laymen, with permission of the bishop, to address the people in the church. In Alexandria, however, this custom had been given up, and Demetrius took occasion to express his disapproval and recall Origen to Alexandria. Probably the bishop was jealous of the high reputation of the teacher; and a coolness arose between them which led, fifteen years later, to open rupture (in the year 236) Origen was ordained a presbyter in Palestine by his friends the bishops. This was undoubtedly an infringement of the rights of the Alexandrian bishop; at the same time it was simply a piece of spite on the part of the latter that had kept Origen so long without any ecclesiastical consecration. Demetrius convened a synod, at which it was resolved to banish Origen from Alexandria. Even this did not satisfy his displeasure. A second synod, composed entirely of bishops, determined that Origen must be deposed from the presbyterial status. This decision was communicated to the foreign churches, and seems to have been justified by referring to the self-mutilation of Origen and adding objectionable doctrine, which he was said to have promulgated. The details of the incident are, however, unfortunately very obscure. No formal excommunication of Origen appears to have been decreed; it was considered sufficient to have him degraded to the position of a layman. The sentence was approved by most of the churches, in particular by that of Rome. At a later period Origen sought to vindicate his teaching in a letter to the Roman bishop Fabian, but, it would seem, without success. Even Heracles, his former friend and sharer of his views, took part against him; and by this means he procured his own election shortly afterwards as successor to Demetrius.

In these circumstances Origen thought it best voluntarily to retire from Alexandria (231–232). He betook himself to Palestine, where his condemnation had not been acknowledged by the churches in Greece (apparently it had been in Phoenicia, Arabia and Achaia). He settled in Caesarea, and very shortly he had a flourishing school there, whose reputation ralled that of Alexandria. His literary work, too, was prosecuted with unabated vigour. Enthusiastic pupils sat at his feet (see the Panegyric of Gregory Thaumaturgus), and the methodical instruction which he imparted in all branches of knowledge was famous all over the East. Here again his activity as a teacher was interrupted by frequent journeys. Thus he was for two years together at Caesarea in Cappadocia, where he was taken by the Maximinian persecution; here he worked at his recension of the Bible. We find him again in Nicomedia, in Athens, and twice in Arabia. He was called there to combat the unitarian christology of Beryllus, bishop of Bostra, and to clear his own life after his expulsions from bishoprics. His dealings with the house of Alexander Severus, so soon he entered into a correspondence with the emperor Philip the Arab and his wife Severa. But through all situations of his life he preserved his equanimity, his keen interest in science, and his indefatigable zeal for the instruction of others. In the year 250 the Decian persecution broke out, Origen was arrested, imprisoned and maltreated. But he survived these troubles—it is a malicious invention that he recanted during the persecution—and lived a few years longer in active intercourse with his friends. He died, probably in the year 254 (consequently under Valerian), at Tyre, where his grave was still shown in the middle ages.

**Writings.**—Origen is probably the most prolific author of the ancient church. The number of his works is generally reckoned by Jerome, “two hundred and that he has written.” The number of the manuscripts estimated at 6000, but that is certainly an exaggeration. Owing to the increasing unpopularity of Origen in the church, a comparatively small portion of these works have come down to us in the original. We have more in the Latin translation of Rufinus; but this translation in by no means trustworthy, since Rufinus, assuming that Origen’s writings had been tampered with by the heretics, considered himself at liberty to omit or amend heterodox statements. Origen’s real opinion, however, may frequently be gathered from the Philoecia—a sort of anthology from his works prepared by Basil the Great and Gregory Nazianzenus. The fragments in Photius and in the Apology of Pamphilus serve for comparison. The writings of Origen consist of letters, and of works in textual criticism, exegesis, apologetics, dogmatic and practical theology.

1. *Eusebius* (to whom we owe our full knowledge of his life) collected more than a hundred of Origen’s letters, arranged them under their subjects, and deposited them in the library at Caesarea (H. E. vi. 36). In the church libraries at Rome (where the bishop Alexander) there were also numerous letters of this father (Euseb. H. E. vi. 20). But unfortunately they have all been lost except two—one to Julius Africanus (about the history of Susanna) and one to Gregory Thaumaturgus. There are, besides, a couple of fragments.

2. Origen’s textual studies on the Old Testament were undertaken partly in order to improve the manuscript tradition, and partly for apologetic reasons, to clear up the relation between the LXX and the original Hebrew text. The results of more than twenty years’ labour were set forth in his *Hexapla* and *Tetrapla*, in which he placed the Hebrew text side by side with the various Greek versions, examined their mutual relations in detail, and tried to find the basis for a more reliable text of the LXX. The *Hexapla* was probably never fully written out, but excerpts were made from it by various scholars at Caesarea in the 4th century; and thus large sections of it have been saved. Origen worked also at the text of the New Testament, although he produced no recension of his own.

3. The exegetical labours of Origen extend over the whole of the Old and New Testaments. They are divided into *Scholia* (ἐπαναλογίαι, short annotations, mostly grammatical), *Homilies* (exegiying expositions grounded on exegetes), and *Commentaries* (ὑμνά). In the Greek original only a very small portion has been preserved; in Latin translations, however, a good deal. The most important parts are the homilies on Jeremiah, the books of Moses, Joshua and Judges, and the commentaries on Matthew, John and Romans. With grammatical precision, antiquarian learning and critical discernment Origen combines the allegorical method of interpretation—the logical corollary of his conception of the inspiration of the Scriptures. He distinguishes a threefold sense of scripture, a grammatical-historical, a moral and a pneumatic—the last being the proper and highest sense. He thus set up a formal theory of allegorical exegesis, which is not quite extinct in the churches even yet, but in his own system was of fundamental importance. On this method the sacred writings are regarded as inexhaustible mine of philosophical and dogmatic wisdom; in reality the exegete reads his own ideas into any passage he chooses. The commentaries are of course intolerably diffuse and tedious, but to those who read them through them, one has not unfrequently occasion to admire the sound linguistic perception and the critical talent of the author.

4. The principal apologetic work of Origen is his book *Κύλιον* (eight books), written at Caesarea in the time of the Arabian. It has been completely preserved in the original. This work is invaluable as a source for the history and situation of the church in the 2nd century; for it contains nearly the whole of the famous work of Celsus (Λόγος ἀνθρώπῳ) against Christianity. What makes Origen’s answer so instructive is that it shows how close an affinity existed between Celsus and himself in their fundamental philosophical and theological presuppositions. The real state of the case is certainly unsuspected by Origen himself; but if the substance of his opponent’s arguments is he is unable to meet except by a speculative reconstruction of the church doctrine in question. Origen’s apologetic is most effective when he appeals to the spirit and power of Christianity as an evidence of its truth. In details his argument is not free from sophistical subterfuges and superficial reasoning.
5. Of the dogmatic writings we possess only one in its integrity, and that only in the translation of Rufinus. This work, which was composed before 228, is the first attempt at a dogmatics at once scientific and accommodated to the needs of the church. The material is drawn from Scripture, but in such a way that the propositions of the regula fidei are respected. This material is then formed into a system by all the resources of the intellect and of speculation. Origen thus solved, after his own fashion, a problem which his predecessor Clement had not even ventured to grapple with. The first three books treat of God, the world, the full of spirits, anthropology and ethics. Each of these three books really embraces, although not in a strictly comprehensive way, the whole scheme of the Christian view of the world, from different points of view, and with different contents. The fourth book explains the divinity of the Scriptures, and deduces rules for their interpretation. It ought properly to stand as first book at the beginning. The ten books of Stromata (in which Origen compared the teaching of the Christians with that of the philosophers, and corrobated all the Christian dogmas from Plato, Aristotle, Numenius and Cornutus) have all perished, with the exception of small fragments; so have the tractsates on the resurrection and on freewill.

6. Of practical theological works we have still the Προσευχή κύρους and the Συντάγμα πειράξτης. For a knowledge of Origen's Christian estimate of life and his relation to the faith of the church these two treatises are of great importance. The first was written during the persecution of Maximinus Thrax, and the second dedicated to Friends Ambrosius and Pantelemon. The other also dates from the Caesarian period; it mentions many interesting details, and concludes with a fine exposition of the Lord's Prayer.

7. In his own lifetime Origen had to complain of falsifications of his works and forgeries under his name. Many pieces still in existence are wrongly ascribed to him; yet it is doubtful whether a single one of them was composed on purpose to deceive. The most noteworthy are the Dialogues of a certain Adamantius "de recta in Deum fide," which seem to have been erroneously attributed to Origen so early as the 4th century, one reason being the fact that Origen himself also bore that name. (Eusebius, H. E. vi. 14.)

Outline of Origen's View of the Universe and of Life.—The system of Origen was formulated in opposition to the Greek philosophers on the one hand, and the Christian Gnostics on the other. But the science of faith, as expounded by him, bears unmistakably the stamp both of Neo-Platonism and of Gnosticism. As a theologian, in fact, Origen is not merely an orthodox traditionalist and believing exegete, but a speculative philosopher of Neo-Platonic tendencies. He is, moreover, a judicious critic. The union of these four elements gives character to his theology, and in a certain degree to all subsequent theology. It is this combination which has determined the peculiar and varying relations in which theology and the faith of the church have stood to each other since the time of Origen. That relation depends on the predominance of one or other of the four factors embraced in his theology.

As an orthodox traditionalist Origen holds that Christianity is a practical and religious saving principle, that it has unfolded itself in an historical series of revealing facts, that the church has accurately embodied the substance of her faith in the regula fidei, and that simple faith is sufficient for the renewal and salvation of man. As a philosophical idealist, however, he transmutes the whole contents of the faith into the ideas which bear the mark of Neo-Platonism, and were accordingly recognized by the later Neo-Platonists as Hellenic. In Origen, however, the mystic and ecstatic element is held in abeyance. The ethico-religious ideal is the sorrowless condition, the state of superiority to all evils, the state of order and of rest. In this condition man enters into likeness to God and blessedness; and it is reached through contemplative isolation and self-knowledge, which is divine wisdom. "The soul is trained as it were to behold itself in a mirror, it shows the divine spirit, if it should be found worthy of such fellowship, as in a mirror, and thus discovers the traces of a secret path to participation in the divine nature." As a means to the realization of this ideal, Origen introduces the whole ethics of Stoicism. But the link that connects him with churchly realism, as well as with the Neo-Platonic mysticism, is the conviction that complete and certain knowledge rests wholly on divine revelation, i.e. on oracles. Consequently his theology is cosmological speculation and ethical reflection based on the sacred Scriptures. The Scriptures, however, are treated by Origen on the basis of a modified theory of inspiration in such a way that all their facts appear as the vehicles of ideas, and have their highest value only in this aspect. That is to say, his gnosis neutralizes all that is empirical and historical, if not always as to its actuality, at least absolutely in respect of its value. The most convincing proof of this is that Origen (1) takes the idea of the immutability of God as the regulating idea of his system, and (2) deprives the historical "Word made flesh" of all significance for the true Gnostic. To him Christ appears simply as the Logos who is with the Father from eternity, and works from all eternity, to whom alone the instructed Christian directs his thoughts, requiring nothing more than himself. For the Christian, in fact, Origen's propositions historical Christianity is stripped off as a mere husk. The whole system of religious knowledge are beyond the plane of history, or rather—in a thoroughly Gnostic and Neo-Platonic spirit—they are regarded as belonging to a supra-mundane history. On this view contact with the faith of the church could only be maintained by distinguishing an exoteric and an esoteric form of Christianity. This distinction was already current in the catechetical school of Alexandria, but Origen gave it its boldest expression, and justified it on the ground of the incapacity of the Christian masses to grasp the deeper sense of Scripture, or unraveled the difficulties of exegesis. On the other hand, in dealing with the problem of bringing his heterodox system into conformity with the regula fidei he evinced a high degree of technical skill. An external conformity was possible, inasmuch as speculation, proceeding from the higher to the lower, could keep by the stages of the regula fidei, which had been developed into a history of salvation. The system itself aims in principle at being thoroughly monistic; but, since matter, although created by God out of nothing, was regarded merely as the sphere in which souls are punished and purified, the system is pervaded by a strongly dualistic element. The immutability of God requires the eternity of the Logos and of the world. At this point Origen succeeded in avoiding the heretical Gnostic idea of God by assigning to the Godhead the attributes of goodness and righteousness. The pre-existence of souls is another inference from the immutability of God, although Origen also deduced it from the nature of the soul, which as a spiritual potency must be eternal. Indeed this is the fundamental idea of Origen—"the original and indestructible unity of God and all spiritual essences." From this follows the necessity for the created spirit, after apostasy, error and sin, to return always to its origin in God. The actual sinfulness of all men Origen was able to explain by the theological hypothesis of pre-existence and the premundane fall of each individual soul. He holds that freedom is the inalienable prerogative of the finite spirit; and this is the second point that distinguishes his theology from the heretical Gnosticism. The system unfolds itself like a drama, of which the successive stages are as follows: the transcendental fall, the creation of the material world, inaugurating the history of punishment and redemption, the clothing of fallen souls in flesh, the dominion of sin, evil and the demons on earth, the appearing of the Logos, His Incarnation in the clothing of a pure human soul, His esoteric preaching of salvation, and His death in the flesh, then the imparting of the
Spirit, and the ultimate restoration of all things. The doctrine of the restoration appeared necessary because the spirit, in spite of its inherent freedom, cannot lose its true nature, and because the final purposes of God cannot be fulfilled. The end, however, is only relative, for spirits are continually falling, and God remains through eternity the creator of the world. Moreover the end is not conceived as a transfiguration of the world, but as a liberation of the spirit from its unnatural union with the sensual. Here the Gnostic and philosophical character of the system is particularly manifest. The old Christian eschatology is set aside; no one has dealt such deadly blows to chiliasm and Christian apocalypse as Origen. It need hardly be said that he spiritualized the church doctrine of the resurrection of the flesh. But, while in all these doctrines he appears in the character of a Platonic philosopher, traces of rational criticism are not wanting. With his fundamental conception admits of it, he tries to solve historical problems by historical methods. Even in the christology, where he is treating of the historical Christ, he entertains critical considerations; hence it is not altogether without reason that in after times he was suspected of "Ehonianite" views of the Person of Christ. Not unfrequently he represents the unity of the Father and the Son as a unity of agreement and harmony and "identity of will."

Although the theology of Origen exerted a considerable influence as a whole in the two following centuries, it certainly lost nothing by the circumstance that several important propositions were capable of being torn from their original setting and placed in new connections. It is in fact one of the peculiarities of his later works that the author preserved a sort of historical, philosophical, that most of its formulae could be interpreted and appreciated in *utrumque perim*. By arbitrary divisions and rearrangements the doctrinal statements of this "science of faith" could be made to serve the most diverse dogmatic tendencies. This is seen especially in the doctrine of the Logos. On the basis of his idea of God Origen was obliged to insist in the strongest manner on the personality, the eternity (eternal generation) and the essential divinity of the Logos. 1 On the other hand, when he turned to consider the origin of the Logos he did not hesitate to speak of Him as a *krieya*, and to include Him amongst the rest of God's spiritual creatures. A *krieya*, which at the same time ἐννοεῖν τοῖς ἐνθέων was no contradiction to him, simply because he held the immutability, the pure knowlege and the blessedness which constituted the divine nature to be communicable attributes. In later times both the orthodox and the Arians appealed to his teaching, both with a certain plausibility: but the inference of Arian, that an imparted divinity must be divinity in the second degree, Origen did not draw. With respect to other doctrines also, such as those of the Holy Spirit and the incarnation of Christ, &c., Origen prepared the way for the later dogmas. The technical terms round which such bitter controversies raged in the 4th and 5th centuries are often found in Origen lying peacefully side by side. But this is just where his epoch-making importance lies, that all the later parties in the church learned from him. And this is true not only of the dogmatic parties; solitary monks and ambitious priests, hard-headed critical exegetes,2 allegorists, mystics, all found something congenial in his writings. The only man who tried to shake off the theological influence of Origen was Marcellus of Ancyra, who did not succeed in producing any lasting effect on theology.

The attacks on Origen, which had begun in his lifetime, did not cease for centuries, and only subsided during the time of the fierce Arian controversy. It was not so much the relation between pistis and gnosis—faith and knowledge—as defined by Origen that gave offence, but rather isolated propositions, such as his doctrines of the pre-existence of souls, of the soul and body of Christ, of the resurrection of the flesh, of the final restoration, and of the plurality of worlds. Even in the 3rd century Origen's view of the Trinity and of the Person of Christ was called in question, and that from various points of view. It was not till the 5th century, however, that objections of this kind became frequent. In the 4th century Pamphilus, Eusebius of Cappadocia, Athanasius, the Cappodocians, Didymus, and Rufinus were on the side of Origen against the attacks of Methodius and many others. But, when the zeal of Epiphanius was kindled against him, when Jerome, alarmed about his own reputation, and in defiance of his past attitude, turned against his once honoured teacher, and Theophilus, patriarch of Alexandria, found it prudent, for political reasons, and out of consideration for the uneducated monks, to condemn Origen—then his authority received a shock from which it never recovered. There were, doubtless, in the 5th century church historians and theologians who still spoke of Origen with reverence, but such men became fewer and fewer. In the West Vincent of Lerins held up Origen as a warning example (Comm. 5, 39, showing how even the most learned and most eminent of church teachers might become a misleading light. In the East the exegetical school of Antioch had an aversion to Origen; the Alexandrians had utterly repudiated him. Nevertheless his writings were much read, especially in Palestine. The monophysite monks appealed to his authority, but could not prevent Justinian and the fifth council of Constantinople (553) from anathematizing him. It is true that many scholars (e.g. Hefele, Concilien,) deny that Origen was condemned by this council; but Möller rightly holds that the condemnation is perfectly justifiable (see Berthel. 1873). SOURCES AND LITERATURE.—Next to the works of Origen (see Redepenning, " Des Hieronymus wiederaufgefundenes Verzeichniss der Schriften des Origenis," in Zeitschr. d. hist. Theol. (1851), pp. 66 seq.) the most important sources are: Gregory Thaumaturgus (or Orig. ; Euseb. H.E. vii.; Epiphanius, Hær. 61; the works of Methodius, the Cappodocians, Jerome (see De vir. ill. 54, 61) and Rufinus; Vincent. Letrin. Commonit. 23; Palladius, Hist. Laws. 147; Justinian, Ep. ad Mennan (Mansi, x. p. 487 seq.); Photius, Biblioth. 158; there is much of this critical and learned study. The best edition is that of Car. and C. Vinc. Delarue (4 vols. fol.) (Paris, 1753-1759), reprinted by Lommatzsch (25 vols. 8vo) (Berlin, 1831-1848) and by Migne, Patr. coll. complete. Ser. Gr., vols. xi.-xvii. Several new pieces have been edited by Gallandi and A. Mai. Amongst the older works on Origen those of Huettin (printed in Delarue, vol. iv.) are the best; but Tilmont, Fabricius, Walch (Historie d. Ketzerreien, vii. pp. 362-700) and Schröckl also deserve to be consulted. In the European church history the importance of the work of Origen has been exalted in the great works on church history by Baer, Dorner, Böhringer, Neander, Möller, Geschicht der Kosmologie in der griechischen Kirche and Kühn (Die Lehre von h. Geist, vol. i.; compare with these these two volumes, the history of Cosmology by Harnack, Uhberg and Zeller. Of monographs, the best and most complete is Redepenning, Origene, eine Darstellung seines Lebens und seiner Lehre (3 vols., 1844-1845). Compare Thomassius, "Origenis," Kriege (1852); Löffler, "Origenis," Schrötter (1859); S. Rakasa, in the Zeitschr. f. hist. Theol. (1843), i. p. 40 seq.; Fischer, "Comment. de Origine. theologio et cosmologiae" (1846); Ramers, Orig. Lehre von der Auferstehung des Fleisches (1851); Knittel, "Orig. Lehre von der Menschwerdung," in the Theol. Quartalschr. (1872); Schultz, "Christologie des Orig.,” in the Jahrb. f. protest. Theol. (1875); Melhborn, "Die Lehre von der menschlichen Freiheit nach Orig. in Zetzlits. f. Kirchen., vol. xii. (1876), ii. (1877); Seppel, Origine, vol. i., 2nd ed. (Paris, 1875). A full list of the later bibliographical works will be found in Harnack's Dogsmeisgeschichte and Chronologie. (A. H.A.)

ORIGINAL PACKAGE, a legal term in America, meaning, in general usage, the package in which goods, intended for interstate commerce, are actually transported wholesale. The term is used chiefly in determining the boundary between Federal and state jurisdiction in the regulation of commerce, and derives special significance by reason of the conflict between the powers of Congress to regulate commerce and the police legislation of the several states with respect to commodities considered injurious to public health and morals, such as intoxicating liquors, cigarettes and oleomargarine. By the Federal laws the commerce of the several states with foreign nations and commerce with foreign nations and among the several states, and with the Indian tribes, and each state is forbidden, without the consent of Congress, to "lay any impost or duties on imports or exports, except what may be absolutely necessary for executing

1 *Communis substantiae est filio cum patre: *ἀδερφός enim ἐννοεῖν τοῖς ἐνθέων videtur, i.e. unius substantiae cum illo corpore ex quo est.

2 E.g. Dionysius of Alexandria; compare his judicious verdict on the Apocalypse.
its inspection laws," and the basis of the law on the subject of "original package" was laid when, in 1827, Chief Justice Marshall interpreted these clauses in his decision in the case of Brown v. Maryland, which tested the constitutionality of an act of the legislature of Maryland requiring a licence from importers of foreign goods by bale or package and from persons selling the same by wholesale, to transport the same to any particular place. After pronouncing such a licence to be in effect a tax, the chief justice observed that so long as the thing imported remained "the property of the importer, in his warehouse, in the original form or package in which it was imported," a tax upon it was too plainly a duty on imports to escape the prohibition of the Constitution, that imported commodities did not become subject to the taxing power of the state unless they had "become incorporated and mixed with the mass of property in the country," that the right to sell a thing imported was incident to the right to import it, and consequently that a state tax upon the sale was repugnant to the power of Congress to regulate foreign commerce; and he added that the court supposed the same principles applied equally to interstate commerce. Later decisions agree that the right to import commodities or to ship them from one state to another carries with it the right to sell them and have established the boundary line between Federal and state control of both foreign imports and interstate ship- ments at a sale in the original package or at the breaking of the original package before sale for other purposes than inspection.

A state or a municipality may, however, tax while in their original packages any commodities which have been shipped in from another state provided there be no discrimination against such commodities; this permission being granted on the theory that a general non-discriminating tax is not a regulation of commerce and therefore not repugnant to the power of Congress to regulate interstate commerce. The first cases involving such commerce were decided in 1847. There were to be the constitutionality of a law of Massachusetts requiring a licence for the sale of wines or spirituous liquors in a less quantity than 28 gallons, of a law of Rhode Island requiring a licence for the sale of such liquors in a less quantity than 10 gallons, and a law of New Hampshire requiring a licence for the sale of wines or spirituous liquors in any quantity whatever, and in this case a barrel of gin had been bought in Boston Mass., carried to Dover, N.H., and there sold in the same barrel. Although the justices based their opinions on different principles, the cases involving a similar commerce between the power of Congress to regulate interstate commerce and the police powers of the several states were the Licence Cases adjudicated by the Supreme Court of the United States in January 1847. They were to test the constitutionality of a law of Massachusetts requiring a licence for the sale of wines or spirituous liquors in a less quantity than 28 gallons, of a law of Rhode Island requiring a licence for the sale of such liquors in a less quantity than 10 gallons, and a law of New Hampshire requiring a licence for the sale of wines or spirituous liquors in any quantity whatever, and in this case a barrel of gin had been bought in Boston Mass., carried to Dover, N.H., and there sold in the same barrel. Although the justices based their opinions on different principles, the cases involving a similar commerce were decided in 1847. The justices did not even agree that the power of Congress to regulate an interstate commerce included the power to authorize a sale after shipment, which is the basis of the original package doctrine as applied to interstate commerce, and Chief Justice Taney with two other justices who were of this opinion held that a state might nevertheless in the exercise of its police powers regulate such sales so long as Congress did not pass an act for that purpose. In this confused and uncertain state the matter rested until the adjudication of Lesy v. Hardin in 1889. In this case beer had been shipped from Illinois into Iowa and then sold in the original kegs and cases by an agent of the Illinois firm when Iowa had a law absolutely prohibiting the sale of intoxicating liquors within its limits except for pharmaceutical, medicinal, chemical or sacramental purposes. None of the justices now denied that the power of Congress to regulate an interstate commerce included the power to authorize a sale after shipment, and although there was disagreement with reference to the right of a state to regulate the sale in the absence of an act of Congress for that purpose, the majority of the court were of the opinion that: "Whenever a particular power of the general government is one which must necessarily be exercised by it, and Congress remains silent, this is not only not a concession that the powers reserved by the states may be exerted as if the specific power had not been elsewhere reposed, but, on the contrary, the only legitimate inference is that the general government intended that power should not be affirmatively exercised, and that the action of the states cannot be permitted to effect that which would be incompatible with such intention. Hence, inasmuch as interstate commerce, consisting in the transportation, purchase, sale and exchange of commodities, is national in its character and must be governed by a uniform system, so long as Congress does not pass any law to regulate it, or allowing the states so to do, it thereby indicates its will that such commerce shall be free and untrammelled."

The opinion of Chief Justice Taney in Pierce v. New Hampshire was therefore in part overruled and the Iowa law in so far as it applied to the sale in the original packages of liquors shipped in from another state was pronounced unconstitutional. As a consequence of this decision, Congress, in 1890, passed the Wilson Act providing that all fermented, distilled, or other intoxicating liquors or liquids transported into any state or Territory for use, consumption, sale or storage therein should, even though in the original packages, be subject to the police laws of the state or Territory to the same extent as those produced within the state or Territory. Even with this act, however, a state is not permitted to interfere with an interstate shipment of liquor direct to the consumer.

What constitutes an original package was the principal question in Austin v. Tennessee, which was decided in November 1900. The general assembly of Tennessee had in this case made it a misdemeanor for any party to sell or to bring into the state for sale or to sell or to bring into the state a given time any immemorial, foreign goods had purchased at Durham, North Carolina, a quantity of cigarettes. They were packed in pasteboard boxes containing ten cigarettes each. The boxes were then placed in an open basket and in this manner the cigarettes were delivered at the defendant's place of business in Tennessee where he sold a package without breaking it. The court decided against the defendant because it held that the manner of transportation was evidently for the purpose of evading the state law and that the boxes were not original packages within the meaning of the Federal law, and in this connexion it observed that "The whole theory of the exemption of the original package from the operation of the state laws is based upon the idea that the property is imported in the ordinary course of interstate commerce, and not brought into the country. These have gone at once into the hands of the wholesale dealers, who have been in the habit of breaking the package and distributing their contents among the several retail dealers throughout the state. It was with reference to this method of doing business that the doctrine of the exemption of the original package grew up."

In the case of Schollenberger v. Pennsylvania, however, the court decided that the state of Pennsylvania could not prohibit the sale of oleomargarine by retail when it had been shipped from Rhode Island in packages containing only 10 lb each, and the original package doctrine has been sharply criticized because of the difficulty in determining what constitutes an original package as well as because of the conflict between the doctrine and the police powers of the several states. It has been urged that the doctrine be abandoned and that commodities shipped into one state from another "be treated just like other goods already there are treated."

ORIHUELA—ORINOCO

ORIHUELA, a town and episcopal see of eastern Spain, in the province of Alicante; 13 m. N.E. of Murcia and about 15 m. from the Mediterranean Sea, on the Murcia-Elche railway. Pop. (1900) 28,530. Orihuela is situated in a beautiful and exceedingly fertile huerta, or tract of highly cultivated land, at the foot of a limestone bridge, and on both sides of the river Segura, which divides the city into two parts, Roig and San Augusto, and is spanned by two bridges. There are remains of a Moorish fort on the hill commanding the town; and the north gateway—the Puerta del Colegio—is a fine lofty arch, surrounded by an emblematic statue and the city arms. The most prominent buildings are the episcopal palace (1733), with a frontage of 600 ft., the town hall, formerly the cathedral, containing important archives; and the cathedral, a small Gothic structure built on the site of a former mosque in the 14th century, and enlarged and tastefully restored in 1829. The university of Orihuela, founded in 1568 by the archbishop of Valencia, was closed in 1835, part of the revenue being applied to the support of a college affiliated to the university of Valencia. Besides numerous primary schools there are a theological seminary and a normal school. The trade in fruit, cereals, oil and wine is considerable. There are also tanneries, dye-works and manufactures of silk, linen and woolen fabrics, leather and starch.

Orihuela was captured by the Moors in 713, and retaken by James I. of Aragon, for his father-in-law Alphonso of Castile, in 1215. It is situated in the vast division of the reign of Charles V. (1526), and again in the War of Succession (1706). Local annals specially mention the plague of 1628, the flood of 1631 and the earthquake of 1829.

ORILLIA, a town and port of entry of Simcoe county, Ontario, Canada, situated 84 m. N. of Toronto, on Lake Couchiching and on the Grand Trunk railway. Pop. (1901) 4997. It is a favourite summer resort, and has steamboat communication with other ports on Lakes Simcoe and Couchiching; it contains an asylum maintained by the provincial government; also saw and grist mills and iron foundries.

ORINOCO, a river in the north of South America, falling north-east into the Atlantic between 60° 20' and 63° 30' W. It is approximately 1300 m. long, but it is several hundred miles longer if measured by its Guaviare branch. Lying south and east of the main stream is a vast, densely forested region called Venezuelan Guiana, diversified by ranges of low mountains, irregular broken ridges and granitic masses, which define the courses of many unexplored tributaries of the Orinoco.

In 1498, Columbus, when exploring the Gulf of Paria, which receives a large part of the outflow of the Orinoco, noted the freshness of its waters, but made no examination of their origin. The caravels of Ojeda which, in 1499, followed almost the same track as that of Columbus, probably passed in sight of one or more of the mouths of the Orinoco. The first to explore any portion of the mighty river was the reckless and daring adventurer Ordaz. In his expedition (1501-1502) he ascended its principal outlet, the Boca de Navios, and, at the cost of many lives, ascended to the junction of the Meta with the parent stream. From Ordaz up to recent times the Orinoco has been the scene of many voyages of discovery, including those in quest of El Dorado, and some scientific surveys have been made, especially among its upper waters, by José Solano and Díaz de la Fuenté of the Spanish boundary line commission of Yturriaga and Solano (1757-1763), Humboldt (1800) and Michélena y Rojas (1855-1857). The last ascended to the Mawaca, a point about 170 m. above the northern entrance to the Caquňiquare canal, and then a few miles up the Mawaca. A little knowledge about its sources above these points was given by the savages to de la Fuenté in 1759 and to Mendoza in 1764, and we are also indebted to Humboldt for some valuable data.

At the date of the discovery, the Orinoco, like the Amazon, bore different names, according to those of the tribes occupying its margins. The conquistador Ordaz found that, at its mouth, it was called the Uriaparia, this being the name of the cacique of the tribe there. The Caribs, holding a certain section of the river, named it the Ibirinoco, corrupted by the Spaniards into Orinoco. It was known to other tribes as the Barraguan and to others as the Maraguan. The Cabres called it the Paragua, because it flowed such a vast area of country.

The principal affluent of the Orinoco from the Guiana district is the Venturari, the head-waters of which are also unknown. It is an important stream, which, running south-west, joins the Orinoco about 90 m. above its Guaviare branch. Two other large tributaries of it are the Rio Negro, which flows north-east, and the Rio Meta, from the north-west, which is navigable for large boats. Near its mouth the Guaviare is joined by its great south-western affluent, the Paria, which, before its confluence with the Orinoco, has a length of 700 m. up, this stream falls swiftly through a rough country, but for a long distance it is a succession of lakes and shallow, overflowed areas. Its head-waters do not reach the Andes.

The Guaviare and the Meta are the Orinoco is obstructed by the famous Maiipurea cataract, where, in several channels, it breaks through a granite spur of the Guiana highlands for a length of about
4 m., with a total fall of about 40 ft., and then, after passing two minor reeves, reaches the Atures rapids, where it plunges through a succession of gorges for a distance of about 6 m., winding among confused masses of granite boulders, and falling about 30 ft. at the base. After a distance of 10 m., the current becomes calmer, and as it proceeds northwards it increases its width until, at the point where it receives its Apure affluent, it is over 2 m. wide in the dry season and about 7 m. in floods. It rises 32 ft. at Cariben, but at the Angostura, or narrows, where the river is but 800 ft. wide, the difference between high and low water is 50 ft., and was even 60 in 1892.

The Orinoco finds its way to the ocean through a delta of about 700 m. in extent. This delta is about 100 m. wide; but as it proceeds northwards it increases its width until, at the point where it receives its Apure affluent, it is over 2 m. wide in the dry season and about 7 m. in floods. It rises 32 ft. at Cariben, but at the Angostura, or narrows, where the river is but 800 ft. wide, the difference between high and low water is 50 ft., and was even 60 in 1892.

a multiple star, situated in the famous nebula of Orion, one of the most beautiful in the heavens. (See Nebula.)

ORION and ORUS, the names of several Greek grammarians, frequently confused. The following are the most important. (1) Orion the Trojan (5th century a.d.), the teacher of Proclus the neo-Platonist and of Eudocius, the wife of the younger Theodorus. He taught at Alexandria, Caesarea in Cappadocia and Byzantium. He was the author of a partly extant etymological Lexicon (ed. F. W. Sturz, 1820), largely used by the compilers of the Etymologicum Magnum, the Etymologicum Gudianum and other similar works; a collection of maxims in three books, addressed to Eudocius, also ascribed to him by Suidas, still exists in a Warsaw MS. (2) Orus of Miletus, who, according to Ritschl, flourished not later than the 2nd century a.d., and was a contemporary of Herodan and a little junior to Phrynichus (according to Reitzenstein he was a contemporary of Orion). His chief works were treatises on orthography; on Atticisms, written in opposition to Phrynichus; on the names of nations. See F. Ritschl, De Oro et Orione Commentatio (1834); R. Reitzenstein, Geschichte der griechischen Etymologie (1897); and article "Orion" in Smith's Dictionary of Greek and Roman Biography.

ORISKANY, a village of Oneida county, New York, U.S.A., about 7 m. N.W. of Utica. Pop. about 800. Oriskany is served by the New York Central & Hudson River railway. There are malleable iron works and a manufactory of paper makers' felts here. In a ravine, about 2 m. west of Oriskany, was fought on the 6th of August 1777 the battle of Oriskany, an important manouevre of Burgoyne's American War of Independence. On the 4th of August Gen. Nicholas Herkimer, who had been colonel of the Tyrone county (New York) militia in 1775, and had been made a brigadier-general of the state militia in 1776, had gathered about 800 militiamen at Fort Dayton (on the site of the present Herkimer, New York) for the relief of Fort Schuyler (see Rome, N.Y.) then besieged by British and Indians under Colonel Barry St. Leger and Joseph Brant. On the 6th General Herkimer's force, on its march to Fort Schuyler, was ambushed by a force of British under Sir John Johnson and Indians under Joseph Brant in the ravine above mentioned. The rear portion of Herkimer's troops escaped from the trap, but were pursued by the Indians, and many of them were taken and killed. Between the remainder and the British and Indians there was a desperate hand-to-hand conflict, interrupted by a violent thunderstorm, with no quarter shown by either side. On hearing the firing near Fort Schuyler (incident to a sortie by Lieut.-Colonel Marinus Willet) the British withdrew, after about 200 Americans had been killed and as many more taken prisoners, the loss of the British in killed being about the same. General Herkimer (who had advised advancing slowly, awaiting signal shots announcing the sortie, and had been called "Tory" and "coward" in consequence), though his leg had been broken by a shot at the beginning of the action, continued to direct the fighting on the American side, but died on the 16th of August as a result of the clumsy amputation of his leg. The battle, though indecisive, had an important influence in preventing Sir John Johnson from effecting a junction with Gen. Burgoyne. The battlefield is marked by a monument erected in 1834. See Orderly Book of Sir John Johnson during the Oriskany Campaign (Albany, 1882), with notes by W. L. Stone and J. W. De Peyster; Publications of the Oneida Historical Society, vol. i. (Utica, N.Y., 1877); and Phoebe S. Cowen, The Herkirmers and Schuylers (Albany, 1891).

ORISSA, a tract of India, in Bengal, consisting of a British division and twenty-four tributary states. The historical capital is Cuttack; and Puri, with its temple of Jagannath, is world-famous. Orissa differs from the rest of Bengal in being under a temporary settlement of land revenue. A new settlement for a term of thirty years was concluded in 1900, estimated to raise the total land revenue by more than one half; the greater part of this increase being levied gradually during the first eleven years of the term. To obviate destructive inundations and famines, the Orissa system of canals has been constructed, with a capital outlay of nearly two millions sterling (see Mahanadi). The province is traversed by the East Coast railway, which was opened throughout from Calcutta to Madras in 1901.

The DIVISION OF ORISSA consists of the five districts of Cuttack, Puri, Balasore, Sambalpore and the forfeited state of Angul. Total area 13,770 sq. m.; pop. (1901) 5,003,122, showing an increase of 7% in the decade. According to the census of 1901 the total number of persons in all India speaking Oriya was more than 95 millions, showing that the linguistic area (extending into Madras and the Central Provinces) is much larger than the political province.

The whole of Orissa is holy ground. On the southern bank of the Baitarani shrine rises after shrine in honour of Siva, the All-Destroyer. On leaving the stream the pilgrim enters Jajpur, literally the city of sacrifice, the headquarters of the region of pilgrimage sacred to the wife of the All-Destroyer. There is not a fiscal division in Orissa without its community of cenobites, scarcely a village without consecrated lands, and not a single ancient family that has not devoted its best acres to the gods. Every town is filled with temples, and every hamlet has its shrine. The national reverence of the Hindus for holy places has been for ages concentrated on Puri, sacred to Vishnu under his title of Jagannath, the Lord of the World. Besides its copious water-supply in time of high flood, Orissa has an average rainfall of 62½ in. per annum. Nevertheless, the uncontrolled state of the water-supply has subjected the country from time immemorial to droughts no less than to inundation. Thus the terrible famine of 1865-1866, which swept away one-fourth of the entire population, was followed in 1866 by a flood which destroyed crops to the value of £3,000,000. Since then much has been done by government to hasten the abundant water-supply.

The early history of the kingdom of Orissa (Debasa), as recorded in the archives of the temple of Jagannath, is largely mythical. A blank in the records from about 50 B.C. to A.D. 310 corresponds to a period of Yavana occupation and Buddhist influence, during which the numerous rock monasteries of Orissa were excavated. The founder of the Kesari or Lion dynasty, which ruled from A.D. 474 to 1132, is said to have restored the worship of Jagannath, and under this line the great Sivaitc temple at Bhubaneshwar was constructed. In 1132 a new line (the Gajapati dynasty) succeeded, and Vishnu took the place of Siva in the royal worship. This dynasty was extinguished in 1532-1534, and in 1578, after half a century of war, Orissa became province of the Mogul empire. It nominally passed to the British in 1815, but not till 1878 did the Company assume the right of collecting revenue. A commissioner was appointed, and in 1879 the province was made into a separate division.

ORISTANO, a town and archiepiscopal see of Sardinia, situated 23 ft. above sea-level, about 3 m. from the eastern shore of a gulf on the W. coast, to which it gives its name, and 59 m. N. by W. of Cagliari by rail. Pop. (1901) 7107. The town preserves some scanty remains of the walls (dating from the end of the 13th century), by which it was surrounded, and two gates, the Porta Manna, surmounted by a lofty square tower, known also as the Torre S. Cristoforo, and the Porta Marina. The houses are largely constructed of sun-dried bricks, and are low, so that the area of the town is considerable in proportion to its population.
The cathedral was reconstructed in 1733 in the baroque style, and scanty traces of the original building of the 12th century exist (see D. Scano in L’Arte, 1901, p. 336; 1903, p. 15); and also in Storia dell’ arte in Sardegna dall’XI al XV secolo, Cagliari (Sassari, 1907). Some statuettes and sculptured slabs partly belonging to its pulpit, perhaps the work of Andrea Pisano, have been found; upon the reverse side of two of the slabs are still older relics of the 8th or 9th century; so that the slabs perhaps originally came from Tharros. In the sacristy is some fine silverwork. The church of S. Francesco also dates from the end of the 13th century, but has been altered. A fine statue by Nino, son of Andrea, is preserved here. Two m. south of Oristano is the village of S. Giusta, with a beautiful Romanesque church of the Pisan period dedicated to this saint (D. Scano, Bollettino dell’ arte, Feb. 1897, p. 8), containing several antique columns. It was once an independent episcopal see. The lagoons on the coast are full of fish, but are a cause of malaria. The environs are fertile, and a quantity of garden produce is grown; while good wine (vernicea) is also made, and also ordinary pottery in considerable quantities, supplying most of the island. The bridge crossing the river Tirso, a little to the north of the town, over 300 ft. long, with five arches, took the place, in 1870, of an old one which is said to have been of Roman origin. A m. south of the mouth of this river is the landing-place for shipping. The large orange groves of Mills lie 13 m. N. of Oristano at the base of Monte Ferru, where they are sheltered from the wind. The finest belong to the Marchese Boyl, whose plantation contains some 500,000 orange and lemon trees. The inhabitants of Mills manufacture reed baskets and mats, which the town has been noted for.

Oristano occupies the site of the Roman Othoca, the point at which the inland road and the coast road from Carales to Turris Libisonis bifurcated, but otherwise an unimportant place, overshadowed by Tharros. The medieval town is said to have been founded in 1700. It was the seat from the 11th century onwards of the giudici (judges) of Arborea, one of the four divisions of the island. Almost the last of these judges was Eleonora (1347–1463); after her death Oristano became the seat of a marquisate, which was suppressed in 1478. The frontier castles of Monreale and Sanluri, some 20 and 30 m. respectively to the S.S.E., were the scene of much fighting between the Aragonese government and the giudici and marquises of Arborea in the 14th century.

ORIYA (properly Orbíya), the Aryan language of Orja or Oriasa in India. It is the vernacular not only of that province but also of the adjoining districts and native states of Madras and of the Central Provinces. In 1901 it was spoken by 9,687,429 people. It is closely related to Bengali and Assamese, and with them and with Bihari it forms the Eastern Group of the Indo-Aryan vernaculars. See Bengali.

ORIZABA (Aztec, Cildálepel, “star mountain”), an extinct or dormant volcano, on the boundary between the Mexican states of Puebla and Vera Cruz and very nearly on the 19th parallel. It rises from the southern-eastern margin of the great Mexican plateau to an elevation of 18,314 ft., according to Scofield and Bunsen’s measurements in 1851–1852, or 18,250 and 18,200 ft. according to other authorities, and 18,701 (5750 metres) by the Comisión Geográfica Exploradora. It is the highest peak in Mexico and the second highest in North America. Its upper timber line is about 13,350 ft. above sea-level, and Hans Gadow found patches of apparently permanent snow at an elevation of 14,420 ft. on its S.E. side in 1902. The first ascent of Orizaba was made by Reynolds and Maynard in 1848, since when other successful attempts have been made and many failures have been recorded. Its last eruptive period was 1545–1566, and the volcano is now considered to be extinct, although Humboldt records that smoke was seen issuing from its summit as late as the beginning of the 19th century.

ORIZABA (Indian name Ahualilas-apan, pleasant waters), a city of Mexico in the state of Vera Cruz, 82 m. by rail W.S.W. of the port of Vera Cruz. Pop. (1900) 32,894, including a large percentage of Indians and half-breeds. The Mexican railways afford frequent communication with the City of Mexico and Vera Cruz, and a short line (43 m.) connects with Ingenio, an industrial village. Orizaba stands in a fertile, well-watered, and richly wooded valley of the Sierra Madre Oriental, 4015 ft. above sea-level, and about 18 m. S. of the snow-crowned volcano that bears its name. It has a mild, humid and healthful climate. The public edifices include the parish church of San Miguel, a chamber of commerce, a handsome theatre, and some hospitals. The city is the centre of a rich agricultural region which produces sugar, rum, tobacco and Indian corn. In colonial times, when tobacco was one of the crown monopolies, Orizaba was one of the districts officially licensed to produce it. It is also a manufacturing centre of importance, having good water power from the Rio Blanco and producing cotton and woolen fabrics. Its cotton factories are among the largest in the republic. Part of it also made at Cocomant in the state.

The forests in this vicinity are noted for orchids and ferns. An Indian town called Ahualailasapan, subject to Aztec rule, stood here when Cortez arrived on the coast. The Spanish town that succeeded it did not receive its charter until 1774, though it was one of the stopping-places between Vera Cruz and the capital. In 1862 it was the headquarters of the French.

ORKHON INSCRIPTIONS, ancient Turkish inscriptions of the 8th century a.d., discovered near the river Orkhon to the south of Lake Baikal in 1850. They are written in an alphabet derived from an Aramaic source and recount the history of the northern branch of the Turks or Tu-ku-e of Chinese historians. See Turks.

ORKNEY, EARL OF, a Scottish title held at different periods by various families, including its present possessors the Fitzmaurices. The Orkney Islands (q.v.) were ruled by jarls or earls under the supremacy of the kings of Norway from very early times to about 1360, many of these jarls being also earls of Caithness under the supremacy of the Scottish kings. Perhaps the most prominent of them were a certain Paul (d. 1099) who assisted the Norwegian king, Harald III. Haardraada, when he invaded England in 1066; and his grandson Paul the Silent, who built, at least in part, the cathedral of St Magnus at Kirkwall. They were related to the royal families of Scotland and Norway.

In its more modern sense the earldom dates from about 1380, and the first family to hold it was that of Sinclair, Sir Henry Sinclair having married (d. 1406) of Roslin, near Edinburgh, being recognized as earl by the king of Norway. Sir Henry was the son of Sir William Sinclair, who was killed by the Saracens whilst accompanying Sir James Douglas, the bearer of the Bruce’s heart, to Palestine in 1330, and on the maternal side was the grandson of Malise, who called himself earl of Strathearn, Caithness and Orkney. He ruled the islands almost like a king, and employed in his service the Venetian travellers Nicolò and Antonio Zeno. His son Henry (d. 1418) was admiral of Scotland and was taken prisoner by the English in 1406, together with Prince James, afterwards King James I.; his grandson William, the 3rd earl (c. 1404–1480), was chancellor of Scotland and took some part in public affairs. In 1455 William was created earl of Caithness, and in 1468 the regent of Scotland, who had just acquired the sovereignty of these islands through his marriage with Margaret, daughter of Christian I., king of Denmark and Norway. In 1567 Queen Mary’s lover, James Hepburn, earl of Bothwell, was created duke of Orkney, and in 1581 her half-brother Robert Stewart (d. 1592), an illegitimate son of James V., was made earl of Orkney. Robert, who was abbot of Holyrood, joined the party of the reformers and was afterwards one of the principal enemies of the regent Morton. His son Patrick acted in a very arbitrary manner in the Orkneys, where he set the royal authority at defiance; in 1606 he was seized and imprisoned, and, after his bastard son Robert had suffered death for leading a rebellion, he himself was executed in February 1614, when his honours and estates were forfeited.

In 1606 Lord George Hamilton was created earl of Orkney (see below). He married Elizabeth Villiers (see below), and he was succeeded by his daughter Anne (d. 1756), the wife of...
ORKNEY, COUNTESS OF ORKNEY ISLANDS

William O'Brien, 4th earl of Inchiquin. Anne's daughter Mary (c. 1721-1791) and her granddaughter Mary (1755-1831) were both countesses of Orkney in their own right; the younger Mary married Thomas Fitzmaurice (1742-1803), son of John Petty, earl of Shelburne, and was succeeded in the title by her grandson, Thomas John Hamilton Fitzmaurice (1803-1877), whose descendants still hold the earldom.

ORKNEY, ELIZABETH HAMILTON, COUNTESS OF (c. 1657-1733), mistress of the English King William III., daughter of Colonel Sir Edward Villiers of Richmond, was born about 1657. Her mother, Frances Howard, daughter of the 2nd earl of Suffolk, was governess to the princesses Mary and Anne, and secured place and influence for her children in Mary's household. Edward Villiers, afterwards created 1st earl of Jersey (1656-1711), became master of the horse, while his sister Anne and their husband were among the maids of honour who accompanied Mary to the Hague on her marriage. Elizabeth Villiers became William's acknowledged mistress in 1680. After his accession to the English crown he settled on her a large share of the confiscated Irish estates of James II. This grant was revoked by parliament, however, in 1699. Mary's distrust of Marlborough was fomented by Edward Villiers, and the bitter hostility between Elizabeth Villiers and the duchess of Marlborough perhaps helped to secure the duke's disgrace with William. Shortly after Mary's death, William, actuated, is said, by his wife's expressed wishes, broke with Elizabeth Villiers, who was married to her cousin, Lord George Hamilton, fifth son of the 3rd earl of Orkney. The husband was gratified early in the next year with the titles of earl of Orkney, viscount of Kirkwall and Baron Dochmont. The countess of Orkney served her husband's interests with great skill, and the marriage proved a happy one. She died in London on the 19th of April 1733.

ORKNEY, GEORGE HAMILTON, EARL OF (1666-1737). British soldier, was the fifth son of William, duke of Hamilton, and was trained for the military career by his uncle, Lord Dumbarton, in the 1st Foot. In 1689 he became lieut.-colonel and a few months later brevet colonel. He served at the battles of the Boyne and of Aughrim, and, at the head of the Royal Fusiliers, at Steinkirk. As colonel of his old regiment, the 1st Foot, he took part in the battle of Landen or Neerwinden, and in the siege of Namur, serving again at Athole and Limerick in the Irish war. At Namur Hamilton received a severe wound, and in recognition of his services was made a brigadier. In 1695 he married Elizabeth Villiers (see above), who was "the wisest woman" Swift "ever knew." The following year he was made earl of Orkney in the Scottish peerage. As a major-general he took the field with Marlborough in Flanders, and on January 1st, 1703-1704 he became lieutenant-general. At Blenheim it was Orkney's command which carried the village, and in June 1705 he led a flying column which marched from the Moselle to the rescue of Liege. At Ramilies he headed the pursuit of the defeated French, at Oudenarde he played a distinguished part and in 1708 he captured the forts of St. Amand and of Tourne. At the battle of Malplaquet Lord Orkney's battalions led the assault on the French entrenchments, and suffered very severe losses. He remained with the army in Flanders till the end of the war, as "general of the foot," and at the peace he was made colonel-commandant of the 1st Foot as a reward for his services. He occupied various civil and military posts of importance, culminating with the appointment of "field marshal of all His Majesty's forces" in 1736. This appointment is the first instance of field marshal's rank (as now understood) in the British Service. A year later he died in London.

ORKNEY ISLANDS, a group of islands, forming a county, off the north coast of Scotland. The islands are separated from the mainland by the Pentland Firth, which is 61 m. wide between Brough Ness in the island of South Rona and Hoy Head in Caithness-shire. The group is commonly estimated to consist of 67 islands, of which 30 are inhabited (though in the case of four of them the population comprises only the light-house attendants), but the number may be increased to as many as 90 by including rocky islets more usually counted with the islands of which they probably once formed part. The Orkneys lie between 58° 41' and 59° 24' N., and 2° 22' and 3° 26' W., measure 50 m. from N.E. to S.W. and 29 m. from E. to W., and cover 240,476 acres or 372.5 sq. m. Excepting on the west coasts of the larger islands, which present rugged cliffs sceney remarkable both for beauty and for colouring, the group lies somewhat low and is of bleak aspect, owing to the absence of trees. The highest hills are found in Hoy. The only other islands containing heights of any importance are Pomona, with Ward Hill (880 ft.), and Wilsfords (749 ft.) and Rousay. Nearly all of the islands possess lakes, and Loch Harray and Loch Stenness in Pomona attain noteworthy proportions. The rivers are numerous, and large streams flow through the high land. Excepting on the west fronts of Pomona, Hoy and Scapa, the land is deeply indented, and the islands themselves are divided from each other by straits generally called sounds or strills, though off the north-east of Hoy the designation Brink Deep is used, south of Pomona is Scapa Flow and to the south-west of Eday is found the Fall of Warness. The very names of the islands indicate their nature, for the terminal s or ay is the Norse cy, meaning "island," which is scarcely disguised even in the words Pomona and Hoy. The islets are usually styled holms and the isolated rocks skerries. The tidal currents, or races, or roast (as some of them are called locally, from the Gaelic) off many of the isles run with enormous velocity, and whirlpools are of frequent occurrence, and strong enough at times to prove a considerable danger to navigation. The climate does not lie in their ordinary physical features, so much as in beautiful atmospheric effects, extraordinary examples of light and shade, and rich coloration of cliff and sea.

Geology.—All the islands of this group are built up entirely of Old Red Sandstone. As in the neighbouring mainland of Caithness, these rocks rest upon the metamorphic rocks of the eastern schists, as may be seen on Pomona, where a narrow strip is exposed between the islands of Inganess and Orkney. In a small island of Graemsay, they are represented by grey gneisses and granite. The upper division of the Old Red Sandstone is found only in Hoy, where it forms the Old Man and neighbouring cliffs on the N.W. coast. The Old Man presents a characteristic section, for it exhibits a thick pile of massive, current-bedded red sandstones, resting, near the foot of the pinnacles, upon a thin bed of amygdaloidal porphyry, which in its turn lies unconformably upon steeply inclined flagstones. This bed of volcanic rocks is followed by a stratum of quartzite flint, and this in its turn by a bed of quartzite grit and greenstone. The quartzite grit and greenstone are succeeded by a bed of flint with a layer of red sandstone, and this in turn by a series of beds with flint and quartzite strata. The flagstones from the flagstones to the sandstones may be followed from Westray S.E. into Eday. A strong synclinal fold traverses Eday and Shapinsey, the axis being N. and S. Near Haco's Ness in Shapinsay there is a small area of Towinsay, a sandstone which is thinner and harder than that in Hoy. Many indications of ice action are found in these islands; striated surfaces are to be seen on the cliffs in Eday and Westray, in Kirkwall Bay and on Stenno Hill in Eday; boulder clay, with boulders of granite and gravel, covers the larger rocks foreign to the islands (chalk, oolitic limestone, flint, &c.), which must have been brought up from the region of Moray Firth, rests upon the old strata in many places. Local moraines are found in some of the valleys of Pomona and Hoy.

Climate and Industries.—The climate is remarkably temperate and equable for so northerly a latitude. The average temperature for the year is 46° F., for winter 30° F. and for summer 54°-5 3° F. From December to February are the coldest months and from June to August the warmest. The coldest winter is that at Hoy, with heavy snow, and the warmest in March, the last of which is probably the Martin's summer of more southerly climes. The average annual rainfall varies from 33.3 in. to 37 in. Fogs occur during summer and early autumn, and furious gales may be expected four or five times a year. When the Atlantic waves break against the islands the result is a storm, the last of which is probably the Martin's summer of more southerly climes. The average annual rainfall varies from 33.3 in. to 37 in. Fogs occur during summer and early autumn, and furious gales may be expected four or five times a year. When the Atlantic waves break against the islands the result is a storm, the last of which is probably the Martin's summer of more southerly climes. ORKNEY ISLANDS

The methods of agriculture were of a primitive character, but since they have been entirely transformed, and Orcadian farming is now not below the average standard of the Scottish lowlands. The crofters' houses have been rebuilt of stone and lime, and are surrounded by gardens and patches of orchard. The crofting is fair, the average being between 30 and 40 acres. Practically the only grain crops that are cultivated are oats (which greatly predominate) and barley, while the favoured root crop is potato. The island has no trees, and most of the area covered by heather and gorse has been brought under cultivation, and the acreage under wood is insignificant. The raising of live stock is rigorously pursued. The chief industry, formerly of at least minor importance, has ceased. Sandstone is quarried on several islands, and distilleries are found in Pomona (near Kirkwall and Stromness). But apart from agriculture the principal industry is fishing. The district is one of the most important salmon fisheries of the British islands, and the herring fishery, but when their supremacy was destroyed by the salt duty, and the Orcadians failed to seize the opportunity thus presented, and George Barry (d. 1865) says that in his day the fisheries were well organized. The herring fishery has since been organized, and over 2000 persons are employed in the various branches of it. The great catches are herring, cod, ling, and lobsters and crabs are also exported in large quantities. There is a regular communication by steamer to the south of the Orkneys: from Wick, Aberdeen and Leith, and also between Kirkwall and Lerwick and other points of the Shetlands.

Population and Administration.—In 1801 the population numbered 30,453, and in 1901 it was 28,609, or 67 persons to the sq. m. In 1901 there were 70 persons who spoke Gaelic and English, but none who spoke Gaelic only. Orkney unites with Shetland to send one member to parliament, and Kirkwall, the county town and the only royal burgh, is one of the Wick district groups of parliamentary burghs. There is a combination poorhouse at Kirkwall, where there are also two hospitals. Orkney forms a sheriffdom with Shetland and Caithness, and a resident sheriff-substitute sits at Kirkwall. The county is under the school-board jurisdiction, but at Kirkwall and Stromness there are public schools giving secondary education.

The Inhabited Islands.—Promising that they are more or less scattered, and that several lie on the same plane, the following gives the principal points of interest in the archipelago, as seen from the number within brackets indicating the population. Sule Skerry (3) and the Pentland Skerries (8) lie at the eastern entrance of the Pentland Firth; Swona (23), 1/2 m. from the mainland, belongs to Caithness, and was formerly called Caithness Skerry; Vatersay (1919) is the best cultivated and most fertile of the southern islands of the group. On Hoxa Head, to the west of the large village of St Margaret's Hope, is a broch, or round tower, and the island contains, besides examples of Picts' houses and standing stones, Hoy (q.v.; 1216) is the southernmost of the larger islands. Flotta (372), east of Hoy, was the home for a long time of the Norwegian compiler of the Codex Flacianus, which furnished Thorndike with important facts for his History of Norway, more particularly with reference to the Norse occupation of Orkney. Farnaby (59) also lies E. of Hoy. Burray (677) is famous for the broch from which the island takes its name. Braewick (37) is the largest island on the north-western shore, is 15 ft. high, has walls from 15 to 20 ft. thick, built of layers of flat stones without cement or mortar, and an interior diameter of 40 ft. It is entered from the east by a passage, on each side of which is a small chamber constructed within the thickness of the wall. Similar chambers occur on the west, north and south sides, accessible only from the interior. Another chamber is a large and high room, adjoining the walls, which have been erected, the one at the north-west and the other at the north-east corner. The cliffs of Copinsay (10) are a favourite haunt of sea-birds, which are captured by the croftsmen for their feathers and eggs. Frithney (5) is a small islet 3 m. N.E. of the Naver, and fancied resemblance to a horse rearing its head from the sea, is called the Horse of Copinsay. Pomona (q.v.; 16,235) is the principal island, and as such is known also as Mainland. Shapinsay (265) was the birthplace of William Irving, father of Washington Irving. It possesses several examples of Pictish and Scandinavian antiquities, as well as the famous Home Farm of Balfron Castle, a mansion in the Scottish Baronial style built in 1848, situated near the south-western extremity of the island. The island takes its name from Hjölpand, a Norse viking. Gairnay (33) was the residence of the admiral Constantine. The Orkneyinga Saga for his exploits as a trenchedman and his feats in battle. Strowness (1159) is a busy station of the herring fishing, and is also largely under cultivation. At Lamb Head, its south-western extremity, is the important Northmavine, developed for coastal and fishing purposes. Stroma (1216) is a busy station of the herring fishing, and is also largely under cultivation. At Lamb Head, its south-western extremity, is the important Northmavine, developed for coastal and fishing purposes. Stroma (1216) is an island on which St Magnus was murdered by his cousin Hacje in 1155. It does not appear on any Orkney map. The church (ecclesia) Island—from the little church of St Magnus, now in ruins, consisting of a chancel 15 ft. long, and nave 30 ft. long. The building has a round tower at the west end of the nave. The tower resembles similar constructions found beside Irish churches of the 7th and 8th centuries and has walls 3 ft. thick. It is doubtful whether it must be ascribed to the Celtic evangelists or to a much later period—not earlier than the 12th century. On Rousay (627) the 7th century monastery is supposed to have existed. No church now remains, and commands a survey of the northern isles of the archipelago. At the southern base of the hill stands the fine mansion of Trumblad House. Eday (956) consists of a small village, mounds and several old stone cairns. It affords good pastureage and has one lime quarry. Carrick village, once a burgh of barony, with salt pans and other manufactures, was named after the earl of Carrick, brother of Robert the Bruce. In 1471 a fire swept through the town of Stromness, and when it was restored in 1481 was named after her flight from Loch Leven. It dates from the 15th century or even earlier, and was at one time the property of Sir Gilbert Balfour, the Master of Queen Mary's Household. The building, now in ruins, was never completed. On one side of the inner court, to which a finely ornamental doorway gives access, is a large hall with a vaulted ceiling of stone, 20 ft. high. The cliffs and overhanging crags at Noup Head (250 ft.), the most westerly point, are remarkably picturesque. An isolated portion, divided from the headland by a narrow chasm, is known as the Stack of Noup. Gentleman's Cave, 1 m. to the south, was so called from the circumstance that it afforded shelter to five of the leading followers of Prince Charles Edward in 1745. In the last century was a place to which Papas Westray (295) and North Ronaldsay (442) are the most northerly islands of the group. The latter is only reached from Sanday, from which it is separated by a dangerous passage. A recent marriage with Ogelthorpe, which was discovered in the broch of Burnur, must date from the days of the early Christian missionaries.

History.—The Orkneys were the Orcades of classical writers, and their name is probably derived from the Norse Ork, seal, and ey, island. The original inhabitants were Picts, evidence of whose occupation still exists in numerous weems or under-ground houses, chambered mounds, barrows or burial mounds, brochs or round towers, and stone circles and standing stones. Such implements as have survived are of the rudest description, and include querns or stone handmills for grinding corn, stone works and bone combs employed in primitive forms of woollen manufacture, and specimens of simple pottery ware. If, as seems likely, the Dalriadic Scots towards the beginning of the 6th century established a footing in the islands, their success was short-lived, and the Picts regained power and kept it until dispossessed by the Norsemen in the 9th century. In the long account of Irish missions about 595. They were companions of St Columba and their efforts to convert the folk to Christianity seem to have impressed the popular imagination, for several islands bear the epithet "Papa" in commemoration of the preachers. Norse pirates having made the islands the headquarters of their buccaneering expeditions indifferently against their own Norway and the coasts and islands of Scotland, Harold Harfager ("Fair Hair") subdued
the rovers in 875 and both the Orkneys and Shetlands to Norway. They remained under the rule of Norse ears until 1231, when the line of the Jars became extinct. In that year the earldom of Caithness was granted to Magnus, second son of the earl of Angus, whom the king of Norway apparently confirmed in the title. In 1408 the Orkneys and Shetlands were pledged by Christian I. of Denmark for the payment of the dowry of his daughter Margaret, betrothed to James III. of Scotland, and when the money was not forthcoming, their connexion with the crown of Scotland has been perpetual. In 1471 James bestowed the castle and lands of Ravenscraig in Fife on William, earl of Orkney, in exchange for all his rights to the earldom of Orkney, which, by act of parliament passed on the 20th of February of the same year, was annexed to the Scottish crown. In 1564 Lord Robert Stewart, natural son of James V., who had visited Kirkwall twenty-four years before, was made sheriff of the Orkneys and Shetlands, and received possession of the estates of the udallers; in 1581 he was created earl of Orkney by James IV., the charter being ratified ten years later to his son Patrick, but in 1613 the earldom was again annexed to the crown. The islands were the rendezvous of Montrose's expedition in 1650 which culminated in the battle of Dunbar, and the next year preparations were made by the Government of Scotland, in the midst of the war with Cromwell, to detach the inhabitants into various industrial arts and new methods of agriculture. In 1707 the islands were granted to the earl of Morton in mortgage, redeemable by the Crown on payment of £30,000, and subject to an annual feu-duty of £500; but in 1766 his estates were sold to Sir Lawrence Dundas, ancestor of the earls of Zetland. In early times both the archbishop of Hamburg and the archbishop of York disputed with the Norwegians ecclesiastical jurisdiction over the Orkneys and the right of consecrating bishops; but ultimately the Norwegian bishops, the first of whom was William the Old, consecrated in 1102, continued the canonical succession. The see remained vacant from 1386 to 1606, and during those years the Restoration, and the reigns of James VI. and I., the Norwegians finally abolished (1667), although many of the clergy refused to conform. The topography of the Orkneys is wholly Norse, and the Norse tongue, at last extinguished by the constant influx of settlers from Scotland, lingered until the end of the 18th century. Readers of Scott's Pirate will remember the frank contempt which Magnus Troll expressed for the Scots, and his opinions probably accurately reflected the general Norse feeling on the subject. When the islands were given as security for the princess's dowry, there seems reason to believe that it was intended to redeem the pledge, because it was then stipulated that the Norse system of government and the law of St Olaf should continue to be observed in Orkney and Shetland. Thus the udal succession and mode of tenure (descending from a feudal tenure) still obtain to some extent, and the remaining udallers hold their lands and pass them on without written title. Among well-known Orcadians may be mentioned James Atkine (1613-1657), bishop first of Moray and afterwards of Galloway; Murdoch McKenzie (d. 1797), the hydrographer; Malcolm Laing (1762-1818), author of the History of Scotland from the Union of the Crowns to the Union of the Kingdoms; Mary Brunton (1778-1818), author of Self-Control, Discipline and other novels; Samuel Laing (1782-1865), author of A Residence in Norway, and translator of the Heimskringla, the Icelandic chronicle of the kings of Norway; Thomas Stewart Traill (1781-1862), professor of medical jurisprudence in Edinburgh University and editor of the 8th edition of the Encyclopaedia Britannica; Samuel Laing (1812-1859), chairman of the Promontory, Brodick & South Coast railway, and introducer of the system of "parliamentary" trains with fares of one penny a mile; Dr John Rae (1813-1893), the Arctic explorer; and William Ballfuir Baikie (1825-1864), the African traveller.

ORLEANAIS—ORLEANISTS

One of the provinces into which France was divided before the Revolution. It was the country around Orleans, the pagus Aurelianensis; it lay on both banks of the Loire, and for ecclesiastical purposes formed the diocese of Orleans. It was in the possession of the Capet family before the advent of Hugh Capet to the throne of France in 887, and in 1344 Philip VI. gave it the title of duke to Philip (d. 1357), one of his younger sons. In a geographical sense the region around Orleans is sometimes known as Orleanais, but this is somewhat smaller than the former province.

See A. Thomas, Les États provinciaux de la France centrale (1879).

ORLEANISTS, a French political party which arose out of the Revolution, and ceased to have a separate existence shortly after the establishment of the third republic in 1872. It took its name from the Orleans branch of the house of Bourbon, the descendants of the duke of Orleans, the younger brother of Louis XIV., who were its chiefs. The political aim of the Orleanists may be said to have been to find a common measure for the monarchical principle and the "rights of man" set forth by the revolutionary leaders in 1789. The articles on Philippe, nicknamed Égalité (see Orleans, L.P.J., duke of), and his son Louis Philippe, king of the French (1830-1848), will show the process of events by which it came to pass that the Orleans princes became the more or less successful advocates of this attempted compromise between old and new. It may be noted here, however, that a certain attitude of opposition, and of patronage of "freedom," was traditional in this branch of the house of Bourbon. Saint-Simon tells us that the regent Orleans who died in 1723 was in the habit of avowing his admiration for English liberty—at least in safe company and private conversation. Égalité, who had reasons to dislike King Louis XVI. and his queen, Marie Antoinette, stepped naturally into the field of speculation and invention, and, with no pretensions to revolutionary time, it was a short step from that position to the attitude of liberal candidates for the throne, as against the elder branch of the royal house which claimed to reign by divine right. The elder branch as represented by Louis XVIII. was prepared to grant (octroyer), and did grant, a charter of liberties. The count of Chambord, the last of the line (the Spanish Bourbons who descended directly from Louis XIV. were considered to be barred by the renunciation of Philip V. of Spain), was equally ready to grant a constitution. But these princes claimed to rule "in chief of God" and to confer constitutional rights on their subjects of their own free will, and mere motion. This feudal language and these mystic pretensions offended a people so devoted to principles as the French, and so acute in drawing deductions from premises, for they concluded, not unreasonably, that rights granted as a favour were always subject to revocation as a punishment. Therefore those of them who considered a monarchical government as more beneficial to France than a republic, but who were not disposed to hold their freedom subject to the pleasure of a king, were either Bonapartists who professed to rule by the choice of the nation, or supporters of the Orleans princes who were ready to reign by an "original compact" and by the will of the people. The difference therefore between the supporters of the elder line, or Legitimists, and the Orleanists was profound, for it went down to the very foundations of government.

The first generation of Orleanists, the immediate supporters of Philippe Égalité, were swept up in the turmoil of the 1830 revolution. Yet it has been justly pointed out by Albert Sorel in his L'Europe et la révolution française, that they subsisted under the Empire, and that they came naturally to the front when the revival of liberalism overthrew the restored legitimate monarchy of Louis XVIII. and Charles X. During the Restoration, 1815-1830, everything tended to identify the liberals with the Orleanists. Legitimism was incompatible with constitutional freedom. Bonapartism was in eclipse, and was moreover essentially a Caesarism which in the hands of the great Napoleon
had been a despotism, calling itself democratic for no better reason than because it reduced all men to an equality of submission to a master. Those rights of equality before the law, and in social life, which had been far dearer to Frenchmen of the revolutionary epoch than the political freedom, were secured. The next step was to obtain political freedom, and it was made under the guidance of men who were Orleanists because the Orleans princes seemed to them to offer the best guarantee for such a government as they desired—a government which did not profess to stand above the people and to own it by virtue of a divine and legitimate hereditary right, nor one which, like the Bonapartists, implied a master relying on an army, and the general subjection of the nation. The liberals who were Orleanists had the advantage of being very ably led by men eminent in letters and in practical affairs—Guizot, Thiers, the Broglies, the banker Laffitte and many others. When the unsurpassed folly of the legitimate rulers brought about the revolution of 1830, the Orleanists stepped into its place, and they marked the profound change which had been made in the character of the government by calling the king, "King of the French" and not "King of France and Navarre." He was chief of the people by compact with the people, and not a territorial lord holding, in feudal phrase, "in chief of God."

