons, and sent up to the House of Lords at least one
month before the end of the session, is not passed by the House of
Lords without amendment within one month after it is sent up to
that house, the House of Commons direct to the contrary,
be presented to His Majesty and become an act of
parliament on the royal assent being signified, notwithstanding
that the House of Lords have not consented to the bill.

2. The introduction of a bill with a similar provision of the Speaker
of the House of Commons contains only provisions dealing with
all or any of the following subjects—namely, the imposition, repeal,
removal, or variation, of any indirect taxes or duties; the
consolidated fund or the provision of money by parliament; supply;
the appropriation, control or regulation of public money; the
raising or guarantee of any loan or the repayment thereof; or
matters incident to those subjects or any of them.

3. When a bill to which the House of Lords has not consented
is presented to His Majesty for assent as a money bill, the bill
shall be accompanied by a certificate of the Speaker of the House of
Commons that it is such a bill.

4. No amendment shall be allowed to a money bill which, in
the opinion of the Speaker of the House of Commons, is such as to
prevent the bill retaining the character of a money bill as
introduced to the House of Commons or sent up to
the House of Lords in each of those sessions, that bill shall, on
its rejection for the third time by the House of Lords, unless
the House of Commons direct to the contrary, be presented to His
Majesty and become an act of parliament on the royal assent
being signified thereto, notwithstanding that the House of Lords
has not consented to the bill; provided that this provision shall not
take effect unless two years have elapsed between the date of
the first introduction of the bill in the House of Commons and
the date on which it passes the House of Commons for the third
time.

5. A bill shall be deemed to be rejected by the House of Lords
if it is not passed by the House of Lords either without amendment
or with such amendments only as may be agreed to by both houses.

6. A bill shall be deemed to be the same bill as a former bill
sent up to the House of Lords in the preceding session if, when it
is sent up to the House of Lords, it is identical with the former
bill or contains only such alterations as are certified by the Speaker
of the House of Commons to be necessary owing to the time
which has elapsed since the date of the former bill, or to represent
amendments which have been made by the House of Lords in the former
bill in the preceding session.

Provided that the House of Commons may, if they think fit,
on the first reading of a bill through the house in the second
or third session, suggest any further amendments without
inserting the amendments in the bill, and any such suggested amend-
ments, or additional provision by that house, shall be treated as
amendments made by the House of Lords and agreed to by the House of Commons; but the exercise
of this power by the House of Commons shall not affect the
operation of this section in the event of the bill being rejected by the
House of Lords.

7. Any certificate of the Speaker of the House of Commons
given under this act shall be conclusive for all purposes, and
shall not be questioned in any court of law.

8. Nothing in this act shall diminish or qualify the existing
rights and privileges of the House of Commons.

9. Five years shall be substituted for seven years as the time
fixed for the maximum duration of Act 1715.

Meanwhile, in the House of Lords, Lord Rosebery had carried
three resolutions declaring certain principles for the reform of
the second chamber, which were assented to by the Unionist
leaders; the policy opposed to that of the government thus
became that of willingness for reform of the constitution of the
Upper Chamber, but not for abolition of its powers.

Lord Rosebery’s Resolutions.—(1) “That a strong and efficient
Second Chamber is not merely an integral part of the British Con-
stitution, but is necessary to the well-being of the State and to
the balance of Parliament.” (2) “Such a Chamber can best be
obtained by the reform and reconstitution of the House of Lords.”
(3) “That a necessary preliminary to such reform and reconstitution
is the acceptance of the principle that the possession of a seat
should no longer of itself give the right to sit and vote in the House of
Lords.

During the summer and autumn the private meetings between the eight leaders were continued, until twenty had been
held. But on the roth of November Mr Asquith issued a
brief statement that the conference on the constitutional
question had come to an end, without arriving at an agree-
ment. Within a few days he announced that another appeal
would at once be made to the electorate. The Parliament
Bill was hurriedly introduced into the House of Lords, with a
formulation by Lord Crewe that no amendments would be
accepted. The dissolution was fixed for the 28th of November.
Time was short for any declaration of policy by the Unionist
peers, but it was given shape at once, first by the adoption of
a further resolution moved by Lord Rosebery for the remodel-
ing of the Upper House, and secondly by Lord Lansdowne’s
shelving the Parliament Bill by coupling the adjournment of the
debate on it with the adoption of resolutions providing
for the settlement of differences between a reconstituted
Upper House and the House of Commons.

Lord Rosebery’s additional resolution provided that “in future
the House of Lords shall consist of Lords of Parliament: (a) chosen
from the bodies of hereditary peers from among themselves
and by nomination by the Crown; (b) sitting by virtue of offices
and of qualifications held by them; (c) chosen from outside.” The
Lords of Parliament were to have a more effective voice than
they had when the House of Lords had been “reconstituted and reduced in numbers.” “In accor-
dance with Lord Rosebery’s plan, (1) any differences arising between
the two houses with regard to a Bill other than a Money Bill, in
two years shall be settled by appeal to the people; (2) any difference of
opinion on matters of considerable importance ought to have an interval of not less than one
year, should be settled, if not adjustable otherwise, in a joint
sitting composed of members of both houses, except in the case of
“a matter which is of great gravity and has not been adequately
submitted to the judgment of the people,” which should be
“submitted for decision to the electors by Referendum”; (2) and as
to Money Bills, the Lords were prepared to forgo their constitu-
tional right of rejection or amendment, if effectual provision were
made against “failing” the decision whether other than financial
matters were dealt with in the Bill resting with a joint committee
of both Houses, with the Speaker of the House of Commons as
chairman, having a casting vote only.

The general election took place in December, and resulted
practically in no change from the previous situation. Both
sides won and lost seats, and the eventual numbers were:
Liberals 272, Labour 42, Irish Nationalists 84 (being “in-
dependents” following Mr William O’Brien), Unionists 272.

The remaining years of the second term of the Independent
Nationalists, Mr Asquith retained an appointment amounting
26 for the ministerial policy, resting as it did on the
determination of the Irish Nationalists to pave the way for Home Rule
by destroying the veto of the House of Lords.

B. House of Commons Internal Reforms.—We have already
sketched the main lines of English parliamentary procedure.
Until the forms of the House of Commons were openly utilized
to delay the progress of government business by what became
known as “obstruction” the changes made in the years
following 1832 were comparatively insignificant. They
consisted in (1) the discontinuance of superfluous forms, questions
and amendments; (2) restrictions of debates upon questions
of form; (3) improved arrangements for the distribution of busi-
ness; (4) the delegation of some of the minor functions of the
house to committees and officers of the house; and (5) increased
publicity in the proceedings of the house. But with the entry
of Mr Parnell and his Irish Nationalist followers into parliament
(1875-1880) a new era began in the history of the House of
Commons. Their tactics were to oppose all business of
whatever kind, and at all hours.

It was not until February 1880 that the house so far overcame
its reluctance to restrict liberty of discussion as to pass, in its
earliest form, the rule dealing with “order in debate.” It
provided that whenever a member was named by the Speaker
or chairman as “disregarding the authority of the chair, or
abus[ing] the rules of the house by persistently and willfully
obstructing the rules of the house,” a motion might be made,
to be decided without amendment or debate, for his suspension
from the service of the house during the remainder of the sitting;
and that if the same member should be suspended three times
in one session, his suspension on the third occasion should continue for a week, and until a motion had been made upon which it should be decided, at one sitting, by the house, whether the suspension should then cease or not. The general election, which took place two months later, restored Mr Gladstone to power and to the leadership of the house. Mr Parnell returned to parliament with a more numerous following, and resumed his former tactics. In January 1881 the Protection of Persons and Property (Ireland) Bill was introduced. For twenty-two hours Parnell fought the motion giving precedence to the bill, and for four sittings its introduction and bringing the fourth sitting lasted forty-five hours. The Speaker Brand intervened, and declined to call on any other member who might rise to address the house, because repeated dilatory motions had been supported by small minorities in opposition to the general sense of the house. He added: "A crisis has thus arisen which demands the prompt interposition of the chair and of the house. The usual rules have proved powerless to ensure orderly and effective debate. An important measure, recommended by Her Majesty nearly a month since, and declared to be urgent in the interests of the state by a decisive majority, is being arrested by the action of an inconsiderable minority, which has departed to those modes of obstruction which have been recognized by the house as a parliamentary offence. The dignity, the credit, and the authority of this house are seriously threatened, and it is necessary they should be vindicated. . . . Future measures for ensuring orderly debate I must leave to the judgment of the house. But the house must either assume more effectual control over its debates, or entrust greater powers to the chair." The Speaker then put the question, which was carried by an overwhelming majority. Then followed the decisive struggle. Mr Gladstone gave notice for the next day (Feb. 3) of an urgency rule, which ordered, "That if the house shall resolve by a majority of three to one that the state of public business is urgent, the whole power of the house to make rules shall be and remain with the Speaker until he shall declare that the state of public business is no longer urgent." On the next day a scene of great disorder ended in the suspension of the Nationalist members, at first singly, and afterwards in groups. The urgency rule was then passed without further difficulty, and the house proceeded to resolve, "That the state of public business is urgent." The Speaker laid upon the table rules of sufficient stringency, and while the members of which procession in public business was possible. During this session the Speaker had to intervene on points of order 935 times, and the chairman of committees 939 times; so that, allowing only five minutes on each occasion, the wrangling between the chair and members occupied 150 hours.

The events of the session of 1881 and the direct appeal of the Speaker to the house proved the necessity of changes in the rules. The closure, of procedure more drastic than that hitherto been proposed. Accordingly, in the first week of the session of 1882 Mr Gladstone laid his proposals on the table, and, moving the first resolution on 20th February, he reviewed, in an eloquent speech, the history of the standing orders. It was his opinion, on general grounds, that the house should settle its own procedure, but he showed that the numerous committees which, since 1832, had sat on the subject, had failed for the most part to carry their recommendations into effect from the lack of the requisite "propelling power," and he expressed his regret that the concentration of this power in the hands of the government had rendered it necessary that they should undertake a task not properly theirs. He noted two main features in the history of the case: (1) the constantly increasing labours of the house, and (2) its constantly decreasing power to despatch its duties; and while he declared that "the fundamental change which has occurred is owing to the passing of the first great Reform Bill," he pointed out that the strain had not become intolerable till the development in recent years of obstructive tactics. He defined obstruction as "the disposition either of the minority of the house, or of individuals, to resist the prevailing will of the house otherwise than by argument," and reached the conclusion that the only remedy for a state of things by which the dignity and efficiency of the house were alike compromised, was the adoption in a carefully guarded form of the process known on the Continent as the "cloûre." He explained that in his early years the house was virtually possessed of a closing power, because it was possessed of a means of sufficiently making known its inclinations; and to those inclinations uniform deference was paid by members, but that since this moral sanction had ceased to be operative, it was necessary to substitute for it a written law. The power to close debate had been of necessity assumed by almost all the European and American assemblies, the conduct of whose members was shaped by no traditional considerations; and the entry into parliament of a body of men to whom the traditions of the house were as nothing made it necessary for the House of Commons to follow this example. He proposed, therefore, that when it appeared to the Speaker, or to the chairman of committees, during any debate to be the evident sense of the house, or of the committee, that the question be now put, he might so inform the house, and that thereupon on a motion being made, "That the question be now put," the question under discussion should be forthwith put from the chair, and decided. The Speaker declared that if supported by more than 200 members, or, when less than 40 members had voted against it, by more than 100 members. This resolution was vehemently contested by the opposition, who denounced it as an unprecedented interference with the liberty of debate, but was eventually carried in the autumn session of the same year, after a discussion extending over nineteen sittings.

On the 20th of November the standing order of the 28th of February 1880, providing for the suspension of members who persistently and wilfully obstructed the business of the house or disregarded the authority of the chair, was amended by the increase of the penalty by suspension on the first occasion for one week, on the second occasion for a fortnight, and on the third, or any subsequent occasion, for a month. The other rules, framed with a view to freeing the wheels of the parliamentary machine, and for the most part identical with the regulations adopted by Mr Speaker Brand under the urgency resolution of 1881, were carried in the course of the autumn session, and became standing orders on the 27th of November.

Mr Gladstone's closure rule verified neither the hopes of his supporters nor the fears of its opponents. It was not put into the chair, and declared on 18th January 1882, when the Speaker's declaration of the evident sense of the house was ratified by a majority of 207—a margin of but seven votes over the necessary quorum. It was clear that no Speaker was likely to run the risk of a rebuff by again assuming the initiative unless in the face of extreme urgency, and, in fact, the rule was enforced twice only during the five years of its existence.

In 1887 the Conservative government, before the introduction of a new Crimes Act for Ireland, gave efficiency to the rule by an important amendment. They proposed that any member during a debate might claim to move, "That the question be now put," and that with the consent of the chair this question should be put forthwith, and decided without amendment or debate. Thus the initiative was transferred from the Speaker to the house. Mr Gladstone objected strongly to this alteration, chiefly on the ground that it would throw an unfair burden of responsibility upon the Speaker, who would now have to decide on a question of opinion, whereas under the old rule he was only called upon to determine a question of evident fact. The alternative most generally advocated by the opposition was the automatic closure by a bare majority at the end of each sitting, an arrangement by which the chair would be relieved from an invidious responsibility; but it was pointed out that under such a system the length of debates would not vary with the importance of the questions debated. After fourteen sittings the closure rule was passed on the 18th of March and made a standing order.

In the next session, on the 28th of February 1888, the rule was yet further strengthened by the reduction of the majority necessary for its enforcement from 200 to 100, the closure rule remaining as follows—
That, after a question has been proposed, a member rising in his place may claim to move, "That the question be now put," and the Speaker shall then call upon the chairman or the Speaker of the house for the consideration of the question. The Speaker shall then call the attention of the minority, the question, "That the question be now put," shall be put forthwith, and decided without amendment or debate. When the motion "That the question be now put" has been carried, and the question consequent thereon has been decided, any further motion may be made (the assent of the chairman of the chamber, and the Speaker) that the question may be put at any time. But this least of all can be done in the motion stand part of the clause, or 'That the clause stand part of, or be added to, the bill, be now put.' Such motions shall be put forthwith, and decided without amendment or debate. It may be presumed that the Speaker will be deemed in the affirmative, if, when a division be taken, it appears by the numbers declared from the chair that not less than one hundred members voted in the majority in support of the amendment.

The closure, originally brought into being to defeat the tactics of obstruction in special emergencies, thus became a part of parliamentary routine. And, the principle being once accepted, its operation was soon extended.

The practice of retarding the progress of government measures by amendments moved to every line, adopted by both the great political parties when in opposition, led to the use of what became known as the "guillotine," for forcing through parliament important bills, most of the clauses in which were thus undisputed. The "guillotine," means that the house decides at what time shall be allowed to certain stages be withdrawn, which may be requisite to laying down at which the closure shall be enforced and division taken. On the 17th of June 1887, after prolonged debates on the Crimes Bill in committee, clause 6 only having been reached, the remaining 14 clauses were put without discussion, and the bill was reported in accordance with previous notice. This was the first use of the "guillotine," but the precedent was followed by Mr Gladstone in 1893, when many of the clauses of the Home Rule Bill were carried through committee and on report by the same machinery. To the Conservatives must be imputed the invention of this method of legislation, to their opponents the use of it for attempting to carry a great constitutional innovation to which the majority of English and Scottish representatives were opposed, and subsequently its extension and development (1906–1909) as a regular part of the legislative machinery.

The principle of closure has been extended even to the debates on supply. The old rule, that the redress of grievances should precede the granting of money, dating from a time when the minister of the Crown was so far from commanding the confidence of the majority in the House of Commons that he was the chief object of their attacks, nevertheless continued to govern the proceedings of the house in relation to supply without much resultant inconvenience, until the period when the new methods adopted by the Irish Nationalist party created a new situation. Until 1872 it continued to be possible to discuss any subject by an amendment to the motion for going into supply. In that year a resolution was passed limiting the amendments to matters relevant to the class of estimates about to be considered, and these relevant amendments were further restricted to the first day on which it was proposed to go into committee. This resolution was continued in 1873, but was allowed to drop in 1874. It was revived in a modified form in 1876, but was again "That the order be amended." In 1876, on the recommendation of the Northcote committee, it was provided in a sessional order that whenever the committees of supply or of ways and means stood as the first order on a Monday, the Speaker should leave the chair without question put, except on first going into committee on the army, navy and civil service estimates respectively. In 1882 Thursday was added to Monday for the purposes of the order, and, some further exceptions having been made to the operation of the rule, it became a standing order. The conditions, however, under which the estimates were voted remained unsatisfactory. The most useful function of the opposition is the exposure of abuses in the various departments of administration, and this can best be performed upon the estimates. But ministers, occupied with their legislative proposals, were irresistibly tempted to postpone the consideration of the estimates until the last weeks of the session, when they were hurried through thin houses, the members of which were impatient to get away for the holidays, and to distribute the time with some regard to the comparative importance of the subjects discussed, Mr Balfour in 1896 proposed and carried a sessional order for the closure of supply, a maximum of twenty-three days being given to its consideration, of which the last three alone might be taken after the 5th of August. On the last but one of the allotted days at 12 o'clock the chairman was to put the outstanding votes, and on the last day the Speaker was to put the remaining questions necessary to complete the reports of supply. In 1901 Mr Balfour so altered the resolution that the question was put, not with reference to each vote, but to each class of votes in the Civil Service estimates, and to the total amounts of the outstanding votes in the army, navy and revenue estimates.

It is only possible here to refer briefly to some other changes in the procedure of the house which altered in various respects its character as a business-like assembly. The chief other of these is as regards the hours. On Mondays, Changes in Methods, Tuesdays, Wednesdays and Thursdays the house meets at 2.45 p.m., "questions" beginning at 3 and ending (apart from urgency) at 3.45; and opposed business ends at 11. On Fridays the house meets at 12 noon, and opposed business is suspended at 5 p.m.; this is the only day when government is not preceded, and private members' bills have the first call, though at 8.15 p.m. on Tuesdays and Wednesdays up to Easter and on Wednesdays up to Whitsun the business is interrupted in order that private members' motions may be taken. These arrangements, which only date from 1906, represent a considerable change from the old days before 1879 when the standing order was formed that no opposed business, with certain exceptions, should be taken after 12.30 a.m., or 1888 when the closing hour was fixed at midnight. In fact the hours of the house have become generally earlier. Another important change has been made as regards motions for the adjournment of the house, which used to afford an opportunity to the private members at any time to discuss matters of urgent importance. Since 1902 no motion for the adjournment of the house can be made until all "questions" have been disposed of, and then, if forty members support it, the debate takes place at 8.15 p.m. This alteration has much modified the character of the debates on such motions, which used to be taken when feelings were hot, whereas now there is time for reflection. In other respects the most noticeable thing in the recent evolution of the House of Commons has been its steady loss of power, as an assembly, in face of the control of the government and party leaders. In former times the private members had far larger opportunities for introducing and carrying bills, which now have no chance, unless the government affords "facilities"; and the great function of debating "supply" has largely been restricted by the closure, under which millions of money are voted without debate. The house is still ruled by technical rules of procedure which are, in the main, dilatory and obstructive, and hamper the expression of views which are distasteful to the Whips and to the government, who can by them arrange the business so as to suit their convenience. It is true indeed that this dilatory character of the proceedings assists to encourage debate, within limits; but with the influx of a new class of representatives, especially the Labour members, there has been in recent years a rather pronounced feeling that the procedure of the house might well be drastically revised with the object of making it a more business-like assembly. Reform of the House of Commons has been postponed to some extent because reform of the House of Lords has, to professional reformers, been a better "cry"; but when reform is once "in the air" in parliament it is not likely to stop, with so large a field of antiquated procedure before it as is represented by many of the traditional methods of the House of Commons.

H. Cr.
PARMA, a town and episcopal see of Emilia, Italy, capital of the province of Parma, situated on the Parma, a tributary of the Po, 55 m. N.W. of Bologna by rail. Pop. (1906), 48,532. Parma, one of the finest cities of northern Italy, lies in a fertile tract of the Lombard plain, within view of the Alps and sheltered by the Apennines, 170 ft. above sea-level. From south to north it is traversed by the channel of the Parma, crossed here by three bridges; and from east to west runs the line of the Via Aemilia, by which ancient Parma was connected on the one hand with Ariminum (Rimini), and on the other with Placentia (Placenza). The old ramparts and bastions (excluding the circuit of the citadel of 1591, now in great part restored, in the south-west) and the quadrilateral walls, 9 ft. 6 in. thick, enclose an area of 13,492 acres; but the enclosed area is not at all occupied by streets and houses.

In the centre of the city the Via Aemilia widens out into the Piazza Garibaldi, a large square which contains the Palazzo del Governo and the Palazzo Municipale, both dating from 1627. The cathedral of the Assumption (originally S. Herculanus), erected between 1604 and 1724, and consecrated in 1706 by Pope Paschal II., is a Lombardo-Romanesque building in the form of a Latin cross. The west front is relieved by three rows of semicircular arches, and has a central porch (there were at one time three) supported by huge marble lions, sculptured no doubt with the rest of the façade by Giovanni Bono da Bissone in 1281. On the south side of the façade is a large brick campainle, and the foundations of another may be seen on the north. The walls and ceiling of the fine Romanesque interior are covered with frescoes of 1570, subdue in colour and well suited to the character of the building; those of the octagonal cupola representing the Assumption of the Virgin are by Correggio, but much restored. The crypt contains the shrine of the bishop S. Bernardino degli Uberti and the tomb of Bartolommeo Prato—the former by Prospero Clementi of Reggio. In the sacristy are fine faience tins.

To the south-west of the cathedral stands the baptistery designed by Benedetto Antelami; it was begun in 1106 and not completed till 1281. The whole structure is composed of red and grey Verona marble. Externally it is an irregular octagon, each face consisting of a lower storey with a semicircular arch (in three cases occupied by a portal), with sculptures by Antelami, four tiers of small columns supporting as many continuous architraves, and forming open galleries, and above these (an addition of the Gothic period) a row of five engaged columns supporting a series of pointed arches and a cornice. Internally it is a polygon of sixteen unequal sides, and the cupola is supported by sixteen ribs, springing from the same number of columns. The frescoes are interesting works of the early 13th century. In the centre is an octagonal font bearing date 1204. The episcopal palace shows traces of the building of 1232. To the east of the cathedral, and at no great distance, stands the church of S. Giovanni Evangelista, which was founded along with the Benedictine monastery in 981, but as a building dates from 1510, and has a façade erected by Simone Moschino early in the 17th century. The interior is an extremely fine early Renaissance work. The frescoes on the cupola representing the vision of St. John are by Correggio, and the arabesques on the vault of the nave by Andrea Mantegna and Giovanni Bellini, who surrounded the Palazzo della Pilotta, a fine church in the form of a Greek cross, erected between 1521 and 1539 after Zaccagni’s designs, contains the tombs and monuments of many of the Bourbon and Farnese dukes of Parma, and preserves its pictures, Parmigianino’s “Moses Breaking the Tables of the Law” and Anselm’s “Coronation of the Virgin.” S. Francesco, probably the earliest Franciscan church in northern Italy (1230-1238; now a prison), is a Gothic building in brick with a fine rose-window. The Palazzo della Pilotta is a vast and irregular group of buildings dating mainly from the 16th and 17th centuries; it now comprises the academy of fine arts (1732) and its valuable picture gallery. Among the most celebrated pictures here are Correggio’s “Madonna di San Girolamo” and “Madonna della Scolatella.” The Teatro Farnese, a remarkable wooden structure erected in 1618-1619 from Aleotti d’Argenta’s designs, and capable of containing 4500 persons, is also in this palace. There are other beautiful ceiling frescoes by Correggio in the former Benedictine nunnery of S. Paolo, erected in 1318-1310; in an adjoining chamber are fine arabesques by Araldi (d. 1538); thence come also some fine majolica tiles (1471-1482), now in the museum. The royal university of Parma, founded in 1601 by Ranuccio I., and reconstituted by Philip of Bourbon in 1768, has faculties in law, medicine and natural science, and possesses an observatory, and natural science collections, among which is the Eritrean Zoological Museum. A very considerable trade is carried on at Parma in grains, cattle and the dairy produce of the district. The grana cheese known as Parmesan is not now so produced at Parma as in some other parts of Italy—Lodi, for example.

From archaeological discoveries it would appear that the ancient town was preceded by a prehistoric settlement of the Bronze Age, the dwellings of which rested upon piles—one, indeed, of the so-called terraziere, which are especially frequent in the neighbourhood of Parma. Parma became a Roman colony of 2000 colonists in 183 B.C., four years after the construction of the Via Aemilia, on which it lay. The bridge by which the Via Aemilia crossed the river Parma, from which it probably takes its name, is still preserved, but has been much altered. A bishop of Parma is mentioned in the acts of the council of Reims in 578. It fell into the power of Alboin in 569 and became the seat of a Lombard duchy; it was still one of the wealthiest cities of Aemilia in the Lombard period. During the 12th, 13th and 14th centuries Parma had its full share of the Guelph and Ghibelline struggles, in which it mainly took the part of the former, and also carried on repeated hostilities with Borgo San Donzino and Piacenza. Its bishop Cadulus (1066-1071) was elected to the papacy by the Lombard and German bishops in 1061, and marched on Rome, but was driven back by the partisans of Alexander III. To him is due the building of the cathedral. As a republic its government, was mainly in the hands of the Rossi, Pallavicino, Correggio and Sanvitale families. The fruitless siege of Parma in 1248 was the last effort of Frederick II. In the cathedral crypts in this siege are preserved. In 1307 the city became a lordship for Gilberto da Correggio, who laid the basis of its territorial power by conquering Reggio, Brescello and Gaustalla, and was made commander-in-chief of the Guelphs by Robert of Apulia. The Correggio family never managed to keep possession of it for long, and in 1346 they sold it to the Visconti (who constructed a citadel, La Rocchetta, in 1356, of which some remains exist on the east bank of the river, while the later lente du pont may be seen on the west bank), and from them it passed to the Sforza. Becoming subject to Pope Julius II. in 1512, Parma remained (in spite of the French occupation from 1515 to 1521) a papal possession till 1545, when Paul III. (Alexander Farnese) invested his son Pierluigi with the duchies of Parma and Piacenza. There were eight dukes of Parma of the Farnese line—Pierluigi (d. 1547), Ottavio (1546), Alessandro (1592), Ranuccio I. (1622), Odorando (1646), Ranuccio II. (1694), Francesco (1727), Antonio (1733). Antonio and Francesco both having died childless, the duchy passed to Charles of Bourbon (Duke of Parma), infant of Charles of Bourbon, Duke of Parma and Piacenza to Austria, but retained the artistic treasures of the Farnese dynasty which he had removed from Parma to Naples. Spain reconquered the duchies in the war of succession (1745); they were recovered by Austria in 1746; and Maria Theresa again surrendered them to Don Philip, infant of Spain, in 1748. Ferdinand, Philip’s son, who succeeded under Dutillot’s regency in 1765, saw his states occupied by the revolutionary forces of France in 1796, and had to purchase his life with 6,000,000 lire and 25 of the best paintings in Parma. On his death in 1802 the duchies were incorporated with the French republic and his son Louis became “king of Etruria.” Parma was thus governed for several years by Moreau de Saint-Méry and by Junot. At the congress of Vienna, Parma, Piacenza and Guastalla were assigned to Marie Louise (daughter of Francis I. of Austria and Napoleon’s second consort), and on her death they passed in 1814 to Charles II. (son of Louis of Etruria.
and Marie Louise, daughter of Charles IV., king of Spain). The new duke, unwilling to yield to the wishes of his people for greater political liberty, was soon compelled to take flight, and the duchy was for a time ruled by a provisional government and by Charles Albert of Sardina; but in April 1849 Baron d'Agrippa, with 15,000 Austrians, took the possession of Parma, and the ducal government was restored under Austrian protection. Charles II. (who had in 1820 married Theresa, daughter of Victor Emmanuel of Sardinia) abdicated in favour of his son Charles III., on the 14th of March, 1849. On the assassination of Charles III. in 1854, his widow, Marie Louise (daughter of Ferdinand, prince of Artois and duke of Berry), became regent for her son Robert. In 1866 his possessions were formally incorporated with the new kingdom of Italy.

The duchy of Parma in 1849 had an area of 2,376 sq. m. divided into five provinces—Borgo San Donnino, Valditaro, Parma, Lunigiana Parmense and Plaisenza. Its population in 1851 was 497,343. Under Marie Louise (1815-1847) the territory of Guastalla (50 sq. m.) formed part of the duchy, but it was transferred in 1847 to Modena in exchange for the communes of Bagno, Fillattiera, &c., which went to constitute the Lunigiana Parmense.

See ALÔ, Storia di Parma (1792-1793); Scarabeli, Storia dei duchi di Parma, Piacenza, e Guastalla (1856); Buttufaco, Dizion. cons. dei duchi d'Parma (1853); MS. hist. et crit. dell' Iscrizione et placientam Parmensae (1855 &c.); L. Testi, Parma (Bergamo, 1905).

PARMENIDES OF ELEA (Vela) in Italy, Greek philosopher. According to Diogenes Laertius he was "his prime" 504-500 b.c., and would thus seem to have been born about 530. Plato indeed (Parmenides, 127 B) makes Socrates see and hear Parmenides when the latter was about sixty-five years of age, in which case he cannot have been born before 519; but in the absence of evidence that any such meeting took place this may be regarded as one of Plato's anachronisms. However this may be, Parmenides was a contemporary, probably a younger contemporary, of Heraclitus. His philosophy was that of physics ended, while Empedocles and Anaxagoras, with whom the succession of physicists began, were very much his juniors. Belonging, it is said, to a rich and distinguished family, Parmenides attached himself, at any rate for a time, to the aristocratic society or brotherhood which Pythagoras had established at Croton; and accordingly one part of his system, the physical part, is apparently Pythagorean. To Xenophon, the founder of Eleaticism—who must have known, even if he was never in any strict sense of the word his disciple—Parmenides was, perhaps, more deeply indebted, as the theological speculations of that thinker unquestionably suggested to him the theory of Being as a unit, and the opposition of the One and the Many, by which he sought to reconcile Ionian "monism," or rather "Ienism," with Italiote dualism. Tradition relates that Parmenides framed laws for the Elecates, who each year took an oath to observe them.

Parmenides embodied his tenets in a short poem, called Nature, of which fragments, amounting in all to about 160 lines, have been preserved in the writings of Sextus Empiricus, Simplicius and others. It is traditionally divided into three parts—the "Proem," "Truth" (râ prósh díkheia), and "Opinion" (râ prósh dôgaz). In "Truth," starting from the formula "the One (or existent) is, the Nonent (or non-existent) is not." Parmenides attempted to distinguish between the unity or universal element of nature and its variety or particularity, insisting upon the reality of its unity, which is therefore the object of knowledge, and upon the unreality of its variety, which is therefore the object, not of knowledge, but of opinion. In "Opinion" he propounded a theory of the world of seeming and its development, pointing out however that, in accordance with the principles already laid down, these cosmological speculations do not pretend to anything more than probability. In spite of the contemptuous remarks of Cicero and Plutarch about Parmenides' versification, Nature is not without literary merit. The diction is rugged, is forcible and picturesque; and the rest of the poem is written in a simple and effective style suitable to the subject.

Proem.—In the "Proem" the poet describes his journey from Elea at night. Born in a whirling chariot, and attended by the daughters of the Muses, who are a ternary in number, he calls the goddess (variously identified by the commentators with Nature, Wisdom or Themis), by whom the rest of the poem is spoken. He invokes the gods, and mentions things of which it is certain, and human opinions; for, though in human opinions there is no "true faith," "they must be studied notwithstanding for what they are worth." 241 "Truth" begins with the declaration of Parmenides' principle in opposition to the principles of his predecessors. There are three ways of research, and three ways only. Of these, one asserts the non-existence of the existent and the existence of the non-existent. The other, considered by Parmenides as the single element which they respectively postulate to be transformed into the various sorts of matter which they discover in the world around them, thus assuming the non-existence of that which is divided, and the existence of that which is undivided, and another, pursued by "restless" persons, whose, "road returns upon itself," assumes that a thing "is and is not," "is the same and not the same." Thus, he concludes, "The way of truth starts from the proposition that "the One is, the Nonent is not."

On the strength of the fundamental distinction between the One and the Nonent, the goddess next announces certain characteristics of the former. The One is uncreated, for it cannot be derived from an antecedent One. The One is not without a non-existent; it cannot pass into the Nonent; it is whole, indivisible, continuous, for nothing exists to break its continuity in space; it is unchangeable [for nothing exists to break its continuity in time]; it is perfect, and cannot be moved. The Goddess further says that the One and the Many can never meet; "the One alone, and another, pursued by "restless" persons, whose, "road returns upon itself," assumes that a thing "is and is not," "is the same and not the same."

As then the One is one, inviable, and immaterial, all plurality, variety and mutation belong to the Nonent. Whence it follows that all human knowledge is one attribute reality, generation and destruction, being and nothing, change of place, alteration of colour are no more than empty words.

Opinion.—The investigation of the Ent [i.e. the existent unity, eternity, and sameness] was prolonged by Parmenides for a reason discovered beneath the variety and the mutability of things] being now complete, it remains in "Opinion" to describe the plurality of things, not as they are, for they not as they are, but as they seem to be. In the phenomenal world there was, has been, or shall be, by Parmenides accepts the theory, which appears to be of Pythagorean origin, two primary elements,—namely, fire, which is gentle, thin, homogenous, and night, which is dark, thick, heavy. Of these elements, which, according to Aristole, were, or rather were analogous to the Ent and the Nonent respectively all things consist, and from them they derive their several characteristics. The foundation for a cosmology having been thus laid, Parmenides went on to light the way for the invention of "earth and sun, and moon and air that is common to all, and the milky way, and further and, the glowing stars": but the scanty fragments which have survived suffice only to show that he conceived the universe consisted of ingredients like the seeds of rings or spheres composed of the two primary elements and of combinations of them, the whole system being directed by an enthroned goddess established at its centre. Next came a theory of animal development. This again was followed by a psychology, which made thought [as well as sensation, which was conceived to differ from thought only in respect of its object] depend upon the excess of the one or the other of the two constituent elements, fire and night. "Such, opinion tells us, was the generation, such is the present existence, such will be the end, of those things to which men have given distinguishing names."

In the truth "the One in the Ent is not," 59. 59. 59. 59. 59. 59. of the Parmenides we encounter a similarity with his predecessors, the physiologist of the Ionian succession. Asking themselves—What is the material universe, they had replied respectively—It is water, It is aerz, It is air, It is fire. Thus, while their question meant, or ought to have meant, What is the single element which underlies the apparent plurality of the material world? their answers, Parmenides conceived, by attributing to the selected element various and varying qualities, reintroduced the plurality which the question sought to eliminate. If we would discover that which is common to all things at all times, we must, he submitted, exclude the differences of things, whether simultaneous or successive. Hence, whereas that which is universally existent with that which is not universally existent, he proposed to distinguish carefully between that which is universally existent and that which is
not universally existent, between $\omega$ and $\mu$. The fundamental trismus is the epigrammatic assertion of this distinction.

In short, the single corporeal element of the Ionian physicists was, to borrow a phrase from Aristotle, a permanent $\omega$ia having $\pi\alpha\theta\gamma$ which change; but they either neglected the $\pi\alpha\theta\gamma$ or confined them with the $\omega$ia. Parmenides sought to reduce the variety of nature to a single material element; but he strictly discriminated the inconstant $\pi\alpha\theta\gamma$ from the constant $\omega$ia, and, understanding by "existence" universal, invariable, immutable being, refused to attribute to the $\pi\alpha\theta\gamma$ anything more than the semblance of existence. Thus discriminated between the permanent unity of nature and its superficial plurality, Parmenides proceeded to the separate investigation of the Ent and the Nonent. The universality of the Ent, he conceived, necessarily carries with it certain characteristics. It is one; it is eternal; it is whole and continuous, both in time and in space; it is immovable and immutable; it is limited, but limited only by itself; it is evenly extended in every direction, and therefore spherical. These propositions having been reached, apart from particular experience, by reflection upon the fundamental principle, we have in them, Parmenides conceived, a body of information resting upon a firm and invincible foundation, to be made the basis by which the information thus obtained is the sum total of "truth"; for, as "existence" in the strict sense of the word cannot be attributed to anything besides the universal element, so nothing besides the universal element can properly be said to be "known."

If Parmenides's poem had had "Being," for its subject it would doubtless have ended at this point. Its subject is, however, "Nature"; and nature, besides its unity, has also the semblance, if no more than the semblance, of plurality. Hence the theory of the unity of nature is necessarily followed by a theory of its seeming plurality, that is to say, of the variety and mutation of things. The theory of plurality cannot indeed pretend to the certainty of the theory of unity, being of necessity untrustworthy, because it is the partial and inconstant representation of that which is partial and inconstant in nature. But, as the material world includes, together with a real unity, the semblance of plurality, so the theory of the material world includes, together with the certain theory of the former, a probable theory of the latter. "Opinion" is then no mere excrecence; it is the necessary sequel to "Truth."

Thus, whereas the Ionians, confounding the unity and the plurality of the universe, had neglected plurality, and the Pythagoreans, containing themselves with the reduction of the variety of nature to a duality or a series of dualities, had neglected unity. Parmenides, taking a hint from Xenophanes, made the antagonistic doxologies supply one another's deficiencies; for, as Xenophanes in his theological system had recognized at once the unity of God and the plurality of things, so Parmenides in his system of nature recognized at once the rational unity of the Ent and the phenomenal plurality of the Nonent.

The foregoing statement of Parmenides's position differs from Zeller's account of it in two important particulars. First, whereas it has been assumed above that Xenophanes was a theologian rather than a philosopher, whence it would seem to follow that the philosophical doctrine of unity originated, not with him, but with Parmenides, Zeller, supposing Xenophanes to have taught, not merely the unity of God, but also the unity of Being, assigns to Parmenides no more than an exact conception of the doctrine of the unity of Being, the justification of that doctrine, and the denial of the plurality and the mutability of things. This view of the relations of Xenophanes and Parmenides is not borne out by their writings; and, though ancient authorities may be quoted in its favour, it would seem that in this case as in others, they have fallen into the easy mistake of confounding successive phases of doctrine, "constructing the utterances of the master in accordance with the presuppositions of his disciple, and calling a simple, by the more finished and elaborate theory " (W. H. Thompson). Secondly, whereas it has been argued above that "Opinion" is necessarily included in the system, Zeller, supposing Parmenides to deny the Nonent even as a matter of opinion, regards that part of the poem which has opinion for its subject as no more than a revised and improved statement of the views of opponents, introduced in order that the reader, having before him the false doctrine as well as the true one, may be led the more certainly to embrace the latter. In the judgment of the present writer, Parmenides, while he denied the real existence of plurality, recognized its apparent existence, and consequently, however little value he might attach to opinion, was bound to take account of it: "pour celui même qui nie l'existence réelle de la nature," says Renouvier, "il reste encore à faire une histoire naturelle de l'illusion."

The teaching of Parmenides variously influenced both his immediate successors and subsequent thinkers. By his recognition of an apparent plurality supplementary to the real unity, he effected the transition from the "monism" or "henism" of the first physical succession to the "pluralism" of the second. While Empedocles and Democritus are careful to emphasize their dissent from "Truth," it is obvious that "Opinion" is the basis of their cosmologies. The doctrine of the deceitfulness of the "unerring eye and the echoing ear" soon established itself, though the grounds upon which Empedocles, Anaxagoras and others may have voted for it are not in the Parmenides. Indirectly, through the dialectic of his pupil and friend Zeno and otherwise, the doctrine of the inadequacy of sensation led to the humanist movement, which for a time threatened to put an end to philosophical and scientific speculation.

But the positive influence of Parmenides's teaching was not yet exhausted. To say that the Platonism of Plato's later years, the Platonism of the Parmenides, the Philolaus and the Timaeus, is the philosophy of Parmenides enlarged and reconstituted, may perhaps seem paradoxical in the face of the severe criticism to which Eleaticism is subjected, not only in the Parmenides, but in the Sophist. The criticism was, however, preparatory to a reconstruction. Thus may be explained the selection of an Eleatic stranger to be the chief speaker in the latter, and of Parmenides himself to take the lead in the former.

In the Sophist criticism predominates over reconstruction, the Zenonian logic being turned against the Parmenides metaphysic in such a way as to show that both the one and the other need revision: see 241 D, 244 B seq., 257 B seq. 258 D. In particular, Plato taxes Parmenides with his inconsistency in attributing (as he certainly did) to the fundamental unity extension and sphericity, so that "the worshipped $\omega$ is after all a pitiful $\mu$ $\omega$" (W. H. Thompson). In the Parmenides reconstruction, the Parmenides predominate over criticism—the letter of Eleaticism being here represented by Zeno, its spirit, as Plato conceived it, by Parmenides. Not the least important of the results obtained in this dialogue is the discovery that, whereas the doctrine of the "one" and the "many" is suicidal and barren so long as the "solitary one" and the "indefinitely many" are absolutely separated (157 C seq. and 163 B seq.), it becomes consistent and fruitful as soon as a "definite plurality" is interpolated between them (142 B seq., 157 B seq., 166 B seq.). In short, Parmenides was no idolater, but Plato recognized in him, and rightly, the prophet of ideas.

PARMENIO—PARMIGIANO

PARMENIO (c. 400-330 B.C.), Macedonian general in the service of Philip II. and Alexander the Great. During the reign of Philip Parmenio obtained a great victory over the Illyrians (356); he was one of the Macedonian delegates appointed to conclude peace with Athens (346), and was sent with an army to uphold Macedonian influence in Euboea (342). In 336 he was sent with Amyntas and Attalus to make preparations for the reduction of Asia. He led the left wing in the battles of the Granicus, Issus and Gaugamela. After the conquest of Drangiana, Alexander was informed that Philotas, son of Parmenio, was involved in a conspiracy against his life, which Philotas was condemned by the army and put to death. Alexander, thinking it dangerous to allow the father to live, sent orders to Media for the assassination of Parmenio. There was no proof that Parmenio was in any way implicated in the conspiracy, but he was not even afforded the opportunity of defending himself.

See Arrian, Anabasis; Plutarch, Alexander; Diod. Sic. xvii.; Curtius vii. 2, 11; Justin xii. 5; for modern authorities see under Alexander III., The Great.

PARMIGIANO (1504-1540). The name of this celebrated painter of the Lombard school was, in full, Giarolamo Francesco Maria Mazzola, or Mazzola; he died in 1540, and was only known as Francesco. He has been more commonly named Il Parmigiano (or its diminutive, Il Parmigianino), from his native city, Parma. Francesco, born on the 11th of January 1504, was the son of a painter. Losing his father in early childhood, he was brought up by two uncles, also painters, Michele and Pier-Hiario Mazzola. His faculty for the art developed at a very boyish age, and he addicted himself to the style of Correggio, who visited Parma in 1510. He did not, however, become an imitator of Correggio; his style in its maturity may be regarded as a fusion of Correggio with Raphael and Giulio Romano, and thus fairly original. Even at the age of fourteen (Vasari says sixteen) he had painted a "Madonna of Christ," surprisingly mature. Before the age of nineteen, when he migrated to Rome, he had covered with frescoes seven chapels in the church of S. Giovanni Evangelista, Parma. Prior to starting for the city of the popes in 1523 he deemed it expedient to execute some specimen pictures. One of these was a portrait of himself as seen in a convex mirror, with all the details of divergent perspective, &c., wonderfully exact—a work which both from this curiosity of treatment and from the beauty of the sitter—for Parmigiano was then "more like an angel than a man"—could not fail to attract. Arrived in Rome, he presented his specimen pictures to the pope, Clement VII., who admiringly accepted them, and assigned to the youthful genius the painting of the Sala de' Pontefici, the ceilings of which had been already decorated by Giovanni da Udine. But while fortune was winning him with her most insinuating smiles, the utter ruin of the sack by the Constable de Bourbon and his German and other soldiers overtook both Rome and Parmigiano. At the date of this hideous catastrophe he was engaged in painting that large picture which now figures in the National Gallery, the "Vision of St Jerome" (with the Baptist pointing upward and backward to the Madonna and infant Jesus in the sky). It is said that through the haze and clouded lights of the sunset in the Parmigiano sat quietly before his vast panel, painting as if nothing had happened. A band of German soldiery burst into his apartment, breathing fire and slaughter; but, struck with amazement at the sight, and with some reverence for art and her votary (the other events of the siege forbid us to suppose that reverence for religion had any part in it), they calmed down, and admired the painter all the protection that he needed at the moment. Their captain, being something of a connoisseur, exacted his tribute, however—a large number of designs. Rome was now no place for Parmigiano. He left with his uncle, intending subsequently to return to Parma; but, staying in Bologna he settled down there for a while, and was induced to remain three or four years. Here he painted for the nuns of St Margaret his most celebrated altarpiece (now in the Academy of Bologna), the "Madonna and Child, with Margaret and other saints."

Spite of the great disaster of Rome, the life of Mazzola had hitherto been fairly prosperous—the admiration which he excited being proportionate to his charm of person and manner, and to the precocity and brilliancy (rather than depth) of his genius; but from this time forward he became an unfortunate, and it would appear a soured and self-neglected, man. In 1531 he returned to Parma, and was commissioned to execute an extensive series of frescoes in the choir of the church of S. Maria della Steccata. These were to be completed in November 1532; and half-payment, 200 golden scudi, was made to him in advance. A ceiling was allotted to him, and an arch in front of the entrance on the arch he painted six figures—two of them in full colour, and four in monochrome—Adam, Eve, some Virtues, and the famous figure (monochrome) of Moses about to shatter the tables of the law. But, after five or six years from the date of the contract, Parmigiano had barely made a good beginning with his stipulated work. According to Vasari, he neglected painting in favour of alchemy—he laboured over futile attempts to "congeal mercury," being in a hurry to get rich anyhow. It is rather difficult to believe that the various graphic and caustic phrases which Vasari bestows upon this theory of the facts of Mazzola's life are altogether gratuitous and wide of the mark; nevertheless, the painter's principal biographer, the Padre Afgo, undertook to refute Vasari's statements, and most subsequent writers have accepted Afgo's conclusions. Whatever the cause, Parmigiano failed to fulfil his contract, and was imprisoned in default. Promising to amend, he was released; but instead of redeeming his pledge he decamped to Casal Maggiore, in the territory of Cremona. Here, according even to Vasari, he relinquished alchemy and resumed painting; yet he still hankered (or is said by Vasari to have hankered) after his retorts and furnaces, lost all his brightness, and presented a dim, poverty-stricken, hirsute and uncivilized aspect. Mazzola died of a fever on the 24th of August 1540, before he had completed his thirty-seventh year. By his own desire he was buried naked in the church of the Servites called La Fontana, near Casal Maggiore.

Grace has always and rightly been regarded as the chief artistic endowment of Parmigiano—grace which is genuine as an expression of the painter's nature, but partakes partly of the artificial and affected in its developments. "Un po'di grazia del Parmigianino" (a little, or, as we might say, just a spice, of Parmigianino's grace) was among the ingredients which Agostino Caracci's famed somet desiderates for a perfect picture. Mazzola constantly made many studies of the same figure, in order to get the most graceful attainable form, movement and drapery—the last being a point in which he was very successful. The proportions of his figures are over-long for the truth of nature—the stature, fingers and neck; one of his Madonnas, now in the Piti Gallery, is currently named "La Madonna del collo lungo." Neither expression nor colour is a strong point in his works; the figures in his compositions are generally few—the chief exception being the picture of "Christ Preaching to the Multitude." He etched a few plates, being apparently the earliest Italian painter who was also an etcher; but the statement that he produced over a hundred is incorrect—he overlooked the production of them by other hands.

The most admired easel-picture of Parmigiano is the "Cupid Making a Bow," with two children at his feet, one crying, and the other laughing. This was painted in 1536 for Francesco Boiardi of Parma, and is now in the gallery of Vienna. There are various replicas of it, and some of these may perhaps be from Mazzola's own hand. Of his portrait-painting, two interesting examples are the likeness of Amerigo Vespucci (after whom America is named) in the Studij Gallery of Naples, and the painter's own portrait in the Uffizi of Florence. One of Parmigiano's principal pupils was his cousin, Girolamo di Michele Mazzola; probably some of the works attributed to Francesco are really by Girolamo.

See B. Bossi, Disegni originali di Francesco Mazzola (1789); A. S. Mortara, Della vita di Francesco Mazzola (1846); Toschi, Africchi, Sc. (1846).

(W. M. R.)
PARNAHYBA—

PARNAHYBA, or Parnahiba, a port of the state of Piauhy, Brazil, on the right bank of the Parnahyba river, 250 m. below the capot, Therezina. Pop. of the municipality (1890), 4415. Parnahyba is situated at the point where the most easterly of the delta outlets, or channels, called the Rio Iguarassú, branches off from the main stream. All the outlet channels of the river are obstructed by bars built up by the strong current along the Atlantic coast, and only vessels of light draught can enter. The town has some well-constructed buildings of the old Portuguese type, including two churches and a fine hospital. Parnahyba is the commercial entrepôt of the state. It exports hides, goat-skins, cotton and tobacco, chiefly through the small port of Amarração, at the mouth of the Rio Iguarassú, 11 m. distant.

PARNASSUS (mod. Lídkoura or Likeri), a mountain of Greece, 8970 ft., in the south of Phocis, rising over the town of Delphi. It has several prominent peaks, the chief known as Tithorea and Lycoreia (whence the modern name). Parnassus was one of the most holy mountains in Greece, hallowed by the worship of Apollo, of the Muses, and of the Corycian nymphs, and by the orgies of the Bacchantes. Two projecting cliffs, named the Phaedrae, frame the gorge in which the Castalian spring flows out, and just to the west of this, on a shelf above the ravine of the Pleistus, is the site of the Pythian shrine of Apollo and the Delphic oracle. The Corycian cave is on the plateau between Delphi and the summit.

PARNASSUS PLAYS, a series of three scholastic entertainments performed at St John's College, Cambridge, between 1597 and 1602. They are satirical in character and aim at setting forth the wretched state of scholars and the small respect paid to learning by the world at large, as exemplified in the adventures of two university men, Philomusus and Studioso. The first part, The Pilgrimage to Parnassus, describes allegorically their four-year's journey to Parnassus, i.e. their progress through the university course of logic, rhetoric, &c., and the temptations set before them by their meeting with Madido, a drunkard, Stupido, a puritan who hates learning, Amoretto, a lover, and Ingenioso, a disappointed student. The play was doubtless originally intended to stand alone, but the favour with which it was received led to the writing of a sequel, The Return from Parnassus, which deals with the adventures of the two students after the completion of their studies at the university, and shows them discovering by bitter experience of how little pecuniary value their learning is. They again meet Ingenioso, who is making a scanty living by the practice of law, but is on the search for a patron, as well as a new character, Luxurioso. All four now leave the university for London, while a draper, a tailor and a tapster lament their unpaid bills. Philomusus and Studioso find work respectively as a sexton and a tutor in a merchant's family, while Luxurioso becomes a writer and singer of ballads. In the meanwhile Ingenioso has met with a patron, a coxcombical fellow named Gullio, for whom he composes amorous verses in the style of Chaucer, Spenser and Shakespeare, the last alone being to the patron's satisfaction. Gullio is indeed a great admirer of Shakespeare, and in his conversations with Ingenioso we have some of the most interesting of the early allusions to him.

A further sequel, The Second Part of the Return from Parnassus, or the Scourge of Simony, is a more ambitious, and from every point of view more interesting, production than the two earlier pieces. In it we again meet with Ingenioso, now become a satirist, who on pretence of discussing a recently-published collection of extracts from contemporary poetry, John Bodenham's Betledere, briefly criticizes, or rather characterizes, a number of writers of the day, among them being Spenser, Constable, Drayton, John Davies, Marston, Marlowe, Jonson, Shakespeare and Nashe—the last of whom is referred to as dead. It is impossible here to detail the plot of the play, and it can only be said that Philomusus and Studioso, having tried all means of earning a living, abandon any further attempt to turn their learning to account and determine to become shepherds. Several new characters are introduced in this part, real persons such as Danter, the printer, Richard Burbage and William Kemp, the actors, as well as such abstractions as Furor Poeticus and Phantasma. The second title of the piece, "The Scourge of Simony," is justified by a sub-plot dealing with the attempts of one, Academico, to obtain a living from an ignorant country patron, Sir Rodrick, who, however, presents it, on the recommendation of his son Amoretto, who has been bribed, to a non-university man Immerito.

The three pieces have but small literary and dramatic value, their importance consisting almost wholly in the allusions to, and recollections of, contemporary literature. Their authorship is unknown, but it is fairly certain, from the evidence of general style, as well as some peculiarities of language, that they are the work of the same writer. The only name which has been put forward with any reasonable probability is that of John Day, whose claim has been supported with much ingenuity by Professor I. Gollancz (see full discussion in Dr A. W. Ward's Eng. Dram. Lit. ii. 640, note 2), but the question still awaits definitive solution.

As to the date there is more evidence. The three pieces were evidently performed at Christmas of different years, the last being T. Heyne's patron's piece. The earliest references to the performances are to Queen Elizabeth, while the Pilgrimage mentions books not printed until 1598, and hence can hardly have been earlier than that year. The prologue of a Return states that that play had been written for the preceding year, and also, in a passage of which the reading is somewhat doubtful, implies that the whole series had extended over four years. Thus we arrive at either 1596, 1600 and 1602, or 1598, 1596 and 1601, as, on the whole, the most likely dates of performance. Mr Fleay, on grounds which do not seem conclusive, dates them 1598, 1601 and 1602. The question of how far the characters are meant to represent actual persons has been much discussed. Mr Fleay maintains that the whole is a personal satire, his identifications of the chief characters in a Return being (1) Ingenioso, Thomas Nashe, (2) Furor Poeticus, J. Marston, (3) Phantasma, Sir John Davies, (4) Philomusus, T. Lodge, (5) Studioso, Drayton. Professor Gollancz identifies Judicio with Henry Chettle (Proc. of Brit. Acad., 1903-1904, p. 202). Dr Ward, while rejecting Mr Fleay's identifications as a whole, considers that by the time the final part was written the author may have more or less identified Ingenioso with Nashe, though the character was not originally conceived with this intention. This is of course possible, and the fact that Ingenioso himself speaks in praise of Nashe, who is regarded as dead, is not an insuperable objection. We must not, however, overlook the fact that the author was evidently very familiar with Nashe's works, and that all three parts, not only in the speeches of Ingenioso, but throughout, are full of reminiscences of his writings.

BIBLIOGRAPHY.—The only part of the trilogy which was in print at an early date was 2 Return, called simply The Return from Parnassus, or the Scourge of Simony (1605), two editions bearing the same date. This has been several times reprinted, the best separate edition being that of Professor Arber in the "English Scholars' Library" (1879). Manuscript copies of all three plays were found among the Harley MSS. in the Bodleian, and the Rowell, W. D. Macray and were printed by him in 1886 (the last from one of the editions of 1606, collated with the MS.). A recent edition in modern spelling by Mr O. Smeeaton in the "Temple Dramatists" is of little value. All questions connected with the play have been elaborately discussed by Dr W. Lühr in a dissertation entitled Die drei cambridge SpieFe vom Parnass (Kiel, 1900). See also, Dr Ward's English Dramatic Literature, ii. 653-642, C. G. Fleay's "The First Chap. of the Eng. Drama," 247-253, (R. B. McK.)

PARNELL, CHARLES STEWART (1846-1891), Irish Nationalist leader, was born at Avondale, Co. Wicklow, on the 27th of June 1826. His father was John Henry Parnell, a country gentleman of strong Nationalist and Liberal sympathies, who married in 1834 Delia Tudor, daughter of Commodore Charles Stewart of the United States navy. The Parnell family was of English origin, and more than one of its members attained civic note at Congleton in Cheshire under the Stuarts and during the
Commonwealth. Among them was Thomas Parnell, who migrated to Ireland after the Restoration. He had two sons, Thomas Parnell the poet and John Parnell, who became an Irish judge. From the latter Charles Stewart Parnell was linearly descended in the fifth generation. Sir John Parnell, chancellor of the exchequer in Grattan’s parliament, and one of O’Connell’s lieutenants in the parliament of the United Kingdom, was the grandson of Parnell the judge. The estate of Avondale was settled on him by a friend and bequeathed by him to his youngest son William (grandfather of Charles Stewart Parnell). His eldest son was imbecile. His second son was Sir Henry Parnell, a noted politician and financier in the early part of the 19th century, who held office under Grey and Melbourne, and after being raised to the peerage as Baron Congleton, died by his own hand in 1842. William Parnell was a keen student of Irish politics, with a strong leaning towards the popular side, and in 1863 he published a pamphlet entitled “Thoughts on the Causes of Popular Discontents,” which was favourably noticed by Sydney Smith in the Edinburgh Review. Thus by birth and ancestry, and especially by the influence of his mother, who inherited a hatred of England from her father, Charles Stewart Parnell was, as it were, dedicated to the Irish national cause.

He was of English extraction, a landowner, and a Protestant. Educated at private schools in England and at Magdalene College, Cambridge, his temperament and demeanour were singularly un-Irish on the surface—reserved, cold, repellent and unemotional. He appears to have been rather turbulent as a schoolboy, contentious, insubordinate, and not over-scrupulous. He was fond of cricket and devoted to mathematics, but had little taste for other studies or other games. He was subject to somnambulism, and liable to severe fits of depression—facts which, taken in connexion with the existence of mental affliction among his ancestors, with his love of solitude and mystery, and his invincible superstitions about omens, numbers and the like, may perhaps suggest that his own mental equilibrium was not always stable. He was as little at home in an English school or an English university as he was afterwards in the House of Commons. “These English,” he said to his brother at school, “despise us because we are Irish, but we must stand up to them. That’s the way to treat an Englishman—stand up to him.”

Parnell was not an active politician in his early years. He found salvation as a Nationalist and even as a potential rebel over the leadership of the young Gladstone. But it was not until some years afterwards that he resolved to enter parliament. In the meanwhile he paid a lengthened visit to the United States. At the general election of 1874 he desired to stand for the county of Wicklow, of which he was high sheriff at the time. The lord-lieutenant declined to relieve him of his disqualifying office, and his brother John stood in his place, but was unsuccessful at the poll. Shortly afterwards a by-election occurred in Dublin, owing to Colonel Taylor having accepted office in the Dacradi government, and Parnell resolved to oppose him as a supporter of Isaac Butt, but was heavily beaten. He was, however, elected for Mount in the spring of 1875.

But he was severely reprimanded by the majority of his constituents and the traditions and courtesy of debate. He looked very coldly on the method of “obstruction”—a method invented by certain members of the Conservative party in opposition to the first Gladstone Administration. Parnell, however, entered parliament as a virtual rebel who knew that physical force was of no avail, but believed that political exasperation might attain the desired results. He resolved to make obstruction in parliament do the work of outrage in the country, to set the church-bell ringing—to borrow Mr Gladstone’s metaphor—and to keep it ringing in season and out of season in the ears of the House of Commons. He did not choose to condemn outrages to gratify the Pharisaism of English members of parliament. He courted the alliance of the physical force party, and he paid the price for it. He invented and encouraged “boycotting,” and did not discourage outrage. When a supporter in America offered him twenty-five dollars, “five for bread and twenty for lead,” he accepted the gift, and he subsequently told the story on at least one Irish platform. In the course of the negotiations in 1882, which resulted in what was known as the Kilmarnock Treaty, he wrote to Captain O’Shea: “If the arrears question be settled upon the lines indicated by us, I have every confidence that the exertions we should be able to make strenuously and unremittingly would be effective in stopping outrages and intimidation of all kinds.” This is at least an admission that he had, or could place, his hand on the stop-valve, even if it be not open to the gloss placed on it by Captain O’Shea in a conversation repeated in the House of Commons by Mr Forster, that the conspiracy which has been used to get up boycotting and outrage will now be used to put them down.”

In 1877 Parnell entered on an organized course of obstruction. He and Mr Joseph Gillis Biggar, one of his henchmen, were gradually joined by a small band of the more advanced Home Rulers, and occasionally assisted up to a certain point by one or two English members. Butt was practically deposed and worried into his grave. William Shaw, a “transient and embarrassed phantom,” was elected in his place, but Parnell became the real leader of a Nationalist party. The original Home Rule party was split in twain, and after the general election of 1880 the more moderate section of it ceased to exist. Obstruction in Parnell’s hands was no mere weapon of delay and exasperation; it was a calculated policy, the initial stage of a campaign designed to show the malcontents in Ireland and their kinmen in other lands that Butt’s strictly constitutional methods were quite helpless, but that the parliamentary armory still contained weapons which he could so handle as to convince the Irish people and even the Fenian and other physical force societies that the way to Irish legislative independency lay through the House of Commons. The Fenians were hard to convince, but, in the autumn of 1877 Parnell persuaded the Home Rule Confederation of Great Britain (an association founded by Butt, but largely supported by Fenians) to depose Butt from its presidency and to elect himself in his place. He defined his attitude quite clearly in a speech delivered in New York early in 1880: “A true revolutionary movement in Ireland should, in my opinion, partake both of a constitutional and illegal character. It should be both an open and a secret organization, using the constitution for its own purposes, but also taking advantage of its secret combination.” Parnell’s opportunity came with the general election of 1885, which displaced the Conservative government and returned to office Mr Gladstone. The Gladstone Government was not strong enough at the outset to overpower the Opposition, even should the latter be reinforced by the whole of Parnell’s contingent. Distress was acute in Ireland, and famine was imminent. Ministers had taken measures to relieve the situation before the dissolution was announced, but Lord Beaconsfield had warned the country that there was a danger ahead in Ireland “in its ultimate results scarcely less disastrous than pestilence and famine... A portion of its population is attempting to sever the constitutional tie which unites it to Great Britain in that bond which has favoured the power and prosperity of both. It is to be hoped that all men of light and leading will resist this destructive doctrine.” The Liberal party and its leaders retorted that they were as strongly opposed to Home Rule as their opponents, but Lord Beaconsfield’s manifesto undoubtedly had the effect of alienating the Irish vote in the English constituencies from the Tory party and throwing it on the side of the Liberal candidates. This was Parnell’s deliberate policy. He would have no alliance with either English party. He would support each in turn with a sole regard to the balance of political power in parliament and a fixed determination to hold it in his own hands if he could. From the time that he became its leader the Home Rule party sat together in the House of Commons and always on the Opposition side.

In the government formed by Mr Gladstone in 1886 Lord Cowper became viceroy and Mr W. E. Forster chief secretary for Ireland. The outlook was gloomy enough, but the Gladstone government did not seem to have anticipated, as Peel anticipated in 1841, that Ireland would be their difficulty. Yet the Land League had been formed by Michael Davitt and others in the
PARNELL, C. S.

autumn of 1879 for the purpose of agrarian agitation, and Parnell after some hesitation had given it his sanction. He visited the United States at the close of 1879. It was then and there that the "new departure"—the alliance of the open and the secret organizations—was confirmed and consolidated. Parnell obtained the countenance and support of the Clan-na-Gael, a revolutionary organization of the American-Irish, and the Land League began to absorb all the more violent spirits in Ireland, though the Fenian brotherhood still held officially aloof from it. As soon as the general election was announced Parnell returned to Ireland in order to direct the campaign in person. Though he had supported the Liberals at the election, he soon found himself in conflict with a government which could neither tolerate disturbance nor countenance a Nationalist agitation, and he entered on the struggle with forces organized, with money in his chest, and with a definite but still undeveloped plan of action. The prevailing distress increased and outrages began to multiply. A fresh Relief Bill was introduced by the government, and in order to stave off a measure to prevent evictions introduced by the Irish party, Mr Forster consented to add a clause to the Relief Bill for giving compensation in certain circumstances to tenants evicted for non-payment of rent. This clause was afterwards embodied in a separate measure—namely, the Compensation for Disturbance Bill, which after a stormy career in the House of Commons was summarily rejected by the House of Lords.

The whole Irish question was once more opened up in its more dangerous and more exasperating form. It became clear that the land question—supposed to have been settled by Mr Gladstone's Act of 1870—would have to be reconsidered in all its bearings, and a commission was appointed for the purpose. In Ireland things went from bad to worse. Evictions increased and outrages were multiplied. Intimidations and boycotting were rampant. As the winter wore on, Mr Forster persuaded his colleagues that exceptional measures were needed. An abortive prosecution of Parnell and some of his leading colleagues had by this time intensified the situation. Parliament was summoned early, and a Coercion Bill for one year, practically suspending the Habeas Corpus Act and allowing the arrest of suspects at the discretion of the government, was introduced, to be followed shortly by an Arms Bill. Parnell regarded the measure as a declaration of war, and met it in that spirit. Its discussion was doggedly obstructed at every stage, and on one occasion the debate was only brought to a close, after lasting for forty-one hours, by the Speaker's claiming to interpret the general sense of the house and resolving to put the question without further discussion. The rules of procedure were then amended afresh in a very drastic sense, and as soon as the bill was passed Mr Gladstone introduced a new Land Bill, which occupied the greater part of the session. Parnell accepted it with many reserves. He could not ignore its concessions, and was not disposed to undervalue them, but he had to make it clear to the revolutionary party, whose support was indispensable, that he regarded it only as a payment on account, even from the agrarian point of view, and no payment at all from the national point of view. A crisis was reached when the League at its instigation determined to "test" the act by advising tenants in general to refrain from taking their cases into court until certain cases selected by the Land League had been decided. The government treated this policy, which was certainly not designed to make the act work freely and beneficially, as a deliberate attempt to intercept its benefits and to keep the Irish people in subjection to the Land League; and on this and other grounds—notably the attitude of the League and its leaders towards crime and outrage—Parnell was arrested under the Coercion Act and lodged in Kilmainham gaol (October 17, 1881).

Parnell in prison at once became more powerful for evil than he had ever been, either for good or for evil, outside. He may have known that the policy of Mr Forster was little favoured by several of his colleagues, and he probably calculated that the detention of large numbers of suspects without cause assigned and without trial would sooner or later create opposition in England. Mr Forster had assured his colleagues and the House of Commons that the power of arbitrary arrest would enable the police to lay their hands on the chief agents of disturbance, and it was Parnell's policy to show that so long as the grievances of the Irish tenants remained unredressed no number of arrests could either check the tide of outrage or restore the country to tranquillity. Several of his leading colleagues followed him into captivity at Kilmainham, and the Land League was dissolved, its treasurer, Patrick Egan, escaping to Paris and carrying with him its books and accounts. Before it was formally suppressed the League had issued a manifesto, signed by Parnell and several of his associates, calling upon the tenants to pay no rent until the government had restored the constitutional rights of the people. Discouraged by the priests, the No-Rent manifesto had little effect, but it embittered the struggle and exasperated the temper of the people on both sides of the Irish Channel.

Lord Cowper and Mr Forster were compelled to ask for a renewal of the Coercion Act with enlarged powers. But there were members of the cabinet who had only accepted it with reluctance, and were now convinced not only that it had failed, but that it could never succeed. A modus vivendi was desired on both sides. Negotiations were set on foot through the agency of Mr O'Shea, who was then a firm political and personal friend of Parnell, but ultimately his accuser in the divorce court—and after a somewhat intricate course they resulted in what was known as the Kilmainham Treaty. As a consequence of this informal agreement, Parnell and two of his friends were to be released at once, the understanding being, as Mr Gladstone stated in a letter to Lord Cowper, "that Parnell and his friends are ready to abandon 'No Rent' formally, and to declare against outrage energetically, intimidation included, if and when the government announce a satisfactory plan for dealing with arrests." Parnell's own version of the understanding was far more precise. It also included a hope that the government would allow the Coercion Act to lapse and govern the country by the same laws as in England. Parnell and his friends were released, and Lord Cowper and Mr Forster at once resigned.

The Phoenix Park murders (May 6, 1882) followed (see Ireland: History). Parnell was prostrated by this catastrophe. In a public manifesto to the Irish people he declared that "no act has ever been perpetrated in our country, during the exciting struggle for social and political rights of the past fifty years, that has so stained the name of hospitable Ireland as this deliberately planned and unprovoked assassination of a friendly stranger." Privately to his own friends and to Mr Gladstone he expressed his desire to withdraw from public life. There were those who believed that nevertheless he was privy to the Invincible conspiracy. There is some prima facie foundation for this belief in the indifference he had always displayed towards crime and outrage when crime and outrage could be made to serve his purpose; in his equivocal relation to the more violent and unscrupulous forms of Irish sedition, and in the fact that Byrne, an official of the Land League, was in collusion with the Invincibles, that the knives with which the murder was done had been concealed at the offices of the Land League in London, and had been conveyed to Dublin by Byrne's wife. But the maxim est fecit cuius protest disallows these suspicions. Parnell gained nothing by the murders, and seemed for a time to have lost everything. A new Crimes Bill was introduced and made operative for a period of three years. A régime of renewed coercion was maintained by Lord Spencer and Mr (afterwards Sir George) Trevelyan, who had succeeded Lord Frederick Cavendish in the office of chief secretary; Ireland was tortured for three years by the necessary severity of its administration, and England was exasperated by a succession of dynamite outrages organized chiefly in America, which Parnell was powerless to prevent. The Phoenix Park murders did more than any other incident of his time and career to frustrate Parnell's policy and render Home Rule impossible.

For more than two years after the Phoenix Park murders Parnell's influence in parliament, and even in Ireland, was only intermittently and not very energetically exerted. His
health was indifferent, his absences from the House of Commons were frequent and mysterious, and he had already formed those relations with Mrs O'Shea which were ultimately to bring him to the divorce court. The Phoenix Park murderers were arrested, and brought to justice early in 1882. Mr Forster seized the opportunity to deliver a scathing indictment of Parnell in the House of Commons. In an almost contemptuous reply Parnell repudiated the charges in general terms, disavowed all sympathy with dynamite outrages, their authors and abetors—the only occasion on which he ever did so—declined to plead in detail before an English tribunal, and declared that he sought only the approbation of the Irish people. This last was shortly afterwards manifested in the form of a subscription known as the "Parnell Tribute," which quickly reached the amount of £400,000, and was presented to the electoral party for the liquidation of debts he was known to have contracted, but mainly in recognition of his public services. The Irish National League, a successor to the suppressed Land League, was founded in the autumn of 1882 at a meeting over which Parnell presided, but he looked on it at first with little favour, and its action was largely paralysed by the operation of the Crimes Act and the vigorous administration of Lord Spencer.

The Crimes Act, passed in 1882, was to expire in 1885, but the government of Mr Gladstone was in no position to renew it as it stood. In May notice was given for its partial renewal, subject to changes more of form than of substance. The Government would not be responsible if the, old measure was killed for the roth of June. On the 8th of June Parnell and thirty-nine of his followers, voted against the measure, and defeated the government by a majority of 265 votes to 252. Mr Gladstone forthwith resigned. Lord Salisbury undertook to form a government, and Lord Carnarvon became viceroy. The session was rapidly brought to an end with a view to the dissolution rendered necessary by the Franchise Act passed in 1883—a measure which was certain to increase the number of Parnell's adherents in parliament. It seems probable that Parnell had convinced himself before he resolved to join forces with the Opposition that a Conservative government would not renew the Crimes Act. At any rate, no attempt to renew it was made by the new government. Moreover, Lord Carnarvon, the new viceroy, was known to Parnell and to some others among the Irish leaders to be not unfavourable to some form of Home Rule if due regard were paid to imperial unity and security. He sought and obtained a personal interview with Parnell, explicitly declared that he was speaking for himself alone, heard Parnell's views, expounded his own, and forthwith with what had taken place to the Prime Minister. In the result the new cabinet refused to move in the direction apparently desired by Lord Carnarvon.

Parnell opened the electoral campaign with a speech in Dublin, in which he pronounced unequivocally in favour of self-government for Ireland, and expressed his confident hope "that it may not be necessary for us in the new parliament to devote our attention to subsidiary measures, and that it may be possible for us to have a programme and a platform with only one plank, and that one plank National Independence." This was startling to English ears. The press denounced Parnell; Lord Hartington (afterwards the duke of Devonshire) protested against so fatal and mischievous a programme; Mr Chamberlain repudiated it with even greater emphasis. Meanwhile Mr Gladstone was slowly convincing himself that the passing of the Franchise Act had made it the duty of English statesmen and English party leaders to give a respectful hearing to the Irish National demand, and to consider how far it could be satisfied subject to the governing principle of "maintaining the supremacy of the crown, the unity of the Empire, and all the authority of parliament necessary for the conservation of the unity." This was the position he took up in the Hawarden manifesto issued in September before the general election of 1885. Speaking later at Newport in October, Lord Salisbury treated the Irish leader with unwonted deference and respect. Parnell, however, took no notice of the Newport speech, and waited for Mr Gladstone to declare himself more fully in Midlothian. But in this he was disappointed.

Mr Gladstone went no farther than he had done at Hawarden, and he implored the electorate to give him a majority independent of the Irish vote. Subsequently Parnell invited him in a public speech to declare his policy and to sketch the constitution he would give to Ireland subject to the limitations he had insisted on. To this Mr Gladstone replied, "through the same confidential channel," that he could not consider the Irish demand before it had been constitutionally formulated, and that, not being in an official position, he could not usurp the functions of a government. The reply to this was the issue of a manifesto to the Irish electors of Great Britain violently denouncing the Liberal party and directing all Irish Nationalists to give their votes to the Tories. In these circumstances the general election was fought, and resulted in the return of 355 Liberals, four of whom were classified as "independent," 249 Conservatives and 86 followers of Parnell.

Mr Gladstone had now ascertained the strength of the Irish demand, but was left absolutely dependent on the votes of those who represented it. Through Mr Arthur Balfour he made informal overtures to Lord Salisbury professing his own support in case the Prime Minister should be disposed to consider the Irish demand in a "just and liberal spirit"; but he received no encouragement. Towards the close of the year it became known through various channels that he himself was considering the matter and had advanced as far as accepting the principle of an Irish parliament in Dublin for the transaction of Irish affairs. Before the end of January Lord Salisbury's government was defeated on the Address, the Opposition including the full strength of the Irish party. Mr Gladstone once more became prime minister, with Mr John Morley (an old Home Ruler) as chief secretary, and Mr Chamberlain provisionally included in the cabinet. Lord Hartington, Mr Bright and some other Liberal chiefs, however, declined to join him.

Mr Gladstone's return to power at the head of an administration conditionally committed to Home Rule marks the culminating point of Parnell's influence on English politics and English parties. And after the defeat of the Home Rule ministry in 1886, Parnell was naturally associated closely with the Liberal Opposition. At the same time he withdrew himself largely from active interposition in current parliamentary affairs, and relaxed his control over the action and policy of his followers in Ireland. He entered occasionally into London society—where in certain quarters he was now a welcome guest—but in general he lived apart, often concealing his whereabouts and giving no address but the House of Commons, answering no letters, and seldom fulfilling engagements. He seems to have thought that Home Rule being now in the keeping of an English party, it was time to show that he had in him the qualities of a statesman as well as whom were revolutionary and a rebel. His influence on the remedial legislation proposed by the Unionist government for Ireland was considerable, and he seldom missed an opportunity of making it felt. It more than once happened to him to find measures, which had been contemptuously rejected when he had proposed them, ultimately adopted by the government; and it may be that the comparative tranquillity which Ireland enjoyed at the close of the 19th century was due quite as much to legislation inspired and recommended by himself as to the disintegration of his following which ensued upon his appearance in the divorce court and long survived his death. No sooner was Lord Salisbury's new government installed in office in 1886, than Parnell introduced a comprehensive Tenants' Relief Bill. The government would have none of it, though in the following session they adopted and carried many of its leading provisions. Its rejection was followed by renewed agitation in Ireland, in which Parnell took no part. He was ill—"dangerously ill," he said himself at the time—and some of his more hot-headed followers devised the famous "Plan of Campaign," on which he was never consulted and which never had his approval. Ireland was once more thrown into a turmoil of agitation, turbulence and crime, and the Unionist government, which had hoped to be able to govern the country by means of the ordinary law, was compelled to resort to severe repressive
measures and fresh coercive legislation. Mr Balfour became chief secretary, and early in the session of 1887 the new measure was introduced and carried. Parnell took no very prominent part in resisting it. In the course of the spring The Times had begun publishing a series of articles entitled "Parnellism and Crime," on lines following Mr Forster's indictment of Parnell in 1885, though with much greater detail of circumstance and absolute statements. The series was addressed to a public not acquainted with the insinuations and allegations of Mr Forster and his friends, and some were exaggerated, some were merely the colourful fictions of political propension, pronounced to be not proven by the special commission which ultimately inquired into them. One of the articles, which appeared on the 18th of April, was accompanied by the facsimile of a letter purporting to be signed but not written by Parnell, in which he apologized for his attitude on the Phoenix Park murders, and specially excused the murder of Mr Burke. On the same evening, in the House of Commons, Parnell declared the letter to be a forgery, and denied that he had ever written any letter to that effect. He was not believed, and the second reading of the Crimes Act followed. Later in the session the attention of the house was again called to the subject, and it was invited by Sir Charles Lewis, an Ulster member and a bitter antagonist of the Nationalists, to declare the charges of The Times a breach of privilege. The government met this proposal by an offer to pay the expenses of a libel action against The Times to be brought on behalf of the Irish members incriminated. This offer was refused. Mr Gladstone then proposed that a select committee should inquire into the charges, including the letter attributed to Parnell, and to this Parnell assented. But the government rejected the proposal. Parnell continued to maintain for the most part an attitude of moderation, reserve and retreat, though he more than once came forward to protest against the harshness of the Irish administration and to plead for further remedial legislation. In July 1888 he announced that Mr Cecil Rhodes had sent him a sum of £10,000 in support of the Home Rule movement, subject to the condition that the Irish representation should be retained in the House of Commons in any future measure dealing with the question. About the same time the question of "Parnellism and Crime" again became acute. Mr F. H. O'Donnell, an ex-M.P. and former member of the Irish party, brought an action against The Times for libel. His case was a weak one, and a verdict was obtained by the defendants. But in the course of the proceedings the attorney-general, counsel for The Times, affirmed the readiness of his clients to establish all the charges advanced, including the genuineness of the letter which Parnell had declared to be a forgery. Parnell once more invited the House of Commons to refer this particular issue—that of the letter—to a select committee. This was again refused; but after some hesitation the government resolved to appoint by act of parliament a special commission, composed of three judges of the High Court, to inquire into all the charges advanced by The Times. This led to what was in substance, though not perhaps in judicial form, the most remarkable state trial of the 19th century. The commission began to sit in September 1888, and issued its report in February 1890. It heard evidence of immense volume and variety, and the speech of Sir Charles Russell in defence was afterwards published in a bulky volume. Parnell gave evidence at great length, with much composure and some cynicism. On the whole he produced a not unfavourable impression, though some of his statements might seem to justify Mr Gladstone's opinion that he was not a man of exact veracity. The report of the commission, drawn up and carefully considered by the judges, carried its recommendations to bring about the absolute independence of Ireland as a separate nation.

I. We find that the respondent members of parliament collectively were not members of a conspiracy having for its object to establish the absolute independence of Ireland, but we find that some of them, together with Mr Davitt, established and joined in the Land League organization with the intention, by its means, to bring about the absolute independence of Ireland as a separate nation.

II. We find that the respondents did enter into a conspiracy, by a system of coercion and intimidation, to promote an agrarian agitation against the payment of agricultural rents, for the purpose of informing among the people of the country the Irish landlords, who were styled 'the English garrison.'

III. We find that the charge that 'when on certain occasions they thought it politic to denote, and did denote, certain leading members of the public in Ireland, as the leaders of public opinion, and the seditious leaders of Ireland and the insurgents in the Phoenix Park murders,' and find that the facsimile letter, on which this charge was chiefly based as against Mr Parnell, is a forgery.

IV. We find that the respondents did disseminate the Irish War of Independence. All other notations tending to incite to sedition and the commission of other crime.

V. We find that the respondents did not directly incite persons to the commission of crime other than intimidation, but that they did indirectly incite to the commission of such crime. Whether that consequence of that incitement was that crime and outrage were committed by the persons incited we find that it has not been proved that the respondents made payments for the purpose of inciting persons to commit crime.

VI. We find, as to the allegation that the respondents did nothing to prevent crime, and expressed no bona fide disapproval, that some of the respondents, and in particular Mr Davitt, did express bona fide disapproval of crime and outrage, but that the respondents did not denounce the system of intimidation that led to crime and outrage, but persisted in it with knowledge of its effect.

VII. We find that the respondents did defend persons charged with agrarian crime, and supported their families: but that it has not been established that they assisted the commission of crime, or were intimately associated with, notorious criminals, or that they made payments to procure the escape of criminals from justice.

VIII. We find, as to the allegation that the respondents made payments to procure, the commission of crime, that they did not make such payments.

IX. As to the allegation that the respondents invited the assistance and co-operation of, and accepted subscriptions of money from, known advocates of crime and the use of dynamite, we find that the respondents did invite the assistance and co-operation of, and accepted subscriptions of money from, Patrick Ford, a known advocate of crime and the use of dynamite; but that it has not been proved that the respondents, or any of them, knew that the Clan-na-Gael controlled the League, or was collecting money for the Parliamentary Fund. It has been proved that the respondents invited and obtained or rendered assistance and co-operation of the physical force party in America, including the Clan-na-Gael, and in order to obtain that assistance abstained from repudiating or condemning the action of that party.

The specific charges brought against Parnell personally were thus dealt with by the commissioners:

(1) That at the time of the intimate negotiations Mr Parnell knew that Sheridan and Boyton had been organizing outrage, and therefore wished to use them to put down outrage.

(2) That Mr Parnell was intimate with the leading Invincibles; that he probably learned from them what they were about with a view to the commission of crime, and that he recognized the Phoenix Park murders as their handiwork.

(3) That Parnell on 23rd January 1883, by an opportune remittance, enabled F. Byrne to escape from justice to France.

(4) That Mr Parnell did not make any remittance to enable F. Byrne to escape from justice.

The case of the facsimile letter alleged to have been written by Parnell broke down altogether. It was proved to be a forgery. It had been purchased with other documents from one Richard Pigott, a near and respectable Irish journal, who afterwards sold the papers to the newspapers. Without offering, in a letter which was produced in court, to confess its forgery. Mercilessly cross-examined by Sir Charles Russell on this letter to the archbishop, Pigott broke down utterly. Before the commission sat again he fled to Madrid, and there blew his brains out. He had confessed the forgery to Mr Labouchere in the presence of Mr G. A. Sala, but did not stay to be cross-examined on his confession. The attorney-general withdrew the letter on behalf of The Times, and the commission pronounced it to be a forgery. Shortly after the letter had been withdrawn, Parnell fled an action against The Times for libel, claiming damages to the
amount of £100,000. The action was compromised without going into court by a payment of £5000.

Practically, the damaging effect of some of the findings of the commission was neutralized by Parnell's triumphant vindication in the matter of the facsimile letter and of the darker charges levelled at him. Parties remained of the same opinion as before: the Unionists still holding that Parnell was steeped to the lips in treason, if not in crime; while the Home Rulers made abundance of capital out of his personal vindication, and sought to excuse the incriminating findings of the commission by the historic antecedents of the Nationalist cause and party. The failure to produce the books and papers of the Land League was overlooked, and little importance was attached by partisans to the fact that in spite of this default (leaving unexplained the matters referred to in Mr. Parnell's letter to Dr. Conolly for Galway), and the extra commissioners "found that the respondents did make payments to compensate persons who had been injured in the commission of crime." Parnell and his colleagues were accepted as allies worthy of the confidence of an English party; they were made much of in Gladstonian Liberal society; and towards the close of 1889, before the commission had reported, but some months after the forged letter had been withdrawn, Parnell visited Hawarden to confer with Mr Gladstone on the measure of Home Rule to be introduced by the latter should he again be restored to power. What occurred at this conference was afterwards disclosed by Parnell, but Mr Gladstone vehemently denied the accuracy of his statements on the subject.

But Parnell's fall was at hand. In December 1889 Captain O'Shea filed a petition for divorce on the ground of his wife's adultery with Parnell. Parnell's intimacy with Mrs O'Shea had begun in 1881, though at what date it became a guilty one is not in evidence. Captain O'Shea had in that year challenged him to a duel, but was pacified by the explanations of Mrs O'Shea. It is known that Captain O'Shea had been Parnell's confidential agent in the negotiation of the Kilmarnock Treaty, and in 1885 Parnell had strained his personal authority to the utmost to secure Captain O'Shea's return to Galway, and had quelled a formidable revolt among some of his most influential followers in doing so. It is not known why Captain O'Shea, who, if not blind to a matter of notoriety, must have been compliant in 1885, became vindictive in 1889. No defence being offered, a decree of divorce was pronounced, and in June 1891 Parnell and Mrs O'Shea were married.

At first the Irish party determined to stand by Parnell. The decree was pronounced on the 17th of November 1890. On the 20th a great meeting of his political friends and supporters was held in Dublin, and a resolution that in all political matters Parnell possessed the confidence of the Irish nation was assumed by acclamation. But the Irish party reckoned without its English allies. The "Nonconformist conscience," which had swallowed the report of the commission, was shocked by the decree of the divorce court. At a meeting of the National Liberal Federation held at Sheffield on the 21st of November, Mr John Morley was privately but firmly given to understand that the Nonconformists would insist on Parnell's resignation. Parliament was to meet on the 23rd. Mr Gladstone tried to convey to Parnell privately his conviction that unless Parnell retired the cause of Home Rule was lost. But the message never reached Parnell. Mr Gladstone then requested Mr John Morley to see Parnell; but he could not be found. Finally, on the 24th, Mr Gladstone wrote to Mr Morley the famous and fatal letter, in which he declared his conviction "that, notwithstanding the splendid services rendered by Mr Parnell to his country, his continuance at the present moment in the leadership would be disastrous in the highest degree to the cause of Ireland," and that "the continuance I speak of would not only place many hearty and effective friends of the Irish cause in a position of great embarrassment, but would render my retention of the leadership of the Liberal party, based as it has been mainly upon the presentation of the Irish cause, almost a nullity." This letter was not published until after the Irish parliamentary party had met in the House of Commons and re-elected Parnell as its chairman without a dissentient voice. But its publication was a thunder-clap. A few days later Parnell was requested by a majority of the party to convene a fresh meeting. It took place in Committee Room No. 15, which became historic by the occasion, and after several days of angry recrimination and passionless discussion, during which Parnell, who occupied the chair, scornfully refused to put to the vote a resolution for his own deposition, 45 members retired to another room and there declared his leadership at an end. The remainder, 26 in number, stood by him. The party was thus divided into Parnellites and anti-Parnellites, and the schism was not healed until several years after Parnell's death.

This was practically the end of Parnell's political career in England. The scene of operations was transferred to Ireland. The next day Parnell fought a bitter and a losing fight, which ended only with his death. He declared that he could never achieve her emancipation by force, and that if she was to achieve it by constitutional methods, it could only be through the agency of a united Nationalist party rigidly eschewing alliance with any English party. This was the policy he proclaimed in a manifesto issued before the opening of the sittings in Committee Room No. 15, and with this policy, when deserted by the bulk of his former followers, he appealed to the Fenians in Ireland—"the hillside men," as Mr Davitt, who had abandoned him early in the crisis, contemptuously called them. The Fenians rallied to his side, giving him their votes and their support, but they were no match for the Church party, which had declared against him. An attempt at reconciliation was made in the spring, at what was known as "the Boulogne negotiations," where Mr William O'Brien endeavoured to arrange an understanding; but it came to nothing in the end. Probably Parnell was never very anxious for its success. He seems to have regarded the situation as fatally compromised by the extent to which his former followers were committed to an English alliance, and he probably saw that the only way to recover his lost position was to build up a new independent party. He knew well enough that within a quarter of a century—five years was the shortest period he allowed himself—but before many months were passed he was dead. The life he led, the agonies he endured, the labours he undertook from the beginning of 1891, travelling weekly to Ireland and intoxicating himself with the atmosphere of passionate nationalism in which he moved, would have broken down a much stronger man. He who had been the most impassive of men became restless, nervous, almost distracted at times, unwilling to be alone, strange in his ways and demeanour. He visited Ireland for the last time in September, and the last public meeting he attended was on the 27th of that month. The next day he sent his friend Dr Kenny, who found him suffering from acute rheumatism, and great distress, to Ireland on the 30th, promising to return on the following Saturday week. He did return on that day, but it was in his coffin. He took to his bed shortly after his return to his home at Brighton, and on the 6th of October he died. His remains were conveyed to Dublin, and on Sunday, the 11th of October, they were laid to rest in the presence of a vast assemblage of the Irish people in Glasnevin Cemetery, not far from the grave of O'Connell.

The principal materials for a biography of Parnell and the history of the Parnellite movement are to be found in Hensard's Parliamentary Debates (1872-1890); in the Annual Register for the same period; in the Report of the Special Commission issued in 1890; in The Life of Charles Stewart Parnell, by R. Barry O'Brien; in The Parnellite Movement, by T. P. O'Connor, M.P.; and in a copious biography of Parnell contributed by an anonymous but well-informed writer to the Dict. of Nat. Biog., vol. xiii.

(J. R. T.)

PARNELL, THOMAS (1879-1718), English poet, was born in Dublin in 1679. His father, Thomas Parnell, belonged to a family (see above) which had been long settled at Congleton, Cheshire, but being a partisan of the Commonwealth, he removed with his children to Ireland after the Restoration, and purchased an estate in Tipperary, which descended to his sons. In 1691 the son entered Trinity College, Cambridge, and in 1700 took his
M.A. degree, being ordained deacon in the same year in spite of his youth. In 1704 he became minor canon of St Patrick's Cathedral and in 1706 archdeacon of Clogher. Shortly after receiving this preferment he married Anne Minchin, to whom he was sincerely attached. Swift says that nearly a year after her death (1711) he was still ill with grief. His visits to London are said to have begun as early as 1706. He was intimate with Richard Steele and Joseph Addison, and although in 1712 he abandoned his Whig politics, there was no change in the friendship. Parnell was introduced to Lord Bolingbroke in 1712 by Swift, and subsequently to the earl of Oxford. In 1713 he contributed to the Poetical Miscellanies edited for Tonson by Steele, and published his Essay on the Different Styles of Poetry. He was a member of the Scriblerus Club, and Pope says that he had a hand in "An Essay of the learned Martinus Scriblerus concerning the Origin of the Sciences." He wrote the "Essay on the Life and writings of Homer," prefixed to Pope's translations, and in the autumn of 1714 both were at Bath together. In 1716 Parnell was presented to the vicarage of Finaglass, when he resigned his archdeaconry. In the same year he published Homer's Battle of the Frogs and Mice. With the remarks of Zoilus. To which is prefixed, the Life of the said Zoilus. Parnell was in London again in 1718, and, on the way back to Ireland, was taken ill and died at Chester, where he was buried on the 24th of October.

Parnell's best known poem is "The Hermit," an admirably executed moral conte written in the old couplet. It is based on an old story found in the Gesta Romanorum and other sources. He cannot in any sense be said to have been a disciple of Pope, though his verse may owe something to his friend's revision. But this and other of his pieces, "The Hymn to Contentment," "The Night Piece on Death," "The Fairy Tale," were original in treatment, and exercised some influence on the work of Goldsmith, Gray and Collins. Pope's selection of his poems was justified by the publication in 1738 of Posthumous Works of Dr Thomas Parnell, containing Poems Moral and Divine, and on various other subjects, which in no way added to his fame. They were contemptuously dismissed as unauthentic by Thomas Gray and Samuel Johnson, but there seems no reason to doubt the authorship.

In 1770 Poems on Several Occasions was printed with a life of the author by Oliver Goldsmith. His Poetical Works were printed in Anderson's and other collections of the British Poets. See The Poetical Works (1804) edited by George A. Aitken for the Alldine Edition, Edinburgh. An edition by the Rev. J. Berry (1829) for the same series (1833) was reprinted in 1866. His correspondence with Pope is published in Pope's Works (ed. Elwin and Courthorpe, vii, 451-467).

PARON (mod. Malevo), the mountain ridge on the east of the Lacoonian plain. Height 626 ft. It is visible from Athens above the top of the Argive mountains.

PARNY, ÉVARISTE-DÉRÉ DE FORGES, VICOMTE DE (1753-1814), was born in the Isle of Bourbon on the 6th of February 1753. He was sent to France at nine years old, was educated at Rennes, and in 1771 entered the army. He was, however, shortly recalled to the Isle of Bourbon, where he fell in love with a young lady whom he addresses as Éléonore. Her father refused to consent to her marriage with Parny, and she married some one else. Parny returned to France, and published his Poésies érotiques in 1778. He also published about the same time his Voyage de Bourgogne (1777), written in collaboration with his friend Antoine de Bertin (1752-1790); Épitres aux habitants de Boston (1777), and Oeuvres poétiques (1779). In 1796 appeared the Guerre des dieux, a poem in the style of Voltaire's Pucelle, directed against Christianity. Parny devoted himself in his later years almost entirely to the religious and political burlesque. He was elected to the Academy in 1803, and in 1813 received a pension from Napoleon. In 1805 he produced an extraordinary allegoric poem attacking George III.,

1 Pope acknowledged the essay with affectionate praise, but in 1720 he said it was written "upon such memoirs as I had collected," and later he complained of its defects, saying it had cost him more pains than it would have done to write it.

his family and his subjects, under the eccentric title of "Goddam! Goddam! par un French-dog." Parny's early love poems and elegies, however, show a remarkable grace and ease, a good deal of tenderness, and considerable fancy and wit. One famous piece, the Elegy on a Young Girl, is scarcely to be excelled in its kind. Parny died in 1814.

His Œuvres choisies were published in 1827. There is a sketch of Parny in Sainte-Beuve's Portraits contemporains.

PARODY (Gr. παρώδια, literally a song sung beside, a comic parallel), an imitation of the form or style of a serious writing in matter of a meaner kind so as to produce a ludicrous effect. Parody is almost as old in European literature as serious writing. The Batrachomyomachia, or "Battle of the Frogs and Mice," a travesty of the heroic epos, was ascribed at one time to Homer himself; and it is probably at least as old as the 11th century B.C. The (18th) taste for the French generation provoked the parodist. Aristophanes parodied the style of Euripides in the Acharnians with a comic power that has never been surpassed. The debased grand style of medieval romance was parodied in Don Quixote. Shakespeare parodied the extravagant heroics of an earlier stage, and was himself parodied by Marston, incidentally in his plays and elaborately in a roughly humorous burlesque of Venus and Adonis. The most celebrated parody of the Restoration was Buckingham's Rehearsal (1672), in which the tragedies of Dryden were immitatively ridiculed. At the beginning of the 18th century The Spectator of John Phillips (1676-1706), which Addison said was "the finest burlesque poem in the English language," brilliantly introduced a fashion for using the solemn movement of Milton's blank verse to celebrate ridiculous incidents. In 1736, Isaac Hawkins Browne (1705-1760) published a volume, A Pipe of Tobacco, in which the poetical styles of Colley Cibber, Ambrose Philips, James Thomson, Edward Young and Jonathan Swift were delightfully reproduced. In the following century, Shelley and John Hamilton Reynolds almost simultaneously produced cruel imitations of the naïveté and baldness of Wordsworth's Peter Bell. But the two most celebrated parodists were the brothers Smith, whose Rejected Addresses may be regarded as classic in this kind of artificial production. The Victorian age has produced a plentiful crop of parodists in prose and in verse, in dramatic poetry and in lyric poetry. By common consent, the most subtle and dexterous of these was C. S. Calverley, who succeeded in reproducing not merely tricks of phrase and metre, but even manneristic turns of thought. In a later day, Mr Owen Seaman has repeated, and sometimes surpassed, the agile feats of Calverley.

PAROLE (shortened from the French parole d'honneur, word of honour), a military term, signifying the engagement given by a prisoner of war that he will not again take up arms against his captors during the term of the engagement or the war, unless previously relieved of the obligation by exchange. "Parole" is also used in the same sense as "word" to imply a watchword or password. The French word, formed from the Late Lat. parallon, paraallaba, Gr. παράλλαβον, story, parable, was also adopted into English as "parol," i.e. verbal, oral, by word of mouth, now only used in the legal term "parol evidence," i.e. oral as opposed to documentary evidence.

PARAPAMISUS, the name given by the Greeks to the parts of the Hindu Kush bordering Kohistan to the north-west of Kabul. It is now applied in a restricted sense to the water-parting between Herat and the Russian frontier on the Kushk river, which possesses no local name of its own. From Herat to the crest of the Parapamisus, which is crossed by several easy passes, is a distance of about 30 miles, involving a rise of 1000 ft.

PAROS, or PARO, an island in the Aegean Sea, one of the largest of the group of the Cyclades, with a population of 5000. It lies to the west of Naxos, from which it is separated by a channel about 6 m. broad, and which it is now grouped together, in popular language, under the common name of Paraxia. It is in 35° N. lat. and 25° 16' E. long. Its greatest length from N.E. to S.W. is 13 m., and its greatest breadth
Parr, Catherine (1512–1548), the sixth queen of Henry VIII., was a daughter of Sir Thomas Parr (d. 1517), of Kendal, an official of the royal household. When only a girl she was married to Edward Borough, and after his death in or before 1520 to John Neville, Lord Latimer, who died in 1542 or 1543. Latimer had only been dead a few months when, on the 12th of July 1543, Catherine was married to Henry VIII. at Hampton Court. The new queen, who was reigning of England during the king's absence in 1544, acted in a very kindly fashion towards her stepchildren; but her patience with the king did not prevent
PARR, SAMUEL—PARRHASIUS

Parr, Samuel (1747–1825), English schoolmaster, son of Samuel Parr, surgeon at Harrow-on-the-Hill, was born there on 26th January 1747. He was educated at Harrow School, and when he left in 1761 he began to help his father in his practice, but the old surgeon realized that his son’s talents lay elsewhere, and Samuel was sent (1762) to Emmanuel College, Cambridge. From February 1767 to the close of 1771 he served under Robert Sumner as head assistant at Harrow, where he had Sheridan among his pupils. When the head master died in September 1771 Parr, after vainly applying for the position, started a school at Stanmore, which he conducted for five years. Then he became head master of Colchester Grammar School (1776–1778) and subsequently, who adopted the name of Parry. In private life his model was Johnson. He succeeded in copying his uncouthness and pompous manner, but had neither his humour nor his real authority. He was famous as a writer of epitaphs and wrote inscriptions for the tombs of Burke, Charles Burney, Johnson, Fox and Gibbon.

There are two memoirs of his life, one by the Rev. William Field (1828), the other, with his works and his letters, by John Johnstone (1828); and E. H. Barker published in 1828–1829 two volumes of Parrians, a continued mass of information on Parr and his friends. An essay on his life is included in De Quincey’s works, vol. v., and a little volume of the Aphorisms, Opinions and Reflections of the late Dr Parr appeared in 1836.

PARR, THOMAS (c. 1453–1635), English canonist, known as "Old Parr," is reputed to have been born in 1483, at Wington, Shropshire, the son of a farmer. In 1506 he is said to have left his home and entered domestic service, and in 1518 to have returned to Wington to occupy the small holding he then inherited on the death of his father. In 1563, at the age of eighty, he married his first wife, by whom he had a son and a daughter, both of whom died in infancy. At the age of 122, his first wife having died, he married again. His vigour seems to have been unimpaired, and when 130 years old he is said to have threshed corn. In 1635 his fame reached the ears of Thomas Howard, 2nd earl of Arundel, who resolved to exhibit him at court, and had him conveyed to London in a specially constructed litter. Here he was presented to King Charles I., but the change of air and diet soon affected him, and the old man died at Lord Arundel’s house in London, on the 14th of November 1635. He was buried in the south transept of Westminster Abbey where the inscription over his grave reads: ‘Tho: Parr of ye county of Salop Born in Ao. 1483. He lived in ye reigns of Ten Princes viz. K. Edward V. K. Richard III. K. Henry VII. K. Henry VIII. K. Edward VI. K. Richard II. K. Henry VII. K. Edward VI. K. Richard II. K. Henry VII. K. Edward VI.’ 174 years and was buried here Nov. 15, 1635.” A post-mortem examination made by the king’s orders by Dr William Harvey, revealed the fact that his internal organs were in an unusually perfect state, and his cartilages unossified.

PARR, a name originally applied to the small Salmonoids abundant in British rivers, which were for a long time considered to constitute a distinct species of fish (Salmo salar). They possess the broad head, short snout and large eye characteristic of young Salmonoids and are distinguished on the sides of the body and tail with about eleven or more broad dark cross-bars, the so-called parr-marks. However, John Shaw proved, by experiment, that these fishes represent merely the first stage of growth of the salmon, before it assumes, at an age of one or two years, and when about six inches long, the silvery smolt-dress preparatory to its first migration to the sea. The parr-marks are produced by a deposit of black pigment in the skin, and appear very soon after the exclusion of the fish from the egg; they are still visible for some time below the new coat of scales of the smolt-stage, but have entirely disappeared on the first return of its youth from the sea. Although the juvenile condition of the parr is now universally admitted, it is a remarkable fact that many male parr, from 7 to 8 inches long, have their sexual organs fully developed, and that their milt has all the fertilizing properties of the seminal fluid of a full-grown and sexually matured salmon. On the other hand, no female parr has ever been obtained with mature ova. Not only the salmon, but also the other species of Salmo, the grayling, and probably also the Coregoni, pass through a parr-stage of growth. The young of all these fishes are barred, the salmon having generally eleven or more bars, and the parr of the migratory trout from nine to ten, or two or three more than the river-trout. In some of the small races or species of river-trout the parr-marks are retained throughout life, but subject to changes in intensity of colour.

PARRAMATTA, a town of Cumberland county, New South Wales, Australia, 14 m. by rail N.W. of Sydney. Pop. (1901) 12,968. It is situated on the Parramatta River, an arm of Port Jackson, and was one of the earliest inland settlements (1788), the seat of many of the public establishments connected with the working of the convict system. Many of these still remain in another form (the district hospital, the lunatic asylum, the gaol, the schools for the infernal and destitute, the orphanages and Catholic orphan schools), involving a government expenditure which partly sustains the business of the town. Parramatta was one of the earliest seats of the tweed manufacture, but its principal industrial dependence has been on the fruit trade. With the exception of Prospect and Pennant Hills, where there is an outburst of trap rock, the surface soil is the disintegration of the Wainamatta shale, which is well suited for orchard and orchards. The first grain grown in the colony was harvested at Parramatta, then called Rosehill. The earlier governors had their country residence near the town, but the domain is now a public park in the hands of the municipality. An early observatory, where in 1822 were made the observations for the Parramatta Catalogue, numbering 73,853 stars, has long been abandoned. Parramatta was incorporated in 1861. It has one of the finest race-courses in Australia, and in the King’s School, founded in 1832, the oldest grammar school in the colony.

PARRHASIUS, of Ephesus, one of the greatest painters of Greece. He settled in Athens, and may be ranked among the Attic artists. The period of his activity is fixed by the anecdote which Xenophon records of the conversation between him and Socrates on the subject of art; he was therefore distinguished
as a painter before 300 B.C. Seneca relates a tale that Parrhasius
bought one of the Olymianos whom Philip sold into slavery, 
346 B.C., and befriended him in order to have a model for his
drawing of Prometheus; but the story, which is similar to one
told of Michelangelo, is chronologically impossible. Another
tale recorded of him describes his contest with Zeuxis. The
latter painted some grapes so perfectly that birds came to peck
at them. He then called on Parrhasius to draw aside the curtain
and show his picture, but, finding that his rival's picture was
the curtain itself, he acknowledged himself to be surpassed,
for Zeuxis had deceived birds, but Parrhasius had deceived
Zeuxis. He was universally placed in the very first rank among
painters. His skilful drawing of outlines is especially praised,
and many of his copies, and then suffered themselves to be
observed and highly valued by later painters for purposes of study.
He first attained skill in making his figures appear to stand out
from the background. His picture of Theseus adorned the
Capitol in Rome. His other works, besides the obscene subjects
with which he is said to have amused his leisure, are chiefly
mythological groups. A picture of the Demos, the personified
People of Athens, is famous; according to the story, which is
probably based upon epigrams, the twelve prominent characters
of the people, though apparently quite inconsistent with each
other, were distinctly expressed in this figure.

Parricide—Parrot

The term "parricide" (Latin pater, father, and caedere, to slay), strictly the murder of a parent; the term
however has been extended to include the murder of any relative or of an ascendant by a descendant. The first Roman law
against parricide was that of the Lex Cornelia de sicariis et
veneficiis (c. 81 B.C.), which enacted that the murderer of a
parent should be sewed up in a sack and thrown into the sea,
and provided other punishments for the killing of near relatives.
The Lex Pompeia de parricidii (52 B.C.) re-enacted the principal
provisions of the Lex Cornelia and defined parricide as the
deliberate and wrongful slaying of ascendants, husbands, wives,
cousins, brothers and sisters, uncles and aunts, stepfathers and
mothers, fathers and mothers-in-law when the person was
of full age. For the murder of a father, mother, grandfather or grandmother, the
Lex Pompeia ordained that the guilty person should be
whipped till he bled, sewn up in a sack with a dog, a cock,
a viper and an ape, and thrown into the sea. Failing water,
he was either to be torn in pieces by wild beasts or burned.

English law has never made any legal distinction between
killing a parent or other relative and simple murder, and the
Netherlands and Germany follow in the same direction. French
law has been exceptionally severe in its treatment of parricide.
Before the Revolution, the parricide if a male, had to make a
reparation in guineas to the heir and pay the loss of the
right-hand; his body was afterwards burned and the ashes scattered
or wings. If the parricide was a female she was burned or
hanged. After the Revolution the penalty became simply one
of death, but the compilers of the penal code adjudged this
insufficient and reintroduced some of the previous provisions:
the parricide was brought to the place of execution clad in a
shirt, bare-footed, and the head enveloped in a black veil.
While he was exposed on the scaffold, an officer read aloud
the decree of condignation; the culprit then had his right
hand cut off, and was immediately afterwards executed. On
the execution of a parricide in 1823, the cutting off of the
right hand was omitted, but the other details remained. Other
continental European countries, following the example of
France, treat the crime of parricide with exceptional severity.

Parrot (according to Skeat, from Fr. Perrot or Pierrot, the
diminutive of the proper name Pierre), the name given
"Parakeet" (in Shakespeare, 1 Hen. IV. ii. 38, "Para-
quette") in Hindustan, and in Portuguese or Spanish, a small Parrot, diminutive of Perico, a Parrot, which
again is diminutive from Pedro, the proper name. Parakeet (spelt in various ways in English) is usually applied to the
smaller kinds of Parrots, especially those which have long tails, not as Perroquet in French, which is used as a general term for all Parrots.
Perroche, or sometimes Perriche, being the ordinary name for what we call Parakeet. The old English "Popinjay" and the old French
Papagei have almost passed out of use, but the German Papagei and
generally to a large and very natural group of birds, which for
more than a score of centuries have attracted attention, not
only from their guilty plumage but, at first sight, is, that it
would seem, from the readiness with which many of them
are said to imitate the sounds they hear, repeating the words and even
phrases of human speech with a fidelity that is often astonishing.
It is said that no representation of any parrot appears in Egyptian
art, nor does any reference to a bird of the kind occur in the
Bible, whence it has been concluded that neither painters nor
writers had any knowledge of it. Aristotle is commonly supposed
to be the first author who mentions a parrot; but this is an
error, for nearly a century earlier Ctesias in his Indica (cap. 3),
under the name of Beraçan (Bittacus), so nectly described a
bird which should speak an "Indian" language—naturally,
though he seems to have thought—or Greeks—so to do—about as big as a sparrow-hawk (Hirax), with a purple
face and a black beard, otherwise blue-green (cyanus) and
vermilion in colour, so that there cannot be much risk in declaring
that he must have had before him a male example of what is
now commonly known as the Blossom-headed parakeet, and
to ornithologists as Psittacus cyanecephalus, an inhabitant
of many parts of India. After Ctesias comes Aristotle's Parrhas
(Pollacce), which Sundewall supposes him to have described
only from hearsay. There can be no doubt that the Indian
accounts of Alexander were the means of making the parrot
better known in Europe, and it is in reference to this fact
that another Eastern species of Psittacus now bears the name of
P. alexandri, though from the localities it inhabits it could
hardly have had anything to do with the Macedonian hero.
That Africa had parrots does not seem to have been discovered
by the ancients till long after, as Pliny tells us (vi. 20) that they
were first met with beyond the limits of Upper Egypt by explorers
employed by Nero. These birds, highly prized from the first,
reprobated by the moralist, and celebrated by more than one
classical poet, in the course of time were brought in great numbers
to Rome, and ministered in various ways to the luxury of the
emperor. Pliny says that they were kept in cages of tortoise-shell and
ivory, with silver wires, but that they were professionally esteemed
as delicacies for the table, and one emperor is said to have fed
his lions upon them! With the decline of the Roman Empire
the demand for parrots in Europe lessened, and so the supply
wilted, yet all knowledge of them was not wholly lost, and
they are occasionally mentioned by one writer or another until
in the 15th century began that career of geographical discovery
which has since proceeded uninterrupted. This immediately
brought with it the knowledge of many more forms of these
birds than had ever before been seen. Yet so numerous is the
group that even now new species of parrots are not uncommonly
recognized.