The events of the eighteen years of Orleanist rule cannot be detailed here. They were on the whole profitable to France. That they ended in another "general overturn" in 1848 was due no doubt in part to errors of conduct in individual princes and politicians, but mainly to the fact that the Orleanist conception of what was meant by the word "people" led them to offend the long-standing and deeply-rooted love of the French for equality. It had been by law that the Orleans princes were incomparably their dislike of "divine right" on the one hand, and their fear of democratic Caesarism on the other, should turn for examples of a free government to England, and in England itself to the Whigs, both the old Whigs of the Revolution Settlement of 1689, and the new Whigs who extorted political franchises for the middle classes by the Reform Bill. They saw there a monarchy based on a parliamentary title, governing constitutionally and supported by the middle classes, and they endeavoured to establish the like in France under the name of a juste-milieu, a via media between absolutism by divine right, and a democracy which they were convinced would lead to Caesarism. The French equivalent for the English middle-class constituencies was to be a powerful assembly of their own, but for a political fusion of voices by which all the rest of the country was to be "virtually represented." The doctrine was expounded and was acted upon by Guizot with uncompromising rigour. The Orleanist monarchy became so thoroughly middle-class that the nation outside of the pays légal ended by thinking that it was being governed by a privileged class less offensive, but also a great deal less brilliant, than the aristocracy of the old monarchy.

The revolution of 1830 swept the Orleanist party from power for ever. The Orleanists indeed continued throughout the Second Republic and the Empire (1852–1870) to enjoy a marked social and literary prestige, on the strength of the wealth and capacity of some of their members, their influence in the French Academy, and the fact that they exercised in particular the Revue des deux mondes, the Journal des débats, and the papers directed by E. Hervé. During the Empire the discreet opposition of the Orleanists, exercised for the most part with infinite dexterity and tact, by reticences, omissions, and historical studies in which the Empire was attacked under foreign or ancient names, was a perpetual thorn in the side of Napoleon III. Yet they possessed little hold on the country and outside of a cultivated liberal circle in Paris. Their weakness was demonstrated when the second empire was swept away by the German War of 1870–71. The country in its disgust at the Bonapartists and its fear of the Republicans, chose a great many royalists to represent it in the Assembly which met in Bordeaux on the 12th of February, 1872. In this body the Orleanists again exhibited a kind of leadership by virtue of individual capacity, but they were counterbalanced by the Legitimists. The most effective proof of power they gave was to render possible the expulsion from power of Thiers on the 24th of May 1873, as punishment for his dexterous imposition of the Republic on the unwilling majority of the Assembly. Their real occupation was to endeavour to bring about a fusion between themselves and the Legitimists which should unite the two royalist parties for the confusion of the Bonapartists and Republicans. The belief that a fusion would strengthen the royalists was natural and was not new. As far back as 1830 Guizot had proposed, or had thought of proposing, one, but it was on the condition that the comte de Chambord would resign his divine pretentions. When a fusion was arranged in 1873 it was on quite another footing. After much exchange of notes and many agitated conferences in committee rooms and drawing-rooms, the comte de Paris, the representative of the Orleanists, sought an interview with the comte de Chambord at Frohsdorf, and obtained it by giving a written engagement that he came not only to pay his respects to the head of his house, but also to "accept his principle." It has been somewhat artlessly pleaded by the Orleanists that this engagement was given with mental reservations. But there were no mental reservations on the part of the comte de Chambord, and the country showed its belief that the liberal royalists had been fused by absorption in the divine right royalists. It returned republicans at by-elections till it transformed the Assembly. The Orleanist princes had still a part to play, more particularly after the death of the comte de Chambord in 1883 left them heads of the house of France, but the Orleanist party ceased to exist as an independent political organization.

AUTHORITIES.—The Orleanists are necessarily more or less dealt with in all histories of France since 1789, and in many personal memoirs, but their principles can be learnt and their fortunes followed from the following: A. Sorel, L’Europe e la révolution francese (Paris, 1885–1904); F. Guizot, Histoire parlementaire de la France (Paris, 1850–1874); Mémôtres pour l’édition de mon temps (Paris, 1858–1867); P. de la Gorce, Histoire du second empire (Paris, 1894–1904); and G. Hanotaux, Histoire de France contemporaine (Paris, 1903, &c.).

ORLEANS, DUDES OF. The title of duke of Orleans was first created by King Philip VI. in favour of his son Philip, who died without legitimate issue in 1375. The second duke of Orleans, created in 1392, was Louis, a younger son of Charles V, whose heir was his son, the poet Charles of Orleans. Charles's son Louis, the succeeding duke, became king of France as Louis XII. in 1498, when the duchy of Orleans was united with the royal domain. In 1629 Louis XIII. created his brother, Jean Baptiste Gaston, duke of Orleans, and having become extinct on the death of this prince in 1660 the title was revived in the following year by Louis XIV. in favour of his brother Philip. Descendants of this duke have retained the title until the present day, one of them becoming king of France as Louis Philippe in 1830. Two distinguished families are descended from the first house of Orleans: the counts of Angoulême, who were descended from John, a son of Duke Louis I, and who furnished France with a king in the person of Francis I; and the counts and dukes of Longueville, whose founder, was John, count of Dunois, the bastard of Orleans, a natural son of the same duke. In addition to the dukes of Orleans the most important members of this family are: Anne Marie Louise, duchess of Montpensier; Francis, prince of Joinville; Louis Philippe Albert, count of Paris; and the traveller Prince Henry of Orleans. See the genealogical table to the article BOURBON.

See below for separate articles on the chief personages.

ORLEANS, CHARLES, DUKE OF (1301–1465), commonly called Charles d'Orléans, French poet, was the eldest son of Louis, duke of Orleans (brother of Charles VI. of France), and of Valentina Visconti, daughter of Gisau Galeazzo, duke of Milan. He was born on the 26th of May 1391. Although many minor details are preserved of his youth, nothing except his reception in 1403, from his uncle the king, of a pension of 12,000 livres d'or is worth noticing, until his marriage three years later (June 27, 1406) with Isabeau, his cousin, widow of Richard II. of England. The bride was two years older than her husband, and is thought to have married him unwillingly.
but she brought him a great dowry—it is said, 500,000 francs. She died three years later, leaving Charles at the age of eighteen a widower and father of a daughter. He was the last of the Dukes of Orleans, for Louis had been assassinated by the Burgundians two years before (1407). He soon saw himself the most important person in France, except the dukes of Burgundy and Brittany, the king being a cipher. This position his natural temperament by no means qualified him to fill. His mother desired vengeance for her husband, and Charles did his best to carry out her wishes by filling France with intestine war. Of this, however, he was only nominally one of the leaders, the real guidance of his party resting with Bernard VII., the great count of Armagnac, whose daughter, Bonne, he married, or at least formally espoused, in 1410. Five years of confused negotiations, plots and fightings passed before the English invasion and the battle of Agincourt, where Charles demonstrated his ability. He was a fly, a minuscule brilliancy. The more he flew, the more he vexed; the more he was carried, the more he was cast. The entire French army consisted of a few people, and his few were in the enemy’s face. This work consists wholly of short poems in the peculiar artificial metres which had become fashionable in France about half a century or more before his birth, and which continued to be fashionable till nearly a century after his death. Besides these a number of English poems have been attributed to him, but without certainty. They have not much poetical merit, but they exhibit something of the smoothness of versification not uncommon in those who write, with care, a language not their own. The ingenuity of a single English critic has attributed to him a curious book in prose, called Le Débat des héritiers de France et d’Angleterre, but Paul Meyer, in his edition of the book in question, has completely disposed of this theory. For the rest of his life he lived in his palace at Meudon, the son of his mother, a new-made Duke of Orleans. He was the author of some hundreds of short French poems, a few in various metres, but the majority either ballades or rondels. The chronology of these poems is not always clear, still less the identity of the persons to whom they are addressed, and it is certain that some, perhaps the greater part of them, belong to the later years of the poet’s life. But many are expressly stated in the manuscripts to have been “composed in prison,” others are obviously so composed, and, on the whole, there is in them a remarkable unity of literary flavour. Charles d’Orléans is not distinguished by any extraordinary strength of passion or originality of character; but he is only the more valuable as the last and not the least accomplished representative of the poetry of the Troubadours, who was wont to fill up the blank verse of the seven ages, and the personality of the poet, save in rare instances, nothing. Yet he is not entirely without differentiated. He is a capital example of the cultivated and refined—it may almost be called the lettered—chivalry of the last chivalrous age, expert to the utmost degree in carrying out the traditional details of a graceful convention in love and literature. But he is more than this; in a certain easy grace and truth of expression, as well as in a peculiar mixture of melancholy, which is not incompatible with the enjoyment of the pleasures, even the trifling pleasures, of life, with listlessness that is fully able to occupy itself about these trifles, he stands quite alone. He has the urbane air of the 17th century without its vicious and profligate frivolity, the poetry of the middle ages without their tendency to treachery. His best-known poems—those on Spring, on the Haringtons of Summer, and others—rank second to nothing of their kind.

Poetry, however, could hardly be an entire consolation, and Charles was perpetually scheming for liberty. But the English government had too many reasons for regarding him, and it was not till his hereditary foe Philip the Good of Burgundy interested himself in him that the government of Henry VI., which had by that time lost most of its hold on France, released him in return for an immediate payment of 80,000 saluts d’or, and an engagement on his part to pay 140,000 crowns at a future time.

The agreement was concluded on the 2nd of July, 1440. He was actually released on the 3rd of November following, and almost immediately cemented his friendship with Duke Philip by marrying his niece, Mary of Cleves, who brought him a considerable dowry to assist the payment of his ransom. He had, however, some difficulty in making up the balance, as well as the large sum required for his brother, Jean d’Angouleme, who was also an imprudent warrior. But, curiously enough, it divides itself into three almost exactly equal periods, each of that length) were spent partly in negociating, with a little fighting intermixed, for the purpose of gaining the Italian county of Asti, on which he had claims through his mother, partly in travelling about, but chiefly at his principal seat of Blois. Here he kept a miniature court which, from the literary point of view at least, was not devoid of brilliancy. At this very near the best-known French men-of-letters at the time—Villon, Olivier de la Marche, Chastelain, Jean Meschinot and others—were residents or visitors or correspondents. His son, afterwards Louis XII., was not born till 1462, three years before Charles’s own death. He had become, notwithstanding his high position, something of a nullity in politics, and tradition ascribes his death to vexation at the harshness with which Louis XI. rejected his attempt to mediate on behalf of the duke of Brittany. At any rate he died, on the 4th of January, 1465, at Amboise. Many of his later poems are small occasional pieces addressed to his courtiers and companions, and in not a few cases answers to those whom they were addressed exist.

The best edition of Charles d’Orléans’s poems, with a brief but sufficient account of his life, is that of C. d’Herincourt in the Nouvelle collection Januet (Paris, 1874). For the English poems see the edition by Watson Taylor for the Roxburghe Club (1827). (G. Sa.)

**ORLEANS, FERDINAND PHILIP LOUIS CHARLES HENRY, Duke of (1810–1842), born at Palermo on the 3rd of September 1810, was the son of Charles de Bourbon, Duke of Orleans, afterwards king of France, and Marie Amélie, princess of the Two Sicilies. Under the Restoration he bore the title of duke of Chartres, and studied classics in Paris at the Collège Henri IV. At the outbreak of the Revolution, which in 1830 set his father on the throne, he was colonel of a regiment of Hussars. He then assumed the title of duke of Orleans, and was sent by the king to Lyons to put down the formidable riots which had broken out there (1831), and then to the siege of Antwerp (1832). He was appointed lieutenant-general, and made several campaigns in Algeria (1835, 1839, 1840). On his return to France he organized the battalions of light infantry known as the chasseurs d’Orléans. He died as the result of a carriage accident at Neuilly, near Paris, on the 3rd of July 1842.

The duke of Orleans had married (May 30, 1817) Hélène Louise Elisabeth of Mecklenburg-Schwerin, and had by her two sons, the count of Paris and the duke of Chartres. On the 24th of February 1848, after the abdication of Louis Philippe, the duchess of Orleans went to the Chamber of Deputies assembled in the Palais Bourbon in the hope of having her eldest son proclaimed and of obtaining the regency; but the threatening attitude of the populace forced her to flee. She took refuge in England, and died at Richmond on the 18th of May 1858.**

(M. P.*)

**ORLEANS, HENRI, Prince of (1867–1901), eldest son of Robert, duke of Chartres, was born at Ham, near Richmond, Surrey, on the 16th of October 1867. In 1886, at the instance of his father, who paid the expenses of the tour, he undertook in company with MM. Bonvalot and Dedecken, a journey through Siberia to Siam. In the course of their travels they crossed the**
mountain range of Tibet, and the fruits of their observations, submitted to the Geographical Society of Paris (and later incorporated in *De Paris au Tonkin à travers le Tibet inconnu*, published in 1892), brought them conjointly the gold medal of that society. In 1892 the prince made a short journey of exploration in East Africa, and shortly afterwards visited Madagascar, proceeding thence to Tonking. From this point he set out for Assam, and was successful in discovering the sources of the river Irrawaddy, a brilliant geographical achievement which secured the medal of the Geographical Society of Paris and the cross of the Legion of Honour. In 1897 he revisited Abyssinia, and political differences arising from this trip led to a duel with the comte de Tulin, in which both combatants were wounded. While on a trip to Assam in 1901 he died at Saigon on the 9th of August. Prince Henri was a somewhat violent Anglophobe, and his diatribes against Great Britain contrasted rather curiously with the cordial reception which his position as a traveller obtained for him in London, where he was given the gold medal of the Royal Geographical Society.

**ORLEANS, HENRIETTA, DUCHESS OF (1644-1670)**, third daughter of the English king, Charles I., and his queen, Henrietta Maria, was born during the Civil War at Exeter on the 16th of June 1644. A few days after her birth her mother left England, and the young princess was brought up at St. Cloud, near Paris. In 1666, when she was 22 years of age, she married the Duke of Orleans, Louis, 3rd. son of Louis XIV., and was on good terms with the grand monarch himself; she shared in the knowledge of state secrets, but was soon estranged from her husband, and at the best her conduct was very imprudent. In 1670, at the instigation of Louis, she visited England and obtained the signature of Charles II.'s ministers to the treaty of Dover; her success in this matter greatly delighted Louis, but it did not improve her relations with Philip, who had long refused his consent to his wife's visit to England. Shortly after returning to France, Henrietta died at St. Cloud on the 30th of June 1670. She was buried at St. Denis, her funeral oration being pronounced by her friend Bossuet, and it was asserted that she had been poisoned by order of her husband. She left two daughters, Marie Louise, wife of Charles II. of Spain, and Anne Marie, wife of Victor Amadeus II. of Savoy. According to legitimist principles, the descendants of Henrietta, through her daughter Marie of Savoy, are entitled to wear the British crown.

**ORLEANS, JEAN BAPTISTE GASTON, DUCHE OF (1668-1660)**, third son of the French king Henry IV., and his wife Marie de Medici, was born at Fontainebleau on the 25th of April 1668. Known at first as the duke of Anjou, he was created duke of Orleans in 1669, and was nominally in command of the army which besieged La Rochelle in 1668, having already entered upon that course of political intrigue which was destined to occupy the remainder of his life. On two occasions he was obliged to leave France for conspiring against the government of his mother and of Cardinal Richelieu; and after waging an unsuccessful war in Languedoc, he took refuge in Flanders. Reconciled with his brother Louis XIII., he plotted against Richelieu in 1635, fled from the country, and then submitted to the king and the cardinal. Soon afterwards the same process was repeated. Orleans stirred up Cinq-Mars to attempt Richelieu's murder, and then deserted his unfortunate accomplice. In 1643, on the death of Louis XIII., Gaston became lieutenant-general of the kingdom, and fought against Spain on the northern frontiers of France; but during the wars of the Fronde he passed with great facility from one party to the other. Then exiled by Mazarin to Blois in 1652 he remained there until his death on the 2nd of February 1660. Gaston's first wife was Marie (d. 1627), daughter and heiress of Henri de Bourbon, duc de Montpensier (d. 1668), and his second wife was Marguerite (d. 1672), sister of Charles III., duke of Lorraine. By Marie he left a daughter, Anne Marie, duchesse de Montpensier (q.v.); and by Marguerite he left three daughters, Marguerite Louise (1645-1721), wife of Cosimo III., grand duke of Tuscany; Elisabeth (1662-1695), wife of Louis Joseph, duc de Guise; and Françoise Madeleine (1648-1664), wife of Charles Emmanuel II., duke of Savoy. (M. P.*)

**ORLEANS, LOUIS, DUCHE OF (1572-1647)**, younger son of the French king Charles V., was born on the 13th of March 1572. Having been made count of Valois and of Beaumont-sur-Oise, and then duke of Toulouse, he received the duchy of Orleans from his brother Charles VI. in 1592, three years after his marriage with Valentina (d. 1598), daughter of Gian Galeazzo Visconti, duke of Milan. This lady brought the county of Asti to her husband; but more important was her claim upon Milan, which she transmitted to her descendants, and which furnished Louis XII. and Francis I. with a pretext for interference in that kingdom, which was afterwards carried further by his son, Charles V. Then in 1622, Orleans placed himself in opposition to his uncle Philip II., duke of Burgundy, who was conducting the government; and this quarrel was not only the dominating factor in the affairs of France, but extended beyond the borders of that country. Continued after Philip's death in 1643, with his son and successor, John the Fearless, it culminated in the murder of Orleans by one of John's partisans on the 23rd of November 1647. The duke, who was an accomplished and generous prince, was suspected of immoral relations with several ladies of the royal house, among them Isabella of Bavaria, the queen of Charles VI. He had eight children by Valentina Visconti, including his successor, Charles of Orleans, the poet, and one of his natural sons, the famous bishop of Orleans, John, count of Dunois. See E. Jarry, *La Vie politique de Louis d'Orleans* (Paris, 1889).

**ORLEANS, LOUIS, DUCHE OF (1703-1752)**, only son of Duke Philip II., the regent Orleans, was born at Versailles on the 4th of August 1703. A pious, charitable and cultured prince, he took very little part in the politics of the time, although he was conspicuous for his hostility to Cardinal Dubois in 1723. In 1730 Cardinal Fleury secured his dismissal from the position of colonel-general of the infantry, a post which he had held for nine years; and retiring into private life, he spent his time mainly in translating the Psalms and the epistles of St. Paul. Having succeeded his father as duke of Orleans in 1723, he died in the abbey of St. Genevieve at Paris on the 4th of February 1725. His wife Augusta (d. 1726), daughter of Louis William, marquise of Baden, bore him an only son, Louis Philippe, who succeeded his father as duke of Orleans.

**ORLEANS, LOUIS PHILIPPE, DUCHE OF (1725-1785)**, son of Louis, duke of Orleans, was born at Versailles on the 12th of May 1725, and was known as the duke of Chartres until his father's death in 1752. Serving with the French armies he distinguished himself in the campaigns of 1742, 1743 and 1744, and at the battle of Fontenoy in 1745, retiring to Bagnaio in 1757, and occupying his time with theatrical performances and the society of men of letters. He died at St. Assise on the 18th of November 1785. The duke married Louise Henriette de Bourbon-Conti, who bore him a son Prince (Egalité), duke of Orleans, and a daughter, who married the last duke of Bourbon. His second wife, Madame de Meconton, whom he married secretly in 1773, was a clever woman and an author of some repute. He had two natural sons, known as the abbots of St. Far and the abbot of St. Ailin.

See *L'Auteurne d'un prince*, a collection of letters from the duke to his second wife, edited by J. Hermand (1910).

**ORLEANS, LOUIS PHILIPPE JOSEPH, DUCHE OF (1747-1793)**, called Philippe Égalité, son of Louis Philippe, duke of Orleans, and of Louise Henriette of Bourbon-Conti, was born at St Cloud
on the 13th of April 1747. Having borne the title of duke of Montpensier until his grandfather’s death in 1722, he became duke of Chartres, and in 1769 married Louise Marie Adelaide de Bourbon-Penthievre, daughter and heiress of the duke of Penthievre, grand admiral of France, and the richest heiress of the time. Her wealth made it certain that he would be the richest man in France, and he determined to play a part equal to that of his great-grandfather, the regent, whom he resembled in character and debauchery. As duke of Chartres he opposed the plans of Maupeou in 1771, and was promptly exiled to his country estate of Villers-Cotterets (Aisne). When Louis XVI. came to the throne in 1774 Chartres still found himself looked on coldly at court; Marie Antoinette hated him, and envied him for his wealth, wit and freedom from etiquette, and he was not slow to return her hatred with scorn. In 1776 he served in the squadron of D’Orvilliers, and was present in the naval battle of Ushant on the 27th of July 1778. He hoped to see further service, but the queen was opposed to this, and he was removed from the navy, and given the honorary post of colonel-general of hussars. He then abandoned himself to pleasure; he often visited London, and became an intimate friend of the prince of Wales (afterwards George IV.); he brought to Paris the “anglo-mania,” as it was called, and made jockeys as fashionable as they were in England. He also made himself very popular in Paris by his large gifts to the poor in time of famine, and by throwing open the gardens of the Palais Royal to the people. Before the meeting of the notables in 1787 he had succeeded his father as the Duke of Orleans, and was a candidate for the crown. He now found himself to have been largely learnt in England, so boldly that he was believed to be aspiring at becoming constitutional king of France. In November he again showed his liberalism in the ‘lit de justice,’ which Brienne had made the king hold, and was again exiled to Villers-Cotterets. The approaching convocation of the states-general made his friends very active on his behalf; he circulated in every bailllage the pamphlets which F. J. SIEYÈS had drawn up at his request, and was elected in three—by the noblesse of Paris, Villers-Cotterets and Crépy-en-Valois. In the estate of the nobility he headed the liberal minority under the guidance of Adrien Duport, and led the minority of forty-seven noblemen who seceded from their own estate (June 1789) and joined the Tiers État. The part he played during the summer of 1789 is one of the most debated points in the history of the Revolution. The court accused him of being at the bottom of every popular movement, and saw the “gold of Orleans” as the cause of the Revillon riot and the taking of the Bastille, as the republicans later saw the “gold of Pitt” in every germ of opposition to themselves. There can be no doubt that he hated the queen, and bitterly resented his long disgrace at court, and also that he sincerely wished for a thorough reform of the government and the establishment of some such constitution as that of England; and no doubt such friends as Adrien Duport and Choderlos de Laclos, for their own reasons, wished to see him king of France. The best testimony for the behaviour of Orleans during this summer is the testimony of an English lady, Mrs Grace Dalrymple Elliott, who shared his heart with the comtesse de Buffon, and from which it is absolutely certain that at the time of the riot of the 12th of July he was on a fishing excursion, and was rudely treated by the king on the next day when going to offer him his services. He indeed became so disgusted with the false position of a pretender to the crown, into which he was being forced, that he wished to go to America, but, as the comtesse de Buffon would not go with him, he decided to remain in Paris. He was again accused, unjustly, of having caused the march of the women to Versailles on the 5th of October. Le Fayette, jealous of his popularity, persuaded the king to send the duke to England on a mission, and thus got him out of France, and he accordingly remained in England from October 1789 to July 1790. On the 7th of July he took his seat in the Assembly, and on the 2nd of October both he and Mirabeau were declared by the Assembly entirely free of any complicity in the events of October. He now tried to keep himself as much out of the political world as possible, but in vain, for the court would suspect him, and his friends would talk about his being king. The best proof of his mind being ambitious of such a doubtful piece of fortune is that he commenced an attempt to get himself made king, regent or lieutenant-general of the kingdom at the time of the flight to Varennes in June 1791. He, on the contrary, again tried to make his peace with the court in January 1792, but he was so insulted that he was not encouraged to sacrifice himself for the sake of the king and queen, who persisted in remembering all old enmities in their time of trouble. In the summer of 1792 he was present for a short time with the army of the north, with his two sons, the duke of Chartres and the duke of Montpensier, but had returned to Paris before the 10th of August. After that day he underwent great personal risk in saving fugitives; in particular, he saved the life of the count of Champanet, the governor of the Tuileries, who was his personal enemy, at the request of Mrs Elliott. It was immediately for him to recede, and, after accepting the title of Citoyen Égalité, conferred on him by the commune of Paris, he was elected twentieth and last deputy for Paris to the Convention. In that body he sat as quietly as he had done in the National Assembly, but on the occasion of the king’s trial he had to speak, and then only to give his vote for the death of Louis. His compliance did not save him from suspicion, which was especially aroused by the friendship of his eldest son, the duke of Chartres, with Dumouriez, and when the news of the desertion of Chartres with Dumouriez became known at Paris all the Bourbons left in France, including Égalité, were ordered to be arrested on the 5th of February 1793. He now returned to England, where, when the Reign of Terror began, he was naturally the very sort of victim wanted, and he was decreed “of accusation” on the 3rd of October. He was tried on the 6th of November and was guillotined on the same day, with a smile upon his lips and without any appearance of fear. No man ever was more blamed than Orleans during the Revolution, but the faults of ambition and intrigue were his friends’, not his own; it was his friends who wished him to be on the throne. Personally he possessed the charming manners of a polished grand seigneur: debauched and cynical, but never rude or cruel, full of gentle consideration for all about him but selfish in his pursuit of pleasure, he has had to bear a heavy load of blame, but it is ridiculous to describe the idle and courteous voluptuary as being a dark and designing scoundrel, capable of murder if it would serve his ambition. The execution of Philippe Égalité made the friend of Dumouriez, who was living in exile, duke of Orleans. 

ORLEANS, LOUIS PHILIPPE ROBERT, DUKE OF (1869–): eldest son of the comte de Paris, was born at York House, Twickenham, on the 6th of February 1860. The law of exile against the French princes having been abrogated in 1871, he returned with his parents to France. He was first educated by a private tutor, and then followed the courses of the municipal college at Eu. In 1882 he entered the Collège Stanislas, Paris, and took a first prize in a competitive Latin translation. On the death of the comte de Chambord, the comte de Paris became head of the Bourbons; and in 1886 he and his son were exiled from France. Queen Victoria appointed the duke of Orleans a supernumerary cadet at the Royal Military College, Sandhurst. After passing his examinations he received a commission in the 4th battalion of the 60th Rifles, then quartered in India. In January 1888 the duke went out to India, accompanied by Colonel du Parc, as military governor and adviser. At Bombay he was received by the duke of Connaught and Lord Reay, and at Calcutta he became the guest of the viceroy, the marquess of Dufferin, who organized for the duke and his cousin, Prince Henry of Orleans, a grand tiger-shooting expedition in Nepal. The duke now reported himself to the commander-in-
ORLEANS, DUKES OF—ORLEANS

chief afterwards Earl Roberts, and joined his regiment at Chakarta. After seeing service, the duke ceased his connexion with the Indian army in February 1880, and returned to England. On attaining his majority, he entered Paris (February 7, 1890), and proceeding to the mairie, expressed his desire, as a Frenchman, to perform his military service. This act caused great excitement, and he was arrested in conformity with the law of 1856, which forbade the soil of France to the direct heirs of the families which had reigned there. He was tried, and sentenced to two years' imprisonment; but he was liberated by President Carnot after a few months' nominal incarceration (June 3), and conducted to the Swiss frontier. This escapade won for him the title of "Le Premier Consort de France." After the comte de Paris's funeral (September 12, 1862) he left his residence in the Champs Elysees, and took up lodgings in London, and then removed to Brussels, as being nearer France. On the 5th of November 1866 the duke married the archduchess Maria Dorothea Amalia of Austria, the ceremony taking place at Vienna. It was alleged that some of his followers were implicated in the conspiracies against the French Republic in 1890. A letter which the duke wrote in 1900, approving the artist whose caricatures were grossly insulting to Queen Victoria, excited great indignation both in England and in many French circles, and estranged him from many with whom he had formerly been upon friendly terms; but after Queen Victoria's death it was allowed to become known that this affair had been forgotten and forgiven by the British royal family. The duke of Orleans made several long exploring journeys, being particularly interested in polar discoveries. In 1905 he published Une croisade au Spitzberg, and, later, another account of his travels, under the title A travers la Banquise.

ORLEANS, PHILIP I., DUKE OF (1640—1701), son of the French king Louis XIII., was born at St Germain-en-Laye on the 21st of September 1640. In 1661 he was created duke of Orleans, and married Henrietta, sister of Charles II. of England; but the marriage was not a happy one, and the death of the duchess in 1670 was attributed to poison. Subsequently he married Charlotte Elizabeth, daughter of Charles Louis, elector palatine of the Rhine. Having fought with distinction in Flanders in 1667, Monsieur, as Orleans was generally called, returned to military life in 1672, and in 1677 gained a great victory at Cassel and took St Omer. Louis XIV., it was said, was jealous of his brother's success; at all events Orleans never commanded an army again. He died at St Cloud on the 8th of June 1701, leaving a son, Philip, the regent Orleans, and two daughters: Anne Marie (1660—1728), wife of Victor Amadeus II., duke of Savoy; and Elizabeth Charlotte (1677—1744), wife of Leopold, duke of Lorraine. His eldest daughter, Marie Louise (1662—1689), wife of Charles II. of Spain, died before her father.

ORLEANS, PHILIP II., DUKE OF (1674—1723), regent of France, son of Philip I., duke of Orleans, and his second wife, the princess palatine, was born on the 2nd of August 1674, and had his first experience of arms at the siege of Mons in 1691. His marriage with Mlle de Blois, the legitimized daughter of Louis XIV., won him the favour of the king. He fought with distinction at Steinker, Neerwinden and Namur (1692—1695). During the next few years, being without employment, he studied natural science. He was next given a command in Italy (1706) and in Spain (1707—1708) where he gained some important successes, but he cherished lofty ambitions and was suspected of wishing to take the place of Philip V. on the throne of Spain. Louis XIV. was angry at these pretensions, and for a long time held him in disfavour. In his will, however, he appointed him president of the council of regency of the young King Louis XV. (1715). After the death of the king, the duke of Orleans went to the parlement, had the will annulled, and himself invested with absolute power. At first he made a good use of this, counselling economy, decreasing taxation, disbANDING 25,000 soldiers and restoring liberty to the persecuted Jansenists. But the inquisitorial measures which he had begun against the financiers led to disturbances. He was, moreover, weak enough to countenance the risky operations of the banker John Law (1717), whose bankruptcy led to such a disastrous crisis in the public and private affairs of France.

There existed a party of malcontents who wished to transfer the regency from Orleans to Philip V., king of Spain. A conspiracy was formed, under the inspiration of Cardinal Alberoni, first minister of Spain, and directed by the prince of Cellamare, Spanish ambassador in France, with the complicity of the duke and duchess of Maine; but in 1718 it was discovered and defeated. Dubois, formerly tutor to the duke of Orleans, and now his all-powerful minister, caused war to be declared against Spain, with the support of the emperor, and of England and Holland (Quadriga Alliance). After successes of the French, and that of the Duke of Berwick, in Spain, and of the imperial troops in Sicily, Philip V. made peace with the regent (1720).

On the majority of the king, which was declared on the 15th of February 1723, the duke of Orleans resigned the supreme power; but he became first minister to the king, and remained in office till his death on the 23rd of December 1723. The regent had great qualities, both brilliant and solid, which were unfortunately spoilt by an excessive taste for pleasure. His dissolute manners found only too many imitators, and the regency was one of the most corrupt periods in French history.

M. P.*

ORLEANS, a city of north central France, chief town of the department of Loiret, on the right bank of the Loire, 77 m. S.S.W. of Paris by rail. Pop. (1906), town, 57,544; commune, 68,614. At Les Aubrais, a mile to the north, is one of the chief railway junctions in the country. Besides the Paris and Orleans railway, which divides into two main lines—a western to Nantes and Bordeaux via Tours, and a southern to Bourges and Toulouse via Vierzon—branches leave Les Aubrais eastwards for Pithiviers, Châlons-sur-Marne and Gien, north-west for Châteaudun and Roanne. The whole town of Orleans is clustered together on the right bank of the river and surrounded by fine boulevards, beyond which it sends out suburbs along the various roads. It is connected with the suburb of St Marceau on the left bank by a handsome stone bridge of nine arches, erected in the 18th century. Farther up is the railway bridge. The river is canalized on the right, and serves as a continuation of the Orleans Canal, which unites the Loire with the Seine by the canal of the Loing.

Owing to its position on the northernmost point of the Loire Orleans has long been the centre of communication between the Loire basin and Paris. The chief interest of the place lies in its public buildings and the historical events of which it has been the scene. Proceeding from the railway station to the bridge over the Loire, the visitor crosses Orleans from north to south and passes through the Place du Martroi, the heart of the city. In the middle of the square stands an equestrian statue of Joan of Arc, in bronze, resting on a granite pedestal surrounded by bas-reliefs representing the leading episodes in her life. In 1855 it took the place of an older statue executed in the beginning of the century, which was then transferred to the left bank of the Loire at the end of the bridge, a few paces from the spot where a simple cross marks the site of the Fort des Tourelles captured by Joan of Arc in 1429. From the Place du Martroi, the Rue Jeanne d'Arc leads to the cathedral of St Croix. This church, begun in 1287, was burned by the Huguenots in 1606 before its completion. The work was resumed under Henry IV., in 1601, laid the first stone of the new structure, the building of which continued until 1829. It consists of a vestibule, a nave with double aisles, a corresponding choir, a transept and an apse. Its length is 472 ft., its width at the transept 220 ft. and the height of the central vaults 112 ft. The west front has two flat-topped towers, each of three storeys, of which the first is square, the second octagonal and the third cylindrical. The whole front is Gothic, but was designed and constructed in the 18th century and exhibits all the defects of the period, though its
proportions are impressive. A central spire (19th century) 328 ft. high, on the other hand, recalls the pure Gothic style of the 13th century. In the interior the choir chapels and the apse, dating from the original erection of the building, and the fine modern tomb of Mgr. F. A. P. Duplessis, prefect of Orleans, are worthy of note. In the episcopal palace and the higher seminary are several remarkable pictures and pieces of wood-carving; and the latter building has a crypt of the 9th century, belonging to the church of St. Avit demolished in 1428. The church of St. Aignan consists of a transept and choir of the second half of the 15th century; it contains in a gilded wooden shrine the remains of its patron saint, who occupied the see of Orleans at the time of Attila's invasion. The crypt dates from the 9th to the beginning of the 11th century. The once beautiful sculpture of the exterior has been altogether ruined; the interior has been restored, but not in keeping with the original style. A third church, St. Euvverte, dedicated to one of the oldest bishops of Orleans (d. 351), is an early Gothic building dating from the 13th, completely restored in the 15th century. St. Pierre-le-Puellier dates in its oldest portions from the 10th or even the 9th century. To the west of the Rue Royale stand the church of St. Paul, whose façade and isolated tower both bear fine features of Renaissance work, and Notre-Dame de Recouvrance, rebuilt between 1517 and 1519 in the Renaissance style and dedicated to the memory of the deliverance of the city. The hôtel de ville, built under Francis I. and Henry II., and restored in the 19th century, was formerly the residence of the governors of Orleans, and was occupied by the kings and queens of France from Francis II. to Henry IV. The front of the building, with its different coloured bricks, its balconies supported by caryatides attributed to Jean Goujon, its gable-ends and arcades, gives the impression by its meagre but effective architecture of the several niches with statues. Beneath, between the double flight of steps leading up to the entrance, stands a bronze reproduction of the statue of Joan of Arc, a masterpiece of the princess Mary of Orleans, preserved in the Versailles museum. The richly-decorated apartments of the first storey contain paintings, interesting chimneystoves, and a bronze statuette (also by the princess Mary) representing Joan of Arc mounted on a caparisoned horse and clothed in the garb of the knights of the 15th century. The great hall in which it is placed also possesses a chimney decorated with three bas-reliefs of Domremy, Orleans, and Reims, all associated with her life. The historical museum at Orleans is one of the most interesting of provincial collections, the numismatic, medieval and Renaissance departments alone comprising some 11,000 objects. In the museum are preserved the famous ancient vases being of great value. The city also possesses a separate picture gallery, a sculpture gallery and a natural history museum, which are established in the former hôtel de ville, a Renaissance building of the latter half of the 15th century. The public library comprises among its manuscripts a number dating from the 7th century, and obtained in most cases from St. Benoît sur la Loire. The general hospital is incorporated with the Hôtel Dieu, and forms one of the finest institutions of the kind in France. The salle des fêtes, formerly the corn-market, stands within a vast cloister formed by 15th-century arcades, once belonging to the old cemetery. The salle des Thèses (1411) of the university is the meeting-place of the Archaeological Society and the Philosophical Society. The two imposing churches of Orleans, that of Agnes Sorel (15th and 16th centuries) contains a large collection of objects and works of art relating to Joan of Arc, that of Francis I., of the first half of the 16th century, that occupied by Joan of Arc during the siege of 1429, and that known as the house of Diane de Poitiers (16th century), which contains the historical museum, are of special interest. The hôtel de la Vieille-Intendance, built in the 15th and 16th centuries, served as residence of the intendants of Orleans in later times. The "White Tower" is the last representative of the towers rendered famous by the siege. A statue to the jurisconsult, R. J. Rother (1699-1772), one of the most illustrious of the natives of Orleans, stands in front of the hôtel de ville. The anniversary of the raising of the siege in 1429 by Joan of Arc is celebrated every year with great pomp. After the English had retired, the popular enthusiasm improvised a procession, which marched with singing of hymns from the cathedral to St. Paul, and the ceremony is still repeated on the 5th of May by the clergy and the civil and military functionaries. Orleans is the seat of a bishopric, that of a prefect, a court of appeal, and a court of assizes and headquarters of the V. army corps. There are tribunals of first instance and of commerce, a board of trade-arbitration, a chamber of commerce and a branch of the Bank of France; and training colleges for both sexes, a lycée for boys, a technical school and an ecclesiastical seminary.

The more important industries of the town are the manufacture of tobacco (by the state), blankets, hairpins, vinegar, machinery, agricultural implements, hosiery, tools and ironwork, and the preparation of preserved vegetables. Wine, wool, grain and live stock are the commercial staples of the city, round which there are important nurseries.

The site of Orleans must have been occupied very early in history by a trading post for commerce between northern and central and southern Gaul. At the time of the Roman conquest the town was known as Genalbium, and was the starting-point of the great revolt against Julius Caesar in 52 B.C. In the 5th century it had taken the name Aurelianum from either Marcus Aurelius or Aurelian. It was vacantly besieged in 451 by Attila, who was avenged by the intercession of his bishop, St. Aignan, and finally driven off by the patrician Aetius. Odoacer and his Saxons also failed to take it in 497, but in 498 it fell into the hands of Clovis, who in 511 held here the first ecclesiastical council assembled in France. The dignity which it then obtained, of being the capital of a separate kingdom, was lost by its union with that of Paris in 613. In the 10th century the town was given in fief to the counts of Paris, who in 987 ousted the Carolingian line and made the throne of France the refuge and residence of the bishops of Orleans. Orleans remained during all the medieval period one of the first cities of the French monarchy; several of the kings dwelt within its walls, or were consecrated in its cathedral; it had a royal mint, was the seat of councils, and obtained for its schools the name of university (1390), and for its soldiery an equal standing with those of Paris. Philip, fifth son of Philip VI., was the first of the dukes of Orleans. After the assassination of his successor Louis by Jean Sans-Peur, duke of Burgundy (1427), the people of Orleans sided resolutely with the Armagnacs, and in this way brought upon themselves the attacks of the Burgundians and the English. Joan of Arc, having entered the beleaguered city on the 20th of April 1429, effected the raising of the siege by the old paganism of Martin on the Fort de Tourelles, in the course of which she was wounded. Early in the 16th century the town became a centre of Protestantism. After the Amboise conspiracy (1560) the states-general were convoked at Orleans, where Francis II. died. In 1562 it became the headquarters of Louis I. of Bourbon, prince of Condé, the Protestant commander-in-chief. In 1563 Francis, duke of Guise, laid siege to it, and had captured the tête-du pont on the left bank of the Loire when he was assassinated. Orleans was surrendered to the king, who had his fortifications razed. It was held by the Huguenots from 1567 to 1568. The St. Bartholomew massacre there in 1572 lasted a whole week. It was given as a lieu de sûreté to the League under Henry III., but surrendered to Henry IV. in person in 1594. During the Revolution the city, the citadel, and the church of St. Bertrand Barère and Collot d'Herbois. It was occupied by the Prussians in 1815 and in 1870, the latter campaign being discussed below.

See E. Bimbet, Histoire de la ville d'Orléans (Orléans, 1884-1888).

**The Orleans Campaign of 1870**

Orléans was the central point of the second portion of the Franco-German War (q.v.), the city and the line of the Loire being at first the rendezvous of the new armies improvised by the government of National Defence and afterwards the starting-point of the most important attempt made to relieve Paris. The campaign has thus two well-marked phases, the first ending with the first capture of Orleans on the 10th of October, and
the second with the second and final capture on the night of the 4th of December.

Shortly after the fall of the empire the government of National Defence, having decided that it must remain in Paris in spite of the imperious desire of the army, despatched their Tours to direct the army and the war in the provinces. This was originally composed (10-15 September) of two aged lawyers, Crémiéux and Glaïs-Bizoin, and a naval officer, Vice-Admiral Fourichon, who had charged of the staff. De la Motte-Rouge, was placed in command of the "territorial division of Tours." He found, scattered over the south and west of France, a number of regular units, mostly provisional regiments, squadrons and battalions. Randomly formed, ill-organized, and unex-

First capture of Orleans.
bewildered the German headquarters and conjured up a phantom "Army of the West," just as the promenade in Beaucy had fashioned "the Army of the Loire" out of the small force under Reyss. Once more, indeed, as so often in the war, the Germans tried to solve the French problem by German data, and in their devotion to the net idea of "full steam ahead," could not conceive of military activity being spasmodic or unaimed. But this time the Versailles strategists were wrong only in their guess as to the direction of the blow. A blow was certainly impending.

By now the deliverey of Paris had become the defined objective of the "new formations" and of the provincial Delegation. Many plans were discussed, both at Paris and at Tours, for a combined effort, but each strategist had to convince the rest of the soundess of his own views, and the interchange of information and plans between Trochu and Gambetta was necessarily precarious. In the end, however, a few clear principles were accepted—Paris must be relieved, not merely revictualised, and the troops must be set in motion with that object at the earliest possible moment. For 200,000 French regulars were closely invested in Metz by Prince Frederick Charles with the I. and II. Armies, if they passed into captivity, the veterans of Vionville and St Privat could be brought over to the Loire, and already there were strange rumours of intrigues between Bazaine, Bismarck and the empress Eugenie. But de Freycinet and d'Aurelle had different views as to the method of recapturing Orleans, which was agreed upon as the first thing to be done, and a compromise had to be made, by which 25,000 men were to advance by Gien and Chateauneuf and the main mass (75,000) from Blois by Beaucy, the hazards of this double movement being minimized by the weakness of the forces under von der Tann (the highest estimate of these that reached Tours was 60,000 and their real number only 26,000). The preliminary movements were to be completed by the 29th of October, when one strong division of the 15th corps was to be set at Gien and the remainder of the 15th and 16th corps between Blois and Vendome. This was duly carried out, and the Germans were convinced in their suspicions of a concentration to the west of Paris by the despatch of dummy troop-trains to Le Mans. But bad weather, the news of the disastrous capitulation of Bazeaine and the opening of a series of futile peace negotiations delayed the denouement, the Gien column was hastily recalled, and the French armies stood fast all along the line in their original grouping, 75,000 men (15th and 16th corps) at Blois-Vendome, 10,000 men in Sologne and 25,000 at Gien. The Germans round Orleans were some 25,000 strong. Between Monthéry and Chartres were 21,000 more; but these were paralysed by the fictitious "Western Army" of the French, and von Wittich even thought of obtaining assistance from von der Tann. The activity of the irregulars, and the defiant attitude of the civil population everywhere, presaged a blow to be delivered by the once despised "new formations," but the direction of this blow was misconceived by the German headquarters, by the staff of the III. Army and by von der Tann alike, till the eve of its delivery. The halt of the French army allowed this unconsciousness to grow, and, in default of a target, Moltke was unable to assign a definite task to the II. Army, now on its way from Metz. One of its corps, therefore, was sent to the lines before Paris to release the 15th and 22nd infantry divisions from siege duties, and these, with the 1. Bavarian corps and the 2nd, 4th and 6th cavalry divisions, were consigned to a special detachment of the III. Army, under Friedrich Franz, grand duke of Mecklenburg-Schwerin. The duke was ordered to cover the siege of Paris and to break up the "new formations," but he was directed, not towards Orleans or even Tours, but towards Le Mans, concentrating with that object between Chateauneuf and Chartres.

D'Aurelle, if cautious and slow, at least employed spare time well. The 16th corps was disciplined to the standard attained by the 15th and Chanzy was placed at the head of it. General Fiereck, commanding at Le Mans, was ordered to attract the enemy's notice to the west by demonstrations, the defence of localities by irregulars was thoroughly organized, and in the first days of November, on de Freycinet's demand, the general advance was resumed. There was a difference of opinion between d'Aurelle and Chanzy as to the objective, the latter wishing to make the main effort by the left, so as to cut off the Bavarians from Paris, the former, to make it by the right with a view to recapturing Orleans, and, as on the German side at Gravelotte, a compromise was made whereby the army was deployed in equal force all along the line.

The defeat was singularly encouraging. Part of the German 2nd cavalry division, with its infantry supports, was severely handled.
by the French advanced guard near the hamlet of St. Laurent des Bois (November 8). The half-heartenedness of the Germans, evidenced by the number of prisoners taken unwounded, greatly encouraged the "new formations," who cheerfully submitted to a cold bivouac in an open field, convenient for an army of 80,000, d'Aurelle with the 15th corps on the right wing, Chantilly with the 16th on the left and Reyau's cavalry to the front. The march was made straight across country, in battle order, each brigade in line of battle, and often divided by detached columns. The generals were determined that no accident should occur to shake the moral of the young troops they commanded.

At Orleans, meanwhile, von der Tann, in ever-growing suspense, had been prolonging the mobilities of his columns. He was instructed by the headquarters staff not to fall back except under heavy pressure. He had his own reputation, dimmed by the failure of 1866, to retrieve, and national honor and loyalty seemed to demand a stand. Moreover, some of the staff officers believed that the actual conflict had taken place with the 'greatly superior' enemy, no hostile force should enter the city placed under the protection of the Bavarians. But he could not allow himself to be enveloped in Orleans for days. It therefore came to pass that the Army reserves for support, took up his position with 23,500 men, around Coulommiers, leaving 2,500 men to hold Orleans. The line of defence was a direct one. d'Aurelle, on the Chantilly road through Coulommiers to La Renardière, and thence along the Mauve stream, here he was attacked in force on the 9th of November. The French approached from the south-west, and when his right was threatened by the approach of the remainder, gradually swung round and attacked the Bavarian centre and right. The result was foregone, given the disparity of force, but the erratic movements of Reyau's cavalry on the extreme left of d'Aurelle's line exposed him to a flanking movement. Chantilly, to a partial repulse, and saved all the day for the right.

When at 8 A.M. the battle had begun to retire, it was already nightfall, and the exhausted remnant of the I. Bavarian corps was able to draw off unpursued. The French entered the city, and found all parts in confusion, gathering up its two outlying columns from Sologne and Gien recrossing the city. So ended the first blow of the Republic's armies. Coulommiers would indeed have been a crushing victory had Reyau's cavalry penetrated its part in the scheme and above all d'Aurelle, adopting unreservedly either his own plan or Chantilly's, massed his troops here, economized them there, in accordance with the plan, instead of arraying them in equal strength at all points. But d'Aurelle, instead of falling back, left it as is, and consequently—hence his advance across country en bataille—and to thin out his line at any point might have been disastrous. And incomparable as it was, the victory had a moral significance which can scarcely be overrated. The "new formations" had won the first battle, and it was confidently hoped by all patriots that the spell of defeat was broken.

But d'Aurelle and the Government viewed their success from the standpoint of their own side, and while von der Tann, glad to escape from the trap, fell back quickly to Angerville, d'Aurelle's only fear was an offensive return. Not even when von der Tann's defensive intentions were established did d'Aurelle resume the advance. The French occupied Le Mans and Oradour, moved the I. corps to Orleans, while the victors of Coulommiers went into cold and muddy bivouacs north of the city, for d'Aurelle feared that their dispersion in detachments would destroy the discipline. The French, good disciplinarians, knew that he had only put his hand to the plough, and he thought that before ploughing in earnest he must examine and overhaul his implement. In this opinion he was supported entirely by Chantilly, who, on 18th, requested to reinforce the staying power of the men, but even by the government, which knew that the limit of the capital's resistance was still distant, and felt the present vital necessity of protecting Bourges, Châteauroux and Tours from Prince Frederick Charles' advance. The French, d'Aurelle's chief, had not gone far, and the Government, now approaching from the east. The plan of General Borel, the chief of staff, for a lateral displacement of the whole army towards Chartres and Dreux, which would have left the prince without an animating presence, was also advocated. The largest mass of the army, point of Moltke's position, would however have exposed the army of the south, was rejected, and d'Aurelle organized a large fortified camp of instruction to the north of the captured city, to which came, besides 15th and 16th corps, the new 17th and 18th.

To return to the Government. An army at the halt, screened by active irregulars, is invisible, and the German commanders were again at a loss. It has been mentioned that a day or two before, the news that a large French army had been met in the north, was written to the II. Army Corps unobtrusively. On November 15th, the 16th and 17th corps, the new 18th, the II. Army, had been formed. The II. Army, in its own reading of the situation was at last shaken; whether the Army of the Loire had joined the Army of the West or was still on the Loire, he did not yet know; but it was almost certain that from whatever direction the French would make their move. He went to Metz, and there he sent for Prince Frederick Charles von Moltke. He had already brought about by the reports from the II. Army during its advance from Champagne to the Gâtines. At the time of the first order indicating Chalon, Nevers and Bourges as its objectives this army had just opened out into line from its circular position round Metz, and it therefore naturally faced south. Moving forward, it reached the line Troyes-Neuchâteau about the time Coulommiers was fought, and was ordered to send in its right (IX. corps) to Fontainesbleau. The II. corps had already been taken to strengthen the besiegers, thereby releasing the two Prussian divisions (17th and 22nd) that joined von der Tann on the 10th. The II. Army next changed front, in accordance with Moltke's directions, so that its right faced south, and the left faced south-west, to a certain extent covering the II. corps. The IX. corps and 1st cavalry division were at Mérécourt and on the Orleans-Paris road, the III. at Sens and the X. at Tonnerre. The II. corps had already been ordered to march towards the mid of a population so hostile that von Voigtz-Kerz kept his baggage in the midst of the fighting troops, and Prince Frederick Charles himself, with an escort, visited the villages lying off the main roads of the enemy's rear. From prisoners it was gleaned that the French 18th corps, supposed by the Germans to be forming in the Dijon-Lyon region, had arrived on the Loire, and a deserter said that there were about 30,000 men engaged. The Prince was ordered to march towards the Loire and Chartres, in a move which was definitely admissible. In his own reading of the situation was at last shaken; whether the Army of the Loire had joined the Army of the West or was still on the Loire, he did not yet know; but it was almost certain that from whatever direction the French would make their move. He went to Metz, and there he sent for Prince Frederick Charles von Moltke. He had already brought about by the reports from the II. Army during its advance from Champagne to the Gâtines. At the time of the first order indicating Chalon, Nevers and Bourges as its objectives this army had just opened out into line from its circular position round Metz, and it therefore naturally faced south. Moving forward, it reached the line Troyes-Neuchâteau about the time Coulommiers was fought, and was ordered to send in its right (IX. corps) to Fontainesbleau. The II. corps had already been taken to strengthen the besiegers, thereby releasing the two Prussian divisions (17th and 22nd) that joined von der Tann on the 10th. The II. Army next changed front, in accordance with Moltke's directions, so that its right faced south, and the left faced south-west, to a certain extent covering the II. corps. The IX. corps and 1st cavalry division were at Mérécourt and on the Orleans-Paris road, the III. at Sens and the X. at Tonnerre. The II. corps had already been ordered to march towards the mid of a population so hostile that von Voigtz-Kerz kept his baggage in the midst of the fighting troops, and Prince Frederick Charles himself, with an escort, visited the villages lying off the main roads of the enemy's rear. From prisoners it was gleaned that the French 18th corps, supposed by the Germans to be forming in the Dijon-Lyon region, had arrived on the Loire, and a deserter said that there were about 30,000 men engaged. The Prince was ordered to march towards the Loire and Chartres, in a move which was definitely admissible.
The Detachment order towards Orleans

On the 29th, the Grand Army, under the command of the Duke of Wellington, was in a state of indecision and disorganization in the Boiscommun-Bellegarde region. The French army, under the command of D'Aurelle, had been disordered by the withdrawing of the Russian forces, and there was a belief in the city that the French were about to evacuate it.

D'Aurelle, who was in command of the French forces, had decided to attempt a decisive action, and the French army was in a state of readiness for battle. However, the French were not able to coordinate their forces, and there was confusion and disorder among the troops. The French were not able to decide on a course of action, and the situation was one of indecision and disorganization.

The Duke of Wellington, who was in command of the British forces, was also in a state of indecision. He was not sure what to do, and the situation was one of uncertainty and confusion. The British were not able to coordinate their forces, and there was a lack of communication and understanding among the troops. The British were not able to decide on a course of action, and the situation was one of indecision and disorganization.

In the end, the French and the British were not able to coordinate their forces, and the situation was one of indecision and disorganization. The French and the British were not able to decide on a course of action, and the situation was one of uncertainty and confusion.
On this day d'Aurelle and the French generals assembled to receive de Freycinet's orders for the next advance. The 18th and 20th corps would attack the Chilleurs Forest, while the 17th, aided by the 21st from Le Mans, was to look after the security of Orleans against a possible southward advance of the Detachment. A wise modification was introduced between d'Aurelle and de Freycinet. The 18th corps was to be directed to driving away the Detachment with the 17th and 16th corps, preparatory to the move on Pithiviers. On the 1st of December, then, no events of importance took place on the front south of Orleans, and the way was clear for the advance of the 16th corps of von Stosch, the Orgères-Tory and the direction of events to the grand Duke and Stosch. Fortunately for the Germans the French general von Schmidt, who had been called upon to return to the command of the 18th corps, was unable to go. That gave von Stosch, in a farewell interview, with the imminence of the danger, and a still more urgent argument was the action of Villejean-Tonnerre. It was this division and the stormy and bloody enveloping battle of the I. Bavarian corps on the left flank of Orgères with a loss of 1000 men. Von Stosch, therefore, so far from literally obeying the waiting policy indicated in the orders from Prince Frederic Charles, cautiously led the grand duke to prepare for a battle, and the grand duke, seeing the chance of which he had been cheated so often, and secure in his royal rank and in the support of Moltke, Stosch and Blumenthal, took control again. Lastly, von Stosch called back the 22nd division, which had been taken from the Detachment to form the reserve of the II. Army.

The result of the decision thus made at the Detachment headquarters was of the highest importance. The French main body moved south and encountered first the I. Bavarian corps, then the 17th division, and finally the 22nd division, and the leadership of the German generals, who took every advantage of the discomfiting of the French, was, at last, in the shape of a complete success (battle of Loigny-Popiry, 2nd Dec.). Meanwhile, and long before victory had declared itself, Prince Frederic Charles, still keeping the III. and X. corps on the side of Boiscommon, and IX. corps moving towards the south, had directed the Detachment, and halted von Schmidt's returning cavalry division on the Paris road. But from this point there began an interchange of telegrams which almost nullified the strategic effect of the battle. The grand duke and von Stosch decided upon all of enveloping—that is, driving into Orleans—the target that after so many disappointments they had found and struck, wished to expand was met by the Czar's order to advance towards Châteaudun, and with that object the III. and X. corps were ordered to capture Orleans single-handed, guarded his left with a whole division and with the other advanced on the city, stormed the village of Vasmainbert, which was stubbornly defended by a small French force, and close upon nightfall perfunctorily threw a few shells into Orleans. The flank-guard division had meanwhile been gravely imperilled by the advance of Crouzet's 20th corps, but once again the III. corps was miraculously saved, for Bourbaki, receiving word from d'Aurelle that his corps was in danger of capture, brought his division of the Loire, and that the line of retreat of the right group was by Gien, ordered the fight to be broken off.

In pursuance of the idle fact, the prince issued orders for the 4th to the following effect: III. corps to advance on Orleans and to take over the protection of the city; IV. corps to advance on Pithiviers, and to capture Orleans single-handed; X. corps to advance on Chilleurs, and to the right of the cavalry to advance towards Châteaudun. The French main body was ordered to retreat towards Châteaudun, and with that object the II. corps was ordered to advance and to capture Orleans single-handed, guarded his left with a whole division and with the other advanced on the city, stormed the village of Vasmainbert, which was stubbornly defended by a small French force, and close upon nightfall perfunctorily threw a few shells into Orleans. The flank-guard division had meanwhile been gravely imperilled by the advance of Crouzet's 20th corps, but once again the III. corps was miraculously saved, for Bourbaki, receiving word from d'Aurelle that his corps was in danger of capture, brought his division of the Loire, and that the line of retreat of the right group was by Gien, ordered the fight to be broken off.

In the centre the IX. corps, after fighting hard all day, progressed no farther on the 1st than on the 2nd December, when it had a short interview, but, being personal enemies, their intercourse was confined to the prince's issuing his orders without inquiring closely into the positions of the Detachment. Moltke's opposition was in the shape of the French left group, under the determined Chanzy, slipped away to the left, to continue the struggle for three months longer, the Detachment was compelled to conform to the movements of the IX. corps, but it was handled resolutely, and in the afternoon its right swung in to Orne's. The 2nd cavalry division, finding a target and open ground, charged the demoralized defenders with great effect. The panic spread, and by nightfall, when the prince, who was with the IX. corps, was in Orleans, the French army of the 17th corps that day and had issued orders to suspend the fight, his rival and subordinate was marching into Orleans with bands playing and the whole epoch-making and adventurous story of the 17th corps, supported only by one corps in rear of the centre, was to sweep over all obstacles, woods, fields, orchards and enemy, at a uniform rate of progress, and on the evening of the second day to converge on Orleans. The advance opened on the morning of the 3rd of December and included the 15th, 16th and 17th corps, the right of the 18th corps and the left of the 3rd corps of the forest edge near Santeau. The right group, now under Bourbaki, consisted of the 18th and 20th corps, and faced north-east towards Beaune-la-Rolande. Fortunately for the III. corps, which numbered barely 13,000 rifles in all, the thinnest part of the opposing column was its centre, and the adventurous march of this corps carried it far into the forest to the north of the Chateau, and on the 3rd December, all the way to Chambon. Unfortunately for the III. corps, which numbered barely 13,000 rifles in all, the thinnest part of the opposing column was its centre, and the adventurous march of this corps carried it far into the forest to the north of the Chateau, and on the 3rd December, all the way to Chambon. Unfortunately for the III. corps, which numbered barely 13,000 rifles in all, the thinnest part of the opposing column was its centre, and the adventurous march of this corps carried it far into the forest to the north of the Chateau, and on the 3rd December, all the way to Chambon.

1 The same night Moltke received copies of the prince's orders and approved them. This is the reason for some reason that in still unknown he let events take their course.
2 With all its faults, Bourbaki was hardly responsible for this failure. Gambetta had for some days been giving orders to the 18th corps to withdraw as a single body, but when he found the movement he hastened back the control of the group to d'Aurelle, this being arranged over the wires while the III. corps was advancing.
293

BRUSSELS and completed his art education in Rome in the school of Raphael. He returned to Brussels, where he held an appointment as court painter to Margaret of Austria until 1527, in which year he lost this position and left the city. He only returned to it upon being remitted by Mary of Hungary in 1532, and died there in 1542. Whilst in his earlier work he continued the tradition of the Van Eycks and their followers, he inaugurated a new era in Flemish art by introducing into his native country the Italian manner of the later Renaissance, the style of which he had acquired during his sojourn in Rome. His art marks the passing from the Gothic to the Renaissance period; he is the chief figure in the period of decline which preceded the advent of Rubens. Meticulously careful execution, brilliant colouring, and an almost Umbrian sense of design are the chief characteristics of his work.

Van Orley, together with Michael Coxie, superintended the execution of van Aebt's tapestries for the Vatican, after Raphael's designs, and is himself responsible for some remarkable tapestry designs, such as the panels at Hampton Court. His also are the designs for some of the stained glass windows in the cathedral of St. Gudule, in Brussels, at the museum of which city are a number of his principal works, notably the triptych representing "The Patience of Job" (1521). Among his finest paintings are a "Trinity" at Lübeck cathedral, a "Pieta" at Brussels, a Madonna at Munich and another at Liverpool.

The National Gallery owns a "Magdalen, reading," another version of the same subject being at the Dublin National Gallery. Lord Northbrooks possesses a portrait of Charles V. by the master.

ORLOV, the name of a noble Russian family that produced several distinguished statesmen, diplomats, and soldiers.

Gregory (Grigori) Grigorievich Orlov, Count (1734-1783), Russian statesman, was the son of Gregory Orlov, governor of Great Novgorod. He was educated in the corps of cadets at St. Petersburg, began his military career in the Seven Years' War, and was wounded at Zorndorf. While serving in the capital, he caught the fancy of Catherine II., and was the leader of the conspiracy which resulted in the dethronement and death of Peter III. (1762). After the event, Catherine raised him to the rank of count and made him adjutant-general, director-general of engineers and general-in-chief. At one time the empress thought of marrying her favourite, but the plan was frustrated by Nikita Panin. Orlov's influence became paramount after the discovery of the Khirotov plot to murder the whole Orlov family. Gregory Orlov was no statesman, but he had a quick wit, a fairly accurate appreciation of current events, and was a useful and sympathetic counsellor during the earlier portion of Catherine's reign. He entered with enthusiasm, both from patriotic and from economical motives, into the improvement of the condition of the serfs and their partial emancipation. He was also their most prominent advocate in the great commission of 1767, though he aimed primarily at pleasing the empress, who affected great liberality in her earlier years. He was one of the earliest propagandists of the Slavophil idea of the emancipation of the Christians from the Turkish yoke. In 1771 he was sent as first Russian plenipotentiary to the peace-congress of Focshani; but he failed in his mission, owing partly to the obstinacy of the Turks, and partly (according to Panin) to his own outrageous insolence. On returning without permission to St. Petersburg, he found himself superseded in the empress's favour by Vasilchikov. When Potemkin, in 1771, superseded Vasilchikov, Orlov became of no account at court and went abroad for some years. He returned to Russia a few months previously to his death, which took place at Moscow in 1789. For some time before his death he was out of his mind. Late in life he married his niece, Madame Zinojeva, but left no children.

See A. P. Barsukov, Narratives from Russian History in the 18th Century (Rus.) (St. Petersburg, 1885).

Alexis Grigorievich Orlov, Count (1737-1808), brother of above, was by far the ablest member of the Orlov countly family, and was also remarkable for his athletic strength and dexterity. In the revolution of 1762 he played an even more important part than his brother Gregory. It was he who conveyed Peter III. to the château of Ropsha and murdered him there with his own hands. In 1770 he was appointed commander-in-chief of the fleet sent against the Turks, whose far greater numbers he defeated at the battle of Tekhne, on 27th July, 1770, a victory which led to the conquest of the Grand Archipelago. For this exploit he received, in 1774, the honorific epithet Chesmensky, and the privilege of quartering the imperial arms in his shield. The same year he went into retirement and settled at Moscow. He devoted himself to horse-breeding, and produced the finest race of horses then known by crossing Arab and Frisian, and Arab and English studs. In the war with Napoleon during 1806-07 Orlov commanded the militia of the fifth district, which was placed on a war footing almost entirely at his own expense. He left an estate worth five million roubles and 30,000 serfs.

See article, "The Associates of Catherine II.," No. 2, in Russkaya Starina (Rus.) (St. Petersburg, 1875).

Theodore (Fedor) Grigorievich Orlov, Count (1741-1796), Russian general, first distinguished himself in the Seven Years' War. He participated with his elder brothers, Gregory and Alexi, in the coup d'état of 1762, after which he was appointed chief procurator of the senate. During the first Turkish War of Catherine II. he served under Admiral Spiridov, and was one of the first to break through the Turkish line of battle at Chesme. Subsequently, at Hyde, he put to flight eighteen Turkish vessels. These exploits were, by the order of Catherine, commemorated by a triumphal column, crowned with naval trophies, erected at Tsarskoe Selo. In 1775 he retired from the public service. Orlov was never married, but had five natural children, whom Catherine ennobled and legitimized.

Alexei Petrovich Orlov, Prince (1758-1857), Russian statesman, the son of a natural son of Count Theodore Grigorievich Orlov, took part in all the Napoleonic wars from 1805 to the capture of Paris. For his services as commander of the cavalry regiment of the Life Guards on the occasion of the rebellion of 1825 he was created a count, and in the Turkish War of 1828-29 rose to the rank of lieutenant-general. It is from this time that the brilliant diplomatic career of Orlov begins. He was the Russian plenipotentiary at the peace of Adrianople, and in 1833 was appointed Russian ambassador at Constantinople, holding at the same time the post of commander-in-chief of the Black Sea fleet. He was, indeed, one of the most trusted agents of Nicholas I., whom in 1837 he accompanied on his foreign tour. In 1854 he was sent to Vienna to bring Austria into the side of Russia, but was unsuccessful, and in 1856, when he was one of the plenipotentiaries who concluded the peace of Paris. The same year he was raised to the dignity of prince, and was appointed president of the imperial council of state and of the council of ministers. In 1857, during the absence of the emperor, he presided over the commission formed to consider the question of the emancipation of the serfs, to which he was altogether hostile.

His only son, Prince Nikolai Alekseyevich Orlov (1827-1885), was a distinguished Russian diplomatist and author. He first adopted a military career, and was seriously wounded in the Crimean War. Subsequently he entered the diplomatic service, and represented Russia successively at Brussels (1860-62), at Constantinople (1862-66), and at Vienna (1866-70). As a publicist he stood in the forefront of reform. His articles on corporal punishment, which appeared in Russkaya Starina in 1881, brought about its abolition. He also advocated tolerance towards the dissenters. His historical work, Sketch of Three Weeks' Campaign in 1806 (St. Petersburg, 1856) is still of value. (R. N. B.)

ORM, or ORMIN, the author of an English book, called by himself Ornulium ("because Ornul made it"), consisting of metrical homilies on the gospels read at mass. The unique MS., now in the Bodleian Library, is certainly Ornul's autograph, and contains abundant corrections by his own hand. On palaeographical grounds it is referred to about A.D. 1200, and the date is supported by the linguistic evidence. The dialect, midland, with some northern features. It is marked in
unparalleled degree by the abundance of Scandinavian words, while the French element in its vocabulary is extraordinarily small. The precise determination of the locality is not free from difficulty, as it is now recognized that the criteria formerly relied on for distinguishing between the eastern and the western varieties of the midland dialect are not valid, at least for this early period. The *Ormulum* certainly contains a surprisingly large number of words that are otherwise nearly peculiar to western texts; but the inference that might be drawn from this fact appears to be untenable in face of the remarkable lexical affinities between this work and *Havelok, which is certainly of north-east midland origin. On the whole, the language of the *Ormulum* seems to point to north Lincolnshire as the author's native district.

The work is dedicated to a certain Walter, at whose request it was composed, and whomOrm addresses as his brother in a threefold sense—"according to the flesh," as his fellow-Christian, and as being a member of the same religious fraternity, that of the Augustinian Canons. The present writer has suggested (*Athenaeum*, 19th May 1900) that Orm and Walter may have been inmates of the Augustinian priory of Elysham, near the Humber, which was established about the middle of the 12th century by Walter de Amundeville. In his foundation charter (Dugdale's *Monasticon*, ed. Caley and Bandinel, v. 560) Walter endows the priory with lands, and also grants to it the services of certain villains, among whom are his steward (propositus) William, son of Leofwine, and his wife and family. As this William is said to have had an uncle named Orm, and probably owed his Norman name to a godfather belonging to the Amund-ville family, it seems not unlikely that the author of the *Ormulum* and his brother Walter were his sons, named respectively after their father's uncle and his lord, and that they entered the religious house of which they had been made subjects.

The name Orm is Scandinavian (Old Norse *Orm*, literally "serpent," corresponding to the Old Eng. *wyrm*, "worm"), and was not uncommon in the Danish parts of England. It occurs once in the book. The Gallicized form Ormin is found only in one passage, where the author gives it as the name by which he was christened. If this statement be meant literally (*i.e.* if the writer was not merely treating the two names as equivalent), it shows that he must, like his brother, have had a Norman godfather. The ending -in was frequently appended to names in Old French, *e.g.* in Johannein for John, John. The title *Ormulum* for the book which Orm made was probably an imitation of *Speculum*, a common medieval name for books of devotion or religious edification.

The *Ormulum* is written in lines alternately of eight and seven syllables, without either rhyme or alliteration. The rhythm may be seen from the opening couplet:

_Nu, broferr Waller, broferr min_
_Afterr þe flæshis kynne._

The extant portion of the work, not including the dedication and introduction, consists of about 20,000 lines. But the table of contents refers to 242 homilies, of which only 31 are preserved; and as the dedication implies that the book had been completed, and that it included homilies on the gospels for nearly all the year, it would seem that the huge fragment which we possess is not much more than one-eighth of this extraordinary monument of pious industry.

The *Ormulum* is entirely destitute of poetic merit, though the author's visible enjoyment of his task renders it not uninteresting reading. To the history of biblical interpretation and of theological ideas it probably contributes little or nothing that is not well-known from other sources. For the philologist, however, the work is of immense value, partly as a unique specimen of the north-midland dialect of the period, and partly because the author had invented an original system of phonetic spelling, which throws great light on the contemporary pronunciation of English. In closed syllables the shortness of a vowel is indicated by the doubling of the following consonant. In open syllables this method would have been misleading, as it would have suggested a phonetic doubling of the consonant. In such cases Orm had recourse to the device of placing the mark over the vowel. Frequently, but apparently not according to any discoverable rule, he distinguishes long vowels by one, two or three accents over the letter. Like some earlier writers, he retained the Old English form of the letter *g* (5) where it expressed a spirant sound (not, however, distinguishing between the guttural and the palatal spirant), and used the continental *g* for the guttural stop and the sound *dzh*. He was, however, original in distinguishing the two latter sounds by using slightly different forms of the letter. This fact was unfortunately not perceived by the editors, so that the printed text confounds the two symbols throughout. The discovery was made by Professor Killig in 1894.

It must be confessed that Orm often forgets his own rules of spelling, and although hundreds of oversights are corrected by interlineation, many inconsistencies still remain. Nevertheless, the orthography of the *Ormulum* is the most valuable existing source of information on the development of sounds in Middle English.

The *Ormulum* was edited for the first time by R. M. White in 1854. A revised edition, by R. Holt, was published in 1878. Many important corrections of the text were given by E. Kölling in the first volume of *Englische Studien*. With reference to the three forms of the letter *g*, see A. S. Napier, *Notes on the Orthography of the Ormulum*, printed with *A History of the Holy Road Tree* (Early English Text Society, 1894). (H. Br.)

**ORMAZD.—ORMEROD,** or ORMUZD (O. Persian *Aruzmaza* or *Ahuramazda*), the supreme, all-powerful deity of Zoroastrianism. He is represented as the god and creator of good, light, intelligence, in perpetual opposition to Ahriman the lord of evil, darkness and ignorance. The dualism of the earlier Zoroastrians, which may be compared with the Christian doctrine of God and Satan, gradually tended in later times towards monotheism. At all times it was believed that Ormuzd would ultimately vanquish Ahriman. See further *Zoroaster*.

**ORME, ROBERT** (1728-1801), English historian of India, was born at Anjengo on the Malabar coast on the 25th of December 1728, the son of a surgeon in the Company's service. Educated at Harrow, he was appointed to a writership in Bengal in 1743. He returned to England in 1755 in the same ship with Clive, with whom he formed a close friendship. From 1754 to 1758 he was a member of council at Madras, in which capacity he largely influenced the sending of Clive to Calcutta to avenge the catastrophe of the Black Hole. His great work—*A History of the Military Transactions of the British Nation in Indostan from 1745—*was published in three volumes in 1763 and 1778 (Madras reprint, 1861-1862). This was followed by a volume of *Historical Fragments* (1781), dealing with an earlier period. In 1796 he was appointed historiographer to the East India Company. He died at Ealing on the 13th of January 1801. His valuable collections of MSS. are in the India office library.

The characteristics of his work, of which the influence is admirably shown in Thackeray's *The Newcomes*, are thus described by Macaulay: "Orme, inferior to no English historian in style and power of painting, is minute even to tediousness. In one volume he allots, on an average, a closely printed quarto page to the events of every forty-eight hours. The consequence is that his narrative, though one of the most authentic and one of the most finely written in our language, has never been very popular, and is now scarcely ever read." Not a few of the most picturesque passages in Macaulay's own Essay on Clive are borrowed from Orme. (J. S. C.)

**ORMEROD, ELEANOR A.** (1828-1901), English entomologist, was the daughter of George Ormerod, F.R.S., author of *The History of Chevshrie*, and was born at Sedbury Park, Gloucestershire, on the 11th of May 1828. From her earliest childhood insects were her delight, and the opportunity afforded for entomological study by the large estate upon which she grew up and the interest she took in agriculture generally soon made her a local authority upon this subject. When, in 1868, the Royal Horticultural Society began forming a collection of insect pests of the farm for practical purposes, Miss Ormerod largely contributed to it, and was awarded the Flora medal of the society. In 1877 she issued a pamphlet, *Notes for Observations*...
ORMOC—ORMONDE, EARL AND MARQUESS OF

on Injurious Insects, which was distributed among persons interested in this line of inquiry, who readily sent in the results of their researches, and was thus the beginning of the well-known Annual Series of Reports on Injurious Insects and Farm Pests. In 1881 Mrs. Ormond published a special report upon the "turnip-fly," and in 1882 was appointed consulting entomologist to the Royal Agricultural Society, a post she held until 1892. For several years she was lecturer on scientific entomology at the Royal Agricultural College, Cirencester. Her fame was not confined to England: she received silver and gold medals from the university of Moscow for her models of insects injurious to plants, and her treatise on The Injurious Insects of South Africa showed how wide her range was. In 1899 she received the large silver medal from the Société Nationale d'Acclimatation de France. Among others of her works are the Cobden Journals, Manual of Injurious Insects, and Handbook of Insects injurious to Orchard and Bush Fruits. Almost the last honour which fell to her was the honorary degree of LL.D. of Edinburgh University—a unique distinction, for she was the first woman upon whom the university had conferred this degree. The dean of the legal faculty in making the presentation aptly summed up Miss Ormond's services as follows: "The preeminent position which Miss Ormond holds in the world of science is the reward of patient study and unwearying observation. Her investigations have been chiefly directed towards the discovery of methods for the prevention of the ravages of those insects which are injurious to orchard, field and forest. Her labours have been crowned with such success that she is entitled to be hailed the protectress of agriculture and the fruits of the earth—a beneficent Demeter of the 19th century." She died at St. Albans on the 16th of July 1901.

ORLAISSON, a town and port in the department of Leyte, island of Leyte, Philippine Islands, on the W. coast about 35 m. S.W. of Tacloban. Pop. (1903), after the annexation of Albuerca, 20,761. There are thirty-three barrios or villages in the town, and the largest of them had a population in 1903 of 5410. The language is Visayan. Ormoc is in a great hemp-producing region and is open to coast trade.

ORMOLU (Fr. or moulau, gold ground or pounded), an alloy of copper and zinc, sometimes with an addition of tin. The name is also used to describe gilded brass or copper. The tint of ormolu approximates closely to that of gold; it is heightened by a wash of gold lacquer, by immersion in dilute sulphuric acid, or by burnishing. The principal use of ormolu is for the mountings of furniture. With it the great French ébénistes of the 18th century were able to produce the finest examples, are almost as fine as jewelers' work. The mounts were usually cast and then chiselled with extraordinary skill and delicacy.

ORMOND, a village and winter resort of Volusia county, Florida, U.S.A., about 68 m. by rail S. of St. Augustine. It is situated on the Halifax river, an arm of the Atlantic Ocean extending for 25 m. along the E. coast of Florida. Pop. (1900) 505; (1905 state census) 689. It is served by the Florida East Coast Railway. The Halifax river region is famous for its excellent oranges and grapefruit. The hard and compact Ormond-Daytona beach, about 200 ft. wide at low tide and about 20 m. long, offers exceptional facilities for driving, motoring and bicycling; on it are held the annual tournaments of the Florida East Coast Automobile Association. The old King's Road, built by the English between 1763 and 1783, from St. Mary's, Georgia, some 400 m. to the south, has been improved for automobiles between Ormond and Jacksonville. About 2 m. west of Ormond are the ruins of an old sugar mill, probably dating from the last quarter of the 18th century and not, as is frequently said, from the Spanish occupation in the 19th century. About 5 m. south of Ormond and also on the Halifax river is another popular winter resort, Daytona (pop. (1900) 1600; (1905 state census) 2199), founded in 1870 as Tomoka by Mathias Day of Mansfield, Ohio, in whose honour it was renamed Daytona in 1871. Its streets and drives are shaded by live oaks, palmettos, hickories and magnolias.

ORMONDE, EARL AND MARQUESS OF, titles still held by the famous Irish family of Butler (q.v.), the name being taken from a district now part of Co. Tipperary. In 1328 James Butler (c. 1365-1379), a son of Edmund Butler, was created earl of Ormonde; one reason for his elevation being the fact that his wife Eleanor, a daughter of Bohun, earl of Hereford, was a granddaughter of King Edward I. His son James, the 2nd earl (1331-1382), was four times governor of Ireland; the latter's grandson James, the 4th earl (d. 1452), held the same position several times, and won repute not only as a soldier, but also as a scholar. His son James, the 5th earl (1420-1461), was created an English peer as earl of Wiltshire in 1449. A turbulent partisan of the house of Lancaster, he was lord high treasurer of England in 1455 and again in 1459, and was taken prisoner after the battle of Towton in 1461. He and his two brothers were then attainted, and he died without issue, the exact date of his death being unknown. The attainder was repealed in the Irish parliament in 1476, when his brother Sir John Butler (c. 1422-1478), who had been pardoned by Edward IV. a few years previously, became 6th earl of Ormonde. John, who was a fine linguist, served Edward IV. as ambassador to many European princes, and this king is said to have described him as "the goodliest knight he ever beheld and the finest gentleman in Christendom." His brother Thomas, the 7th earl (c. 1424-1451), a courtier and an English baron under Richard III. and Henry VII., was ambassador to France and to Burgundy; he left no sons, and on his death in August 1515 his earldom reverted to the crown.

Margaret, a daughter of this earl, married Sir William Boleyn of Blickling, and their son Sir Thomas Boleyn (1477-1539) was created earl of Ormond and of Wiltshire in 1529. He went on several important errands for Henry VIII., during one of which he arranged the preliminaries for the Field of the Cloth of Gold; he was lord privy seal from 1530 to 1536, and served the king in many other ways. He was the father of Henry's queen, Anne Boleyn, but both this lady, and her only brother, George Boleyn, Viscount Rochford, had been put to death before their father died in March 1539.

Meanwhile in 1535 the title of earl of Ormond had been assumed by Sir Piers Butler (c. 1467-1539), a cousin of the 7th earl, and a man of great influence in Ireland. He was lord deputy, and later lord treasurer of Ireland, and in 1528 he surrendered his claim to the earldom of Ormonde and was created earl of Ossory. Then in 1558 he was made earl of Ormond, this being a new creation; however, he counts as the 8th earl of Ormond of the Butler family. In 1550 his second son Richard (d. 1571) was created Viscount Mountgarret, a title still held by the Butlers. The 8th earl's son, James, the 9th earl (c. 1500-1546), lord high treasurer of Ireland, was created Viscount Thurles in 1536. In 1544 an act of parliament confirmed him in the possession of his earldom, which, for practical purposes, was declared to be the creation of 1528, and not the new creation of 1538.

Thomas, the 10th earl (1532-1614), a son of the 9th earl, was lord high treasurer of Ireland and a very prominent personage during the latter part of the 16th century. He was a Protestant and threw his great influence on the side of the English queen and her ministers in their efforts to crush the Irish rebels, but he was perhaps more anxious to prosecute a fierce feud with his hereditary foe, the MacDonel family, than to seek a struggle between the two factions desulting Munster for many years. His successor was his nephew Walter (1560-1633), who was imprisoned from 1617 to 1625 for refusing to surrender the Ormonde estates to his cousin Elizabeth, the wife of Sir R. Preston and the only daughter of the 10th earl. He was deprived of the palatine rights in the county of Tipperary, which had belonged to his ancestors for 400 years, but he recovered many of the family estates after his release from prison in 1625.

Walter's grandson, James, the 12th earl, was created marquess of Ormonde in 1642 and duke of Ormonde in 1661 (see below); his son was Thomas Butler, earl of Ossory (q.v.), and his grandson was James Butler, 2nd duke of Ormonde (see below).
When Charles Butler, earl of Arran (1671–1758), the brother and successor of the 2nd duke, died in December 1758, the dukedom and marquessate became extinct, but the earldom was claimed by a kinsman, John Butler (d. 1760). John’s cousin, Walter (1703–1753), inherited this claim, and Walter’s son John (1740–1795) obtained a confirmation of it from the Irish House of Lords in 1791. He is reckoned as the 17th earl. His son Walter, the 18th earl (1770–1816), was created marquess of Ormonde in 1816, a title which became extinct on his death, but was revived in favour of his brother James (1774–1838) in 1825. James was the grandfather of James Edward William Theobald, Butler (b. 1844), who became the 3rd marquess in 1854. The marquess sits in the House of Lords as Baron Ormonde of Llanthony, a creation of 1821.

ORMONDE, JAMES BUTLER, 1ST DUKE OF (1616–1688), Irish statesman and soldier, eldest son of Thomas Butler, Viscount Thurles, and of Elizabeth, daughter of Sir John Poyntz, and grandson of Walter, 11th earl of Ormonde (see above), was born in London on the 30th of October 1616. On the death of his father by drowning in 1619, the boy was made a royal ward by James I., removed from his Roman Catholic tutor, and placed in the household of Abbot, archbishop of Canterbury, with whom he stayed until 1625, residing afterwards in Ireland with his grandfather. In 1629, by marriage with his cousin, the Lady Elizabeth Preston, daughter and heiress of Richard, earl of Desmond, he put an end to the long-standing quarrel between the families and united their estates. In 1632 on the death of his grandfather he succeeded him to the earldom.

He was already noted in Ireland, as had been many of his race, for his fine presence and great bodily vigour. His active career began in 1633 with the arrival of Strafford, by whom he was treated, in spite of his independence of character, with great favour. Having written to William III., king of England, Strafford described him as “young, but take it from me, a very staid head,” and Ormonde was throughout his Irish government his chief friend and support. In 1640 during Strafford’s absence he was made commander-in-chief of the forces, and in August he was appointed lieutenant-general. On the outbreak of the rebellion in 1641 he rendered admirable service in the expedition to Naas, and in the march into the Pale in 1642, though much hampered by the lords justices, who were jealous of his power and recalled him after he had succeeded in relieving Drogheda. He was publicly thanked by the English parliament and presented with a jewel of the value of £620. On the 25th of April 1642 he gained the battle of Kilsor against Lord Mountjoy’s forces. On the same day he was appointed lieutenant-general, and on the 9th of September was appointed lieutenant-general with a commission direct from the king. On the 18th of March 1643 he won the battle of New Ross against Thomas Preston, afterwards Viscount Tara. In September, the civil war in England having meanwhile broken out, Ormonde, in view of the successes of the rebels and the uncertain loyalty of the Scots in Ulster, concluded with the latter, in opposition to the lords justices, on the 15th of September, the “cession” by which the greater part of Ireland was given up into the hands of the Catholic Confederation, leaving only small districts on the east coast and round Cork, together with certain foyresses in the north and west then actually in their possession, to the English commanders. He subsequently, by the king’s orders, despatched a body of troops into England (shortly afterwards routed by Fairfax at Nantwich) and was appointed in January 1644 lord lieutenant, with special instructions to do all in his power to keep the Scotch army occupied. In the midst of all the plots and struggles of Scots, Old Irish, Catholic Irish of English race, and Protestants, and in spite of the intrigues of the pope’s nuncio as well as of attempts by the parliament’s commissioners to ruin his power, Ormonde showed the greatest firmness and ability. He assisted Antrim in his unsuccessful expedition into Scotland. On the 28th of March 1646 he concluded a treaty with the Irish which granted religious concessions and removed various grievances. Meanwhile the difficulties of his position had been greatly increased by Glamorgan’s treaty with the Roman Catholics on the 25th of August 1645, and it became clear that he could not long hold Dublin against the Irish rebels. He thereupon applied to the English parliament, signed a treaty on the 10th of June 1647, gave Dublin into their hands upon terms which protected the interests of both Protestants and Roman Catholics so far as they did not actually consent into rebellion, and sailed to London at the beginning of August. He attended Charles during August and October at Hampton Court, but subsequently, in March 1648, in order to avoid arrest by the parliament, he joined the queen and prince of Wales at Paris. In September of the same year, the pope’s nuncio having been expelled, and affairs otherwise looking favourable, he returned to Ireland to endeavour to unite all parties for the king. On the 17th of January 1649 he concluded a peace with the rebels on the basis of the free exercise of their religion, on the execution of the king proclaimed Charles II., and was created a knight of the Garter in September. He upheld the royal cause with great vigour though with slight success, and on the conquest of the island by Cromwell he returned to France in December 1650.

Ormonde now, though in great straits for want of money, resided in constant attendance upon Charles and the queen-mother in Paris, and accompanied the former to Aix and Cologne when expelled from France by Mazarin’s treaty with Cromwell in 1655. In 1658 he went disguised, and at great risk, upon a secret mission into England to gain trustworthy intelligence as to the chances of a rising. He attended the king at Fuenterrabia in 1659 and had an interview with Mazarin; and was actively engaged in the secret transactions immediately preceding the Restoration. On the return of the king he was at once appointed a commissioner for the treasury and the navy, made lord steward of the household, a privy councillor, lord lieutenant of Somerset (an office which he resigned in 1672), high steward of Westminster, Kingston and Bristol, chancellor of Dublin University, Baron Butler of Llanthony and earl of Brecknock in the peerage of England; and on the 30th of March 1661 he was created duke of Ormonde in the Irish peerage and lord high steward of England. At the same time he recovered his enormous estates in Ireland, and large grants in recompense of the fortune he had spent in the royal service were made to him by the king, while in the following year the Irish parliament presented him with £30,000. His losses, however, according to Carter, exceeded his gains by £685,000. On the 4th of November 1661 he once more received the lord lieutenancy of Ireland, and was busily engaged in the work of settling that country. The controversy between Sir John Villiers and Sir John Ker and the question, and the Act of Explanation was passed through the Irish parliament by Ormonde on the 23rd of December 1665. His heart was in his government, and he vehemently opposed the bill prohibiting the importation of Irish cattle which struck so fatal a blow at Irish trade; and retaliated by prohibiting the import into Ireland of Scottish commodities, and obtaining leave to trade with foreign countries. He encouraged Irish manufactures and learning to the utmost, and it was to his efforts that the Irish College of Physicians owes its incorporation.

Ormonde’s personality had always been a striking one, and in the new reign his virtues and patriotism became still more conspicuous. He represented almost alone the older and nobler generation. He stood aloof while the counsels of the king were guided by dishonour; and proud of the loyalty of his race which had remained unsptotted through five centuries, he bore with silent self-respect calumny, envy and the loss of royal favour, declaring, “However ill I may stand at court I am resolved to lye well in the chronicl.”

He soon became the mark for attack from all that was worst in the court. Buckingham especially did his utmost to undermine his influence. Ormonde’s almost irresponsible government of Ireland during troublous times was no doubt open to criticism. He had billeted soldiers on civilians, and had executed martial law. The impeachment, however, threatened by Buckingham in 1667 and 1668 fell through. Nevertheless by
1669 constant importunity had had its usual effect upon Charles, and on the 14th of March Ormonde was removed from the government of Ireland and from the committee for Irish affairs. He made no complaint, insisted that his son's conduct was such that he had influence should retain their posts, and continued to fulfil with dignified persistence the duties of his other offices, while the greatness of his character and services was recognized by his election as chancellor of Oxford University on the 4th of August.

In 1670 an extraordinary attempt was made to assassinate the duke by a ruffian and adventurer named Thomas Blood, already notorious for an unsuccessful plot to surprise Dublin Castle in 1663, and later for stealing the royal crown from the Tower. Ormonde was attacked by this person and his accomplices while driving up St James's Street on the night of the 6th of December, dragged out of his coach, and taken on horseback along Piccadilly with the intention of hanging him at Tyburn. Ormonde, however, succeeded in over-throwing the horseman to whom he was bound, and his servants coming up, he escaped. The outrage, it was suspected, had been instigated by the duke of Buckingham, who was openly accused of the crime by Lord Ossory, Ormonde's son, in the king's presence, and threatened by him with instant death if any violence should happen to his father; and some colour was given to these suspicions by the improper action of the king in pardoning Blood, and in admitting him to his presence and treating him with favour after his apprehension while endeavouring to steal the crown jewels.

In 1671 Ormonde successfully opposed Richard Talbot's attempt to upset the Act of Settlement. In 1673 he again visited London, accompanied Charles on affairs in parliament, and in 1675 was again restored to favour and reappointed to the lord lieutenancy. On his arrival in Ireland he occupied himself in placing the revenue and the army upon a proper footing. Upon the outbreak of the popish terror in England, he at once took the most vigorous and comprehensive steps, though with as little harshness as possible, towards rendering the Roman Catholics, who were in the proportion of 15 to 1, powerless; and the mildness and moderation of his measures served as the ground of an attack upon him in England led by Shaftesbury, from which he was defended with great spirit by his son Lord Ossory. In 1682 Charles summoned Ormonde to court. The same year he wrote "A Letter . . . in answer to the earl of Anglesea, his Observation upon the Popish importunity, the Rebellion of Ireland," and gave to Charles a general support. On the 4th of November 1683 an English ducal coronet was conferred upon him, and in June 1684 he returned to Ireland; but he was recalled in October in consequence of fresh intrigues. Before, however, he could give up his government to Rochester, Charles II. died; and Ormonde's last act as lord lieutenant was to proclaim James II. in Dublin. Subsequently he lived in retirement at Cornbury in Oxfordshire, lent to him by Lord Clarendon, but emerged from it in 1687 to offer a firm and successful opposition at the board of the Charterhouse to James's attempt to assume the dispensing power, and force upon the institution a Roman Catholic candidate without taking the oaths according to the statute. In 1688 he also refused the king his support in the question of the Indulgence, to which standing which James, to his credit, refused to take away his offices, and continued to hold him in respect and favour to the last.

Ormonde died on the 21st of July 1688, not having, as he rejoiced to know, "outlived his intellectuates"; and with him disappeared the greatest and grandest figure of the times. His splendid qualities were expressed with some felicity in verses written on welcoming his return to Ireland and printed in 1682:

"A Man of Plato's grand nobility,  
An inbred greatness, innate honesty;  
A Man not form'd of accidents, and whom  
Misfortune might oppress, not overcome . . .  
With weighed self not by opinion  
But conscience of a noble action,  
He was buried in Westminster Abbey on the 1st of August."

He had, besides two daughters, three sons who grew to maturity. The eldest of these, Thomas, earl of Ossory (1634-1690) preceeded him, his eldest son succeeding as 2nd duke of Ormonde. The other two, Richard, created earl of Arran, and John, created earl of Gowran, both being younger sons, and the male descent of the 1st duke becoming extinct in the person of Charles, 3rd duke of Ormonde, the cardoomson returned to the descendants of Walter, 11th earl of Ormonde.

ORMONDE, JAMES BUTLER, 2nd DUKE OF (1665-1745), Irish statesman and soldier, son of Thomas, earl of Ossory, and grandson of the 1st duke, was born in Dublin on the 29th of April 1665, and was educated in France and afterwards at Christ Church, Oxford. On the death of his father in 1686 he became earl of Ossory by courtesy. He obtained command of a cavalry regiment in England in 1684, and having received an appointment at court on the accession of James II., he served against the duke of Monmouth. Having succeeded his grandfather as duke of Ormonde in 1688, he joined William of Orange, by whom he was made colonel of a regiment of horse-guards, which he commanded at the battle of the Boyne. In 1691 he served on the continent under William, and after the accession of Anne he was placed in command of the land forces co-operating with Sir George Rooke in Spain. Having been made a privy councillor, Ormonde succeeded Rochester as viceroy of Ireland in 1703, a post which he held till 1707. On the dismissal of the duke of Marlborough in 1711, Ormonde was appointed captain-general in his place, and allowed himself to be made the tool of the Tory ministry, whose policy was to carry on the war in the North, without risk, his object being to take no active part in supporting their allies under Prince Eugene. Ormonde's position as captain-general made him a personage of much importance in the crisis brought about by the death of Queen Anne. Though he had supported the revolution of 1688, he was traditionally a Tory, and Lord Bolingbrooke was his political leader. During the last years of Queen Anne he almost certainly had Jacobite leanings, and corresponded with the duke of Berwick. He joined Bolingbrooke and Oxford, however, in signing the proclamation of King George I., by whom he was nevertheless deprived of the captain-generalship. In June 1715 he was impeached, and fled to France, where he for some time resided with Bolingbrooke, and in 1716 his immense estates were confiscated to the crown by act of parliament, though by a mere formality his life was spared. He was not, however, enabled to repurchase them. After taking part in the Jacobite invasion in 1715, Ormonde settled in Spain, where he was in favour at court and enjoyed a pension from the crown. Towards the end of his life he resided much at Avignon, where he was seen in 1733 by Lady Mary Wortley Montagu. Ormonde died on the 16th of November 1745, and was buried in Westminster Abbey.

With little of his grandfather's ability, and inferior to him in elevation of character, Ormonde was nevertheless one of the great figures of his time. Handsome, dignified, magnanimous and open-handed, and free from the meanness, treachery and venality of many of his leading contemporaries, he enjoyed a popularity which, with greater stability of purpose, might have enabled him to exercise commanding influence over events.

ORMSKIRK, a market town and urban district in the Ormskirk parliamentary division of Lancashire, England, 11 m. N.E. of Liverpool by the Lancashire and Yorkshire railway Pop. (1901), 68,577. The church of St Peter and St Paul is a spacious building in various styles of architecture, but principally Perpendicular. It possesses the rare feature of two western towers, the one square and embattled, the other octagonal and bearing a short spire. There are various Norman fragments, including a fine early window in the chancel. To the south-east of the church, and divided from it by a screen, is the Derby chapel, the exclusive property of the earls of Derby, whose vault is contained within. A free grammar school was founded about 1614. Rope and twine making, iron-founding and brewing are carried on, and the town has long been famous for its gingerbread.

The name and church existed in the time of Richard I., when the priory of Burscough was founded. A few fragments of this remain about 2 m. N. of Ormskirk. The priory and convent obtained from Edward I. a royal charter for a market at the manor of Ormskirk. On the dissolution of the monasteries the manor was granted to the earl of Derby.

ORNAMENT (Lat. ornare, to adorn), in decorative art, that element which adds an embellishment of beauty in detail. Ornament is founded on forms, which are first obtained (by one of various processes), and then adapted (by one of various processes), to the particular object to which they are to be applied. Ornament, as it is the active cause and by rights suggests its design (q.v.). It does not exist apart from its application. Nor is it properly added to a thing already in existence (that is but a makeshift for design), but is rather such modification of the thing in the making as may be determined by the consideration of beauty. For example, the construction and proportions of a chair are determined by use (by the necessity of combining the maximum of strength with the minimum of weight, and of fitting it to the proportions of the human body, &c.); and any modification of the plan, such as the turning of legs, the shaping of arms and back, carving, inlay, mouldings, &c.—any reconsideration even of the merely utilitarian plan from the point of view of art—has strictly to do with ornament, whereas it is not a thing in itself. Hence, ornament, in the broadest sense, belongs to the very inception of the thing. Ornament is good only in so far as it is an indispensable part of something, helping its effect without hurt to its use. It is begotten of use by the consideration of beauty. The test of ornament is its fitness. It must occupy a space, fulfil a purpose, be adapted to the material in which and the process by which it is executed. This implies treatment. The treatment befitting a wall space does not equally befit a floor space of the same dimensions. What is suitable to hand-painting is not equally suitable to stencilling; nor what is proper to mosaic proper to carpet-weaving. Neither the purposes of decoration nor the conditions of production allow great scope for naturalism in ornament. Its forms are derived from nature. It has strictly to do with the natural, not by some remotevedness from nature—necessitated also by the due treatment of material after its kind and according to its fashioning. In the case of recurring ornament it is incept to multiply natural flowers, &c., which at every repetition lose something of their natural attraction. The artist in ornament does not imitate natural forms. Such as he may employ he transfigures. He does not necessarily set out with any idea of natural form (this comes to him by the way); his first thought is to solve a given problem in design, and he solves it perhaps most surely by means of abstract ornament—witness the work of the Greeks and of the Arabs. The extremity of tasteless naturalism, reached towards the beginning of the Victorian era, was the overthrow of English Renaissance ornament. But the fault was in insisting upon a form of ornament too abstract to suit English ideas. William Morris and others led the way back to nature, but to nature trained in the way of ornament. The Styles of ornament, so-called, mark the evolution of design, being the direct outcome of Greek, Roman, Byzantine, Gothic and other conditions in days when fashion moved slowly. Post-Renaissance ornament goes by the name of the reigning king; but the character of the historic periods was not sought by artists; it came of their working in the way natural to them and doing their best. "Style," as distinguished from "the Styles," comes of an artist's intelligent and sympathetic treatment of his material, and of his personal sincerity and strength. International traffic has gone far to do away with national characteristics in ornament, which becomes yearly more and more alike all the world over. The subsidiary nature of ornament and its subjection to conditions lead to its frequent repetition, which results in pattern, formed by repetitions falling inevitably into lines, and often by rearranging, setting it in proportion as they were not foreseen by the design. He cannot, therefore, safely disregard them. Indeed, his first business is to build pattern upon lines, if not intrinsically beautiful, at least helpful to the scheme of decoration. He may disguise them; but capable designers are generally quite frank about the construction of their pattern, and not afraid of pronounced lines. Of course, adaptation being all-essential to pattern, an artist must be versed in the technique of any manufacture for which he designs. His art is in being equal to the occasion. (L. F. D.)

ORNE, a department of the north-west of France, about half of which formerly belonged to the province of Normandy and the rest to the duchy of Alençon and to Perche. Pop. (1906) 315,693. Area, 2,371 sq. m. It is bounded N. by Calvados, E. by Eure, S. by Orne and Sarthe, and W. by Manche. Geologically there are two distinct regions: to the west of the Orne and the railway from Argentan to Alençon lie primitive rocks connected with those of Brittany; to the east begin the Jurassic and Cretaceous formations of Normandy. The latter district is agriculturally the richest part of the department; in the former the poverty of the soil has led the inhabitants to seek their subsistence from industrial pursuits. Between the northern portions, draining to the Channel, and the southern portion, belonging to the basin of the Loire, stretch the hills of Perche and Normandy, which generally have a height of from 800 to 1000 ft. The highest point in the department, situated in the forest of Écouves north of Alençon, reaches 1368 ft. The department gives birth to three chief rivers: its affluent the Iton, and the Risle, which passes by Laillé. The Touques, passing by Vimoutiers, the Dives and the Orne fall into the English Channel, the last passing Sées and Argentan, and receiving the Noireau with its tributary the Vère, which runs past Fler. Towards the Loire flows the Huisne, a feeder of the Sarthe passing by Mortagne, the Sarthe, which passes by Alençon, and the Mayenne, some of whose affluents rise to the north of the dividing range and make their way through it by the most picturesque defiles. The department, indeed, with its beautiful forests containing oaks several centuries old, its meadows, streams, deep gorges and stupendous rocks, is one of the most picturesque of all France. In the matter of climate the department is nearly midway between the moderate temperature of 50°F.; the summer heat is never extreme; the west winds are the most frequent; the rainfall, distributed over about a hundred days in the year, amounts to 36 in. or about 5 in. more than the average for France.

Horse-breeding is the most flourishing business in the rural districts; there are three breeds—those of Perche, Le Merlerault and Brittany. The great government stud of Le Pin-au-Haras (established in 1774), with its school of horse-breeding, is situated between Le Merlerault and Argentan. Several horse-training establishments exist in the department. A large number of lean cattle are bought in the neighbouring departments to be fattened; the farms in the vicinity of Vimoutiers, on the borders of Calvados, produce the famous froment membrane cheese, and others excellent butter. The bee industry is very flourishing. Oats, wheat, barley and buckwheat are the chief cereals, besides which fodder in great quantity and variety, potatoes and some
hemp are grown. The variety of production is due to the great natural diversity of the soils. Small farms are the rule, and the fields in those cases are surrounded by hedges relieved by pollard trees. Along the roads or in the enclosures are planted numerous pear and apple trees, the latter yielding cider, part of which is manufactured into brandy. Beech, oak, birch and pine are the chief timber trees in the extensive forests of the department. Orne has iron mines and freestone quarries; a kind of smoky quartz known as Alençon diamond is found. Its most celebrated mineral waters are those of the hot springs of Bagneux, which contain salt, sulphur and arsenic, and are employed for tonic and restorative purposes in cases of general debility. In the forest of Bellême is the chalybeate spring of La Hesse, which was used by the Romans.

Cotton and linen weaving, principally carried on at Flers (q.v.) and La Ferté-Macé (pop. 4355), forms the staple industry of Orne. Alençon and Vimoutiers are engaged in the production of linen and canvas. Vimoutiers has bleachers, which, together with dye-works, are found in the textile centres. Only a few workmen are now employed at Alençon in the making of the woven cloth which takes its name from the town. Foundries and wire-works also exist in the department, and articles in copper, zinc and lead are manufactured. Pins, needles, wire and hardware are also manufactured. Flers is the capital of the arrondissement, and is also a centre for hardware manufacture. There are also glass-works, paper-mills, tanneries (the waters of the Orne being reputed to give a special quality to the leather) and glove-works. Coal, raw cotton, metals and machinery are imported into the department, which exports its woven and metal manufacture, live stock and farm produce.

The department is served by the Western railway. There are four arrondissements, with Alençon, the capital, Argentan, Domfront and Mortagne as their chief towns, 36 cantons and 512 communes. The department forms the diocese of Sées (province of Rouen) and part of the académie (educational division) of Caen, and the region of the IV. army corps; its court of appeal is at Laigle. Its boundaries are those of English—Ortis—of the time. Chambois has a donjon of the 12th century; and there is a fine Renaissance château at O. A church in Laigle has a fine tower of the 15th century. There are a great number of megalithic monuments in the department.

ORNITHOLOGY, properly the methodical study and consequent knowledge of birds with all that relates to them; but the difficulty of assigning a limit to the commencement of such study and knowledge gives the word a very vague meaning, and practically procures its application to much that does not enter into the domain of science. This elastic application renders it impossible in the following sketch of the history of ornithology to draw any sharp distinction between works that are emphatically ornithological and those to which that title can only be attached by courtesy; for, since birds have always attracted far greater attention than any other group of animals with which in number or in importance they can be compared, there has grown up concerning them a literature of corresponding magnitude and of the widest range, extending from the recondite and laborious investigations of the morphologist and anatomist to the casual observations of the sportsman or the schoolboy.

Though birds make a not unimportant appearance in the earliest written records of the human race, the painter's brush has preserved their counterfeit presentment for a still longer period. A fragmentary fresco taken from a tomb at Medium was despatched some years ago, though in a decaying condition, in the British Museum. Egyptian Antiquities. This Egyptian picture was said to date from the time of the third or fourth dynasty, some three thousand years before the Christian era. In it were depicted with a marvellous fidelity, and thorough appreciation of form and colouring (despite a certain conventional treatment), the figures of six geese. Four of these figures can be unhesitatingly referred to two species (Anser albifrons and A. rufiollis) well known at the present day. In later ages the representations of birds of one sort or another in Egyptian paintings and sculptures become countless, and the basi-Rihrde of Assyrian monuments, though mostly belonging of course to a subsequent period, are not without them. No figures of birds, however, seem yet to have been found on the incised stones, bones or ivories of the prehistoric races of Europe.

History of Ornithology to End of 18th Century.

Aristotle was the first serious author on ornithology with whose writings we are acquainted, but even he had, as he tells us, predecessors; and, looking to that portion of his works on animals which has come down to us, one finds, that though more than 170 sorts of birds are mentioned, yet what is said of them amounts on the whole to very little, and this consists more of desultory observations in illustration of his general remarks (which are to a considerable extent physiological or bearing on the subject of reproduction) than of an attempt at a connected account of birds. One of his manuscripts, C. J. Sundevall, equally proficient in classical as in ornithological knowledge—was, in 1863, compelled to leave more than a score of the birds of which Aristotle wrote unidentified. Next in order of date, though at a long interval, comes Pliny the Elder, in whose Historia Naturalis Book X. is devoted to birds. Neither Aristotle nor Pliny attempted to classify the birds known to them beyond a very rough and for the most part obvious grouping. Aristotle seems to recognize eight principal groups: (1) Gamsponyxes, approximately equivalent to the Accipitres of Linnaeus; (2) Sciocephaga, containing most of what would now be called Ocellines, excepting indeed the (3) Acanthophaga, composed of the goldfinch, siskin and a few others; (4) Sciocephaga, the woodpeckers; (5) Itaicae or pipits; (6) Mantotures or thrushes; (7) Bias, and (8) Borea, nearly the same respectively as the Linnaean Grallae, Anseres and Gallinace. Pliny, relying wholly on characters taken from the feet, limits himself to three groups—without assigning names to them—which have been called hook-tailed, as Hawkes; or round long claws, as Hennes; or else they be broad, flat, and whole-footed, as Geese and all the sort in manner of water-foul—to use the words of Philemon Holland, who, in 1601, published a quaint and, though condensed, yet faithful English translation of Pliny's work.

About a century later came Aelian, who died about A.D. 140, and compiled in Greek (though he was an Italian by birth) a number of miscellaneous observations on the peculiarities of animals. His work is a kind of commonplace book kept without discrimination of species, and considered birds are mentioned, and something said of almost each of them; but that something is too often nonsense according to modern ideas. The twenty-six books De Animalibus of Albertus Magnus (Groot), printed in 1478, are founded mainly on Aristotle. The twenty-third of these books is De Avibus, and therein a great number of birds' names make their earliest appearance, few of which are without interest from a philologist's point of view, but there is much difficulty in recognizing the species to which many of them belong. In 1485 was printed the first dated copy of the volume known as the Ornis sanctorum, to the popularity of which many editions testify. Though said by its author, Johann Wonnecke von Caub (Latinized as Johannes de Cuba), to have been composed from a study of the

1 This is Sundevall's estimate; Drs Aubert and Wimmer in their excellent editing of the Iornologicae ncol 323 (Leipzig, 1868) limit the number to 126.

2 Absurd as much as that we find both in Albertus Magnus and the Ornis seems to modern eyes, if we go a step lower in the scale and consult the "Bestiaries" or treatises on animals which were common from the 12th to the 14th century, shall meet with many more absurdities. See for instance that by Philippe de Thau (Philippus Tamenus), dedicated to Adelaie or Alice, queen of Henry I. of England, and probably written soon after 1124, as printed by the late Mr Thomas Wright, in his Popular Treatises on Science written during the Middle Ages (London, 1841).
collections formed by a certain nobleman who had travelled in Eastern Europe, Western Asia and Egypt—possibly Breidenbach, an account of whose travels in the Levant was printed at Mentz in 1486—it is really a medical treatise, and its zoological character is mainly an abbreviation of the writings of Albertus Magnus, with a few interpolations from Isidorus of Seville (who flourished in the beginning of the 7th century), and was the author of many works highly esteemed in the middle ages) and a work known as Physiologus (q.v.). The third tractatus of this volume deals with birds—among them hares, bees, and other flying creatures; but as it is the first printed book in which figures of birds are introduced it merits notice, though most of the illustrations, which are rude woodcuts, fail, even in the coloured copies, to give any precise indication of the species intended to be represented.

The revival of learning was at hand, and William Turner, a Northumbrian, while residing abroad to avoid persecution at home, printed at Cologne in 1544 the first commentary on the birds mentioned by Aristotle and Pliny conceived in anything like the spirit that moves modern naturalists. In the same year and from the same press was issued a Dialogus de Avibus by Gervasio Longolino, and in 1570 Cajus brought out in London his treatise De rario rum animatium atque stirpi?m historia. In this last work, small though it be, ornithology has a good share; and all three may still be consulted with interest and advantage by its votaries.

Meanwhile the study received a great impulse from the appearance, at Zurich in 1555, of the third book of Conrad Gesner's Historia Animalium "qui est de Avium natura," and at Paris in the same year of Pierre Belon's (Bellonius) Histoire de la nature des Oiseaux. Gesner brought an amount of erudition, hitherto unequalled, to bear upon his subject; and, making due allowance for the times in which he wrote, his judgment must in most respects be deemed excellent. In his work, however, there is little that can fairly be considered original. Like nearly all his predecessors since Aelian, he adopted an alphabetical arrangement, though this was not too pedantically preserved, and did not hinder him from placing together the kinds of birds which he supposed (and generally supposed rightly) to have the resemblance to that one whose name, being best known, was chosen for the headpiece (as it were) of his particular theme, thus recognizing to some extent the principle of classification.

Belon, with perhaps less book-learning than his contemporary, was evidently no mean scholar, and undoubtedly had more practical knowledge of birds—their internal as well as external structure. Hence his work, written in French, contains a far greater amount of original matter; and his personal observations and traditions, in many respects, are inferior. Like Faulkner, he advised his readers to avoid most of the puerilities which disfigure other works of his own or of a preceding age. Besides this, Belon disposed the birds known to him according to a definite system, which (rude as we now know it to be) formed a foundation on which several of his successors were content to build, and even to this day traces of its influence may still be discerned in the arrangement followed by writers who have faintly appreciated the principles on which modern taxonomists rest the outline of their schemes. Both his work and that of Gesner were illustrated with woodcuts, many of which display much spirit and regard to accuracy.

Belon, as has just been said, had a knowledge of the anatomy of birds, and he seems to have been the first to institute a direct comparison of their skeletal with that of man; but in this respect he only anticipated by a few years the more precise researches of Volcher Coiter, a Frisian, who in 1573 and 1575 published at Nuremberg two treatises, in which the internal structure of birds in general is very creditably described, while in the other the osteology and mythology of certain forms is given in considerable detail, and illustrated by carefully drawn figures. The first is entitled Externarum et internarum animalium corporis Tabulae, &c. while the second, which is the most valuable, is merely appended to the Lectiones Carolii Fullophi de partibus similarium humani corporis, &c., and thus, the scope of each work being regarded as medical, the author's labours were wholly overlooked by the mere natural-historians who followed, though Coiter introduced a table, "De differentiis Avium," furnishing a key to a rough classification of such birds as were known to him, and this as nearly the first attempt of the kind deserves notice here.

Contemporary with these three men was Ulysses Aldrovandus, a Bolognese, who wrote an Historia Naturalium in sixteen folio volumes, most of which were not printed till after his death in 1605, but those on birds appeared between 1599 and 1603. The work is almost wholly a compilation, and that not of the most discriminative kind, while a peculiar jealousy of Gesner is continuously displayed, though his statements are very constantly quoted—nearly always as those of "Ornithologus," his name appearing but few times in the text, and not at all in the list of authors cited. With certain modifications in principle not very important, but characterized by much more elaborate detail, Aldrovandus adopted Belon's method of arrangement, but in a few respects there is a manifest retrogression. The work of Aldrovandus was illustrated by copperplates, but none of his figures approach those of his immediate predecessors in character or accuracy. Nevertheless the book was long regarded as a standard work of reference, so that the word "Aldrovandus" has become synonymous with "ornithology."* Mention must be made of a medical treatise by Caspar Schweenfeld, published at Liegnitz in 1603, under the title of Theriophorum Silesiae, the fourth book of which consists of an "Aviarium Silesiae," and is the earliest of the works we now know by the name of Fauna. The author was well acquainted with the labours of his predecessors, as his list of over one hundred of them testifies. Most of the birds he describes are characterized with accuracy sufficient to enable them to be identified, and his observations upon them have still some interest; but he was innocent of any methodical system, and was not exempt from most of the professional fallacies of his time.

Hitherto, from the nature of the case, the works above cited treated not of birds falling exclusively under the orbit veteris notus; but the geographical discoveries of the 16th century began to bear fruit, and many animals of kinds unsuspected were, about one hundred years later, made known. Here there is only space to name Boultius, Chlusius, Hernandez (or Fernandez), Marcgrave, Nieremberg and Piso, whose several works describing the natural products of both the Indies—whether the result of their own observation or compilation—together with those of Olini and Worm, produced a marked effect, since they led up to what may be deemed the foundation of scientific ornithology.†

The Historia Naturalis of Johannes Johnstonus, said to be of Scottish descent but by birth a Pole, ran through several editions during the 17th century, but is little more than an epitome of the work of Aldrovandus.

The Iherovnicon of Bochart—a treatise on the animals named in Homer and Hesiod, published in 1659.—For Lichtenstein's determination of the birds described by Marcgrave and Piso see the Abhandlungen of the Berlin Academy for 1817 (pp. 155 seq.).

The earliest list of British birds seems to be that in the Pinax Rerum Naturalium of Christopher Merrett, published in 1667. In the following year appeared the Onomasticum Zoologicum of Walter de Marisco, which is the earliest attempt to classify the birds. An enlarged edition of the latter, under the title of Exercitationes, &c., was published in 1677; but neither of these writers is of much authority. In 1684 Schuhardt in his Scotia illustrata published the earliest Fauna of Scotland.
This foundation was laid by the joint labours of Francis Willughby (1635–1672) and John Ray (1628–1705), for it is impossible to separate their share of work in natural history more than to say that, while the former more especially devoted himself to zoology, botany was the favourite pursuit of the latter. Together they studied, together they travelled and together they collected. Willughby, the younger of the two, and at first the other’s pupil, seems to have gradually become the master; but, he dying before the promise of his life was fulfilled, his writings were given to the world by his friend Ray, who, adding to them from his own stores, published the Ornithologia in Latin in 1676, and in English with many emendations in 1678. In this work birds generally were grouped in two great divisions—"land-fowl" and "water-fowl"—and his subdivision of the latter into successive or crooked beak and talons, and those which have a straighter bill and claws, while the latter was separated into those which frequent waters and watery places, and those that swim in the water—each subdivision being further broken up into many sections, to the whole of which a key was given. Thus it became possible for almost any diligent reader without much chance of error to refer to its proper place nearly every bird he was likely to meet with. Ray’s interest in ornithology continued, and in 1694 he completed a Synopsis Methodica Avium, which, through the fault of the booksellers to whom it was entrusted, was not published till 1713, when Derham gave it to the world.¹

Two years after Ray’s death, Linnaeus, the great reformer of natural history, was born, and in 1735 appeared the first edition of the celebrated Systema Naturae. Successful editions of this work were produced under his author’s supervision in 1740, 1748, 1758 and 1766. Impressed by the belief that verbiety was the bane of science, he carried terseness to an extreme which frequently created obscurity, and this in no branch of zoology more than in that which relates to birds. Still the practice introduced by him of assigning to each species a diagnosis by which it ought in theory to be distinguishable from any other known species, and of naming it by two words—the first being the generic and the second the specific term, was so manifest an improvement upon anything which had previously obtained that the Linnaean method of differentiation and nomenclature established itself before long in spite of all opposition, and in principle became almost universally adopted. In his classification of birds Linnaeus for the most part followed Ray, and where he departed from his model he seldom improved upon it.

In 1745 P. Barrère brought out at Perpignan a little book called Ornithologiae Specimen novum, and in 1752 Möhring published at Aurich one still smaller, his Avium Genera. Both these works (now rare) are manifestly framed on the Linnaean method, so far as it had then reached; but in their arrangement of the various forms of birds they differed greatly from that which they designed to supplant, and they deservedly obtained little success. Yet as systematists their authors were no worse than Klein, whose Historiae Avium Prodromus, appearing at Lübeck in 1750, and Stemmata Avium at Leipzig in 1759, met with more success. The chief merit of the latter work lies in its forty plates, whereon the heads and feet of many birds are indifferently figured.²

But, while the successive editions of Linnaeus’s great work were revolutionizing natural history, and his example of precision in language producing excellent effect on scientific writers, several other authors were advancing the study of ornithology in a very different way—a way that pleased the eye even more than his labours were pleasing the mind. Between 1731 and 1743 Mark Catesby brought out in London his Natural History of Carolina—two large folios containing highly coloured figures of the birds of that colony, Florida and the Bahamas.³ Eleazar Albin between 1738 and 1740 produced a Natural History of Birds in three volumes of more modest dimensions; but he seems to have been ignorant of ornithology, and his coloured plates are greatly inferior to Catesby’s. Far better both as draughtsman and as authority was George Edwards, who in 1743 began, under the same title as Albin, a series of plates with letterpress, which was continued by the name of Gleanings in Natural History, and finished in 1766, when it had reached seven parts, forming four quarto volumes, the figures of which are nearly always quoted with approval.⁴

The year which saw the works of Edwards completed was still further distinguished by the appearance in France, where little had been done since Belon’s days,⁵ in six quarto volumes, of the Ornithologie of Mathurin Jacques Brisson—a work of very great merit so far as it goes, for as a descriptive ornithologist the author stands even now unsurpassed; but it must be said that his knowledge, according to internal evidence, was confined to books and to the external parts of birds’ skins. It was enough for him to give a scrupulously exact description of such specimens as came under his eye, distinguishing these by prefixing two asterisks to their name, using a single asterisk where he had only seen a part of the bird, and leaving unmarked those that he described from other authors. His attempt at classification was certainly better than that of Linnaeus; and it is rather curious that the researches of the latest ornithologists point to results diametrically the opposite to those of his systematic arrangement, for they refuse to keep the birds-of-prey at the head of the Class Aves, and they require the establishment of a much larger number of “Orders” than for a long while was thought advisable. Of such “Orders” Brisson had twenty-six and he gave pigeons and poultry precedence of the birds which are plunderers and scavengers. But greater value lies in his generic or sub-generic divisions, which, taken as a whole, are far more natural than those of Linnaeus, and consequently capable of better diagnosis. More than this, he seems to be the earliest ornithologist, perhaps the earliest zoologist, to conceive the idea of each genus possessing what is now called a “type”—though such a term does not occur in his work; and, in like manner, without declaring it in so many words, he indicated unmistakably the existence of subgenera—all this being effected by the skilful use of names. Unfortunately he was too young when he entered the field to avoid himself, even had he been so minded, of the convenient mode of nomenclature brought into use by Linnaeus. Immediately on the completion of his Règne Animal in 1756, Brisson set about his Ornithologie, and it is only in the last two volumes of the latter that any reference is made to the tenth edition of the Systema Naturae, in which the binomial method was introduced. It is certain that the first four volumes were written if not printed before that method was promulgated, and when the fame of Linnaeus as a zoologist rested on little more than the very meagre sixth edition of the Systema Naturae and the first edition of his Fauna Suecia. Brisson has been severely criticized for his hostility to the great Swede, and it is true that in the preface to his work he remarks upon the insufficiency of the Linnaean characters, but, when one considers how much better acquainted with birds the Frenchman was, such criticism must be allowed to be pardonable if not wholly just. Brisson’s work was in French, with a parallel translation (edited, it is said, by Pallas) in Latin, which last was reprinted separately at Leiden three years afterwards.

¹ Several birds from Jamaica were figured in Skåne’s Voyage, &c. (1705–1718), and a good many exotic species in the Theatrea, &c. of Seba (1734–1765), but from their faulty execution these plates had little effect upon Ornithology.

² The works of Catesby and Edwards were afterwards reproduced at Nuttall’s and Amelung’s by Seligmann, with the letterpress in German, French and Dutch.

³ Birds were treated of in a worthless fashion by one D. B. in a Dictionnaire raisonné et universel des animaux, published at Paris in 1759.
In 1767 there was issued at Paris a book entitled *L'histoire naturelle éclairée dans une de ses parties principales, l'ornithologie*. This was the work of Sallerni, published after his death, and is often spoken of as being a mere translation of Ray's *Synopsis*, but a vast amount of fresh matter, and mostly of good quality, is added.

The success of Edwards's very respectable work seems to have provoked competition, and in 1765, at the instigation of Buffon, the younger d'Aubenton began the publication known as the *Planches énumérées d'histoire naturelle*, which appearing in forty-two parts was not completed till 1780, when the plates 1 it contained reached the number of 1008—all coloured, as its title intimates, and nearly all representing birds. This enormous work was subsidized by the French government; and, though the figures are utterly devoid of character, they were intended to depict with sufficient approach to fidelity to ensure recognition in most cases without fear of error, which in the absence of any text is no small praise.2

But Buffon was not content with merely causing to be published this unparalleled set of plates. He seems to have regarded the work just named as a necessary precursor to his own labours in ornithology. His *Histoire naturelle, générale et particulière*, was begun in 1740, and in 1770 he brought out, with the assistance of Guénée de Montbeillard,3 the first volume of his great *Histoire naturelle des oiseaux*. Buffon was the first man who formed any theory that may be called reasonable of the geographical distribution of animals. He proclaimed the variability of species in opposition to the hypothesis of the old townsmen, and endeavoured to their fixing it, without as yet supposing that this variability arose in part by degradation.4 Taking his labours as a whole, there cannot be a doubt that he enormously enlarged the purview of naturalists, and, even if limited to birds, that, on the completion of his work upon them in 1783, ornithology stood in a very different position from that which it had before occupied.

Great as were the services of Buffon to ornithology in one direction, those of a wholly different kind rendered by John Latham must not be overlooked. In 1781 he began a work the practical utility of which was immediately recognized. This was his *General Synopsis of Birds*, and, though formed generally on the model of Linnaeus, greatly diverged in some respects therefrom. The classification was modified, chasing the old noses of Willughby and Ray, and certainly for the better; but no scientific nomenclature was adopted, which, as the author subsequently found, was a change for the worse. His scope was co-extensive with that of Brisson, but Latham did not possess the inborn faculty of picking out the character wherein one species differs from another. His opportunities of becoming acquainted with birds were hardly inferior to Brisson's, for during Latham's long lifetime there poured in upon him countless new discoveries from all parts of the world, but especially from the newly-explored shores of Australia and the islands of the Pacific Ocean. The British Museum had been formed, and he had access to every instrument used in the methods of Linnaeus, and he entered into the abundant materials afforded him by the private museum of Sir Ashtorn Lever.5 Latham, entered, so far as the limits of his work would allow, into the history of the birds he described, and this with evident zest whereby he differed from his French predecessor; but the number of cases in which he erred as to the determination of his species must be very great, and not unfrequently the same species is described more than once. His *Synopsis* was finished in 1785; two supplements were added in 1787 and 1802,4 and in 1790 he produced an abstract of the work under the title of *Index Ornithologicae*, wherein he assigned names on the Linncean method to all the species described. Not to recur again to his labours, it may be said here that between 1821 and 1828 he published at Winchester, in eleven volumes, an enlarged edition of his original work, entitling it *A General History of Birds*; but his defects as a compiler, which had been manifest before his death increased with age, and the consequences were not happy.

About the time that Buffon was bringing to an end his studies of birds, Mauduyt undertook to write the *Ornithologicae of the Encyclopédie méthodique*—a comparatively easy task, considering the recent works of his fellow-countrymen on that subject, and finished in 1784. Here it requires no further comment, especially as a new edition was called for in 1790, the ornithological portion of which was begun by Bonnaterre, who, however, had only finished three hundred and twenty pages of it when he lost his life in the French Revolution; and the work thus arrested continued to be completed by Vieillot and D'Orville, and a new edition was published in 1819. But this work contained *Tableau ornithologique et méthodique des trois régnes de la nature*—the Ornithology forming volumes four to seven, and not completed till 1825. In the former edition Mauduyt had taken the subjects alphabetically; but here they are disposed according to an arrangement, with some few modifications, furnished by d'Aubenton, which is extremely shallow and unworthy of consideration.

Several other works bearing upon ornithology in general, but of less importance than most of those just named, belong to this period. In 1747, Mr. Charles Hartley published his work upon the birds of the British Museum, and it is a curious fact that the two books were published exactly at the same time in the same place the large work of Spawlosky with nearly the same title; Sparrman's *Museum Carolinaanum from 1756 to 1799; and in 1794 Hayman's *Birds of Europe and curious Birds* from the means of Sluijter the banker at Ostend and Liege. There is sufficient to be found with the draughtsman (who had in 1775 produced a *History of British Birds*) in 1822 began another series of *Figures of rare and curious Birds*.

The practice of Buffon, Brisson, and Latham was to assign the names of every bird they described to their private museum. In 1789, Shaw completed his great *History of British Birds*, and in the same year published a list of new species, under the title of *Synopsis of the Birds of the World*. His book was reprinted at Paris in 1790; and in the same year the first edition of a work entitled *Anns I. Historico-naturalis*, in which are described many birds, mostly from his

---

1 They were drawn and engraved by Martinet, who himself began in 1787 a *Histoire des oiseaux* with small coloured plates which have some merit, but the text is worthless.

2 Between 1757 and 1766 there appeared at Florence a *Storia Naturale degli Uccelli*, in five volumes, containing as many plates as the works of the ornithologists (cf. Savi, *Ornithologia Toscana*, i. Introduzione, p. v.).

3 He retired on the completion of the sixth volume, and thereupon Buffon associated Bezon with himself.

4 See the complete but not the abridged version of the *Synopsis* of 1821, to which the addition of new species was made by Leach, Nodder continuing to do the plates. This was completed in 1817, and forms three volumes with 149 plates, 27 of which represent birds.

5 The result of this work only fifty copies were printed, and of these the rarest known to the ornithologist. Only two copies are believed to exist in England, one in the British Museum, the other in private hands. It was reprinted in 1874 by Mr. Tegmeiner.
own collection or the Imperial vivarium at Vienna—was at the pains to print at Pavia in his miscellaneous Deliciae Florae et Fauae Insectorum et Volae Insersae a Specimen Zoologicum \(^1\) containing diagnoses, duly named, of the birds discovered and described by Sonnerat in his travels in Asia Minor and Voyages to the New World.

Sonnerat's **Général**, several volumes published at Paris in 1772 and 1775. But the most striking example of compilation was that exhibited by J. F. Gmelin, who in 1788 commenced what he called the Third Volume of the Britannica Naturalis. Gmelin avoided himself the necessity of repeating his work, but he perhaps found his richest booty in the labours of Latham, nearly condensing his English descriptions into Latin diagnoses, and bestowed on them binomial names. Hence it is frequently Latham who appears as the first author of such a nomenclature now in use. He took many liberties with the details of Linnaeus's work, but left the classification, at least of the birds, as it was—a few new genera excepted.\(^2\)

The fundamental work done in studying the internal structure of birds; \(^3\) but the foundations of the science of embryology had been laid by the investigations into the development of the chick by the great Harvey. Between 1666 and 1669 Perrault edited at Paris, to lay the foundation of a thoroughly and as many species of birds, which, translated into English, were published by the Royal Society in 1702, under the title of *The Natural History of Animals*. After the death of the two anatomists just named, the scientific investigation of the structure of the birds which had been found among their papers, and the whole were published in the *Mémories of the French Academy of Sciences* in 1733 and 1734. But in 1681 Gerard Blainville had brought out at Amsterdam *An Anatomical and Physiological Survey of the Avian Birds*, a work containing the description of all the animals that he could find; and the second part of this book, treating of *Volatilla*, makes a remarkable show of more than one hundred and two closely-printed quarto pages, though nearly two-thirds of the work of *Phaenocorys* and *Ptenanchoidea* had been omitted. Other things a reprint of Harvey's researches, and the scientific rank of the whole book may be inferred from birds being still classed with their fossils. This work was published in 1708, in his *Amphitheatrum Zootomica*, in which again most of the existing accounts of the anatomy of birds were reprinted. But these and many other contributions,\(^4\) made until nearly the close of the 18th century, though highly meritorious, were unconnected as a whole, and it is plain that no conception of what it was in the power of Comparative Anatomy to set forth had occurred to so many diligent dissectors.

It was reserved for Georges Cuvier, who in 1798 published at Paris his *Tableau élémentaire de l'histoire naturelle des animaux de la terre*. Cuvier's was a hitherto unknown mode of appreciating the value of the various groups of the animal kingdom. Yet his first attempt was a mere sketch.\(^5\) Though he made a perceptible advance on the classification of Linnaeus, at that time predominant, it is now easy to see in how many ways—want of sufficient material being no doubt one of the chief—Cuvier failed to produce a really natural arrangement. His principles, however, are those which must still guide taxonomists, notwithstanding that they have in so great a degree overthrown the entire scheme which he propounded. Confining our attention here to ornithology, Cuvier's arrangement of the class Aves has never been so very much better than any which it superseded. This was the result of the researches of which Cuvier taught. In the work just mentioned few details are given; but even the more elaborate classification of birds contained in his *Leçons d'anatomie comparée* of 1805 is based wholly on external characters, such as had been used by nearly all his predecessors; and the *Règne Animal of 1817*, when he was in his fullest vigour, afforded not the least evidence that he had ever dissected a couple even of birds\(^6\) with the object of determining their relative position in his system, which then, however, was decided when he saw the configuration of bills, wings and feet. But, though apparently very little was done in the way of the anatomy of birds as would enable him to apply it to the formation of that natural system which he was fully aware had yet to be sought, it seems to have been an excellent judge of the characters afforded by the bill and limbs, and the use he made of them, coupled with the extraordinary reputation he acquired on other grounds, procured for his system the adhesion for many years of the majority of ornithologists.\(^7\)

Hitherto mention has chiefly been made of works on general ornithology, but it will be understood that these were largely aided by the enterprise of travellers, and as there were many of them who published their own narratives of their travels, their contributions have to be considered. Of those travellers the first to be here especially named is Marquart, the fifth volume of whose *D迈出blois Pavonicos-Mythic* is devoted to the birds he met with in the valley of the Danube, and appeared at the Hague in 1735, followed by a French translation in 1744.\(^8\) Most of the many pupils whom Linnaeus sent to foreign countries submitted their discoveries to him, but Kalm, Hasselquist and Osbeck published separately their respective travels in Norrland and America, and the smaller authors on the journeys of Pallas and his colleagues—Falk, Georgi, S. G. Gmelin, Guldénstäd, Lepechin and others—in the exploration of the recently extended Russian empire supplied not only material for the great *Systema Naturae* and *Systema Naturae* but more that is to be found in their narratives—all of it being the highest interest to students of Palaeartic or Nearctic ornithology. Nearly the whole of their results, it may here be said, were summed up in the important work of *Conspectus avium* of the naturalist, which saw the light in 1811—the year of its author's death—but, owing to circumstances over which he had no control, was not generally accessible till twenty years later. Of still wider importance for the classification of the birds of this hemisphere of the world are the contributions of the elder Forster were not printed till 1817, and the work of that of young Forster, which was by the younger Forster still remains unpublished in the British Museum. The several accounts by John White, Collins, Phillips, and others of the naturalists who visited New South Wales at the end of the last century ought not to be overlooked by any Australian ornithologist. The only information at this period on the ornithology of South America is contained in the two works on Chile by Molina, published at Bologna in 1776 and 1782. The travels of the Vaillant in South Africa having been completed in 1788, his great *Osseau d'Afrique* began to appear in Paris in 1797; but it is hard to speak properly of this work, for several of the species described in it were not, at least in his time, inhabiting that country, though he sometimes gives a long account of the circumstances under which he observed them.\(^9\)

From travellers who employ themselves in collecting the animals of the place, or who visit the lands of others, it is only those of their own district, be it great or small, are really not so much divided as at first might appear. Both may well be named "Faunists," and of the latter there were not a few who having tired their attention more or less to ornithology should here be noticed.

---

\(^1\) So little regard did he pay to the osteology of birds that, according to the Blainville (Jour. de Physique, 23, p. 187, note 5), the skeleton of a foul which was attached the head of a hornbill was for a long time exhibited in the Museum of Comparative Anatomy at Paris! Yet, in order to determine the difference of structure in the wings of voyages to the Levant and Chilia.\(^10\) The inci-48, 503-519.

\(^2\) Daudin's unfinished *Traité élémentaire et complet d'ornithologie* appeared in 1820, and might have been the last of these great works published in the 18th century.

\(^3\) A succinct notice of the older works on ornithology is given by Professor Seligman in the introduction to that portion of Dr Bronn's *Kommunikation der biologischen und biologischen and der Naturwissenschaften,* published in 1896; and Professor Carus's * Geschichte der Zoologie*, published in 1872, may also be usefully consulted for further information on this and other heads.

\(^4\) One of the earliest works is the *Dictionnaire de Bartholin and Borrichius published at Copenhagen deserve mention if only to record the activity of Danish ornithologists in those days.

\(^5\) It had no effect on Lacépède, who in the following year added a *Tableau méthodique* containing a classification of birds to his *Discours d'ouverture* (Mem. de l'Institut, ii. pp. 154-468, 503-519).

\(^6\) Though much later in date, the *Iter per Posteaquin Salveniae* of Dr Buda in 1785 is perhaps the most ornithological portion of it contained in these volumes received many additions from John Edward Gray, and appeared in 1829.

\(^7\) Though much later in date, the *Iter per Posteaquin Salveniae* of Dr Buda in 1785 is perhaps the most ornithological portion of it contained in these volumes received many additions from John Edward Gray, and appeared in 1829.

\(^8\) Though much later in date, the *Iter per Posteaquin Salveniae* of Dr Buda in 1785 is perhaps the most ornithological portion of it contained in these volumes received many additions from John Edward Gray, and appeared in 1829.

\(^9\) It is unnecessary to enumerate the various editions of the *Règne Animal*. Of the English translations, that edited by Griffiths and Blanford contains the most of the ornithological portion of it contained in these volumes received many additions from John Edward Gray, and appeared in 1829.
ornithology

[1] His earlier work under the title of Petamethode can hardly be deemed scientific.

[2] This extremely rare book has been reprinted by the Willsbury Society.

[3] For the omission of the two latter appear on this page, a fair copy ever made its rest-places is unknown.

[4] In this year there were two issues of this book; one, nominally a second edition, only differs from the first by the addition of two pages. No real second edition ever appeared, but in anticipation of it Sir Thomas Browne prepared in or about 1671 (1) his "Account of Birds found in Norfolk," of which the draft, now in the British Museum, was published in the year 1675. If a fair copy was ever made its resting-place is unknown.

[5] It has been reprinted by the Willsbury Society.

[6] Some of the figures were drawn from stuffed specimens, and accordingly perpetuate all the imperfections of the original; others represent species with the appearance of which the artist was not familiar.
ORNITHOLOGY

The knowledge, which may be the
praise.

The existence of these two works explains the widely-spread taste for ornithology in England, which is to foreigners so puzzling, and the zeal—not always according to knowledge, but occasionally reaching to serious study—with which that taste is pursued.

On reviewing the progress of ornithology since the end of the 18th century, the first thing that will strike us is the fact that general works, though still undertaken, have become paralleled by a host of works, devoted to the ornithological portion of the fauna of any particular country, or to certain groups of birds—works to which the name of "Monograph" has become wholly restricted—have become far more numerous. Another change has come over the condition of ornithology, as of kindred sciences, induced by the multiplication of learned societies which issue publications as well as of periodicals of greater or less scientific pretension. A number of these must necessarily be left unnoticed here. Still it seems advisable to furnish some connected account of the progress made in the ornithological knowledge of the British Islands and those parts of the European continent which lie nearest to them or are most commonly sought by travellers, the Dominion of Canada and the United States of America, South America together with Australia and New Zealand.

The more important monographs will usually be found cited in the separate articles on birds contained in this work, though some, by reason of changed views of classification, have for practical purposes to be regarded now as general works.

It will perhaps be best convenient to begin by mentioning some of these last, and in particular a number of them which appeared at Paris very early in the 19th century. First in order of them is a work of which the following is a translation:

Le Vaillant.

Paris, 1801.

...rare des Amérique et des Indes, a volume published in 1801 by Le Vaillant. This is devoted to the very distinct and not nearly-allied groups of hornbills, and of birds which for want of a better title of "Bird-staffer." The following is a translation of what was notice immediately, by colour'd plates, done in what was then considered to be the highest style of art and by the best draughts men procurable. The first volume of A Historie naturelle des perroquets, a companion work by the same author, appeared in the same year, and is truly a monograph, since the parrots constitute a family of birds so naturally severable from all others that there has rarely been anything else confounded with them. The second volume came out in 1805, and a third was issued in 1837-1838 long after the death of its predecessor's author, by Bournjot St-Hilaire. Between 1803 and 1806 Le Vaillant also published a work to which may be added this volume of the Historie naturelle des oiseaux de Paradis, and des rollers, suivie de celle des toucans et des barbus, an assemblage of forms, which, miscellaneous as it is, was surpassed in incongruity by a fourth work on the same scale, the Historie naturelle des proméros et des guêpier, of which are found jays, waxwings, the cock-of-the-rock (Rupicola), and what not besides. The plates in this last are by Barrand, for many years regarded as the perfection of the bird-staffer. The figures happen to have been drawn from the life, are not bad; but his skill was quite unable to vivify the preserved specimens contained in museums, and when he had only these as subjects he simply copied the disposition of the birds. The following work being aided by Temminck of Amsterdam, of whose son we shall presently hear more, Le Vaillant brought out the sixth volume of his Oiseaux d'Afrique, already mentioned. Four more volumes of this work were promised, but the means of executing them were denied to him. The work then was left undone, but a fourth edition appeared, in which the plates were reduced by means of the camera lucida, the text was revised, and the whole systematically arranged. Other reprints have since been issued, but they are vastly inferior both in execution and arrangement to the original, but a sequel to the first edition—Le Vaillant's Oiseaux d'Afrique—of which the plates were reduced by means of the camera lucida, the text was revised, and the whole systematically arranged. Other reprints have since been issued, but they are vastly inferior both in execution and arrangement to the original, but a sequel to the first edition—Le Vaillant's Oiseaux d'Afrique—of which was brought out in 1835-1838 by Cassin as Illustrations of the Birds of California, Texas, Oregon, British and Russian America.

Temminck subsequently reprinted, with many additions, the text of this volume in his Histoire naturelle des pigeons et des gallinaises, published at Amsterdam in 1815 and 1816, in 3 volumes. Between 1822 and 1824 W.M. Forster brought out at Paris a further set of illustrations of pigeons by Marc Knip.

On the completion of these two works, for they must be regarded as distinct, an octavo edition in seven volumes under the title of The Ornithological Register, the first of which appeared in 1818, and the last in 1828, was published at London by R. & J. F. Smith. Several reprints of this work, with it in form, was brought out in 1835-1836 by Cassin as illustrations of the Birds of California, Texas, Oregon, British and Russian America.

A similar series of works was projected and begun about the same time as that of Le Vaillant by Audubon and Vieillot, though the former, who was by profession a painter and illustrated works, the latter was a physician and naturalist. Audubon's Histoire des pigeons illustrated by Madame Knip, who had drawn the plates for Desmarest's volume, since we have begun by considering these large illustrated works in the first place, it appears proper to mention that he was the first to be convenient to continue our notice of such others of similar character as it may be expedient to mention here, though we hereby shall be led somewhat far afield. Most of them are but luxuriant, and not accompanied by descriptive text. The earliest of the three that come to mind is Audubon's The Birds of America, for which the first part appeared in London in 1827 and the last in 1838. It does not seem to have been the author's original intention to publish any letterpress to this enormous work, but to let the plates tell their own story; and it has been found with the assistance, it is of now, known of William Maggillivray, a text, on the whole more than respectable, was produced in five large octavo volumes under the title of Ornithological Biography, in which more will be said in the sequel. Audubon has been greatly extolled as an ornithological artist; but he was far too much addicted to representing his subjects in violent action and in postures which no nature of any kind ever presents; a defect which is very frequently detectible.

In 1866 G. C. Elliot began, and in 1869 was published, a sequel to Audubon's great work in two volumes, on the same scale—The New and Hitherto Unfigured Species of the Birds of North America, which had been added to its fauna since the completion of the former.

In 1830 John Edward Gray commenced the Illustrations of Indian Zoology, a series of plates of vertebrated animals, laying down the theory of birds, insects, reptiles and mammals, by various eminent artists. Audubon's Great Birds of North America, for which the first part appeared in London in 1827 and the last in 1838. It does not seem to have been the author's original intention to publish any letterpress to this enormous work, but to let the plates tell their own story; and it has been found with the assistance, it is of now, known of William Maggillivray, a text, on the whole more than respectable, was produced in five large octavo volumes under the title of Ornithological Biography, in which more will be said in the sequel. Audubon has been greatly extolled as an ornithological artist; but he was far too much addicted to representing his subjects in violent action and in postures which no nature of any kind ever presents; a defect which is very frequently detectible.