The home of the vast majority of parrot-forms is unquestion-
ably within the tropics, but the popular belief that parrots are
tropical birds only is a great mistake. In North America the
Carolina parakeet, Conu-rus carolinensis, at the beginning
of the 19th century used to range in summer as high as the
shores of lakes Erie and Ontario—a latitude equal to the south of
France; and even much later it reached, according to trust-
worthy information, the junction of the Ohio and the Mississippi,
though now its limits have been so much curtailed that its
occurrence is in any but the Gulf States is doubtful. In South
America, at least four species are found in Chile or the La Plata
region, and one, Conu-rus patagonus, is pretty common on the
bleak coast of the Strait of Magellan. In Africa it is true
that no species is known to extend to within ten degrees of
the tropic of Cancer; but Pionias robus-tus inhabits territories
Italian Papagao still continue in vogue. These names can be traced
to the Arabic Babaghad; but the source of that is unknown.
The Anglo-Saxon name of the Parrot, a river in Somerset, is Petred
or Petriedra, which at first sight looks as if it had to do with
the proper name, Petre; but Skeat believes there is no connection
between them—the latter portion of the word being rith, a stream.
2 The passage seems to have escaped the notice of all naturalists
except W. J. Broderip, who mentioned it in his article "Psittacidae,
the Penny Cyclopaedia" (xix. 83).
lying quite as far to the southward of the tropic of Capricorn. In India the northern range of the species is only bounded by the slopes of the Himalaya, and farther to the eastward parrots are not only abundant over the whole of the Malay Archipelago, as well as Australia and Tasmania, but two very well-defined families are peculiar to New Zealand and its adjacent islands (see KAKAPO and NESTOR). No parrot has recently inhabited the Arctic Region, yet another (the Conurus carolinensis, just mentioned) probably belongs to the Nearctic; nor are parrots represented by many different forms in either the Ethiopian or the Indian Regions. In continental Asia the distribution of parrots is rather remarkable. None extend farther to the westward than the valley of the Indus, which, considering the nature of the country in Baluchistan and Afghanistan, is perhaps intelligible enough; but it is not so easy to understand why none are found either in Cochin China or China proper; and they are also wanting in the Philippine Islands, which is the more remarkable and instructive when we find how abundant they are in the groups a little farther to the southward. Indeed, A. R. Wallace has well remarked that the portion of the earth's surface which contains the largest number of parrots, in proportion to its area, is undoubtedly that covered by the islands extending from Celebes to the Solomon group. “The area of these islands is probably not one-fifteenth of that of the four tropical regions, yet they contain from one-fifth to one-fourth of all the known parrots” (Geogr. Distr. Animals, ii. 332).

He goes on to observe also that in this area are found many of the most remarkable forms—all the red Lories, the great Hyacinthine Parakeets, the pigmy Nymphs, and similar parrot-like birds. In South America the species of parrots, though numerically nearly as abundant, are far less diversified in form, and all of them seem capable of being referred to two, or at most, three sections. The species that has the widest range, and that by far, is the common Ring-necked Parakeet, Psilopsittacus torquatus, a well-known cage-bird which is found from the mouth of the Gambia across Africa to the coast of the Red Sea, as well as throughout the whole of India, Ceylon and Burmah to Tenasserim. On the other hand, there are plenty of cases of parrots which are restricted to an extremely small area—often an island of insignificant size, as Conurus sautholeucus, confined to the island of St Thomas in the Antilles, and Palatornis eadi to that of Rodriguez in the Indian Ocean—to say nothing of the remarkable instance of Nestor productus (see Nestor).

The systematic treatment of this very natural group of birds has long been a subject of much difficulty. A few systematists, among whom C. L. Bonaparte was chief, placed them at the top of the class, conceiving that they were the analogues of the Primates among mammals. T. H. Huxley recognized the Psittacornorhinae as forming one of the principal groups of Carinate birds, and they are now generally regarded as forming a suborder Psittaci of the Cuculiform Birds (see BIRDS). Owing to the erroneous number of forms and the close similarities of structure, the subdivision of the group has presented great difficulties. Buffon was unaware of the existence of some of the most remarkable forms of the group, in particular of Strigops and Nester; but he began by making two great divisions of those that he did know, separating the parrots of the Old World from the parrots of the New, and subdividing each of these divisions into various sections somewhat in accordance with the names they had received in popular language—a practice he followed on many other occasions, for it seems to have been with him a belief that there is more truth in the discrimination of the unelearned than the scientific are apt to allow. In 1867-1868 Dr O. Fisch published at Leiden an elaborate monograph of the parrots, regarding them as a family, in which he admitted 26 genera, forming 5 subfamilies: (1) that composed of Strigops (Kakapo); (2) that containing the crested forms or cockatoos; (3) one which he named Sittacinae, comprising all the long-tailed species—a somewhat heterogeneous assemblage, made up of Macaws (Q. v.) and which are commonly known as parakeets; (4) the parrots proper with short tails; and (5) the so-called "brush-tongued" parrots, consisting of the Lories (Q. v.) and Nesters (Q. v.). In 1874 A. H. Garrold communicated to the Zoological Society the results of his dissection of examples of 82 species of parrots, which had lived in its gardens, and these results were published in its Proceedings for that year (pp. 586-598, pls. 70, 71). Summarily expressed, Garrold's scheme was to divide the parrots into two families, Palaeornithidae and Psittacidae, assigning to the former three subfamilies, Palaeornithinae, Cacatuidae and Stringopinaceae, and to the latter four, Arinae, Pyrrhurinae, Platycercinae and Chrysinae. That each of these sections, except the Cacatuidae, is artificial any regard to ontology would show. In the Journal fur Ornithologie for 1881 A. Richemont published a Genus Palaeornis, Psittacidae, founded, as several others have been, on external characters only. He makes 9 families of the group, and recognizes 45 genera, and 442 species, besides subspecies. His grouping is generally very different from Garrold's, but displays as much artificiality: for instance, Nester is referred to the family which is otherwise composed of the cockatoos.

The system now generally accepted is based on a combination of external and anatomical characters, and is due to Count T. Salvadori (Cat. Birds, Brit. Mus. XX., 1801), and H. F. Gadow (Bromn's Thier-Reich, Aves, 1893). About 86 genera with more than 500 species are recognized, divided into the family Psittacidae with the subfamilies Stringopinaceae, Psittacinaceae and Cacatuidae, and the family Trichoglossidae with the subfamilies Cyclopsittacinae, Lorinae and Nestorinae.

The headquarters of parrots are in the Australian Region and the Malay countries; they are abundant in South America; in Africa and India the number of forms is relatively small; in Europe and North Asia there are none now alive, in North America one only. Parrots are gregarious and usually feed and roost in companies, but are at least temporarily monogamous. Most climb and walk well; the flight is powerful but low and undulating in most. The food is varied but chiefly vegetable, whilst parrots are alone amongst birds in holding the food in the claws. The usual cry is harsh and discordant, but many softer notes are employed. A large number of forms learn in captivity to talk and whistle, the well-known red-tailed grey parrot (Psittacus erithacus) of tropical Africa being pre-eminent. The eggs are laid usually in holes in trees, rocks, or the ground, no lining being formed. The larger species produce one to three, the smaller as many as twelve, the colour being dull white. The young when hatched are naked and helpless.

(A. N.)

Parrot-fishes

The following notes, which are derived from the locality of the family to have influenced opinion, and without that difference they would scarcely have been separated, for in many other groups of birds distinctions so slight are regarded as barely evidence of local races.

1 A few remains of a Parrot have been recognized from the Miocene of the Allier in France, by A. Milne-Edwards (Obs. Foss. France, vol. 5, 1857). They are represented by a few bones, some of which show a resemblance to the common Grey Parrot of Africa, Psittacus erithacus, through having some affinity to the Ring-necked Parakeet of the same country, Psilopsittacus torquatus. He refers them, however, to the same genus Psittacus, for the reasons of locality remained.

2 The statements that have been made, and even repeated by writers of authority, as to the occurrence of "a green parrot" in Syria (Chesney, Express Survey, Euphrates and Tigris, ii. 443, 537) and the Satrapy of Turanian (Journ. As. Soc. Beng., ii. 185, 186) originated with gentlemen who had no ornithological knowledge, and are accordingly erroneous.

3 While it is granted that the African examples of this bird are said to be distinguished from the Asiatic by their somewhat shorter wings and weaker bill, and hence they are considered by some authorities to form a distinct species or subspecies, P. doulicis; but it is also considered that all the other varieties of the species have, influenced opinion, and without that difference they would scarcely have been separated, for in many other groups of birds distinctions so slight are regarded as barely evidence of local races.
dentition, of jaws as well as pharynx. The teeth of the jaws are soldered together, and form a sharp-edged beak similar to that of a parrot, but without a middle projecting point, and the upper and lower beak are divided into two lateral halves by a median suture. In a few species the single teeth can be still distinguished, but in the majority (Pseudocarcus) they are united into a homogeneous substance with polished surface. By this sharp and hard beak parrot-fishes are enabled to bite or scrape off those parts of coral-stocks which contain the polyps or to cut off branches of tough fucus, which in some of the species forms the principal portion of their diet. The process of triturating the food is performed by the pharyngeal teeth, which likewise are united, and form plates with broad masticatory surfaces, not unlike the grinding surface of the molars of the elephant. Of these plates there is one pair above, opposed to and fitting into the single one which is coalesced to the lower pharyngeal bone. The contents of the alimentary canal, which are always found to be finely divided and reduced to a pulp, prove the efficiency of this triturating apparatus; in fact, ever since the time of Aristotle it has been maintained that the Searus ruminates. Nearly one hundred species of parrot-fishes are known from the tropical and sub-tropical parts of the Indo-Pacific and Atlantic Oceans; like other coral-feeding fishes, they are absent on the Pacific coasts of tropical America and on the coast of tropical West Africa. The most celebrated is the Searus of the Mediterranean. Beautiful colours prevail in this group of wrasses, but are subject to great changes and variations in the same species; almost all are evanescent and cannot be preserved after death. The majority of parrot-fishes are edible, some even esteemed; but they (especially the carnivorous kinds) not infrequently acquire poisonous properties after they have fed on corals or medusae containing an acid poison. Many attain to a considerable size, upwards of 3 ft. in length.

PARRY, SIR CHARLES HUBERT HASTINGS, Bart., English musical composer (1848— ), second son of Thomas Gambier Parry, of Highham Court, Gloucester, was born at Bournemouth on the 27th of February 1848. He was educated at Malvern, Twyford, near Winchester, Eton (from 1861), and Exeter College, Oxford. While still at Eton he wrote music, two anthems being published in 1865; a service in D was dedicated to Sir John Stainer. He took the degree of Mus.B. at Oxford at the age of eighteen, and that of B.A. in 1870; he then left Oxford for London, where in the following year he entered Lloyd's, abandoning his studies for a time, but soon resuming them. He studied successively with H. H. Pierson (at Stuttgart), Stempdale Bennett and Macfarren; but the most important part of his artistic development was due to Edward Dannreuther. Among the larger works of this early period must be mentioned an overture, Guilem de Cabestany (Crystal Palace, 1879), a pianoforte concerto in F sharp minor, played by Dannreuther at the Crystal Palace and Richter concerts in 1880, and his first choral work, the Scenes from Prometeus Unboold, produced at the Gloucester Festival, 1886. These, like a symphony in G given at the Birmingham Festival of 1882, seemed strange even to educated ears, who were educated by Mendelssohn's doctrine of treatment. It was not until his setting of Shirley's ode, The Glories of our Blood and State, was brought out at Gloucester, 1883, and the Partita for violin and pianoforte was published about the same time, that Parry's importance came to be realized. With his sublime eight-part setting of Milton's Best Pair of Sirens (Bach Choir, 1887) began a fine series of compositions to sacred or semi-sacred words. In Judith (Birmingham, 1888), the Ode on St Cecilia's Day (Leeds, 1889), L'Allegro ed il Penseroso (Norwich, 1890), De Profundis (Hereford, 1891), The Lotus Eaters (Cranbridge, 1892), Job (Gloucester, 1892), King Saul (Birmingham, 1894), Immortelles (Leeds, 1895), Magnificat (Hereford, 1897), A Song of Darkness and Light (Gloucester, 1898), and Te Deum (Hereford, 1900), are revealed the highest qualities of music. Skill in piling up climax after climax, and command of every choral resource, are the technical qualities most prominent in these works; but in his orchestral compositions, such as the three later symphonies, in F, C and E minor, in two suites, one for strings alone, and above all in his Symphonic Variations (1897), he shows himself a master of the orchestra, and his experiments in modification of the conventional forms, such as appear in the work last named, or in the Nineteen Variations for Pianoforte Solo, are always successful. His music to The Birds of Aristophanes (Cambridge, 1883) and The Frogs (Oxford, 1892) are striking examples of humour in music; and that to Agamemnon (Cambridge, 1906) is among the most impressive compositions of the kind. All his choral music, exquisite part-songs and solo songs maintain the high standard of his greater works. At the opening of the Royal College of Music in 1883 he was appointed professor of composition and of musical history, and in 1894, on the retirement of Sir George Grove, Parry succeeded him as principal. He was appointed Choragus of Oxford University in 1883, succeeding Stainer in the professorship of the university in 1900. He received the honorary degree of Mus.D. at Cambridge 1883, Oxford 1884, Dublin 1891; and was knighted in 1898. Outside the domain of creative music, Parry's work for music was of the greatest importance: as a contributor of many of the most important articles on musical forms, &c., in Grove's dictionary, his literary work first attracted attention; in his Studies of Great Composers musical biography was treated, almost for the first time, in a really enlightened and enlightening way; and his Art of Music is a splendid monument of musical literature, in which the theory of evolution is applied to musical history with wonderful skill and success.

PARRY, SIR WILLIAM EDWARD (1799–1855), English rear-admiral and Arctic explorer, was born in Bath on the 19th of December 1799, the son of a doctor. At the age of thirteen he joined the flag-ship of Admiral Cornwallis in the Channel fleet as a first-class volunteer, in 1806 became a midshipman, and in 1810 was promoted to the rank of lieutenant in the "Alexander" frigate, which was employed for the next three years in the protection of the Spitzbergen whale fishery. He took advantage of this opportunity for the study and practice of astronomical observations in northern latitudes, and afterwards published the results of his studies in a small volume on Nautical Astronomy by Night (1816). From 1813–1817 he served on the North American station. In 1818 he was given the command of the "Alexander" brig in the Arctic expedition under Captain (afterwards Sir) John Ross. This expedition returned to England without having made any new discoveries but Parry, confident, as he expressed it, "that attempts at Polar discovery had been hitherto relinquished just at a time when there was the greatest chance of succeeding," in the following year obtained the chief command of a new Arctic expedition, consisting of the two ships "Gripper" and "Heca." This expedition returned to England in November 1820 after a voyage of almost unprecedented Arctic success (see POLAR REGIONS), having accomplished more than half the journey from Greenland to Bering Strait, the completion of which solved the ancient problem of a North-west Passage. A narrative of the expedition, entitled Journal of a Voyage to discover a North-west Passage, appeared in 1821. Upon his return Lieutenant Parry was promoted to the rank of commander. In May 1821 he set sail with the "Fury" and "Heca" on a second expedition to discover a North-west Passage, but was compelled to return to England in October 1823 without achieving his purpose. During his absence he had in November 1821 been promoted to post rank, and shortly after his return he was appointed acting hydrographer to the navy. His Journal of a Second Voyage, &c., appeared in 1824. With the same ships he undertook a third expedition on the same quest in 1824, but was again unsuccessful, and the "Fury" being wrecked, he returned home in October 1825 with a double-screw sloop. Of this voyage he published an account in 1826. In the following year he obtained the sanction of the Admiralty for an attempt on the North Pole from the northern shores of Spitzbergen, and his extreme point of 82° 45' N. lat. remained for 49 years the highest latitude attained. He published an account of this journey under the title of Narrative of the Attempt to reach the North Pole.
PARRY—PAREES

North Pole, &c. (1827). In April 1829 he was knighted. He was subsequently selected for the post of commodore of the newly created department of steam machinery of the Navy, and held this office until his retirement at the age of sixty, the year when he was appointed captain-superintendent of Haslar Hospital. He attained the rank of rear-admiral in 1832, and in the following year became a governor of Greenwich Hospital, and retained this post till his death on the 8th of July 1855. The religious side of Sir Edward Parry's character was strongly marked, and besides the journals of his different voyages he was also the author of a Lecture to Scamen, and Thoughts on the Parental Character of God. See Memoirs of Rear-Admiral Sir W. E. Parry, by his son, Rev. Edward Parry, 1873.

PARRY (from Fr. parier, to ward off), to turn aside a blow from a weapon. The term is used especially of a defensive movement of the sword or foil in fencing, hence, by transference, to ward off any attack, to turn aside an objectionable question. (See FENCING, &c.)

PAREES, or PARSES, the followers in India of Zoroaster (Zarathustra), being the descendants of the ancient Persians who emigrated to India on the conquest of their country by the Arabs in the 8th century. They first landed at Sanjan on the coast of Gujarat, where the Hindu rulers received them hospitably. To this day their vernacular language is Gujarati, which they have cultivated in literature and journalism. Their settlement in Bombay dates only from the British occupation of that island. In 1901 the total number of Parsees in all India was 94,000, of whom all but 7000 were found in the Bombay presidency and the adjoining state of Baroda, the rest being widely scattered as traders in the large towns.

Among Parsees the men are well formed, active, handsome and intelligent. They have light olive complexions, a fine aquiline nose, bright black eyes, a well-turned chin, heavy arched eyebrows, thick sensual lips, and usually wear a light curling moustache. The women are delicate in frame, with small hands and feet, and fair skin. Their black eyes, finely arched eyebrows, and a profusion of long black hair, which they dress to perfection, and ornament with pearls and gems. The Parsees are much more liberal in their treatment of women than any other Asiatic race; they allow them to appear freely in public, and leave them the entire management of household affairs.

The characteristic costume of the Parsees (now frequently abandoned) is loose and flowing, very picturesque in appearance, and admirably adapted to the climate in which he lives. The head is covered with a turban, or a cap of a fashion peculiar to the Parsees; it is made of stiff material, something like the European felt bonnet, with a wide rim, and has a knot or button on the top of the forehead backwards. It would not be respectful to uncover in presence of an equal, much less of a superior. The colour is chocolate or maroon, except with the priests, who wear a white turban.

A Parsee must be born upon the ground floor of the house, as the teachings of their religion require life to be commenced in humility, and by "good thoughts, words and actions" alone can an elevated position be attained either in this world or the next. The mother is not seen by any member of the family for forty days. Upon the seventh day after the birth an astrologer is invited to cast the nativity of the child. He has first to enumerate the names which the child may bear, so that the parents may make choice of one of them. Then he draws on a wooden board a set of hieroglyphs in chalk, and his dexterity in counting or recounting the stars under whose region or influence the child is declared to be born is marvelled at by the superstitious creatures thronging around him. This document is preserved in the family archives as a guidance and encouragement to the child through life. At the age of seven or thereabouts, according to the judgment of the priest, the first religious ceremony is performed upon the young Parsee. He is first subjected to the process of purification, which consists of an ablation with nirang (cow-urine). The ceremony consists in investing him with the kusti, or girdle of his faith. This is a cord, woven by women of the priestly class, composed of seventy-two threads, representing the seventy-two chapters of the Yasna, a portion of the Zend-Avesta, in the sacredness of which the young Parsee is invested. The priest ties the cord around the waist as he pronounces the benediction upon the child, throwing upon his head at each sentence slices of fruit, seeds, perfumes and spices. He is thus received into the religion of Zoroaster, and is henceforth considered morally accountable for his acts. If a child die before the performance of this ceremony he is considered to have gone back to Ahurá-Mazdá, who gave him, as pure as he entered into this world, having not reached the age of accountability.

The marriages of children engage the earliest attention of the parents. The wedding day having been fixed by an astrologer, whose divination is highly esteemed, they give instructions to the friends from house to house with a list of the guests to be invited, and delivers the invitations with much ceremony. The father of the bride waits upon near relatives and distinguished personages, soliciting the honour of their attendance. A little before sunset a procession is formed at the house of the bridegroom, and proceeds with a band of music, amid great pomp and ceremony, to the house of the bride's father. Here a number of relatives and friends are collected at the door to receive the bridegroom with due honour. Presents are sent before, according to the time-honoured custom of the East. Upon the arrival of the procession at the house of the bride the gentlemen remain outside, leaving room for the ladies to enter the house as the escort of the bridegroom. As he passes the threshold his future mother-in-law meets him with a tray filled with fruits and rice, which she strews at his feet. The fathers of the young couple are seated side by side, and between them stands the priest ready to perform the ceremony. The young couple are seated in two chairs opposite each other, their right hands tied together by a silken cord, which is gradually wound around them as the ceremony progresses, the bride in the meantime being concealed with a veil of silk or muslin. The priest lights a lamp of incense, and repeats the mutual benediction first in Zend and then in Sanskrit. At the conclusion of the ceremony they each throw upon the other some grains of rice, and the most expeditious in performing this feat is considered to have got the start of the other in the future control of the household, and receives the applause of the male or female part of the congregation as the case may be. The priest now throws some grains of rice upon the heads of the married pair in token of wishing them abundance; bouquets of flowers are handed to the assembled guests, and rose-water is showered upon them. The bride and bridegroom now break some sweetmeats, and, after they have served each other, the company are invited to partake of refreshments. The termination of this feast the procession re-forms, and with lanterns and music escorts the bridegroom back to his own house, where they feast until midnight. As midnight approaches they return to the house of the bride, and escort her, with her dowry, to the house of the bridegroom, and, having delivered her safely to her future lord and master, disperse to their respective homes. Eight days afterwards a wedding feast is given by the newly-married couple, to which only near relatives and particular friends are invited. This feast is composed entirely of vegetables, but at each course the wine is served, and toasts are proposed, as "happiness to the young couple." &c.

The funeral ceremonies of the Parsees are solemn and imposing. When the medical attendant declares the case hopeless a priest advances to the bed of the dying man, repeats sundry texts of the Zend-Avesta, the substance of which tends to afford him consolation, and breathes a prayer for the forgiveness of his sins. After life is extinct a funeral sermon is delivered by the priest, in which the deceased is made the subject of an exhortation to his relatives and friends to live pure, holy and righteous lives, so that they may hope to meet again in paradise. The body is then taken to the ground floor where it was born, and, after being washed and perfumed, is dressed in clean white clothes, and laid upon an iron bier. A dog is brought in to take a last look at his inanimate master in order to drive away the evil spirits. This
ceremony is called sagdā. A number of priests attend and repeat prayers for the repose of the soul of the departed. All the male friends of the deceased go to the door, bow down, and raise their two hands from the floor to their heads to indicate their respect for the departed. The body, when put upon the bier, is covered over from head to foot. Two attendants bring it out of the house, holding it low in their hands, and deliver it to four pall-bearers, called nassosalar, clad in well-washed, white clothes. A procession is formed by the male friends of the deceased, headed by a number of priests in full dress, to follow the body to the dakhma, or "tower of silence." In Bombay these towers are erected in a beautiful garden on the highest point of Malabar Hill, amid trees swarming with vultures; they are constructed of stone, and rise some 25 ft. high, with a small door at the side for the entrance of the body. Upon arriving at the "tower of silence" the bier is laid down, and prayers and ablutions are performed, containing a fire-sanctuary, which is erected near the entrance to the garden. The attendants then raise the body to its final resting-place, lay it upon its stony bed, and retire. A round pit about 6 ft. deep is surrounded by an annular stone pavement about 7 ft. wide, on which the body is exposed to the vultures, where it is soon denuded of flesh, and the bones fall through an iron grating into a pit beneath, from which they are afterwards removed into a subterranean entrance prepared for their reception. On the third day after death an assemblage of the relatives and friends of the deceased takes place at its last residence, and thence proceed to the Attih-bahram, or "fire temple." The priests stand before the uras in which the celestial fire is kept burning, and recite prayers for the soul of the departed. The son or adopted son of the deceased kneels before the high-priest, and promises due performance of all the religious duties and obsequies to the dead. The relatives and friends then hand the priest a list of the contributions and charities which have been subscribed in memory of the deceased, which concludes the ceremony of "rising from mourning," or "the resurrection of the dead." On each successive anniversary of the death of a Parsee funeral ceremonies are performed in his memory. An iron framework, covered with cloth in which shrubs are planted and flowers cultivated to bloom in memory of the departed, before the frame, on iron stands, are placed copper or silver vases, filled with water and covered with flowers. Prayers are said before these iron frames two or three times a day. These ceremonies are called mikhlo, or "ceremonies of departed souls."

The Parsees of India are divided into two sects, the Shensahis and the Kadmis. They do not differ on any point of faith; the dispute is confined to a quarrel as to the correct chronological date for the computation of the era of Yazdegard, the last king of the Sassanian dynasty, who was dethroned by the caliph Omar about 640 A.D. The difference has been productive of no other inconvenience than arises from the variation of a month in the celebration of the festivals. The Parsees compute time from the fall of Yazdegard. Their calendar is divided into twelve months of thirty days each; the other five days, being added for holy days, are not counted. Each day is named after some particular angel of bliss, under whose special protection it is passed.

On feast days a division of five watches is made under the protection of five different divinities. In midwinter a feast of six days is held in commemoration of the six periods of creation. About the 21st of March, the vernal equinox, a festival is held in honour of agriculture, when planting begins. In the middle of April a feast is held to celebrate the creation of trees, shrubs and flowers. On the fourth day of the sixth month a feast is held in honour of Sahrivar, the deity presiding over mountains and mines. On the sixteenth day of the seventh month a feast is held in honour of Mithra, the deity presiding over and directing the course of the sun, and also a festival to celebrate truth and friendship. On the tenth day of the eighth month a festival is held in honour of Farvarzin, the deity who presides over the departed souls of men. This day is especially set apart for the performance of ceremonies for the dead. The people attend on the hills near the "tower of silence." The difference has been productive of no other inconvenience than arises from the variation of a month in the celebration of the festivals. The Parsee scriptures require the last ten days of the year to be spent in doing deeds of charity, and in prayers of thanksgiving to Ahurā-Maādi. On the day of Yazdegard, or New Year's Day, the Parsees emulate the western world in rejoicing and social intercourse. They rise early, and after having performed their prayers and ablutions dress themselves in a new suit of clothes, and sally forth to the "fire-temples," to worship the emblem of their divinity, the sacred fire, which is perpetually burning on the altar. Unless they duly perform this ceremony they believe their souls will not be allowed to pass the bridge "ChinvaT, leading to heaven. After they have performed their religious services they visit their relations and friends, when the ceremony of hamijur, or joining hands, is performed. The ceremony is a kind of greeting by which they wish each other a happy new year." Their relatives and friends are invited to dinner, and they spend the day in social intercourse, rejoicing and feasting the poor, and new suits of clothes are presented to servants and dependants.

There are only two distinct classes among the Parsees—the priests (dastars, or high priests; mobeds, or the middle order; and herbads, or the lowest order) and the people (be各种, be各种, or "followers of the best religion"). The priestly office is hereditary, and no one can become a priest who was not born such; but the son of a priest may become a layman.

The secular affairs of the Parsees are managed by an elective committee, or panchayat, composed of six dastars and twelve mobeds, making a council of eighteen. Its functions resemble the Venetian council of ten, and its objects are to preserve unity, peace and justice amongst the followers of Zoroaster. One law of the panchayat is singular in its difference from the custom of any other native community in Asia; nobody who has a wife living shall marry another, except under peculiar circumstances, such as the barrenness of the living wife, or her immoral conduct. Recently a serious difference arose among the Parsees of Bombay on the question of proselytism. A Parsee had married a French lady, who took the necessary steps to adopt the religion of her husband. But it was decided by the High Court, after prolonged argument, that, though the creed of Zoroaster theoretically admitted prosytes, their admission was not consistent with the practice of the Parsees in India.

Their religion teaches them benevolence as the first principle, and no people practise it with more liberality. A beggar among the Parsees is unknown, and would be a scandal to the society. The sagacity, activity and commercial enterprise of the Parsees are proverbial in the East, and their credit as merchants is almost unlimited. In this connexion may be mentioned the well-known names of Sir Jamsetjee Jeejeebhoy and Sir Dinshaw Petit, both baronets, and also of J. N. Tata, founder of the Institute of Scientific Research at Bangalore.

The Parsees have shown themselves most desirous of receiving the benefits of an English education; and their eagerness to embrace the science and literature of the West has been conspicuous in the wide spread of female education, and in the activity shown in studying their sacred writings in critical texts. In recent years many have taken to the professions of law and medicine, and a Parsee barrister was appointed a judge of the High Court at Bombay in 1866. Two Parsees have also been the only natives of India elected to the House of Commons.

See Menant, Les Parsees (Paris, 1898); Dosabhai Framji Karaka, History of the Parsees (London, 1843); Servati and Patch, Gujarat Parsees from the Earliest Times (Bombay, 1898).

PARSIFAL BELL-INSTRUMENT (Ger. Parsifal Klavier Instrument), a strange instrument ingeniously constructed by Schweigut, of Carlsruhe, from Dr Mottl's design, as a substitute for the church bells in Wagner's Parsifal. This instrument has been constructed somewhat on the principle of the grand piano; the massive frame is shaped like a billiard table. There are five notes, each with six strings, three in unison giving the fundamental note and three an octave higher. The strings are struck by large hammers, covered with cotton-wool, which the performer sets in motion by a strong elastic blow from his fist. The hammers are attached to arms 22 in. long, screwed to...

 Parsifal Bell-Instrument
strong wooden span bridge placed horizontally above the strings at about two-fifths of the length from the front. On the point of the arm is the name of the note, and behind this the felt ledge struck by the fist. Two belly bridges and two wrest-plank bridges, one set for each octave, determine the vibrating length of the strings, and the belly bridge, as in other stringed instruments, is the medium through which the vibrations of the strings are communicated to the sound-board. The arrangement of partitions makes it exactly the same as on the piano.

The realism demanded by modern dramatic music taxes the resources of the orchestra to the utmost when the composer aims at reproducing on the stage the effect of church bells, as, for instance, in the Golden Legend, Castavelia rusticana, Pozziacci, Rienzi and Parsifal. The most serious difficulty of all arose in the last-mentioned drama, where the solemnity of the scene and its deep religious significance demand a corresponding atmosphere on the stage. Real church bells for the notes Wagner has scored in the familiar chime would overpower the orchestra. All substitutes for bells were tried in vain; no other instrument, leaving aside the question of pitch, gave a tone in the least similar to that of the bell. Independently of the rich harmonics composing the clang, the bell has two distinct simultaneous notes, first the tap tone, which gives the pitch, and the hum tone or lower accompanying note. On the interval separating the hum from the tap tone depend the dignity and beauty of the bell tone and the emotional atmosphere produced. A stringed instrument, similar to the one here described but with four notes only, was used at Bayreuth for the first performance of Parsifal, and with it tam-tams or gongs, but after many trials the following combination was adopted as the best makesset: (1) the stringed instrument with four keys; (2) four tam-tams or gongs tuned to the pitch of the four notes composing the chime; (3) a bass-tuba, which plays the notes staccato in quavers to help make them more distinct; (4) a fifth tam-tam, on which a roll is executed with a drumstick.

The special peal of hemispherical bells constructed for Sir A. Sullivan’s Golden Legend is the only other successful substitute known to the writer; the lowest of these bells is a minor tenth higher than the lowest note required for Parsifal, and the aggregate weight of the four bells is 11 cwt. The bell are struck with mallets and have both tap and hum tone. (K.S.)

PARSIMONY, LAW OF (Lat. parsimonia, from parere, to save), the name given to William of Occam’s principle “Entia non sunt multiplicanda praeter necessitatem;” i.e. that it is scientifically unsound to set up more than one hypothesis to account for a phenomenon. This principle is known as “Occam’s razor” (see Occam, William of).

PARSLEY, a hardy biennial herb known botanically as Petroselinum sativum (natural order Umbelliferae), the leaves of which are much used for garnishing and flavouring. It occurs as a garden escape in waste places in Britain and it is doubtful if it is known anywhere as a truly wild plant; A. de Candolle, however (Origin of Cultivated Plants) considers it to be wild in the Mediterranean region. It grows best in a partially shaded position, in good soil of considerable depth and not too light; a thick dressing of manure should be given before sowing. For a continuous supply three sowings should be made, as early in February as the weather permits, in April or early in May and in June—the last for the winter supply in a sheltered position with southern exposure. Sow thinly in drills from 12 to 15 in. apart and about 1 in. deep; thin out to 3 in. and finally to 6 in. each. In winter the plants should be protected by frames or hand-glasses. The curled and mussy-leaved varieties are preferable. The Hamburg or turnip-rooted variety is grown for the root, which is cut up and used for flavouring.

PARSNIP, botanically known as Pastinaca sativa (or Paece- danum sativum), a member of the natural order Umbelliferae, found wild in roadsides and waste places in England and throughout Europe and temperate Asia, and as an introduced plant in North America. It has been cultivated since the time of the Romans for the sake of its long slender whitish root, which has a peculiar but agreeable flavour. It succeeds best on a free sandy loam, which should be trenched and manured in the previous autumn, the manure being well buried. The seed should be sown thinly in March, in rows 15 to 18 in. apart, and finally thinned out to 1 ft. apart. The leaves will decay in October or November, when a portion of the roots may be taken up and stored in dryish sand for immediate use, the rest being left in the ground, to be taken up as required, but the whole should be uprooted when the field begins to be fallow, in order to keep it from becoming infested.

The best sorts are the Hollow-crowned, the Maltese and the Student. Dusting the ground with soot when sowing the seed and again when the leaves appear will keep the plants free from pests.

PARSON, a technical term in English law for the clergyman of the parish. It is a corruption of persona, the parson being, as it were, the persona ecclesiae, or representative of the Church in the parish. Parson impassonne (persona impersonata) is he that as rector is in possession of a church parochial, and of whom the church is full, whether it be presentative or improper (Coke upon Littleton, 300 6). The word parson is properly used only of a rector. A parson must be in holy orders; hence a lay rector could not be called a parson. There are four requisites to the appointment of a parson, viz. holy orders, presentation, institution and induction. The parson is tenant for life of the parsonage house, the glebe, the tithes and other dues, so far as they are not appropriated.

See also Rector; Vicar; Benefice; and Tithes.

PARSONS (or Persons), ROBERT (1546-1610), English Jesuit and political agitator, son of a blacksmith, was born at Nether Stowey, Somerset, on the 24th of June 1560. The vicar of the parish gave him instruction and procured his entrance in 1565 as an exhibitor to Balliol College, Oxford. He graduated B.A. in 1568, and M.A. in 1572. He was fellow, bursar and dean of his college, but in 1574 he resigned or was dismissed his fellowship and offices, for reasons which have been disputed, some alleging improprieties of conduct, and others suspected disloyalty. For some time after his resignation he went to London, and in June to Louvain, where he entered the Roman Catholic Church and spent some time in the company of Father William Good, a Jesuit. In July 1575 he entered the Jesuit Society at Rome. In 1580 he was selected, along with Edmund Campion, a former associate at Oxford, and others, to undertake a secret religious and political mission to England. The two emissaries engaged in political intrigue in England and on the Continent. In 1581 Campion was arrested, but Parsons made his escape to Rouen, whence he returned to Rome, where he continued to direct the religious mission. In 1588 he went to Spain, where he remained for nine years, founding seminaries for the training of English priests at Valladolid, Lucar, Seville, Lisbon and St Omer. On the death of Cardinal Allen in 1594 he made strenuous efforts to be appointed his successor. He failed in this, but was made rector of the English college at Rome in 1597, and died there on the 18th of April 1610.

Parsons was the author of over 30 polemical writings, mostly tracts. Among the more important are Certaine Reasons why Catholiques refuse to goe to Church (Doyle, 1580), A Christian Directorie guiding Men to their Saluation (London, 1583-1591, 2 parts), A Conference about the Next Succession to the Crowne of England (1604), Treatise of the Three Conversions of England (1603-1604, 3 parts), an answer to Pope's Acts and Monuments. For portrait, see Gentleman's Magazine, iv.

PARSONS, THEOPHILUS (1750-1813), American jurist, was born in Byfield, Massachusetts, on the 24th of February 1750, the son of a clergyman. He graduated from Harvard College in 1769, was a schoolmaster at Falmouth (now Portland), Maine, in 1770-1773, studied law, and was admitted to the bar in 1774. In 1800 he removed to Boston. He was chief justice of the supreme court of Massachusetts from 1806 until his death in Boston on the 30th of October 1813. In politics he took an active part as one of the Federalist leaders in the state. He was a member of the Essex County convention of 1778, called to protest against the proposed state constitution, and as a member of the “Essex Junto” was probably the author of The Essex
PARSONS—PARTHENON

Result, which helped to secure the rejection of the constitution at the polls. He was a member of the state constitutional convention of 1779-1780, and one of the committee of twenty-six which drafted the constitution; he was also a delegate to the state convention of 1788 which ratified the Federal Constitution; and according to tradition was the author of the famous "Conciliatory Resolutions," or proposed amendments to the constitution, which did much to win over Samuel Adams and John Hancock to the side of ratification. His Commentaries on the Laws of the United States (1836) contains some of his more important legal opinions.

His son Theophilus Parsons (1797-1882), who was Dane professor of law at Harvard from 1848 to 1876, is remembered chiefly as the author of a series of useful legal treatises, and some books in support of Swedenborgian doctrines; he wrote a life of his father (Boston, 1859).

PARSONS, a city of Labette county, in south-eastern Kansas, U.S.A., situated at the junction of the Big and Little Labette creeks, about 138 m. S. by W. of Kansas City. Pop. (1890), 6173; (1900), 7682, of whom 807 were negroes; (1905, state census), 11,720. It is served by the Kansas City Fort Scott & Memphis (St Louis & San Francisco system) and the Missouri Kansas & Texas railways. The city has large machine shops of the Missouri Kansas & Texas railway and various manufactures. Natural gas is utilized for light and heat. The first settlement on the site of the city was made in 1860 and was called Mendota ("place of meeting"—i.e. of the creeks). In 1871 the city was chartered, and in 1910 government by commission went into effect. It was named in honour of Levi Parsons (1822-1887), the first president of the Missouri Kansas and Texas railway.

PARTABGARH, or Pertabgarh, a native state of India, in the Rajputana agency. Area, 886 sq. m.; pop. (1901), 52,025, showing a decrease of 40% in the decade, owing to the effects of famine. The inhabitants are mostly Brahils and other aboriginal tribes. Estimated revenue, £2,000. The town of Partabgarh (pop., 9191) is connected by a metalled road (20 m.) with the station of Mandasor on the Rajputana railway. It has a reputation for a special kind of enamelled jewellery.

PARTABGARH, Pertabgarh, of Pratapgarh, a district of British India in the Fyzabad division of the United Provinces. The administrative headquarters are at Bela. Area, 1442 sq. m.; pop. (1901), 912,484. The Ganges forms the south-western boundary line, while the Gomti marks the eastern boundary for a few miles. The only mineral products are salt, saltpetre and kankar or nodular limestone. The principal crops are rice, barley, pulse, millets, sugar-cane and poppy. The district is traversed by the branch of the Oudh & Rohilkhand railway from Rae Bareilly to Benares, opened in 1808. There are manufactures of sugar and a little silk; and grain, opium, oilseeds, hemp and hides are exported.

See Partabgarh District Gazetteer (Allahabad, 1904).

PARRERTE, a term, taken from the French phrase par terre, i.e. on the surface of the ground, and used of an arrangement in a garden of beds of flowers with gravel or other paths and plots of grass; also of that part of the auditorium of a theatre which is occupied by the orchestra stalls.

PARTHENAY, a town of western France, capital of an arrondissement in the department of Deux-Sèvres, 27 m. N.N.E. of Niort, on the railway between that town and Saumur. Pop. (1900), 6015. The town retains considerable portions of its fine 13th-century ramparts, including the Porte St Jacques, a fortified gateway guarding an old bridge over the Thouet. Amongst ancient buildings of interest are the church of Ste Croix, of the 12th century, restored in 1885, with a 17th-century belfry; the church of St Laurent, also restored in modern times, portions of whose walls date from the 11th century; the ruined Romanesque portal of Notre-Dame de la Coudrel; and 1 m. south-west of the town the ancient church (12th century) of Parthenay-le-Vieux. The manufacture of woollen goods and wool-spinning are the principal local industries.

PARTHENIUS, of Nicæa in Bithynia, Greek grammarian and poet. He was taken prisoner in the Mithridatic War and carried to Rome (72 B.C.); subsequently he visited Neapolis, where he taught Virgil Greek. Parthenius was a writer of elegies, especially dirges, and of short epic poems. The pseudo-Virgilian Morænum et Cirís were imitated from his Mortuæ and Mæroborææ. His Παρθενίου τα ῥήματα is still extant, containing a collection of 36 love-stories which ended unhappily, taken from different historians and poets. As Parthenius generally quotes his authorities, these stories are valuable as affording information on the Alexandrian poets and grammarians.

See E. Martini in Mythographi graci, vol. ii. (1902, in Teubner Series); poetical fragments in A. Meineke, Analecta alexandrina (1853).

PARTHENON, the name generally given, since the 4th century B.C., to the chief temple of Athena on the Acropolis at Athens (e.g. Demosthenes, " Androt., 13, 76). The name is applied in the official inventories of the 5th and early 4th centuries to one compartment of the temple, and this was probably its original meaning. It is certainly to be associated with the cult of Athena Parthenos, "the Virgin," though it is not clear why the name was given to this particular chamber.

The most convenient position for a temple upon the natural rock-platform of the Acropolis was occupied by the early temple of Athena. When it was decided to supersede this by a larger and more magnificent temple, it was necessary to provide a site for this new temple by means of a great substructure, which is on its south side about 40 ft. high. This substructure was not built for the present temple, but for an earlier one, which was larger and narrower in shape; there has been much discussion as to the date of this earlier temple; F. C. Penrose maintained that it was the work of Peisistratus. Some have thought that it dated from the time immediately after the Persian wars; but the fact that portions of its columns and entablature, damaged by fire, were built into the north wall of the Acropolis by Themistocles seems to prove that it dates from the 6th century, whether it be the work of the tyrants or of the renewed democracy under Cleisthenes.

The extant temple was the chief among the buildings with which Pericles adorned the Acropolis. The supervision of the whole work was in the hands of Pheidias, and the architects of the temple were Ictinus and Callicrates. The actual building was not begun until 447 B.C., though the decision to build was made ten years earlier (Kell, Anonymus argenteorum). The temple must have been structurally complete by the year 438 B.C., in which the gold and ivory statue of Athena Parthenos was dedicated; but the work of decoration and finish was still going on in 433 B.C. The temple as designed by Ictinus was about 15 ft. shorter and about 6 ft. wider than the building for which the foundations were intended; it thus obtained a proportion of length to breadth of exactly 9:4. It is the most perfect example of the Doric order (see Architecture: Greek). The plan of the temple was peculiar. The cela, which was exactly 100 ft. long, kept the name and traditional measurement of the old Heptakopedon. It was surrounded on three sides by a Doric colonnade, and in the middle of it was the great basis on which the statue was erected. This cela was probably lighted only by the great doorway and by the light that filtered through the marble tiles. The common notion that there was a hospitium opening is
erroneous. At the back of the cells was a square chamber, not communicating with it, but entered from the west end of the temple; this was the Parthenon in the narrower sense. It seems to have been used only as a store-house, though it may have been originally intended for a more important purpose. The Prodomus and the Opisthomous were enclosed by bronze gratings fixed between the columns, and were thus adapted to contain valuable offerings and other treasures. We have inventories of money, jewels, and gold and silver plate from these four compartments of the temple. The opisthomous, in particular, probably served as a treasury for sacred and other money, though it has been disputed whether the opisthomous mentioned in the inscriptions is part of the Parthenon or another building.

For the sculptures decorating the Parthenon and the statue by Pheidias in the cella, see article Greek Art. The metopes over the outer colonnade were all sculptured, and represented on the east the battle of gods and giants, on the west, probably, the battle of Greeks and Amazons on the south Greeks and Centaurs; those on the north are almost lost. The east pediment represented the birth of Athena, the west pediment her contest with Poseidon for the land of Attica. The frieze, which was placed above the cella wall at the sides, represented the Panathenaic procession, approaching on three sides the group of gods seated in the middle of the east side. These sculptures are all of them admirably adapted to their position on the building, and are, in themselves, the most perfect works that sculpture has ever produced.

The Parthenon probably remained intact until the 5th century of our era, when the colossal statue was removed, and the temple itself was much altered. It became transformed into a church dedicated to St. Sophia. In the 6th century it was dedicated to the Virgin Mother of God (Θεοτόκος). The adaptation of the building as a church involved the removal of the inner columns and roof, the construction of an apse at the east end, and the opening of a door between the cells and the chamber behind it. These alterations involved some damage to the sculptures. In 1456 Athens was captured by the Turks, and the Parthenon was consequently changed into a mosque, apparently without any serious structural alterations except the addition of a minaret. In this state it was described by Spon and Wehler in 1676 and the sculptures were drawn by the French artist Caurey in 1674. In 1687 the Turks used the building as a powder magazine during the bombardment of the Acropolis by a Venetian army under Morosini, and a shell caused the explosion which blew out the middle of the temple and threw down the columns at the sides. Still further damage to the sculptures was done by Morosini's unsuccessful attempt to lower from the west pediment the chariot of Athena. Later a small mosque was constructed in the midst of the ruins; but nothing except gradual damage is to be recorded during the succeeding century except the visits of various travellers, notably of James Stuart (1713–1778) and Nicholas Revett (1720–1809), whose splendid drawings are the best record of the sculpture as it existed in Athens. In 1801 Lord Elgin obtained a firm contract authorizing him to make casts and drawings, and to pull down extant buildings where necessary, and to remove sculpture from them. He caused all the remains of the sculpture to be found on the ground or in Turkish houses, and a certain amount—notably the metopes—that was still on the temple, to be transported to England. Some fault has been found with his methods or those of his workmen; but there is no doubt that the result was the preservation of much that would otherwise have been lost. The Elgin marbles were bought by the British government in 1816 and are now in the British Museum. Certain other sculptures from the Parthenon are in the Louvre, Copenhagen or elsewhere, and much is still in Athens, either still on the temple or in the Acropolis museum.

The most accurate measurements of the temple, showing the exactness of its construction and the subtlety of the curvature of all its lines, was made by F. C. Penrose.

**Parthia**, the mountainous country S.E. of the Caspian Sea, which extends from the Elburz chain eastwards towards Herat, and is bounded on the N. by the fertile plain of Hyrcania (about Astrabad) at the foot of the mountains in the corner of the Caspian and by the Turanian desert; on the S. by the great salt desert of central Iran. It corresponds to the modern Khurasan. It was inhabited by an Iranian tribe, the *Parthava* of the inscriptions of Dareius; the correct Greek form is *Haghaeoia*. Parthia became a province of the Achaemenian and then of the Macedonian Empire. Seleucus I. and Antiochus I. founded Greek towns: Sotera, Charis, Achaea, Callope (Appian, Syr. 27; Plin. vi. 15; cf. Strabo xi. 116); the capital of Parthia is now known only by its Greek name *Heptamypolos* ("The Hundred-gated") from the many roads which met there (Polyb. x. 28), and was, according to Appian, founded by Seleucus I. (cf. Curtius vii. 2). In 208 many Greek inhabitants are found in the towns of Parthia and Hyrcania (Polyb. x. 31, 11).

When about 255 B.C. Diotodus had made himself king of Bactria (q.v.) and tried to expand his empire, the chieftain of a tribe of Iranian nomads (Dahan Seyts) east of the Caspian, the Parni or Aparni, who bore the Persian name Arsaces, fled before him into Parthia. Here the satrap Andragoras appears to have shaken off the Seleucid supremacy, as he struck gold and silver coins in his own name, on which he wears the diadem, although not the royal title (Gardner, *Numism. Chronicle*, 1879–1881). In Justin xii. 4, 12, Andragoras is wrongly made satrap of Alexander, of Persian origin, and ancestor of Arsaces. He was slain by Arsaces (Justin xii. 4), who occupied Parthia and became the founder of the Parthian kingdom. The date 248 B.C. given by the list of the Olympiads in Euseb. Chron. i. 207, and in his Canon, i. 120 (cf. Appian, Syr. 65; Justin, xli. 4, gives wrongly 256 B.C.), is confirmed by numerous Babylonian tablets dated simultaneously from the Seleucids and Arsacid eras (cf. Norden, *Dialektische Abhandlungen*, Leipzig, 1901, xv. 52 sqq.; Lehmann Haupt in *Beiträge zur alten Geschichte*, 1905, v. 128 sqq.). The origin and early history of the Parthian kingdom, of which we possess only very scanty information, is surrounded by fabulous legends, narrated by Arrian in his *Parthica* (preserved in Photius, cod. 58, and Synelbos, p. 550 seq.). Here Arsaces and his brother Tiridates are derived from the royal house of the Achaemenids, probably from Artaxerxes II.; the young Tiridates is insulted by the prefect Agathocles or Phereoes; in revenge the brothers kill him, Tiridates (corresponding to the seven Persians of Darius) slay him, and Arsaces becomes king. He is killed after 130 years and succeeded by his brother Tiridates, who reigns 37 years. There is scarcely anything historical in this account, perhaps not even the name Tiridates, for, according to the older tradition, Arsaces himself ruled for many years. The troubles of the Seleucid empire, and the war of Seleucus II. against Tplotmy III. and his own brother Antiochus Hierax, enabled him not only to maintain himself in Parthia, but also to conquer Hyrcania; but he was constantly threatened by Diotodus of Bactria (Justin xii. 4). When, about 235 B.C., Arsaces was killed by Diotodus, his son and successor of the same name (corresponding to the seven Persians of Darius) was put to death, and his other son Tiridates was made king of Bactria (Justin xii. 9). He was killed in 219, and was succeeded by a cousin, possibly also called Tiridates, who ruled 4 years. Tiridates was killed by another cousin, who was killed in turn, and was succeeded by his son Arsaces, who called himself Cleopatra. When, in 200, he was killed by Artaxerxes I., his son and successor continued the same name (cf. Strabo xii. 515; cf. Polyb. x. 48). But Seleucus was soon recalled by a rebellion in Syria, and Arsaces returned victorious to Parthia; "the day of this victory is celebrated by the Parthians as the beginning of their independence" (Justin xii. 4). Arsaces was proclaimed king at Asaak in the district of Astaeuna, now Kuchan in the upper Atrek (Attrak) valley (Isidor, Charac.), and built his residence Danara on a rock in a fertile valley in Apavarkitekene (Justin xii. 5; Plin. vi. 46), now Kelat still further eastward; the centre of his power evidently lay on the borders of eastern Khurasan and the Turanian desert. The principal institutions of the Parthian kingdom

1 Strabo xi. 515; cf. Justin xii. 4; the Parthi are said by Strabo (ibid.) to have immigrated from southern Russia, a tradition wrongly transferred to the Parthians themselves by Justin xii. 1, and Arrian ap. Phot. cod. 58.
were created by him (cf. Justin xi. 3). The Scythian nomads became the ruling race; they were invested with large landed property and formed the council of the king, who appointed the successor. They were archers fighting on horseback, and in their cavalry consisted the strength of the Parthian army; the infantry were mostly slaves, bought and trained for military service, like the janissaries and musketeers. But these Scythians soon amalgamated with the Parthian peasants. They adopted the Iranian religion of Zarooaster (in the royal town Asaak an eternal fire was maintained), and "their language was a mixture of Scythian and Median" (i.e., Iranian). Therefore their language and writing are called by the later Persians "Pehlevi," i.e., Parthian (Pehlevi is the modern form of Parthian) and the magi of themselves termed "Aheri," i.e., "the term transferred by Firdousi to the heroes of the old Iranian legend. But the Arsacid kingdom never was a truly national state; with the Scythian and Parthian elements were united some elements of Greek civilization. The successors of Arsaces I. even founded some Greek towns, and when they had conquered Babylonia and Mesopotamia they all adopted the epithet "philhellene."

To Arsaces I. probably belong the earliest Parthian coins; the oldest simply bear the name Arsaces; others, evidently struck after the coronation in Asaak, have the royal title (bahrilay "Ahrasek). The reverse shows the seated archer, or occasionally an elephant; the head of the king is beardless and wears a diadem and a diadem; only from the third or fourth king they begin to wear a beard after the Iranian fashion. In honour of the founder of the dynasty all his successors, when they came to the throne, adopted his name and officially (e.g. on the coins) are almost always called Arsaces, whereas the historians generally use their individual names.

Of the successors of Arsaces I. we know very little. His son, Arsaces II., was attacked by Antiochus III., the Great, in 209, who conquered the Parthian and Hrycanian towns but at last granted a peace. The next king, whom Justin calls Priaputus, ruled 15 years (about 180-175) and was succeeded, Phraates I., stood by the mountainous tribe of the Marzi (in the Elburz). He died early, and was succeeded not by one of his sons but by his brother, Mithradates I., who became the founder of the Parthian empire. Mithradates I. (c. 170-138) had to fight hard with the Greeks of Bactria, especially with Eucratides (g.v.); at last he was able to conquer a great part of eastern Iran. Soon after the death of Antiochus IV. Epaphrodes (163) he conquered Media, where he founded the town of Raghas (Rai near Teheran) under the name of Arsac; and about 141 he invaded Babylonia. He and his son Phraates II. defeated the attempts of Demetrios II. (130) and Antiochus VII. (120) to regain the eastern provinces, and expelled the Arsacide toxin to the Ephiphanes.

For the later history of the Parthian empire reference should be made to Persia: Ancient History, and biographical articles on the kings. The following is a list of the kings, as far as it is possible to establish their succession.

The names of pretenders not generally acknowledged are put in brackets.

Arsaces I. the Great. (perhaps Tiridates I. itself)

Arsaces II. Mithradates II. the Great. (perhaps Tiridates I.)

Santraces IV. A. D. 67-70

Phraates III. A. D. 70-57

OrrDATES III. A. D. 57-53

Phraates IV. A. D. 57-2

Tiridates IV. A. D. 2 B.C.-A.D. 5

Orodes II. A. D. 5-7

Vologases IV. A. D. 101-209

Artabanus IV. A. D. 209-222

Vologases V. A. D. 209-222

AUTHORS.—Persian tradition knows very little about the Arsacids, who by it are called Ashkianians (from Ashak, the modern form of Arsaces). Of course, the history of the Parthians (besides the numismatic literature) the most important are: G. Rawlinson, The Sixth Oriental Monarchy (1873), and A. von Gutschmid, Geschichte Irans and seine Nachbarlander von Alexander bis zu den Unternehmungen der Russen (1875), who carefully revised the statements of his predecessors. Cf. also Petrovich, Arcadideminsen (Vienna, 1904), and Allotte de la Fuye, "Classement des monnaies arsacides," in Revue numismatique, 4 (1891), 291.

PARTICK (formerly Perely or Partick), a municipal and police burgh of the parish of Govan, Lanarkshire, Scotland. Pop. (1891), 36,558; (1901), 54,288. It lies on the north bank of the Clyde, and is continuous with Glasgow, from which it is separated by the Kelvin, and of which it is a large and wealthy residential suburb. Shipbuilding yards are situated in the burgh, which has also industries of paper-making, flour-milling, hydraulic-machine making, weighing-machine making, brass-founding and galvanizing. The tradition is that the flour-mills and granaries —the Bunhouse Mills—as they are called locally, were given by the Regent Moray to the bankers of Glasgow but their public spirit in supplying his army with bread at the battle of Langside in 1568. Victoria Park contains a grove of fossil trees which were discovered in a quarry. The town forms the greater part of the Partick division of Lanarkshire, which returns one member to Parliament. Though it remained a village till the middle of the 19th century, it is an ancient place. Morken, the Pictish king who persecuted St. Kentin, is believed to have dwelt here and, in 1136, David I. gave the lands of Partick to the see of Glasgow. The bishop's palace stood by the side of the Kelvin, and was occupied—or a mansion erected for him on its site—by General Hope-Hodson (1580-1639), founder of the Hutcheson Hospital in the city.

PARTISAN, or PARTIZAN. (1) A thoroughly going "party" man or adherent, usually in a depreciatory sense of one who puts his party before principles; (2) an irregular combatant or guerrilla soldier; (3) a weapon with a long shaft and a broad bladed head, of a type intermediate between the spear and the halberd (g.v.). In senses (1) and (2) the word is derived through the Fr. from It. partigiano, from parteggiare, to share, take part in, Lat. pars, part. The name for the weapon has also been attributed to the same origin, as being that used by partisans, but there is no historical evidence for this. The form which the word now takes, Fr. Partizan, partizan, has given rise to a connection with partis, partout, hol, Lat. partus, partendere, to strike through. But the most probable derivation is from the Teutonic parta, barta, axe, which forms the last part of "halberd."

PARTITION, in law, the division between several persons of land or goods belonging to them as co-proprietors. It was a maxim of Roman law, followed in modern systems, that in communiione vel societate nemo potest titulus detinere. Partition was either voluntary or was obtained by the actio communis dividendi. In English law the term partition applies only to the division of lands, tenements and hereditaments, or of chattels real between coparceners, joint tenants or tenants in common. It is to be noticed that not all hereditaments are capable of partition. There can be no partition of homage, fealty, or common of turbary, or of an inheritance of dignity, such as a peerage. Partition is either voluntary or compulsory. Voluntary partition is effected by mutual conveyances, and can only be made where all parties are sui juris. Since the Real Property Act 1845, § 3, it must be made by deed, except in the case of copolnets. Compulsory partition is effected by private act of parliament, by judicial process, or through the inclusion commissioners. At common law none but coparceners were entitled to partition against the will of the rest of the proprietors, but the Acts of 31 Henry VIII. c. 1 and 32 Henry VIII. c. 32 gave a compulsory process to joint tenants and tenants in common of
PARTNERSHIP

freetholds, whether in possession or in reversion, by means of the writ of partition. In the reign of Elizabeth the court of chancery began to assume jurisdiction in partition, and the writ of partition, after gradually becoming obsolete, was finally abolished by the Red-Rose Act Limitation 1833. The court of chancery could not decree partition of copyholds until the passing of the Copyholds Act 1841. This act was repealed by the Copyholds Act 1864, which empowers the alienation of ancient tenements with the licence of the lord. By the Judicature Act 1873, § 34, partition is one of the matters specially assigned to the chancery division. An order for partition is a matter of right, subject to the discretion vested in the court by the Partitions Act 1868 (amended by the Partition Act 1876). By § 3 of the act of 1868 the court may, on the request of a party interested, direct a sale instead of a partition. If a sale would be more beneficial than a partition, by § 12 a county court has jurisdiction in partition where the property does not exceed £500 in value. Under the powers of the Incorporation Act 1845, and the acts amending it, the incorporation commissioners have power of enforcing compulsory partition among the joint owners of any inclosed lands. An order of the incorporation commissioners or a private act vests the legal estate, as did also the old writ of partition. But an order of the chancery division only declares the rights, and requires to be perfected by mutual conveyances so as to pass the legal estate. Where, however, all the parties are not sui juris, the court may make a vesting order under the powers of the Trustee Act 1850, § 3.

Partition is not a technical term of Scots law. In Scotland division of common property is effected either extrajudicially, or by action of declarator and division or division and sale in the court of session, or by the sheriff; the sheriff courts of common property are divisible in English law without an act of parliament or a decree of the division commissioners, but in Scotland the act of 1605, c. 38, made all communities, except those belonging to the king or royal burghs, divisible, on the application of any having interest, by action in the court of session. By the Sheriff Courts (Scotland) Act 1877, § 8, the action for division of common property or community is competent in the sheriff court, when the subject matter is not property of the value of £500 or more. Runrig lands, except when belonging to corporations, were made divisible by the act of 1905, c. 23. A decree of division of common property, or runrig lands has the effect of a conveyance by the joint proprieters to the several participators (Conveyancing (Scotland) Act 1871, § 35).

In the United States, "it is presumed," says Chancellor Kent, "(4 Comm., lect. iv.), "that the English statutes of 3 & 2 Henry VIII. have been generally re-enacted and adopted, and probably with increased facilities for partition." In a large majority of the states, partition may be made by a summary method of petition to the court of the county where the property is situate. In the other states the court has exclusive jurisdiction. As between heirs and devisees the probate courts may in some states award partition. The various state laws with regard to division will be found in Washburn, Real Property of the United States, ch. viii., § 7.

PARTNERSHIP (earlier forms, partner, parcener, from Late Lat. particinarius for partitionarius, from partio, sharing, pars, part), in general, the voluntary association of two or more persons for the purpose of gain, or sharing in the work and profits of any enterprise. This general definition, however, requires to be further restricted, in law, according to the account given below.

The partnership of modern legal systems is based upon the societas of Roman law. Societas was either universorum bonorum, a Rechtsgemach Limitation 1845, for the purpose of a single transaction; vectigalis, for the collection of taxes; or rei unius, joint ownership of a particular thing. The prevailing form was societas universorum quae ex quaestu veninunt, or trade partnership, from which all that did not come under the head of trade profit (quaestus) was excluded. This kind of societas was presumed to be contemplated in the absence of proof that any other kind was intended. Societas was a consensual contract, and restated nominally on the consent of the parties—really, no doubt (though this was not in terms acknowledged by the Roman jurists), on the fact of available commerce. No formalities were necessary for the constitution of a societas. Either property or labour must be contributed by the socius; if one party contributed neither property nor labour, or if one partner was to share in the loss but not in the profit (lucrum societas), there was no true societas. Societas was dissolved on grounds substantially the same as those of English law (see below). The only ground peculiar to Roman law was the change of status (capitis deminiutio). Most of the Roman law on the subject of societas is contained in Dig. xvii. tit. 2, Pro socio.

Though the English law of partnership is based upon Roman law, there are several matters in which the two systems differ. (1) There was no limit to the number of partners in Roman law. (2) In societas one partner could generally bind another only by express mandatum; one partner was not regarded as the implied agent of the others. (3) The debts of a societas were not aggregated, but not joint and several. (4) The herit of a deceased partner could not succeed to the rights of the deceased, even by express stipulation. There is no such disability in England. (5) In actions between partners in Roman law, the beneficium competentiae applied—that is, the privilege of being condemned only in such an amount as the partner could pay without being reduced to destitution. (6) The Roman partner was in some respects more strictly bound by his fiduciary position than is the English partner. For instance, a Roman partner could not retire in order to enjoy alone a gain which he knew was awaiting him. (7) There was no special tribunal to which matters arising out of societas were referred.

Previous to the Partnership Act 1800 the English law of partnership was to be found only in legal decisions and in textbooks. It was mostly the result of judge-made law, and as distinguished from the law of joint stock companies was affected by comparatively few acts of parliament.

In 1800 the Partnership Act of that year was passed to declare and amend the law of partnership; the act came into operation on the 1st of January 1801. With one important exception (§ 23), it applies to the whole United Kingdom. It is not a complete act of partnership law; it contains no provisions regulating the administration of partnership assets in the event of death or bankruptcy, and is silent on the subject of goodwill. The existing rules of equity and common law continue in force, except so far as they are inconsistent with the express provisions of the act. Indeed, the act of 1800 has to be read in the light of the decisions which have built up these rules. On all points specifically dealt with by the act it is now the one binding authority. The act has made no important changes in the law, except in respect of the mode of making a partner's share of the partnership assets available for payment of his separate debts. The act is divided into the four main divisions mentioned below.

1. Nature of Partnership.—Partnership is defined to be the "relation which subsists between persons carrying on a business in common with a view of profit." From this definition corporations and companies, such as joint-stock companies and cost-book mining companies, which differ from ordinary partnerships in many important respects, are expressly excluded. The act also contains several subsidiary rules for determining the existence of a partnership. These rules are of a fragmentary nature, and for the most part are expressed in a negative form; they have not introduced any change in the law. Co-ownership of property does not of itself create a partnership, nor does the sharing of gross returns. The sharing of profits, though not of itself sufficient to create a partnership, is prima facie evidence of one. This means that if all that is known is that two persons are sharing profits, the inference is that such persons are partners; but if the participation in profits is only one amongst other circumstances, all the circumstances must be considered, and the participation in profits must not be treated as raising a presumption of partnership, which has to be rebutted. To illustrate the rule that persons may share profits without being partners, the act gives statutory expression to the decision in Cox v. Hickman (1866, 8 H.L.C., 268), viz. that the receipt
by a person of a debt or other fixed sum by instalments, or otherwise, out of the accruing profits of a business does not, or of itself make him a partner; and it re-enacts with some slight modification the repealed provisions of Bovill’s Act (28 & 29 Vict. c. 86), which was passed to remove certain difficulties arising from the decision in Cox v. Hickman. Whenever the question of partnership or no partnership arises, it must not be forgotten (though this is not stated in the act) that partnership is a relation arising out of a contract; regard must be paid to the true contract and intention of the parties as appearing from the whole facts of the case. If a partnership is the legal consequence of the true agreement, the parties thereto will be partners, though they may have intended to avoid this consequence (Adam v. Newbigging, 1888, L.R. 13 App. Cas. 312). Partners are called collectively a ‘firm’; the name under which they carry on business is called the firm name. Under English law the firm is not a corporation, nor is it recognized as distinct from the members composing it; any change amongst them destroys the identity of the firm. In Scotland a firm is a legal person distinct from its members, but each partner can be compelled to pay its debts.

As a rule, no partner, or corporation, of which a partner is a member, but by the Companies Act 1862 (25 & 26 Vict. c. 80, § 4), not more than ten persons can carry on the business of bankers, and not more than twenty any other business, unless (with some exceptions) they conform to the provisions of the act.

(See Company, and also Limited Partnerships below.)

II. Relations of Partners to Persons dealing with them.—

Every partner is an agent of the firm and of his co-partners for the purpose of the partnership business; if a partner does an act for carrying on the partnership business in the usual way in which businesses of a like kind are carried on—in other words, if he acts within his apparent authority—he thereby prima facie binds the firm. The partners may by agreement between themselves restrict the power of any of their number to bind the firm. If there be such an agreement, no act done in contravention of it is binding on the firm with respect to persons who have notice of the agreement. Such an agreement does not affect persons who have no notice of it, unless indeed they do not know or believe the person with whom they are dealing to be a partner; in that case he has neither real, nor, so far as they are concerned, apparent authority to bind his firm, and his firm will not be bound. If a partner does an act, e.g. pledges the credit of the firm, for a purpose apparently not connected with the firm’s ordinary course of business, he is not acting in pursuance of his apparent authority, and whatever liability he may personally incur, his partners will not be bound unless he had in fact authority from them.

Apart from any general rule of law relating to the execution of deeds or negotiable instruments, a firm and all the partners will be bound by any act relating to the business of the firm, and done in the firm name, or in any other manner showing an intention to bind the firm, by any person thereto authorized. An admission or representation by a partner, acting within his apparent authority, is evidence against his firm. Notice to an innocent party thereto is no limit to the power of the partnership to bind itself.

A firm is liable for loss or injury caused to any person not a partner, or for any penalty incurred by any wrongful act or omission of a partner acting in the ordinary course of the partnership business, or with the authority of his co-partners; the extent of the firm’s liability is the same as that of the individual partner. The firm is also liable to make good the loss (a) where one partner, acting within his apparent authority, receives money or property of a third person and misapplies it; and (b) where a firm in the course of its business receives money or property of a third person, and such money or property while in the custody of the firm is misapplied by a partner. It is not sufficient, in order to fix innocent partners with liability for the misapplication of money belonging to a third party, merely to show that such money was employed in the business of the partnership, otherwise all the members of a firm would in all cases be liable to those beneficially interested therein for trust money improperly employed in this manner by one partner. This is not the case. To fix the other partners with liability, notice of the breach of trust must be brought home to them individually.

The liability of partners for the debts and obligations of their firm arising ex contractu, is joint, and in Scotland several also; the estate of a deceased partner is also severally liable in a due course of administration, but subject, in England or Ireland, to the prior payment of the separate debt. The liability of partners for the obligations of their firm arising ex delicto, is joint and several.

The authority of a partner to bind his co-partners commences with the partnership. A person therefore who enters into a partnership does not thereby become liable to the creditors of his partners for anything done before he became a partner. But a partner who retires from a firm does not thereby cease to be liable for debts or obligations incurred before his retirement. He may be discharged from existing liabilities by an agreement to that effect between himself and the members of the firm as newly constituted and the creditors. This agreement may be either express or inferred as a fact from the conduct of dealing between the creditors and the new firm. The other remedies in which a partner may be freed from partnership liabilities incurred before his retirement are not peculiar to partnership liabilities, and are not therefore dealt with by the Partnership Act.

A continuing guaranty given to a firm, or in respect of the transactions of a firm, is, in the absence of agreement to the contrary, revoked as to the future by a change in the firm. The reason is that such a change destroys its identity.

Any person, not a partner in the firm, who represents himself (or, as the phrase is, ‘holds himself out’), or knowingly suffers himself to be represented, as a partner, is liable as a principal to any person who has given credit to the firm on the faith of the representation. The representation may be by words spoken or written, or by conduct. The liability will attach, although the person who makes the representation does not know that the person who has acted on it knew of it. The continued use of a deceased partner’s name does not impose liability on his estate.

III. Relations of Partners to one another.—The mutual rights and duties of partners depend upon the agreement between them. Many of these rights and duties are stated in the Partnership Act; but, whether stated in the act or ascertained by agreement, they may vary by the consent of all the partners; such consent may be express or inferred from conduct. Subject to any agreement, partners share equally in the capital and profits of their business, and must contribute equally to losses, whether of capital or otherwise; they are entitled to be indemnified by their firm against liabilities incurred in the proper and ordinary conduct of the partnership business, and for anything necessarily done for its preservation; they are entitled to interest at 5% on their advances to the firm, but not on their capital. Every partner may take part in the management of the partnership business, but no partner is entitled to any of the profit for so doing. The majority can bind the minority in ordinary matters; they cannot, however, without their consent, bind the firm, but cannot change its nature nor expel a partner, unless expressly authorized so to do. No partner may be introduced into the firm without the consent of all the partners. The partnership books must be kept at the principal place of business, and every partner may inspect and copy them. Partners must render to each other true accounts and full information of all things affecting the partnership. A partner may not make use of anything belonging to his firm for his private purposes, nor may he compete with it in business. If he does so he must account to his firm for any profit he may make.

Partners may agree what shall and what shall not be partnership property, and can by agreement convert partnership property into the separate property of the individual partners, and vice versa. Subject to any such agreement, all property originally brought into the partnership stock, or acquired on
account of the firm or for the purposes and in the course of its business, is declared by the act to be partnership property. Property bought with money of the firm is prima facie bought on account of the firm. Partnership property must be applied exclusively for partnership purposes and in accordance with the partnership agreement. Co-owners of land may be partners in the profits of the land without the land being partnership property; if such co-owners purchase other lands out of the profits, these lands will also belong to them (in the absence of any agreement to the contrary) as co-owners and not as partners. The legal estate in partnership land devolves according to the general law, but in trust for the persons beneficially interested therein. As between partners, and as between the heirs of a deceased partner and his executors or administrators, such lands is treated as personal or moveable estate, unless a contrary intention appears.

When no fixed term has been agreed upon for the duration of the partnership, it is at will, and may be determined by notice at any time by any partner. If a partnership for a fixed term is continued after the term has expired without any express new agreement, the rights and duties of the partners remain as before, so far as they are consistent with a partnership at will.

A partner may assign his share in the partnership either absolutely or by way of mortgage. The assignee does not become a partner; during the continuance of the partnership he has the right to receive the share of profits to which his assignor would have been entitled, but he has no right to interfere in the partnership business, or to require any accounts of the partnership transactions, or to inspect the partnership books. On a dissolution he is entitled to receive the share of the partnership assets to which his assignor is entitled as between himself and his partners, and for this purpose to an account as from the date of dissolution.

Since the act came into operation no writ of execution may issue in England or Ireland against any partnership property, except on a judgment against the firm. If in either of these countries a judgment creditor of a partner wishes to enforce his judgment against that partner's share in the partnership, he must obtain an order of court charging such share with payment of his debt and interest. The court may appoint a receiver of the partner's share, and may order a sale of such share. If a sale be ordered the other partners may buy the share; they may also at any time redeem the charge. The mode of making a partner's share liable for his separate debts in Scotland has not been altered by the act.

IV. Dissolution of Partnership.—A partnership for a fixed term, or for a single adventure, is dissolved by the expiration of the term or the termination of the adventure. A partnership for an undefined time is dissolved by notice of dissolution, which may be given at any time by any partner. The death or bankruptcy of any partner dissolves the partnership as between all its members. If a partner suffers his share in the partnership to be charged under the act for his separate debts, his partners may dissolve the partnership. The foregoing rules are subject to any agreement there may be between the partners. A partnership is in every case dissolved by any event which makes the partnership or its business unlawful. The court may order a dissolution in any of the following cases, viz.;

When a partner is found lunatic or is of permanently unsound mind, or otherwise permanently incapable of performing his duties as a partner; when a partner has been guilty of conduct calculated to injure the partnership business, or wilfully or persistently breaks the partnership agreement, or so conducts himself in partnership matters that it is not reasonably practicable for his partners to carry on business with him; when the partnership can only be carried on at a loss; and lastly, whenever a dissolution appears to the court to be just and equitable.

The act is silent as to the effect of the assignment by a partner of his share in the partnership as a cause of dissolution; probably it is now no more than a circumstance enabling the court, if it thinks fit, to grant a dissolution on the ground that it is just and equitable to do so. A dissolution usually is not complete as against persons who are not partners, until notice of it has been given; until then such persons may treat all apparent partners as still members of the firm. Consequently, if notice is not given when it is necessary, a partner may be made liable for partnership debts contracted after he ceased to be a partner. Notice is not necessary to protect the estate of a dead or bankrupt partner from partnership debts contracted after his death or bankruptcy; nor is notice necessary when a person not known to be a partner leaves a firm. If a person not generally known to be a partner is known to be so to certain individuals, notice must be given to them. Notice in the Gazette is sufficient as regards all persons who were not previously customers of the firm; notice in fact must be given to old customers. On a dissolution, or the retirement of a partner, any partner may notify the fact and require his co-partners to concur in doing so.

After a dissolution, the authority of each partner (unless he be a bankrupt) to bind the firm, and the other rights and obligations of the partners, continue so far as may be necessary to wind up the partnership affairs and to complete unfinished transactions. The partners are entitled to have the partnership property applied in payment of the debts of the firm, and to have any surplus divided between them. Before a partner can receive any part of the surplus he must prove himself to be a partner as may be due from him as a partner to the firm. To enforce these rights, any partner or his representatives may apply to the court to wind up the partnership business. It was well established before the act, and is still law, that in the absence of special agreement the right of each partner is to have the partnership property—including the goodwill of its business, if it be saleable—realized by a sale. The value of the goodwill depends largely on the right of the seller to compete with the purchaser after the sale. The act makes no mention of goodwill, but the rights of a seller in this respect were fully discussed in the House of Lords in Treanor v. Hable (L. C. 1862, 60 L. J. Eq. 74).

In the absence of special agreement the seller may set up business in competition with, and in the immediate neighbourhood of, the purchaser, and advertise his business and deal with his former customers, but may not represent himself as carrying on his former business, nor canvass his former customers. The purchaser may advertise himself as carrying on the former business, canvass its customers, and trade under the old name, unless that name is or contains the name of the vendor, and the purchaser by using it without qualification may induce the vendee to the liability of being sued as a partner in the business. If, on a dissolution or change in the constitution of a firm, the goodwill belongs under the partnership agreement exclusively to one or more of the partners, the partner who is entitled to the goodwill has the right of a seller, and those to whom the goodwill does not belong have the rights of a purchaser.

When a partner has paid a premium on entering into a partnership for a fixed term, and the partnership is determined before the expiration of the term, the court may, except in certain cases, order a return of the premium or of some part of the premium, but not the whole. In such case the court cannot make such an order when the partnership was at will, or, being for a fixed term, has been terminated by death or by reason of the misconduct of the partner who paid the premium; nor can it do so if terms of dissolution have been agreed upon, and the agreement makes no provision for the return of premium.

When a person is induced by the fraud or misrepresentation of others to become a partner with them, the court will rescind the contract at his instance (Adam v. Newbigging, 1888, R. 13 App. Cas. 508). Inasmuch as such a person is liable for the same liability to third parties for liabilities of the firm incurred before rescission as he would have been under had the contract been valid, he is entitled on the rescission to be indemnified by the person guilty of the fraud or making the representation against these liabilities. He is also entitled, without prejudice
to any other rights, to receive out of the surplus assets of the partnership, after satisfying the partnership liabilities, any money he may have paid as a premium or contributed as capital, and to stand in the place of the creditors of the firm for any payments made by him in respect of the partnership debt.

If a partner ceases to be a member of a firm, and his former partners continue to carry on business with the partnership assets without any final settlement of accounts, he, or, if he be dead, his estate, is, in the absence of agreement, entitled to such part of the subsequent profits as can be attributed to the use of his share of the partnership assets, or, if he or his representatives prefer it, to interest at 5% on the amount of his share. If his former partners have by agreement an option to purchase his share, and exercise the option and comply with its terms, he is not entitled to any further or other share in profits than that given to him by the agreement. If, however, his former partners, assuming to exercise such an option, do not comply with its terms, they are liable to account for subsequent profits or interest to the extent mentioned above. Subject to any agreement between the partners, the amount due from the surviving or continuing partners to an outgoing partner, or the representatives of a deceased partner, in respect of his share in the partnership, is a debt accruing at the date of the dissolution or death.

In the absence of any special agreement on a final settlement of accounts between partners, losses (including losses of capital) are paid first out of profits, next out of capital, and lastly by the partners in the proportions in which they share profits. The assets of the firm, including all sums contributed to make up losses of capital, are applied in paying the debts and liabilities of the firm to persons who are not partners; then in paying to each partner rateably what is due from the firm to him, first for advances and next in respect of capital; and the ultimate residue (if any) is divisible among the partners in the proportion in which profits are divisible.

**Limited Partnerships.**—In the law of partnership as set out above, the Limited Partnership Act 1907 introduced a considerable innovation. By that act power was given to form limited partnerships, like the French société en commandite—that is, a partnership consisting not only of general partners, but of others whose liability is limited to the amount contributed to the concern. Such a limited partnership must not consist, in the case of a partnership carrying on the business of banking, of more than ten persons, and in the case of any other partnership of more than twenty persons. There must be one or more persons called general partners who are liable for all the debts and obligations of the firm, and limited partners, who on entering into partnership contribute a certain sum or property with which they bind themselves. Limited partners cannot withdraw or receive back any of their contributions; any withdrawal brings liability for the debts and obligations of the firm up to the amount withdrawn. A body corporate may be a limited partner. No limited partner can take part in the management of a partnership business; if he does so he becomes liable in the same way as a general partner, but he can at all times inspect the books of the firm and examine into the state and prospects of the business. Every limited partnership must be registered with the registrar of joint stock companies, and the following particulars must be given: (a) the firm name; (b) the general nature of the business; (c) the principal place of business; (d) the full name of each of the partners; (e) the term, if any, for which the partnership is entered into and the date of its commencement; (f) a statement that the partnership is limited, and the description of every limited partner as such; (g) the sum contributed by each limited partner, and whether paid in cash or how otherwise. If any change occurs in these particulars, a statement signed by the firm and specifying the nature of the change, must be sent within seven days to the registrar. An advertisement must also be inserted in the gazette of any arrangement by which a general partner becomes a limited partner or under which the share of a limited partner is assigned. Any person making a false return for the purpose of registration commits a misdemeanour and is liable to imprisonment with hard labour for a term not exceeding two years. The law of private partnerships applies to limited partners except where it is inconsistent with the express provisions of the Limited Partnership Act.

**Scots Law.**—The law of Scotland as to partnership agrees in the main with the law of England. The principal difference is that Scots law recognizes the firm as an entity distinct from the individuals composing it. The firm of the company is either proper or descriptive. A proper or personal firm is a firm designated by the name of one or more of the partners. A descriptive firm does not introduce the name of any of the partners. The former may sue and be sued under the company name; the latter only with the addition of the names of three at least (if there are so many) of the partners. A consequence of this view of the company as a separate person is that an action cannot be maintained against a partner personally without application to the company in the first instance, the individual partners being in the position of cautions for the company rather than as principals. The provisions of the Partnership Act 1875 (10 & 20 Vict. c. 60, § 8), do not affect the case of partners. But, though the company must first be discussed, diligence must necessarily be directed against the individual partners. Heritable property cannot be held in the name of a firm; it can only stand in the name of individual partners. Notice of the retirement of even a dormant partner is necessary. The law of Scotland draws a distinction between joint adventure and partnership. Joint adventure or joint trade is a partnership confined to a particular adventure or speculation, in which the partners, whether latent or unknown, use no firm or social name, and incur no responsibility beyond the limits of the adventure. In the rules applicable to cases of insolvency and bankruptcy of a company and partners, Scots law differs in several respects from English. Thus a company can be made bankrupt without the partners being made so as individuals. And, when both company and partners are bankrupt, the company creditors are entitled to rank on the separate estates of the partners for the balance of their debts equally with the separate creditors. But in sequestration, by the Bankruptcy Act 1868, § 66, the creditor of a company, in claiming upon the sequestrated estate of a partner, must deduct from the amount of his claim the value of his right to dividend in the sequestrated estate. The former can thus be ranked as creditor only for the balance. (See Erskine's Inst. bk. iii. tit. iii.; Bell's Comm. ii. 500-562; Bell's Principles, §§ 350-403.)

**United States.**—In the United States the English common law is the basis of the law. Most states have, however, their own special legislation on the subject. The law in the United States permits the existence of limited partnerships, corresponding to the sociétés en commandite established in France by the ordinance of 1673, and those legalized in England under the act of 1907 (see above). The State of New York was the first to introduce this kind of partnership by legislative enactment. The provisions of the New York Act have been followed by most of the other states. In many states there can be no limited partnerships in banking and insurance. In this form of partnership one or more persons responsible in solido are associated with one or more dormant partners liable only to the extent of the funds supplied by them. In Louisiana such partnerships are called partnerships in commandite (Civil Code, art. 2716).

1 In France, it is to be noted, the style of a firm must contain no names other than those of actual partners. In Germany it must, upon the first constitution of the firm, contain the name of at least one actual partner, and must not contain the name of any one who is not a partner; when once established the style of the firm may be continued notwithstanding changes.
PARTON—PARTRIDGE

In New York the responsible partners are called general partners, the others special partners. Such partnerships must, by the law of most states, be registered. In Louisiana universal partnerships (the societates universorum bonorum of Roman law) must be created in writing and registered (Civil Code, art. 2860). In some states the English law as it stood before Cox v. Hickman is followed, and participation in profits is still regarded as the test of partnership, e.g. Legget v. HF (58 N.Y. Rep., 272). In some states nominal partners are not allowed. Thus in New York, where the words "and Company" or "and Co." are used, they must represent an actual partner or partners. A breach of this rule subjects offenders to penalties. In most states claims against the firm after the death of a partner must, in the first instance, be made to the survivors. The creditors cannot, as in England, proceed directly against the representatives of the deceased. An ordinary partnership between miners for working a mine is not dissolved by the death of one of the partners, nor by the transfer by one of his interest in the concern. Contract is not deemed the basis of the relation between the partners, but rather a common property and co-operation in its exploitation (Parsons, Principles of Partnership, § 15). A corporation cannot become a partner in any mercantile adventure, unless specially authorized by charter or general statute. If it could, the management of its affairs would no longer be exclusively in the hands of its directors, to whom the law has entrusted it. Hence, corporations cannot associate for the formation of a "trust" to be managed by the associated partners.

PARTON, James (1812–1891), American biographer, was born in Canterbury, England, on the 9th of February 1822. He was taken to the United States when he was five years old, studied in New York City and White Plains, New York, and was a schoolmaster in Philadelphia and then in New York. He removed (1852) to Newburyport, Massachusetts, where he died on the 17th of October 1891. Parson was the most popular biographer of his day in America. His most important books are Life of Horace Greeley (1855), Life and Times of Aaron Burr (1857), Life of Andrew Jackson (1859–1860), Life and Times of Benjamin Franklin (1864), Life of Thomas Jefferson (1874), and Life of Voltaire (1881). Among his other publications are General Butler in New Orleans (1863), Famous Americans of Recent Times (1867), The People’s Book of Biography (1868); Noted Women of Europe and America (1883), and Captains of Industry (two series, 1884 and 1891), for young people. His first wife, Sara (1811–1872), sister of N. P. Willis, and widow of Charles H. Eldredge (d. 1846), attained considerable popularity as a writer under the pen-name “Fanny Fern.” (See James Parton’s Fanny Fern: a Memorial Volume, 1873). They were married in 1856. Her works include the novels, Ruth Hall (1854), reminiscent of her own life, and Rose Clark (1857); and several volumes of sketches and stories. In 1876 Parton married Ethel Eldredge, his first wife’s daughter by her first husband.

PARTONOEUS DE BLOIS, hero of romance. The French romance of Partonoeus de Blois dates from the 13th century, and has been assigned, on the strength of an ambiguous passage in the prologue to his Vie de saint Edmund le rei to Denis Flarium. The tale is, in its essence a variation of the legend of Cupid and Psyche. Partonoeus is represented as having lived in the days of Clovis, king of France. He was seized while hunting in the Ardennes, and carried off to Montclair, the residence of the inhabitants of which were invisible. Melior, empress of Constantinople, came to him at night, stipulating that he must not attempt to see her for two years and a half. After successful fighting against the “Saracens,” led by Soronegur, king of Denmark, he returned to the castle, armed with an enchanted lantern which broke the spell. The consequent misfortunes have a happy termination. The tale had a continuation giving the adventures of Fursin or Anselet, the nephew of Soronegur. The name of Partonoeus or Partonopeus is generally assumed to be a corruption of Parthenopaeus, one of the seven against Thebes. It has been suggested that the word might be derived from Partenay, a supposition coloured by the points of similarity between this story and the legend of Mélusine (see Jean d’Arras) attached to the house of Lusignan, as the lords of these two places were connected.

BIBLIOGRAPHY.—The French romance was edited by G. A. Gravelet, with an introduction by A. C. M. Robert, as Partonoeus de Blois avec des notes (1843); as an English Partonoeus of Blois, by W. E. Buckley for the Roxburghe Club (London, 1862), and another fragment for the same learned society in 1873; the German Partonöiper von Montclair von Würzburg by K. Barsch (Vienna, 1871); the Icelandic Portalipó saga by O. Klokhoff in Upsala Universitets Årsskrift for 1887; See also H. L. Ward, Catalogue of Romances, (1. 686, &c.): E. Köhl, Die verschiedenen Gestaltungen der Partonöiper (Göttingen, 1922); in German, the Icelandic version is compared with the Danish poem Persenober and the Spanish prose Historia del conde Partinobles; E. Pfeiffer, "Über die Hs des Part. de Blois" in Stengel’s Ausg. in Abb. vom phil. (Darmstadt, 1895).

PARTRIDGE, JOHN BERNARD (1861— ), British artist, was born in London, son of Professor Richard Partridge, F.R.S., president of the Royal College of Surgeons, and nephew of John Partridge (1790–1872), portrait-painter extraordinary to Queen Victoria. He was educated at Stonyhurst College, and after matriculating at London University entered the office of Dunn & Hansom, architects. He then joined for a couple of years a firm of stained-glass designers (Lavers, Barraud & Westlake), learning drapery and ornament; and then studied and executed church ornament under Philip Westlake, 1850–1854. He began illustration for the press and practised water-colour painting, but his chief success was derived from book illustration. In 1858 he joined the firm of the Royal Institute of Painters in Water-colours and of the Pastel Society. For some years he was well known as an actor under the name of “Bernard Gould.”

PARTRIDGE, WILLIAM ORDWAY (1861— ), American sculptor, was born at Paris, France, on the 11th of April 1861. He received his training as a sculptor in Florence (under Galli), in Rome (under Velonksi), and in Paris. He became a lecturer and writer, chiefly on art subjects, and from 1894 to 1897 was professor of fine arts in Columbus University (now the George Washington University), Washington, D.C. Among his publications are: Art for America (1894), The Sing Life of a Sculptor (1894), The Technique of Sculpture (1895), The Angel of Clay (1900), a novel, and Nathan Hale, the Ideal Patriot (1902). His sculptural works consist largely of portraiture.

PARTRIDGE (Du. Patrijis, Fr. perdix, apparently onomatopoetic from the call of the bird), a game-bird, whose English name properly denotes the only species indigenous to Britain, often nowadays called the grey partridge, the Perdix cinerea of ornithologists. The excellence of its flesh at table has been esteemed from the time of Martial. For the sport of partridge-shooting see Shooting.

The grey partridge has doubtless largely increased in numbers in Great Britain since the beginning of the 19th century, when so much down, heath, and moorland was first brought under the plough, for its partiality to an arable country is very evident. It has been observed that the birds which live on grass lands or heather only are apt to be smaller and darker in colour than the average; but in truth the species when adult is subject to a much greater variation in plumage than is commonly supposed, and the well-known chestnut horse-shoe mark, generally considered distinctive of the cock, is very often absent. In Asia the grey partridge’s ranges between China and the Pamirs; in parts of Eastern Siberia its place is taken by a very nearly allied form, P. barbar, and in Tibet there is a bird, P. hodgsoniæ, which can hardly with justice be generically separated from it.

The common red-legged partridge of Europe, generally called the French partridge, Caccabits rufa, seems to be justifiably considered the type of a separate group. This bird was introduced into England in the last quarter of the 18th century, and has established itself in various parts of the country, notwithstanding a widely-spread, and in some respects unreasonable, prejudice against it. It has certainly the habit of trusting
nearly as much to its legs as to its wings, and thus incurred the obloquy of old-fashioned sportmen, whose dogs it vexatiously kept at a running point; but, when it was also accused of driving away the grey partridge the character only showed the ignorance of those who brought it, for as a matter of fact the French partridge rather prefers ground which the common inhabitant avoids—such as the heaviest clay-soils or the most common infestations heaths. The French partridge has several congeners, all with red legs and plumage of similar character. In Africa north of the Atlas there is the Barbary partridge, C. petrosa; in southern Europe another, C. saxatilis, which extends eastward till it is replaced by C. chukar, which reaches India, where it is a well-known bird. Two very interesting desert-forms, supposed to be allied to Caccidix, are the Anmoperdix heyi of North Africa and Palestine and the A. bonhami of Persia, but the former is not of much occurrence. An incessant spur, suggests (in our ignorance of their other osteological characters) an alliance rather to the genus Perdix. On the other hand the groups of birds known as Francolins and Snow-Partridges are generally furnished with strong but blunt spurs, and therefore probably belong to the Caccacine group. Of the former, containing many species, there is only room here to mention the francolin, which used to be found in many parts of the south of Europe, Francolinus vulgaris, which also extends to India, where it is known as the black partridge. This seems to have been the Aitagen or Attagen of classical authors, a name so celebrated for its exquisite flavour, the strange disappearance of which from all or nearly all its European haunts still remains inexplicable. It is possible that this bird has been gradually vanishing for several centuries, and if so to this cause may be attributed the great uncertainty attending the determination of the Aitagen—it being a common practice among men in all countries to apply the name of a species that is growing rare to some other that is still abundant. Of the snow-partridges, Tetroagallus, it is only to be said here that they are the giants of their kin, and that nearly every considerable range of mountains in Asia seems to possess its specific form. By English colonists the name Partridge has been very loosely applied, and especially so in North America. Where a qualifying word is prefixed no confusion is caused, but without it there is sometimes a difficulty at first to know whether the Ruffed Grouse (Bonasa umbellus) or the Virginia Quail (Ortyx virginianus) is intended. In South America the name is given to various Tinamous (q.v.).

PARTY WALL, a building term which, in England, apart from special statutory definitions, may be used in four different legal senses (Watson v. Gray, 1886, 14 Ch. D. 192). It may mean (1) a wall of which the adjoining owners are tenants in common; (2) a wall divided longitudinally into two strata, each belonging to each of the neighbouring owners; (3) a wall which belongs entirely to one of the adjoining owners, but is subject to an easement or right in the other to have it maintained as a dividing wall between the two tenements; (4) a wall divided longitudinally into two moieties, each moiety being subject to a cross easement, in favour of the owner of the other moiety. Outside London the rights and liabilities of adjoining owners of party walls are subject to the rules of common law. In London they are governed by the London Building Act 1894. A tenant in common of a party wall is entitled to have a partition vertically and longitudinally, so as to hold separately (Mayfair Property Co. v. Johnstone, 1894, 1 Ch. 508); each owner can then use only his own part of the wall. By the London Building Act 1894, § 5 (16) the expression ‘‘party wall’’ means—(a) a wall forming part of a building and used or constructed to be used for separation of adjoining buildings belonging to different owners, or occupied or constructed or adapted to be occupied by different persons; or (b) a wall forming part of a building, and standing to a greater extent than the projection of the footings on lands of different owners. Section 87 regulates the rights of owners of adjoining lands to erect party walls on the line of junction. Sections 88–90 determine the rights of building owners to deal with party walls by underpinning, repairing or rebuilding. The act contains provisions for settling disputes (§§ 91–92), and for bearing and recovering expenses (§§ 95–100). Part VI. of the act regulates the structure and the thickness, height, &c., of party walls.

See A. R. Rudall, Party Walls (1907).

PARUTA, PAOLO (1540–1598), Venetian historian, was born at Padua. He served the Venetian republic in various political capacities, including that of secretary to one of the Venetian delegates at the Council of Trent. In 1570 he published a work entitled Della Perfezione della vita politica, and the same year he was appointed official historian to the republic, in succession to Luigi Contarini. He took up the narrative from where Cardinal Bembo had left it, in 1513, and brought it down to 1551. He was made provveditore to the Chamber of Loans in 1586, saio del gran consiglio in 1590, and governor of Brescia in the following year. In 1596 he was appointed provveditore of St. Mark, and in 1597 superintendent of fortifications. He died a year later. His history, which was at first written in Latin and subsequently in Italian, was not published until after his death—in 1590. Among his other works may be mentioned a history of the War of Cyprus (1570–72) and a number of political orations.

See Apostolo Zeno’s edition of Paruta’s history (in the series Degli storici delle cose veneziane, Venice, 1718), and C. Monzani’s edition of Paruta’s political works (Florence, 1852).

PARVIS, PARVISE, or PARYSE, an open space surrounded by an enceinte or stone parapet in front of buildings, particularly cathedrals or large churches; probably first used to keep the people from pressing on and confusing the marshalling of processions. The word ‘‘parvis’’ is French and is a corruption of Lat. parvisus, an enclosed garden or paradise (q.v.), which is sometimes also used instead of ‘‘parvis’’. The Lat. parvisus is defined by Du Cange (Glossarium, s.z.) as atrium particulis circumdatum aut adæsae sacras. At St. Paul’s in London the ‘‘parvis’’ was a place where lawyers met for consultation.

PARYSATIS, daughter of Artaxerxes I., married to her brother Ochus (Ctesias, Pers. 44), who in 424 B.C. became king of Persia under the name of Darius II. (q.v.). She had great influence over her husband, whom she helped by perjury in the suppression of his brothers Scyedians, who was king before him, and Arsites, who rebelled against him (Ctes. Pers. 48–51). Her favourite son was Cyrus the Younger, whom she assisted as far as possible in his attempt to gain the throne. But when he was slain at Cunaxa (491) she nevertheless regained absolute dominion over the victorious Artaxerxes II. She was the evil genius of the reign among the intrigues she was able to invent the most atrocious punishment on all those who had taken part in the death of Cyrus. (Ed. M.)

PASADENA, a city in the San Gabriel valley of Los Angeles county, in southern California, U.S.A., about 9 m. N.E. of Los Angeles and about 20 m. from the Pacific Ocean. Pop. (1880) 301; (1890) 4882; (1900) 9117, of whom 1278 were foreign-born; (1910 census) 35,291. Area about 11 sq. m. It is served by the Southern Pacific, the Santa Fé, and the San Pedro, Los Angeles & Salt Lake railway systems, and by interurban electric lines. The city lies at an altitude of 750–1000 ft., about 5 m. from the base of the Sierra Madre range. Some half-dozen mountain peaks in the immediate environs rise to heights of 3200 to more than 6000 ft., notably Mt Wilson (6666 ft.), whose base is about 5 m. north-east of Pasadena, Echo mountain (9016 ft.), and Mt Lowe (6100 ft.). From Rubio canyon, near Pasadena, to the summit of Echo mountain, runs a steep cable railway, 1000 yds. long. On Echo mountain is the Lowe Observatory (3500 ft.), with a 16-in. equatorial telescope, and on Mt Wilson is the Solar Observatory (8868 ft.) of the Carnegie Institution of Washington, equipped with a 60-in. reflecting telescope and other instruments for stellar photography, a horizontal telescope for solar photography,
a 60-ft. tower telescope (completed in 1907), and a second tower telescope of 150 ft. focal length (under construction in 1910). At this observatory important researches in solar and stellar spectroscopy have been carried on under the direction of George Ellery Hale (b. 1868), the inventor of the spectrophotograph. The physical laboratory, computers' offices and instrument construction shops of the Solar Observatory are in Pasadena.  

The principal ruins of the town of Pasargadae at Murghab are a great terrace like that of Persepolis, and the remains of three buildings, on which the building inscription of Cyrus, “I Cyrus the king the Achaemenid” (i.e. “have built this”), occurs five times in Persian, Susian and Babylonian. They were built of bricks, with a foundation of stones and stone door-cases, like the palaces at Persepolis; and on these fragments of a procession of tribute-bearers and the figure of a winged demon (wrongly considered as a portrait of Cyrus) are preserved. Outside the town are two tombs in the form of towers and the tomb of Cyrus himself, a stone house on a high substructure which rises in seven great steps, surrounded by a court with columns; at its side the remains of a guardhouse, in which the officiating Magians lived, are discernible. The ruins of the tomb absolutely correspond to the description of Aristobulus.  

Nevertheless, some modern authors\(^1\) have doubted the identity of the ruins of Murghab with Pasargadae, as Ptolomy (vi. 4, 7), places Pasargada or Pasarracha south-eastwards of Persepolis, and mentions a tribe Pasargadae in Carmania on the sea (vi. 8, 12); and Phiny, Nat. hist. vi. 90, names a Persian river Sitojanus \(^2\) on which one navigates in seven days to Pasargadae. But it is evident that these accounts are erroneous. The conjecture of Oppert, that Pasargadae is identical with Fishiyavuβada, where (on a mountain Arakadri) the usurper Gaumāta (Smerdis) proclaimed himself king, and where his successor, the second false Smerdis Vahyazdata, gathered an army (inscrip. of Behistun, i. 11; iii. 41), is hardly probable.
though somewhat troublesome intendency of Rouen. The family accordingly removed to the Norman capital, though Gilberte Pascal shortly after, on her marriage, returned to Clermont. At Rouen they became acquainted with Cornelle, and Blaise pursued his studies with such success. Pascal already is given to brilliant speculations on the laws of science, and the beginnings of an injured constitution. Nothing, however, of importance happened till the year 1646. Then Pascal the elder was confined to the house by the consequences of an accident on the ice, and was visited by certain gentlemen of the neighbourhood who had come under the influence of Saint-Cyran and the Jansenists. It does not appear that up to this time the Pascal family had been controversialists of religion, but they now eagerly embraced the creed, or at least the attitude of Jansenism, and Pascal himself showed his zeal by informing against the supposed unorthodoxy of a Capuchin, the Père Saint-Hugo.

His bodily health was at this time very far from satisfactory, and he appears to have suffered, not merely from acute dyspepsia, but from a kind of paralysis. He was, however, indefatigable in his mathematical work. In 1647 he published his Nouvelles expériences sur le vide, and in the next year the famous experiment with the barometer on the Puy de Dome was carried out for him by his brother-in-law Perier, and repeated on a smaller scale by himself at Paris, to which place by the end of 1647 he and his sister Jacqueline had removed, to be followed shortly by their father. In a letter of Jacqueline's, dated the 27th of September, an account of a visit paid by Descartes to Pascal is given, which, like the other information on the relations of the two, give strong suspicion of mutual jealousy. Descartes, however, gave Pascal the very sensible advice to stay in bed as long as he could (it may be remembered that the philosopher himself never got up till eleven) and to take plenty of beef-tea. As early as May 1648 Jacqueline Pascal was strongly drawn to Port Royal, and her brother frequently accompanied her to its church. She desired indeed to join the convent, but her father, who returned to Paris with the dignity of counsellor of state, disapproved of the plan, and took both brother and sister to Clermont, where Pascal remained for the greater part of two years. E. Flecher, in his account of the Grands Jours at Clermont many years after, speaks of a "belle savante" in whose company Pascal had frequently been—a trivial mention on which, as on many other trivial points of scantily known lives, the most childish structures of comment and conjecture have been based. It is sufficient to say that at this time, despite the Rouen "conversion," there is no evidence to show that Pascal was in any way a recluse, an ascetic, or in short anything but a young man of great intellectual promise and performance, not indifferent to society, but of weak health. He, his sister and their father returned to Paris in the late autumn of 1649, and in September of the next year Étienne Pascal died. Almost immediately afterwards Jacqueline fulfilled her purpose of joining Port Royal—a proceeding which led to some soreness, finally healed, between herself and her brother and sister as to the disposal of her property. It has sometimes been supposed that Pascal, from 1651 or earlier to the famous accident of 1654, lived a dissipated, extravagant, worldly, luxurious (though admittedly not vicious) life with his friend the duc de Roannez and others. His Discours sur les passions de l'amour, a striking and characteristic piece, not very long since discovered and printed, has also been assigned to this period, and has been supposed to indicate a hopeless passion for Charlotte de Roannez, the duke's sister. But this is sheer romancing. The extant letters of Pascal to the lady show no trace of any affection (stronger than friendship) between them. It is, however, certain that in the autumn of 1654 Pascal's second "conversion" took place, and that it was lasting. He betook himself at first to Port Royal, and began to live a recluse and austere life there. Mme Perier simply says that Jacqueline persuaded him to abandon the world. Jacqueline represents the retirement as the final result of a long course of dissatisfaction with mundane life. But there are certain anecdotic embellishments of the act which are too famous to be passed over, though they are in part apocryphal. It seems that Pascal in driving to Neuilly was run away with by the horses, and would have been plunged in the river but that the traces fortunately broke. To this, which seems authentic, is usually added the tradition (due to the abbé Boisseau) that afterwards he used to times to see an imaginary precipice by his bedside, or at the foot of the chair on which he was sitting. Further, from the 23rd of November 1654 dates the singular document usually known as "Pascal's amulet," a parchment slip which he wore constantly about him, and which bears the date followed by some lines of incoherent and strongly mystical devotion.

It must be noted that, though he lived much at Port Royal, and partly at least observed its rule, he never actually became one of its famous solitaries. But for what it did for him (and for a time his health as well as his peace of mind seems to have improved) he very soon paid an ample and remunerative. At the end of 1655 Arnauld, the chief light of Port Royal, was condemned by the Sorbonne for heretical doctrine, and it was thought important by the Jansenist and Port Royal party that steps should be taken to disabuse the popular mind. Arnauld would have undertaken the task himself, but his wiser friends knew that his style was anything but popular, and overruled him. It is said that he personally suggested to Pascal to try his hand, and that the first of the famous Provinciales (Provincial Letters, proper Lettres écrites par Louis de Monluc à un provincial de ses amis) was written in a few days, or, less probably, in a day. It was printed without the author's name on the 23rd of January 1656, and, being immensely popular, and successful, was followed by others to the number of eighteen.

Shortly after the appearance of the Provinciales, on the 24th of May 1656, occurred the miracle of the Holy Thorn, a fragment of the crown of Christ preserved at Port Royal, which cured the little Marguerite Perier of a fistula lacrymalis. The Jesuits were much mortified by this Jansenist miracle, which, as it was officially recognized, they could not openly deny. Pascal and his friends rejoiced in proportion. The details of his later years after this incident are somewhat scanty. For years before his death we hear only of acts of charity and of, as it seems to modern ideas, extravagant asceticism. Thus Mme Perier tells us that he disliked to see her caress her children, and would not allow the beauty of any woman to be talked of in his presence. What may be called his last illness began as early as 1658, and as the disease progressed it was attended with more and more pain, chiefly in the head. In June 1660, having given up his own house to a poor family who were suffering from small-pox, he went to his sister's house to be nursed, and never afterwards left it. His state was, it seems, much more serious, and such a stupor had come over the Church that no prayers were allowed. Church were long put off. He was able, however, to receive the Eucharist, and soon afterwards died in convulsions on the 19th of August. A post mortem examination was held, which showed not only grave derangement in the stomach and other organs, but a serious lesion of the brain.

Eight years after Pascal's death appeared what purported to be his Pensées, and a preface by his nephew Perier gave the world to understand that these were fragments of a great projected apology for Christianity which the author had, in conversation with his friends, planned out years before. The editing of the book was peculiar. It was submitted to a committee of influential Jansenists, with the duc de Roannez at their head, and, in addition, it bore the imprimatur of numerous unofficial approvers who testified to its orthodoxy. It does not appear that there was much suspicion of the garbling which had been practised—garbling not unusual at the time, and excused in this case by the fact of a pull in the troubles of Port Royal and a great desire on the part of its friends to do nothing to disturb that bull. But as a matter of fact no more entirely factitious book ever issued from the press. The fragments which it proceeded to give were in themselves confused and incoherent enough, nor is it easy to believe that they all formed...
part of any such single and coherent design as that referred to above. But the editors omitted, altered, added, separated, combined and so forth entirely at their pleasure, actually making some changes which seem to have been thought improvements of style. This rifacimento remained the standard text with a few unimportant additions for nearly two centuries, except that, by a truly comic revolution of public taste, Condorcet in 1776 published, after study of the original, which remained accessible in manuscript, another garbling, conducted this time in the interests of orthodoxy. It was not till 1782 that Victor Cousin drew attention to the untrustworthy condition of the text, nor till 1844 that A.P. Fauqué edited that text from the MS, in something like a condition of purity, though, as subsequent editions have shown, not with absolute fidelity. But even in its spurious condition the book had been recognized as remarkable and almost unique. Its contents, as was to be expected, are of a very chaotic character--of a character so chaotic indeed that the reader is almost at the mercy of the arrangement, perforce an arbitrary arrangement, of the editors. But the subjects dealt with concurred more or less in all the great problems of thought on which Pascal was to be called the thinker of modern times. The sufficiency of reason, the trustworthiness of experience, the admissibility of revelation, free will, foreknowledge, and the rest. The peculiarly disjointed and fragmentary condition of the sentiments expressed by Pascal aggravates the appearance of universal doubt which is present in the Pensées, just as the completely unfinished condition of the work, from the literary point of view, constantly causes slighter or graver doubts as to the actual meaning which the author wished to express. Accordingly the Pensées have always been a favourite exploring ground, not to say a favourite field of battle, to persons who take an interest in their problems. Speaking generally, their tendency is toward the combating of scepticism by a deeper scepticism, or, as Pascal himself calls it, Pyrrhonism, which occasionally goes the length of denying the possibility of any natural theology. Pascal explains all the contradictions and difficulties of human life and thought by the doctrine of the Fall, and relies on faith and revelation alone to justify each other.

Excluding here his scientific attainments (see below), Pascal presents himself for comment in two different lights, the second of which can if the first be called the popular side, so to say, is the colour of the theology and the philosophy more distinctly personal. Yet his character as a man is not very distinct. The accounts of his sister and niece have the defect of all hagiology; they are obviously written rather with a view to the ideas and the wishes of the writers than with a view to the actual and absolute personality of the subject. Except from these interesting but somewhat tainted sources, we know little or nothing about him. Hence conjecture, or at least inference, must always enter largely into any estimate of Pascal, except a purely literary one.

On that side, fortunately, there is no possibility of doubt or difficulty to any competent inquirer. The Provincial Letters are the first example of French prose which is at once considerable in bulk, varied and important in matter, perfectly finished in form. They owe not a little to Descartes, for Pascal's indebtedness to his predecessor is unquestionable from the literary side, whatever may be the case with the scientific. But Descartes had had neither the opportunity, nor the desire, nor probably the power, to write anything of the literary importance of the Provinciales. The first example of polite controversial irony since Lucian, the Provinciales have continued to be the best example of it during more than two centuries in which the style has been sedulously practised, and in which they have furnished a model to generation after generation. The unfailing freshness and charm of the contrast between the importance, the gravity, in some cases the dry and austere nature, of their subjects, and the lightness, sometimes almost approaching levity in its special sense, of the manner in which these subjects are attacked is a triumph of literary art of which no familiarity dims the splendour, and which no lapse of time can ever impair. Nor perhaps is this literary art really less evident in the Pensées, though it is less clearly displayed, owing to the fragmentary or rather chaotic condition of the work, and partly also to the nature of the subject. The vividness and distinction of Pascal's phrase, his singular faculty of inserting without any loss of dignity in the gravest and most impassioned meditation what may be almost called quips of thought and charity, the intense earnestness of his meaning weighting but not confusing the style, all appear here.

No such positive statements as these are, however, possible as to the substance of the Pensées and the attitude of their author. Hitherto the widest differences have been manifested in the estimate of Pascal's opinions on the main questions of philosophy, theology and human conduct. He has been represented as a determined apostle of intellectual orthodoxy animated by an almost fanatical "hatred of reason," and possessed with a purpose to overthrow the appeal to reason; as a skeptic and pessimist of a far deeper dye than Montaigne, as a dangerous ascetic parlor, and paradoxer affecting the credo quia impossibile in intellectual matters and the adi quia amabile in matters moral and sensuous; as a wanderer in the regions of doubt and belief, alternately bringing a vast though vague power of thought and an unequalled power of expression to the expression of ideas incompatible and irreconcilable. An unbiased study of the scanty facts of his history, and of the tolerably abundant but scattered and chaotic facts of his literary production, will show any one to steer clear of these exaggerations, while admitting at the same time that it is impossible to give a complete and final account of his attitude towards the riddles of this world and others. He certainly was no mere advocate of orthodoxy; he as certainly was no mere victim of terror at scepticism; least of all was he a freethinker in disguise. He appears, as far as can be judged from the fragments of his Pensées, to have seized firmly and fully the central idea of the difference between reason and religion. Where the difficulty rises respecting the matter of human belief to think that man who has not been subjected to a mere concordat, have let religion go and contented themselves with reason. Pascal, equally discontented with the concordat, held fast to religion and continued to fight out the questions of difference with reason. Surveying these positions, we shall not be astonished to find much that is surprising and some things that are contradictory in Pascal's utterances on "les grands sujets." The influence exercised on him by Montaigne is the one fact regarding him which has not been and can hardly be exaggerated, and his well-known Extrait with Sacy on the subject (the restoration of which to its proper form is one of the most valuable results of modern criticism) leaves no doubt possible as to the source of his "Pyrrhonian" method. But it is impossible for anyone who takes Pascal's Pensées simply as he finds them in connexion with the facts of Pascal's history to question his theological orthodoxy, understanding by theological orthodoxy the acceptance of revelation and dogma; it is equally impossible for any one in the same condition to declare him absolutely converted with dogma and revelation. It is of the essence of an active mind like Pascal's to explore and state all the arguments which make for or make against the conclusion it is investigating.

To sum up, the Pensées are excursions into the great unknown made with a full acknowledgment of the greatness of that unknown. From the point of view that belief and knowledge, based on experience or reasoning, are separate domains with an unexplored sea between and round them, Pascal is perfectly
PASCAL, J.—PASchal (POpes)

comprehensible, and he need not be taken as a deserter from one region to the other. To those who hold that all intellectual exercise outside the sphere of religion is impious or that all intellectual exercise inside that sphere is futile, he must remain an enigma.

There are few writers who are more in need than Pascal of being fully and competently edited. The chief nominally complete edition at present in existence is that of Bossut (1779, 5 vols., and since reprinted), which not only appeared before any attempt had been made to give the text of the works, but is in other respects quite inadequate. The edition of Lahure, 1858, is not much better, though the Pensees appear in their more genuine form. An edition promised for the Cellsell collection of French by A. P. Faugere has been executed as far as the Pensees go by Leon Bruncheigh (3 vols., 1904), who has also issued a one-volume edition. The Oeuvres completes appeared in three volumes (Pari, 1878) with a preface by Prof. de la Porte, to which are appended other fragments of which there are numerous editions, no one much to be preferred to any other, for the text is undoubted and the book itself contains almost all the exegesis of its own contents necessary. Pascal can be read only at a disadvantage. There are five chief editions of the true Pensees earlier than Bruncheigh's: that of Faugere (1844), the editio princeps; that of Havet (1852, 1867 and 1881), on the whole the best; that of Victor Roche (1873), good, but arranged and edited with the deliberate intention of making Pascal first of all an orthodox apologist; that of Moliner (1877-1879), a carefully edited and interesting text, the important corrections of which have been introduced recently by M. Gasparetto and M. Michel (Pisa, 1896). Unfortunately, none of these can be said to be exclusively satisfactory. The minor works must chiefly be sought in Bossut or reprints of him. Works on Pascal are innumerable: Sainte-Beuve's Port Royal, Cousin's writings on Pascal and his Jacqueline Pascal, and the essays of the editors of the Pensees just mentioned are the most noteworthy. Principal Tullech contributed a useful little monograph to the series of Foreign Classics for English Readers (Edinburgh and London, 1878). Recent handling are, in French, E. Boutour's Pascal (Paris, 1903) and, in English, an article in the Quarterly Review (No. 407) for April 1906.

Pascal as Natural Philosopher and Mathematician.—Great as is Pascal's reputation as a philosopher and man of letters, it may be fairly questioned whether his claim to be remembered by posterity as a mathematician and physicist is not even greater. It is true that the youth of the author was partly to the difficulty in publishing scientific works in those days, and partly no doubt to the continual struggle on his part to devote his mind to what appeared to his conscience more important labour, this work (like many others by the same master hand) was never published. We know nothing of what it contained from a report by Leibnitz, who had seen it in Paris, and from aresume of its results published in 1640 by Pascal himself, under the title Essai pour les coniques. The method which he followed was that introduced by his contemporaries, though it was not until later that the true importance of Pascal was appreciated. His work in the theory of probability was one of those developments in which the 17th century was characterized, and the creator of the theory of conic sections, Galilei, Descartes, Fermat, Huygens, and Roberval, were all working on similar lines.

Pascal also distinguished himself by his skill in the infinitesimal calculus, then in the embryonic form of Cavalieri's method of indivisibles. The cycloid was a famous curve in those days; it had been discussed by Galilei, Descartes, Fermat, Roberval, and Torricelli, who had in turn exhausted their skill upon it. Pascal solved the hitherto refractory problem of the general quadrature of the cycloid, and proposed and solved a variety of others relating to the centre of gravity of the curve and its segments, and to the volume and centre of gravity of solids of revolution generated in various ways by means of it. He published a number of these theorems without demonstration as a challenge to contemporary mathematicians. Solutions were furnished by Wallis, Huygens, Wren and others; and Pascal published his own in the form of letters from Amos Dettonville (his assumed name as challenger) to Pierre de Carcavy. There has been some discussion as to the fairness of the treatment accorded by Pascal to his rivals, but no question of the fact that his initiative led to a great extension of our knowledge of the properties of the cycloid, and indirectly hastened the progress of the differential calculus.

Among the founders of pure mathematics Pascal ranks as a founder. The mathematical theory of probability and the allied theory of the combinatorial analysis were in effect created by the correspondence between Pascal and Fermat, concerning certain questions as to the division of stakes in games of chance, which had been propounded to the former by the gaming philosopher De Méré. A complete account of this interesting correspondence would surpass our present limits; but the reader may be referred to Todhunter's History of the Theory of Probability (Cambridge and London, 1869), pp. 7-21. It appears that Pascal contemplated publishing a treatise De adeo geometrica; but all that actually appeared was a fragment on the mathematical triangle (Traité du triangle arithmétique, "Properties of the Figure Number"), printed in 1654, but not published till 1665, after his death.

Pascal's work as a natural philosopher was not less remarkable than his discoveries in pure mathematics. His experiments and his treatise (written between 1651, published 1663) on the equilibrium of fluids entitle him to rank with Galileo and Stevinus as one of the founders of the science of hydrodynamics. The idea of the pressure of the air and the invention of the instrument for measuring it were both new when he made his famous experiment, showing that the height of the mercury column in a barometer decreases when it is carried upwards through the atmosphere. This experiment was made by himself in a tower at Paris, and was carried out on a grand scale under his instructions by his brother-in-law Florin Périer on the Puy de Dôme in Auvergne. Its success greatly helped to break down the old prejudices, and to bring home to the minds of ordinary men the truth of the new ideas propounded by Galileo and Torricelli.

Whether we look at his pure mathematical or at his physical researches we receive the same impression of Pascal; we see the strongest marks of a great original genius creating new ideas, and seizing upon, mastering, and pursuing farther everything that was fresh and unfamiliar in his time. We can still point to much in exact science that is absolutely his; and we can indicate infinitely more which is due to his inspiration.

PASCAL, JACQUELINE (1625-1661), sister of Blaise Pascal, was born at Clermont-Ferrand, France, on the 4th of October 1625. She was a genuine infant prodigy, composing verses when only eight years, and a five-act comedy at eleven. In 1646 the influence of her brother converted her to Jansenism. In 1655, she took the veil, despite the strong opposition of her brother, and subsequently was largely instrumental in the latter's own final conversion. She vehemently opposed the attempt to compel the assent of the nuns to the Papal bulls condemning Jansenism, but was at last compelled to yield her own. This blow, however, hastened her death, which occurred at Paris on the 4th of October 1661.

PASchal (Paschalis), the name of two popes, and one anti-pope.

PASCAL, I., pope from 517 to 524, a native of Rome, was raised to the pontificate by the acclamation of the clergy, shortly after the death of Stephen IV., and before the election of the emperor (Louis the Pious); but he had been ordained a deacon as an instance for which he was one of his first cares to apologize. His
relations with the imperial house, however, never became cordial; and he was also unsuccessful in winning the sympathy of the Roman nobles. He died in Rome while the imperial commissioners were investigating the circumstances under which two important Roman personages had been seized at the Lateran, blinded and afterwards beheaded; Paschal had shielded the murderers but denied all personal connivance in their crimes. He had no counteracted his opponents in the pope's burial within the church of St Peter, but he now holds a place in the Roman calendar (May 16). The church of St Cecilia in Trastevere was restored and St Maria in Dominica rebuilt by him; he also built the church of St Prassed. The successor of Paschal I. was Eugenius II.

PASchal II. (Ranieri), pope from the 13th of August 1099 to the 21st of January 1118, was a native of Bieda, near Viterbo, and a monk of the Cluniac order. He was created cardinal-priest of S. Clemente by Gregory VII. about 1076, and was consecrated pope in succession to Urban II. on the 14th of August 1099. In the long struggle with the emperors over investiture, he zealously carried on the Hildebrandine policy, but with only partial success. In 1104 Paschal succeeded in instigating the emperor's second son to rebel against his father, but in 1106 Paschal returned to the Council of Guastalla (Oct. 1106) simply renewed the prohibition of investiture. In the same year he brought to an end the investiture struggle in England, in which Anselm, archbishop of Canterbury had always engaged with King Henry I., by obtaining himself exclusive right to invest with the ring and crosier, but recognizing the royal nomination to vacant benefices and oath of fealty for temporal domains. He went to France at the close of 1106 to seek the mediation of King Philip and Prince Louis in the imperial struggle, but, his negotiations remaining without result, he returned to Italy in September 1107. When Henry V. advanced with an army into Italy in order to be crowned, the pope agreed to a compact (Feb. 1111), by the terms of which the Church should surrender all the possessions and royalties it had received of the empire and kingdom of Italy since the days of Charlemagne, while Henry on his side should renounce lay investiture. Preparations were made for the coronation on the 12th of February 1111, but the Romans rose in revolt against the compact, and Henry retired taking with him pope and curia. After sixty-one days of harsh imprisonment, Paschal yielded and guaranteed investiture to the emperor. Henry was then crowned in St Peter's on the 13th of April, and after exacting a promise that no revenge would be taken for what had passed beyond the Alps. The Hildebrandine party was aroused to action, however; a Lateran council of March 1112 declared null and void the concessions extorted by violence; a council held at Vienna in October actually retributed the emperor, and Paschal sanctioned the proceeding. Towards the end of the pontificate trouble began anew in England, Paschal complaining (1115) that councils were held and bishops translated without his authorization, and threatening Henry I. with excommunication. On the death of the countess Matilda, who had bequeathed all her territories to the Church (1115), the emperor at once laid claim to them as imperial fiefs and forced the pope to flee from Rome. Paschal returned after the emperor's withdrawal at the beginning of 1118, but died within a few days on the 21st of January 1118. His successor was Gelasius II.

The principal sources for the life of Paschal II. are his Letters in the Monumenta Germaniae historica, E. pseudae, vol. 5, 6, 7, 13, 17, 20-21, 22, 25, 32, and 36; the Lettres du Pape Paschalis II. de Duchesne (Paris, 1892). Important bulls are in J. A. von Pflugk-Harttung, Die Bulen der Päpste bis zum Ende des zwintigen Jahrhundert (Gotha, 1901), and a valuable digest in J. Wetttenbach, Realencyclopiade, iii. (1853-1868).

(Breslau, 1877); W. Schum, Die Politik Papst Paschalis II. gegen Kaiser Heinrich V. im Jahre 1112 (Erfurt, 1877); I. Rößken, Heinrich V. (Essen, 1885); G. Gerhard, Die Investiturstreit zwischen Kaiser Heinrich V. und dem Papste Paschalis II. (Heidelberg, 1900); G. Peiser, Der deutsche Investitur- streit unter Kaiser Heinrich V. und dem Papste Paschalis II. (Berlin, 1900); and B. Montagu, Les Sarcophages de Paschal II, avec Philippe I. (Paris, 1907). There is an exhaustive bibliography with an excellent article by Carl Mibrt in Herzog- Hauck, Realencyclopiade (3rd ed., 1903).

(C. H. H. A.)

PASchal III., anti-pope from 1164 to 1168, was elected the successor of Victor IV. on the 22nd of April 1164. He was an aged aristocrat, Guido of Crema. Recognized at once by the emperor Friedrich I. he soon lost the support of Barbarossa, and the emperor crushed opposition in Germany, and gained the co-operation of Henry II. of England. Supported by the victorious imperial army, Paschal was enthroned at St Peter's on the 22nd of July 1167, and Pope Alexander III., became a fugitive. Sudden imperial reverses, however, made Paschal glad in the end to hold so much as the quarter on the right bank of the Tiber, where he died on the 20th of September 1168. He was succeeded by the anti-pope Callixtus III.

See A. Hauck, Kirchengeschichte Deutschlands, Bd. IV. (Leipzig, 1903, 250-276); H. Böhmer in Herzog-Hauck, Realencyclopiade, Bd. XIV., 724 seq.; and Lobbekitz, Statistik der Päpste (Freiburg, i. B. 1905).

PASchal Chronicle (Chronicum Paschale, also Chronicum Alexandrinum or Constantinopolitanum, or Fasti Siculi), so called from being based upon the Easter canon, an outline of chronology from Adam down to A.D. 629, accompanied by numerous historical and theological notes. The work, which is called Chron. Pasch. i. (Chron. Pasch. i. of 627), is preceded by an introduction on the Christian methods of reckoning time and the Easter cycle. It was written during the reign of Heraclius (610-641), and is generally attributed to an unknown Byzantine cleric and friend of the patriarch Sergius, who is specially alluded to as responsible for the introduction of certain ritual innovations. The so-called Byzantine or Roman era (which continued in use in the Greek Church until its liberation from Turkish rule) was adopted in the Chronicon for the first time as the foundation of chronology, in accordance with which the date of the creation is given as the 21st of March, 5567. The author is merely a compiler from earlier works, except in the history of the last thirty years, which has the value of a contemporary record.

The chief authorities used were: Julius Sextus Africanus (3rd century): the consular Fasti; the Chronicle and Church History of Eusebius; John Malalas; the Acta martyrum; the treatise of Sophronius and the bishop of Halicarnassus (4th century), onWeights and Measures. Editions: L. Dindorf (1832) in Corpus scriptorum hist. byzantiae, with Du Cange's preface and commentary; J. P. Migne, Patrologia graeca, xcii.; J. M. G. Schulten, Geschichte des Studium der alten geschichte (1895); H. Gelzer, Sextus Julius Africanus and die byzantinische Chronographie, ii. 1 (1885); J. van der Hagen, Observations in Heraclius imperatoris methodum paschalem (1736, but still considered indispensable); E. Schwarz in Pauly-Wissowa, Realencyclopiade, iii., pt. 2 (1899); C. Krumbacher, Geschichte der byzantinischen Literatur (1897).

PAS-de-CALAIS, a maritime department of northern France, formed in 1790 of nearly the whole of Artois and the northern maritime portion of Picardy including Boulognais, Calaisis, Ardresis, and the districts of Langle and Bredenarde, and bounded N. by the Straits of Dover ("Pass de Calais."); E. by the English Channel. Pop. (1906), 1,072,466; Area 2,666 sq. m. Except in the neighbourhood of Boulogne-sur-Mer with its côtes de fer or "iron coasts," the seaboard of the department, which measures 65 m., consists of duines. From the mouth of the Aa (the limit towards Nord) it trends west-south-west to Gris Nez, the point of France nearest to England; in this section the line of Calais, Cape Blanc Nez, rising 440 ft. above the sandy shores, and the point of Wissant (Wishant). The seaside resorts include Boulogne, Berck-sur-Mer, Paris-Plage, Wimereux, &c. The coast of Nord is the driest; in it a large salt-water direction is due south; this section is the small port of Ambleteuse, Boulogne at the mouth of the Liane, and the two bays formed by the
estuaries of the Canche and the Authie, the limit towards Somme. The highest point in the department (500 ft.) is in the west, between Boulogne and St. Omer. From the uplands in which it is situated the Lys and Scarpe flow east to the Scheldt, the Aa north to the German Ocean, and the Slack, Wimereux and Liane to the Channel. Farther south are the valleys of the Canche and the Authie, running E.S.E. and W.N.W., and thus parallel with the Somme. Vast plains, open and monotonous, but extremely fertile and well cultivated, occupy most of the department. To the north of the hills running between St. Omer and Boulogne, to the south of Gravelines and the south-east of Calais, lies the district of the Wattergands, less now drained by means of canals than it was, and turned into highly productive land. The climate is free from extremes of heat and cold, but damp and changeable. At Arras the mean annual temperature is 47°; on the coast it is higher. The rainfall varies from 24 to 32 in., though at Cape Gris Nez the latter figure is much exceeded. Cereals are largely grown and give good yields to the acre; the other principal crops are potatoes, sugar-beet, forage, oil-plants and tobacco. Market gardening flourishes in the Wattergands. The rearing of livestock and poultry is actively carried on, and the horses of the Boulognais are specially esteemed. The department is the chief in France for the production of coal, its principal coal-basin, which is a continuation of that of Valenciennes, centring round Béthune. The manufacture of beetroot-sugar, oil and alcohol distilling, iron-working, dyeing, brewing, paper-making, and various branches of the textile manufacture, are foremost among the industries of the department. Boulogne, Calais and Étaples fit out a considerable number of vessels for the cod, herring and mackerel fisheries. Calais and Boulogne are important ports of passenger-transit for England; and Boulogne also carries on a large export trade in the products of the department. The canal system comprises part of the Aa, the Lys, the Scarpe, the Deûle (a tributary of the Lys passing by Lille), the Lave (a tributary of the Lys passing by Béthune), and the Sensée (an affluent of the Scheldt), as well as the canals of Aire to Bauvin, Neuflion, Calais, Calais to Arders, &c., and in this way a line of communication is formed from the Scheldt to the sea by Béthune, St. Omer and Calais, with branches to Gravelines and Dunkirk. The department is served by the Northern railway.

Pas-de-Calais forms the diocese of Arras (archbishopric of Cambrai), belongs to the district of the 1st army corps, the educational division (académie) of Lille and the circumscription of the appeal court of Douai. There are 48 arrondissements (Arras, Béthune, Boulogne, Montreuil-sur-Mer, St. Omer and St. Pol-sur-Ternoise). The more noteworthy places are Arras, the capital, Boulogne, Calais, St. Omer, Béthune, Lens, Montreuil-sur-Mer, Bray, Berck, Étaples and Aire-sur-la-Lys, which are noticed separately. Besides some of the towns mentioned, Liévin (22,070), Hénin-Liétard (13,384), in the neighbourhood of Lens, are large centres of population. Other places of some importance are: Lillers (pop. 3,541), which carries on boot-making and has a fine Romanesque church of the 12th century; Hesdin, which owes its regular plan to Charles V, by what it was built in the 12th century. The Deûle and Scarpe, the ancient fortifications and castles and gave its name to the famous counts of St. Pol.

PASDELOUP, JULES ÉTIENNE (1819-1887), French conductor, was born in Paris, and educated in music at the conservatoire. He founded in 1847 a "société des jeunes artistes du conservatoire," and, as conductor of its concerts, did much to popularize the best new compositions of the time. His "popular concerts" at the Cirque d'hiver, from 1860 till 1884, had also a great effect in promoting French taste in music.

PASEWALK, a town of Germany, in the Prussian province of Pomerania, on the Ucker, 56 m. N.W. from Stettin by the railway to Strassburg. Pop. (1895), 10,510. Pasewalk became a town during the 12th century and was soon a member of the Hansatic League. In 1350 it passed to the dukes of Pomerania. Frequently ravaged during the wars which devastated the district, it was plundered several times by the imperialists during the Thirty Years' War; in 1657 it was burned by the Poles and in 1713 by the Russians. By the peace of Westphalia in 1648 it was given to Sweden, but in 1676 it was conquered by Brandenburg, and in 1720, by the peace of Stockholm, it was definitely assigned to Brandenburg-Prussia.

See Hückstädt, Geschichte der Stadt Pasewalk (Pasewalk, 1883).

PASHA, also written "pacha" and formerly "pashaw," &c., a Turkish title, superior to that of bey (q.v.), borne by persons of high rank and placed after the name. It is in the gift of the sultan of Turkey and, by delegation, of the khedive of Egypt. The title appears, originally, to have been bestowed exclusively upon Turkish princes, but it is now given to any high official, and also to unofficial persons whom it is desired to honour. It is conferred indifferently upon Moslems and Christians, and is frequently given to foreigners in the service of the Turks or Egyptians. Pashas are of three grades, formerly distinguished by the number of horse-tails (three, two and one respectively) which they were entitled to display as symbols of authority when on campaign. A pashalik is a province governed by or under the jurisdiction of a pasha.

The word is variously derived from the Persian pāshā, Turkish pāşā, equivalent to king or emperor, and from the Turkish bash, in some dialects pash, a head, chief, &c. In old Turkish there was no fixed distinction between b and p. As first used in western Europe the title was written with the initial b. The English forms bashaw, bassaw, bucha, &c., general in the 16th and 17th centuries, were derived through the med. Lat. et Ital. bassa.

PASIG, a town and the capital of the province of Rizal, Luzon, Philippine Islands, about 6 m. E.S.E. of Manila. Pop. (1903), 11,887. The town, which covers a considerable area, is traversed by the Pasig river and its tributary, the Marikina river, and for a short distance borders on Laguna de Bay. In the south-western part is Fort McKinley. Although built on low ground, Pasig is fairly healthy. It was formerly an important commercial centre, the inhabitants being largely engaged in a carrying and forwarding trade between Manila and the lake ports; but this trade was lost after the establishment of direct rail and steamboat service between these ports. The principal industries are rice-farming, the manufacture of a cheap red pottery, and fishing. The language is Tagalog.

PASITELES, the most important member of the Neo-Attic school of sculpture in the time of Julius Caesar. At that period there was at Rome a demand for copies of, or variations on, noted works of Greek sculptors; the demand was met by the workshops of Pasiteles and his pupils Stephanus and Menelaus and others, several of whose statues are extant. In working from early Dorian models they introduced refinements of their own, with the result that they produced beautiful, but somewhat vivid and academic types. Pasiteles is said by Pliny (Nat. Hist. xxxvi. 39) to have been a native of Magna Graecia, and to have been granted the Roman citizenship.

PASKEVICH, IVAN FEDOROVICH (1785-1850), count of Erivan, prince of Warsaw, Russian field marshal, descended from an old and wealthy family, was born at Poltava on the 18th of May 1777, and was educated at the military institution for pages, where his progress was rapid, and in 1800 received his commission in the Guards and was named aide-de-camp to the tsar. His first active service was in 1805, in the auxiliary army sent to the assistance of Austria against France, when he took part in the battle of Austerlitz. From 1807 to 1812 he was engaged in the campaigns against Turkey, and distinguished himself by many brilliant and daring exploits, being made a general officer in his thirtieth year. During the French War of 1812-14 he was present, in command of the 26th division of infantry, at all the most important engagements; at the battle of Leipzig he won promotion to the rank of lieutenant-general. On the outbreak of war with Persia in 1826 he was appointed second in command, and, succeeding in the following year to the chief command, gained rapid and brilliant successes which compelled the shah to sue for peace in February
In reward of his services he was named by the emperor count of Erivan, and received a million of rubles and a diamond-mounted sword. From Persia he was sent to Turkey in Asia, and, having captured in rapid succession Turkish fortresses, he was at the end of the campaign made a field marshal at the age of forty-seven. In 1830 he subdued the mountaineers of Daghestan. In 1831 he was entrusted with the command of the army sent to suppress the revolt of Poland, and after the fall of Warsaw, which gave the death-blow to Polish independence, he was raised to the dignity of prince of Warsaw, and finally compelled the surrender of the Hungarians at Vajsko. He was again appointed in command of the army of the Danube, but on the 9th of June, at Silistra, where he suffered defeat, he received a contusion which compelled him to retire from active service. He died on the 13th (1st) of February 1856 at Warsaw, where in 1860 a memorial was erected to him. He held the rank of field marshal in the Prussian and Austrian armies as well as in his own service.

See Tadto's, Essai biographique et historique sur le field-maréchal Prince de Varsovie (Paris, 1835); Notice biographique sur le Maréchal Pasley (Paris, 1856); and Prince Scherbatskov’s Life (St. Petersburg, 1885-1894).

Pasley, Sir Charles William (1780-1861), British soldier and military engineer, was born at Easdale Muir, Dumfriesshire, on the 8th of September 1780. In 1796 he entered the Royal Military Academy, Woolwich; a year later he gained his commission in the Royal Artillery, and in 1798 he was transferred to the Royal Engineers. He was present in the defence of Gaeta, the battle of Maidda and the siege of Copen- hagen. In 1807, being then a captain, he went to the Peninsula, where his knowledge of Spanish led to his employment on the staff of Sir David Baird and Sir John Moore. He took part in the retreat to Corunna and the Walcheren Expedition, and was severely wounded while gallantly holding a sally port for a colonel at Flushing. During his tedious recovery he employed himself in learning German. He saw no further active service, the rest of his life being devoted to the foundation of a complete science of military engineering and to the thorough organization and training of the corps of Royal Engineers. He was so successful that, though only a captain, he was allowed to act for two years as commanding royal engineer at Plymouth and given a special grant. The events of the Peninsula War having emphasized the need of a fully trained engineer corps, Pasley’s views were adopted by the war office, and he himself placed at the head of the new school of military engineering at Woolwich. This was in 1812, and Pasley was at the same time gazetted brevet major. He became brevet lieutenant-colonel in 1813 and substantive lieutenant-colonel in 1814. The first volume of his Military Instruction appeared in 1814, and contained a course of practical geometry which he had framed for his company at Plymouth. Two other volumes completing the work appeared by 1817, and dealt with the science and practice of fortification, the latter comprising rules for construction. He published a work on Practical Architecture, and prepared an important treatise on The Practical Operations of a Siege (1820-1832), which was translated into French (1847). He became brevet colonel in 1830 and substantive colonel in 1831. From 1831-1834 the subject that engaged his leisure was that of standardization of coins, weights and measures, and he published a book on this in 1834. In 1838 he was presented with the freedom of the city of London for his services in removing sunken vessels from the bed of the Thames near Gravesend; and from 1839 to 1844 he was occupied with clearing away the wrecks of H.M.S. "Royal George", from Spithead and H.M.S. "Edgar" from St. Helens. All this work was subsidiary to his great work of creating a comprehensive art of military engineering. In 1844 on promotion to the rank of major-general he was made inspector-general of railways. In 1846 on vacating this appointment he was made a K.C.B., and thenceforward up to 1855 was chiefly concerned with the East India Company’s military academy at Addiscombe. He was promoted lieutenant-general in 1851, made colonel-commandant of the Royal Engineers in 1853, and general in 1860. He died in London on the 10th of April 1861. His eldest son, Major-General Charles Pasley (1824-1890), was a distinguished Royal Engineer officer.

Amongst Pasley’s works, besides those mentioned, were separate editions of his Practical Geometry Method (1822) and of his Course of Elementary Fortification (1822), both of which formed part of his Military Instruction; Rules for Escalading Fortifications not having Palisaded Covered Ways (1822; new eds. 1845 and 1854); descriptions of a semaphore invented by himself in 1804 (1822 and 1823); A Simple Practical Treatise on Paris Fortification (1823); and Exercise of the Pneumatic Pump invented by Lieutenant Colonel Pasley (1834).

Pasquier, Étienne (1750-1815), French lawyer and man of letters, was born at Paris, on the 7th of June 1750 by his own account, according to others a year earlier. He was called to the Paris bar in 1740. In 1758 he became very ill through eating poisonous mushrooms, and did not recover fully for two years. This compelled him to occupy himself by literary work, and in 1760 he published the first book of his Recherches de la France. In 1765, when he was thirty-seven, his fame was established by a great speech still extant, in which he pleaded the cause of the University of Paris against the Jesuits, and won it. Meanwhile he published the Recherches sur Paris, which gained him fame for a time, its much miscellaneous work. His literary and legal occupations coincided in a curious fashion at the Grands Jours of Poitiers in 1779. These Grands Jours (an institution which fell into desuetude at the end of the 17th century, with bad effects on the social and political welfare of the French provinces) were a kind of irregular assize in which a commission of the parlement of Paris, selected and despatched at short notice by the king, had full power to hear and determine all causes, especially those in which seigniorial rights had been abused. At the Grands Jours of Poitiers of the date mentioned, and at those of Troyes in 1783, Pasquier officiated; and each occasion had left a curious literary and memorial record which his friends and colleagues revered their graver duties. The Poitiers work was the celebrated collection of poems on a fleet (see Southey’s Doctor). In 1858 Pasquier was appointed by Henry III. advocate-general at the Paris cours des comptes, an important body having political as well as financial and legal functions. Here he distinguished himself particularly by opposing, sometimes successfully, the mischievous system of selling hereditary places and offices, which more perhaps than any single thing was the curse of the older French monarchy. The civil wars compelled Pasquier to leave Paris, and on the years he lived in Tour- nay, notably at his great book, but also he was in London in Henry IV’s train in March 1594. He continued until 1604 at his work in the chambre des comptes; then he retired. He survived this retirement more than ten years, producing much literary work, and died after a few hours’ illness on the 1st of September 1615.

In so long and so laborious a life Pasquier’s work was naturally considerable, and it has never been fully collected or indeed printed. The standard edition is that of Amsterdam (2 vols. fol., 1723). But for ordinary readers the selections of Léon Feuquier, published at Paris (2 vols. 8vo, 1849), with an elaborate introduction, are most accessible. As a poet Pasquier is chiefly interesting as a minor member of the Plébiscite movement. As a prose writer he is of much more account. The three chief divisions of his prose work are his Recherches, his letters and his professional speeches. The letters are of much biographical interest and historical importance, and the Recherches contain in a somewhat miscellaneous fashion invaluable information on a vast variety of subjects, literary, political, anti- quarantine and other.

Pasquier, Étienne Denis, Duke (1767-1862), French statesman, was born on the 22nd of April 1767. Descended from a family which had long been distinguished at the bar and in connexion with the parlements of France, he was destined for the legal profession and was educated at the college of Jullly. He then became a member of the council of nobility of Paris. Many of the incidents that marked the growing hostility between that body and Louis XVI. in the years preceding the outbreak of the French Revolution in 1789. His views
were those of a moderate reformer, who desired to renovate but not to end the institutions of the old monarchy; and his memoirs set forth in a favourable light the actions of that parliament, the existence of which was soon to be terminated amid the political storms of the close of the year 1789. For some time, and especially during the Reign of Terror (1793-1794), Pasquier remained in obscurity; but this did not save him from arrest in the year 1794. He was thrown into prison shortly before the coup d'état of Thermidor (July 1794) which overthrew Robespierre. In the reaction in favour of ordinary government which ensued Pasquier regained his liberty and his estates. He did not retire to the public affairs until the period of the Empire, when the arch-chancellor Cambacérès used his influence with Napoleon to procure for him the office of "maître des requêtes" to the council of state. In 1809 he became baron of the French Empire, and in February 1810 counsellor of state. Napoleon in 1810 made him prefect of police.

The chief event which ruffled the course of his life at that time was the strange conspiracy of the republican general Malet (Oct. 1812), who, giving out that Napoleon had perished in Russia, managed to surprise and capture some of the ministers and other authorities at Paris, among them Pasquier. The collapse of this bold and elaborate plot was immediate, however, and迅速ly to regain his liberty.

When Napoleon abdicated in April 1814 Pasquier continued to exercise his functions for a few days in order to preserve order, and then resigned the prefecture of police, whereupon Louis XVIII. allotted to him the control of roads and bridges. He took no share in the imperial restoration at the time of the Hundred Days (1815), and after the second entry of Louis XVIII. into Paris he became minister of the interior, but finding it impossible to work with the hot-headed royalists of the Chamber of Deputies (La Chambre intérieure), he resigned office. Under the more moderate ministers of succeeding years he again held various appointments, but refused to join the reactionary cabinets of the close of the reign of Charles X. After the July Revolution (1830) he became president of the Chamber of Peers—a post which he held through the whole of the reign of Louis Philippe (1830-1848). In 1842 he was elected a member of the French Academy, and in the same year was created a duke. After the overthrow of Louis Philippe in February 1848, Pasquier retired from active life and set to work to compile the notes and reminiscences of his long and active career. He died in 1862.

**PASQUINADE—PASSAGLIA**

A variety of libel or lampoon, of which it is not easy to give an exact definition, separating it from other kinds. It should, perhaps, more especially deal with public men and public things. The distinction, however, has been rarely observed in practice, and the chief interest in the word is its curious and rather legendary origin. According to the earliest version, given by Mazzocchi in 1598, Pasquino was a schoolmaster (others say a cobbler), who had a biting tongue, and lived in the 15th century at Rome. His name, at the end of that century or the beginning of the next, was transferred to a statue which had been dug up in 1500 in a mutilated condition (some say near his shop) and was set up at the corner of the Piazza Navona, opposite the palace of Cardinal Caraffa. To this statue it became the custom to affix squibs on the papal government and prominent persons. At the beginning of the 16th century Pasquino had a partner provided for him in the shape of another statue found in the Campus Martius, said to represent a river god, and dubbed Marforio, a foro Martis. The regulation form of the pasquinade then became one of dialogue, or rather question and answer, in which Marforio usually addressed leading inquiries to his friend. The proceeding soon attained a certain European notoriety, and a printed collection of the squibs due to it (they were long written in Latin verse, with an occasional excursion into Greek) appeared in 1590. In the first book of Pontagruel (1532 or thereabouts) Rabelais introduces books by Pasquillus and Marphurius in the catalogue of the library of St Victor, and later he quotes some utterances of Pasquin's in his letters to the bishop of Maillezais.

These, by the way, show that Pasquin was by no means always satirical, but dealt in grave advice and comment. The original Latin pasquinades were collected in 1544, as Pasquillorum tomi due, edited by Caduel Secundus Curio. The vogue of these lampoons now became general, and rose to its height during the pontificate of Sixtus V. (1585-1590). These utterances were not only called pasquinades (pasquinate) but simply pasquis (pasquillus, pasquillo, pasquile), and this form was sometimes used for the mythical personage himself. It was used in English for purposes of satire by Sir Thomas Hanmer in his Pasquin the Plain (1590) and by the anonymous author of Pasquin in a Trance (1596); but it was first made popular in England by Thomas Nash, who in 1580 began to sign his violent controversial pamphlets with the pseudonym of Pasquil of England. It continues to occur through the course of the Marprelate controversy as the title of the enemy of the Puritans. These English lampoons were in prose. The French pasquis (examples of which may be found in Fournier's Variétés historiques et littéraires) were more usually in verse. In Italy itself Pasquin is said not to have condescended to the vernacular till the 18th century. Contemporary comic periodicals, especially in Italy, still occasionally use the Marforio-Pasquin dialogue form. But this survival is purely artificial and literary, and pasquinade has, as noted above, ceased to have any precise meaning.

**PASQUINI, BERNARDO** (1637-1710), Italian musical composer, was born at Massa in Val di Nievole (Tuscany) on the 5th of December 1637. He was a pupil of Marcoranto Cesti and Loretto Vittori. He came to Rome while still young and entered the service of Prince Borghese; later he became organist of St Maria Maggiore. He enjoyed the protection of Queen Christina of Sweden, in whose honour an opera of his, Den è amore et pieta, was produced in 1670. During Alessandro Scarlatti's second sojourn in Rome (1703-1708), Pasquini and Corelli were frequently associated with him in musical performances, especially in connexion with the Arcadian Academy, of which all three were members. Pasquin died at Rome on the 22nd of November 1710, and was buried in the church of St Lorenzo in Lucina. He deserves remembrance as a vigorous composer for the harpsichord; and an interesting account of his music for this instrument will be found in J. S. Sheldon's The Floridobrev Solenda.

**PASSAGLIA**, the name of an old Spanish dance, supposed to have been引进 from farin, to walk, and calle, street, the tune being played by wandering musicians in the streets. It was a slow and rather solemn dance of one or two dancers. The dance tune resembled the "chaccone," and was, like it, constructed on a ground-bass. Brahms's Symphony in E Minor, No. 4, ends with an elaborate passacaglia.

**PASSAGLIA, CARLO** (1812-1857), Italian divine, was born at Lucca on the 2nd of May 1812. Passaglia was soon destined for the priesthood, and was placed under the care of the Jesuits at the age of fifteen. He became successively doctor in mathematics, philosophy and theology in the university of Rome. In 1837, being made a member of the Collegio Romano, the well-known Jesuit college in Rome. In 1845 he took the vows as a member of the Jesuit order. In 1848, during the expulsion of the Jesuits from Rome which followed on the revolution troubles in the Italian peninsula, he paid a brief visit to England. On his return to Italy he founded, with the assistance of Father Curci and Luigi Taparelli d'Azeglio, the celebrated organ of the Jesuit order entitled the Civiltà Cattolica. In 1854 came the decision of the Roman Church on the long-debated question of the Immaculate Conception of the Virgin. Into the agitation for the promulgation of this dogma Passaglia threw himself with great eagerness, and by so doing recommended himself strongly to Pope Pius IX. But his favour with the pope was of short duration. In 1859, when the war between Austria and France (the first step towards the unification of Italy) broke out, Passaglia espoused the popular side. He took refuge at Turin, and under the influence of Cavour he wrote an Epistola ad
PASSAIC—PASSION

Episcopos Catholicos pro causa Italic, in which, like Liverani before him, he boldly attacked the temporal power of the pope. For this he was expelled from the order of Jesuits, his book was put on the Index, and his figure stood out, by the pope's order, from a picture painted to commemorate the proclamation of the dogma of the Immaculate Conception. A refuge from the anger of the pope was afforded him in the Casa Cavour at Turin, the house in which Cavour was born. There he laboured for Italian unity with indomitable energy in the North of Italy, in conjunction with Cardinal d'Andrea in the south, and he collected the signatures of 9000 priests to an address to the pope in opposition to the temporal power, and in favour of abandoning all resistance to the union of Italy under a king of the House of Savoy. He and the 9000 priests were excommunicated on the 6th of October 1859, and d'Andrea, who had retired to his Italian nationality, continued his work as professor of moral philosophy at Turin, to which he had been appointed in 1861, and began a series of Advent addresses in the church of San Carlo at Milan. But on arriving in order to preach his second sermon he found himself met by an inhibition on the part of Mgr Caccia, the administrator of the archdiocese of Milan. Elected deputy in the Italian parliament, he still advocated strongly the cause of Italian independence, and at a later period wrote a defence of the rights of the episcopate under the title De La Causa di sua eminentia il cardinale d'Andrea. He also (1864) wrote against Renan's Vie de Jésus. Eight days before his death he endeavoured to be reconciled to the pope, and made a full retraction. He died at Turin on the 12th of March 1887.

PASSAIC, a city of Passaic county, New Jersey, U.S.A., at the head of navigation on the Passaic river, 5 m. S.E. of Paterson. (Pop. (1890), 13,028; (1900), 27,777, of whom 12,900 were foreign-born; (1910 census), 54,773. Passaic is served by the Erie and the Delaware, Lackawanna & Western railways. The east part of the city is a plain occupied chiefly by factories, for which water-power is furnished by the river and a canal; the west part, which is almost wholly residential, extends over hills which command excellent views. Among the principal buildings are the city hall, and the Jane Watson Reid Memorial Library. The city's factory products increased in value from $12,804,805 in 1900 to $22,782,725 in 1905, or 77.9%. About one-half of the value in 1905 was in worsteds, cottons and woolens; other important manufactures are rubber goods and electrical supplies. There are large vineyards near the city. A settlement was established here by the Dutch in 1679, and was called Acquackanonk or Paterson Landing until the middle of the 19th century. Passaic was incorporated as a village in 1869, and in 1873 was chartered as a city.

PASSAUN, a town and episcopal see of Germany, in the kingdom of Bavaria, picturesquely situated at the confluence of the Danube, the Inn and the Iiz, close to the Austrian frontier, 89 m. N.E. from Munich and 74 S.E. of Regensburg by rail. (Pop. (1900), 18,003, nearly all being Roman Catholics. Passau consists of the town proper, lying on the rocky tongue of land between the Danube and the Inn, and of four suburbs, Innsstadt, on the right bank of the Inn, Ilzstadt on the left bank of the Iiz, Anger in the angle between Iiz and the Danube, and St Nikola. It is one of the most beautiful places on the Danube, a fine effect being produced by the way in which the houses are piled up one above another on the heights rising from the river. The best general view is obtained from the Oberhaus, an old fortress, now used as a prison, which crowns a hill 300 ft. high on the left bank of the Danube. Of the eleven churches, the most interesting is the cathedral of St Stephen, a florid, rococo edifice. It was built after a fire in the 17th century on the site of a church said to have been founded in the 5th century; it has two towers, and contains some valuable relics. Other churches are the Gothic church of the Holy Ghost; the churches of St Severin, of St Paul, of St Wenzel, of St Maria, and of St John; and the Romanesque Votiv Kirche. The post office occupies the site of a building in which in 1532 the Treaty of Passau was signed between the emperor Charles V. and Maurice, elector of Saxony. The fine Dom Platz contains a statue of the Bavarian king, Maximilian I. The old forts and bastions of the city have been demolished, but the two lineal fortresses, the Oberhaus and the Niederhaus, are still extant. The former was built early in the 13th century by the bishop in consequence of a revolt on the part of the citizens; the latter, mentioned as early as 737, is now private property. The chief industries are the manufacture of tobacco, beer, leather, porcelain, machinery and paper. Large quantities of timber are floated down the Iiz. The well-known Passau crucibles are made at the neighbouring village of Obernzell.

Passau is of ancient origin. The first settlement was probably a Celtic one, Batodura; this was on the site of the present Innstadt. Afterwards the Romans established a colony of Batavian veterans, the castro batava here. It received civic rights in 1225, and soon became a prosperous place, but much of its history consists of broils between the bishops and the citizens. The strong fortress of the Oberhaus was taken by the Austrians in 1742, and again in 1805. The bishopric of Passau was founded by St Boniface in 738. The diocese was a large one, including until 1468 not only much of Bavaria, but practically the whole of the archduchy of Austria. About 1260 the limits of the diocese were the same as those of the Empire. Amongst the earlier bishops was Pilgrin or Pilgrim (d. 991), and less famous ones were the Austrian archbishops, Leopold and Leopold William, the former a brother and the latter a son of the emperor Ferdinand II. In 1803 the bishopric was secularized, and in 1805 its lands came into the possession of Bavaria. The area, which was diminished in the 15th, and again in the 18th century, was then about 350 sq. m., and the population about 50,000. A new bishopric of Passau, with ecclesiastical jurisdiction only, was established in 1817.

See Eckhart, Geschichte der Stadt Passau (Passau, 1862-1864); and Mein, Passau (1815), and the history of the bishopric see Schöller, Die Bischöfe von Passau (Passau, 1844); and Schrödl, Passauische Geschicht des Bistums Passau (Passau, 1879).

PASSEURAT, JEAN (1534–1602), French poet, was born at Troyes, on the 18th of October 1534. He studied at the university of Paris, and is said to have had some curious adventures—at one time working in a mine. He was, however, a scholar by nature, and became eventually a teacher at the Collège de Plessis, and on the death of Ramus was made professor of Latin in 1572 in the Collège de France. In the meanwhile Passerat had studied law, and had composed much agreeable poetry in the Pléiade style, the best pieces being his short ode Du Premier jour de mai, and the charming villanelle, J'ai perdu ma tourterelle. His exact date in the Satyre ménippe (Tours, 1594), the great manifesto of the politique or Moderate Royalist party when it had declared itself for Henry of Navarre, is differently stated; but it is agreed that he wrote most of the passage, and the harangue of the guerilla chief Rieux is sometimes attributed to him. The famous lines Sur la journée de Sensis, in which he commends the duc d'Aumale's ability in running away, is one of the most celebrated political songs in French. Towards the end of his life he became blind. He died in Paris on the 14th of September 1602.

See a notice by P. Blanchemain prefixed to his edition of Passerat's Poésies françaises (1880). Among his Latin works should be noticed Kalendae iuniores et varia quaedam poëtica (2 vol., 1606), addressed chiefly to his friend and patron Henri de Mesmes. For the Satyre ménippe see the edition of Charles Read (1876).

PASSION (post-classical Latin, passio, formed from patti, passus, to suffer, endure), a term which is used in two main senses: (1) the suffering of pain, and (2) feeling or emotion. The first is chiefly used of the sufferings of Jesus Christ, extending from the time of the agony in the garden until his death on the cross. In this sense passion was used by early Christians, and the term is also applied to the sufferings and deeds of saints and martyrs, synonymously with acta or gesta, a book containing such being known as a "passional" (liber passionis) or
"passionary" (passionarius). The order of Passionist Fathers, the full title of which is the "Congregation of the Discalced Clerks of the Most Holy Cross and Passion of our Lord Jesus Christ," was founded by St Paul of the Cross (Paolo della Croce, 1604–1773; canonized 1867) in 1720, but full sanction was not obtained for the order till 1737, when the first monastery was established at Monte Argentario, Orbetello. The secondary sense of "passion" is due to the late use of passio to translate the Greek philosophical term σάθος, the classical Latin equivalent being affectus. The modern use generally restricts the term to strong and uncontrolled emotion.

PASSIONFLOWER (Passiflora), the typical genus of the order to which it gives its name. The name passionflower—flos passionis—arose from the supposed resemblance of the corona to the crown of thorns, and of the other parts of the flower to the nails, or wounds, while the five sepals and five petals were taken to symbolize the ten apostles—Peter, who denied, and Judas, who betrayed, being left out of the reckoning. The species are mostly natives of western tropical South America; others are found in various tropical and sub-tropical districts of both hemispheres. The tacsonias, by some considered to form part of this genus, inhabit the Andes at considerable elevations. They are mostly climbing plants (fig. 1) having a woody stock and herbaceous or woody branches, from the sides of which tendrils are produced which enable the branches to support themselves at little expenditure of tissue. Some few form trees of considerable stature destitute of tendrils, and with broad magnolia-like leaves in place of the more or less palmately-lobed leaves which are most generally met with in the order. The leaf is usually provided at the base of the leaf-stalk with stipules, which are inconspicuous, or large and leafy; and the stalk is also furnished with one or more glandular excrescences, as in some cases are the leaf itself and the bracts. The inflorescence is of a cymose character, the terminal branch being represented by the tendril, the side branches by flower-stalks, or the inflorescence may be reduced to a single stalk. The bracts on the flower-stalk are either small and scattered or large and leafy, and then placed near the flower, forming a sort of outer calyx or epicalyx. The flower itself (seen in section in fig. 2) consists of a receptacle varying in form from that of a shallow saucer to that of a long cylindrical or trumpet-shaped tube, thin or fleshy in consistence, and giving off from its upper border the five sepals, the five petals (rarely these latter are absent), and the threads or membranous processes constituting the "corona." This corona forms the most conspicuous and beautiful part of the flower of many species, and consists of outgrowths from the tube formed subsequently to the other parts, and having little morphological significance, but being physiologically useful in favouring the cross-fertilization of the flower by means of insects. Other outgrowths of similar character, but less conspicuous, occur lower down the tube, and their variations afford useful means of discriminating between the species. From the base of the inner part of the tube of the flower, but quite free from it, uprises a cylindrical stalk surrounded below by a small cup-like outgrowth, and bearing above the middle a ring of five flat filaments each attached by a thread-like point to an anther. Above the ring of stamens is the ovary itself, upraised on a prolongation of the same stalk which bears the filaments, or sessile.

The stalk supporting the stamens and ovary is called the "gynophore" or the "gynandrophore," and is a characteristic of the order. The ovary of passionflowers is one-celled with three parietal placertas, and bears at the top three styles, each capped by a large button-like stigma. The ovary ripens into a berry-like, very rarely capsular, fruit with the three groups of seeds arranged in lines along the walls, but imbedded in a pulpy arillus derived from the stalk of the seed. This succulent berry is in some cases highly perfumed, and affords a delicate fruit for the dessert-table, as in the case of the "grana-" (P. quadrangularis), P. edulis, P. macrocarpa, and various species of Tacsonia known as "curubas" in Spanish South America; P. laurifolia is the water-lemon, and P. malaformis the sweet calabash of the West Indies. The fruits do not usually exceed in size the dimensions of a hen's or of a swain's egg, but that of P. macrocarpa is a goyard-like oblong fruit attaining a weight of 7 to 8 lb.

The tacsonias, which in cultivation are generally regarded as distinct, differ from Passiflora in having a long cylindrical calyx-tube, bearing two crowns, one at the throat, the other near the base; they are stove or greenhouse plants; T. pinutatisipula, with pale rose-coloured flowers, a native of Chile and Peru, has long been in cultivation; T. Van-Volxemii, with handsomely scarlet flowers, is one of the finest species.

PASSION WEEK, the fifth week in Lent, beginning with Passion Sunday (dominica passions or de passione domini), so called from very early times because with it begins the more special commemoration of Christ's passion. Passion week is often incorrectly identified with Holy week (q.v.). In the north of England Passion Sunday was formerly known as Carle or Carling Sunday, a name corrupted from "care," in allusion to the sorrowful season which the day heralds. It was the universal custom in medieval England to eat on this Sunday a grey pea steeped and fried in butter, which came to be called from its association "Carling Nut."
PASSOVER, a Hebrew spring festival, celebrated by the Jews in commemoration of the exodus from Egypt by a family feast in the home on the first evening, and by abstaining from leaven during the seven days of the feast. According to tradition, the first Passover ("The Passover of Egypt"), was preordained by Moses at the command of God. The Israelites were commanded to select on the tenth of Abib (Nisan) a he-lamb of the first year, without blemish, to kill it on the eve of the fourteenth and to sprinkle with its blood the lintel and sidepost of the doors of their dwellings so that the Lord should "pass over" them when he went forth to slay the first-born of the Egyptians. The lamb thus drained of blood was to be roasted and entirely consumed by the Israelites, who should be ready with loins girded, shoes on feet and staff in hand so as to be prepared for the exodus. In memory of this the Israelites were for all time to eat unleavened bread (mazzoth) for seven days, as well as keep the sacrifice of the Passover on the eve between the fourteenth and the fifteenth of Nisan. This evening meal was not to be attended by any stranger or uncircumcised person. On the morrow of the Sabbath a wave offering of a sheaf of barley was to be made. Those who were laying great stress upon obligations as implying non-existence. The main passages and their contents are arranged chronologically in the following way:

A. In the Elohistic Book of the Covenant (Exod. xxiii.). The feast of the unleavened bread was to be kept seven days at the time appointed in the month Abib.

B. In the Yahwistic Source (Exod. xxxiv. 18-21, 25). The feast of unleavened bread to be kept seven days, &c. All firstlings to be the Lord's, the first-born sons to be redeemed; none to appear before the Lord empty; six days' work, seventh day rest, in the harvest; the sacrifice of the Passover shall not remain until the morning.

C. In the Yahwistic History (Exod. xii. 21-27, 29-36, 38-39, xiii. 3-10). Moses summons the elders of Israel and orders them to kill the Passover and besprinkle the lintel and sideposts with a bunch of hyssop dipped in blood so that the Lord will pass over the door. In later days when the children shall ask what this mysterious observance is, it shall be said that this is the sacrifice of the Lord's Passover. At midnight all the first-born of the Egyptians are slain and Pharaoh sends the Israelites out of Egypt in haste, and the people took the dough before it was leavened upon kneading troughs upon their shoulders.

D. The Deuteronomist (Deut. xvi. 1-8, 16-17).Observe the month of Abib and keep the Passover because in that month God brought out the Israelites from Egypt. The sacrifice of the Passover of the flock and the herd shall be done in the place where God shall cause His name to dwell. No leaven shall be eaten with it for seven days. No leaven formed of affliction shall be eaten because they came forth from Egypt in haste. Flesh shall not remain until the morning; the sacrifice must not be within their gates but in the place where the Lord shall cause His name to dwell. It shall be sodden and eaten among your tents. They shall not carry any of their garments to the house of the Lord in that night. If a soul shall eat unleavened bread, on the seventh a solemn assembly. Reckon seven weeks from the time of putting the sicle to the standing corn.

E. In the Holiness Code (Lev. xxii. 4-8, 9-14).The 14th of the first month at even is the Passover of the Lord; on the 15th of the same month is the feast of unleavened bread for seven days.

First and seventh days shall be holy assembly, but a re-offering for seven days. On the morrow after the sabbath a wave offering and also a burnt offering of the he-lamb (with the corresponding meal offering and drink offering), and hundred shekels of incense on the altar, and perish corn shall be eaten until the oblation is made.

F. In the Priestly History (Exod. xii. 1-20, 28-31, xii. 1-2). The 15th day of Abib, a solemn appointment. Offer a burnt offering of a whole male without blemish, of sheep or goat, and should it kill on the 14th at even, and sprinkle the two sideposts and lintel with the blood, and eat the roasted flesh, not sodden, including head, legs and inward; all remaining over until the morning to be burned by fire. It should be eaten with loins girded, shoes on feet, and staff in hand because in haste. It is the Lord's Passover; when He will pass over and there will be no plague upon you. As a memorial this shall be kept to the Lord in the month Abib, on the 14th day at even, until the 21st day at even; when children shall ask what this service means, you shall say that it is the Passover of the Lord for our having been redeemed.

G. In the Secondary Sources of the Priestly Code (Exod. xxi. 40-41, 43-50, ix. 1-14, xix. 15-25). No alien, sojourner or hired servant shall eat thereof, but a bought servant, if circumcised. It shall be eaten in haste; none of the flesh should be carried forth, neither shall a bone be broken. If a sojourner should wish to keep the Passover, all his male shall be circumcised and he will be as one born in the land. The Passover was kept in the first month on the 14th day of the month at even and in the wilderness of Sinait but certain men, unclean by touching a dead body, asked what they should do; they were to keep it on the second month on the 14th day at even. Eating of the meat of the Passover in the 2nd month, two young bullocks and one lamb and seven firstling he-lambs without blemish, with appropriate meal offering and one he-goat for sin-offering; on the seventh day another holy assembly.

Many discrepancies have been observed among critics in the different portions of this series of enactments. Thus in the Elohist and Deuteronomist the date of the festival is only vaguely stated to be in the month of Abib, while in the Holiness Code and in the Priestly History the exact date is given. In the Yahwist and Deuteronomist a solemn assembly is to be held on the seventh day, but in the Holiness Code and in the secondary sources of the Priestly Code both the first and the seventh day of the Feast of Unleavened Bread are to be solemn assemblies. In the Deuteronomist the Passover sacrifice can be from either flock or herd, whereas in the Holiness Code it is explicitly stated that the place occurs concerning the place of sacrificing the Passover; as enjoined in Deuteronomy this is to be by the males of the family at Jerusalem, whereas both in the presumably earlier Yahwist and in the later Priestly Code the whole household joins in the festival which can be celebrated wherever the Israelites are settled. These discrepancies however are chiefly of interest in their bearing upon the problem of the Priestateuch, and really throw little light upon the origin of the two feasts connected together under the name of the Passover, to which the present remarks might be mainly applied. It may be observed however that the absence of a definite date in Deuteronomy must be accidental.
beginning of barley harvest is however generally associated with it, while the wheat harvest is connected with Pentecost. The "sheaf of the first-fruits of your harvest," mentioned in Lev. xxiii. 10, is associated in Jewish tradition with the barley harvest (Mishna, Menachoth x). This, however, is not immediately connected with the Passover, and is of more significance as determining the exact date of Pentecost.

Considering however the two sections of the Passover separately, it is remarkable how many of the ceremonies associated either historically or ceremonially with the Passover have connexion with the idea of a covenant. The folk-etymology of the word Passover given in Exod. xii. 23 seems to connect the original of the feast with a threshold covenant (see Trumbull, Threshold Covenant, Philadelphia, 1902); the daubing of the side-posts and lintel with blood at the original Passover, which finds its counterpart in Babylonian custom (Zimmern, Beit. z. Bab. Rel. ii. 126–7) and in Arabic usage (Wäkîlî, ed. Kremer, p. 28), implies a blood covenant. The communion meal would, according to the views of Robertson Smith, also involve the idea of a covenant; while the fact that no person joining in the meal should be uncircumcised connects the feast with the covenant of Abraham. Finally, the association of the first-born with the festival specially referred to in the texts, and carried out both in Samaritan tradition, which marks the forehead of the first-born with the blood of the lamb, and in Jewish custom, which obliged the first-born to fast on the day preceding Passover, also connects the idea of the feast with the sacro-sanctity of the first-born. The Hebrew tradition further connects the revelation of the sacred name of the God of the Hebrews with this festival, which thus combines, in itself, all the associations connecting the Hebrews with their God. It is not surprising therefore that Hebrew tradition connects it with the Exodus, the beginning of the theocratic life of the nation. It seems easiest to assume that the festival, so far as the Passover itself is concerned, was actually connected historically with the Exodus.

With regard to the abstention from leavened bread, the inquiry is somewhat more complicated. As before remarked, there seems no direct connexion between the paschal sacrifice and what appears to be essentially an agricultural festival; the Hebrew tradition, to some extent, dissociates them by making the sacrifice on the 14th of Nisan and beginning the Feast of Unleavened Bread on the 15th. This seeming casual connexion, to some extent, conforms the historic connexion suggested by the text, that the festival was kept in the fields and prepared in haste; but not even Hebrew tradition attempts to explain why the abstinence should last for seven days. The attempt of modern critics to account for the period as that in which the barley harvest was gathered in, during which the workers in the field could not prepare leavened bread, is not satisfactory. The first-fruits of the barley harvest are to be gathered on the "morning of the sabbath" (Lev. xxiii. 11). This expression has formed the subject of dispute between Samaritans and other sectaries and the Jews, the former of whom regard it as referring to the first Sunday during the festival, the latter as a special expression for the second day of the festival itself (see Hoffmann, Lex. xlv. 21–22). But a Heb. expression is taken that the connexion of the festival with the harvest is only secondary.

The suggestion has been made by Wellhausen and Robertson Smith that the Passover was, in its original form, connected with the sacrifice of the firstlings, and the latter points to the Arabic annual sacrifices called 'Atair, which some of the lexicographers interpret as firstlings. These were presented in the month Rajab, corresponding to Nisan (Smith, Religion of Semites, p. 210). But the real Arabic sacrifice of firstlings was called Far'a; it might be sacrificed at any time, as was also the case with the Hebrews (Exod. xxii. 30). The paschal lamb was not necessarily a firstling, but only in the first year of its life (Exod. xii. 5). The suggestion of Wellhausen and Robertson Smith confuses the offering of firstlings (Arabic Far'a) and that of the first yearlings of the year in the spring (Arabic 'Atair). It is possible that the Passover was originally connected with the latter (cf. Wellhausen, Reste arab. Heidentums, pp. 94 seq.). As regards the Feast of Unleavened Bread, now indissolubly connected with the paschal sacrifice, no satisfactory explanation has been given either of its original intention or of its connexion with the Passover. It has been suggested that it was originally a hag or pilgrimage feast to Jerusalem, of which there were three in the year connected with the agricultural festivals (Exod. xxxiv. 17, 18). But the real agricultural occasion was not the eating of unleavened bread but the offering of the first sheaf of the barley harvest on the "morning of the sabbath" in the Passover week (Lev. xxiii. 10, 11), and this occasion determined the second agricultural festival, the Feast of Weeks, fifty days later (Deut. xvi. 9; Lev. xxiii. 16; see PENTECOST). The suggestion that the eating of cakes of unleavened bread, similar to the Australian "dامر," was due to the exigencies of the harvest does not meet the case, since it does not explain the seven days and is incongruous with the fact that the first sheaf of the harvest was put to the sickle not earlier than the third day of the feast. It still remains possible therefore that the seven days' eating of unleavened bread (and bitter herbs) is an historical reminiscence of the incidents of the Exodus, where the normal commissariat did not begin until a week after the first exit. On the other hand, the absence of leaven may recall primitive practice before its introduction as a domestic luxury; sacral rites generally keep alive primitive custom. There was also associated in the Hebrew mind a connexion of impurity and corruption with the notion of leaven which was tabu in all sacrifice (Exod. xiii. 18; Lev. ii. 11).

According to Robertson Smith, the development of the various institutions connected with the Passover was as follows. In Egypt the Israelites, as a pastoral people, sacrificed the firstlings of their flocks in the spring; and, according to tradition, it was a refusal to permit a general gathering for this purpose that caused the Exodus. When the Israelites settled in Canaan they found there an agricultural festival connected with the beginnings of the barley harvest, which coincided in point of date with the Passover and was accordingly associated with it. At the time of the reformation under Josiah, represented by Deuteronomy, the attempt was made to turn the family thank-offering of firstlings into a sacrificial rite performed by the priests in the Temple with the aid of the males of each household, who had to come up to Jerusalem but left the next morning to celebrate the Feast of Unleavened Bread in their homes. During the exile this was found impossible, and the old home ceremonial was revived after the return of the exile. This is a highly ingenious hypothesis to explain the discrepancies of the text, but is, after all, nothing but hypothesis.

There appears to have been originally considerable variety in the mode of keeping the Passover, but the earliest mention in the historical narratives (Josh. v. 11) connects the paschal sacrifice with the eating of unleavened bread. But it is unsafe to assume, from 2 Kings xxiii. 22, that the festival was not kept in the time of the early kings, since Solomon appears to have kept up the three great pilgrimage festivals, 2 Kings lx. 25, and it is possibly referred to in Isa. i. 9. The complex of observances connected with the Passover and the very want of systematised observance in the Temple would seem to vindicate the primitive character of the feast, which indeed is recognized by all inquirers.

At any rate the Samaritans have, throughout their history, observed the Passover with all its Pentateuchal ceremonial and still observe it down to the present day. They sacrifice the paschal lamb, which is probably the oldest religious rite that has been continuously kept up. In two important points they differ from later Jewish interpretation. The term "between the evenings" (Lev. xxiii. 5) they take as the time between sunset and dark, and the "morning of the sabbath" (v. 11) they take literally as the first Sunday in the Passover week; wherein they agree with the Saducees, Boethusians, Karaites and other Jewish sectaries. This would seem to point to a time when the fixing of the sabbath was determined by the age of the moon, so that the first day of the Passover, which is on the 15th of Nisan, would always occur on a sabbath.
During the existence of the Temple there was a double celebration of the Passover, a series of stipulated sacrifices being offered during the seven days in the Temple, details of which are given in Numbers. The festival itself was still kept up and gradually developed a special ritual, which has been retained among orthodox Jews up to the present day. The paschal lamb is no longer eaten but represented by the shank bone of a lamb roasted in the ashes; unleavened bread and bitter herbs (koreseth) are eaten; four cups of wine are drunk before and after the repast, and a certain number of Psalms are recited. The family service, termed Haggada shel Pesach, includes a description of the Exodus with a running commentary, and is begun by the youngest son of the house asking the father the reason for the difference in Passover custom.

It is related in the gospels that the Last Supper was the Passover meal, though certain discrepancies between the accounts given in the Synoptics and in John render this doubtful. It is, at any rate, certain that Jesus came up to Jerusalem in order to join in the celebration of the Passover. When the Passover fell upon the sabbath, as occurred during his visit, a difficulty arose about the paschal sacrifice, which might involve work on the sabbath. There appears to have been a difference of practice between the Sadducees and the Pharisees on such occasions, the former keeping to the strict rules of the Law and sacrificing on the Friday, whereas the Pharisees did so on the Thursday. It has been suggested that Jesus followed the Pharisaic practice, and ate the Passover meal (the Last Supper) on Thursday evening, which would account for the discrepancies in the gospel narratives (see Chwolson, Das letzte Passahmahl Jesu, 2nd ed., St. Petersberg, 1904). It seems probable in any case that the ritual of the Mass has grown out of that of the Passover service (see Bickell, Messe und Pascha, tr. W. F. Skene, Edinburgh, 1881).

Up to the Nicene Council the Church kept Easter (q.v.) coincident with the Jewish Passover, but after that period took elaborate precautions to dissociate the two.

See the commentaries on Exodus and Leviticus; that of Kalisch on the former book (1843; London, 1871) anticipates much of the critical position. The article in Winer's Bild. Reuss. Sprechbuch gives a succinct account of the older views. A not altogether unsuccessful attempt to defend the Jewish orthodox position is made by Hoffmann in his Commentary on Leviticus (Berlin, 1906, ii. 116-226). Wellhausen's views are given in his Prolegomena, ch. iii. A critical yet conservative view of the whole question is given by R. Schnader, Das Passah-Mazzoih-Fest (Gutersloh, 1900) which has been partly followed above. For the general attitude towards the comparative claims of institutional archaeology and literary criticism adopted above see J. Jacobs, Studies in Biblical Archaeology (London, 1885).

PASSOW, FRANZ LUDWIG CARL FRIEDRICH (1786-1831). German classical scholar and lexicographer, was born at Ludwigslust in Mecklenburg-Schwerin on the 20th of September 1816. In 1807 he was appointed to the professorship of Greek literature at the Weimar gymnasium by Goethe, whose acquaintance he had made during a holiday tour. In 1815 he became professor of ancient literature in the university of Breslau, where he continued to reside until his death on the 17th of March 1833. His advocacy of gymnastic exercises, in which he himself took part, met with violent opposition and caused a quarrel known as the " Breslauer Turnfehde." Passow's great work was his Handwörterbuch der griechischen Sprache (1819-1824), originally a revision of J. G. Schneider's lexicon, which appeared in the fourth edition (1831) as an independent work without Schneider's name (new ed. by Cröner, 1901). It formed the basis of Liddell and Scott's lexicon. Other works by him are Grundzüge der griech. und röm. Literatur- und Kunstgeschichte (2nd. ed., 1829) and editions of Persius, Longus, Tacitus Germania, Dionysius Periegetes, and Musaeus. His miscellaneous writings have been collected in his Opuscula academica (1835) and Vermischte Schriften (1843).

See Franz Passow's Leben und Briefe (1839), by L. and J. Wachler, which contains a full bibliography.

PASSPORT, or safe-conduct in time of war, a document granted by a belligerent power to protect persons and property from the operation of hostilities. In the case of the ship of a neutral power, the passport is a requisition by the government of the neutral state to suffer the vessel to pass freely with the crew, cargo, passengers, &c., without molestation by the belligerent; the requisition, when issued by the civil authorities of the port from which the vessel is fitted out, is called a sea-letter. But the terms passport and sea-letter are often used indiscriminately. A form of sea-letter (litere salvi conduitus) is appended to the Treaty of the Pyrenees, 1659. The passport is frequently mentioned in treaties, e.g. the Treaty of Copenhagen, 1679, between Great Britain and Denmark. The violation of a passport, or safe conduct, is a grave breach of international law. The offence in the United States is punishable by fine and imprisonment where the passport or safe conduct is granted under the authority of the United States (Act of Congress, Oct. 3, 1862). It is a document authorizing a person to pass out of or into a country, or a licence or safe-conduct to the person specified therein and authenticating his right to aid and protection. Although most foreign countries may now be entered without passports, the English foreign office recommends travellers to furnish themselves with them, as affording a ready means of identification in case of need. They are usually granted by the foreign office of a state, or by its diplomatic agents abroad. The English Foreign Office charges two shillings for a passport, whatever number of persons may be named in it. Passports granted in England are subject to a stamp duty of sixpence. They may be granted in naturalized as well as natural-born British subjects.

See "The Passport System," by N. W. Sibley, in Jour. Comp. Leg. new series, vol. vii. The regulations respecting passports issued by the English Foreign Office as well as the passport requirements of foreign countries will be found in the annual Foreign Office List.

PASTE (O. Fr. paste, modern pâte, Late Lat. pusta, whence also in Spain, Port. and Itali., from Gr. πατή or ποστά, barley porridge, or salted pottage, πεσεῖς, to sprinkle with salt), a mixture or composition of a soft plastic consistency. The term is applied to substances used for various purposes, e.g. in cookery, a mixture of flour and water with yeast, butter or suet, for making pies and pastry, or of flour and water boiled, to which starch or other ingredients to prevent setting are added, forming an adhesive for the affixing of wall-paper, bill-posting and other purposes. In technical language, the term is also applied to the prepared clay which forms the body in the manufacture of pottery and porcelain (see Ceramics) and to the specially prepared glass, known also as "strass," from which imitation gems are manufactured. This latter must be the purest, most transparent and most highly refractive glass that can be prepared. These qualities are comprised in the highest degree in a flint glass of unusual density from the large percentage of lead it contains. Among various mixtures regarded as suitable for strass the following is an example: powdered quartz 300 parts, red lead 470, potash (purified by alcohol) 163, borax 22, and white arsenic 1 part by weight. Special precautions are taken in the melting. The finished colourless glass is used for imitation diamonds; and when employed to imitate coloured precious stones the strass is melted up with various metallic oxides. Imitation gems are easily distinguished from real stones by their inferior hardness and by chemical tests; they may generally be detected by the comparatively weak sensation they communicate to the tongue.

PASTEL, the name of a particular method of painting with dry pigments, so called from the "paste" into which they are first compounded. The invention of pastel, which used to be generally called "crayon," has frequently been accredited to Johann Alexander Thiele (1685-1752), landscape-painter and etcher of distinction, as well as to Mme Verneirn and Mlle Held (1688-1753), both of Danzig. But the claim cannot be substantiated, as drawing in coloured chalks had been practised long before, e.g. by Guido Reni (1606-1642), by whom a head and bust in this manner exists in the Dresden Gallery. Thiele was perhaps the first to carry the art to perfection, at least in Germany, where it was extensively exploited in the
17th century; but his contemporary, Rosalba Carriera of Venice (1657–1757), is more completely identified with it, and in her practice of it made a European reputation which to this day is in some measure maintained. The Dresden Museum contains 157 examples of her work in this medium, portraits, subjects and the like. Thècle was followed by Anton Raphael Mengs (1728–1779) and his sister Theresia Mengs (afterwards Maron, 1725–1806), and by Johann Heinrich Schmitz (1745–1820).

When in 1720 Rosalba Carriera accepted an invitation to visit Paris, where she was received with general enthusiasm, she found the art of pastel-painting well established; that is to say, it was used to reproduce local colour with truth, and never as fashionable and combined truth with high finish. Nearly a hundred years before Claude Lorrain had used coloured chalks as Dutch and Italian painters had used them, often with high finish, employing mainly red, blue and black, for the sake of prettiness of effect and not with the intention of reproducing with accuracy the actual colours of the head, the figure, or the landscape before them. This method of making drawings—rehausstes, as they called—has remained in common use almost to the present day, especially for studies. It is necessary only to cite among many examples the series of heads by Holbein, the highly esteemed studies by Watteau, Boucher and Greuze, and of John Raphael Smith and Sir Thomas Lawrence, to indicate how general has been the employment of the coloured chalk. In 1747 Nattier (1655–1766) showed a pastel portrait of M. Logerot in the Paris Salon, and his son-in-law, Louis Vaucé (1666–1772), soon followed with similar work. Hubert, Drouais (1699–1767) had preceded his rival Nattier in the Salon by a single year with five pastel portraits, and Chardin (1699–1770) followed in 1771. This great master set himself to work in emulation of Quentin de la Tour (1704–1788), who in spite of the ability of his rivals may be regarded as the most eminent pastellist France has produced. His portraits of Mme Boucher and himself appeared at the Salon in 1737; his full strength as a portrait-pastellist is to be gauged in the collection of eighty-five of his principal works now in the museum of St Quentin. Then followed Simon Mathurin Lantara (1729–1778), who was one of the first to paint pastel-pictures of landscapes, including sunsets and moonlight, as well as marines, into which the figures were drawn by Joseph Vernet, Casanova and others, and Jean Baptiste Perronneau (1731–1796), the best of whose heads have been often attributed to de la Tour and whose “Jeune fille au chat” in the Louvre, though not the finest, is perhaps the best known of his works, was the last pre-eminent French pastellist of the 18th century. Since then they have been legion; of these it is needful to mention only Girodet and the flower-painters, Jean Saint-Simon and Spredonc.

Two Swiss painters had considerable influence in spreading the use of pastel—the experimentalist Dietrich Meyer (1572–1658), one of the first to make designs in coloured chalks (and reputed inventor of soft-ground etching), and Jean Étienne Liébard (1702 or 1704–1788), one of the most brilliant pastellists who ever lived. Two of his works are world-famous, “La Belle Chocolatière de Vienne,” executed in 1745, now in the Dresden Museum, and “La Belle Liseuse” of the following year at the museum at St Etienne. It is a case of the latter which his niece Mlle Lavergne. In 1753, and again in 1772, Liébard visited England, where his brilliant work, portraits and landscapes, produced a great effect, almost equal to that of de la Tour twenty years before. To the Royal Academy between 1773 and 1775 Liébard contributed the portraits of Dr Thomson, himself, Lord Duncannon and General Cholmondeley.

Crayon-painting was practised in England at an early date, and John Riley (1650–1690), many of whose finest works are attributed to Sir Peter Lely, produced numerous portraits in that medium. Francis Knapp (1668–1779), court painter, was a more prolific master, and he, with William Hoare of Bath (?1707–1762) who had studied pastel in Italy and made many classic designs in that medium, exhibiting at the Royal Academy his “Boy as Cupid,” “Prudence instructing her Puppy,” “Diana,” “A Zingara,” and others, prepared the way for the triumph of Francis Cotes (1723–1770). Then for the first time pastel-painting was fully developed by an English hand. Before he became a painter in oil Cotes had worked under Rosalba Carriera, and, although he was rather cold and chalyk in his tones, he produced portraits, such as his “Mr and Mrs Bates” and “Lord Hawke,” which testify to his high ability. He was, however, far surpassed by his pupil, John Russell, R.A. (1745–1806), who brought the art to perfection, displaying grace and good expression in all his pastel work, whether portrait, fancy picture, historical subject, group, or “conversation-piece.” He had brought from Rosalba her four fine pictures representing “The Seasons,” and in a great measure founded his style of painting on them. He was in a sort of brilliancy in colour, and when he was at his best his high, smooth finish in no way robbed his work of vigour. Romney (1734–1802) in his single pastel portrait, a likeness of William Cowper the poet, showed that he might have excelled in this medium, which, indeed, was particularly suited to his tender manner. Hugh D. Hamilton (c. 1734–1806) of the Royal Hibernian Academy, produced noteworthy portraits, mainly in grey, red and black, until on the suggestion of Flaxman he abandoned pastel for oil. Olaus Humphry, A.R.A. (1742–1810), painter and miniaturist, is an important figure among the pastellists, commonly believed to be the first in England who made a point of letting his colour strokes be seen (as by Emile Wauters and others in our own day), contrary to the practice of Russell and his predecessors, whose prime effort was to blend all into imperceptible gradations. Richard Cosway, R.A. (1742–1821) was mainly experimental in his pastels, but his portraits, such as that of George prince of Wales, are forcible and brilliant; those of his wife Maria Cosway (1750–1838) are more delicate. Daniel Gardner (?1750–1805), whose pictures in oil have often been mistaken for Reynolds’s and Gainsborough’s, gave rein to his exuberant fancy and his rather exaggerated taste in compositions which, in his arrangement of children, remind us of Sir Thomas Lawrence in his more fantastic mood. Gardner marked the deterioration of the art, which thereafter declined, Henry Bright (1814–1873) being almost the only pastellist of real power who followed him. Bright’s landscapes have probably in their own line never been surpassed.

Since 1870 there has been a revival of the art of pastel, the result of a better understanding and appreciation on the part of the public. Grimm’s denunciation of it to Diderot—“every one is agreed that pastel is unworthy the notice of a great painter”—which for many years had found general acceptance, is now seen to have been based on forgetfulness or ignorance of the virtues inherent in the method. It was thought that “coloured chalks,” as it used to be called in English-speaking countries, promised nothing but sketches of an ephemeral kind, so fragile that they were at the mercy of every chance blow or every touch of dampness. The fact is, that with care no greater than is accorded to every work of art, pastel properly used is not more perishable than the oil-painting or the water-colour. Damp will affect it seriously, but so also will it ruin the water-colour; and rough usage is to be feared for the oil-picture not less than for the pastel. Moreover, pastel possesses advantages that can be claimed by neither oil-painting nor water-colour. The effect of light and shade is reproduced in them; the shadows of children are shown; the mouths of infants in their first moments, with their lips darkened. If you look at the pastel of Bright with a magnifying glass, you will see that the papers used can hardly have been the Coopers, or Tintoretto, or Zoffany, or Reynolds, and no water-colourist has ever seen a man or woman like that by Bright.
always be secured without fear of that loss of brilliancy commonly attendant on the mixing of colour on the palette. Moreover, the fact of pastel being dry permits the artist to leave his work and take it up again as he may choose; and he is free from many of the technical troubles and anxieties natural to oil and water-colour painting. Applied with knowledge, pastel, which has been likened for delicacy of beauty to “the coloured dust upon the velvet of butterflies’ wings,” will not fall off. It can, if desired—though this is hardly necessary or desirable—be “fixed,” most commonly by a fixatif. If intending so to treat his work, the artist must paint in a somewhat lighter key, as the effect of the fixing medium is slightly to lower the general tone. The fixatif Lacaze is considered the best, but the general consensus of opinion among artists is against the use of any such device. This preparation has the advantage of leaving the colour unchanged, even though it dulls it; shellac fixatif has the effect of darkening the work.

The inherent qualities of pastel are those of charm, of subtlety, softness, exquisite depths of tone, unsurpassable harmonies and unique freshness of colour, sweetness, delicacy, mystery—all the virtues sought for by the artist of daintiness and refinement. Pastel-painting is essentially, therefore, the art of the colourist. Now, these very qualities suggest its limitations. Although it is unfair to relegiate it—as fashion has foolishly done for so long—to the bunch of pretty trillings which Carlyle called “Pompadourisms,” we must recognize that a medium which suggests the bloom upon the peach is not proper to be employed for rendering the more serious subjects, or for the covering of large surfaces of canvas. It is inappropriate to the painting of classic compositions, although in point of fact it has been so used, not without success. It is best adapted to the rendering of still life, of landscape and of portraiture. But in these cases it is not advisable to aim at that solidity which is the virtue of oil-painting, if only because oil can bring about a better result. The real reason is that, in securing subtlety, pastel tends to forfeit that lightness and grace which constitute its special charm and merit. Strength belongs to oil, tenderness and subtlety to pastel, together with freshness and elegance.

The pre-eminent technical advantage, in addition to those already mentioned, is the permanence of the tones. In water-colours there is an admixture of gum and glycerine which may attract moisture from the air; and, besides, the pigment is used in very thin washes. In oil-painting not only does the oil darken with age but sometimes draws oxygen from a pigment and changes its hue. In pastel the colour is put on without any moist admixture, and can be laid on thick. Moreover, the permanence may arise from the method of manufacture. In a very rare work, The Excellency of the Pen and Pencil (1691), a small volume by the young and little known artist (sic) “of several colours for drawing figure, landskip, architecture, &c., on blew paper,” describes the manner of grinding up the pigments with grease. This used to be the secret of pastel—that every grain of colour was separately and securely locked up in grease, and so was secured from any chemical change that might have come about through contact of the colours with one another or with the atmosphere. With pastel nothing of the kind could occur; and the works of Rosalba Carriera in Italy, of Quentin Latour, Peronneau, Watteau, St Jean, Paul Hoin and Chardin in France or of Russell and Cotes in England—to name no others—testify to the permanency of the colours. Some manufacturers nowadays employ gum as the binding medium; others beeswax (which at one time was more frequently used than it is at present); others, again, a very small proportion of tallow, and sometimes a little soap. But this introduction of binding media is now adopted only in the case of certain colours. Whether the point or edge of the stick be used (as in pastel drawing), or the side of it, helped with the tips of the fingers (as in pastel painting), the result is equally permanent; and if, when the work is done, it be struck two or three times, and then topped up by hand-crayons, no dropping of colour from the paper need ever occur. The drawing is made on a ground paper that will hold the chalk, or on a specially manufactured toothed cloth. The French paper known as gras gris bleuté is employed by certain of the leading pastellists. The crisp touches of the pastel can be placed beside side, or the “vibrations” which the artist seeks may be obtained by glazes and superimposed tones. It should be noticed that in the 19th century M. Jean-François Raffaelli produced in Paris sticks of oil colours which he claimed would in a great measure replace painting with the brush. Although the system was widely tried and many good pictures painted in this method, it was found that the colours became dull, and such vogue as these "solid paints" enjoyed for a time has to a very great extent disappeared.

The art of pastel, as M. Roger Ballu expressed it, “was a kind of a free and most ideal fashion in painting,” a fashion in France and met with ready appreciation. With many artists it was a matter of “coloured chalks,” as, for example, with Millet, Lermite and Degas in France, and with Whistler in England. With the majority the full possibilities were seized, and a great number of artists abroad then practised the art for the sake of colour, among whom may be mentioned Adrien Moreau, A. Besnard, Emile Levy, Machard, Pointelin, Georges Picard, de Nittis, Twill, René Billotte, Johanna Liebermann, A. C. Kremer, and Levy-Dhumer in France; in Belgium, Émile Wauters (who has produced a great series of life-sized portraits of both men and women); in Russia, L. Machard; in America, the strength and colour of the pastel were best exploited by Kohniff; in Italy, C. Laurenti, P. Fracagnoli and Giovanni Segantini; in Holland, Joselin de Jong; in Germany, F. von Lenbach, Max Liebermann and Franz Stuck; and in Norway, Fritz Thaukow.

The first exhibition of the Pastel Society was held in the Grosvenor Gallery. The exhibition was a succès d’estime, but after a while the society languished until, in 1899, it was reconstituted, and obtained the adhesion of many of the most distinguished artists practising the art. The most recently held was that of 1898. The full possibilities of pastel-painting have been directed to the work of the country, as well as of a score of eminent foreign painters. In that year, and since, it has held exhibitions of a high order; and intelligent publication has been directed to the work of the most noteworthy contributors. Among these are E. A. Abbey, R.A.; M’Lure Hamilton, J. M. Swan, R.A.; J. Lorimer, R.S.A.; A. Peppercorn, R. Anning Bell, J. J. Shannon, R.A.; Sir James Geddes, R.S.A., R.A.); Adolphe Moreau, M. J. C. Mestrel, R.A., A.R.A.; S. J. Solomon, R.A.; and W. Rothenstein. Sec Karl Robert (Georges Meusnier), Le Pastel (Lausans, Paris, 1890); J. L. Spirek, A Guide to Pastel Painting (Rowley, London).

The main Murray, The Art of Painting and Drawing in Coloured Crayons (Winsor & Newton, London). Among early works are: John Russell, R.A., Elements of Painting with Crayons (1776); M. P. C. C., Traité de la peinture au pastel avec les moyens de prévenir l’altération des couleurs (Paris, 1758); Rosalba Carriera, Diario degli anni 1720 e 1721 scritto di proprio mano in Parigia, etc. (Giovanni Vinellari, Venice, 1793, 4to); Girolamo Zannetti, Elégie de l’art Pastel (Rome, 1753); M. J. C. Mestrel, Les Pastels de M. Quentin de La Tour & St Quentin, préface par Gustave Larroumet (Paris), George C. Williamson, John Russell, R.A. (London, 1892).
enabling him to become candidate for the École normale. But here something (probably the examiner) was at fault; for a note was attached to Pasteur's diploma stating that he was only "mediocre" in chemistry. In those early days and early trials the dominant note of Pasteur's life was sounded. To his sisters he writes: "Cette trois choses, la volonté, le travail, le succès, se partagent toute l'existence humaine. La volonté ouvre la porte aux carrières brillantes et heureuses; le travail les franchit, et une fois arrivé au terme du voyage, le succès vient couronner l'œuvre." Throughout his life, and to the very end, "work" was his constant inspiration. On his deathbed he turned to the devoted pupils who watched over his last hours. "Où en êtes-vous?" he exclaimed. "Que faites-vous?" and ended by repeating his favourite words, "Il faut travailler."

The first incentive to his serious study of chemistry was given by hearing J. B. A. Dumas lecture at the Sorbonne; and ere long he broke new ground for himself, A. J. Balard having given him an opportunity for chemical work by appointing him to the post of laboratory assistant. A few words of explanation concerning Pasteur's first research are necessary to give the key to all his future work. What was the secret power which enabled him to bring under the influence of scientific laws phenomena of disease which had so far baffled all previous endeavour? It simply consisted in the application, to the elucidation of these complex problems, of the exact methods of chemical and physical research. Perhaps the most remarkable discovery of modern chemistry is the existence of compounds, which, whilst possessing an identical composition, are absolutely different bodies, judged of by their properties. The first of the numerous cases of isomerism now known was noted, but unexplained, by J. J. Berzelius. It was that of two tartaric acids, deposited from wine-liquors. The different behaviour of these two acids to a ray of polarized light was subsequently observed by J. B. Biot. One possessed under the microscope, and at the expense of the polarized ray to the right; the other possessed no rotary power. Still no explanation of this singular fact was forthcoming, and it was reserved for the young chemist from Franche-Comté to solve a problem which had baffled the greatest chemists and physicists of the time. Pasteur proved that the inactivity of the one acid depended upon the fact that it was composed of two isomeric constituents; one the ordinary or dextrorotary acid, and the other a new acid, which possessed an equally powerful left-handed action. The veteran Biot whose acquaintance Pasteur had made, was incredulous. He insisted on the repetition of the experiment in his presence, and when his master's demonstration was repeated he exclaimed to the discoverer: "Mon cher enfant, j'ai tant aimé les sciences dans ma vie que cela me fait battre le cœur." Thus at one step Pasteur gained a place of honour among the chemists of the day, and was immediately appointed professor of chemistry at the Faculté of Science at Strasbourg, where he soon afterwards married Mlle Laurent, who proved herself to be a true and noble helpmeet. Next he sought to prepare the inactive form of the acid by artificial means; and after great and long-continued labour he succeeded, and was led to the commencement of his classical researches. Pasteur was at this time himself the subject of an experiment in the laboratory. Pasteur's case was that the inactivity of the inactive acid was placed in contact with a special form of mould (Penicillus glaucum) the right-handed acid alone being destroyed, the left-handed variety remained unchanged. So well was his position as a leading man of science now established that in 1854 he was appointed professor of chemistry and dean of the Faculté des Sciences at Lille. In his inaugural address he used significant words, the truth of which was soon manifested in his case: "In the field of observation chance only favours those who are prepared." The diseases or sicknesses of beer and wine had from time immemorial baffled all attempts at cure. Pasteur one day visited a brewery containing both sound and unsound beer. He examined the yeast under the microscope, and at once saw that the globules from the sound beer were nearly spherical, whilst those from the sour beer were elongated; and this led him to a discovery, the consequences of which have revolutionized chemical as well as biological science, inasmuch as it was the beginning of that wonderful series of experimental researches in which he proved conclusively that the notion of spontaneous generation is a chimera. Up to this time the phenomenon of fermentation was considered strange and obscure. Explanations had indeed been put forward by men as eminent as Berzelius and Liebig, but they lacked experimental foundation. This was given in the most complete degree by Pasteur. For he proved that the various changes occurring in the several processes of fermentation—as, for example, in the vinous, where alcohol is the chief product; in the acetic, where vinegar appears; and in the lactic, where milk turns sour—are invariably due to the presence and growth of minute organisms called fermenters. Exclude every trace of these organisms, and no change occurs. Brewers' wort remains unchanged for years, milk keeps permanently sweet, and these and other complex liquids remain unaltered when freely exposed to air from which all these minute organisms are removed. "The chemical act of fermentation," writes Pasteur, "is essentially a correlative phenomenon of a vital act beginning and ending with it."

But we may ask, as Pasteur did, Why does beer or milk become sour on exposure to ordinary air? Are these invisible germs which cause fermentation always present in the atmosphere? Are they not generated, if indeed originated, by the constituents of the fermentable liquid? In other words, are these organisms not spontaneously generated? The controversy on this question was waged with spirit on both sides; but in the end Pasteur came off victorious, and in a series of the most delicate and most intricate experimental researches he proved that when the atmospheric germs are absolutely excluded no changes take place. In the interior of the grape, in the healthy blood, no such germs exist; crush the grape, wound the flesh, and expose them to the ordinary air, then changes, either fermentative or putrefactive, run their course. But place the crushed fruit or the wounded animal under conditions which preclude the presence or destroy the life of the germ, and again no change takes place; the grape juice remains sweet and the wound clean. The application of these facts to surgical operations, in the able hands of Lord Lister, was productive of the most beneficent results, and has indeed revolutionized surgical practice.

Pasteur was now the acknowledged head of the greatest chemical movement of the time, the recipient of honours both from his own country and abroad, and installed at the École normale in Paris in a dignified and important post. Not, however, was it without grave opposition from powerful friends in the Academy that Pasteur carried on his work. Biot—who loved and admired him—was the first to express fear that his enterprise was chimerical and the problem insoluble; Dumas evidently thought so too, for he advised Pasteur not to spend more of his time on such a subject. Yet he persevered: "Travailleur, travailler toujours" was his motto, and his patience was rewarded by results which have not merely rendered his name immortal, but have benefited humanity in a way and to a degree for which no one could have ventured to hope. To begin with a comparatively small, though not unimportant, matter, Pasteur's discoveries on fermentation inaugurated a new era in the brewing and wine-making industries. Empiricism, hitherto the only guide, if indeed guide at all, was replaced by exact scientific knowledge; the connexion of each phenomenon with a controllable cause was established, and rule-of-thumb quackery banished for ever by the free gift to the world of the results of his researches.

But his powers of patient research and of quick and exact observation were about to be put to a severe test. An epidemic of a fatal character had ruined the French silk producers. Dumas, a native of the Alais district, where the disease was rampant, urged Pasteur to undertake its investigation. Up to that time he had never seen a silkworm, and hesitated to attempt so difficult a task; but at the entreaty of his friend he consented, and in June 1865 went to the south of France for the purpose of studying the disease on the spot. In September of the same year he was able to announce results which pointed to
the means of securing immunity from the dreaded plague. The history of this research, of the gradual elimination of the unimportant conditions, of the recognition of those which controlled the disease, is one of the most fascinating chapters of scientific discovery. Suffice it here to say that careful experiment and accurate observation succeeded in ascertaining the cause of the disease and in preventing its recurrence, thus bringing back to prosperity the silk trade of France, with all that this entails. "There is no greater charm," says Pasteur, "for the investigator than to make new discoveries; but his pleasure is heightened when he sees that they have a direct application to practical life." Pasteur had the good fortune, and just reward, of seeing the results of his work applied to the benefit both of the human race and of the animal world. It is to him that the world is indebted for the introduction of methods which have already worked wonders, and bid fair to render possible the preventive treatment of all infectious diseases. Just as each kind of fermentation possesses a definite organized ferment, so many diseases are dependent on the presence of a distinct microbe; and just as the gardener can pick out and grow a given plant or vegetable, so the bacteriologist can (in most cases) eliminate the adventitious and grow the special organism—in other words, can obtain a pure cultivation which has the power of bringing about the special disease. But by a process of successive and continued artificial cultures under different conditions, the virus of the organism is found to become attenuated; and when this weakened virus is administered, the animal is rendered immune against further attacks. The first disease investigated by Pasteur was that of chicken cholera, an epidemic which destroyed 10% of the French fowls; after the application of the preventive method the death-rate was reduced to below 1%. Next came the successful attempt to deal with the fatal cattle scourge known as anthrax. This is also caused by the presence of a microbe, of which the virus can also be attenuated, and by inoculation of this weakened virus the animal rendered immune. Many millions of sheep and oxen all over the world have thus been treated, and the rate of mortality reduced from 10 to less than 1%. As to the money value of these discoveries, T. H. Husley gave it as his opinion that it was sufficient to cover the whole cost of the war indemnity paid by France to Germany in 1870.

The most interesting of Pasteur's investigations in preventive and curative medicine remains to be told. It is no less than a cure for the dread disease of hydrophobia in man and of rabies in animals; and the interest of the achievement is not only that he successfully combated one of the most mysterious and most fell diseases to which man is subject, but also that this was accomplished in spite of the fact that the special microbe causing the disease had not been isolated. To begin with, Pasteur, in studying the rabbid dogs, came across a disease in which the virus had its seat in the nerve centres, and he proved that the injection of a portion of the matter of the spinal column of a rabbid dog into the body of a healthy one produces in the latter with certainty the symptoms of rabies. The next step was to endeavour so to modify and weaken the virus as to enable it to be used as a preventative or as an antitoxin. This, after long and serious labour, he effected; the dog thus inoculated proved to be immune when bitten by a rabbid animal. But this was not enough. Would the inoculation of the attenuated virus have a remedial effect on an animal already bitten? If so, it might be possible to save the lives of persons bitten by mad dogs. Here again experiment was successful. A number of dogs were inoculated, the same number were untreated, and both sets were bitten by rabbid animals. All the treated dogs lived; all the untreated died from rabies. It was, however, one thing to experiment on dogs, and quite another to do so on human beings. Nevertheless Pasteur was bold enough to try. The trial was successful, and by doing so he earned the gratitude of the human race. Then, on the 14th of November 1888, the Institut Pasteur was founded. Thousands of people suffering from bites from rabid animals, from all lands, have been treated in this institute, and of all death-rate from this most horrible of all diseases has been reduced to less than 1%. Not only in Paris, but in many cities throughout the world, institutes on the model of the original one have been set up and are doing beneficent work, all arising from the genius and labour of one man. At the inauguration of the institute Pasteur closed his oration with the following words:

"Two opposing laws seem to me now in contest. The one, a law of blood and death, opening out each day new modes of destruction, forces nations to be always ready for the battle. The other, a law of peace, work and health, whose only aim is to deliver man from the calamities which beset him. The one seeks violent conquests, the other the relief of mankind. The one places a single life above all victories, the other sacrifices hundreds of thousands of lives to the ambition of a single individual. The law of which we are the instruments strives even through the carnage to cure the wounds due to the law of war. Treatment by our antiseptic methods may preserve the lives of thousands of soldiers. Which of these two laws will prevail, God only knows. But of this we may be sure, that science, in obeying the law of humanity, will always labour to enlarge the frontiers of life."

Rich in years and in honours, but simple-minded and affectionate as a child, this great benefactor to his species passed quietly away near St Cloud on the 28th of September 1895. Mention need only be made of Pasteur's chief works, as follows: Études sur le vin (1866), Études sur le vinaigre (1868), Études sur la maladie des vers à soie (1870), Études sur la bière (1876). He began the practice of inoculation for hydrophobia in 1885.

See Vie de Pasteur, by René Vallery-Radot (Paris, 1900).

(H. E. R.)

PASTICIO, an Italian word, now often Englished as "pastiche," formed from pasto, paste, for a composition in music, painting or other arts, made up of selections from fragments or imitations of the work of other artists, a medley or pot-pourri. The term has also been applied to a form of musical composition in which selections from various operas, &c., are pieced together to form a consecutive whole, special libertinings being sometimes written for them.

PASTO, a city of Colombia and capital of the department of Narino, about 46 m. from the boundary line with Ecuador, on one of the inland trade routes with that republic, and on a principal line of communication with the great forested regions of the Caquetá (Japurá), Putumayo and Napo. Pop. (1906 estimate), 6000. It stands on an elevated plain, 8347 ft. above the sea, at the eastern foot of the Pasto volcano, which rises above the city to a height of 13,990 ft. Wool is produced to some extent and is woven for the local market in the woollen factories of the city.

PASTON LETTERS, an invaluable collection of letters and papers, consisting of the correspondence of members of the Paston family, and others connected with them, between the years 1422 and 1500, and also including some state papers and other important documents. The bulk of the letters and papers were sold by William Paston, 2nd earl of Yarmouth, the last representative of the family, to the antiquary Peter Le Neve early in the 18th century. On Le Neve's death in 1729 they came into the possession of Thomas Martin of Palgrave, who married his widow; and upon Martin's death in 1771 they were purchased by John Worth, a chemist at Diss, whose executors sold them three years later to John Fenn of East Dereham. In 1787 Fenn published a selection of the letters in two volumes, and general interest was aroused by this publication. In 1789 Fenn published two other volumes of letters, and when he died in 1794 he had prepared for the press a fifth volume, which was published in 1823 by his nephew, Serjeant Freer. In 1787 Fenn had received a knighthood, and on this occasion, the 23rd of May, he had presented the originals of his first two volumes to King George III. These manuscripts soon disappeared, and the same fate attended the originals of the three other volumes. In these circumstances it is not surprising that some doubt should have been cast upon the
authenticity of the letters. In 1865 their genuineness was impugned by Herman Merivale in the Fortnightly Review; but it was vindicated on grounds of internal evidence by James Gairdner in the same periodical; and within a year Gairdner’s contention was established by the discovery of the originals of Fenn’s fifth volume, together with other letters and papers, by Sergeant Frere’s son, Philip Frere, in his house at Dungate, Cambridgeshire. Ten years later the originals of Fenn’s third and fourth volumes, with ninety-five unpublished letters, were found at Roydon Hall, Norfolk, the seat of George Frere, the heir of the Frere family; and finally in 1880 the originals of the two remaining volumes were discovered at Orwell Park, Ipswich, the residence of Captain E. G. Pretyman. This latter batch of papers are the letters which were presented to George III., and which possibly reached Orwell through Sir George Pretyman Tomline (1750-1827), the tutor and friend of William Pitt.

The papers which had been in the hands of Sir John Fenn did not, however, comprise the whole of the Paston letters which were extant. When the 2nd earl of Yarmouth died in 1732 other letters and documents relating to the Pastons were found at his seat, Oxburgh Hall, and some of these came into the hands of the Rev. Francis Blemefield, who failed to carry out a plan to unite his collection with that of Martin. This section of the letters was scattered in various directions, part being acquired by the antiquary John Ives. The bulk of the Paston letters and documents are now in the British Museum; but others are at Orwell Park; in the Bodleian Library, Oxford; at Magdalen College, Oxford; and a few at Pembroke College, Cambridge.

Fenn’s edition of the Paston Letters held the field until 1872, when James Gairdner published the first volume of a new edition. Taking Fenn’s work as a basis, the aim of the new editor was to include all the letters which had come to light since his publication; and in his careful and accurate work on three volumes (London, 1872-1873) he printed over four hundred letters for the first time. Gairdner’s edition, with notes and index, also contained a valuable introduction to each volume, including a survey of the reign of Henry VI.; and he was just completing his task when the discovery of 1875 was made at Roydon. His appendix gave particulars of this discovery, and the unpublished letters were printed as a supplement to subsequent editions. In 1904 a new and complete edition of the Paston Letters was edited by Gairdner, and these six volumes, containing 1888 letters and papers, possess a very valuable introduction, which alone makes the work worth possessing.

The family of Paston takes its name from a Norfolk village about twenty miles north of Norwich, and the first member of the family about whom anything is known was living in this village early in the 15th century. This was one Clement Paston (d. 1419), a peasant, holding and cultivating about one hundred acres of land, who gave an excellent education to his son William, and enabled him to study law. Making good use of his opportunities, William Paston (1378-1444), who is described as “a right cunning man in the law,” attained an influential position in his profession, and in 1420 became a justice of the common pleas. He bought a good deal of land in Norfolk and Hertfordshire; included some in Paston, and improved his position by his marriage with Agnes (d. 1479), daughter and heiress of Sir Edmund Berry of Hartlibury, Hertfordshire. Consequently when he died he left a large and valuable inheritance to John Paston (1421-1456), the eldest of his five sons, who was already married to Margaret (d. 1454), daughter of John Mauetye of Mauetye. At this time England was in a very distracted condition. A weak king surrounded by turbulent nobles was incapable of discharging the duties of government, and only the strong man armed could hope to keep his goods in peace. The latter was his father, Paston spent much time in London, leaving his wife to look after his business in Norfolk; and many of the Letters were written by Margaret to her husband, detailing the progress of affairs in the county. It is during the lifetimes of John Paston and his eldest son that the Letters are most numerous and valuable, not only for family matters, but also for the history of England. In 1448 Paston’s manor of Gresham was seized by Robert Hungerford, Lord Molyneux (1431-1464), and although it was afterwards recovered, the owner could obtain no redress for the loss and injury he had sustained. More serious troubles, however, were at hand. Paston had become very intimate with the wealthy knight, Sir John Fastolf, who was probably related to his wife, and who had employed him on several matters of business. In 1459 Sir John died without children, leaving his affairs in rather a tangled condition. In accordance with the custom of the time, he had conveyed many of his estates in Norfolk and Suffolk to trustees, among whom were John Paston and his brother William, retaining the revenues for himself, and probably intending his trustees after his death to devote the property to the foundation of a college. However, it was found that a few days before his decease Fastolf had executed a fresh will in which he had named ten executors, of whom two only, John Paston and another, were to act; and, moreover, that he had bequeathed all his lands in Norfolk and Suffolk to Paston, subject only to the duty of founding the college at Caister, and paying 4000 marks to the other executors. At once taking possession of the lands, Paston soon found his rights challenged. Various estates were clapped by different noblemen; the excluded executors were angry and aggressive; and Paston soon found himself in a whirlwind of litigation, and exposed also to more violent methods of attack. Something like a regular warfare was waged around Drayton and Hellesden between John de la Pole, duke of Suffolk, and the Pastons under Margaret and her eldest son, John; Caister Castle was seized by John Mowbray, 3rd duke of Norfolk (d. 1461); and similar occurrences took place elsewhere. Some compensation, doubtful, was found in the fact that in 1460, and again in 1461, Paston had been returned to parliament as a knight of the shire for Norfolk, and enjoying the favour of Edward IV. had regained his castle at Caister. But the royal favour was only temporary, and, having been imprisoned on three occasions, Paston died in May 1466, leaving the suit concerning Fastolf’s will still proceeding in the church courts. John Paston left at least five sons, the two eldest of whom were, curiously enough, both named John, and the eldest of whom had been knighted during his father’s lifetime. Sir John Paston (1442-1479) was frequently at the court of King Edward IV., but afterwards he favoured the Lancastrian party, and, with his brother John, fought for Henry VI. at the battle of Barnet. Meanwhile the struggle over Fastolf’s estates continued, although in 1461 the king and council decided that Paston’s estates should be restored to him, and consequently that his title to his father’s lands was good. Caister Castle was taken after a regular siege by John Mowbray, 4th duke of Norfolk (1444-1476), and then recovered by the Pastons, and retaken by the duke. But in 1474 an arrangement was made with William Waynflete, bishop of Winchester, the representative of the excluded executors, by which some of the estates were surrendered to the bishop for charitable purposes, while Paston was secured in the possession of others. Two years later the opportune death of the duke of Norfolk paved the way for the restoration of Caister Castle; but in 1478 a fresh struggle broke out with the Pastons. In 1478 a new subject arose. Sir John, who was a cultured man, had shown great anxiety to recover Caister; but in general he had left the conduct of the struggle to his mother and to the younger John. Owing to his carelessness and extravagance the family lands were also diminished by sales; but nevertheless when he died unmarried in November 1479 he left a goodly inheritance to his brother John. About this time the Letters begin to be scanty and less interesting, but the family continued to flourish. The younger John Paston (d. 1503), after quarrelling with his uncle William over the manors of Ooxned and Marlingford, was knighted at the battle of Stoke in 1471. He married Margaret, daughter of Sir Thomas Brews, and left a son, William Paston (c. 1479-1554), who was also knighted, and who was a prominent figure at the court of Henry VIII. Sir William’s second son, Clement (c. 1515-1557), served his country with distinction on the sea, and was wounded at the battle of Pinkie. The family was continued by Sir William’s eldest son, Erasmus (d. 1548), whose son William succeeded to his grandfather’s
PASTORAL

PASTORAL (from Lat. pastor, a shepherd), the name given to a certain class of modern literature in which the "idyll" of the Greeks and the "eclogue" of the Latins are imitated. It was a growth of humanism at the Renaissance, and its first home was Italy. Virgil had been imitated, even in the middle ages, but it was the example of Theocritus (q.v.) that was originally followed in pastoral. Pastoral, as it appeared in Tuscany in the 16th century, was really a developed eclogue, an idyll which had been expanded from a single scene into a drama. The first dramatic pastoral which is known to exist is the Favola di Orfeo of Politian, which was represented at Mantua in 1472. This poem, which has been elegantly translated by J. A. Symonds, was a tragedy, with choral passages, on an idyllic theme, and is perhaps too grave in tone to be considered as a pure piece of pastoral. It led the way more or less directly, as well as to pastoral, and it is the Il Sagramo of Agostino Beccari, which was played at the court of Ferrara in 1554, that is always quoted as the first complete and actual dramatic pastoral in European literature.

In the west of Europe there were various efforts made in the direction of non-dramatic pastoral, which it is hard to classify. Early in the 16th century Alexander Barclay, in England, translated the Latin eclogues of Mantuanus, a scholiastic writer of the preceding age. Barnabe Googe, a generation later, in 1563, published his Eloges, Epistles and Sonnets, but not very successful attempts to introduce pastoral into English literature. In France it is difficult to deny the title of pastoral to various productions of the poets of the Pléiade, but especially to Remy Belleau's pretty miscellany of prose and verse in praise of a country life, called La Bergerie (1590). But the final impulse was given to non-dramatic pastoral by the publication, in 1594, of the famous Arcadia of J. Sannazar, a work which passed through sixty editions before the close of the 16th century, and which was abundantly copied. Torquato Tasso followed Beccari after an interval of twenty years, and by the success of his Aminta, which was performed before the court of Ferrara in 1573, secured the popularity of dramatic pastoral. Most of the influence in this class may be traced back to either of the Arcadia or of the Aminta. Tasso was immediately succeeded by Alvisi Pasqualino, who gave a comic turn to pastoral drama, and by Cristoforo Castelletti, in whose hands it grew heroic and romantic, while, finally, Guarini produced in 1590 his famous Pastor Fido, and Ongaro his fishermens's pastoral of Alceo in 1591. During the last quarter of the 16th century pastoral drama was really a power in Italy. Some of the best poetry of the age was written in this form, to be acted privately on the stages of the little court theatres, that were everywhere springing up. In a short time music was introduced, and rapidly predominated, until the little forms of tragedy, and pastoral altogether, were merged in opera.

With the reign of Elizabeth a certain tendency to pastoral was introduced in England. In Gascoigne and in Whetstone traces have been observed of a tendency towards the form and spirit of the eclogue. It has been considered that this tendency, combined with the study of the few extant eclogues of Clémont Marot, led Spenser to the composition of what is the finest example of pastoral in the English language, the Shepherd's Calendar, printed in 1579. This famous work is divided into twelve eclogues, and it is remarkable because of the constancy with which Spenser turns in it from the artificial Latin style of pastoral then popular in Italy, and takes his inspiration direct from Theocritus. It is important to note that this is the first effort made in European literature to bring upon a pastoral stage the actual rusticities of a modern country, using their own peasant dialect. That Spenser's attempt to depict a naturalistic pastoral that is not must not conflict against the genuineness of the effort, which the very adoption of such names as Willie and Cuddie, instead of the customary Damon and Daphnis, is enough to prove. Having led up to this work, the influence of which was to be confined to England, we return to Sannazzaro's Arcadia, which left its mark upon every literature in Europe. This remarkable romance, which was the type and the original of so many succeeding pastorals, is written in rich but not laborious periods of musical prose, into which are inserted at frequent intervals passages of verse, and in which he attributes to his "humile fistula di Cordone," or laments for the death of some beautiful virgin. The characters move in a world of supernatural and brilliant beings; they commune without surprise with "glioriosi spiriti degli boschi," and reflect with singular completeness their author's longing for an innocent voluptuous existence, with no hell or heaven in the background.

It was in Spain that the influence of the Arcadia made itself most rapidly felt outside Italy. The earliest Spanish eclogues had been those of Juan de Encina, acte in 1492. Gil Vicente, who was also a Portuguese writer, had written Spanish religious pastorals during the reign of Manuel I., and in 1509 Manrique introduced into Spain the first genuine pastoral, El Dulce lamento de los pastores, is considered one of the finest poems of its kind in ancient or in modern literature. He wrote little, and died early, in 1536. Two Portuguese poets followed him, and composed pastorals in Spanish, Francisco de Sâ de Miranda, who imitated Theocritus, and the famous Jorge de Montemayor, whose Diana (1524) was founded on Sannazzaro's Arcadia. Gaspar Gil Polo, after the death of Montemayor in 1561, completed his romance, and published in 1564 a Diana enamorada. It will be recalled that both these works are mentioned with respect, in their kind, by Cervantes. The author of Don Quixote himself published an admirable pastoral romance, Galatea, in 1584.