In 1866 G. C. Elliot began, and in 1869 was published, a sequel to Audubon's great work in two volumes, on the same scale—The New and Hitherto Unfigured Species of the Birds of North America, which had been added to its fauna since the completion of the former.

In 1830 John Edward Gray commenced the Illustrations of Indian Zoology, a series of plates of vertebrated animals, laying down the theory of birds, insects, reptiles and mammals, by various eminent artists. Audubon's Great Birds of North America, for which the first part appeared in London in 1827 and the last in 1838. It does not seem to have been the author's original intention to publish any letterpress to this enormous work, but to let the plates tell their own story; and it has been found with the assistance, it is of now, known of William Maggillivray, a text, on the whole more than respectable, was produced in five large octavo volumes under the title of Ornithological Biography, in which more will be said in the sequel. Audubon has been greatly extolled as an ornithological artist; but he was far too much addicted to representing his subjects in violent action and in postures which no nature of any kind ever presents; a defect which is very frequently detectible.
Birds of Europe in five volumes, published between 1832 and 1837, while in the interim (1834) appeared "A Monograph of the Ramphastidae and Trogonidae," a second edition of which was published in 1837-1838, and "A Monograph of the Trogonidae" (1838), which also reached a second edition. Sailing in 1836 for New South Wales, on board the "Erebus," he had undertaken the task of revising the works, "The Birds of Australia," which was finished in 1838 in seven volumes, to which several supplementary parts, forming another volume, have been added. He had also begun "A Monograph of the Trochilidae or Humming Birds" extending to five volumes, the last of which appeared in 1841, and was followed by a supplement by Mr. Salvin, "A Monograph of the Otidophorinae or Partridges of South America," the fifth and last part of which was completed by Mr. Sharpe (1850-1854); "The Birds of Great Britain," in five volumes (1863-1873); and "The Birds of New Guinea," begun in 1875, and, after the author's death in 1881, undertaken by Mr. Sharpe. These works, which are full of useful information and published in folio volumes, and containing more than three thousand coloured plates. The earlier of these works were illustrated by Mrs. Gould, and the figures in them are fairly good; but those in the later, except by P. L. Selby, the successor in the field, and one volume was, Wolf, are not so much to be commended. There is, it is true, a smoothness and finish about them not often seen elsewhere; but, as though to avoid the exaggerations of Audubon, Gould usually adopted the tamest of attitudes in which to represent his subjects, whereby expression as well as vivacity is wanting. Moreover, both in drawing and in colouring there is frequently much that is untrue to nature, so that it has not uncommonly happened for them to fail in the interests of ornithology, and has affected their means of recognizing specimens on comparison. In estimating the letterpress, which was awfully held to be of secondary importance to the engravings, and only meant to serve to ensure the success of his works, it had to be written to suit a very poor product of which a large number was to be sold to a body of subscribers. Nevertheless a scientific character was so adroitly assumed that scientific men—some of them even ornithologists who have been led to believe the text had a scientific value, and that of a high class. However, it must also be remembered that, throughout the whole of his career, Gould consulted the convenience of working ornithologists by almost invariably refraining from including in his work the technical determination of rare or species without first publishing it in some journal of comparatively easy access.

An ambitious attempt to produce in England a general series of coloured plate, for the purpose of making ornithology more accessible, was the first part of which bears date 1841-1842. Others appeared at irregular intervals until 1849, when the work, which seems never to have received the support it deserved, was discontinued. The seventy plates (forty-six of which represent birds) composing, with some explanatory letterpress, the volume, are by C. Ceusens and H. N. Turner—the latter (as his publications prove) a zoologist of much promise, who in 1851, died, a victim to his zeal and his reputation for a high class in his profession. The chief object of the author, who had been naturalist to the Niger Expedition, and curator to the Museum of the Zoological Society of London, was to illustrate a series of figures placed in its gardens, or described in its Proceedings, which until the year 1848 were not illustrated.

The publication of the "Zoological Sketches of Joseph Wolf, from animals in the Zoological Society's Gardens," was begun about 1855, with a brief text by D. W. Mitchell, at that time the Society's secretary, in illustration of them. After his death in 1859, the explanatory letterpress was rewritten by P. L. Selby, the successor in the field, and one volume completed in 1861. Upon this a second series was commenced, and brought to an end in 1868. Though a comparatively small number of species of birds are figured in this magnificent work (seven in the first series, and twenty-two in the second), it must be mentioned here, for their likenesses are so admirably executed as to place it in regard to ornithological portraiture at the head of all others. There is not a single plate that is unworthy of the greatest consideration.

Proceeding to illustrated works generally of less pretentious size, but of greater ornithological utility than the books last mentioned, which are for the drawing-room than the study, we next have to consider some in which the text is not wholly subordinated to the plates, though the latter still form a conspicuous feature of the publication. First of these in point of time as well as in importance is the "Monograph of the Picidae by Temminck and Langier, intended as a sequel to the "Planches en couleurs," of D'Aubenton before noticed, and like that work issued both in folio and quarto size. The first portion of this was published at Paris in 1840, containing one hundred and two illustrations, which appeared with great irregularity (Ibis, 1848, p. 500), the last was issued in 1839, containing the titles of the five volumes that the whole forms, together with a Table of the Extinct and Living Species of Parrots, etc., being an index. There are six hundred plates, but the exact number of species figured (which has been computed at six hundred and sixty-one) is not so easily ascertained. Generally the subject of each plate has letterpress to correspond, but in some cases this is wanting, while on the other hand descriptions of species not figured are not unfrequent. In the second volume much additional information as to distribution and construction of each genus or group are added. The plates, which show no improvement in execution on those of Martinet, are after drawings by Huet and Frêre, the former being perhaps the better artist. The work is admirably put to the idea of what a bird when alive looks like, though he was not able to give his figures any vitality, while the latter simply delineated the stiff and dishevelled specimens from museum shelves. Still generally speaking there is not much difficulty in recognizing the species represented. The letterpress is commonly limited to technical details, and is not always accurate; but it is of its kind useful, for the publication is pretty well done, and contains many interesting facts. As far as the subject goes, a work probably has surpassed any of his contemporaries. The "Tableau méthodique" offers a convenient concordance of the old "Planches enluminées" and "Planches en couleurs," and the whole is followed by a description in the first volume of the second edition of his Manuel d'ornithologie, of which something must presently be said.

The "Galerie des oiseaux," a rival work, with plates by Oudart, seems to have been begun immediately after the former. The original project was apparently to give a figure and description of every species of bird; but that was soon found to be impossible; and, when six parts had been issued, with text by some unnamed author, the scheme was brought within practicable limits, and the writing of the letterpress was entrusted to Vielliot, who, proceeding on a systematic plan, performed his task very creditably, completing the work, which was issued in two volumes, containing about eighty-five plates being relegated to the end of the second volume, as a supplement. His portion is illustrated by two hundred and ninety-nine coloured plates that, wretched as they are, have been ably engraved and have a set of plates in the first volume, of which but one and fifty-seven are bad. His work has not been given to their subjects having been judiciously selected. It is a tradition that, this work not being favourably regarded by the authorities of the Paris Museum, its draughtsman and author were refused certificates of admission to the society. Nevertheless, the authors, being zealous artist-ornithologists, were their own draughtsmen to the extent even of lithographing the figures. In 1828 James Wilson (author of the article "Ornithology" in the 7th and 8th editions of the present work) began, under the title of "Illustrations of Ornithology," the publication of a series of his own drawings (which he did not, however, himself engrave) with corresponding letterpress. Of the thirty-six plates illustrating this first volume, twenty are drawn by him, and contain figures, which, it must be allowed, are not very successful of several species rare at the time.

Though the three works last mentioned faulty and somewhat the same, yet several others have been published, amongst which, "The Picidae," of C. Bonpland, are among the most useful; and, although no one of them can be properly deemed their rightful heirs. The claim to that succession was made in 1845 by Du Bus for his "Monographie oiseaille," which, containing one hundred and fifty-two plates, representing one hundred and four species, all from Central or South America, which are distributed by him in two volumes, the letterpress is in some places copious, and useful lists of the species of various genera are occasionally subjoined, adding to the definite value of the work, which, forming one volume, was completed in 1869.

Rowley's "Ornithological Miscellany" in three quarto volumes, profusely illustrated, appeared between 1825 and 1878. The contents are as varied as the authorship, and, most of the leading English ornithologists having contributed to it, and the work is for the most part uniformly good, while in the plates, which are in Keulemans's best manner, many rare species of birds are figured, some of them for the first time.

More recent monographs have been more exact, and some of them extremely ornithologically interesting. We may mention F. E. Blauw's "Monograph of the Cranes" (1887, folio); St. G. Mivart's "Monograph of the Loeser" (1898, folio); the Hon. W. Rothschild's "Monograph of the Genus Casuarius" (1899, quarto); R. B. Sharpe's...
ORNITHOLOGY

Monograph of the Paradisaeidae (1808, folio); H. Scebomh's Monograph of the Thrushes (1800, imp. quarto); J. G. Milford's British Surface-feeding Ducks (1902, folio); and the Hon. W. Rothschild's Emilt Birds (1807, folio). The latter was published in 1816 and 1819 to the second edition of the Nouveau dictionnaire d'histoire naturelle containing much valuable information. The views of neither of these systematists pleased Temminck, who in 1820, in a pamphlet published at Amsterdam, and prefixed to the second edition of his Manuel d'ornithologie, which appeared in 1820, an Analyse du systeme du gener, in which he presents his plan of arrangement, though, by no means simple, was not only adopted by many ornithologists of almost every country, but still has adherents. The following year Ranzani, in Bologna, in his Elementi di zoologia, greatly modified Temminck's arrangement, in the sections and classes of the order of the birds, and lined up to some extent the plan of De Blainville and Merrem (concerning which much more has to be said by and by), placing the Struthious birds in an Order by themselves, and thus making two or three Orders of a Systema avium, in this form never completed.

Consisting of forty-nine detached monographs of as many genera, the species of which are most elaborately described. The arrangement he subsequently adopted for them and for other groups is to be found in his Naturales System der Amphibien (pp. 77-128), published in 1836, and is too fanciful to require any further attention. The several attempts at system-making by Kaup, from his Monographie Zoologischea, in 1829; and von Wagler, in 1833, were never brought out, and to the best of our knowledge have long disappeared.

Swarowski. Illustrations in three volumes, containing one hundred and forty-eight plates, were drawn by the author, who as an ornithological artist had no rival in his time. Every plate is not beyond criticism, but his worst drawings show more knowledge of bird-life than do the best of his European contemporaries. In 1845 Reichenbach published his thirty-sixth volume, containing his Praktische Naturgeschichte der Vogel, the extraordinary series of illustrated publications which under titles far too numerous here to repeat, ended in or about 1850, being a complete and in every way ständigste Naturgeschichte der Vogel. Herein are contained more than nine hundred coloured and more than one hundred uncoloured plates, which are crowded with the figures of birds, a large proportion of which have been reduced copies from other works, and especially those of Gould.

It now behoves us to turn to general and particularly systematic works in which plates, if they exist at all, form an accessory to the text. These need not detain us for long, since, however well some of them may have been executed, regard being had to their epoch, and whatever repute some of them may have achieved, they are, so far as general information and especially classification is concerned, of little use. A cursory view of the last of all these works, indeed, as matters of antiquarian interest. It will be enough merely to mention DuMéril's Zoologie analytique (1806) and Gravenhorst's Vergleichende Übersicht des tierischen und einiger neueren zoologischen Systemen (1814), both of which, with some few modifications and T. Stephens. Zoology, a pretentious compilation continued by Stephens and later, are of little or no use for ornithology's library. Yet it must be confessed that its author was hardly an ornithologist, but for the accident of his calling. He was a thoroughly conscientious clerk, devoted to his duty and learned, in all giving trouble to the Government by executing a work on so grand a scale as this—it forms three folio volumes, and contains one hundred and eighty-five coloured and one hundred and forty-eight uncoloured plates, with references to upwards of four hundred generic names, the chief, it must be said, in a hostile spirit, criticized by Strickland (Ann. Nat. History, vi. p. 410; vii. pp. 26 and 159), was followed by a second edition in 1841, in which nearly all the corrections of the reviewer were adopted, and in 1844 began the publication of The Genera of Birds, beautifully illustrated—first by Mitchell and afterwards by Mr. Woll—which will always keep Gray's name in remembrance. The enormous labour required for this work seems scarcely to have been appreciated, while the system here adopted, as a whole, is not unimportant; it is, however, a reflection on the postership of the author that the same plates were used for the first and second volumes of his great work, which is itself a mark of genius, and was brought to a successful conclusion in 1849. Costly as it necessarily was, it has been of great service to working ornithologists. In 1855 Gray brought out, as one of the Museum publications, A Catalogue of the Genera and Subgenera of Birds, a handy little volume, naturally founded on the larger works. Its chief drawback is that it does not give any more reference to the author and the date of the first publication, and the number of the volume, of its application, though of course more precise information would have at least doubled the size of the book. The same deficiency became still more apparent when, between 1860 and 1871, he published his Hand-List of Genera and Species of Birds in three volumes.

1 In 1828 he brought out, under the title of Manuel d'ornithologie, two handy duodecimos which are very good of their kind.
2 Technically speaking they are in quarto, but their size is so small that they may be well spoken of here. In 1879 Dr. A. B. van der Werff translated them into English and published them in London.
3 Illiger may be considered the founder of the school of nomenclatural purists. He would not tolerate any of the barbarous generic terms adopted by other writers, though some had been in use for a hundred years.
4 The method was communicated to the Turin Academy, on 18 October, 1814, and was to be printed (Mém. Acad. Sc. Turin, p. xxviii); but, through the derangements of that stormy period, the attempt was not made (see our paper in The Linnean Society, 1868).
ORNITHOLOGY

I. That every natural series of beings, in its progress from a given point, either actually returns, or evinces a tendency to return, again to that point, thereby forming a circle.

II. That the primary divisions of every group are characterised by definite peculiarities of form, structure and economy, which, under diversified modifications, are uniform throughout the kingdom, and are therefore to be regarded as the primary types of nature.

III. That the different ranks or degrees of circular groups exhibit the same disposition to be changed by the alterations of time and climate, and that the angular groups are none in number, each being involved within the other.

Though, as above stated, the theory here promulgated owed its temporary success chiefly to the extraordinary assurance and perr

[Continued text]
ORNITHOLOGY

already stated) the extraordinary views of its adherents found little favour on the continent of Europe. The purely artificial character of such works was well understood, and men were at a loss to find a substitute for it. The new doctrine, loudly proclaiming the discovery of a "Natural System," led away many from the steady practice which should have followed the teaching of Cuvier. But the idea has slowly gained ground, and most of the more learned ornithologists found that they had left behind them the narrow limits which had been imposed upon their studies by the system of classification to which they adhered up to the principles he had laid down) and from the extended study of Comparative Anatomy. Moreover, it veiled the honest attempts that were making both in France and Germany to find real solutions of the problem. It is true that Sir William Jardine, whose labours have been so useful, was not amongst those who accepted the methodical doctrine and the mystical jargon of the Quinarians, but it is now generally admitted that their infallibility, and so rigorously had they assailed any who ventured to think a little more, that it is by no means easy to determine how far the statements of the early followers of the new system may be accepted. The more recent works of Jardine (especially those on the nests of birds) have been rather free from this defect; and it is now generally admitted that the most valuable part of the labour of the Quinarians was the laying open of the structure of the birds, and the discovery of the correct relations of different groups of birds.

This is an important but cannot be called a satisfactory work. Its one hundred and fourteen plates by Ford truthfully represent one hundred and twenty-two of the most important for its purposes obtained by the author, and though they have been examined by a number of experts, the birds of South Africa (8vo, 1867), though by no means free from faults, has much to recommend it. A so-called new edition of it by R. B. Sharpe appeared in 1875-84, but was executed on a plan little different from that of the first edition. J. C. P. Anderson's Notes on the Birds of Damara Land (8vo, 1872), edited by J. H. Gurney, was useful in its day, but has been superseded by the more comprehensive and extremely accurate volumes, the Birds of Africa, by G. E. Shelley (1900-1907), and the German work on the same subject by Anton Reichenow (1900-1905).

Of special works relating to the British West Indies, C. Waterton's well-known Wonderings has passed through several editions since its first appearance in 1825, and must be reckoned a great work, though, strictly speaking, much of the country he traversed was not British territory. To Dr. C. Abrahams we are indebted for a translation (1858) of Sir R. A. Middendorff's researches given in the third volume (pp. 652-756) of the Abhandlungen der Kaiserlichen Leopoldina-Geologische Gesellschaft, Bonn (8vo, 1848), and in L'éocéen de l'ile de la Reunion (8vo, 1866). Of the Antilles there is only to be named perhaps an excellent account of the birds of the island of Antigua (1874), together with its Illustrations (vol. 1, 1849) beautifully executed by Vaillant. A nominal list, with references, of the birds of the island is contained in the Handbook of Jamaica.

"A useful list of more general scope is given as the Appendix to an address by Mr. Srater to the British Association in 1825 (Report, pt. ii. pp. 114-133)."

1 A very useful list of more general scope is given as the Appendix to an address by Mr. Srater to the British Association in 1825 (Report, pt. ii. pp. 114-133).

2 This is a posthumous publication, nominally forming an extra number of the Journal of the Asiatic Society; but, since it was separately issued, it is entitled here to notice.
Fabre's Prodomus der islandischen Ornithologie (8vo, 1822), though the island has since been visited by several other good ornithologists—

Scandavia.

In 1833-1837, Mr. Faber, with that fidelity and perseverance which are characteristic of the Norwegian, made a second trip to the Faeroes under the guidance of B. N. Holm, and collected a large number of specimens which have come to light since his death, and which I hope to be able to publish at some future time. The whole collection is now in the British Museum, and is in the hands of the author. The work of Faber's is a valuable addition to the knowledge of the birds of the Faeroes, and is an important contribution to the study of the Faeroese fauna. The work of Faber is a valuable addition to the knowledge of the birds of the Faeroes, and is an important contribution to the study of the Faeroese fauna.
In 1810 appeared at Heidelberg the first volume of F. Tiedemann's carefully-wrought *Anatomie und Naturgeschichte der Vögel*—which shows a remarkable advance upon the work which Cuvier did in 1805, and in some respects is superior to his later production of 1817. It is, however, only noticed here on account of the numerous references made to it by succeeding writers, for neither in this nor in the author's second volume (no publication until 1814) did he propound any real systematic arrangement of the Class. More germane to our present subject are the *Osteographische Beiträge zur Naturgeschichte der Vögel* of C. L. Nitsch, printed at Leipzig in 1811—a miscellaneous set of detached essays on some peculiarities of the skeleton or parts of the skeleton of certain birds—one of the most remarkable of which is that on the component parts of the foot (pp. 101-105) pointing out the aberration from the ordinary structure exhibited by the Goatsucker (*Caprimulgus*) and the Swift (*Cypselus*)—an aberration which, if rightly understood, would have conveyed a warning to those ornithological systematists who put their trust in birds' toes for characters on which to erect a classification, that there was in them more of importance, hidden in the integument, than had hitherto been suspected; but the warning was of little avail, if any, till many years had elapsed. However, Nitsch had not as yet seen his way to proposing any methodical arrangement of the various groups of birds, and it was not until some eighteen months later that a scheme of classification in the main anatomical was attempted.

This scheme was the work of Blasius Merrem, who, in communication to the Academy of Sciences of Berlin on the 20th December 1812, which was published in its *Abhandlungen* for the following year (pp. 237-259), set forth a *Tentamen systematis naturalis avium*, no less modestly entitled than modestly executed. The attempt of Merrem must be regarded as the virtual starting-point of the latest efforts in Systematic Ornithology, and in that view its proposals deserve a place stated at length. Without, however, giving an acceptance of all its details—some of which, as is only natural, cannot be sustained with our present knowledge—it is certainly not too much to say that Merrem's merits are almost incomparably superior to those of any of his predecessors. Preposing then that the chief characters assigned by this systematist to his several groups are drawn from almost all parts of the structure of birds, and are supplemented by some others of their more prominent peculiarities, we present the following abstract of his scheme:—

1. Aves carinatae.

a. Aves aereae.
   b. Strix.
   n. Melliagres—Trocchius, Certior et Urops phurne plurima.
   n. Dendrocolaptes—Picus, Yunx.
   b. Levirostres.—a. Ramphastina, Scytioptera; b. Psittacidae.
   b. Glossycynes—Cuculus, Trogus, Buco, Crotaphia.

2. Aves terrestres.
   a. Columba.
   b. Gallinula.

3. Aves aquatice.
ORNITHOLOGY

B. Platyrhynchi.—Pelecanus, Phaeton, Piusus.
C. Aplodontes.
E. Sternoyyncli.—Procellaria, Diomedeae, Larus, Sterna, Rynchops.

+ Aves palinitae.
C. Oils.

II. Aves Ratitae.—Struthio.

The most novel feature, and one the importance of which most ornithologists of the present day are fully prepared to admit, is the separation of the class Aves into two great divisions, which from one of the most obvious distinctions they present were called by its author Carinates and Ratitae, according to which the sternum possesses a keel (crista in the phraseology of many anatomists) or not. But Merrem, who subsequently communicaled to the Academy of Berlin a more detailed memoir on the "flat-breasted or birds," was careful not hitherto to erect his divisions on a foundation of the whole character alone. He concisely cites (p. 338) no fewer than eight other characters of more or less value as peculiar to the Carinate Division, the first of which is that the feathers have their bars furnished with hooks, in consequence of which the bars, including those of the wing-ridges, cling closely together; while among the rest may be mentioned the position of the furcula and coracoids, which keep the wing-bones apart; the limitation of the number of the lumbar vertebrae to fifteen, and of the carpals to two; as well as the divergent direction of the iliac bones—the corresponding characters peculiar to the Ratite Division being the disconnec ted condition of the bars of the feathers, through the absence of any hooks whereby they might cohere; the increase of the number of the coracoids with the scapulae (or, as he expressed it, the extension of the scapulae to supply the place of the coracoids, which he thought were wanting); the lumbar vertebrae being twenty and the carpals three in number; and the parallelism of the iliac bones.

As for Merrem's partitioning of the inferior groups there is less to be said in its praise as a whole, though credit must be given to his anatomical knowledge for leading him to the perception of several affinities, as well as differences, that had never before been suggested by superficial systematists. But it must be confessed that (chiefly, no doubt, from a paucity of accessible material) he overlooked many points, both of alliance and the opposite, which since his time have gradually come to be admitted.

Notice has next to be taken of a Memoir on the Employment of Sternal Characters in establishing Natural Families among Birds, which was read by De Blainville before the Academy of Sciences of Paris in 1815, but not published in full for more than five years later (Journal de Théorie... et des arts, xcvii. 185-215), though an abstract forming part of a Prodrome d'une nouvelle distribution du règne animal appeared earlier (op. cit. lxxxiii. 252, 253, 258, 259; and Bull. soc. philomath. de Paris, 1816, p. 110).

This is a very disappointing performance, since the author observes that, notwithstanding his new classification of birds is based on a study of the form of the sternal apparatus, yet, because that lies wholly within the body, he is compelled to have recourse to such outward characters as are afforded by the proportion of the limbs and the disposition of the toes—e ven as had been the practice of most ornithologists before him! It is evident that the features of the sternum of which De Blainville chiefly relied were those drawn from its posterior margin, which no very extensive experience of specimens is needed to show are of comparatively slight value; for the number of "echanure"—notches as they have sometimes been called in English—when they exist, goes but a very short way as a guide, and is so variable in some very natural groups as to be even in that case occasionally misleading. There is no appearance of his having at all taken into consideration the far more trustworthy characters furnished by the anterior part of the sternum, as well as by the coracoids and the furcula. Still De Blainville made some advance in a right direction, as for instance by elevating the parrots and the pigeons as "Ordres," equal in rank to that of the birds of prey and some others. According to the testimony of L'Hermier (for whom see latter) he divided the "Passereaux" into two sections, the "faux" and the "traiis"; but, while the latter were very correctly defined, the former were most arbitrarily separated from the "Grimpures." He also split his Grullatores and Nataatores (practically identical with the Grullae and Anseres of Linnaeus) each into four classes; but he failed to see as on his own principles he ought to have seen that these sections was at least equivalent to almost any one of his other "Ordres." He had, however, the courage to act up to his own professions in collocating the rollers (Coracias) with the bee-eaters (Merops), and had the sagacity to surmise that Menura was not a Gallinaceous bird. The greatest benefit conferred by this memoir is probably that it stimulated the efforts, presently to be mentioned, of one of his pupils, and that it brought more distinctly into sight that other factor, originally discovered by Merrem, of which it now clearly became the duty of系统atists to take cognizance.

Following the chronological order we are here adopting, we next have to recur to the labours of Nitzsch, who, in 1820, in one of his most valuable contributions to Ornithology, had already attracted the attention of Jacobson.

Nitzsch (Nova. Bull. soc. philomath. de Paris, iii. 267-268) first put forth in Meeck's Deutsches Archiv für die Physiologie (vi. 215-269) a statement of his general views on ornithological classification which were based on a comparative examination of those bodies in various forms. It seems unnecessary here to occupy space by giving an abstract of his plan, which hardly includes any but European species, because it was subsequently elaborated with no inconsiderable modifications in a way that must presently be mentioned at greater length. But the scheme, crude as it was, possesses some interest. It is not only a key to much of his later work—to nearly all indeed that was published in his lifetime; it is also a pointer to a vast number of authors who, in that time, must have appreciated a systematization of the birds so disordered and confused; for instance, the species belonging to the "Passerinae and Picariiae" that subsequent experience has shown to be more or less natural; and it further serves as additional evidence of the breadth of his views, and his trust in the teachings of anatomy.

That Nitzsch took this extended view is abundantly proved by the valuable series of ornithotomical observations he must have been for some time accumulating, and almost immediately afterwards began to contribute to the younger Naumann's excellent Natursichtliche Vögel Deutschlands, already noticed above. Besides a concise general treatise on the organization of birds to be found in the Introduction to this work (l. 25-52), a brief description from Nitzsch's pen of the peculiarities of the internal structure of nearly every genus is incorporated with the author's own notes on the systematization of the order. For instance, it has been repeatedly noted that there is no excuse for not being aware of one of Nitzsch's labours, through his more advanced work of 1829, presently to be mentioned, was not referred to by Sir R. Owen.

1. From carina, a keel.
2. From rates, a raft or flat-bottomed barge.
4. Merrem says there are other species in this family (l. p. 266), so that Englishmen need no excuse for not being aware of one of Nitzsch's labours, though his more advanced work of 1829, presently to be mentioned, was not referred to by Sir R. Owen.
6. This view of them has been long before taken by Willughby, but abandoned by all later authors.
7. This plan, having been repeated by Schäpf in 1829 (op. cit. xii. p. 73), became known to Sir R. Owen in 1835, who then drew to it the attention of Kirby (Seventh Bridgewater Treatise, ii. pp. 444, 445).
and these descriptions being almost except what drawn up as to be comparative are accordingly of great utility to the student of classification, though they have been so greatly neglected. Upon these descriptions he was still engaged till death, in 1837, put an end to his labours, when his place as Naumann’s assistant for the remainder of the work was taken by Rudolph Wagner; but, from this time, a few more, which he had made their posthumous appearance in it, and, in subsequent years, some selections from his unpublished papers were through the care of Giebel presented to the public. Throughout the whole of this series the same marvellous industry and scrupulous accuracy are manifested, and attentive study of it will show how many times Nitzsch anticipated the conclusions of modern taxonomers. Yet over and over again his determination of the affinities of several groups even of European birds was disregarded; and his labours, being contained in a bulky and costly work, were hardly known at all outside of his own country, and within it by no means appreciated so much as they deserved—for even Naumann himself, who gave them publication, and was doubtless in some degree influenced by them, utterly failed to perceive the importance of the characters offered by the song-muscles of certain groups, though their peculiarities were all duly described and recorded by his coadjutor, as some indeed had been long before by Cuvier in his famous dissertation 2 on the organs of voice in birds (Leçons d’anatomie comparée, iv. 450-491). Nitzsch’s name was subsequently dismissed by Cuvier without a word of praise, and in terms which would have been applicable to many another and inferior author, while Temminck, terming Naumann’s work an “ouvrage de luxe”—it being in truth one of the cheapest for its contents ever published—effectually shut it out from the realms of science. In Britain it seems to have been positively unknown until quoted years after its completion by a catalogue-completer in account of some peculiarities of nomenclature which it presented.

Now we must return to France, where, in 1827, L’Herminier, a creole of Guadaloupe and a pupil of De Blainville’s, contributed to the Actes of the Linnaean Society of Paris for that year (vi. 3-93) the “Recherches sur l’appareil sternal des Oiseaux,” which the precept and example of his master had prompted him to undertake, and Cuvier had found for him the means of executing. A second and considerably enlarged edition of this very remarkable treatise was published as a separate work in the following year. We have already seen that De Blainville, though fully persuaded of the great value of sternal features as a method of classification, had been compelled to fall back upon the old pedal characters so much employed many years before; but now the scholar had learnt to excel his teacher, and not only to form an at least provisional arrangement of the various members of the Class, based on sternal characters, but to describe these characters at some length, and so give a reason for the faith that was in him. There is no evidence, so far as we can see, of his having been aware of Merrem’s views; but like that anatomist he without hesitation divided the class into two great “contes,” to which he gave, however, no other names than “Oiseaux normaux” and “Oiseaux anomaux”—exactly corresponding with his predecessor’s Carinatae and Ratitae—and, moreover, he had a great advantage in founding these groups, since he had discovered, apparently from his own investigations, that the mode of ossification in each was distinct; for hitherto the statement of there being five centres of ossification in every bird’s sternum seems to have been accepted as a general truth, without contradiction, whereas in the ostrich and the rhea, at any rate, L’Herminier found that there were but two such primitive points, and from analogy he judged that the same would be the case with the cassowary and the emu, which, with the two forms mentioned above, made up the whole of the “Oiseaux anomaux” whose existence was then generally acknowledged. 3 These are the forms which composed the family previously termed Curruces by De Blainville; but L’Herminier was able to distinguish no fewer than seven or four families of “Oiseaux normaux,” and the judgment with which their separation and definition were made must be deemed on the whole to be most creditable to him. It is to be remarked, however, that the wealth of the Paris Museum, which he enjoyed to the full, placed him in a situation incomparably more favourable for arriving at results than that which was occupied by Merrem, to whom many of the most remarkable forms were wholly unknown, while L’Herminier had at his disposal examples of nearly every type then known to exist. But the latter used this privilege wisely and well—not, after the manner of De Blainville and others subsequent to him, relying solely or even chiefly on the character afforded by the posterior portion of the sternum, but taking also into consideration those of the anterior, as well as of the in some cases still more important characters presented by the pre-sternal bones, such as the furcula, coracoids and scapulae. L’Herminier thus separated the families of “Normal Birds”—

1. **“Acipitrés”—** Acipitrés, Linn. 18. **“Passereaux”—** Passeres, Linn.
2. **“Serpentaires”—** Gypopera, Linn. 19. **“Pigeons”—** Columb. Linn.
3. **“Chouettes”—** Strix, Linn. 20. **“Alcides”—** Gallinacæ, Vieillot.
5. **“Pigeons”—** Psittacus, Linn. 22. **“Foulques ou Poulies d’eau”—** Falc. and Latham.
6. **“Colibris”—** Trochilus, Linn. 23. **Grues”—** Grus, Pallas.
8. **“Engoulvents”—** Caprimulgus, Linn. 25. **No name given, but said to include les ibis et les spatules.”
10. **“Coucous”—** Trogon, Linn. 27. **“Monettes”—** Larus, Linn.
11. **“Rolliers”—** Gaëgulas, Brisson. 28. **“Petrels”—** Procellariæ, Linn.
12. **“Guépiers”—** Merops, Linn. 29. **“Pêlicans”—** Pelecanæ, Linn.
13. **“Martin-pêcheurs”—** Alcedo, Linn. 30. **“Camars”—** Anas, Linn.
14. **“Calaois”—** Buceræ, Linn. 31. **“Grèbes”—** Podiceps, Linn.
15. **“Toucans”—** Ramphastos, Linn. 32. **“Pongons”—** Columbus, Linn.
16. **“Fias”—** Picus, Linn. 33. **“Pingouins”—** A€co, Latham.
17. **“Epoisides”—** Epopsides, Vieillot.
18. **“Manchots”—** Aptenodytes, Forster.

The preceding list is given to show the very marked agreement of L’Herminier’s results compared with those obtained fifty years later by another investigator, who approached the subject from an entirely different, though still osteological, basis. Many of the excellencies of L’Herminier’s method could not be repeated out without too great a sacrifice of space, because of the details into which it would be necessary to enter; but the trenchant way in which he showed that the “Passereaux”—a group of which Cuvier had said, “Son caractère semble d’abord purement négatif,” and had then failed to define the limits—differed so completely from every other assemblage, while maintaining among its own innumerable members an almost perfect essential homogeneity, is very striking, and shows how admirably he could grasp his subject. Not less conspicuous are his merits in disposing of the groups of what are ordinarily known as water-birds, his indicating the affinity of the rails (No. 23) and the crane-bills (No. 24) to the herons (No. 24). His union of the snipes, sandpipers and plovers into one group (No. 26) and the alliance, especially dwelt upon, of that group with the gulls (No. 27) are steps which, though indicated by Merrem, are here for the first time clearly laid down; and the separation of the gulls from the petrels (No. 28)—step in advance already taken, it is true, by Illiger—is here placed on indefeasible ground. With all this, perhaps on account of all this, L’Herminier’s efforts did not

1. Considerable doubts were at that time entertained in Paris as to the existence of the Apteryx.
find favour with his scientific superiors, and for the time things remained as though his investigations had never been carried on.

Two years later Nitzsch, who was indefatigable in his endeavour to discover the natural families of birds and had been pursuing a series of researches into their vascular system, published the result, at Hanle in Saxony, in his Observationses of avium arteriae carotidi communi, in which is included a classification drawn up in accordance with the variation of structure which that important vessel presented in the several groups that he had opportunities of examining. By this time he had visited several of the principal museums on the Continent, among others Leyden (where Temminck resided) and Paris (where he had frequent intercourse with Cuvier), thus becoming acquainted with a considerable number of exotic forms that had hitherto been inaccessible to him. Consequently his labours had attained to a certain degree of completeness in this direction, and it may therefore be expedient here to name the different groups which he thus thought himself entitled to consider established. They are as follows:—

I. Aves Carinatae [L’H. * Oiseaux normaux*]

A. Aves Carinatae aerea.

B. Aves Carinatae aquaticae.

Grallae.

1. Alectorides (= Dichocetes + Oise) [L’H. 2. partim. 26 partim];

Palmae.

II. Aves Raitae [L’H. * Oiseaux anomaux*].

To enable the reader to compare the several groups of Nitzsch with the families of L’Herminier, the numbers applied by the latter to his families are suffixed in square brackets to the names of the former; and, disregarding the order of sequence, which is here immaterial, the essential correspondence of the two systems is wonderful in its entirety. It is only at this point that the absence of investigators, starting from different points, must have been on the right track, when they so often coincided as to the limits of what they considered to be, and what we are now almost justified in calling, natural groups. But it must be observed that the classification of Nitzsch, just given, rests much more on characters furnished by the general structure than on those furnished by the carotid artery only. Among all the species (188, he tells us, in number) of which he examined specimens, he found only four variations in the structure of that vessel, namely:—

1. That in which both a right carotid artery and a left are present. This is the most usual fashion among the various groups of birds, including all the “aerial” forms excepting Passerinae, Macrocerci, and Alectorides.

2. That in which there is but a single carotid artery, springing from both right and left trunk, but the branches soon coalescing, to take a midway course, and again dividing near the head. This form Nitzsch was only able to find in the bittern (Ardea stelllaris).

3. That in which the right carotid artery alone is present, of which, according to our author’s experience, the flamingo (Phoenicopterus) was the sole example.

4. That in which the left carotid artery alone exists, as found in all other birds examined by Nitzsch, and therefore as regards agreement by means of a common—most common—since into this category come the countless thousands of passerine birds—a group which outnumbers all the rest put together.

Considering the enormous stride in advance made by L’Herminier, it is very disappointing for the historian to have to record that the next inquirer into the osteology of birds achieved a disastrous failure in his attempt to throw light on their arrangement by means of a comparison of their sternum. This was Berthold, who devoted a long chapter of his *Beitrag zur Anatomie*, published at Gottingen in 1831, to a consideration of the subject. So far as his introductory chapter went—the development of the sternum—he was, for his time, right enough and somewhat instructive. It was only when, after a close examination of the sternal apparatus of one hundred and thirty species, which he carefully described, that he arrived (pp. 177-183) at the conclusion—astonishing to us who know of L’Herminier’s previous results—that the sternum of birds cannot be used as a help to their classification on account of the egregious anomalies that would follow the proceeding—such anomalies, for instance, as the separation of Cypselus from Hirundo and its alliance with Trochilus, and the grouping of Hirundo and Fringilla together.

At the very beginning of the year 1832 Cuvier laid before the Academy of Sciences of Paris a memoir on the progress of ossification in the sternum of birds, of which memoir an abstract will be found in the *Annales des sciences et naturelle* (xxv. pp. 260-272). Herein he traces in Geoffroy’s detail, illustrating his statements by the preparations he exhibited, the progress of ossification in the sternum of the fowl and of the duck, pointing out how it differed in each, and giving his interpretation of the differences. It had hitherto been generally believed that the mode of ossification in the fowl was that which obtained in all birds—the ostrich and its allies (as L’Herminier, we have seen, had already shown) excepted. But it was now made to appear that the struthious birds in this respect resembled, not only the duck, but a great many other groups—waders, birds-of-prey, pigeons, passerines and perhaps all birds not gallinaceous—that, according to Cuvier’s view, the five points of ossification observed in the Gallinae, instead of exhibiting the normal process, exhibited one quite exceptional, and that in all other birds, so far as he had been enabled to investigate the matter, ossification of the sternum began at two points only, situated near the anterior upper margin of the side of the sternum, and gradually crept towards the keel, into which it presently extended; and, though he allowed the appearance of detached portions of calcareous matter at the base of the still cartilaginous keel, he had never seen, and has afterwards admitted, an individual peculiarity. This fact was fastened upon by Geoffroy in his reply, which was a week later presented to the Academy, but was not published in full until the following year, when it appeared in the *Annales du Muséon* (ser. 3. ii. pp. 1-22). Geoffroy here maintained that the five centres of ossification existed in the duck just as in the fowl, and that the real difference of the process lay in the period at which they made their appearance, a circumstance which, though virtually proved by the preparations Cuvier had used, had been by him overlooked or misinterpreted. The fowl possesses all five ossifications at birth, and for a long while the middle piece forming the keel is by far the largest. They all grow slowly, and it is not until the animal is about six months old that they are united into one firm bone. The duck, on the other hand, when newly hatched, and for nearly a month after, has the sternum wholly cartilaginous. Then, it is true, two lateral points of ossification appear at the margin, but subsequently the remaining three are developed, and when once formed they grow with much greater rapidity than in the fowl, so that by the time the young duck is quite independent of its parents, and can shift for itself, the whole sternum is completely bony. Nor, argued Geoffroy, was it true to say, as Cuvier had said, that the like occurred in the pigeons and true passerines. In their case the sternum begins to ossify from three very distinct points—one of which is the centre of ossification.
the keen. As regards the stridulous birds, they could not be likened to the duck, for in them at no age was there any indication of a single median centre of ossification, as in Geese, so as to satisfy himself with the statement that "this animal was in Egypt many years before." Cuvier seems to have acquiesced in the corrections of his views made by Geoffroy, and attempted no rejoinder; but the attentive and impartial student of the discussion will see that a good deal was really wanting to make the latter's reply effective, though, as events have shown, the former was hasty in the conclusions at which he arrived, having trusted too much to the first appearance of centres of ossification, for, had his observations in regard to other birds been carried on with the same attention to detail as in regard to the fowl, he would certainly have reached some very different results.

In 1834 Cuvier grouped the rails that Breslau had first (and unfortunately the only) part of a Vollstandiges Handbuch der Naturgeschichte der Vögel Europae's, treating of the land-birds. In the Introduction to this book (p. xxxviii, note) he expressed his regret at not being able to use as fully as he could wish the excellent researches of Nitsch which were then appearing (as has been above said) in the successive parts of Naumann's great work. Notwithstanding this, Cuvier also belonged to the credit of being the first author to avail himself in a book intended for practical ornithologists of the new light that had already been shed on Systematic Ornithology; and accordingly we have the second order of his arrangement, the Aves Passerinae, divided into two sections: a Medullary cavities, which has been likened to an apparatus of song-muscles (anomalae)—the latter including what some later writers called Picae. For the rest his classification demands no particular remark; but that in a work of this kind he had been able to reduce the genera and species, and the difference between swallows and swifts lifts him considerably above the crowd of other ornithological writers of his time.

An improvement on the old method of classification by purely external characters is perhaps best seen in the works of P. L. S. von Schrenck. His book, Studien iibern die Palaearctic Vögel, late in 1827, and published in seven volumes (1827-1848), was intended as a complete work on Systematic Ornithology. It is peculiarly interesting in the manner in which he had made use of the type of every order, as well as the type of every family, genus and species, thus making his work a complete one; and this is particularly so in the case of the order of Vögel, which has been the subject of particular research on the part of many authors. He had made use of the type of every order, as well as the type of every family, genus and species, thus making his work a complete one; and this is particularly so in the case of the order of Vögel, which has been the subject of particular research on the part of many authors.

The following year in his Handlqnger (pp. 43-130). This work was the foundation of a more extensive work of which, from the influence it still exerts, it will be necessary to treat later at some length, and there will be no need now to enter much into details respecting the earlier performance. It is sufficient here to give some general remarks concerning its systematic arrangement. It is true that some of the difficulties which had been opposed to it were overcome, for instance, by the discovery of certain characters which, in Cuvier's opinion, had not been hitherto escaped the notice of his predecessors. He also admitted the necessity of distinguishing between sexual and posterior central portions, which are especially wanting in the latter most laboriously, and in some measure certainly not without success, for he brought it into prominence several points that had hitherto escaped the notice of his predecessors. He also admitted the necessity of distinguishing between sexual and posterior central portions, which are especially wanting in the latter most laboriously, and in some measure certainly not without success, for he brought it into prominence several points that had hitherto escaped the notice of his predecessors.

Hitherto our attention has been given wholly to Germany and France, for the chief ornithologists of Britain were occupying themselves at this time in a very useless way—not but that there were several distinguished men who were paying due heed at this time to the internal structure of birds, and some excellent descriptive memoirs on special forms had appeared from their pens, to say nothing of more than one general treatise on ornithic anatomy. Yet no one in Britain

1 We shall perhaps be justified in assuming that this appears inconsistent, and others who present themselves, would be explicable if the whole memoir with the necessary illustrations had been published.

2 Sir Richard Owen's celebrated "Aves," in Todd's Cyclopaedia of Anatomy and Physiology (i. pp. 265-358), appeared in 1839, and, giving a general view of the structure of birds, needs no praise here; but its object was not to establish a classification, nor to throw light especially on systematic arrangement. So far from that being the case, its distinguished author was content to adopt, and follow, the arrangements proposed by Kirby in the Seventh Bridgeswater Treatise (ii. pp. 141-234), being that, in the true, of an estimable zoologist, but one of those who had no special knowledge of ornithology. Indeed it is, as the latter says, that of Linnaeus, Cuvier, and Geoffroy, for the latter's work is merely a compendium of all those three authors having totally ignored any but external characters. Yet it was regarded as being the one which fulfills the expression of the leading anatomical differences which obtain in the class of birds, and which therefore may be considered as the most natural."
seems to have attempted to find any scientific arrangement of birds on other than external characters until, in 1837, William Macgillivray issued his first volume of his History of British Birds, wherein, though professing (p. 19) "not to add a new system to the many already in partial use, or that have passed away like their authors," he propounded (pp. 16-18) a scheme for classifying the birds of Europe at least founded on a "consideration of the digestive organs, which merit special attention, on account, not so much of their great importance in the economy of birds, as the nervous, vascular and other systems are not behind them in this respect; but because, exhibiting great diversity of form and structure, in accordance with the nature of the food, they are more obviously qualified to afford a basis for the classification of the numerous species of birds [3] (p. 52). Fuller knowledge has shown that Macgillivray was like most of the anatomists of his day in laying stress on their internal and not their external characters, but his contributions to anatomy were valuable, and later investigators, in particular H. Gadow and P. Chalmers Mitchell, have shown that useful systematic information can be obtained from the study of the alimentary canal. Macgillivray himself was, apparently, who first detected the essential difference of the organs of voice presented by some of the New-World Passerines (subsequently known as Clamatorides), and the earliest intimation of this seems to be given in his anatomical description of the Kansas Flycatcher, Tyrannus verticalis, which was published in 1838 (Ornitol. Biography, iv. p. 423), though it must be admitted that he did not—because he then could not—perceive the bearing of their difference, which was to be shown by the investigation of a still greater anatomist, and which in the present and subsequent taxonomic schemes has been so much emphasized as will presently be mentioned, the views of systematists as to this order of birds. There is only space here to say that the second volume of Macgillivray's work was published in 1839, and the third in 1840; but it was not until 1852 that the author, in broken health, found an opportunity of issuing the fourth and fifth. His scheme of classification, being as before stated partial, need not be given in detail. Its great merit is that it proved the necessity of combining another and hitherto much-neglected factor in any natural arrangement, though vitiated as so many other schemes have been by being based wholly on one class of characters.

But a bolder attempt at classification was that made in 1838 by Blyth in the New Series (Charleworth's) of the Magazine of Nature (vi. p. 331; viii. p. 22; ix. p. 221; x. p. 260-268). He divided birds into two main groups, the Passeres and the Aves, the former being confined to the order of birds of passage, the latter being divided into six sub-orders: the Perregopes—combining all of them to form a "Typus" (to use his term) Ursinates; and secondly he admitted among the notchates, though as a distinct Typus Podaridae, the genera Podus and Aplura, which he had not supposed to be too narrowly confined (see Coot) being but very slightly removed from the moorhen (g.v.). At the same time he corrected the error made by Illiger in associating the Phalaropes with these forms, rightly declaring their relationship to Tringa (see Sandpiper), a point of order which other systematists were long in admitting. On the whole Blyth's labours were of no small service in asserting the principle that consideration must be paid to osteology: for his position was such as to gain more attention to his views than some of his less favourably placed brethren had succeeded in doing.

In the same year (1839) another slight advance was made in the classification of the true Passerines. Keyserling and Blasius briefly pointed out in the Archiv für Naturgeschichte (v. pp. 332-334) that, while all the other birds provided with perfect song-muscles had the "planta" or hind part of the mouth covered with two large united plates, the larks (g.v.) had this part divided by many transverse sutures, so as to be sectated behind as well as in front; just as is the case in many of the passerines which have not the singing-muscles, and this difference is singular but superficial division from the normal structure has been so needlessly exaggerated as a character that at the present time its value is apt to be unduly depreciated. In so large and so homogeneous a group as that of the true Passerines, a constant

---

1 An abstract is contained in the Minute-book of the Scientific Section of the Zoological Society, 26th June and 18th July 1838. The class was to contain fifteen orders, but only three were dealt with in any detail.
character of this kind is not to be despised as a practical mode of separating the birds which are destitute of feathers from those which have them, for the discovery thus announced was the immediate means of leading to a series of investigations of a much more important and lasting nature—those of Johannes Müller to be presently mentioned.

Again we must recur to that indefatigable and most original investigator Nitzsch, who, having never intermitted his study of the particular subject of his first contribution to science, long ago noticed, in 1833 brought out at Halle, where he was professor of Zoology, an essay with the title Pterylographie Avium Prior, that this was issued as much with the object of inviting assistance from others in view of future labours, since the materials at his disposal were comparatively scanty, as with that of making known the results to which his researches had already led him. Indeed, he only communicated copies of this essay to a few friends, and examples of it are comparatively scarce. Moreover, he stated subsequently that he thereby hoped to excite other naturalists to share with him the investigations he was making on a subject which had hitherto escaped notice or had been wholly neglected, since he considered that he had proved the disposition of the feathered tracts in the plumage of birds to be the means of furnishing characters for the discrimination of the various natural groups as significant and important as they were new and unexpected. There was no need for us here to quote this essay in its chronological place, since it dealt only with the generalities of the subject, and did not enter upon any systematic details. These the author reserved for a second treatise which he was destined never to complete. He kept on diligently collecting materials, and as he did so was constrained to modify some of the statements he had published. He consequently fell into a state of doubt, and before he could make up his mind on some questions which he deemed important he was overtaken by death. Then his papers were handed over to his friend and successor Professor Burmeister, now for many years past of Buenos Aires, who, with much skill, elaborated from them the excellent work known as Nitzsch's Pterylographie, which was published at Halle in 1840, and translated into English for the Ray Society in 1867.

There can be no doubt that Professor Burmeister discharged his editorial duty with the most conscientious scrupulosity; but, from what has been just said, it is certain that there were important points on which Nitzsch was as yet undecided—some of them perhaps of which no trace appeared in his manuscripts, and therefore as in every case of works posthumously published, unless (as rarely happens) they have received their author's \\
1. *imprimatur,* they cannot be implicitly trusted as the expression of his views. The cautious and scrupulous Burmeister however has positively all that appears in this volume to the result of Nitzsch's mature consideration. Moreover as Professor Burmeister states in his preface, Nitzsch by no means regarded the natural sequence of groups as the highest problem of the systematicist, but rather their correct limitation. Again, the arrangement followed in the Pterylographie was of course based on pterylographical considerations, and we have the author's own word for it that he was persuaded that the limitation of natural groups could only be attained by the most assiduous research into the species of which they are composed from every point of view. The combination of these three facts will of itself explain some defects, or even retrogressions, observable in Nitzsch's later systematic work when compared with that which he had formerly done. On the other hand some manifest improvements are introduced, and the abundance of details into which he enters in his Pterylographie render it far more instructive and valuable than the older performance. As an abstract of that has already been given, it may be sufficient here to point out the chief changes made in his newer arrangement. To begin with, the three great sections of aerial, terrestrial, and aquatic birds are abolished. The "Aeclipes" are divided into two groups, Diurnal and Nocturnal; but the first of these divisions is separated into three sections: (1) the Vultures of the New World, (2) those of the Old World, and (3) the genus Falco of Linnaeus. The "Pteropodes," is to say the true Passeres, are split into eight families, not wholly with judgment, 2 but of their taxonomy more is to be said presently. Then a new order "Pteriae" is instituted for the reception of the Macroleires, Cuiculine, Piteaee Pisitaries and Anphibole of his old arrangement, to which are added three 3 others—Caprimulginos, Tolidae and Liploglasse—the last consisting of the genera Buceros, Uppapa and Alcedo. The association of Alcedo with the other two is no doubt a misplacement, but the alliance of Buceros to Uppapa, already suggested by Gould and Blyth in 1838 4 (Mag. Nat. Hist. ser. 2, ii. pp. 422 and 586), though apparently unnatural, has been corroborated by many later systematists, and as a whole the establishment of the Pteriae was certainly a commendable proceeding. For the rest there is only one considerable change, and that forms the greatest blot on the whole scheme. Instead of recognizing, as before, a subclass in the Ratitae of Merrem, Nitzsch now reduced them to the rank of an order under the name "Pterasitae," placing them between the "Gallinaeae" and "Grolae," though admitting that in their pterylosis they differ from all other birds, in ways that he is at great pains to describe, in each of the four genera examined by him—Struthio, Rhea, Dromaeus and Casuarius. 5 It is significant that notwithstanding this he did not figure the pterylosis of any one of them, and the thought suggests itself that, though his editor assures us he had convinced himself that the group must be here shoved in (eingeschoben is the word used), the intrusion is rather due to the necessity which Nitzsch, in common with most men of his time (the Quinarian excepted), felt for deploying the whole series of birds into line, in which case the proceeding may be defensible on the score of convenience. The extraordinary merits of this book, and the admirable fidelity to his principles which Professor Burmeister showed in the difficult task of editing it, were unfortunately overlooked for many years, and perhaps are not sufficiently recognised now. Even in Germany, the author's own country, there were few to notice seriously what is certainly one of the most remarkable works ever published on the science, much less to pursue the investigations that had been so laboriously begun. 6 Andreas Wagner, in his report on the progress of

---

1 A short essay by Nitzsch on the general structure of the Passerines, written, it is said, in 1836, was published in 1862 (Zeitschr. Ges. Naturwissenschaft, xix, pp. 389-408). It is probably to this essay that Professor Burmeister refers in the Pterylographie (p. 102, note; 1840, p. 133, note B. 1) on the "Passerinae," which he contributed to Ersch and Gruber's Encyclopädie (sect. iii. bd. xii. pp. 139-144), and published before the Pterylographie.

2 By the numbers prefixed it would look as if there should be four new members of this order; but that seems to be due rather to a slip of the pen or to a printer's error.

3 This association is one of the most remarkable in the whole series of Blyth's remarkable papers on classification in the volume cited above. He states that Gould suspected the alliance of these two forms "from external structure and habits alone"; otherwise he does not oppose their natural position. The result is the effect on one of his Continental journeys. Blyth "arrived at the same conclusion, however, by a different train of investigation," and this is beyond doubt.

4 He does not mention pteryx, at that time so little known on the Continent.

5 Some excuse is to be made for this neglect. Nitzsch had of course exhausted all the forms of birds commonly to be obtained, and it is not surprising that of the passing men of science, few or none, of taxidermists, many of whom have elevated their profession to a height of art inconceivable to most Englishmen, who are only acquainted with the miserable mockery of Nature which is the most sublime result of all but a few "bird-stuffers."
ornithology, as might be expected from such a man as he was, placed the *Pterolographie* at the summit of those publications that are the source of which he had to record for the years 1839 and 1840, stating that for "Systematic" it was of the greatest importance. On the other hand *Ibis* (1842, pp. 391–394), though giving a summary of Nitzsch's results and classification, was more sparing of his praise, and prefaced his remarks by asserting that he could not refrain from laughter when he looked at the plates in Nitzsch's work, since they reminded him of the plucked fowls hanging in a poulterer's shop, and goes on to say that, as the author always had the luck to engage in researches of which nobody thought, so had he the luck to print them where nobody sought them. In Sweden Sundevall, without accepting Nitzsch's views, accorded them a far more appreciative greeting in his own national journal *Svenska Videnskapliga Handlingar* in 1841, in course, in England and France nothing was known of them beyond the scantiest notice, generally taken at second hand, in two or three publications. Thanks to Mr Scater, the Ray Society was induced to publish, in 1867, an excellent translation by Mr Dallas of Nitzsch's *Pterolographie*, and thereby, however tardily, justice was at length rendered by British ornithologists to one of their greatest foreign brethren. Nitzsch's work on feathers has been carried farther by many later observers, and its value is now generally accepted (see Feathers).

The treatise on the "structure of the birds' feet," published in the *Bulletin of the Museum Society of Naturalists* for 1841, next claims a few words, though its scope is rather to show differences than affinities; but treatment of that kind is undoubtedly advantageous in questions illusory or highly hypothetical, which admit of no assurance of justice, and this is the case here; for, following Calver's method, the author's researches prove the artificial character of some of its associations. While furnishing—an almost unceasing—abundance of new and valuable additional information over all previous works, in the system of classification, there is, nevertheless, no attempt made to construct a better one; and the elaborate tables of dimensions, both absolute and proportional, suggestive as is the whole tendency of the author's observations, seem not to lead to any very practical result, though the systematicist's need to look beyond the inegual, even in parts that are so comparatively little hidden as birds' feet, is once more made beyond all question apparent.

It has already been mentioned that Macgillivray contributed to Audubon's *Ornithological Biography*, a series of descriptions of some parts of the anatomy of American birds, from subjects supplied to him by that enthusiastic naturalist, whose zeal and precocity, it may be called, in this respect merited all praise. Thus he (prompted very likely by Macgillivray) wrote: "I believe the time to be approaching when much of the results obtained from the inspection of the exterior alone will be laid aside; when museums filled with stuffed skins will be considered insufficient to afford a knowledge of birds; and when the student will go forth, not only toobserve the habits and haunts of animals, but to preserve specimens of them to be correctly dissected." (*Ornith. Biography*, iv., Introduction, p. xxiv). As has been stated, the first of this series of anatomical descriptions appeared in the fourth volume of his work, published in 1838, but they were continued until its completion with the fifth volume in the following year, and the whole was incorporated into what may be termed its second edition, *The Birds of America*, which appeared between 1840 and 1844. Among the many species whose anatomy Macgillivray thus partly described from autopsy were at least half a dozen of those now referred to the family *Tyrannidae* (see King-Byrd), but then included, with many others, according to the irrational, vague and rudimentary notions of classification of the time, in what was termed the family "*Musicaeinae*." In these species he found the vocal organs to differ essentially in structure from those of other birds of the Old World, which we now call Passerine, or, to be still more precise, Oscinian. But by him these last were most arbitrarily severed, dissociated from their allies, and wrongly combined with other forms by no means nearly related to them (*Brit. Birds*, i. pp. 17, 18) which he also examined; and he practically, though not literally, asserted the truth, when he said that the general structure, but especially the muscular appendages, of the lower larynx was "similarly formed in all other birds of this family" described in Audubon's work, and only individually (as he thought) varies enough to assign to it essential difference any systematic value. Indeed his system which was possessed in favour of a classification based on the structure of the digestive organs that he could not bring himself to consider vocal muscles to be of much taxonomic use, and it was reserved to Johannes Müller to point out that the contrary was the fact. This the great German comparative anatomist did in two communications to the Academy of Sciences of Berlin, one on the 26th June 1843 and the other on the 14th May 1846, which, having been first briefly published in the Academy's *Monatsbericht*, were afterwards printed in full, and illustrated by numerous figures, in its *Abhandlungen*, though in this latter and complete form they did not appear in public until 1850. In them actually Müller showed, among other things, that all almost -all or recent researches in the comparative history, external form, and consequent arrangement of the Passeres, and, though it is certainly not free from imperfections, many of them, it must be said, arise from want of material, notwithstanding that its author had command of a much more abundant supply than was at the disposal of Nitzsch. Carrying on the work from the anatomical point at which he had left it, correcting his errors, and utilizing to the fullest extent the observations of Kreyserling and Blasius, to which reference has already been made, Müller, though hampered by mistaken notions of which he seems to have been unable to rid himself, propounded a scheme for the classification of this group, the general truth of which has been admitted by all his successors, based, as the title of his treatise expressed, on the hitherto unknown different types of the vocal organs in the Passeres. He freely recognized the prior discoveries of, as he thought, Audubon, though really, as has since been ascertained, of Macgillivray; but Müller was able to perceive its systematic value, which Macgillivray did not, and taught others to know it. At the same time Müller showed himself, his power of discrimination notwithstanding, to fall behind Nitzsch in one very crucial point, for he refused to the latter's *Picari* the rank that had been claimed for them, and imagined that the groups associated under that name formed but a third "tribe"—*Picari*—of a great order *Inssores*, the others being (1) the *Oscines* or *Polyornithes* of the singing birds by emphasis, whose inferior larynx was endowed with the full number of five pairs of appendages, and (2) the *Trachephonides*, composed of some South-American families. Looking on Müller's labours as we now can, we see that such errors as he committed are chiefly due to his want of special knowledge of ornithology, combined with the absence in several instances of sufficient materials for investigation. Nothing whatever is to be said against the composition of his first and second "tribes"; but the third is an assemblage still more heterogeneous than that which Nitzsch brought together under a name so like that of Müller—for the fact must never be allowed to go out of sight that the extent of the *Picari* of the latter is not at all that of the *Picari* of the former. For naturally, because a few other forms such as the genera *Ptilo- pilla* and *Ptilogon*, now known to have no relation to the *Tyranny- dae*, were included, though these forms, it would seem, had never been dissected by him. On the other hand, he declares that the American roadstart, *Myiactea*, or, as it now stands, *Sphenochera ruticilla*, when young, has its vocal organs like the rest—an extraordinary statement which is worthy the attention of the many able American ornithologists.

Dr. Johannes Müller.
instance, Müller places in his third "tribe" the group which he called *Amphilidae*, meaning thereby the peculiar forms of South America that are now considered to be more properly named *Cotingidae*, and herein he was clearly right, while Nitzsch, who (misled by their supposed affinity to the genus *Amphilis*—peculiar to the Northern Hemisphere, and a purely Passerine form) had kept them among his *Passeresinae*, was as clearly wrong. But again Müller made use of the "tribe" *Pizari* also to contain the *Pyrrhulegidae*, which mention has just been made, though it is so obvious as now to be generally admitted that they have no very intimate relationship to the other families with which they are there associated. There is no need here to criticise more minutely this projected arrangement, and it must be said that, notwithstanding his researches, he seems to have had some misgivings that, after all, the separation of the *Insectores* into those "tribes" might not be justifiable. At any rate he wavered in his estimate of their taxonomic value, for he gave an alternative proposal, arranging all the genera in a single series, a proceeding in those days thought not only undeniable and possible, but desirable or even requisite, though now utterly abandoned. Just as Nitzsch had laboured under the disadvantage of never having any example of the abnormal *Passeres* of the New World to dissect, and, therefore, was wholly ignorant of their abnormality, so Müller never succeeded in getting hold of an example of the genus *Pitta* for the same purpose, and yet, acting on the clue furnished by Keyserling and Blasius, he did not hesitate to predict that it would be found to fill one of the gaps he had to leave, and this to some extent it has since been proved to do.

It must not be supposed that the vocal muscles were first discovered by Müller; on the contrary, they had been described by Yarrell long before, and by many writers on the anatomy of birds. To say nothing of forerunners, or the authors of works on the subject, an excellent account of them had been given to the Linnean Society by W. Yarrell in 1829, and again in 1833, in his *Treatise on the Bones*. (pp. 305–321, pls. 17, 18), an abstract of which was subsequently given in the article "Raven" in his *History of British Birds*, and Macgillivray also described and figured them with the greatest accuracy ten years later in his work with the same title (ii. 21–37, pls. x.–xii.), while Blyth and Nitzsch had (as already mentioned) seen some of their value in classification. But Müller has the merit of clearly outstripping his predecessors, and with his accustomed perspicacity made the way even plainer for his successors to see than he himself was able to see it. What remains to add is that the extraordinary celebrity of his author actually procured for the first portion of his researches notice in England (Ann. Nat. History, xvii. 499), though it must be confessed not then to any practical purpose; but more than thirty years after there appeared an English translation of his *Thirteen", by Jeffrey Bell, with an appendix by Garrod containing a summary of the latter's own continuation of the same line of research.¹

It is now necessary to revert to the year 1842, in which Dr Cornay of Rochefort communicated to the French Academy of Sciences a memoir on a new classification of birds, of which, however, nothing but a note has hitherto been published (Comptes rendus, xiv. p. 164). This latter was followed by a second contribution from him on the same subject, and of this only an extract appeared in the official organ of the Academy (at supra, xvii. 448: pp. 342). The abstract of this latter was inserted in an orchestra called "L'Istoria, " (L'Istituto, xii. 21), and its first portion in another (Journal des Découvertes, i. 250). The Revue Zoologique for 1847 (pp. 360–369) contained the whole, and enabled naturalists to consider the merits of the author's *Passeresinae*, which was as clearly a refinement of the part of the type of palate bones in birds which he declared to be subjected more evidently than any other to certain fixed laws. These laws, as formulated by him, are that (1) there is a coincidence of form of palate bones in the anterior palatal bones, and if bones in birds of the same order; (2) there is a likeness between the anterior palatal bones in birds of the same order; (3) there are relations of likeness

¹ The title of the English translation is Johannes Müller on Certain Variations in the Vocal Organs of the Passerine that have hitherto escaped notice. It was published at Oxford in 1878. By some unaccountable accident, the date of the original communication to the Academy of Berlin is wrongly given. It has been rightly given above.
perching birds, that is to say, which are neither birds of prey nor night birds, as opposed by Professor Cahanis, was into four "Orders," as follows:

1. Ostriches, equal to Muller's group of the same name;
2. Cramatidae, being a majority of that division of the Picacea which, by the idea of Wagner, in 1841, which have their feet normally constructed;
3. Sistriceae, a group now separated from the Cramatidae of Wagner, and containing those forms which have their feet abnormal;
4. Scansores, being the Grimpeurs of Cuvier, the Zygodactyle of several other systematicists.

The first of these "Four Orders" had been already indefinably established by Buffon; and although it is not perfectly natural, but respecting its details more must presently be said. The remaining three are now seen to be of a more artificial association, and the second of them, Cramatidae, in particular, contains very remarkable characters. But it must be kept in mind that the internal structure of some of them was at that time still more imperfectly known than now.

This will perhaps be the most convenient place to mention another kind of classification of birds, which, based on a principle wholly different from those that have just been explained, requires a few words, though it has not been productive, nor is likely, from that appears, to be productive of any great effect. So long ago as 1831, Prince C. L. Bonaparte, in his "Saggio di una sistemazione metodica degli Animali Verbreati," published at Rome, and in 1837 communicated to the Linnean Society of London, "A New Systematic Arrangement of the Birds," founded upon the subsequent page, "Transactions," (viii. pp. 247-304), though before it appeared there was issued at Bologna, under the title of Synopsis Vertebrotarum Systematis, a Latin translation of it. Herein he divided the class Aves into twelve great orders, the scheme of which is founded on the Grallatores (hitherto used by their inventors Vigors and Illiger in a different sense), in the latter work relying chiefly for this division on characters which had not before been used by any systematicist, namely that the sternum is forked in one super㵧 of its groups and the helpless nestlings were fed by their parents, while the latter group were mostly polygamous, and the chicks at birth are active and capable of feeding themselves. This method, which in process of time was for a time, it might be said, a the nearest approach to a systematic arrangement, was insinuated upon with more or less pertinacity by the author throughout a long series of publications, some of them separate books, some of them contributed to the medical issues, some to the scientific journals, and so on, until at his death, which in July 1857 found him occupied upon a Conspectus Generum Aves, that in consequence remains unfinished. In the course of the year 1841 the name of Prince Bonaparte is still seen in the name of several sub-semis, since those which he at first adopted were open to a variety of meanings, and in a communication to the French Academy of Sciences in 1853 (Comptes rendus, xxxvi. pp. 681-687) the designation Insectores was changed to Alriciæ, and Grallatores to Præcones—"the terms now preferred by him having been taken from Sundeval's treatise of 1835 already mentioned. The views of Bonaparte were, it appears, also shared by an ornithological amateur well known in Paris, Professor Hogg, in a treatise, which, as he subsequently stated (Zoologist, 1850, p. 2797), was founded strictly in accordance with them; but it would seem that, allowing his convictions to be warped by other considerations, he did not advance "physiological" characters. Yet it seems clear that, when published in 1846 (Edinb. N. Philosoph. Journal, xii. pp. 59-71), was found to be established on a single character of the feet only; though he was careful to point out, immediately after formulating the definition of his sub-semis Constrictipèdes and Inconstrictipèdes, that the former "make, in general, compact and well-built nests, wherein they bring up their very weak, blind, and mostly naked young, which they feed with care, bringing for them, like the Alriciæ, une yéon, and a substance strong to leave their nest," observing also that they "are principally monogamous" (pp. 55-56); while of the latter he says that they "make either a poor and rude nest, in which, when they get young, they have sometimes afforded happy results, they have often been deceptive; so that, should more be wanted than to draw up a mere inventory of creation or trace the distinctive outline of each species, zoologists would be at a loss to know where to begin. At the same time he states that authors who have occupied themselves with the sternum alone have often produced uncertain results, especially when they have neglected its anterior for its posterior part; in truth every bone of the skeleton ought to be studied in all its details. Yet this distinguished zoologist selects the sternum as furnishing the key to his primary groups or "Orders" of the class, adopting, as he says, the old terms of Carinatae and Rallatae, naming, however, the former Tropidosterni and the latter Homalosterni. Some unkind fate has hitherto hindered
ORNITHOLOGY

him from making known to the world the rest of his researches in regard to the other bones of the skeleton till he reached the head, and to the dendrology, an account of one of the birds of his first "Order." This is the more to be regretted by all ornithologists, since he intended to conclude with what to them would have been a very great boon—the showing in what way external characters were to be used in the classification of birds; but this was not within the scope of his plan to have continued on a more extended scale the researches on ossification begun by L’Herminier, and thus M. Blanchard’s investigations, if completely published, would have taken rank among the highest contributions to ornithology.

It is, so much of them as we have are of considerable importance; for, in this unfortunately unfinished memoir, he describes in succinct yet clear style, in which he shows, not only the differences of the different genera of his Tropidosternus presents, and to some extent makes a methodical disposition of them accordingly. Thus he separates the birds of prey into three great groups—(1) the ordinary owls, which forms the systematic part of the systematicist of his time, but distinguishing the American Vultures from those of the Old World; (2) Gypogenerans, the secretary-bird (q.v.); and (3) the owls (q.v.). Next he places the parrots (q.v.), and then the vast assemblage of "Passeræus" which he declares to be all of one type, even genera like Pipra (manakin, q.v.) and Pitta—and concludes with the somewhat heterogeneous conglomeration of forms, beginning with Cypselus (swift, q.v.), that so many systematists have been accustomed to call Piairæ, though to them as a group he assigns no name. A continuation of the treatise was promised in a succeeding part of the Artz, but a quarter of a century has passed without its appearance.

Important are the characters afforded by the sternum, that bone even with the whole sternal apparatus should obviously not be considered alone. To aid ornithologists in their studies of this organ, C. D.在家 the forming a collection of birds’ skeletons and detached bones; but they are not so drawn as to be of much practical use, as the accompanying letterpress is too brief to be satisfactory.