In France there has always been so strong a tendency towards a graceful sort of bucolic literature that it is hard to decide what should and what should not be mentioned here. The charming pastorales of the 13th century, with their knight on horseback and shepherds by the roadside, need not detain us further than to hint that when the influence of Italian pastoral began to be felt in France these earlier lyrics gave it a national inclination. We have mentioned the Bergerie of Rémy Belleau, in which the art of Sannazzaro seems to join hands with the simple sweetness of the medieval pastorale. But there was nothing in France that could compare with the school of Spanish pastoral writers which we have just noticed. Even the typical French pastoral, the Astre of Honoré d'Urfé (1610), has almost more connection with the knightly romances which Cervantes laughed at than with the pastorals which he praised. The famous Astre was
PASTORAL

897

the result of the study of Tasso’s Aminta on the one hand and Montemayor’s Diana on the other, with a strong flavouring of the romantic spirit of the Amadis. To remedy the pagan tendency of the Astre a priest, Camus de Pontcarre, wrote a series of Christian pastorals. Racan produced in 1625 a pastoral drama, Les Belles Fees, based on the Astre, but his verses, with the exception of the first line, were not printed until 1633.

In England the movement in favour of Theocritan simplicity which had been introduced by Spenser in the Shepherd’s Calendar, was immediately defeated by the success of Sir Philip Sidney’s Arcadia, a romance closely modelled on the masterpiece of Sannazaro. So far from attempting to sink to colloquial idiom, and adopt a realism in rustic dialect, the tenor of Sidney’s narrative is even more grave and stately than it is conceivable that the conversation of the most serious nobles can have ever been. Henceforward, in England, pastoral took one or other of these forms. It very shortly appeared, however, that the Arcadian form was more suited to the temper of the age, even in England, than the Theocritan. In 1583 a great impetus was given to the former by Robert Greene, who was composing his Morando, and still more in 1584 by the publication of two pastoral dramas, the Gallathea of Lyly and the Arraignment of Paris of Peele. It is doubtful whether either of these writers knew anything about the Arcadia of Sidney, which was posthumously published, but Greene, at all events, became more and more imbued with the Italian spirit of pastoral. His Menaphon and his Never too Late are pure bucolic romances. While in the general form of his stories, however, he follows Sidney, the verse which he introduces is often, especially in the Menaphon, extremely rustic and colloquial. In 1590 Lodge appended some eclogues to his SceUa’s Metamorphosis, but in his Rosalynde (1590) he made a much more important contribution to English literature in general, and to Arcadian poetry in particular. This beautiful and fantastic book is modelled more exactly upon the masterpiece of Sannazaro than any other in our language. The Sise Idilia of 1588, paraphrases of Theocritus, are anonymous, but conjecture has attributed them to Sir Edward Dyer. In 1598 Bartholomew Young published an English version of the Diana of Montemayor.

In 1595 Watson published his collection of Latin eclogues, entitled Amyntas, which was translated into English by Abraham Francce in 1587. Watson is also the author of two frigid pastorals, Meliboeus (1590) and Amyntas gaudia (1592). John Dickenson printed at a date unstated, but probably not later than 1592, a “passionate eclogue” called The Shepherd’s Complaint, which begins with a harsh burst of hexameters, but which soon settles down into a harmonious prose story, with lyrical interludes. In 1594 the same writer published the romance of Arisbad. Drayton is the next pastoral poet in date of publication. His Idea: Shepherd’s Garland bears the date 1593, but was probably written much earlier. In 1595 he published The Shepherds Calendar, which probably takes its title from the Aesopic fable of the sire of D’Urfo. He then turned his fluent pen to the other branches of poetical literature; but after more than thirty years, at the very close of his life, he returned to this early love, and published in 1627 two pastorals, The Quest of Cynthia and The Shepherd’s Sirena. The general character of all these pieces is rich, but vague and inconsiderate. The Queen’s Arcadia of Daniel must be allowed to lic open to the same charge, and to have been written rather in accordance with a fashion than in following of the author’s predominant impulse. The singular eclogue by Barnfield, The Affectiionate Shepherd, printed in 1594, is an exercise on the theme “O crudelis Alexi, nihil mea carmina curis,” and, in spite of its juvenility and indiscretion, takes rank as the first really poetical following of Spenser and Virgil, in distinction to Sidney and Sannazaro. Marlowe’s pastoral lyric Come live with me, although not printed until 1590, has been attributed to 1589. In 1600 was printed the anonymous pastoral comedy in rhyme, The Maid’s Metamorphosis, long attributed to Lyly.

With the close of the 16th century pastoral literature was not extinguished in England as suddenly or as completely as it was in Italy and Spain. Throughout the romantic Jacobean age the English love of country life asserted itself under the guise of pastoral sentiment, and the influence of Tasso and Guarini was felt in England just when it had ceased to be active in Italy. In England it became the fashion to publish lyrical eclogues, usually in short measure, a class of poetry peculiar to the nation and new to the stage. The lighter stanzas of The Shepherd’s Calendar were the model after which all these graceful productions were drawn. We must confine ourselves to a brief enumeration of the principal among these Jacobean eclogues. Nicholas Breton came first with his Passionate Shepherd in 1604. Wither followed with The Shepherd’s Hunting in 1615, and Brathwaite, an inferior writer, published The Poet’s Willow in 1613 and Shepherd’s Tales in 1621. The name of Wither must recall to our minds that of his friend William Browne, who published in 1613–1616 his beautiful collection of Devonshire idylls called Britannia’s Pastorals. These were in heroic verse, and less distinctly Spenserian in manner than any of the others. The Arcades of Milton is scarcely dramatic; but it is a bucolic ode of great stateliness and beauty. In the Sad Shepherd, which was perhaps written about 1635, and in his pastoral masques, we see Ben Jonson not disdaining to follow along the track that Fletcher had pointed out in the Faithful Shepherdess. With the Piscatory Eclogues of Phineas Fletcher, in 1633, we may take leave of the more studied forms of pastorals in England early in the 17th century.

When pastoral had declined in all the other nations of Europe, it enjoyed a curious recrudescence in Holland. More than a century after date, the Arcadia of Sannazaro began to exercise an influence on Dutch literature. Johan van Heemskirk led the way with his popular Batavische Arcadia in 1637. In this curious romance the shepherds and shepherdesses move to and fro between Katewijk and the Hague, in a landscape unadorned by Dutch. Heemskirk had a troop of imitators. Hendrik Zoetbooom published his Zwaanlandsche Arcadia in 1658, and Lambertus Bos his Dordtsche Arcadia in 1662. These local imitations of the suave Italian pastoral were followed by still cruder romances, the Rotterdamsche Arcadia of Willem den Elger, the Walcherse Arcadia of Gargon, and the Noordwijk Arcadia of Jacobus van der Valk. Germany has nothing to offer us of this class, for the Diana of Werdler (1644) and Die achtzehnzigst Rosenmald of Zesen (1654) are scarcely pastorals even in form.

In England the writing of eclogues of the sub-Spenserian class of Breton and Wither led in another generation to a rich growth of lyrics which may be roughly called pastoral, but are not strictly bucolic. Carew, Lovelace, Suckling, Stanley and Cartwright are lyrists who all contributed to this harvest of country song, but by far the most copious and the most characteristic of the pastoral lyrists is Herrick. He has, perhaps, no rival in modern literature in this particular direction. His command of his resources, his deep originality and observation, his power of concentrating his genius on the details of rural beauty, his interest in recording homely facts of country life, combined with his extraordinary gift of song to place him in the very first rank among pastoral writers; and it is noticeable that in Herrick’s hands, for the first time, the pastoral became a real and modern, instead of being an ideal and humanistic thing. From him we date the recognition in poetry of the humble beauty that lies about our doors. His genius and influence were almost instantly obscured by the Restoration. During the final decline of the Jacobean drama a certain number of pastorals were still produced. Of these the only ones which deserve

XX. 20
mention are three dramatic adaptations, Shirley's Arcadia (1640), Fanshawe's Pastor Fido (1640), and Leonard Willan's Astraea (1651). The last pastoral drama in the 17th century was Steele's Pastor Fido (1677). The Restoration was extremely unfavourable to this species of literature. Sir Charles Sedley, Aphra Behn and Congreve published eclogues, and the Pastoral Dialogue between Thirris and Stephon of the first-mentioned was much admired. All of these, however, are in the highest degree insipid and unreal, and partook of the extreme artificiality of the age.

Pastoral came into fashion again early in the 18th century. The controversy in the Guardian, the famous critique on Ambrose Philips's Pastoral was the anger and rivalry of Pope, and the doubt which must always exist as to Steele's share in the magnification given to these imaginary aspects of bucolic writing. Pope had written his idylls first, and it was a source of infinite annoyance to him that Philips contrived to precede in publication. He succeeded in throwing ridicule on Philips, however, and his own pastorals were greatly admired. Yet there was some nature in Phillips, and, though Pope is more elegant and faultless, he is not one whit more genuinely bucolic than his rival. A far better writer of pastoral than either is Gay, whose Shepherd's Week was a serious attempt to throw to the winds the ridiculous Arcadian tradition of nymphs and swains, and to copy Theocritus in his simplicity. Gay was far more successful in executing this pleasing and natural cycle of poems than in writing his pastoral tragedy of Dione or his "tragi-comico pastoral farce" of The What d'ye call it? (1715). He deserves a very high place in the history of English pastoral on the score of his Shepherd's Week. Swift proposed to Gay that he should write a Newgate pastoral in which the swains and nymphs should talk and warble in slang. This Gay never did attempt; but a northern admirer of his and Pope's achieved a veritable and lasting success in Lowland Scott, a dialect then considered no less beneath the dignity of verse. Allan Ramsay's Gentle Shepherd, published in 1725, was the last, and remains the most venerated and interesting bucolic drama produced in Great Britain. It remained a favourite, a hundred and fifty years after, among Lowland reapers and milkmaids.

With the Gentle Shepherd the chronicle of pastoral in England practically closes. This is at least the last performance which can be described as a developed eclogue of the school of Tasso and Guarini. It is in Switzerland that we find the next important revival of pastoral properly so-called. The taste of the 18th century was very agreeably tickled by the religious idylls of Salomon Gessner, who died in 1787. His Daphnis and Phillis and Der Toi Abbt were cutting this pleasing and natural cycle of poems in the last, and Gay was far more successful in executing this pleasing and natural cycle of poems than in writing his pastoral tragedy of Dione or his "tragi-comico pastoral farce" of The What d'ye call it? (1715). He deserves a very high place in the history of English pastoral on the score of his Shepherd's Week. Swift proposed to Gay that he should write a Newgate pastoral in which the swains and nymphs should talk and warble in slang. This Gay never did attempt; but a northern admirer of his and Pope's achieved a veritable and lasting success in Lowland Scott, a dialect then considered no less beneath the dignity of verse. Allan Ramsay's Gentle Shepherd, published in 1725, was the last, and remains the most venerated and interesting bucolic drama produced in Great Britain. It remained a favourite, a hundred and fifty years after, among Lowland reapers and milkmaids.

In the Gentle Shepherd they left but little mark, but in France they were cleverly copied by Arnaud Berquin. A much more important pastoral writer is Jean Pierre Clavis de Florian, who began by imitating the Galateo of Cervantes, and continued with an original bucolic romance entitled Estelle. It has always been noticeable that pastoral is a form of literature which disappears before a breath of ridicule. Neither Gessner nor his follower Abbt were able to survive the laughter of Herder. Since Florian and Gessner there has been no reappearance of bucolic literature properly so-called. The whole spirit of the pastoral was lost in the latter part of the 18th century, though it was revived in the Lutweid and Der Toi Abbt as the most venerated and interesting bucolic drama produced in Great Britain. It remained a favourite, a hundred and fifty years after, among Lowland reapers and milkmaids.

Half a century later something like pastoral reappeared in a totally new form, in the fashion for Dorfgeschichten. About 1830 the Danish poet S. S. Blicher, whose work connects the grim studies of George Crabbe with the milder modern strain of pastoral, began to publish his studies of out-door romance among the poor in Jutland. Immermann followed in Germany with his novel Der Oberhof in 1839. Auerbach, who has given to the 19th-century novelist its peculiar character, began to publish his Schwarzerdter Dorfgeschichten in 1843. Meanwhile George Sand was writing Jenaue in 1844, which was followed by La Mare au Diable and Francois le Long in 1848 and in England Clough produced in 1848 his remarkable long-va
dation pastoral The Bethie of Tober-na-Vuichich. It seems almost certain that these writers followed a simultaneous but independent impulse in this curious return to bucolic life, in which, however, every case, the old tiresome conventional and affection of lady-like airs and graces were entirely dropped. This school of writers was presently enriched by Norway and Bjornson, whose Synnave Sembokken was the first of an exquisite series of pastoral romances. But perhaps the best of all modern pastoral romances is Fritz Reuter's Ut mine Stromtid, written in the Mecklenburg dialect of German. In England the Dorsetshire poems of William Barnes and the Dorsetshire novels of Thomas Hardy belong to the same class. It will be noticed, of course, that all these recent productions have so much in common with the literature which is produced around them that they almost evade separate classification. It is conceivable that some poet, in following the antiquarian tendency of the age, may enshrine his fancy once more in the five acts of a pure pastoral drama of the school of Tasso and Fletcher, but any great vitality in pastoral is hardly to be looked for in the future.

(E. G.)

PASTORAL EPISTLES, the name given to St Paul's letters to Timothy and Titus. The term seems to have originated with J. A. L. Wegscheider (1771-1840), professor at Halle. The three epistles mentioned are written to men rather than churches, and to men appointed to certain pastoral work. In this respect they differ from the personal and intimate letters which Paul wrote to Philemon. They are closely related in origin, style, diction and thought, and occupy so distinct a place in these respects that the Pauline authorship of them has been much questioned. (See TIMOTHY, EPISTLES TO; TITUS, EPISTLE TO.)

PASTORAL LETTER, an open letter addressed by a bishop to the clergy or laity of his diocese, or to both, containing either general admonition, instruction or consolation, or directions for behaviour in particular circumstances. In the Catholic Church such letters are also sent out regularly at particular ecclesiastical seasons, particularly at the beginning of fasting. In the non-episcopal Protestant churches the name "pastoral letter" is given to any open letter addressed by a pastor to his congregation, but more especially to that customarily issued at certain seasons, e.g. by the moderator of a Presbyterian assembly or the chairman of a Congregational or Baptist union.

PASTORAL STAFF, in the Christian Church, an ensign of office or dignity. It is some five feet long, ending at the top in a crook (volute) bent inwards, and made of metal, ivory or wood. If of metal, it is hollow; if of wood, it is usually covered with metal. The crook may be elaborately ornamented and is divided from the shaft by a boss; the shaft is commonly separated into sections by rings, so that it can be taken to pieces.

The pastoral staff is the ensign proper of cardinals (except cardinal-deacons) and bishops; but the former are entitled to use it only in the churches from which they derive their titles, the latter only in their dioceses. The pope so early as the time of Innocent III. did not carry the pastoral staff, and it would seem never to have been his custom. The formula that the Ordo of Cencius Sabellius (ch. 48) speaks of was not a pastoral staff, but the symbol of authority over the papal palace, with which the pope was invested upon his entrance there. The ordo was confirmed by Luitprand of Cremona in his account of the deposition of Benedict V., and the baculus auricus of the Historia dedications ecclesiae cænsiens (Acta Sanctorum, 4 March, i. 354) are sceptres. Abbots carry the pastoral staff only when specially empowered by the pope to do so, and then only in the territory under the jurisdiction of their monastery and in the churches subordinate to it. With certain restrictions the pastoral staff is also sometimes conceded to dignitaries of cathedral and collegiate churches, but never to abbesses (Sacro Congreg. Rot. 20 Jan. 1656).

The pastoral staff, as its name implies, symbolizes the pastoral office and authority, a symbolism already known to Isidore of Seville (De ecclesiast. aff. ii. 5). This symbolism is expressed in the words used, at least since the 10th century, by the consequence in delivering the pastoral staff at the consecration of a
bishops and the benediction of an abbot. The pastoral staff is carried in the left hand, in order that the right may remain free to give the blessing. The bishop is directed so to hold it (Cerem. episc. ii. 8, 25) that the crook is turned towards the people. It is used not only at pontifical High Mass but at all solemn pontifical functions, e.g. vespres, consecrations, processions. It is uncertain at what period the use of the pastoral staff was introduced; but the evidence tends to show that it was about the 5th century, in Gaul or Spain. The pastoral staff was certainly in use in Gaul in the 6th century (Vita S. Caezar. Arcat. ii. 18), in Spain at least as early as the 7th, and in Ireland also in the 7th; in Italy, so far as the available evidence shows, its use was comparatively late. It had originally nothing of its present liturgical character; this was given to it in the post-Carolingian period.

As regards the development of the form of the pastoral staff, there are four principal types: (1) staves with a simple crook, the oldest form, which survived in Ireland until the 12th century; (2) staves with a ball or knob at the top, a rare form which did not long survive as a pastoral staff; (3) staves with a horizontal crook, so-called Tau-staves, used especially by abbots and surviving until the 13th century; (4) staves with crook bent inwards. These last already appear in miniatures of the 9th century: from the 11th onwards they predominated; and in the 13th century they ousted all other forms. Originally plain, the crook was from the 11th century onwards often made in the form of a snake (5), which in richer staves encircled the Lamb of God or the representation of a figure. Since the 13th century the staff, under Gothic influence, developed into a boldly designed tendril set with leaves, which usually encircled a figure or group of figures, and the knob dividing staff and crook into an elegant chapel (6 and 7). Finally, at the close of the middle ages, the lower part of the crook was bent outwards so that the actual volute came over the middle of the knob, the type that remained dominant from that time onwards (8). As a decoration, rather than for practical reasons, a fine folded cloth (pinnatellus, sudarium, selvum, Eng. veil), was from the 14th century onward often suspended from the knob of the pastoral staff. This was done both in the case of bishops' and of abbots' staves, but is now confined to the latter (Cerem. episc. i. 11, 5; Decr. Alex. VII. 27 Sept. 1659; Sacr. Congr. Rit. 27 Sept. 1847).

From the pastoral staff must be distinguished the staff of the chaelebishopus (director of the choir) and cantors, which is still in use here and there. This, which is also known as bordonas, was developed out of the choir-staves, originally no more than sticks to lean on during the long services.

The Reformation abolished the pastoral staff almost everywhere. In the Church of England, however, it was retained among the episcopal ornaments prescribed by the first Prayer-book of Edward VI., and, though omitted in the second Prayer-book, its use seemed once more to be enjoined under the Ornaments Rubric of Elizabeth's Prayer-book. Whatever the theoretical value of this injunction may have been, however, in practice the use of the pastoral staff was discontinued until its gradual revival in the last decades of the 19th century.

In the Churches of the East, a pastoral staff (Gr. χάφλος, Russ. poschok, paterista, Syr. and Nest. churba, Arm. հայրափետա, Copt. ibot) is borne among the Syrians only by the patriarch, in all the other rites by all bishops, in the Greek Church also by archimandrites and abbots, and in the Armenian Church also by the vartapedes (teachers). The staff of Armenian bishops is reminiscent of that of the West, from which it is apparently derived; that of the vartapedes is encircled at the upper end by one or two snakes. The Coptic patriarch uses an iron cross-staff. For the rest, the pastoral staff in the Oriental rites is T-shaped. It is of wood inlaid with ivory and mother-of-pearl. A veil is attached to the staff among the Greeks, Armenians and Copts. The bishops of the Coptic, Syrian and Nestorian Uniate Churches have adopted the Roman pastoral staff.

See Ch. Cahier et A. Martin, Mélanges d'archéologie (Paris, 1860), iv. 145 seq.; Rohault et Fleury, La Messe (Paris, 1889), vii. 73 seq. For the Anglican usage see the Report of the Sub-committee on Convocation on the Ornaments of the Church, 1906 (J. Brink).

PATAGONIA, the name given to that portion of South America which, to the east of the Andes, lies mainly south of the Rio Negro (41°S.), and, to the west of the Andes, south of the Chilean province of Llanquihue (42°S.). The Chilean portion embraces the two provinces of Chiloé and Magallanes. East of the Andes the Argentine portion of Patagonia is divided into four territories: (1) Neuquen, 42,000 sq. m. approximately, including the triangle between the rivers Limay and Neuquen, and extending northward to the northern shore of Lake Nahuel-Huapi (48°S.) and northward to the Rio Colorado; (2) Rio Negro, 76,000 sq. m. approximately, extending from the Atlantic to the Cordillera of the Andes, to the north of 42°S.; (3) Chubut, 95,000 sq. m. approximately, embracing the region between 42° and 46°S.; and (4) that portion of the province of Santa Cruz which stretches from the last-named parallel as far south as the dividing line with Chile, and between Point Dungeness and the watershed of the Cordillera, an area approximately of 106,000 sq. m.

The general character of the Argentine portion of Patagonia is for the most part a region of vast steppe-like plains, rising in a succession of abrupt terraces about 300 ft. at a time, and covered with an enormous bed of shingle almost bare of vegetation. In the region of the plateaux of brackish lakes, or lagoons, and of these rivers, such as the Yagatoo, Musters and Colhuapi, and others situated to the south of Puerto Deseado, in the centre of the country. In the central region volcanic eruptions, which have taken part in the formation of the plateau from the Tertiary period to the present day, have erupted up to a cover of large pumice-stone, and formed the western third more recent volcanic deposits appear above the lava. There, in contact with folded Cretaceous rocks, uplifted by the Tertiary granite, erosion, caused principally by the sudden melting and re-eruption of the ice, has scooped out a deep longitudinal depression, which generally separates the plateau from the last lowly hills, the ridges generally called the pre-Cordillera, while on the west of these there is a similar longitudinal depression all along the foot of the snowy Andean Cordillera. This latter depression contains the richest and most fertile land of Patagonia.

The table of physical characteristics according to its physiography. The Tertiary plateau, flat on the east, gradually rising on the west, shows Upper Cretaceous caps at its base. First come Lower Cretaceous hills, raised by granite and diorite rocks, unbroken across the Tertiary beds, so rich in mammal remains; then follow, on the west, metamorphic schists of uncertain age; then quartzites appear, resting directly on the primordial structure, and granite which form the axis of the Cordillera. Porphyritic rocks occur between the schists and the quartzites. The Tertiary deposits are greatly varied in character, and there is considerable difference of opinion concerning the succession and correlation of these beds. They are divided by Wickens into the following series (in ascending order):

The Upper Cretaceous and Tertiary deposits have revealed a most interesting vertebrate fauna. This, together with the discovery of the perfect cranium of a chelonian of the genus Mylosuria, which seemed to be almost identical with Mylosura oswestyi of the Pleistocene age in Queensland, forms an evident proof of the connexion between the Australian and South American continents. The Patagonian Molasse has also yielded the Upper Chalk, having been found associated with remains of Dinornis. Other remains of the interesting fauna of Patagonia, belonging to the Middle Tertiary, are the gigantic wingless birds, exceeding in size any hitherto observed, and the singular elk, one of whose long legs is fully five feet in length. In the Tertiary marine formation a considerable number of cetaceans has been discovered. In deposits of much later date, formed when the physiography of the country did not differ materially from that of the present time, have been discovered remains of paenmammals, such as Glyptodon and Macrauchenia, and in a cave near Last Hope Inlet, a gigantic ground sloth (Grypotherium bitulatum), an animal which lived contemporaneously with the animals of the Pliocene, has been found. Its extermination was undoubtedly very recent. With the remains of Grypotherium have been found those of the horse (Onosphippidium), which latter appears to be a direct descendant of the Palaeotherium, Arctotherium, which is found, although not in abundance, in even the most modern Pleistocene deposits in the pampas of Buenos Aires. It would not be surprising if this latter animal were still in existence, and that which may now exist is the remnant of a local race of the same species as that observed on the borders of the rivers Tamango and Pista, affluent of the Las Heras, which run through the eastern foot-hills of the Cordillera in 47° 47' south latitude.

Glaciers cover the valleys of the main chain and some of the ridges of the Cordiller, and descend to lakes San Martin, Viedma, Argentino and others in the same locality, strewning with them their terminal moraines, 1000 feet or more in thickness. It is not improbable that the ice, at its maximum development, covered the whole of the present Atlantic coast during the first ice age, at the close of the Tertiary epoch, while, during the second glacial age in modern times, the terminal moraines have generally stopped, 50 miles in the north and south. West, east, north, and south, as far as the eye could see. These ice-sheets, which scooped out the greater part of the longitudinal depressions, and appear to have rapidly retreated to the point where the glaciers now exist, did not, however, in their retirement fill up all the depressions, but allowed the foot-hills to remain as truncated remnants, which are strewed with moraines, and with the exception of a few scattered peaks, are covered with a dense forest of large evergreen trees of the same species as those of the Andes, the Araucaria.

In so far as its main characteristics are concerned, Patagonia seems to belong to the Andean system, and is the Antártico, that is, the scene of that great drift of admixture, which dates from very recent times, as is evidenced by the apparent recent emergence of the islets around Chiloé, and by the general character of the pampen formation. Some of the promontories of Chiloé (el Pichilemu, Chonchi, etc.) are considered by some as "islands"; and this may perhaps be accepted as perpetuating the recollection of the time when they actually were islands. They are composed of sand, gravel, and gravel-like sand, and the more or less with the boulders, sand and volcanic ashes, precisely of the same form as occurs on the Patagonian plateau. From an examination of the pampen formation it is evident that in recent times the land of the province of Buenos Aires extended farther to the east, and that the advance of the sea, and the salt-water deposits left by it when it retired, forming some of the lowlands which occur on the littoral and in the interior of the pampas, are much more recent phenomena; and that the same is true of the Mar Chiquita, which is derived from rocks of a different class from those of the neighbouring hills, which are observed on the Atlantic coasts of the same province, and increase in quantity and size towards the south, seem to indicate that the cape of shingle with now cover such a great part of the Patagonian territory recently extended farther to the east, over land which has now disappeared beneath the sea, while other marine deposits along the same coasts because 42° 36' south, the point where the Patagonian plateau is said to end, and the edge of the sea. There are besides, in the neighbourhood of the present coast, deposits of volcanic ashes, and the ocean throws up on its shores black, thin, argillaceous lava, which in all probability proceed from eruptions of submarine volcanoes, which apparently demonstrates with greater certainty the existence in recent times of land that is now lost, is the presence of remains of several genera of Pteropods, found both in the Plateau of the Andes, at an elevation of 42° 36' south, in the province of Patagonia, and in Santa Cruz. The animals undoubtedly reached these localities from the east; it is not at all probable that they advanced from the north southwards across the plateau intersected at that time by rivers and lakes, and covered with the exception of the discoveries at the inlet of Ultima Esperanza, which is in close communication with the Atlantic valley of Gallegos, none of these remains have been discovered in the Andean regions.

On the upper plains of Neuquen territory thousands of cattle can be found, and the river Neuquen and Nahuel-Huapi yield large quantities of valuable timber. This, however, is not navigable, but as its waters are capable of being easily dammed in places, large stretches of land in its valley are utilized; but the best timber is in the higher districts. On the borders of the territories of Neuquen and of the valleos of Rio Negro, the valleys of Norquin and Las Lajas, which are a part of the Andean region, is the terminal part of the Patagonian Cordillera. The river Neuquen, the river Chimehuin, and Vega de Chapelo, near Lake Lacaú, where are situated villages of some importance, such as Junín de los Andes and San Martin de los Andes. Close to these are the borders of the orchards supposed to have been planted by the Jesuits in the 17th and 18th centuries. These regions are drained by the river Collon-Cura, the principal affluent of the river Limay. Lake Lacaú is a contributory of the Pacific, its outlet having been opened to the west, owing to a passage having been opened through the Cordillera.

The Rio Negro runs along a wide transverse depression, the middle part of which is that of the Rio Negro territory, and the middle portion of the line of depresions of Neuquen at the confluence of the rivers Limay and Neuquen. In this depression are several settlements, among them Viedma, the capital of the Rio Negro territory, Frías, Conesa, Choele-Choele, whose site was selected by the missionaries to plant the first mission on these shores of the Pacific. This territory is intersected by the depressions of the Gualicho and Maquinchao, which in former times directed the waters of two great rivers (now disappeared) to the gulf of San Matías, the first-named depression drains the network of the Collon-Cura, and the second the Nahuel Huapi lake system. In 42° 3° there is a third broad transverse depression, apparently the bed of another great river, now becoming, on the one hand, the river of the east, and, on the other, of the western slope of the Andes, between 41° 36' and 41° 3° 36'.

Chubut territory presents the same characteristics as the Rio Negro territory. Rawson, the capital, is situated at the mouth of the river Chubut, which is formed by the confluence of the rivers Puelo and San José de Mayo, and is founded in 1865 by a group of colonists from Wales, assisted by the Argentine government; and its prosperity has led to the foundation of other important centres in the valley, such as Trelew and Gaiman, which is connected by railway with Porto Madryn on Bahia Nueva. Here is the seat of the governor of the province, and in 1895 the inhabitants of this part of the territory, composed principally of Argentina, Welsh and Italians, numbered 25,555. The valley has been irrigated and cultivated, and produces the best wheat of the Argentine Republic. Between the Chubut and the Senguerr there are vast stretches of fertile land, spreading over the Andean region to the valley of the river Neuquen. The valley of the river San José de Mayo, which is the direct source of all the streams that water the eastern rise of the Cordillera, and filling the basins of some desolated lakes, which have been occupied since 1885, and farms and colonies founded upon them. The chief of these colonies is that of the 16th of October (16 de Octubre), and has been occupied since 1885 at the head of the valley of the San José de Mayo, the longitudinal valley which extends to the eastern foot of the Cordillera. Other rivers in this territory flow into the Pacific through breaches in the Cordiller, as the rivers Palena and Rio Ciñes. The principal affluent of the Palena, the Carreleno, carries off the waters of Lake General Paz, situated on the eastern slope of the Cordillera. Rio Fico, an affluent of the same river, receives nearly the whole of the waters of the extensive undulating plain which lies between the Rio Teka and the Rio Senguerr to the east of the Cordillera, while the remainder are carried away by the effluents of Rio Jehus, viz., the Cherque, Omkel and Apipge. The effluents of these streams, which are of no great extent, are situated upon numerous deposits, veins of galena and lignite in the mountains farther west which flank the Cordillera, have not been properly investigated. At Lake Fontana there are auriferous drifts and lignite deposits which abound in fossil plants of the Cretaceous age. The streams which form the rivers Mayo and Challa join the tributaries of the Rio Aisen, which flows into the Pacific, watering in its course extensive plains and distributing among the colonies which are situated along it by Argentine settlers. Colonies have also been formed in the basin of Lakes Musters and Cholhué; and on the coasts near the Atlantic, along Bahia Camarones and the Gulf of San Jorge, there are extensive plains.

The territory of Santa Cruz is arid along the Atlantic coast and in the central portion between 46° and 50° S. With the exception of the southern district, or Patagonian Plateau, the region is of the same nature as the other districts of the Andean region situated between Lakes Buenos Aires and Pueyrredon.
Into this inlet there flowed at the time of the conquest a voluminous river, which subsequently disappeared, but returned again to its ancient bed, owing to the river Fenix, one of its affluent, which had deviated to the west, regaining its original direction. Lake Buenos Aires and Lago Finchel (Patagonia 75 E) poured its waters into the Atlantic even in post-glacial times by means of the river Descado; and it is so depicted on the maps of the 17th and 18th centuries; and so to this hour, Puyerredeville, now empties itself westward, through the river Las Heras, into the Caincal of the Pacific, in 48° S. San Julian on Puerto San Julian, where Ferdinand Magellan wintered, is one of the rare spots suitable for cultivation. In the Cordillera is laid up into the interior the upper valley of a now extinct river which in comparatively recent times carried down to Puerto San Julian the waters of Lakes Volean, Belgrano, Azara, Nansen, and some other lakes which have deviated from their floodplains. But the devotion of the Tehuelches to the chase, addiction to gambling and to drinking, also capable of long endurance of privation. Their religion recognized a Great Spirit, and designated the new moon as an object of worship. The Tehuelches differ in type and language from the Tehuelches. The remaining population is composed of Araucanians, a mixture of the Tehuelches and Gennaken. But these are not the only type of people who have dwelt in Patagonia. The ancient burial-places have yielded the bones of other races quite distinct from the present inhabitants, some of them having greatly resembled the primitive types which are met with more to the north, in the Argentine Chaco and in Brazil; while others, again, strongly resembled certain of the Pacific races, in that they possessed ethnic characteristics which have not been observed elsewhere in South America. Among these remains every type of artificial deformity of the skull hitherto known has been found, while at the present time the natives only practise the occipital deformation which is so common among the western tribes of America.

History.—Patagonia was discovered in 1520 by Ferdinand Magellan, who on his passage along the coast named many of the mainland features—Gulf of Santa Matías, Cape of Santa Maria, etc.—and Virgins (now simply Cape Virgenes), &c. By 1611 the Patagonian god Seteos (Settadob in Pigafetta) was familiar to the hearers of the Tempest. Rodrigo de Islas, despatched inland in 1535 from Santa Matías by Alcazava Sotomayor (on whom western Patagonia had been conferred by the king of Spain), was the first to traverse the great Patagonian plain, and, for the mutiny of his men, he would have struck across the Andes to the Chilean side. Pedro de Mendoza, on whom the country was next bestowed, lived to found Buenos Aires, but not to carry his explorations to the south. Alonso de Camargo (1539), Juan Ladrillero (1557) and Hurtado de Mendoza (1558) helped to make known the western coasts, and Sir Francis Drake's voyage in 1577. In 1577 the eastern coast from the strait and northward by Chile and Peru was memorable for several reasons; but the geography of Patagonia owes more to Pedro Sarmiento de Gamboa (1579-1580), who, devoting himself especially to the south-west region, made careful and accurate surveys. The settlement which he founded at Nombre de Dios and San Felipe were neglected by the Spanish government, and the latter was in such a miserable state when Thomas Cavendish visited it in 1587 that he called it Fort Famine. The district in the neighbourhood of Puerto Deseado, explored by John Davis about 1599, was taken possession of by Sir John Narborough in the name of King Charles II. in 1669. In the second half of the 18th century knowledge of Patagonia was augmented by Byron (1764-1765), S. Wallis (1766) and L. A. de Bougainville (1766); Thomas Falkner, a Jesuit who "resided near forty years in those parts," published his Description of Patagonia (Hereford, 1774); Francesco Viedma founded El Carmen, and Antonio advanced inland to the Andes (1782); and Basilio Villarino ascended the Rio Negro (1782). The Adventure" and "Beagle" expeditions under Philip King (1826-1830) and Robert Fitzroy (1832-1836) were of first-rate importance, the latter especially from the point of view of natural history. The interior of the country nothing was observed except 200 miles of the course of the Santa Cruz. Captain C. M. Musters in 1869 wandered in company with a band of Tehuelches through the whole length of the country from the strait to the Manzanero in the north-west, and collected a great deal of information about the people and their mode of life. Since that date explorations have been carried on by F. P. Moreno, Ramon Lista, Carlos M. Moyano, A. Bertrand, H. Steffen, P. Krüger, R. Hauthal, C. Burckhardt, O. Nordenskiöld, J. H. Hatcher, the surveyors of the Argentine and Chilean Boundary Commissions and others.

Bibliographical lists for Patagonia are given in J. Wappaus, Handbuch der Geogr. u. Stat. des ehem. span. Mittel- und Süd-Amerika (Leipzig, 1863-1870); in V. G. Quesada, La Patagonia y las tierras australes del continente americano (Buenos Aires, 1875); and in T. Cook, Adventures in Patagonia (New York, 1880). See also C. Darwin, Journal of Researches (London, 1845), and Geological Description of South America (London, 1846); W. Parker Snow, A Two Years' Cruise off... Patagonia (London, 1857); G. C. Musters, At Home with the Patagonians (London, 1871); R. O. Cunningham, Nat. Hist. of the Strait of Magellan (Edinburgh, 1874); F. P. PATAN—PATEL

PATAN ("city"), the name of two historic cities in India.

One of these, known as Anthikavada Patan, was the capital of the last Vakta dynasty, which was conquered by Mahmud of Ghazni and finally destroyed by the Mahommedans in 1028. Near its ruins, which are not considerable, has sprung up a modern town, in the state of Baroda (pop. 31,002), which contains many Jain temples (with palm-leaf MSS.) and has manufactures of fine cotton and silk textiles. The other Patan, known as Lalita Patan, was the capital of one of the three Newar kingdoms in the valley of Nepal, conquered by the Gurkhas at the end of the 18th century. It is situated close to Katmandu, on the opposite bank of the river Bagmati. The population is estimated at about 30,000, mostly Newars, who are Buddhists; and the buildings consist mainly of old Buddhist shrines and monasteries.

PATARA, an ancient town of Asia Minor, on the Lycaen coast, 3 m. E. of the mouth of the Xanthus river (mod. Esben Chai). It was noted from early times for its temple and oracle of Apollo, and, as the port of Xanthus and other towns of the same valley, had a large trade, and was regarded as the metropolis of Lycia. Enlarged by Ptolemy Philadelphus I. and renamed for a time Arsinoe, it was adored by Vespasian with baths. St. Paul changed there into a "ship of Phoenix" on his way to Jerusalem in A.D. 60. Patara was the reputed birth-place of St. Nicholas.

The principal extant monuments are a triple triumphal arch, with inscription, through which ran the road to the temple; walls, discernible on either hand of it; the theatre, 246 ft. in diameter, built in A.D. 145 (as attested by an inscription) and wonderfully well preserved, though largely filled with drift sand; and the thermæ built by Vespasian north of the harbour.

PATARENES, or PATARELLI, a name apparently first used in Milan about 1058 to denote the extreme opponents of clerical marriage. The party was so called because, under the leadership of Aribaldus, a deacon of Milan, its members used to assemble in the Patara or ragmen's quarter of that city (petes being a provincial word for a rag). In the 13th century the name was adopted by the Cathari, who said it came from "petali" (plains), because they endured hardship for their faith. See Bogomils.

PATAS MONKEY, a West African species of the guenon monkeys (see GUENON), characterized by its large size, the foxy-red colour of the upper parts, blue face and white belly. Scientifically it is known as Cercocebus (Erythrocebus) patas, and typifies a section of its genus of which the other representative is the East African nūnas (C. [L.] pyrrhonotus). See Primates.

PATAVIUM (mod. Padova, Eng. Padua, q.v.), an ancient city of Venetia, Italy, 55 m. E. of Verona by road. Its central position gave it great importance. One road led from it southwest to Ateste, Hostilia (where the Po was crossed) and Bononia; another east-north-east to Altinum and Concordia. It was accessible by canals from the sea, a distance of about 30 m. The old town (30 ft. above sea-level) lay and lies on a peninsula surrounded by the Bacchiglione except on the south, where it was protected by a canal. Of the bridges which cross the canal by which Padua is now intersected, four go back to Roman times. Remains of a public building, possibly belonging to the forum, were found in the centre of the modern city in making the foundations of the Caffè Pedrocchi at the south-west angle of Piazza Cavour—possibly a colonnade of fine Corinthian architecture (see P. Selvatico, Relazione dello Scavo su la Piazzetta Pedrocchi). A large mosaic with geometric designs was also recently discovered in the centre of the city. In imperial times the town spread even farther, as is shown by the position outside the town of the amphitheatre, built of blocks of local stone with brick courses, which was excavated in 1881 (G. Ghirardini in Notizie degli Scavi, 1881, 225). It measures 325 by 205 ft., and is the only Roman building of which visible remains exist. A so-called "paletta" (a bronze plate with a handle—possibly a bell or a volute axe or a simple pendant) with a figure of a horse on one side and a votive inscription on the other, belonging to the 5th or 4th century B.C., was found in 1809 at a great depth close to the church of S. Antonio (G. Ghirardini in Notizie degli Scavi, 1901, 374). The name of the town is probably connected with the name Patavi (see above). According to the legend it was founded by the Trojan Antenor. The memory of the defeat of the Spartan king Cleonymus by the fleet of Patavium in 302 B.C. was perpetuated by Spartan spoils in the temple of Juno and a yearly sea-fight which took place on the river. On land Patavium was equally powerful (it had been able, we are told, to put 120,000 men into the field), and perpetually made war against its Celtic neighbours. Patavium acquired Roman citizenship with the rest of Gallia Transpadana in 49 B.C. Under Augustus, Strabo tells us, Patavium surpassed all the cities of the north in wealth, and in the number of Roman knights among its citizens in the census of Augustus was only equalled by Gades, which had 10,000." The Roman military supremacy which had been held for so long by the Ionians was gradually undermined, and the city was for a time the seat of the Germanic Osiarii. Its commercial importance was also great, being especially due to its trade in wool. The numerous inscriptions, however, as Th. Mommsen remarks (Corp. inscr. latm. v. 268), show remarkable dignity and simplicity and avoidance of pomposity; to this Pliny the younger and Martial testify. The importance of Patavium as a literary centre was also considerable. Livy, Q. Asconius Pedianus and Thrasea Paetus were natives of the town; and Quintilian speaks of the directness and simplicity of their diction as Patavina, comparing it with the artificial obscurity of the writers of Rome itself.

After the 2nd century A.D. it is hardly mentioned, and seems to have been outstripped by other cities, such as Milan and Aquileia. It was destroyed by the Lombards with fire and sword, and it was then that it lost practically all its monuments of the Roman period (T. As.)

PATEL, FRAMJEE NASARWANJEE (1884–1904), Parsee merchant and philanthropist, was born in 1884, and had a sound vernacular education, with a smattering of English received in Bombay. At the age of fifteen he entered upon a business career, and its pursuit proved so congenial that by 1827 he had worked his way to a partnership in the firm of Frith, Bomanjee & Co. Banking facilities being then exceedingly scanty, such Parsees as had any capital at command acted as bankers and brokers to the rising English firms. Patel's experience enabled him in a few years to raise the status of his compatriots to the higher level of independent merchants, and he founded in 1844 a business house under the name of Wallace & Co., in which he was himself a partner with the English members of the firm. When he retired in 1858 he had amassed a large competence, and in the following year he established a firm on the same lines under the style of Framjee, Sands & Co., of which the members were some of his sons, together with English partners. It was, however, not so much his success as a merchant, as his generosity and liberality as an educator, reformer and philanthropist, that his name is notable in the annals of western India. He entered on his civic labours in 1857, and in all public movements figured prominently as an accredited representative of his community. As a pioneer of education, both for boys and girls, his example inspired the younger men of his time, like Dadabhai Naoroji, at one time M.P. for East Finsbury, and Naoroji Fardoujee and Sorabjee Shapurjee Bhandale. When Mountstuart Elphinstone, during his governorship, conceived the idea of concentrating the literary and educational activity which had arisen from isolated efforts on the part of men who had themselves been brought into contact with Western culture, among his chief collaborators were Framjee Cowasjee Banajee and Framjee Patel. To their initiative was due the establishment of the Elphinstone Institution, which comprised a high school and, after some years,
a college, which continue to hold foremost rank among the similar
colleges since established in western India. But Mr Patel’s
most remarkable public service was performed in connexion with
the Parsee Law Association, of which he was president. Since
their exodus from Persia the domestic affairs of the Parsees had
been in a very unsettled state. Matrimonial obligations and the
rights of succession in cases of intestacy had fallen into
hopeless confusion, and the adjudication of disputes in relation
thereto was effected by certain elders of the community, who had
neither the knowledge and help of fixed principles to guide their
judgments, nor any authority to enforce their decisions. The
case of Ardasir Cursetjee v. Piroxath, which came up on appeal
before the privy council in England, both parties admitted the
fact that the supreme court of Bombay had no jurisdiction
over matrimonial and ecclesiastical disputes among Parsees.
This state of lawlessness was recognized by that community as
intolerable, and the agitation which ensued thereupon led to the
appointment of a commission, of which the distinguished jurist,
Sir Joseph Arnould, was the president and Framjee Patel the chief
Parsee member. The Parsee Law Association, under the
guidance of Patel and Sorabjee Bengalee, rendered invaluable help
to the commission, and their joint efforts resulted in the
passing by the government of India of the Parsee Marriage and
Divorce Act by the Indian Councils Act 1863 (47 & 48 Vict. c. 110
of 1865). These acts form the charter of matrimonial and ecclesi-
astical status for the Parsees. At the time of his death in 1894,
in the ripe age of nearly ninety years, Framjee Patel was the
most revered and best beloved of the distinguished natives of
India, having during an eventful public life extending over sixty
years worked in co-operation with three generations of the most
prominent of his compatriots to better the condition of their
country. His family surname refers to the title of pateil, that is,
“mayor,” of Bombay, conferred on his founder for services rendered to the English in 1662.

Paten—Patents

PATEN (through the Fr. from Lat. patina or pisaina, Gr. πατανή, a flat dish), the name of the shallow plate or dish used in
the celebration of the Eucharist for the consecrated food or wafer.
The patent has from the first been almost always of a circular shape. There is a rare example of a rectangular one,
dating from the 7th century, in the Cabinet des Medailles in
Paris. The central portion of the patent is sometimes decorated
with the engraved head of the Saviour, or commonly with a group
of lobes.

Patenôtre des Noyers, Jules (1845– ), French
diplomatist, was born at Baye (Marne) on the 20th of April
1845. Educated at the Ecole Normale Superieure, he taught for
some years in the lyceum of Algiers, but he joined the diplo-
matic service in 1871. His most important mission was in 1884,
when he was sent as French minister to China to regularize
the French dominion in Annam. After arranging at Hué with
the king of Annam the condition of the French protectorate, he
proceeded to Shanghai to settle with China the difficulties
which had arisen over the evacuation of Tongking by the Chinese
troops. The negotiation failed, and the French admiral resumed
hostilities against China in August. Next year Patenôtre signed
with Li Hung Chang a treaty of peace at Tien-tsin, by which the
French protectorate in Annam and Tongking was recognized, and
both parties agreed to remain within their own borders in the
future. After serving as minister plenipotentiary in Morocco
(1888–1891), M. Patenôtre was sent to Washington, where he was
raised to the rank of ambassador in 1893. He was ambassador
at Madrid from 1897 to 1902.

Pierre Loti in Au Marce has described his diplomacy in Morocco.
M. Patenôtre himself published some reminiscences in the Revue
des deux mondes.

Patents. Properly documents conferring some privilege,
right, &c., short for “letters patent” (q.v.). Patents for
inventions, instruments which formerly bore the great seal of the
United Kingdom, are now issued at the Patent Office in London
under the seal of that office. By their means inventors obtain
a monopoly in their inventions for fourteen years, a term which,
if insufficient to remunerate the inventor, can be extended.

This monopoly is founded on exactly the same principle as the
copyright enjoyed by authors and artists. Those persons
who argue that no such privilege should be permitted, there are
others who think that the most trilling exertions of the inventive
faculties should be protected. The right course clearly lies
between these extremes. To grant a very long term of exclusive
possessions might be detrimental to the public, since it would tend
to stop the progress of improvement. A limited property must
therefore be allowed—large enough to give the inventor an
opportunity of reaping a fair reward, but not barring the way for
an unreasonable period. And, when this compromise has been
decided on, it will be seen how difficult it may be to determine
the period of the merit of an invention, and apportion the
time to that merit. Hence it has been customary to allot one fixed period for all kinds of inventions falling
within the purview of the patent laws.

United Kingdom.—Formerly the reigning prince considered
himself entitled, as part of his prerogative, to grant privileges
of the nature of monopolies to any one who had gained his favour.
These grants became so numerous that they were oppressive
and unjust to various classes of the commonwealth; and hence,
in the reign of James I., a statute was wrung from that king which
declared all monopolies that were grievous and inconvenient
to the subject and the realm to be void. (See Letters Patent;
Monopoly.) There was, however, a special exception from this
enactment of all letters patent and grants of privilege of the
“sole working or making of any manner of new manufacture
within the realm to the true and first inventor of such manufacture,
which others at the time of making such letters patent and grants
should not use, so they he not contrary to law, nor mischievous
to the state by raising of the prices of commodities at home or
hurt of trade or generally inconvenient.” Upon these words
hangs the whole law of letters patent for inventions. Many
statutes were afterwards passed, but these were all repealed by
the Patent Act of 1883 (46 & 47 Vict. c. 57), which, besides
introducing a new procedure, modified the law in several par-
ticulars. Subsequently acts amending the law were passed in
1885, 1886, 1888, 1901, 1902 and 1907. These acts, with the
exception of certain sections of the act of 1883, were repealed by a
consolidating act, the Patents and Designs Act 1907, which also
introduced new provisions into English patent law. Where
the law is not expressly laid down by act of parliament, it has to
be gathered from the numerous decisions of the courts, for patent
law is to no inconsiderable extent “judge-made law.”

The inventions for which patents are obtained are chiefly
either vendible articles formed by chemical or mechanical
operations, such as cloth, alloys, vulcanized india-rubber, &c.,
or machinery and apparatus, or processes. It may be remarked
here that a scientific principle cannot form the subject of a valid
patent unless its application to a practical and useful end and
object is shown. An abstract notion, a philosophical idea, may
be extremely valuable in the realm of science, but before it is
allowed to form a sound basis for a patent the world must be
shown how to apply it so as to gain therefrom some immediate
material advantage. With regard to processes, the language
of the statute of James has been strained to bring them within the
words “any manner of new manufacture,“ and judges on the
bench have admitted that the exposition of the act has gone much
beyond the letter. However, it is unblamed that a process
is patentable; and patents are accordingly obtained for processes
every day.

The principal classes of patentable inventions seem to be
these: (1) new contrivances applied to new ends, (2) new
contrivances applied to old ends, (3) new combinations of old parts,
whether relating to material objects or processes, (4) new methods
of applying a well-known object.

With regard to a patent for the new application of a well-
known object it may be remarked that there must be some display
of ingenuity, some amount of invention, in making the appli-
cation, otherwise the patent will be invalid on the ground
that the subject-matter is destitute of novelty. For example, a
fishplate, used before the introduction of railways to connect
wooden beams could not be patented to connect the rails of a railroad (Harwood v. Great Northern Railway Co., 1856-1856, 11 H. L. C. 654); nor can a spring long used in the rear of a carriage be patented for use in the front (Morgan v. Winder, 1890, 7 R. P. C. 131). But a small amount of invention will suffice, so long as the improvement is manifest, either as saving time or labour (Rickmann v. Thirrey, 1896, 14 R. P. C. 105: Patent Exploitation, Ltd. v. Siemens & Co., 1904, 21 R. P. C. 540).

Whatever be the nature of the invention, it must possess the incidents of utility and novelty, else any patent obtained in respect of it will be invalid. The degree of utility need not, however, be great. As to novelty, this is the rock upon which most patents are split. For, although it can be shown that other persons have used or published the invention before the date of the patent, it will fall to the ground, although the patentee was an independent inventor deriving his ideas from no one else. The difficulty of steering clear of this rock will be apparent at once. Suppose A in London patents an invention the result of his own ingenuity and patient study, and it afterwards appears that B, in some distant part of the kingdom, had been previously openly using the same thing in his workshop, A’s patent is good for nothing.

Thus, where the patent sued on was a lock, it was proved that a similar lock had been in use in London prior to the patent, which was accordingly invalidated (Carpenier v. Smith, 1842, 1 Web. P. C. 540). It is therefore a very frequent subject of inquiry, whether an invention has been previously used to such an extent as to have been publicly used in the sense attached by the courts to this phrase. But whereas “user” in public is sufficient prior publication to invalidate a subsequent patent for the invention so used, publication in books, &c., will not be a bar to novelty unless its effect is to make the invention actually a part of public knowledge; and in dealing with alleged anticipations by patents that have never come into general use until the courts will not invalidate a subsequent patent unless upon a term of ordinary knowledge of the subject, on having the alleged anticipation brought under his notice, would at once perceive, understand, and be able practically to apply the invention without making experiments or seeking for further information. The inventor himself is not allowed to use his invention, either in public or secretly, with a view to profit, before the date of the patent. Thus, if he manufactures an article by some new process, keeping the process an entire secret, but selling the produce, he cannot afterwards obtain a patent in respect of it. If he were allowed to do this he might in many cases easily obtain a monopoly in his invention for a much longer period than that allowed by law (Morgan v. Sceard, 1837, 1 Web. P. C. 192).

The rule that an inventor’s use of the invention invalidates a subsequent patent does not, however, apply to cases where the use was only by way of experiment with a view to improve or test the invention (Elias v. Greensena Tinplate Co., 1890, 7 P. O. R. 466). And it has been repeatedly decided that the previous experiments of other persons, if incomplete or abandoned before the realization of the discovery, will not have the effect of vitiating a patent. Even the prior discovery of an invention will not prevent another independent discoverer from obtaining a valid patent; a subsequent patent is not invalidated by this secret to himself, the law holding that he is the “true and first inventor” who first obtains a patent.

The Patents Act 1883 provided that the exhibition of an invention at an industrial or international exhibition certified as such by the Board of Trade, or the publication of any description of the invention during the period of the holding of the exhibition, or its use for the purpose of the exhibition in the place where it is held, or during the period of the exhibition by any person elsewhere, without the privity or consent of the inventor, should not prejudice the right of the inventor or of his legal personal representative to apply for and obtain a patent, or the validity of any patent granted on the application, provided that two conditions are complied with, viz. (a) the exhibitor must, before exhibiting the invention, give the Comptroller-General a prescribed notice of his intention to do so; and (b) the application for the patent must be made before or within six months from the date of the opening of the exhibition. The Patents Act 1886, enabled the Sovereign, by order in council, to extend the provision above mentioned to industrial and international exhibitions held out of the United Kingdom. The act of 1907 re-enacted these provisions (§§ 45, 50). When an invention is the joint production of more persons than one, they must all apply for and obtain a joint patent, for a patent is rendered invalid on showing that a material part of the invention was due to some one not named therein. The mere suggestion of a workman employed by an inventor to carry out his ideas will not, however, require that he should be joined, provided that the former adds nothing substantial to the invention.

Procedure.—The attributes of novelty and utility being possessed in due degree by an invention, it remains to put in motion the machinery for its protection. The Patents Act 1907, re-enacting most of the provisions of the former acts, provides that an application to be made in a prescribed form (the forms and stamps are on sale at all postal money order offices in the United Kingdom, and left at or sent by post to the patent office in the prescribed manner. The application must state that the applicant is the true and first inventor, and it must be accompanied by either a provisional or complete specification. A provisional specification describes the nature of an invention, and a complete specification particularly describes the invention and shows how it can be made and used. A patentee is not entitled to sue for an infringement of his invention unless that invention is described in the specification in which it is to be performed. Since the introduction of the patent specification, it has been necessary that an invention progressively disclose its subject matter. Formerly, when the condition on which letters patent issued was that the patentee should file a specification completely describing the nature of his invention within a certain time after the grant, then, if he were afterwards to give rise, even after the subject was to some extent discharged by the title; at any rate, the validity of the grant was liable to be objected to on the ground of the title being too general. Under the present law the task of provisional disclosure falls to the provisional specification, introduced by the Patent Law Amendment Act 1852, and continued by the Patents Acts of 1883 and 1907, although a patentee may, under the latter statutes, dispense with a provisional specification and present a complete specification for examination and approval. However, these two specifications are filed, it becomes of vital moment to an inventor that the true relation between them should be maintained as defined above. The object of the provisional specification is to secure immediate protection, and to enable a patentee to work at and improve his invention without the risk of his patent being invalidated by premature publication. He is therefore entitled to embody in his complete specification any improved method of working his invention which he may discover in the interval; and he is indeed bound to do so, since, as we have said, the price that a man who desires a patent has to pay to the public is the privilege of manufacturing and selling what he has invented in his complete specification. But there is a limit to what the patentee may do in this respect. He must not describe in his complete specification anything that is different from that described in the provisional specification. If he falls into this trap, he will be held to have committed a “variance” or “disconformity” between the two specifications. The Patents Act 1883, § 9, made it the duty of the examiner to examine both the provisional specification and the complete specification to ascertain whether any such disconformity between specifications on applications for patents, but the only power the comptroller had, on discovery of disconformity, was to refuse to accept the specification until the disconforming parts had been eliminated. By the act of 1907, § 6, he may now refuse to accept the complete specification until it has been amended to his satisfaction, or (with the consent of the applicant) cancel the provisional specification and treat the application as having been made on the date at which the complete specification was left. Moreover, if the complete specification includes an invention not included in the provisional specification, the application may be rejected if a disconformity exists either which would prejudice the additional invention included in the complete specification be regarded as an application for that invention made on the date at which the complete specification was left. An act of 1902 (which, with certain exceptions, was not carried into operation until the 1st of January 1905) provided for an examination or search as to novelty, such investigation dealing with British complete specifications published and dated within five years prior to the date on which the application was re-enacted by the act of 1907 (§ 7) and power given to the comptroller to refuse the grant of a patent in cases in which the invention had been wholly and specifically claimed in specifications to which his examination has been made.

The term for which a patent is originally granted is fourteen years, but a patentee may, after advertisement according to the rules of the Supreme Court, extend the term to twenty-one years. The point at issue in considering its decision, takes regard of the nature and merit of the invention in relation to the public, of the profits made by
the patentee as such, and of all the circumstances of the case. If it appears therefore that the patentee has been inadequately remunerated by his patent, it may extend the term of the patent to a further term not exceeding seven or, in exceptional cases, fourteen years, or may order the grant of a new patent term, with any restrictions or provisions it may think fit (Act of 1907, § 18).

Patent privileges, like most other rights, can be made the subject of licence and may be granted under the special enactment of licences, instruments which empower other persons to exercise the invention, either universally and for the full term of the patent (when they are tantamount to an assignment of the patentee's entire rights), or for specific periods of time and under specified conditions. By an exclusive licence is meant one that restrains the patentee from granting other licences to any other one. By means of a licence a patentee may derive benefits from his patent by entering into agreements and thereby reduce the risks of a partnership.

One of the regulations of the act of 1883 was that a patentee could be compelled by the Board of Trade to grant licences to persons who were able to show that the patent was not being worked in the United Kingdom, or that the reasonable requirements of the public with respect to the invention could not be supplied, or that any person was prevented from working or using to the best advantage an invention of which he was possessed. This, however, remained practically a dead letter, for only three applications were made between the years 1883 and 1897, and these never proceeded to a hearing. After 1897 a few petitions were filed, but the Act of 1907 substituted the High Court, and there was withdrawn by agreement between the parties. By § 3 of the act of 1902, the hearing of petitions for a grant of compulsory licences is given to the Board of Trade, and not to the Patent Court, which was the practice under the Patents on Council, but the act of 1907 substituted the High Court as the tribunal in the place of the judicial committee. It also laid down that the reasonable requirements of the public should not be deemed to be supplied if the patented invention was used or manufactured to an adequate extent and supply on reasonable terms, the patented article or any part thereof necessary for its efficient working or to carry on the patented process to an adequate extent or to grant licences on reasonable terms, if the trade or industry in the United Kingdom is unfairly prejudiced, or the demand for the patented article is too small to warrant the risk of a judgment for an injunction, or if the trade or industry in the United Kingdom is unfairly prejudiced by the conditions attached by the patentee before or after the passing of the act to the purchase, hire or use of the patented article or to the granting of licences for its use or manufacture.

The most important and most widely used of all the remedies is the licences, open to any person to work without the leave of the patentee for a certain period on specified conditions. By the licences, the patentee may be restrained from working or using the article in the United Kingdom or outside it, or licensing it to others. The patentee is entitled to ask the court for an injunction against anyone who is not licensed, however, the right to sue for infringement is not lost if the patentee does not exercise his right to sue for infringement.

The patent business of the United Kingdom is transacted at the Patent Office in London under the superintendence of the comptroller, an officer appointed by the Board of Trade, under whose direction the patentee must procure his patent. If any patentee does not license his invention for use in the United Kingdom, he is liable to a fine of £10. The Patent Office has power to grant licences to the patentee under the act, and to grant licences under a patent. An illustrated journal of patent inventions is published at the same office, where printed copies of all specifications can be obtained. The fee payable on a patent in England is £10. The act of 1883 provided that the patentee should be paid a reasonable royalty, but the fee payable on the sealing of the patent is now reduced from £15 to £100. A new Patent Office was constructed on the site of the old building and the work from Southampton Buildings into Staple Inn. The number of applications for patents, which sprang from 598 in 1883 to 17,110 in 1884, culminated in a total of 19,193 for the year 1894, of which the number of patents issued fell to 16,060 in 1907. The proportion of seals to applications varies from about 46 to 50%. The receipts from patent fees in 1908 were £262,892, against a total expenditure of £179,531.

The official publications of the Patent Office deserve some notice, as, in the absence of official investigation into novelty, the onus of search rests with the applicant or his agent. The procedure has been greatly simplified by the patent instruments and a patent under the present system and at a low rate (is. per volume), of illustrated abridgments of specifications. From 1877 practically the date the searcher obtains a chronological digest of all specifications falling within a given class of inventions or combinations of inventions, a "abridgment class and index key," which at once directs the searcher to his proper class and index heading.

**Patent Agents.**—Patents are frequently obtained through the intervention of persons specially interested or experienced in such a case. In prosecuting such a suit he subjects those rights to a searching examination, for the alleged infringer is at liberty to show that the invention is not new, that the patentee is not the true inventor, or that the combination of parts is not useful as such. If it appears that the combination is not new, or that the infringement is not really an infringement. But it may here be remarked that a patentee is not bound down (unless he chooses so to do), to prove every precise mode of working the invention described in the patent. It may be stated, in this state of the law, to be expected that he can describe every mode of working it; he will sufficiently secure the principle by giving some illustrations of it; and no person will be permitted to adopt some mode of carrying the same principle into effect on the ground that such mode has not been described by the patentee. On the other hand, when the principle is not new, a patentee can only secure the particular method which he has invented, and other persons may safely use the principle, provided the particular mode of applying it is carried out every day; and it is well known that scores of patents have been taken out for screw-propellers, steam-hammers, water-meters, &c., each of which is limited to the particular construction described, which is not the construction of the patentee. A patentee's patent consists of a combination of parts, some old and some new, the whole constituting a new machine or a new process, it is not open to the world to copy the new part and reject the rest. A new construction must be patentable in itself, and that, the identical combination not having been used, there has been no infringement. If he has borrowed the substance of the patent, it will be with great advantage if, in forming a common law a person who, alleging that he has a patent, threatens his rivals in trade, is liable to an action for damages, but the plaintiff cannot succeed without showing that the threats were made maliciously. The Patents Act 1883, provided another remedy, what is known as "the threats action." This has been incorporated in the act of 1907, § 36. The statute makes the good faith of the patentee threatening legal proceedings no answer to an action for infringement.

The Patent and Contrivances Act 1852, does not extend beyond the United Kingdom. The Patent Office, at the Patent when sealed is to have effect in the United Kingdom and the Isle of Man. The act of 1907, unlike the Patent Law Amendment Act 1852, does not extend beyond the United Kingdom, under the jurisdiction of the Patent Office, at the Patent when sealed is to have effect in the United Kingdom and the Isle of Man. The act of 1907, unlike the Patent Law Amendment Act 1852, does not extend beyond the United Kingdom.
British Dominions.—The following notes on colonial law give the salient facts. Prior to 1852 British letters patent extended to all the colonies, but the act of 1852 restricted the rights granted to the United Kingdom, Channel Islands and Isle of Man.

Australia.—The Commonwealth Acts are No. 21 of 1903, and No. 19 of 1906. They are founded on the English act of 1883 and amending acts. They provide for a department of patents controlled by a commissioner "under the minister" (§ 10 of 1903). Any person, whether a British subject or not, may apply for a patent (§ 32 of 1903). The term of a patent is 17 years. The Commonwealth or a state may acquire patents compulsorily (§§ 93, 94 of 1903). The act, creates a new class of "patent attorneys" (§ 101, 1903). There is an examination as to novelty. The renewal fee amounts to a sum of £5 before the end of the 4th year, and £5 before the end of the 7th year from the date of the patent.

Bahama Islands.—The law is regulated by the following acts of the colony: 52 Vict. c. 27; 53 Vict. c. 2; 54 Vict. c. 12; and 63 Vict. c. 3. Duration of patent 7 years, with power in governor to renew for another 7 years, and thereafter for a period of 7 years. The fees are £10 on filing specification, £10 for second renewal and £10 for third renewal. Apparently there is no preliminary examination as to novelty.

Barbadoes.—Acts of 1903 (No. 31) and of 1908 (No. 10). Duration of patent 14 years. There is a preliminary examination, but there are no compulsory, penal or penalty licence fees or penalties. No renewal fees are payable. The novelty is examined by the commissioner. The act, creates a new class of "patent attorneys" (§ 101, 1908). There is an examination as to novelty. The renewal fee amounts to a sum of £5 before the end of the 4th year, and £5 before the end of the 7th year from the date of the patent.

British Guiana.—The law is regulated by ordinance No. 11 of 1902 and is practically the same as the English act of 1883. The fees are £35 on filing specification and £100 before the end of the 7th year.

British Honduras.—The law of the 10th of September 1862 has been re-enacted with slight modifications (see supplement to Patents Commissions, the World, No. 4, 1900). There is no examination as to novelty.

British India.—The law is now governed by Act 5 of 1888, which applies to the whole of British India. Duration of patent 14 years. There is a preliminary examination, but there are no compulsory, penal or penalty licence fees or penalties. There are no renewal fees payable. The novelty is examined by the commissioner. There is no new class of "patent attorneys" (Act 1883). There is no examination as to novelty. The renewal fee amounts to a sum of £10 before the end of the 4th year, and £5 before the end of the 7th year from the date of the patent.

British North Borneo.—Strait Settlements law (No. 12 of 1871) as adopted by Patents Proclamation 1887 (No. 1 of 1887).

Canada.—Patent legislation belongs exclusively to the Dominion Parliament [B.N.A. Act 1877, § 91 (22)]. The existing acts are Canada Patents: B.N.A. Act 1877, c. 24; 1880, c. 23; 1890, c. 28; 1899, c. 15. The duration of the patent is 18 years. At the time of application the applicant may pay the full fee required for that term (viz. $60) or the partial fee required for the term of 6 years ($20) or 12 years ($35). There is only a payment of the amount stated in the patent, and the patentee ceases at the end of the term covered by such partial payment, unless he has, before the term the patentee pays the fee required for the further term of 6 or 12 years, viz. $30 in the former case and $40 in the latter. There is a preliminary examination into novelty by examiners, with an appeal from the decision of the commissioner of patents to the governor in council. The patent is void unless it is worked in Canada within 2 years, or if after the expiration of 12 months, or any authorized extension of either of these periods, the patentee imports the invention into Canada for the purpose of making or using it, or for the purpose of manufacturing or working it in Canada, as, for example, a licence to another to manufacture, &c.

Cape of Good Hope.—The law is regulated by act No. 17 of 1860, No. 24 of 1902 and No. 28 of 1904. There is no preliminary examination into novelty, and the act contains no provisions as to compulsory working, or as to the importation of patented articles from abroad.

Ceylon.—The law is now regulated by act 15 of 1906. The duration of the patent is 14 years, with power vested in the governor in council to grant extensions of 7 and 11 years. There is a preliminary examination into novelty, but there are no provisions as to compulsory working or the importation of patented articles from abroad. The renewal fees are Rs. 50 annually from before the expiration of the 4th year to before the expiration of the 8th year, Rs. 150 after the expiration of the 8th and before the expiration of the 9th year, Rs. 150 after the expiration of the 9th and before the expiration of the 10th year, and Rs. 200 annually after the expiration of the 10th year to before the expiration of the 13th year.

Channel Islands.—These are not now included in grant of letters patent. See form of grant, schedule I, form D, Patents Act 1883.

Falkland Islands.—By ordinance No. 2 of 1903 letters patent for an invention may be granted to any person holding in the United Kingdom a valid patent for any improvement, to whom all interest in the patent has been assigned. The fee on application is £5.

Gambia.—The law depends on ordinances No. 3 of 1879 and 7 of 1882, and order of December 29, 1890. The duration of the patent is 14 years. A fee of 5 guineas is payable on deposit of petition and specification. The fee for provisional protection is 5 guineas; on obtaining letters patent is £5, and £10 on renewal.

Gibraltar.—There is no patent law in Gibraltar, but special ordinances are sometimes passed extending the privileges of British patents to the dependency for the unexpired residues of the original terms. See as examples No. 5 of 1890, No. 1 of 1896, No. 1 of 1898. The Gold Coast.—The law is now regulated by the Patents Ordinances 1900 to 1906, which closely resemble the Imperial Act.

Hong-Kong.—The law is regulated by ordinance No. 2 of 1892. There is a preliminary examination into novelty, but there are no compulsory, penal or penalty licence fees or penalties. No renewal fees are payable. The novelty is examined by the commissioner. There are no new classes of "patent attorneys" (Act 1892). There are no provisions as to compulsory working or importation from abroad.

Ireland.—The term of a patent is 14 years. There is no preliminary examination as to novelty, and there are no provisions as to compulsory working or importation from abroad.

Jamaica.—The law is still in substance governed by c. 30 of 1857. But under ordinance No. 13 of 1891 the stamp duty on letters patent is £2 instead of £5, 10s., and there is no longer any fee payable on the reference to the attorney general. There is no preliminary examination as to novelty, and there are no provisions as to compulsory working or importation from abroad.

Lagos.—Ordinances of 1900 (No. 17) and 1902 (No. 2) introduce substantially the English law.

Leeward Islands.—Act No. 5 of 1906 has adopted the English act, as amended by Patents Proclamation £2, 10s.; at end of 4th year £50; at end of 7th year £40.

Malta.—The law is governed by ordinance No. 11 of 1899 and No. 7, of 1907, the duration of the patent is 14 years. There is no express provision for a preliminary examination into novelty. Provision is made for compulsory assignment or licence, where the invention has not been put into use within 3 years subsequent to the grant of its working has been suspended for 3 years continuously. The annual fees are £5 before the expiration of the 4th year from the date of the patent; £6 before the expiration of the 5th; £7 and £8 respectively before the expiration of the 6th, 7th, and 8th years; £9 before the expiration of the 9th; and from £11 to £14 before the expiration of the 10th, 11th, 12th and 13th years.

Mauritius.—The law is now regulated by ordinance No. 16 of 1873. There is a preliminary examination as to novelty, and there are no provisions as to compulsory working or importation from abroad.

Newfoundland.—The law is contained in the Consolidated Statutes, t. xii. c. 109. There is no preliminary examination into novelty. In addition to the office fees, the patentee is required to deposit with the colonial secretary the sum of $25, to be paid by him to the receiver of patents for the use of the government of New Zealand.—The law now depends on No. 12 of 1889, amended in detail by No. 8 of 1897. The duration of a patent is 14 years. There is no preliminary examination as to novelty, and there are no provisions as to compulsory working or importation from abroad. The following fees are payable: £2 on obtaining letters patent, £5 before the expiration of the 4th year and £10 before the expiration of the 7th year.

Nigeria, Northern.—No. 12 of 1902 introduces practically the English law of 1883.
St Helena.—The law is regulated by ordinance No. 3 of 1872. The grantee of an English patent, or his representatives, can have the grant extended to the colony. All cases of doubt and difficulty not provided for by the laws of the colony are governed by the law of England. No satisfaction shall be taken or any copy of letters patent and specification with the register of the Supreme Court.

Strait Settlements.—The law is prescribed by ordinance No. 12 of 1871. The duration of a patent is 14 years. There is no preliminary examination into novelty, and there are no provisions as to compulsory working or importation from abroad. There is a stamp duty of 50 on the petition. No renewal fees are payable.

Transvaal Colony.—Proclamations Nos. 22 and 29 of 1902 introduced a patent law.

Trinidad and Tobago.—The law is regulated by ordinance No. 10 of 1900 and No. 13 of 1905. The duration of the patent is 14 years. There is no preliminary examination into novelty, and there are no provisions as to compulsory working or importation from abroad. A fee of 10 is payable for application for a patent.

Turks and Caicos Islands.—The law of the country has been extended to these islands by No. 7 of 1897. See supplement to Patent Laws of the World, No. 3 of 1900.

Windward Islands.—In the Windward Islands other than Barbados, viz., Grenada, St Lucia and St Vincent, patents for invention were granted until recently only by special ordinances. See, e.g., St Lucia, ordinance No. 41 of 1875 (Tooth’s patent). A stamp duty of 10 was payable in this island on letters patent for inventions (No. 6 of 1881, schedule). But ordinances based on the Imperial Patent Act of the United Kingdom have now been passed in the British Possessions (§§ 5 of 1898), Grenada (No. 4 of 1898) and St Lucia (No. 14 of 1899).

Foreign Patent Laws.—For the text of these see Patent Laws of the World, ed. 1899 and supplemental volumes. But the following are the essential facts.

Argentina Republic.—The law of October 11, 1884, is still in force.

Belgium.—A law of January 11, 1897, came into force on January 1, 1899. The principal changes introduced by this measure are as follows. A still preliminary examination was made into the novelty. The term of the patent was fixed at 15 years, and besides an application fee of 10 florins, annual fees were imposed rising from 20 florins for the 1st year to 400 florins for the 15th. The period for compulsory working is fixed at 3 years. The condition of the patentee is that the grant should be made within 18 months from the date of the publication of the grant of the patent in the patent journal. Provision was made for the conversion of patents under the old law of August 15, 1852 (extended to Hungary by law of June 27, 1878, and to Bosnia and Herzegovina by law of December 20, 1879) into patents under the present law.

Bolivia.—The law is regulated by a law of February 21, 1898. The term of the patent is 15 years. There is a preliminary examination into novelty. The period for compulsory working is 3 years. No patent will be granted if the applicant is not a citizen of Bolivia, or if the instrument in which the rights are obtained is not payable on file. A patent lapses unless the invention is put into complete practice within a year and a day from the date of the privilege, unless the omission is excused by justifiable causes according to law.

Brazil.—Patents are granted under the law of October 14, 1882. The patent lapses unless the invention is brought into effective use within 3 years from the date of the grant, or if such use is suspended for more than a year, except by reason of force majore attributed to circumstances that are not in the power of the patentee, and fees, patents of invention are subject to an annual and progressive tax, commencing at 20 and increasing at the rate of 10 a year, to be paid annually to the government.

Chile.—The law is regulated by the law of September 9, 1840, decree of August 1, 1851, and laws of July 25, 1872, January 20, 1883, and January 20, 1888. There is a preliminary examination and a year’s grace, but if the invention is not put into practical use within 3 years by the president of the republic, if the report of the experts on the nature and importance of the invention seem to justify it. Then the government may cancel the patent.

Colombia.—Patents are granted under law No. 35 of 1869 and decree No. 218 of 1900. The term varies from 5 to 20 years at the option of the applicant. There is no preliminary examination as to novelty, and a patent cannot be revoked for non-payment of fees. A patent for a new industry is valid if such industry is used for a whole year, unless inevitable circumstances have impeded such use. If the patentee does not pay the fees which悠久, if the patent is refused, and taken in payment of the patent fee if it is granted. The patent tax is from 5 to 20 pesos a year for every year of the privilege.

Congo.—Patents are issued under a law of October 29, 1886, and a decree of October 30, 1886. They are of three kinds, patents of invention, of importation and of improvement. There is no preliminary examination as to novelty, and the patent expires in 20 years from the date of the grant of a patent. The term of a patent of invention is 20 years. A patent of importation or of improvement expires in the former case with the foreign, in the latter case with the national patent. The patentees are not liable to any tax; on other patents a payment of 100 francs is required. There are no provisions as to compulsory working or prohibiting the importation of patented articles.

Costa Rica.—Patents are granted under a law of March 28, 1899. The term of the patent is 15 years, and no extension can be granted. There is a preliminary examination into novelty. The patent may, on terms, be appropriated by the state if the public interest demands it. The period for compulsory working is 3 years, and the patent will also lapse if the exercise of the invention is discontinued for more than a year. The patent commission may release the patentee from the obligation of manufacturing the patented article in Costa Rica, if satisfied that the cost of such manufacture would be unreasonable, on condition that the patented article is always kept on sale in Costa Rica. The tax is an annual fee of 25 kroner for the first 3 years, 50 kroner for the next 3 years, 100 kroner for 3 years 200 kroner yearly, and for the last 3, 300 kroner yearly.

Ecuador.—Patents are granted under a law of October 18, 1880. The provisions are identical with those given for Bolivia.

France.—The law is regulated by the law of February 21, 1898. The term of the patent is 15 years. There is a preliminary examination into novelty. The period for compulsory working is 3 years. Royalties payable on the annual fee amounting to one third of the tax imposed by the law (40 francs) are payable on file. A patent lapses unless the invention is put into complete practice within a year and a day from the date of the privilege, unless the omission is excused by justifiable causes according to law.

Greece.—Patents (the law as to which is not affected by the civil code of 1900) are granted under a law of April 7, 1891. The duration of the patent is 15 years. There is no preliminary examination into novelty. The period for compulsory working is 3 years, but it is sufficient if the patentee does not make use of the invention that is necessary to ensure the carrying out of the invention. A tax of 30 marks has to be paid before the grant. In addition to this there is an annual tax of 10 marks. The annual tax for every following year of the term a tax amounting to 50 marks for the first year and increasing by 50 marks every subsequent year. An act of 1900 regulates the profession of patent agents.

Germany.—Patents (the law as to which is not affected by the civil code of 1900) are granted under a law of April 7, 1891. The duration of the patent is 15 years. There is no preliminary examination into novelty. The period for compulsory working is 3 years, but it is sufficient if the patentee does not make use of the invention that is necessary to ensure the carrying out of the invention. A tax of 30 marks has to be paid before the grant. In addition to this there is an annual tax of 10 marks. The annual tax for every following year of the term a tax amounting to 50 marks for the first year and increasing by 50 marks every subsequent year. An act of 1900 regulates the profession of patent agents.

Great Britain.—If the patentee is a private individual, a private act is required, which can be introduced by a deputy and is treated like any other bill.

Guatemala.—Patents are granted under the law of Nov. 21, 1887. The term of the patents ranges from 5 to 15 years. An annual tax of 30 pesos is payable. The period of compulsory working is 1 year, and abandonment of working for a year forfits the patent. There is a preliminary examination into novelty, and the patent expires 20 years from the date of the decree, Dec. 17, 1887, but there is no prohibition of the importation of patented articles.

Honduras.—Patents were issued till 1900 under the civil code (§§ 255, 256) and a law of August 29, 1884, which were not at first affected by the annexation of the islands by the United States. There was a preliminary examination as to novelty.
The maximum duration of the patent was 10 years. On application a fee of 25 was payable, the commissioner of patents received $20 for his examination, and a fee of 25 was payable when the patent was issued. The patent would run for 10 years from the date of the application, but none into utility, and for 10 years, or until the 20th year, forfeited years, and applied 1859. The 1907. There is no preliminary examination as to novelty, and the importation of patented articles is not prohibited. The duration of a patent is 15 years, and it is subject to an annual and progressive tax as follows: 10 pesos for the 1st year, 20 for the 2nd, 30 for the 3rd, and so on successively to the 5th or 20th year, for which the tax is $25. The 100 and 200 patents. 1899. The term is 15 years. The annual tax is 25 crowns for the 2nd, 3rd, 4th and 5th years; 50 crowns for each of the following 5 years; and 75 crowns for each of the following 5 years. There is no preliminary examination as to novelty, the period for compulsory working is 3 years, and dis-continuance during any entire year entails forfeiture. There is no prohibition of the importation of patented articles.

Turkey.—Patents are still granted under the law of the 2nd of March 1886. There is no preliminary examination as to novelty, and the patentee is entitled to demand a copy of the record while there is no patent, and the terms of the words "without guarantee of government," is liable to a maximum penalty of 45 Turkish pounds.

United States.—The American law may be considered at greater length here, as "to promote the progress of science and useful arts by securing, for limited times to... inventors the exclusive right to their... discoveries," is one of the fundamental principles of all the laws of the empire of free invention. The American patent law is based on a series of acts of Congress, on the interpretation of those acts, the whole of which is based on the Statute of Monopolies and the Statute of Anne. It is an equitable system in its practice, and it is administered by the Patent Office, which is an integral part of the government. There are no preliminary examinations as to novelty or the importation of patented articles. The patentee is entitled to demand a copy of the record while there is no patent, and the terms of the words "without guarantee of government," is liable to a maximum penalty of 45 Turkish pounds.

Spain.—Patents are issued under the law of June 7, 1902. There is no preliminary examination as to novelty, and the importation of patented articles is not prohibited. The duration of a patent is 15 years and it is subject to an annual and progressive tax as follows: 10 pesetas for the 1st year, 20 for the 2nd, 30 for the 3rd, and so on successively to the 5th or 20th year, for which the tax is $25. The 100 and 200 patents. 1899. The term is 15 years. The annual tax is 25 crowns for the 2nd, 3rd, 4th and 5th years; 50 crowns for each of the following 5 years; and 75 crowns for each of the following 5 years. There is no preliminary examination as to novelty, the period for compulsory working is 3 years, and dis-continuance during any entire year entails forfeiture. There is no prohibition of the importation of patented articles.

Turkey.—Patents are still granted under the law of the 2nd of March 1886. There is no preliminary examination as to novelty, and the patentee is entitled to demand a copy of the record while there is no patent, and the terms of the words "without guarantee of government," is liable to a maximum penalty of 45 Turkish pounds.

There is no prohibition of the importation of patented articles.
The patent examiner is required to examine the application and, if satisfied that the invention is novel, to issue a certificate thereof. The patentee is required to pay the issue fees, and the patent is issued to him upon the certificate. The patentee is also required to pay the annual maintenance fees, and the patent is continued in force for 17 years after the date of issue. The patentee may assign or license his patent rights, and the assignee or licensee is bound by the terms of the patent. The patentee may also make and sell the patented article during the term of the patent, and the patentee is entitled to the exclusive right to make, use, sell, offer to sell, or import the patented article for 17 years after the date of issue.

PATENTS OF PRECEDENCE—PATER

notice; and in any suit for infringement by a party failing so to mark, all damages sustained thereby shall be recoverable by the plaintiff, except on proof that the defendant was duly notified of the infringement, and continued after such notice to make, use, or vend the article so patented. A new law not less than 100 years is attached to false marking or labelling articles as patented.

When through inadvertence, accident or mistake, and without fraudulent or deceptive intention, a patentee has claimed more than is validly patentable, the period of the patentee's interest shall be the term, truly and justly his own; provided this is a material or substantial part of the thing patented and the patentee, or his heirs or assigns, on payment of the prescribed fee ($10) disclaim the surplusage. The disclaimer must be in writing, and attested by one or more witnesses; it is recorded in the Patent Office, and is thereafter considered a part of the original specification. But no disclaimer affects any action pending at the time of its being filed, as far as may relate to the question of unreasonable neglect or delay in filing it.

In the same circumstance, or where a patent is ineptive or invalid by reason of an obvious defect, or if the patentee, or any other person, may, by the publication of the application for the patentee and on payment of a fee of $30, issue a new patent in accordance with the amended specification.

Uruguay (law of 12th November 1888).—The term is 3, 6 or 9 years, at the option of the applicant. There is an annual tax of $25 for every year of the privilege. The invention must be worked by the patentee, or by one or more persons under his control; and it must not be discontinued for a year, on pain of forfeiture. There is no preliminary examination as to novelty.

Patents were first granted by a decree of the 19th of March 1900, but revoked in January 1902 and the old law of 1882 substituted. The term is 5, 10 or 15 years. The tax is 80 francs (bolivars) a year if the patent is for an invention or discovery, and 5 francs (bolivars) a year if it relates to an improved process. There is no preliminary examination as to novelty, nor is there any compulsory working.

International Patents.—The International Convention for the protection of industrial property was signed at Paris on the 20th of March 1883; the necessary ratifications were exchanged on the 6th of June 1884, and the Convention came into force 12 months later. Provision was made by sections 193 and 194 of the Patents Act 1883 for carrying out the Convention in Great Britain by orders in council, applying it from time to time to (a) British possessions whose legislatures had made satisfactory arrangements for the protection of inventions patented in Great Britain; (b) foreign states with which the sovereign had made arrangements for the mutual protection of inventions. The following governments have signed the international convention: Australia, Austria-Hungary, Belgium, Brazil, Ceylon, Cuba, Denmark, France, Germany, Italy, Japan, Mexico, Netherlands, New Zealand, Portugal, Spain, Sweden, Switzerland, Trinidad and Tobago, Tunis and the United States. Under the powers of the Foreign Jurisdiction Act 1890 penalties have been imposed on British subjects committing offences against the Patents, &c., Acts 1883-1888, and the orders in council issued thereunder, in Africa, East Africa, Morocco, Persia, Persian coast and Zanzibar.

An international bureau in connexion with the Convention has been established at Bern, where an official monthly periodical, La Propriété industrielle, is published. Conferences were held under the Convention at Rome in April and May 1889, and at Madrid 1891 and 1892. At Madrid an important article was adopted, under which it is left to each country to define and apply “compulsory working” (exploitation) for the purposes of the convention in the sense that it chooses.

PATENTS OF PRECEDENCE.—A patent of precedent is a grant to an individual by letters patent (q.v.) of a higher social or professional position than the precedence to which his ordinary rank entitles him. The principal instance in modern times of patents of grants of this description has been the grant of precedence to members of the English bar. In the days when acceptance of the rank of king’s counsel not only precluded a barrister from appearing against the Crown, but, if he was a member of parliament, vacated his seat, a patent of precedence was resorted to as a means of conferring similar marks of honour on distinguished counsel without any such disability attached to it. The patents obtained by Mansfield, Erskine, Scott and Brougham were granted on this ground. After the order of the court lost its exclusive right of audience in the court of common pleas, it became customary to grant patents of precedence to a number of the serjeants-at-law, giving them rank immediately after those of the Crown and subject to the payment of a small sum in consideration. Mr Justice Phillimore was, on his appointment as a judge of the queen’s bench division (1897) the only holder of a patent of precedence at the bar, except Serjeant Simon, who died in that year, and who was the last of the serjeants who held such a patent. See also Precedence.

In Canada patents of precedence are granted both by the governor-general and by the lieutenant-governor of the provinces under provincial legislation which has been declared infra vires. (Att. Gen. for Canada v. Att. Gen. for Ontario, 1898, A.C. p. 247; Todd v. Attorney-General for Canada, 2nd ed. p. 333.)

Patent, Walter Horatio (1830-1894), English man of letters, was born at Shadwell on the 4th of August 1830. He was the second son of Richard Glode Pater, a medical man, of Dutch extraction, born in New York. Jean-Baptiste Pater, the painter, was probably of the same family. Richard Pater moved from Olney to Shadwell early in the century, and continued to practise there among the poorer classes. He died while his son Walter was yet an infant, and the family then moved to Enfield, where the children were brought up. In 1853 Walter Pater was sent to King’s School, Canterbury, where he was early impressed by the aesthetic beauties of the cathedral. These associations remained with him through life. As a schoolboy he read Modern Painters, and was attracted to the study of art, but he did not make any conspicuous mark in school studies, and showed no signs of the literary taste which he was afterwards to develop. His progress was always gradual. He gained a school exhibition, however, with which he proceeded in 1858 to Queen’s College, Oxford. His undergraduate life was unusually uneventful; he was a shy, reading man,” making few friends. Jowett, however, was struck by his promise, and volunteered to give him private tuition. But Pater’s class was a disappointment, and he only took a second in literae humaniores in 1862. After taking his B.A., he settled down to a quiet life at his residence. As a boy he had cherished the idea of entering the Anglican Church, but, under the influence of his Oxford reading, his faith in Christianity became shaken, and by the time he took his degree he had thoughts of graduating as a Unitarian minister. This project, too, he resigned; and when, in 1864, he was elected to a fellowship at Brasenose, he had settled down easily into a university career. But it was no part of his ambition to sink into academic torpor. With the assumption of his duties as fellow the sphere of his interests widened rapidly; he became acutely interested in literature, and even began to write articles and criticisms himself. The first of these to be printed was a brief essay upon Coleridge, which he contributed in 1866 to the Westminster Review. A few months later (January, 1867) appeared in the same review his now well-known essay on Winckelmann, the first expression of his idealism. In the following year his study of “Aesthetic Poetry” appeared in the Fortnightly Review, to be succeeded by essays on Leonardo da Vinci, Sandro Botticelli, Pico della Miranda and Michelangelo. These, with other studies of the same kind, were in 1878 collected in his Studies in the History of the Renaissance. Pater was now the centre of a small but very interesting circle of Oxford men, and his tastes and ideas were naturally spread.
in the university, but among men of letters in London and elsewhere. The little body of Pre-Raphaelites were among his friends, and by the time that *Marius the Epicurean* appeared he had quite a following of disciples to hail it as a gospel. This fine and polished work, the chief of all his contributions to literature, was published early in 1885. In it Pater displays, with perfect naturalness, a memory and a power of recalling the full life, its cult of beauty as opposed to bare asceticism, and his theory of the stimulating effect of the pursuit of beauty as an ideal of its own. In 1887 he published *Imaginary Portraits*, a series of essays in philosophic fiction; in 1889, *Appreciations, with an Essay on Style*; in 1890, *Plato and Platonism*; and in 1894, *The Child in the House*. His Greek Studies and his *Miscellaneous Studies* were collected posthumously in 1895; his posthumous romance of *Gaston de Latour* in 1896; and his *Essays from the "Guardian"* were privately printed in 1897. A collected edition of Pater's works was issued in 1901. Pater changed his residence from time to time, living sometimes at Kensington and in different parts of Oxford; but the centre of his work and influence was always his rooms at Brazenose. Here he laboured, with a wonderful particularity of care and choice, upon perfecting the expression of his theory of life and art. He wrote with difficulty, correcting and recorrecting with imperturbable assiduity. His mind, moreover, returned to the religious fervour of his youth, and those who knew him best believed that he had lived longer he would have resumed his boyish intention of taking holy orders. He was cut off, however, in the prime of his powers. Seized with rheumatic fever, he racketed, and sank again, dying on the staircase of his house, in his sixtieth years, on the morning of Monday the 30th of July 1894. Pater's nature was so contemplative, and in a way so centred upon reflection, that he never perhaps gave full utterance to his individuality. His peculiar literary style, too, burnished like the surface of hard metal, was too austere to be always persuasive.

At the time of his death Pater exercised a remarkable and a growing influence among that necessarily restricted class of persons who have themselves something of his own love for beauty and the beautiful phrase. But the cumulative richness and sonorous depth of his language harmonized intimately with his deep and earnest philosophy of life; and those who can sympathize with a nervous Idealism will always find inspiration in his sincere and sustained desire to "burn with a hard, gem-like flame," and to live in harmony with the highest.

(A. W.)

**PATERA**, the Latin name for a shallow circular vessel used for drinking or for pouring libations. The Greek name for such a vessel was *φαλάς*. It has no foot or stem underneath, but occasionally a boss rising in the centre inside. The term is sometimes given incorrectly in architecture to a circular dish, carved with a conventional rose, which is found in many early styles, the proper term being *roselet*.

**PATERNO**, a town of Sicily, in the province of Catania, 11 m. W.N.W. of Catania by rail, at the southern foot of Mt Etna. Pop. (1881), 15,230; (1901), 20,008 (town), 22,857 (commune). The castle, originally erected in 1073, upon the acropolis of the ancient Hybla Minor or Gelaetis, has a square tower and a chapel with frescoes belonging to the 14th century. Some mosaic pavements still exist under the houses in the Strada dell'Ospedale, and remains of baths and of an ancient bridge over the Simeto on the road to Centuripa are to be seen in the neighbourhood. A small place was magnificently besieged by the Athenian forces in the summer of 415 B.C.

**PATERSON, ROBERT** (1715–1801), Scottish stone-mason, who suggested to Sir Walter Scott the character of "Old Mortality," was born near Hawick in 1715. Through the patronage of Sir Thomas Kirkpatrick, whose cook he had married, he obtained the lease of a quarry at Gatelawbrig, but in 1745 his house was plundered by the retreating Jacobites, and Paterson himself, a pronounced Cameronian, was carried off a prisoner. He subsequently devoted his life to cutting and erecting stones for the graves of the Covenanters, for 40 years wandering from place to place in the lowlands. He died in poverty in 1801, and his memory was afterwards uncomplimented by Scott's publishers in 1869 in Caerlaverock churchyard.

**PATERSON, WILLIAM** (1658–1719), British writer on finance, founder of the Bank of England and projector of the Darien scheme, was born in April 1658 at the farmhouse of Skipmyre, parish of Tinwald, Dumfriesshire. His parents occupied the farm there, and with them he resided till he was about seventeen. A desire to escape the religious persecution then raging in Scotland, and the inmemorial ambition of his race, led him southward. He went through England with a pedlar's pack ("whereof the print may be seen, if he be alive," says a pamphleteer in 1700), settled for some time in Bristol, and then proceeded to America. There he lived chiefly in the Bahamas, and is said by some to have been a predicant or preacher, and by others a buccaneer. In truth his intellectual and moral superiority to his fellow-settlers caused his selection as their spiritual guide, whilst his thirst for knowledge led to intercourse with the buccaneers. It was here he formed that vast design which is known in history as the Darien scheme. On his return to England he was unable to induce the government of James II. to engage in his plan. He went to the continent and pressed it to no purpose in Hamburg, Amsterdam and Berlin, and on his return to London he engaged in trade and rapidly amassed a considerable fortune. About 1690 he was occupied in the formation in the Hampstead Water Company, and in 1664 he founded the Bank of England. The government required money, and the country, rapidly increasing in wealth, required a bank. The subscribers lent their money to the nation, and this debt became the bank stock. The credit of having formulated the scheme and persuaded its adoption is due to Pateron. He was one of the original directors, but in less than a year he fell out with his colleagues, and withdrew from the management. He had already propounded a new plan for an orphan bank (so called because the debt due to the city orphans by the corporation of London was to form the stock). They feared a dangerous rival to their own undertaking, and they felt some distrust for this eager Scotsman whose brain teemed with new plans in endless succession.

At that time the people of the northern kingdom were considering how best to share in that trade which was so rapidly enriching their southern neighbours. Pateron saw his opportunity. He removed to Edinburgh, unfolded his Darien (q.v.) scheme, and soon had the whole nation with him. He is the supposed author of the act of 1656 which formed the "Company of Scotland trading to Africa and the Indies." This company, he arranged, should establish a settlement on the Isthmus of Darien, and "thus hold the key of the commerce of the world." There was to be free trade, the ships of all nations were to find shelter in this harbour not yet erected, differences of race or religion were neglected; but a small tribute was to be paid to the company, and this and other advantages would so act that, at one supreme stroke, Scotland was to be changed from the poorest to the richest of nations.

On the 26th of July 1698 the first ships of the expedition set sail "amidst the tears and prayers and praises of relatives and friends and countrymen." Some financial transactions in which Pateron was concerned, and in which, though he had acted with perfect honesty, the company had lost, prevented his nomination to a post of importance. He accompanied the expedition as a private individual, and was obliged to look idly on whilst what his enemies called his "golden dream" faded away indeed like the "baseless fabric of a vision" before his eyes. His wife and child died, and he was seized with a dangerous illness, "of which, as I afterwards found," he says, "trouble of mind was not the least cause." It was noted that "he hath been so mightily concerned in this sad disaster, so that he looks now more
like a skeleton than a man." Still weak and helpless, and yet protesting to the last against the abandonment of Darien, he was carried on board ship, and, after a stormy and terrible voyage, he and the remnant of the ill-fated band reached home in December 1699.

In his native air Paterson soon recovered his strength, and immediately his fertile and eager mind was at work on new schemes. He prepared an elaborate plan for developing Scottish resources by means of a council of trade, and then tried to induce King William, with whom he had frequent interviews, to enter on a new Darien expedition. In 1701 he removed to London, and here by conferences with statesmen, by writing, and by personal persuasion helped on the union. He was much employed in settling the financial relations of the two countries. One of the last acts of the Scots parliament was to recommend him to the consideration of Queen Anne for all he had done and suffered.

The United Parliament, to which he was returned as a member for the Dumfries burghs, though he never took his seat, decided that his debts should be settled, but it was not till 1715 that an indemnity of £5,241 was ordered to be paid him. Even then he found considerable difficulty in obtaining his due. His last years were spent in Queen Square, Westminster, but he removed from there shortly before his death on the 22nd of January 1719.

As many as twenty-two works, all of them anonymous, are attributed to Paterson. These are classified by Bannister under six heads, as dealing with (1) finance, (2) legislative union, (3) colonial enterprise, (4) trade, (5) administration, (6) various schemes. He prepared an elaborate plea for constituting a Council of Trade (Edinburgh, 1701). This was a plan to develop the resources of his country. A council, consisting of a president and twelve members, was to be appointed. It was to have a revenue collected from a duty on sales, lawsuits, successions, &c. With these funds the council was to revive the Darien scheme, to build workhouses, to employ, relieve and maintain the poor, and to encourage manufactures and fisheries. It was to give loans without interest to companies and shippers, to remove monopolies, to construct all sorts of vast public works. Encouragement was to be given to foreign merchants, and the taxes on wool, silk, and velvet were to be reduced. All commerce with foreign countries was to be encouraged, and it was proposed that no goods were to be sold or bought at less than their nominal value. The banks were to be abolished and import regulated on a new plan. Paterson believed that thus the late disasters would be more than retrieved.

(2) A Proposal to plant a Colony in Darien to protect the Indians against Spain, and to open the Trade of South America to all Nations (1701). This was the Darien scheme on a new and broader basis. It points out in detail the advantages to be gained; free trade would be advanced all over the world, and Great Britain would largely profit. (3) Edinburgh: Club Dialogues upon the Union (London, 1706). These were imaginary conversations in a club in the city of London about the union with Scotland. Paterson’s real opinions were put into the mouth of a speaker called May. Till the Darien business all Scots were for the union, and they were so still if reasonable terms were offered. Such terms ought to include an incorporating union with equal taxes, freedom of trade, and a proportionate representation in parliament. A union with Ireland, “as likewise with other dominions the queen either hath or shall have,” is proposed. (4) Along with this another discussion of the same imaginary body, An Inquiry into the State of the Union of Great Britain and the Trade thereof (1717), may be taken. This was a consideration of the union, which, now “that its honeymoon was past,” was not giving satisfaction in some quarters, and also a discussion as to the best means of paying off the national debt—a subject which occupied a great deal of Paterson’s attention during the later years of his life.

Paterson’s plans were vast and magnificent, but he was no mere dreamer. Each design was worked out in minute detail, each was possible and practical. The Bank of England was a stupendous success. The Darien expedition failed from hostile attacks and bad arrangements. But the original design was that the English and Dutch should be partners in it, and, if this had occurred, and the arrangements, against many of which Paterson in letter after letter in vain protested, had been sound, the Darien Company might have become another India. Paterson was a zealous almost a fanatic free-trader like Adam Smith, and his remarks on finance and his argument against an convertible paper-currency, though then novel, now hold a place of economic orthodoxy. Paterson’s works are excellent in form and matter; they are quite impersonal, for few men who have written so much have said so little about themselves. There is no reference to the scurrilous attacks made on him. They are the true products of a noble and disinterested as well as vigorous mind. There is singular fitness in the motto “Sic vos non vobis” inscribed under the only portrait of him we possess.

See Life of W. Paterson, by S. Bannister (Edinburgh, 1888); Paterson’s Works, by S. Bannister (3 vols., London, 1890); The Birthplace and Parentage of W. Paterson, by W. Pagan (Edinburgh, 1895); Eng. Hist. Rev. xi. 266. The brilliant account of the Darien scheme, the immensely important volume of Darien’s Historical Records and the account of Paterson’s life by H. J. S. Coquillett. For a list of Paterson’s writings see Poole’s Index of Periodicals. (F. W. A.)

PATERNON, a city and the county-seat of Passaic, New Jersey, U.S.A., in the north-eastern part of the state, on the west bank of the Passaic river, and 16 m. N.W. of New York city. Pop. (1880), 51,031; (1890), 78,347; (1900), 105,171; (1906, estimate), 112,801; (1910), 125,600. Of the total in 1890, 38,701 were foreign-born. Paterson is served by the main lines of the Delaware & Hudson, Lackawanna & Western, the Erie, and the New York Susquehanna & Western railways, and by a number of interurban electric lines. The Morris Canal was formerly important for shipping freight between Paterson and Jersey City, but has fallen into disuse. The city lies along a bend of the Passaic river, the southern portion being in a plain and the extreme northern part lying among the hills that rise from the stream near the Great Falls. The river has a descent here of about 70 ft. (of which 50 ft. are in a perpendicular fall), and furnishes water-power for manufactories. The principal public buildings are the Custom-house, the Paterson Museum, the War Memorial of the Danforth Memorial (public library) building. Paterson is preeminently a manufacturing centre. There were, in 1905, 513 factories employing a capital of $53,905,455, and furnishing work for 28,509 employees; and the total factory product was valued at $54,073,943. The city is the centre of silk manufacturing in the United States. In 1905 it contained 190 silk-mills, and the products were valued at $25,433,245. There were also, in 1905, 27 dyeing and finishing establishments, with products valued at $5,699,293; 39 foundries and machine shops, with products valued at $2,317,185; 3 wholesale slaughtering and packing houses, with products valued at $2,206,603; and 3 jute and jute-goods factories, with an output valued at $909,310. Among the machine works are two locomotive shops, with an average capacity of three locomotives per day, and a large steel mill.

Paterson had its origin in an act of the legislature of New Jersey on the 22nd of November 1791, incorporating the Society for Establishing Useful Manufactures, the plan for this society being drawn up by Alexander Hamilton. As the most suitable location for its enterprise the society in the following year selected the Great Falls of the Passaic river, and named the place Paterson, in honour of William Paterson (1714-1806), a member of the state Constitutional Convention in 1776, attorney-general of New Jersey in 1776-1781, a delegate to the Continental Congress in 1786-1781, and to the Constitutional Convention of
PATEY—PATHOLOGY

PATHOLOGY (from Gr. πάθος, suffering), the science dealing with the theory or causation of disease. The term by itself is usually applied to animal or human pathology, rather than to vegetable pathology or Phytopathology (see PLANTS: Pathology).

The outstanding feature in the history of pathology during the 19th century, and more particularly of the latter half of it, was the completion of its rescue from the thraldom of abstract philosophy, and its elevation to the dignity of one of the natural sciences. Our forefathers, if one may venture to criticize them, were too impatient. Influenced by the prevailing philosophy of the day, they interpreted the phenomena of disease through the medium of one or another of the external causes: they restored the classificatory method of pathology to philosophical order when the only elements of philosophical order were wanting. The pathology of the present day is more modest; it is content to labour and to wait. Whatever its faults may be—it is for our successors to judge of these—there is this to be said in its favour: that it is in nowise dogmatic. The eloquence of facts appeals to the scientific mind nowadays much more than the assertion of crude and unproved principles. The complexity and mystery of action inherent in living matter have probably been accountable for much of the vague philosophy of disease in the past, and have furnished one reason at least why pathology has so long in asserting its independence as a science. This, indeed, holds good of the study of biology in general. There are other factors, however, which have kept pathology in the background. Its existence as a science could never have been recognized so long as the subjects of physics, chemistry and biology, in the widest acceptance of the term, remained unevolved. Pathology, in fact, is the child of this ancestry; it begins where they end.

Progress in the study of pathology has been greatly facilitated by the introduction of improved methods of technique. The certainty with which tissues can now be fixed in the state in which they were when living, and the delicacy with which they can be stained differentially, have been the means of opening up a new world of exploration. Experimental pathology has benefited by the use of antisepitic surgery in operations upon animals, and by the adoption of exact methods of recording; while the employment of solid culture media in bacteriology—the product of Koch's fertile genius—is responsible for a great part of the extraordinary development which has taken place in this department of pathological research. The discoveries made in pathological bacteriology, indeed, must be held to be among the most brilliant of the age. Inaugurated by Pasteur's early work, progress in this branch of the subject was first marked by the discovery of the parasite of anthrax and of those organisms reproductive of fowl-cholera and septic disease. Then followed Koch's great revelation in 1882 of the bacillus of tubercle (fig. 22, Pl. II.), succeeded by the isolation of the organisms of typhoid, cholera, diphtheria, actinomycosis, tetanus, &c. The knowledge we now possess of the causes of immunity from contagious disease has resulted from this study of pathological bacteriology: momentous practical issues have also followed upon this study. Amongst these may be mentioned the neutralizing of the toxins in cases of diphtheria, tetanus and spinal fever; the poisonous snake-bite; the usage of broth and of serum therapeutics; and treatment by "vaccines." By means of "vaccination" we are enabled to induce an active immunity against infection by certain pathogenic bacteria. The value of such protective inoculations is demonstrated in the treatment against small-pox ( Jenner), cholera, plague (Haffkine) and typhoid (Wright and Semple). Pasteur's inoculation against hydrophobia is on the same principle. "Vaccines" are also used as a method of treatment during the progress of the disease. Sir A. Wright, and others, in recent work on opsonins, have shown that, by injecting dead cultures of the causal agent into subjects infected with the organism, there is produced in the body fluids a substance (opsonin) which apparently in favourable conditions unites with the living causal bacteria, and so sensitizes them that they are
readily taken up and destroyed by the phagocytic cells of tissues. Before the discovery of the bacillus of tubercle, scrofula and tuberculosis were regarded as two distinct diseases, and it was supposed that a patient’s constitution could be distinguished from the tuberculous. It was always felt, however, that there was a close bond of relationship between them. The fact that the tubercule bacillus is to be found in the lesions of both has set at rest any misgiving on the subject, and put beyond dispute the fact that so-called scrofulous affections are simply local manifestations of tuberculosis. A knowledge of the bacteriology of scrofulous affections of bone and joints, such as caries and gelatinous degeneration, has shown that they also are tubercular diseases—that is to say, diseases due to the presence locally of the bacillus. At a very early period F. Antoni, his pupil Vigreix showed that the large cheesy masses found in tuberculosis of the lung are to be regarded as pneumonic infiltrations of the air-vees. Their pneumonic nature has been amply substantiated in later times; they are now regarded simply as evidence of pneumonic reaction to the stimulus of the tubercule bacillus. The caseous necrosis of the implicated mass of lung tissue, and indeed of tubercles generally, is held to be, in great measure, the result of the necrotic influence of the secretions from the bacillus.

Tubercular pneumonia may thus be looked upon as comparable to pneumonia excited by any other specific agent. Among the affects of the feeling ran somewhat high over the rival doctrines concerning the origin of pus-corpuscles. Cohnheim and his school maintaining that they were derived exclusively from the blood, that they were leucocytes which had emigrated through the walls of the vessels and escaped into the surrounding tissue-spaces, while Stricker and his followers, although not denying their origin in part from the blood, traced them, in considerable proportion, to the fixed elements, such as fibrinous tissues and endothe1ia. Our present-day knowledge prompts the adoption of a middle course between the two theories. The cells found in an inflamed part are undoubtedly drawn from both sources; and it is probable that they have a great tendency to become fatty and to die, those cells derived from the fixed tissues incline more to organization; the latter are, in fact, the source of the cicatrix which follows upon the cessation of suppuration (fig. 23. Pl. II. and figs. 31 and 32. Pl. III.). Organization and healing have been keenly inquired into, with results which seem to point the lesson that all methods of healing are to be regarded as extensions of the natural phenomena of growth. Normal cytology, of late, has become a science of itself, and has had a direct bearing upon which is pathological.

At the present time there is advance of knowledge of diseases of the nervous system as during the last thirty years of the 19th century. The localization of function in the cerebral and in the cerebellar cortex has doubtless been the main cause of this progress, and has proceeded pari passu with an extended insight into the structure and connexions of the parts concerned. The pathology of aphasia, as worked out by a combination of the experimental, the pathological and the anatomical lines of inquiry is a favourable example of what has been accomplished. The origin, nature, and propagation of neoplasms of all kinds, especially of those which are malignant, are engaging much attention. Much light has been thrown upon the functions and diseases of the blood-forming tissues. The origin of the corpuscles, previously a matter of so much difference of opinion, is now pretty fairly set at rest, and has proved the key to the interpretation of the pathology of many diseases of the blood, such as the different forms of anemia, of leucocytæmia, &c.

It is largely to researches on the bone marrow that we owe our present knowledge of the origin and the classification of the different cellular elements of the blood, both erythrocytes or red corpuscles, and the "cytes" of leucocytes or white corpuscles. Whatever be the ancestral cell from which these cells spring, it is in the bone marrow that we find a differentiation into the various marrow cells from which are developed the mature corpuscles that pass from the marrow into the blood circulation. The healthy bone marrow reacts with remarkable rapidity to the demand for more blood cells which may be required by the organism; its reactions and variations in disease are very striking. If the demand be for the red cells owing to loss from haemorrhage or any of the anaemias, the fatty marrow is rapidly replaced by cellular elements; this is mainly an active proliferation of the nucleated red cells, and gives rise to the erythroblastic type of marrow. If the white cells be required, as in local suppurating abscess, general sepsis, pneumonia, &c., the bone marrow will form myelocytes to form the polymorpho-nuclear leucocytes, so that we have in this condition a leucoblastic transformation of the fatty marrow.

The cytology of bone marrow, with the technique of blood-examination, is of great assistance in the diagnosis of different pathological conditions. The deleterious influence of high blood-pressure is well exemplified by the use of the pathologists in later years, and the conclusion arrived at is, that although it may arise from accidental causes, such as malcomposition of the blood, yet that in many instances it is a hereditary or family defect, and that it is connected with the general constitutional state of the kidney. The pathology of intra-cardiac and vascular murmurs has also been inquired into experimentally, the general impression being that these abnormal sounds result in most cases at least, from the production of a sonorous liquid vein. Pathology of the croupous type has been proved to be, as a rule, a germ disease, the nature of the germ varying according to circumstances. The destruction occurring in the bronchi in catarhal bronchitis have been ascertained, and, as in the case of pneumonia, have been shown to be frequently excited by the presence of a microphage. The vexed question of the diagnosis of diphtheria is now a thing of the past. Quite irrespective of the nature of the anatomical lesion, the finding of the diphtheria bacillus on the part affected and the inodibility of this upon a suitable fresh soil are the sole means by which the diagnosis can be made certain.

The tubercle bacilli have been revealed as a member of the general economy of the organism has also received much attention. The gland evidently excretes, or at any rate gets rid of, a certain waste product of a proteid nature, which otherwise tends to accumulate in the body, and to excite inflammation. The waste products in the disease known as "myxoedema," and the above product gathers in the tissues, in that disease, to such an extent as to give rise to what has been termed a "loss of substance" questionableness if the substance in question is mucoid. The pituitary body probably subserves a like purpose. When the pancreas is excited in an animal, or when it is destroyed in man by disease, grape-sugar appears in the urine. The gland is supposed to secrete a ferment, which, being absorbed into the portal circulation, breaks up a certain portion at least of the grape-sugar contained in the portal blood, and so prevents this overflowing into the circulation as the diabetics do. The function of the pancreas is to destroy the tissues of an animal, thus rendered artificially diabetic, is said to restore it to health.

Pathological chemistry has been remarkable chiefly for the knowledge we have obtained of the nature of bacterial poisons. Certain of these are alkaloids, others appear to be allumoxes. The publication of Ehrlich's chemical, or rather physical, theory of the poisons thrown much light upon this very intricate and obscure subject.

Pathology is the science of disease in all its manifestations, whether structural or functional, progressive or regressive. In times past it has been the habit to look upon its sphere of connexion with human medicine more particularly; as something tagged on to the treatment of human disease, but unworthy of being studied for its own sake as a branch of knowledge. Such a view can recommend itself to only the narrowest of minds. A bearing, and of course an essential bearing on the study of medicine, it must always have. A system of medicine reared upon anything but a pathological basis would be unworthy of consideration. Yet it may well be asked whether the functional and the pathological relations of each organ or group of organs should be the end of all departments of biological study, must be the biological unit, and it is to the alterations to which this is subject, under varying conditions of nutrition and stimulation, that the science of pathology must apply itself. Man can never be the only object of appeal in this inquiry. The human organism is far too complex to enable us to understand the true significance of diseased processes. Our range must embrace a much wider area—must comprise, in fact, all living matter, if we are ever to arrive at a scientific conception of what disease really means. Hence not only must the study of our subject include the diseases peculiar to man and the higher animals, but, those of the lowest forms of animal life, and of plant life, must be held equally worthy of attention. Modern research seems to show that living protoplasm, wherever it exists, is subject to certain laws and manifests itself by certain phenomena, and that there is no hard and fast line between what prevails in the two
kings. So it is with the diseased conditions to which it is a
prey: there is a wonderful community of design, if the term may
be used in such a case, between the diseases of animals and
plants which becomes singularly striking and instructive the
more they are inquired into. Utilitarian, or perhaps rather
practical, considerations have very little to do with the subject
from a scientific point of view—no more so than the science of
chemistry has to do with the art of the manufacturing chemist.
The practical bearings of a science, it will be granted, are simply,
as it were, the summation of its facts, with the legitimate con-
clusions from them, the natural application of the data ascer-
tained, and have not necessarily any direct relationship to its
pursuit. It is when studied on these lines that pathology finds
its proper place as a department of biology. Disease as an entity
—as something to which all living matter is subject—is what the
pathologist has to recognize and to investigate, and the practical
application of the knowledge thus acquired follows as a natural
consequence.

Since pathology is the science of disease, we are met at the
very threshold by the question: What is disease? This may
best be answered by defining what we understand by
health. What do we mean when we talk of a healthy
organism? Our ideas upon the subject are purely
arbitrary, and depend upon our everyday experience. Health is
simply that condition of structure and function which, on examina-
tion of a sufficient number of examples, we find to be commonest.
The term, in fact, has the same significance as "the normal." Disease we may define, accordingly, as any departure from the
normal standard of structure or function of a tissue or organ. If,
for instance, we find that instead of the natural number of
Malpighian bodies in the kidney there are only half that number,
then we are entitled to say that this defect represents disease of
structure; and if we find that the organ is excreting a new
substance, such as albumen, we can affirm logically that its
function is abnormal. Once grant the above definition of
disease, and even the most trivial aberrations from the normal
must be regarded as diseased conditions, quite irrespective of
whether, when structural, they interfere with the function of the
part or not. Thus an abortive supernumerary finger may not
cause much, if any, inconvenience to the possessor, but nevertheless it must be regarded as a type of disease, which, trivial as it
may appear, has a profound meaning in phylogeny and ontogeny.

Classification.—From the foregoing it will be gathered that
the problems in pathology are many-sided and require to be
attacked from all points of vantage; and the subject falls
naturally into certain great divisions, the chief of which are the
following:—

I. Morbid anatomy.
(a) Naked-eye or macroscopic.
(b) Morbid histology or microscopic.
II. Pathological physiology.
III. Pathogenesis.
IV. Aetiology.
V. Pathological chemistry.

The term "pathogenesis" has reference to the generation and
development of disease, and that of "aetiology" in its present
bearing, has to do with its causes. The use of the term "patho-
logical physiology" may at first appear strange, for if we define
physiology as the sum of the normal functions of the body or
organism, it may be hard to see how there can be a physiology
which is pathological. The difficulty, however, is more apparent
than real, and in this sense, that if we start with a diseased organ
as our subject of inquiry, we can quite properly, and without
committing a solecism, treat of the functions of that organ in terms
of its diseased state.

Influences Working for Evil upon the Organism
(a) Malnutrition.—When the blood supply is entirely cut off
from a tissue the tissue dies, and in the act of dying, or after-
wards, it suffers an inflammatory change. The end-results,
however, are usually more or less of the putrefactive kind.
Those parts of the body which are least vascularized are the
last to show signs of disintegration. The oil separates from the fat-cells and is found lying free, while the sublphured hydrogen evolved as one of the
products of putrefaction reaction upon the iron of the blood and
throws down a precipitate of sulphide of iron, which in course
of time imparts to the limb a range of colour commencing in
green and terminating in black.

The temperature at which the limb is kept, no doubt, favours
and hastens the natural process of destruction, so that putre-
facative fermentation goes on sooner than would be the case with a dead
tissue removed from the body and kept at a lower temperature.
Nevertheless, gangrene is nothing more or less than the putre-
facative fermentation of an animal tissue still attached to the body.

If the amount of liquid contained in the tissue be small in quantity
the part mummies, giving rise to what is known as "dry
gangrene." If the dead part be protected from the ingress of
putrefactive organisms, however, it separates from that which is
living without the ordinary evidences of gangrene, and is then
known as an "aseptic slough." Should the portion of tissue
deprieved of its circulation be contained in an internal organ, as is
so often the case where the obstruction in the artery is due to
collateral circulation, it becomes converted into what is known as an
"infarction." These infarcts are most common in organs
provided with a terminal circulation, such as prevail in the
kidney and spleen. The terminal branches of the arteries
supplying these organs are usually described as not anastomosing
but many, if not all, of Cohnheim's end-arteries have minute
collateral channels; which, however, are usually insufficient to
completely compensate for the blocking that may occur in these
arteries, therefore, when one of them is obstructed, the area
irrigated by it dies from malnutrition. Being protected from
the ravages of the organisms which induce putrefaction, however,
it does not become gangrenous; it is only where the obstructing
agent has allowed these organisms to a gangrenous slough
follows, or, in the case of the contamination of an organ by tra-
umatic variation, ends in the formation of a so-called "pyaemic
abscess," followed by rapid dissolution of the dead tissue (fig.
24, Pl. II.). In ordinary circumstances, where the artery is
obstructed by an agent free from such organismal contamination,
the part becomes first red. This is due to intense engorgement of
the vessels brought about through these minute existing
collateral channels and results in a peripheral congested zone
round the infarct. There may be haemorrhage from these
vessels into the tissues. This collateral supply not being suffi-
cient to keep up the proper flow of blood through the part the
veins tend to become thrombosed, thus increasing the engorge-
ment. The central part of the obstructed area very soon under-
goes degenerative changes, and rapidly becomes decolorized.
This necrosed area forms the pale infarct. Absorption of this
infarcted zone is carried on by means of leukocytes and other
phagocytic cells, and by new blood-vessels. If absorption be not
complete the mass undergoes caseation and becomes surrounded
by a capsule of fibrous tissue—being sharply cut off from the
healthy tissue.

Where the malnutrition is the effect of poorness in the quality
of the blood, the results are of course more widespread.
The muscles suffer at an early period: they fall off in bulk, and later
suffer from fatty degeneration, the heart being probably the first
muscle to give way. Indeed, all tissues when under-nourished,
either locally as the result of an ischaemia, or generally as from some impairment of the blood, such as that prevailing in pneumococcus septicemia, tend to suffer from fatty degeneration; and at first sight it seems somewhat remarkable that under-nourished tissues should develop fat in their substance (figs. 26 and 27, Pl. II.).

The fatty matter, however, it must be borne in mind, is the expression of dissimilation of the actual substance of the proteids of the tissue, and not of the dissimilation of proteids or other carboninous nourishment supplied to them.

A part deprived of its natural nerve-supply sooner or later suffers from the effects of malnutrition. When the trigeminal nerve is divided (Maydencz), or when its root is compressed injuriously, say by a tuberculoum tumour, the cornea begins to show processes of atrophy. In this instance the eyeball may become an immense, total disintegration of the eyeball. The earliest interpretation put upon this experiment was that the trophic influence of the nerve having been withdrawn, the tissue failed to nourish itself, and that degeneration ensued as a result. The subsequent experiments of Snellen, Senflteben, and, more lately, of Turner, seem to show that, if the eyeball be protected from the impingement of foreign particles, an accident to which it is liable owing to its state of anæsthesia, the ulceration may be warded off indefinitely. If the eyeball be kept perfectly clean and no organism be admitted from the outside then ulceration will not follow. If, on the other hand, any pathogenic organisms be present the results are disastrous, because the tissue, deprived of its nervous trophic supply, has greatly lessened resistance. The bed-sores which follow paralysis of the limbs are often quoted as proof of the direct trophic action of the nerves in the nutrition of the skin, and there these results are somewhat contradictory. Still, there are facts which, for want of a better explanation, we are almost bound to conclude are to be accounted for on the direct nerve-control theory. The common variety of bed-sore is the result of the pressure of the weight of the body upon the parts, and the irritation of the skin, the vitality and resistence of which are lowered by a lesion of the cord cut off the trophic supply to the region. The natural phenomenon is, in some cases, a true trophic lesion occurring, as it may, on parts not subjected to continuous pressure or irritation. Trophic disturbance in the nutrition of the skin may be so great that a slight degree of external pressure or irritation is sufficient to excite even a dangerous inflammation. Again, a fractured bone in a paralysed limb often fails to unite, while another in the opposite sound limb unites readily, and an ulcerated surface on a paralysed limb shows little healing reaction. A salivary gland degenerates when its nerve-supply is cut off; and the nerves leading up to the symmetrical sloughs in Raynaud's disease have been found in an advanced state of degeneration (Alfleck and Wigglesworth). It is just a question, however, whether, even in instances such as these, the nutritional failure may not be explained upon the assumption of withdrawal of the local vasomotor control. There seems to be little doubt, notwithstanding, that one and another of the above-listed results are at least due to the destruction of a trophic influence along its axon. When a nerve-trunk is separated from its central connexion, the distal portion falls into a state of fatty degeneration (Wallerian or secondary degeneration). This degeneration, however, is not a gradual process, but the nerve, as it is, seems to be a myth. It is much more likely, as Verworn alleges, that the nerves which influence the characteristic function of any tissue regulate the interchange of fluids in the tissues, and that any influence of the sympathetic, the parasympathetic, or other nerves on the every nerve serves as a trophic nerve for the tissues it supplies. It is a significant fact that neoplasms contain very few nerve-fibres, even although growing luxuriantly, and there is a doubt whether the few twigs contained in them may not merely have been dragged into their midst as the tumour mass expanded (Young).

Overwork.—The effect of overwork upon an organ or tissue varies in accordance with (a) the particular organ or tissue concerned, (b) the amount of nourishment conveyed to it, and (c) the power of assimilation possessed by its cells. In the case of muscle, if the available nourishment be sufficient, and if the power of assimilation of the muscle cells remain unimpaired, its bulk increases, that is to say, it becomes hypertrophied. It would be advisable to define exactly what is meant by "hypertrophy," as the term is often used in a loose and insignificant sense. More enlargement of an organ does not imply that it is in a state of hypertrophy, for some of the largest organs met with in morbid anatomy are in a condition of extreme atrophy. Some organs are subject to enlargement from deposition within them of a foreign substance (amyloid, fat, &c.). This, it need hardly be said, has nothing to do with hypertrophy. The term hypertrophy is used when the individual tissue elements become bigger to meet the demands of greater functional activity; hyperplasia, if there is an increase in the number of these elements; and pseudo-hypertrophy, when the specific tissue element is largely replaced by another tissue.

There are conditions in which we have an abnormal increase in the tissue elements but which strictly should not be defined as hypertrophies, such as new-growths, abnormal enlargements of bones and organs due to syphils, tuberculosis, osteitis deformans, acromegaly, myxoedema, &c. The enormously long tendons of the arm, sometimes found in children, are true hypertrophies, as they are normally endowed with rapid growth to compensate for the constant and rapid attrition which takes place from the opposed teeth. Should one of these teeth be destroyed the opposed one loses its natural means of attrition and becomes a remarkable, curved tusk-like elongation. The nails of the fingers, or the hair of the scalp may grow to an enormous length if not trimmed.

True hypertrophy is commonly found in the hollow muscular organs such as the heart, bladder and alimentary canal. As any obstruction to the outflow of the contents throws an increased amount of work on the walls, in order to overcome the resistance, the intermittent strain, acting on the muscle cells, stimulates them to enlarge and proliferate, fig. 28, Pl. II., and gives rise to adaptive hypertrophy. Should there be much loss of tissue of an organ, the cells of the remaining part will enlarge and undergo an active proliferation (hyperplasia) so that it may be made up to the original amount. Or again, in the case of paired organs, if one be removed by operation, or destroyed by disease, the other at once undertakes to carry on the functions of both. To do so a general enlargement takes place until it may reach the size and weight equal to the original pair. This is known as compensatory hypertrophy.

Examples of physiological hypertrophy are found in the ovaries, uterus and mammary glands, where there is an increased functional activity required at the period of gestation. Local hypertrophy may also be due to stimulation resulting from friction or intermittent pressure, as one may see in the thickenings on the skin of the artisan's hands. The extreme development of the muscles in the weight-lifting athlete and in the arm of the blacksmith is the result of increased functional activity with a corresponding increase in the vascular supply; this exercise may produce an over-development so excessive as to be classed as abnormal.

In atrophy we have a series of retrograde processes in organs and tissues, which are usually characterized by a progressive diminution in size which may even end in their complete disappearance (fig. 29, Pl. II.). This wasting may be general or local—continuously from the embryonic period there is this natural process of displacement and decay of tissues going on in the growing organism. The functions of the thymus gland begin to cease after the second year from birth. The gland then slowly shrinks and undergoes absorption. From atrophy of their roots, caused by the pressure of the growing permanent teeth, the " milk teeth " in children become loose and are cast off. The ovaries show atrophic changes after the menopause. In old age there is a natural wearing out of the elements of the various tissues. Their physiological activities gradually fail owing to the constructive processes having become so exhausted from long use that the destructive ones are able to overtake them. As the cell fails and shrinks, so does it become more and more unable to make good the waste due to metabolism. This physiological wasting is termed senile atrophy.

General atrophy or emaciation is brought about by the tissues being entirely or partially deprived of nutriment, as in starvation, or in malignant, tuberculous, and other wasting diseases; by the alimentary system which interfere with the proper ingestion, digestion or absorption of food material. The toxic actions produced in continued fevers, in certain chronic diseases, and by intestinal parasites largely aid in producing degeneration, emaciation and atrophy.

Atrophy may follow primary arrest of function—disuse atrophy. The loss of an eye will be followed by atrophy of the optic nerve; the tissues in a stump of an amputated limb show atrophic changes; a paralysed limb from long disuse shows much wasting; and one finds at great depths of the sea fishes and marine animals, which have almost completely lost the organs
of sight, having been cut off for long ages from the stimuli (light) essential for these organs, and so brought into an atrophic condition from disuse.

Atrophy may also follow from overwork. Increased work thrown on to a tissue may produce hypertrophy, but, if this excessive function be kept up, atrophy will follow; even the blacksmith's arm breaks down owing to the hypertrophic muscle fibres becoming markedly atrophied.

From these causes a certain shrinkage is liable to occur, more evident in some parts of the body than in others. Thus the brain falls off in bulk, and the muscles become attenuated, and in no muscle is this more notable than in the case of the heart. A tendency to pigmentation also develops in certain tissues of the body, such as the nerve and muscle cells. As a result of these various degenerations the functions of the body deteriorate, the faculties become blunted, and the muscular energy of the body is below what it was in earlier life, while the secreting glands in certain instances become functionally obsolete.

Continuous Over-pressure.—The tissues of an animal or plant are all under a certain pressure, caused, in the one case, by the expansive action of the heart and the restraint of the skin and other elastic tissues, and, in the other case, by the force of the rising sap and the restraint of the periderm or bark. Under this normal amount of pressure they can live and grow. But whenever, from any cause, the degree of pressure which they are naturally intended to withstand is surpassed, they fail to nourish themselves, become granular, die, and, falling to pieces, are absorbed.

Detleterious Surroundings.—There can be little doubt that all unnatural and artificial modes of life tend to deterioration of the patient residing on them, the one or another of the conditions exemplified in plant life in circumstances which are unnatural to the life of the plant, and the prevalence of certain constitutional tendencies among the inhabitants of crowded cities bears evidence to the same law.

Man, like other animals, was naturally intended to lead an outdoor life. He was originally a hunter and a tiller of the ground, breathing a pure atmosphere, living on a frugal diet, and exercising the muscles in every action. His powers of resistance to disease are lessened, and certain tendencies begin to show themselves, which are generally termed constitutional. Thus the liability to tubercular infection is far commoner in the midst of a depraved population than in one fulfilling the primary laws of nature; rickets is a disease of great cities rather than of rural districts; and syphilis is more disastrous and protracted in its course in the deprived in health than in the robust. Cattle kept in close stalls are in a large proportion of cases tuberculous, whereas those leading an outdoor life are much less liable to infection. The improvement which has taken place in the general health of the population over the last forty to fifty years with the decrease of contagious and epidemic diseases is a triumph of hygiene legislation, is ample proof of the above assertions. The diminution in the number of deaths from tuberculosis during the last forty to fifty years of the 19th century of itself points in this direction. The statistics of the organisation of animal and vegetable, tends to the maintenance of a normal state of health; it is when the natural laws of health are violated that the liability to disease begins to assert itself. If, in these circumstances, the food supply be also insufficient, the combination of influences is sure, in course of time, to bring about a physical deterioration of the race. Certain avocations have a direct and immediate influence in causing diseased states of body. Thus workers in lead suffer from the effects of this substance as a poison, those who work in phosphorous are liable to necrosis of bone and fatty degeneration of the blood vessels and organs, and the many occupations in which dust is inhaled (coal-mining, sandblasting), are deleterious to health, and render any attempt to maintain a normal state of health almost impossible. It is when the natural laws of health are violated that the liability to disease begins to assert itself.

In, these circumstances, the food supply be also insufficient, the combination of influences is sure, in course of time, to bring about a physical deterioration of the race. Certain avocations have a direct and immediate influence in causing diseased states of body. Thus workers in lead suffer from the effects of this substance as a poison, those who work in phosphorous are liable to necrosis of bone and fatty degeneration of the blood vessels and organs, and the many occupations in which dust is inhaled (coal-mining, sandblasting), are deleterious to health, and render any attempt to maintain a normal state of health almost impossible. It is when the natural laws of health are violated that the liability to disease begins to assert itself. If, in these circumstances, the food supply be also insufficient, the combination of influences is sure, in course of time, to bring about a physical deterioration of the race. Certain avocations have a direct and immediate influence in causing diseased states of body. Thus workers in lead suffer from the effects of this substance as a poison, those who work in phosphorous are liable to necrosis of bone and fatty degeneration of the blood vessels and organs, and the many occupations in which dust is inhaled (coal-mining, sandblasting), are deleterious to health, and render any attempt to maintain a normal state of health almost impossible. It is when the natural laws of health are violated that the liability to disease begins to assert itself.

Parasitism.—Of all external agents acting for evil, however, probably vegetable and animal micro-organisms with a pathogenic bent are most to be feared. When we consider that tuberculosis, diphtheria, cholera, tetanus, typhoid fever, anthrax, malaria and a host of other contagious diseases have each been proved to be of parasitical origin, an idea may be conveyed of the range of the subject. The living organism may be regarded as constantly engaged in warfare with these silent and apparently insignificant messengers of destruction and death, with the result that too often the battle ends in favour of the attacking enemy.

Hereditary.—The tendencies to disease are in great part hereditary. They probably express a variation which may have occurred in a far-back ancestor, or in one more recent, and render the individual vulnerable to the attacks of parasitic fungi, or, it may be, become manifest as errors of metabolism. The psychopathic, the tubercular, the ricketty, and the gouty constitution may all be transmitted through a line of descendants, and only require the necessary exciting agents to render them apparent. A distinction must be drawn between the above and diseases, like syphilis and small-pox, in which the contagion of, not the tendency to, the disease is transmitted directly to the foetus in utero. (See Heredity.)

The Cellular Doctrine in Pathology

The cellular pathology is the pathology of to-day; indeed, protoplasm—its vital characteristics under abnormal influences and its decay—will be regarded most likely as the basis of pathology in all time. According to our present knowledge of physiological and pathological chemistry, the cell is the ultimate biological unit—a unit of structure and a unit of function; this was first put forward by Schleiden in 1838, and by Schwann in 1839, but we owe to Virchow the full recognition of the fundamental importance of the living cell in all the processes of life, whether in health or disease. When Virchow wrote, in 1850, "every animal presents itself as a sum of vital units, each of which manifests all the characteristics of life," he expressed a doctrine whose sway since then has practically been unimpeached. The somatic cells represent communities or republics, as it were, which we name organs and tissues, but each cell possesses a certain autonomy and independence of action, and exhibits phenomena which are indicative of vitality.

Still, it must be borne in mind that this alleged autonomy of action is said to be founded upon an erroneous supposition, on the supposition that each cell is structurally, and it may be said functionally, separated from those in its neighbourhood. It is well known that in the vegetable kingdom the protoplasm of one cell frequently overflows into that of cells adjacent—and that there is, as it were, a continuous network of protoplasm (idioplasm of Nägeli) prevailing throughout vegetable tissues, rather than an aggregation of isolated units. The same inter-communication and dependence of adjacent cells is manifest in some animal tissues, and more particularly in those which are pathological, as in the case of the epithelial cells of cancer. Assuming, with Sedgwick and others, this amassened and bound condition of the tissues to be true, it would be necessary to reject the cell-doctrine in pathology altogether, and to regard the living basis of the organism as a continuous substance whose parts are incapable of living independently of the whole. Until, however, further evidence is forthcoming in support of this syncytial theory of structure, it would be unwise to regard it as established sufficiently to constitute a serviceable working hypothesis; hence, for the time being, we accept the assertion that the cell represents the ultimate tissue-unit. Our present day definition of a cell is a minute portion of living organized substance or protoplasm.

The cells met with in morbid parts which are in a state of active vitality are built up of the same components as those found in normal tissues (Pl. I.). Thus they are provided with a nucleus which is the centre of cell activity; both of the reproductive and chemical (metabolic) processes which occur in the cell protoplasm. The executive centre

PATHOLOGY

varies in shape, but is usually round or oval, and is sharply defined by a nuclear membrane from the cytoplasm in which it lies. The nuclear membrane is made up of reticulin, or networks of threads containing in the meshes the so-called nuclear-sap; attached to the network are the chromosomes, in the form of small irregular masses, which have a strong affinity for the basic dyes. Embedded in the nuclear sap are other masses (plasmosomes) having a strong affinity for the "acid dyes." The nucleus shows an unstable point at the centre known as the endonucleolus or nucleolus (Auerbach). The cell body, or cytoplasm, is apparently composed of a fine reticulum or network, containing within the meshes a soft viscid, transparent substance, the cell-sap, or hyaloplasm, which is probably a network of the living cell. Within the cytoplasm are found manifestations of functional activity, in the form of digestive vacuoles, granules, fat, glycogen, pigment, and foreign bodies. Usually the cytoplasm shows a marked affinity for the acid stains, but the difference found in the cell may show great variation in their staining reactions.

The centromeres which play so important a part in cell division may be found either lying within or at one side of the nucleus in the vegetative condition of the cell. Centromeres may be single, but usually two are lying close together in the attraction-square. When mitosis is about to take place, they separate from one another and pass to the poles of the nucleus, forming the achromatic spindle. After the division and cleavage of the chromosomes of the original nucleus have taken place they pass from the equator to the poles of the spindle, rearranging themselves close to the separated centromeres of each nucleus. The cytoplasm of the cell now undergoes division in a line between the two daughter nuclei. When complete separation has taken place, we have two daughter cells formed from the original, each being a portion of the original karyokinetic unit. Usually a number of tumours, of bone, and those of tubercle, are polynucleated; in some instances they may contain as many as thirty or more nuclei. The only evidence we have in pathology of living structures in which apparently one has one nucleus, and nucleus does not exist, is in the case of bacteria, but then there comes the question whether they may not possess chromatin distributed through their substance, in the form of microscopic points, as is the case in some infusoria (Trachelocerca, Gruber). Although the methods of cell-division prevailing in normal structures are maintained generally in those which are pathological, yet a comparison of the pathological cells, such as the giant-cells, with the original nuclei of the tubercle bacilli and those of tubercle by Baumgarten, shows that the nuclei within multinucleated cells may occasionally be engaged in mitotic division, the others being in the resting state.

In the earlier accepted notion of direct segmentation, usually known as the schema of Remak, division was described as commencing in the nucleus, as thereafter spreading to the nucleus, and as ultimately displacing the cell-substance. But, curiously, finds confirmatory evidence of this in the division of cells in sarcoma. Contrary, however, to the experience of others, he has never found that the attraction-spheres play an important part in the cell-division, and he has never been able to determine the law of attraction. The facts present within the cells (sarcoma), the attraction-spheres were represented by quite clear unpigmented areas, sometimes with a centromere in their midst.

REPAIR OF INJURIES

In the process of inflammation we have a series of reactions on the part of the tissues, and fluids of the body, to counteract the ill effects of irritation or injury, to get rid of the cause, and to repair its results. Injury and loss of tissue are usually followed by repair, and both the destructive and reparative changes are, as a rule, classified under the term inflammation. The irritants may be bacteria and their toxins, or they may be nother substances. The latter are usually chemical irritants.

We do not now concur with the old view that inflammation was essentially an injurious process; rather do we look upon it as beneficial to the organism. In the various reactions of the tissues against the exciting cause of the injury we see a striking example of a beautifully organized plan of attack and defence on the part of the organism.

In some of the infective conditions the conflict fortifies the organism against future attacks of the same nature, as for example in the immunity following many of the acute infectious diseases. This acquired immunity is brought about by the development of specific antibodies and the result of the struggle of the cells and fluids of the body with the invading bacteria and their toxins. This resistance may be more or less permanent. If the invasion is due to a pus-producing micro-organism which settles in some local part of the body, the result is an abscess (fig. 25, pi. II).

Abscesses.—One can easily demonstrate all the actions and reactions which take place in this form of acute inflammation. In such a conflict one can see the presence of these minute but dangerous foes which have hitherto been able to proceed to make good their hold on the position they have secured by secreting and throwing out toxins which cause more or less injury to the tissues in their immediate neighbourhood. These micro-organisms having found in the tissues everything favourable for their needs, rapidly multiply and very soon produce serious results. At this point one's attention is focused on the wonderful reactions possessed by the healthy tissues to combat the evil influences.

In a very short period within three or four hours after infection—there appears to have been a message conveyed to the defenders of the body both as to the point of attack and the nature of the invasion. This message has thus brought into play a series of processes on the part of the tissues—the vascular inflammatory changes—which is really the first move to neutralize the malaria effects. We find at this early stage oedema of the part. This is an increased exudation of fluid into the interstices, which engorged blood vessels which not only dilates the capillaries, but is supposed to contain substances which in some way act on these living micro-organisms and render them a more easy prey to the polymorpho-nuclear leucocytes (fig. 25, pi. II)—cells that are motile and extremely phagocytic to these bacteria. At this stage the

raptidity of the blood circulation has become greatly diminished. The polymorphonuclear leucocytes are seen in great numbers in the blood vessels. In local areas these cells, belonging to our first army of defenders, are found continually circulating in the blood stream in fairly large numbers; they are ever ready to rush to the point of attack, where they at once leave the blood stream and become white blood corpuscles in the tissues. The red blood corpuscles, however, have to steady the blood stream, and the white corpuscles rush to the point of danger. There they show marked phagocytosis, attacking and taking up into their interior and destroying the micro-organisms in large numbers. At the same time the leucocytes, as a rule, are more numerous than the platelets, but even the death of these cells is of value to the body, as in the process of breaking down there are set free ferments which not only act detrimentally to the bacteria, but also may stimulate the bringing into action of another form of cell defenders—the mononuclear leucocyte.

To replace this cellular destruction there has been a demand for reinforcements on the home centres of the polymorphonuclear leucocytes. The process is strictly limited by an active proliferation and steady maturing of the myelocytes in the marrow to form the polymorphonuclear leucocytes. These then pass into the blood stream in very large numbers, and appear to be specially attracted to the point of injury by a positive chemiotactic action. This phenomenon, called chemiotaxis, has been studied by several investigators. Leber experimented with several numbers of cells. These are mononuclear and are extremely phagocytic; by using fine glass tubes sealed at the outer end and containing a chemical substance, and by introducing the open end into the blood vessels he found that the leucocytes were attracted—positive chemiotaxis. Leber found the substance to be turpentine, other substances. That quinine, chloroform, glycogen, alcohol, with others, had no attractive influence on them—negative chemiotaxis. It was also found that a weak solution may attract the cells, whereas a strong solution has an opposite effect of the same substance will have the opposite effect. It has been proved that the pyo-genic bacterial toxins, if not too concentrated, will also bring the polymorphonuclear leucocytes, but if concentrated, may have a repelling influence.

Then we have the property of adaptation, in which the negative reaction may be changed into a positive; a given toxin may at first repel the leucocytes, but by gradual process the cell becomes accustomed to such a toxin and will move towards it.

On reaching the vicinity they leave the blood stream and join in the warfare, many performing their function of phagocytosis (g.e.), other leucocytes by ingesting the cells of the organism, disorganized or destroyed, and their place is taken by the mass of warring cellular elements now recognized as pus. As soon as the fluids and the polymorphonuclear leucocytes have succeeded by the action of their digestive enzymes, the second army of defenders—the large mononuclear leucocytes (fig. 23, pl. III.) make their appearance at the field of battle in ever increasing numbers. These cells are known as cells of the same type, their power of digestion being greatly developed. Their principal function is to bring about the removal of foreign, dead or degenerating material. This they take up into their protoplasm, where it is digested by the action of the digestive enzyme called lysozyme or ferment (fig. 31, pl. III.) Where the material is too large to be taken up by an individual cell, the dissolution is brought about by the cells surrounding the material, to which they closely apply themselves. This dissolution is the gradual process of digestion is brought about with ultimate absorption.

If the abscess be deeply situated in some tissue and not able to open on to a free surface so allowing the contents to drain off, the phagocytic cells play a very prominent part in the resolution of the abscess. They are seen pushing their way right into the field of conflict and greedily ingesting both friends and foes. The first defenders, the polymorphonuclear leucocytes, having performed their functions, are of no more use to the organism and are therefore removed by the mono-nuclear phagocytes as useless material (fig. 31, pl. III.).

The tissues having now mobilized an army that completely surrounds the fighting zone, there is a gradual and general advance made from all sides. The vanguard of this advancing army is composed of a more or less compact layer of the mono-nuclear phagocytes. This zone is supplied with a constant food supply from the food material that is necessary by the advancing army if it is successfully to carry on its function; they probably also drain off the deleterious liquid substances formed by the cellular disintegration that is going on. The leading edge of this army of phagocytes or scavenger cells forms the third line of defenders, the connective tissue cells or fibroblasts.

All these cells are probably of local origin and are now stimulated to activity. The chief battle is now being waged by the fibroblasts (fig. 32, pl. III.) They are seen in active proliferation around the phagocytic zone. These fibroblasts are often round or oval in shape; later they become spindle shaped, arranging themselves in layers, and develop definite fibres which differentiate into fibrous laminae forming a zone which shuts off the abscess from the healthy tissue and so prevents the further invasion and injurious effects of the micro-organism. By the aid of the new fibroblasts this fibrous tissue, formed by the rapid proliferation of the phagocytic layer of cells as they proceed with the absorption of the pus mass (fig. 33, pl. III.). When complete removal of the pus has been accomplished by the healthy tissue in the damaged area is replaced by the new fibrous tissue and the latter becomes condensed and forms the cicatricial or scar tissue (fig. 35, pl. III.)—a healed abscess. The healing of wounds is brought about by similar processes to that seen in the evolution of an abscess.

In the case of an incised wound the skin and subcutaneous tissues without any septic contamination, there usually remains a maximum of three months, by which time the edges of the wound are brought into apposition there is little or no blood lodged between them, so that an extremely narrow strip of fibrin glues the cut edges together. This strip is rapidly invaded by the fibroblasts and the new tissue is growing across the temporary filled breach and firmly uniting the two cut surfaces. The vascular changes are practically absent in healing by first intention.

Healing by second intention, or granulation, is usually seen where there has been loss of tissue, or extensive damage. The reactions of the tissues vary in degrees according to the nature and extent of the injury. The 'granulation tissue' which appears at the end of an injury is remarkable uniformity and regularity in the processes is brought about by the different cells and fluids of the healthy tissues of the body. Although we have not reached a stage of certainty regarding their origin, we can supply the evidence to elucidate the importance of the part played by the different cells in the various types of the inflammatory process.

If there be a loss of tissue brought about by severe injury the skin is invaded by a deepseated wounded edge of tissue of the blood from the severed vessels. Along with the exuded serum this fills up the breach in the tissues and the whole is rapidly formed into a cavity which is the prelude to the fibrous tissue forming a new membrane over the damaged leucocytes setting free their ferment. The ferment thus set free brings about the coagulation of the serum, which acts as a protective and temporary overshadowing the injured tissues. As between the fibrous membrane and the tissue of injured and degenerated tissue elements, the result of the trauma.

As early as six hours after the injury the polymorphonuclear leucocytes have been seen passing in large numbers from the dilated and congested blood vessels of the tissues at the margin of the wound into the injured zone, where they carry on an active phagocytosis. It is believed that these secrete bactericidal substances and ferments which bring about the liquefaction of the fibrin and the damaged tissues—histolysis—and thus assist the process of absorption. They appear to prepare the injured zone for the coming of the next set of cells. Their function being at an end they give way to these cells which carry on the process of absorption.

In a period varying from twenty-four to thirty hours there is marked evidence of the removal of the degenerated cellular material. The fibroblasts, together with polyblasts, are visible in the fibrin mass, and the vessels at the periphery of the damaged zone are now seen to be sending out ollتصف which assist in the process of absorption. These grow into a great number of small solid projections of cells; they then become channelled and form the new but temporary meshwork. After two to four days these processes are more clearly emphasized. By these processes we reach the stage where the fibrin mass and damaged tissues have been completely removed, and replaced by a temporary vascular and cellular tissue, known as granulation tissue (fig. 34, pl. III.), which in turn has to give way to the more firm and differentiated fibrous tissue. By this time the skin epithelium may have grown over the wound.

After five to seven days we find the connective tissue cells taking the place of the part of the skin removed for at this stage there is an active proliferation of the fibroblasts. These cells of various shapes are seen in large numbers, mainly lying in a direction perpendicular to the new surface of the wound. Numerous fibroblasts, together with polyblasts, are visible in the fibrin mass, and the vessels at the periphery of the damaged zone are now seen to be sending out ollتصف which assist in the process of absorption. The growth of the new meshwork is more and more assuming a position at right angles to the vessels (fig. 34, pl. III.); the two edges of the wound are thus more firmly bound together. As their fibrils become interwoven the wounds are laid down first in the deeper part of the wound. When this process has reached a certain stage and all the absorption necessary has occurred the new blood vessels, the investing primary and successive fibrous layers, gradually dwindle and become obliterated, i.e. at a period corresponding to
the condensation of the fibrous laminae and the disappearance of the cellular character of the granulation tissue. This is formed in the pit area a permanent tissue known as scar tissue (figs. 35, Pl. III.).

Fibrosar.—Where a chronic inflammatory process has taken possession of an organ, or, let us say, has been located in periostum or any other fibrous tissue, there is a great tendency to the production of cicatrical fibrous tissue in mass. Thus it is laid down in large quantity in cirrhosis of the liver, kidney or lung, and reacts upon these organs by contracting and inducing atrophy. The term "cirrhosis" is also applied to such deposits of fibrous tissue in organs (figs. 36 and 37, Pl. IV.), that is "sclerosis" is used when such a deposition of fibrous tissue occurs within the central nervous system. Gull and Sutton asserted that sclerotic tissue is formed in the hyalin of the arterial wall, usually of the tunica intima, and hence they termed the supposed diseased state "arterio-capillary fibrosis," and gave the fibrous substance the name "hyaline-fibroid." They held that the cicatricial kidney is simply a local manifestation of a general fibroser disease. Their theory, however, has fallen into disfavour of late years.

TUMOURS OR NEW GROWTHS

The various definitions of the term "new growth" leave us with a definite conception of it as a new formation of tissue, which approaches the older one in no way independently. We have already compared the body to a social community, each constituent element of which—the cell—lives its own life but subordinates its individuality to the good of the whole organism. The essential characteristic of a new growth is that this subordination is lost and the tissue elements, freed from the normal! mutual restraint of their interdependence, give way to an abnormal growth. All the hypotheses about the causation of new growths seek to explain the secret of this individuality or "autonomy," as they recognize that the mystery of the origin of the great majority of tumours would be solved if we could trace the history of the tissue elements in which they develop first towards this abnormal growth.

Tumours are divided into two main groups—innocent and malignant. These differ only in degree and there is no hard and fast line between them. Innocent tumours are usually sharply defined from the surrounding tissues, and show no tendency to spread into them or to pass by means of lymphatics and blood-vessels to neighbouring parts (fig. 38, Pl. IV.). Malignant tumours, on the other hand, invade the adjacent tissues and pass by lymphatics and blood vessels to distant parts, where they set up secondary growths (fig. 39, Pl. IV.).

New growths are sporadically, i.e. without evident cause; they may develop in association with prolonged irritation or injury (later referred to in more detail). To heredity, as an indirect or predisposing cause, has probably been assigned too great importance, and the many facts brought forward of the relative frequency of cancer in members of one family only justify the conclusion that the tissue-resistance of certain families is lowered.

At the present time we have still before us the question, what is the essential cause of tumours (g.v.)? This, one of the most difficult problems of pathology, is being attacked by many able workers, who are all striving from different standpoints to elucidate the nature of these new formations, which spring from the normal tissues in which they develop and which they destroy. In spite of all the valuable research work that has been done within the last few years, the essential cause of new growths still remains unknown.

To the work carried on by the Imperial Cancer Research Fund in England, and to investigators in other countries, are due the present day scientific efforts made to systematize investigation and clear away many of the hypothetical speculations that have gathered round this most difficult subject. Their investigations on cancers formed the framework of their work and have led to the important transplantations, and the culture of such growths into a new host of the same species (mice and rats), have greatly advanced our knowledge of the etiology of this disease.

Many of the hypotheses of the past put forward to explain cancer must be discarded, in view of the facts brought to light by the comparative and experimental research of recent times. According to some hypotheses cancer arises from a disturbance of equilibrium between the normal epithelium and its supporting structure, the connective tissue, but with advancing age this balance is upset owing to the connective tissue gradually losing its restraining power. The epithelial cells are then able to pass from their normal tissue and consequently to multiply and, at the same time, revert to a more primitive type of cell. In this way they give rise to a malignant new growth.

Cohnheim's hypothesis of "embryonic residues" provides that cells and the cells of one of the groups of cells, are separated from their organic continuity during the various foldings that take place in the actively growing embryo. The separated cells become intermingled with other tissue elements around them and finally grow and undergo some proliferation in abeyance. At a later date in the life of the individual, by some unknown stimuli, they resume their active power of proliferation and secondarily develop.

The "tissue-tension" hypothesis of Ribbert is a combination of the two foregoing. He holds that new growths arise, both before birth or at any subsequent period of life, by the separation of cells from their continuous matrix, and by the growth of these cells in the interstitial tissue, where there is a balance between the various tissues and tissue elements regulated by what he calls the "tissue-tension" of the part, i.e. that cells or groups of cells have a restraining power on one another which prevents any physiological activity.

From whatever cause the resisting power of the tissue elements is thus weakened, the invasion of other tissue elements is then allowed. This being the normal inhibiting power of the neighbouring elements, multiply and go on to the formation of a new growth. According to Ribbert it is the isolation, together with the latent capacity of isolated cells for unlimited proliferation that grows to the new growth.

Hansemann's "anaplasia" hypothesis seeks to find an explanation of the formation of new growths in the absence of the histological differentiation of the cell associated with a corresponding dissipation of its proliferative power and a suspension, or loss, of its functional activity.

The greater the degree of anaplasia the more the tumour cells conform to the character and structure of the tissue which they have replaced. The more abnormal the original tissue, the more malignant is the new growth. A simple fibroma is a growth composed of fully formed fibrous tissue (fig. 40, Pl. IV.). The small well rounded cells sarcoma is a malignant growth, and is composed of tissue-anaplastic type of cell that goes to form fibrous tissue (fig. 41, Pl. IV.).

Then we have Beard's "germ-cell" hypothesis, in which he holds that many of the germ-cells in the growing embryo fail to become part of the new tissue (in which they are distributed), and become quiescent in some somatic tissue of the embryo. They may at some later date become active in some way, and so give rise to a cellular proliferation, to create the structure in which they grow, so giving rise to new growths.

Some workers regard certain appearances in dividing cells found in cancer as evidence of a reversion of the somatic cell to the germ-cell type (heterotaxis), otherwise found only in the process which results in the formation of an embryo. These appearances are probably due to a pathological mitosis, commonly found in cancer, in which there is an irregular diminution in the number of chromo-somes which become exceedingly small in size, and pass over to one of the daughter cells, leaving a reduced number in the other, and thus give rise to asymmetrical mitosis.

From the histological examination of tumour cells there is now a tendency to show that the normal protozoal unicellular organisms in occasionally passing through a sexual process of reproduction, i.e. that nuclear conjugation between cells ever takes place.

In recent years the successful experimental transplantation of new growths, occurring sporadically in white mice and rats, into animals of the same species, has thrown a fresh light on all the features of malignant growths. From these experiments it is shown that new growths are transmitted to the offspring of the animals which carried them. Heterografts of the same species of animal; this substance, however, has not the power of transforming the normal tissue into a cancerous one.

Hensel, Bencke, Adami, Marchand and others have also put forward new hypotheses for the nature of certain growths. These observers maintain that the cells from some cause lose, or may never have had developed, their functional activity, and thus

acquire the activity of growth. The descendants of such cells will become more and more undifferentiated, thereby developing an increasing vegetative activity.

Oertel finds an explanation of this want of complete cell-differentiation, loss of function, and acquired vegetative activity in the absence of some characteristic elements of the cell, and maintains that the different properties of the cell are carried and handed down by the different orders of chromatin loops. We have analogies to this in the two nuclei of some of the protozoa. One nucleus, for example, is closely associated with the functional activities of the cell, the other being associated with the functional activities of the cell. Oertel thinks that in man we have these two different functions carried on by the one nucleus containing both chromatin orders. If, in this way, the chromosomes of the cell are lost the descendants of such a cell, being unable to restore these loops, will be minus the functional attributes associated with the lost elements. These, having the full equipment of the cell, will not develop the inherent power of proliferation to a greater or lesser extent.

The foregoing hypotheses have all sought the origin of new growths in some intrinsic cause which has altered the characters of the cell or cells which gave rise to them, but none of them explain the direct exciting cause. The parasitic hypothesis postulates the invasion of a parasite from without, thus making a new growth an infective process. Many cancer-parasites have been described in cancerous growths, including bacteria, yeasts and protozoa, but the innumerable attempts made to demonstrate the causal infective organism have all completely failed.

In the thyroid, it is noteworthy that in places where there has been chronic irritation; an example may be found in cancer of the tongue following on prolonged irritation from a jagged tooth. Clay-pipes may also give rise to cancer of lips in males in England, while cancer of the mouth is found both in the Orient in India where chewing a mixture of betel leaves, areca-nut, tobacco and slaked lime is the usual practice. In the case of the squamous epithelial cancer of the oral cavity of the natives of Kashmir, the position of the cancer is peculiar to this people, and is due to the chronic irritation following on repeated burns from using the kangri—a small earthenware vessel containing charcoal fire enclosed in basketwork and suspended round the waist, to assist in maintaining warmth in the extreme cold of the hills of Kashmir.

The irritant may be chemical, as is seen in the skin cancers that develop on the affected skin of an acantholytic dermatosis. In this connection it is noteworthy that the squamous epithelial cancer of nose, which has been the subject of much discussion, is found only in the nasal cavity and remains confined to it. The chronic irritation due to inhaled dust is a frequent cause of squamous epithelial cancer of the lungs. The irritant may be physical, by exposure to cold, heat or other injuring causes, which may cause changes in the tissue which may be followed by irritation, and lead to cancer. The irritant may be mechanical, by injury to the skin or other tissue, and the consequent irritation resulting from this injury. The irritant may be infective, by bacteria, fungi or protozoa, or by chemical irritants such as those of tobacco, tobacco smoke, or other irritating substances.

At the present time we are quite uncertain what is the ultimate cause of new growths; in all probability there may be one or more aetiological factors at play disturbing the perfect condition of equilibrium and co-ordination of the cells, or the stimulated active vegetative cellular elements, or the more fully differentiated tissue, to over-develop and form tumours, simple or malignant.

**Other Tissue Products.**

**Mucoid.** In many pathological conditions we have degenerative products of various kinds formed in the tissues. These substances may be formed in the cells and given out as a secretion, or they may be formed by an intercellular transformation. In the mucinoid conditions, usually termed “mucoid” and “colloid” degenerations, we have closely allied substances which, like the normal mucins of the body, belong to the glucoproteins, and have in common similar physical characters. There is neither any absolute difference nor a constancy in their chemical reactions, and there can be brought about a transition of the “colloid” material into the “mucoid,” or conversely. By mucoid is understood a soft gelatinous substance containing mucin, or pseudomucin, which is normally secreted by the epithelial cells of both the mucous membranes and glands. In certain pathological conditions an excessive formation and discharge of such material is usually associated with catarrhal changes in the epithelium. The desquamated cells containing this jelly-like substance become disorganized and blend with the secretion. Should this take place into a closed gland space it will give rise to cysts, which may attain a great size, as is seen in the ovarian adenomata. In some of the adenoid cancers of the alimentary tract this mucoid material is formed by the epithelial cells from which it flows out and infiltrates the surrounding tissues; both the cells and tissues appear to be transformed into this gelatinous substance, forming the so-called “colloid cancer” (fig. 42, Pl. IV.).

The connective tissue is supplied normally with a certain amount of mucoid material which is derived from the ground substance of that tissue, and any pathological conditions this tissue is commonly found to undergo mucoid or myxomatous degeneration, which is regarded as a reversion to a closely similar type—that of foetal connective tissue (fig. 43, Pl. IV.). This condition is found in enucleation, in metaphasia of cartilage, in many tumours, especially mixed growths of the parotid gland and testicle, and in various inflammatory granulation ulcers. In the wasting of the thyroid gland in myxoeid, the connective tissue of the gland is completely removed by operation, the myxomatous areas are found in the subcutaneous tissue of the skin, nerve-sheaths, &c.

**Colloid.**—This term is usually applied to a semi-solid substance of homogeneous and gelatinous consistence, which results partly from irritation and partly from degeneration of cellular structures, more particularly of the epithelial type. These cells become swollen by this translucent substance and are thrown off into the space where they become fused together, forming colloid masses. This substance differs from the mucus by being precipitated by tannic acid but not by acetic acid, and being endowed with a higher proportion of sulphur.

In the normal thyroid there is formed and stored up in the spaces this colloid material. The enlarged cystic goitres show, in the distended vesicles, an abnormal formation and retention of this substance (fig. 44, Pl. V.). Its character is readily known from the aspect of the glands which take place in these glands during some of the acute fevers; this semi-solid consistence may become mucoid or even fluid.

Serous degeneration is met with in epithelial cells in inflammatory conditions and following on burns. The vitality of these cells being altered there is imbibration and accumulation of watery fluid in the clefts of the cells and the glands which take place in these glands during some of the acute fevers; the semi-solid consistence may become mucoid or even fluid.

PATHOLOGY

which is produced by certain organic and inorganic poisons; it is seen especially in phosphorus and chloroform poisoning. The changes are also common in pernicious anaemia, advanced chlorosis, cachexias, and in the later stages of starvation. In diabetes mellitus, in which there is marked derangement in metabolism, extreme fatty changes are occasionally found in the liver. They likewise occur in the adipose tissue of very fat globules. This lipemic condition may cause emboilism, the plugging especially occurring in the lung capillaries.

Fatty degeneration is common to all dead or decaying tissues in the body, and may be followed by calcification.

Autoysis is a disintegration of dead tissues brought about by the action of their own enzymes, while degeneration takes place in the still living cell. The study of autolytic phenomena which closely simulates the changes seen in the degenerating cell has thrown much light on these degenerative processes.

These conditions may be purely physiological, e.g. in the mammary gland during lactation or in sebaceous glands, caused by increased functional activity. It may follow diminished functional activity, as in the atrophying thymus gland and in the muscle cells of the uterus after parturition.

Any of the abnormal conditions that bring about general or local defective nutrition is an important factor in producing fatty degeneration.

The part played by fats and closely allied compounds in normal and abnormal metabolism need not here be discussed, as the subject will come later in the volume. It will suffice to state briefly what appears to be the result of recent investigation.

The neutral fats are composed of fatty acids and glycerin. In the process of pathological process of intestinal digestion, the precursors of such fats are split up into these two radicles. The free fatty acid radicle then unites with an alkali, and becomes transformed into a soapsaponin which is then readily absorbed in this liquid condition by the epithelial cells of the mucous membrane. There it is acted on by fermentations (lipases) and converted into neutral fat, which may remain in the cell as such. By the reverse action on the part of the same enzymes in the cell, these neutral fats may be resynthesized and pass into the lacteals.

Many cells throughout the body contain this fat. The soluble soaps which are readily conveyed by the blood will be quickly taken up by such cells, synthesized into neutral fats, and stored in a non-diffusible form till required. The fat in this condition is readily recognized by the usual microchemical and staining reactions. As fat is a food element essential to the carrying out of the vital energies of the cell, a certain amount of fatty matter must be present, in a form, however, unrecognizable by our present microchemical and staining methods.

Some investigators hold that the soaps may become combined with albumin, and that on becoming incorporated with the cytoplasm they can no longer be distinguished as fat. If some cause the cell be damaged in such a way as to produce disintegration of the cell, the fat will be liberated and may be transformed into oedematiouc saline condition, so that the fat will be set free from the complex protein molecule in which it was combined as a soap-albumin, and will become demonstrable by the usual methods as small droplets of oil. This splitting up of the fats previously combined with albumin in the cell by the action of natural ferments—lipases—and the setting free of the fats under the influence of oxys represent the normal and pathological process in the production of so-called fatty degeneration.

Calcification.—Calcification and calcareous deposits are extremely common in many pathological conditions.

There are few of the connective tissues of the body which may not become affected with deposits of calcareous salts (fig. 47, Pl. V.). This condition is not so frequently seen in the more highly differentiated cells, but may follow necrosis of secreting cells, as is found in the kidney, in corrosive sublimate poisoning and in chronic nephritis. These conditions are quite distinct from the normal process of ossification as is seen in bone.

Many theories have been advanced to explain these processes, and recently the subject has received considerable attention. The old idea of the circulating blood being supersaturated with lime salts which in some way had first become liberated from atrophying bones, is now generally discredited. The calcareous deposits in different tissues will have to be given up, as there is no evidence that this "metastatic" calcification ever takes place. In all probability no excess of soluble lime salts in the blood or lymph can ever be deposited in healthy living tissues.

At the present day both experimental and histological investiga-
tions indicate that in instances where calcification occurs there is a combination of the organic substances present in degenerated tissues, or in tissues of low vitality, with the lime salts of the body. From whatever cause the tissues become disorganized and undergo degenerative changes, the fatty acids may become liberated and combine with the alkalies to form potash and soda soaps.

The potash and soda is then gradually replaced by calcium to form an insoluble calcium soap. The interaction between the soaps, the fats and alkalies and the fatty acids and lime is brought about by the blood and lymph to the result in the weaker fatty acids being displaced by phosphoric and carbonic acid, and thus in the formation of highly insoluble calcium phosphate and carbonate depositions in their new combined state.

Pathological Pigmentations.—These pigmentary changes found in abnormal conditions are usually classified under (1) Albuminoïd, (2) Haemogenous, (3) Extraneous.

1. The normal animal pigments and closely allied pigments are usually found in the skin, hair, eye, supra-renal glands, and in certain nerve cells. These represent the albuminoid series, and are probably elaborated by the cells from albuminous substances through the influence of specific ferments. This pigment is usually intracellular, but may be found lying free in the intercellular substance, and is generally in the form of fine granules of a yellowish-brown or brown-black colour. In the condition known as albinism there is a congenital deficiency or entire absence of pigment. Trophic and nervous conditions sometimes cause localized deficiency of pigment which produces white areas in the skin.

Excessive pigmentation of tissue cells (fig. 48, Pl. V.) is seen in old age, and usually in an accompaniment of certain atrophic processes and functional disorders. Certain degenerative changes in the supra-renal glands may lead to Addison's disease, which is characterized by an excessive pigmentary condition of the skin and mucous membranes. This melanin pigment is found in certain tumour growths, pigmented moles of the skin, and especially in melanotic sarcomata (fig. 49, Pl. V.) and cancer. The action of the sun's rays stimulates the cells of the skin to increase the pigment as a protection to the underlying tissues, e.g. summer bronzing, "freckles," and the skin of the negro.

The coloured fats, or lipochromes, are found normally in some of the cells of the internal organs, and under certain pathological conditions. This pigment is of a light yellow colour, and contains a fatty substance that reacts to the fat-staining reagents. Little is known regarding this class of pigment.

2. Haemogenous pigments are derived from the haemoglobin of the red blood corpuscles. These corpuscles may break down in the blood vessels, and their colouring material (haemoglobin) is set free in the serum. But their disintegration is more commonly brought about by "phagocytosis" on the part of the phagocytic cells in the different organs concerned with the function of haemolysis, i.e. the liver, spleen, haemolympath glands and other tissues.

The haemoglobin may be transformed into haematothm, a pigment that does not contain iron, or into a pigment which does contain iron, haemosiderin.

The haematothm pigment may vary in colour from yellowish or orange-red to a red-brown, and forms granular masses, rhomboid prisms or acicular crystals. It can be formed independently of coagulation by certain processes, and is more or less resistant to absorption, are found in old blood clots, and have been known to persist in old cerebral haemorrhages for many years. The haematothm pigment metabolism is largely excreted by the liver in the form of bilirubin.

Haemosiderin, an iron-containing pigment (probably an hydrated iron oxide), is found in more or less loose combination with cellular substances, and is frequently found in areas which have been once irritated, in the liver and spleen, in epidermis and other tissues. Cellular activity and oxygen appear to be essential for its development; it is found usually in the cells of certain organs, or it may be deposited in the intercellular tissues. Haemosiderin in the normal process of haemolysis is stored up in the cells of certain organs until required by the organism for the formation of fresh haemoglobin. In diseases where haemolysis is extreme, particularly in pernicious anaemia, there may be relatively large quantities occasionally as much as ten times the normal amount of haemosiderin deposited in the liver.

In hæmopigmentary pigmentation (icterus or jaundice) we have the iron-free pigment modified and transformed by the action of the liver cells into bile pigment (bilirubin). If the discharge of this

Fig. 50.—Melanotic sarcoma. Many of these malignant cells develop and accumulate in their protoplasm granules of melanin pigment. (×300 diam.)

Fig. 51.—Liver, waxy. The swolken waxy capillaries are pressing on the columns of liver cells and are causing marked atrophy. (×75 diam.)
which Schmiedeberg had previously obtained from cartilage and named “chondroitin-sulphuric acid” (Chondroitinsulfatlärung). It also occurs in bones and elastic tissue, but is not present in the normal human liver. Oddi does not regard it as the essential constituent of amyloid, chiefly because the colour reactions are forthcoming in the resulium after the substance has been removed, while the substance itself does not give the reactions. Oddi called this substance the reversible one of the substance with a proteid. The soda combination of the acid as obtained from the nasal cartilage of pigs had the composition C4H2Na2N5O7.

Krawkow in 1897 clearly demonstrated it to be a proteid in firm combination with chondroitin-sulphuric acid. As probably the protein constituent varies in the different organs, one infers that this will account for the varying results got from the analysis of the substance obtained from different organs in such cases.

This amyloid substance is slowly and imperfectly digested by peptic-digestion being more complete with trypsin and by autolysic enzymes.

There is no evidence that this material is brought by the circulating blood and infiltrates the tissues. It is believed rather that the condition is due to deleterious toxic substances which act for prolonged periods on the tissue elements and so alter their histon proteins that they combine in situ with other protein substances which are brought by the blood or lymph.

Amyloid develops in various organs and tissues and is commonly associated with chronic phthisis, tubercular disease of bone and joints, and syphilis (congenital and acquired). It is known to occur in cachexia, and has been described in connexion with a few other diseases. A number of interesting experiments, designed to test the relationship between the condition of suppuration and the precipitation of amyloid, have been made in animals most suitable for experimenting upon is the fowl, but other animals have been found to react. Thus Krawkow and Nowak, employing the frequent subcutaneous injection of the usual organisms of suppuration, have induced in the fowl the deposition within the tissues of a homogeneous substance giving the colour reactions of true amyloid. When hardened in spirit, however, the greater part of this experimental amyloid in the fowl vanishes, and the reactions are not forthcoming. They were unable to verify any direct connexion between its production and the organism of tubercle. These observations have been verified in the rabbit, mouse, fowl, guinea-pig and cat by Dahlscheid, occasionally in the dog by Lubarsch; and confirmatory observations have also been made by Czerny and Maximonoff. Lubarsch succeeded in inducing it merely by the subcutaneous injection of turpentine, which produces a very similar result, and Krawkow, however, found later that he could generate it where the turpentine failed to induce suppuration: he believes that it may arise quite apart from the influence of the organisms of suppuration, that it is a physiological product of the micro-organisms of disease, and also that it has nothing to do with emaciation. It is a retrogressive process producing characteristic changes in the fine connective-tissue fibrils. The change appears to begin in the fibrils which lie between the circular muscle fibres of the middle coat of the smaller arteries and extends both backwards and forwards along the vessels. It spreads forwards, affecting the supporting fibres outside the endothelium of the capillaries, and then passes to the connective-tissue fibrils of the veins. The secreting cells never show this change, although they may become atrophied or destroyed by the pressure and the disturbance of nutrition brought about by the condition of the blood vessels. The circulation is little interfered with, although the walls of the vessels are much thickened by the amyloid material (fig. 51, PL V).
in giving all its colour reactions. The reaction with methyl-
violinate, however, differs from that with true amylol in being
evanescent.

Response of Tissues to Stimulation
A stimulus may be defined as every change of the external
agencies acting upon an organism; and if a stimulus come in
contact with a body possessing the property of irritability, i.e.
the capability of reacting to stimuli, the result is stimulation
(Verwendung). If stimuli comprise chemical, mechanical, thermal,
photonic and electrical changes in the environment of the organism.
A stimulus may act on all sides and induce a general effect with-
out direction of movement, but in the production of movement in
a definite direction the stimulus must be applied unilaterally.
Stimuli applied generally, not unilaterally, in most cases induce
increased divisibility of the cells of the part.

Thus the poison of various insects induces in plants the cellular
new formation known as a gall-nut; a foreign body implanted in
a limb may become encysted in a capsule of fibrous tissue; septic
matter introduced into the abdomen will cause proliferation of
the lining epi(endo)thelium; and placing an animal (salamander,
Galótti) in an ambient medium at a higher temperature than that
to which it is accustomed naturally, increases the rapidity of cell-
division of its epithelium with augmentation of the number of
karyokinetic figures. Hair and some other like structures grow
luxuriantly on a part to which there is an excessive flux of blood.
Bone (the so-called bones) may be developed unilaterally, with no natural
bone-forming tendencies, as a result of interrupted pressure, or a
fatty tumour may arise in the midst of the natural subcutaneous
fat in the same circumstances.

Among stimuli acting unilaterally, perhaps none has proved
more interesting, in many respects, than what is known as Chemio-
taxis. It is that the property an organism endowed with the
power of movement has to move towards or away from a chemical
stimulus applied unilaterally, or, at any rate, where it is
applied in a more concentrated state on the one side than on the
others, and more particularly where the concentration increases
gradually in one direction away from the living organism acted
upon. Observed originally by Engelmann in bacteria, by Stahl
in myxomycetes, and by Pfeffer in ferns, mosses, etc., it has
now become recognized as a widespread phenomenon. The
influence of the chemical substance is either that of attraction
or repulsion, the one being known as positive, the other as
negative chemotaxis.

The female organs of certain cryptogams, for instance, exert a
positive chemotactic action upon the spermatozoids, and probably,
as Pfeffer suggests, the chemical agent which exerts the influence
is malic acid. No other substance, at least, with which he experi-
mented had a like effect, and it is possible that in insects which
contains the ovum malic acid is present. Massart and
Bordet, Leber, Metchnikoff and others have studied the pheno-
menon in leucocytes, with the result that while there is evidence of
their action chemotactic to the toxins of many pathogenic
microbes, it is also apparent that they are negatively influenced by
such substances as lactic acid.

From a pathological point of view the subject of chemotaxis
must be considered along with that of phagocytes. Certain
free mobile cells within the body, such as blood-leucocytes, as
well as others which are fixed, as for instance the endothelium of
the hepatic capillaries, have the property of seizing upon some
cells of particulate matter brought within their reach. Within
a quarter of an hour after a quantity of clamydites has been injected
into the blood of the frog nearly every particle will be found
engulfed by the protoplasm of the leucocytes of the circulating
blood. Some bacteria, such as those of anthrax, are seized upon
in the same manner, indeed; very much as small algae and other
particles are incorporated and devoured by amoebae. melanine
particles formed in the spleen in malaria, which pass along with
the blood through the liver, are appropriated by the endothelial
cells of the hepatic capillaries, and are found embedded within
their substance. If the particle enveloped by the protoplasm
be of an organic nature, such as a bacterium, it undergoes
digestion and ultimately becomes destroyed, and accordingly
the term "phagocyte" is now in common use to indicate cells
having the above properties. This phagocytic action of certain
cells of the body is held by Metchnikoff and his followers to
have an important bearing on the pathology of immunity.
Phagocytes act as scavengers in ridding the body of noxious
particles, and more especially of harmful bacteria.

A further application of the facts of chemotaxis and phago-
cytosis has been made by Metchnikoff to the case of Inflammation.
It is well known that many attempts to define the process of
inflammation have been made from time to time, all of them more
or less unsatisfactory. Among the latest is that of Metchnikoff:
"Inflammation generally," he says, "must be regarded as a
phagocytic reaction on the part of the organism against irritants.
This reaction is carried out by the mobile phagocytes sometimes
alone, sometimes with the aid of the vascular phagocytes, or of
the nervous system." Given a noxious agent in a tissue, such,
let us say, as a localized deposit of certain bacteria, the phago-
cytosis takes place in the immediate vicinity of the new action
where the bacteria have invaded up their residence. They surround individual bacteria, absorb
them into their substance, and ultimately destroy them by diges-
tion. The phagocytes are attracted from the blood vessels and
elsewhere toward the noxious focus by the chemiotaxis exerted
upon them by the toxins secreted by the bacteria contained
within it. The chemiotaxis in this instance is positive, but the
toxins from certain other bacteria may act negatively; and such
bacteria are fraught with particular danger from the fact that
they can spread through the body unopposed by the phagocytes,
which may be looked upon as their natural enemies.

Natural Protection against Parasitism
The living organism is a rich storehouse of the very materials
from which parasites, both animal and vegetable, can best derive
their nourishment. Some means is necessary, therefore, to
protect the one from the encroachments of the other. A plant
or animal in perfect health is more resistant to parasitical invasion
than one which is ill-nourished and weakly. Of a number of
plants growing side by side, those which become infected with
moulds are the most weakly, and an animal in low health is
more subject to contagious disease than one which is robust.
Each organism possesses within itself the means of protection
against its parasitical enemies, and these properties are more in
evidence when the organism is in perfect health than when it is
debilitated.

One chief means employed by nature in accomplishing this
object is the investment of those parts of the organism liable to
be attacked with an armour-like covering of epidermis, periderm,
etc. The gnathopod of the spider, the epidermis of the moss,
parasites, the Peziza penetrates, and before long brings about the
destruction of the branch. So long as the epidermis of animals
remains sound, disease germs may come in contact with it almost
with impunity, but immediately on its being fissured, or a larger
wound made through it, the underlying parts, the blood and soft
tissues, are attacked by them. A very remarkable instance of an
acquired means of protecting a wound against parasitical invasion
is to be found in granulations. Should those remain unbroken
they constitute a natural barrier to the penetration of most patho-
genic and other forms of germ-life into the parts beneath. Bacteria
which have a location or whose parts are exposed to the air
are acted upon by them in a manner similar to that of the
granulations, for it is observed that all wounds which become
abundantly filled with granulations, and when they are allowed
to develop to the fullest extent, are found to be fully protected.

Dropsy
During conditions of health a certain quantity of lymphoid
fluid is constantly being effused into the tissues and serous cavities
of the body, but in the case of the tissues it never accumulates
to excess, and in that of the serous cavities it is never more than
sufficient to keep them moist. When any excessive accumulation takes place the condition is known as "hydrops" or "dropsy." A "transudate" is a liquid having a composition resembling that of blood-serum, while the term "exudate" is applied to an effused liquid whose composition approaches that of the blood-plasma in the relationship of its solid and liquid parts, besides in most cases containing numbers of colourless blood-corpuscles. Exudates are poured out under inflammatory conditions, while none of the truly drospical effusions are of inflammatory origin, and hence the class of exudates, as above defined, may be rejected from the category of liquids we are at present considering. Where the drospical condition is more or less general the term "anasarca" is applied to it; if the; the tissues are infiltrated locally the term "oedema" is employed; and various names are applied, with a local significance, to dropsies of individual parts or cavities, such as "hydrothorax," "hydroperitoneum," or "ascites," "hydrocelephalus," and so on. In "anasarca" the tissues which suffer most are those which are peculiarly lax, such as the lower eyelids, the scrotum, and the backs of the hands and feet. It is invariably the result of some cause acting generally, such as renal disease, valvular defect of the heart, or an impervious state of the blood; while a mere oedema is usually dependent upon some local obstruction to the return of blood or lymph, or of both, the presence of parasites within the tissue, such as the filaria sanguinis hominis or trichina spiralls, or the poisonous bites of insects. Dropsy of the serous cavities is very commonly merely part of a general anasarca, although occasionally it may be, as in the case of ascites, the sequel to an obstruction in the venous return. Dorsopal liquids are usually pale yellow or greenish, limpid, with a saltish taste and alkaline reaction, and a specific gravity ranging from 1005 to 1024. They all contain albumen and throw down a precipitate with heat and nitric acid. None of them, in man, coagulates spontaneously, although they contain fibrinogen. The addition of some of the liquid squeezed out from a blood-clot, of the squeezed blood-clot itself, or of a little blood-serum, is sufficient to throw down a fibrinous coagulum (Buchanan), evidently by these substances supplying the fibrin-ferment. The proteid constituents are very much like those of blood-serum, although they never come up to them in amount (Runge). The quantity of proteid matter in a purely drospical effusion never amounts to that of an inflammatory exudation (Lassar). Certain peculiar substances, probably degenerative products, some of them resembling coagulated cerebrospinal fluid. The fluids of "dropsy" and ascites sometimes contain chyle in abundance ("hydrops luteus"); the escape having taken place from a ruptured receptaculum chelii.

In a given case of anasarca due to a cause acting generally, it will be found that the liquid of the pleural cavity always contains the albumin, an agent of facts, that of the peritoneal cavity comes next, that of the cerebral ventricles follows this, and the liquid of the subcutaneous areolar tissue contains the lowest. The reason of this is apparently that the negative pressure of the pleural, and partly of the peritoneal, cavity tends to aspirate a liquid relatively thicker, so to speak, than that effused where no such extravasal mechanism is at work (James).

The subject of the conditions under which drospical liquids are produced is a wide one, and one about which there is the greatest diversity of opinion. It turns in part, but in part only, upon the laws regulating the effusion of lymph, and the physiology of the lymphatic system, which are the subjects of the present chapter.

Thus Ludwig was of opinion that the lymph-flow is dependent upon two factors, first, difference in pressure of the blood in the capillaries and the liquid in the plasma spaces outside; and, secondly, chemical interchanges setting up osmotic pressure through the vessel-walls. His results, so far, have been confirmed by Starling, who finds that the amount of lymph-flow from the thoracic duct is dependent upon difference in pressure. It varies with the increase of the intracapillary or decrease of the extra-capillary pressure, and is also in part regulated by the greater or lesser permeability of the vessel-walls. Heidenhain, on the other hand, has rejected entirely the filtration view of lymph-formation, believing that the capillary wall is permeable and totipotential, a mere secretion brought about by the secretory function of the endothelial plates. Starling does not accept this view, and cannot reconcile the idea with his experiments. He himself regards the normally secretory filtration plays no part in the formation of lymph. Lazaurus- Barlow, again, looks upon the pouring out of lymph as evidence of the demands of the tissue-elements for nutrition. An impulse is communicated to the blood vessels in accordance with this demand, and a greater or smaller outflow is the result. He traces various influences to the production of those changes in the lymphatic capillaries, which are responsible for the increased lymphatic excretion, and the influence, over the same period, of the kidney, the liver, the peritoneum, and the cutaneous vessels. It is clear that the second class (sugar, &c.), on injection into the blood, attract water from the tissues and cause a condition of hydramic plethora with increased lymphatic flow. The increased flow of lymph is due to the increased pressure in the abdominal capillaries.

It is now coming to be recognized that increase of blood pressure alone is not sufficient to account for all drospical effusions. Much more important is the effect of the alteration in the amount of crystalloids in the tissues and blood and therefore of the alteration in the osmotic pressure between these. Loeb found experimentally that the increase of osmotic pressure in blood vessels caused an increased osmotic pressure, and so it would absorb water from a relatively concentrated sodium chloride solution. Welch produced oedema of the lungs experimentally by increasing the pressure in the pulmonary vessels by ligature of the aorta; ligature of the inferior vena cava produced only one-tenth of an atmosphere, while in some of Loeb's experiments the osmotic pressure, due to retained metabolic products, was equal to over thirty atmospheres. Thus differences in osmotic pressure might cause much more powerful in producing oedema than mere differences in blood pressure.

Now differences in the amount of crystalloids cause alteration in osmotic pressure while the protein content affects it but little; and of the crystalloids the chlorides appear to be those most liable to variation.

Widal, Lemierre and other French observers have noted a distinctive type of the chlorid anasarca, or "starlanna," which is usually associated with oedema; Widal and Javal found that a chloride-free diet caused diminution in the oedema and a chloride containing diet an increase of oedema. Oliver and Audibert published some cases of cirrhosis of the liver with ascites in which they got results comparable to those of Widal. Some other observers, however, have not got such good results with a chloride-free diet, and Mährisch, Scheel, Linbeck, Dreser and others, dispute Widal's hypothesis of a secondarily chloridosis, and believe the cause of the accumulation of renal dropsy at all events; they assert that the chlorides are held back in order to keep the osmotic pressure of the fluid, which they thereby cause to have a profuse excretion. They look to the ribs, thoracic valves, and membranes as causes of the accumulation of fluids. Certainly not all cases of renal dropsy show diminution in the excretion of chlorides. Bainbridge suggests that a retention of metabolic products may cause the oedema in renal disease, Bradford having proved experimentally that the removal of a certain amount of renal tissue caused retention of metabolic products in the tissues. As sodium chloride is one of the most permeable of crystalloids it seems strange that a condition which lessens the osmotic pressure of the tissues should have such a powerful action. There is some evidence to show that the blood-flow through renal tissue causes less sodium chloride to appear in the urine while the excretion of urea and sulphates remains unaffected; apparently the chloride, being more permeable than the urea and sulphates, is reabsorbed and so only appears to be excreted in less quantity.

In the dropsy of cardiac disease, owing to the deficient oxidation from the diminution of the blood and interstitial fluid, the accumulation in the tissues; also lymph return must be impeded by the increased pressure in the veins and so dropsy results (Wells).

The local oedema seen in some nervous affections might be explained by the hyperactive cerebral blood circulation in these areas due to some local nervous stimulation.

Thus, while increased pressure in the blood or lymph vessels may be one factor, and increased permeability of the capilary walls another, the osmotic pressure of the blood and lymph is probably the most important in the production of dropsy. This increased osmotic pressure is again due to accumulation of crystalloids in the tissues, either products of metabolism or substances derived from the blood. While some of these may be from another cause, or, it may be, as in some cases of nephritis, owing to a retention or reabsorption of chlorides in the tissues.

**Practical Applications**

Medicine and surgery have never been slow to appropriate and apply the biological facts of pathology, and at no period have
PATIALA—PATKUL

PATIALA, or PUTTIALA, a native state of India, within the Punjab. It is the premier state of the Punjab, and chief of the three Sikh Phulkian states—Patiala, Natha and Jind. It consists of three detached blocks of territory, mostly in the plains, though one portion extends into the hills near Simla. Area 5412 sq. m.; pop. (1901), 1,596,662; estimated revenue, £140,000; military force (including Imperial Service troops), 3420 men. The state was founded by a Sikh chief about 1763, and came under British protection, with the other cis-Sutlej states, in 1858. Patiala remained conspicuously loyal to the British during the Mutiny of 1857, Narindar Singh, its ruler, setting an example to the other Sikh states which was of the utmost value. The maharaja, Rajendra Singh, who died in 1900, was devoted to riding and sport. He took part personally in the Tirah campaign of 1895-98, with a battalion of his own Imperial Service infantry and a field troop of Imperial Service hangers. In recognition of his services on this occasion he received the G.C.S.I. He was succeeded by his son, Bhupindar Singh, who was born in 1891. The town of Patiala has a station on the branch of the North-Western railway from Rajpura to Bhathinda. Pop. (1901), 53,545. It contains several fine modern buildings, including palaces, hospitals and schools.

See Phulkian States Gazetteer (Lahore, 1909).

PATIENCE, the name given to certain card-games played by a single person. Although known for centuries, they have seldom been mentioned by writers on playing-cards, and the rules have for the most part been handed down orally. There are two main varieties; in one luck alone prevails, since the player has no choice of play but must follow strict rules; in the other an opportunity is given for the display of skill and judgment, as the player has the choice of several plays at different stages of the game. The usual object is to bring the cards into regular ascending or descending sequences. The starting card is called the "foundation," and the "family" (sequence) is built upon it. In other varieties of Patience the object is to make pairs, which are then discarded, the game being brought to a successful conclusion when all the cards have been paired; or to pair cards which will together make certain numbers, and then discard as before. There are hundreds of Patience games, ranging from the simplest to the most complicated.

See Jarbart's Games of Patience in De la Rue's series of handbooks (1905); Patience Games, by "Cavendish" (London, 1890); Cyclopædia of Card and Table Games, by Professor Hoffmann (London, 1891); Patience Games, by Professor Le Grand (London, 1892); Games of Patience, by A. Howard Cady (Spalding's Home Library, New York, 1890); Dick's Games of Patience, edited by W. B. and H. B. Dick (New York, 1890); Games of Patience (4 series), by Mary E. W. Jones (London, 1898); Le Livre illustré des patiences, by "Comtesse de Blancœur" (Paris, 1898).

PATINA (probably from the Latin word for a flat dish, from patere, to lie open; cf. "paten"), a thin coating or incrustation which forms on the surface of bronze after exposure to the air or burial in the ground. It is looked on as a great addition to the beauty of the bronze, especially when it is of the green colour found on antique bronzes (see BRONZE). By extension, the word is applied to the discoloured or incrustated surface of marble, flint, &c., acquired after long burial in the ground or exposure to the air, and also to the special colour given to wood surfaces by time.

PATIÑO, JOSÉ or JOSEF (1666-1736), Spanish statesman, was born at Milan, on the 11th of April 1666. His father, Don Lucas Patiño de Ibarra, Señor de Castelar, who was by origin a Galician, was a member of the privy council and inspector of the troops in the duchy of Milan for the king of Spain, to whom it then belonged. His mother's maiden name was Beatrice de Rosales y Fascini. The Patiño family were strong supporters of the Bourbon dynasty in the War of the Spanish Succession. The elder brother Baltasar, afterwards marquis of Castelar, had a distinguished career as a diplomatist, and his son Luis was a general of some note. José Patiño, who had been invited for the priesthood but adopted a secular career, was granted the reversion of a seat in the senate of Milan on the accession of Philip V. in 1700, but on the loss of the duchy he was transferred to Spain, and put on the governing body of the military orders in 1707. During the War of Succession he served as intendent of Estremadura, and then of Catalonia from 1711 to 1718. In 1717 he was named intendent of the navy, which had just been reorganized on the French model. His capacity and his faculty for hard work secured him the approval of Alberoni, with whom, however, he was never on very friendly terms in private life. Patiño's Italian education, which affected his Spanish style, and caused him to fall into Italianisms all through his life, may have served to recommend him still further. Patiño profoundly distrusted the reckless foreign policy undertaken by Alberoni under the instigation of the king and his obdurate queen, Elizabeth Farnese. He foretold that it would lead to disaster, but as a public servant he could only obey orders, and he had the chief merit of organizing the various expeditions sent out to Sardinia, Sicily and Ceuta between 1718 and 1720. He became known to the king and queen in the latter year, while he was acting as a species of commissary-general during the disastrous operations against the French troops on the frontier of Navarre. It was not, however, until 1726 that he was fully trusted by the king. He and his brother, the marquis of Castelar, were the chief opponents of the adventurer Ripperda, who captivated the king and queen for a time. On the fall of this remarkable person, Patiño was named secretary for the navy, the Indies—that is to say the colonies—and for foreign affairs. The war office was added to the other departments at a later date. From the 13th of May 1726 until his death on the 3rd of November 1736 Patiño was in fact prime minister. During the later part of his administration he was much engaged in the laborious negotiations with England in relation to the disputes between the two countries over their commercial and colonial rivalries in America, which after his death led to the outbreak of war in 1739.

In his Patiño y Campillo (Madrid, 1882), Don Antonio Rodriguez Villa has collected the dates of the statesman's life, and has published some valuable papers. But the best account of Patiño's administration is to be found in Couse's Memoirs of the Kings of Spain of the House of Bourbon (London, 1845), which is founded on the correspondence of the English ministers at Madrid.

PATIO, the Spanish name for an inner court or enclosed space in a house, which is open to the sky. The "patio" is a common feature in houses in Spain and Spanish America. The word is generally referred to the Lat. patere, to lie open; cf. "patent," or to spatio, space.

PATKUL, JOHANN REINHOLD (1660-1727), Livonian politician and agitator, was born in prison at Stockholm, and spent his early years in Austrian service, then lay under suspicion of treason. He entered the Swedish army at the age of 20, and, when, in 1680, at the head of a deputation of Livonian gentility, he went to Stockholm to protest against the rigour with which the land-recovery project of Charles XI. was being carried out in his native province. His eloquence favourably impressed Charles XI., but his representations were disregarded, and the offensive language with which, in another petition addressed to the king three years later, he renewed his complaints, involved him in a government prosecution. To save himself from the penalties of high treason, Patkul fled from Stockholm to Switzerland, and was condemned to confinement for nine years. His escape was at the same time confiscated. For the next four years he led a vagabond life, but in 1688, after vainly petitioning the new king, Charles XII., for pardon, he entered the service of Augustus the Strong of Saxony and Poland, with the deliberate intention of wresting from Sweden Livonia, to which he had now no hope of returning so long as that province belonged to the Swedish Crown. The aristocratic republic of Poland was obviously the most convenient suzerain for a Livonian nobleman; so, in 1689, Patkul proceeded to the court of the king-elector at Dresden and bombarded Augustus with proposals for the partition of Sweden. His first plan was a near repetition of the project of the 30 Danish and Brandenburg; but, Brandenburg rejecting him, he was obliged very unwillingly to admit Russia into the partnership. The tsar was to be content with Ingrid and Esthonia, while Augustus was
PATMORE, COVENTRY—PATMOS

to take Livonia, nominally as a fief of Poland, but really as an hereditary possession of the Saxon house. Military operations against Sweden's Baltic provinces were to be begun simultaneously by the Saxons and Russians. After thus forging the first link of the partition treaty, Patkul proceeded to Moscow, and, at a secret conference held at Preobrazhenskoye, easily persuaded Peter the Great to accede to the nefarious league (Nov. 11, 1690). Although the earlier, unlooker days of the Great Northern War, Patkul was the mainstay of the confederates. At Vienna, in 1702, he picked up the Scottish general George Benedict Ogilvie, and enlisted him in Peter's service. The same year, recognizing the unprofitableness of serving such a master as Augustus, he exchanged the Saxon for the Russian service. Peter was glad enough to get a man famed for his talents and energy, but Patkul speedily belied his reputation. His knowledge was too local and limited. On the 10th of August 1704 he succeeded, at last, in bringing about a treaty of alliance between Russia and the Polish republic to strengthen the hands of Augustus, but he failed to bring Prussia also into the anti-Swedish league because of Frederick I's fear of Charles and jealousy of Peter. From Berlin Patkul went on to Dresden to conclude an agreement with the imperial commissioners for the transfer of the Russian contingent from the Saxon to the Austrian service. The Saxon ministers, after protesting against the new arrangement, arrested Patkul and shut him up in the fortress of Sonnenstein (Dec. 10, 1756), altogether disregarding the remonstrances of Peter against such a gross violation of international law. After the peace of Altranstädt (Sept. 24, 1707) he was delivered up to Charles, and at Kazimierz in Poland (Oct. 10, 1707) was broken alive on the wheel, Charles rejecting an appeal for mercy from his sister, the princess Ulrica, on the ground that Patkul, as a traitor, could not be pardoned for example's sake.

PATMORE, COVENTRY KERSEY DIGHTON (1825–1896), English poet and critic, the eldest son of Peter George Patmore, himself an author, was born at Woodford in Essex, on the 23rd of July 1825. He was privately educated, being his father's intimate and constant companion, and derived from him his early literary enthusiasm. It was his first ambition to become an artist, and he showed much promise, being awarded the silver palette of the Society of Arts in 1838. In the following year he was sent to school in France, where he studied for six months, and began to write poetry. On his return his father continued the publication of Patkul's poems; but in the meanwhile Coventry had evinced a passion for science and the poetry was set aside. He soon, however, returned to literary interests, moved towards them by the sudden success of Tennyson; and in 1844 he published a small volume of Poems, which was not without individuality, but marred by inequalities of workmanship. It was widely criticized, both in praise and blame; and Patmore, distressed at its reception, bought up the remainder of the edition and caused it to be destroyed. What chiefly wounded him was a cruel review in Blackwood, written in the worst style of unreasoning abuse; but the enthusiasm of private friends together with their warmer criticism did much to help him and to foster his talent. Indeed, the publication of this little volume bore immediate fruit in introducing its author to various men of letters, among whom was Dante Gabriel Rossetti, through whose offices Patmore became known to Holman Hunt, and was thus drawn into the eddies of the pre-Raphaelite movement, contributing his poem "The Seasons" to the Germ. At this time Patmore's father became involved in financial embarrassments; and in 1846 Monckton Milnes secured for the son an assistant-librarianship in the British Museum, a post which he occupied industriously for nineteen years, devoting his spare time to poetry. At about 1847 he married Emily, daughter of Dr Andrews of Camberwell. At the Museum he was austere and remote among his companions, but was nevertheless instrumental in 1852 in starting the Volunteer movement. He wrote an important letter to The Times upon the subject, and stirred up much martial enthusiasm among his colleagues. In the next year he republished, in Paternoster Church Tower, the more successful pieces from the Poems of 1844, adding several new poems which showed distinct advance, both in conception and treatment; and in the following year (1854) appeared the first part of his best known poem, "The Angel in the House," which was continued in "The Espousals" (1856), "Faithful for Ever" (1860), and "The Victorics of Love" (1862). In 1862 he lost his wife, after a long and lingering illness, and shortly afterwards joined the Roman Catholic Church. In 1865 he married again, his second wife being Miss Marianne Byles, second daughter of James Byles of Bowden Hall, Gloucester; and a year later purchased an estate in East Grinstead, the history of which may be read in How I Managed my Estate, published in 1886. In 1877 appeared The Unknown Eros, which unquestionably contains his finest work in poetry, and in the following year Amelia, his own favourite among his poems, together with an interesting, though by no means undisputable, essay on English Metrical Law. This departure into criticism he continued further in 1879 with a volume of papers, entitled Principle in Art, and again in 1893 with Religio poecae. Meanwhile his second wife died in 1889, and in the next year he married Miss Harriet Robson. In later years he lived at Lymington, where he died on the 26th of November 1886.

A collected edition of his poems appeared in two volumes in 1886, with a characteristic preface which might serve as the author's epitaph. "I have written little," it runs; "but it is all my best; I have never spoken when I had nothing to say, nor spared time or labour to make my words true. I have respected posterity; and should there be a posterity which cares for letters, I dare to hope that it will respect me." The obvious sincerity which underlies this statement, combined with a certain lack of humour which peeks through its naivety, points to two of the principal characteristics of Patmore's earlier poetry; characteristics which came to be almost unconsciously merged and harmonized as his style and his intention drew together into unity. In the higher flights, to which he arose as his practice in the art grew perfected, he is always noble and often sublime. His best work is found in the volume of odes called The Unknown Eros, which is full not only of passages but of entire poems in which exalted thought is expressed in poetry of the richest and most dignified melody. The animating spirit of love, moreover, has here deepened and intensified into a crystalline harmony of earthy passion with the love that is divine and transcending; the outward manifestation is replaced as a symbol of a sentiment at once eternal and quintessential. Spirituality informs his inspiration; the poetry is of the finest elements, glowing and alive. The magnificent piece in praise of winter, the solemn and beautiful cadences of "Departure," and the homely but elevated pathos of "The Toys," are in their various manners unsurpassed in English poetry for sublimity of thought and perfection of expression. Patmore is one of the few Victorian poets of whom it may confidently be predicted that the memory of his greater achievements will outlive all consideration of occasional lapses from taste and dignity. He wrote, at his best, in the grand manner, melody and metre combining with perfection of expression, and his finest poems have that indefinable air of the inevitable which is after all the touchstone of the poetic quality. His son, Henry John Patmore (1860–1883), left a number of poems posthumously printed at Mr Daniel's Oxford Press, which show an unmistakable lyrical quality. (A. W.)

The standard life of Patmore is the Memoirs and Correspondence, edited by Miss Patmore (1905, Literary Lives series), and an essay by Mrs Meynell prefixed to the selection (1905) in the "Muses' Library.

PATMOS, an island in the east of the Aegean Sea, one of the group of the Sporades, about 28 m. S.S.W. of Samos, in 37° 20' N. lat. and 26° 35' E. long. Its greatest length from N. to S. is about 10 m., its greatest breadth 6 m., its circumference, owing to the winding nature of the coast, about 37 m. The island,
which is volcanic, is bare and rocky throughout; the hills, of which the highest rises to about 800 ft., command magnificent views of the neighbouring sea and islands. The skill of the natives as seamen is proverbial in the archipelago. The deeply indented coast, here falling in huge cliffs sheer into the sea, there retiring to form a beach and a harbour, is favourable to commerce, as in former times it was to piracy. Of the numerous bays and harbours the chief is that of Scala, which, running far into the land on the eastern side, divides the island into nearly equal portions—a northern and a southern. A narrow isthmus separates Scala from the bay of Metroka on the west coast. On the belt of land between the two bays, at the junction between the northern and southern half of the island, stood the ancient town. On the hill above are still to be seen the massive remains of the citadel, built partly in polygonal style. The modern town stands on a hill top in the southern half of the island. A steep paved road leads to it in about twenty minutes from the port of Scala. The town clusters at the foot of the monastery of St John, which, crowning the hill with its towers and battlements, resembles a fortress rather than a monastery. Of the 600 MSS. once possessed by the monastery, only a few are of any value. The rest of the town are better built than those of the neighbouring islands, but the streets are narrow and winding. The population is about 4000. The port of Scala contains about 140 houses, besides some old well-built magazines and some potteries. Scattered over the island are about 300 chapels.

Patmos is mentioned first by Thucydides (iii. 33) and afterwards by Strabo and Pliny. From an inscription it has been inferred that the name was originally Patnos. Another ancient inscription seems to show that the Ionians settled there at an early date. The chief, indeed, the only title of the island to fame is that it was the place of banishment of St John the Evangelist, who according to Jerome (De ser. ill. c. 9) and others, was exiled thither under Domitian in A.D. 95, and released about eighteen months afterwards under Nerva. Here he is said to have written the Apocalypse; to the left of the road from Scala to the town, about half-way up the hill, a grotto is still shown (στήριγμα της ἀποκάλυψεως) in which the apostle is said to have received the heavenly vision. It is reached through a small chapel dedicated to St Anne. The Acts of St John, attributed to Prochorus, narrates the miracles wrought by the apostle during his stay on the island, but, strangely enough, while describing how the Gospel was revealed to him in Patmos, it does not so much as mention the Apocalypse. During the dark ages Patmos seems to have been entirely deserted, probably on account of the pirates. In 1088 the emperor Alexis Comnenus, by a golden bull, which is still preserved, granted the island to St Christodulus for the purpose of founding a monastery. This was the origin of the monastery of St John, which now owns the greater part of the southern half of Patmos, as well as farms in Crete, Samos and other neighbouring islands. The embalmed body of the saintly founder is to be seen to this day in a side chapel of the church. The number of the monks, which amounted to over a hundred at the beginning of the 18th century, is now much reduced. The abbot (1790) has the rank of a bishop, and is subject only to the patriarch of Constantinople. There is a school in connexion with the monastery which formerly enjoyed a high reputation in the Levant. The modern town was recruited by refugees from Constantinople in 1453, and from Crete in 1660, when these places fell into the hands of the Turks. The island is subject to Turkey; the governor is the pasha of Rhodes. The population is Greek. The women are chiefly engaged in knitting cotton stockings, which, along with some pottery, form the chief exports of the island. See Tournier, Relation d'un voyage du Levant (Lyons, 1717); Walpole, Memoirs (relating to Turkey) (London, 1820); Ross, Reisen auf den griechischen Inseln (Stuttgart and Halle, 1849-1852); Guizot, History of Greece (Paris, 1856); H. F. Tozer, Islands of the Aegean, pp. 178-195.

**PATNA**, a city, district, and division of British India, in the Behar province of Bengal. The city, which is the most important commercial centre in Bengal after Calcutta, lies on the right bank of the Ganges, a little distance below the confluence of the Sone and the Gogra, and opposite the confluence of the Gandak, with a station on the East Indian railway 332 m. N.W. of Calcutta. Municipal area, 6184 acres. Pop. (1901), 1,344,785. Including the civil station of Bankipur to the west, the city stretches along the river bank for nearly 9 miles. Still farther west is the military cantonment of Dinapur. A government college was founded in 1862. Other educational institutions include the Behar school of engineering organized in 1857.

Patna city has been identified with Patapalputra (the Pallibothra of Megasthenes, who came as ambassador from Seleucus of Nicaea to Chandragupta about 300 B.C.). Megasthenes describes Pallibothra as being the capital of India. He adds that its length was 80 stadia, and breadth 10; that it was surrounded by a ditch 30 cubits deep, and that the walls were adorned with 570 towers and 64 gates. According to this account the circumference of the city would be 190 stadia or 253 miles. Asoka built an outer masonry wall and beautified the city with innumerable stone buildings. The greater part of the ancient city still lies buried in the silt of the rivers under Patna and Bankipur at a depth of from 15 to 20 ft. The two events in the modern history of the district are attacks on the south of Patna (1857) and the Sepoy Mutiny in 1857. The former occurrence, which may be said to have settled the fate of Mahomedan rule in Bengal, was the result of a quarrel between the nawab, Mir Kasim, and the English authorities regarding transit duties, which ultimately led to open hostilities. The company's sepoys, who had occupied Patna city by the orders of the company's factor, were driven out by the nawab's troops and nearly all killed. The remainder afterwards surrendered, and were put into confinement, together with the European officers and the entire staff of the Cossimbazar factory, who had also been arrested on the first outbreak of hostilities. Mir Kasim, who had now come to power, pitched battles at Gharia and Udhanala (Oodeynullah) in August and September 1763, and in revenge ordered the massacre of all his prisoners, which was carried out with the help of a renegade in his employment named Walter Reinhardt, (afterwards the husband of the famous Begum Samru). About sixty Englishmen were murdered on this occasion, the bodies being thrown into a well belonging to the house in which they were confined. At the outbreak of the mutiny in May 1857 three sepoy regiments stationed at Dinapur (the military cantonment of Patna, adjoining the city) were allowed to retain their arms till July, when, in an attempt being made to disarm them, they broke out into open revolts. Although the British forces in the Ganges in boats were fire into and run down by a pursuing steamer, the majority crossed by the Sone river into Shahabad, where they joined the rebels under Kuar Singh who were then besieging a small European community at Arrah.

The **District of Patna** has an area of 2075 sq. m.; pop. (1901), 1,624,085. Throughout the greater part of its extent the district is a level plain; but towards the south the ground rises into hills. The soil is for the most part alluvial, and the country along the bank of the Ganges is a rich rice-land. The general line of drainage is from west to east; and high grounds along the south of the Ganges forces back the rivers flowing from Gaya district. The result is that during the rains nearly the whole interior of the district south of a line drawn parallel to the Ganges, and 4 or 5 m. from its bank, is flooded. In the south-east are the Rajgir Hills, consisting of two parallel ridges running south-west, with a narrow valley between, intersected by ravines and passes. These hills, which seldom exceed 1000 ft. in height, are rocky and clothed with thick low jungle, and contain some of the earliest memorials of Indian Buddhism. The chief rivers are the Ganges and the Sone. The only other river of any consequence is the Kameswar, which is chiefly remarkable for the number of petty irrigation canals which it supplies. So much of the river is thus diverted that only a small portion of its water ever reaches the Ganges at Patwa. The chief crops are rice, wheat, barley, maize and pulse; poppy and potatoes
are also of importance. Apart from the Sone canal, irrigation
is largely practised from private channels and also from wells.
The district is traversed by the main line of the East Indian
railway, with two branches south to Gaya and Bihar.

The Division of Patna extended across both sides of the
Ganges. It comprised the seven districts of Patna, Gaya,
Shahabad, Saran, Champaran, Muzaffarpur and Darbhanga.
Total area, 23,748 sq. m.; pop. (1901), 15,514,987. In 1908
the four last districts north of the Ganges were formed into
the new division of Tirhut; and the name of Patna division
was confined to the three first districts south of the Ganges.

See L. A. Waddell, Discovery of the Exact Site of Asoa's Classic
Capital of Fatipatna (1892); Vincent Smith, Asoa ('Rulers of
India” series, 1901); Patna District Gazetteer (Calcutta, 1907).

**Patna**, one of the Orissa tributary states in Bengal, with
an area of 2,399 sq. m. It lies in the basin of the Mahanadi
river, and is divided by a forest-clad hilly tract into a northern
and a southern portion, both of which are undulating and well
cultivated. Pop. (1901), 277,748, showing a decrease of 16
in the decade, mainly due to the effects of famine in 1906.
Nearly the whole population consists of Orijis. The capital is
Bolangir: pop. (1901), 3,706. The principal crop is rice.
The maharajas of Patna were formerly heads of a group of
states known as the **aihara gharaj** or “eighteen forts.” They
are Chablian Rajputs, and claim to have been established in
Patna for six centuries. Patna was the scene of a rebellion of
the Khonds, followed by atrocities on the part of their rulers,
in 1859, and, in consequence, came under British management
in 1871. The maharaja Ramchandra Singh, installed in 1894,
was insane and put an end to his own life in the following year,
whereupon his uncle, Lal Dalganj Singh, became chief,
undertaking to administer with the assistance of a diwan or
minister appointed by the British government. The powers
of this official were extended in 1900 after a serious outbreak
of dacoity. Till 1905 the state was included in the Central
Provinces.

**Patois**, a French term strictly confined to the dialect of
a district or locality in a country which has a common literary
language, often used of the form of a common language as
spoken by illiterate or uneducated persons, marked by vulgarisms
in pronunciation, grammar, &c. The origin of the word is
not certain. It has been taken to be a corruption of **patois**,
from Low Lat. **patriensis**, of or belonging to one's **patria**,
or native country, fatherland.

**Paton, John Brown** (1830— ), British Nonconformist
divine, was born on the 17th of December 1830. He was
educated at London, Poole and Spring Hill College, Birming-
ham; he graduated B.A. at London University in 1849, and
was Hebrew and New Testament prismizen in 1850 and gold meda-
lied by the college in 1853. He received the honorary degree of
doctor of divinity from Glasgow University in 1851. When
the Nottingham Congregational Institute was founded in
1863 he became the first principal, a post which he held
till 1898, when he was succeeded by James Alexander Mitchell
(1849-1905), who from 1903 till his death was general secretary
of the Congregational Union. Paton became vice-president of
the British and Foreign Bible Society in 1907. He took an
active part in the foundation and direction of a number of socie-
ties for religious and social work, notably the National
Home Reading Union Society and English Land Colonization
Society, and was a constant contributor to literary reviews.
His publications include The Two-fold Alternative (3rd ed., 1900),
The Inner Mission of the Church (new ed., 1900), and two
volumes of collected essays. His son, John Lewis Paton
(b. 1863), who headed the Cambridge classical tripos in 1886,
became head master of Manchester grammar school in 1903.

**Paton, Sir Joseph Noel** (1821—1901), British painter,
was born, on the 13th of December 1821, in Woolers Alley,
Dunfermline, where his father, a fellow of the Scottish Society
of Antiquaries, carried on the trade of a damask manufacturer.
He showed strong artistic tendencies in early childhood,
but had no regular art training, except a brief period of

study in the Royal Academy School in 1843. He gained
a prize of £200 in the first Westminster Hall competition,
in 1845, for his cartoon "The Spirit of Religion," and in
the following year he exhibited at the Royal Scottish Academy
his "Quarrel of Oberon and Titania." A companion fairy
picture, "The reconciliation of Oberon and Titania" went
to Westminster Hall in 1847, and for it and his picture of
"Christ bearing the Cross" he was awarded a prize of £500
by the Fine Arts Commissioners. The two Oberon pictures
are in the National Gallery of Scotland, where they have long
been a centre of attraction. His first exhibited picture,
"Ruth Gleaning," appeared at the Royal Scottish Academy
in 1844. He began to contribute to the Royal Academy of
London in 1850. Throughout his career his preference was
for allegorical, fairy and religious subjects. Among his most
famous pictures are "The Pursuit of Pleasure" (1855), "Mors
Janus Vitae" (1866), "Ookold and the Elf-maidens" (1874),
and "In Die Malo" (1882). Sir Noel Paton also produced
a certain amount of sculpture, more notable for design than
for searching execution. He was elected an associate of the
Royal Scottish Academy in 1847, and a full member in 1850;
he was appointed Queen's Limner for Scotland in 1856,
and received knighthood in 1867. In 1878 the University of Edin-
burgh conferred upon him the degree of LL.D. He was a poet
of distinct merit, as his Poems by a Painter (1856) and Spinifidi
(1867) pleasantly exemplified. He was also well known
as an antiquary, his hobby, indeed, being the collection of arms
and armour. Sir Noel died in Edinburgh on the 26th of December
1901. His eldest son, Diarmid Noel Paton (b. 1859),
became regius professor of physiology in Glasgow in 1906;
and another son, Frederick Noel Paton (b. 1861), became
in 1905 director of commercial intelligence to the government of
India.

**Patras** (Gr. **Patrai**), the chief fortified seaport town on
the west coast of Greece, and chief town of the province of
Achaea and Elis, on a gulf of the same name, 70 m. W.N.W. of Corinth.

There are two railway stations, one in the north-east on the line
from Athens (via Corinth), the other on the line to Pyrgos. Pop.
(1899), 33,520; (1907), 37,401. It has been rebuilt since 1821
(the War of Independence), and is the seat of a Greek arch-
bishop and an appeal court. It is the chief port of Greece,
from which the great bulk of its currents are dispatched.
The port, formed by a mole and a breakwater, begun in 1886, offers
a fair harbour for vessels drawing up to 22 ft. The exports
consist of currents, sultanas, valonea, tobacco, olive oil, olives
in brine, figs, citrons, wine, branded, cocoons, and lamb, goat,
and kid skins. The imports consist chiefly of colonial produce,
manufactured goods and sulphate of copper. The two most
noteworthy buildings are the custom-house, on the site of the ancient
acropolis, and the cathedral of St Andrew, which is highly popular
as the reputed burial-place of the saint.

The foundation of Patras goes back to prehistoric times,
the legendary account being that Eumelus, having been taught
by Triptolemus how to grow grain in the rich soil of the Glaucus
valley, established three townships, Aroé (i.e. ploughland),
Antheia (the flowery), and Mesatis (the middle settlement),
which were united by the common worship of Artemis Tricia
at her shrine on the river Melichus. The Achaean,
having strengthened and enlarged Aroé, called it Patrae, as the exclusive
residence of the ruling family, and it was reckoned as one of
the twelve Achaean cities. In 410 B.C. the town was, by
the advice of Alcibiades, connected with its harbour by long walls
in imitation of those at Athens. The whole armed force was
destroyed by Metellus after the defeat of the Achaean at
Scarpheia, and many of the remaining inhabitants forsok the
city; but after the battle of Actium Augustus restored the ancient
name Aroé, introduced a military colony of veterans from the
10th and 12th legions (not, as is usually said, the 22nd),
and bestowed the rights of coloni on the inhabitants of Rhpiae and
Dyme, and all the Locri Ozolae except those of Amphissa.
Colonia Augusta Aroé Patrasiae became one of the most
populous of all the towns of Greece; its colonial coinage extends
from Augustus to Gordian III. That the town was the scene of the martyrdom of St Andrew is purely apocryphal, but, like Corinth, it was an early and effective centre of Christianity; its archbishop is mentioned in the lists of the Council of Sardica in 347. In 531 it was laid in ruins by an earthquake. In 587 it was able without external assistance to defeat the Slavonians (Avars), though most of the credit of the victory was assigned to St Andrew, whose church was enriched by the imperial share of the spoils, and whose archbishop was made superior of the bishops of Methone, Laodicea and Corone. Captured in 1205 by William of Champlite and Villehardouin, the city became the capital and its archbishop the primate of the principality of Achaia. In 1387 De Heredia, grand master of the order of the Hospital at Rhodes, endeavoured to make himself master of Achaia and took Patras by storm. At the close of the 15th century the city was governed by the archbishop in the name of the pope; but in 1428 Constantine, son of John VI., managed to get possession of it for a time. Patras was at length, in 1687, surrendered by the Turks to the Venetians, who made it the seat of one of the seven fiscal boards into which they divided the Morea. In 1714 it again fell, with the rest of the Morea, into Turkish hands. It was at Patras that the Greek revolution began in 1821; but the Turks, confined to the citadel, held out till 1828.

Patriarch (M.E. and O. Fr. patriarche, Lat. patriarcha, Gr. πατριάρχης, from πατήρ, clan, and ἀρχή, rule), originally the father or chief of a tribe, in this sense now used more especially of the "patriarchs" of the Old Testament, i.e. Abraham, Isaac and Jacob, with their forefathers, and the twelve sons of Jacob. In late Jewish history the title "patriarch" ( Heb. nāṣ, prince, chief) was given to the head of the sandedim in Palestine, and is sometimes, though wrongly, applied to the "cailarch," a head of the Jewish college at Babylon.

In the early centuries of the Christian Church the designation "patriarch" was applied, like "archbishop," to bishops of the more important sees as a merely honorary style. It developed into a title implying jurisdiction over metabolis, partly as a result of the organization of the empire into "dioceses," partly owing to the ambition of the greater metropolitan bishops, which had early led them to claim and exercise authority in neighbouring metropolitans. At the Council of Chalcedon (451) the patriarchs still bore the title of "exarch"; it was not until the 7th century that that of "patriarch" was fixed as proper to the bishops of Constantinople, Alexandria, Antioch and Jerusalem, "exarch" being reserved for those of Ephesus and Caesarea, who had fallen to a lower rank. In the West the only patriarch in the fully developed sense of the Eastern Church has been the bishop of Rome, who is patriarch as well as pope.

Patricians (Lat. patricius, an adjectival form from pater, father: not, as some say, from pater and cire, to call), a term originally applied to the members of the old citizen families of ancient Rome (see I. below). Under the later Roman Empire the name was revived by the Byzantine emperors as the title of a new order of nobility. Subsequently it was used as a personal title of honour for distinguished servants of Constantine I. and his successors, and was conferred on barbarian chiefs (II. below). It was afterwards conferred by the popes on the Frankish kings. In the medieval Italian republics, e.g. Genoa and Venice, the term was applied to the hereditary aristocracy (patrizio), and in the free cities of the German Empire it was borne by distinguished citizens (patrizer). In Italy it is still used for the hereditary nobility. From these specific uses the word has come into general use as a synonym of aristocrat or "noble," and implies the possession of such qualities as are generally associated with long descent, hereditary good breeding and the like. In Church history a sect founded by Patricius (c. 387), teacher of Symmachus the Marcionite, are known as the Patricians; they believed that all flesh was made by the devil. The name is also, though rarely, applied to the Roman Catholic body in Ireland regarded as the followers of St Patrick.

I. From the earliest period known to us the free population of Rome contains two elements, patricians and plebeians, the former class enjoying all political privileges, the latter unprivileged. The derivation and significance of the two names have been established with certainty. The patricians (patricii) are those who can point to fathers, i.e. those who are members of the clans (gentes) whose members originally comprised the whole citizen body. The plebeians (plebes, plebejus) are the complement (from root pleus, till, see plebs) of the noble families possessing a genealogy, and include all the free population other than the patricians. It has been held by T. Mommsen that the plebeian order had its sole origin in the clients who attached themselves in a position of semi-freedom to the heads of patrician houses, and gradually evolved a freedom and citizenship of their own (see Patron and Client). The logical consequence of this view is that the plebs as an order in the state is of considerably later growth than the beginning of the city, the patricians being originally the only freemen and the only citizens. But this view is untenable on two grounds. First, in the struggle between the two orders for political privilege we find the clients struggling on the side of the patricians against the main body of the plebeians (Livy ii. 56). Again, a method of taking up Roman citizenship which is well attested for a very early period reveals the possibility of a plebeian who does not stand in any relation to a patron. When an immigrant moved to Rome from one of the cities of the Latin league, or any city which enjoyed the jus communiei with Rome, and by the exercise of the right of voluntary exile from his own state (jus exulandi), claimed Roman citizenship, it is impossible to suppose that it was necessary for him to make application to a Roman patron to represent him in his legal transactions; for the jus communiei gave its holder the right of suing and being sued in his own person before Roman courts. Such an immigrant, therefore, must have become at once a free plebeian citizen of Rome. It may therefore be assumed that long before the clients obtained the right to hold land in their own names and appear in the courts in their own persons there was a free plebs existing alongside of the patricians enjoying limited rights of citizenship. But it is equally certain that before the time of Servius Tullius the rights and duties of citizenship were practically exercised only by the members of the patrician clans. This is perhaps the explanation of the strange fact that the clients, who through their patrons were attached to these clans, obtained political rights which place them on an equal footing with the plebeians who had no such semi-servile taint. At the time of the Servian reforms both branches of the plebs had a plausible claim to recognition as members of the state, the clients as already partial members of the curia and the gens, the unattached plebeians as equally free with the patricians and possessing clans of their own as solid and united as the recognized gentes.