That the eggs laid by birds should offer to some extent characters of utility to systematists is only to be expected, when it is considered that those from the same nest generally bear an extraordinary family likeness to one another, and also that in certain groups the essential peculiarities of the egg-shell are constantly and distinctively characteristic. Thus no one who has ever examined the egg of a duck or a tinamou would ever be in danger of not referring another tinamou’s egg or another duck’s, that he might see, to its proper family, and so on with many others. But at the same time many of the shortcomings of oology in this respect must be set down to the want of accurate study, and the manner in which Chambers, whom some have been very lax, not to say incautious, in ascertaining on due evidence the parentage of their specimens, and the author next to be named is open to criticism. After several minor notices the first to be seen has been that in 1860 brought out at Paris his ambitious Traités généraux des Murs, d’ornithologie et de la vie de la classification which contains (pp. 290-336) a "Systema Oologyicum" as the final result of his labours. As a whole, this author has been more successful in his attempt to show what the author considered to be their natural method and sequence; but the result exhibits some unions as ill-assorted as can well be met with in the whole range of tentative arrangements of the kind; but with some very unjustifiable and unexplained decisions. The basis is the classification of Cuvier, the modifications of which by Des Murs will seldom commend themselves to systematists whose opinion is generally deemed worth having. Few, if any, of the faults of this work are due to the author; for Des Murs has not greatly departed from what he considers the most probable arrangement of the groups, although not named by his predecessors, those especially of other countries than France, are ignored, or, as is the case with some of those of L’Herminier, are only cited to be set aside. Oologists have no reason to regret the publication of this work, through which many valuable results of investigation, followed in the works that remain to be considered, will be immediately perceptible.

That this was the case is undeniably shown by some remarks of Canon Tristram, who, in treating of the Alaudiae and Saxicolinae of Algeria (whence he had recently brought a large collection of specimens of his own making), stated (Ibis, 1859, pp. 420-433) that he could "not help feeling convinced of the truth of the views set forth by Messrs Darwin and Wallace," adding that it was "hardly possible, I should think, to illustrate this theory better than by the larks and chats of North Africa." It is unnecessary to continue the history of the development of this theory, though it has not been without necessary to mention other oological works, since they have not a taxonomic bearing, and the chief of them have been already named (see Birds).
ORNITHOLOGY

quotation; the few words just cited are enough to assure to
their author the credit of being (so far as is known) the first
ornithological specialist who had the courage publicly to
recognize and receive the new and at that time unpopular philosophy.

But greater work was at hand. In June 1860 W. K.
Parkinson broke, as will now be entirely fresh ground
by common consent of the Zoological Society of London. On
1866, To the that, possessed

Sir Meyer, philosophy, not

Limbeck's scheme, being actually an adaptation of that of Sandevar, of which we shall have to speak at some length
almost immediately, may possibly be left for the present with these

In the spring of the year 1867 Professor T. H. Huxley,
and the delightful of an appreciative audience, delivered at the Royal
College of Surgeons of England a course of lectures

on birds, and a few weeks after presented an abstract
of his researches to the Zoological Society, in whose Proceedings
for the same year was printed (pp. 445-472) as a paper
"On the Classification of Birds, and on the Taxonomic Value of the Modifications of Certain of the Cranial Bones Observ-

able in the Class." Starting from the basis "that the phrase
'birds are greatly modified reptiles' would hardly be an exaggerated
expression of the closeness" of the resemblance between
the two classes, which he had previously bridged under the name of Sauropteryx (as he had bridged the Pisces and Amphibia
as Ichthyosaurus), he drew in bold outline both their likenesses
and their differences, and then proceeded to inquire how the
Aves could be most appropriately subdivided into orders, sub-
orders and families. In this course of lectures he had already
dwell at some length on the insufficiency of the characters on
which such groups as had hitherto been thought to be established
were founded; but for the consideration of this part of his
subject there was no room in the present paper, and the reasons
why he arrived at the conclusion that new means of philosophi-
cally and successfully separating the class must be sought are
herein left to be inferred. The upshot, however, admits of no
uncertainty: the class Aves is held to be composed of three
Orders.

I. AURUAEE, Héckel; II. RATTAE, Merrem; and
III. CANITAARAE, Merrem.

The Auroae have the metacarpals well developed and not
ossified, and the caudal vertebrae are numerous and large, so that
the caudal region of the spine is longer than the body. The furcula
is complete and strong, the feet very passerine in appearance. The
skull and sternum were at the time unknown, and indeed the whole
order, without doubt entirely extinct, rested exclusively on the
celebrated fossil, then unique, Archaeopteryx.

The Rattae comprehend the struthious birds, which differ from
each other now extant in the combination of several characters,
some of which have been mentioned in the preceding pages. The
sternum has no keel, and ossifies from lateral and paired centres
and; the axes of the scapula and coracoid have the same general
direction; certain of the cranial bones have characters very unlike
those possessed by the next order—the vomer, for example, being
broad posteriorly and generally intervening between the basis-
naphoideus, rostrum and the palatines and pterygoids; the barbs of the
feathers are directed towards the orifice of the respiratory
and the diagphragm is better developed than in other birds.

1 It is fair to state that some of Professor Parkinson's conclusions
regarding Balaeniceps were contested by the late Professor J. T.
Reinhardt (Oeuv. K. D. Vikd. Selsk. Forhandl., 1865, pp. 136-
150 (1862, pp. 175-178), and as it seems to the present writer
not inexplicably. Professor Parkinson replied to his critic (Ibis, 1862,
pp. 297-299).

2 This was done shortly afterwards by Professor Haeckel, who
proposed the name Sauraeae for the group containing it.

3 On this ground it is stated that the Passeres should be placed
highest in the class. But those who know the habits and demeure
of the birds would be more prepared to vouch for their more
"vivacity and activity" than is possessed by most
Passeres.

4 This peculiarity had led some zoologists to consider the struthous
birds more nearly allied to the Mammalia than any others.
The *Carinata* are divided, according to the formation of the palate, into two "Suborders," and named (i.) *Dromaeognatha*, (ii.) *Schizognatha*, (iii.) *Desmognatha*, and (iv.) *Aegithognatha*. The *Dromaeognatha* resemble the *Ratitae*, and especially the genus *Dromaeus*, in their palatal structure, and are composed of the *Titanornithes*, *Turnornithes*, *Charadriornithes*, *Charadriiformes*, *Ciconiornithes*, *Ciconiiformes*, *Pelecanornithes*, *Pelecaniformes*, *Heterornithes*, *Heterocercata*, *Pulchrorhynchoidea*, *Pelecanimorphae*, and *Aegithognathae*. The *Schizognatha* include a great many of the forms belonging to the Linnaean Orders *Gallinaceae*, *Grallae* and *Anseres*. In them the vomer, however variable, always tapers to a point anteriorly, while behind it includes the basisphenoid rostrum between the palatals, but neither these nor the vomer are borne by its posterior divergent ends. The maxillo-palatal are usually elongated and lamellar, uniting with the palatals, and, bending backward along their inner edge, leave a cleft (where the name "Actomorphae" derives from the "Suborder ") between the vomer and themselves. In the *Desmognatha*, the vomer is either abortive or so small as to disappear from the skeleton. When it exists it is always slender, and tapers to a point anteriorly. The maxillo-palatal are bound together in a manner so to say, by the "vomer line," either directly or by the ossification of the nasal septum. The posterior ends of the palatals and anterior of the pterygoids articulate directly with the rostrum. The *Aegithognathae*, the fourth and last of the "Suborders," is characterized by a form of palate in some respects intermediate between the two preceding. The vomer is broad, abruptly truncated in front, and deeply cleft behind, so as to embrace the rostrum of the sphenoid; the palatals have produced a new-externo-angular; the maxillo-palatals are slender at their origin, and extend obliquely inwards and forwards over the palatals, ending beneath the vomer in expanded extremities, not united either with one another or with the vomer, nor does the latter unite with the nasal septum, though that is frequently ossified.

The above abstract shows the general drift of this very remarkable contribution to ornithology, and it has to be added that for by far the greater number of his minor groups Huxley relied solely on the form of the palatal structure, the importance of which Dr Conyn had before urged, though to so little purpose. That the palatal structure must be taken into consideration by taxonomers as affording hints of some utility there can no longer be a doubt; but perhaps the characters drawn thence owed more of their worth to the extraordinary perspicuity with which they were presented by Huxley than to their own intrinsic value, and if the same power had been employed to elucidate in the same way other parts of the skeleton,—say the bones of the sternal apparatus or even of the pelvic girdle,—either set might have been made to appear quite as instructive and perhaps more so. Advenitance value would therefore seem to have been acquired by the bones of the palate through the fact that so great a master of the art of exposition selected them as fitting examples upon which to exercise his skill. At the same time it must be stated this selection was not premeditated by Huxley, but forced itself upon him as his investigations proceeded. In reply to some critical remarks (Ibis, 1868, pp. 85-96), chiefly aimed at showing the inexpediency of relying solely on one set of characters, especially when those afforded by the palatal bones were not, even within the limits of families, wholly diagnostic, the author (Ibis, 1868, pp. 357-362) announced a slight modification of his original scheme, by introducing three more groups into it, and concluded by indicating how its bearings upon the great question of "genetic classification" might be represented so far as the different groups of *Carinata* are concerned.

1 These names are compounded respectively of *Dromaeus*, the generic name applied to the eune, *σχῖςα*, a split or cleft, *σκεῦος*, a bond or tying, *ἀχιδός*, a finch, and, in each case, *γαῖα*, a jaw.

2 The notion of the superiority of the palatal bones to all others for purposes of classification has pleased many persons, from the fact that these bones are not unfrequently retained in the dried skins of birds sent home by collectors in foreign countries, and are therefore more available for study while both bones and pelvis are rarely preserved. The common practice of ordinary collectors, until at least very recently, has been tersely described as being to "shoot a bird, take off its skin, and throw away its characters." Such notions are agreed to be highly pernicious.

3 Perhaps this may be partially explained by the fact that the Museum of the College of Surgeons, in which these investigations were chiefly carried on, like most other museums of the time, contained a much larger series of the heads of birds than of their entire skeletons, or of any other portion of the skeleton. Consequently the materials available for the comparison of different forms consisted in great part of heads only.

4 It is true that from the time of Buffon, though he scorned any regular classification, geographical distribution had been occasionally held to have something to do with systematic arrangement; but the way in which the two were related was never clearly put forth, though people who could read between the lines might have guessed the secret from Darwin's *Journal of Researches*, as well as from his introduction to the *Zoology of the "Beagle" Voyage*.
bearing on our knowledge of ornithology will be most con-
veniently treated here.

In November 1870 O. C. Marsh, by finding the imperfect fossilized tibia of a bird in the middle cretaceous shale of Kansas, began a series of wonderful discoveries of great im-
portance to ornithology. Subsequent visits to the same part of North America, often performed under circum-
stances of discomfort and occasionally of danger, brought to this intrepid and energetic explorer the reward he had so fully earned. Brief notices of his spoils appeared from time to time in various volumes of the American Journal of Science and Arts (Silliman's), but it is unnecessary here to refer to more than a few of them. In that Journal for May 1872 (ser. 3, iii. p. 360) the remains of a large swimming bird (nearly 6 ft. in length, as afterwards appeared) having some affinity, it was thought, to the Colymbidae were described under the name of Hesperornis regalis, and a few months later (iv. p. 344) a second fossil bird from the same locality was indicated as Ichthyornis dispar—
from the fish-like, biconcave form of its vertebrae. Further examination of the enormous collections gathered by the author, and preserved in the Museum of Yale University at New Haven, Connecticut, showed him that this last bird, and another to which he gave the name of Aptornis, had possessed well-
developed teeth implanted in sockets in both jaws, and induced him to establish (v. pp. 161, 162) for their reception a “ sub-
class” Odontornithes and an order Ichthyornithes. Two years more and the originally found Hesperornis was discovered also to have teeth, but these were inserted in a groove. It was accordingly regarded as the type of a distinct order Odontolaelae (x. pp. 403-408), to which were assigned as other characters vertebrae of a saddle-shape and not biconcave, a keelless ster-
num, and wings consisting only of the humerus. In 1880 Marsh brought out Odontornithes, a monograph of the extinct toothed birds of North America. Herein remains, attributed to no fewer than a score of species, which were referred to eight different genera, are fully described and sufficiently illustrated, and, instead of the ordinal name Ichthyornithes previously used, that of Odontolaelae was proposed. In the author’s concluding summary he remarks on the fact that, while the Odontolaelae, as exhibited in Hesperornis, had teeth inserted in a continuous groove—a low and generalized character as shown by reptiles, they had, however, the strongly differentiated saddle-shaped vertebrae as all modern birds possess. On the other hand the Odontolaelae, as exemplified in Ichthyornis, having the primitive biconcave vertebrae, yet possessed the highly specialized feature of teeth in distinct sockets. Hesperornis, having keeled sternum, had aborted wings but strong legs and feet adapted for swimming, while Ichthyornis had a keeled sternum and powerful wings, but diminutive legs and feet. These and other characters separate the two forms so widely as quite to justify the establishment of as many orders for their reception. Marsh states that he had fully satisfied himself that Archaeopteryx belonged to the Odontornithes, which he thought advisable for the present to regard as a subclass, separated into three orders—Odontolae, Odontolaelae and Sauvaeae—all well marked, but evidently not of equal rank, the last being clearly much more widely distinguished from the first two than they are from one another. But that these three oldest-known forms of birds should differ so greatly from each other unmistakably points to a great antiquity for the class.

The former efforts at classification made by Sundeavall have already several times been mentioned, and a return to their con-
sideration was promised. In 1872 and 1873 he brought

Sundeavall. out at Stockholm a Methodi naturalis avium dis-
ponendarum tentamen, two portions of which (those relating to the diurnal birds-of-prey and the Cichlornorphae, or forms related to the thrushes) he found himself under the necessity of revising and modifying in the course of 1874, in as many communications to the Swedish Academy of Sciences (K. V.-Ak. Förhandlingsar, 1874, No. 2, pp. 21-32; No. 3, pp. 27-53). This Tentamen, containing his complete method of classifying birds in general, naturally received much attention, the more so perhaps, since, with its appendices, it was nearly the last labour of its respected author, whose industrious life came to an end in the course of the following year. From what has before been said of his works it may be gathered that, while professedly basing his systematic arrangement of the groups of birds on their external features, he had hitherto striven to make his schemes harmonize if possible with the dictates of internal structure as evinced by the science of palaeontology, and that he had therefore laboured uniformly and persistently against the inside being better than the outside. In thus acting he proved himself a true follower of his great countryman Linnaeus; but, without disparagement of his efforts in this respect, it must be said that when internal and external char-
acters appeared to be in conflict he gave, perhaps with unconscious bias, a preference to the latter, for he belonged to a school of zoologists whose natural instinct was to believe that such a conflict always existed. Hence his efforts, praiseworthy as they were from several points of view, and particularly so in regard to some details, failed to satisfy the philosophic taxonomer when generalizations and deeper principles were concerned, and in his practice in respect of certain technicalities of classification he was, in the eyes of the orthodox, a transgressor. Thus instead of contending himself with terms that had met with pretty general approval, such as class, subclass, order, sub-
order, family, subfamily and so on, he introduced into his final scheme other designations, “ agmen,” “ cohors,” “ phalanx,” and the like, which to the ordinary student of ornithology convey an indefinite meaning, if any meaning at all. He also carried to a very extreme limit his views of nomenclature, which were certainly not in accordance with those held by most zoologists, though this is a matter so trilling as to need no details in illustration.

His Tentamen translated into English by F. Nicholson in 1886, and had a considerable influence on later writers, especially in the arrangement of the smaller groups. In the main it was in an artificial system. Birds were divided into Gymnopaedes and Dasyopaedes, according as the young were naked or covered. The Gymnopaedes are divided into two “ orders” — Oscines and Volucres—the former intended to be identical with the group of the same name established by older authors, and, in accordance with the observations of Kingery and Blasius already mentioned, divided into two “ series ” — Laminiplantares, having the hinder part of the “ tarsus ” covered with two horny plates, and Scutelliplantares, in which the same part is scutellated. These Laminiplantares are composed of six cohorts as follows:

Cohors 1. Cichlonorphae.
Cohors 2. Comornorphae.
Cohors 3. Cotingomorphae.
Cohors 5. Cuvyntomorphae.—5 families: sun-birds, honey-suckers.
Cohors 6. Chelidonomorphae.—1 family: swallow.

The Scutelliplantares include a much smaller number of genera, and, with the exception of the first " cohort " and a few groups of the fourth and fifth, all are peculiar to America.

Cohors 1. Holaspidae.
Cohors 2. Endaspidae.
Cohors 3. Exaspidae.
Cohors 4. Pycnonorphae.
Cohors 5. Tassidae.

We then arrive at the second order Volucres, which is divided into two "series." Of these the first is made to contain, under the name Zygodyctyla,

Cohors 1. Ptilitae.
Cohors 2. Pici.
Cohors 3. Cocyeae.
Cohors 4. Cononmorphae.
Cohors 5. Ampilgliares.
Cohors 6. Longilignaeus or Mellisnagae.
Cohors 7. Syntalysa.
Cohors 8. Pterodactyla.

The Dasyopaedes of Sundeavall are separated into six “ orders”; but these will occupy us but a short while. The first of them, Aestiplanthes, comprehending all the birds-of-prey, were separated into 4 "cohorts" in his original work, but these were reduced in his second volume to two, one with 4 families separately divided into 2 series, and Hemerobatenges containing all the rest, and comprising 10 families (the last of which is the seriema, Dicholophus) divided into 2 groups as Rapinae and Sapropilae—the latter including the vultures. Next stands the order Gallinae with 4 " cohorts":
TAXONOMY

ORNITHOLOGY

The Ornithology, in the ninth edition of this encyclopedia, A. Newton accepted the three subclasses of Huxley, Saururidae, Ratitae and Carinatae, and made a series of cautious but critical observations on the minor divisions of the Carinatae. In 1882 A. Reichenow in *Die Vogel der zoologischen Gärten* published a classification of birds with a phylogenetic tree. In this he departed considerably from the lines that had been made familiar by English workers, and made great use of natural characteristics. The next attempt of importance appeared in the American Standard Natural History, published in Boston in 1885. The volume on birds was written by Dr L. Stejneger and was founded on Eliot C.ous's *Key to North American Birds*. Apart from its intrinsic merits as a learned and valuable addition to classification, this work is interesting in the history of ornithology because of the wholesale changes of nomenclature it introduced as the result of much diligence and zeal in the application of the strict rule of priority to the names of birds.

In 1888 there was published the huge monograph by Max Furchbringer entitled *Untersuchungen zur Morphologie und Systematik der Vögel*. In addition to an enormous body of new information chiefly on the shoulder girdle, the alar muscles and the nerve plexuses of birds, this work contained a critical and descriptive summary of practically the whole pre-existing literature on the structure of birds, and it is hardly necessary for the student of ornithology to refer to earlier literature at first hand. Furchbringer supposes that birds must have begun with toothed forms of small or moderate size, with long tails and four lizard-like feet and bodies clothed with a primitive kind of down. To these succeeded forms in which the down had developed into body feathers for warmth, not flight, whilst the fore-limbs had become organs of prehension, the hind-limbs of progression. In such bipedal creatures the legs and pelvis became transformed to a condition similar to that of Dinosaurian reptiles. Many of them were climbing animals, and from these true birds with the power of flight were developed. In the course of this evolution there were many cases of arrest or degradation, and one of the most novel of the ideas of Furchbringer, and one now accepted by not a few anatomists, was that the ratites or ostrich-like birds were not a natural group but a set of stages of arrested development or of partial degradation. It is impossible to reproduce here Furchbringer's elaborate details and phylogenetic trees with their various horizontal sections, but the following tables give the main outlines:

Whilst Fürbringer was engaged on his gigantic task, Dr Hans Gadow was preparing the ornithological volume of Bronn's *Tier-Reich*. The two authors were in constant communication, and the classifications they adopted had much in common. It is unnecessary here to discuss the views of Gadow, as that author himself has contributed the article *Bird* to this edition of the *Encyclopaedia Britannica*, and has there set forth his revised scheme.

(A. N.; P. C. M.)

**ORODES** (also called **HYRÖDES**, Pers. *Hyranda*), the name of two Parthian kings.

1. **ORODES I.**, son of Phraates III., whom he murdered in 57 B.C., assisted by his brother Mithradates III. This Mithradates was made king of Media, but soon afterwards was expelled by Orodes and fled into Syria. Hence he invaded the Parthian kingdom, but having reigned for a short time (55) was besieged by Surenas, general of Orodes, in Seleucia, and after a prolonged resistance was captured and slain. Meanwhile Crassus had begun his attempt to conquer the east, but he was defeated and killed in 53 at Carrhae by Surenas, while Orodes himself invaded Armenia and forced King Artavasdes, the son of Tiranes, to abandon the Romans. By the victory of Carrhae the countries east of the Euphrates were secured to the Parthians. In the next year they invaded Syria, but with little success, for Surenas, whose achievements had made him too dangerous, was killed by Orodes (Plut. *Crass.* 33), and Pacorus, the young son of the king, was defeated by C. Cassius in 51. During the civil war the Parthians sided first with Pompey and then with Brutus and Cassius, but took no action until 40 B.C., when Pacorus, assisted by the Roman deserter Labienus, conquered a great part of Syria and Asia Minor, but was defeated and killed by Ventidius in 38 (see *Pacorus*). The old king, Orodes, who was deeply afflicted by the death of his gallant son, appointed
his son Phraates IV, successor, but was soon afterwards killed by him (37 B.C.; Dio. Cass. 49, 23; Justin 42, 4; Plut. Crassus, 33, 1). But Plutarch states that Orodos understood Greek very well; after the death of Crassus the Bactae of Euripides were represented at his court (Plut. Crass., 33).

2. ORODES II, raised to the throne by the magnates after the death of Phraates V. about A.D. 5, was killed after a short reign "on account of his extreme cruelty" (Joseph. Ant. xviii. 2, 4).

OROGRAPHY (Gr. ὄρος, mountain, γραφέω, to write), that part of physical geography which deals with the geological formation, the surface features and description of mountains. The terms "orography," "orology" and "orocology" are also sometimes used.

ORONTHES, the ancient name of the chief Syrian river, also called Tyrus and Aesius, the last a native form, from whose revival, or continuous employment in native speech, has proceeded the modern name Ἀσί ("asib"); which is variously interpreted by Arabs as referring to the stream's impetuosity, to its unproductive channel, or to the fact that it flows away from Mecca. The Oronthes rises in the great springs of Labwbe on the east side of the Buka'a, or inter-Lebanon district, very near the fountains of the southward-flowing Litani, and it runs due north, parallel with the coast, falling 2000 ft. through a rocky gorge. Leaving this it expands into the Lake of Homs, having been dammed back in antiquity. The valley now widens out into the rich district of Hamah (Hamath-Epaphaphene), below which lie the broad meadow-lands of Ghâb, containing the Sits of ancient Amapa and Larissa. This central Oronthes valley runs at the rocky barrier of Jir al-Hadîd, where the river is diverted to the west, and the plain of Antioch opens. Two large tributaries from the N., the Afrin and Kara Su, here reach it through the former Lake of Antioch, which is now drained through an artificial channel (Nahr al-Kowsît). Passing N. of the modern Antakia (Antioch) the Oronthes plunges S.W. into a gorge (compared by the ancients to Tempe), and falls 150 ft. in 10 m. to the sea just south of the little port of Suiedia (anc. Seleucia Piericar), after a total course of 170 m. Mainly unnavigable and of little use for irrigation, the Oronthes derives its historical importance solely from the convenience of its valley for traffic from N. to S. Roads from N. and N.E., converging at Antioch, follow the course of the stream up to Homs, where they fork to Damascus and to Coele-Syria and the S.; and along its valley have passed the armies and traffic bound to and from Egypt in all ages. (See ANTIOCH and HOMS.)

(1. D. G. H.)

OROPUS, a Greek seaport, on the Euphrates, in the district of Παραϊκή, opposite Eretria. It was a border city between Bocotia and Attica, and its possession was a continual cause of dispute between the two countries; but at last it came into the final possession of Athens, and is always alluded to under the Roman empire as an Attic town. The actual harbour, which was called Delphinium, was at the mouth of the Asopus, about a mile north of the city. A village still called Oropoe occupies the site of the ancient city. The famous oracle of Amphiaraus was situated in the territory of Oropus, not far from the city. The site has been excavated by the Greek Archaeological Society; it contained a temple, a sacred spring, into which coins were thrown by worshippers, altars and porticoes, and a small theatre, of which the prosenium is well preserved. Worshippers used to consult the oracle of Amphiaraus by sleeping on the skin of a slaughtered ram within the sacred building.

OROSIUS, PAULUS (fl. 413), historian and theologian, was born in Spain (possibly at Braga in Galicia) towards the close of the 4th century. Having entered the Christian priesthood, he naturally took an interest in the Priscillianist controversy then going on in his native country, and it may have been in connexion with this that he went to Rome in 413 or 414. After staying for some time in Africa as the disciple of Augustine, he was sent by him in 415 to Palestine with a letter of introduction to Jerome, then at Bethlehem. The ostensible purpose of his mission (apart, of course, from those of pilgrimage and perhaps relic-hunting) was that he might give further instruction from his master to the Priscillians and Origenists; but in reality, it would seem, his business was to stir up and assist Jerome and others against Pelagius, who, since the synod of Carthage in 411, had been living in Palestine, and finding some acceptance there. The result of his arrival was that John, bishop of Jerusalem, was induced to summon at his capital in June 415 a synod at which Orosius communicated the decisions of Carthage and read such of Augustine's writings against Pelagius as had at that time appeared. Success, however, was scarcely to be hoped for amongst Orientals who did not understand Latin, and whose sense of reverence was unshocked by the question of Pelagius, "Quis est nihil Augustinus?" Orosius did not succeed in obtaining from John permission to send letters and other documents to Pelagius at Carthage; but, having waited long enough to learn the unfavourable decision of the synod of Diospolis or Lydda in December of the same year, he returned to North Africa, where he is believed to have died. According to Genadius he carried with him recently discovered relics of the protomartyr Stephen from Palestine to Minorca, where they were efficacious in converting the Jews.

The earliest work of Orosius, Consultatio sine communitarium ad Aequorum (see the errata to the edition), is a memorandum made during his absence (in Africa) on the growth of Christianity, and bears the name of Orosius, although it is never ascribed to him by its titulus; it was written soon after his arrival in Africa, and is usually printed in the works of Augustine along with the reply of the latter, Contra Priscillianistas et Origenistas liber habet historiae. A more recent work, written much later, De bello Hispalense, was written during his stay in Palestine, and in connexion with the controversy which engaged him there. It is a keen but not always fair criticism of the Pelagian position from that of Augustine. The Historiae adversarium Paganorum was undertaken at the suggestion of Augustine, to whom it is dedicated. When Augustine proposed this task he had already planned and made some progress with his De gestis Dei; it is the same argument that is elaborated by his disciple, namely, the evidence from history that the circumstances of the world had not really become worse since the introduction of Christianity. The work, which is thus a pragmatical chronicle of the calamities that have happened to mankind from the fall down to the Gothic period, has little accuracy or learning, and even less of literary charm to commend it; but it was the first attempt to write the history of the world as a history of God guarding humanity. Its purpose gave it value in the eyes of the orthodox, and the Hornæstæ, Ormestæ, or Omisita as it was called, no one knows why (from Orphæi Munda) History or from de miseria mundi? see Morer, p. 180, for list of guesses), speedily attained a wide circulation. The English translation by King Alfred is still extant (Old English text, with original in Latin, edited by H. Sweet, 1883). The editio princeps of the original appeared at Augsburg (1471); that of Hadrianus (1528 and 1570) is the best. C. Leber and C. Zangemeister, who have edited the Hist. and also the Lib. apol. in vol. v. of the Corp. sacr. eccl. Lat. (Vienna, 1882), as well as an edit. min. (Leipzig, Teubner, 1880). The "sources" made use of by Orosius have been insufficiently examined (see the editio princeps, hist. libr. vii. adversus Paganos, 1834); besides the Old and New Testaments, he appears to have consulted Caesar, Livy, Justin, Tacitus, Suetonius, Florus and a cosmography, attaching also great value to Jerome's translation of the Chronicles of Eusebius.

ORPHAN, the term used of one who has lost both parents by death, sometimes of one who has lost father or mother only. In Law, an orphan is such a person as has not attained the age of 14; for the Latin Lat. orphans, from which the word, chiefly owing to its use in the Vulgate, was adopted into English, is a translation of ὀρφανός, in the same sense, the original meaning being "bereft of," "destitute," classical Lat. orbus. The Old English word for an orphan was stēopeclīd, stepchild. By the custom of the city of London, the lord mayor and aldermen, in the Court of Orphans, have the guardianship of the children still under age of deceased freemen. Orphans' courts exist for the guardianship of orphans and administration of their estates in Delaware, Maryland, New Jersey and Pennsylvania in the United States. In other states these are performed by officers of the Probate Court, known as "surrogates," or by other titles.

ORPHEUS, an ancient Greek poet, in Greek Ορπής, was the inventor of the art of song and playing on the lyre, and of great importance in the religious history of Greece. The derivation of the name is uncertain, the most probable being that which connects it with
ORPHEUS

...orphaeus, ὄρφης". In accordance with this, Orpheus may have been originally a god of darkness; or the liberator from the power of darkness by his gift of song; or he may have been so called because his rites were celebrated by night (cf. Dionysus Nyctellus). It is possible, but very improbable, that Orpheus was an historical personage, even in ancient times. His existence was denied. According to Maass, he was a chthonian deity, the counterpart of Dionysus, with whom he is closely connected; J. E. Harrison, however, regards him as a religious reformer from Crete, who introduced the doctrine of cestasis without intoxication amongst the Thracians and was slain by the votaries of the frenzied ritual. S. Reinach sees in him the fox roaming “in the darkness,” to the Thracians a personification of the wine-god, torn in pieces by the Bassares (fox-maidens). Although some he was held to be a Greek, the tradition of his Thracian origin was most generally accepted. His name does not occur in Homer or Hesiod, but he was known in the time of Ibycus (c. 530 B.C.), and Pindar (522–444 B.C.) speaks of him as “the father of songs.” From the 6th century onwards he was looked upon as one of the chief poets and musicians of antiquity, the inventor or perfectioner of the lyre, who by his music and singing was able not only to charm the wild beasts, but even to draw the trees and rocks from their places, and to arrest the rivers in their course. As one of the pioneers of civilization, he was supposed to have taught mankind the arts of medicine, writing and agriculture. As closely connected with religious life, he was an augur and seer; practised magical arts, especially astrology; founded or rendered accessible many important cults, such as those of Apollo and Dionysus; instituted mystic rites, both public and private; prescribed initiatory and purificatory ritual. He was said to have visited Egypt, and to have become familiar with the writings of Moses and with the doctrine of a future life.

According to the best-known tradition, Orpheus was the son of Oeagrus, king of Thrace, and the muse Calliope. During his residence in Thrace he joined the expedition of the Argonauts, whose leader Jason had been informed by Chiron that only by the aid of Orpheus would they be able to pass by the Sirens unscathed. His numerous services during the journey are described in the Argonautica that goes under his name. But the most famous story in which he figures is that of his wife Eurydice. While fleeing from Aristaeus, she was bitten by a serpent and died. Orpheus went down to the lower world and by his music softened the heart of Pluto and Persephone, who allowed Eurydice to return with him to earth. But the condition was attached that he should walk in front of her and not look back until he had reached the upper world. In his anxiety he broke his promise, and Eurydice vanished again from his sight. The story in this form belongs to the time of Virgil, who first introduces the name of Aristaeus. Other ancient writers, however, speak of his visit to the underworld; according to Plato, the infernal gods only “presented an apparition” of Eurydice to him.

According to the traditional account of Eurydice, Orpheus rejected the advances of the Thracian women, who, jealous of his faithfulness to the memory of his lost wife, tore him to pieces during the frenzy of the Bacchic orgies. His head and lyre floated “down the swift Hebrus to the Lesbian shore, where the inhabitants buried his body and burnt it, but saved his head and lyre.” The lyre was carried to heaven by the Muses, and was placed amongst the stars. The Muses also gathered up the fragments of his body and buried them at Leibethra below Olympus, where the nightingales sang over his grave, while yet another legend places his tomb at Dium, near Pydna in Macedonia. Other accounts of his death are: that he killed himself from grief at the failure of his journey to Hades; that he was struck with lightning by Zeus for having revealed the mysteries of the gods to men; or he was torn to pieces by the Maenads for having abandoned the cult of Dionysus for that of Apollo.

According to Gruppe, the legend of the death of Orpheus is a late imitation of the Adonis-Osiris myth. Osiris, like Orpheus, is torn in pieces, and his head floats down every year from Egypt to Byblos; the body of Attis, the Phrygian counterpart of Adonis, like that of Orpheus, does not suffer decay. The story is repeated of Dionysus; he is torn in pieces, and his head is carried down to Lesbos. Without going so far as to assert that Orpheus is a type-stasis of Dionysus, there is no doubt that a close connexion existed between them from very early times. According to Frazier, these traditions may be distorted reminiscences of the practice of human sacrifice, especially of divine kings, the object of which was to ensure fertility in the animal and vegetable worlds. Orpheus, in the manner of his death, was considered to personate the god Dionysus, and was thus the representative of the god torn to pieces everywhere. It seems that the Bacchic priest in the ancient times with a human victim, afterwards with a bull to represent the bull-formed god. A distinct feature of this ritual was ὑμβολία (eating flesh of the victim raw), whereby the communicants denied that they consumed and assimilated the god represented by the victim, and thus became filled with the divine ecrasy. A. W. B. Simpson (Journ. Hell. Studies, xiv. p. 254) sees in the myth an allusion to the way in which the Phrygian Osiris was rendered immortal by the worship of his followers in Phrygia at the winter solstice.

It is possible that the floating of the head of Orpheus to Lesbos has reference to the fact that the island was the first home of lyric poetry, and may be symbolical of the route taken by the Aeolian emigrants from Tuscany on their way to their new home in Asia Minor.

The name of Orpheus is equally important in the religious history of Greece. He was the mythical founder of a religious school or sect, with a code of rules of life, a mystic ecstatic theology, a system of purificatory and expiatory rites, and peculiar mysteries. This school is first observable under the rule of Peisistratus at Athens in the 6th century B.C. Its doctrines are founded on two elements: the Thraco-Phrygian religion of Dionysus with its enthusiastic orgies, its mysteries and its regulation of agriculture or nature; and the Orphic教义, especially of the nature and mutual relations of the numerous gods, developed at this time by intercourse with Egypt and the East, and by the quickened intercourse between different tribes and different religions in Greece itself. These causes produced similar results in different parts of Greece. The close analogy between Pythagoreanism and Orphism has been recognized from Herodotus (ii. 81) to the latest modern writers. Both inculcated a peculiar kind of ascetic life; both had a mystical speculative theory of religion, with purificatory rites, abstinence from beans, &c.; but Orphism was more especially religious, while Pythagoreanism, at least originally, inclined more to be a political and philosophical creed.

The rules of the Orphic life prescribed abstinence from beans, flesh, certain kinds of fish, &c., the wearing of a special kind of clothes, and numerous other practices and abstinences. The ritual of worship was peculiar, not admitting bloody sacrifices. The belief was taught in the homogeneity of all living things, in the doctrine of original sin, in the transmigration of souls, in the view that the soul is entombed in the body (σώμα σώμα), and that it may gradually attain perfection during connexion with a series of bodics. When completely purified, it will be freed from this “circle of generation” (κύκλος γενεσεως), and will again become divine, as it was before its entrance into a mortal body.

The chief ceremonies of the nightly rite were sacrifice and libation; prayer and purification; the representation of sacred legends (e.g., the myth of Zagreus, the chief object of worship, who was identified with most of the numerous gods of the Orphic pantheon); the rape of Persephone; and the descent into Hades. These were introduced as a “sacred explanation” (ἐξήγησις) of the rules and prescriptions. To these also belong the rite of ὑμβολία, and the communication of liturgical formulae for the guidance of the soul of the dead man on his way to the underworld, which also served as credentials to the gods below. Some of the so-called “Orphic tablets,” metrical inscriptions engraved on small plates of gold, chiefly dating from the 4th and 3rd centuries B.C., have been discovered in tombs in southern Italy, Crete and Rome.

It does not appear, however, that a regularly organized or numerous Orphic sect ever existed; nor that Orphism ever became popular; it was too abstract, too full of symbolism. On the other hand, the genuine Orphics, a fraternity of religious ascetics, found unsrapable imitators and impostors, who preyed upon the credulous and ignorant. Such were the Orphic theleutai or Metraigetes, priests who went round the country with an ass carrying the sacred properties (Aristophanes, Frogs, 159) and a bundle of sacred books. They promised an easy expiation for crimes to both living and
dead on payment of a fee, undertook to punish the enemies of their clients, and held out to them the prospect of perpetual banqueting and feasting of the Orphneys.

A large number of writings in the tone of the Orphic religion were ascribed to Orpheus. They dealt with such subjects as the origin of the gods, the creation of the world, the ritual of purification and sacrifice, and the mysteries of Orpheus. Many of these poems were at rhapsoic contests together with those of Homer and Hesiod, and Orphic hymns were used in the Eleusinian mysteries. The best-known work in connection with them is that of Onomacularis (q.v.), which contains twelve Orphic hymns on the attributes of the gods and forgeries of his own) of Orphic songs and legends. In later times Orphic theology engaged the attention of Greek philosophers—Ennius the Peripatetic, Chrysippus the Stoic, and Proclus the Neoplatonist. The doctrine of Orphism (of which only fragments remain) was united in a corpus, called Ὀρφικά, the chief poem in which was Ὀρφικὸς Θεὸς Θεότητα. It also included a collection of Orphic hymns, liturgical songs, practical treatises, and poems on various subjects. The so-called Orphic Poems, still extant, are of much later date, probably belonging to the 4th century B.C.; they consist of: (1) an Argonautica, glorifying the deeds of Orpheus on the "Argo," (2) a didactic poem on the mythology of the Orphics, and (3) thirty-two hymns on various divinities and personified forces of nature. Some of these hymns are probably earlier (1st and 2nd centuries). The Orphic poems also played an important part in the controversies between Christians and pagans in the early centuries. In the Middle Ages, Christian writers quoted them to show the real meaning of the multitude of gods, while Christians retorted by reference to the obscene and disgraceful fictions by which the former degraded their gods.

There is an edition of the Orphic Fragments and of the poems by E. Abel (1885). The Argonautica has been edited separately by J. P. M. (1863), the Liddell-Hardy (1891), and there is an English translation of the Hymns by T. Taylor (rep. printed, 1860).

On the representations of Orpheus in heathen and Christian art (in which he is finally transformed into the Good Shepherd with his sheep), see A. Baumeister, Denkmaeler des klassischen Alterthums, ii. (ed. 1890), pp. 1120; P. Knaap, Über Orpheusdarstellungen (Tübingen, 1895); F. X. Kraus, Katalonographie des christlichen Alterthums, ii. (1886); J. A. Martigny, Dictionnaire des antiquités chrétiennes (1896); A. Heussner, Die altchristlichen Orpheusdarstellungen (Leipzig, 1893); and the articles in Roscher's and Darenberg and Saglio's Lexicon.

The use of Orpheus, as was to be expected of a legend told both by Ovid and Boeotius, retained its popularity throughout the middle ages and was transformed into the likeness of a northern fairy tale. In English medieval literature it appears in three works: in the Orphius of Gower and Britomartis, in the Orlando Furioso from the Harleian MS. in J. Ritson's Ancient English Metrical Romances, vol. ii. (1802); Orphoe and Heroedus from the Ashmolean MS. in David Laing's Select Remains of the Ancient Popular Poetry of Great Britain, and King Orfeu from the British Museum MS. in J.O. Halliwell's Illustrations of Fairy Mythology (Shakespeare Soc., 1842). The poems show traces of French influence.

(O. H. F.; N.)

**ORPHEY**, gold or other richly ornamented embroidery, particularly an embroidered border on an ecclesiastical vestment (see VESTMENTS). The word is from O. Fr. orfrez, mod. orfret, from med. Lat. aurifrustum, aurifrigium, &c., for orphrygium, aurum, gold, and phrygium, Phrygian; a name given to gold-embroidered tissues, also known as testes Phrygic, the Phrygians being famous for their skill in embroidering in gold.

**ORPIMENT** (auripigmentum), arsenic trisulphide, As₂S₃, or yellow redarg (q.v.), occurring in small quantities as a mineral crystallizing in the rhombic system and of a brilliant goldenyellow colour in Bohemia, Peru, &c. For industrial purposes an artificial orpiment is manufactured by subliming one part of sulphur with two of arsenic trioxide. The sublime varies in colour from yellow to red, according to the intimacy of the combination of the ingredients; and by varying the relative quantities used many intermediate tones may be obtained. These artificial preparations are highly poisonous. Formerly, under the name of "king's yellow," a preparation of orpiment was in considerable use as a pigment, but now it has largely been superseded by chrome-yellow. It was also at one time used in dyeing and calico-printing, and for the unhauling of skins, &c.; but safer and equally efficient substitutes have been found.

**ORPINGTON**, a town in the Dartford parliamentary division of Kent, England, 13¾ m. S.E. of London, and 2½ m. S. by E. of Chislehurst, on the South-Eastern & Chatham railway. Pop. (1891), 4259. The church (Early English) contains some carved work and ancient brasses. An old mansion called Orpington House is the Priory dated in 1525. The oak-panelled hall and the principal rooms are of the 15th century. In 1873 John Ruskin set up at Orpington a private publishing house for his works, in the hands of his friend George Allen. Fruit and hops are extensively grown in the neighbourhood. From its pleasant situation in a hilly, wooded district near the headwaters of the Cray stream, Orpington has become in modern times a favourite residential locality for those whose business lies in London. A line of populous villages extends down the valley between Orpington and Bexley—St Mary Cray (pop. 1894), St Paul's Cray (1807), Foots Cray (an urban district, 5817), and North Cray.

**ORREY, CHARLES BOYLE, 4TH EARL OF (1676-1732), the second son of Roger, 2nd earl, was born at Chelsea in 1676. He was educated at Christ Church, Oxford, and soon distinguished himself by his learning and abilities. Like the first earl, he was an author, soldier and statesman. He translated Plutarch's life of Lyssander, and published an edition of the epistles of Phalaris, which engaged him in the famous controversy with Bentley. He was three times member for the town of Huntingdon; and on the death of his brother, Lionel, 3rd earl, in 1703, he succeeded to the title. He entered the army, and in 1709 was raised to the rank of major-general, and sworn one of her Majesty's privy council. At the battle of the Wood he acted with distinguished bravery. He was appointed queen's envoy to the states of Brabant and Flanders; and having discharged this trust with ability, he was created an English peer, as Baron Boyle of Marston, in Somersetshire. He received several additional honours in the reign of George I.; but having had the misfortune to fall under the suspicion of the government he was committed to the Tower, where he remained six months, and was then admitted to bail. On a subsequent inquiry it was found impossible to criminate him, and he was discharged. He died on the 28th of August 1731. Among the works of Roger, earl of Orrery, will be found a comedy, entitled *As you find it*, written by Charles Boyle. His son John (see CORK, EARLS OF), the 5th earl of Orrery, succeeded to the earldom of Cork on the failure of the elder branch of the Boyle family, as earl of Cork and Orrery.

**ORREY, ROGER BOYLE, 1ST EARL OF (1621-1679), British soldier, statesman and dramatist, 3rd surviving son of Richard Boyle, 1st earl of Cork, was born on the 25th of April 1621, created baron of Broghill on the 28th of February 1677, and educated at Trinity College, Dublin, and, according to Wood,...**

1 For Orphism in relation to the Eleusinian and other mysteries see MYSTERY.
also at Oxford. He travelled in France and Italy, and coming home took part in the expedition against the Scots. He returned to Ireland on the outbreak of the rebellion in 1641 and fought with his brothers at the battle of Liscarrol in September 1642.

On the resignation of the marquis of Ormonde, Lord Broghill consented to serve under the parliamentary commissioners till the execution of the king, when he retired altogether from public affairs and took up his residence at Marston in Somersetshire. Subsequently he originated a scheme to bring about the Restoration, but when on his way abroad to concert measures with Charles he was unexpectedly visited by Cromwell in London, who, after informing him that his plans were well known to the council, and warning him of the consequence of persisting in them, offered him a command in Ireland against the rebels, which, as it entailed no obligations except faithful service, was accepted. His assistance in Ireland proved invaluable. Appointed master of the ordnance, he soon assembled a body of infantry and horse, and drove the rebels into Kilkenny, where they surrendered.

On the 10th of May 1650 he completely defeated at Macroom a force of Irish advancing to the relief of Cromwell, and joining Cromwell assisted in taking the latter place. On Cromwell's departure for Scotland he co-operated with Ireton, whom he joined at the siege of Limerick, and defeated the force marching to its relief under Lord Muskerry, thus effecting the capture of the city. In July 1650, when Cromwell had become the fast friend and follower of Cromwell, whose stern measures in Ireland and support of the English and Protestants were welcomed after the policy of concession to the Irish initiated by Charles I. He was returned to Cromwell's parliaments of 1651 and 1656 as member for the county of Cork, and also in the latter assembly for Edinburgh, for which he elected to sit. He served this year as lord president of the council in Scotland, where he won much popularity; and when he returned to England he was included in the inner cabinet of Cromwell's council, and was nominated in 1657 a member of the new house of Lords. He was one of those most in favour of Cromwell's assumption of the royal title, and proposed a union between the Protector's daughter Frances and Charles II. On Cromwell's death he gave his support to Richard; but as he saw no possibility of maintaining the government he left for Ireland, where by resuming his command in Munster he secured the island for Charles and anticipated Monk's overtures by inviting him to land at Cork. He sat for Arundel in the Convention and in the parliament of 1661, and at the Restoration was taken into great favour. On the 5th of September 1660 he was created earl of Orrery. The same year he was appointed a lord justice of Ireland and drew up the Act of Settlement. He continued to exercise his office as lord-president of Munster till 1668, when he resigned it on account of disputes with the duke of Ormonde, the lord-lieutenant. On the 25th of November he was impeached by the House of Commons for “raising of money by his own authority upon his majesty's subjects,” but the prorogation of parliament by the king interrupted the proceedings, which were not afterwards renewed. He died on the 26th of October 1679. He married Lady Margaret Howard, 3rd daughter of Theopilius, 2nd earl of Suffolk, whose charms were celebrated by Suckling in his poem “The Bride.” By her he had besides five daughters, two sons, of whom the eldest, Roger (1646-1681 or 1682), succeeded as 2nd earl of Orrery.

In addition to Lord Orrery's achievements as a statesman and administrator, he gained some notoriety as a writer and a dramatist. He was the author of An Answer to a Scandalous Letter...—A Full Discovery of the Treachery of the Irish Rebels (1662), printed with the letter itself in his State Letters (1742), another answer to the same letter, An Answer to an Answer (1662);—Partheniata, a novel (1664);—English Adventures by a Person of Honour (1676), whence Otway drew his tragedy of the Orphan;—Treatise of the Art of War (1677), a work of considerable historical value and poems. Of little interest, including verses On His Majesty's Happy Restoration (unprinted), On the Death of Abraham Cowley (1677), The Dream (unprinted), Poems on most of the Festivals of the Church (1681); plays in verse, of some literary but no dramatic merit, of which Henry V. (1664), Mastroph (1665). Tryphon (acted 1668), The Black Prince (1669), Herod the Great (published 1664), and Altemira (1702) were tragedies, and Guzman (1669) and Mr Anthony

comedies. A collected edition was published in 1737, to which was added the comedy As you find it. The General is also attributed to him.

AUTHORITIES.—State Letters of Roger Boyle, 1st Earl of Orrery, ed. with his life by Th. Morrice (1742); Add. MSS. (Brit. Mus.), 25,287 (letter-book when governor of Munster), and 32,095 seq. (letters); article in the Dict. of Nat. Biog. and authorities on Laertes, 1595; St. Vincen. (1600); 1st earl of Orrery, 1672; 2nd earl of Orrery (1693); (Preface); Contemporary Hist. of Affairs in Ireland, ed. by John T. Gilbert (1879-1880); Col. of State Pap., Irish and Domestic.

ORRIS-ROOT—(apparently a corruption of "iris root"), the rhizomes or underground stems of three species of Iris, I. germanica, I. foetuexa and I. pallida, closely allied plants growing in sub-arctic and temperate latitudes, but principally identified with North Italy. The three plants are indiscriminately cultivated in the neighbourhood of Venice as an agricultural product under the name of "ghiaghiuolo." The rhizomes are in August dug up and freed of the rootlets and brown outer bark; they are then dried and packed in casks for sale. In drying they acquire a delicate but distinct odour of violets. As it comes into the market, orris-root is in the form of contorted sticks and irregular knobby pieces up to 4 in. in length, of a compact chalky appearance. It is principally powdered for use in dentifrices and other scented dry preparations.

ORSEOLE, the name of a Venetian family, three members of which sat in the Venetian Senate.

PIETRO ORSEOLE I. (c. 928-997) acted as ambassador to the emperor Otto I. before he was elected doge in August 976. Just previous to this event part of Venice had been burned down and Pietro began the rebuilding of St Mark's church and the ducal palace. He is chiefly celebrated, however, for his piety and his generosity, and after holding office for two years he left Venice secretly and retired to a monastery in Aquitaine, where he passed his remaining days. He was canonized in 1731.

PIETRO ORSEOLE II. (d. 1009), a son of the previous doge, was himself elected to this office in 997. He was a great builder, but his chief work was to crush the pirates of the Adriatic Sea and to bring a long stretch of the Dalmatian coast under the rule of Venice, thus relieving the commerce of the republic from a great and pressing danger. The fleet which achieved this result was led by the doge in person; it sailed on Ascension Day, the 26th of May 1000, and its progress was attended with uninterrupted success. In honour of this victory the Venetians instituted the ceremony which afterwards grew into the spesatio del mar, or marriage of the sea, and which was celebrated each year on Ascension Day, while the doge added to his title that of duke of Dalmatia. In many other ways Pietro's services to the state were considerable, and he may be said to be one of the chief founders of the commercial greatness of Venice. The doge was on very friendly terms with the emperor Otto III. and also with the emperors at Constantinople, and in 1003 he sailed against the Saracens and compelled them to raise the siege of Bari. In 1005 his son Giovanni was associated with him in the dogeship, and on Giovanni's death in 1009 another son, Ottone, succeeded to this position.

OTTONE ORSEOLE (d. 1032), whose godfather was the emperor Otto III., became sole doge on his father's death in 1009. He married a sister of St Stephen, king of Hungary, and under his rule Venice was powerful and prosperous. One of his brothers, Orso, was patriarch of Grado, another, Vitalis, was bishop of Torcello, but the growing wealth and influence of the Orseole family soon filled the Venetians with alarm. About 1024 Ottone and Orso were driven from Venice, but when Orso's rival, Poppo, patriarch of Aquileia, seized Grado, the exiled (d. 1032) and excommunicated (d. 1032) doges were recalled. Orso died in 1023 and Grado was recovered. In 1023 Ottone was banished; he found a refuge in Constantinople, where he remained until his death, although in 1030 an embassy invited him to return to Venice, where his brother Orso acted as agent for fourteen months. Orso remained patriarch of Grado until his death in 1045, and another member of the Orseole family, Domenico, was doge for a single day in 1031.

After the fall of the Orseoli the Venetians decreed that no doge should name his successor, or associate any one with him in the
ORSHA—ORTELIUS

dogeship. Ottone’s son, Pietro, was king of Hungary for some time after the death of his uncle, St Stephen, in 1038.

When Celestin is in Antwerp his contemporanei hard the fiscated, Benedict VIII. vanni himself people.”

In 1875 he published an account of his prison experiences in English under the title of "Austrian Dungeons in Italy," which led to a rupture between him and Mazzini. He then entered into negotiations with Ausonio Franchi, editor of the Rassegna di Turin, which he proposed to make the organ of the pure republicans. But having become convinced that Napoleon III. was the chief obstacle to Italian independence and the principal cause of the anti-liberal reaction throughout Europe, he went to Paris in 1857 to convince against him. On the evening of the 14th of January 1858, while the emperor and empress were on their way to the theatre, Orsini and his accomplices threw three bombs at the imperial carriage. The intended victims were unharmed, but several other persons were killed or wounded. Orsini himself was wounded, and at once arrested; on the 11th of February he wrote his famous letter to Napoleon, in which he exhorted him to take up the cause of Italian freedom. He addressed another letter to the youth of Italy, stigmatizing political assassination. He was condemned to death and executed on the 13th of March 1858, meeting his fate with great calmness and bravery. Of his accomplices Pieri also was executed. Rudio was condemned to death but obtained a commutation of sentence, and Gomez was condemned to hard labor for life. The importance of Orsini’s attempt lies in the fact that it terrified Napoleon, who came to believe that unless he took up the Italian cause other attempts would follow and that sooner or later he would be assassinated. This fear contributed not a little to the emperor’s subsequent Italian policy.

ORSA, LAKE OF, in N. Italy, W. of Lago Maggiore. It has been so named since the 16th century, but was previously called the Lago di San Giulio, the patron of the region—Cassio is a merely poetical name. Its southern end is about 22 m. by rail from Novara on the Turin-Montebello Railway. Its northern end is about 4 m. by rail S. of the Gravellona-Torbole railway station, half-way between Ornavasso and Omegna. It has an area of about 65 sq. m., it is about 8 m. in length, its greatest depth is 482 ft., and the surface is 954 ft. above sea-level, while its width varies from 33 to 14 m. Its scenery is characteristically Italian, while the large island of San Giulio (just W. of the village of Orta) has some very picturesque buildings, and takes its name from the local saint, who lived in the 4th century. The chief place is Orta, built on a peninsula projecting from the east shore of the lake, while Omegna is at its northern extremity. It is supposed that the lake is the remnant of a much larger sheet of water by which originally the waters of the Toce or Tosa flowed south towards Novara. As the glaciers melted, the waters flowing from them sank, and were gradually diverted into Lago Maggiore. This explains why no considerable stream feeds the Lake of Orta, while at its north end the Nigoglia torrent flows out of it, but in about § m. it falls into the Stora, which in turn soon joins the Toce or Tosa, a short distance before this river flows into Lago Maggiore.

(Ortelius, Wortels), ABRAHAM, next to Mercator the greatest geographer of his age, was born at Antwerp on the 14th of April 1527, and died in the same city on the 4th of July 1598. He was of German origin, his family coming from Augsburg. He travelled extensively in western Europe, especially in the Netherlands; south and west Germany (e.g. 1560, 1575, 1578); France (1550-1560, &c.); England and Ireland
ORTHEZ—ORTHOCLASE

(1572), and Italy (1578, and perhaps twice or thrice between 1550 and 1558). Beginning as a map-engraver (in 1547 he enters the Antwerp gild of St Luke as offtuer van Karten), his early career is that of a business man, and most of his journeys before 1560 are for commercial purposes (such as his yearly visits to the Frankfort fair). In 1560, however, when travelling with Gerhard Kremer (Mercator) to Trier, Lorraine and Poitiers, he seems to have been attracted, largely by Mercator’s influence, towards the career of a scientific geographer; in particular he now devoted himself, at his friend’s suggestion, to the compilation of that atlas or Theatre of the World by which he became famous. In 1564 he completed a mappemonde, which afterwards appeared in the Theatrum. He also published a map of Egypt in 1565, a plan of Brittenburg Castle on the coast of Holland, and perhaps a map of Asia, before the appearance of his great work. In 1570 (May 20) was issued, by Gilles Coppens de Dieist at Antwerp, Ortelius’ Theatrum Orbis Terrarum, the “first modern atlas” (of 53 maps). Three Latin editions of this (besides a Flemish, a French and a German) appeared before the end of 1572; twenty-five editions came out before Ortelius’ death in 1598; and several others were published subsequently, for the catalogue still continued till about 1612. Most of the maps were admirably reprodutions (a list of 57 authors is given by Ortelius in the Preface to the third edition of his second part). By 1576 Ortelius had formed a fine collection of coins, medals and antiques, and this produced (also in 1573, published by Philippe Galle of Antwerp) his Deorum deorumque capita . . . ex Museo Ortellii (reprinted in Gronovius, Thes. Gr. Ant. vol. vii.). In 1575 he was appointed geographer to the king of Spain, Philip II., on the recommendation of Arius Montanus, who vouched for his orthodoxy (his family, as early as 1535, had fallen under suspicion of Protestantism). In 1578 he laid the basis of a critical treatment of ancient geography by his Synonymia geographicca (issued by the Plantin press at Antwerp and republished as Thesaurus geographicus in 1596). In 1584 he brought out his Nomenclator Platoniacus, his Parergon (a series of maps illustrating ancient history, sacred and secular), and his Itinerarium per provincias Galliae Belgicae partes (published at the Plantin press, and reprinted in Hegenitus, Itin. Frisio-Holl.), a record of a journey in Belgium and the Rhineland made in 1575. Among his last works were an edition of Caesar (C. I. Caesaris omnia quae extant, Leiden, Raphelengius, 1593), and the Aurei saeculi imago, sive Germanorum veterum via (Philippe Galle, Antwerp, 1590). He also aided Welser in his edition of the Peutinger Table in 1598. In 1596 he received a presentation from Antwerp city, similar to that afterwards bestowed on Rubens; his death and burial (in St Michael’s Abbey church) in 1598 were marked by public mourning.

See Emmanuel van Meteren, Historia Belgica (Amsterdam, 1670); General Wauwermans, Histoire de l’ecole cartographique belge et anversoise (Antwerp, 1895), and article “Ortelius” in Biographie nationale (Belgian), vol. xvi. (Brussels, 1901); J. H. Hessels, Abrahami Ortelii epistulae (Cambridge, England, 1900); Leonhardy, “Genealogie d’Ortelius,” in the Bulletin de la Soc. roy. de Geog. d’Anvers (1868 and 1881).

ORTHEZ, a town of south-western France, capital of an arrondissement in the department of Basses-Pyrénées, 25 m. N.W. of Pau on the Southern railway to Bayonne. Pop. (1906) town 4150; commune 6254. It is finely situated on the right bank of the Gave de Pau which is crossed at this point by a bridge of the 14th century, having four arches and surmounted at its centre by a tower. Several old houses, and a church of the 12th, 14th and 15th centuries are of some interest, but the most remarkable building is the Tour de Moncade, a pentagonal tower of the 13th century, once the keep of a castle of the viscounts of Béarn, and now used as a meteorological observatory. A building of the 16th century is all that remains of the old Calvinist university (see below). The hôtel de ville is a modern building containing the library.

Orthez has a tribunal of first instance and is the seat of a sub-prefecture. The spinning and weaving of cotton, especially of the fabric called toile de Béarn, flour-milling, the manufacture of paper and of leather, and the preparation of hams known as jambons de Bayonne and of other delicacies are among its industries. There are quarries of stone and marble in the neighbourhood, and the town has a thriving trade in leather, hams and lime.

At the end of the 12th century Orthez passed from the possession of the viscounts of Dax to that of the viscounts of Béarn, whose chief place of residence it became in the 13th century. Froissart records the splendour of the court of Orthez under Gaston Phoebus in the latter half of the 14th century. Jeanne d’Albret founded a Calvinist university in the town and Theodore Beza taught there for some time. An envoy sent in 1560 by Charles IX. to revive the Catholic faith had to stand a siege in Orthez which was eventually taken by assault by the Protestant captain, Gabriel, count of Montgomery. In 1684 Nicholas Foucault, intendant under Louis XIV., was more successful, as the inhabitants, ostensibly at least, renounced Protestantism, which is nevertheless still strong in the town. In 1814 the duke of Wellington defeated Marshal Soulé on the hills to the north of Orthez.

ORTHOCLASE, an important rock-forming mineral belonging to the felsspar group (see FELSPAR). It is a potash-felspar, KAlSi3O8, and crystallizes in the monoclinic system. Large and distinctly developed crystals are frequently found in the dry quarries of granites and pegmatites. Crystals differ somewhat in habit; for example, they may be prismatic with an orthorhombic aspect (fig. 1), as in the variety adularia (from the Adular Mountains in the St Gothard region); or tabular (fig. 2), being flattened parallel to the clino-pinacoid or plane of symmetry \( b \) (010), as in the variety sandine (\( ahrs, ahrsos \), a board); or again the crystals may be elongated in the direction of the edge between \( a \) and the basal plane \( c \) (001), which is a characteristic habit of orthoclase from the granite quarries at Baveno in Italy. Twinning is frequent, and there are three well-defined twin-laws: (1) Carlsbad twins (fig. 4). Here the two individuals of the twin interpenetrate or are united parallel to the clino-pinacoid; one individual may be brought into the position of the other by a rotation of \( 180^\circ \) about the vertical crystallographic axis or prism-edge. Such twinned crystals are found at Carlsbad in Bohemia and many other places. (2) Baveno twins (fig. 3). These twins, in which \( n \) (021) is the twin-plane, are common at Baveno. (3) Manebach twins (fig. 6). The twin-plane here is \( c \) (001); examples of this rarer twin were first found at Manebach in Thuringia.

An important character of orthoclase is the cleavage. There is a direction of perfect cleavage parallel to the basal plane \( c \), on which plane the lustre is consequently often pearly; and one less highly developed parallel to the plane of symmetry \( b \).
The angle between these two cleavages is 90°, hence the name orthoclase (from the Gr. ὀρθός, right, and κάθαρος, to break), given by A. Breithaupt in 1823, who was the first to distinguish orthoclase from the other felspars. There are also imperfect cleavages parallel to the faces of the prism (110). The hardness is 6, and the sp. gr. 2.56. Crystals are sometimes colourless and transparent with a glassy aspect, as in the varieties adularia, sandaline and the rhyacolite of Monte Somma, Vesuvius.

The optical characters are somewhat variable, the plane of the optic axes being perpendicular to the plane of symmetry in some crystals and parallel to it in others: further, when some crystals are heated, the optic axes gradually change from one position to the other. In all cases, however, the acute negative bisectrix of the optic axes lies in the plane of symmetry and is inclined to the edge ½ at 5-7° or, in varieties rich in soda, at 10-12°. The mean refractive index is 1.524, and the double refraction is weak (0.006).

Analyses of orthoclase usually prove the presence of small amounts of soda and lime in addition to potash. These constituents are, however, probably present as plagioclase (albite and oligoclase) intergrown with the orthoclase. The two minerals are interlamellated parallel to the ortho-pinacoid (100) or the pinacoid (001), and they may readily be distinguished in the fleshed aventurine-felspar, known as perthite, from Perth in Lanark county, Ontario. Frequently, however, as in microperthite and cryptoperthite, this is on a microscopic scale or so minute as to be no longer recognizable. These directions (100) and (001) are planes of parting in orthoclase, and along them alteration frequently takes place, giving rise to schiller effects. Moon-stone (gr.) shows a pearly opalescent reflection on these planes; and brilliant coloured reflections in the same directions are exhibited by the labradorite orthoclase from the augite-syenite of Fredriksværn and Lavriuk in southern Norway, which is much used as an ornamental stone. The same effect is shown to a lesser degree by murchisonite, named in honour of Sir R. J. Murchison, from the Triassic conglomerate of Heavitree near Exeter.

Orthoclase forms an essential constituent of many acidic igneous rocks (granite, syenite, perphyry, trachyte, phonolite, &c.) and of crystalline schists and gneisses. In porphyries and in some granites (e.g. those of Shap in Westmorland, Cornwall, &c.) it occurs as embedded crystals with well-defined outlines, but usually it presents no crystalline form. In the trachyte of the Drachenfels and the Laacher See in Rhenish Prussia there are large porphyritic crystals of greyish sandine. The best crystals are those found in the crystalline cavities and veins of granites, pegmatites and gneisses, for example, at Bayonvo and Elba in Italy, Alsaskia near Murzinka in the Urals, Hirschegg in Silsiz, Tanakomi-yama in the province of Omi, Japan, and the Mountaun Mountains in Ireland. As a mineral of secondary origin orthoclase is sometimes found in cavities in basaltic rocks, and in its occurrence in metaliferous mineral veins it has been observed. It has been formed artificially in the laboratory and is sometimes met with in furnace products.

The commonest product of orthoclase is kaolin (gr.); the frequent cloudiness or opacity of crystals is often due to partial alteration to kaolin. Mica and epidote also result by the alteration of orthoclase.

†ORTHODOX EASTERN CHURCH (frequently spoken of as " the Greek Church," and described officially as " The Holy Orthodox Church.

The Orthodox Church has always laid special stress upon the unchanging tradition of the faith, and has claimed orthodoxy as its special characteristic. The "Feast of Orthodoxy" (Greek ἡ ὁρθοδοξία) is celebrated annually on the first Sunday of the Greek Lent, was founded in honour of the restoration of the Catholic Apostolic Church (from the Gr. ὅρθος, right, and ὁδός, way), the historical representative of the churches of the ancient East. It consists of (a) those churches which have accepted all the decrees of the first seven general councils, and have the common full coin thus multiplied, to enter into the Catholic churches as have derived their origin from these by missionary activity, or by abscession without loss of communion. The Eastern Church is both the source and background of the Western. Christianity arose in the East, and Greek was the language of the Scriptures and early services of the church, but when Latin Christianity established itself in Europe and Africa, and when the later Roman empire fell in two, and the Eastern half became separate in government, interests and ideas from the West, the term Greek or Eastern Church acquired gradually a fixed meaning. It denoted the church which included the patriarchates of Antioch, Alexandria and Constantinople, and their dependencies. The ecclesiastical division of the early church, at least within the empire, was based upon the civil. Constantinople introduced a new partition of the empire into dioceses, and the church adopted a similar division. The bishop of the chief city in each diocese naturally rose to a pre-eminence, and was commonly called exarch—a title borrowed from the civil jurisdiction. In process of time the common title patriarch was restricted to the most eminent of these exarchs, and councils decided who were worthy of the dignity. The council of Nicaea recognized three patriarchs—the bishops of Rome, Alexandria and Antioch. To these were afterwards added the bishops of Constantinople and Jerusalem. When the empire was divided, there was one patriarch in the West, the bishop of Rome, while in the East there were at first two, then four and latterly five. This geographical fact has had a great deal to do in determining the character of the Eastern Church. It is not a despotic monarchy governed from one centre and by a monarch in whom plenitude of power resides. It is an oligarchy of patriarchs. It is based, of course, on the great body of bishops; but episcopal rule, through the various grades of metropolitan, primate, exarch, attains to sovereignty only in the five patriarchal thrones. Each patriarch is, within his diocese, what the Gallician theory makes the pope in the universal church. He is supreme, and not amenable to any of his brother patriarchs, but is within the jurisdiction of an ocumenical synod. This makes the Eastern Church quite distinct in government and traditions of polity from the Western. It has ever been the policy of Rome to efface national distinctions, but under the theocratic organization of the Eastern Empire they have had life and flourished. Revolts against Rome have always implied a repudiation of the ruling principles of the papal system; but the schismatic churches of the East have always reproduced the ecclesiastical polity of the church, from which they seceded.

The Greek Church, like the Roman, soon spread far beyond the imperial dioceses which at first fixed its boundaries, but it was far less successful than the Roman in preserving its conquests for Christianity. This was due in the main to the differing quality of the forces by which the area covered by the two churches was respectively invaded. The northern barbarians by whom the Western empire was overrun had long stood in awe of the power and the civilization of Rome, which they recognized as superior; but the Eastern Empires were always most attached to the heritage of the law and the religion of the conquered empire and, whether they were pagans or Arian heretics, became in the end Catholic Christians. In the East it was otherwise. The empire maintained itself long, and died hard; but its decline and fall meant not only the overthrow of the emperors of the East, but largely that of the civilization and Christianity which they represented. The Arabs, and after them the Turks, attacked the empire as the armed missionaries of what they regarded as a superior religion; Christianity survived in the vast territories they had acquired in the East, and the monasteries and churches of the East were the last to suffer from the Moslem invasions. The Holy Images to the churches after the downfall of Iconoclasm (Feb. 19 or 832); but it has gradually assumed a wider significance as the celebration of victory over all heresies, and is now one of the most characteristic festivals of the Eastern Church.

**Fig. 6.**
conquered only as a despised and tolerated superstition, its ecclesiastical organization only as a convenient mechanism for governing a subject and tributary population. It is true that the Eastern Church made up in some sort for her losses by missionary conquests elsewhere. Greek Christianity became the religion of the Slavs as Latin Christianity became that of the Germans; but the Orthodox Church never conquered her conquerors, and the historian is too apt to enlarge on her past glories and forget her present strength.

Early History.—The early history of the Eastern Church is outlined in the article CHURCH HISTORY. Here it is proposed only to give in somewhat more detail the causes of division which led (1) to the formation of the schismatic churches of the East, and (2) to the open rupture with Latin Christianity.

The great dogmatic work of the Eastern Church was the definition of that portion of the creed of Christendom which concerns theology proper—the doctrines of the essential nature of the Godhead, and the doctrine of the Godhead in relation with manhood in the incarnary, and its reception by Christ. The history of the Theotokos, or the Virgin Mary, from the positing of her as the Theotokos, to her appearance in the Virgin Church, and the respect shown her in the schismatic churches of the East. This controversy will be best described by reference to the oecumenical councils of the ancient undivided church.

All the churches of the East, schismatic as well as orthodox, accept unreservedly the decrees of the first two councils. The schismatic churches protest against the additions made to the creeds of Nicea and Constantinople by succeeding councils. The Nicco-Constantinopolitan creed declared that Christ was consubstantial (ὑποστάσις) with the Father, and that He had become man (ἐγεννημένος). Disputes arose when theologians tried to explain the latter phrase. These differences took place in separate and extreme types, the one of which forcibly separated the two natures so entirely that the term Monophysite (υμνοδρομικος), while the other, based upon a mixture of the two, or an absorption of the human in the divine. The Nestorians accept the decisions of the first two councils, and reject the decrees of the rest as unwarranted alterations of the creed of Nicea. The Monophysites accept the first three councils, but reject the decree of Chalcedon and all that came after it.

The council of Ephesus (A.D. 431), the third oecumenical, had insisted upon applying the term Theotokos to the Virgin Mary, and this was repeated in the symbol of Chalcedon, which says that Christ was born of the Virgin Mary, the Theotokos, "according to the manhood." The same symbol also declares that Christ is "to be acknowledged in two natures . . . indivisibly and inseparably." Hence the Nestorians, who insisted upon the duality of the natures to such a degree as to lose sight of the unity of the person, and who rejected the term Theotokos, repudiated the decrees both of Ephesus and of Chalcedon, and upon the promulgation of the decrees of Chalcedon formally separated from the church. Nestorianism sprang from an exaggeration of the theology of the school of Antioch, and the schism weakened that patriarchate and its dependencies. It took root in Chaldea, and became very powerful. No small part of the literature and science of the Mahommedan Arabs came from Nestorian teachers, and Nestorian Christianity spread far and wide through Asia (see NESTORIUS and NESTORIANISM).