But not only can it be shown that patricians and plebeians coexisted as distinct orders in the Roman state at an earlier date than the evolution of citizenship by the clients. It has further been established on strong archaeological and linguistic evidence that the long struggle between patricians and plebeians in early Rome was the result of a racial and social difference between them. There is reason to believe that the patricians were a Sabine race which conquered a Ligurian people of whom the plebeians were the survivors (see Rome: History). Apart from the definite evidence, the theory of a racial distinction gains probability from the fact that it explains the survival of the distinction between the patricii, men with a family and genealogy, and the rest of the citizens, for some time after the latter had acquired the legal status of patres and were organized in gentes of their own; for on this theory privilege would belong not to all who could trace free descent but only to those who could trace descent to an ancestor of the conquering race. The family organization of the conquering race was probably higher than that of the conquered, and was only gradually attained by the latter. Thus descent from a father would be distinctive enough of the dominant race to form the title of that race (patricii), and when that term had been definitely adopted as the title of a class its persistence in the same sense after the organization
of the family and the clan by the unprivileged class would be perfectly natural.

The absurdity of excluding the plebeians from all but a merely theoretical citizenship, based on the negative fact of freedom, seems to have become apparent before the close of the monarchical period. The aim of the reforms associated with the name of Servius Tullius appears to have been the imposition of the duties of citizenship upon the plebeians. Incidentally this involved an extension of plebeian privilege in two directions. First, it was necessary to unify the plebian order by putting the plebian estates of clients on a level with that of the unattached plebeians; and again enrolment in the army involved registration in the tribes and centuries; and as the army soon developed into a legislative assembly meeting in centuries (comitia centuriata), the whole citizen body, including plebeians, now acquired a share of political power, which had hitherto belonged solely to the patricians. At the close of the monarchy, the plebeian possessed the private rights of citizenship in entirety, except for his inability to contract a legal marriage with a patrician, and one of the public rights, that of giving the sacred games, in the exercise of which the plebeians were excluded to break the political monopoly to the duties of citizenship, military service and taxation, he was entirely on a level during the monarchy, when the king served to hold the power of the patrician families in check. But when these families had expelled the Tarquins, and formed themselves into an exclusive aristocracy of privilege, the inconsistency between partial privilege and full burdens came to be strongly felt by the plebeians.

The result was the long struggle for entire political equality of the two orders which occupies the first few centuries of the republic (see Polyb., History, § 11. “The Republic”). The struggle was inaugurated by the plebeian, who in 494 B.C. formed themselves into an exclusive order with annually elected officers (tribuni plebis) and an assembly of their own, and by means of this machinery forced themselves by degrees into all the magistracies, and obtained the coveted right of intermarriage with the patricians. Admission to the higher magistracies carried with it admission to the senate, and by the close of the struggle (about 300 B.C.) the political privilege of the two orders was equalized, with the exception of certain disabilities which, originally designed to break the political monopoly of the order, continued to be attached to the patricians after the victory of the plebs. They were excluded from the tribunate and the council of the plebs, which had become important instruments of government, and were only eligible for one place in the consulship and censorship, while both were open to plebeians. It is possible, though far from certain (see Seneca), that the powers of the interrex and the senatorial confirmation (patrum auctoritas) necessary to give validity to decisions of the people, remained the exclusive privileges of the patrician members of the senate. But while the patrician disabilities were of a kind that had gained in importance with the lapse of centuries, these privileges, even if still retained, had become merely formal in the second half of the republican period. Since the plebeian element in the state had an immense numerical preponderance over the patrician these disabilities were not widely spread, and seem generally to have been cheerfully borne as the price of belonging to the families still recognized as the oldest and noblest in Rome. But the adoption of P. Clodius Pulcher into a plebeian family in 59 B.C. with a view to election to the tribunate shows that a rejection of patrician rights (tribunos ad plebeis) was not difficult to effect by any patrician who preferred actual power to the dignity of ancient descent. It was not so easy to recruit the ranks of the patricians. The traditions of early Rome indeed represent the patricians as receiving the Claudii by a collective act into their body; but the first authenticated instance of the admission of new members to the patriciate is that of the lex Cassia, which authorized Caesar as dictator to create fresh patricians. The same procedure

was followed by Augustus. Later on, the right of creating patricians came to be regarded as inherent in the principate, and was exercised by Claudius and Vespasian without any legal enactment, apparently in their capacity as censor (Tac. Ann., xi., 255; Viti M. Antonini, i, 1). Patrician rank seems to have been regarded as a necessary attribute of the princes; and in two cases we are told that it was conferred upon a plebian posthumously (Vita Julii), 3 Macrini., 7). A comparison of this procedure with the original conception of the patriciate as revealed by the derivation of the word, is significant of the history of the conception of nobility at Rome, and illustrative of the tenacity with which the Romans clung to the name and form of an institution which had long lost its significance. After the political equalization of the two orders, noble birth was no longer recognized as constituting a claim to political privilege. Instead of the old hereditary nobility, consisting of the members of the patrician clans, there arose a nobility of office, consisting of all those families, whether patrician or plebeian, which had held curule office. It was now the tenure of office that conferred distinction. In the early days of Rome, office was only open to the member of a patrician gens. In the principate, patrician rank, a sort of abstract conception based upon the earlier state of affairs, was held to be a dignity suitable to be conferred on an individual holder of office. But the conferment of the rank upon an individual as distinct from a whole family (gens) is enough to show how widely the modern conception of patrician rank differed from the ancient. The explanation of this is that the plebeians were organized, like the patricians, in gentes, and nothing remained of the old nobility except a vague sense of dignity and worth. (A.M.C.)

II. Under Constantine an entirely new meaning was given to the word Patrician. It was used as a personal title of honour conferred for distinguished services. It was a title merely of rank, not of office; its holder ranked next after the emperor and the consul. It naturally happened, however, that the title was generally bestowed upon officials, especially on the chief provincial governors, and even among barbarian chieftains whose friendship was valuable enough to earn the imperial benediction. Among the former it appears to have become a sort of ex officio title of the Byzantine vicereguents of Italy, the archbishops of Ravenna; among the barbarian chiefs who were thus dignified were Odoacer, Theodoric, Sigismund of Burgundy, Clovis, and even in later days princes of Bulgaria, the Saracens, and the West Saxons. The word thus acquired an official connotation. The dignity was not hereditary and belonged only to individuals; thus a patrician family was merely one whose head enjoyed the rank of patricius. Gradually the root sense of “father” came to the front again, and the patricius was regarded as the “father of the emperor” (Ann., Aug. xxix. 2). With the word were associated such further titles as aeminentia, magnitudo, magnificiencia. Those patricians who were purely honorary were called honorarii or codicellarii; those who were still in harness were praesentes. They were all distinguished by a special dress or uniform and in public always drove in a carriage. The emperor Zeno enacted that no one could become patricius who had not been praefectus militum, consul or magister militum, but less careful emperors gave the title to their favourites, however young and undistinguished. The writer in which the title was conferred was the “diploma” of Pippin the Young, the name of which is marked by its incorporation on Pippin the Young as diploma. The idea of this extension originated no doubt in the fact that the Italian patricius of the 6th and 7th centuries had come to be regarded as the defender, protector, patronus of the Church. At all events, the conferment of the title by a pope was entirely unprecedented; previously its validity had depended on the emperor solely. As a matter of fact it is clear that the patriciate of Pippin was a new office, especially as the title is henceforward generally patricius Romanorum, not patricius alone. It was

1 The name is used of Charles Martel, but it was not apparently formally conferred upon him.
subsequently conferred on Charlemagne at his coronation, and
borne, as we gather from medieval documents, indiscriminately,
not only by subsequent emperors, but also by a long line
of Burgundian rulers and minor princes of the middle ages
generally. On the fall of the Carolingian house the title passed
to Alberic II. Subsequently it was held by John Crescentius,
and many leading men who received it from Otto III. (e.g.
Boleslaw Chabi of Poland). In 1046 it returned to the German
Henry III. The crown-wearder Bertharossa was the last,
to wear the insignia (in 1167).

PATRICK, ST., the patron saint of Ireland, was probably born
about the year 380. He was the son of a deacon, Calpurnius,
and the grandson of a presbyter named Potitus. His father was a
middle-class landlord and proprietor, a deacon, who is represented
as living at a place called Banamante. The only place of this name we
know is Devanity, but it seems more probable that Patrick’s home is to be sought somewhere in the
region of that on the three places called Banwen in Glamorgan-
shire may be intended. The British name of the future apostle was
Sucat, to which Mod. Welsh hygyd, “warlike,” corresponds.
His Roman name has also survived in a hibernized form,
Cothirg, with the common substitution of Irish c for Brythonic
p (cf. Irish cise, Lat. pascha). Patrick was doubtless educated as
a Christian and was imbued with reverence for the Roman
Empire. When about sixteen years of age he was carried off by a
band of Irish marauders. The latter were possibly taking part
in the raid of the Irish king Niall Noigiallach, who met with his
end in Britain in 405. Irish tradition represents the future
apostle as the owner of a chieftain of the tribe of Milucc
(Milich), near the mountain called Slemish in county Antrim,
but Bury tries to show that the scene of his captivity was
Connaught, perhaps in the neighbourhood of Croagh Patrick.
His bondage lasted for six years. During this time he became
subject to religious emotion and beheld visions which encouraged
him to effect his escape. He fled, in all probability to the coast
of Wicklow, and encountered a vessel which was engaged in the
export of Irish wool-dogs. After three days at sea the traders
landed, possibly on the west coast of Gaul, and journeyed
for twenty-eight days through a desert. At the end of two months
Patrick arrived from this country and betook himself to the
monastery of Lérins, where he probably spent a few years. On
leaving the Mediterranean he seems to have returned home.
It was doubtless during this stay in Britain that the idea of mission-
ary enterprise in Ireland came to him. In a dream he saw a
man named Victorius bearing innumerable epistles, one of
which he received and read; the beginning of it contained the
words “The Voice of the Irish”; whilst repeating these words
he says, “I imagined that I heard in my mind the voice of those
who were near the wood of Foclut (Fochlad), which is near the
western sea, and thus they cried: ‘We pray thee, holy youth,
to come and walk again amongst us as before.’” The forest
of Fochlad was in the neighbourhood of Killala Bay, but it is
possible that it extended considerably to the south. Despite
his natural difflence, and opposition on the part of his relatives,
Patrick resolved to return to Gaul in order to prepare himself
for his mission. He proceeded to Auxerre—a place which seems
to have had a close connexion with Britain and Ireland—and
was ordained deacon by Bishop Amator, along with two others
who were afterwards associated with him in spreading the faith
in Ireland. The one was an Irishman called Fitz, better known
as Iserninus, the other Auxilius. Patrick must have spent at
least fourteen years at Auxerre.

It seems not unlikely that Pelagianism had taken root among
the Christian communities of Ireland, and it was found necessary
to send a bishop to combat the heresy. Pope Celestine’s choice
fell on the deacon Palladius, who had taken a prominent part in
stamping out the doctrine in Britain. The mission of Palladius
(431-432), whom Zimmer has endeavoured to identify with
Patrick, is obscure. Tradition associates his name with the
mountains of Wicklow, and we are told that he retired to the
land of the Picts in North Britain, where he died. Patrick
probably felt great disappointment when Palladius was sent as
the chosen envoy of Rome, but now Germanus seems to have
decided that Patrick was the man for the task, and he was
consecrated in 432. For the peculiar social conditions with
which the Christian missionary would be confronted in Ireland
see BREHON LAWS AND IRELAND: Early History. Suffice it to
say here that the land belonged to the tribes, and that the success
of Patrick’s undertaking depended entirely on his ability to gain
the goodwill of the tribal kings and chiefs of clans. We are
totally ignorant as to the extent and number of the pre-Patrician
Christian communities in Ireland. It seems probable that they
were, largely, if not wholly confined to the south-east of
the island. Patrick landed at Inveradea, the mouth of the river Vartry in
Wicklow, but we are not informed as to any of his doings in
Leinster at this period. According to the story, he immediately
proceeded northward to the kingdom of Uldia (east Ulster),
though a certain tradition represents him as going to Meath.
Landing on the shores of Strangford Lough, he commenced his
labours in the plain on the south-west side of that inlet. A
convert chief named Dichu granted him a site for an establish-
ment, and a wooden barn is stated to have been utilized for
the purpose of worship, whence the modern Saul (Ir. saiball, “barn”).
Patrick’s activity was bound to bring him sooner or later into
conflict with the High-king Loigaire (reigned 428-467), son of
Niall Noigiallach. Fedelma, a sister of the monarch, is
represented as having made over his estate at Trim to the saint
to found a church, and thus the faith was established within
Loigaire’s territory. The story in picturesque fashion makes
Patrick challenge the royal authority by lighting the Paschal
fire on the hill of Slane on the night of Easter Eve. It chanced
to be the occasion of a pagan festival at Tara, during which no
fire might be kindled until the royal fire had been lit. A number
of trials of skill between the Christian missionary and Loigaire’s
Druids ensued, and the final result seems to have been that the
monarch, though unwilling to embrace the foreign creed,
derived the protection of the Christian bishop. At a later date the saint
was probably invited by Loigaire to take part in the codification
of the Souchus Mor in order to represent the interests of
the Christian communities. On another occasion Patrick is reported
to have overthrown a famous idol known as Cenn Cruithch
or Crom Cruach in the plain of Mag Slecht (county Cavan).
Several churches seem to have been founded in the kingdom
of Meath by the saint, but they cannot now be identified.
Patrick is stated to have visited Connaught on three different
occasions and to have founded churches, one of the most impor-
tant being that at Elphin. As regards Ulster our information
is very meagre, though we must not forget that this province was
under the three kingdoms of the province (Ailech, Oriel and Ulidia).
Patrick’s work is more closely identified with the north of Ireland
than with the south. Traces of his mission, however, are to be
found in Ossory and Muskerry. But his task in the south was
doubtless rather that of an organizer, and a kind of circular letter
has come down to us which was addressed by Patrick, Auxilius
and Iserninus, to all the clergy of the island. There is some

1 We even find a feminine form, patricissa, for the wife of a patricius.
The golden circlet worn on the head by the patricius as a symbol of
his dignity was called a patricialis circulus.

2 His career is involved in considerable obscurity. Widely varying
views have been put forward as to the extent to which some going so far as to treat all the accounts of his labours as
the fictitious creation of a later age. In the present account Bury’s
reconstruction of the saint’s life has been chiefly followed. Apart
from this, Bury’s broadening of the other Bury’s treatment of the
subject has at any rate the merit of defending the traditional view
of St Patrick’s career.
In the later 17th and early 18th centuries, a number of important Irish works were published, including the *Life of St Patrick* by John Colgan (1679), which was based on Bede's *Ecclesiastical History*. This work was followed by *The Life of St Patrick in History* by J. B. Bury (1905), and *The Celtic Church in Britain and Ireland* by J. Gwynn (1902), both of which provided critical editions of the earlier writings. The *Life of St Patrick* was also translated into Latin as *Thaumaturga* by Whitley Stokes, and printed as *The Life of St Patrick* (critical ed.) in *Proceedings of the Royal Irish Academy* (1904).

**PATRICK, SIMON** (1625-1707), English divine, was born at Gainsborough, Lincolnshire, on the 8th of September 1626. He entered Queen's College, Cambridge, in 1644, and after taking orders in 1651 became successively chaplain to Sir Walter St John and vicar of Battersea, Surrey. He was afterwards (1652) preferred to the rectory of St Paul's, Covent Garden, where he continued to labour during the plague. He was appointed dean of Peterborough in 1677, and bishop of Chichester in 1689, in which year he was employed, along with others of the new bishops, to settle the affairs of the Church in Ireland. In 1691 he was translated to the see of Ely, where he held until his death on the 31st of May 1707. His sermons and devotional writings, which are very numerous, were long held in high estimation, and his *Commentary on the Historical and Poetical Books of the Old Testament*, in 10 vols., brought down as far as the Song of Solomon, was reprinted as recently as 1853.

**PATRIZZI, FRANCESCO** (Franciscus Patritius) (1529-1597), Italian philosopher and scientist, was born at Chiaia, in Dalmatia, and died in Rome. He gained the patronage of the Duke of Mantua, and was sent to Germany and Greece, where he was recognized as a scholar. He was immediately recognized by his appointment to the chair of philosophy at Ferrara. He was subsequently invited to Rome by Clement VIII. In spite of his almost incessant controversies with the Aristotelians, he found time to make a comprehensive study of contemporary science. He published in 15 books a treatise on the *New Geometry* (1587), and works on history, rhetoric and the art of war. He studied ancient theories of music, and is said to have invented the thirtysyllable verse known subsequently as versi marlitrani. In his philosophy he was mainly concerned to defend Plato against the followers of Aristotle.

His two greatest works, *Discussionum peripateticorum libri XV.* (Basel, 1571), and *Nova de universis philosophia* (Basel, 1501), developed the view that, whereas Aristotle's teaching was in direct opposition to Christianity, Plato, on the contrary, foreshadowed the Christian revelation and prepared the way for its acceptance. In the earlier treatise he treats the life and character of Aristotle, impugns the authenticity of almost all his works, and attempts to trace the doctrines from a mythical standpoint. In the second and greater work he goes back to the theories and methods of the Ionians and the pre-Socratics generally. His theory of the universe is that, from God there emanated Light which extends throughout space and is the explanation of all development. This Light is not corporeal and yet is the fundamental reality of things. From Light came Heat and Fluidity; these three together with Space make up the elements out of which all things are constructed. This cosmic theory is a curious combination of materialistic and abstract ideas; the influence of his master Telesio (q.v.), generally predominant.
is not strong enough to overcome his inherent dishonesty in the adequacy of purely scientific explanation.

PATROCLUSES (c. 312–261 B.C.), a Macedonian general and writer on geographical subjects, who lived during the reigns of Seleucus I and Antiochus I. With the command of the fleet of Seleucus (285) he undertook a voyage of exploration on the Caspian Sea to discover possible trade routes, especially for communication with the peoples of northern India. He came to the conclusion that the Caspian was a gulf or inlet, and that it was possible to enter it by sea from the Indian Ocean. The only information as to his work (even the title is unknown) is derived from Strabo. After the death of Seleucus, Patrocles was sent by his successor Antiochus I to put down a revolt in Asia Minor, and lost his life in an engagement with the Bithynians.

See Strabo ii. 68, 74, xi. 308, xv. 689; Diod. Sic. x. 100; Plutarch, Deis. 214; Mommsen, Illyricorum, ed. 224 (in Mem- non); C. W. Müller, Fragmenta historiorum graecorum, ii. 442; E. H. Bunbury, Hist. of Ancient Geography, vol. i. (1879); W. W. Tarn, "Patrocles and the Open-Caspian Trade Route" in Journal of Hellenic Studies, vol. xxi. (1910).

PATROL (Fr. patrouiller, connected with potte, foot), a verb meaning to move up and down or traverse a specified "round" or "beat" in a district in a town, camp or other place, or on a stretch of water on a river or sea, for the purpose of watching and protecting the same, or for reconnoitering the numbers or positions of an enemy. As a substantive the term is used of the detachment of troops or police employed.

PATRON, a word of which the various meanings in European languages are derived and transferred from that of the Lat. patronus, whose position in Roman law and antiquities is treated below (PATRON AND CLIENT). The most general application of the word in these transferred senses is that of an influential supporter or protector. The earliest use of the word in English appears to have been in the special ecclesiastical sense of the holder of an advowson, the right of presentation to a benefice. From this meaning is deduced that of the person in whom lies the right of presenting to public offices, privileges, &c., still surviving in the title of the Patronage Secretary of the Treasury in Great Britain. From the earliest Christian times the saints took the place of the pagan tutelary deities (Di tutelares) and were in this capacity called tutelares or patroni, patron-saints. To them churches and other sacred buildings are dedicated, and they are regarded as the protectors and guardians of countries, towns, professions, trades and the like. Further, a person may have a patron-saint, usually the one on or near whose festival he has been born, or whose name has been taken in baptism.

A full list of saints, with the objects of the peculiar patronage of each, is given in M. E. C. Walcott's Sacred Archaeology (1868).

PATRON AND CLIENT (Lat. patronus, from pater, father; clientes or clientes, from clueri, to obey), in Roman law. Clientage appears to have been an institution of most of the Graeco-Italian peoples in early stages of their history; but it is in Rome that we can most easily trace its origin, progress and decay. Until the reforms of Servius Tullius, the only citizens proper were the members of the patrician and gentile houses; they alone could participate in the solemnities of the national religion, take part in the government and defence of the state, contract quiritarian marriage, hold property, and enjoy the protection of the laws. But alongside of them was a gradually increasing non-citizen population composed partly of slaves, partly of free-men, who were nevertheless not admitted to bourgeois rights. To the latter class belonged the clients, individuals who had attached themselves in a position of dependence to the heads of patrician houses as their patrons, in order thereby to gain attachment to a гос, which would involve a de facto freedom. Mommsen held that the плеbs consisted originally of clients only; but the earliest records of Rome reveal the possibility of a man becoming a plebeian member of the Roman state without assuming the dependent position of clientship (see PATRIANS); and long before the time of Servius Tullius the clients must be regarded as a section only of the plebeian order, which also contained members unattached to any patronus. The relationship of patron and client was ordinarily created by what, from the client's point of view, was called adoptio ad patronum, from that of the patron, susceptor clientis—the client being either a person who had come to Rome as an exile, who had passed through the asylum, or who had belonged to a state which Rome had overthrown. According to Dionysius and Plutarch, it was one of the early cares of Romulus to regulate the relationship, which, by their account of it, was estimated a very inferior one, imposing upon the patron duties only less sacred than those he owed to his children and his ward, more urgent than any he could be called upon to perform towards his kinsmen, and whose neglect entailed the penalty of death (Tellermonis sacer esto). He was bound to provide his client with the necessaries of life; and it was a common practice to make him a grant during a pleasure of a small plot of land to cultivate on his own account. Further, he had to advise him in all his affairs; to represent him in any transactions with third parties in which, as a non-citizen, he could not act with effect; and, above all things, to stand by him, or rather be his substitute, in any litigation in which he might become involved. The client in return had not only generally to render his patron the respect and obedience due by a dependant, but, when he was in a position to do so and the circumstances of the patron required it, to render him pecuniary assistance. As time advanced and clients amassed wealth, we find this duty insisted upon in a great variety of forms, as in contributions towards the dowries of a patron's daughters, towards the ransom of a patron or any of his family who had been taken captive, towards the payment of penalties or fines imposed upon a patron, even towards his maintenance when he had become reduced to poverty. Neither might give evidence against the other—a rule we find still in observance well on in the 1st cent. B.C., when C. Herennius declined to be a witness against C. Marius on the ground that the family of the latter had for generations been clients of the Herennii (Plut. Mar. 3). The client was regarded as a minor member (gentilicius) of his patron's gens; he was entitled to assist in its religious services, and bound to contribute to the cost of them; he had to follow his patron to battle on the order of the gens; he was subject to its jurisdiction and discipline, and was entitled to burial in its common sepulchre. And this was the condition, not only of the client who personally had attached himself to a patron, but that also of his descendants; the patronage and the clientage were alike hereditary. The same relationship was held to exist between a freedman and his former owner; for originally a slave did not on enfranchisement become a citizen; it was a de facto freedom merely that he enjoyed; his old owner was always called his patron, while he and his descendants were substantially in the position of clients, and often so designated.

In the two hundred years that elapsed before the Servian constitutional reforms, the numerical strength of the clients, whether in that condition by adplicatio, enfranchisement or descent, must have become considerable; and it was from time to time augmented by the retainers of distinguished immigrants admitted to the ranks of the patriciate. There seems also to have been during this period a gradual growth of virtual independence on the part of the clients, and it is probable that their precarious tenure of the soil had in many cases come to be practically regarded as ownership, when a patron had not asserted his right for generations. The exact nature of the privileges conferred on the clients by Servius Tullius is not known. Probably this king guaranteed to the whole plebeian order, including the clients, the legal right of private ownership of Roman land. At the same time he imposed upon the whole body of his subjects the annual assessment of a tax, which was levied on a basis of wealth. The client had previously been liable to military service in the command of the gens. Now he was called upon to take his part in it as a member of the state. As a natural corollary to this, all the plebeians seem to have been enrolled in the tribes, and after the institution of the plebeian assembly (concilium plebis) the clients, who formed a large part of the order, secured a political influence which steadily increased. It is not certain how soon they acquired the right to litigate in person on their own behalf, but their possession of this right
seems to be implied in the XII. Tables, and may have been granted them at an earlier date. At any rate after 449 B.C. there were no disabilities in private law involved in their status. The relation of patron and client, it is true, still remained; the patron could still exact from his client respect, obedience and service, and he and his gens had still an eventual right of succession to a deceased client’s estate. But the fiduciary duties of the patron were greatly relaxed, and practically little more was expected of him than that he should continue to give his client his advice, and prevent him falling into a condition of indigence. Frederick C. was entitled to be the protector of protection denied or withheld, its application being limited to *frons facta*, which in the language of the Tables meant positive injury inflicted or damage done.

So matters remained during the 4th, 3rd and 2nd centuries. In the 2nd and 1st a variety of events contributed still further to modify the relationship. The rapacity of patrons was checked by the lex Cincia (passed by M. Cinclus Alimentus, tribune in 204 B.C.), which prohibited their taking gifts of money from their clients; marriages between patron and client gradually ceased to be regarded as unlawful, or as indirectly disastrous to the issue the status of the patron father. At the same time the remaining political disabilities of the clients were removed by their enrolment in all the tribes instead of only the four city tribes, and their admission to the magistracy and the senate. Hereditary clientage ceased when a client attained to a curule dignity; and in the case of the descendants of freedmen enfranchised in solemn forms it came to be limited to the first generation. Gradually but steadily one feature after another of the old institution disappeared, till by the end of the 1st century it had resolved itself into the limited relationship between patron and freedman. On the one hand, the former had an exaggerated honorific relationship between the patron who gave gratuitous advice on questions of law and those who came to consult him on the other. To have a large following of clients of this class was a matter of ambition to every man of mark in the end of the republic; it increased his importance, and ensured him a band of zealous agents in his political schemes. But amid the rivalries of parties and with the venality of the lower orders, baser methods had to be resorted to in order to maintain a patron’s influence; the favour and support of his clients had to be purchased with something more substantial than mere advice. Writing of his native city, one of the most vigorous and warlike of his countrymen, of which Martial, who was not ashamed to confess himself a first-rate specimen of the breed, has given us such graphic descriptions; gatherings of idlers, syphophants and spendthrifts, at the leves and public appearances of those whom, in their favouring servility, they addressed as lords and masters, but whom they abused behind their backs as close-fisted upstarts—and all for the sake of the *spalata*, the daily dole of a dinner, or of a few pence wherewith to procure one. With the middle empire this disappeared; and when a reference to patron and client occurs in later times it is the sense of counsel and client, the word patron and advocate being used almost synonymously. It was not so in the days of the great forensic orators. The word advocate, it is said, occurs only once in the singular in the pages of Cicero. But at a later period, when the bar had become a profession, and the qualifications, admission, numbers and fees of counsel had become a matter of state regulation, *advocati* was the word usually employed to designate the pleaders as a class of professional men, each individual advocate, however, being still spoken of as patron in reference to the litigant with whose interest he was entrusted. It is in this limited connexion that patron and client come under our notice in the latest monuments of Roman law.

**PATTEN (adapted from Fr. *patin*, in modern usage meaning a “skate”; Med. Lat. *patinus*, Ital. *pattino*, of unknown origin; cf. *patte*, paw), a kind of shoe which, varying in form at different times and places, raised the wearer from the ground in order to keep the feet out of mud or wet. Pattens were necessary to women of all classes and uncleaned and unpaved streets of the 16th, 17th and 18th centuries. They may still be found in use in rural parts of England. A wooden shoe or clog, a light strapped shoe with a very thick sole of wood or cork, and, more recently, a little distaffing shoe, sitting at right angles to the ground, was a wooden sole with a strap through which the foot slips, have all been types which the patten has taken. An extraordinary kind of “patten” was fashionable in Italy and Spain in the 16th or 17th centuries. This was the *chopine*, a loose slipper resting on a very thick sole of cork or wood. During the 17th century at Venice ladies wore “chopines” of exaggerated size. Coryat, in his * Crudities*, 1611 (vol. i, p. 400, ed. 1905), gives a description of these Venetian “chapanays.” They were of wood covered with red, white and yellow leather, some gilt or painted, and reached a height sometimes of half a yard. Ladies henceforward considered it degrading to wear a chopine; thus Samson’s “curate” was compelled by the authorities to doff his chopine, and.attendants to prevent them falling. There is a 16th century Venetian “chopine” in the British Museum. The “Patten-makers” Company is one of the minor Livery companies of London. The patten-makers were originally joined with the “Pouch and Gallowe Makers,” and are mentioned as early as 1400. They became a separate fraternity in 1496, but did not obtain a charter till 1670.

**PATTER, properly a slang word for the secret or “cant” language used by beggars, thieves, gipsies, &c., hence the fluent plausible talk that a cheap-jack employs to dissuade off his goods, or a conjurer to cover up his tricks. It is thus used of any rapid manner of talking, and of a “patter-song,” in which a very large number of words have to be sung at high speed to fit them to the music. The word, though in some of its senses affected by “patter,” to make a series of rapid strokes or pats, as of raindrops, is derived from the quick, mechanical repetition of the *Patterner*, or Lord’s Prayer.

**PATTERN, a model, that which serves as an original from which similar objects may be made, or as an example or specimen; in particular an artistic design serving as a sample or model, hence the arrangement or grouping of lines, figures, &c., which make up such a design. The word was taken from Fr. *patron*, Lat. *patronus*, a defender or protector. In medieval Latin *patronus* had the specific meaning of example, and in modern French both meanings of patron and pattern attach to *patron*. “Patron” in the sense of copy, example, began to be pronounced and spelled in England as “pattern” in the 16th century.

**PATTESON, JOHN COLERIDGE (1827-1871), English missionary, bishop of Melanesia, was born in London on the 1st of April 1827, the eldest son of Sir John Patteson, judge of the Supreme Court of Hong Kong, and a native of the Bahamas. Colonel Patteson was the relative of Samuel Taylor Coleridge. He was educated at Ottery St Mary and at Eton, where he distinguished himself on the cricket-field. He entered Balliol College, Oxford, in 1845, graduated B.A. in 1848, and in 1852 became a fellow of Merton College. In 1853 he became curate of Allington, Devon, and in the following year he was ordained priest. He then joined George Augustus Selwyn, bishop of New Zealand, in a mission to the Melanesian islands. There he laboured with great success, visiting the different islands of the group in the mission ship the “Southern Cross,” and by his good sense and devotion winning the esteem and affection of the natives. His linguistic powers were...

1 The word is taken from an obsolete French *chopine* or Spanish *chapin*, and is of doubtful origin. The Spanish *chapin*, flat plate, has been suggested. The word does not occur in Italian, though it is often Italianized in English in such forms as *cioppino*. 
exceptional, and he spoke 23 languages with ease. In 1861 he was consecrated bishop of Melanesia, and fixed his headquarters at Mata. He was killed by natives at Nukapu, in the Santa Cruz group, on the 20th of September 1871, the victim of a tragic error. The traders engaged in the nefarious traffic in Kanaka labour for Fiji and Queensland had taken to personating missionaries in order to facilitate their kidnapping; Patteson was mistaken for one of these and killed. His murderers evidently found out their mistake and repented of it, for the bishop's body was found at sea floating in a canoe, covered with a palm fibre matting, and a palm-branch in his hand. He thus represented in the last-relucted erected in Merton College to his memory.

See Life by Charlotte M. Yonge (1873).

**PATTI, ADELINA JUANA MARIA** [BARONESS CEDERSTRÖM] (1833–1919), the famous vocalist, daughter of an Italian singer, Salvatore Patti, was born at Madrid on the 15th of February 1843. Her mother, also a singer, was Spanish, being known before her marriage as Signora Barili. Both the parents of Adelina went to America, where their daughter was taught singing by Maurice Strakosch, who married Amelia Patti, an elder sister. Gifted with a brilliant soprano voice, Adelina Patti made her public debut at the extraordi- nary concert at the Union Hall, New York, in 1854. In 1855 she also made her first appearance as Lucia in Donizetti's opera, Lucia di Lammermoor. On the 14th of May 1861 she sang as Amina in Bellini's opera La Sonnambula at Covent Garden, and from this time she became the leading operatic prima donna, her appearances in London, Paris and the other principal musical centres being a long succession of triumphs, and her rôles covering all the great parts in Italian opera. In 1868 she married Henri, marquis de Caux, a member of Napoleon III's household, from whom she was divorced in 1855; she then married Nicodini, the tenor, who died in 1859; and in 1869 she became the wife of Baron Cederström, a society lady, who naturalized as an Englishman. Madame Patti ceased to appear on the operatic stage in public after the 'eighties, but at Craig-y-Nos, her castle in Wales, she built a private theatre, and her occasional appearances at concerts at the Albert Hall continued to attract enthusiastic audiences, her singing of "Home, Sweet Home" becoming peculiarly associated with those events. Partly owing to her fine original training, partly to her splendid method and partly to her avoidance of Wagnerian rôles, Madame Patti wonderfully preserved the freshness of her voice, and she will be remembered as, after Jenny Lind, the greatest soprano of the 19th century. He is the town and episcopal see of Sicily, the principal city of Messina, 42 m. W. by S. of Messina by rail. Pop. (1901), 5473 (town), 19,005 (commune). The cathedral, founded about 1300, has been modernized; it contains the tomb (restored in the 17th century) of Adelasia, widow of Count Roger of Sicily. The abandoned church of San Marco is built into the remains of a Greek temple.

**PATTISON, MARK** (1813–1884), English author and rector of Lincoln College, Oxford, was born on the 20th of October 1813. He was the son of the rector of Hauxwell, Yorkshire, and was privately educated by his father. In 1832 he matriculated at Oriel College, where he took his B.A. degree in 1836 with second-class honours. After other attempts to obtain a fellowship, he was elected in 1839 to a Yorkshire fellowship at Lincoln, an anti-Puseyite College. Pattison was at this time a Puseyite, and generally under the influence of J. H. Newman, for whom he worked, helping in the translation of Thomas Aquinas's Catena Aurea, and writing in the British Critic and Christian Rememb-rancer. He was ordained priest in 1843, and in the same year became tutor of Lincoln College, where he rapidly made a reputation as a clear and stimulating teacher and as a sympathetic friend of youth. The management of the college was practically in his hands, and his reputation as a scholar became high in the university. In 1851 the rectorship of Lincoln became vacant, and it seemed certain that Pattison would be elected, but he lost it by a disagreeable intrigue. The disappointment was acute and his health suffered. In 1855 he resigned the tutorship, travelled in Germany to investigate Continental systems of education, and began his researches into the lives of Casaubon and Scaliger, which occupied the remainder of his life. In 1861 he was elected rector of Lincoln, marrying in the same year Emilia Francis Strong (afterwards Lady Dilke). The rector contributed largely to various reviews on literary subjects, and took a considerable interest in social science, even presiding over a section at a congress in 1876. The routine of university business he avoided with contempt, and refused the vice-chancellorship. But while living the life of a student, he was fond of society, and especially of the society of women. He died at Harrogate on the 30th of July 1884. His biography of Isaac Casaubon appeared in 1875; Milton, in Macmillan's English Men of Letters series in 1879. The 18th century, alike in its literature and its theology, was a favourite study, as is illustrated by his contribution (Tendencies of Religious Thought in England, 1688–1750) to the once famous Essays and Reviews (1866), and by his edition of Pope's Essay on Man (1869), &c. His Sermons and Collected Essays, edited by Henry Nettleship, were published posthumously (1884), as well as the Memoirs (1885), an autobiography deeply tinged with melancholy and bitterness. His projected Life of Scaliger was never finished. Mark Pattison was an anti-Puseyite, and seems hardly consistent with his position as a priest of the English Church.

Mark Pattison’s tenth and youngest sister was Dorothy Wyndlow Pattison (1832–1878), better known as Sister Dora, the name she took in 1864 on becoming a member of the Anglican sisterhood of the Good Samaritan at Cootham, Yorkshire. In 1865 she was sent as nurse to their cottage hospital in Walsall, and from 1867 to 1877 she was in charge of a new hospital there. She left the sisterhood in 1874, and their hospital in 1877, to take charge of the municipal epidemic hospital, where the cases were largely small-pox. She had meanwhile qualified herself thorough- ly in medicine, and was a nurse of the highest rank. Her efforts greatly endeared her to those among whom she worked, and after her death a memorial window was erected in the parish church, and a marble portrait statue by F. J. Williamson in the principal square of Walsall.

See Margaret Lonsdale’s Sister Dora (1887 ed.).

**PATTON, FRANCIS LANDY** (1843–1903), American educationalist and theologian, was born in Warwick parish, Bermuda, on the 22nd of January 1843. He studied at Knox College and at the university of Toronto; graduated at Princeton Theological Seminary in 1865; was ordained to the Presbyterian ministry in June 1868; was professor of the 8th Street Presbyterian Church, New York City, in 1865–1867, of the Presbyterian Church of Nycck, New York, in 1867–1870, of the South Church, Brooklyn, in 1871, and of the Jefferson Park Presbyterian Church, Chicago, in 1874–1881; and in 1872–1881 was professor in McCormick Seminary, Chicago. He was moderator of the General Assembly of the Presbyterian Church in 1878. In 1881–1888 he was Stuart professor “of the relation of philosophy and science to the Christian religion” (a chair founded for him) in Princeton Theological Seminary; in 1888–1902 he was president of the College of New Jersey, which in 1896 became Princeton University, and in 1902 he became president of Princeton Theological Seminary. He brought charges of heresy in 1874 against David Swing, and was prosecuting attorney at Swing’s trial. In 1891 and 1892 he was one of the opponents of Dr Charles A. Briggs at the time of the Briggs heresy case. Dr Patton was an opponent of the revision of the Confession.
PAU—PAUL, THE APOSTLE

of Faith. He was editor, with Dr Briggs, of the Presbyterian Review, in 1888-1889. He wrote The Inspiration of the Scriptures (1869), and Summary of Christian Doctrine (1874).

Pau is a city of south-western France, chief town of the department of Basses-Pyrénées, 66 m. N.E.E. of Bayonne on the southern railway to Toulouse. Pop. (1906), 30,315. It is situated on the border of a plateau 130 ft. above the right bank of the Gave de Pau (a left-hand affluent of the Adour), at a height of about 620 ft. above the sea. A small stream, the Hédas, flowing in a deep ravine and crossed by several bridges, divides the city into two parts. The modern importance of Pau is due to its climate, which makes it a great winter health-resort. The most striking characteristic is the stillness of the air, resulting from the peculiarly sheltered situation. The average rainfall is about 33 in., and the mean winter temperature is 43°, the mean for the year being 56°.

The town is built on a sandy soil, with the streets running east and west. The Place Royale (in the centre of which stands Nicolas Bernard Raggi’s statue of Henry IV., with bas-reliefs by Antoine Etex) is admired for the view over the valley of the Gave and the Pyrenees; it is connected by the magnificent Boulevard des Pyrénées with the castle gardens. Beyond the castle a park of thirty acres planted with beech trees stretches along the high bank of the Gave. Access to the castle is obtained by a stone bridge built under Louis XV.; this leads to the entrance, which gives into a courtyard. On the left of the entrance is the donjon or tour de Gaston Phébus. On the right are the tour neuve, a modern erection, and the Tour de Montaunet (Monte-Oiseau), the higher storeys of which were reached by ladders; Tour de Bihères faces north-west, the Tours de Mazères south-west. Another tower between the castle and the Gave, the Tour de la Monnaie, is in ruins.

In the gardens to the west of the castle stand a statue of Gaston Phébus, count of Foix, and two porphyry vases presented by Bernadotte king of Sweden, who was born at Pau. On the ground-floor is the old hall of the estates of Béarn, 85 ft. long and 36 ft. wide, adorned with a white marble statue of Henry IV., and magnificent Flemish tapestries ordered by Francis I. Several of the upper chambers are adorned with Flemish, Brussels or Gobelins tapestry, but the most interesting room is that in which Henry IV. is said to have been born, containing his cradle made of a tortoise-shell, and a magnificent carved bed of the time of Louis XII. The churches of St Jacques and St Martin in the Gothic style are both modern. The lyceé occupies a portion of the buildings of a Jesuit college founded in 1622. The prefecture, the law-court and the hotel de ville present no remarkable features. Pau is the seat of a court of appeal and a court of assizes and has a tribunal of commerce and a chamber of arts and manufactures. There are training colleges for both sexes, a library, an art museum and several learned societies. Pau owes most of its prosperity to its visitors. The golf club, established 1856, has a course of 18 holes, on the Plaine de Bihèrè, about a mile from the town. Among the industrial establishments are flour-mills, cloth factories and tanneries, and there is trade in wine, hams, horses and cloth.

Pau derives its name from the word pöl, in allusion to the stake or platform placed up on the site chosen for the town. It was founded probably at the beginning of the 11th century by the viscounts of Béarn. By the erection of the present castle in the latter half of the 14th century, Gaston Phébus made the town a place of importance and after his death the viscounts of Béarn visited it frequently. Gaston IV. granted a charter to the town in 1494. François Phébus, grandson and successor of Gaston, became king of Navarre in 1479, and it was not until 1512 that the loss of Spanish Navarre caused the rulers of Béarn to transfer their residence from Pamplona to Pau, which till 1589 was their seat of government. Margaret of Valois, who married Henri d’Albret, made her court one of the most brilliant of the time. In 1533 her daughter Jeanne d’Albret gave birth to Henry IV., who governed Béarn in the name of her brother. In 1620 when French Navarre and Béarn were reduced to the rank of province, the intendants took up their quarters there. In the 19th century Abd-el-Kader, during part of his captivity, resided in the castle.

PAUL, “the Apostle of the Gentiles,” the first great Christian missionary and theologian. He holds a place in the history of Christianity second only to that of the Founder himself. It was no accident that one who has been styled “the second founder of Christianity” was born and bred a Pharisee. Rather it was through personal proof of the limitations of legal Judaism that he came to distinguish so clearly between it and the Gospel of Christ, and thereby to present Christianity as the universal religion for man as man, not merely a sect of Judaism with proselytes of its own. For this, and nothing less, was the issue involved in that great trial in the temple when he was accused of teaching the Jews Jesus to be Christ; and it was Paul who settled it once and for all.

A modern Jew has said, “Jesus seems to expand and spiritualize Judaism; Paul in some senses turns it upside down.” The reason of this contrast is their respective attitudes to the Law as the heart of Judaism. Jesus seems never to have breathed the atmosphere of Rabbinic Judaism. Hence his was a purely positive reinterpretation of the spirit of Old Testament religion as a whole. His attitude to the Law was one of habitual detachment to its ordinances, combined with sovereign freedom towards its letter when the interests of its spirit so required (cf. F. J. A. Hort, Judaistic Christianity, chap. II.). To this the primitive apostles and their converts in the main adhered, without seeing far into their Master’s principle in the matter; nor did they feel any great straining of the spirit by the letter of the Mosaic, rather than the Rabbinic Law. But with Paul it was otherwise. As Saul the Pharisee he had taken the Mosaic Torah as divine Law in the strictest sense, demanding perfect inner and outer obedience; and he had relied on it utterly for the righteousness it was held able to confer. Hence when it gave way beneath him as means of salvation—nay, plunged him ever more deeply into the Slough of Despond by bringing home his inability to be righteous by doing righteousness—he was driven to a revolutionary attitude to the Law as method of justification.

“Through (the) Law” he “died unto (the) Law,” that he “might live unto God” (Gal. ii. 19). By this experience not only Pharisaic Judaism, but the legal principle in religion altogether, was turned “upside down” within his own soul; and of this fact his teaching and career as an apostle were the outcome.

But Paul had in him other elements besides the Jewish, through these lay latent till after his conversion. As a native and citizen of Tarsus he had points of contact with Greek culture and sentiment which helped to explain the sympathy and tact with which he adapted his message to the Greek. As a Roman citizen likewise, conscious of membership in a world-wide system of law and order which overrode local and racial differences, he could realize the idea of a universal religious franchise, with a law and order of its own. Both these factors in his training contributed to the moulding of Paul the missionary statesman. In his mind the conception of the Church as something Catholic as the Roman Empire first took shape; and through his wonderful labours the foundations of its actual realization were firmly laid. In giving to his account of this man and of his teaching, we shall depend the latter mainly as it emerges in the course of his personal career.

Method.—Paul’s own letters are our critical basis, as F. C. Baur and the Tilgernian school made clear once for all. The book of Acts and other sources of information are to be used only so far as they

1 This, since the full success of the Maccauleyan reaction more than a century before, was determined by the Pharisian notion of the Law, as a rigorous and technical method of attaining “righteousness” before God by correctness of religious conduct. But this ideal represented only one stream of the religion of the original Chasidim, or “pious ones” of the Psalms (see ASHDRENS). The simpler form in which their piety lived on in less official circles, was that amongst which John the Baptist and Jesus himself were reared and breathed in. In the more popular literature of distinction represented by the Testament of the Twelve Patriarchs, as well as in Luke i., ii.
are compatible with the letters, as our only strictly contemporary documents. If our results to-day are far more positive than those of the Tübingen critics, this is due partly to the larger number of letters now generally acknowledged as Paul's (some eight or ten), and partly to a fuller knowledge both of Judaism and the Graeco-Roman world. These are seen to have embraced more varieties of religious thought and life than were as yet generally assumed. The study in Judaism was more limited than Baur supposed; while there was even a pre-Christian gnosticism, both Jewish and non-Jewish. Albrecht Ritschl in his Althil. Kirche (8th ed. 1871) and in his History of the School of Christianity (1874) portrays the Jewish world, and the Jewish sects and parties of the school in which he was trained, and in particular showed that Gentile Christians generally were far from Pauline in their modes of conceiving either Law or Gospel.

Chronology. This has been discussed by Sir W. M. Ramsay in Pauline and Other Studies (1897), and by C. H. Turner in Hastings's Dict. of the Bible (article "Chronology of New Test."). Their results agree in the main for the period when precision first becomes possible, i.e. in the time of the earliest Pauline letters, and they are confirmed by the chronology of the Acts. The modern studies of Ramsay place 58 and Ramsay in 59, while they agree in excluding 56 (Blass and Harnack), 57 (Bacon), 60 (Lightfoot, Zahn), as well as yet earlier and later extremes (Clemen argues for 61). On the chronology from Paul's conversion down to the Relief visit (Acts xii. 30), c. 45-47, hardly two scholars agree; but on the whole the tendency is to put his conversion rather earlier than was formerly usual.

1 Paul's Life. — "Saul, who is also Paul," was a "Hebrew, of Hebrews" born, i.e. of strict Jewish origin, and of the tribe of Benjamin (Phil. iii. 5; Acts ix. 11; xxii. 3). Yet there is much reason to believe that Paul was reared on Jewish soil but amid the Dispersion, at Tarsus in Cilicia, the son of a Roman citizen (Acts xxii. 28; cf. xvi. 37, xxii. 27). "Saul," his Jewish name, was a natural one for a Benjamite to bear, in memory of Israel's first king. "Paul" was his name for the non-Jewish world, according to a usage seen also in John Mark, Simeon Niger, &c. Paulus was not an uncommon name in Syria and eastern Asia Minor (see the Index nominum in Boeckh's Corp. inscr. graec.), and was a natural one for the son of a Roman citizen. Ramsay develops this point suggestively (Pauline and Other Studies, p. 63), "It is as certain that he had a Roman name and spoke the Latin language as it is that he was a Roman citizen. If, for example's sake, we could think of him sometimes as Gaius Julius Paulus—to give him a possible and even not improbable name—how completely would our view of him be transformed. Much of what has been written about him [as a narrow, one-sided Jew] would never have been written if Luke had mentioned his full name." Nor would much of the same sort have been written, if the influences due to his Tarsian citizenship (xvi. 39), viewed in the light of the habits of Jewish life in Asian cities, had been kept in mind. Tarsus, it seems, was peculiarly successful in producing leaders of the Dispersion, and outsiders in the Septuagint and Occidental spirit in unison attained in some degree to a higher plane of thought and action" (id., The Cities of St. Paul, 89). Accordingly it is natural that Paul's letters should bear traces of Hellenic culture up to the level of a man of liberal education. Whether he went beyond this to a first-hand study of philosophy, particularly of the Stoic type for which Tarsus as a university was famous, is open to question. 5 In any case Paul had learnt, when he wrote his epistles, to value Greek "wisdom" at its true worth—"the suggestiveness and sanity of its best thoughts, the method which reverses this relation, using the "we" passages of Acts to discredit the epistles of Paul (as well as the rest of Acts), is a mere tour de force, which has received artificial vogue by incorporation in the Encyclopaedia Biblica, and to a less degree in the external and partial article "Saul of Tarsus" in the Jewish Encyclopedia. The essential harmony of the epistles and Acts has been shown afresh by A. Harnack, Die Apostelgeschichte (1908).

2 Probably as member of the Jewish "tribe" dating from the Seleucid colony planted there in 177 B.C. (Ramsay).

3 For instance, on any other points of contact between Paul and Hellenism, is the fact that he certainly got many of his Greek ideas through the medium of Judaeo-Greek and the Hellenistic Jew, as Paul of Samos (cf. Romans i. 18-21, 28). It is clear from the way in which he uses the Greek Bible, even where it diverges wrongly from the original, that he was reared on it rather than on the Hebrew text.

but at the same time its inadequacy to meet the deeper longings of the human spirit. Above all he felt the mental and moral shallowness of the verbal "show of wisdom" which marked current philosophical rhetoric.

Thanks to his letters, we can form some idea of the character and strength of the element in Paul's early life due to Judaism. Looking back, he says (Phil. iii. 4-7), "If any other man thinketh to have confidence in the flesh, I yet think mine more; circumcised the eighth day, of the stock of Israel, of the tribe of Benjamin, a Hebrew of the Hebrews; as touching the Law, a Pharisee; as touching the righteousness which is in the Law, found blameless. Howbeit what things were gain to me, these have I counted for loss for Christ."

He came indeed to regard such inherited advantages as in themselves things of the flesh," natural rather than spiritual (vv. 4, 9). Yet as advantages, tending to awaken the spirit's thirst for God, he did esteem them, seeing in them part of the preparation vouchsafed by divine providence to himself (Gal. i. 15). Upon the "advantage of the Jew," as "entrusted with the oracles of God" (Rom. iii. 1-5), he dwells in Rom. xi. 17 in a way suggestive of his own youthful attitude to the "name of a Jew." Thus we may imagine the eager boy in Tarsus, as developing, under the instructions of a father strictly loyal to the Law, and under the teaching of the synagogue, a typical Jewish consciousness of the more serious and sensitive order.

A good deal depends on the age at which the young Saul passed from Tarsus to Jerusalem and the school of Gamaliel. If he felt his vocation as teacher of the Law at the earliest possible age, this great change may have come soon after his fifteenth year, when Rabbinic studies might begin. This would well accord with the likelihood that he never married. But in any case we must not exaggerate the contrast involved, since he came from a Pharisaic home and passed to sit at the feet of the leader of the more liberal Palestinian Rabbinism. The transition would simply accentuate the legal element in his religious life and outlook. Nor was it mere personal acceptance with God that floated before his soul as the prize of such earnestness. The end of ends was a righteous nation, worthy the fulfillment of the divine promises. But this too could come only by obedience to the Law. Thus all that the young Pharisee cared for most hung upon the Law of his fathers.

Outwardly he obtained the goal of legal blamelessness as few attained it; and for a time he may have felt a measure of self-satisfaction. But if so, a day came when the inner meaning of the Law, as extending to the sphere of desire and motive, came home to him in stern power, and his peace fled (Rom. vii. 9). For sin in his inner, real life was unsubdued; nay, it seemed to grow ever stronger, standing out more clearly and definitely as insight into the moral life grew by means of the Law. To the Law he had been taught to look for righteousness. In his experience it proved but the means to a knowledge of sin, without a corresponding impulse towards obedience. Not only did it make him realize the latent possibilities of the evil desire ("the evil heart," Pater barbat), it also made him aware of a sublier evil, the reaction of self-will against the demands of the Law. While one element was in abiding harmony with the will of God, the other was in equal sympathy with the law of sin. Could the Law achieve the separation, making the moral person "die" to "the flesh" and so escape its sway? No, answered Saul's experience: the Law rather adds power to sin as self-will (1 Cor. xv. 56; Rom. vii. 15, 17). Whence then is deliverance to come? It can only come with the Messianic age and through Messiah. The Law would reign inwardly; outwardly, being written on the heart," as promised in prophecy.

So may we conceive the position reached by Saul, though not with full consciousness, before he came into contact with Christianity. But as yet he did not realize that "through the Law he had died to the Law" (Gal. v. 19), much less the logical bearing of this fact upon the nature and function of the Law. How then would the message, "Jesus is the Messiah," strike such a
man? It would seem a blasphemous caricature of things most sacred. It is doubtful whether he had heard Jesus Himself (2 Cor. v. 16 has perhaps another meaning). He may even have been absent from Jerusalem in the first days of apostolic preaching, possibly as a rabbi in Tarsus. But if so, his ardent nature soon brought him on the scene, in time at least to hear Stephen and take part against him (Acts vii. 58, 60).

If the simple message of the first witnesses, that one whose life and preaching were largely out of harmony with the Law as Saul understood it, had in fact been received from the dead by Israel's God and so vindicated—to the condemnation of that generation of God's people—if this seemed to Saul mere madness, what was he to say to Stephen's views as to the Law and the people of the Law, both past and present? (see Stephen. Saul could not be right in the views which still divided them. Perish the thought! Perish too all those who upheld the crucified Nazarene, the accused of the Law! For His death could mean but one of two things. Either He was accused of God also, or—awful alternative, yet inevitable to Saul's logical mind—the Law relative to which He was accused was itself set aside. Saul turned from the suggestion as too shocking to his pride alike in his people and in its divine Law, for he seriously felt to be both its acknowledged author, the Restor- tion, and the supernaturally powerful and goodness of Him whose claims it was held to confirm. Why stay to weigh the evidence of Galilean common folk (Am-ha-arets), themselves lax in their observance of Thorah, when over against it stood the whole weight of immemorial prescription, and the deliberate judgment of the custodians of the Law as to this man as a "deceiver"? No doubt they were self-deceived fanatics. But the logic of the movement had at length declared itself through the mouth of Stephen, and weak toleration must be abandoned.

So Saul was driven to persecute, driven by his acute sense of the radical and absolute value of the Law, and by the hope to find relief from his own bitter experience in such zeal for the Law. Yet the goading of unsatisfied intuitions did not cease. We may even suspect that Stephen's philosophy of Israel's history had made an impression on him, and was undermining his confidence in the infallibility of his nation's religious authorities. If mistaken before, why not again? This granted possible, all turned on the evidence as to the Resurrection of the crucified Prophet of Nazareth. Yet though the joyous mien of His followers, even when confronted with death, seemed to be then a good consequence before God, which could hardly fail in man's eyes, Saul felt the case of the Law to be too grave an issue to depend on the probabilities of human testimony. So he plunged on, in devotion to what still seemed the cause of God against impugners of His Thorah, but not without his own doubts. He was, in fact, finding it "hard to kick against the goad" (Acts xxvi. 14) plied in his deeper consciousness, as he followed his inherited and less personal beliefs. He was, in language which he later applied to his compatriots, both to "submit himself to the righteousness of God" (Rom. x. 3), when it came in a manner humbling to his feelings. Still he was in the main honest (1 Tim. i. 13), and the bondages to his belief were exceptional. Direct personal experience on the point on which all hinged, the alleged divine vindication of Jesus as Messiah following on the legal condemnation by the national authorities, was needful to open up a clear exit from his religious impasse.

It was at this critical point in his inner history that, as he neared Damascus on a mission of persecution, there was granted him—as he believed ever after in the face of all challenge—a vision of Jesus, in risen and glorified humanity, as objective as those to the original witnesses with which in 1 Cor. xv. He classed it.

As to the sense in which this vision, so momentous in its issues, may be regarded as "objective," the following points deserve notice. On the one hand it is generally agreed (1) that Paul distinguished this appearance of the risen Jesus from his other visions and revelations; (2) that he believed Jesus gave new status to a critical juncture in his life, and clasped it with those to the Twelve and others which first created the belief that Jesus had been "raised from the dead"; (2) that this belief included for Paul a transformed or spiritualized body (cf. the note of time, "on the third day," and the argument in 1 Cor. xv. 12 sqq., 35 sqq.), his own vision of which seems to colour his conception of the Resurrection body generally (Phil. iii. 21, though he had been taught in his religious education a "corporeal" body). On the other hand, Paul was furnished with a controversial psychology, including a sudden vision amid light and the bearing of a message of religious crisis in certain cases, affect our ability to take Saul's consciousness in the matter as a simple transcript of objective experience, and to regard the belief which lies behind the vision as such a fact, if it blinded Saul temporarily (Acts ix. 8—19) and affected his companions (xxii. 9, xxvii. 14). Others confine the objectivity to a divine act, producing by special action on Saul's brain a vision not due simply to the antecedents in himself. Thus it was not merely subjective, a mere vision in the sense of hallucination, but an objectiv vision or genuine revelation of the real, as Paul claimed. Such an objectiv-subjective revelation, borne in the connection between the light into which he was involved in his religious vision, accords in general with modern research as to telepathy and phantasms of distant or deceased persons. But, after all, the present aspect for Paul's religious psychology as the basis of all theories of the vision—what question as to the degree of difference between his thought before and after the event. On this Paul is clear and emphatic; nor can we here go behind the evidence of one hostile writings prove him a master in introspective speculation. The Lord. If Saul's personal problem as to acceptance with God and victory over sin was a religious one, his question of what it meant to be united with the Messiah was to come about. He had vanished and "condemned sin in the flesh" by His perfect obedience (Rom. viii. 3, v. 16), of which the Cross was now seen to be the crowning act. As for the Law as means of justification, it was superseded by the very fact that Messiah had realized His righteousness on another principle altogether than that of "works of the Law," and had in consequence been crucified by its action, as one already dead to it as a dispensational principle. This meant that those united to Him by faith were themselves sharers in His death to the Law as dispensational master and judge, and so were quit of its claims in that new moral world into which they were raised as sharers also in His Resurrection (Rom. vi. 1—vii. 6). Henceforth they "lived unto God" in and through Messiah, by the self-same Spirit by which He had lived the sinless life (vii. 9).

Here we have at once Paul's mysticism and his distinctiv gospel in germ, though the full working out in various directions came only gradually under the stimulus of circumstances. But already the old regime had dissolved. His first act was to go boldly to the supreme confession of his submission and adhesion to Jesus as Messiah implicit in his cry from the ground, "What shall I do, Lord?" Thereby he formally "washed away his sins" (Acts xxii. 16; cf. Rom. x. 6). Then with new-born enthusiasm he began boldly to proclaim in the synagogues of Damascus that Jesus, whose followers he had come to root out, was verily the Messiahian Son of God (ix. 20; cf. Matt. xvi. 16). Yet ere long he himself felt the need for quiet in which to think...
out the theory of his new position. He withdrew to some secluded spot in the region south of Damascus, then vaguely called Arabin (Gal. i. 17). Chief among the problems pressing for reinterpretation in the light of his recent experience was the place of the Law in God's counsels. While the Law could condemn, warn and in some degrees restrain the sinner from overt sins, it could not redeem or save him from the love of sin. In a word, it could not "give life" (Gal. iii. 21). Hence its direct remedial action was quite secondary. Its primary effect, and therefore divine purpose, was to drive men humbly to seek God's grace. It "shut up all unto (realized) disobedience, that God might have mercy upon all" (Rom. xi. 32; Gal. iii. 22). Thus the place of the Law in God's counsels was episodic. The radical egoism of the natural man could be transcended, and self-glorying excluded, not by the law, with its "law (principle) of works," but by the "law of faith" (Rom. iii. 27). In fine, the function of the Law was secondary, preparatory, temporary. The reign of the Law closed when its work in shutting up men to faith in Christ—the perfect form of faith, that of conscious sonship—was accomplished. It had a high place of honour as a dispensation for a limited end and time; but its day was over when Jesus accepted crucifixion at its hands, and so passed on as the inaugurator of a new dispensation marked by a final relation between man and God, the filial, the Spirit of which was already in the hearts of all Christian believers (Gal. iii. 23-iv. 7). Thus the Cross of Jesus was the satisfaction of the claims of the Law as a dispensation or divinely sanctioned method, which had to be honoured even in the act of being transcended, that God might be just (i.e. dispensationally consistent), while justifying the believer in Jesus on a fresh basis (Rom. iii. 26). Such a view did but establish the Law as the (c. 31) within its own proper sphere, while pointing beyond it to one in which its final aim found fulfillment. (Rom. ii. 12 seq). Here lay the revolutionary element in Paul's thought in relation to Judaism, turning the latter "upside down" and marking his gospel off from the form in which Judaeo-Christianians had hitherto apprehended the salvation in Jesus the Christ. It was the result of profound insight, and, historically, it saved Christianity from being a mere Jewish sect. But as it was conditioned by recoil from an overdriven use of the Law in the circles in which Saul was trained, so there was something one-sided in its emphasis on the pathological workings of the Law upon human nature in virtue of that Law itself. Saul was so exalted by this as to be mankind for ever against bondage to religious legalism. He it was who first detected that specific virus generated by Law in the “natural man,” and also discovered the sovereign antidote provided in Christ. Nor is it as though Paul, even in those apologetic writings which present his antitheses to Law in the sharpest form, had the Jewish Thorah exclusively in view. He deals with it rather as the classic type of law in religion: it is really law quia law, even the unwritten law in conscience, as de-ermining man's relations to God, that he has in mind in his psychological criticism of its tendencies in the human conscience (Eph. ii. 3 seq): "Nimimur in vitium cupimusque negata." This is too often overlooked by his Jewish critics. Paul felt nothing but reverence for the Thorah in what he took to be its proper place, as secondary to faith and subordinate to Christ. In short, Paul first perceived and set forth the principle of inspiration to God-likeness by a personal ideal in place of obedience to an impersonal Law, as condition of salvation. The former includes the latter, while safeguarding the filial quality of religious obedience.

The above seems to meet part of the criticism directed by modern Jews against Paul's theory of the Law. Other criticisms (cf. C. G. Montefiore, Jewish Quarterly Review, vi. 428-474, xii. 161-217) may just be noted. If Paul applies his theory by bad Scripture exeges, that is a common Rabbinic failing. If it be said that it is monstrous to hold that God gave the Law mainly for another end than the ostensible one, viz. to lead to life by obedience, this holds so far; but one cannot exclude from the divine purpose the negative effect, viz. promotion of self-knowledge in sinful man and the breaking down of his self-confidence, conditions essential to a mature filial relation between man and God. Nor did Paul deny the positive or directly beneficent, though limited, function of the Law, so far as it was viewed in the light of the grace of God, as the Lawgiver, psalmists, and others who "walked humbly with God," not as meriting His approval as of right by "works of law." But, objects the modern Jew, the notion of Rabbinic Judaism as generally "legalism" is any way the notion of Paul. Nevertheless it is unproven and improbable that Paul unfairly represents the prevailing tendency in the Pharisaic Judaism of his own day. If it was characteristic of the Pharisaic unbeliever and exclusivist witness upon the point, as just defined, if we except certain apocalyptic writings (where evidence modern Jews are anxious to discount), like the Apocalypse of Baruch and 4 Ezra, the latter of which makes the Law (so far as it is realized by the prophets) of Jerusalem being was being felt. Finally the same liberal Jew who complains that Paul turns Judaism "upside down" by his doctrine of the Law, cites with approval his words, "There is no distinction between Jew and Greek" (Gal. iii. 28), that the Law is the inauguration of the prophetic universalism attain its goal. Surely there is a vital connexion between these two things. "Universalism" was the true issue of the higher tendency in Hebrewism, as seen in certain of Israel's prophets. But it was attained only through Jesus of Nazareth; and historically the main link between His super-normal universalism and its actual outcome in the Christian Church was the ex-Pharisee Saul, with his anti-legal gospel.

Saul's conversion left Jesus the Christ as central to his new world as the Law had been to his old. All was summed up in Christ, and Him crucified. This was to him the essence of Christianity as distinct from Judaism. The Christ of Paul. As, to the Jew, life was lived under the Law or in it as native element, so the Christian life was in "Christ" as element and law of being. Christ simply replaced the Law as form and medium of relations between God and man. In this Paul went far beyond the older apostles, whose simpler attitude to the Law had never suggested the problem of its dispensational relation to Messiah, though in fact they relied on Messiah alone for justification before God. The logic of this, as Paul later urged it on Peter of Antioch (Gal. ii. 15 seq.), they did not yet perceive. To him it was clear from the first. But the contrast goes farther. The very form in which Jesus was known to Saul by direct experience, namely, as a spiritual being, in a body already glorified in virtue of a regnant "spirit of holiness"—revealed by the Resurrection as the essence of His personality (Rom. i. 4)—determined all his thought about Him. To this even Jesus' earthly life, real as it was, was subordinate. Paul was not indifferent to Jesus' words and deeds, as helping to bring home in detail the spirit of Him who by resurrection and ascension ascends far beyond the Law, save that from this he only draws from insight into His redemptive work, knowledge of the fact of His being was of little religious moment. The extent of Paul's knowledge of the historical Jesus has been much debated. Few think that he had seen Jesus the flesh; some even deny that he knew or cared for more than the bare facts to which he alludes in his epistles—the Davidic birth, the institution of the Supper, the Death and Resurrection. But beyond his express appeals to precepts of "the Lord" in 1 Cor. vii. 10, ix. 14 (cf. Rom. xii. 14), he "shows a marked insight into the character of Jesus as it is described in the Gospels" (see 2 Cor. 10, 11; cf. Phil. ii. 3-8). The sources of such knowledge were "knowledge already obtained, e.g. Peter (Gal. i. 18), who was present at the Mark, as well as collections of Jesus' words along with connected incidents in His life, used in catechesis. Thus Saul's attitude to Jesus was fixed by his own experience. The varied theoretic expressions found in his writings as to Christ's relations to God, to mankind, and to the world, even to the universe, were to him but corollaries of this. The most persistent element in his conception of Christ's person, viz. as a heavenly being, who, though God's Son, voluntarily humbled Himself and suffered in fulfillment of God's will, and had in consequence been exalted to fresh glory, took its start from his own personal experience, although it included the speculative postulate of preexistence in terms of some current Messianic form of thought. Paul's theory expressed the deeper sense of the all-inclusive significance of Christ, in keeping with his own experience. Hence, too, all his distinctive thoughts on religion, sometimes called His Theology Rooted in Experience.
"Paulinism" (see below), were both experimental in origin and capable of statement in terms of his Christ. To him the Death and Resurrection of Christ were not isolated facts, nor yet abstractions. To this man of faith the crucial fact of Christ's Resurrection, in full spiritual humanity, had been brought within his own experience; so that here, and not in any second-hand facts touching Christ's earthly career, lay the real and verified basis of the whole Christian life. This makes his gospel so individual, and at the same time so universal—for those at least who at all share his religious feelings. It is likely that Saul began straightway to preach all his ideas or even those most prominent in his epistles, which belong only to some ten years at the end of a ministry His Early Apostolate, of thirty. In particular his special mission to the Gentiles dawned on him only gradually. No doubt as he looked back in writing Gal. i. 15 seq., he felt that the final purpose of God in "revealing His Son in him" had been that he "might preach Him among the Gentiles." But this does not prove that he saw it all at once as involved in "the heavenly vision." For one thing the contracted horizon afforded by his hope of "Parousia" we would limit his outlook materially. Then too he was intensely Jewish in feeling; and the probability is that he would begin to declare salvation through Christ alone, apart from "works of the Law," to his compatriots. Only bitter experience convinced him (Rom. ix. 1 seq., vi. 1 sqq.) that the Jews as a people did not share his experience as to the Law, and spurned their professed brotherhood in Messiah.

Saul began his preaching in the synagogues of Damascus, and made a deep impression, especially, we may suppose, after his return from Arabia (Acts x. 22; Gal. i. 17). His Jewish opponents planned with him by the connivance of the ethnarch of King Aretas (cf. 2 Cor. xi. 32 seq.). Then came his first visit to Jerusalem since his conversion, in the third year from that event, for the purpose of making the personal acquaintance of Peter (Gal. i. 18), presumably to hear first-hand about Jesus' earthly ministry and teaching, as well as to make the leading apostle directly acquainted with his own remarkable conversion and mission. It was natural that Barnabas should help to break through the suspicion with which the arch-en persecutor was at first regarded; also that such preaching as Saul did in Jerusalem should be amongst the Hellenists (Gal. i. 26). This led to his having to leave suddenly, apparently after a vision in the Temple which brought him fresh light as to the scope of his future ministry. During the ten or eleven years at least "in the regions of Syria and Cilicia" which ensued, it was still primarily to the Jews that he preached; for the news of him which reached "the churches of Judaea" from time to time (ἀκοοέοις Ἡσαρ) was such that they "kept glorifying God" in him (Gal. i. 21–23), as they certainly would not have done had he all along addressed himself largely to Gentiles. His preaching, that is, was for the most part confined to the synagogue and its adherents of non-Jewish origin, whether circumcised or not. Of Saul's actual history, however, during these obscure years we gain only rare glimpses,1 the first and most important being in connexion with the foundation at Antioch of a mixed Church of Jews and Gentiles. Whatever may have been the first beginnings of this new departure (a question which depends on the alternative readings2 "Hellenists" and "Greeks" in Acts xi. 20), a situation soon arose which Barnabas, who had been sent from Jerusalem to supervise the work begun by certain Hellenist preachers, felt to call for Saul's co-operation. He sought him out in Tarsus; and "for a whole year" the two enjoyed the hospitality of the Antiochene Church and instructed numerous converts—including not a few uncircumcised Gentiles. It is not clear how far Saul continued to reside in Antioch after his first "whole year" of continuous work as colleague of Barnabas. It no doubt remained his headquarters. Indeed, he is described as "a Jew of Tarsus", while in Bible form the region between Antioch and Tarsus (Gal. i. 21; cf. Acts xv. 23, 41). Whilst so engaged, whether at Antioch or elsewhere, he seems to have attained quite a fresh sense of the degree to which Gentiles were destined to form an integral part of that "Israel of God" which was being gathered through faith in Jesus as the Christ (cf. the name "Christians," Acts xi. 26). Writing about summer A.D. 50, he speaks of having had an overpowering revelation some thirteen years previously (2 Cor. xi. 2–4), that is, about 42–43, the very period now in question. He says nothing, it is true, as to its theme; but it can hardly have been unconnected with his central preoccupation, the scope of the Church, as set forth later in Eph. ii. 11, iii. 13.

1 See Galatians (i. 18 seq.) emphasizes its own special points of interest, in that Saul stayed only a fortnight and saw of the apostolic leaders none save Peter and James the Lord's brother; whereas Acts xxii. 12 refers to the whole of the more public side of his visit, conveys a rather different effect, yet one not incompatible with what he himself relates.

2 It is likely that some at least of the five scurrings in synagogues referred to in Cor. xi. 24, befell him during this period. Many Jews would resent not only the preaching of a crucified Messiah, but also the filching from them of their proselytes.

3 The present writer now believes that "Hellenists," the better supported term (cf. ii. 1 seq. and iv. 27–29) to the exclusion of "Greeks," is key secondary, being due to assimilation to preceding usage in vi. 1, ix. 29, and possibly also to misinterpretation of the turning to the Gentiles in xii. 46.

4 How essential a mark of true piety such conduct was in the eyes of Jews at this time is well known. A synonym for always being "righteousness" (cf. Matt. vi. 1 seq.); it is specially praised, in the Pirqe Aboth, along with Torah and divine worship, as the "three things on which the world rests" (cf. Sanh. 10 b, vei. 16b). As "sin-offering" makes atonement for Israel, so "alms" for the Gentiles. In the light of this, confirmed by Acts x. 2, 4, in the case of Cornelius, it seems that the reference in Gal. ii. 10 to "the table of the Lord" cannot be as a charge against the Messianic proselytes, just as in ordinary Jewish ones; for the primitive Judaico-Christian mission was most earnest on the point: cf. Acts ii. 44 seq., iv. 32–37.
relief to the poor in Judea, which he and Barnabas fitly adminis-
ter in person (Acts xi. 30, xii. 25). This relief visit took place about
45-46. Having now reached an understanding with the
leaders in Jerusalem as to his mission to the Gentiles Saul felt
anxious to break fresh ground, and probably broached
the subject to the local leaders. As they waited on
God for guidance, the Spirit through one of the
"prophets" directed that Barnabas and Saul be set apart for
such an enterprise; and this was done in solemn form (xiii. 1-3).
Naturally Barnabas thought of his native Cyprus; and thither
they sailed, about spring A.D. 47, with Mark (g.e.) as their
sister. That year saw at least one other companion to
preach not only from the Paul and Barnabas letter (xiii. 13), but also from the traces of eyewitness in the narrative of
But at Paphos an unparalleled event occurred, to which due
prominence is given. The Roman proconsul, Sergius Paulus,
a man whose wide religious interest showed itself in having
about his person a Jewish "prophet," with magical pretensions,
sent for the new preachers. Barnes, the magus or wizard
(as his surname, Elymas, probably denotes), opposed the rivals
to his patron's attention; and this brought Saul decisively to
the front. He acted for his part, as Barnabas had urged him
seriously. "We are not sent out to the heathen (to the Jews) in
疫情期间,由本地教会,而是在遇到的危险。
}\footnote{1 Sir W. M. Ramsay would identify the visit of Gal. ii. 1-10 with
the relief visit itself (a view different but little in effect from that
above); but most scholars identify it with Acts xv., esp. Gal. i. 22 seq.,
compared with Acts xi. 30, xii. 25.}
\footnote{2 For these, their history and significance in connexion with each
of the cities studied, see Sir W. M. Ramsay, The Cities of St Paul
(1907).} Hellenized in speech and education. It is in this light that
we must view the enthusiasm with which Paul's gospel was
received (xii. 44 seq.; Gal. iv. 14 seq.), and which marked an
episode in his ministry to the Gentiles. It was here and now
that he uttered the memorable exclamation: "It was necessary
that the word of God should first be spoken to you: seeing ye
thrust it from you, and judge yourselves unworthy of eternal
life, lo, we turn to the Gentiles" (xii. 46). Yet even so he did
not here and now give up all hope that the Jews of the Dispersion
with their more liberal conception of Judaism, might be won
over to a spiritual rather than a national fulfilment of "the
promise made to the fathers" by the union of the church of
Gentiles. (cf. xii. 26-27; Acts xvii. 15 seq.) Primarily this "turning to
the Gentiles" had given for Paul only a local meaning, as he continued
to be in each city with the synagogue. But the emphasis
laid on the incident in Acts shows that to one looking back it
had a more far-reaching meaning, since henceforth Paul's work
was in fact to lie mainly among Gentiles.
Paul's experiences were much the same at Iconium, whether
he and Barnabas betook themselves when expelled from
Antiochene territory (probably after being scourged by the
lictors, 2 Cor. xi. 29). There, too, Jews were at the bottom of
the scale of things, and they opposed Paul and the missionarybd
Apostles ("apostles," xiv. 4, 14), which forced them to see into the Lyconian
region of the province. In this district, marked by the native pre-Greek
village system, they made Lystra and Derbe successively their
headquarters. In the former occurred the healing of the lame
man at the word of Paul (cf. Rom. xv. 9; 2 Cor. xii. 12; Gal.
iii. 5), with its sequel in the native worship offered to the strangers
as gods manifest in human form. The story, told in a few
graphic touches, sets before us Paul as the apostle, meeting
the needs of the simple Lyconians with an elementary
natural theology. Again his work was disturbed by Jews,
this time his old foes from Antioch and Iconium, and he barely
escaped death in Philippi ("delusion," xiv. 2-3), to which he refers
in 2 Cor. xi. 23, a passage which shows how far Acts is from
exhausting the tale of Paul's hardships and dangers, either
in Galatia or elsewhere (with xiv. 1 cf. 2 Tim. iii. 11). At Derbe,
the frontier city of Galatia to the south-east, Paul was within
easy reach of Tarsus, his old home. But the needs of his young
converts drew him back to face fresh dangers in Lystra, Iconium
and Antioch (where, however, new magistrates were now in
office), in order to encourage "the disciples." To give them the
support of responsible oversight, the apostles procured the
election of "elders" in each church, probably on the model
of the synagogue. For Saul a large council of elders—so-called—
from the Galatian highlands on purpose to get rid of malarial
fever, contracted in the lowlands of Pamphylia. But Mark
would hardly have left under these conditions. It seems better to
suppose that it was only on the arduous journey to Antioch, amid "perils
of waters, perils of robbers," or even after his arrival there, that
the malaria (if such it was) so developed as to reduce Paul to the
pitiable state, as of one smitten by the wrath of some deity, in which
he preached to the Galatians in the first instance (Gal. iv. 13 seq.).
It was in the late summer or autumn of A.D. 46 or 47 that
Paul arrived in the Pisidian Antioch, a considerable Roman
 colony. Its population was typical of the Graeco-
 South Galatia.
Oriental part of the empire. It included the native
Anatolian, the Greek, and the Jewish elements, so
frequently found together in Asia Minor since the days of the
Seleucid kings of the Hellenistic period, who used Jews
as colonists attached to their cause. The Anatolian ground-stock
had marked affinity with the Semitic peoples, though it was
\footnote{3 Naturally Paul would have a regular address which he used with
minor variations in beginning his mission in any local synagogue;
and this Luke has in substance preserved for us here. For its
authenticity, see Sir W. M. Ramsay, op. cit. 303 seq.; compare A.
Salisier, L'Apostle Paul (3rd ed., 1896), p. 89, for disregard of
dependence on Stephen's speech.}
in toto, it could not but appear to many Jewish Christians time to reconsider the situation, and boldly deny the reality of any Gentile's portion in Messianic salvation apart from circumcision (as binding to observance of the Law). So argued the stricter section, those with Pharisaic antecedents, who boldly invaded the headquarters of the liberal mission at Antioch, and began to teach the Gentiles converts that circumcision and the Law were matters of life and death to them. Paul and Barnabas took up the gage; and as the judaizers no doubt claimed that they had the Judean Church at their back, the local church felt that the issue would have to be decided in Jerusalem itself.

So Paul went up Paul and Barnabas 'and certain others of their number' (Acts xv. 2; contrast Gal. ii. 1 seq.) to confer with 'the apostles and elders' there. The fact that Paul consented to go at all, to the seeming prejudice of his direct divine commission, is best explained by his prior understanding with "the Pillars of the Judean Church itself (Gal. ii. 1-10). His object was twofold: to secure in the centre of Judeaco-Christianity that public vindication of Gentile freedom from "the yoke of the Law" on which he felt he could count, and at the same time to save the Church of Christ from outward schism.

On the main issue there could be no compromise. It was contended that the influence of Peter and James, that the good pleasure of the Holy Spirit (xv. 28), in possessing Gentile hearts, settled the question. But as to the need of considering age-long Jewish sentiment on points where divergent practice would tend to prevent Jewish Christians from recognizing Gentile believers as brethren, as well as place a needless stumbling-block between Jews and a Messianic society in which unlimited 'uncleanness' was tolerated—on this compromise was possible. The compromise was proposed by James (xv. 20 seq.) and accepted by Paul. Indeed he had less to sacrifice than the other side in the concordat. For his Gentile converts had only to limit their freedom a little, in the cause of considerate love; but their Jewish brethren had to surrender a long-standing superiority conferred by divinely instituted national law. For while the law of Moses was still observed by Jewish Christians, in the case of Gentile proselytism to Messianic Judaism it was to be waived, and a minimum of proselyte rules, indispensable (xv. 28) to a type of piety! essentially common to all "in Christ," taken as sufficient. Of the "abstinences" in question only that touching blood (in its two forms) was really a ritual matter, and it was one on which there was a good deal of scruple outside Judaism. But the rest were points of fundamental Christian ideas, as well as elements of proselyte piety.

On the other hand, security against Gentile liberty undermining Jewish-Christian observance of the Law was felt to exist in the firmly rooted tradition of the synagogues of the Diaspora (xv. 21).

The above is only one reading of the case, though the simplest. Not a few scholars dispute that Paul could have been a party to such a concordat at all, and suppose that the letter embodying it is a fiction, probably composed by the author of Acts. Others hold that, if any such letter were ever sent, it was by James and the Jerusalem Church at a later date, without consulting Paul. In fact it was their solution of the deadlock to which interference with Peter's table-fellowship with Gentiles led in Antioch after the Jerusalem conference; but the author of Acts unhistorically fused it with the decision of that conference. Finally Harnack (Die Apostelgeschichte, 1908, pp. 158 seq.) maintains that the reference to "things strangled" is an interpolation, not shared by early Western authorities for the text, and that "blood" meant originally homicide. Hence the rules had no reference to food apart from ceremonial, idiosyncrasy. But to consider the contradiction with Gal. ii. 10, on the assumption that Acts. xv. = Gal. ii. 1-10 seems at once textually improbable (feeling in the East being too close to the hebdomadal age to allow of such an interpolation) and historically needless.

At no point in his career does Paul's greatness appear more strikingly now than in his relations with Judeaco-Christianity. Equally above the 
doctrinaire temper which cannot see its favourite principle practically limited by others, and a mere opportunism which snatches at any compromise as the line of least resistance, he acted as a true missionary statesman, with his eye both on the larger future and historical opportunity, on the limiting present. As he himself obeyed the principle of loving concern for others' good by conforming to certain Jewish forms of piety (1 Cor. ix. 19 seq., 22), as being a Jew by training; so he was ready to enjoin on Gentiles, short of the point of compulsion, abstinence from blood simply as a thing abhorrent to Jewish sentiment. His was the spirit of a strong man, who can afford and loves to be generous for the good of all. This is the key to his conduct all along, leading him to interrupt his work on two later occasions simply to keep in touch with Jerusalem by conciliatory visits, as prejudice against him recurred owing to rumours of his free conduct on his Gentile missions.

On the other hand, it was the opposite side of his character, viz. inflexible courage in defence of vital principle, that was called into action soon after, owing to Peter's visit to Antioch (the abrupt reference to which in Gal. ii. 11 probably means that the judaizers were seeking to make capital of it in Galatia). There for a time Peter fell in rapidly to the suggestion of the Jews by whom Jewish and Gentile Christians ate together. But this was more than was understood even by James to be involved in alliance of the two missions. It was one thing not to force Judaism on Gentile Christians; it was another to sanction table-fellowship between Gentile and Jewish Christians, in consideration for the former as brethren. Let Peter, said James through his friends, remember Judean feelings as well. Such a step was in advance of their convictions; and in any case it seemed wrong to break with the sentiment of the Mother Church in Judea for the comfort of Gentile brethren on the spot, whom they had but recently regarded as by nature "unclean." One man, however, saw further into both the logic and the expediency of the case. Paul saw that by their very reliance on Christ rather than the Law for justification, Jewish Christians had in principle set aside the Law as the divinely appointed means of righteousness: that thereby they had virtually come down from their prerogative standing on the Law and classed themselves with "sinners of the Gentiles"; and finally that they had been led into this by Jesus the Messiah Himself. If that attitude were sinful on their part, the step was one of unrighteousness. If righteousness depends after all on the Law, then why did Christ die? This penetrating analysis (Gal. ii. 14-21) of the implications of Christian faith was unanswerable as regards any legal observance as condition of justification. But was it not possible that the degree of sanctification to be hoped for depended, for Jews at least, upon adhering as closely as possible to the old law of holiness? This was probably the position of Peter and Barnabas and the rest, as it was certainly the theory with which the judaizers "be-witched" the Galatian converts for whose benefit Paul recounts the story (iii. r-5). But for it too he had an answer, in his doctrine of an evangelical sanctification, homogeneous in nature and motives with the justification out of which it grows, as fruit from root (iii. 5, v. 16-26). But at Antioch he confined his protest to the vital matter of principle, the true relation of Christ and the Law, and the deadly danger of confusing their values and functions if both were to be treated as essential to Christian faith. Thus a higher expedition, for Jews in particular, told against the expedition alleged on the other side; while as for expedition in relation to the Gentiles, it was a matter not only of Antioch and the Jews and Gentiles there involved, but also of the Roman world and the relative numbers of potential converts from either class in it. This point is not made explicit in Gal. ii. 14 seq.; but it was probably present to Paul's mind and added to the intensity of his feeling touching the gravity of the issue.

The standpoint of the Epistle to the Galatians is of great moment in judging of its historical retrospect. What Paul had to establish in the first instance was his independence up to the date of his
evangelization of the Galatians, which God had obviously blessed (ii. 2, 5). It is therefore natural to regard all related in chapters i.–ii., including his invitation of Peter, as prior to that cardinal fact. Not the less does, as well as i. 26, the explicit words of v. 11 suggest that Paul's material must have been written in the winter of Paul's first journey to Europe, e. S. at Corinth (so, for example, the common view that Gal. ii. 1 sqq. = Acts xvi.). Finally, v. 12 makes it clear that the visit to Jerusalem rules out any visit to Thessalonica, including the relief visit to Judea of Acts xii; although the visit that of Gal. ii. 1 sqq. This, the visit of Paul to Jerusalem in the winter of Paul's first journey to Europe, is 1 S. 5–21, say in the 18th verse: "how quickly" of i. 6, but also his inability to hasten to their side (v. 19). No less than half a century later, when Antioch was written, both Antioch on the eve of the second mission (McGiffert) and third (Ramsay) missionary journey, and Ephesus during Paul's long sojourn there. The one seeming alternative, viz. Antioch on the eve of the conference in Acts xvi. (so V. Welcker), is preferable only on the assumption that the epistle concludes all knowledge of this event (as the present writer formerly held).

Not long after this episode Paul proposed to Barnabas a visitation of the churches they had jointly founded. But Paul's judgment, perhaps more than before, the difference in their attitudes to the Law, the mode of John Mark as their helper a condition of co-operation. To this Paul demurred on the ground that he would not be able to rely on them at all in his free movement; and the feeling caused by this difference as to Mark's fitness was sufficient to cause Paul and Barnabas to take separate lines. Each went to his own sphere of work, Barnabas to Cyprus and Paul towards Asia Minor, and we never again read of them as together, though Paul continued to refer to his old colleague (Gal. i. 29). Paul found a colleague in Silvanus (Silvan), the "a man in the Jerusalem church and a "prophet," but like himself a Roman citizen (Acts xvi. 39); and started, with the goodwill of the Antiochene Church, probably in summer A.D. 50. His way lay through churches of his own foundation, in one of which he found a helper to replace Mark, Timothy of Lystra, who was to be a son to him up to the very end. Confident in the conciliatory spirit of both sides in the Concordat, and anxious to show how ready he was to consider Jewish feeling where Gentile freedom was not involved, he circumcised this young semi-Jew before taking him as his associate into regions where work would soon be done. In the case, as well as his explicit words, in i. 27, then recommended the resolutions of the Concordat to the observance of his churches in Galatia, though the circular letter of the conference did not make it apply to more than those of the Syro-Cilician region.

But while the immediate result of this visit was good, the secondary issues were among the bitterest in Paul's life, owing to the unscrupulous action of Judaizers who, taking advantage of his absence, soon began a vigorous, but subtle, propaganda amongst his converts in this region. They represented Paul as having changed his policy in defence of those of Jewish extraction to the extent of allowing that the Law had some claim upon Gentile believers in the Jewish Messiah. Otherwise why were the "abstinences" enjoined? Nay, more: these had been put forward as a bare minimum of what was expedient, to judge from the practice of those same Judaean authorities. But if so, surely it must at least be necessary to full Christian piety (Gal. iii. 3; cf. Peter's conduct at Antioch), though not perhaps to a bare place in the coming kingdom. Had not Paul himself confessed the value of circumcision (Acts xi. 11) in the case of Timothy, the son of a Gentile father? As for his own case, the words of the Second Epistle imply only the wish to humour his convert's prejudices (i. 10), to beget profit. At any rate the gospel they now brought was the authentic Apostolic Gospel, and if Paul's did differ from it, so much the worse for his gospel, since it could not fail to be derived from theirs (i. 1–9, 11 seq.). How plausible must such a plea have seemed to inexperienced Gentile converts, "bewitching" their minds away from the central facts, Christ crucified and the free gift of the spirit through faith in Him. But how disingenuous as regards Paul's real position! Can we wonder at his indignation as he wrote in reply, and that he was goaded on to pass, in his final peroration, a counter-judgment upon their motives too sweepingly severe (vi. 12 sqq.)? In any case the gross abuse by the judaizers of Paul's promulgation of the "abstinences" in Galatia fully explains his contrary practice elsewhere.

Paul left his Galatian converts about autumn A.D. 50, bound for the farthest outposts of the Eastern Empire. But not even yet was he to preach there, being diverted by something in which he saw the divine hand. Such as when, on his way northwards through the Phrygian region of Galatia,1 he tried to enter Bithynia (where also were cities with a large Jewish element), he was again turned aside by the "Spirit of Jesus" (Acts vi. 7, cf. viii. 22). Thus his course seemed open only westwards through Phrygia towards Asia, where was reached to Troas, the chief port in the north-west Aegean for intercourse between Asia and Macedonia. These were but sister provinces, the second the outer extension of the first. In conditions of work it was a new departure to which Paul found himself summoned, when in a night-vision "a certain Macedonian" stood as if entreating him: "Come over into Macedonia and help us." Here was the positive guidance to which two negative negative interventions had been leading up. Paul hesitated not a moment, though the idea was bolder than that of his own frustrated plan. "Straightway," in the words of Luke, "we sought to go forth into Macedonia, concluding that God had called us for to preach the Gospel unto them" (Acts xvi. 10). So, at this crucial point in Paul's mission to the Gentiles, Lake seems to preserve the thrill of emotion which passed from the leader to his companions, by breaking out into the first person plural (see Acts, for the psychological rather than literary reason of this "we," here and later).

The new mission began at Philippi, a Roman colonia. Here the Jewish settlement, in which as usual Paul sought first to gain a footing, was a small one, consisting in the main of women—who enjoyed much freedom in Macedonian society. But the normal extension of his work was cut short by an incident characteristic both of the age and of the way in which the fortunes of the Gospel were affected by the vested interests of Jewry. The story of Paul's imprisonment, with the light it casts on his quiet mastery of any situation, is familiar in its vivid detail.

After being thus "shamefully treated" in Philippi (I Thess. i. 2), Paul passed on rapidly to Thessalonica, the real capital of the province and an admirable centre of influence (cf. I Thess. i. 8). In this great seaport there was at least one synagogue; and for three weeks there he there discussed from the scriptures the cardinal points in his message (cf. I Cor. xv. 3 seq.), "that it behoved the Christ to suffer and to rise again from the dead," and that accordingly "this message," i. e. the Christ (2 Thess. ii. 2 seq.). Some Jews believed, "and of course the Gentiles (semi-proselytes) a large number, including not a few of the leading women. There was also successful work among those who turned directly "from idols, to serve a God living and real" (1 Thess. i. 9). This, must have occupied several weeks beyond those specified above (cf. I Thess. i. ii.; and the material help received more than once from Philippi, Phil. iv. 16).

But Jewish jealousy was aroused particularly by the loss of their converts; and at length in alliance with the rabble of the market place, it was able once more to cut short the preachers' work amongst the Gentiles. The charge made against them had a serious ring, since it involved not only danger to public order...

---

1 The region to which some think the Epistle to the Galatians (see supra) was addressed—so modifying the older "North Galatian" theory of Bishop Lightfoot and others.
but treason against the emperor (laesa majestas). Thus at Thessalonica Paul had experience of the imperial system as rival to his gospel of the sovereignty of God and of the imperial cult. His Christ, the true king of humanity. Yet it is doubtful if he was thinking of this 1 when he wrote to his converts touching "the mystery of lawlessness," working towards its final conflict with the divine principle also at work in the world. He seems in the whole passage (2 Thess. ii. 3-12) to view the empire in its positive aspect as a system of law and order rather than in its idolatry of its official head, the incarnation of worldly success and power; and he alludes to both emperor and empire (6 seq.) as the force at present restraining "the mystery of lawlessness" (árródia). This phrase itself suggests something more abnormal than the world-principle latent in paganism, such as "the apostasy" of God's own people, the Jews, and, as before in the Synagogue, Epiphanes the prototype of "the man of lawlessness" seated in "the temple of God" (v. 4), of whom the late emperor Caligula might well seem a forerunner. Even so monstrous an issue of Jewish refusal of God's truth, in His Messiah, would be but the climax of so unshalled an alliance as that which existed at Thessalonica between Jewish unbelief and paganism, seeing that the former was using the very Messianic idea itself to stir up the latter against the followers of Jesus (Acts xvii. 7; cf. 1 Thess. ii. 15 seq.). Paul and Silas withdrew by night, and began work in Berœa, a small city of Thessali, in the hope of returning when excitement had died away in the Synagogue stirred up the populace with the old charges, and Paul, as the prime actor, was forced to retire, first to the coast (whence he may have thought of a secret visit to Thessalonica, 1 Thess. ii. 18; cf. iii. 5), and then by sea to Athens.

At Athens he was consumed with anxiety, and sent word to Silas and Timothy to join him with fresh news about his "orphans" in the faith. While waiting, however, he felt compelled by the signs of idolatry on every hand to preach his gospel. He began his great work in the Synagogue with the Jews within their circle, and also in the Agora, after the manner of the place, in informal debate with casual listeners. The scope of his doctrine, the secret of right living, was such as to attract the notice of the Epicureans and Stoics. But its actual contents seemed to them a strange farago of familiar Greek phrases and outlandish talk about a certain "Jesus" and some power associated with him styled "the Resurrection." To clear up this, the latest intellectual novelty of the Athenian quidnuncs, they carry him off to "the Areopagus," probably the council, 2 so called after its original place of meeting on Mars' Hill. This body seems still to have had in some sense charge of religion and morals in Athens; and before it this itinerant "sophist" seemed most likely to make his exact position plain. A mark of authenticity is the very fruitlessness of his attempt to adapt the gospel of Jesus to Greek "wisdom." One only of his audience, a member of the Areopagus, seems to have been seriously impressed. The real effect of the episode was upon Paul himself and his future ministry among typical Greeks. Before Timothy's return Paul had moved on to Corinth, where he was to win success and to find material for such experiences, both when present and absent, as to excite the heart and mind, (see Corinthians, Epistles to the). Corinth was more typical of the Graeco-Roman world than any other city, certainly of those visited by Paul. In addition to its large Jewish colony, it had Oriental elements of other kinds, especially mystic and ecstatic cults; and its worship of Venus under semi-oriental attributes added to the general sensuality of the moral atmosphere. Over all was a veneer of Greek intellect and polish; 1

1 As Sir W. M. Ramsay argues in his Cities of St Paul, pp. 425-428.

2 This is the view favoured by archaeologists like Ernst Curtius (Expositor, vii. 4. 436 seq.) and Sir W. M. Ramsay. On the whole it suits the narrative better than the view which regards the Hill of Arex simply as a good spot for one of those rhetorical "displays" in which Athenians delighted.

for in its way Corinth prided itself on its culture no less than did Athens. No wonder that Paul's first feeling in this microcosm was one of utter impotence. It was "in weakness, and in fear, and in much trembling," though in dauntless faith, that he began a most fruitful ministry of a year and a half. His guiding principle was to trust solely to the moral majesty of the gospel of the Cross, declared in all simplicity as to its form (1 Cor. ii. 1 seq.), not heeding its first impression upon the Jew of intolerable humiliation, and on the Greek of utter folly (i. 18 seq.). Most gladly then would he preach in such a way that "faith should not stand in the wisdom of men, but in the power of God" (ii. 3); "that no flesh should glory before God" (i. 20). How central this was to his gospel, especially as it defined itself over against Greek self-sufficiency of intellect, may be seen from his whole conception of the spiritual man in his letters to Corinth (esp. 1 Cor. xiv. 4-9). Before this great work there began, Paul gained two fresh fellow-workers, whose share in parts at least of his later ministry was very great, Aquila, a Jew of Pontus, and his talented wife Priscilla. Probably they were already Christians, and as they too were tent-makers Paul shared their home and their work. That he was often in straitened circumstances is proved by his having to accept aid from Macedonia (2 Cor. xi. 9; cf. Phil. iv. 15). On the arrival of Silas and Timothy from that quarter, he began to preach with yet more intensity, especially to the Jews (xviii. 3). A breach with the Synagogue soon followed. The desire to turn all to the Gentiles met with much success, and Paul was encouraged by a night vision to continue in Corinth for more than a year longer. An attempt of the Jews (cf. 1 Thess. ii. 15 seq.; 2 Thess. iii. 1 seq.) to use Gallio, the new proconsul of Achaea, as a tool against him, not only failed but recoiled upon themselves. It was during his first winter at Corinth, a.d. 51-52 3 that he wrote his earliest extant missionary letters (see above for Galatians). Paul wrote not as a theologian but as the First Missionary to the Gentiles, full of sympathy for others and asking from them only such faith as could be real to them at the time.

His Thessalonian converts had met with much social persecution. The bulk belonged to the working class (iv. 11, 2 Thess. iii. 10-12); and Paul must have endeared himself to them by sharing their lot and plying his own manual industry (Acts xviii. 3). However hard his double toil of teacher and tent-maker might be, no sordid suspicions, such as his Jewish foes were ready to suggest (1 Thess. ii. 9; 2 Thess. iii. 8), should gain any colour from his conduct. He would be to his converts as a father, and an embodiment of the new Christian ethics which he pressed upon his spiritual children as the essential "fruit of the Spirit," and also as a demonstration of the Gospel to "them that were without" (i. 7-12; cf. i. 6, iv. 1 seq.). One of his special purposes of his first two epistles is affected by the brevity of his stay at Thessalonica and the severity of persecution there. Owing to the latter fact the Parousia, as a vindication of their cause, so near as reasonably to influence conduct (v. 11), had naturally been prominent in his teaching among them. So in these epistles he deals with it more fully than elsewhere (iv. 13 seq.); and the moral fruits of the new life in the Spirit are here enjoined in a very direct manner (iv. 1-8).

We need not suppose that Paul himself or his assistants used a set of rules as elaborate as the "Two Ways" (of Life and Death)

3 This date (and so Ramsay's chronology from this point) is confirmed by a fresh inscription showing that Gallio was proconsul from 52-53 (spring), rather than 51-52; see Expositor for May 1903, pp. 407-409.
embodied, e.g. in the *Teaching of the Apostles.* But to judge from these epistles (1 Thess. iv. 1 seq.; 2 Thess. i. 15; iii. 6), and his reference to the death of the Master, Paul may have used the word "obedience" also as loose as "unrighteousness" — to which the Roman Christians had been "committed" (Rom. vi. 16 seq.). Paul gave to his converts a fairly full outline of moral instruction, similar at least to that of Judaism. Brotherly love was the uniform basis of vices in Rom. i. 24 seq.; 1 Cor. v. 10 seq.; Gal. v. 19; Col. iii. 5; cf. E. von Dobschütz, *Christian Life in the Primitive Church,* app. 6).

What was distinctive of Paul's ethical teaching was not any lack of positive precepts, but the intimate way in which he, like his Master, infused them with the spirit in which, and by which, they were to be realized, as aspects of the ideal of love to God and man. He was supremely and generally moral, not, of course, in the sense in which his own experience made him the most inspiring of teachers and the greatest interpreter of the mind of Christ. The master motive on which he relied for all, was the imitation of Christ in a peculiarly inward sense. To the believer Christ was no mere external example, but was already within him as the principle of his own new moral being, in virtue of the Holy Spirit indwelling as the Spirit of Christ. Here lay the secret of the new "power" so characteristic of the Gospel (Rom. i. 16), a power adequate to realize even the enhanced moral ideal revealed in Christ. The wonder of it was that this power annulled the moral past, or rather transformed it into a present and future with the "virtuous." To this sovereign, emancipating influence of God's holy Spirit, antagonizing "the flesh" and all its works, Paul confidently entrusted his converts for "sanctification" or progressive transformation (Gal. iii. 3, v. 16 seq.) into "the image of Christ," the full actuality of the type already latent in Christian faith. Such teaching is implicit in the Thessalonian letters; but it is explicit in the Epistle to the Galatians. Here he announces in the clearest accents the secret of Christian conduct. Walk by (the) Spirit, and desire of the flesh ye shall not fulfill. 10 If we live by the Spirit, by the Spirit let us also walk. 11 Or the whole conduct (of Paul, in which all (to the conscience) were ye called; only turn not freedom into an opportunity for the flesh, but through love serve one another.

Pauline Antinomianism. These are the watchwords of Paul's antinomianism, which had grown out of the soil of his own strict moral discipline, where the ethical ideal had become an instinct and a passion. But how would they be taken by raw Gentiles, say in Corinth, untutored to self-denial whether in the things of sense or spirit? That their egoism often perverted Paul's life-long love to liberty into an apostasy for libertinism in keeping with current habits, as well as for selfish individualism in the use of intellect or even "gifts of the Spirit," may be gathered from his letters to Corinth (see CORINTHIANS, EPHESIANS TO THE). What here concerns us, however, is the splendidly open way in which Paul met such abuses, not by falling back upon legalism as a "safeguard" against licence, but by reapplying the laws of spirituality, both in relation to God as source of spiritual gifts, and to God's people as the appointed sphere of their exercise. He does not recede from his way of teaching; he insists that they shall understand it and abide by its real obligations. But while thinking of its wide sphere in Corinth, we must not forget certain special religious conditions affecting both the reception of his gospel and the way in which it was afterwards conceived. Side by side with the religion of the city and the family, both of them polytheistic and utilitarian in the main, stood the "mysteries" or esoteric cults, which were sought out and participated in by the individual for the satisfaction of essentially personal religious needs. Clearly those trained by such Mysteries would be more drawn than ordinary polytheists to his gospel, with its doctrine of mystery yet real union with the divine in Christ, and would less than others find the Cross, with its message of life through death, to be folly. This being so, we shall not be surprised to find, especially at Corinth, traces of the reaction of conceptions proper to the Mysteries upon the ideas and practices of Paul's converts (cf. 1 Cor. xv. 20), and even upon the language in which he set forth his meaning to them (see ii. 6 seqq.). Whether Paul himself was influenced by such ideas, e.g. in relation to the Sacraments, is a further question as to which opinions are divided.

After some eighteen months in Corinth, Paul felt the time had come to break fresh ground now at last perhaps at Ephesus, the key to the province of Asia. With this in view he visited to Jerusalem. Paul started before autumn A.D. 53 for his third great campaign, the centre of which he had already chosen in Ephesus, where Priscilla and Aquila were helping to prepare the ground. Passing through south Galatia, where he further fortified his converts (viii. 23), he would reach Ephesus before winter closed in. Already his circle of helpers had gained a fresh member of great gifts, the Alexandrine Jew Apollos (q.v.), who had been brought into fuller sympathy with the Pauline gospel by Priscilla and Aquila, and who, learning from them the situation in Corinth, volunteered to try to overcome the prejudices of the Jews there (viii. 24-25). At first Paul taught in the synagogue, until growing hostility drove him to "separate the disciples" and transfer his headquarters to the school of Tyrannus. This was a lecture-room such as "so- phists" or *rhetors* were wont to hire for their "displays." The change was not only one of place, but also of style of discourse, his appeal now being directly to the Gentiles, who would at first regard Paul as a new lecturer on morals and religion. The influence which went forth from this centre radiated throughout the whole province of Asia, partly through visitors to Ephesus on business or for worship at its great temple, and partly through Paul's lieutenants, such as Timothy and Epaphras (Col. i. 7; iv. 13). Witness to this extensive influence, the Epistle of Paul to the Ephesians. This result was due not only to Paul's persuasive speech but also to deeds of power, connected with the supernatural gifts with which he felt himself to be endowed by the Spirit of God (Acts xix. 11; cf. Rom. xv. 18 seq.; 2 Cor. xii. 12). Nor can we feel Paul's full greatness unless we remember that he was tried by the searching test of supernatural psychic and physical powers operating through him, and that he came through all with an enhanced sense of the competency of rational and moral gifts, and of love as the crown and touchstone of all, as well as with a deepened humility. That he suffered much before the final tumult, due to his success affecting trades dependent on the cult of the Ephesian Artemis, as implied in his own words, "humanly speaking, I..." The affirmative is maintained by the so-called *Religionsgeschichtliche Schule* in particular. - The more general verdict is not proven.

2 In this light his polling of his head before embarking at Cenchreae in token of a vow of special self-consecration (to be redeemed at the end of a month in Jerusalem itself; cf. Josephus, *Jewish Wars* ii. 1. 1), is significant of his feelings as to the critical nature of the visit, including danger from Jewish fanaticism during a voyage probably on the eve of a least (say Pentecost), for which he went up on his head (Acts xxi. 22). 3 We may doubt whether Paul himself countravened the practices by which some believed that they drew magical virtue from his relics, in other cases; cf. (Rom. xvi. 20). However, what he, in common with his age, believed to be the exorcism of evil spirits, as the story of Sceva's sons itself implies (xix. 13 seqq.).
fought the beasts at Ephesus (1 Cor. xvi. 32), which may mean that he was almost torn in pieces by mob fury. It was perhaps on this occasion that Aquila and his wife risked their lives for him (Rom. xv. 26; Acts xvi. 4). Indeed he lived much of his time in Ephesus as one under daily sentence of death, so constant was his danger (1 Cor. xvi. 30 seq.; cf. iv. 2; Cor. i. 15; iv. 9-11). But this almost unceasing strain on his human frailty simply deepened his sense of dependent union with Jesus, both in His death and victorious life, and softened his strong nature into a wonderful gentleness and sympathy with suffering in others (2 Cor. i. 4 sqq.). It is no accident that it was from the midst of his Ephesian experiences that his Hymn of Love (1 Cor. xiii. 1-8, 13) sounded forth. His own spiritual life seems to have grown in Ephesus more than at any other period since the era of his conversion.

This brings us to the most tragic episode in Paul's career, judged by his own feelings, a psychological crucifixion of which we have the vivid record in his correspondence with the Corinthian church. Reduced to its simplest terms the situation was as follows. The Corinthian church was suffering from the fermentation of ideas and ideals too heterogeneous for their powers of Christian assimilation. Paul had laid the foundation, and others had built on it with materials of varied kind and value (see CORINTHIANS). Specially dangerous was the intellectual and moral reaction of the typical Greek mind, starting from a deep-seated dualism between mind and matter, upon the facts and doctrines of the Gospel. Its issue was an exaggeration of Paul's own religious antithesis between "the flesh" and "the mind," into a metaphysical dualism, so that the conduct of the body, crudely identified with "the flesh," became a thing indifferent for the inner and higher life of the spirit illumined by the Spirit of God. There was not only divergent practice in morals and in religious usage; there was also a spirit of faction threatening to destroy the unity of church life, to which Paul attached the greatest importance. To lead them to realize their unity in Christ and to set their love as the central aim of Paul's first letter to this church. He rises sheer above every manifestation of the sectional element in man—whether Jewish, Greek, intellectual, ritual, or ascetic—into the sphere of pure religion, the devotion of the whole personality to God and His ends, as realized once for all in Christ, the second Adam, the archetype of divine sonship. It is his enforcement of this idea, along with firm yet flexible application to the various disorders and errors at Corinth of certain other of his fundamental principles, such as the indwelling of the Holy Spirit in the individual and the community, that makes this epistle so significant for Paul's biography, while it gives a purpose to the beginnings of a Pauline church than all other sources of knowledge put together, at the same time illustrates the rare balance of Paul's mind. But neither this letter nor the influence of Timothy (1 Cor. xvi. 17), already on his way to Corinth with Erastus via Macedonia, on collection business (Acts xix. 22; Cor. xvi. 1 seq., 10 seq.)—nor even, as some think, of Paul himself in person (2 Cor. ii. 1; xii. 11, 21; xiii. 1 seq.)—brought about an understanding on certain points involving Paul's authority. In this connexion the presence of interloping Jewish "apostles" with their claims for themselves and their insinuations as to Paul's motives (2 Cor. xii. 14-16), greatly complicated and confused the situation on both sides.

When next the curtain rises, we gather that Paul had been forced to write a letter of protest in a tone of severity fitted Paul leaves to arouse his converts' better selves. It was in fact an ultimatum that Titus carried to Corinth before Paul left Ephesus, his departure hastened by the great tumult. On leaving for Macedonia he "exhorted" the assembled disciples, and perhaps left Timothy to check the tendencies to error which he perceived at work (xx. 1, v. 14. i. 3). Then starting from Miletus, the chief port in the vicinity (cf. xx. 15)—where he had to leave Trophimus owing to sickness (2 Tim. iv. 20, probably a fragment from a brief note to Timothy written soon after)—he reached Troas. Here he intended to evangelize pending the return of Titus (1 Cor. xii. 12 seq). But though "a door of opportunity at once opened to him, growing anxiety as to the reception of his severe letter drove him forward to meet Titus half-way in Macedonia. There "fightings without" as were added to "fears within" (vii. 5), until at last his meeting with Titus brought unspeakable relief. The hulk of the Corinthian church, in deep remorse for the way in which they had wound him who after all was their "father" in Christ (1 Cor. iv. 13), had come out clearly as loyal to him, not only in word but also in discipline on the arch offender, whose contumacious conduct (now repulsive in the church's eyes) had soured him, but for whom Paul is now the first to bespeak loving treatment ("let them not be swallowed up of excessive grief" (ii. 5 sqq.; vii. 12). Accordingly in his next letter his heart overflows with gladness and affection, yet not so as to blind his clear eye to the roots of danger still remaining in the situation.

The interleaving judaizing missionaries (xi. 4 seq., 13, 22; cf. x. 7) are still on the spot, clarifying themselves and glorifying in their welcome on the field prepared by another's toils (x. 12-18); while in the church itself there are moral abuses yet unredressed, even unacknowledged (xii. 20 seq.), on which Paul felt bound still to press home the essential Gospel message and principle (1 and 2 Cor.)—indeed, so brazenly insinuate, in reliance on his not having acted summarily on his former visit, when the church as a whole was not heartily with him. Hence Paul felt himself bound to act boldly (x. 1-6), if and when he arrived, to correct the church in the matter of discipline (xiii. 6). It is to prepare the way for this (xiii. 10) that Paul, while recognizing in the main the church's loyal affection, accepts the second part of his letter (x-xiii. 10) in so different a key, striving to complete the reaction against errors, with their taunt as to his not daring openly to take an apostle's support from his converts at Corinth (xi. 12 sqq., xii. 11-18).

The Second Epistle to the Corinthians was written from Philippi or Thessalonica (ix. 2); and Timothy joins in its opening salutation. He had, it seems, been summoned to Paul's side from Ephesus while Paul was in Rome (Phil. i. 26). But he had not been left in Corinth, in which he is informed that Erastus had remained in Corinth (? as now city-treasurer, Rom. xvi. 13), while Paul had been deprived also of the help of Trophimus, so that Timothy was unexpectedly needed at his side (this is embedded in an alien context in 2 Tim. iv. 20, 21* see below). One reason at least for Paul's need of Timothy is suggested by the reference to Erastus (cf. Acts xix. 22), viz. the business of the great collection from his churches in Galatia, Asia, Macedonia and Achaia. This had been some time in progress and was to be carried by delegates to Jerusalem on Paul's approaching visit, which was hoped in connexion with the unity of Jewish and Gentile Christianity. Another may have been the labour of inspecting the churches in those parts, which now reached at least as far as, if not into, Illyricum (Rom. xv. 19). In any case it was midwinter (x) before Paul became the guest of the hospitable Gaius in Corinth (Rom. xvi. 23).

Touching the resettlement of local church affairs during Paul's three months in Corinth, we know nothing. For us the great event of this visit is the writing of that epistle which shows that his mind was now bent on the extension of his mission westward to the limits of the Roman Empire. To Rome his thoughts had been turned for many a year, but he had time and again checked the impulse to visit it (Rom. xvii. 22 seq.). For the city had long been occupied by the Gospel in one form or another; and it was a point of honour with him to preach "where Christ was not named," not to build on others' foundations (xv. 20). But his eye was now fixed on Spain, if not also on south Gaul. It was, then, largely as his mission to the western Mediterranean that Paul viewed Rome. Yet after all Rome was not like other places; it was the focus of the world. Hence Paul could not pass by it (xv. 1 seq.). Very tactfully does he now offer his preliminary contribution to them—"by way of reminder," at least—emboldened thereto by the consciousness of a divine commission to the Gentiles, proved by what he had been enabled already to accomplish (xv. 15 seq.).
But how could Paul write at length to a community he had never visited? Not to dwell on what he might have gathered from "Priscus and Aquila," the wonderful list of salutations by name, often with brief characterizations, proves how constant was the flow of Christian life between the capital and provincial centres like Ephesus and Corinth. But, beyond all this, there is the nature of the epistle itself as a great "tract for the times," applicable to the general situation at Rome, but in the view of the writer, especially to the conditions of Paul's own companions. It has therefore a profound biographical significance for Paul himself, summing up all his thought so far, on the basis of his conversion as unfolded by his experiences as an apostle. It is his philosophy of religion and of history, the first worthy of the name, because the first deep-based upon the conception of the unity of humanity, as related to God, its source and the determining factor in its destiny. As such it also includes in broadest outline (viii. 18 sqq.) a philosophy of nature, as related to humanity, its crown and key. Thus it is in effect a universal philosophy in terms of the moral order, which Paul, like every Hebrew, regarded as the most real and significant element in the universe. At the centre of this grand survey stands the Jewish race, the chosen vessel for bearing God's treasure for mankind during the provisional period of human history; and at its spiritual heart, in turn, Jesus, Messiah of Israel, Saviour of mankind, in whom the distinction between the special and general spheres of revelation is transcended, while the law, "the middle wall of partition" between them, is broken down by the Cross.

Into the sweep of this high argument, as it is unfolded step by step, with an organic completeness or exposition peculiar to Romans among its writings (cf. Ephesians), there is wrought not only the problem of the Jew and Gentile (still the burning question of the time), but also the stubborn paradox of the actual rejection of Israel's Messiah by the nation as a whole. This forms a great appendix (ix.-xi.) to the more theoretic part of the epistle, and lays bare Paul's inmost heart, showing how truly a Jewish patriot he was. Even the categories in which he grapples, without formal success, with the problem of divine election and human responsibility, betray the Jew, to whom the final axioms are God's sovereignty and God's righteousness. Further into the contents of this most characteristic writing it is not ours to go (see Romans). Suffice it to say, he who apprehends it, as the issue of a real religious experience, already knows Paul as he knew himself and cared to be known. He who masters its thought knows the Pauline theology. Some indeed assume that Paul ceased really to progress beyond the point represented by Romans, and that certain of his later writings, if they be his at all, show a certain enfeeblement of grasp upon principle. But that is to confuse once more Paul's personal theology with the forms of instruction which experience showed him were expedient for the strengthening and development of feeble or undeveloped moral types.

Yet while the horizon of the Roman epistle was so universal in one sense, it was restricted in another. Owing to the foreshortening influence of the parousia hope, even Paul's programme of a world-mission meant simply seizing certain centres of influence, to serve as earnest of Messiah's possession of all mankind on His return to take His great power and reign. Evangelization on the farther side of the parousia was the greater part of the whole. So we gather from this very epistle, as well as from 1 Cor. xv, 23-25 (and yet more clearly from Col. i. 23). In other ways, too, the Christianity of Paul and his age was relative to the parousia, both in theory and in practice (e.g. in giving the Gentile world a gospel of personal holiness as the typical reflection of the world of spirits operating upon human life, are the chief things to be allowed for in reading his epistles. Thus viewing things, how eagerly Paul must have looked westwards at this time. Yet his heart turned also to Judaea, where he felt his line of march still threatened by the danger of disunion in the very Body of Christ. Paul's Care for Unity. At all cost this must be averted. The best hope lay in a practical exhibition of Gentile sympathy with the Mother Church in Jerusalem, such as would be to it a token of the Holy Spirit as indwelling Paul's churches. The means for such a thankoffering for benefits received ultimately from Jerusalem (Rom. xv. 27) had been collected with much patient labour, and the delegates to accompany Paul with it had already assembled at Corinth (xx. 4). Paul had intended to cross the Aegean from Corinth with his party, by the direct route to Jerusalem (xx. 16); but, at the last moment, it was decided that one of the members of the delegates should make the journey on the voyage, in order to start earlier by the longer land-route, as far as Philippi, whence, after waiting to observe the Days of the Unleavened Bread,1 he sailed to join his fellow-almoners at Troas. There is no need to follow all the stages of what follows (see Ramsay, St. Paul the Traveller). But every personal touch is meant to tell, even Paul's walk from Troas to Assos, perhaps for solitary meditation, away from the crowded ship; and all serves to heighten the feeling that it was the path to death that Paul was already treading (xx. 23). This lies too at the heart of his impressive farewell to the Ephesian elders, a discourse which gives a vivid picture of his past ministry in Ephesus. Its burden, as Luke is at pains to emphasize by his comment upon the actual parting, is that "they should behold his face no more."

The scene was repeated at Tyre; while at Caesarea, the last stage of all, the climate was reached, in Agabus' prophetic action and the ensuing dissuasion of all those about him. But Paul, though moved in his feelings, was not to be moved from his purpose. The party went forward, taking the precaution to secure Paul a trusty host on the road to Jerusalem in the person of Mnason, a Hellenist of Cyprus. He entered the holy city in good time to show his loyalty to the Jewish Feast of Pentecost. He was well received by James and the elders of the church. So far scholars are agreed, since the "we" form of narrative which began again at Philippi (xx. 5), reaches to this point. But as to the historical value of what follows, before "we" reappears with the start for Rome from Caesarea there is large diversity of opinion. The present writer, holding that "we" is no exclusive mark of the eyewitness, sees no reason to doubt the substantial accuracy of the narrative in Acts xxii. 10-xxvi.2 touching the Jewish outbreak against Paul and its sequel. Its significance for Paul's life is fairly clear, though we are not told what acceptance the Gentile offering of loyal love met with in the Jerusalem church as a whole. But that its general effect upon the comity of the two branches of the Messianic Ecclesia was good seems implied by the serene tone of Paul's later references to the unity of the Body (Eph. ii. 19-22; iii. 5 seq.). What does stand out clearly in Acts is all that bears on Paul's position as between the Jewish and the Roman authorities. Here we observe a gradual shifting of the charge against him, corresponding in part to the changes of venue. The more local elements recede, and those of interest to a Roman court emerge.

To the Jewish mob he is "the man that teacheth all men everywhere against the People, and the Law, and this place; and moreover he brought Greeks also into the Temple" (xx. 28.). Before this, Tertullus describes him as "a pestilent fellow, and a mover of tumults among all the Jews throughout the world, and a ringleader of the sect of the Nazarenes, who also tried to profane the Temple" (xxv. 8 seq.). Similarly among "the many and grievous" offences alleged before Festus (xxv. 7 seq.) we gather that one or more were

1 This is a valuable datum not only for Paul's own loyalty to the usage of the Jewish piety in connexion with the memory of his life, and revealing in the light of what follows the day of the week on which Passover fell that year, and so tending to fix the year as 56 or 57 (see below, Chronology).

2 These chapters contain passages as vivid and circumstantial as any in the "we" sections. As to the speeches, their fidelity naturally varies with the circumstances of delivery; but in all there is that which could not be Luke's free composition. The verisimilitude of Tertullus' demonstration of Paul's "heresy" is demonstrated in connexion with the other Jewish piety in connexion with the four men under vows (xx. 23-27) is complete, especially in view of Paul's own vow at Conchreae and the prayer for Jewish release (xxv. 7 seq.); the Jewish representation of the high priest in what was not a regular session of the Sanhedrin (xxiii. 2-5), is quite probable. Other points hardly merit notice here; see Knowling's Testimony of St. Paul, loc. xct.
Paul at Caesarea.

Though he must have been in correspondence with his churches, at least through messengers, nothing from his pen has reached us. We can only infer from epistles written later how much this period contributed to his reflective life. The outlook was indeed stimulating to thought. Near at hand Judaea was sliding rapidly down the incline of lawlessness and fanaticism of Roman rule, towards a catastrophe which Paul's eye, trained by Jewish Apocalyptic to regard certain things as signs of the day of Antichrist, would seem to betoken the prelude of the Parousia itself. Then, farther afield, the growing confederacy of Messiah's churches was stepping into the place vacated by "Israel after the flesh," as the people ready for God's Messiah.

The journey to Rome calls for no detailed notice (see Ramsay, St Paul the Traveller). Its main interest for us is the impression of nobility, courage and power which Paul conveyed to the centurion Julius and his fellow-passengers generally; while the enthusiasm of the eyewitness himself visibly reaches its climax as dangers thicken and Paul rises above them all. At last Italy is reached, and Paul is met by detachments of "brethren," from Rome, who came as far as thirty and forty miles to welcome him: "whom when Paul saw, he thanked God and took courage."

From Paul's letters, however, we gather that if he looked for sympathy from the Roman Christians, he looked largely in vain. Whilst some welcomed and most regarded him as indeed a champion of the Gospel whose fearless testimony even in bonds emboldened many, including the judaizing section who wished him no good, to preach Jesus more openly than before; few, if any, really showed him brotherly love or cared for the interests of Christ outside Rome. That the latter still was on his mind (Phil. ii. 12-15; ii. 21). Such absorption in their own local affairs struck Paul as strangely un-Christian in spirit, and added disappointment to his irksome confinement, chained as he was by one wrist to a praetorian soldier night and day. Yet he rose above it all. Only let "Christ be magnified in his body, whether by life or death. Then should he not be ashamed, come what might.

The letter which makes us aware how things lay is Philippians, the most devoted of all his writings and the most Christlike. It is the perfect expression of personal "Paulinism", in its mature and strongest manner. It flows as joyous thanks for tokens of continued mindfulness of him recently received from his old Philippian friends through Epaphroditus, one of their number. Touched and filled with spiritual joy the more that, save for his own personal circle, love was so scant around him, he turns to comfort his friends in their sorrow for him, out of the stores of Divine consolation received through his own fresh sense of need (cf. 2 Cor. i. 3 seq.). "Rejoice in the Lord" is its recurring note. Here we get the word of the hour, both for Paul and for his converts. The date of Philippians is an open question, English scholars tending to place it early, while most scholars put it late in the "two years" of Acts. The present writer would place it last of those written during the first year, i.e. last of all save 2 Timothy.

Of the remaining imprisonment epistles, the beautiful little note to Philemon touching his slave Onesimus casts fresh light on Paul "the Christian gentleman," by its humour and perfect considerateness of tone. The two letters do not seem at first sight to reflect his personality so much as his Letters to the Churches.

Paul at Caesarea.

This man could have been set at liberty had he not appealed to Caesars," are probably recorded with a touch of tragic irony.

The journey to Rome calls for no detailed notice (see Ramsay, St Paul the Traveller). Its main interest for us is the impression of nobility, courage and power which Paul conveyed to the centurion Julius and his fellow-passengers generally; while the enthusiasm of the eyewitness himself visibly reaches its climax as dangers thicken and Paul rises above them all. At last Italy is reached, and Paul is met by detachments of "brethren," from Rome, who came as far as thirty and forty miles to welcome him: "whom when Paul saw, he thanked God and took courage."

From Paul's letters, however, we gather that if he looked for sympathy from the Roman Christians, he looked largely in vain. Of the remaining imprisonment epistles, the beautiful little note to Philemon touching his slave Onesimus casts fresh light on Paul "the Christian gentleman," by its humour and perfect considerateness of tone. The two letters do not seem at first sight to reflect his personality so much as his Letters to the Churches.

The Ethical Supposition of the Pastoral Epistles in Paul's later Epistles.

In this respect, as in nearly every other, these epistles exhibit marked affinity with the next group, claiming to come from Paul's pen, the so-called Pastoral Epistles, the 1 Timothy, 2 Timothy, Titus, which are supposed "morality" of which is often urged against their authenticity. In both cases the development is quite natural in Paul the missionary, as it answers to growing defects among his churches in the sphere of conduct. Such errors, while twofold in effect, alike sprang from a defective sense for ethics as the essential form of piety (1 Tim. vi. 3-11; 2 Tim. iii. 5; cf. Jas. i. 27) flowing from Christian faith. A merely intellectual faith, instead of the genuinely Pauline type, involving enthusiastic moral devotion to Christ, tended in practice either to negative and religious, as at Colossae, or to moral laxity. The latter was sometimes defended on a dualistic theory of "flesh" and "spirit," as two realms radically opposed and morally independent. But if so, why not apply this to the crisis at Philippi also?
Paul met both errors by his doctrine of the “new man,” the new moral personality, God’s workmanship, “created in Christ Jesus for good works” (Eph. ii. 10), whose nature it is to be fruitful unto holiness and love (cf. Gal. v. 6, vi. 15).

In the so-called Pastoral Epistles the same subject is handled similarly, yet more summarily, as before. He writes instructions to friends familiar with the spirit behind the concrete precepts. Allowing for this, and for the special circumstances presupposed, there is no “moralism” about the “wholesome instruction” in the Christian walk given in these epistles (1 Tim. i. 10; cf. vi. 3; 2 Tim. iv. 3) than in the other group. “Moralism” is ethical precept given with the Christian moral life in mind. It is not associated with the notion of salvation as “of works” rather than “by grace.” But this of course is a real trace in the Pastoralas, which are a type of letter by themselves, as regards their recipients and certain of the aspects of church life with which they deal. As dealing with methods of instruction and organization, which must have occupied increasingly the attention of those responsible for the daily course of church life, they contain nothing inappropriate to the last two years of Paul’s life, when he was considering how his churches might best be safeguarded from errors in thought and practice in his absence or after his decease.

The main difficulties as to their substance have been imported by an apparent restoration of the Pastoralas, and by the progress of exegesis and knowledge of the conditions of early church life. Our real difficulties in conceiving the Pastoralas as what they purport to be, relate to their form, and lie in the field of language and of ideas. They are in language not Greek, but Jewish. But these, even as regards style and syntax, are reduced to narrow limits, when once due weight is given to the fresh analogies furnished by the (already familiar) “Pastoral” language of Jud. (11:25-27). 

This is specially the case with the use of the new words of religious import, like “Saviour” or “Deliverer” (Soter, of God and Christ; see Eph. v. 23; Phil. iii. 20)—the idea of which spurs the imagination of the writer’s own and the reader’s mind, as well as the colour of the tone of the times; see Lightfoot, “Pastoral Essays,” and further a few comments of mine, in the Epistles (see Lightfoot, Epistle to Titus, 3rd ed. 1899). This is especially the case with the use of the new words of religious import, like “Saviour” or “Deliverer” (Soter, of God and Christ; see Eph. v. 23; Phil. iii. 20)—the idea of which spurs the imagination of the writer’s own and the reader’s mind, as well as the colour of the tone of the times; see Lightfoot, “Pastoral Essays,” and further a few comments of mine, in the Epistles (see Lightfoot, Epistle to Titus, 3rd ed. 1899). This is especially the case with the use of the new words of religious import, like “Saviour” or “Deliverer” (Soter, of God and Christ; see Eph. v. 23; Phil. iii. 20)—the idea of which spurs the imagination of the writer’s own and the reader’s mind, as well as the colour of the tone of the times; see Lightfoot, “Pastoral Essays,” and further a few comments of mine, in the Epistles (see Lightfoot, Epistle to Titus, 3rd ed. 1899). This is especially the case with the use of the new words of religious import, like “Saviour” or “Deliverer” (Soter, of God and Christ; see Eph. v. 23; Phil. iii. 20)—the idea of which spurs the imagination of the writer’s own and the reader’s mind, as well as the colour of the tone of the times; see Lightfoot, “Pastoral Essays,” and further a few comments of mine, in the Epistles (see Lightfoot, Epistle to Titus, 3rd ed. 1899). sending him a letter of encouragement and specific instructions, to open with a sentence (characteristically wanting a grammatical conclusion) in which he recalls a parallel case, where he had exhorted Timothy to "stay on" in Ephesus (1 in A.D. 56). Nor was the need less urgent now, owing to Judaic "fables" touching the primitive period, of biblical history (genealogies), meant to bear on certain parts of the Law (i. 4-7) as of universal religious validity. At Ephesus (as also in Crete) much the same type of Judaism was re-emerging at Colossae was reacting on local Christianity; while here and there were traces of dualistic antinomian theory (see i. 19 seq.; cf. 2 Tim. ii. 17 seq.). The general need of the hour was wholesome Christian ethics applied all round, supported by firmer organization in church life, especially with a view to check irresponsible teaching (1 Tim. v. 17, vi. 3; Tit. i. 9-11; 2 Tim. ii. 2, iv. 3). To the special local problems Paul addresses himself in this letter, but above all to the bracing of Timothy's somewhat sensitive nature to face the opposition which he must encounter as a Christian leader at such a time (note the similes of the soldier and athlete, both of whom face hardship readily, as part of their profession, i. 18, v. 8 sqq., vi. 12 seq., 20; 2 Tim. ii. 3 seqq., iv. 5). In this connexion occur also certain autobiographic passages, as well as solemn affirmations of his own divine commission (e.g. i. 1, 11 sqq., ii. 7), the aim of which is to reassure his disciple that his gospel will bear all the strain that is being put upon it, or can be in the future (cf. Eph. vi. 19 seq. for all this). Here Paul is answering challenges which he knows to be coming on the other side, especially now that the apostle seemed less likely to return to Asia. He himself does not flinch, because he knows he had not run save "at the command of God" (i. 1), after being wondrously changed from his former self (i. 12 seqq.). Thus as to the authority of the Gospel "committed to his charge," however much it may be called in question (i. 10 seqq., ii. 7), he has no shadow of doubt.

When the curtain rises for the last time, it is on the morrow of the long-expected hearing of Paul's appeal. The case stands adjourned, but he is less and less able to endure. It is to its final issue. His one comfort is that by the Lord's support he had been delivered from the greatest danger, "the mouth of the lion" ready to "swallow up" (cf. 1 Pet. v. 8) his soul through covenar fear, as he stood solitary before Caesar. From that the Lord had rescued him, and would yet rescue him from every "work of ill" (2 Tim. iv. 16-18). Yet his earthly work is done (iv. 6 seqq.). So he writes to Timothy, his "beloved child," whom now he longs to see once more. But lest this should not be granted him, he pretexts to the summonses a last will and testament, which may help Timothy to rise above it. He who has lived out the hands of Roman law is bound to cause. Let Timothy take up the Gospel torch as it falls from his own dying hand, and "do the work of an Evangelist," heeding not the hardship. Then after providing for the Gospel, he turns to more personal interests, "Hasten to me with all speed," he says in effect, "for I am all alone, save for Luke. My other trusty friends are away on various missions, and Demas has deserted the sinking ship. Typhicus I had already sent to Ephesus; he will replace you. Pick up Mark and bring him with you—he is so helpful. Bring my cloak, papers and books (copies of the Scriptures, lying in Cars) in hand at Troas (evidently Horse AA. xx. 6 sqq. Alexander the bronze-worker (an old Jewish foe at Ephesus, Acts xix. 33) did me many a bad turn in my case (his case is in the Lord's hands); be on thy guard against him." Then follow allusions to Paul's "first defence," unsupported by such as might have appeared on his behalf (especially from Asia; cf. i. 15); and next salutations to Prisca and Aquila, and to the house of Onesiphorus—an Ephesian who had sought Paul out in Rome (i. 16-18).

So the curtain falls for the last time. But Paul's fate is hail or mordure. He himself says that the charge against him, unburdened by independent evidence, merely "the executioner's sword, the last penalty for a Roman citizen. With this late 2nd-century tradition agrees (Tertullian, De praeces. hær. 36), naming the very spot on the Ostian Way, marked by a martyr-memorial (trophiæum, Caius ap. Euseb. ii. 25), probably at the modern Tre Fontane, some three miles from Rome. But the traditional date (June 29) reaches us only on far later authority. Acts simply suggests the first half of A.D. 62; and we may imagine Timothy reaching Rome in time to share Paul's last days (cf. Heb. xiii. 23).

Early Tradition has little to say about Paul. Possibly the earliest reference outside the New Testament is a Christian addition to the Testament of Benjamin, xi., which describes a Benjamite as "enlightening with new knowledge the Gentiles." The notice in Clement's epitaph (ch. v.) to Paul's having borne bonds "seven times" (cf. Acts xiii. 37) is hardly echoed elsewhere. Ignatius refers with reference (cf. Rom. iv. 3) to Paul as his example in martyrdom (Ad Eph. xii. 2); similarly Polycarp (Ad Phil. iii. 2) deprecates the notion that, if he, or any other like him, could rival the "courage of the Jewish apostle Paul," and refers to his letter (s) to the Philippians. The Acts of Paul, composed not long after A.D. 150 by an Asian presbyter, in order to glory Paul by supplementing the Lukan and Mathian traditions (for himself in certain circles; but it contains so far as extant in the Coptic, which also enables us to identify other documents as once parts of these Acts) no fresh data, unless the episode dealing with Paul's trial before the Jewish council is of Judaic tradition (see Pseudo-Clementine, and Pisinian Antioch). Its description of Paul as "a man small in size, bald, bow-legged, sturdy, with eyebrows meeting and a slightly prominent nose, full of grace " in expression, may or may not be based on purely Jewish or Christian traditions (cf. R. L. Lipsius, Die apostol. Apostelgesch. n.s.w., and C. Kcken, Paulus, i. 331 seqq.).

Paul's personality is one of the most striking in letters. No character of the distant past is known to us more fully both from within and from without, thanks largely to the self-revealing quality of his letters. His was a deep, complex, many-sided nature, varying widely in mood, yet all so concentrated by moral unity of purpose that the variety of gift and capability is apt to escape notice. During his career every faculty comes into play, and we realize how largely human he was. "Even though Paul was an apostle," says Chrysostom, "still he was a man." A true picture of him must probably be sought in the psalm literature, as well as in the earlier Christian clementine literature (cf. R. L. Lipsius, Die apostol. Apostelgesch. n.s.w., and C. Kken, Paulus, i. 331 seqq.).

Kken, Paulus, i. 331 seqq.).
morality on the other. It was his own experience as a passionate seeker after righteousness which gave him the theory of the justification of Jesus Christ as at once moral ideal, master motive and immanent principle of life at work in the soul by the Spirit which is the power of life and may be styled his ethical mysticism.

This was his main contribution to Christianity; and as depending on his personal experience, it was bound up closely with his personality—a fact which makes his direct influence, intense, yet limited, amount in the highly personal.

At the root of Paul's nature lay the Hebrew capacity for personal devotion to the Divine as moral perfection, to an unbounded degree. It found its object in a concrete form, stirring both imagination and affections, in Jesus the Christ, the model and guide of the apostle, whose spiritual glory man was created to reflect. This instinct for ideal devotion seems never to have been diverted, even for a season, into a single human channel, in the love of woman. From his early years Paul was surrounded by this kind of life. His people. This he came to regard as a special divine gift or vocation (1 Cor. vii. 7), imposing on his person, in the face of the world's needs (cf. 2 Cor. xi. 2), a higher duty than could be fulfilled within the conditions of the closest human religions (12–15). But the tenderness and chivalrous self-sacrifice which found no vent in the ordinary channel came to pour itself forth in an absorbing love for his churches, which were to him as his own spouse, though his aim was rather to "present himself as a virgin to Christ" (2 Cor. xi. 2).

This educated his human affections, and softened the outlines of a nature inflexibly loyal to principle and absorbed with the divine aspect of life. The love of Christ was in him a consuming fire, compelling him to look at all, as it were, through Christ's eyes, that Paul could come to love men even to the point of a self-forgetfulness that seemed to some hardly sane (2 Cor. v. 13–16); cf. Mark iii. 21. "He is beside himself, self-wrong, self-gifted; he is the joy of the invisible; the 'mocked and conciliatoriness of Christ' to such a degree that during the Corinthian troubles his critics contrasted the vigour of his letters with the seeming feebleness of his outward bearing (2 Cor. ii. 7).

There is no evidence that his presence was physically weak or unimpressive, even if his stature was small, as tradition has it (see above; cf. Acts xiv. 12). Nor is there any sign that he bore habits that made him the perfect apostle type from the health and hardy body allied to epilepsy, but apparently not involving loss of consciousness—to which, as dating from a certain overpowering trance about 42 A.D., he alludes (Acts xix. 1; 1 Cor. xiii. 1). His physical vigour was in his mirth when they lasted (cf. Gal. iv. 14). But they seem not to have drained his energy even for great and constant labours of body and mind. His energy was portentous, as he himself terms it, when he traced it in his letters (cf. 1 Cor. x. 29), and that most effectively when he felt weakest in himself (2 Cor. xii. 9 sq.).

Not only had Paul a supernatural spiritual force, marked by rare combination of qualities, resulting in the religious and ethical movements which made him impressive both as speaker and writer, he had also a genius for adaptation to varied mental conditions, due partly to his Hellenistic training, but also to the fact that his message was one not of any fresh doctrine or of any school, but of a peculiar doctrine, in iv. 1 sq. It is true that in 1 Cor. ii. 1 sq. he showed itself as tact in relation to individuals and special audiences, and as statesmanlike breadth of view in handling large problems of principle, such as were gradually emerging in relation to Jewish and Gentile life. But the apostolical charm of Christ to the Christian against the pagan state (Rom. xiii. 1 sq.). He combined grasp with vital flexibility in a degree which made him the prince of missionaries, who had no rival in the first century of Christian history. He was the theologian in the reflective interpretation which he gave to it, in terms derived mainly from a profound knowledge of Jewish thought, liberalized by contact with another world, the Graeco-Roman; but above all he was the missionary in the attitude in which he stood to his gospel and to men as its subjects. There was in him nothing doctrinaire: to that, along with the legal attitude, he had been crucified with Christ, for both belonged to "the rudiments of the world, both the letter and the spirit." See 1 Cor. xiii. 3; Phil. iv. 7). Accordingly he was great as an organizer of a new order among his Gentile churches, where much was left to local instinct informed by the one Spirit, while yet he jealously cared for such unity in usages as seemed needful to the embodiment of the one life of the Spirit in all, Jew and Gentile alike (1 Cor. iv. 17, xv. 33, 36). In particular he showed his Christian largeness in his exertions to keep alive his relations of Christ's people, to the point of risking his life for this end.

In his more personal relations he had the power of feeling and inspiring friendship of the noblest order, a comradeship in which Christ was "the Head and the Body," and of loyal and unreserved trust, even of playfulness on occasion (Phil. i.). He was a man of heart, with rapid alternations of mood, with nothing of the Stoic

1 See Lightfoot, Galatians, pp. 183 sqq.; who cites King Alfred as a parallel; and Hastings's Dict. Bibl., ii. 701. Sir W. M. Ramsay, St Paul the Traveller, pp. 94 sqq., prefers "a species of chronic malarial fever," connecting it specially with the attack mentioned in Gal. iv. 13 sqq.

in his self-mastery, which was an acquired grace, rooted in the inherent and inevitable frame of character which Christianiloquiem and choler temperature that there lurked "the last infirmity of nature", soul, which at times betrayed him into vehemence of expression (Acts xxii. 4 sqq.) and a sweeping harshness of judgment (cf. 2 Cor. vii. 10). This conflict is indeed a phase in the battle those who were interfering with his work for Christ or imputing base motives to himself, like thejudges in Galatia and Corinth (cf. Phil. iii. 2). As to the change of egoism, based on the emphasis he lays on Christ, he is indeed a new man, and we shall see that he can hold on so far as Paul can be shown to do this gratuitously, and not really in the interests of his vocation. By this latter standard Paul is careful, moreover, to distinguish his ordinary and his vocation itself (2 Cor. xii. 11), as he says he is doing about his spiritual gifts, as he says he is doing about his spiritual gifts, as he says he is doing about his spiritual gifts, as he says he is doing about his spiritual gifts, as he says he is doing ab
to reproduce the Pauline "system" as a whole, it is best to take the form in which it appears in the Epistle to the Romans, and then supplement it with the fresh elements in the later epistles (so far as these seem really to be in terms of the writer's thought, rather than his readers'), instead of constructing an amalgam from the whole range of his epistles taken pro·miscuously. Paulinism, in the widest sense,1 includes much that is not distinctively his at all; what can here be given is confined to Paul's specific contribution to Christianity.

i. Paulinism proper springs from an absorbing passion for a righteousness real and final, greater than that which could be satisfied by "works of the Law," i.e., deeds prompted by the categorical imperative of Law, itself viewed as the will of God and supported by sanctions of reward and penalty. Two things happened. The first was the idea of the Law as a means to the end, in which God could reckon him radically righteous, must be due to grace, "apart altogether from "works of law" and their desert. The medium of such grace was the Christ, in whom the claims of the divine order of the God and his wisdom, has been satisfied by death, while the Resurrection set the seal of God's approval upon Christ's fulfillment of righteousness (Rom. v. 17-19; 1 Cor. xv. 17) on the new and higher plane of filial obedience by love for the Father.

Thus what the Law could not do, in its weakness in relation to the flesh, had been divinely achieved by God's Son, the Messiah, in view of that "will of God" that was expressed in the words, "as in the image of his likeness in human nature (Rom. viii. 2-4), first in the flesh of Christ as second Adam, and then in the humanity which should be united to Him as spiritual Head (1 Cor. xv. 45). This union was affirmed by Paul in the apologetic argument by which the Saviour became as it were the germ of the new moral personality of the believer. He was "in Christ" and Christ "in him" by a mutual spiritual interpenetration, begun on Christ's side by vicarious self-sacrificing love, and consummated on the believer's side by self-surrendering trust under the influence of the Spirit of God, and Christ's (Gal. ii. 20; Rom. viii. 9, 15 seq.).

Such mystic union by faith (cf. Eph. iii. 16-19) is the very nerve of Paul's thought. In its initial aspect, it is the real basis of justification (as radical sanctification) and regeneration; in its abiding aspect, it is the secret of progressive sanctification or assimilation to the image of Christ in the Christian's experience. To the one aspect corresponds the initial rite of baptism; to the other the recurring rite of communion in the Lord's Supper. These have both an essentially corporate significance. It is as members of the body of Christ that Paul and the first generation of the Church, Paul's "fathers of the faith," the "seed of Abraham," the "children of God" (Gal. iii. 29) were "in Christ the Head and of His Body the Church—that believers, already united to the Head by faith, partake in these sacraments (1 Cor. xi. 12 seq., x. 16 seq.). The keystone of all this is the Christ of God, the glorified Christ who appeared to Paul at his conversion, and in the rays of whose heavenly glory the earthly life of Jesus of Nazareth was seen. Here, as elsewhere, the mode of Paul's conversion determined his whole perspective. It differentiated his emphasis from that of the older Judaeo-Christianity, which always started from the earthly manifestation, while it looked fixedly forward to the future manifestation of its Christ (the future glory of the Church fore-gleams). To Paul the glorified Jesus or spirit-Christ (1 Cor. xv. 45; 2 Cor. iii. 18) of his vision became the Christ mystical of permanent, present Christian faith and experience. The way of the self-sacrificing attitude toward the Saviour in the Christian's "daily walk" is that which made his great advance on Judaeo-Christianity, with its preponderant eschatological emphasis, along with a more external conception of Jesus, as Jewish Messiah, and of relation to Him. To this mode of thought Christ was the "perfect form," the prototype of the personification of human nature, while Judaeo-Christianity only implicitly or unconsciously transcended legalism, Paulinism did so explicitly and consciously, thus safeguarding the future. For Paul's religion was Christocentric in a sense unknown before. Compared with this, his distinctive contribution to the "system" known to us as Paulinism, which formed of Christ's pre-existence was secondary and conditioned by inherited modes of thought. His own specific contribution was his consciousness of Christ's complete religious efficacy, which marked his religion essentially as the religion of God in the highest sense conceivable under human conditions.

ii. Jesus and Paul.—In calling Paulinism Christocentric, one raises the question that the Christ of such a metaphysical presupposition, as would Paul conceived himself as utterly dependent on his gospel upon the Christ of Nazareth, is not in doubt, but only how far he unconsciously modified the Gospel by making Christ its subject and his own teaching a "proof of the truth" set forth in the form of Paul's question as to Paul's attitude to the historic Jesus over again: yet it is more. Granting that Paul felt his gospel to be in essential agreement with the words and deeds of Jesus of Nazareth, as known to him by revelation from the Holy Spirit, how can he be persuaded, in a perspective as to change the relative emphasis on points central to the teaching of Jesus, and so alter his spirit. A school of writers, by no means unappreciative of Paul as they understand him, of whom W. Wrede may be taken as example, argue that Paul's changed Christianity as to become its "second founder"—the real founder of ecclesiastical Christianity as distinct from the Christianity of Jesus; they say, "other Jesus or Paul; it cannot be both at once." They urge not only that Paulinism is involved in certain "mythological" conceptions, by its view of sin, of redemption and of the pre-existent celestial person of the Redeemer; but also that, granting these things, Paul's whole mystical attitude towards Christ as the medium of redemption (an idea borrowed, they say, not from Jesus Himself but from the religion of the Mysteries) is alien to the sunny and sane teaching of Jesus.

The essential issue here is this. Could Jesus the Messiah set forth the Gospel in the same perspective as a devoted disciple of His? By so doing, Christianity is reduced to a religion of faith, the freedom by Jesus Himself, and so His personality, become the prime medium through which this life in its essential features, and especially in its spirit of devoted love, attains and maintains its hold on his disciples. Christianity is radically self-sacrificing, and moved deeply and movingly sub specie Christi; and the imitatio Christi, in an inner sense which finds in Him the very principle of the new Christian consciousness as to God and man, must be the most truly Christian, and one by which the disciple may become the type. Thus to say that Paulinism is practically and proximately "Christocentric," is not to deny that it is ultimately and theoretically "Theocentric," if only Christ be regarded as the revealer of the God Father. But that in virtue of a special connection, one of nature with Him as Son. It may be questioned whether Paul attained, or indeed had within his reach in that age, the best intellectual equivalent of his religious intuition of Christ as "mediator between God and man." But it is another matter to question whether his intuition that the personality of the Christ Himself was the secret of the spiritual power latent in His Gospel, be a true interpretation of the Gospel itself. For it is clear, whatever be thevary of the type of Christian experience, any one have the right to ask whether the Christian is to appeal rather with those who see in Paul "Jesus's most genuine disciple" (H. Weinel), the one who best understood and reproduced His thought. True, Jesus's teaching or seen through the sinless conceptions of Paul, but Paul's vision of the Son of God is that of a conscious sinner. But that is the perspective in which mankind generally has to view the Gospel; and apart from the special intensity of the personal, historical, revelation of Jesus Christ, there is no reason why personal love of Paul and faith in him may sure be in principle the needful experimental complement to the Gospel as set forth in more ideal form by Jesus Himself. By restoring Jesus's own stress upon "eternal life" as present rather than future, and that on lines other than those of obedience to a divine law, Paul saved Christianity from a judaizing of the universal and spiritual religion with which Jesus had in fact inspired His personal disciples, but which they had not been able to grasp.

No doubt there is another side to all this, the side of Paul's idiosyncrasy, both religiously and as a thinker. The peculiar depth and form of Paul's religious experience, especially as regards sin, have more than a suggestive resemblance to the mystical "numberless men have discovered themselves in reading Paul," more have not been found by him; and of those who have felt the religious appeal of his writings, not a few have gravely misunderstood. This is the spirit of the "imitatio Christi," both of one way or another, was Paul's usual lot in the ancient Church, as regards his most distinctive ideas, partly due to the difficult form in which some of those ideas were couched. But to say this is little enough suggesting the influence of Paul. One may be more indirectly due to the less general influence of Paul, or that given by his Master Jesus Christ. To do full justice to this difficulty, it would be necessary to examine Paul more deeply than we can do here.2

---

1 One of the best critical summaries of "Pauline Theology" is that by E. Hatch in the Ency. Brit. 9th ed.

2 The whole history of Christianity is proof that the personality of Jesus has counted for more in producing Christians than his teaching per se, that is, his Gospel in the narrower sense. And it is the spiritual and personal experience of the Gospel as it "found" him, that is the chief foundation on that personality as the type and pledge of man's potential sonship to God.

See S. Means, Saint Paul and the anti-Nicene Church (1903).
to Paulinism in this respect, we must compare it with other interpretations of Jesus and His Gospel in the age immediately ensuing. At the one extreme were the Christianizers, with its ultra-conservatism and undeveloped spirituality; at the other Gnosticism, with its ultra-spiritualism, born of a rigid dualism and defective sense for historical continuity. One of the firsts Paulus, in his two works, takes the positive ideas of both in a religious unity of immense ethical power and initiative; while the other and intermediate types represented in the New Testament—by 1 Peter, Hebrews and the Johannina and Marcionite works—assuredly demand a different approach and a different understanding of the church history.

LITERATURE.—For this in anything like its immense range, reference may be made to the articles "Paul" in Hastings’s Dict. Bible; the Ency. Bibl.; A. Hauck’s Realencyklopädie (Zahn); to R. J. Knowling's Witness of the Bible; N. H. Scott’s History of the Church of Christ, 2 vols. (1890, 1904). C. Clemen, Paulus (1904), the footnotes of which are a mine of information on this subject. Besides these, the leading works on New Testament introduction or theology and on the theology of the Christian church are with little comparison: the Kingstone and Freytag, Bibliothek der KirchenALTERE (1835; 3rd ed., 1885; Eng. trans. 1886); E. Renan (1869); T. Lewin (1854; 2 ed., 1874; rich in archaeology); Conybeare and Howson (1852 and later); H. Ewald, History of Israel (vol. vi., 3rd ed., 1868); G. F. W. Farrar (1875); F. W. Farrar (1890); A. Sabatier (2nd ed., 1881); K. Schmidt, Die Apostelgeschichte (vol. i., 1883); C. Weltszäcker, Das apostolische Zeitalter (1886; Eng. trans., 1903); A. Dieterich, Geschichte der Paulinischen Kirche und Roman Christentum (1893); A. C. McGiffert, The Apostolic Age (1897; O. Cone (1898); C. Clemen (1904); B. W. Bacon (1905). Some of these deal largely with Paul's teaching.

Paulus, the name of five popes.

Paul I., pope from 757 to 767, succeeded his brother Stephen III, on the 20th of May 757. His pontificate was chiefly remarkable for his close alliance with Pippin, king of the Franks, to whom he made a present of books highly significant of the intellectual poverty of the times; and for his unsuccessful endeavours to effect a reconciliation with the iconoclastic emperor of the East, Constantine Copronymus. He died on the 28th of June 767. His successor was Stephen IV.

Paul II. (Pietro Barbo), pope from the 30th of August 1464 to the 26th of July 1471, was born at Venice in 1417. Intended for a business career, he took orders during the pontificate of his uncle, Eugenius IV., and was appointed successively archdeacon of Bologna, bishop of Cervia, bishop of Pisacenza, protonotary of the Roman Church, and in 1440 cardinal-deacon of Sta Maria Nuova. He was made cardinal-priest of Sta Cecilia, then of St. Marco by Nicholas V., was a favourite of Calixtus III. and was unanimously and unexpectedly elected the successor of Pius II. He immediately declared that every act of the former pontificate which had led him into the habit of affirming as rules of conduct for future popes, could affect a new pope only as counsels, not as binding obligations. He opposed with some success the domineering policy of the Venetian government in Italian affairs. His repeated condemnations of the Pragmatic Sanction of Bourges resulted in strained relations with Louis XI. of France. He pronounced excommunication and deposition against King George Podiebrad on the 23rd of December 1466 for refusal to enforce the Basel agreement against the Utraquists, and prevailed on Matthias Corvinus, king of Hungary, to declare war against him on the 31st of March 1468. Matthias was not particularly successful, but George Podiebrad died on the 22nd of March 1471. The pope carried on fruitless negotiations (1469) with the emperor Frederick III. for a crusade against the Turks. Paul enmity of the Turks, and depicted their wonderful city in the college of abbreviators (1466), but this called forth violent protests from the historian Platina, one of their number and subsequently librarian under Sixtus IV., who is responsible for the fiction that Paul was an illiterate persecutor of learning. It is true that the pope suppressed the Roman academy, but on religious grounds. On the other hand he was friendly to Christian scholars; he restored many ancient monuments; made a magnificent collection of antiquities and works of art; built the Palazzo di St Marco, now the Palazzo di Venezia; and probably first introduced printing into Rome. Paul embellished the costume of the cardinals, collected jewels for his own adornment, provided games and food for the Roman people and practically instituted the carnival. He began in 1460 a revision of the Roman statutes of 1363—a work which was not completed until 1490. Paul established the special tax called the quin- dennium in 1470, and by bull of the same year (April 19) announced the jubilee for every twenty-five years. He began negotiations with Ivan III. for the union of the Russian Church with the Roman see. Paul was undoubtedly not a man of quick parts or unusual views, but he was handsome, attractive, strong-willed, and has never been accused of promoting nephews or favourites. He died very suddenly, probably of apoplexy, on the 26th of July, 1471, and was succeeded by Sixtus IV.

Paul III. (Alessandro Farnese), pope from 1534 to 1549, was born on the 28th of February 1468, of an old and distinguished family. As a pupil of the famous Pomponius Lactant, and, subsequently, as a member of the circle of Cosmo de’ Medici, he received a finished education. From Florence he passed to Rome, and became the father of at least two children, later legitimized. Upon entering the service of the Church, however, he lived more circumspectly. His advancement was rapid. To the liaison between his sister Giulia Farnese Orsini and Alexander VII. he owed his cardinal’s hat; but the steady favour which he enjoyed under successive popes was due to his own cleverness and capacity for affairs. His election to the papacy, on the 13th of October 1534, to succeed Clement VII., was virtually without opposition.

The pontificate of Paul III. forms a turning-point in the history of the papacy. The situation at his accession was grave and complex: the steady growth of Protestantism, the preponderant power of the emperor and his prolonged wars with France, the advances of the Turks, the uncertain mind of the Church itself—all conspired to produce a problem involved and delicate. Paul was shrewd, calculating, tenacious; but on the other hand he was hard-headed and indecisive, more inclined to talk than to strike at the critical moment. His instincts and ambitions were those of a secular prince of the Renaissance; but circumstances forced him to become the patron of reform. By the promotion to the cardinalate of such men as Contarini, Caraffa, Pole and Morone, and the appointment of a commission to report upon existing evils and their remedy, the way was opened for reform; while by the introduction of the Inquisition
into Italy (1542), the establishment of the censorship and the Index (1543), and the approval of the Society of Jesus (1540), most efficient agencies were set on foot for combating heresy.

But in the matter of a general council, so urgently desired by the emperor, Paul showed himself irresolute and procrastinating. Finally on the 13th of December 1545 the Council assembled in Trent; but when the victories of Charles V. seemed to threaten its independence it was transferred to Bologna (March 1547) and not long afterwards suspended (Sept. 1549). He concluded the truce of Nice (1538) between Charles and Francis, and contracted an alliance with each. But the peace of Cremona and the emperor’s negotiations with the pope (1544) turned him against Charles, and he was suspected of desiring his defeat in the Schmalkaldic War. The most deplorable weakness of Paul was his nepotism. Parma and Piacenza, states of the Church, he bestowed upon his natural son Pier Luigi (1545). But in 1549 Pier Luigi was assassinated by his outraged subjects, and the emperor thereupon claimed the two duchies for his son-in-law Ottavio Farnese, Paul’s grandson. This led to a family quarrel which greatly embittered the last days of the pope and hastened his death (Nov. 19, 1559). Parma and Piacenza continued to be a bone of contention for two more and twenty years. Paul was gifted and cultured, a lover and patron of art. He began the famous Farnese Palace; constructed the Sala Regia in the Vatican; commissioned Michelangelo to paint the “Last Judgment,” and to resume work upon St Peter’s; and otherwise adorned the city. Easy-going, luxurious, worldly-minded, Paul was not in full sympathy with the prevailing influences about him.

Paul IV. (Giovanni Pietro Caraffa), pope from 1555 to 1559, was born on the 28th of June 1476, of a noble Neapolitan family. His ecclesiastical preferment he owed to the influence of an uncle, Cardinal Oliviero Caraffa. Having filled the post of nuncio in England and Spain, he proved successful as administrator of papal finances and was employed in the delicate task of trying to stem the tide of reform. But he resigned his benefices, and, in conjunction with Cajetan, founded the order of the Theatinus (1524) with the object of promoting personal piety and of combating heresy by preachment. In 1536 Paul III. made him cardinal-archbishop of Naples and a member of the reform commission. After the failure of Contarini’s attempt at reconciliation with the Protestants (1541) the papacy committed itself to the reaction advocated by Caraffa; the Inquisition and censorship were set up (1542, 1543), and the extermination of heresy in Italy undertaken with vigour. Elected pope on the 23rd of May 1555, in the face of the veto of the emperor, Paul regarded his elevation as the work of God. With his defects of temper, his violent antipathies, his extravagant notion of papal prerogative, his pontificate was filled with strife. Blinded by ungovernable hatred he joined with France (1555) in order to drive the “accursed Spaniards” from Italy. But the victory of Philip II. at St Quentin (1557) and the threatening advance of Alva upon Rome forced him to come to terms and to abandon his French alliance. He denounced the peace of Augsburg as a pact with heresy; nor would he recognize the abdication of Charles V. and the election of Ferdinand. By insisting upon the restitution of the confiscated church-lands, assuming to regard England as a papal fief, requiring Elizabeth, whose legitimacy he aspersed, to submit her claims to him, he raised insuperable obstacles to the return of England to the Church of Rome. Paul’s attitude towards nepotism was at variance with his character as a reformer. An unworthy nephew, Carlo Caraffa, was made cardinal, and other relatives were invested with the duchies of Paliano and Montebello. It was Paul’s hope in this way to acquire a support in his war with the Spaniards. But the defeat of his plans disillusioned him, and he turned to reform. A stricter life was introduced into the papal court; the regular observance of the services of the Church was enjoined; many of the grosser abuses were prohibited. These measures only increased Paul’s unpopularity, so that when he died, on the 18th of August 1559, the Romans vented their hatred by demolishing his statue, liberating the prisoners of the Inquisition, and scattering its papers. Paul’s want of political wisdom, his passion for nepotism, his belief in human nature aroused antagonisms fatal to the success of his cause.

See Panvinio, continuator of Platina, De vitis pontiff. rom.; Ciaconius, Vita et res gestae summorum pontif. rom. (Rome, 1601–1602, both contemporaries of Paul IV); Caraccioli, De vita Pauli IV. P.M. (Cologne, 1612; for criticism see Hist. Zentr Eur. xlv. 460 seq.), whose rich collection of materials was used by Bromata, Vita di Paolo IV. (Ravenna, 1748), and Summ. Une Question ital. au seizième siècle (Paris, 1851). See also Castaldo, Vita del pontefice Paolo Quario (Modena, 1648); Ranke, Popes (Eng. trans. by Austin), i. 286 seq. (an excellent sketch); v. (1878), vol. i.; Ancel, Disgrace et procés des Caraffa (1909); Riess, Politik Pauls IV. (1909).

Paul V. (Camillo Borghese), successor of Leo XI., was born in Rome on the 17th of September 1552, of a noble family. He studied in Perugia and Padua, became a canon lawyer, and was vice-legate in Bologna. As a reward of a successful mission to Spain Clement VIII. made him cardinal (1556) and later (1558) papal legate in France. He was pope, on the 10th of May 1665, his extreme conception of papal preeminence, his arrogance and obstinacy, his perverse insistence upon the theoretical and disregard of the actual, made strife inevitable. He provoked disputes with the Italian states over ecclesiastical rights. Savoy, Genoa, Tuscany and Naples, wishing to avoid a rupture, yielded; but Venice resisted. The republic stood upon her right to judge all her subjects, and by her demands touching benefits, tithes and papal bulls showed her determination to be supreme in her own territory. Excommunication and interdict (April 17, 1666) were met with defiance. The cause of the republic was brilliantly advocated by Fra Paolo Sarpi, counsellor of state; the defenders of the papal theory were Cardinals Baronius and Bellarmine. The pope talked of coercion by arms; but Spain, to whom he looked for support, refused to be drawn into war, and the quarrel was finally settled by the mediation of France (March 22, 1667). Notwithstanding certain concessions, the victory remained with the republic (see Sarpi).

Paul became involved in a quarrel with England also. After the Gunpowder Plot parliament required a new oath of allegiance to the king and a denial of the right of the pope to depose him or release his subjects from their obedience. Paul forbade Roman Catholics to take the oath; but to no purpose, beyond stirring up a literary controversy. By his condemnation of Gallicanism (1643) Paul angered France, and provoked the defiant declaration of the states general of 1614 that the king held his crown from God alone.

Paul encouraged missions, confirmed many new congregations and brotherhoods, authorized a new version of the Ritual, and canonized Carlo Borromeo. His devotion to the interests of his family exceeded all bounds, and they became enormously wealthy. Paul began the famous Villa Borghese, enlarged the Quirinal and Vatican; completed the nave, facade and portico of St Peter’s; erected the Borghese Chapel in St Maria Maggiore; and restored the aqueduct of Augustus and Trajan (“Acqua Paolina”). He also added to the Vatican library, and began a collection of antiquities. Paul died on the 28th of January 1621, and was succeeded by Gregory XV.

See Bzovius (Browalski), De vita Pauli V. (Rome, 1625; contained in Platina, De vitis pontiff. rom., ed. 1626), who depicts Paul as a man of all publishings; more recent is P. Josephi, continuator of Ciaconius, Vita et res gestae summorum pontif. rom. (a contemporary of the pope); Goujet, Hist. du pontificat de Paul V.
PAUL I. (1754-1801), emperor of Russia, was born in the Summer Palace in St Petersburg on the 1st of October (n.s.)—the 20th of September by the Russian calendar—1754. He was the son of the grand duchess, afterwards empress, Catherine. According to a scandalous report his father was not her husband, the grand duke Peter, afterwards emperor, but one Colonel Dukhov, whom she fancied for his beauty except gossip, and the cynical malice of Catherine. During his infancy he was taken from the care of his mother by the empress Elizabeth, whose ill-judged fondness is believed to have injured his health. As a boy he was reported to be intelligent and good-looking. His extreme ugliness in later life is attributed to an attack of typhus, from which he suffered in 1771. It has been asserted that his mother hated him, and was only restrained from putting him to death while he was still a boy by the fear of what the consequences of another palace crime might be to herself. Lord Buckinghamshire, the English ambassador, in her court, expressed this opinion as early as 1763. In fact, however, the evidence goes to show that the empress, who was at all times very fond of children, treated Paul with kindness. He was put in charge of a trustworthy governor, Nikita Panin, and of competent tutors. Her disinterested court was a bad home for a boy who was to be the sovereign, but Catherine took great trouble to arrange his first marriage with Wilhelmina of Darmstadt, who was renamed in Russia Nathalie Alexeevna, in 1773. She allowed him to attend the council in order that he might be trained for his work as emperor. His tutor Poroshin complained of him that he was "always in a hurry," acting and speaking without thought, and that he began to put on airs in intrigue. He suspected his mother of intending to kill him, and once openly accused her of causing broken glass to be mingled with his food. Yet, though his mother removed him from the council and began to keep him at a distance, her actions were not unkind. The use made of his name by the rebel Pugachev in 1775 tended no doubt to render his position more difficult. When his wife died in childbirth in that year his mother arranged another marriage with the beautiful Sophia Dorothea of Wurttemberg, renamed in Russia Maria Fedorovna. On the birth of his first child in 1777 she gave him an estate, the estate of Pavlovsk, which Paul and his wife, with no solicitation from her, took through western Europe in 1781-1782. In 1783 the empress gave him another estate at Gatchina, where he was allowed to maintain a brigade of soldiers whom he drilled on the Prussian model. As Paul grew his character became steadily degraded. He was not incapable of affection nor without generous impulses, but he was flighty, passionate in a childish way, and when angry capable of cruelty. The affection he had for his wife turned to suspicion. He fell under the influence of two of his wife's maids of honour in succession, Nelinov and Lapukin, and of his barber, a Turkish slave named Korossov. For some years before Catherine died it was obvious that he was hovering on the border of insanity. Catherine contemplated setting him aside in favour of his son Alexander, to whom she was attached. Paul was aware of his mother's half-intention—for it does not appear to have been more—and became increasingly suspicious of his wife and children, whom he rendered perfectly miserable. No definite step was taken to set him aside, probably because nothing would be effective short of putting him to death, and Catherine shrank from the extreme course. When she was seized with apoplexy he was free to destroy the will by which she left the crown to Alexander, if any such will was ever made. The four and a half years of Paul's rule in Russia were unquestionably the reign of a madman. The excitement of the change from his retired life in Gatchina to omnipotence drove him below the line of insanity. His conduct of the foreign affairs of Russia plunged the country into the second revolution against France in 1776, and then into the armed neutrality against Great Britain in 1801. In both cases he acted on personal pique, quarrelling with France because he took a sentimental interest in the Order of Malta, and then with England because he was flattered by Napoleon. But his political follies might have been condoned. What was unpardonable was that he treated the people about him like a shah, or one of the craziest of the Roman emperors. He began by repealing Catherine's law which exempted the free classes of the population of Russia from corporal punishment and mutilation. Nobody could feel himself safe from exile or brutal ill-treatment at any moment. If Russia had possessed an institution to protect the poor and suffering, the tsar would have put under restraint. But the country was not sufficiently civilized to deal with Paul as the Portuguese had dealt with Alphonso VI., a very similar person, in 1667. In Russia as in medieval Europe there was no safe prison for a deposed ruler. A conspiracy was organized, some months before it was executed, by Counts Pahlen and Panin, and a half-Spanish, half-Neapolitan adventurer, Admiral Ribas. The death of Ribas delayed the execution. On the night of the 11th of March 1801 Paul was murdered in his bedroom in the St Michael Palace by a band of dismissed officers headed by General Bennigsen. The conspirators took Paul, his wife, his son and many of his attendants into his bedroom after supper together and when flushed with drink. The conspirators forced him to the table, and tried to compel him to sign his abdication. Paul offered some resistance, and one of the assassins struck him with a sword, and he was then strangled and trampled to death. He was succeeded by his son, the emperor Alexander I., who was actually in the palace, and to whom Nicholas Zubov, one of the assassins, announced his accession.

PAUL OF SAMOSATA, patriarch of Antioch (260-272), was, if we may credit the encyclical letter of his ecclesiastical opponents preserved in Eusebius's History, bk. vii. ch. 30, of humble origin. He was certainly born farther east at Samosata, and may have owed his promotion in the Church to Zenobia, queen of Palmyra. The letter just mentioned is the only indisputably contemporary document concerning him and was addressed to Dionysius and Maximus, respectively bishops of Rome and Alexandria, by seventy bishops, priests and deacons, who assembled at Antioch in 260 and deposed Paul. Their sentence, however, did not take effect until late in 272, when the emperor Aurelian, having defeated Zenobia and anxious to impose upon Syria the dogmatic system fashionable in Rome, deposed Paul and allowed the rival candidate Domnus to take his place and emoluments. Thus it was a pagan emperor who in this momentous dispute ultimately determined what was orthodox and what was not; and the advanced Christology to which he gave his preference has ever since been upheld as the official orthodoxy of the Church. Aurelian's policy moreover was in effect a recognition of the Roman bishop's pretension to be arbiter for the whole Church in matters of faith and dogma. Scholars will pay little heed to the charges of rapacity, extortion, pomp and luxury made against Paul by the authors of this letter. It also accuses him not only of consorting himself with two "sisters" of ripe age and fair to look upon; but of allowing his presbyters and deacons also to contract platonic unions with Christian ladies. No actual lapses however from chastity are alleged, and it is only complained that suspicions were aroused, apparently among the pagans.

The real graveramen against Paul seems to have been that he championed the Christology of which he would become arbiter and had in Rome and Alexandria already fallen into the background.
Paul's heresy lay principally in his insistence on the genuine humanity of Jesus of Nazareth, in contrast with the rising orthodoxy which merged his human consciousness in the divine Logos. It is best to give Paul's beliefs in his own words; and the following sentences are translated from Paul's *Discourses to Sabinus*, of which fragments are preserved in a work against heresies ascribed to Anastasius, and printed by Angelo Mai:

I. "Having been anointed by the Holy Spirit he received the title of the anointed (i.e. Christos), suffering for according to his nature, working wonders in accordance with grace. For in fixity and resoluteness of character he likened himself to God; and having kept himself free from sin was united with God, and was therefore able to subsist and manifest His power and wonders. By these he was shown to possess over and above the will, one and the same activity (with God), and won the title of Redeemer and Saviour of our race."

II. The Saviour is holy and just; and by struggle and hard work overcame the sins of our forefather. By these means he succeeded in perfecting himself, and was through his moral excellence united with God; having attained to unity and sameness of will and energy (i.e. activity) with Him through his advances in the path of good deeds. This will be preserved inseparable (from the Divine), and so inherited the name which is above all names, the name of Saviour and Redeemer, and was thus unsealed in grace to his fathers.

III. "The different natures and the different persons admit of union in one way alone, namely in the way of a complete agreement in respect of will; and thereby is revealed the One (or Monad) in and with the unity of those (will) which have coalesced in the manner described."

IV. "We do not award praise to beings which submit merely in virtue of their nature; but we do award high praise to beings which submit because their attitude is one of love; and so submitting because their inspiring motive is one and the same, they are confirmed and strengthened by one and the same indwelling power, of which the force ever grows, so that it never ceases to stir. It was in virtue of this love that the Saviour coalesced with God, so as to admit of no divorce from Him, but for the purpose of retaining one and the same will and activity with Him, an activity perpetually at work in the manifestation of good."

V. "Wonder not that the Saviour had one will with God. For as nature manifests the substance of the many to subsist as one and the same, so the attitude of love produces in the many an unity and sameness of will which is manifested by unity and sameness of approval and well-pleasingness."

From other fairly attested sources we infer that Paul regarded the baptism as a landmark indicative of a great stage in the moral advance of Jesus. But it was a man and not the divine Logos which was born of Mary. Jesus was a man who came to be God, rather than God become man. Paul's Christology therefore was of the Adoptionist type, which we find among the primitive Ebionite Christians of Judaea, in Hermas, Theodotus and Artemon of Rome, and in Archelaus the opponent of Mani, and in the other great doctors of the Syrian Church of Antioch. From Antioch and his school derived their inspiration from Paul, and he was through Lucian a forerunner of Ariusianism. Probably the Paulicians of Armenia continued his tradition, and hence their name (see PAULICIANS).

Paul of Samosata represented the high-water mark of Christian specification; and it is deplorable that the fanaticism of his own and of succeeding generations has left us nothing but a few scattered fragments of his writings. Already at the Council of Nicea in 325 the Paulians were put outside the Church and condemned as heretics. It is interesting to note at the synod of Antioch the use of the word *consubstantial* to denote the relation of God the Father to the divine Son or Logos was condemned, although it afterwards became at the Council of Nicea the watchword of the orthodox faction.

*Literature.—* Adolph Harnack, History of Dogma, vol. iii.; Gieseler's *Compendium of Ecclesiastical History* (Edinburgh, 1853); vol. iv.; *The History of the Christian Church* (Colophon, 1878). It is interesting to note at the synod of Antioch the use of the word *consubstantial* to denote the relation of God the Father to the divine Son or Logos was condemned, although it afterwards became at the Council of Nicea the watchword of the orthodox faction.

**Paulding, James Kirke (1778–1860), American writer and politician,** was born in Dutchess county, New York, on the 22d of August 1778. After a brief course at a village school, he removed in 1800 to New York City, where in conjunction with his brother-in-law, William Irving, and Washington Irving, he began in January 1807 a series of short brightly humorous articles, under the title of *The Salmagundi Papers*. In 1814 he published a political pamphlet, "The United States and England," which attracted the notice of President Madison, who in 1815 appointed him secretary to the board of navy commissioners, which position he held until November 1823. Subsequently Paulding was navy agent in New York City from 1825 to 1837, and from 1837 to 1841 was secretary of the navy in the United States, and at the Battle of Tripoli. From this time until his death on the 6th of April 1860 he lived near Hyde Park, in Dutchess county, New York. Although much of his literary work consisted of political journalism, he yet found time to write a large number of essays, poems and tales. From his father, an active revolutionary patriot, Paulding inherited strong anti-British sentiments. He was among the first distinctively American writers, and protested vigorously against intellectual thraldom to the mother-country. As a prose writer he was chaste and elegant, generally just, and realistically descriptive. As a poet he is gracefully commonplace, and the only lines by Paulding which survive in popular memory are the familiar—

"Peter Piper picked a peck of pickled peppers: Where is the peck of pickled peppers Peter Piper picked?"

which may be found in Koningsmarke.

The following is a partial list of his writings: *The Diverting History of John Bull and Brother Jonathan* (1812); *The Lay of the Scottish Paddle* (1813), a good-natured parody on *The Lay of the Last Minstrel*; *The Salmagundi* (2nd series, 1819–1820); A Sketch of Old England, by a New England Man (1822); *Koningsmarke*, the Long Finne (1823), a quiz on the romantic school of Walter Scott; *John Bull in America,* or the New Munchausen (1824), a broad caricature of the early type of British traveller in America; *The Merry Tales of the Three Wise Men of Gotham* (1826); *Chronicles of the City of Gotham,* from the *Papers of a Retired Common Councilman* (1830); *The Dutchman's Fireside* (1831); *Westward Ho!* (1832); A Life of Washington (1835), ably and gracefully written; *Slavery in the United States* (1836), in which he defends slavery as an institution; *The Book of Saint Nicholas* (1837), a series of stories of the old Dutch settlers; American Comedies (1847), the joint production of himself and his son William J. Paulding; and *The Puritan and his Daughter* (1839). The same son also published an edition of Paulding's Select Works (4 vols., 1867–1868), and a biography called, *Literary Life of James Kirck Paulding* (New York, 1867).

**PAULET, Poulett or Powell, an English family of an ancient Somersetshire stock, taking a surname from the parish of Paullett near Bridgwater. They advanced themselves by a series of marriages with heirs, acquiring manors and lands in Somersetshire, Wiltshire, Devonshire and Hampshire. A match with a Denebaur early in the 15th century brought the manor of Hinton St George, still the seat of the elder line, the Earl Poulett. An ancestor of this branch, Sir Amias Poulett or Paullet (d. 1557), knighted in 1457 after the battle of Stoke, was treasurer of the Middle Temple in 1521, when Wolsey, in revenge for an indignity suffered at the knight's hands when the future chancellor was a young parson at Limington, forbade his leaving London without leave. To propitiate the cardinal, Sir Amias, rebuilding the Middle Temple gate, decorated it with the cardinal's arms and badge. Sir Hugh Poulett, his eldest son, a soldier who had distinguished himself in 1544 at Boulogne in the king's presence, had, in 1551, a patent of the captaincy of Jersey with the governance of Montorgueil Castle. His wisdom and experience in the wars made Queen Elizabeth employ him at Havre in 1562 as adviser to the earl of Warwick. In 1572, having married, as his second wife, the wealthy widow of Sir Thomas Pope, founder of Trinity College, Oxford, Sir Amias Poulett (1536–1588), Sir Hugh's son and heir by his first marriage, is famous as the puritan knight into whose charge at Tisbury and Chartley was given the queen of Scots. After his prisoner's sentence at Fotheringhay, he bested Elizabeth's ministers with messages advising her execution, but he firmly withstood "with great grief and bitterness," the suggestion that she should be put to death secretly, saying that God and the law forbade. Sir Anthony Poulett (1562–1600),
his eldest surviving son, succeeded him as governor of Jersey and was father of John Poulett (1586-1649) to whom Charles I. in 1627 gave a patent of peerage as Lord Poulett of Hinton St George. In spite of the puritan opinions of his family he declared for the king, raising for the royal army a brigade which he led in Dorsetshire and Devonshire. He was taken prisoner for the second time at the fall of Exeter in 1646 and suffered a heavy fine. His eldest son John, the second Lord Poulett (1613-1665) was taken with his father at Exeter. John, the fourth Lord Poulett (1663-1743), having been a commissioner for the union, was created Lord Poulett of Hinton of Hinton St George and Earl Poulett. In 1710-1711 he was first lord of the treasury and nominal head of an administration controlled by Harley. A garter was given him in 1712. A moderate Tory, his places were taken from him at the accession of the house of Brunswick. The fifth earl (d. 1864) re-settled the family estates in 1853 in order to bar the inheritance of one William Turnour Thomas Poulett who, although born in wedlock of the wife of the earl's cousin William Henry Poulett, was repudiated by her husband, afterwards the sixth earl. In 1903 the sixth earl's son by a third marriage established his claim to the peerage and in 1909 judgment was given against the claim of William Turnour Thomas Poulett, then styling himself Earl Poulett.

A younger line of the Paulets, sprung from William Paulet of Melcombe, serjeant-at-law (d. 1453), reached higher honours than an earldom. William Paulet, by his marriage with Eleanor Delamare (d. 1413), daughter of Philip Delamare and heir of her brother, acquired for his descendants Fisherton Delamare in Wiltshire and Nunney Castle in Somerset. Their son Sir John Paulet married Constance, daughter and coheiress of Hugh Poyning, son and heir of Sir Thomas Poyning, Lord St John of Basing. Through this marriage came the lordship and manor of Basing, and the manor of Ampthor or Ham Poort, which is still with the descendants of Hugh de Port, its Norman lord at the time of the Domesday Survey. Sir John Paulet of Basing, by his cousin Alice Paulet of the Hinton line (his wife in or before 1467), was father of Sir William Paulet, who, during a very long and supple career as a statesman in four reigns—"I am sprung," he said, "from the willow and not from the oak"—raised his house to a marquessate. Henry VIII. rewarded his diplomatic and judicial services and his campaign against the Pilgrims of Grace with the site and lands of Netley Abbey, the revival of the St John barony, a garter and many high offices. The King's death found him lord-precentor of the council and one of the executors of the famous will of the sovereign. The fall of the protector Somerset gave him the lord treasurership and a patent of the earldom of Wiltshire. He shared the advancement of Northumberland and was created in 1551 marquess of Winchester, but, although he delivered the crown jewels to the Lady Jane in 1553, he was with the lords at Baynard Castle who proclaimed Queen Mary. In spite of his great age he was in the saddle at the proclamation of Mary's successor and was speaker in two Elizabethan parliaments. Only his death in 1572 drove from office this tenacious treasurer, whose age was then a hundred years.

His princely house at Basing was held for King Charles by John, the fifth marquess, whose diamond had scratched "Aimer Loyauté" upon every pane of its windows. Looking on a main road, Basing, with its little garrison of desperate cavaliers, held out for two years against siege and assault, and its shattered walls were in flames about its gallant master when Cromwell himself stormed an entry. The old cavalier marquess died in 1675, his great losses unrecompensed, and his son Charles, a morose extravagant, had the dukedom of Bolton in 1659 for his desertion of the Stuart cause. This new title was taken from the Bolton estates of the Scropes, Lord Winchester having married a natural daughter of Emmanuel, earl of Sunderland, the last Lord Scrope of Bolton. Charles, second duke of Bolton (1660-1722), was made lord-lieutenant of Ireland in 1717. A third Charles, the 3rd duke, is remembered as an opponent of Sir Robert Walpole and as the husband of Lavinia Fenton, the Polly Peacoom of Gay's opera. The sixth and last duke of Bolton, an admiral of undistinguished services, died in 1794 without legitimate issue. His dukedom became extinct, and Bolton Castle again passed by bequest to an illegitimate daughter of the fifth duke, upon whom it had been entailed with the greater part of the ducal estates. (O. BA.)

PAULI, REINHOLD (1823-1882), German historian, was born in Berlin on the 25th of May 1823. He was educated at the universities of Bonn and Berlin, went to England in 1847, and became private secretary to Baron von Bunsen, the Prussian ambassador in London. Returning to Germany in 1855 he was appointed to the chair of modern history and Roman law at the universities of Rostock, Tübingen (which he left in 1866 because of differences of views), Marburg and Göttingen. He retained his chair at Göttingen until his death at Bremen on the 3rd of June 1882. He was a careful and industrious student of the English records, and his writings are almost wholly devoted to English history.

His first work, König Aelfred und seine Stellung in der Geschichte Englands (Berlin, 1851), was followed by monographs on Bischof Grosstedte and Adam von Marsh (Tübingen, 1864), and on Simon von Montfort (Tübingen, 1867). He continued J. M. Lappenberg's Geschichte von England from 1154 to 1509 (Gottha, 1853-1858), and himself wrote a Geschichte Englands (Leipzig, 1864-1875), dealing with the same period and including the years 1814 and 1852. Two volumes of historical essays, Bilder aus Alt-England (Gottha, 1860 and 1870), and Aufsätze zur englischen Geschichte (Leipzig, 1860 and 1883), and numerous historical articles in German periodicals came from his pen; and he contributed the general of the Monumenta Germaniae historica.

See R. Pauli, Lebenserinnerungen, edited by E. Pauli (Halle, 1898); and the sketch of his life prefixed to O. Hartwig's edition of his Aufsätze (Leipzig, 1883).

**PAULICIANS**, an evangelical Christian Church spread over Asia Minor and Armenia from the 5th century onwards. The first Armenian writer who notices them is the patriarch Nerses II. They were an encyclical of 563, who describe them as living in communion with Nestorians in belief and prayer, and take their bread offerings to their shrines and receive communion from them, as if from the ministers of the obligations of the Paulicians.” The patriarch John IV. (c. 728) states that Nerses, his predecessor, had chastised the sect, but ineffectually; and that after his death (c. 554) they had continued to lurk in Armenia, where, reinforced by Iconoclasts driven out of Albania of the Caucasus, they had settled in the region of Djirkâ, probably near Lake Van. In his 31st canon John identifies them with the Mes-salians, as does the Armenian Gregory of Narek (c. 950). In Armenia they were always numerous. We connect with Greek sources. An anonymous account was written perhaps as early as 840 and incorporated in the Chronicon of Georgius Monachus. This (known as Es) was edited by J. Friedrich in the Munich Academy Sitzungsberichte (1896), from a 10th century Escorial codex (Plut. 1, No. 1). It was also used by Philitus (c. 867), bk. 1, chs. 1-10 of his Historia Manicheorum, who, having held inquisition of Paulicians in Constantinople was able to supplement Es. with a few additional details; and by Petrus Siculus (c. 868). The latter visited the Paulician fortress Tephtike to prepare for the release of Byzantine prisoners. His History of the Manichaeans is dedicated to the archbishop of Bulgaria, whither the Paulicians were seducing missionaries Ziganbonus (c. 1100), in his Panoplia, uses beside Es. an independent source.

The Paulicians, were, according to Es, Manicheans, so called after Paul of Samosata (q.v.), son of a Manichean woman Callinice. She sent him and her other son John to Armenia as missionaries, and they settled at the village of Epispars, or “seedplot,” in Phanarea. One Constantine, however, of Mananali, a canton on the western Euphrates 60-70 m. west of Erzerum, was regarded by the Paulicians as their real founder. He based his teaching on the Gospels and the Epistles of Paul, rejecting other old scriptures; and taking the Pauline name of Silvanus, organized churches in Castrum Colonias and Gibuso, which he called Macedonia, after Paul’s congregation of that

2. Opera (Venetia, 1834), p. 89.
name. His successors were Simeon, called Titus; Gegnesius, an Armenian, called Timotheus; Joseph, called Epaphroditus; Zachariah, rejected by some; Basnes, accused of immoral teaching; lastly Sergius, called Tychicus. As Cibossa, so their other congregations were renamed, Mananali as Achaea, Argeaum and Cynchoschora as Colossae, Mopsuestia as Ephesus, and so on.

Photius and Petrus Sclusus supply a few dates and events. Constantine was martyred 684 by Simeon whom Constantine Pogonatus had sent to repress the movement. His victim’s death so impressed him that he was converted, and in 722 was taken to Constantinople, where he won over to his opinions the iconoclast emperor, Leo the Isaurian. He died in 745, and was succeeded by Joseph, who evangelized Phrygia and died near Antioch of Pisidia in 775. In 752 Constantine V. transplanted many Paulicians from Germanicia, Dolchê, Melitene, and Thedosopolis (Erzertim), to Thrace, to defend the empire from Bulgarian and Sclavonian incursions. Early in the 9th century Sergius, greatest of the leaders, profiting by the tolerance of the emperor Nicephorus, began that ministry which, in one of the epistles canonized by the sect, but lost, he describes thus: “I have run from east to west, and from north to south, till my knees were weary, preaching the gospel of Christ.” The iconoclast emperor Leo V., an Armenian, persecuted the sect afresh, and provoked a rising at Cynchoschora, whence many fled into Saracen territory to Argeaum near Melitene. For the next 50 years they continued to raid the Byzantine empire, although Sergius condemned retaliation. The empress Theodora (842–855) hung, crucified, beheaded or drowned some 100,000 of them, and drove yet more over the frontier, where Argaeum was, Tephrêk and other strongholds their generals Karbeas and Chrysoschoer harried the empire, until 873, when the emperor Basil slew Chrysoschoer and took Tephrêk.

Their sect however continued to spread in Bulgaria, where in 690 John Zimiskes settled a new colony of them at Philippopolis. Here Frederick Barbarossa found them in strength in 1180. In Armenia they reformed their ranks about 821 at Thonarak (Tendarek) near Diadin, and were numerous all along the eastern Euphrates and in Albania. In this region Smbat, of the great Bagruduni clan, reorganized their Church, and was succeeded in 1173 by his son Smbat, who by his sacred holiness, enumerated by the Armenian Grigor Magistros, who as duke of Mesopotamia under Constantine Monomachos harbored them about 1140. Fifty years later they were numerous in Syria and Cilicia, according to the Armenian bishops Nerses the Graceful and Nerses of Lambron. In the 10th century Gregory of Narek wrote against them in Armenian, and in the 11th Aristaces of Lastivert and Paul of Taron in the same tongue. During these later centuries their propaganda embraced all Armenia. The crusaders found them everywhere in Syria and Palestine, and corrupted their name to Pahlcani, under which name, often absurdly conjoined with Saducei, we find them during the ages following the crusades scattered all over Europe. After 1200 we can find no notice of them in Armenian writers until the 18th century, when they reappear in their old haunts. In 1828 a colony of them settled in Russian Armenia, bringing with them a book called the Key of Truth, which contains their rites of name-giving, baptism and election, compiled from old MSS., 1 we know not when.

Regarding Paulician beliefs we have little except hostile evidence, which needs sifting. Esc. gives these particulars:—

1. They anathematized Mani, yet were dualists and affirmed two principles—one the heavenly Father, who rules not this world but the world to come; the other an evil demiurg, lord and god of this world, who made all flesh. The good god created angels only. The Romans (i.e. the Byzantines) erred in confusing these two first principles. Similarly the Armenian writer Gregory Magistros (c. 1040) accuses the Paulicians of teaching that “Moses saw not God, but the devil,” and infers thence that they held Satan to be the creator of heaven and earth, as well as of mankind. The Key of Truth teaches that after the fall Adam and Eve and their children were slaves of Satan until the advent of the newly created Adam, Jesus Christ. Except Gregory Magistros none of the Armenian sources lays stress on the dualism of the Paulicians. John IV. does not hint at it.

2. They blasphemed the Virgin, alleging her as the upper Jerusalem in which the Lord came in and went out, and denying that he was really made flesh of her. John IV. records that in the orthodoxy among the Armenians of the 17th century many held Christ to have been made flesh in, but not of, the Virgin; and Armenian hymns call the Virgin mother church at once Theotokos and heavenly Jerusalem. It is practically certain that Paulicians held this view.

3. They allegorized the Eucharist and explained away the bread and wine of which Jesus said to His apostles, “Take, eat and drink,” as mere words of Christ, and denied that we ought to offer bread and wine as a sacrifice.

Such allegorization meets us already in Origen, Eusebius and other early fathers, and is quite compatible with that use of a metaphor like that of Nerses II. attests among the Paulicians of the early 6th century, and for which the Key of Truth provides a form. The Thonarak, according to Gregory Magistros, held that “Jesus in the evening meal, spoke not of an offering of the mass, but of every table.” We infer that the Paulicians merely rejected the Eucharistic rites and doctrine of the Greeks. According to Gregory Magistros the Thonarak would say: “We are no worshippers of matter, but of God; we reckon the cross and the church and the priestly robes and the sacrifice of mass all for nothing; and only lay stress on the inner sense.”

4. They ascribed the reality of the doctrine of the Church to the instrument. John IV. and other Armenian writers report the same of the Armenian Paulicians or Thonarak, and add that they smashed up crosses when they could.

5. They repudiated Peter, calling him a devil of Christ, and would not accept his repentance and tears. 2 So Gregory the language is concerned, may belong to the remote age which alone suits the adoptionist Christology of the prayers.

1 That this is so, is proved by the presence of a doublet in the text of the rite of baptism, the words “But the penitent.” on p. 96, as far as “the person baptized.” on p. 97, repeating, substituting the words “Next the elect one.” on p. 97, reminiscent on p. 95. This rite therefore was compiled from at least two earlier MSS. In the colophon also the compiler (as he calls himself) says the errors of orthography and grammar on the ground that they are not due to himself but to earlier and ignorant抄ists. The division (often inept) of the text into chapters, the references to chapter and verse of a printed N.T., and sundry places where the text interrupts the context, are due to a later editor, perhaps to the copyist of the existing text of 1782. The controversial introduction is later than the Crusades; but the rituals, as far as
Magistros reports the Thonraki as saying, “We love Paul and excrerate Peter.” But in the *Key of Truth* there is little trace of extreme hostility to Peter. It merely warns us that “all the apostles constitute the Church universal and Peter alone; and in the rite of election, i.e. of laying on of hands and reception of the Spirit, the reader who is being elected assumes the ritual name of Peter. An identical rite existed among the 12th century Cathars (q.v.), and in the Celtic church of Gildas every presbyter was a Peter.

6. The monkish garb was revealed by Satan to Peter at the baptism, when it was the devil, the ruler of this world, who, so costumed, leaned forward and said, This is my beloved son. The same hatred of monkery characterized the Thonraki and inspires the *Key of Truth*. The other statements are nowhere echoed.

They called their meetings the Catholic Church, and the places they met in places of prayer, προσευχή. The Thonraki equally denied the name of church to buildings of wood or stone, and called themselves the Catholic Church.

8. They explained away baptisms as “words of the Holy Gospel,” citing the text “I am the living water.” So the Thonraki taught that the baptismal water of the Church was “mere bath-water,” i.e. they denied it the character of a reserved sacrament. But there is no evidence that they eschewed water-baptism. The modern Thonraki baptize in rivers, and in the 17th century when Gregory asked them why they did not allow themselves to be baptized, they answered: “Ye do not understand the mystery of baptism; we are in no hurry to be baptized, for baptism is death.” They no doubt deferred the baptism which is death to sin, perhaps because, like the Cathars, they held post-baptismal sin to be unforgivable.

9. They permitted external conformity with the dominant Church, and held that Christ would forgive it. The same trait is reported of the Thonraki and of the real Manichæans.

10. They rejected the orders of the Church, and had only two grades of clergy, namely, associate φιλιτηρεις (συνεδρία), Acts xix. 29) and coepisti (συνελευσις). A class of *Astati* (ἀστάτος) is also mentioned by Photius, I. 24, whom Neander regards as elect disciples of Sergius. They called their four original founders apostles and prophets—titles given also in the *Key of Truth* to the elect one. The Synecdemi and Notarii dressed like other people; the Thonraki also scorned priestly vestments.

11. Their canon included only the “Gospel and Apostle,” of which they respected the text, but distorted the meaning. Gregory Magistros, as we have seen, attests their predilection for the apostle Paul, and speaks of their perpetually “quoting the Gospel and the Apostolon.” These statements do not warrant us in supposing that they rejected 1 and 2 Peter, though other Greek sources allege it. The “Gospel and Apostle” was a comprehensive term for the whole of the New Testament (except perhaps Revelation), as read in church.

13. Their Christology was as follows: God out of love for mankind called up an angel and communicated to him his desire and counsel; then he bade him go down to earth and be born of woman. . . And he bestowed on the angel so commissioned the title of Son, and foretold for him insults, blasphemies, sufferings and crucifixion. Then the angel undertook to do what was enjoined, but God added to the sufferings also death. However, the angel, on hearing of the resurrection, cast away fear and accepted death as well; and came down and was born of Mary, and named himself Son of God according to the grace given him from God; and he fulfilled all the command, and was crucified and buried, rose again and was taken up into heaven. Christ was only a creature (κριάς), and obtained the title of Christ the Son of God in the reign of Octavius Caesar by way of grace and remuneration for fulfilment of the command.

The scheme of salvation here set forth recurs among the Latin Cathars. It resembles that of the *Key of Truth*, in so far as Jesus is Christ and Son of God by way of grace and reward for faithful fulfilment of God’s command. But the *Key* lays more stress on the baptism. “Then, it says, he became Saviour of us sinners, then he was filled with the Godhead; then he was sealed, then anointed; then was he called by the voice, then he became the loved one.” In this scheme therefore the Baptism occupies the same place which the Birth does in the other, but both are adoptionism.

The main difference then between the Greek and Armenian accounts of the Paulicians is that the former make more of their dualism. Yet this did not probably go beyond the dualism of the New Testament itself. They made the most of Paul’s antithesis between law and grace, bondage to Satan and freedom of the Spirit. Jesus was a new Adam and a fresh beginning, in so far as he was made flesh in and not of his mother, to whom, as both Esc. and the *Key* insist, Jesus particularly denied blessedness and honour (Mark iii. 31-35), limiting true kinship with himself to those who shall do the will of God. The account of Christ’s flesh is torn out of the *Key*, but it is affirmed that it was both 1. Baptism that “put on that primal raiment of light which Adam lost in the garden.” And this view we also meet with in Armenian fathers accounted orthodox.

The Armenian fathers held that Jesus, unlike other men, possessed incorruptible flesh, made of ethereal fire, and so far they shared the main heresy of the Paulicians. In many of their homilies Christ’s baptism is also regarded as his regeneration by water and spirit, and this view almost transcends the modest adoptionism of the Thonraki as revealed in the *Key of Truth*.

What was the origin of the name Paulician? The word is of Armenian formation and signifies a son of Paulik or of little Paul. Its origin must here have originally expressed scorn and contempt. Who then was this Paul? “Previously the Paulicians from a certain Paul of Samosata,” says Esc. “Here then you see the Paulicians, who got their poison from Paul of Samosata,” says Gregory Magistros. They were thus identified with the old party of the Pauliani, condemned at the first council of Nice in 325, and diffused in Syria a century later. They called themselves the Apostolic Catholic Church, but hearing themselves nicknamed Paulicians by their enemies, probably interpreted the name in the sense of “followers of St. Paul.” Certain features of Paulicianism noted by Photius and Petrus Gallicus are omitted in Esc. One of these is the Christhood of the fully initiated, who as such ceased to be mere “hearers” (audientes) and themselves became vehicles of the Holy Spirit. As Jesus anointed by the Spirit became the Christ, so they became christs. So Gregory of Narek upholds the Thonraki for their “anthropoplastic apostasy, their self-conferred contemptible priesthood which is a likeness of themselves to Satan” (= Christ in Thonraki parlance). And he repeats the taunt which the Arab Emir addressed to Smbat their leader, as he led him to execution: “If Christ rose on the third day, then since you call yourself Christ, I will slay you and bury you; and if you shall come to life again after thirty days, then I will know you at last, even though you take so many days over your resurrection.” Similarly (in a 12th-century form of renunciation of Bogomil error preserved in a Vienna codex) we hear of Peter the “founder of the heresy of the Messalians or Lycopetrians or Fundaitae and Bogomils who called himself Christ and promised to rise again after death.” Of this Peter, Tychichus (?) Sergius is reported in the same document to have been fellow initiate and disciple.

Because they regarded their Perfect or Elect ones as Christ and anointed with the Spirit, the medieval Cathars regularly adopted them. So it was with Celtic saints, and Adamnan, in his life of St. Columba, i. 37, tells how the brethren after listening to St. Baithene, “still knowing, with eyes unspeaking, and with hands spread out to heaven, venerated Christ in the holy and blessed man.” So in ch. 44 of the same book we read how a humble stranger “worshipped Christ in the holy man” (i.e. St. Columba); but such veneration was due to every presbyter. In 1837 we read of how an elect one of the Thonraki sect in Russian Armenia addressed his followers thus: “Lo, I am the cross: on my two hands light tapers, and give me adoration. For I am able to give you salvation, as much as the other.

It is then on the whole probable that the Paulicians who appear in Armenian records as early as 350, and were afterwards called Thronraki, by the Greeks by the Armenian name Paulikion, were the remains of a primitive adoptionist Christianity, widely despised in the east and already condemned under the name of Paulicians by the council of Nice in 325. A renegade Armenian Catholicos of the 7th century named Isaac has preserved to us a document which sums up their tenets. He adduces it as a sort of reducito ad absurdum of Christians who would model life and cult on Christ and his apostles, unencumbered by later church traditions. It runs thus: (1) Christ was thirty years old when he was baptized. Therefore they baptized no one until he is thirty years of age. (2) Christ, after baptism, was not anointed with myrrh nor with holy oil, therefore let them not be anointed with myrrh or holy oil. (3) Christ was not baptized in a font, but in a river; he therefore must not be baptized in a font. (4) Christ, when he was about to be baptized, did not recite the creed of the 318 fathers of Nice, therefore shall they not make profession of it. (5) Christ when about to be baptized, was not first made to turn to the west and renounce the devil and blow upon him, nor again to turn to the east and make a compact with God. For he was himself true God. So let them not impose these things on those to be baptized. (6) Christ, after he had been baptized, did not partake of his own body. Nor let them so partake of it. (7) Christ, after he had been baptized, fasted 40 days and 40 nights; and for 120 years such was the tradition which prevailed in the Church. We, however, fast 50 days before Pashua. (8) Christ did not hand down to us the teaching to celebrate the mystery of the offering of bread in church, but in an ordinary house and sitting at a common table. So then let them not offer the sacrifice of bread in churches. (9) It was after supper, when his disciples were sated, that Christ gave them to eat of his own body. Therefore let them first eat meat and be sated, and then let them partake of the mysteries. (10) Christ, although he was crucified for us, was not crucified on a cross nor on a stake nor on a gibbet. Let them therefore not adore the cross. (11) The cross was of wood. Let them therefore not adore a cross of gold or silver or bronze or stone. (12) Christ wore neither humeral nor amice nor maniple nor stole nor chasuble. Therefore let them not wear these garments. (13) Christ did not institute the prayers of the liturgy or the Holy Epiphanies, and all the other prayers for every action and every hour. Let them therefore not repeat them, nor be hallowed by such prayers. (14) Christ did not lay hands on patriarchs and metropolitans and bishops and presbyters and deacons and priests and monks, nor did he ordain them to be bishops, therefore not be ordained nor blessed with these prayers. (15) Christ did not enjoin the building of churches and the furnishing of holy tables, and their anointing with myrrh and hallowing with a myriad of prayers. Let them not do it either. (16) Christ did not fast on the fourth day of the week and on the Paraskritis. Let them not fast either. (17) Christ did not bid us pray towards the east. Neither shall they pray towards the east.
bishop, was born at Bordeaux in A.D. 352. His father, professus praetorius in Gaul, was a man of great wealth, who entrusted his son's education, with the best of results, to Ausonius. In 378 Paulinus was raised to the rank of consul suffectus, and in the following year he appears to have been sent as consularis into Campania. It was at this period, while present at a festival of St Felix of Nola, that he entered upon his lifelong devotion to the cult of that saint. He had married a wealthy Spanish lady named Thesaria; this happy union was clouded by the death in infancy of their only child—a bereavement which, combined with the many disasters by which the empire was being visited, did much to foster in them that world-weariness to which they afterward so fully surrendered. Not until forty years afterwards did Paulinus return to his native place and came into correspondence or personal intimacy with men like Martin of Tours and Ambrose of Milan, and ultimately (about 380) he was formally received into the church by bishop Delphinus of Bordeaux, whence shortly afterwards he withdrew with his wife beyond the Pyrenees. The asceticism of Paulinus and his liberality towards the poor soon brought him into great repute; and while he was spending Christmas at Barcelona the people insisted on his being forthwith ordained to the priesthood. The irregularity of this step, however, was resisted by many of the clergy, and the occurrence is still passed lightly over by his Roman Catholic panegyrists. In the following year he went into Italy, and after visiting Ambrose at Milan and Siricius at Rome—the latter of whom received him somewhat coldly—he proceeded into Campania, where, in the neighborhood of Nola, he settled among the rude structures which he had caused to be built around the tomb and relics of his patron saint. With Thesaria (now a sister, not a wife), while leading a life of rigid asceticism, he devoted the whole of his vast wealth to the entertainment of needy pilgrims, to payment of the debts of the insolvent, and to public works of utility or ornament; besides building basilicas at Fondi and Nola, he provided the latter place with a much-needed aqueduct. At the next vacancy, not later than 409, he succeeded to the bishopric of Nola, and this office he held with ever-increasing honor until his death, which occurred shortly after that of Augustine, whose friend he was, in 431. He is commemorated by the church of Rome on the 22nd of June.

The extant writings of Paulinus consist of some fifty Epistolae, addressed to Sulpicius Severus, Delphinus, Augustine, Jerome and others; thirty-two CAERNESE in a great variety of metre, including a series of hexameter “natales,” begun about 393 and continued annually in honour of the festival of St Felix, metrical epistles to Ausonius and Gestildus, and paraphrases of three psalms; and a Passio S. Genesii. They reveal to us a kindly and cheerful soul, well versed in the literary accomplishments of the period, but without any strength of intellectual grasp and particularly prone to superstition.

His works were edited by Rosweyde and Fronton le Duc in 1622 (Antwerp, 8vo), and their text was reprinted in the Bibli. max. patr. (1677). The next editor was Le Brun des Marettes (2 vols. 410, Paris, 1685), whose text was reproduced in substance by Muratorii (Verona, 1736), and reprinted by Migne. The poems and letters are edited in the Vienna Corpus script. ecc. lat. vol. xxvii. See also P. Riehert, Studien über die Briefe d. l. Paulin von Nola (Breslau, 1893) and other literary closure in Herzig-Hauck, Real- encyk, für prot. Theol. vol. xv.

PAULINUS (d. 644), first bishop of the Northumbrians and archbishop of York, was sent to England by Pope Gregory I. in 601 to assist Augustine in his mission. He was consecrated by Justus of Canterbury in 623 and endorsed aethelberht, to the Northumbrian king Edwin (q.v.). In 637 Edwin was baptized and assigned York to Paulinus as his see. It was at Lincoln that he consecrated Honorius as archbishop of Canterbury. In 633 Edwin was slain at Hatfield Chase and Paulinus returned to Kent, where he became bishop of Rochester. The previous year he had left his province. He died in 644.

PAULINUS, GAUSUS UETONIUS (1st century A.D.), Roman general. In 42, during the reign of Claudius, he led a revolt in Mauretania, and was the first of the Romans to cross the Atlas range. He subsequently wrote an account of his experiences. From 59–62 he commanded in Britain, and, after a severe defeat, finally crushed the Iceni under Boudicca (Boudicca). A complaint having been made to the emperor that he was needlessly protracting hostilities, he was recalled, but he was consul (for the second time) in 66. During the civil war he fought on the side of Otho against Vitellius, and obtained a considerable success against Aulus Caecina Alenius (one of the Vitellian generals) near Cremona, but did not follow it up.

PAULUS, FRIEDRICH (1846–1908), German philosopher and educationalist, was born at Langenhorn (Schleswig) and educated at Erlangen, Bonn and Berlin, where he became extraordinary professor of philosophy and pedagogy in 1878. In 1886 he succeeded Eduard Zeller as professor of moral philosophy at Berlin. He died on the 14th of August 1908. He was the greatest of the pupils of G. T. Fechner, to whose doctrine of panpsychism he gave great prominence by his Einleitung in die Philosophie (1852; 7th ed., 1900; Eng. trans., 1895). He went, however, considerably beyond Fechner in attempting to give an epistemological account of our knowledge of the psychophysical. Admitting Kant's hypothesis that by inner sense we are conscious of mental states only, he holds that this consciousness constitutes a knowledge of the so-called "thing-in-itself"—which Kant denies. Soul is, therefore, a practical reality which Paulsen, with Schopenhauer, regards as known by the act of will. But this will is neither rational desire, unconscious irrational will, nor conscious intelligent will, but an instinct, a will to live (Zielstrebigkeit), often subconscious, pursuing ends, indeed, but without reasoning as to means. This conception of will, though consistent and convenient to the main thesis, must be rigidly distinguished from the ordinary significance of will, i.e. rational desire. Paulsen is almost better known for his educational writings than as a pure philosopher. His German Education, Past and Present (Eng. trans., by I. Lorenz, 1907) is a work of great value.

Among his other works are: Versuch einer Entwickelungsgeschichte d. Kant'schen Erkenntnistheorie (Leipzig, 1875); Im Kant (1898, 1899); "Gründung Organisation und Lebensordnungen der deutschen Universitäten im Mittelalter" (in Sybels Histor. Zeitschr. vol. xlv. 1881); Gesch. d. gelehrten Unterrichts auf d. deutschen Schulen und Universitäten (1885, 1890); System der Ethik (1889, 1890; Eng. trans. (partial) 1899); Das Realgymnasium u. d. humanist. Bildung (1889); Kant d. Philosoph. d. Protestantismus (1890); Schopenhauer, Hamlet u. Shakespeare (1900); Philosophie multiplan (1900, 1901); Pariser Redaktions u. Moral (1900).

PAULUS, HEINRICH EBERHARD GOTTOLO (1761–1831), German rationalistic theologian, was born at Leonberg, near Stuttgart, on the 1st of September 1761. His father, a Lutheran clergyman at Leonberg, dabbled in spiritualism, and was deprived of his living in 1771. Paulus was educated in the seminary at Tübingen, was three years master in a German school, and then spent two years in travelling through England, Germany, Holland and France. In 1785 he was chosen professor of oriental languages at Jena. Here he lived in close intercourse with Schiller, Goethe, Herder and the most distinguished literary men of the day. In 1793 he succeeded Johann Christoph Döderlein (1745–1799) as professor of exegetical theology. His special work was the exposition of the Old and New Testaments in the light of his great Oriental learning.
and according to his characteristic principle of "natural explanation." In his explanation of the Gospel narratives Paulus sought to remove what other interpreters regarded as miracles from the Bible by distinguishing between the fact related and the author's opinion of it, by seeking a natural exercise of a man's powers, and that every θάλασσα (Matt. xiv. 25) means by the shore and not on the sea, by supplying circumstances omitted by the author, by remembering that the author produces as miracles occurrences which can now be explained otherwise, e.g., exorcisms. His Life of Jesus (1828) is a synoptical translation of the Gospels, prefaced by an account of the preparation for the Christ and a brief summary of His history, and accompanied by very short explanations interwoven in the translation. The form of the work was fatal to its success, and the subsequent Evangelisches Handbuch rendered it quite superfluous. Paulus really contributed much to a true interpretation of the Gospel narratives. In 1803 he became professor of theology and Consistorialrat at Würzburg. After this he filled various posts in south Germany—school director at Bamberg (1807), Nuremberg (1808), Ansbach (1810)—until he became professor of exegesis and church history at Heidelberg (1811-1834). He died on the 10th of August 1831.

His chief exegetical works are his Philologisch-kritischer und historischer Kommentar über das 2. Testament der Propheten (1803), Collected works in Philologisch-kritischer und historischer (1804), Philologischer Atlas über die Propheten (1791); and Philologischer Clavis über Jesaias (1793); and particularly his Evangelisches Handbuch über die drei ersten Evangelien (3 vols., 1803-1833; 2nd ed., 1836). He also edited a collected small edition of Baruch Spinoza's works (1802-1803), a collection of the most noted Eastern travelers (1792-1803), F. W. J. Schelling's Vorlesungen über die Offenbarung (1843), and published Skizzen aus meiner Bildungs- und Lebensgeschichte (1839). See Karl Reichlin-Meldegg, H. E. G. Paulus und seine Zeit (1853), and article in Herzog-Hauck, Realencyclopädie; cf. F. Lichtenberger, History of German Theology in the Nineteenth Century, pp. 21-24.

PAULUS (older form PAULUS), LUCIUS AEMLIUS, surnamed MACEDONIUS (c. 225-360 B.C.), Roman general, a member of the patrician family of the same name who fell at Cannae. As consul for the second time (168) he was entrusted with the command in the Macedonian War, which the incapacity of previous generals had allowed to drag on for three years. He brought the war to a speedy termination by the battle of Pydna, fought on the 22nd of June (Julian calendar)168. Macedonia was henceforward a Roman province, and Paulus, having made a tour through Greece, with the assistance of ten Roman commissioners arranged the affairs of the country. He enjoyed a magnificent triumph, which lasted three days and was graced by the presence of the captive king Perseus, who was received by the Emperor as his second wife, and was thus left without a son to bear his name, his two sons by his first wife having been adopted into the Fabian and Cornelian gentes. Paulus was censor in 164, and died in 166 after a long illness. At the funeral games exhibited in his honour the Hecyra of Terence was acted for the second and the Adelphi for the first time. An aristocrat to the backbone, he was yet beloved by the people. Of the vast sums brought by him into the Roman treasury from Spain and Macedonia he kept nothing to himself, and at his death his property scarcely sufficed to pay his wife's dowry. As a general he was a strict disciplinarian, and an augur he discharged his duties with care and exactness. He was greatly in sympathy with Greek learning and art, and was a friend of the historian Polybius.

See Plutarch, AEMLIUS Paulus; Livy xiv. 17-xlvi. 41; Polybius xxxix-xxxi.

PAULUS, surnamed SILENTIARIUS ("the silentary," one of the ushers appointed to maintain silence within the imperial palace), Greek poet, contemporary and friend of Agathias, during the reign of Justinian. In addition to some 80 epigrams, chiefly erotic and panegyric in character, preserved in the Greek Anthology, there is extant by him a description of the church of St Sophia, and of its pulpit (διήκον), in all some 1300 hexameters after the style of Nonnus, with short iambic dedications to Justinian. The poem was recited at the second dedication of the church (A.D. 562), in the episcopal hall of the patriarchate. The poems are of importance for the history of Byzantine art in the 6th century. Another poem (also preserved in the Anthology) on the warm baths of Pythia in Bithynia, in which the Anacreontic rhythm, has sometimes been attributed to him.

BIBLIOGRAPHY.—Ed. of the poems on St Sophia, by I. Bekker in the Bonn Corpus scriptorum hist. Byz. (1837), including the descriptions of the church by Du Cange and Banduri, and in J. J. Keller, Patrologia, in its extant metric translations, with commentary, by C. W. Kortlandt (1823), and J. J. Keller (1857); poems on the Baths in G. E. Lessing, Zur Geschichte und Literatur, i. 5 (1773); see also Merian-Genast, De Paulo Silentiario (Leipzig, 1869).

PAULUS DIACONUS of WARNEFRID, of CASINENSIS (c. 720-c. 800), the historian of the Lombards, belonged to a noble Lombard family and flourished in the 8th century. An ancestor named Leupichis entered Italy in the train of Alboin and received lands at or near Forum Julii (Friuli). During an invasion the Avars swept off the five sons of this warrior into Ilyria, but one, his namesake, returned to Italy and restored the ruined fortunes of his house. The grandson of the younger Leupichis was Warnefrid, who by his wife Theodellinda became the father of Paulus. Born between 720 and 725 Paulus received an exceptionally good education, probably at the court of the Lombard king Desiderius, who made him a trusted counsellor and often sent him as an envoy to the Franks and the Lombards. He was later called upon by the two kings to repair the ramparts of Rome. It is probable that he was secretary to the Lombard king Desiderius, the successor of Ratcliff; it is certain that this king's daughter Adelperra was his pupil. After Adelperra had married Archis, duke of Benevento, Paulus at her request wrote his continuation of Europius. It is possible that he took refuge at Benevento when Pavia was taken by Charlemagne in 774, but it is much more likely that his residence there was anterior to this event by several years. Soon he entered a monastery on the lake of Como, and before 782 he had become an inmate of the great Benedictine house of Monte Cassino founded by the abbot Secondus. The sixth abbot of Monte Cassino, Paulus was elected in 787 to the see of Pavia. About 770 his brother Archis had been carried as a prisoner to France, and when five years later the Frankish king visited Rome, Paulus successfully wrote to him on behalf of the captive. His literary attainments attracted the notice of Charlemagne, and Paulus became a potent factor in the Carolingian renaissance. In 785 he returned to Italy and to Monte Cassino, where he died on the 13th of April in one of the years between 794 and 800. His surname Diaconus, or Levita, shows that he took orders as a deacon; and some think he was a monk before the fall of the Lombard kingdom.

The chief work of Paulus is his Historia gentis Langobardorum. This important historical work was completed after 787 and deals with the story of the Lombards from 568 to the death of King Liutprand in 747. The story is told from the point of view of a Lombard patriot and is especially valuable for its descriptions of the political life of the ninth century. Paulus preserved the story of Marsilio of Padua and the document called the Origo gentis Langobardorum, the Liber pontificalis, the lost history of Secundus of Trent, and the lost annals of Benevento; he made a free use of Bede, Gregory of Tours and Isidore of Seville. In some respects he suggests a comparison with Jordanes, but in learning and literary honesty is greatly the superior of the Goth. Of the Historia there are about a hundred manuscripts extant. It was largely used by subsequent writers, who continued, and was first printed in Paris in 1514. It has been translated into English, German, French and Italian, the English translation being by W. D. Fouke (Philadelphia, 1807), and the Latin version by O. Abel and R. Jacob (Leipzig, 1878). Among the editions of the Latin the best is that edited by L. Bethmann and G. Waizt, in the Monumenta Germaniae historica. Scriptores rerum langobardarum (Heidelberg, 1875).

Cognate with this work is Paulus's Historia romana, a continuation of the Brevarium of Eutropius. This was compiled between 766 and 771, at Benevento. The story runs that Paulus advised the Italian chroniclers to read the work of Eutropius and this heathen writer said nothing about ecclesiastical affairs and stopped with the accession of the emperor Valens in 364; consequently Paulus interpolated extracts from the Scriptores ecclesiastici, and from other sources with Eutropius, and added six books, thus bringing the history down to 553. This work has little value, although it was very popular during the middle ages. It has been edited by H. Pregerius in Monumenta Germaniae historica. Anteores antiquissimi, Bd. ii. (1879).
Paulus wrote at the request of Angilram, bishop of Metz (d. 791), a history of the bishops of Metz to 766, the first work of its kind north of the Alps. This Gesta episcoporum Metrensis was published with the Monumenta Germaniae Latina historica Scriptores, and has been translated into German (Leipzig, 1886). He also wrote many letters, verses, and epitaphs, including those of Duke Archis and of many members of the Carolingian family. Some letters were published in the Historia Langobardorum in the Monumenta; the poems and epitaphs edited by E. Dümmler will be found in the Poetae latini aevi carolini, Bd. i. (Berlin, 1885). The Duomo and the cathedral having come to light, a new edition of the poems (Die Gedichte des Paulus Diaconus) has been edited by Karl Neff (München, 1908). While in France Paulus was requested by Charlemagne to compile a collection of homilies. He executed this work in the monastery of Monte Cassino, and later learned in the Frankish churches. A life of Pope Gregory the Great has also been attributed to him.

Paul Veronese (1528-1588), the name ordinarily given to Paolo Caliari, or Cagliari, the last great cycle of painters of the Venetian school. He was born in Verona in 1528 according to Zanetti and others, or in 1532 according to Ridolfi. His father, Gabriele Caliari, a sculptor, began to train Paolo to his own profession. The boy, however, showed more propensity to painting, and was therefore transferred to his uncle, the painter Antonio Badile, whose daughter he eventually married. According to Vasari, he was the pupil of Giovanni Carotto, a painter proficient in architecture and perspective; this statement remains unconfirmed. Paolo, in his early years, applied himself to copying from the engravings of Albert Dürer and the drawings of Parmigianino. He did some work in Verona, but found there little outlet for his abilities, the field being pretty well occupied by Ligozzi, Battista del Moro, Paolo Farinato, Domenico Riccio, Brussarelli, and other artists. Cardinal Ercole Gonzaga took him when barely twenty years of age, to Mantua, along with the three last-named painters, to execute in the cathedral a picture of the "Temptation of St. Anthony"; here Caliari was considered to excel his competitors. Returning to Verona, he found himself exposed to some envy and ill-will. Hence he formed an artistic partnership with Battista Zelotti, and they painted together in the territories of Vicenza and Treviso. Finally Paolo went on to Venice to look for a fortune. In 1550, he was in the sacristy and church of St. Sebastian, an uncle of his being prior of the monastery. The subjects on the vaulting are taken from the history of Esther; and these excited so much admiration that henceforward Caliari, aged about twenty-eight, ranked almost on a par with Tintoretto, aged about forty-five, or with Titian, who was in his eightieth year. Besides the Esther subjects, these buildings contain his pictures of the "Baptism of Christ," the "Martirdom of St. Marcus and St. Marcellinus," the "Martirdom of St. Sebastian," etc. As regards this last-named work, dating towards 1563, there is a vague tradition that Caliari painted it when he had taken charge of the monastery of the great cycle of competition for painting the ceiling of the library of St. Mark, and not only obtained the commission but executed it with so much power that his very rivals voted him the golden chain which had been tendered as an honorary distinction. At one time he returned to Verona, and painted the "Banquet in the House of Simon the Pharisee, with Jesus and Mary Magdalen," a picture now in Turin. In 1560, however, he was in Venice again, working partly in the S. Sebastiano buildings and partly in the ducal palace. He visited Rome in 1563, in the suite of Giroldo Grimaldi, the Venetian ambassador, and studied the work of Raphael, Michelangelo, and especially the antique. Returning to Venice, he was overwhelmed with commissions. He was compelled to decline an invitation from Philip II. to go to Spain and assist in decorating the Escorial. One of his pictures of this period is the famous "Venice, Queen of the Sea," in the ducal palace. He died in Venice on the 20th (or perhaps 10th) of April 1588, and was buried in the church of S. Sebastiano, a monument being set up to him there by his two sons, Gabriele and Carlo, and his brother, Benedetto, all of them painters.