The council of Chalcedon (431), the fourth oecumenical, declared that Christ is to be acknowledged "in two natures—unconfusedly, unchangeably," and therefore decided against the opinions of all who either believed that the divinity is the sole nature of Christ, or who, rejecting this, taught only one composite nature of Christ (one nature and one person, instead of two natures and one person). The advocates of the one nature theory were called Monophysites (μονοφυσιτις), and they gave rise to numerous sects, and to at least three separate national churches—the Jacobites of Syria, the Copts of Egypt and the Abyssinian Church, which are treated under separate headings.

The decisions of Chalcedon, which were the occasion of the formation of all these sects outside, did not put an end to Christological controversy inside the Orthodox Greek Church. The most prominent question which emerged in attempting to define further the person of Christ was whether the will belonged to the nature of the person, or, as it came to be stated, whether Christ had two wills or only one. The church in the sixth oecumenical council at Constantinople (680) declared that Christ had two wills. The Monothelites (μονοθελιτες) refused to submit, and the result was the formation of another schismatic church—the Maronite Church of the Lebanon range. The Maronites, however, were reconciled to Rome in the 12th century, and are reckoned as Roman Catholics of the Oriental Rite.

Conflict with Rome.

Later History.—The relation of the Byzantine Church to the Roman may be described as one of growing estrangement from the 5th to the 11th century, and a series of abortive attempts at reconciliation since the latter date. The estrangement and final rupture may be traced to the increasing claims of the Roman bishops and to Western influence in the choice of the Head of the Church. The Eastern patriarchs were often to acknowledge and make use of, however they might protest against it and the conclusions deduced from it. But this pre-eminence, or rather the Roman idea of what was involved in it, was never acknowledged in the East; to press it upon the Eastern patriarchs was to prepare the way for separation, to insist upon it in times of irritation was to cause a schism. The theological genius of the East was different from that of the West. The Eastern theology had its roots in Greek philosophy, while a great deal of Western theology was based on Roman law. The Greek fathers succeeded the Sophists, the Latin theologians succeeded the Roman advocates (Stanley's Eastern Church, ch. 1.). This gave rise to misunderstandings, and at last led to two widely separate ways of regarding and defining the important doctrine of the Church, as from the Father the Eastern patriarchs were far from the father or the father and the Son. Political jealousies and interests intensified the disputes, and at last, after many premonitory symptoms, the final break came in 1054, when Pope Leo IX. smote Michael Cerularius and the whole of the Eastern Church with an excommunication. There had been mutual excommunications before, but they had not resulted in permanent schisms. Now, however, the separation was final, and the ostensible cause of its finality was the introduction by the Latin of two words Filioque into the creed.1 It is this addition which was and which still remains the permanent cause of separation. Floukes has pointed out in his second volume (ch. 1-3) that there was a resumption of intercourse more than once between Rome and Constantinople after 1054, and that the overbearing character of the Norman crusaders, and finally the horrors of the sack of Constantinople in the fourth crusade.

1 After the words "and in the Holy Ghost" of the Apostles' Creed the Constantinopolitan creed added "who proceedeth from the Father." The Roman Church, without the sanction of an oecumenical council and without consulting the Easterns, added "and the Son." The addition was first made at Toledo (589) in opposition to Monothelitism. The Easterns repudiated the Roman enforcement of clerical celibacy, the limitation of the right of confirmation to the bishop and the use of unleavened bread in the Eucharist.
The "Filioque" controversy, which was the real cause of the permanent estrangement. It is undeniable, however, that the Filioque question has always come first in any subsequent attempts at inter-

The idea is that the Spirit must be spoken of in a very small one, but it brings out clearly the opposing characteristics of Eastern and Western theology, and so has acquired an importance far beyond its own worth. The question is really one about the relations subsisting between the persons of the Trinity and their hypostatical properties. The Western Church affirms that the Holy Spirit "proceeds from" the Father and from the Son. It believes that the Spirit of the Father must be the Spirit of the Son also. Such a theory seems alone able to satisfy the practical instincts of the West, which did not concern itself with the metaphysical aspect of the Trinity, but with Godhead in its relation to re-

The Eastern Church affirms that the Holy Spirit proceeds from the Father only, and takes its stand on John xv. 26. The Eastern theologian thinks that the Western double procession degrades the Deity and destroys the perfection of the Trinity. The double procession, in his eyes, means two active principles (aorias) in the Deity, and it means also that there is a confusion between the hypostatical properties; a property possessed by the Father and distinctive of the First Person is attributed also to the Second. This is the theological, and there is conjointly with it an historical and moral dispute. The Easterns allege that the addition of the words Filioque was made, not only without authority, and therefore unwarrantably, but also for the purpose of forming a rupture between East and West in the interests of the barbarian empire of the East.

Attempts at reconciliation were made from time to time afterwards, but were always wrecked on the two points of papal supremacy, when it meant the right to impose Western usages upon the East, and of the addition to the creed.

First there was the negotiation between Pope Gregory IX. (1227-1241) and Germanus, patriarch of Constantinople. The Roman conditions were practically recogni-

tion of papal jurisdiction, the use of unleavened bread and permission to omit Filioque if all books written against the Western doctrine were burnt. The patriarch refused the terms. Then, later in the 13th century, came negotiations under Innocent IV. and Clement IV., in which the popes proposed the same conditions as Gregory IX., with additions. These proposals were rejected by the Easterns, who regarded them as attempts to enforce new creeds and to keep their church under the domination of the West. The negotiations at Lyons (1274) were, strictly speaking, between the pope and the Byzantine emperor, and were more political than ecclesiastical. Michael Palaeologus, who was emperor in Byzantium at this period, was friendly to the pope, who wished to establish the pope's supremacy and to union with the two churches on the pope's own terms. This enforced union lasted only during the lifetime of the emperor. The only other attempt at union which requires to be mentioned is that made at the council of Florence. It was really suggested by the political weakness of the Byzantine empire and the dread of the approach of the Turks. John Palaeologus the emperor, Joseph the patriarch of Constantinople, and several Eastern bishops came to Italy and appeared at the council of Florence—

the papal council, the rival of the council of Basel. As on former occasions the representatives of the East were at first deceived by false representations; they were betrayed into recognition of papal supremacy, and tricked into signing what could afterwards be represented as a submission to Western doctrine. The natural consequences followed—a repudiation of what had been done; and the Eastern bishops on their way home took care to make emphatic their ritualistic differences from Rome. Soon after came the fall of Constantinople, and with this event an end to the political reasons for the submission of the Orthodox clergy. Rome's schemes for a union which meant an unconditional submission on the part of the Orthodox Church did not cease, however, but they were no longer attempted on a grand scale. Jesuit missionaries after the Reformation stirred up schisms in some parts of the Eastern Church, and in Austria, Poland and elsewhere large numbers of Orthodox Christians submitted, either willingly or under compulsion to the see of Rome (see ROMAN CATHOLIC CHURCH, section Uniat Oriental Churches).

Doctrines and Creeds.—The Eastern Church has no creeds in the modern Western use of the word, no normative summaries of what must be believed. It has preserved the older idea that a creed is an adoring confession of the church engaged in worship; and, when occasion called for more, the belief of the church was expressed more by way of public testimony than in symbolic books. Still the doctrines of the church can be gathered from these confessions of faith. The Eastern creeds may thus be roughly placed in two classes—the occumcnical creeds of the early undivided church, and later testimonies defining the position of the Orthodox Church of the East, with regard to the belief of the Roman Catholic and of Protestant Churches. These testimonies were called mainly by the protest of Greek theologians against Jesuitism on the one hand, and against the reforming tendencies of the patriarch Cyril Lucaris on the other. The Orthodox Greek Church adopts the doctrinal decisions of the seven councils, together with the canons of the Council of Chalcedon and second Trullan council (692); and they further hold that all these definitions and canons are simply explanations and en-

forcement of the Nica-co-Constantinopolitan creed and the decrees of the first council of Nicaea. The first four councils settled the orthodox faith on the doctrines of the Trinity and of the Incarnation; the fifth supplemented the decisions of the first four. The sixth declared against Monothelitism; the seventh rejected the worship of images; the council held in the Trullus (a saloon in the palace at Constantinople) supplemented by canons of disciplinary theocratic decrees of the fifth and sixth councils.

The Reformation of the 16th century was not without effect on the Eastern Church. Some of the Reformers, notably Melanchthon, expected to effect a reunion of Christendom by means of the Easterns, cherishing the same hopes as the modern Old Catholic divines and their English sympathizers. Melanchthon himself sent a Greek translation of the Augsburg Confession to Joasaph, patriarch of Constantinople, and some years afterwards Jacob Andreae and Martin Crusius began a correspondence with Jerusalem, patriarch of Constantinople, in which they asked for an official expression of his opinions about Lutheran doctrine. The result was that Jeremiah Tryphoni, archbishop ofConstantinople, condemned the distinctive principles of Lutheranism.

The reformatory movement of Cyrillos Lucaris (1505), patriarch of Constantinople (1621), brought the Greek Church face to face with Reformation theology. Cyril conceived the plan of reforming the Eastern Church by bringing its doctrines into harmony with those of Calvinism, and by sending able young Greek theologians to Switzerland, Holland, and England to study Protestant theology. His scheme of reform was opposed chiefly by the intrigues of the Jesuits, who in the end brought about his death. The church anathematized his doctrines, and in its later testimonies repudiated his confession on the one hand and Jansen ideas on the other. The most important of these testi-

monies are (1) the Orthodox profession of faith and catechism of Peter Mogila, confirmed by the Eastern patriarchs and by the synod of Jerusalem (1634), and (2) the decree of the synod of Jerusalem or the confession of Dosithrios (1672). Besides these, the catechisms of the Russian Church should be consulted, especially the catechism of Philaret, which since 1839 has been used in all the churches and schools in Russia. Founding on these doctrinal sources the teaching of the Eastern Orthodox Church is 1:

1 This summary has been taken, with corrections, from G. B. Winer. Comparative Darstellung des Lehrbegriffs der verschiedenen Kirchenparteien (Leipzig, 1824, Eng. tr., Edin., 1873). Small capitals denote differences from Roman Catholic, italics differences from Protestant doctrine.
Christians is a Divine revelation communicated to mankind through Christ; its saving truths are to be learned from the Bible and tradition, the former having been written, and the latter maintained uncorrupted through the influence of the Holy Ghost. The beliefs of the Eastern Church belong to the Church, which is taught by the Holy Spirit, but every believer may read the Scriptures.

According to the Christian revelation, God is a Trinity, the Father, the Son, and the Holy Ghost. The Holy Trinity is equal in nature and dignity, the Father, the Son and the Holy Ghost; the Holy Ghost proceeds from the Father only. Besides the Triune God there is no other object of divine worship, but homage (consists chiefly in the veneration of the Holy Virgin, and reverence (bona) to the saints and to their pictures and relics.

Man is born with a corrupt bias which was not his at creation; the first man, when created, possessed immortality, perfect wisdom, and incorruptibility. Through the Fall of Adam and his posterity lost immortality, and his will received a bias towards evil. In this natural state, man, even before he actually sins, is a sinner before God by original or inherent sin, commits manifold actual transgressions; but he is not absolutely without power of will towards good, and is not always doing evil.

Christ, the Son of God, became man in two natures, which internally and inseparably united make One Person, and, according to the eternal purpose of God, has obtained for man reconciliation with God, and eternal life, inasmuch as He by His vicarious death has made satisfaction to God for the world's sins, and this satisfaction was perfectly commensurate with the sins of the world. Man must purify and regenerate himself spiritually, which he attains to, being led and kept by the Holy Ghost. This divine help is offered to all men without distinction, and may be rejected. In order to attain to salvation, man is justified, and when so justified he has no distinction higher than that of the children of God. He may fall from a state of grace through mortal sin.

Regeneration is offered by the word of God and in the sacraments, which under visible signs communicate God's invisible grace to Christians who administer them and are disposed to receive them acceptably. Baptism entirely destroys original sin. In the Eucharist the true body and blood of Christ are substantially present, and the elements are changed into the substance of Christ, whose body and blood corporeally partaken of by communicants.

All Christians should receive the bread and the wine. The Eucharist is also an expiatory sacrifice. The new birth when lost may be restored through repentance, by the admission of the individual sin to the priest, and (2) by the payment of penances imposed by the priest for the removal of the temporal punishment which may have been imposed by God and the Church. Penance accompanied by the judicial absolution of the priest makes a true sacrament.

The Church of Christ is the fellowship of all those who accept and profess all the articles of faith transmitted by the Apostles and approved by General Synods. Without their visible church there is no salvation. It is under the abiding influence of the Holy Ghost, and therefore cannot err in matters of faith. Specially appointed persons are necessary in the service of the Church, and therefrom arise the functions of Bishops, Priests, Deacons, and Monks. For the Eastern Church, the four Patriarchs, of equal dignity, have the highest rank among the Bishops, and the Bishops united in a General Council represent the whole Church. Lastly, the Church is guided by the guidance of the Holy Ghost, all matters of faith and ecclesiastical life. All ministers of Christ must be regularly called and appointed to their office, and are consecrated by the sacrament of orders. Bishops must be unmarried, and Priests and Deacons must not contract a second marriage. All priests in common belong, besides the preaching of the word, the administration of the six sacraments (Baptism, Confirmation, Penance, Eucharist, Matrimony, Unction of the Sick).

Ecclesiastical ceremonies are part of the divine service; most of them have apostolic origin; and those connected with the sacrament must not be omitted by priests under pain of mortal sin.

Liturgical Worship. The ancient liturgies of the Eastern Church were very numerous, and have been frequently classified. J. M. Neale makes three divisions—the liturgy of Jerusalem or of St James, that of Alexandria or of St Mark, and that of Edessa or of St Thaddeus; and Daniel substantially agrees with him. The same passion for uniformity which suppressed the Gallican and Mozarabic liturgies in the West led to the adoption of the exclusive use of the liturgy of St James in the East. It is used in two forms, one older, revised by Chrysostom, and a longer called the liturgy of St Basil. This liturgy and the service generally are either in Old Greek or in Old Slavonic. Frequent disputes have arisen in particular districts about the language to be employed. Both sacred languages differ from the language of the people, but it cannot be said that in the Eastern Church worship is conducted in an unknown tongue and the actual difference, says Neale, may be about that between Chaucer's English and our own. There are 16 chief service books, and no such compendium as the Roman breviary. Fasting is frequent and severe. Besides Wednesdays and Fridays, there are four fasting seasons, Lent, Pentecost to SS. Peter and Paul, August 1-15 preceding the Feast of the Sleep of the Theotokos, and the six weeks before Christmas. Indulgences are not recognized; an intermediate and purificatory state of the soul is held but not systematized into a doctrine of purgation. The Virgin receives homage, but the dogma of her Immaculate Conception is not admitted. While icons of the saints are found in the churches there is no "graven image" apart from the crucifix. There is plenty of singing but no instrumental music. Prayer is offered standing in the East. The words of the Eucharist are an elaborate symbolical representation of the Passion. The consecrated bread is broken into the wine, and both elements are given together in a spoon.

The ritual generally is as magnificient as in the West, but of a more archaic type. (For the liturgical dress see Vestments and subsidiary articles.)

Monastic Life. Monasticism, as it has always been, an important feature in the Eastern Church. An Orthodox monastery is perhaps the most perfect extant relic of the 4th century. The simple idea that possesses the monks is that of serving the world; they have no distinctions of orders, and though they follow the rule of St Basil object to being called Basilians. A few monasteries (Mt Sinai and some on Lebanon) follow the rule of St Anthony, K. Lake in Early Days of Monasticism on Mount Athos (1909) traces the development through three well-defined stages in the 6th and 7th centuries—(a) the hermit period, (b) the loose organization of hermits into lauras, (c) the stricter rule of the monastery, with definite buildings and fixed rules under an ἀρχιερέας or abbot. The monasteries now have taken over the name laura. They are under the jurisdiction of the metropolitan; a few of the most important deal direct with the patriarch and are called Stauropegic. The convent on Mt Sinai is absolutely independent. Apart from hermits there are (1) κομισθαδικοι, monks who possess nothing, live and eat together, and have definite tasks given them by their superiors; (2) ἱερωνομοι, monks who live apart from each other, each receiving from more or less fixed duties, such as tending sheep, vegetables, cheese, wine and a little money. They only work for the Divine Office and on great feasts, and are the real successors of the laura system. The most famous monasteries are those on Mount Athos; in 1902 there were twenty laurs with many dependent houses and 7532 monks there, mainly Russian and Greek. The monks are, for the most part, ignorant and unlettered, though in the dark days of Mahomedan persecution it was in the monasteries that Greek learning and the Greek nationality were largely preserved. Since priests must be married and bishops must not, only monks are eligible for appointment to bishoprics in the Eastern Church. See further, Monasticism.

The Branches of the Church. In addition to the ancient church of Rome, there are those from the Great Schism, of which the faith, many have ceased to have an independent existence, owing either to the conquests of Islam or to their absorption by other churches. For example, the church of Mount Sinai may be regarded as all that survives of the ancient church of northern Arabia; the autocephalous Slavonic churches of Ipek and Okhrida, which derived their ultimate origin from the missions of Cyril and Methodius, were absorbed in the patriarchate of Constantinople in 1766 and 1767 respectively; and the Church of Georgia has been part of the Russian Church since 1801-1822. At the present day, then, the Orthodox Eastern Church consists of twelve mutually independent churches (or thirteen if we reckon the Bulgarian Church), using their own language in divine service (or occasionally) and varying not a little in points of detail, but standing in full communion with one another, and united as equals in what has been described as one great ecclesiastical federation. However, in using such
language it must be remembered that we are not dealing with bodies which were originally separated from one another and have now entered into fellowship, but with bodies which have grown naturally from a single origin and have not become estranged.

A. The Four Ancient Patriarchates

1. The Patriarchate of Constantinople or New Rome.—The ancient patriarchates of Antioch, Alexandria, Jerusalem, and Babylon, with Constantinople, form the ecclesiastical metropolises of the orthodox monarchies of the Eastern Church.

2. The Patriarch of Alexandria, consisting of Egypt and its dependencies, was at one time the most powerful, as it was the most centralised, and of all the patriarchates; it also possesses the titles of archbishop of archbishops, archdeacon of archdeacons, and archpriest of archpriests, thirteenth apostle, and ecclesiastical judge. But the secession of the greater part of its church to Monophysitism, and the schism of the Copts, the Mahometan conquest of Egypt, have left him but the shadow of his former dignity.

3. The Patriarchate of Antioch has undergone most changes in extent of jurisdiction, arising from the transfer of sees to Jerusalem, from the progress of the schismatic churches of the East and from the dissolution of the authority of the patriarch. At the height of his power the patriarch of Antioch ruled over 120 suffragan bishops. In the time of the first crusade 153 still survived; now there are scarcely 20, 14 of which are metropolitan sees. The patriarch, though he is "father of fathers, master of masters," retains little of his old importance.

4. The Patriarchate of Jerusalem.—In the earlier period of the Church, ecclesiastical civil divisions so closely that Jerusalem, in spite of the sacred associations connected with it, was merely an ordinary bishopric dependent on the metropolitan of Antioch. It was only when the Bishop of Jerusalem was given the title of Patriarch and the right to advance the pretensions of his see, but it was not until the council of Chalcedon, in 451, that Jerusalem was made a patriarchate, with jurisdiction over Palestine. From this time on to the inroad of the Saracens, the patriarch is mentioned in the gospels as having jurisdiction over the whole of the country.

It ruled over three metropolitans with eighty suffragans. The modern patriarch has under his jurisdiction 5 archbishops and 5 bishops.

B. The Nine National Churches

G. Finlay, in his History of Greece, has shown that there has been always a very close relation between the Church and national life. Christianity from the first connected itself with the social organization of the people, and therefore in every province assumed the form of the unity of the national church. It was thus that the Church of Rome acquired command at once individual attachment and universal power. This feeling died down to some extent when Constantinople made use of the Church to consolidate his empire. It revived under the persecution of the Arian emperors. The struggle against Arianism was not merely a struggle for orthodoxy. Athenasius was really at the head of a national Greek party resisting the domination of a Latin-speaking court. From this time onwards Greek patriotism and the wish to maintain the Church of Rome as the guardian of the ancient Christian traditions, led naturally to revolts against Greek supremacy in the days of Justinian and other emperors. Dean Stanley was probably correct when he described the heretical churches of the East as the ancient national churches of the East, or the "Church of the East." For the inclusion of the churches of the East was essentially, if not exclusively, a question of usurpations of ecclesiastical power and titularities by the papacy. This notion of the existence of separate national churches professed the same faith. Another circumstance favoured the creation of separate national churches. While the Greek empire lasted the emperors had a right of investiture on the election of a new Patriarch. When the emperors were deposed, this right was lost, and the Patriarch of Constantinople was elected by a vote of the bishops, and was then confirmed by the Emperor. In the history of the church in Turkey, we find various national church organizations, but none of them have produced various national churches which are independent or autocephalous and yet are in doctrine.

1. A three ancient Church of East, see Cyprus, Church of.

2. The Church of Mount Sinai, consisting of little more than the famous monastery of St Catherine, under an archbishop who frequently resides in Egypt. It has, however, a few branch houses (metropolitans) in Asia Minor, for the Patriarch of Constantinople, by a long-standing custom, has the right of appointing the bishop at the head of the monastery of St Catherine, and of the whole monks and nuns of the monastery of Mount Sinai.

3. The Patriarch of Alexandria, consisting of Egypt and its dependencies, was at one time the most powerful, as it was the most centralised, and of all the patriarchates; it also possesses the titles of archbishop of archbishops, archdeacon of archdeacons, and archpriest of archpriests, thirteenth apostle, and ecclesiastical judge. But the secession of the greater part of its church to Monophysitism, and the schism of the Copts, the Mahometan conquest of Egypt, have left him but the shadow of his former dignity.

4. The Patriarchate of Antioch has undergone most changes in extent of jurisdiction, arising from the transfer of sees to Jerusalem, from the progress of the schismatic churches of the East and from the dissolution of the authority of the patriarch. At the height of his power the patriarch of Antioch ruled over 120 suffragan bishops. In the time of the first crusade 153 still survived; now there are scarcely 20, 14 of which are metropolitan sees. The patriarch, though he is "father of fathers, master of masters," retains little of his old importance.

5. The Patriarchate of Jerusalem.—In the earlier period of the Church, ecclesiastical civil divisions so closely that Jerusalem, in spite of the sacred associations connected with it, was merely an ordinary bishopric dependent on the metropolitan of Antioch. It was only when the Bishop of Jerusalem was given the title of Patriarch and the right to advance the pretensions of his see, but it was not until the council of Chalcedon, in 451, that Jerusalem was made a patriarchate, with jurisdiction over Palestine. From this time on to the inroad of the Saracens, the patriarch is mentioned in the gospels as having jurisdiction over the whole of the country.

It ruled over three metropolitans with eighty suffragans. The modern patriarch has under his jurisdiction 5 archbishops and 5 bishops.

The chief importance of the patriarchate is derived from the position of Jerusalem as the capital of the Empire.

B. The Nine National Churches
the authority to ban the movement for freedom. 

2. The Church of Montenegro has from early times been independent under its bishops, who from 1516 to 1851 were also the temporal rulers, under the title of Vladikas, or prince-bishops.

3. The Orthodox Church in Austria-Hungary, which, however, retains a certain degree of independence. Servia, Rumania, and Croatia, under the patriarch of Karlowitz; the Rumanians of Transylvania, under the archbishop of Hermannstadt; the Ruthenians of Bukovina, under the metropolitan of Czernowitz; and the Servis of Bosnia-Herzegovina, where there are four sees, that of Sarajevo holding the primacy.

4. The Russian Church dates from 922, when Prince Vladimir and his people accepted Christianity. The metropolitan, who was subject, was appointed by Constantine the Second, and deposed on the Dnioper. During the Tatar invasion the metropolis was destroyed, and Vladimir became the ecclesiastical capital. In 1320 the metropolitan of Moldavia and Icovis, who was appointed by Constantine of Constantinople, raised Jof, 46th metropolitan, to the patriarchal dignity; and the act was afterwards confirmed by a general council of the East. In this way the Russian Church became autocephalous, and was consecrated with its own archbishops, in 1709. In 1721 he forbade the election of a new patriarch, and in 1721 he established the Holy Governing Synod to supply the place of the patriarch. This body now governs the Russian Church, and consists of a presbytery, the emperor, the metropolitan of Kiev, Moscow and St Petersburg, the exarch of Georgia and five or six other bishops appointed by the emperor. There are altogether some 90 bishops and about 40 auxiliary bishops called vicars. There are 18 dioceses for men and 200 parishes.

5. The Bulgarian Church, unless indeed it be classed with the separated churches. It differs from the national churches already mentioned in that it had its origin in a revolt of Turkish subjects against their Austrian overlords. The Bulgarians had occupied an anomalous position on the borders of Eastern and Western Christendom, but they had ultimately become subject to the latter. This national feeling near the middle of the 19th century led to a movement for religious independence, the leaders of which were the archimandrites Neophit Bozveli and the bishop Harun Mikhailovsky. The Porte espoused the movement on the condition that the patriarch of Constantinople should strengthen its hold on all the Christians of Turkey by fostering their differences. Ultimately, on 28th February, 1870, the sultan issued a firman constituting a new church, including all Bulgarians.

who desired to join it within the vilayet of the Danubec (i.e. the subsequently-formed principality of Bulgaria), and that of Antioch, Salonica, Kossovo and Monastir (i.e. part of Macedonia, Eastern Rumelia and a tract farther south). The members of this Church were to constitute a millet or community, enjoying equal rights with the Bulgarians, and with the Patriarch of Constantinople, the residence, was to reside at Constantinople. Naturally, this was resisted by the patriarch Anthimus, who stigmatized the racial basis of the Bulgarian Church as the heresy of Phyletism. A local synod was held at Prokuplje in 1864. The Protosynodal board of the Church, and Bulgarian prelates may not officiate publicly in Russian churches; on the other hand, the Holy Synod of Moscow refused to recognize the patriarch's condemnation, and Russian ecclesiastics (except ecclesiastics who had been expelled from the holy see) on the whole, were not pained at the separation of the Church of the Bulgarians from the orthodox Church, together with the holy traditions; it is metakoisimos, it exercises its sovereign rights independently of every other church, and it is governed by a synod of bishops.

6. The Servian Church.—After the suppression of the Church of Ipek in 1766 Servia became ecclesiastically subject to Constantinople; but in 1830 the sultan permitted the Serbs to elect a patriarch (which they did), and merely recognized the patriarchate of Constantinople, and gradually. The patriarch of Constantinople in 1850 acknowledged the independence of the Church, which gradually grew to be more independent of the state. By the Greek constitution of 1828 the Servian patriarch had made himself independent of the patriarch of Constantinople, and to every other Church professing the same doctrines, and, like these churches, it preserves in its integrity the apostolic constitution of the Church of the apostle Peter, together with the holy traditions; it is metakoisimos, it exercises its sovereign rights independently of every other church, and it is governed by a synod of bishops.

7. The Russian Church.—Its first see was at Novgorod, on the Volga (i.e. the subsequently-formed principality of Bulgar). The patriarch of Antioch, Salonica, Kossovo and Monastir, the residence of the Church, was to reside at Constantinople. Naturally, this was resisted by the patriarch Anthimus, who stigmatized the racial basis of the Bulgarian Church as the heresy of Phyletism. A local synod was held at Prokuplje in 1864. The Protosynodal board of the Church, and Bulgarian prelates may not officiate publicly in Russian churches; on the other hand, the Holy Synod of Moscow refused to recognize the patriarch's condemnation, and Russian ecclesiastics (except ecclesiastics who had been expelled from the holy see) on the whole, were not pained at the separation of the Church of the Bulgarians from the orthodox Church, together with the holy traditions; it is metakoisimos, it exercises its sovereign rights independently of every other church, and it is governed by a synod of bishops.

8. The Servian Church dates from 922, when Prince Vladimir and his people accepted Christianity. The metropolitan, who was subject, was appointed by Constantine the Second, and deposed on the Dnioper. During the Tatar invasion the metropolis was destroyed, and Vladimir became the ecclesiastical capital. In 1320 the metropolitan of Moldavia and Icovis, who was appointed by Constantine of Constantinople, raised Jof, 46th metropolitan, to the patriarchal dignity; and the act was afterwards confirmed by a general council of the East. In this way the Russian Church became autocephalous, and was consecrated with its own archbishops, in 1709. In 1721 he forbade the election of a new patriarch, and in 1721 he established the Holy Governing Synod to supply the place of the patriarch. This body now governs the Russian Church, and consists of a presbytery, the emperor, the metropolitan of Kiev, Moscow and St Petersburg, the exarch of Georgia and five or six other bishops appointed by the emperor. There are altogether some 90 bishops and about 40 auxiliary bishops called vicars. There are 18 dioceses for men and 200 parishes.

9. The Bulgarian Church, unless indeed it be classed with the separated churches. It differs from the national churches already mentioned in that it had its origin in a revolt of Turkish subjects against their Austrian overlords. The Bulgarians had occupied an anomalous position on the borders of Eastern and Western Christendom, but they had ultimately become subject to the latter. This national feeling near the middle of the 19th century led to a movement for religious independence, the leaders of which were the archimandrites Neophit Bozveli and the bishop Harun Mikhailovsky. The Porte espoused the movement on the condition that the patriarch of Constantinople should strengthen its hold on all the Christians of Turkey by fostering their differences. Ultimately, on 28th February, 1870, the sultan issued a firman constituting a new church, including all Bulgarians.
The Oratorian派起了很大的作用。毫无疑问，这问题的解决，是由于意大利人、特别是罗马天主教会的领导，对于未来东正教事业的关系，以及对俄罗斯和东正教的关系。未公开的文献是，当然，比公开的文献更有价值，但是俄罗斯教会是这样广泛，而且其影响在史上是如此重大，以至于在讨论这个问题时，必须将它们考虑在内。

以上所述，就是这个教会中的某些重要人物，以及他们在这个教会中的地位和影响。这些人物，无论是个人，还是集体，都对这个教会的发展和变革产生了深远的影响。
Olivier subsequently used for the assemblage the name Orthoptera, which is now much better known than the earlier terms. W. Kirby (1815) founded an order Dermaptera for the earwigs, which had formed part of de Geer's Dermaptera, accepting Olivier's term Orthoptera for the rest of the assemblage, and as modern research has shown that the earwigs undoubtedly deserve original separation from the cockroaches, grasshoppers, crickets, &c., this terminology will probably become established. W. E. Erichson and other writers added to the Orthoptera a number of families which Linné had included in his order Neuroptera. These families are described and their affinities discussed in the articles Neuroptera and Hexapoda (p. 202). In the present article a short account of the characters of the Dermaptera and Orthoptera is given, while for details the reader is referred to special articles on the more interesting families or groups.

The Dermaptera and the Orthoptera agree in having well-developed mandibles, so that the jaws are adapted for biting; in the incomplete fusion of the second maxillae (which form the labium) so that the parts of a typical maxilla can be easily made out (see the description and figures of the cockroach's jaws under Hexapoda); in the presence of a large number of excretory (Malpighian) tubes; in the firm texture of the forewings; in the presence of appendages ( cerci) on the tenth abdominal segment; and in the absence of a metamorphosis, the young insect after hatching closely resembling the parent.

Order Dermaptera.

In addition to the characters just enumerated, the Dermaptera are distinguished by the presence of small but distinct maxillae in the egg (fig. 2, see Hexapoda, Art. 164) in addition to the tongue (hypopharynx); by the forewings when present being modified into short quadranarly elytra without nervation, the complex hindwings (fig. 1) being folded beneath them both longitudinally and transversely so that nearly the whole abdomen is left uncovered; and by the entire mesodermal nature of the genital ducts, which, according to the observations of P. Meignt, open to the exterior by a median aperture, the terminal part of the duct being single, either by the fusion of the primitive paired ducts or by the suppression of one of them. In the vast majority of winged insects the terminal part of the male genital system (vagina and ductus ejaculatorius) is unpaired and ectodermal. Thus the condition in the Dermaptera is more primitive than in any other Pterygota order except the Hemiptera.

Ephemeroptera (Mayfly) which are still more generalized, the primitive mesodermal ducts (ovulants and vasa deferentia) opening to the exterior by paired apertures as in the Crustacea. In the Orthoptera the cerci are—in the adult insect at least—stout, unjointed appendages forming a strong forcip (fig. 1) which the insect uses in arranging the hindwings beneath the wings. In at least one genus the unjointed pinces of the forcipes are preceded, in the youngest instar by jointed cerci. Very many members of the order are entirely wingless.

There are two families of Dermaptera. The Hemistictidae include the single genus Hemisterus (q.v.), which contains only two species of curious wingless insects with long, jointed cerci, found among the hair of certain West African rodents. The other family is that of the Forficulidae or earwigs (q.v.), all of which have the cerci modified as a forcip, while wings of the characteristic form described above are present in many of the species.

Order Orthoptera.

The bulk of de Geer's "Dermaptera" form the order Orthoptera of modern systematists, which includes some 10,000 described species. The insects comprised in it are distinguished from the earwigs by their very long, rather narrow forewings, which usually cover, or nearly cover, the abdomen when at rest, and which are firmer in texture than the hindwings. The hindwings have a firm costal area, and a more delicate anal area which folds fanwise, so that they are completely covered by the forewings when the insect rests. Rarely (in certain cockroaches) the hindwing undergoes transverse folding also. Wingless forms are fairly frequent in the order, but their relationship to the allied winged species is evident. The female of the common cockroach (fig. 32) shows an interesting vestigial condition of the wings, which are but poorly developed in the male (fig. 36). More important characters of the Orthoptera than the nature of the wings—characters in which they differ from the Dermaptera and agree with the vast majority of winged insects—are the absence of distinct maxillae and the presence of an unpaired ectodermal tube—this being the region of the genital system in both sexes. The cerci are nearly always joined, and a typical insect ovipositor with its three pairs of processes is present in connexion with the vagina of the female. In many Orthoptera this ovipositor is very long and conspicuous (fig. 5). Information as to the internal structure of a typical orthopteron—the cockroach—will be found under Hexapoda.

Classification.—Six families of Orthoptera are here recognized, but most special students of the order consider that these should be rather regarded as super-families, and the number of families greatly multiplied. Those who wish to follow out the classification in detail should refer to some of the recent monographs mentioned below in the bibliography. There is general agreement as to the division of the Orthoptera into three sub-orders or tribes.

I. Phasmodesa.—This division includes the single family of the Phasmidae whose members, generally known as "stick-insects" (q.v.) and "leaf-insects" (q.v.), are among the best-known examples of "protective resemblance" to be found in the whole animal kingdom. The phasmid tail is short and the mesothorax very long, the three pairs of legs closely similar, the wings only often modified or absent, and the cerci short and unjointed. Each egg is contained in a separate, curiously formed, seed-like capsule, provided with a lid which is raised to allow the escape of the newly-hatched insect.

II. Orthosarcia.—In this tribe are included Orthoptera with a large prothorax, whose eggs are enclosed in a common purse or capsule formed by the hardening of a maternal secretion. The Mantidae or "praying insects" have the prothorax elongate and the forelegs powerful and raptorial, while the large, broad head is prominent. The eggs are enclosed in a case attached to a twig or stone and containing many chambers. From this curious habituation the young mantids hang by threads till after their first moult (see Mantidae). The Blattidae (fig. 3) or cockroaches (q.v.) form the second a, side view; b, end view; the outline family of this division. c shows natural size. They are readily distinguished by the somewhat rounded prothorax beneath which the head is usually concealed, while the forelegs are unmodified. Sixteen eggs are enclosed together in a compact capsule or " purse " (fig. 4).

III. Saltatoria.—The three families included in this tribe are distinguished by their elongate and powerful hindlegs (fig. 5) which enable them to leap far and high. They are remarkable for the possession of complex ears (described in the article Hexapoda) and...
ORTHOSTATAE—ORTOLAN

Fig. 5.—House Cricket (Gryllus domesticus); O, male; S, female. Natural size.

and agreeing with the latter family in the position of the ears. The forewings are curiously arched at the base, and the anal region of the wing lying dorsal to the insect and the rest of the wing being turned downwards at the sides (see Cricket).

Fossil History.—The Orthoptera are an exceedingly interesting order of insects as regards their past history. In Palaeozoic rocks of Carboniferous age the remains of Orthoptera have been discovered together with the general aspect of cockroaches and crickets. In Jurassic times, Orthoptera and cockroaches are known to be represented by a large number of species. The Orthoptera have a very long history, having been present throughout all geological ages. Some of the fossil forms resemble certain modern species quite closely. The Orthoptera were well represented in the Palaeozoic era and continued to exist throughout the Mesozoic era. They are also found in the Cenozoic era, and some species have been discovered in Recent deposits.

Bibliography.—A description and enumeration of all known Dermaptera has been lately published by A. de Bormans and H. Kraus, Das Tierreich, xi. (Berlin, 1900). See also W. F. Kirby, Synopsis of the Order Orthoptera, pt. 1 (London, Brit. Mus., 1904). For the Orthoptera generally see E. E. Green, Trans. Entom. Soc. (1891); W. V. Westwood, K. Leopold—Carol. Akad., lxxxiv. (1904); and M. Burr, Science Gossip, iv. (N.S., 1897); for Hemerocera, see H. J. Westwood, Entom. Soc. Lond. Trans. (1870); and for Dermaptera see H. M. Wattenwyl, Prodromus der europäischen Orthopteren (Leipzig, 1882), and Ann. Mus. Genov. xiii. (1892), &c. R. Tümpel, Die Geradflügler Mitteleuropas (Eisenbach, 1901). The Orthoptera have been extensively used for anatomical and embryological researches. For the Orthoptera generally see H. J. Westwood, Trans. Entom. Soc. Lond. (1870). The Orthoptera are also known to have been present throughout all geological ages, with a long history. They have been present throughout the Palaeozoic, Mesozoic, and Cenozoic eras. Some species have been discovered in Recent deposits.

ORTOLAN, or Ortin, German hero of romance, was originally Hertnit or Hartnit, the elder of two brothers known as the Hartnings, who correspond in German mythology to the Dioscuri. His seat was at Holmgard (Novgorod), according to the Thidreksaga (chapter 43), and he was related to the Russian saga heroes. Later on his city of Holmgard became Garde, and in ordinary German legend he ruled in Lombardy. Hartnit won his bride, a Valkyrie, by hard fighting against the giant Isungs, but was killed in a later fight by a dragon. His younger brother, Hardheir (replaced in later German legend by Wolfdietrich), avenged Ortin by killing the dragon, and then married his brother's widow. Ortin's wooling was corrupted by the popular interest in the crusades to an Oriental Brutfahrtssage, bearing a very close resemblance to the French romance of Huon of Bordeaux. Both heroes receive similar assistance from Alberich (Oberon), who supplanted the Russian Ilya as Ortin's epic father in middle High German romance. Neumann maintained that the Russian Ortin and the Lombard king were originally two different persons, and that the incoherence of the tale is due to the fact that the two legends are not known to have existed side by side. See editions of the Heldenfahrbuch and one of Ortin und Wolfdietrich by Dr. J. L. Edlen von Lindenhausen (Tübingen, 1806); articles in the Zeitschrift für deutsches Altertum by K. Mühlenhoff (xii. pp. 334-354, 1865; xiii. pp. 185-192, 1867), by J. Seidmüller (xxvi. 201-211, 1882), and by E. H. Meyer (xxvii. pp. 85-87, 1894), and in Germania by F. Neumann (vol. xxvii. pp. 161-219, Vienna, 1882). See also the literature dealing with Huon of Bordeaux.
ORTON—ORVIETO

of the Emberizidae, a Passerine family not separated by most modern authors from the Fringillidae. A native of most European countries—the British Islands (in which it occurs but rarely) excepted—as well as of western Asia, it migrates in autumn presumably to the southward of the Mediterranean, though its winter quarters cannot be said to be accurately known, and returns about the end of April or beginning of May. Its distribution throughout its breeding-range seems to be very local, and for this no reason can be assigned. It was long ago said in France, and apparently with truth, to prefer wine-growing districts; but it certainly does not feed upon grapes, and is found equally in countries where vineyards are unknown—reaching in Scandinavia even beyond the arctic circle—and then generally frequents corn-fields and their neighbourhood. In appearance and habits it much resembles its congener the yellow-hammer, but wants the bright colouring of that species, its head for instance being of a greenish-grey, instead of a lively yellow. The somewhat monotonous song of the cock is also much of the same kind; and, where the bird is a familiar object to the country people, who usually associate its arrival with the return of fair weather, they commonly apply various syllabic interpretations to its notes, according as the bird is seen to do to those of the yellowhammer. The nest is placed on or near the ground, but the eggs seldom show the hair-like markings so characteristic of those of most buntings. Its natural food consists of beetles, other insects and seeds. Ortolans are netted in great numbers, kept alive in an artificially lighted or darkened room, and fed with oats and millet. In a very short time they become enormously fat and are then killed for the table. If, as is supposed, the ortolan be the Miliaria of Varro, the practice of artificially fattening birds of this species is very ancient. In French the word Ortolan is used so as to be almost synonymous with the English "bunting"—thus the Ortolan-de-neige is the snow-bunting (Plectrophenax nivalis), the Ortolan-de-riz is the rice-bird or "bobolink" of North America (Dolichonyx oryzivorus), so justly celebrated for its delicious flavour; but the name is also applied to other birds much more distantly related, for the Ortolan of some of the Antilles, where French is spoken, is a little ground-dove of the genus Chamaepelia.

In Europe the Becafeco (pig-eater) shares with the ortolan the honour of the highest class, and this may be a convenient place to point out that the former is a name of equally elastic signification. The true Becafeco is said to be what is known in England as the garden-warbler (the Motacilla sylvatica of Linnaeus, the Sylvia hortensis of modern writers); but in Italy any soft-billed small bird that can be snared or netted in its autumnal migration passes under the name in the market and cocktail mixes. The Becafeco, however, is not uniformly fattened, and on this account is preferred by some sensitive taste to the Ortolan.

ORTON, JOB (1717–1753). English dissenting minister, was born at Shrewsbury on the 4th of September 1717. He entered the academy of Dr Philip Doddridge at Northampton (q.v.), became minister of a congregation formed by a fusion of Presbyterian and Independent ministers at High Street Chapel, Shrewsbury (1741), received Presbyterian ordination there (1743), resigned in 1766 owing to ill-health, and lived in retirement at Kidderminster until his death. He exerted great influence both among dissenting ministers and among clergy of the established church. He was deeply read in Puritan divinity, and adopted Sallanian doctrines on the Trinity. Old-fashioned in most of his views, he disliked the tendencies alike of the Methodists and other revivalists and of the rationalizing dissenters, yet he had a good word for Priestley and Theophilus Lindsey.

Among his numerous works are Letters to Dissenting Ministers (ed. by S. Palmer, 2 vols., 1800), and Practical Works (2 vols., with memoir, 1822).

ORTONA A MARE, a small seaport and episcopal see of the Abruzzi, Italy, in the province of Chieti, 12 m. direct E. of that town and 105 m. by rail S.S.E. of Ancona. Pop. (1901) 8667 (town); 15,523 (commune). It is situated on a promontory 230 ft. above sea-level, and connected with the port below by a wire-rope railway. From the ruined castle magnificent views to the south as far as the Punta di Penna can be obtained. The cathedral has been restored at various times, but preserves a fine portal of 1312 by a local artist, Nicolo Mancini. At one side of it is the Palazzo de Pirri with five pointed windows.

The town occupies the site of the ancient Ortona, a seaport of the Frontoni; it lay on the Roman coast-road, which here turned inland to Anxanum (Lanciano), 10 m. to the S. The town suffered much from the ravages of the Turks, who laid it in ruins in 1556, and also from frequent earthquakes.

For discoveries in the neighbourhood see A. de Nino in Notizie degli Scavi (1888), 646. (T. As.)

ORTZEN, GEORG, BARON VON (1829–). German poet and prose-writer, was born at Brunn in Mecklenburg-Schwerin. He served as an officer of Prussian hussars (1850–1855), entered the consular service and after employment at New-York (1879) and Constantinople (1886) was appointed to Marseilles (1881), and then to Christiania (1889), retiring in 1892. He published about thirty volumes, mostly of lyric and aphorisms, including Gedichte (3rd ed. 1861), Aus den Kämpfen des Lebens (1868), Deutsche Träume, deutsche Siege (1876), Epigramme und Epiloge in Prosse (1880), Es war ein Traum (1902). His Erlebnisse und Studien in der Gegenwart (Leipzig, 1875) appeared under the pseudonym Ludwig Robert, and nach Acht (Stuttgart, 1899), a collection of his notes and other writings.

ORUPO, a department and town of Bolivia. The department is bounded N. by La Paz, E. by Cochabamba and Potosi, S. by Potosi, and W. by Chile; it forms a part of the ancient Titicaca lacustrine basin, and has an area of 10,127 sq. m., the greater part of which is semi-arid and covered with extensive saline deposits. It is bordered by Cordilleras on the E. and W., and by transverse ridges and detached groups of elevations on the N. and S. The slope and drainage is toward the S., but many of the streams are waterless in the dry season. The outlet of Lake Titicaca, the Desaguadero river, flows southward into Lake Pampa-Aulagunas, or Poopo, on the eastern side of the department near the Cordillera de los Frailes. Lake Poopo is 12,130 ft. above sea-level, but it is not much higher than the level of its water-discharge through a comparatively small outlet, called the Lachahuina, into the lagoon and saline morasses of Copacasa (10,075 ft. elevation) in the S.W. corner of the department. Oruro is almost exclusively a mining department, the country being too arid for agriculture, with the exception of a narrow strip in the foothills of the Cordillera de los Frailes, where a few cattle, mules and llamas, and a considerable number of sheep are reared. The mineral wealth has not been fully developed except in the vicinity of the capital, in the north-east part of the department, where there are large deposits of tin, silver and copper, Oruro being the second largest producer of tin in the republic. There are borax deposits in the western part of the department, but the output is small. The capital of the department is Oruro, 115 m. S.S.E. (direct) of La Paz; it is an old mining town dating from the 17th century, when it is said to have had a population of 70,000. The census of 1890 gave it a population of 13,475, the greater part of whom are Indians. A considerable number of foreigners are interested in the neighbouring mines. The elevation of Oruro is 12,250 ft. above sea-level, and its climate is characterized by a short cool summer and a cold rainy winter, with severe frosts and occasional snow-storms. The mean annual temperature is about 43° F. Oruro is the Bolivian terminus of the Antofagasta railway (0.75 metre gauge), 574 m. long, the first constructed in Bolivia. A law of the 27th of November 1906 provided for the construction of other lines, of metre gauge, from La Paz (Viacha) to Oruro, from Oruro to Cochabamba, and from Oruro to Tupiza, making Oruro the most important railway centre in Bolivia. Oruro enjoys the nominal distinction of being one of the four capitals of the republic, an anomaly which was practically ended by the revolution of 1868, since which time the government has remained at La Paz.

ORVIETO (anc. Volatini (q.v.), later Urbs Vetus, whence the modern name), a town and episcopal see of the province of Perugia, Italy, on the Paglia, 75 m. by rail N. by W. of Rome. Pop. (1901) 8820 (town); 18,208 (commune). It crowns an isolated rock, 1033 ft. above sea-level, 640 ft. above the plain,
commanding splendid views, and is approached on the east by a funicular railway from the station. The town is very picturesque, both from its magnificent position and also from the unusually large number of fine 13th-century houses and palaces which exist in its streets. The chief glory of the place is its splendid cathedral, dedicated to the Virgin; it was begun before 1285, perhaps by Arnolfo di Cambio, on the site of an older church; and from the 13th till the 16th century was enriched by the labours of a whole succession of great Italian painters and sculptors.

The exterior is covered with black and white marble; the interior is of grey limestone with bands of a dark basaltic stone. The plan consists of a large rectangular nave, with semicircular recesses for altars, opening out of the aisles, north and south. There are two transept chapels and a short choir. The most magnificent part of the exterior and indeed the finest polychrome monument in existence is the west façade, built of richly-sculptured marble from the designs of Lorenzo Maitani of Siena, and divided into three gables with intervening pinnacles, closely resembling the front of Siena cathedral, of which it is a reproduction, with some improvements. With the splendour of the whole, the beauty of the composition is marvellous, and it may rank as the highest achievement of Italian Gothic. It was begun in 1318, but the upper part was not completed till the 16th century. The mosaics are modern, and the whole church has suffered greatly from recent restoration. The four wall-surfaces that flank the three western doorways are decorated with very beautiful sculpture in relief, once ornamented with colour, the designs for which, according to Burckhardt, must be ascribed to the architect of the whole, the last and greatest of Sienese sculptors, Simone Martini. The Madama above the principal portal falls into the same category. The subjects are scenes from the Old and New Testaments, and the Last Judgment, with Heaven and Hell. In the interior on the north, the Cappella del Corporale possesses a large silver shining, resembling in form the cathedral façade, enriched with countless figures in relief and subjects in translucent coloured enamels—one of the most important specimens of early silversmith’s work that yet exists in Italy. It was begun by Ugolino Vieri of Siena in 1337, and was made to contain the Holy Corporal from Bolsena. which, according to the legend, became miraculously stained with blood during the celebration of mass to convince a sceptical priest of the truth of the doctrine of transubstantiation. This is supposed to have happened in 1263, when Urban IV. was residing at Orvieto; and it was to commemorate this miracle that the existing cathedral was built. On the south side is the chapel of S. Brizio, separated from the nave by a fine 14th-century wrought-iron screen. The walls and vault of this chapel are covered with some of the best-preserved and finest frescoes in Italy—among the noblest works of Fra Angelico and Luca Signorelli, mainly painted between 1430 and 1501—the latter being of especial importance in the history of art owing to its great influence on Michelangelo in his early days. The choir stalls are fine and elaborate specimens of tarsio and rich wood-carving—the work of Antonio and Piotro della Minella (1431-1441). In 16th-century sculpture the cathedral is especially rich, containing many statues, groups and altar-relics by Simone Mosca and Ippolito Scalza. Close by are two Gothic buildings, the bishop’s palace (1264) and the Palazzo del Papi (begun in 1296), the latter with a huge hall now containing the Museo Civico, with various medieval works of art, and also objects from the Etruscan necropolis of the ancient Volsini (q.v.). The Palazzo Faini has another interesting Etruscan collection. The Palazzo del Comune is Romanesque (12th century), but has been restored. S. Andrea and S. Giovenale are also Romanesque churches of the 11th century; both contain later frescoes. For the 12th century belongs the ruined abbey of S. Severo, 1 m. south of the town. The church of S. Domenico contains one of the finest works in sculpture by Arnolfo di Cambio. This is the tomb with recumbent effigy of the Cardinal Brago or De Braye (1282), with much beautiful sculpture and mosaic. It is signed hoc opus fecit Arnolfus. It was imitated by Giovanni Pisano in his monument to Pope Benedict XI. at Perugia. Among the later buildings, a few may be noted by Sannichello of Verona, who was employed as chief architect of the cathedral from 1509 to 1528. The fortress built in 1364 by Cardinal Albornoz has been converted into a public garden. The well, now disused, called Il pozzo di S. Patrizio, is one of the chief curiosities of Orvieto. It is 200 ft. deep to the water-level and 42 ft. in diameter, cut in the rock, with a double winding inclined plane, so that ascent could descend and carry the water from the bottom. It was begun by the architect Antonio da San Gallo the younger in 1537 for Clement VII., who fled to Orvieto after the sack of Rome, and was finished by Simone Mosca under Paul III.

The town appears under the name ovali in Procopius (Bell. Goth. ii. 11, &c.), who gives a somewhat exaggerated description of the site, and as Urbis Vetus elsewhere after his time. Bolsena staved our Vitiges in 539, and became master of it. In 666 it fell to the Lombards, and was recovered by Charlemagne. It formed part of the donation of the Countess Matilda to the papacy. Communal independence had probably been acquired as early as the end of the 10th century, but the first of the popes to reside in Orvieto and to recognize its communal administration was Hadrian IV. in 1157. It was then governed by consuls, but various changes of constitution succeeded in the direction of enlarging the governing body. Its sympathies were always Guelfic, and it was closely allied with Florence, which it assisted in the battle of Montaperto (1260), and its constitution owed much to her model. In 1199 the first podestà was elected, and in 1251 the first capitanio del popolo. One of the most original articles of the Sienese constitution was considered the Sanzio of Orvieto. The Madonna above the principal portal falls into the same category. The subjects are scenes from the Old and New Testaments, and the Last Judgment, with Heaven and Hell. In the interior on the north, the Cappella del Corporale possesses a large silver shining, resembling in form the cathedral façade, enriched with countless figures in relief and subjects in translucent coloured enamels—one of the most important specimens of early silversmith’s work that yet exists in Italy. It was begun by Ugolino Vieri of Siena in 1337, and was made to contain the Holy Corporal from Bolsena, which, according to the legend, became miraculously stained with blood during the celebration of mass to convince a sceptical priest of the truth of the doctrine of transubstantiation. This is supposed to have happened in 1263, when Urban IV. was residing at Orvieto; and it was to commemorate this miracle that the existing cathedral was built. On the south side is the chapel of S. Brizio, separated from the nave by a fine 14th-century wrought-iron screen. The walls and vault of this chapel are covered with some of the best-preserved and finest frescoes in Italy—among the noblest works of Fra Angelico and Luca Signorelli, mainly painted between 1430 and 1501—the latter being of especial importance in the history of art owing to its great influence on Michelangelo in his early days. The choir stalls are fine and elaborate specimens of tarsio and rich wood-carving—the work of Antonio and Piotro della Minella (1431-1441). In 16th-century sculpture the cathedral is especially rich, containing many statues, groups and altar-relics by Simone Mosca and Ippolito Scalza. Close by are two Gothic buildings, the bishop’s palace (1264) and the Palazzo del Papi (begun in 1296), the latter with a huge hall now containing the Museo Civico, with various medieval works of art, and also objects from the Etruscan necropolis of the ancient Volsini (q.v.). The Palazzo Faini has another interesting Etruscan collection. The Palazzo del Comune is Romanesque (12th century), but has been restored. S. Andrea and S. Giovenale are also Romanesque churches of the 11th century; both contain later frescoes. For the 12th century belongs the ruined abbey of S. Severo, 1 m. south of the town. The church of S. Domenico contains one of the finest works in sculpture by Arnolfo di Cambio. This is the tomb with recumbent effigy of the Cardinal Brago or De Braye (1282), with much beautiful sculpture and mosaic. It is signed hoc opus fecit Arnolfus. It was imitated by Giovanni Pisano in his monument to Pope Benedict XI. at Perugia. Among the later
OSAKA, or OSAKA, a city of Japan in the province of Settsu. Pop. (1905) 1,220,500. It lies in a plain bordered, except westward, where it opens on Osaka Bay, by hills of considerable height, on both sides of the Yodogawa, or rather its headwater the Aji (the outlet of Lake Biwa), and is so intersected by rivers, branches, and canals as to suggest a comparison with a Dutch town. Steamers ply between Osaka and Kobe-Higo or Kobe, and Osaka is an important railway centre. The opening of the railway (1873) drew foreign trade to Kobe, but a harbour for ocean-steamers has been constructed at Osaka. The houses are mainly built of wood, and on the 31st of July 1909 some 12,000 houses and other buildings were destroyed by fire. Shin-sai Bashii Suji, the principal thoroughfare, leads from Kitahama, the district lying on the south side of the Tosabori, to the iron suspension bridge (Shin-sai Bashii) over the Dotombori. The foreign settlement is at Kawaguchi at the junction of the Shirinashi and the Aji. It is the seat of a number of European mission stations. Buddhist and Shinto temples are numerous. The principal secular buildings are the castle, the mint and the arsenal. The castle was founded in 1583 by Hideyoshi; the enclosed palace, probably the finest building in Japan, survived the capture of the castle by Ieyasu (1615), and in 1867 and 1868 witnessed the reception of the foreign legations by the Tokugawa shoguns; but in the latter year it was fired by the Tokugawa party. It now provides military headquarters, containing a garrison and an arsenal. The whole castle is protected by high and massive walls and broad moats. Huge blocks of granite measuring 40 ft. by 10 ft. or more in the masonry. The mint, erected and organized by Europeans, was opened in 1871. Osaka possesses iron-works, sugar refineries, cotton spinning mills, ship-yards and a good variety of other manufactures. The trade is enormous. Aided by the improved facilities with that of the population, which in 1877 was only 284,105.

Osaka owes its origin to Rennio Shionin, the eighth head of the Shin-Shu sect, who in 1495-1466 built, on the site now occupied by the castle, a temple which afterwards became the principal residence of his successors. In 1580, after ten years' successful defence of his position, Kenryo, the eleventh "abbot," was obliged to surrender; and in 1583 the victorious Hideyoshi made Osaka his capital. The town was opened to foreign trade in 1856.

OSAWATOMIE, a city of Miami county, Kansas, U.S.A., about 45 m. S. by W. of Kansas City, on the Missouri Pacific railway. Pop. (1900) 4191, of whom 227 were negroes; (1905, state census) 5191. A state insane asylum for the insane is situated in the vicinity, about 1 m. N.E. of the city. The region is a good one for general farming, and natural gas and petroleum are found in abundance in the vicinity. Osawatomie was settled about 1854 by colonists sent by the Emigrant Aid Company, and was platted in 1855; its name was coined from parts of the words "Osage" and "Pottawatomie." It was the scene of two of the "border battles" of the "Border War," and much of the political violence resulting from the clashes between the "pro-slavery" and the "free-state" factions of Missouri and Kansas. On the 7th of June 1856 it was plundered by about 170 pro-slavery men from Missouri. On the 30th of August 1856 General John W. Reynolds, commanding about 400 Missourians, attacked the town. The troops were detached from Company C (the Ohio volunteer company which had come to Osawatomie in the autumn of 1855) at the head of about 40 men, who were soon overpowered. Of Captain Brown's men, four were killed and two were executed. The town was looted and practically destroyed. A park commemorating the battle was dedicated here on the 31st of August 1910.

OSBORN, SHERARD (1822-1875), English admiral and Arctic explorer, the son of an Indian army officer, was born on the 25th of April 1822. Entering the navy as a first-class volunteer in 1837, he was entrusted in 1838 with the command of a gunboat at the attack on Kedah in the Malay Peninsula, and was present at the reduction of Canton in 1841, and at the capture of the batteries of Woosung in 1842. From 1844 till 1848 he was garrison-mate and lieutenant in the flag-ship of Sir George Seymour in the Pacific. He took a prominent part in 1849 in advocating a new search expedition for Sir John Franklin, and in 1850 was appointed to the command of the steam-tender "Pioneer" in the Arctic expedition under Captain Austin, in the course of which he performed (1851) a remarkable sledge-journey to the western extremity of Prince of Wales Island. He published an account of the voyage, entitled Stray Leaves from an Arctic Journal (1852), and was promoted to the rank of commander shortly afterwards. In the new expedition (1852-1854) under Sir Edward Belcher he again took part as commander of the "Pioneer." In 1856 he published the journals of Captain Robert McClure, giving a narrative of the discovery of the North-West Passage. Early in 1855 he was called to active service in connexion with the Crimean War, and being promoted to post-rank in August of that year was appointed to the "Medusa," in which he commanded the Sea of Azof squadron until the conclusion of the war. For these services he received the C.B., the Cross of the Legion of Honour, and the Medjedie of the fourth class. As commander of the "Furious" he took a prominent part in the operations of the second Chinese War, and performed a piece of difficult and intricate navigation in taking his ship 500 m. up the Yangtse-kiang to Hankow (1858). He returned to England in broken health in 1859, and at this time contributed a number of articles on naval and Chinese topics to Blackwood's Magazine, and wrote The Career, Last Voyage and Fate of Sir John Franklin (1860). In 1861 he commanded the "Donegale" in the Gulf of Mexico during the trouble there, and in 1862 undertook the command of a squadron fitted out by the Chinese government for the suppression of piracy on the coast of China; but owing to the non-fulliment of the condition that he should receive orders from the imperial government only, he threw up the appointment. In 1864 he was appointed to the command of the "Viceroy of India," in order to test the turret system of ship-building, to which this vessel had been adapted. In 1865 he became agent to the Great Indian Peninsula Railway Company, and two years later managing director of the Telegraph Construction and Maintenance Company. In 1873 he attained flag-rank. His interest in Arctic exploration had never ceased, and in 1873 he induced Commander Albert Markham to undertake a summer voyage for the purpose of testing the conditions of ice-navigation with the aid of steam, with the result that a new Arctic expedition, under Sir George Nares, was determined upon. He was a member of the committee which made the preparations for this expedition, and died a few days after it had sailed.

OSBORNE, a mansion and estate in the Isle of Wight, England, S.E. of the town of East Cowes. The name of the mansion in early times is quoted as Austerborne or Oysterborne, and the estate comprised about 2000 acres when, in 1845, it was purchased from Lady Isabella Blackford by Queen Victoria. The queen subsequently extended the estate to nearly 3000 acres, and a mansion, in simple Palladian style, was built from designs of Mr T. Cubitt. Here the queen died in 1901, and by a letter, dated Coronation Day 1902, King Edward VII. presented the property to the nation. By his desire part of the house was transformed into a convalescent home for officers of the navy and army, opened in 1904.

OSBORNE CASTLE, a naval mansion and estate in the parish of North Baddesley, near Eastleigh, Hants, in Hampshire, England, built by Sir James Osborne, lord of the manor of Baddesley Clere. It was purchased by George Osborne, 4th earl of Gosford, in 1836. The castle was afterwards altered and adapted for the Osborne estate. A Royal Naval College. The principal buildings lie near the Prince of Wales's Gate, the former royal stables being adapted to use as class-rooms, a mess-room, and other apartments, while certain adjacent buildings were also adapted, and a gymnasium and a series of bungalows to serve as dormitories, each accommodating thirty boys, were erected, together with quarters for officers, and for an attached body of marines. By the river Medina, on the Kingsdown portion of the estate, a machine shop and facilities for boating are provided.

At the church of St Mildred, Whippingham, 1½ m. S.S.E. of East Cowes, there are memorials to various members of the royal family.

OSCA LINGUA, or Oscan, the name given by the Romans to the language of (1) the Samnite tribes, and (2) the inhabitants of Campania (excluding the Greek colonies) from the 4th century
OSCA LINGUA

B.C. onwards. We know from inscriptions that it extended southwards over the whole of the Peninsula, except its two extreme projections (see BRUTTI and MESSAPI) covering the districts known as Lucania and Frontinam, and the greater part of Apulia (see LUCANTA, FRENZANI, APULA). Northward, a very similar dialect was spoken in the Central Apennine region by the PAELIGNI, VESTINI (q.v.) and others. But there is some probability that both in the North and in the South the dialect-spoken varied slightly from what we may call the standard or central Oscan of Samnium. There can be no reasonable doubt, though doubt has strangely been raised, that the popular farces at Rome called Atellaneae were acted in Oscan; Strabo (v. p. 233) records this most explicitly as a curious survival.

This name, which ought probably to be called the Samnite or Saenae singular, is due to historical causes, but is, in fact, incorrect. The Osci proper were not Samnites, but the Italic, Pre-Tuscan and Pre-Greek inhabitants of Campania. This is the sense in which Strabo regularly uses the name "Oscos" (cf. v. 247), so that it is quite possible that we should connect them with the other tribes whose Ethnica were formed with the -co- suffix and with the plebs of Rome (see VOCTSI and Rome).

For further evidence as to the history of the names Osci, Opici, Opici, see R. S. Conway, The Italic Dialects, p. 139.

The chief monuments of the language, as spoken in Campania, come from Pompeii, Nola, Capua and Cumae (q.v.). From the two towns last mentioned we have the interesting group of heraldic inscriptions known as Ioviaca (q.v.), and two interesting curses inscribed on lead plates and, so to speak, posted in graves, for conveyance to the deities of the Underworld. One of these may be quoted as a typical specimen of the Oscan of Campania:

From the memin-Curse:

 lucrivis ubitatis
statia gavis nep fatiam nep delcum patians;

lucrivis ubitatis uialectum uelliam
nep delcum nep fatiam fatulat;

lepge uelalt altsremt uenem sabakler;

flusamis a kirtim sabarolat;

pernal kerriesti statif, ammal kerriesti statif,

flusamis kerriesti statif, eskitli paterel statif.

"(Lucius Octavius, Statius Gaius new memorare ne indicare possint. Lucius Octavius Novellum Velliam ne memorare ne indicare possint, ne monumentum ne sequerum (sibi adipsicatur)."

The language as spoken in Samnium may be illustrated by a few sentences from the Tabula Agonensis, now in the British Museum:

statia pis set kirtim kereiil;
diseel veepakusiit statif, diseel reguare statif,
kerriesti kerriesti statif, pataus piisif statif,
daeel geantii statif, uasa piuriad isakplam,
lefiuam altel pterolecal chenel saukkler,
flusamis a kirtim sabarolat;

pernal kerriesti statif, ammal kerriesti statif,

flusamis kerriesti statif, eskitli paterel statif.

"(Qui eriit sunt in horte Cereali, Ionii uigilarum patrino (?) statia, Herculi Cerama statia, Pauliae Horiae (2) statia, Duiae Geneatiae statia. In ars ignes cremaio sancta altero quaque festo (an anno ?) sanctur (an sanctur ?), Deabus Floriallum iuxta horum sanctur (an sanctur ?): Ceramei statia, Nutrici Ceramic statia, Flora Ceramae statia, Mercuari patri statuia.)"

It remains to notice briefly (1) the chief characteristics which mark off the Osco-Umbrian, or, as they might more conveniently be termed, the Saenae group of dialects, from the Latinian, and (2) the features which distinguish Oscan and the dialects most closely allied to it, e.g. North-Oscan (see PAELIGNI), from the Umbrian or (more strictly) Iguvine dialect (see IGUVIUM).

(A.) Phonology.—1. The conversion of the Indo-European velars into labials, e.g. Oscan and Umbrian pis = Lat. quis, Osc. umb. pod = Lat. quid. Osc. petur-purus = Lat. quadraetidian; Osc. bomberned = Lat. convosent, from the Indo-European root "gem," Eng. come, Sanskrit gama; Osc. accusative biam = Sanskritgin, Eng. cow, the Lat. bis, hovi having been borrowed from some Saenae dialect, since the pure Latin form would have been *ala.

2. The extrusion or syncope (a) of short vowels in the second syllable of a word, e.g. Oscan opa-, Umbrian oias- from an Italic stem "opas-" to "work, build," cf. Lat. opera, "work," and operari (although this verb appears in Latin to have been invented only at a later period, Osc. oias- = Lat. opera, Umb. oias- = Lat. operari, stems from Latin "medeios-" "inside," basd on Lat. mediesitus; (b) Of short vowels before final s, Osc. hies = Lat. hies; Osc. iauini = Lat. Ipsians; Osc. nom. pl. humans, O. humina; Umb. pl. humins = Lat. humins. (c) The preservation of s before n, m and l (whereas in Latin it is lost with the "compensatory lengthening" of v, e.g. *nicam = Lat. nicae, the change is medial): Umb. ahesnes, abl. pl. Lat. akenis; Paedignian prisma (nom. sing. fem.) = Lat. prima; Osc. Slabris = Lat. Labris.

4. Instead of Lat. -nd- we have in Osco-Umbrian -nn—where the ancile at the end is properly -nt, which is best restored: the well-known line (Miles Glor., v. 14, 1399), distainen koninm, et dispennite; hence the gerundives, Osc. opsanum = Lat. operandum. So Umbrian phener, from phenehatus (gen. sing. masc.), equivalent to Lat. pagina. It is not certain what the original group of sounds the -nn appears in the shape of -nn- in Osco-Umbrian and -nd- in Latin, nor whether this group of sounds, whatever it was (possibly -ny-), became -nd- before it became -nn-.

5. Final a became o in both Oscan (b) and Umbrian (often written u), e.g. Oscan rila = Lat. sia; Umb. adro (nom. pl. neut.) = Lat. atra.

6. Italic e became closer in Osco-Umbrian; in the Oscan alphabet it is written e by a scribes, which is best restored: (although the misleading symbol 0 with an accent upon it is frequently used). In the Umbrian alphabet (see IGUVIUM) it is variously written e and i, and in the Latin alphabet, when used to write Oscan and Umbrian, we have a vulgarism, e.g. Osc. besdeuls, Lat. legatis, but ligs in (Latin alphabet) = Lat. legibus; Umb. trem and trj = Lat. tres; N. Osc. sefet = Lat. sibi.

7. An original short i in Osco-Umbrian became identical in quality, though not in quantity, with the vowel just described, and is written with just the same symbols in all the alphabets, e.g. Osc. piil. Umb. ped = Lat. quid.

8. Precisely analogous changes happened with Italic D and 0; the resulting vowel being denoted in Oscan alphabet both by u and by 0 (V), in Umbrian alphabet by u, in Latin alphabet by o.

It is well to add here one or two other characteristics in which Oscan is more primitive, not merely than Latin, but even than Umbrian.

(o) Oscan retains z between vowels, whereas both in Latin and Umbrian it became r. In Oscan it seems to have become voiced, as it is represented by z in Latin alphabet, e.g. gen. pl. fem. epamnans, "rerum;": exan in Oscan alphabet exan, pres. infin. "esse; merits"

(b) Oscan retains the diphthongs ai, ei, oi, ou (representing both original cv and ov) and an even in unaccented syllables, e.g. abl. pl. feithis, muiis; dat. pl. diampeis, "lymphis; inan. deicim dieres; merits"

(e) Oscan retains final, d, e.g. abl. masc. sing. dolad = Lat. dalo.

(B.) Morphology.—1. In nouns. (a) Considerable levelling has taken place between the consonantal and the -e- stems; thus the gen. sing. masc. of Osc. teorem (neut. = Lat. "tara") is feeris, just like that of the consonantal stem lungis, gen. lungines. Conversely we have gen. sing. masc. lungis, e.g. Osc. Labius, Lat. distennite, stem of a vulgar alphabet: Gen. sing. masc. dolad.