Beyond his magnificent performances as a painter, the known incidents in the life of Paul Veronese are very few. He was honoured and loved, being kind, amiable, generous and an excellent father. His person is well known from the portraits left by himself and others; he was a dark man, taller good-looking than otherwise, somewhat bald in early middle age, and with nothing to mark an exceptional energy or turn of character. In his works the first quality which strikes one is their palatial splendour. The pictorial inspiration is entirely that of the piercing and comprehensive eye and the magical hand—not of the mind. The human form and face are given with decorous coldness, often with beauty; but of individual apposite expression there is next to none. In fact, Paolo Veronese is pre-eminently a painter working pictorially, and in no wise amenable to a literary or rationalizing standard. He enjoys a sight much as Ariosto enjoys a story, and displays it in form and colour with a zest like that of Ariosto for language and verse. He was supreme in representing, without huddling or confusion, numerous figures in a luminous and diffused atmosphere, while in richness of draperies and transparency of shadows he surpassed all the other Venetians or Italians. In gifts of this kind Rubens alone could be pitted against him. In the moderation of art combined with its profusion he far excelled Rubens; for, dazzling as is the first impression of a great work by Veronese, there is in it, in reality, as much of soberness and serenity as of exuberance. By variety and apposition he produces a most brilliant effect of colour; and, yet his hues are seldom bright. He hoards his primary tints and his high lights. He very rarely produced small pictures: the spacious was his element.

Of all Veronese's paintings the one which has obtained the greatest world-wide celebrity is the vast "Marriage at Cana," now in the Louvre. It contains about a hundred and twenty figures or heads—those in the foreground being larger than life. Several of them are portraits. Among the personages specified (some of them probably without sufficient reason) are the Marquis del Vasto, Queen Eleanor of France, Francis I., Queen Mary of England, Sultan Suleyman I., Vittoria Colonna, Charles V., Tintoretto, Titian, the elder Bassano, Benedetto Caliari and Paolo Veronese himself (the figure playing the port of Aretino). As regards the procedure of the picture, it appears that in the first impression of Ariosto's story, the point of view from which it falls is that of the New Testament narrative; for there is no relation between the Galilean wedding and Veronese's court-banquet. This stupendous performance was executed for the refectory of the monastery of St. Giorgio Maggiore in Venice, the contract for it being signed in June 1562 and the picture completed in September 1563. Its price was 324 silver ducats (¼£160), along with the artist's living expenses and a tun of wine. There are five other great banquet-pictures by Caliari, only inferior in style for its value to that of Cana. One of them is also in the Louvre, a Feast in the House of Simon the Pharisee painted towards 1570-1575 for the refectory of the Servites in Venice. A different version of the same theme is in the Brera Gallery of Milan. "The Feast of Simon the Leper" (1570) was done for the refectory of the monks of St Sebastian, and the "Feast of Levi" (St Matthew) (1573), now in the Venetian academy, for the refectory of the monks of St John and St Paul. In each instance the price barely exceeded the cost of the materials. The Louvre contains ten other specimens of Veronese, notably the "Susanna and the Elders" and the "Supper at Emmaus." In the National Gallery, London, are ten examples. The most famous is St Helena's Vision of the Cross," founded upon an engraving by Marcantonio after a drawing supposed to be the work of Raphael. Far more famous than this is the "Family of Darius at the Feet of Alexander the Great after the Battle of Issus"—the captives having mistaken Hephæstion for Alexander. It was bought for £13,500, and has even been termed (very unreasonably) the most celebrated of all Veronese's works.
principal figures are portraits of the Pisani family. It is said that Caliari was accidentally detained at the Pisani villa at Este, and there painted this work, and, on quitting, told the family that he had left behind him an equivalent for his courteous entertainment. Another picture in the National Gallery, “Europa and the Bull,” is a study for the large painting in the imperial gallery of Vienna, and resembles one in the ducal palace of Venice. The Venetian academy contains fourteen works by Veronese. One of the finest is a comparatively small picture of the Battle of Lepanto, with Christ in heaven pouring light upon the Christian fleet and darkness on the Turkish. In the Uffizi Gallery of Florence are properly the finest beauty of the “Annunciation” and “Esther Presenting herself to Ahasuerus”; for delicacy and charm this latter work yields to nothing that the master produced. In Verona “St George and St Julian,” in Brescia the “Martyrdom of St Afra,” and in Padua the “Martyrdom of St Justina” are works of leading renown. Celebrated frescoes by Caliari are in four villas near Venice, more especially the Villa Masiara. His drawings are very fine, and he took pleasure at times in engraving on copper.

The brother and sons of Paolo already mentioned, and Battista Zelotti, were his principal assistants and followers. Benedetto Caliari, the brother, who was about ten years younger than Paolo, is reputed to have had a very large share in the architectural backgrounds which form so conspicuous a feature in Paolo's compositions. If this is not overstated, it must be allowed that a substantial share in Paolo's fame accrues to Benedetto; for not only are the backgrounds admirably sketched and limned, but they govern to a large extent the invention and distribution of the groups. Of the two sons Carlo (or Carletto), the younger, is the better known. He was born in 1570, and was sent to study under Bassano. He produced various noticeable works, and died young in 1596. Gabriele, born in 1568, attended, after Carlo's death, almost entirely to commercial affairs; his works in painting are rare. All three were occupied after the death of Paolo in finishing his pictures left unfinished.

See Ridolfi, Le Meraviglie dell'arte, &c.; Dal Pozzo, Vite de' pittori veronesi, &c.; Zacetti, Della Pittura veneta, &c.; and Lantzi; also, among recent works, the biographies by C. Yriarte (1888); F. H. Meitner (1897); and Mrs Arthur Bell (1904).

(W. M. R.)

PAUMOTU, PAUNCEFOTE, or LOW ARCHIPELAGO, a broad belt of 78 atolls in the Pacific Ocean, belonging to France, between 14° and 24° S., and 131° and 149° W. They trend in irregular lines in a north-west and south-west direction, and the major axis of the group extending over 1300 m. The largest atoll, Rangiroa, with a lagoon 45 m. long by 15 wide, is made up of twenty islets. Fakarava, the next in size, consists of fifteen islets, and its oblong lagoon affords the best anchorage in the group. Hau has fifty islets, and its lagoon is dangerously studded with coral. The symmetrically placed eleven islets of Ana'a suggested to Captain Cook the name of Chain Island. Heavy storms sometimes greatly alter the form of the atolls. The first discovery of part of the archipelago was made by the Spaniard Pedro Fernandez Quiros in 1606. Many navigators subsequently discovered or rediscovered part of the archipelago; among them may be mentioned Jacob Lemaire and Willem Schouten (1610), John Byron (1762), Philip Carteret (1767), Louis Antoine de Bougainville (1768), Captain James Cook (1769), Lieutenant Bligh (1792), Captain Wilson of the "Duff" (1797), Otto von Kotzebue (1813 and 1824), Fabian Gottlieb von Bellinghausen (1815-1820) and Charles Wilkes (1839) who made a detailed survey of the islands. As a result almost all the islands bear alternative names. The dates given are those of first discovery. In the north-west part of the chain are Rangiroa (Vliegen, Deans or Nairara, this part of the group bearing the name of the Palliser Islands); Fakarava (St. George), the seat of the French resident; Ana'a (Chain, 1769), Makemo (Makima, Phillips, Kutusov, 1803), Hau (Hao, Harp, Bow, 1768). North and east of these are Manihi (Oahe, Waterland, 1616), Tikei (Romanzov, 1815), the Disappointment group (1705) of which Napuka is the chief island, Putapuka (Henuine, Holden, Dog, 1616), Raroia (Barclay de Tolly, 1820), Angataa (Ahangati, Arakchev, 1820), Akahaina (Fakakia, Predpratie, 1824), Takatoko (Narcissus, Egmont, Clerke, 1774), Fukuaruha (Serle, 1757). In the southern part of the archipelago are Hereheretui (Bligh, Santalbo, 1660), the Duke of Gloucester group (1767), Tematangata (Bligh Lagoon, 1762), Maruroa (Braburgh, Matilda, 1767), the Actaeon or Amphitrite group (discovered by the Tahitian trading vessel "Amphitrite" in 1833), Marutea (Lord Hood, 1761), and the Gambier or Mangareva group (1797), of which Mangareva (Gambier, Pearl) is the chief island. To the south again are: Pecaila (q.v.), Ducie, and a few other islets, which are British possessions. The Gambier Islands are a cluster of four larger and many smaller volcanic islets, enclosed in one wide reef. The wooded crags of Mangareva, the largest islet, 5 m. in length, rise to a height of 1315 ft. and are covered with rich vegetation, quite Tahitian in character; but, as in the other Paumotus, there is a dearth of animal life.

The climate of the islands is healthy, and they have a mean lower temperature than Tahiti. The easterly trade winds prevail. Rain and fog occur even during the dry season. The season of storms lasts for seven months, when devastating hurricanes are uncommon and a south-western swell renders the western shores dangerous. Plants and animals are scantily represented. Coco-nut palms and the pandanus thrive on many of the islets, and the bread-fruit, banana, pine-apple, water-melon and yam have been introduced from Tahiti into the western islands. Mammals are represented by a few rats; among land-birds parakeets, thrushes and doves are noticeable; and of reptiles there are only lizards. Insects are scarce. But the sea and lagoons teem with turtle, fish, molluscs, crustaceans and zoophytes. Coral is luxuriant everywhere. From the abundance of pearl oysters the archipelago gets its traders' name of Pearl Islands.

The Paumotus are sparsely inhabited by a fine strong race of Polynesians, more muscular and mostly darker-skinned than that inhabiting Tahiti. In the west considerable mixture with other races has taken place. In physique, language, religion and customs the Gambier Islanders closely resemble the Raro-tangans. The pearl fisheries in the rocky and surly waters are a source of revenue, the pearls being sold in Tahiti. The best harbour of the group is that of Fakarava, which, together with Mangareva, is open to trade.

The land area of the entire group is about 330 sq. m., and the population is about 6000. The group passed under the protection of France in 1844, and was annexed in 1851, forming part of the dependency of Tahiti.

PAUNCEFOTE, JULIAN PAUNCEFOTE, 1ST BARON (1828-1902), English diplomatist, third son of Robert Pauncefote of Preston Court, Gloucestershire, was born on the 21st of September 1828. He was educated at Marlborough, Paris and Geneva, and called to the bar at the Inner Temple in 1852. He was for a short time secretary to Sir William Molesworth, secretary for the colonies, and in 1862 went out to Hong-Kong, where he was made attorney-general (1863) and then chief justice of the supreme court. He was appointed chief justice of the Leeward Islands in 1875, and, returning to England in the next year, became one of the legal advisers to the colonial office. Two years later he received a similar appointment in the foreign office, and in 1882 was made permanent under-secretary of state for foreign affairs. In 1883 he was one of the delegates to the Suez Canal international commission, and received the G.C.M.G. and the K.C.B. Lord Salisbury departed from precedent in choosing him to succeed Sir Lionel Sackville-West as British minister at Washington in 1886, but the event showed that his knowledge of international law made up for any lack of the ordinary diplomatic training. He did much during his term of office to maintain friendly relations between the two countries, especially during the Venezuelan crisis. The Bering Sea fisheries dispute (1890-1892) was successfully negotiated by him; he arranged a draft treaty for Anglo-American arbitration, which was, however, quashed by the Senate; and carried through
PAUPERISM—PAUSANIAS

The revision of the Clayton-Bulwer Treaty on the subject of the Panama Canal. In 1853 the British minister at Washington was raised to the rank of ambassador, and Sir Julian Pauchecote became the doyen of the diplomatic corps. He died on the 26th of May 1902 at Washington. He had been made Baron Pauchecote of Preston in 1890 in recognition of his services at the Peace Conference at the Hague, and he was a member of the Court of Arbitration which resulted from the conference.

PAUPERISM (Lat. pauper, poor), a term meaning generally the state of being poor, poverty; but in English usage particularly the condition of being a pauper, i.e. in receipt of relief administered under the poor law. In this sense the word is to be distinguished from "poverty." A person to be relieved under the poor law must be a destitute person, and the moment he has been relieved he becomes a pauper, and as such incurs certain civil disabilities. Statistics dealing with the state of pauperism in this sense convey not the amount of destitution actually prevalent, but the particulars of people in receipt of poor law relief.

PAUSANIAS (5th century B.C.), Spartan regent and commander, of the Agiad family, son of Cleombrotus and nephew of Leonidas, the hero of Thermopylae. Upon the death of the latter in 480 B.C. his son Pleistarchus became king, but still a minor the regency devolved on Cleombrotus's brother Cleomeloth, and after his death in 479 on Pausanias. He first distinguished himself as commander of the combined Greek forces in the victory of Plataea. In 478 he was appointed admiral of the Greek fleet, and succeeded in reducing the greater part of Cyprus, the strategic key of the Levant, and in capturing Byzantium from the Persians, thus securing the command of the Bosporus, and of the route by which Darius had invaded Europe. But he entered into treacherous negotiations with the Persian king, and his adoption of Oriental dress and customs, and his haughty behaviour to the Greeks under his command, roused their resentment and suspicion (see DELLIAN LEAGUE). Pausanias was recalled by the ephors and, though acquitted on the main charge of Medias, was not again sent out in any official position. He returned to Byzantium, nevertheless, in a ship of Hermione and seized that town and, apparently, Sestos also. He was dislodged from both by the Athenians, to whom the allies had transferred from Sparta the naval hegemony. For some time he lived at Cleonae in the Troad, carrying on negotiations with Xerxes, but was again recalled to Sparta, where he incited the helots to revolt. When his schemes were almost matured, the evidence of a confidential slave led to the discovery of his plot by the ephors, and he was devolved to the sanctuary of Athena Chalcoene in the Spartan Acropolis: there he was immured, and when starvation and exposure had all but done his work he was dragged out to die. This crime against religion the state subsequently expiated by the burial of his body at the spot where he died and the dedication of two bronze statues. To commemorate Leonidas and Pausanias a yearly festival was held, at which speeches were made extolling their victories; this was still celebrated when the geographer Pausanias visited Sparta more than six centuries later (Paus. iii. 14). The date of the regent's death probably falls in 478 or 479, though some assign it to a later date on a very doubtful statement of Justin (ix. 1) that Pausanias held Byzantium for seven years.

See Herodotus v. 32, ix. 10-88; Thucydides i. 69-96, 189-134, ii. 71, 72, iii. 58; Diodorus Siculus xl. 30-47, 54; Cornelius Nepos, Pausanias; Justin ii. 15, ix. 1, 3; Pausanias iii. 4, 14, 17; Polyaeus vili. 57; Aristodemos ii. iv., iv., vii.; Atheneus xii. 535E, 536A; Plutarch, Cleomenes, Thucydides, 23, Aristides ii. 11-30, 253-257; as his wife, Uber den Königsgenossen Pausanias (Leipzig, 1875). (MN. T. N.)

PAUSANIAS, Greek traveller and geographer of the 2nd century A.D., lived in the times of Hadrian, Antoninus Pius and Marcus Aurelius. He was probably a native of Lydia, and was possibly born at Magnesia ad Sipylum; he was certainly interested in Pergamum and familiar with the western coast of Asia Minor; but his travels extended far beyond the limits of Ionia. Before visiting Greece he had been to Antioch, Joppa and Jerusalem, and to the banks of the river Jordan. In Egypt he had seen the pyramids and had heard the music of the vocal Memnon, while at the temple of Ammon he had been shown the hymn once sent to that shrine by Pindar. He had taken note of the fortiifications of Rhodes and Byzantium, had visited Thessaly, and had gazed on the rivulet of "blue water" beside the pass of Thermopylae. In Macedonia he had almost certainly viewed the traditional tomb of Orpheus, while in Epirus he was familiar with the oracular oak of Dodona, and with the streams of Acherson and Cocytus. Crossing over to Italy, he had seen something of the cities of Campania, and of the wonders of Rome.

His Description of Greece (περὶ οἰκονομίας Ἑλλάδος) takes the form of a tour in the Peloponnesus and in part of northern Greece. It is divided into ten books: (i.) Attica and Megara; (ii.) Argolis, including Mycenae, Tiryns and Epidaurus; (iii.) Laconia; (iv.) Messenia; (v.) and (vi.) Elis, including Olympia; (vii.) Achaea; (viii.) Arcadia; (ix.) Boeotia, and (x.) Phocis, including Delphi.

Book i. was written after Herodes Atticus had built the Athenian Stadium (A.D. c. 143), but before he had built the Odeum (c. 160-161). There is reason to believe that this book was written about the regency years 150-160. The statement in book iv. (1, 2), that 217 years had elapsed since the resolution of the fourth (44 B.C.), shows that Pausanias was engaged on his account of Elis in the year A.D. 174, during the reign of Marcus Aurelius. He had lived in that emperor's time, but had not actually seen that emperor's favourite, Antinous, who died about 138. He mentions the wars of Antoninus Pius against the Moors, and of Marcus Aurelius (in and after A.D. 166) against the Germans (vili. 43). The latest event which he records is the incursion of the robber-borde of the Costoboci (A.D. c. 176; x. 34, 5). Book i. having been published before the reign of Antoninus Pius, the information of the whole must have extended over more than fourteen years.

The work has no formal preface or conclusion. It suddenly begins with the promontory of Sunium, the first point in Attica that would be seen by the voyager from the shores of Asia Minor, and it ends abruptly with an anecdote of a blind man of Naupactus. The author's general aim may be inferred from his saying at the close of his account of Athens and Attica: "Such (in my opinion) are the most famous of the Athenian traditions and sights; from the mass of materials I have aimed from the outset at selecting the really notable" (i. 39, 3). It is possible that the hope of giving variety and interest to the topographical details of Athens that the author intersperses them with lengthy historical disquisitions; but the result is that the modern reader is tempted to omit the "history" and to hasten on to the "topography," on which the author is now a primary authority. In the subsequent books he introduces two improvements. His account of each important city begins with a sketch of its history; and, in his subsequent descriptions, he adopts a strictly topographical order. He takes the nearest road from the frontier to the capital; he there makes for the central point, e.g. the market-place, and describes in succession the several places that interested the foreigner. Similarly, in the surrounding district, he follows the principal roads that run from the capital to the capital in each case, until, at the end of the last road, he crosses the frontier for the next district. In the later books he supplies us with a few glimpses into the daily life of the inhabitants. He is constantly describing ceremonial rites or superstitious customs. He frequently introduces narratives from the domain of history and of legend and folklore; and it is only the tomb of Helena at Jerusalem, which Pausanias vili. 16, 4-5, compares with the Mausoleum, is mentioned in succession, Josephus, Ant. xx. 4, 3; Bell. jud. v. 2, 21, 3, 3; 4, 2; land Eusebius, H.E. ii. 12, 3. Helen, the daughter of Ixares, king of Adiabene, sent large shiploads of provisions to Rome during the great famine in the time of Claudius (A.D. 44-51). Her tomb is identified by universal consent with the so-called "Tombs of the Kings," half a mile north of the Damascus gate. Cf. Schürer, Geschichte des judischen Volkes, 3rd ed., iii. 120-122; view of tomb in Picturcaische Palestine, i. 103.
rarely that he allows us to see something of the scenery. But, happily, he notices the pine-trees on the sandy coast of Elis, the deer and the wild boars in the oak-woods of Phelloé, and the crows amid the giant oak-trees of Alcamenae. He tells us that “there is no fairer river than the Ladon,” “no reeds grow so tall as those in the Boeotian Asopus,” and the rain that deluges the fallow plain of Mantinea vanishes into a chasm to rise again elsewhere. It is mainly in the last three books that he touches on the products of nature, the wild strawberries of Helicon, the date-palms of Aulis, and the olive-oil of Tithorea, as well as the bustards of Phocis, the tortoises of Arcadia and the blackbirds of Cyllene. He is rather reserved, in fact, on the character of the roads, but he records, with the gratitude of a traveller, the fact that the narrow and perilous cornice of the Scironian way along the coast of Megara had been made wider and safer by Hadrian. He is inspired by a patriotic interest in the ancient glories of Greece, recognizing in Athens all that was best in the old Greek life, and lamenting the ruin that had befallen the land on the fatal field of Chaeronea. He is most at home in describing the religious art and architecture of Olympia and of Delphi; but, even in the most secluded regions of Greece, he is fascinated by all kinds of quixotic and primitive images of the gods, by the relics of the religious and masonic things. He is interested in visiting the battlefields of Marathon and Plataea, and in viewing the Athenian trophy on the island of Salamis, the grave of Demosthenes at Calauria, of Leonidas at Sparta, of Epaminondas at Mantinea, and the colossal lion guarding the tomb of the Thebans on the Boeotian plain. At Thebes itself he views the shields of those who died at Leuctra, and the ruins of the house of Pindar; the statues of Hesiod and Arion, of Thamyris and Orpheus, in the grove of the Muses on Helicon; the portrait of Corinna at Tanagra, and of Polybius in the cities of Arcadia. At Olympia he takes note of the ancient quires of Iphitus inscribed with the terms of the Olympic truce, the tablets recording treaties between Athens and other Greek states, the memorials of the victories of the Greeks at Plataea, of the Spartans at Tanagra, of the Messenians at Naupactus, and even those of Philip at Chaeronea and of Mummius at Corinth. At Delphi, as he climbs the sacred way to the shrine of Apollo, he marks the trophies of the victories of the Athenians at Marathon and on the Eurymedon, of the united Greeks at Artemision, Salamis and Plataea, of the Spartans at Agesipotami, of the Thebans at Leuctra, and the shields dedicated to the memory of the trench and the defeat of the Gauls at Delphi itself. At Athens, he sees palaestrae, battle-scenes, statues of famous poets, orators, statesmen and philosophers, and inscriptions recording the laws of Solon; on the Acropolis, the trophy of the Persian wars, the great bronze statue of Athena; at the entrance to the harbour of the Peiraicus, the grave of Themistocles; and, outside the city, the monuments of Harmodius and Aristogeiton, of Cleisthenes and Pericles, of Conon and Timotheus, and of all the Athenians who fell in battle, except the heroes of Marathon, “for these, as a need of valour, were buried on the field.”

In the topographical part of his work, he is fond of digressions on the wonders of nature, the signs that herald the approach of an earthquake, the phenomena of the tides, the ice-bound seas of the north, and the noonday sun which at the summer solstice casts no shadow at Syene. While he never doubts the existence of the gods and heroes, he sometimes criticizes the myths and legends relating to them. His main interest is in the monuments of ancient art, and he prefers the works of the 5th and 4th centuries B.C. to those of later times. At Delphi he admires the pictures of Polygnotus, closing the seven chapters of his minute description with the appreciative phrase: “so varied and beautiful is the painting of the Thasian artist” (x. 31, 2). In sculpture his taste is no less severe. Even in the “uncharted” work of Daedalus, he recognizes “a touch of the divine” (ii. 4, 5). In architecture, he admires the prehistoric walls of Tiryns, and the “Treasury of Minys,” the Athenian Propylaee, the theatre of Epidaurus, the temples of Bassae and Tegea, the walls of Messene, the Odeum at Patrae, as well as the building of the same name lately built at Athens by Herodes Atticus (vii. 20, 6), and finally the Stadium which the munificent Athenian had faced with white marble from the quarry of Pentelicus. His descriptions of the monuments of art are plain and unadorned; they bear the impress of reality, and their accuracy is confirmed by the extant remains. He is perfectly frank in his confessions of ignorance.

He has been well described by J. G. Frazer as “a man made of common stuff and cast in a common mould; his intelligence and abilities seem to have been little above the average, his opinions not very different from those of his contemporaries.” Pindar, he says, was his “ideal muse.” He criticizes his style as “plain and unadorned yet heavy and laboured”; it is not careless or slovenly; the author tries to write well, but his “sentences are devoid of rhythm and harmony” (Introduction, pp. xlix, lxxix).

In considering his use of previous writers, we must draw a distinction between the historical and the descriptive parts of his work. In the former it was necessary for him to depend on written or oral testimony; in the latter it was not. In the historical passages, his principal poetic authority is Homer; he frequently quotes the Theogony of Hesiod, and he often refers to Pindar and Aeschylus. His writings are full of echoes of Herodotus, and his two descriptive passages mentioned above, beyond the isolated mention of their names (i. 3, 4; vi. 10, 9). He has carefully studied the Elean register of the Olympic victors; he makes large use of inscriptions, and has generally examined them with care and copied them with accuracy. In the descriptive portion the question arises whether he derived his knowledge from personal observation, or from books, or from both. He does not profess to have seen everything, but he does not acknowledge that he has borrowed any of his descriptions from previous writers. He “cannot commend the men who took the measurements,” “the Zeus at Olympia” (viii. 14, 1). A critic of his day, who seems to have been a spring is the source of an Arcadian river, “cannot have seen the spring himself, or spoken with any one who had; I have done both” (viii. 41, 10). There are fifty passages in which he either directly states or implies that he had seen the things that he describes. All of these have been carefully collected and examined by R. Heberdey (1894), who, by using a distinctive type in marking on a map the places “seen” by Pausanias, and by joining those places by lines representing the routes described by him, has shown the large extent of the author’s travels in Greece. The complicated coast of Hermione has, however, been left uncharted (i. 14, 7). It is certain, however, that he has been in the account of the three roads leading to the north from Lepreus, in the extreme south of Elis (v. 5, 3).

A greater difficulty has long been felt in connexion with the “Enneacrunus episode” in the description of Athens (i. 8, 6, and 14, 1–6). In the midst of the account of the market-place, north-west of the Acropolis, the reader is transported to the fountain of Enneacrunus and to some buildings in its neighbourhood, and is suddenly brought back to the market-place. It has been naturally assumed that the Enneacrunus can only be the fountain of that name in the bed of the Ilissus. If so, the description of the fountain is out of place, and its insertion at this point has been ascribed either to some confusion in the author’s notes or to a dislocation in the text. On the other hand, it has been suggested that the description may really refer to some other fountain near the market-place, which was shown to Pausanias as the Enneacrunus. Thus it has been held by Dr Dörpfeld that the name Enneacrunus was originally applied to a spring west of the Acropolis, that the old name of this spring, Callirrhoe, had been abandoned from the time when Pelisistratus converted it into a “fountain with nine jets,” and that the names Callirrhoe and Enneacrunus were afterwards transferred to another fountain in the bed of the Ilissus. This would be in accordance with the general practice of the inhabitants of Athens near the eastern foot of the hill of the Pnyx, and to identify certain adjacent remains with the buildings mentioned by Pausanias. If this opinion is correct, the account of the Enneacrunus is an excursus and not part of the narrative proper; in order to avoid confusion it would be best to be an “episode,” and falls into the natural sequence of the narrative. The “episode” has been fully discussed by the expounders and translators of Pausanias, and by the writers on the topography of Athens. Dr Dörpfeld’s views are clearly set forth in Miss J. E. Harrison’s Primitive Athens (1906). A. Malinik’s paper (Vienna,
PAUSIAS—PAVEN

969

(1906), which assumes a dislocation of the text, has been answered by Dürpfeld (Wachschrift für k. Philologie (1907), p. 940 seq.).

The account of the law courts of Athens and of the altars at Olympia may have been derived from monographs on those subjects. In both cases the author departs from his usual method of following the order of place, and deals with a group of monuments belonging to the same class. But in the extant literature of antiquity (as J. G. Frazer has shown) no passage has been found agreeing in form or substance so closely with the description in Pausanias as to make it probable that he copied it. The theory that Pausanias borrowed largely from Polemon of Illium, who flourished about 200-177 B.C., and wrote on the Acropolis and the eponymous heroes of Athens, on the treasures of Delphi, and on other antiquarian topics, was incidentally suggested by Pfeiffer in his edition of the fragments (1838), and was gravely treated from Wreden and Schubart (1787-1788). It was subsequently maintained by Kalkmann (1860) that Pausanias slavishly copied from Polemon the best part of his descriptions of Athens, Delphi and Olympia, and described those places, not as they were in his own age, but as they had been in that of Polemon, some 300 years before. It is alleged that, in the notices of the monuments on the Acropolis of Athens, and of the sculptors and the athlete-statues of Olympia, the lower limit of Pausanias is practically 150 B.C.; it is inferred that the authority followed by him ended with this date, and it is more than suggested that his sole authority was Polemon. It is not improbable that many works later than 150 B.C. might also be explained by the fact that the independence of Greece came to an end in 146. And, further, it is supposed that Pausanias refers to very few sculptors for the 140 years (266-156 B.C.) before the age of his supposed authority, while some of the sculptors represented at Olympia have since been placed after that date, and not a few of the Athenian monuments described by Pausanias belong to the period between that date and the accession of Hadrian, or, approximately, the period between about 166 B.C. and A.D. 171 (Gurlitt, Über Pausanias, pp. 117 seq., 194 seq., 257-267). More than one hundred extracts from, or reference to, the works of Polemon have come down to us, and it has been shown by Mr Frazer that "the existing fragments hardly justify us in supposing that Pausanias was acquainted with the writings of his learned predecessor; certainly they lend no countenance to the view that he borrowed descriptions of places and monuments from them." Again, it has been urged that his brief description of the Peiraenae is not true of his own time, as it had been burnt by Sulla (86 B.C.), and was still lying desolate in the age of Augustus, but his account of the buildings and monuments has been confirmed by an inscription conjunctively ascribed to the time of Pausanias (Frazer ii. 14 seq.). It has also been stated that the description of Arcadia must have been borrowed from far earlier writers, because Strabo (p. 385) says that most of the famous cities of that land had either ceased to exist or had left hardly a trace behind them; but the evidence of coins has proved that at least seven of the eleven cities described by Pausanias were still in existence long after the death of Strabo. It has further been assumed that his account of the temple of Apollo at Delphi is "irreconcilable with the remains of the building," and with the inscriptions recently discovered by the French archaeologists. We are told that Pausanias describes the temple of the 6th century B.C. as if it still existed in his own time. On the contrary, he states that the first sculptures for the gables were executed by a pupil of Calamis, the pupil of a sculptor still at work in 427 B.C., and the shields that he saw suspended on the architrave were captured from the Gauls in 279. Again, his description of New Corinth, built in 44 B.C., more than a century after the time of Polemon, is most minute and systematic, and it is confirmed by coins of the imperial age. In at least one important point Pausanias compares favourably with Strabo. While Strabo erroneously declares that not a vestige of Mycenae remains, Pausanias gives a brief but accurate description of the Lion-gate and the existing circuit-wall of the Acropolis, with a notice of the tombs "within the wall" (ii. 16, 5-7), a notice which led to their discovery by Schlemm. In all parts of Greece the accuracy of his descriptions has been proved by the remains of the buildings which he describes; and a few unimportant mistakes (in v. 16, 6 and 9; viii. 37, 3, and 45, 5), and some slight carelessness in copying inscriptions, do not lend any colour to an imputation of bad faith. It has been urged by justice for Frazer (p. xcv. seq.) that "without him the ruins of Greece would for the most part be a labyrinth without a clue, a riddle without an answer." "His book furnishes the clue to the labyrinth, the answer to the many riddles. It will be studied so long as ancient Greece shall continue to engage the attention and awaken the interest of mankind." EDITIONS.—Siebold (Leipzig, 1822); Schubart and Walz (1838); Translation of Gurlitt, Schubart, and Schubart; Hitzig and Blümmer, books i-xix., already published in five parts (Leipzig, 1856-1897). Special edition of Pausanias' Descriptions, edited by R. Haran, 3rd ed. (1893), with maps and plans, &c., A. Michaelis (1901). F. Imhoof-Blum and Percy Gardner, "Numismatic Commentary on Pausanias," first published in Journal of Hellenic Studies, vii.-xiii. (1885-1887); J. G. Frazer, Pausanias' Description of Greece, in six vols., introduction and translation (vol. i.), commentary (vols. ii.-v.), maps and index (vol. vi.) (Macmillan, London, 1898); introduction reprinted in Frazer's Pausanias' Description of Greece (1900). SPECIAL LITERATURE.—Wernicke, De Pausanias studii herodoteis (Berlin, 1884); Wilmotwitz, "Thukydideslegende," in Hermes (1857), xiii. 346; F. Hirt, De fimbios Pausanias in Elidico tempore (1858); A. Bremmer's Denkmaler, ii. "Olympia," pp. 90 (1857); A. Kalkmann, Pausanias' Leben (Berlin, 1886), and in Archäologischer Anzeiger (1895), p. 12; opposed by W. Gurlitt, Uber Pausanias (Graz, 1890), 494 pp.; Benoer, Frazer's Pausanias and the Greek Sketchers (1890).—PAUSANIAIS, a Greek painter of the 4th century, of the school of Sicyon. He introduced the custom of painting ceilings of houses. His great merit appears to have lain in the better rendering of foreshortening. The words in which the name is written (XX. 83, 127) describes a bull painted by him should be quoted: "Wishing to display the length of the bull's body, he painted it from the front, not in profile, and yet fully indicated its measure. Again, while others fill in with white the high lights, and paint in black what is less salient, he painted the whole bull of dark colour, and gave substance to the shadow out of the shadow itself, with great skill making his figures stand out from a flat background, and indicating their shape when foreshortened." This passage well marks the state of painting at the time.

PAVANE, PAVAN or PAVIN, the name of a slow stately dance of the 16th and 17th centuries. The word has been variously ascribed to Pavone, a Frenchman from Provence (1590), and to Pavone of Padua, Italy; the dance, however, is usually taken to have come from Spain. As an instrumental composition, common in the 16th and 17th centuries, the "pavane" was usually followed by the quick and lively "galliard," as the "gigue" followed the "saraband" in the later suite (see DANCE).

PAVEMENT (Lat. pavimentum, a floor beaten or rammed hard, from pavere, to beat), a term originally applied to the covering of a road or pathway with some durable material, and so used of the paved footway at the side of a street—the "sidewalk" as opposed to the roadway proper. The term is also extended to the interior floor of churches and public buildings. It is probable that the earliest pavements consisted only of rammed clay, as in the "beehive" tombs of Mycenae, or of cement or stucco decorated with lines in coloured marbles, such as those mentioned in the Book of Esther (vi. 1) in the palace at Susa. W. M. Flinders Petrie discovered at Tell el Amarna in the palace of Akhenaton the remains of a stucco pavement, decorated with foliage, flowers, birds, &c., and a complete naturalistic treatment. The threshold of the doors of the Assyrian palaces were of stone carved with patterns in imitation of those in a
The pavements of Greek temples were either in stone or marble, and at Olympia the *pronaos* of the temple of Zeus was laid in mosaic representing tritons, and the floor of the *naos* was in coloured marbles. The Roman pavements were invariably in mosaic, sometimes of a very elaborate nature, as in the House of the Faun at Pompeii, where the mosaic represented the battle between Alexander the Great and Darius III., a reproduction probably of some Greek painting of the period. In Rome the palaces on the Palatine Hill and the thermae were all paved with mosaic, and numerous pavements have been found in Carthage, many of which are in the British Museum, as are also examples from the Roman villas in England. Perhaps the richest Roman pavements outside Italy are those at Trieres in Germany. The Roman tradition was continued by the Byzantine architects, who, throughout the East, paved their churches with mosaics, frequently of the same designs and materials as those of the Romans, but with Christian symbols. The churches of the Romanesque, Gothic and Renaissance periods were all paved in marble, but of a different character from those of the earlier period (see MOSAIC).

**PAVIA** (anc. *Ticinum*, q.v.), a town of Lombardy, Italy, capital of the province of Pavia, situated on the Ticino about 2 m. above its junction with the Po, 225 m. S. of Milan by rail, 253 ft. above sea-level. Pop. (1906), 28,706 (town), 36,424 (commune). On the right bank of the river lies the small suburb of Borgo Ticino, connected with the town by a remarkable arched bridge dating from 1351-1354. In 1572 the city ceased to be a fortress, and the bastions have been transformed into boulevards and public gardens. The church of San Michele Maggiore is one of the finest specimens of the Lombard style in existence, and as it was within its walls that the crown was placed on the head of those "kings of Italy" from whom the house of Savoy claims descent it was by royal decree of 1803 given the title of Basilica Reale. S. Michele (for plan see ARCHITECTURE: § Romanesque and Gothic in Italy) was originally constructed under the Lombard kings, but was burnt in 1094, and the present building dates from the latter part of the 12th century, and especially from the first half of the 12th centuries (façade and nave with two aisles), and was completed in 1155. The lower part of the façade is adorned with three fine portals and with reliefs of a fantastic kind in sandstone, arranged in horizontal bands, and has arcading under the gable. The dome is octagonal. The interior is vaulted and has eight pillars, supporting double round arches. The interior has a mosaic pavement of the 10th-11th centuries. The cathedral church of San Martino is a Renaissance building begun in 1488 by Cristoforo Rocchi; it is a vast "central" structure, finely designed, with four arms, which remained for centuries unfinished until 1852, when it was completed by Filippo Juvarra (architect of the cathedral at Florence) and façade were completed in 1808 according to Rocchi's still extant model; adjoining the church is the massive Torre Maggiore, 258 ft. high, which is mentioned as early as 1330. The upper part is due to Pellegrino Tibaldi (1583). The cathedral contains the tomb of S. Syrus, first bishop of Pavia (2nd century); an altar-piece (1521), the best work of Giampietino (Rizzal), a pupil of Leonardo da Vinci; and another, the masterpiece of Bernardino Gatti of Parma (1531). The church of S. Pietro in Ciel d'Oro, the origin of which dates from the beginning of the 6th (7th) century, but which as it stands was consecrated in 1132, is very similar to S. Michele in respect of its façade (though it has not the elaborate sculptures), dome and mosaic pavements. The use of disks of majolica may be noted in the decoration of the exterior. It has been carefully restored. It served as the burial place of the Lombard king Liutprand (711-744), whose bones were found there in 1896 (R. Majocchi in Nuovo bulletin d'archeologia cristiana, 1896, p. 139). The Areca di S. Agostino (after 1362) is a sumptuous tomb containing the relics of S. Augustine of Hippo brought hither by Liutprand from Sardinia. It was only restored to this, its original position, from the cathedral when the church itself was restored.

The church of S. Maria del Carmine is externally one of the most beautiful of the brick Gothic churches in northern Italy and dates from 1273 (or 1325). S. Francesco has also a good façade after that of Chiavarelli near Milan. The church of S. Maria di Canepanova with its small dome was designed by Bramante. Neir these three follow the brick domes of the Gothic period. S. Teodoro with a 12th century exterior has frescoes by For-Tolamo di Suardi (Bramantino) after 1507. Outside the town on the west lie the churches of S. Salvatore (founded in the 7th century but rebuilt in the 15th and 16th), and of S. Lanfranc (or the Holy Sepulchre, 12th century) with the fine tomb of Bishop Lanfranco Becardi (d. 1189) by Giovanni Antonio Amedeo (1498), one of the best Lombard sculptors and architects of this period (1447-1522) and a native of Pavia, which has a few other works by him. He was for eighteen years in charge of the work at the Certosa. Interesting medieval views of Pavia are to be found in the church of the former dating from 1522 has been published by P. Moiraghi in Bulletin storico passe (1893), i. 41 sqq. (See Magenap, I Visconti e gli Sforza nel castello di Pavia (Milan, 1884), for other medieval plans.)

Of the secular buildings the most noteworthy is the university founded by Galeazzo II. in 1361 on the site of a law school probably founded by Lanfranc (d. 1050), though we find Pavia a centre of study as early as a.d. 825. The present imposing building was begun by Lodovico il Moro in 1490; in the library are preserved some of the ashes of Columbus, who was a student here. Volta made here his first electrical experiments. For the maintenance of a number of poor students there are two subsidiary colleges, the Borromeo and the Ghisleri founded by S. Carlo Borromeo (1563) and Pope Pius V. (1569); of the latter a colossal bronze statue has been erected in the piazza before his college. The university of Pavia has long been famous as a medical school, and has the oldest anatomical cabinet in Italy; in addition it has a natural history museum founded under Spallanzini in 1772, a botanical garden, begun in 1774, and excellent geological, palaeontological and mineralogical collections. The old castle of the Visconti built in 1366 for Galeazzo II. is used as barracks. The Museo Civico is housed in the Palazzo Malaspina and contains many interesting national relics and a small picture gallery, with a large collection of offprints on paper from niello plates, including a very fine "Fountain of Love" by Antonio Pollainolo; another fine old palace, the Palazzo Mezzabarba, is now used as the Municipio.

Pavia has a number of iron-foundries, military engineering and electrical production works, and other factories, as well as a large covered market, built in 1882. Pavia lies on the main line from Milan to Genoa (which crosses the Ticino by a bridge half a mile long, and shortly afterwards the Po), which branch lines from the Po can pass down the Po to the Adriatic or to Milan by canal. Five miles north of Pavia is the Carthusian monastery of Certosa di Pavia, one of the most magnificent in the world. Its founder Gian Galeazzo Visconti (also the founder of Milan Cathedral) laid the first stone in August 1306, and the nave was then begun in the Gothic style, but was not completed until 1465. However the influence of the Early Renaissance had meanwhile become supreme throughout Italy, and the rest of the church with its external arcaded galleries and lofty pinnacles (including the finest steeple) and the cloisters were executed in the new style under Guiniforte Solari (1455-1481) with details in terra-cotta of great beauty and richness. Giovanni Antonio Amedeo was chief architect in 1481-1490, and the lower part of the façade was finished in 1507. It is perhaps the finest piece of elaborate and richly adorned Renaissance architecture in existence, and is the work of a number of different artists. In the south transept of the church is the tomb of the founder; the figure of Galeazzo guarded by angels lies under a marble canopy, with the Madonna in a niche above. It was begun in 1493-1497 by Giovanni Cristoforo Romano and Benedetto Brissio, but was not finished until 1551. In the north transept is the tomb of Lodovico Sforza, il Moro, and his wife, the figures on which were brought from S. Maria della Grazie in 1564 when the monument of the prince in
that church was broken up and sold; these statues are considered to be one of the chief works of Cristoforo Solari. The church contains numerous other works of art. An elegant portal leads from the church into the small cloister, which has a pretty garden in the centre; the terra-cotta ornaments surmounting the slender marble pillars are the work of Rinaldo de Stauros (1463-1478), who executed similar decorations in the great cloister. This cloister is 142 ft. long by 334 ft. wide and contains 24 cells of the monks, pleasant little three-roomed houses each with its own garden. Within the confines of the monastery is the Palazzo Ducale which since 1901 has been occupied by the Certosa museum. The Carthusian monks, to whom the monastery was entrusted by the founder, were bound to employ a certain proportion of their annual revenue in prosecuting the scheme of its completion. After 1542 the monks continued voluntarily to expend large sums on further decoration. The Certosa di Pavia is thus a practical textbook of Italian art for wellnigh three centuries. The Carthusians were expelled in 1782 by the emperor Joseph II., and after being held by the Cistercians in 1784 and the Carmelites in 1789 the monastery was closed in 1810. In 1843 the Certosa was restored to the Carthusians and was exempted from confiscation in 1866, but it has since been declared a national monument.

**History.**—For earlier period see**Ticinum**. Under the name Pavia (Pavia) the city became a capital of the Lombard kingdom, one of the leading cities of Italy. By the conquest of Pavia and the capture of Desiderius in 774, Charlemagne completely destroyed the Lombard supremacy; but the city continued to be the centre of the Carolingian power in Italy, and a royal residence was built in the neighbourhood (Cor-tolona on the Olona). It was in San Michele Maggiore in Pavia that Berengar of Friuli, and his quasi-regal successors down to Berengar II. and Adalbert II., were crowned "kings of Italy." Under the reign of the first the city was sacked and burned by the Hungarians, and the bishop was among those who perished. At Pavia was celebrated in 951 the marriage of Otto I. (king of Germany) to Judith, a niece of the late ruler, which was a great influence on the relations of the empire and Italy; but, when the succession to the crown of Italy came to be disputed between the emperor Henry II. and Arduin of Ivrea, the city sided strongly with the latter. Laid in ruins by Henry, who was attacked by the citizens on the night after his coronation in 1004, it was none the less ready to close its gates on Conrad the Salad in 1026. In the 11th and 12th centuries we find Pavia called the "Second Rome." The jealousy between Pavia and Milan having in 1056 broken out into open war, Pavia had recourse to the hated emperors, though she seems to have taken no part in the battle of Legnano; and for the most part she remained attached to the Ghibelline party till the latter part of the 13th century. From 1360, when Galeazzo was appointed imperial vicar by Charles IV., Pavia became practically a possession of the Visconti family and in due course formed part of the duchy of Milan. For its insurrection against the French garrison in 1490 it paid a terrible penalty in 1590, and in 1512, after the victory of Ravenna, Pavia presented to Louis XII., as a sign of idleness, a magnificent standard: this however fell into the hands of Swiss mercenaries and was sent to Fribourg as a trophy of war (it no longer exists). Having been strongly fortified by Charles V., the city was in 1555 able to bid defiance to Francis I., who was so disastrously beaten in the vicinity, but two years later the French under Lautrec subjected it to a sack of seven days. In 1625 Prince Thomas of Savoy invested Pavia with an army of 20,000 Frenchmen, but had to withdraw after 52 days' siege. The Austrians under Prince Eugène occupied it in 1706, the French in 1733 and the French and Spaniards in 1743; and the Austrians were again in possession from 1746 till 1796. In May of that year it was seized by Napoleon, who, to punish it for an insurrection, condemned it to three days' pillage. In 1814 it became Austrian once more. The revolutionary movement of February 1848 was crushed by the Austrians and the university was closed; and though the Sardinian forces obtained possession in May, the Austrians soon recovered

their ground. It was not till 1839 that Pavia passed with the rest of Lombardy to the Sardinian crown.

A short while after the Cistercian monastery was converted into a centre of great intellectual activity. It was according to tradition in a tower which, previous to 1534, stood near the church of the Annunziata that Boethius wrote his De consolatione philosophiae; the legal school of Pavia was rendered celebrated in the 11th century by Lanfranc (afterwards archbishop of Canterbury); Petrarach was frequently here as the guest of Galeazzo II., and his grandson died and was buried here. Columbus studied at the university about 1447; and printing was introduced in 1471. Two of the bishops of Pavia were raised to the papal throne as John XIV. and Julius III. Lanfranc, Pope John XIV., Porta the anatomist and mathematician was born in the city.

Pavia was the capital of the ancient province of Po or Pavia, now called Lombardy, which was a province of the Roman Empire.

**PAVIA Y ALBUQUERQUE, MANUEL (1828-1853), Spanish general, was born at Cadiz on the 2nd of August 1828. He was the son of Admiral Pavia, a naval officer of some note in the early part of the 19th century. He entered the Royal Artillery College at Segovia in 1841; became a lieutenant in 1846, a captain in 1855 and major in 1862. Three years later he joined the staff of Marshal Prim, and took part in the two unsuccessful revolutionary movements concerted by Prim in 1866, and, after two years of exile, in the successful revolution of 1868. Pavia showed much vigour against the republican risings in the southern provinces; the governments of King Amadeus of Savoy, from 1871 to 1873, also showed him much favour. After the abdication of that prince, General Pavia put down the Carlists and the cantonal insurrections of the chief towns of the south. On three occasions during the eventful year 1873, as captain-general of Madrid, he offered his services to put an end to the anarchy that was raging in the provinces and to the disorganization prevalent in the Cortes. To all he used the same arguments, namely, that they had to choose between a republic or a monarchy, and, if a republic, between a central or provincial type of constitution. He hoped to reconcile Castelar, but the plan was interrupted by the military pronunciamiento for the purpose of dissolving the Cortes of 1873. As soon as the federal Cortes had defeated Castelar, Pavia made his coup d'état of the 3rd of January 1874, and after the pronunciamiento was absolute master of the situation, but having no personal ambition, he sent for Marshal Serrano to form a government with Sagasta, Martos, Uloa and other Conservatives and Radicals of the revolution. Pavia sat in the Cortes of the Restoration several times, and once defended himself skilfully against Emilio Castelar, who upbraided him for the part he had played on the 3rd of January 1874. He died suddenly on the 4th of January 1893.

**PAVILION,** properly a tent, a late use of Lat. *papilio,* butterfly, from which the word is derived through the French. The term is chiefly used of a tent with a high pitched roof, a small detached building used as a summer-house, &c., and particularly for a building attached to a recreation ground for the use of players and members. In architecture the term pavilion is specifically applied to a portion of a building which projects from the side or central part. It is a characteristic of French renaissance architecture. Where the buildings of a large institution are broken up into detached portions, as in St. Thomas's Hospital, London, the term is generally applied to such detached buildings. London, the term is generally applied to such detached buildings. For the musical instrument known as the Chinese pavilion or Jingling Johnny, see **Chinese Pavillon**.

**PAVIS,** or **Pavese,** a large convex shield, some 4 to 5 ft. high and sufficiently broad to cover the entire body, used in medieval warfare, as a protection against arrows and other missiles. The word appears in innumerable forms in Old French, Italian and Medieval Latin, and is probably to be referred to Pavia, in Italy, where such shields were manufactured. The term "pavise" or "paviseade" was used of a portable screen of...
hurdles behind which archers might find protection, or of a similar defensive screen formed by linking together "pavises," especially on board a ship of war extending along the bulwarks, and hence in later times of a canvas screen similarly placed to conceal the rowers in a galley or the sailors on other types of ships.

Pavo, a town of Russia, in the government of Nizhniy-Novgorod, 42 m. S.W. of the town of Nizhniy-Novgorod, on the Oka river. Pop. (1887), 12,200. It is the centre of a considerable cutlery, hardware and locksmith trade, which, carried on since the 17th century in cottages and small workshops, engages, besides Pavlovo itself, no less than 120 villages. There are also steel works and cotton, silk, soap and match factories.

PAVLOVO POSAD, or Vozhina, a town of Russia, in the government of Moscow, 41 m. by rail E. of the city of Moscow, on the Klyazma river. Pop. (1897), 10,020. It is the centre of a manufacturing district, with silk, cotton and woollen mills, and dyeing and printing works.

PAVLOVSK, a town of Russia, in the government of St Petersburg 17 m. by rail S. of the city of St. Petersburg. Pop. (1887), 4940. It has an imperial castle (1728-1805) standing in a beautiful park and containing a small fine art museum and gallery. In the vicinity are smaller imperial palaces and summer residences of St Petersburg families.

PAWN. (1) A pledge, an object left in the charge of another as security for the repayment of money lent, for a debt or for the performance of some obligation (see PAWNBROKING). The word is an adaptation of O. Fr. pawn, pledge, plunder, spoil. This has usually been identified with pan, from Lat. panus, piece of cloth. The Teutonic words for pledge—such as Du. pand, Ger. Pfand have been also traced to the same source; on the other hand these Teutonic forms have been connected with the word which appears in O. Eng. as pendant, a penny, Ger. Pfennig, but this too has been referred to panus. (2) The word pawnbroking is from the Latin panntis. In its early form, poun, poun, &c., is taken from Fr. poun or poun, variants of poun, Med. Lat. pedo, pedonis, a foot soldier, from pes, foot.

PAWNBROKING (O. Fr. pan, pledge, piece, from Lat. panus; for "broking" see BROKER), the business of lending money on the security of goods taken in pledge. If we desire to trace with minuteness the history of pawnbroking, we must go back to the earliest ages of the world, since the business of lending money on portable security (see MONEY-LENDING, and USURY) is one of the most ancient of human occupations. The Mosaic Law struck at the root of pawnbroking as a profitable business, since it forbade the taking of interest from a poor borrower, while no Jew was to pay another for timely accommodation. And it is curious to reflect that, although the Jew was the almost universal usurer and money-lender upon security of the middle ages, it is now very rare in Great Britain to find a Hebrew pawnbroker.

In China the pawnshop was probably as familiar two or three thousand years ago as it is to-day, and its conduct is still regulated quite as strictly as in England. The Chinese conditions, too, are decidedly favourable to the borrower. He may, as a rule, take three years to redeem his property, and he cannot be charged a higher rate than 3% per cent, per annum. The regulation which would close every pawnshop in England in a month. Both Rome and Greece were as familiar with the operation of pawning as the modern poor all the world over; indeed, from the Roman jurisprudence most of the contemporary law on the subject is derived. The chief difference between Roman and English law is that under the former certain things, such as wearing apparel, furniture, and instruments of tillage, could not be pledged, whereas there is no such restriction in English legislation. The emperor Augustus converted the surplus arising to the state from the confiscated property of criminals into a fund from which sums of money were lent with interest, to those who could pledge valuables equal to double the amount borrowed. It was, indeed, in Italy, and in more modern times, that the pledge system which is now almost universal on the continent of Europe arose. In its origin that system was purely benevolent, the early mons de piété established by the authority of the papacy lending money to the poor only, without interest, on the sole condition of the advances being covered by the value of the pledges. This was virtually the Augustan system, but it is obvious that an institution which costs money to manage and derives no income from its operations must either limit its usefulness to the extent of the voluntary support it can command, or must come to a speedy end. Thus as early as 1108 something of the kind was started at Freising in Bavaria; while in 1330 a similar endeavour was made at Salins in Franche Comté, where interest at the rate of 3½% was charged. Nor was England backward; for in 1350 Michael Nevell, or de Nivelbourn, bishop of London, bequeathed 1000 silver marks for the establishment of a free pawnshop. These primitive efforts, like the later Italian ones, all failed. The Vatican was therefore constrained to allow the Sacri monti di piété—no satisfactory derivation of the phrase has yet been suggested—to charge sufficient interest to their customers to enable them to defray expenses. Thereupon a learned and tedious controversy arose upon the lawfulness of charging interest, which was only finally set at rest by Pope Leo X., who, in the tenth sitting of the Council of Trent, declared that the free pawnshop was a work of piety, a charitable institution, and threatened with excommunication those who should presume to express doubts upon the subject. The Council of Trent infirmly confirmed this decision, and at a somewhat later date we find St Charles Borromeo counselling the establishment of state or municipal pawnshops.

Long before this, however, mons di piéét charged interest for their loans had become common in Italy. The date of their establishment was not later than 1464, when the earliest of which there appears to be any record in that country—it was at Orvieto—was confirmed by Pius II. Three years later another was opened at Perugia by the efforts of two Franciscans, Barnabas Interamnensis and Fortunatus de Copolis. They collected the necessary capital by preaching, and the Perugian pawnshop was opened with such success that there was a substantial balance of profit at the end of the first year. The Dominicans endeavoured to preach down the "lending-house," but without avail. Viterbo obtained one of 1469, and Sixtus IV. confirmed another to his native town in Savona in 1470. After the death of Brother Barnabas in 1474, a strong impulse was given to the creation of these establishments by the preaching of another Franciscan, Father Bernardinio di Peltre, who was in due course canonized. By his efforts mons di piétét were opened at Assisi, Mantua, Parma, Lucca, Piacenza, Padua, Vicenza, Pavia and a number of places of less importance. At Florence the veiled opposition of the municipality and the open hostility of the Jews prevailed against him, and it was reserved to Savonarola, who was a Dominican, to create the first Florentine pawnshop, after the local theologians had declared that there was "no sin, even venial," in charging interest. The readiness of the popes to give permission for pawnshops all over Italy, makes it the more remarkable that the papal capital possessed nothing of the kind until 1539, and 1559, and 1628 at Rome. From Italy the pawnshop spread gradually all over Europe. Augsburg adopted the system in 1501, Nuremberg copied the Augsburg regulations in 1618, and by 1622 it was established at Amsterdam, Brussels, Antwerp and Ghent. Madrid followed suit in 1705, when a priest opened a charitable pawnshop with a capital of fivepenes taken from an alms-box.

The institution was, however, very slow in obtaining a footing in France. It was adopted at Avignon in 1577, and at Arras in 1624. The doctors of the once powerful Sorbonne could not reconcile themselves to the lawfulness of interest, and when a pawnshop was opened in Paris in 1626, it had to be closed within a year. Then it was that Jean Boucher published his Défense des mons de piété. Marseilles obtained one in 1655; but it was not until 1777 that the first mons de piéét was founded in Paris by
PAWNBROKING

royal patent. The statistics which have been preserved relative to the business done in the first few years of its existence show that in the twelve years between 1777 and the Revolution, the average value of the pledges was 42 francs 50 centimes, which is double the present average. The interest charged was 10% per annum, and large profits were made upon the sixteen million livres that were lent every year. The National Assembly, in an evil moment, destroyed the monopoly of the mont de piété, but it struggled on until 1795, when the competition of the money-lenders compelled it to close its doors. So great, however, were the extortions of the usurers that the people began to clamour for its reopening, and in July 1797 it recommenced business with a fund of £30,000 found by five private capitalists. At first it charged interest at the rate of 36% per annum, which was gradually reduced, the gradations being 30, 24, 18, 15, and finally 12% in 1804. In 1806 it fell to 6%, and in 1817 to 7%. In 1820, Napoleon III., as prince-president, regulated it by new laws that are still in force. In Paris the pledge-shop is, in effect, a department of the administration; in the French provinces it is a municipal monopoly; and this remark holds good, with modifications, for most parts of the continent of Europe.

In England the pawnbroker, like so many other distinguished personages, "came in with the Conqueror." From that time, indeed, to the famous legislation of Edward I., the Jew money-lender was the only pawnbroker. Yet, despite the valuable services which the class rendered, not infrequently to the Crown itself, the usurer was treated with studied cruelty—Sir Walter Scott's Isaac of York was no mere creation of fiction. These barbarities, by diminishing the number of Jews in the country, had, long before Edward's decree of banishment, begun to make it worth the while of the Lombard merchants to settle in England. It is now as well established as anything of the kind can be that the three golden balls, which have for so long been the trade sign of the pawnbroker, were the symbol which these Lombard merchants hung up in front of their houses, and not, as has often been suggested, the arms of the Medici family. It has, indeed, been conjectured that the golden balls were originally three flat yellow effigies of byzants, or gold coins, laid heraldically upon a sable field, but that they were presently converted into balls the better to attract attention. In 1338 Edward III. pawned his jewels to the Lombards to raise money for his war with France. An equally great king—Henry V.—did much the same in 1415.

The Lombards were not a popular class, and Henry VII. harried them a good deal. In the very first year of James I. "An Act against Brokers" was passed and remained on the statute-book until Queen Victoria had been thirty-five years on the throne. It was aimed at "counsellor-brokers," of whom there were then many in London. This type of broker was evidently regarded as a mere receiver of stolen goods, for the act provided that "no sale or pawn of any stolen jewels, plate or other goods to any pawnbroker in London, Westminster or Southwark shall alter the property therein," and that "pawnbrokers refusing to produce goods to their owner from whom stolen shall forfeit double the value."

In the time of Charles I. there was another act which made it quite clear that the pawnbroker was not deemed to be a very respectable or trustworthy person. Nevertheless a plan was mooted for setting that king up in a pawnshop. The stock was appraised and supplies were even needed, when a too ingenious Royalist proposed the establishment of a state "pawnhouse." The preamble of the scheme recited how "the intolerable injuries done to the poor subjects by brokers and usurers that take 30, 40, 50, 60, and more in the hundredth, may be remedied and redressed, the poor thereby greatly relieved and eased, and His Majesty much benefited." That the king would have been "much benefited" is obvious, since he was to enjoy two-thirds of the profits, while the working capital of £100,000 was to be found by the city of London. The reform of what Shakespeare calls "breaking pawn" was in the air at that time, although nothing ever came of it, and in the early days of the commonwealth it was proposed to establish a kind of mont de piété. The idea was emphasized in a pamphlet of 1651 entitled Observations manifesting the Convenience and Commodity of Mount Pinneys, or Public Banks for Relief of Poor or Others in Distress upon Pawnes. No doubt many a ruined cavalier would have been glad enough of some such means of raising money, but this radical change in the principles of English pawnbroking was never brought about. It is said that the Bank of England, under its charter, has power to establish pawnshops; and we learn from A Short History of the Bank of England, published in its very early days, that it was the intention of the directors, "for the ease of the poor," to institute a "Lombard" "for small pawns at a penny a pound interest per month."

Throughout both the 17th and 18th centuries the general suspicion of the pawnbroker appears to have been on well founded. It would appear from the references Fielding makes to the subject in Amelia, which was written when George II. was on the throne, that, taken in the mass, he was not a very scrupulous tradesman. Down to about that time it had been customary for publicans to lend money on pledges that their customers might have the means of drinking, but the practice was at last stopped by act of parliament. Nor was respect for the honesty of the business increased by the attempt of "The Charitable Corporation" to conduct pawnbroking on a large scale. Established by charter in 1707, "this nefarious corporation," as Smollett called it, was to have plied wildly with the shareholders' money, and in the end the common council of the city of London petitioned parliament for the dissolution of this dishonest concern, on the ground that "the corporation, by affording an easy method of raising money upon valuables, furnishes the thief and pickpocket with a better opportunity of selling their stolen goods, and enables an intending bankrupt to dispose of the goods he buys on credit for ready money, to the defrauding of his creditors." When the concern collapsed in 1733 its cashier was Mr George Robinson, M.P. for Marlborough. In company with another principal official he disappeared, less than £50,000 being left of a capital which had once been twenty times as much.

The pawnbroker's licence dates from 1785, the duty being fixed at £10 in London and £5 in the country; and at the same time the interest chargeable was settled at 2½% per month, the duration of loans being confined to one year. Five years later the interest on advances was raised over £2 and under £10 was raised to 15%. The modern history of legislation affecting pawnbroking begins, however, in 1800, when the act of 39 & 40 Geo. III. c. 90 (1800) was passed, in great measure by the influence of Lord Eldon, who took the directors gambled an act that, when he was a young barrister without briefs, he had often been indebted to the timely aid of the pawnshop. The pawnbrokers were grateful, and for many years after Lord Eldon's death they continued to drink his health at their trade dinners. The measure increased the rate of interest to a halfpenny per half-crown per month, or fourpence in the pound per person—that is to say, 20% per annum. Loans were to be granted for a year, although pledges might be redeemed up to fifteen months, and the first week of the second month was not to count for interest. The act worked well, on the whole, for three-quarters of a century, but it was thrice found necessary to amend it. Thus in 1815 the licence duties were raised to £15 and £7, 10s. for London and the country respectively; another act of 1840 aboliished the reward to the "common informer" for reporting illegal rates of interest; while in 1860 the pawnbroker was empowered to charge a halfpenny for the pawn-ticket when the loan was under five shillings. As time went on, however, the main provisions of the act of 1800 were found to be very irksome, and the Pawnbrokers' National Association and the Pawnbrokers' Defence Association worked hard to obtain a liberal revision of the law. It was argued that the usurious laws had been abolished for the whole of the community with the
single exception of the pawnbroker who advanced less than £10. The limitations of the act of 1800 interfered so considerably with the pawnbrokers' profits that, as was argued, they could not afford to lend money on bulky articles requiring extensive storage room. In 1870 the House of Commons appointed a Select Committee on Pawnbrokers, and it was stated in evidence before that body that in the previous year 205,780,000 pledges were lodged, of which between thirty and forty millions were lodged in London. The average value of pledges appeared to be about 4s., and the proportion of articles pawned dishonestly was found to be only 1 in 14,000. Later official statistics show that of the forfeited pledges sold in London less than 20 per million are claimed by the police.

The result of the Select Committee was thePawnbrokers Act of 1872, which repealed, altered and consolidated all previous legislation on the subject, and is still the measure which regulates the relations between the public and the "brokers of pawn." Based mainly upon the Irish law passed by the Union Parliament it put an end to the old irritating restrictions, and reduced the annual tax in London from £15 to the £7, 10s. paid in the provinces. By the provisions of the act (which does not affect loans above £10), a pledge is redeemable within one year, and seven days of grace added to the year. Pledges pawned for 10s. or under and not redeemed in time become the property of the pawnbroker, but pledges above 10s. are redeemable until sale, which must be by public auction. In addition to one halfpenny for the pawn-ticket—which is sometimes not charged for very small pawns—the pawnbroker is entitled to charge as interest one halfpenny per month on every 2s. or part of 2s. lent where the loan is under 40s., and on every 2s. 6d. where the loan is above 40s. "Special contracts" may be made where the loan is above 40s. at a rate of interest agreed upon between lender and borrower. Unlawful pawning of goods not the property of the pawnner, and taking in pawn any article from a person under the age of twelve, or intoxicated, or any linen, or apparel or unfinished goods or materials entrusted to wash, make up, &c., are, inter alia, made offences punishable by summary conviction. A new pawnbroker must produce a magistrate's certificate before he can receive a licence; but the permit cannot be refused if the applicant gives sufficient evidence that he is a person of good character. The word "pawnbroker" must always be inscribed in large letters over the door of the shop. Elaborate provisions are made to safeguard the interests of borrowers whose unredeemed pledges are sold under the act. Thus the sales by auction may take place only on the first Monday of January, April, July and October, and on the following days should one not be sufficient. This legislation was, no doubt, favourable to the pawnbroker rather than to the borrower. The annual interest on loans of 2s. had been increased by successive acts of parliament from the 6% at which it stood in 1784 to 2 1/2% in 1800, and to 2 1/2% in 1860—a rate which was continued by the measure of 1872. The annual interest on a loan of half-a-crown is now 260%, as compared with 175 in 1860 and 86 in 1784; while the extreme point is reached in the case of a loan of 1s. for three days, in which case the interest is at the rate of 10 1/4% per annum. An English mont de piété was once projected by the Salvation Army, and in 1804 the London County Council considered the practicability of municipal effort on similar lines; but in neither case was anything done.

The growth of pawnbroking in Ireland, where the law as to pledge agrees generally with that of England, is remarkable. Early in the 19th century there was only one pawnbroker in that country, and in 1833 the number reached only 52. Even in 1865 there were no more than 312. It is probable that at the present moment Glasgow and Edinburgh together contain nearly as many as that total. In Ireland the rates for loans are practically identical with those charged in England, but a penny instead of a halfpenny is paid for the ticket. Articles pledged for less than £f must be redeemed within six months, but nine months are allowed when the amount is £f or over. £f2 is a fraction of a month is calculated as a full month for purposes of interest, whereas in England, after the first month, fortinights are recognized. In 1835 there was an endeavour to establish mons de piété in Ireland, but the scheme was so unsuccessful that in 1841 the ight charitable pawnshops that had been opened had to be closed. The amount of £530. But 1847 only three were left, and eventually they collapsed entirely, or the official authority.

The pawnbroker in the United States is, generally speaking, subject to considerable legal restriction, but violations of the laws and ordinances are frequent. Each state has its own regulations, but those of New York and Massachusetts may be taken as fairly representative. "Brokers of pawn" are usually licensed by the mayors, or by the mayors and aldermen, but in Boston the police commissioners are the licensing authority. In the state of New York permits are renewable annually on payment of $500, and the pawnbroker must file a bond with the mayor, executed by himself and two responsible sureties, in the sum of $10,000. The business is conducted on much the same lines as in England, and the rate of interest is 3% per month for the first six months, and 2% monthly afterwards. Where, however, the loan exceeds $500 the rates are 2 and 1 1/2% respectively. To exact higher rates is a misdemeanor. Unredeemed pledges may be sold at the end of a year. Pawnbrokers are not allowed to engage in any kind of second-hand business. New York contains one pawnshop to every 12,000 inhabitants, and most of the pawnbrokers are Jews. In the state of Massachusetts unredeemed pledges may be sold four months after the date of deposit. The licensing authority may fix the rate of interest, which may vary for different amounts, and in Boston every pawnbroker is bound to furnish to the police daily a list of the pledges taken in during the preceding twenty-four hours, specifying the hour of each transaction and the amount lent.

The fact that on the continent of Europe mons de piété are almost invariably either a state or a municipal monopoly necessarily places them upon an entirely different footing from the British pawnshop, but, compared with the English system, the foreign is very elaborate and rather cumbersome. Moreover, in addition to being slow in its operation, it is, generally speaking, based upon the supposition that the borrower carries in his pockets "papers" testifying to his identity. On the other hand, it is argued that the English borrower of more than £f is at the mercy of the pawnbroker in the matter of interest, that sum being the highest for which a legal limit of interest is fixed. The rate of interest upon a "special contract" may be, and often is, high. For the matter of that, indeed, this system of obtaining loans is always expensive, either in actual interest or in collateral disadvantages, whether the borrower is a man of piety or of the more prosaic order. Municipal Pawnshops.

The operation of the various banks of piété in France is conducted under the direction of the French government. The Bank of Monceau, which has been in business since 1769, is the oldest of the charitable bodies, and the bank of the Republic, opened in 1816, is the largest and most important. A large proportion of the capital required for conducting the institutions has to be raised by loan, while some part of the property they possess is the product of gifts and legacies. The profits of the Paris mont de piété are paid over to the "Assistance Publique," the comprehensive term used by France to indicate the body of charitable foundations. Originally this was the rule throughout France, but now many of them are entirely independent of the charitable institutions. Counting the head office, the branches and the auxiliary shops, the Paris establishment has its doors open in some fifty or sixty districts; but the total number of transactions is probably smaller than that transacted by the London pawnbrokers. The amount to be
advanced by a municipal pawnshop is fixed by an official called the commissaire-priseur, who is compelled to lend the scales against the borrower, since, should the pledge remain unredeemed and be sold for less than was lent upon it, he has to make good the difference. This official is paid at the rate of 1% upon loans and renewals, and 3% on the amount obtained by the sales of forfeited pledges. This is obviously the weakest part of the French system. The Paris mont de pieté undertakes to lend four-fifths of the intrinsic value of articles made from the precious metals, and two-thirds of that of other articles. The maximum and minimum that may be advanced are also fixed. The latter varies in different parts of the country at 6% plus, and the former from a very small sum to the 10,000 francs which is the rule in Paris. Loans are granted for twelve months with right of renewal, and unredeemed pledges may then be sold by auction, but the proceeds may be claimed by the borrower at any time within three years. Pledges may be redeemed by instalments.

Somewhere between forty and fifty French towns possess municipal pawnshops, a few of which, like those of Grenoble and Montpellier, having been endowed, charge no interest. Elsewhere the rate varies from nil in some towns, for very small pledges, to 10%. The constant tendency throughout France has been to reduce the rate. The great attraction in the system, is that the capital—recovered and surplus forming the balance—by borrowing money at varying rates from 2 to 5%, according to the length of time for which the loan is made. Under a law passed in 1891 the Paris mont de pieté, in respect of its activities at 6%, plus a duty of 5% cents upon every hundred francs. The maximum that can be lent in this way is 50. Up to 80% is lent on the face value of government stock and on its own bonds, and 75% upon other securities, but 60% only, may be advanced on railway shares. These advances are made for six months. Persons wishing to borrow a larger sum than sixteen francs from the Paris mont de pieté have to produce their papers of identity. In every case a numbered metal check is given to the customer, and a duplicate is attached to the article itself. The appraising clerks decide upon the sum that can be lent, and the amount is called out with the number on it. The pawn is recorded on the individual's account, and can be claimed on redemption of the property, but if he accepts the offer he has to give full particulars of his name, address and occupation. The experts calculate that every transaction involving less than twenty-two francs results in a loss to the Paris mont de pieté, while it is only those exceeding eighty-five francs which can be counted upon to be invariably profitable. The average loan is under thirty francs.

The borrowing of money on the security of goods deposited has been the subject of minute regulations in the Low Countries from an early date. So far back as the year 1600 the "archdukes" Albert and Isabella, governors of the Spanish Netherlands under Philip III, reduced the lawful rate of interest from 3% to 2%. Holland and Belgium have been more generous since external pressure has led them to introduce the "mont de pieté" in 1618, and, as we have already seen, in the course of a dozen years the institution was established in all the populous Belgian towns, with one or two exceptions. The interest chargeable to borrowers was fixed originally at 15%, but was shortly afterwards reduced, to be again increased to nearly the old level. Meanwhile various towns possessed charitable funds for gratuitous loans, apart from the official institutions. Shortly after the mont de pieté was introduced in the Spanish provinces, the prince-bishop of Liège (Ferdinand of Bavaria) followed the example set by the archdukes. He ordained that the pawn should be redeemed and be the property of the borrower, who was to be used in reduction of the charges. The original rate was 15%, when the Lombard money-lenders had been charging 45, but the prince-bishop's monts de pieté were so successful that for many years their rate of interest did not exceed 5%—it was, indeed, not until 1788 that it was increased by one-half. These flourishing institutions, along with those in Belgium proper, were ruined by the French Revolution. They were, however, re-established under French dominion, and for many years the laws governing them were constantly altered by the French, Dutch and Belgian governments in turn. The whole subject is beyond the scope of this book and may be treated in the preparation of a new constitution for the Brussels mont de pieté dating from 1851.

The working capital of those official pawnshops is furnished by charitable institutions or the municipalities, but the Brussels one possesses a certain capital of its own in addition. The rate of interest charged in various parts of the country varies from 4 to 16%, but in Brussels it is usually less than half the maximum. The arrangement is very similar to that of the French monts de pieté, but the arrangements are much more favourable to the borrower. The ordinary limit of loans is £120. In Antwerp there is an "anonymous" pawnshop, where the customer need not name the lender, and for any sum under £30. Pledges are taken in pledge, brokers flourish side by side with the municipal "Banken van Leeuven," nor are there any limitations upon the interest that may be charged. The office rules are very similar to those of the monts de pieté in the Latin countries, and unredeemed pledges are sold publicly fifteen months after being pawned. A large proportion of the advances are made upon gold and silver, but mortgages are not taken in pledge, and the amount lent varies from 8d. upwards. On condition of finding such sum of money as may be required for working capital over and above loans from public institutions, and the "caution money" deposited by the city officials, the municipality receives the profits.

Pawnbroking in Germany is conducted at once by the state, by the municipalities, and by private enterprise; but of all these institutions the state loan office in Berlin is the most interesting. It dates from 1834, and the working capital was found, and still continues to be in part provided, by the Prussian State Bank. The profits are invested, and the interest devoted to charitable purposes. The maximum and minimum rates of interest are fixed, but the rate varies, and often stands at about 12%. Two-thirds of the estimated value is the usual extent of a loan; four-fifths is advanced on silver, and five-sixths on fine gold. State and municipal bonds may be pledged up to a maximum of £150, the advance being 80% of the value, and a fixed interest of 6% is charged upon these securities. The values are fixed by professional valuers, who are liable to make good any loss that may result from over-estimation. The bulk of the loans are under £5, and the state office is used less by the poor than by the middle classes. Loans run for six months, but a further six months' grace is allowed for redemption before the article pledged can be sold by auction. The net annual profit usually amounts to little more than 1% upon the capital employed. The pawnbroking laws of Austria-Hungary are very similar to those which prevail in England. Free trade exists, and the private trader, who does most of the business, has to obtain a government concession and deposit caution-money varying in amount from £80 to £500, according to the size of the town. He has, however, to compete with the monts de piéť or Verzastzameter. The chief of these is the imperial pawn office of Vienna, which was founded with charitable objects by the emperor Joseph I. in 1707, and one-half of the annual surplus has still to be paid over to the Vienna poor fund. Here, as in Berlin, the profits are relatively small. Interest is charged at the uniform rate of 10%, which is calculated in fortnightly periods, however speedily redemption may follow upon paying. For small loans varying from two to three kronen, 5% only is charged. The Hungarian state and municipal institutions appear, on the whole, to compete somewhat more successfully with the private firms in money or any other particulars. In Holland private pawnshops are the case in Vienna.

In Italy, the "country of origin" of the mont de piéť, the institution still flourishes. It is, as a rule, managed by a committee or commission, and the regulations follow pretty closely the lines of the one in Rome, which never lends less than 10d. or more than £40. Four-fifths of the value is lent upon gold, silver and jewels, and two-thirds upon other articles. The interest, which is reckoned monthly, varies with the amount of the loan from 5 to 7%, but no interest is chargeable upon loans up to 5 lire. A loan runs for six months, and may be renewed for similar periods up to a maximum of forty. If the renewal does not take place within a fortnight from the expiration of the ticket, the pledge is sold, any surplus there may be being paid to the pawnor. When more than 10 lire is lent there is a charge of 1% for the ticket. Agencies of the mont de piéť are scattered about Rome, and carry on their business under the same rules as the central office, with the disadvantage to the borrower that he has to pay an"? agent's
fee" of 2%, which is deducted from the loan. Private pawnshops also exist in Italy, under police authority; but they charge very high interest. The mons de piètre in Spain have for a generation past been inseparably connected with the savings banks. We have already seen that the institution owes its origin in that country to the charitable exertions of a priest who charged no interest, and the system grew up in 1839, a century after his death, the mons de piètre began to receive the sums deposited in the savings bank, which had just been established, for which it paid 5% interest. In 1860 the two institutions were united. This official pawnshop charges 6% upon advances which run for periods varying from four to twelve months, according to the nature of the article pledged, and a further month's grace is allowed before the pledges are sold by auction. Private pawnbrokers also are very numerous, especially in Madrid; but their usual charges amount to about 6% per annum. They appear, however, to derive advantage from making larger advances than their official rivals, and from doing business during more convenient hours. In Portugal the montem pio is an amalgamation of bank, benefit society and pawnshop. Its business consists chiefly in lending money upon marketable securities, but it also makes advances upon plate, jewelry and precious stones, and it employs officially licensed valuers. The rate of interest varies with the bank rate, which it slightly exceeds, and the amount advanced upon each article is about three-fourths of its certified value. There is in Portugal a second class of loan establishment answering exactly to the English pawnshop. The pawnbroker is compelled to deposit a sum, in acceptable securities, equal to the capital he proposes to embark, and the register of his transactions must be submitted quarterly to the chief of the police for examination. As regards small transactions, there appears to be no legal limit to the rate of interest. The sale of unredeemed pledges is governed by the law affecting the "monet pio geral." In Russia the state maintains two pawnbroking establishments, one at Petersburg and the other at Moscow; but only articles of gold and silver, precious stones and ingots of the precious metals are accepted by them. Advances are made upon such securities at 6% per annum, and the amounts of the loans are officially limited. Loans run for twelve months, with a month's grace before unredeemed pledges are put up to auction. The bulk of this class of business in Russia is, however, conducted by private companies, which advance money upon all descriptions of movable property except stocks and shares. The interest charged is not allowed to exceed 1% per month, but there is an additional charge of 1% per month for "insurance and safe keeping." The loan usually runs for a year, with two months' grace for redemption before sale. There are also a certain number of pawnshops conducted by individuals, who find it very difficult to compete with the companies. These shops can only be opened by a police permit, which runs for five years, and security, varying from £100 to £500, has to be deposited; 2% per month is the limit of interest fixed, and two months' grace is allowed for redemption after the period for which an article is pledged. Pawnbroking in Denmark dates from 1753, when the Royal Naval Hospital was granted the monopoly of advancing money on pledges and of charging higher interest than the law permitted. The duration of a loan is three months, renewals being allowed. The old law was extended in 1867, and now all pawnbrokers have to be licensed by the municipalities and to pay a small annual licence fee. The rate of interest varies from 6 to 12% according to the amount of the loan, which must not be less than 7d., and unredeemed pledges must be sold by auction. In Sweden there are no special statutes affecting pawnbroking, with the exception of a proclamation by the governor of Stockholm prohibiting the lending of money upon articles which may be suspected of having been stolen. Individuals still carry on the business on a small scale, but the bulk of it is now conducted by companies, which give general satisfaction. For many years there was in Stockholm a municipal establishment charging 10% for loans paid out of the city funds. The cost of administration was, however, so great that there was an annual loss upon its working, and the opportunity was taken when, in 1880, a private company was formed called the "Pant Aktie Bank," to lend money on furniture and wearing apparel at the rate of 3 øre per krone a month, and 2 øre per krone a month on gold, silver and other valuables: a krone, which equals ns. 13d., contains 100 øre. Some years later an opposition was started that charged only half these rates, with the result that the original enterprise reduced its interest to the same level, charging, however, 2 øre per krone per mensen for bulky articles—a figure which is now usual for pledges of this kind. Costs are limited by law to 2% and must be paid at the end of five months the pledge, if unredeemed, is sold by auction under very carefully prescribed conditions. In Norway a police licence is required for lending money on pawn where the amount advanced does not exceed £4, 10s. Beyond that sum no licence is necessary, but the interest charged must not exceed such a rate as the king may decide.

The fate of pawnbroking in Switzerland appears to be not very dissimilar from that of the Jew who is fabled to have once started in business at Aberdeen. Nevertheless, however, the cantons of Bern and Zürich have elaborated their own regulations. In Zürich the broker must be licensed by the cantonal government, and the permit can be refused only when the applicant is "known to be a person undeserving of confidence." Regular books have to be kept, which must be at all times open to the inspection of the police, and not more than 1 ½% interest per month must be charged. A loan runs for six months, and unredeemed pledges may be sold by auction a month after the expiration of the fixed period, and then the sale must take place in the parish in which the article was pledged. No more than two persons at a time have ever been licensed under this law, the business being with profitable outcome to the low rate of interest and amount of the pledge, the canton of Bern there were once two pawnbrokers. One died and the other put up his shutters. The Zürich cantonal bank, however, conducts a pawnbroking department, which lends nothing under £s. or over £40 without the special sanction of the bank commission. Loans must not exceed two-thirds of the trade value of the pledge, but 80% may be lent upon the intrinsic value of gold and silver articles. The establishment makes practically no profit. The Swiss disinclination to go to the pawnshops, perhaps, accounted for in some measure by the growing number of dealers in second-hand articles, to whom persons in want of ready money sell outright such things as are usually pledged, in the hope of subsequently buying them back. Since, however, the dealer is at liberty to ask his own price for repurchase, the expectation is often illusory, and can usually be fulfilled only upon ruinous terms. 

PAWTUCKET, a city of Providence county, Rhode Island, U.S.A., on the Blackstone river (known below the Pawtucket Falls here as the Pawtucket or Seekonk river), 4 m. N. of Providence, and near the city of Central Falls. Pop. (1895, state census), 43,381, of whom 14,360 were foreign-born, including 1273 English, 3484 Irish, 2706 French Canadians, and 1108
Scotch; (1910), 51,622. Pawtucket is served by the New York, New Haven & Hartford railroad; and the river is navigable below the falls. The city lies on both sides of the river and its land area in 1956 was nearly 866 m. The eastern bank of the river rises quite abruptly 15–25 ft., but back of this the surface is level or only slightly undulating. On the west side the surface is more diversified. The Blackstone River here makes a picturesque plunge of nearly 50 ft. (Pawtucket Falls) over an irregular mass of rocks, providing a good water-power. The most attractive public building is the Sayles Memorial Library, erected (1869–1870) by Frederick Clark Sayles (1835–1902) in memory of his wife. The city has a park of 184 acres in the east end, a park of 55 acres on the west side, three small parks near the business centre, a soldiers' monument, a home for the aged, an emergency hospital, and a state armory. The retail value of the factory products increased from $80,271,582 in 1900 to $25,858,680 in 1905, or 341%. More than one-half the value for 1905 was represented by textiles. Other important manufactures in 1905 were foundry and machine-shop products, packed meats, and electrical machinery, apparatus and supplies. The commerce of the city has been much increased by the deepening and widening of the channel of the Pawtucket river by the United States government. In 1897 the river could not be navigated at low water by boats drawing more than 5 ft. of water, but by March 1905 the government had constructed a channel 100 ft. wide and 12 ft. deep at low water, and Congress had passed an act for increasing the depth to 16 ft.; in 1907 the Federal Congress and the general assembly of the state made appropriations to complete the work.

That portion of Pawtucket which lies east of the river was originally a part of the township of Rehoboth, Massachusetts, but in 1812 the township of Seekonk was set apart from Rehoboth, in 1828 the township of Pawtucket was set apart from Seekonk, and in 1862 almost all of the Massachusetts township of Pawtucket was transferred to Rhode Island. The portion west of the river was taken from the township of North Providence and annexed to the township of Pawtucket in 1874, and in 1885 Pawtucket was chartered as a city. The first settlement within the present city limits was made about 1670 on the west side by Joseph Jenks (c. 1632–1717), a manufacturer of domestic iron implements. His manufactories was destroyed during King Philip's War, but he rebuilt it, and until a century later the industries on the west side were managed largely by his family. In 1790 Samuel Slater reproduced here the Arkwright machinery for the manufacture of cotton goods; this was the first manufactury of the kind that had any considerable success in the United States, and his old mill is still standing in Mill Street.

See R. G. Gunther, A Brief History of Pawtucket, Central Falls, and Vicinity (Pawtucket, 1897).

**PAX** (Lat. for "peace"), the name given in ecclesiastical usage to a small panel or tablet decorated usually with a representation of the Crucifixion, which in the Roman rite was kissed at the eucharistic service by the celebrating priest, then by the other priests and deacons, and then by the congregation. The "Pax" is also known by the names oscillatorium, tabula pacis and pax-bred (i.e. "pax-board"). The use of the "pax" dates from the 13th century, and it is said to have been first introduced in England in 1250 by Archbishop Walter of York. It took the place of the actual "kiss of peace" (osculum sanctum, or osculum pacis) which was in the Roman Mass given by the bishop to the priests, and took place after the consecration and before communion. In the Greek Church the kiss (elixophy, αουραγουσ) takes place at the beginning of the service, and now consists in the celebrating priest kissing the oblation and the deacon kissing his stole (see F. E. Brightman, Liturgies Eastern and Western, 1896). Owing to disputes over questions of precedence the kissing of the pax at the service of the Mass was given up. It is still used at times of prayer by religious communities or societies. In the 15th and 16th centuries such articles were published on the pax, and beautiful examples of enamelled paxes with chased gold and silver frames are in the British Museum. Though the Crucifixion is most usually represented, other religious subjects, such as the Virgin and Child, the Annunciation, the figures of patron saints and devils, are found. In the "Inventario of the Plate, Jewells...and other Ornaments appertaining to the Cathedrall Churche of Sayntc Paule in London," 1552, we find two paxes mentioned; one "with the ymage of the Crucifix and of Marie and John all gylle with the Sonne alsole and the Moone, the backyside whereof is crysomelin velvet," and another "with the ymage of our Ladie sette aboute with x greate stones the backyside whereof is grene velvet." (Hierorgia anglicana, pt. I, 1922.)

**PAKO** (PAKOS), one of the Ionian Islands (q.v.), about 8 m. S. of the southern extremity of Corfu, lies north-west of the Peloponnesus, and 2–3 mi. wide, bounded on the east by the Ionian Sea, on the north by a smaller channel, and 60 ft. high. Pop. about 5000. Though it has only a single stream and a few springs, and the inhabitants were often obliged, before the Russians and English provided them with cisterns, to bring water from the mainland, Paxo is well clothed with olives, which produce oil of the very highest quality. Gaion (or, less correctly, Gaia), the principal village, lies on the east coast, and has a small harbour. Towards the centre, on an eminence, stands Papani, the residence of the bishop of Paxo, and throughout the island are scattered a large number of churches, whose belltowers add greatly to the picturesque of the views. On the mainland and south-west the scenery is most remarkable, of which an account will be found in Davy's Ionian Islands, i. 66–71. Ancient writers—Polybios, Pliny, &c.—do not mention Paxos by itself, but apply the plural form PAXO (Paxou) to Paxos and the smaller island which is now known as Antipaxo (the Propaxos of the Antonine Itinerary). Paxos is the scene of the curious legend, recorded in Plutarch's De defectu oraculorum, of the cry: "Pan is dead" (see Pan).

**PAXTON, SIR JOSEPH** (1801–1866), English architect and ornamental gardener, was born of humble parents at Milton Bryan, near Woburn, Bedfordshire, on the 3rd of August 1801, and was educated at the grammar school at Hitchin. He served his apprenticeship as gardener from the age of fifteen, and himself constructed a large lake when gardener to Battlesden in 1821, he was in 1825 employed in the arboretum at Chiswick, the seat of the duke of Devonshire, and eventually became superintendent of the duke's gardens and grounds at Chatsworth, and manager of his Derbyshire estates. In 1836 he began to erect a grand conservatory 300 ft. in length, which was finished in 1840, and formed the model for the Great Exhibition building of 1851. In this year Paxton received the honour of knighthood. Perhaps his most interesting design was that for the mansion of Baron James de Rothschild at Ferrières in France, but he also designed many other important buildings. His versatility was shown in his organization of the Army Works Corps which served in the Crimea, his excellent capacity as a man of business in railway management, and his enterprising experiments in floriculture. In 1854 he was chosen M.P. for Coventry, which he continued to represent in the Liberal interest till his death at Sydenham on the 8th of June 1866. Paxton was elected in 1826 a fellow of the Horticultural Society. In the following year he married Sarah Bown. In 1833 he became a fellow of the Linnean Society, and in 1844 he was made a knight of the order of St. Vladimir by the emperor of Russia.

He was the author of several contributions to the literature of horticulture, including a Practical Treatise on the Culture of the Dahlia (1838), and a Pocket Botanical Dictionary (1st ed., 1840). He also edited the Cottage Calendar, the Horticultural Register and the Botanical Magazine.

**PAYMASTER-GENERAL**, in England, a public officer and a member of the ministry for the time being. The office was, by statutes passed in 1835 and 1838, consolidated with other offices through which moneys voted by parliament were previously paid. The paymaster-general is appointed by sign manual warrant, is unpaid, and does not require to offer himself for election on acceptance of office. The money appropriated by parliament for the various services of the country is placed
PAYMENT—PAYMENT OF MEMBERS

by order of the Treasury to the account of the paymaster-general, and a communication to that effect made to the comptroller and auditor-general. The paymaster-general then makes all payments required by the various departments in accordance with the parliamentary vote. The duties of the office are carried out by a permanent staff, headed by an assistant paymaster-general, acting on powers granted by the paymaster-general.

PAYMENT (Fr. paiement, from payer, to pay; Lat. paccare, to appease, pax, peace), the performance of an obligation, the discharge of a sum due in money or the equivalent of money. In law, in order that payment be made, it must be made at a proper time and place, in a proper manner, and by and to a proper person. If the sum due be not paid at the appointed time, the creditor is entitled to sue the debtor at once, in spite of the readiness of the latter to pay at a later date, subject, in the case of bills and notes, to the allowance of days of grace. In the common case of sale of goods for ready money, a right to the goods vests at once upon sale in the purchaser, a right to the price in the seller; but the seller need not part with the goods till payment of the price.

Payment may be made at any time of the day upon which it falls due, except in the case of mercantile contracts, where there is a liability upon the creditor to maintain due diligence to secure payment, and this diligence is regarded as being the same thing as a bound to wait for payment beyond the usual hours of mercantile business. If no place be fixed for payment, the debtor is bound to find, or to use reasonable means to find, the creditor, unless the latter be abroad. Payment must be made in money which is a legal tender (see below), unless the creditor waive his right to payment in money by accepting some other mode of payment, as a negotiable instrument or a transfer of credit. If the payment be by negotiable instrument, the instrument may operate either as an absolute or as a conditional discharge. In the ordinary case of payment by cheque the creditor accepts the cheque on the occasion of the debt beinghonoured; if it be dishonoured, he is remitted to his original rights. If payment be made through the post, in a letter properly directed, and it be lost, the debt is discharged if there was a direction so to transmit the money. The creditor has a right to payment in full, and is not bound to accept part payment unless by special agreement. Part payment is sufficient to take the debt out of the Statute of Limitation. It is a technical rule of English law that payment of a smaller sum, even though accepted by the creditor in full satisfaction, is no defence to a subsequent action for the debt. The reason of this is that the creditor foregoes his right to full payment. In order that payment of a smaller sum may satisfy the debt, it must be made by a person other than the person originally liable, or at an earlier date, or at another place, or in another manner than the date, place, or manner contracted for. Thus a bill or note may be satisfied by money to a less amount, or a money debt by a bill or note to a less amount; a debt of £100 cannot be discharged by payment of £90 (unless the creditor execute a release under seal), though it may be discharged by payment of £10 before the day appointed, or by a bill for £90. Payment must in general be made by the debtor or his agent, or by a stranger with the assent of the debtor. If payment be made by a stranger without the assent of the debtor, it seems uncertain how far English law regards such payment as a satisfaction of the debt. If the debtor ratify the payment, it then undoubtedly becomes a satisfaction. Payment must be made to the creditor or his agent. A bona fide payment to an apparent agent may be good, though he has in fact no authority to receive it. Such payment will usually be good where the authority of the agent has been countermanded without notice to the debtor. The fact of payment may be presumed, as from lapse of time. Thus payment of a testator’s debts is generally presumed after twenty years. A written receipt is only presumptive and not conclusive evidence of payment. By the Stamp Act 1891 a duty of one penny is imposed upon a receipt for or upon the payment of money amounting to £2 or upwards, and also a fine of £10 upon any person who, in any case where a receipt would be liable to duty, refuses to give a receipt duly stamped. If payment be made under a mistake of fact, it may be recovered, but it is otherwise if it be made under a mistake of law, for it is a maxim of law that ignorants leges neminem excitare. Money paid under compulsion of law, even though not due, cannot generally be recovered where there has been no fraud or extortion. For appropriation of payments see APPROPRIATION.

Payment Into and Out of Court.—Money is generally paid into court to abide the result of pending litigation, as where litigation has already begun, as second for costs or as a defence or counter defence to a claim. Payment into court does not necessarily (except in actions for libel and slander) operate as an admission that the money is owing. Payment is regulated by the Supreme Court, O. xxi. The fact that money has been paid into court may not be mentioned to a jury. Money may sometimes be paid into court where no litigation is pending, as in the case of a final discharge of costs or in the absence of a direction of the court upon petition or summons or otherwise, or simply on the request or the written authority of the person entitled to it.

Payment of Wages.—The payment of wages to labourers and workmen otherwise than in coin is prohibited. See LABOUR LEGISLATION. Truck. Domestic or agricultural servants are excepted. Payment of wages in public-houses (except in the case of domestic servants) from English law. In some states, however, money may be recovered, even when it has been paid under a mistake of law. The question of legal tender has been an important one. In 1862 and 1863 Congress passed acts making treasury notes lawful tender. After the American Civil War the Federal Court of the United States decided in 1871 (Knox v. Leo) in favour of the constitutionality of these acts, both as to contracts made before and after the passing of the act. These notes are legal tender for discharge of the debt, but to enable the debtor, when sued for the debt, to pay the money into court and to get judgment for the costs of his defence.

The law of Scotland as to payment agrees in most points with that of England. Where a debt is constituted by writ payment cannot be proved by witnesses; where it is not constituted by writ, payment to the amount of £100 Scots may be proved by one witness and a court. The manner of proof by writ is by tender and proof, which is legal tender, unless the creditor waive his right to a legal tender, as where he objects to the amount and not the mode of tender. Bank of England notes are legal tender for any sum, except ½d. and 1d., except when they are tendered to any amount, silver up to 40s., bronze up to 1s. (Coinage Act 1870). Any gold coinage, whether British, colonial or foreign, may be tendered. Tender is also made by proof of payment of any sum of money, to discharge the debt, but to enable the debtor, when sued for the debt, to pay the money into court and to get judgment for the costs of his defence.

The law of Scotland as to payment agrees in most points with that of England. Where a debt is constituted by writ payment cannot be proved by witnesses; where it is not constituted by writ, payment to the amount of £100 Scots may be proved by one witness and a court. The manner of proof by writ is by tender and proof, which is legal tender, unless the creditor waive his right to a legal tender, as where he objects to the amount and not the mode of tender. Bank of England notes are legal tender in Scotland or in Ireland.

United States.—In the United States the law as a rule does not make money tender of account come from English law. In some states, however, money may be recovered, even when it has been paid under a mistake of law. The question of legal tender has been an important one. In 1862 and 1863 Congress passed acts making treasury notes lawful tender. After the American Civil War the Federal Court of the United States decided in 1871 (Knox v. Leo) in favour of the constitutionality of these acts, both as to contracts made before and after the passing of the act. These notes are legal tender for discharge of the debt, but to enable the debtor, when sued for the debt, to pay the money into court and to get judgment for the costs of his defence.

The state shall . . . make anything but gold and silver coin a tender in payment of debts (art. i. § 10). (T. A. I.)

PAYMENT OF MEMBERS. From time to time proposals have been made to reintroduce in the English parliamentary system a practice which is almost universally adopted in other countries, that of paying a state salary to members of the legislative body. In the earlier history of the English parliament the payment of commoners or representatives of the people was for long the practice. They had first been summoned to the great council of the realm in 1265 in the reign of Henry III. The sheriff and the boroughs they represented paid them for their services, and reimbursed the expenses they were put to in journeying to and from the place of meeting. In 1322, by a statute of Edward II., the salary of a knight was fixed at 4s. a day, and that of a citizen or burgher at 2s. a day. These payments could be enforced by writs issued after the dissolution of each parliament, and there are many instances of the issue of such writs down to the reign of Henry VIII.; but the last known instance is that of one Thomas King, who in 1603 obtained
a writ for his salary against the corporation of Harwich. The practice of the payment of members of parliament gradually fell into desuetude, and in the second parliament of Charles II., strong disapproval was expressed of the practice. Its gradual abandonment was due first to the difficulty of securing representatives in the early parliaments. Men of business were unwilling to detach themselves from their affairs, as travel was slow and dangerous; in addition to the perils of the journey there was the almost certain knowledge that a safe return from parliament would be followed by the ill will of the member's neighbours, for every meeting of parliament was but a device on the part of the sovereign for inflicting some new form of taxation, and a refusal to vote such taxation was but to incur the royal displeasure. The towns themselves were equally disinclined to bear the burden of their member's maintenance, and some even went so far as to obtain their disfranchisement. In the second place, the growing influence of parliament in the 17th century brought about a revulsion of feeling as to parliamentary services, and the increase in the number of candidates led first to bargaining on their part in the shape of undertaking to accept reduced wages and expenses, and, finally, to forgo all. A step further was reached when the constituency bargained as to what it should receive from its representative, resulting in wholesale bribery, which required legislation to end it (see CORRUPT PRACTICES).

In England, the House of Commons has on various occasions carried resolutions in favour of the principle, more especially on the 24th of March 1803 (by 276 votes to 229), and on the 22nd of March 1853 (by 176 to 158). On these occasions the resolutions simply specified an "adequate allowance," but on the 7th of March 1906 a resolution was carried (by 338 votes to 110) in favour of an allowance "at the rate of £500 per annum." Appended are the salaries paid to legislators in various countries in 1910.

**BRITISH COLONIES**

**South Africa.**—Before the South Africa Act 1909, which brought about the union of Cape Colony, Natal, Orange River Colony and the Transvaal, each colony had its own legislature. For purposes of comparison, the salaries which were paid to the members of these state legislatures are given below. The act of 1909 reduced the colonies to the position of dependent provinces, entrusted only with local administration by means of provincial councils. The act of 1909 (§ 76) enacts that the members of provincial councils shall receive such allowances as shall be determined by the governor-general in council. Members of the South African legislature receive £100 a year, subject to a deduction of one day per week for each day's non-attendance.

**Cape Colony.**—Members of either house were paid £120 a year, and those residing more than 15 miles from Cape Town an additional £10 a year.

**Orange River Colony.**—At the end of the session each member received £150, and an additional £2 for each day of actual attendance, but not more than £300 in all.

**Transvaal Colony.**—As in the Orange River Colony.

**Canada.**—Federal government. Members of both houses are paid $2500 per session, but subject to a deduction of $15 a day for each day of non-attendance.

**Ontario.**—Members of the Legislative Assembly are paid mileage and an allowance of $6 a day for 30 days, with a maximum of $1000. Members of the Legislative Assembly are paid $6 a day during the session.

**Nova Scotia.**—Members are paid an indemnity of $500 for the session.

**New Brunswick.**—Members of the Legislative Assembly receive $500 per session and travelling expenses.

**Manitoba.**—Members of the Legislative Assembly receive $1000 per session and travelling expenses.

**British Columbia.**—Members of the Legislative Assembly receive $1200 per session and travelling expenses.

**Prince Edward Island.**—Members of the Legislative Assembly receive $160 per annum and travelling expenses, with an additional $12 for postage.

**Australian Commonwealth.**—Members of parliament receive $600 per annum.

**New South Wales.**—Members of the Legislative Assembly receive $300 per annum, and free travel over all government railways and tramways. They are also given official stamped envelopes for their postage purposes.

**Queensland.**—Members of the Legislative Assembly receive $300 per annum, with travelling expenses.

**South Australia.**—Members of the Legislative Council and of the House of Assembly receive $200 per annum and free passes over all government railways.

**Western Australia.**—Members of the Legislative Council receive $350 per annum and free passes over all government railways.

**Tasmania.**—Members of both houses receive $100 a year and free railway passes.

**New Zealand.**—Members of the Legislative Council are paid $200 per annum. Members of the House of Representatives are paid £25 a month.

**UNITED STATES**

**Federal Government.**—Senators, representatives or delegates receive $7500 a year, and travelling expenses.

**Alabama.**—There is a session once in four years, such session being limited to 50 days, during which senators and representatives receive $4 a day and mileage.

**Delaware.**—A session of limited duration, of 60 days' duration, during which members of the council and representatives receive $4 a day and mileage.

**Hawaii.**—Has a biennial session of 60 days' duration, for which senators and representatives receive $6 a day and mileage.

**California.**—Legislature meets biennially, but there is no fixed length for the session. Senators and members of the Assembly receive $100 a day and mileage for each day of the session, with mileage.

**Connecticut.**—Senators and representatives receive $7 a day and mileage during session.

**Florida.**—Has biennial sessions of 60 days. Senators and representatives receive $6 a day during the session and mileage.

**Georgia.**—Has annual sessions limited to 50 days. Senators and representatives receive $5 a day during sessions.

**Idaho.**—Senators and representatives receive mileage and $5 a day during the session, which is biennial.

**Illinois.**—Has a biennial session, for which senators and representatives receive $6 a day and mileage.

**Kentucky.**—Has biennial sessions of fixed length, Senators and representatives receive $550 for the session, with mileage.

**Louisiana.**—Has biennial sessions limited to 60 days. Senators and representatives receive $5 a day during the session with mileage.

**Maine.**—Senators and representatives receive $500 a year and mileage. Sessions are biennial and of no fixed length.

**Maryland.**—Has biennial sessions limited to 90 days. Senators and representatives receive $5 a day during the session and mileage.

**Massachusetts.**—Has an annual session, for which senators and representatives receive each a lump sum of $750 and mileage.

**Michigan.**—Has biennial sessions of fixed duration, and senators and representatives receive $800 a year and mileage.

**Minnesota.**—Has biennial sessions limited to 90 days. Senators and representatives receive $1000 a year besides limited travelling expenses.

**Mississippi.**—Has a session every four years, unlimited in length. Special sessions, also, limited to 30 days, are held in alternate years. Senators and representatives receive a sum of $400 for each session.

**Missouri.**—Has a biennial session of limited duration, and senators and representatives receive $5 a day for the first 70 days of each session, and $1 a day for each succeeding day.

**Montana.**—Has biennial sessions limited to 60 days. Senators and representatives receive $5 a day during sessions.

**Nebraska.**—Has biennial sessions unlimited in length. Senators and representatives are paid $5 a day and mileage (10 cents a mile) during any session. It extra-ordinary sessions are held the total days paid for must not exceed 100 during the two years for which they sit.
PAYMENT OF MEMBERS

Nevada has biennial sessions limited to 60 days, but special sessions limited to 20 days may be held. Senators and representatives receive $200 a day and mileage during sessions.

New Hampshire has biennial sessions, which last until prorogued by the governor. The duration is usually about three months. Senators and representatives receive $200 for the session and mileage.

New Jersey has an annual session, unlimited in length. Senators and members of the General Assembly receive $500 a year.

New Mexico has biennial sessions of 60 days. Members of the Court of Appeals receive $1,000 a year.

New York has an annual session. Members of the Senate and of the Assembly receive $1,500 a year.

North Carolina has biennial sessions limited to 60 days. Senators and representatives receive $5 a day during the session, and mileage.

North Dakota has biennial sessions limited to 60 days. Senators and representatives receive $10 a day and mileage during sessions.

Ohio has biennial sessions not limited in length. Senators and representatives receive $1,000 a year.

Oklahoma has biennial sessions. Senators and representatives receive $6 a day for the first 60 days—thereafter $2 a day—and mileage (10 cents a mile).

Oregon has biennial sessions limited to 240 days. Senators and representatives receive $3 a day and mileage during the session.

Pennsylvania has biennial sessions. Senators and representatives receive $1,500 for the session with mileage, with an extra allowance of $150 for stationery and postage.

Rhode Island has a biennial session unlimited in length. Senators and representatives receive $5 a day during the session.

South Carolina has an annual session unlimited in length. Senators and representatives receive $4 a day for the first 40 days.

South Dakota has biennial sessions of 60 days. Senators and representatives receive $5 for each day’s attendance, and travelling expenses.

Tennessee has biennial sessions. Senators and representatives receive $4 a day for not more than 75 days a session and mileage (16 cents a mile). If absent they do not receive pay, unless they are physically unable to be present.

Texas has biennial sessions, unlimited in length. Senators and representatives receive mileage and $5 a day for the first 60 days of the session; for succeeding days $2 a day.

Utah has biennial sessions limited to 60 days. Senators and representatives receive $4 a day during the session, and mileage.

Vermont has biennial sessions unlimited in length. Senators and representatives receive $4 a day during the session and mileage.

Virginia has biennial sessions limited to 60 days. Senators and delegates receive $500 for the session and mileage.

Washington has biennial sessions limited to 60 days. Senators and representatives receive $5 a day for each day’s attendance and travelling expenses.

West Virginia has biennial sessions limited to 45 days, which can be added to by a two-thirds majority. Senators and delegates receive $4 a day during the session and mileage.

Wisconsin, as the result of a special session, has Members of the Assembly receive $500 for the session, and travelling expenses at the rate of 10 cents a mile.

Wyoming has biennial sessions limited to 40 days. Senators and representatives receive $8 a day during the session and mileage.

FOREIGN COUNTRIES

Argentina.—Both senators (30) and members of the House of Deputies (120) receive £1,000 a year.

Austria.—Members of the Lower House (516) receive 16s. 8d. for each day’s attendance, with travelling expenses.

Belgium.—Members of the Chamber of Representatives (160) receive £100 a year and a free pass over railways.

Bolivia.—Senators (16) and deputies (60) receive £40 a month during sessions, which last from 60 to 90 days.

Bulgaria.—Members of the Legislature receive 16s. a day during the session, which nominally lasts from the 15th of October to the 15th of December.

Denmark.—Members both of the Landsting (66) and of the Folketing (114) receive 11s. 1d. a day for the first six months of the session, and 6s. 8d. for each additional day of the session. They receive also second-class free passes on all railways.

Estonia.—Members both of the Senate (300) and of the Chamber of Deputies (600) receive £500 a year.

German Empire.—Members both of the Bundesrat (58) and of the Reichstag (397) receive £150 for the session, but have deducted £1 for each day’s absence. They receive also free passes over the German railways during the session.

Baden pays members of its Second Chamber and such members of the Upper Chamber as have not got hereditary seats 12s. a day and travelling expenses, but to those members who reside in the capital 9s. a day only.

Bavaria pays members of the Lower House (103) £180 for a regular session. They are also allowed free travel over the government railways.

Hesse.—Members of the Second Chamber (30) and non-hereditary members of the Upper Chamber who reside more than 1½ m. from the place of meeting receive 9s. a day and 3s. for each night, besides a refund of their travelling expenses.

Prussia.—Members of the Lower Chamber (433) receive travelling expenses and diet money (according to a fixed scale) of 15s. a day.

Saxe-Coburg.—Members of the Second Chamber residing in Coburg or Gotha receive 6s. a day; other members receive 10s. a day and travelling expenses.

Saxony.—Members of the Second Chamber (81) and non-hereditary members of the Upper Chamber receive 12s. a day (6s. a day if they live in the place of meeting) and an allowance for travelling.

Württemberg.—Members of both chambers receive 15s. a day for actual attendance; also free passes over the railways.

Greece.—The members (235) receive £72 for the session, also free passes on railway and steamship lines.

Hungary.—Members of the House of Representatives (453) receive £200 a year, with allowance of £66 13s. for house rent.

Italy.—Members of the Legislature receive no payment, although attempts have been made from 1862 onwards to introduce payment of members. It was last brought forward in 1908, the amount suggested being £24, for every sitting attended.

Japan.—Members of the House of Representatives (379) and non-hereditary members of the House of Peers receive £210 a year, besides travelling expenses.

Mexico.—Both senators (36) and representatives (340) receive £3,000 a year.

Netherlands.—Members of the First Chamber (30) not residing in the Hague receive 16s. 8d. a day during the session; members of the Second Chamber (100) receive £166 a year, besides travelling expenses.

Norway.—Members of the Storting (123) receive £135 4d. a day during the session, besides travelling expenses.

Paraguay.—Both senators and deputies receive £200 a year.

Portugal.—Deputies have been unpaid since 1892, but deputies for the colonies, whose homes are in the colonies, receive £60 a month or 13s. 4d. a day during sitting of the Chamber, and £10 a month when the Chamber is not sitting.

Rumania.—Both senators (120) and deputies (183) receive 16s. 8d. for each day of attendance, besides free railway passes.

Russia.—Members of the Duma receive 21s. a day during the session, and travelling expenses.

Serbia.—Deputies (120) receive 12s. a day and travelling expenses.

Spain.—Members of the Legislature receive no salary, but deputies on their election receive a railway ticket for 2450 m. travel.

Sweden.—Members of both the First Chamber (150) and the Second Chamber (239) receive £60 for each session of 4 months, besides travelling expenses.

Switzerland.—Members of the State Council are paid by the canton they represent, and their salary varies according to the wealth or liberality of the canton. The salary ranges thus from 12s. 6d. to £400 a day, the average of the whole being 16s. a day.

Members of the National Council (167) are paid from Federal funds. They receive 16s. 8d. a day for each day they are present, with travelling expenses.