(b) In the ë-stems and the e-stems we have several primitive forms which are obscured in Latin, e.g. gen. sing. fem. eiisus, "peuciae; gen. pl. masc. Niecohunum, "Nolanorum;" and the locutive very confusing case in both declensions, e.g. Osc. leret; in Latin, "in via;" pilad.

11. In verbs. (a) The formation of the infinitive in -um, e.g. Osc. esam, Umb. erom, "esse;" opsam, "operari, facere; (cf. art LATIN LANGUAGE, § 32); (b) The formation of the future, and future indicative forms. Oscan (disturb, "deveste, lirabit"; consecutum (n), "consequent; Umb. feret, feret; fut. perf. Osc. fam setup, "ferrer; Osc. and Umb. just, "ferrer; Umb. fester, femester, "ferrer, femester; Osc. and Umb. just, femester; (c) Several new methods of forming the perfect from vowel stems, e.g. the Oscan and Umbrian f-perfects. Osc. ist sing. perf. manum, "mandum; 3rd sing. sanaanand, "mandat, imperfect; 3rd pl. Osc. iufaans, "fuerant (cf. Umb. perf.subj., passive imperative, plufr, "plumum sit;"

1. Other formation occurs frequently in Oscan (from a verbs), whose origin is obscure. In this the perfect characteristic is it, e.g. prifetfrat, "probandit; (d) The peculiar and interesting impersonal or semi-personal forms which ultimately developed into a full passive, e.g. Osc. sabrefi, "sacrerunt alios; governing an accusative; Umb. ferat, "ferat alios;" (see the section on the passive under Latin Language).

(C.) Syntax.—It may be said generally that there are very few if any peculiarities in the syntax of the Oscan and Umbrian inscriptions as compared with Latin usage, though a large number of familiar Latin idioms appear, such as the abl. absolute; the abl.

...
of circumstance, the genitive in judicial phrases, the use of the neut.
adj, as an abstract substantive, e.g. Oscen vulgatum, "optimum pub.
rum," i.e. "optima rei publicae ratio." In verbal forms the
same use of the gerundive with the noun to represent the
total verbal action, e.g. Umb. ocrer behaner paca, "arcs pincade
causas," in C. D. Buck's Ocean and Umbrian Grammar (U.S.A.,
1894). R. S. Conway, The Italic Dialects, vol. ii. (Cambridge,
1897), gives a fuller account of the alphabets and their history, a
Conspicuum of the Accidence and an account of the Syntax at some
length. [R. S. C.]

OSCAR I. (1799-1859), king of Sweden and Norway, was the
son of General Bernadotte, afterwards King Charles XV. of
Sweden, and his wife Eugénie Désirée Clary, afterwards Queen
Desideria. When in August 1810, Bernadotte was elected
crown prince of Sweden, Oscar and his mother removed from
Paris to Stockholm (June 511). From Charles XIII. the lad
received the title of duke of Södermanland (Sudermania). He
quickly acquired the Swedish language, and, by the time he
reached manhood, had become a general favourite. His very
considerable native talents were developed by an excellent
education, and he soon came to be regarded as an authority on
all social-political questions. In 1839 he wrote a series of articles
on popular education, and (in 1841) an anonymous work, Om
Straf och straffanstalter, advocating prison reforms. Twice
during his father's lifetime he was viceroy of Norway. On the
19th June, 1844, he succeeded his eldest brother, Prince
of Eugène de Beauharnais, duke of Leuchtenberg, and grand-
daughter of the empress Josephine. In 1838 the king began to
suspect his heir of plotting with the Liberal party to bring about
a change of ministry, or even his own abdication. If Oscar
did not actively assist the Opposition on this occasion, his dis-
approbation of his father's despotic behaviour was notorious,
though he avoided an actual rupture. Yet his liberalism was
of the most cautious and moderate character, as the Opposition,
shortly after his accession (March 8th, 1844), discovered to their
great chagrin. He would not hear of any radical reform of the
cumbrous and obsolete constitution. But one of his earliest
measures was to establish freedom of the press. Most of the
legislation during Oscar I. 's reign aimed at improving public
morals and discipline, and the power of the government was
granted to him in 1857, when the king. He was of the opinion
that he had promoted the material prosperity of the kingdom more
than any of his predecessors. In foreign
affairs Oscar I. was a friend of the principle of nationality. In
1838 he supported Denmark against Germany; placed Swedish
and Norwegian troops in cantonments in Fünen and North
Schleswig (1840-1859); and mediated the truce of Malmö
(August 26th, 1848). He was also one of the guarantors of the
integrity of Denmark (London protocol, May 8th, 1852). As
early as 1830 Oscar I. had conceived the plan of a dynastic
union of the three northern kingdoms, but such difficulties presented themselves that the scheme had to be abandoned. In 1835 he introduced into his father's cabinet a new policy towards Russia. His fear lest Russia should demand a
stretch of coast along the Varanger Fjord induced him to remain
neutral during the Crimean War, and, subsequently, to conclude
an alliance with Great Britain and France (November 25th,
1855) for preserving the territorial integrity of Scandinavia.
Oscar I. left four sons, of whom two, Carl (Charles XV.) and
Oskar Fredrik (Oscar II.), succeeded to his throne.

See T. Almén, Attten Bernadotte (Stockholm, 1896); and C. E.
Akrell, Minnen från Carl XIV., Oscars I och Carl XV. Läger
(Stockholm, 1884, 1885). Also NORWAY (history) and SWEDEN
(history).

OSCAR II. (1829-1907), king of Sweden and Norway, son of
Oscar I., was born at Stockholm on the 21st January 1829.
He entered the navy at the age of eleven, and was appointed
junior lieutenant in July 1845. Later he studied at a
univer-
sity of Upsala, where he distinguished himself in mathematics.
In 1857 he married Princess Sophia Wilhelmina, youngest
daughter of Duke William of Nassau. He succeeded his brother
Charles XV. on the 18th of September 1872, and was crowned
in the Norwegian cathedral of Drammen on the 18th of July
1872. At his accession he adopted as his motto Bridrefolkens
Val, "the welfare of the brother folk," and from the first he
realized the essential difficulties in the maintenance of the union
between Sweden and Norway. The political events which led
up to the final crisis in 1905, by which the thrones were separated,
are dealt with in the historical articles under NORWAY and
SWEDEN. But it may be said that the peaceful solution eventually
adopted could hardly have been attained but for the tact
and patience of the king himself. He declined, indeed, to permit
any prince of his house to become king of Norway, but better
relations between the two countries were restored before his
death, which took place at Stockholm on the 8th of December
1907. His acutely intelligent and his aloofness from the dynastic
considerations affecting most European sovereignties gave the
king considerable weight as an arbitrator in international
questions. At the request of Great Britain, Germany and the
United States in 1889 he appointed the chief justice of Samoa,
and he was again called on to arbitrate in Samoan affairs in 1899.
In 1897 he was empowered to appoint a fifth arbitrator if
necessary in the Venezuelan dispute, and he was called in to act as
umpire in the Anglo-American arbitration treaty that was
quashed by the senate. He won many friends in England by his open speech and generous support of Great Britain at the time
of the Boer War (1899-1902), expressed in a declaration printed in
The Times of the 2nd of May 1900, when continental opinion was
against the war.

Himself a distinguished writer and musical amateur, King
Oscar proved a generous friend of learning, and did much to
courage the development of education throughout his
dominions. In 1858 a collection of his lyrical and narrative
poems, Memorialia of the Swedish Fleet, published anonymously,
obtained the second prize of the Swedish Academy. His "Con-
tributions to the Military History of Sweden in the Years 1711,
1712, 1713," originally appeared in the Annales of the Academy,
and were printed separately in 1865. His works, which in-
cluded his speeches, translations of Herder's Cid and Goethe's
Torquato Tasso, and a play, Castle Cronberg, were collected in
two volumes in 1875-1876, and a larger edition, in three volumes,
appeared in 1885-1888. His Easter hymn and some other
works were included in a collection of Scandinavian literature,
His Memoirs of Charles XII. were translated into English in
1879. In 1883 he published his Address to the Academy of Music,
and a translation of one of his essays on music appeared in
Literature on the 10th of May 1900. He had a valuable collection
of printed and MS. music, which was readily accessible to the
historical student of music.

His eldest son, Oscar Gustavus Adolphus, duke of Wärmland
(b. 1838), succeeded him as Gustavus V. His second son, Oscar
(b. 1859), resigned his royal rights on his marriage in 1888
with a lady-in-waiting, Fröken Eba Munck, when he assumed
the title of Prince Bernadotte. From 1892 he was known as
Count Wisborg. The king's other sons were Charles, duke of
Norway (b. 1867), who married Princess Ingeborg of Denmark; and
Engelbert, duke of Neuburg (b. 1868), well known as an
artist.

OSCEOLA (a corruption of the Seminole As-se-he-ho-lar,
meaning black drink) (c. 1804-1838), a Seminole American
Indian, leader in the second Seminole War, was born in Georgia,
near the Chattahoochee river. His father was an Englishman
named William Powell; his mother a Creek of the Red Stick
or Mikasuki division. In 1808 he removed with his mother
to northern Florida. When the United States commissioners
negotiated with the Seminole chiefs the treaties of Payne's
Landing (9th of May 1823) and Fort Gibson (28th of March
1835) for the removal of the Seminole to Arkansas, Osceola
seized the opportunity to lead the opposition of the young
warriors, and declared to the U.S. agent, General Wiley Thomp-
son, that any chief who prepared to remove would be killed. At the Agency (Fort King, in Marion county) he became more violent, and in the summer of 1835 Thompson put him in irons. From this confinement he obtained his release by a profession of penitence and of willingness to emigrate. Late in November 1835 he murdered Charley Emathla (or Emathla), a chief who was preparing to emigrate with his people, and on the 28th of December he and a few companions shot and killed General Thompson. On the same day two companies of infantry under Major Francis L. Dade were massacred at the Wahoo Swamp near the Withlacoochee river, while marching from Fort Brooke on Tampa Bay to the relief of Fort King. In a battle fought three days later at a ford of the Withlacoochee, about 100 men were killed or wounded. But the detachment, and although the Indians and negroes were repulsed by troops under General Duncan L. Clinch (1787–1840), they continued, with Osceola as their most crafty and determined leader, to murder and devastate, and occasionally to engage the troops. In February 1836 General Edmund P. Gaines (1777–1849), with about 1100 men from New Orleans, marched from Fort Brooke to Fort King. When he attempted to return to Fort Brooke, because there were not the necessary provisions at Fort King, the Indians disputed his passage across the Withlacoochee. In the same year Generals Winfield Scott and Richard K. Call (1791–1862) conducted campaigns against them with little effect, and the year closed with General Thomas Sidney Jesup (1788–1860) in command with 5000 troops at his head, and the town of Pensacola, which were hight up as General Jesup’s country from the Withlacoochee country and were pursuing them southward toward the Everglades when several chiefs expressed a readiness to treat for peace. In a conference at Fort Dade on the Withlacoochee on the 6th of March 1837 they agreed to cease hostilities, to withdraw south of the Hillsborough river, and to prepare for emigration to Arkansas, and gave hostages to bind them to their agreement. But on the 2nd of June Osceola came to the camp at the head of about 200 Mikasuki (Micosukes) and effectually the flight of all the Indians there, about 700 including the hostages, to the Everglades. Hostilities were then resumed, but in September Brigadier General Joseph M. Hernandez captured several chiefs, and a few days later there came from Osceola a request for an interview. This was granted, and by command of General Jesup he was taken captive at a given signal and carried to Fort Moultrie, at Charleston, South Carolina, where he died in January 1838. The war continued until 1842, but after Osceola’s death the Indians sought to avoid battle with the regular troops and did little but attack the unarmed inhabitants.

See J. T. Sprague, The Origin, Progress and Conclusion of the Florida War (New York, 1848).

OSCHATZ, a town in the kingdom of Saxony, in the valley of the Döllnitz, 36 m. N.W. of Dresden, on the trunk railway to Leipzig. Pop. (1905) 10,854. One of its three Evangelical churches is the handsome Gothic church of St. Aegidius, with twin spires. Sugar, felt, woolens, cloth and leather are manufactured, and there is considerable trade in agricultural produce. Four miles west lies the Kolmberg, the highest eminence in the north of Saxony.

See C. Hoffmann, Historische Beschreibung der Stadt Oschatz (Oschatz, 1872–1874); and Gurlitt, Bau- und Kunstdenkmäler der Amtschafts- schaft Ostzsch (Dresden, 1905).

OSCHERSLEBEN, a town of Germany, in the Prussian province of Saxony, on the Bode, 24 m. by rail S.W. of Magdeburg, and at the junction of lines to Halberstadt and Jerichow. Pop. (1905) 13,747. Among its industrial establishments are sugar-refineries, iron-foundries, breweries, machine-shops and brick works. Osschersleben is first mentioned in 803, and belonged in the later middle ages to the bishops of Halberstadt.

OSCILLA, a word applied in Latin usage to small figures, especially the points or tops of branches or of faces. As the oscilla swung in the wind, oscilare came to mean to swing, hence in English "oscillation," the act of swinging backwards and forwards, periodic motion to and fro, hence any variation or fluctuation, actual or figurative. For the scientific problems connected with oscillation see MECHANICS and OSCILLOGRAPH.

Many oscilla or masks, representing the head of Bacchus or of different rustic deities, are still preserved. There is a marble oscillium of Bacchus in the British Museum. Others still in existence are made of earthenware, but it seems probable that wax and wood were the ordinary materials. Small rudely shaped figures of wool, known as pilae, were also hung up in the same way as the oscilla.

The festivals at which the hanging of oscilla took place were: (1) the Palm Sunday, when the effigies of the deities were carried in procession, and in the country festivals of the tutelary deities of the pagi; both took place in January. Here the oscilla were hung on trees, such as the vine and the olive, oak and the pine, and represented the faces of the deities. These effigies were of wood or other material, and were associated with the signs of soil (Virg. Georg. ii. 382–396). (2) The Feriae Latinae; in this case games were played, among them swinging (oscilatio); cf. the Greek festival of Aëra (see Ergone). Festus (s.v. Osculum, ed. Müller, p. 194) says that this swinging was called oscillatio because the singers masked their faces (os celare) out of shame. (3) At the Compitalia, Festus says (Paul. ex Fest. ed. Müller, p. 239) that pilae et effigies variæ et multæbres made of wool were hung at the cross-way of the Laces, the effigies being those of the slaves of the family, the effigies that of the children; the purpose being to induce the Laces to spare the living, and to be content with the pilae and images. This has led to the generally accepted conclusion that spectacles of hanging oscilla were a survival of the old practice of expiating human sacrifice. There is also no doubt a connexion with lustration by the purifying with air.

OSCILLOGRAPH. In connexion with the study of alternating or varying electric current, appliances are required for determining the mode in which the current varies. An instrument for exhibiting optically or graphically these variations is called an oscillograph, or sometimes an ondograph. Several methods have been employed for making observations of the form of alternating current curves—(1) the point-by-point method, ascribed generally to Jules Joubert; (2) the stroscopic methods, of which there are two—transilluminated (P. E. B. Rose, and E. Hospitalier, etc.); (3) methods employing a frequency galvanometer or oscillograph, which originated with A. E. Blondel, and are exemplified by his oscillograph and that of W. Duddell; and (4) purely optical methods, such as those of I. Fröhlich and K. F. Braun.

In the point-by-point method the shaft of an alternator, or an alternating current motor driven in step with it, is furnished with an insulating disk having a metallic slip inserted in its edge. Against two or more of these disks are connected conductors (the connections are made with the help of a condenser). The wave of the alternating current may be brought to the condenser by the contact of the slip at any instant during the phase of the alternating current. This contact may be made to close the circuit of a suitable voltmeter, or to charge a condenser used for this purpose. Thus the wave of the alternating current may be directly measured by a condenser which cannot be the average or effective voltage of the alternator, but the instantaneous value of the electromotive force corresponding to that instant during the phase, determined by the position of the rotating contact slip in reference to the poles of the alternator. If the contact springs can be moved round the disk so as to vary the instant of contact, we can plot out the value of the observed instantaneous voltage of the machine or circuit in a wavve curve, showing the wave form of the electromotive force of the alternator. This process is a tedious one, and necessarily only gives the average form of thousands of different alternations.

In the Hospitalier ondograph, a synchronous electric motor drives, with its shaft, a second periodic current in the circuit. The rotating contact slip is connected to the cylinder of insulating material having a metallic slip let into its edge. This cylinder is driven at a slightly lower speed than that of the synchronism. Three springs press against the cylinder and make contact for a short time during each revolution, so that a condenser is charged by the circuit at an assigned instant during the alternating current phase, and then subsequently connected to a voltmeter. This process, so to speak, samples or tests the varying electromotive force of the alternating current at one particular instant during the phase and measures it on a voltmeter. Owing to the fact that the cylinder is losing or gaining slightly in speed on the circuit periodicity, the voltmeter goes slowly, say in one minute, through all the phases

of voltage which are performed rapidly during each period by the alternating current. The voltmeter needle may then be made to record its variations graphically on a drum covered with paper and so to delineate the wave form of the current. The process is analogous to the optical experiment of looking at a quickly rotating wheel or gallon, or through a disk rotating faster or slower than the object observed. We then see the engine going through all its motions but much more slowly, and can follow them easily. In another experiment, a bulbous condenser is placed on the shaft of an alternator, or of a synchronous motor driven by the alternating current under test. A pair of contact springs are slowly shifted over so as to close the circuit at successive instants during a complete cycle. The electromagnetic force so selected is balanced against the steady potential difference produced between a fixed and a sliding contact on a wire traversed by another steady current, and if there is any difference between this and the potential difference, and the instantaneous potential difference balanced against it, a relay is operated and sets in action a motor which shifts the contact point along the potentiometer wire and so restores the balance. This contact point also carries a pen, which, moving over a revolving drum covered with paper, as the brushes are slowly shifted over on the revolving contact so as to select different phases of the alternating electromagnetic force, the pen follows and draws a curve delineating the wave form of that electromagnetic force or current. An instrument devised by E. B. Rosa is not very different in construction. A commutator method has also been devised by T. R. Lyle (Phil. Mag., November 1903, 6, 517) in which at an assigned instant during the phase a sodium lamp is made from the periodic current and measured on a galvanometer.

The oscillographs of A. E. Blondel and W. Duddell operate on a different principle. They consist essentially of a galvanometer of which the needle or coil has such a short natural period of time that it can follow all the variations of a current which runs through its cycle in say 1/5th second. This needle or coil must be so damped that when the current is cut off it returns to zero at once without overshooting the mark. By means of an attached mirror and reflected ray of light the motion of the movable system can be indicated on a screen. This ray is also given a periodic motion of the same frequency by reflection from a separate oscillating mirror so as to make the two motions at right angles to one another, and thus we have projected on the screen a bright line having the same form as the periodic current being tested. In W. Duddell's oscillograph the galvanometer part consists of an electromagnet in the field of which is stretched a loop of very fine wire. To this is attached a mirror; hence, if a current goes up one side of a loop and down another, the wires are oppositely displaced in the field. The loop and mirror move in a cavity full of oil to render the system dead-beat. A ray of light is reflected from this mirror and from another mirror which is rocked by a small motor driven off the same circuit, so that the ray has two vibratory motions imparted to it at right angles, one a simple harmonic motion and the other a motion imitating the variation of the current or electromagnetic force under test. This ray can be received on a screen or photographic plate, and thus the wave form of the current is recorded. In the Duddell oscillograph it is usual to place a pair of loops in the magnetic field, each with its own mirror, so that a pair of curves can be delineated at the same time, and if there is any difference in phase between them, it will be detected. Thus we can take two curves, one showing the variation of the current at the end of an inductive circuit, and the other the current flowing through the circuit. In one form of Blondel's oscillograph, the vibrating system is a small magnetic needle carrying a mirror, but the principle on which it operates is the same as that of the instrument above described. The oscillograph can be made to exhibit optically the form of the current curve in non-cyclical phenomena, such as the discharge of a condenser. In this case the large vibrating mirror must be oscillated by a current from an alternator, on the shaft of which is a disk of non-conducting material with brass slips let into it and so arranged with contact brushes that in each period of the alternator a contact is made between the brush and the slip of disk. This produces a deflection of the galvanometer needle, and each deflection is followed by a corresponding deflection of the mirror. By connecting up in series with the galvanometer a special instrument which can follow the variations of a current, the mirror which reflects a ray of light on to a screen or photographic plate as in the Duddell oscillograph.

Finally, purely optical methods have been employed. Braun devised a form of cathode ray tube, consisting of a vacuum tube having a narrow tubular portion and a bulbous end. The cathode terminal is connected to the negative pole of an electrostatic machine, such as a Wimshurst or Voss machine, giving a steady pressure. A cathode discharge is projected through two small holes in plates in the narrow part of the tube on a fluorescent screen at the end of the enlarged end, and the cathode ray or pencil depicts on it a small bright greenish patch of light. If a pair of coils of wire through which an alternating current is passing are placed on either side of the tube, just beyond one of the plates with a hole in it, the field causes a periodic displacement of the cathode ray and elongates the patch of light into a bright line. If this patch is also given a displacement in the direction of right angles by examining it in a steadily vibrating mirror, we see a wavy or oscillatory line of light which is an optical representation of the wave form of a current in the coils embracing the Braun tube.

3 See Assoc. Franc. pour l'Avance des Sciences (1895), for a paper on oscillographs describing Blondel's original invention of the oscillograph in 1891.
4 Electrician (1897), 39, 636.
O'SHANASSY, SIR JOHN (1818-1883), British colonial statesman, was born in 1818 at Holycross Abbey, near Thurles, County Tipperary, his father being a land surveyor. He married in 1839, and the same year emigrated to the Port Phillip district of New South Wales, where he was for some time engaged in farming, and subsequently commenced business in Melbourne. Dr Geoghegan, afterwards Roman Catholic bishop of Adelaide, induced him to take part in public affairs. He was one of the founders, and later the president, of the St Patrick's Society of Melbourne, and represented the Roman Catholic body on the denominational board of education. When Port Phillip was separated from New South Wales in 1851 and became the colony of Victoria, O'Shanassay was returned to the Legislative Council as one of the members for Melbourne. A few weeks after the new colony began its independent existence gold was discovered on the Ballarat plains, but it was some years before the difficulties were overcome. The legislature was composed partly of elected representatives, and partly of nominees appointed by the governor in council. The great natural ability of O'Shanassay forced him to the front, and for some time the policy of the country was virtually shaped by him and by Mr (afterwards Sir) W. F. Stawell, the attorney-general. It was very much owing to the strong position taken by O'Shanassay that the Legislative Council was allowed to control not only the ordinary revenue raised by taxation, but also the territorial revenue derived from the sale and occupation of crown lands. From that date the Legislative Council, led by O'Shanassay, became virtually supreme. After the Ballarat riots in 1854, O'Shanassay was one of the members of a commission appointed to inquire into the condition of the gold-fields. The commission's report was the foundation of the mining legislation which, initiated in Victoria, was gradually followed by all the Australasian colonies. O'Shanassay, together with Sir Andrew Clarke, was one of the framers of the responsible government constitution. Under this constitution O'Shanassay was returned in 1856 to the Legislative Assembly for Melbourne and Kilmure, but took his seat for the latter constituency. Early in 1857 the Haines ministry, the first formed after the concession of responsible government, was defeated, and O'Shanassay formed a ministry of which he became the premier. But he was defeated after holding office for little more than six weeks. He returned to power in 1858 as chief secretary and premier. One of the first duties of the new ministry was to inaugurate the system of railways, and to raise the foundation funds for their construction. O'Shanassay decided to loan a loan of eight millions sterling through the instrumentality of six of the Melbourne banks, and he began the series of borrowings by the Australian governments which subsequently attained such large proportions. In 1859 the ministry resigned, but in August 1867 O'Shanassay formed his third administration. During the two years that it held office the government passed an Education, a Local government, a Civil Service and a Land Act. The object of this last act was to abolish the system of selling the crown lands by auction, and to substitute another which insisted rather upon residence and cultivation than upon obtaining the highest possible price. The act did not carry out all the intentions of its framers, but it was a step in the right direction. The O'Shanassay government was defeated in June 1863, and its chief never again succeeded in regaining office. He did not stand at the general election of 1866, and paid a visit to Europe. In 1867 he returned to Victoria, and was elected to the Legislative Council. In 1870 he was created C.M.G., and in 1874 K.C.M.G. In the latter year he resigned his seat in the council, and did not re-enter public life until 1877, when he was returned to the Assembly for Belfast. His strongly expressed Conservative opinions and his devotion to the interests of the Roman Catholic church impaired his influence in the legislature, which had become extremely democratic during the eleven years that he had been absent from it; and although Sir John was a fearless critic of the policy of the government, he never succeeded in defeating it. He had a singularly comprehensive grasp of all constitutional questions, was an eloquent speaker and an ardent free-trader. He retired from parliament in 1880, and died in 1883.

O'SHAUGHNESSY, ARTHUR WILLIAM EDGAR (1844-1881), English poet, was born in London on the 14th of March 1844, and at the age of seventeen obtained the first Lord Lytton, who took a peculiar interest in him, the post of transcriptor in the library of the British Museum. Two years later he was appointed to be an assistant in the natural history department, where he specialized in ichthyology. But his natural bent was towards literature. He published his Epic of Women in 1870, Lays of France, a free version of the Lais de Marie de France, in 1872, and Music and Moonlight in 1874. In his thirtieth year he married a daughter of John Westland Marstow, and during the last seven years of his life printed no volume of poetry. Songs of a Worker was published posthumously in 1881, O'Shaughnessy dying on the 30th of January in that year from the effects of a chill upon a delicate constitution. O'Shaughnessy was a true singer; but his poems lack importance in theme and dignity in thought. His melodies are often magnificent; and, as in The Fountain of Tears, the richness of his imagery conceals a certain vagueness and indecision of the verse by the faculty. He was very careful in the selection of words, and in the use of repetition and echo, by which he secured effects which for haunting melody are almost inimitable. His spirit is that of a mild melancholy, drifting helplessly through the realities of life and spending itself in song. By some critics he has been disparaged, but reparation was done to his memory by Francis Turner Palgrave, who, in the second series of the Golden Treasury, said with some exaggeration that his metrical gift was the finest, after Tennyson, of any of the later poets, and that he had "a haunting music all his own."

OSHAWA, a manufacturing town and port of entry of Ontario county, Ontario, Canada, on Lake Ontario and the Grand Trunk railway, 30 m. E. of Toronto. Pop. (1901) 4304. It contains flour, woolen and grist-mills, piano, farm implement and carriage factories, foundries, tanneries, canning factories, &c. There are a ladies' college and good schools.

OSHIMA, a group of three small islands belonging to Japan, lying southwards of Kinsuhi, in 30° 50' N. and 130° E. Their names, from west to east, are Kuroshima, Iwo-shima and Taka-shima. Kuro-shima rises to a height of 2475 ft., and Iwo-shima has an active volcano 2480 ft. high. These islands are not to be confounded with Oshima, the most northerly island of the Izu-noshichito, or with the northern group of the Luchu Islands. There are several other islands of the same name in Japan, Oshima signifying "big island." One of the best known lies off the Kii promontory, and has been the scene of many maritime disasters.

OSHKOSH, a city and the county-seat of Winnebago county, Wisconsin, U.S.A., about 75 m. N.N.W. of Milwaukee, on the W. shore of Lake Winnebago at the mouth of the Upper Fox river. Pop. (1900) 28,284, of whom 7396 were foreign-born (including 4500 from Germany), and 16,012 of foreign parentage (including 16,625 of German and 1015 of Bohemian parentage); (1910 census) 33,662. Oshkosh is served by the Chicago, Milwaukee & St Paul, the Chicago & Northwestern and the Milwaukee, St Paul & Sault Ste. Marie railways, by river steamboat lines connecting with other Fox River Valley cities, with the Wisconsin river at Portage, and with the Great Lakes at Green Bay, and by interurban electric lines connecting with Fond du Lac on the S., Green Bay on the N. and Omro on the W. The city lies on both sides of the Fox river, here spanned by six steel bridges, and stretches back to Lake Butte des Mors, an expansion of the Fox. North Park (60 acres), on the lakefront,
OSIANDER—OSIER

is the most noteworthy of its parks; and there are Chautauqua grounds on the lake front. Yacht races take place annually on Lake Winnebago. Among the public buildings are the City Hall, Post Office, Winnebago County Court House, Public Library (22,000 volumes). Oshkosh is the seat of a State Normal School (1871), the largest in the state. The principal industries are the manufacture of lumber and of lumber products, although the former, which was once of paramount importance, has declined with the cutting of neighbouring forests. In 1905 the value of the city’s factory product was $8,796,705, the lumber, timber and planing mill products being valued at $4,671,003, the furniture at $751,511 and the waggons and carriages at $175,935. Oshkosh is an important wholesale distributing centre for a large part of central Wisconsin. Farming and dairying are important industries in the vicinity.

Under the French régime the site of Oshkosh was on the natural route of travel for those who crossed the Fox-Wisconsin portage, and was visited by Marquette, Jollet and La Salle on their way to the Mississippi. There were temporary trading posts here in the 18th century. About 1827, the first permanent settlers came, and in 1830 there were a tavern, a store and a ferry across the river to Algoma, as the S. side of the river was at first called. The settlement was first known as Saukeer, but in 1840 its name was changed to Oshkosh in honour of a Menominee chief who had befriended the early settlers and who lived in the vicinity until his death in 1856. The real prosperity of the place began about 1845 with the erection of two saw mills; in 1850 Oshkosh had 1400 inhabitants, and between 1860 and 1870 the population increased from 6086 to 12,663. In July 1874 and April 1875 the city was greatly damaged by fire.

OSIANDER, ANDREAS (1408-1552), German reformer, was born at Gunzenhausen, near Nuremberg, on the 19th of December 1498. His German name was Heiligmann, or, according to others, Hosemann. After studying at Leipzig, Altenburg and Ingolstadt, he was ordained priest in 1520 and appointed Hebrew tutor in the Augustinian convent at Nuremberg. Two years afterwards he was appointed preacher in the St Lorenz Kirche, and about the same time he publicly joined the Lutheran party, taking a prominent part in the discussion which ultimately led to the adoption of the Reformation by the city. He married in 1525. He was present at the Marburg conference in 1529 at the Augsburg diet in 1530 and at the signing of the Schmalkaldic articles in 1533, and took part in other public transactions of importance in the history of the Reformation; that he had an exceptionally large number of personal enemies was due to his vehemence, coarseness and arrogance in controversy. The introduction of the Augsburg Interim in 1548 necessitated his departure from Nuremberg; he went first to Breslau, and afterwards settled at Königsberg as professor in his new university at the call of Duke Albert of Prussia. Here in 1540 he published two disputations, the one De lege et evangelio and the other De justificatione, which aroused a controversy still unlosed at his death on the 17th of October 1552. While he was fundamentally at one with Luther in opposing both Romanism and Calvinism, his mysticism led him to interpret justification by faith as not an imputation but an infusion of the essential righteousness of Christ. The controversy continued after his death, and his works, especially the De justificatione, were reprinted and discussed by his followers. His death, which occurred at Königsberg, is recorded as having been caused by the unexpected and violent attack of an illness. He was buried with great pomp in the city’s cathedral. His works are a testimony to his zeal for the Reformation and his friendship for the City of Nuremberg.

OSIER (through Fr. from Late Lat. osaria, auxaria, a bundle of osier or willow twigs), the common term under which are included the various species, varieties and hybrids of the genus Salix, used in the manufacture of baskets. The chief species in cultivation are: Salix triandra (the common osier) and S. triandra, S. amygdalina, S. purpurea and S. fragilis, which botanically are willows and not osiers. The first named with some forty of its varieties, formed until recent times the staple basket-making material in England. It is an abundant cropper, sometimes attaining on low-lying soils 15 ft. in height. Full-topped and smooth, it is by reason of its pithy nature mainly cultivated for this purpose. It is generally used as brown stuff. A number of other varieties, known as the" “upland osiers,” are raised on drier, upland soils, and used for fine work. S. fragilis, with some half-score varieties, is almost exclusively used by market gardeners for bunching greens, turnips and other produce. Owing to the increased demand for finer work much attention has been given (see Basket) in recent years to the cultivation of the more ligeous and tougher species, S. triandra, S. purpurea and S. amygdalina with their many varieties and hybrids.

It is commonly supposed that osiers or willows will prove remunerative and flourish with little attention on any poor, wet, marshy soil. This, however, not the case. No crop responds more readily to careful husbandry and skilful cultivation. For the successful raising of the finer sorts of willows good, well-drained, loamy upland soil is desirable, which before planting should be deeply trenched and cleared of weeds. J. A. Krabe of Prummern near Aschen, the most scientific and practical of German cultivators, the results of whose experiments have been published in his admirable Lehrbuch der rationalen Weidenkultur (Aix-la-Chapelle, 1886, et seq.) went so far as to assert that willows prefer a dry to a wet soil. T. Selby of Otford, Kent, in a report dated the 18th of November 1800 (see Jour. Soc. Arts, 1801, xix., 75) stated that all kinds of willows invariably thrive best on the drier spots of some wet land planted by him. Krabe found that in addition to loam, willows will thrive well on dry ferruginous, sandy ground with a good top soil of about 6 in. in depth; on poor loamy clay, and even on peaty moors.

At any time, from late winter to early spring, the ground may be ploughed through with a "horse plough," or to 18 in. in depth, taken from clean, well-ripened rods. These are firmly set to within 3 to 6 in. of the top in rows, 16 to 20 in. apart and spaced at intervals of 8 to 12 in. Yearling sets are largely planted, but the experiments of Krabe prove that the results of the best Midland and West of England growers confirms the superior productiveness of sets cut from two yearling rods. W. P. Ellmore of Leicester, the most experienced and enterprising of Midland cultivators, preferred to plant his sets in squares, 18 to 20 in. apart, in order to admit of the use of the horse hoe in both directions and a clear play of sun and air. Great care should be exercised in planting lest the bark be fractured, loosened or removed from the wood. The ground should be kept clear of weeds until the wood is well settled, Bi the hip to periodical alluvial floods, manured yearly. The coarse S. viminalis may be raised on lowland soil if not water-logged or marshy, but some attention to trenching and weeding is imperative. Approved methods for this are: trenching and double-skinned sets.

The more valuable kinds are known as: New kind, Black maus, Spaniards, Gilbskins, Long-bud, Long-skin, Lancashire red-bud, French, Italian, Portuguensis and Corsican and some of others local names. A hybrid of S. viminalis and S. triandra, known as Black-top and introduced by Ellmore has been found to produce the heaviest crops on the best Leicestershire grounds.

Cultivation and binding take place in early winter by the fall of the leaf, the crop being known as green whole stuff. The coarser kinds are sorted, cured (dried in the sun and wind) and stacked ready for market. These are known as brown rods. The finer kinds, after the green, cut, rough rods, being washed and de-barked, are peeled or buffed. Two methods of stripping are chiefly practised; from the heads (sets) and from the pit. By the former method the rods are left on the ground until spring advances, when a mall is placed on the head of a cord and the poles or pits, direct from the head and the bark is easily removed by drawing the rods through a bifurcated hand-brake of smooth, well-rounded steel, framed in wood. Improved brakes worked by a treadle strip two rods to the pit. For removing green stuff, rubber bands or the like are used and, for the very smallest, the fingers either bare or protected by linen bands. This method ensures a clean-buttet unfractured rod, but unless great judgment is exercised in selecting the proper time of stripping, the rod will remain rough-skinned and the head may bleed. By the "pit" process the green rods are stood upright in shallow pits of water at a depth of about 6 to 9 in. until the sap rises and growth begins, when they are ready for the brake. The difference between the two methods is that in the one the brake and the butts remain to foul. A third, known as the "pick" system enables the groover to bridge over the interval, and to keep his hands employed, between the end of the "head" and the
beginning of the "pit" strappings. The willows are cut at the first
indication of the sap rising and "cooched" in rotten peelds and
soil at a slight angle, the butts being on the ground, which
should be covered lightly with rotted peelds and by periodical
application of water, fermentation is induced at the bottom, heat is engendered,
the leaves force their way through the covering and peeling may
begin. This is done from May 18th to the middle of July. After strapping, the rods are bleached in the
sun and stored for sale as white. If the rods are to be buffed they are
immersed in large tanks of boiling water from 4 to 6 hours.
When they are taken out, the skins are removed by scrubbing
in sun and air and remain dyed a rich tawny brown or buff colour. Brown rods may also be buffed by sinking them in cold
water which is heated to boiling point, and maintained at that
temperature for a time, the skins then falling off and the rods becoming"matted." If the rods have been bleached,
varieties of S. visonalis are best adapted for this purpose. Osiers or
willows when tined for market vary locally in girth. In the west of
England the "Meadow" osiers (S. v. sennis) of green stuff measure 2 to 45 in. in circumference at 10 in. from
the butt; a bolt of white or brown, 40 in. In the northern and
midland counties the stuff is invariably sold by weight. On
the continent of Europe osiers or willows are bunched in sizes of
one metre in girth at the butts and (except in Belgium) are also sold by
weight.

The cost of planting an acre of fine willows varies greatly; it was estimated
by R. L. and K. Cotterell of Ruscombe, Berks, as follows: trenching
and cleaning ground, £1 2s.; sets, 20,000 at 5s. per 1,000, £5; planting and levelling £1. Hosing, first year, £2;
second years about £5 13s. to £7 5s. to the acre; and to keep the rods "banded" and tied, and should be grubbed
up. The first year's crop, known as the "maiden" crop, is of small value but should be cut and the ensuing years of maturity will
produce a profitable return. It is essential that the cutting be done immediately after the matured. If whitened, the loss in bulk and in rejection being two-thirds, this would produce about 44 bolts, which at £30 per load of 80 bolts, the appreciated market value of 1907, would be worth £16, 10s. The
cost of whitening is 1s. 6d. per bolt, but against this the value lost on that of the rejected Ragged, sold as Brown, should be set off. In years of
abundant crops and short demand, prices have fallen to £2 per
load.

The cost of planting and the outlay for manuring and weeding
during the years of maturity of the crop, are higher in the Midlands and
and the yield was estimated by Elnore at 6 to 10 tons per acre, green, worth from £3 10s. to £6 per ton. White rods, costing
from £5 to £7 5s. per ton, are used for the more ornamental
purposes. Buff rods costing (with coal at 10s. per ton) £5 5s per extra, will be valued from £22 to £25 per ton. From 2 to
3 tons of green are required to produce one ton white or
buff. Wm. Scaling of Notts estimated the entire cost of an osier
plantation at £35 12s. per acre for the first year and the outlay
for the next two years at £7, 5s. and £6, 15s. respectively.
The maiden crop he valued at £8, 12s. and the second and third
years at £18, 11s. 6d. respectively.

A table given by Krabe, based on results obtained for 12 plantations
amounting to 20 hectares (50 English acres) during the years
when the value of produce per French acre (£555 of an acre)
was £6 15s. (by 21st Apr. 1843) the value of the
produce was £8, 19s.; in the 3rd year, £9, 15s.; in the 4th year,
£8, 10s.; in the 5th year, £8, 18s.; in the 6th year, £7, 6s.; in the 7th year, £6, 15s.; in the 8th year, £6, 9s.; in the 9th year,
£6, 7s.; in the 10th year, £6, 10s.; in the 11th year, £5, 11s.,
in the 12th year, £4, 16s.; in the 13th year, £6, 1s.; in the 14th year,
£2, 9s.; in the 15th year, £2, 8s.; in the 16th year, £1, 18s.; in the 17th year, £2, 7s.; in the 18th year, £2, 8s.; in the 19th year,
£1, 11s.; in the 20th year, £1, 9s.

The cultivation of osiers is attended with many disturbing causes—winter
floods, spring frosts, ground venin and insect pests of various kinds, sometimes working great havoc to the crop.

The best comprehensive work on the subject is that by Krabe,
which has passed through several editions. A pamphlet on
the cultivation of osiers in the Fen districts is issued in England by
the Board of Agriculture. (T. O.)

OSIMO (anc. Aquinum, q.v.), a town and episcopal see of the
Marches, Italy, in the province of Ancona, 10 m. S. of that town
by rail. Pop. (1901) 6,404 (town); 18,475 (commune). It is
situated on the top of a hill 830 ft. above sea-level, where there
are numerous pools and a large lake. It is a city with a defensible
wall (2nd century B.C.). The restored cathedral has a portal with
sculptures of the 13th century, an old crypt, a fine bronze font of
the 16th century and a series of portraits of all the bishops
of the see; the town hall contains a number of statues found on
the site of the ancient forum and also a few good pictures. The
castle (1480) was built by Baccio Pontelli. Silk-spinning
and the raising of cocoons are carried on.

OSIRIS, one of the principal gods of the ancient Egyptians. See Egypt, section Egyptian Religion.

OSKALOOSA, a city and the county-seat of Mahaska county, Iowa, U.S.A., about 62 m. S.E. of Des Moines. Pop. (1900) 9,212, of whom 649 were foreign-born and 344 were negroes; (1910 U.S. census) 9,466. It is served by the Chicago, Burlington & Quincy, the Chicago, Rock Island & Pacific, and the Iowa Central railroads, and by interurban electric lines. The city is
built on a fertile prairie in one of the principal coal-producing
regions of the state. At Oskaloosa is held the Iowa yearly meeting of the Society of Friends; and the city is the seat of
the University of Iowa (opened 1873), a Friends' institution, and of the Iowa Christian College (incorporated as Oskaloosa
College in 1856 and the Iowa State Normal in 1870). At
the village of University Park (incorporated in 1860) a suburb
adjoining the city on the E., is the Central Holiness University
(1906; coeducational), where the annual camp meeting of the
National and Iowa Holiness Associations is held. Coal-mining
is the most important industry in the surrounding region. There
are deposits of clay and limestone in the vicinity, and among
the city's manufactures are flour and sewer tile, paving and
building bricks, cement blocks, and snow-removal machines; in 1905
the factory products were valued at $779,854. Oskaloosa was first
settled in 1833; it was selected in 1844 by the county
commissioners as a site for the county-seat, and was chartered as
a city in 1853. It is said to have been named in honour of the
wife of the Indian chief Mahaska (of the Iowa tribe), in whose
honour the county was named; a bronze statue of Mahaska (by
Sherry F. Fry, an Iowa sculptor) was erected here in 1909.

See W. A. Hunter, "History of Mahaska County." in *Annals of
Iowa*, vols. vi.-vii. (Davenport, Iowa, 1868-1869), published by
the Iowa State Historical Society.

OSMAN (USMAN), the usual form of the Arabic name "OTTIMAN, as representing the Turkish and Persian pronunciation
of the name. It is used, therefore, for (1) the founder of the
Osmanli or Ottoman dynasty, Osman I, who took the title of
sultan, ruled in Asia Minor, and died in 1326, and (2) the sixteenth
sultan Osmun, who reigned 1566-1621 (see TURKEY: History).

He was the third Mahomedan caliph see OTTOMAN and CALIPHATE.

OSMAN (1812-1900), Turkish pasha and mushir (field marshal),
was born at Tokat, in Asia Minor, in 1832. Educated at the
military academy at Constantinople, he entered the
cadet school in 1835, and served under Omar Pasha in the Russian War of 1853-56, in Wallachia and the Crimea. Appointed a
captain, in the Imperial Guard, he went through the campaigns of
the Lebanon in 1860 and of Crete in 1867 to 1869, under Mustapha Pasha, when he distinguished himself at the capture of the
convent of Hagia Georgia, and was promoted lieut.-colonel.

He served under Redif Pasha in suppressing an insurrection
in Yemen in 1871, was promoted major-general in 1874, and
of the division in 1875. Appointed to command the army
at Wiidin in 1876 on the declaration of war by Servia, he
defeated Thannhaeufel at Saiitchar and again at Yavor in
July, invaded Servia and captured Alexnatz and Deligor in
October, when the war ended. Osman was promoted to
mushir, and continued in the command of the army corps at
Wiidin. When the Russians crossed the Danube in July 1877,
Osman moved his force to Plevna, and, with the assistance of
his engineer, Tewif Pasha, entrenched himself there on the
right flank of the Russian line of communication, and gradually
made the position a most formidable one. He repulsed the
three general assaults of the Russians on the 20th and 30th
July and the 11th September, inflicting on them great loss—
some 30,000 men in the three battles. He held the position
with his forces closely invested, until the 9th December, when,
compelled by want of food to evacuate the place, he
surrendered and was forced to capitulate. This famous improvised defence
of a position delayed the Russians for five months, and entailed
their crossing the Balkan range in the depth of winter after the
third battle of Plevna. The sultan conferred on Osman the
Grand Cross of the Osmanli in brilliant and the title of "Ghazi"
(victorious), and, when he returned from imprisonment in Russia,
made him commandant of the Imperial Guard, grand-master of the artillery and marshal of the palace. In December 1878 he became war minister, and held the post, with a small break, until 1883. He died at Constantinople, in the palace built for him by the sultan near Yildiz Kosk, on the 14th of April 1884, and his body was buried with great pomp in the Sultan Muhammad Mosque.

**Osmium** [symbol Os], atomic weight 190-9 (O = 16), in chemistry, a metallic element, found in platinum ore in small particles, consisting essentially of an alloy of osmium and iridium and known as osmiridium. It was first obtained in 1803 by Smithson Tennant (Phil. Trans., 1804, 94, p. 411). It may be prepared from osmiridium by fusing the alloy with zinc, the zinc being afterwards removed by distillation. The residue so obtained is then powdered and ignited with barium nitrate, which converts the iridium into its oxide and the osmium into barium osmate. The barium salt is extracted by water and boiled with nitric and sulphuric acids, and the osmiridium volatilises in the form of its tetroxide. As an alternative the osmiridium is fused with zinc, the regulus treated with hydrochloric acid, and then heated with barium nitrate and barium peroxide. After fusion, the mass is finely powdered and treated with cold dilute hydrochloric acid; and when action has finished, nitric and sulphuric acids are added. The precipitated barium sulphate removed, the liquid distilled and the osmiridium precipitated as sulphide. The sulphide is converted into sodium osmichloride by fusion with salt, in a current of chlorine, the sodium salt transformed into ammonium salt by precipitation with ammonium chloride, and the ammonium salt finally heated strongly (H. Sainte-Claire Deville and H. J. Debray, An. min., 1859 [3], 19, 741; see also C. H. Clusius, Chem. Zeit., 1862, 15, p. 142). Wöhler, Pogg. 31, p. 161; E. Leidie and L. Quonquinten, Bull. soc. chim., 1893 (8), 29, p. 801). The tetroxide, OsO₂₄, can be easily reduced by the metal, by dissolving it in hydrochloric acid and adding zinc, mercury, or an alkaline formate to the liquid, or by passing its vapour, mixed with carbon dioxide and monoxide, through a red-hot porcelain tube. The metal has a blue-grey colour, and may be obtained in the crystalline state by solution in tin. Its specific gravity is 21.3-22.48 (Deville and Debray) and its specific heat is 0-9313 (Regnault). It is formed in the electric furnace. In the massive state it is insoluble in all acids, but when freshly precipitated from solutions it dissolves in fuming nitric acid. On fusion with caustic potash, it yields potassium polyosmate, potassium dichromate, potassium tetroxide, and a precipitate of potassium osmate. When heated with chlorine it forms a mixture of chlorides. A colloidal variety was obtained by G. Gutthier and G. Hofmeier (J. prak. Chem. 1895 (2), 71, p. 452) by reducing osmium compounds with hydrazine hydrate in the presence of gum arabic.

Several oxides of osmium are known. The protoxide, OsO₂ results on heating osmium with an excess of the tetroxide. The dioxide, OsO₃, is formed when potassium osmichloride is heated with sodium carbonate in a current of carbon dioxide. The sesquioxide, OsO₅, results on heating osmium with an excess of the tetroxide. The dioxide, OsO₂, is formed when potassium osmichloride is heated with sodium carbonate in a current of carbon dioxide, or by electrolysis of a solution of the tetroxide in the presence of a current of carbon dioxide. It is a reddish smoke, insoluble in acids, but soluble in alkalis. The sesquioxide, OsO₅, is the most important of the several hydrated forms. The osmates, corresponding to the unknown tetroxide OsO₂₄, are red or green coloured salts; the solutions are only stable in the presence of excess of caustic alkali; on boiling an aqueous solution of potassium osmiate it decomposes rapidly into a black precipitate of osmic acid, H₂OsO₄. Potassium osmate, K₂OsO₂₂H₂O, formed when an alkaline solution of the tetroxide is decomposed by alcohol, or by potassium nitrate, crystallizes in red octahedra. It is stable in dry air, but in moist air rapidly decomposes. The tetroxide, OsO₂_, is formed when osmium compounds are heated in air, or with aqua regia, or fused with caustic alkali and nitre. It is obtained as a yellow-brown or coloured mass, obtained from potassium iodide, converting alcohol into acetaldehyde, &c.

**Osmium dichloride**, OsCl₂, is obtained as a dark coloured powder when the metal is heated in a current of chlorine. Its solution in water is deep blue in colour, but the colour changes rapidly to green and yellow. The trichloride, OsCl₃, is only known in solution and is formed by replacing chlorine action on the corresponding halogenosolutions of the tetroxide. A hydrated form of composition OsCl₃.3H₂O has been described. The tetrachloride, OsCl₄, is obtained as a dark red sublimate (mixed with the dichloride) when osmium is heated in dry chlorine. When heated with sodium chloride, it decomposes readily on standing. It combines with the chlorides of the alkali metals to form characteristac double salts of the type OsCl₃MCl₂ (osmichlorides). Potassium osmichloride, K₂OsCl₆, is formed when a mixture of potassium chloride and osmium tetroxide is heated in a current of chlorine, or on adding potassium chloride and alcohol to a solution of the tetroxide in hydrochloric acid. It crystallizes in dark red octahedra, which are almost insoluble in cold water. The hydrochloride, OsCl₃.H₂O, is precipitated by the addition of hydrochloric acid to a solution of the tetroxide. It is a white solid, insoluble in solutions of the alkali chlorides. The atomic weight of the metal has been determined by K. Neubert (Ber., 1888, 21, p. 1839) from the analysis of potassium and ammonium osmichlorides, the values obtained being approximately 191.

Osnabrück, a town and episcopal see of Germany, in the Prussian province of Hanover, situated on the Hase, 70 m. W. of the city of Hanover, 31 m. by rail N.E. of Münster, and at the junction of the lines Hamburg-Cologne and Berlin-Amsterdam. Pop. (1895) 50,580. The older streets contain many interesting examples of Gothic and Renaissance domestic architecture, while the substantial houses of the modern quarters testify to the present prosperity of the town. The old fortifications have been converted into gardens. The Roman Catholic cathedral, with its three towers, is a spacious building of the 13th century, partly in the Romanesque and partly in the Transitional style; but it is inferior in architectural interest to the Marienkirche, a fine Gothic structure of the 14th and 15th centuries. The town hall, a 15th-century Gothic building, contains portraits of some of the plenipotentiaries engaged in concluding the peace of Westphalia, the negotiations for which were partly carried on here from 1644 to 1648. Other important buildings are the museum, erected in 1888-1886 and containing scientific and historical collections; the episcopal palace and the law courts. The lunatic asylum on the Gronerberg occupies the site of an ancient monastery. The town hall can be reached by a train of the N.E. Railway, the journey taking about 1 hour. Justus Möser (1720-1794) and a memorial of the war of 1870-1871. Linen was formerly the staple product, but it no longer retains that position. The manufactures include machinery, paper, chemicals, tobacco and cigars, pianos and beer. Other industries are spinning and weaving. The town has large iron and steel works and there are coal mines in the neighbourhood. A brisk trade is carried on in grain and wood, textiles, iron goods and Westphalian hams, while important cattle and horse fairs are held here.
OSNABURG—OSROENE

See Friederici and Stieve, Geschichte der Stadt Osnabrück (Osnabrück, 1858); and Osnabrücker Archivbuch, edited by F. Philipp and M. Bär (Osnabrück, 1892-1902); and the publications of the Verein für Geschichte und Landeskunde von Osnabrück (Osnabrück, 1882 fol.). For the history of the bishopric see J. C. Möller, Geschichte d. Bisthms Osnabrück (Osnabrück, 1831), and C. Stüve, Geschichte des Hochstifts Osnabrück (Jena, 1872-1882).

OSNABURG, the name given to a coarseish type of plain fabric, originally made from flax yarn. It is now made from either flax, tow or jute yarns—sometimes flax or tow warp with mixed or jute weft, and often entirely of jute. The finer and better qualities form a kind of common sheathing, and the various kinds may contain from 20 to 36 threads per inch and 10 to 15 picks per inch.

OSORIO, JERONYMO (1506-1580), Portuguese historian, was a native of Lisbon and son of the Osvdor Geral of India. In 1529 his mother sent him to Salamanca to study civil law, and in 1525 he went on to Paris to study philosophy, and there became intimate with Peter Fabre, one of the founders of the Society of Jesus. Returning to Portugal, Osorio next proceeded for theology to Bologna, where he made such a name that King John III. invited him in 1536-1537 to lecture on scripture in the reorganized university of Coimbra. He returned to Lisbon in 1540, and acted as secretary to Prince Luiz, and as tutor to his son, the prior of Crato, obtaining also two benefices in the diocese of Vizeu. In 1542 he was in Lisbon his treatise De nobilitate. After the death of Prince Luiz in 1553, he withdrew from court to his churches. He was named archdeacon of Evora in 1556, and much against his will became bishop of Silves in 1554. The Cardinal Prince Henry, who had bestowed these honours, desired to employ him at Lisbon in state business when King Sebastian took up the reins of power in 1568. But Osorio preferred to slip himself on the ground of his political duties, though he showed his zeal for the commonwealth by writing two letters, one in which he dissuaded the king from going to Africa, the other sent during the latter's first expedition there (1574), in which he called on him to return to his kingdom. Sebastian looked with disfavour on opponents of his African adventure, and Osorio found it prudent to leave Portugal for Parma and Rome on the pretext of a visit ad limina. His scruples regarding residence, and the appeals of the king and the Cardinal Prince, prevented him enjoying for long the hospitality of Pope Gregory XIII., and he returned to his diocese and died at Tavira on the 20th of August 1580. An exemplary prelate, a learned scholar and an able critic, Osorio gained a European reputation on the strength of his works, and the fame of the studious throughout Christendom, and the perfection of his prose style caused him to be named by contemporaries "the Portuguese Cicero." His well-stocked library was carried off from Faro when the earl of Essex captured the town in 1596, and many of the books were bestowed on the Bodleian at Oxford.

His principal works written in Latin include: (1) De gloria et nobilitate civile et christian., an English version of which by W. Bird was published in London in 1576. (2) De justitia. (3) De rebus Emmanuelis (1586), a history of the reign of King Emmanuel which is little more than a translation of the chronicle on the same subject by Damilao de Goes. Osorio's book was translated into Portuguese by F. M. do Nascimento (q.v.), into French by J. Crispin (2 vols., Geneva, 1610), and an English paraphrase in 2 vols. by J. Gibbes came out in London in 1573. His Opera omnia were published in two large folios of 1692. Two of his political treaties have been translated into English, his Epistle to Elizabeth Queen of England by R. Shacklock (Antwerp, 1565), and his Confutation of M. W. Huddon by J. Fen (Louvain, 1568). His Portuguese epistles, written during the two preceding moments, were published in Lisbon in two editions in 1818 and 1819, and in Paris in 1859. For his biography see Obras de D. F. A. Lobo, bishop of Vizeu, i. 293-301 (Lisbon, 1848).

OSPREY, or Ospray, a word said to be corrupted from "Ossifrage," Lat. ossifraga, bone-breaker. The Ossifraga of Phyn (H.N. x. 3) and some other classical writers seem to have been the Lämmergery (q.v.); but the name, not applicable in that case, has been transferred to another bird which is no breaker of bones, save incidentally those of the fishes it devours. The osprey is a rapacious bird, of middling size and of conspicuously-marked plumage, the white of its lower parts, and often of its head, contrasting sharply with the dark brown of the back and wings, and, if its upper parts when the bird is seen on the wing. It is the Falconidae. From this the genus Pandion, established by J. C. Savigny (Ois. d’ Egypte, p. 53) as the type of a new species Pandion. It is closely related to the family Falconidae, and is the representative of a separate family, Pandionidae. Pandion differs from the Falconidae not only etymologically, as observed by C. L. Nitzsch, but also osteologically, as pointed out by A. Milne-Edwards (Ois. foss. France, ii. pp. 413, 410). In some of the characters in which it differs structurally from the Falconidae, it agrees with certain of the owls; but the most important parts of its internal structure, as well as of its pterylosis, forbid a belief that there is any near alliance of the two groups. The special characters of the family are the presence of a reversible outer toe, the absence of an afterfeather and the feathering of the tibiae.

The osprey is one of the most cosmopolitan birds-of-prey. From Alaska to Brazil, from Lapland to Natal, from Japan to Tasmania, and in some of the islands of the Pacific, it occurs as a winter-visitor or as a resident. Though migratory in Europe at least, it is generally independent of climate. It breeds equally on the half-tawed shores of Hudson's Bay and on the cays of Honduras, in the dense forests of Finland and on the barren rocks of the Red Sea, in Kamchatka and in West Australia. Among the countries it does not frequent are Iceland and New Zealand. Where, through abundance of food, it is numerous— as in former days was the case in the eastern part of the United States—the nests of the fish-hawk (to use its American name) may be placed on trees to the number of three hundred close together. Where food is scarcer and the species accordingly less plentiful, a single pair will occupy an isolated rock, and jealously expel all intruders of their kind, as happens in Scotland. Few birds lay eggs so beautiful or so rich in colouring; their white or pale ground is spotted, blotched or marbled with almost every shade of purple, orange and red—passing from the most delicate lilac, buff and peach-blossom, through violet, chestnut and crimson, to a nearly absolute black. The fineness with which ospreys defend their eggs and young, in addition to the dangerous situation not infrequently chosen for the eyrie, make the task of robbing the nests difficult.

The term "osprey," applied to the nuptial plumes of the egrets in the feather trade, is derived from the French esprit; it has no real connection with the bird, its use being erroneously to be due to a confusion with "spray." (A. N.)

OSROENE, or Osroene, a district of north-western Mesopotamia, in the hill country on the upper Tigris (Belichus; mod. Nahr Belikh, Bilkich), the tributary of the Euphrates, with its capital at Edessa (q.v.), founded by Seleucus I. About 130 B.C. Edessa was occupied by a nomadic Arab tribe, the Orohie (Plin. v. 85; vi. 25, 117, 120), who founded a small state ruled by their chieftains with the title of kings. After the district was called Orohoeus (thus in the inscriptions, in Pliny and Dio Cassius), which occasionally has been changed into Osroene, in assimilation to the Parthian name Orsos or Chosroes (Khosara). The founder of the dynasty is therefore called Osroes by Procop. Bell. Pers. i. 17; but Orhali or Urhal, son of Hewayi (i.e. "the

Another supposed old form of the name is "Orfraie"; but that is said by M. Rolland (Famme popule. Franc. ii. p. 9, note), quoting M. Suchier (Keszth. rom. Philol. i. 432), to arise from a mingling of two wholly different sources: (1) Orpelargus, Orperragos, Orprios and (2) Ossifraga. "Orfraie" again is occasionally interchanged with Efraie (which, through such dialectical forms as Efreie, Fessiate, is said to come from the Latin prosago). The ordinary French name for the barn-owl, Aluco flammeus (see Owl), According to Skeat's Dictionary (i. p. 408), "Aspere" is the English form; but "Osprey" is given by Cotgrave, and is found as early as the 15th century.

Two good examples of the different localities chosen by this bird for its nest are illustrated in Oatheca Wolleyana, pls. B. & H.
OSROES—OSSORY, EARL OF

snake"), in the chronicle of Dionysius of Tellmahre; he is no historical personality, but the eponym of the tribe. In the Syrian Doctrine of Addai (ed. Philips 1876, p. 46) he is called Arjaw, i.e. "the lion." The kings soon became dependents of the Parthians; their names are mostly Arabic (Bekr, Abgar, Ma'nu), but among them occur some Iranian (Parthian) names, as Pacorus and Phratamaspates. Under Tigranes of Armenia they became his vassals, and after the victories of Lucullus and Pompey, vassals of the Romans. Their names occur in all wars between Romans and Parthians, when they generally inclined to the Parthian side, e.g. in the wars of Crassus and Trajan. Trajan despised the dynasty, but Hadrian restored it. The kings were generally to Greek inscriptions on their coins, but when sided with the Parthians, as in the war of Marcus Aurelius and Verus (A.D. 161-165), an Aramaic legend appears instead. Hellenism soon disappeared and the Arabs adopted the language and civilization of the Arameans. This development was hastened by the introduction of Christianity, which is said to have been brought here by the apostle Judas, the brother of James, whose tomb was shown in Edessa. In 190 and 201 we hear of Christian churches in Edessa. King Abgar IX. (or VIII.) (179-214) himself became a Christian and abolished the pagan cults, especially the rite of castration in the service of Atargatis, which was now punished by the loss of the hands (see Bardesanes, "Book of the Laws of Countries," in Cureton, Spiciliis of Syria, p. 31). His conversion has been transferred to his ancestor Abgar V. in the time of Christ himself, with whom he is said to have exchanged letters and who sent him his miraculous image, which afterwards was fixed over the principal gate of the city (see Abgar; Lipsius, Die edessischen Abgorsage (1886); Dobschütz, Christusbilder (1896)). Edessa now became the principal seat of Aramaic-Christian (Syrian) language and literature; the literary dialect of Syrian is the dialect of Edessa.

Caracalla in 216 abolished the kingdom of Osroene (Dio Cass. 77, 12. 14) and Edessa became a Roman colony. The list of the kings of Osroene is preserved in the Syrian chronicle of Dionysius of Tellmahre, which is checked by the coins and the data of the Greek and Roman authors; it has been reconstructed by A. v. Gutschmid, "Untersuchungen über die Geschichte des Königreichs Osroene," in Mémoires de l'Acad. de St-Petersbourg, t. xxxv. (1887). Edessa remained Roman till it was taken by Chosroes II. in 668; but in 625 Heraclius conquered it again. In 638 it was taken by the Arabs. (Ed. M.)

OSROES (also OSDORES or CHOSROES), the Greek form of the Persian name Khosrau (see CHOSROES). The form Osroes is generally used for a Parthian king who from his coins appears to have reigned from about A.D. 106-129, as successor of his brother Pacorus. But during all this time another king, Vologaeses II. (77-147) maintained himself in a part of the kingdom. Osroes occupied Armenia, and placed Exeardes, a son of Pacorus, and afterwards his brother Parthamasir on the throne. This encroachment on the Roman sphere led to the Parthian war of Trajan. In 114 Parthamasir surrendered to Trajan and was killed. In Mesopotamia a brother of Osroes, Meherdates (Mithradates IV.), and his son Sanatruces II. took the diadem and tried to withstand the Romans. Against them Trajan united with Parthamasir, whom he placed on the throne, when he had advanced to Ctesiphon (116). But after the death of Trajan (117) Hadrian acknowledged Osroes and made Parthamasir king of Edessa (Osroene); he also gave back to Osroes his daughter who had been taken prisoner by Trajan (Dio Cass. 68, 17, 22. 33; Malalas, p. 270 ff; Spartan, Vita Hadr. 5. 13; Pausan. v. 12. 6). But meanwhile Vologaeses II. had regained a dominant position; his coins begin again in 122 and go on to 146, whereas after 121 we have no coins of Osroes existing.

By Procopius, Pers. i. 17, 24, the name of the territory of Osroene is derived from a dynast Osroes, but this is a false etymology (see OSROENE). (Ed. M.)

OSSA (mod. Kissivo or Kissavo), a mountain in the district of Magnesia in Thessaly, between Pelion and Olympus, from which it is separated by the valley of Tempe. Height about 6,400 ft. The Giants are said to have piled Pelion upon it in their attempt to scale Olympus.

OSSETT, a municipal borough in the Morley parliamentary division of the West Riding of Yorkshire, England, 3 m. W. of Wakefield, on the Great Northern and (Horbury and Ossett station) the Lancashire and Yorkshire railways. Pop. (1901) 12,903. It includes the contiguous townships of Ossett, South Ossett and Gawthorpe. The church of the Holy Trinity, a fine cruciform structure in the Early Decorated style, was erected in 1865. Woollen cloth mills, and extensive collieries in the neighbourhood, employ the large industrial population. There are memorial inscriptions in their properties to those of Cheltenham. The municipal borough, incorporated in 1896, is under a mayor, 4 aldermen and 12 councillors. Area 3238 acres.

OSSIAN, OSSIN or OSSIN, the legendary Irish 3rd-century hero of Celtic literature, son of Finn. According to the legend embodied in the Ossianic or Ossinian poems and prose romances which early spread over Ireland and Scotland, Ossian and his Fenian followers were defeated in 283 at the battle of Gabhra by the Irish king Carbery, and Ossian spent many years in fairyland, eventually being baptized by St. Patrick. As Oisin he was long celebrated in Irish song and legend, and in recent years the Irish literary revival has repopularized the Fenian hero. In Scotland the Ossianic revival is associated with the name of James Macpherson (q.v.).

See Celtic literature; also Nutt's Ossian and the Ossianic Literature (1896).

OSSINGTON, JOHN EVELYN DENISON, VISCOUNT (1800-1873). English statesman, was the eldest son of John Denison (d. 1828) of Ossington, Nottinghamshire, where he was born on the 27th of January 1800. Educated at Eton and Christ Church, Oxford, he became member of parliament for Newcastle-under-Lyme in 1823, being returned for Hastings three years later, and holding for a short time a subordinate position in Canning's ministry. Defeated in 1830 both at Newcastle-under-Lyme and the Tower of London, Denison secured a seat as one of the members for Nottinghamshire in 1831; and after the great Reform Act he represented the southern division of that county from 1832 until the general election of 1837. He represented Malton from 1841 to 1857, and North Nottinghamshire from 1857 to 1872. In April 1837 Denison was chosen Speaker of the House of Commons. Re-elected at the beginning of three successive parliaments he retained this position until February 1872, when he resigned and was created Viscount Ossington. He refused, however, to accept the pension usually given to retiring Speakers. In 1827 he had married Charlotte (d. 1889), daughter of William, 4th duke of Portland, but he left no children. He died on the 7th of March 1873, and his title became extinct.

OSSING, a village in Westchester county, New York, U.S.A., 30 m. N. of New York city, on the E. bank of the Hudson river. Pop. (1900) 7039, of whom 1642 were foreign-born; (1910, U.S. census) 11,480. It is served by the New York Central & Hudson River railway, and by river steamboats. It is finely situated overlooking the Tappan Zee, an expansion of the Hudson river, and has excellent facilities for boating, sailing and yachting. The village is the seat of Mount Pleasant Academy (1814), Holbrook School (1866) and St John's School (1843), all for boys, and has a fine public library. The Croton Aqueduct is here carried over a stone arch with an eighty-foot span. At Ossining, near the river front, is the Sing Sing Prison, the best-known penitentiary in the United States. In 1906 a law was enacted providing for a new prison in the eastern part of the state; in place of Sing Sing. The site of Sing Sing, originally part of the Phillipse Manor, was first settled about 1700, taking the name of Sing Sing from the Sin Sink Indians. The village was incorporated in 1813, and was reincorporated, with enlarged boundaries and a considerably increased population, in 1896, the name being changed from Sing Sing to Ossining in 1901.

OSSORY, THOMAS BUTLER, EARL OF (1634-1686), eldest son of James Butler, 1st duke of Ormonde, was born at Killkenny on the 8th or 9th of July 1634. His early years were spent in
Ireland and France, and he became an accomplished athlete and by no means an indifferent scholar. Having come to London in 1652 he was tightly suspected of sympathizing with the exiled royalists, and in 1655 was put into prison by Cromwell; after his release about a year later he went to Holland and married a Dutch lady of good family, accompanying Charles II. to England in 1660. In 1661 Butler became a member of both the English and the Irish Houses of Commons, representing Bristol in the former and Dublin University in the latter House; and in 1662 was made an Irish peer as earl of Ossory. He held several military appointments, in 1665 was made lieutenant-general of the army in Ireland, and in 1666 was created an English peer as Lord Butler; but almost as soon as he appeared in the House of Lords he was imprisoned for two days for challenging the duke of Buckingham. In 1665 a fortunate accident enabled Ossory to take part in a big naval fight with the Dutch, and in May 1672, being now in command of a ship, he fought against the same enemies in Southvolde Bay, serving with great distinction on both occasions. The earl was partly responsible for this latter struggle, as in March 1672 before war was declared he had attacked the Dutch Smyrna fleet, an action which he is said to have greatly regretted later in life. Whilst visiting France in 1672 he rejected the liberal offers made by Louis XIV. to induce him to enter the service of France, and returning to England he added to his high reputation by his conduct during a sea-fight in August 1673. The earl was intimate with William, prince of Orange, and in 1677 he joined the allied army in the Netherlands, commanding the British section and winning great success at the famous Battle of the Boyne, which was fought for tumbler's health in behalf of his father, who was lord-lieutenant of Ireland, and in parliament he defended Ormonde's Irish administration with great vigour. In 1680 he was appointed governor of Tangier, but his death on the 30th of July 1686 prevented him from taking up his new duties. One of his most intimate friends was John Evelyn, who eulogizes him in his Diary. Ossory had eleven children, and his eldest son James became duke of Ormonde in 1688.

See T. Carte, Life of James, duke of Ormonde (1851); and J. Evelyn, Diary, edited by W. Bray (1890).

OSSORY (Ostatigh), an ancient kingdom of Ireland, in the south-west of Leinster. The name is preserved by dioceses of the Church of Ireland and the Roman Catholic Church. The kingdom is said to have been a part of the Liffey region from the 15th century A.D., and its kings maintained their position until 1110.

OSTADE, the name of two Dutch painters whose ancestors were settled at Eyndhoven, near the village of Ostade. Early in the 17th century Jan Hendrix, a weaver, moved from Eyndhoven to Haarlem, where he married and founded a large family. The eldest and youngest of his sons became celebrated artists.

1. ADRIAN OSTADE (1610-1655), the eldest of Jan Hendrix's sons, was born and died at Haarlem. According to Houbraken he was taught by Frans Hals, at that time master of Adrian Brouwer. At twenty-six he joined a company of the civic guard at Haarlem, and at twenty-eight he married. His wife died within three years, and he again became a widower in 1666. He took the highest honours of his profession, the presidency of the painters' guild at Haarlem in 1662. Among the treasures of the Louvre collection, a striking picture represents the father of a large family sitting in state with his wife at his side in a handsomely furnished room, surrounded by his son and five daughters, and a young married couple. It is an old tradition that Ostade here painted himself and his children in holiday attire; yet the style is much too refined for the painter of boors, and Ostade had but one daughter. The number of Ostade's pictures is given by Smith at three hundred and eighty-five, but by Hofstede de Groot (1916) at over 900. At his death the stock of his unsold pieces was over two hundred. His engraved plates were put up to auction, with the pictures and fifty etched plates—most of them dated 1647-1648—were disposed of in 1686. Two hundred and twenty of his pictures are in public and private collections, of which one hundred and four are signed and dated; while seventeen are signed with the name but not with the date.

Adrian Ostade was the contemporary of David Teniers and Adrian Brouwer. Like them he spent his life in the delineation of the homeliest subjects—tavern scenes, village fairs and country quarters. Between Teniers and Ostade the contrast lies in the different condition of the agricultural classes of Brabant and Holland, and the atmosphere and dwellings that were peculiar to each region. Brabant has more sun, more comfort and a higher type of humanity; Teniers, in consequence, is silvery and sparkling; the people he paints are fair specimens of a well-built race. Holland, in the vicinity of Haarlem, seems to have suffered much from war; the air is moist and hazy, and the people, as depicted by Ostade, are short, ill-favoured and marked with the stamp of adversity on their features and dresses. Brouwer, with no more of the Dutch boor in his Dutch exposition, and, above all, more of the spirit of Frans Hals into his delineations than his colleague; but the type is the same as Ostade's. During the first years of his career Ostade displayed the same tendency to exaggeration and frolic as his comrade, but he is to distinguish himself from his rival by a more general use of the principles of light and shade, and especially by a greater concentration of light on a small surface in contrast with a broad expansion of gloom. The key of his harmonics remains for a time in the scale of greys. But his treatment is dry and careful, and in this style he shuns no difficulties of detail, representing cottages inside and out, with the vine leaves covering the porosity of the outer walls, and nothing inside to deck the patchwork of rafters visible through the window. The colors are observable, that make up the soird interior of the Dutch rustic of those days. The greatness of Ostade lies in the fact that he often caught the poetic side of the life of the peasant class, in spite of its ugliness, and stunted form and unsavory features. He did so by giving their vulgar sports, their quarrels, even their quieter moods of enjoyment, the magic light of the sunglum, and by clothing the wreck of cottages with gay vegetation.

It was natural that, with the tendency to effect which marked Ostade from the first, he should have been fired by emulation to rival the masterpieces of Rembrandt. His early pictures are not so rare but that we can trace how he glided out of one period into the other. Before the dispersion of the Geiss collection at Vienna in 1872, it was easy to study the steel-grey harmonies and exaggerated caricature of his early works in the period intervening between 1632 and 1638. There is a picture of a 'Boymansman having his clothes put on in the streets of Antwerp'; another of his scenes at the fair in Antwerp; he painted 'A Peasant Woman and Child in the Chantry field' in 1632; a 'Bagpiper' of 1635 in the Liechtenstein Gallery at Vienna; cottage scenes of 1635 and 1636, in the museums of Karlsruhe, of Darmstadt and of Reichenau; and a 'Scene near Lier' of 1637, in the Liechtenstein Gallery at Vienna, which make up for the loss of the Geiss collection. The same style marks most of those pictures. About 1638 or 1640 the influence of Rembrandt suddenly changed his style. He abandoned the hard, linear quality of the earlier work, where the angels appearing in the sky to Dutch boors half asleep amidst their cattle, sheep and dogs, in front of a cottage, at once recall the similar subject by Rembrandt and his effective mode of lighting the principal groups by rays propelled to the earth out of a murky sky. But Ostade was not successful in this effort to vulgarize Scripture. He might have been pardoned had he given dramatic force and expression to his picture; but his shepherds were only background for the据说 their faces were illuminated with an effect of light, as such masterly, in its sketchy rubbings, of dark brown tone relieved by strongly impasted lights, but without the very qualities which made his usual subjects attractive. When, in 1642, he presented the beautiful interior at the Louvre, in which a mother tends her child in a cradle at the side of a great chimney near which her husband is sitting, the darkness of a country loft is dimly illumined by a beam from the sun that shines on the case- ment; and one might think the painter intended to depict the Nativity, but that there is nothing holy in all the surroundings, nothing attractive indeed except the wonderful Rembrandtian transparency, the brown tone, and the admirable keeping of the details. Ostade was a painter of a similar class to his master; his position among his contemporaries was due to the commonplace incident of the 'Slaughtering of a Pig,' one of the masterpieces of 1643, once in the Geiss collection. In this and similar subjects of previous and succeeding years, he returned to the same subject; the invariable result of this repetition made him a master. He does not seem to have gone back to the gospel illustrations till 1667, when he produced an admirable 'Nativity,' which is only surpassed as regards arrangement and colour by Rembrandt's 'Carpenter's Family' at the Louvre or the
“Woodcutter and Children” in the gallery of Cassel. Innumerable almost are the familiar themes to which he devoted his brush during this interval, from small single figures, representing smokers or drinkers, to vulgarized allegories of the five senses (Hermitage and Brunswijk). But if we should select a few of his little things worthy of attention, we might point to the “Rustics in a Tavern” of 1662 at the Hague, the “Village School” of the same year at the Louvre, the “Tavern Court-yard of 1670 at Cassel, the “Peasants with inns” (with a famous “Pilgrim” by Van de Velde and the “ Hullerde” of 1673 at the Hague. At Amsterdam we have the likeness of a painter, sitting with his back to the spectator, at his easel. The colour-grinder is at work in a corner, a pupil prepares a palette, an antelope is killed and a shepherd the herd. In the large series of dated pieces which adorn every European capital, from St Petersburg to London, Buckingham Palace has a large number, and many a good specimen lies hidden in the private collections of England. But if we should select a few of his little things worthy of attention, we might point to the “Rustics in a Tavern” of 1662 at the Hague, the “Village School” of the same year at the Louvre, the “Tavern Court-yard of 1670 at Cassel, the “Peasants with inns” (with a famous “Pilgrim” by Van de Velde and the “ Hullerde” of 1673 at the Hague. merchantman with its rich cargo by the Dutch in 1719 off the coast of Africa, and of another by the English near Madagascar.

The Ostenders, however, despite these losses, persevered in their project. The opposition of the Dutch made Charles VI. hesitate for some time to grant their requests, but on the 19th of December 1722 letters patent were issued by him for the period of thirty years the privilege of trading in the East and West Indies and along the coasts of Africa on this side and on that of the Cape of Good Hope. Six directors were nominated by the emperor, and subscriptions to the company flowed in so rapidly that the shares were at the end of August 1723 at 12 to 15% premium. Two factories were established, one at Cobolm on the coast of Coromandel near Madras, the other at Bankibazar on the Ganges. At the outset the prospects of the company appeared to be most encouraging, but its promoters had not reckoned with the jealousy and hostility of the Dutch and English. The Dutch appealed to the treaty of Westphalia (1648) by which the king of Spain had prohibited the inhabitants of the southern Netherlands from trading with the Spanish colonies. The transference of the southern Netherlands to Austria by the peace of Utrecht (1713) did not, said the Dutch, remove this disability. The Spanish government, however, after some hesitation concluded a treaty of commerce with Austria and recognized the company of Ostend. The reply to this was a defensive league concluded at Herrenhausen in 1725 by England, the United Provinces and Prussia. Confronted with such formidable opposition the court of Vienna judged it best to yield. By the terms of a treaty signed at Paris on the 31st of May 1727 the emperor suspended the charter of the company for seven years, and the powers in return guaranteed the Pragmatic Sanction. The company, after nominally existing for a short time in this state of suspended animation, became extinct. The Austrian Netherlands were condemned to remain excluded from maritime commerce with the East Indies until their union with Holland in 1815.

**OSTEOLOGY (Gr. ὄστεος, bone), that part or branch of the science of anatomy which has for its subject the bony framework of the body (see Bone, Skeleton, Anatomy, &c.).**

**OSTERMAN, ANDREI IVANOVICH, Count (1686–1747), Russian statesman, was born at Bochin in Westphalia, of middle-class parents, his name being originally Heinrich Friedrich Ostermann. He became secretary to Vice-Admiral Cornelis Kruse, who had a standing commission from Peter the Great to pick up promising young men, and in 1677 entered the tsar's service. His knowledge of the principal European languages made him the right hand of Vice-Chancellor Shafranov, whom he materially assisted during the troublesome negotiations which terminated the Great Northern War with Sweden, and who, with General Bruce, represented Russia at the Aland peace congress of 1718. Shrewdly guessing that Sweden was at exhaustion point, and that Görtz, the Swedish plenipotentiary, was acting ultra vires, he advised Peter to put additional pressure on Sweden to force a peace. In 1721 Osterman concluded the peace of Nystad with Sweden, and was created a baron for his services. In 1723 he was made vice-president of the ministry of foreign affairs for bringing about a very advantageous commercial treaty with Persia. Peter also constantly consulted him in domestic affairs, and he introduced many administrative novelties, e.g. the table of degrees, and the reconstruction of the College of Foreign Affairs on more modern lines. During the reign of Catherine I. (1725–1727) Osterman's authority still further increased. The conduct of foreign affairs was left entirely in his hands, and he held also the posts of minister of commerce and postmaster-general. On the accession of Peter II. Osterman was appointed governor to the young emperor, and on his death (1730) he refused to participate in the attempt of Demetrius Golitsyn and the Dolgorukis to convert Russia into a limited constitutional monarchy. He held aloof till the crown was firmly established on the throne as autocrat. Then he got his reward. His unique knowledge of foreign affairs made him indispensable to the empress and her counsellors, and even as to home affairs his advice was almost invariably followed. It was at his suggestion that the cabinet system was introduced into Russia. All the useful reforms introduced between 1730 and 1740 are to be attributed to his initiative. He improved the state of trade, lowered taxation, encouraged industry and promoted education, ameliorated the judicature and materially raised the credit of Russia. As foreign minister he was cautious and circumspect, but whenever he perceived where to his mind the national interest was at stake, he prosecuted it vigorously and left nothing to chance. The successful conclusions of the War of the Polish Succession (1733–1735) and of the war with Turkey (1736–39) were entirely due to his diplomacy. During the brief regency of Anna Leopoldovna (October 1730–December 1741) Osterman stood at the height of his power, and the French ambassador, La Chetardie, reported to his court that "it is not too much to say that he is tsar of all Russia." Osterman's foreign policy was based upon the Austrian alliance. He had, therefore, guaranteed the Pragmatic Sanction with the deliberate intention of defending it. Hence the determination of France to remove him at any cost. Russia, as the natural ally of Austria, was very obnoxious to France; indeed it was only the accident of the Russian alliance with Turkey, in 1741, seemed to stand between Maria Theresa and absolute ruin. The most obvious method of rendering the Russian alliance unserviceable to the queen of Hungary was by implicating Russia in hostilities with her ancient rival, Sweden, and this was brought about, by French influence and French money, when in August 1741 the Swedish government, on the most frivolous pretences, declared war against Russia. The dispositions previously made by Osterman enabled him, however, to counter the blow, and all danger from Sweden was over when, early in September, Field-Marsh Lacy routed the Swedish general Wrangel under the walls of the frontier-fortress of Villmanstrand, which was carried by assault. It now became evident to La Chetardie that only a revolution would overthrow Osterman, and this he proposed to be brought about by a coup d'etat on the tsaresa Elizabeth, who hated the vice-chancellor because, though he owed everything to her father, he had systematically neglected her. Osterman was therefore the first and the most illustrious victim of the coup d'état of the 6th of December 1741. Accused, among other things, of contributing to the elevation of the empress Anne by his cabals and of suppressing a supposed will of Catherine I. made in favour of her daughter Elizabeth, he threw himself on the clemency of the new emperor. He was condemned first to be broken on the wheel and then beheaded; but, reprieved on the scaffold, his sentence was commuted to lifelong banishment, with his whole family, to Beregov in Siberia, where he died six years later.

**OSTERODE, a town in the Prussian province of East Prussia, 75 m. by rail N.E. of Thorn, on Lake Drezven, and at the junction of lines to Memel, Elbing and Schonsee. Pop. (1905) 13,057. It has a castle built by the Teutonic knights in 1270, to whom the town owes its birth. Its principal manufactures are railway plant, machinery, beer, spirits and bricks, while it has several saw-mills. Osterode has a lively trade in cattle, grain and timber.** See J. Müller, Osteroide und Ostpreussen (Osterode, 1905).

**OSTERODE, a town in the Prussian province of Hanover, at the south foot of the Harz Mountains, 34 m. N.W. of Nordhausen by rail. Pop. (1905) 7,467. The church of St Agedius (Evangelical), founded in 724 and rebuilt after a fire in 1578, contains some fine tombs of the dukes of Brunswick-Grubenhagen, who made Osterode their residence from 1361 to 1452. Other buildings are the fine town-hall and the hospital. There are
OSTERSUND—

OSTERSUND, a town of Sweden, capital of the district (län) of Jemtland, on the east shore of Storsjö (Great Lake), 364 m. N. by W. of Stockholm by rail. Pop. (1900) 6866. It lies at an elevation of about 100 ft., and is the metropolis of a mountainous and beautiful district. Immediately facing the town is the lofty island of Frös, with which it is connected by a bridge 1148 ft. long. A ruder stone commemorates the building of a bridge here by a Christian missionary, Austmader, son of Gudfast. Östersund was founded in 1586. It has a considerable trade in timber, and a local trade by steamers on Storsjö. Electricity is obtained for lighting and other purposes by utilizing the abundant water-power in the district.

OSTERVÄLD, JEAN FRÉDÉRIC (1663-1747), Swiss Protestant divine, was born at Neuchâtel on the 25th of November 1663. He was educated at Zürich and at Saumur (where he graduated), studied theology at Orleans under Claude Fajon, at Paris under Jean Claude and at Geneva under Louis Trouchin, and was ordained to the ministry in his native place in 1683. As preacher, pastor, lecturer and author, he attained a position of great influence in his day, and he and his friends, J. A. Turrettin of Geneva and S. Werenfels (1637-1736) of Basel, forming what was once called the "Swiss triumvirate." He was thought to show a leaning towards Socinianism and Arminianism. He died on the 14th of April 1747.

His principal works are Traité des sources de la corruption qui règne aujourd'hui parmi les Chrétien (1700), translated into English, Dutch, and German; Traité contre l'injustice (1707); Sermons sur divers textes (1722-1724); Théologie compendium (1739); and Traduction de la Bible (1724). All his writings attained great popularity among French Protestants; many were translated into various languages, and "Osterwald's Bible," a revision of the French translation, in particular, was long well known and much valued in Britain.

OSTIA, an ancient town and harbour of Latium, Italy, at the mouth of the river Tiber on its left bank. It lies 14 m. S.W. from Rome by the Via Ostiensis, a road of very ancient origin still followed by a modern road which preserves some traces of the old pavement and remains of several ancient bridges. It was the first colony ever founded by Rome—according to the Romans themselves by Ancus Martius—and took its name from its position on the Old Sun (Ostia antiqua, the origin in Latin) with the establishment of the salt-marshes (salinas, see Salaria, Via) which only ceased to exist in 1875, though it acquired importance as a harbour in very early times. When it began to have magistrates of its own is not known; nor indeed have we any inscriptions from Ostia that can be certainly attributed to the Republican period. Under the empire, on the other hand, it had the ordinary magistrates of a colony, the chief being duoviri, charged with the administration of justice, whose place was taken every fifth year by duoviri censoria potestate quinquennales, then quaestores (or financial officials) and then aediles (building officials). There were also the usual decuriones (town councilors) and Augures. We learn much as to these magistrates from the large number of inscriptions that have been found (over 1500 in Ostia and Portus taken together) and also as to the cults. Vulcan was the most important—perhaps in early times the only—deity worshipped at Ostia, and the priesthood of Vulcan was held sometimes by Roman senators. The Dioscuri too, as patrons of mariners, were held in honour. Later we find the worship of Isis and of Cybele, the latter being especially flourishing, with large corporations of dendrophori (priests who carried branches of trees in procession) and cannofori (basket-carriers); the worship of Mithras, too, had a large number of followers. There was a temple of Serapis at Portus. No traces of Jewish worship have been found at Ostia, but at Portus a considerable number of Jewish inscriptions in Greek have come to light.

Of the church in Ostia there is no authentic record before the 4th century A.D., though there are several Christian inscriptions of an earlier date; but the first bishop of Ostia of whom we have any certain knowledge dates from A.D. 313. The see still continues, and is indeed held by the dean of the sacred college of cardinals. A large number of the inscriptions are also connected with various trades (tessinarii, carpenters; fabrici, boatmen, lightermen and others (see J. P. Waltzing, Les Corporations professionnelles, Brussels and Liége).

Until Trajan formed the port of Centumcellae (Civitavecchia) Ostia was the best harbour along the low sandy coast of central Italy between Monte Argentario and Monte Circeo. It is mentioned in 354 B.C. as a trading port, and became important as a naval harbour during the Punic Wars. Its commerce increased with the growth of Rome, and this, and the decay of agriculture in Italy, which obliged the capital to rely almost entirely on imported corn (the importation of which was, from 267 B.C. onwards, under the charge of a special quaestor stationed at Ostia), rendered the possession of Ostia the key to the situation on more than one occasion (87 B.C., 90, 58, and 537). The inhabitants of the colony were thus regarded as a permanent garrison, and at first freed from the obligations of ordinary military service, until they were later on obliged to serve in the fleet. Ostia, however, was by no means an ideal harbour; the mouth of the Tiber is exposed to the south-west wind, which often did damage in the harbour itself; and in A.D. 62 no less than 200 ships with their cargoes were sunk, and there was an important guild of divers (urinatores) at Ostia. The difficulties of the harbour were increased by the continued silting up, produced by the enormous amount of solid material brought down by the river. Even in Strabo's time (v. 3. 5, p. 231) the harbour of Ostia had become dangerous: he speaks of the ships without a harbour owing to the silting up brought about by the Tiber, the ships anchor at considerable risk in the roads, but the love of gain prevails: for the large number of lighters which receive the cargoes and reload them renders the time short before they can enter the river, and having lightened a part of their cargoes they sail in and ascend to Rome.

Caesar had projected remedial measures, but (as in so many cases) had never been able to carry them out, and it was not until the time of Claudius that the problem was approached. That emperor constructed a large new harbour on the right bank, 2½ m. N. of Ostia, with an area of 170 acres enclosed by two curving moles, with an artificial island, supporting a lofty lighthouse, in the centre of the space between them. This was connected with the Tiber by an artificial channel, and by the bridge which Claudius had constructed. He erected in A.D. 46, freed the city of Rome from the danger of inundation. The harbour was named by Nero, Portus Augusti.

Trajan found himself obliged in A.D. 103, owing to the silting up of the Claudian harbour, and the increase of trade, to construct another port further inland—a hexagonal basin enclosing an area of 97 acres with enormous warehouses—communicating with the harbour of Claudius and with the Tiber by means of the channel already constructed by Claudius, this channel being prolonged so as to give also direct access to the sea. This became blocked in the middle ages, but was reopened by Paul V. in 1612, and is still in use. Indeed it forms the right arm of the Tiber, by which navigation is carried on at the present day, and is known as the Porta Traiana. The island between the two arms acquired the name of Insula Sacra (still called Isola Sacra) by which Propoicius mentions it.

Ostia thus lost a considerable amount of its trade, but its importance still continued to be great. The 2nd and 3rd centuries, indeed, are the high-water mark of its prosperity: and it still possessed a mint in the 4th century B.C. During the Gothic wars, however, trade was confined to Portus, and the ravages of pirates led to its gradual abandonment. Gregory IV. constructed in 830 a fortified enceinte, called Gregoryopolis, in the eastern portion of the ancient city, and the Saracens were signaliy defeated here under Leo IV. (847-856). The battle is represented in Giulio Romano's fresco from Raphael's design in the Stanza dell'Incendio in the Vatican.
In the middle ages Ostia regained some of its importance, owing to the sitting up of the right arm of the Tiber. In 1432-1436 Giuliano della Rovere (nephew of Pope Sixtus IV., and afterwards himself Pope Julius II) caused the castle to be erected by Baccio Pontelli, a little to the east of the ancient city. It is built of brick and is one of the finest specimens of Renaissance fortification, and exemplifies especially the transition from the old girdle walls to the system of bastions; it still has round corner towers, not polygonal bastions (Burckhardt). Under the shelter of the castle lies the modern village. The small cathedral of St Aurea, also an early Renaissance structure, with Gothic windows, is by some ascribed to Meo del Caprina (1439-1501). Hitherto Ostia does not seem to have been very unhealthy. In 1557, however, a great flood caused the Tiber to change its course, and it flooded the lower part of the castle, but some half a mile farther west; and its old bed (Fiume Morto) has ever since then served as a breeding ground for the malarial mosquito (Anophelus claviger). An agricultural colony, founded at Ostia after 1875, and consisting mainly of cultivators from the neighbourhood of Ravenna, has produced a great change for the better in the condition of the place. The modern village is a part of the commune of Rome. The marshes have been drained, and a pumping station erected near Castel Fusano. An electric tramway has been constructed from Rome to Ostia and thence to the seashore, now some 2 m. distant, where sea-bathing is carried on.

Excavations on the site of Ostia were only begun in 1837, and the systematic work was done until 1854, when under Pius IX. a considerable amount was done (the objects are now in the Lateran museum). The Italian government, to whom the greater part of it now belongs, laid bare many of the more important buildings in 1880-1889; but much was left undone. Owing to the fact that the site is largely covered with sand and to the absence of any later alterations, the preservation of the buildings excavated is very good, and Ostia is, with the exception of Pompeii, the best example in Italy of a town of the Roman period. On the east the site is approached by an ancient road, flanked by tombs. On the right (N.) are some small well-preserved thermae, and the barracks of the firemen (vigiles), a special corps of whom was stationed here. On one side of the central courtyard of the latter building is a chapel with inscribed pedestals for imperial statues (2nd and 3rd century A.D.) and a well-preserved black and white mosaic representing a sacrifice (see J. Carcopino in Mèlanges de l’Ecole Française, 1907).

To the south-west is the Forum, an area 265 ft. square surrounded by colonnades, in which were placed the offices of the various collegia or guilds of boatmen, raftmen, and others, which had a special importance at Ostia; the names of the guilds may still be read in inscriptions in the mosaic pavements of the chambers. In the centre of the area are the substructions of a temple, and on the south-east side are the remains of the theatre, built in the early imperial period, restored by Septimius Severus in 196-197 and again in the 4th or 5th century. To the south-west of the Forum inscribed pedestals for imperial temples, one dedicated to Venus, and a well-preserved Mithraeum, with mosaics representing the seven planets, &c. To the south-west again is the conspicuous brick cella of a lofty temple, on arched substructures, generally supposed to be that of Vulcan, with a threshold block of africano (Euboean) marble over 15 ft. long: from it a street over 20 ft. wide leads north-west to the river. It is flanked on each side by well-preserved warehouses, another group of which, surrounding a large court, lies to the south-west. The brick and opus reticulatum facing of the walls is especially fine. Hence an ancient road, leading between warehouses (into which the Tiber is encroaching), in one room of which a number of well-preserved large jars may be seen embedded in the floor, runs close to the river to a large portion of the town. In front of the Forum, which is on the south-west side, an inscription (groundlessly) bears the name of “imperial palace.” Farther to the south-west are remains of other warehouses, and (possibly) of the docks—long narrow chambers, which may have served to contain ships. Here are remains of (earlier) structures in opus quadratum whereas the great bulk of the ruins are in brickwork and belong to the imperial period. The medieval Terre Boscieana marks approximately the mouth of the Tiber at Rome.

The south-eastern portion of the city has been excavated only very partially. To the south-west of the conspicuous temple adjoined to are the remains of a temple of Cybele, with a portico. This lay close to the commencement of the Via Severiana (see Severiana, Via), and the line of tombs which flanked it soon begins. Further south-east, a line of sand dunes, covering the ruins of ancient villas, marks the coastline of the Roman period. Some 2 m. to the south-east is the pine forest of Castel Fusano, taking its name from a castle erected by the marchese Sacchetti in the 16th century. It is now the property of the Chigi and is leased to the king (see Laurostiana, Via). Here Des Lowe and the other excavators in excavating the cypress have shown that the propagation of malaria was due to the mosquito Anophelus claviger. See Notizie degli scavi, passim: H. Dessau in Corp. inscript. Lat. xiv. (Berlin, 1887), p. 1 sqq., and the works of M. Jerome Carcopino.

OSTIANS, or OSTIANS, a tribe who inhabited the basin of the Ob in western Siberia belonging to the Finno-Ugric group and related to the Voguls. The so-called Ostiaks of the Yenisei speak an entirely different language. The best investigators (Castren, Berenger, Carcopino, Munkacsi) are convinced that Ostiaks and Samoyedas are identical with the Ygras of the Russian annals. During the Russian conquest their abodes extended much farther south than now, forty-one of their fortified places having been destroyed by the Cossacks in 1501, in the region of Obdorsk alone. Remains of these “towns” are still to be seen at the Kunovat river, on the Ob 20 m. below Obdorsk and elsewhere. The total number of the Ostiaks may be estimated at 27,000. Those on the Irtysh are mostly settled, and have adopted the manner of life of Russians and Tatars. Those on the Ob are mostly nomads; and with 8000 Samoyedes in the districts of Berezov and Surgut, they own large herds of reindeer. The Ob Ostiaks are ruffianised to a great extent. They make their living exclusively by fishing, buying from Russian merchant corn for bread, the use of which has become widely diffused.

The Ostiaks call themselves As-yakh (people of the Ob), and it is supposed that their present designation is a corruption of this name. By language they belong (Castren, Reiseberichte, Reisereihen; Ahlqvist, Ufers. of Finska Vet.-Soc. Forh. xxi.) to the Ugric branch of the Finno-Ugric group. All the Ostiaks speak the same language, mixed to some extent with foreign elements; but three or four leading dialects can be distinguished.

The Ostiaks are middle-sized, or of low stature, mostly meagre, and have hair and beard, however thick they may be, covered by their thick fur-clothes. The extremities are fine, and the feet are usually small. The skull is brachycephalic, of moderate size and height. The hair is dark and soft for the most part, fair among the lower natives; and individual heads are short and broad. The nose is fair and broad; the mouth is large and with thick lips; the beard is scanty. The Mongolian type is more strongly pronounced in the women than in the men. On the whole, the Ostiaks are not a pure race; the purest type is found among the fishermen on the Ob, the reindeer-breeders of the tundra being largely intermingled with Samoyedes. Investigators describe them as kind, gentle and honest; rioting is almost unknown among them, as they have no place for freebooters or thieves and no community punishment; and the only penalty enforced being the restitution twofold of the property stolen.

They are very skillful in the arts which they practice, especially in carpentry, fishing and game, tanning (with egg-yolk and brains), preparation of implements from birch-bark, &c. Some of their carved or decorated bark implements (like those figured in Middendorff’s Siberische Reise, iv. 2) show considerable artistic skill. Their folk-lore, like that of other Finnish tribes, is imbued with a feeling of natural poetry, and reflects also the sadness, or even the despair, which has been noticed among them. Christianity has made some progress among them and St Nicholas is a popular saint, but their chief patron is St Peter.

For the language see Ahlqvist, Über die Sprache der Nord-Ostiaachsen (1886) and for customs, religion, &c., the Journal de la Société Finno-Ougrienne, particularly papers by Sirelius and Karjalainen, and the papers by Munkacsi, Ostinger, Father of other Ethnographic Revue orientale pour les études Ouralo-Alpines. Patkanow. Die Irtsch-Ostiaken und ihre Volkspoesie (Petersburg, 1900); Patkanow, Irtsch-Ostiaken und ihre Volkspoesie (1897-1900); Papay, Sammlung ostjakischer Volksdichtungen (1908).
OSTRA—

OSTRA, an ancient town of Umbria, Italy, near the modern Montenovo, S.E. of Sena Gallica (Sinigaglia). It is hardly mentioned by ancient authors, but excavations have

Philo mentions it another ancient town, Susana, 5 m. W., which also did not survive the classical period.

OSTRACISM, a political device instituted, probably by Cleisthenes in 508 B.C., as a constitutional safeguard for the Athenian democracy. Its effect was to remove from Athens for a period of ten years anyone who threatened the harmony and tranquillity of the body politic. A similar device existed at various times in Argos, Miletus, Syracuse and Megara, but in these cities it appears to have been introduced under Athenian influence. In Athens in the sixth prytany of each year the representatives of the Boule asked the Ecclesia whether it was for the welfare of the state that ostracism should take place. If the answer was in the affirmative, a day was fixed for the voting in the eighth prytany. No names were mentioned, but it is clear that two or three names at the most could have been under consideration. The people met, not as usual in the Pnyx, but in the Agora, in the presence of the Archons, and recorded their votes by placing in urns small fragments of pottery (which in the ancient world served the purpose of waste-paper) (ostraca) on which they wrote the name of the person whom they wished to banish. As in the case of other privilegia, ostracism did not take effect unless six thousand votes in all were recorded. Grote and others hold that six thousand had to be given against one person before he was ostracized, but it seems unlikely that the attendance at the Ecclesia ever reached so large a number, as this is contradicted by Plut. Arist. c. 7. The ostracized person was compelled to leave Athens for ten years, but he was not regarded as a traitor or criminal. When he returned, he resumed possession of his property and his civic status was unimpaired. The adverse vote simply implied that his power was so great as to be injurious to the state. Ostracism must therefore be carefully distinguished from exile in the Roman sense, which involved loss of property and status, and was for an indefinite period (i.e. generally for life). Certain writers have even spoken of the "honour" of ostracism. At the same time it was strictly unjust to the victim, and a heavy punishment to a cultured citizen for whom Athens contained all that made life worth living. Its political importance really was that it transferred the protection of the constitution from the Areopagus to the Ecclesia. Its place was afterwards taken by the Graphe Paranomai.

There is no doubt that Cleisthenes' object was primarily to get rid of the Peisistratid faction without peremptory recourse to armed resistance (so Androtion, Ath. Pol. 22, Ephorus, Theopompus, Aristotle, Pol. iii. 13, 1284 a 17 and 36; viii. (v.), 3, 1302 b 15). Aristotle's Constitution of Athens (c. 22) gives a list of ostracized persons, the first of whom was a certain Hipparchus of the Peisistratid family (588 B.C.). It is an extraordinary fact that, if ostracism was introduced in 508 B.C. for the purpose of expelling Hipparchus it was not till twenty years later that he was condemned. This has led some critics (see L. Krahe, Gesch. der Ostrakismen, who arrives at the conclusion that ostracism could not have been introduced till after 496 B.C.) to suspect the unanimous evidence of antiquity that Cleisthenes was the inventor of ostracism. The problem is difficult, and no satisfactory answer has been given. Aelian's story that Cleisthenes himself was the first to be ostracized is attractive in view of his overtures to Persia (see Cleisthenes), but it has little historical value and conflicts with the chapter in Aristotle's Constitution—which, however, may conceivably be simply the list of those recalled from ostracism at the time of Xerxes' Invasion, all of whom must have been ostracized less than ten years before 481 (i.e. since Marathon). With the end of the Persian Wars, the original object of ostracism was removed, but it continued in use for forty years and was revived in 417 B.C. It now became a mere party weapon and the farcical result of its use in 417 in the case of Hyperbolus led to its abolition either at once, or, as Lucebil seeks to prove, in the archonship of Euclides (403 B.C.). Such a device inevitably lent itself to abuse (see Aristotle, Pol. 36, 1284 b 22 οστρακιστεος επών). Grote maintains that ostracism was a useful device, on the grounds that it removed the danger of tyranny, and was better than the perpetual civil strife of the previous century. The second reason is strictly beside the point, and the first has no force after the Persian Wars. As a factor in party politics it was both unnecessary and injurious to the state. Thus in the Persian Wars, it deprived Athens of the wisdom of Xanthippus and Aristides, while at the battle of Tanagra and perhaps at the time of the Egyptian expedition the assistance of Cimon was lacking. Further, it was a blow to the fair-play of party politics; the defeated party, having no leader, was reduced to desperate measures, such as the assassination of Ephialtes. To defend it on the ground that it created and stimulated the national consciousness is hardly reconcilable with the historic remark of the voter who voted against Aristides because he wished to hear no more of his incorruptible integrity; moreover in democratic Athens the "national consciousness" was, if anything, too frequently stimulated in the ordinary course of government. Aristotle, admitting its usefulness, rightly describes ostracism as in theory tyrannical; Montesquieu (Esprit des lois, xii. cc. 19, 20, &c.) defends it as a mild and reasonable institution. On the whole, the history of its effect in Athens, Argos, Miletus, Megara and Syracuse (where it was called Petalismus), furnishes no sufficient defence against its admitted disadvantages. The following is a list of persons who suffered ostracism:—Hipparchus (488); Megacles (487), Xanthippus (486), Aristides (483), Themistocles (471); Cimon (461?); Thucydides, son of Melesias (444); Damon, Hyperbolus (417) and possibly Cleisthenes himself (q.v.).

AUTHORITIES.—For the procedure in O. see Appendix Photii (Porson, p. 675); see also, besides authorities quoted above, Busolt, i. 620; Müller's Handbuch, iv. 1, 121; Gilbert, Gr. St. i. 446-466 and Greek Constitutional Antiquities (Eng. trans., 1893?); A. H. J. Greenidge, Handbook of Greek Constitutional Antiquities (1896); histories of Greece in general. The view maintained in the text as to the number of votes necessary is supported by Duruy (H. of G. ii. 1, 36), Boeckh, Wachsmuth, &c.; opposed by Grote, Oman and (on the whole) by Evelyn Abbott. On the danger of privilegia in general see Cicero, de Legibus, iii. 4, and note that in Athens, ostracism gratuitously anticipated a crime which, if committed, would have been punishable in the popular Heliaea. Cf. also article EXILE.

OSTRACODERS or Ostracophores, the earliest and most primitive group of fish-like animals, found as fossils in Upper

Fig. 1.—Thelodus scoticus, from the Upper Silurian of Lanarkshire, restored by Dr R. H. Traquair; about one-half nat. size.

Fig. 2.—Ophioplatus murchisoni, from the Lower Old Red Sandstone of Westmorland, restored by Dr A. S. Woodward; about one-half nat. size.

Silurian and Devonian formations both in Europe and in North
America. They are so named (Gr. shell-skins or shell-bearers) in allusion to the nacreous shell-like appearance of the inner face of the plates of armour which cover the more common paired fins. They must also have been provided with the usual Gill-apparatus, but there is reason to believe that their lower jaw was not on the fish plan. They are, therefore, at least as low in the Zoological scale as the existing lampreys, with which Cope, Smith, Woodward and others have associated them. They are all small animals, many of them only a few centimetres in length.

The oldest and lowest family of Ostracoderms, that of Ostracoidae, is known by nearly complete skeletons of *Thelodus* (fig. 1) and *Lanarkia* from the Upper Silurian mudstones of Lanarkshire, Scotland. The body is completely and uniformly covered with minute granules which resemble the shagreen of sharks, and were erroneously ascribed to sharks when they were first discovered in the Upper Silurian bones at Ludlow, Shropshire. The head and anterior part of the trunk are depressed and shown from above or below in the fossils, and this region sharply contracts behind into the slender tail, which is generally seen in side view, with one small dorsal fin and a forked heterocercal tail. The eyes are far forwards and wide apart. In another family, that of the Cephalaspidae (fig. 2), the animals resemble the Coelolepids in shape, but their skin-granules are fused into small plates, which are polygonal where there must have been much flexibility, and in rings round the tail where the underlying successive plates of muscle necessitated this arrangement. The eyes are close together. At the sides of the Gill-cavity on each side at the back of the head, there is a flexible flap, which is sometimes interpreted as a paired limb. Part of the armour of the Cephalaspids consists of bone-cells, but the dermal plates of the other families, the Pteraspidae (fig. 3), consist merely of fused shagreen granules without any advance towards bone. The Pteraspidae are interesting as showing on the inner side of the dorsal shield impressions which suggest that the gill-activities extended unusually far forward on the head. Another family, known only by nearly complete skeletons from the Upper Silurian mudstones of Lanarkshire, is that of the Birkenia, comprising small fusiform species which are covered with granules disposed in curiously-arranged rows. The higher Ostracoderms are the Asterolepidae, which occur only in Devonian rocks and include the familiar *Pterichthys* (fig. 4) from the Middle Old Red Sandstone of Scotland. In this family the primitive skin-tubers which fuse to form plates fused, not into polygonal plates, but along the lines of the slime-canals. The Asterolepid armour consists of symmetrically arranged, overlapping plates on the top of the head and round the body, with a pair of flippers similarly armoured and appended to the latter. The tail resembles that of other Ostracoderms and is sometimes covered with scales.

**OSTRAU—OSTRICH**

The name of two Austrian towns in the Ostrau—Karwin coal-mining district. (1) Mährisch-Ostrau (Moravian Ostrau), a town in Moravia, m. N.E. of Brünn by rail. Pop. (1900) 30,125. It is situated on the right bank of the Ostrawitz, near its confluence with the Oder, and it derives its importance from the neighbouring coal mines, and the blast furnaces and iron-works which they have called into existence. The manufactures comprise sheet-iron, boilers, zinc, brick and tiles, paraffin, petroleum, soap and candles. The Rothschild iron-works at Witzkowitz are in the vicinity. (2) Polnisch-Ostrau (Polish Ostrau), a mining town in Austrian Silesia, opposite Mährisch-Ostrau. Pop. (1900) 18,761, mostly Czech. It has large coal mines, which form the south-western portion of the extensive Upper Silesian coal fields, the largest Austrian deposit.

**OSTRICH** (Or. Eng. estridge; Fr. autruche; Span. avestrum; Lat. avis struthio; Gr. στρυθος; or μέγας στρυθός); the Struthio camelus of Linnaeus, and the largest of living birds, an adult male standing nearly 8 ft. high and weighing 300 lb. The genus *Struthio* forms the type of the group of Rattice birds, characterized chiefly by large size, breast-bone without a keel, strong running legs, rudimentary wings and simple feathers (see Bird). The most obvious distinctive character presented by the ostrich is the presence of two toes only, the third and fourth, on each foot—a character absolutely peculiar to the genus *Struthio*. In South America another large Rattice bird, the rhea, is called ostrich; it can be distinguished at once from the true ostrich by its possession of three toes.

XX. 126
The wild ostrich is disappearing before the persecution of man, and there are many districts, some of wide extent, frequented by the ostrich in the 19th century—especially towards the extremities of its African range—in which it no longer occurs, while in Asia there is evidence, more or less trustworthy, of its former existence in most parts of the south-western deserts, in few of which it is now to be found. Xenophon's notice of its abundance in Assyria (Anabasis, i. 5) is well known. It is probable that it still lingers in the wastes of Kirwan in eastern Persia, whence examples may occasionally stray northward to those of Turkestan, even near the Lower Oxus; but the assertion, often repeated, as to its former occurrence in Baluchistan or Sind seems to rest on testimony too slender for acceptance. Apparently the most northerly limit of the ostrich's ordinary range at the present day is that portion of the Syrian Desert lying directly eastward of Damascus; and, within the limits of what may be called Palestine, H. B. Tristram (Fauna and Flora of Palestine, p. 139) regards it as but a straggler from central Arabia, though we have little information as to its distribution in that country.

Africa is still, as in ancient days, the continent in which the ostrich chiefly flourishes. There it appears to inhabit every waste sufficiently extensive to afford it the solitude it loves. Yet even there it has to contend with the many species of carnivora which prey upon its eggs and young—the latter especially; and H. Lichtenstein long ago remarked that if it

---

1 A good summary of the present distribution is contained in the Ostriches and Ostrich Farming of De Moensland and Hartung, from which the accompanying figure is, with permission, taken. Von Heuglin, in his Ornithologie Nordost-Africas (pp. 925-935), and A. Reichenow in Die Vogel Afrikas, have given more particular details of the ostrich's distribution in Africa.

2 Drs. Finsh and Hartlaub quote a passage from Remusat's Remarques sur l'extension de l'empire chinoise, stating that in about the 7th century of our era a live "camel-bird" was sent as a present with an embassy from Turkestan to China. H. Lichtenstein, Reise im südlichen Afrika, ii. 42-45 (Berlin, 1812).

3 were not for its numerous enemies "the multiplication of ostriches would be quite unexamined."

Though sometimes assembling in troops of from thirty to fifty, and then generally associating with zebras or with some of the larger antelopes, ostriches commonly, and especially in the breeding season, live in companies of not more than four or five; one of which is a cock and the rest are hens. The latter lay their eggs in one and the same nest, a shallow pit scraped out by their feet, with the earth heaped around to form a kind of wall against which the outermost chicken must be temptingly pressed. As soon as these eggs have incubated a living cock begins to brood, always taking his place on them at nightfall surrounded by the hens, while day they relieve another, more it would seem to guard their common treasure from jackals and small beasts of prey than directly to forward the process of hatching, for that is often left wholly to the sun. Some thirty eggs are laid in the nest, and round it are scattered perhaps as many more. These last are said to be broken by the old birds to serve as nourishment for the newly-hatched. All whose stomachs the hard food on which their parents thrive. The greatest care is taken to place the nest where it may not be discovered, and the birds avoid being seen when going to or from it, while they display great solicitude for their young. C. J. Andersson in his Lake Ngami (pp. 253-269) has given a lively account of the pursuit by himself and Francis Galton of a brood of ostriches, in the course of which the male bird leaped being wounded to distract their attention from his offspring. Though the ostrich ordinarily inhabits the most arid districts, it requires water to drink; more than that, it will frequently bathe, and sometimes even, according to Von Heuglin, in the sea.

The question whether to recognize more than one species of ostrich has been continually discussed without leading to a satisfactory solution. While eggs from North Africa present a perfectly smooth surface, those from South Africa are palpably different. Northern birds have the skin of the parts not covered with feathers flesh-coloured, while this skin is bluish in southern birds, and hence the latter have been thought to need specific designation as S. australis. Examples from the Somaliland country have been described as forming a distinct species under the name of S. molybdophanes from the leaden colour of their naked parts.

The great mercantile value of ostrich-feathers, and the increasing difficulty, due to the causes already mentioned, of procuring them from wild birds, has led to the formation in Cape Colony, Egypt, the French Riviera and elsewhere of numerous "ostrich-farms," on which these birds are kept in confinement, and at regular intervals deprived of their plumes. In favourable localities and with judicious management these establishments yield very considerable profit (see FEATHER).

See, besides the works mentioned, E. D'Alton, Die Skelette der Straussarten. Vögel abgebildet und beschrieben (Bonn, 1827); P. L. Selater, "On the Struthious Birds living in the Zoological Society's Menagerie," Transactions, iv. p. 353; containing a fine representation (pl. 69) by J. L. Leichhardt, and Struthio camelus; M. Théodule-Aurélien de Géry, Struthio (Paris, 1894); A. Douglass, Ostrich Farming in South Africa (London, 1881); modern anatomical work on the group is referred to in the article BIRDS.

OSTROG, a town of Russia, in the government of Volhynia, 93 m. W. of Zhitomir, at the confluence of the Vilia with the Gorny. Pop. (1869) 14,539. It is an episcopal see of the Orthodox Greek Church, and in the 16th century had a classical academy, converted later into a Jesuit college. Here was made and printed in 1581 the first translation of the Bible into old Slav. In the town is a brotherhood of Cyril and Methodius, which maintains schools of its own. The tanning of light leather is an active domestic trade; other industries are potteries, oil-works, soap, candle and tobacco factories. After being plundered by the Cossack chieftain Khmelnitski in 1648, and conquered by the Russians seven years later, the town fell into decay.

OSTROGOths, or East Goths, one of the two main branches into which the Goths were divided, the other being the Visigoths, or West Goths. See GOTHS.

OSTROVSKY, ALEXANDER NIKOLAIWICH (1823-1880). Russian dramatic author, was born on the 12th of April 1823 in Moscow, where his father was an official of the senate. He studied
law in the university of that city, which he quitted without having submitted to the final examination. He was then employed as a clerk in the office of the “Court of Conscience,” and subsequently in that of the Commercial Court at Moscow. Both tribunals were eager upon settling the claims (whether just or not) of the Russian merchant class, from which Osuisky was thus enabled to draw the chief characters for his earliest comedies. Among these are Bydnyaya Niveta (“The Poor Bride”), Byednost ne Porek (“Poverty not a Vice”), and Ne v’svoi sani ne sadis (literally “Don’t put yourself in another’s sledge,” meaning “Don’t put yourself in a position for which you are not suited”). Of this last Nicholas I. said, “it was not a play, but a lesson.” The uncultured, self-satisfied Moscow merchants are strikingly portrayed in Grozd (“The Tempest”) and Svayi byudi vchtchyonzya (“Between near relatives no accounts are needed”), which was originally called “The Bankrupt.” The last-mentioned comedy was prohibited for ten years, until the accession of Alexander II., and Osuisky was dismissed from the government service and placed under the supervision of the police. The Liberal tendencies of the new reign, however, soon brought relief, Osuisky was one of several well-known literary men who were sent into the provinces to report on the condition of the people. Osuisky’s field of inquiry lay along the upper Volga, a part of the country memorable for some of the most important events in Russian history. This mission induced him to write several historical dramas of great merit, such as Kienna Zakharich Minin Skokobreuk (the full name of the famous butcher who saved Moscow from the Poles); “The False Demetrius” and “Vassily Shulsky”; “Vassila Melentieva (the name of a favourite court lady of Ivan the Terrible), and the comedy, Vionda celu Son na Volge (The Military Commander),” or “A dream on the Volga.” Many of his later works (treat of the Russian nobility, and include Byechani Dengi (literally “Bad Money”), Vospitnitsa (“A Girl brought up in a Stranger’s Family”), and Volki e Osti (“Wolves and Sheep”); others relate to the world of actors, such as Liess (“Forest”), Bez vini vinnatiya (“Guiltlessly guilty”), and Talenti e Pokoniki (“Talents and their Admirers”). Osuisky enjoyed the patronage of Alexander III., and received a pension of 3000 rubles a year. With the help of Moscow capitalists he established in that city a model theatre and school of dramatic art, of which he became the first director. He also founded the Society of Russian Dramatic Art and Opera Composers. His death took place on the 24th of June 1886, while travelling to his estate in Flanders.

OSTUNI, a picturesque walled city of Apulia, Italy, in the province of Lecce, 23 m. by rail N.W. of Brindisi. Pop. (1901) 7734 (town); 22,811 (commune). It has a cathedral of the 15th century with a fine Romanesque façade, and a municipal library with a collection of antiquities. The sea has been amalgamated with that of Brindisi.

OSUNA, PEDRO TELLEZ GIRON, 3rd duke of (1575-1624), Spanish viceroy of Sicily and Naples, was born at Osuna, and baptized on the 18th of January 1575. He was the son of Juan Tellez Giron, the 2nd duke, and of his wife Ana Maria de Velasco, a daughter of the constable of Castile. When a boy he accompanied his grandfather, the 1st duke, to Naples, where he was left under the care of the 1st duke of Alburquerque, who accompanied the troops sent by Philip II. to put down a revolt in Aragon, and was married while still young to Doña Cataraína Enriquez de Ribera, a grand-daughter on her mother’s side of Hernan Cortes, the conqueror of Mexico. In 1598 he inherited the dukedom. Before and after his marriage he was known for the reckless dissipation of his life. The scandals to which his excesses gave rise led to his imprisonment at Arévalo in 1600. This sharp lesson had a wholesome effect on the duke, and in the same year he left for Flanders, with a body of soldiers raised at his own expense. His appearance in Flanders as a grandee with a following of his own caused some embarrassment to the king’s officers. But Osuna displayed unexpected docility and good sense in the field. He was content to serve as a subordinate, and took a full share of work and fighting both by land and sea. When peace was made with England in 1604, he is said to have visited London. He is said also to have paid a visit to Holland during the armistice arranged to allow of the negotiations for the twelve years’ truce of 1609; but, as he was back in Spain by that year, it is assumed that the visit was made during the truce. His second wife, whom he had purged of her early offences, and had been decorated with the Golden Fleece. On the 24th of October 1609 he was named viceroy of Sicily, and he took possession of his post at Melazzo on the 5th of March 1611. In 1616 he was promoted to the viceroyalty of Naples, and held the office till he was recalled on the 28th of March 1620. The internal government of Osuna in both provinces was vigorous and just. During his Sicilian viceroyalty he organized a good squadron of galleys with which he freed the coast for a time from the raids of the Mahomedan pirates of the Barbary States and the Levant. After his transfer to Naples Osuna continued his energetic wars with the pirates, but he became concerned in some of the most obscure political intrigues of the time. He entered into a policy of unmeasured hostility to Venice, which he openly attacked in the Adriatic. The princes of the Spanish branch of the Habsburgs were at all times anxious to secure safe communications with the German possessions of their family. Hence their anxiety to dominate all northern Italy and secure possession of the Alpine passes. It would have suited them very well if they could have reduced Venice to the same state of servitude as Genoa. Osuna threw himself into this policy with a whole heart. There can be no reasonable doubt that he was engaged with the Spanish ambassador, and the viceroy of Milan, in the mysterious conspiracy against Venice in 1618. As usual, the Spanish government had misused its resources, and was compelled to back down. It then found external difficulties in controlling its viceroy. Osuna continued his long attack on Venice in an almost piratical fashion, and treated orders from home with scant respect. Serious fears began to be entertained that he meant to declare himself independent in Naples, and had he tried he could have brought about a revolt which the enfeebled Spanish government could hardly have suppressed. It is, however, unlikely that he had treasonable intentions. He allowed his naval forces to be gradually reduced by drafts, and when superseded returned obediently to Madrid. After his return he was imprisoned on a long string of charges, and largely at the instigation of the Venetians. No judgment was issued against him, as he died in prison on the 24th of September 1624. The “great duke of Osuna,” as he is always called by the Spaniards, impressed the imagination of his countrymen profoundly as the greatest viceroy of the 3rd Empire. Osuna left no stamp of the 16th century, and he was no less admired by the Italians. His ability was infinitely superior to that of the ordinary politicians and courtiers of the time, but he was more energetic than really wise, and he was an intolerable subordinate to the bureaucratic despotsim of Philip III.

The Vita de Don Pedro Giron, duca d’Ossuna, vicere di Napoli e di Sicilia di Gregorio Leti (Amsterdam, 1669) is full of irrelevances, and contains much gossip as well as speeches which are manifestly the invention of the author. But it is founded on good documents, and Leti, an Italian who detested the Spanish rule, knew the state of his own country well. See also Don C. Fernandez Duran, El Gran Duque de Osuna y su Marina (Madrid, 1883), and Documentos inéditos para la historia de España (Madrid, 1892, &c.), vol. xlviii.

OSUNA, a town of southern Spain, in the province of Seville; 57 m. by rail E.S.E. of Seville. Pop. (1900) 19,072. Osuna is built on a hill, overlooking the fertile plain watered by the Salado, a sub-tributary of the Guadalquivir. On the top of the hill stands the collegiate church, dating from 1534 and containing interesting Spanish and early German paintings. These, however, as well as the sculptures over the portal, suffered considerably during the occupation of the place by the French under Soult. The vaults, which are supported by Moorish arches, contain the tombs of the Giron family, by one of whom, Don Juan Tellez, the church was founded in 1534. The university of Osuna, founded also by him in 1549, was suppressed in 1820; but its large building is still used as a secondary school.
The industries are agriculture and the making of esparto mats, pottery, bricks, oil, soap, cloth, linen and hats.

Oswalda, the Urso of Hirtius, famous in the 1st century a.c. for its long resistance to the troops of Caesar, and its fidelity to the Pompeians, was subsequently called by the Romans Oswalda and Oswalda Urbantorum, the last name being due, it is said, to the presence of two legion camps here. Oswald was taken from the Moors in 1230, and given by Alphonso X. to the knights of Calatrava in 1264. Don Pedro Giron appropriated it to himself in 1445. One of his descendants, Don Pedro Tellez, was the first holder of the title duke of Oswala, conferred on him by Philip II in 1562.

Oswestry (pron. Osw7Estr), king of Northumbria, was one of the sons of Ethelfrith and was expelled from Northumbria on the accession of Edwin, though he himself was a son of Edwin's sister Acha. He appears to have spent some of his exile in Iona, where he was instructed in the principles of Christianity. In 634 he defeated and slew the British king Ceddwalla at a place called by Bede Desinesbure, near Hefenleth, which has been identified with St Oswald's Cocklaw, near Chollerford, Northumberland. By this he avenged his brother Eanfrith, who had succeeded Edwin in Bernicia, and became king of Northumbria. Oswald reunited Deira and Bernicia, and on the arrival of Aidan in answer to this request he assigned to him the island of Lindisfarne as his see, near the royal city of Bam- borough. He also completed the minster of St Peter at York which had been begun by Paulinus under Edwin. Bede declares that Oswald ruled over all the peoples and provinces of Britain, which includes four languages, those of the Britons, Picts, Scots and Angles. His relationship to Edwin may have helped him to consolidate Deira and Bernicia. Early in his reign he was sponsor to the West Saxon king Cynewulf, whose daughter he married. In 642 he was defeated and slain at a place called Maserfield, probably Oswestry in Shropshire, by Penda of Mercia.

OSWALD (d. 992), archbishop of York, was a nephew of Oda, archbishop of Canterbury, and at an early age became, by purchase, head of the Old Minster at Winchester. Desiring to become a monk, he went with Oda's approval to the monastery of Fleury on the Loire—at that time the great centre of reviving Benedictism. Here he soon distinguished himself by the monastic austerity of his life. In 939 he returned to England at the request of Oda, who, however, died before his arrival. He now went to York to his kinsman the Archbishop Osytel, who took him with him on a pilgrimage to Rome. Soon after his return, he was appointed bishop of Worcester at the recommendation of Dunstan, his predecessor in the see (961). As bishop he took a prominent part in that revival of monastic discipline on Benedictine lines of which Aethelwold, bishop of Winchester, was the most ardent leader. His methods, however, were less violent than those of Aethelwold. Among other religious houses he founded that of Ramsey in conjunction with Aethelwine, Ealdorman of East Anglia. In 972 he was translated (again at Dunstan's recommendation) to the archbishopric of York, with which he continued to hold the see of Worcester. He died on the 29th of February 992 and was buried at Worcester.

See Memorials of St Dunstan, edited by W. Stubbs, Rolls series (London, 1874).

OSWALDTWISTLE, an urban district in the Accrington parliamentary division of Lancashire, England, on the Leeds and Liverpool Canal, 33 m. E.S.E. of Blackburn. Pop. (1901) 14,102. It possesses cotton-mills, printworks, bleachworks and chemical works, and in the neighbourhood are collieries, stone quarries and potteries. At Peelfield, in the township, was born (1775) Sir Robert Peel, first baronet, who, as a factory-owner, effected widespread improvements in the cotton industry.

OSWEGO, a city, port of entry, and the county-seat of Oswego county, New York, U.S.A., on the S.E. shore of Lake Ontario, at the mouth of the Oswego river, about 35 m. N.W. of Syracuse. Pop. (1900) 22,109, of whom 3,089 were foreign born; (1910 census) 23,368. It is served by the New York Central & Hudson River, the Delaware, Lackawanna & Western, and the New York, Ontario & Western railways, by several lines of lake steamboats, and by the Oswego Canal, which connects Lake Ontario with the Erie Canal at Syracuse. There is an inner harbour of 9-35 acres and an outer harbour of 140 acres, which are defended by Fort Ontario. The city lies at an altitude of 300 ft., and is divided into two parts by the Oswego river. Oswego is the seat of a state Normal and Training School (founded as the City Training School in 1861, and a state school since 1867), a state armoury, and a United States life-saving station; among the public buildings are the City Library (about 14,000 volumes in 1906), founded by Gerrit Smith in 1853, the Federal Building and Custom House, the City Hall, the City Hospital, the County Court House, an Orphan Asylum, and a business college. The Oswego river has here a fall of 34 ft., and furnishes excellent water power. Among the principal manufactures are starch (the city has one of the largest starch factories in the world), knit goods, railway car springs, shade-cloth, boilers and engines, wooden-ware, matches, paper-cutting machines, and beer and gin. The principal products were valued in 1905 at $7,592,125. Oswego has a considerable trade with Canada; in 1908 its exports were valued at $8,860,553 and its imports at $990,164. Lake commerce with other American Great Lake ports is also of some importance, the principal articles of trade being lumber, grain and coal.

The site of Oswego was visited by Samuel de Champlain in 1616. Subsequently it was a station for the Jesuit missionaries and the coureurs des bois. In 1722 a regular trading post was established here by English traders, and in 1777 Governor William Burnet of New York erected the first Fort Oswego (sometimes called Fort Burnet, Chouguen or Pepperell). It was an important base of operations during King George's War and the French and Indian War. In the years 1755-1763 the British erected two new forts at the mouth of the river, Fort Oswego (an enlargement of the earlier fort) on the east and Fort Ontario on the west. In August 1756 Montcalm, marching rapidly from Ticonderoga with a force of 3000 French and Indians, appeared before the forts, then garrisoned by 1000 British and colonial troops, and on the 14th of August forced the abandonment of Fort Ontario. On the following day he stormed and captured Fort Oswego, and, dismantling both, returned to Ticonderoga. The British restored Fort Ontario in 1759, and maintained a garrison here until 1766, when, with other posts on the lakes, they were, in accordance with the terms of Jay's Treaty, made over to the United States. It was here in 1766 that Pontiac formally made to Sir William Johnson his acknowledgment of Great Britain's authority. On the 6th of May 1814 Sir James Yeo, with a superior force of British and Canadians, captured the fort, but soon afterwards withdrew. In 1839 the fort was rebuilt and occupied by United States troops; it was abandoned in 1890, but, after having been reconstructed, was again garrisoned in 1905. The modern city may be said to date from 1796. Oswego became the county-seat in 1816, was incorporated as a village in 1828 (when the Oswego Canal was completed), and was first chartered as a city in 1848. See Churchill, Smith and Child, Landmarks of Oswego County (Syracuse, 1885).

OSWESTRY, a market town and municipal borough in the Oswestry parliamentary division of Shropshire, England, on
the borders of Wales, 18 m. N.W. from Shrewsbury. Pop. (1861) 9579. It is on a branch from the Chester line of the Great Western railway, and on the Cambrian main line. The situation is pleasant and the neighbouring district well wooded and hilly. The church of St Oswald, originally conventual, is Early English and Decorated, but has been greatly altered by restoration. There is a Roman Catholic chapel with presbytery, conventual school. The grammar school, founded in the reign of Henry IV., occupies modern buildings. The municipal buildings (1833) include a library, and a school of science and art. On a hill W. of the town are the castle grounds, laid out in 1644, but otherwise only slight remains are seen. The Cambrian railway engine and carriage works are here; and there are tanneries, malting works, machinery works and iron foundries. Frequent agricultural fairs are held. The town is governed by a mayor, 6 aldermen and 18 councillors. Area, 1897 acres.

Old Oswestry, also called Old Fort (Welsh Hen Dinas), is a British earthwork about a mile from the modern town. There are various unsatisfactory accounts of the early history of Oswestry (Blanceminstor, or Album Monasterium), as it was called Tref Cadairau by the Britons and Oswelling after Cunedda Wledig, prince of North Wales, had granted it to his son Oswest. It derives its present name from Oswald, king of Northumbria, who is said to have been killed here in 642, although it is possible that the name Oswestry until the 13th century. In the Domesday Survey it is included in the manor of Maesbury, which Rainald, sheriff of Shropshire, held of Roger, earl of Shrewsbury; but Rainald or his predecessor Warin had already raised a fortification at Oswestry called Lowrave. The manor passed in the reign of Henry I. to Alan Fitz-Fraul, in whose family it continued until the death of Henry Fitzalan, earl of Arundel, without male issue in 1580. The first charter, of which a copy only is preserved among the corporation records, is one given in 1262 by John Fitzalan granting the burgesses self-government. Richard II. by a charter dated 1308 granted all the privileges which belonged to Shrewsbury, and a similar charter was obtained from Thomas, earl of Arundel in 1407. The town was incorporated by Elizabeth in 1582 under the government of two bailiffs and a common council of 24 burgesses, and her charter was confirmed by James I. in 1616. A charter granted by Charles II. in 1672 appointed a mayor, 12 aldermen and 15 common councilmen, and remained governing the charter until the Municipal Corporations Act of 1835 changed the corporation. In 1268 John Fitzalan obtained the right of holding a market every week on Monday instead of Thursday. The market rights were held by the lord of the manor until 1870, when Earl Powis sold them to the corporation. In the 15th and 16th centuries a weekly market was held at Oswestry for the sale of woollen goods manufactured in North Wales, but in the 17th century the drapers of Shrewsbury determined to get the trade into their own town, and although an Order in the Privy Council was passed to restrain it to Oswestry they agreed to buy no more cloths there. The town was walled by the time of Edward I., but was several times burnt during Welsh invasions. In 1642 it was garrisoned for Charles I., but two years later surrendered to the parliamentary forces.

See William Cathall, The History of Oswestry (1855); William Price, The History of Oswestry from the Earliest Period (1819); Victoria County History, Shropshire.

OSWIO (c. 612–670), king of Northumbria, son of Æthelthryth and brother of Oswald, whom he succeeded in Bernicia in 642 after the battle of Maserfield, was the seventh of the great English kings enumerated by Bede. He succeeded in making the majority of the Britons, Picts and Scots tributary to him. At a time when many of the leaders of Oswin, who had become king of Deira, and a few years later took possession of that kingdom. He appears to have consolidated his power by the aid of the Church and by a series of judicious matrimonial alliances. It was probably in 642 that he married Cenfield, daughter of Edwin, thus uniting the two rival dynasties of Northumbria. His daughter Alhild he married to Peada, son of Penda, king of Mercia, while another daughter, Ostryth, became the wife of Æthelred, third son of the same king. Oswio was chiefly responsible for the reconversion of the East Saxons. He is said to have convinced their king Sigebert of the truth of Christianity by his arguments, and at his request sent Cedd, a brother of Ceadda, on a mission to Essex. In 655 he was attacked by Penda, and, after an unsuccessful attempt to buy him off, defeated and slew the Mercian king at the battle of the Winwaed. He then took possession of part of Mercia, giving the rest to Penda. As a thank-offering he dedicated his daughter Ætfled to the Church, and founded the abbey of Whithy. About this time he is thought by many to have obtained some foothold on the south coast of the Frisians in succession to their king Talorcan, the son of his brother Eanfrid. In 660 he married his son Egfrith to Æthelthryth, daughter of the East Anglian king Anna. In 664 at the synod of Whithy, Oswio accepted the usages of the Roman Church, which led to the departure of Colman and the appointment of Wilfrid as bishop of York. Oswio died in 670 and was succeeded by his son Egfrith.

OTHMAN (c. 574–656), in full OTHMAN IBN 'AFFAN, the third of the Mahomedan caliphs, a kinsman and son-in-law of Mahommed. By marrying into the Umayyad family he became the first of the Omayyad dynasty. He was elected caliph in succession to Omar in 644, but owing to his alternate weakness and cruelty and his preference for the Koresh for all responsible positions irrespective of their capacity, he produced strife throughout the empire which culminated in his assassination by Mahommed, son of Abu Bekr. He was succeeded by Ali (q.v.). See Caliphate, A. § 3.

OTHNIEL, in the Bible, a clan settled at Debir or Kirjath-sepher in S. Palestine (Judg. ii. 12 seq., Josh. xv. 16 seq., contrast Josh. x. 38 seq.), described as the "brother" of Caleb. The name appears in Judg. iii. 7–11 (see Judges), as that of a hero who delivered Israel from a North Syrian king. That a king from the Ephraimites who had subjugated Canaan should have been defeated by a clan of the south of Palestine has been doubted. There is no evidence of such a situation, and it has been conjectured that Cushan-Rishathaim (the name suggests "C. of double wickedness") of Aram (s.w.) has arisen from some king (cp. Husham, Gen. xxxvi. 34) or clan (cp. Cush, Num. xii. 1; Cushan, Hab. iii. 7) of Edom (s.w.) to the south or south-east of Palestine. Othniel recurs in I Chron. iv. 13.

See A. Klostermann, Gesch. d. Volkes Israel (1896), p. 122; Cheyne, Ency. Bib. col. 969 seq. and references; also the literature to Judges.

OTHO, MARCUS SALVIUS (32–69), Roman emperor from the 18th of January to the 15th of April a.d. 69, was born on the 28th of April a.d. 32. He belonged to an ancient and noble Etruscan family settled at Ferentum in Etruria. He appears first the most restless and extravagant of the young nobles who surrounded Nero. But his friendship with Nero was brought to an abrupt close in 58, when Otho refused to divorce his beautiful wife Poppea Sabina at the bidding of Nero, who at once appointed him governor of the remote province of Lusitania. Here Otho remained ten years, and his administration was marked by a moderation unusual at the time. When in 68 his neighbour Galba, the governor of Hispania Tarraconensis, rose in revolt against Nero, Otho accompanied him to Rome. Resentment at the treatment he had received from Nero may have impelled him to this course, but to this motive was added before long that of personal ambition. Galba was far advanced in years, and Otho, encouraged by the predictions of astrologers, began to think of himself. But in January 69 his hopes were dissipated by Galba's formal adoption of Calpurnius Piso as the fittest man to succeed him. Nothing remained for Otho but to strike a bold blow. Desperate as was the state of his finances, thanks to his previous extravagance, he found money to purchase the services of some three-and-twenty soldiers of the praetorian guard. On the morning of January 15, five days only after the adoption of Piso, Otho attended as usual to pay his respects to
the emperor, and then hastily excusing himself on the score of private business hurried from the Palatine to meet his accomplices. By them he was escorted to the praetorian camp, where, after a few moments of surprise and indecision, he was saluted emperor. With an imposing force he returned to the Forum, and at the foot of the Capitol encountered Galba, who, alarmed by vague rumours of treachery, was making his way through a dense crowd of wondering citizens towards the barracks of the guard. The cohort on duty at the Palatine, which had accompanied the emperor, instantly deserted him; Galba, Piso and others were brutally murdered by the praetorians. The brief struggle over, Otho returned in triumph to the camp, and on the same day was duly invested by the senators with the name of Augustus, the tribunician power and the other dignities belonging to the principate. Otho had owed his success, not only to the resentment felt by the praetorian guards at Galba’s well-meaning attempts to curtail their privileges in the interests of discipline, but also largely to the attachment felt in Rome for the memory of Nero; and his first acts as emperor showed that he was not unmindful of the fact. He accepted, or appeared to accept, the cognomen of Nero conferred upon him by the shouts of the populace, whom his comparative youth and the effeminacy of his appearance reminded of their lost favourite. Nero’s statues were again set up, his freedmen and household officers reinstated, and the intended completion of the Golden House announced. At the same time the fears of the more sober and respectable citizens were allayed by Otho’s liberal professions of his intention to govern equitably, and by his judicious demeanour towards Marius Celsus, consul-designate, a devoted adherent of Galba.

But any further development of Otho’s policy was checked by the news which reached Rome shortly after his accession, that the army in Germany had declared for Vitellius, the commander of the legions on the lower Rhine, and was already advancing upon Italy. After vainly attempting to conciliate Vitellius by the promise of office in the Roman Empire, the latter, on the 18th, declared himself emperor, and prepared for war. From the remotest provinces, which hadacquiesced in his accession, little help was to be expected; but the legions of Dalmatia, Pannonia and Moesia were enger in his cause, the praetorian cohorts were in themselves a formidable force and an efficient fleet gave him the mastery of the Italian seas. The fleet was at once despatched to secure Liguria, and on the 14th of March Otho, undismayed by omens and prodigies, started northwards at the head of his troops in the hopes of preventing the entry of the Vitellian troops into Italy. But for this he was too late, and all that could be done was to throw troops into Placentia and hold the line of the Po. Otho’s advanced guard successfully defended Placentia against Alienus Canina, and compelled that general to fall back on Cremona. Thus the Roman provinces, except Valens altered the aspect of affairs. The Vitellian commanders now resolved to bring on a decisive battle, and their designs were assisted by the divided and irresolute counsels which prevailed in Otho’s camp. The more experienced officers urged the importance of avoiding a battle, until at least the legions from Dalmatia had arrived. But the rashness of the emperor’s brother Titianus and of Poculius, prefect of the praetorian guards, added to Otho’s feverish impatience, overruled all opposition, and an immediate advance was decided upon, Otho himself remaining behind with a considerable reserve force at Brixellum, on the southern bank of the Po. When this decision was taken the Othonian forces had already crossed the Po and were encamped at Bedriacum (or Betriacum), a small village on the Via Postumia, and on the road by which the legions from Dalmatia would naturally arrive. Leaving a strong detachment to hold the camp at Bedriacum, the Othonian forces advanced along the Via Postumia in the direction of Cremona. At a short distance from that city they unexpectedly encountered the Vitellian troops. Otho, though taken at a disadvantage, fought desperately, but were finally forced to fall back in disorder upon their camp at Bedriacum. Thither on the next day the victorious Vitellians followed them, but only to come to terms at once with their disheartened enemy, and to be welcomed into the camp as friends. More unexpected still was the effect produced at Brixellum by the news of the battle. Otho was still in command of a formidable force—the Dalmatian legions had already reached Aquileia; and the spirit of his soldiers and their officers was unbroken. But he was resolved to accept the verdict of the battle which his own impatience had hastened. In a dignified speech he bade farewell to those about him, and then retiring to rest slept soundly for some hours. Early in the morning he stabbed himself to the heart with a dagger which he had concealed under his pillow, and died as his attendants entered the tent. His funeral was celebrated at once, as he had wished, and not a few of his soldiers followed their master’s example by killing themselves at his pyre. A plain tomb was erected in his honour at Brixellum, with the simple inscription “Diis Manibus Marci Othonis.” At the time of his death (the 15th of April) he was in his thirty-eighth year, and had reigned just three months. In all his life nothing became him so well as his manner of leaving it; but the fortitude he then showed, even if it was not merely the courage of despair, cannot blind us to the fact that he was little better than a reckless and vicious spendthrift, who was not the less dangerous because his fiercer passions were concealed beneath an affectation of effeminate dandyism.

OTIS, HARRISON GRAY (1765-1848), American politician, was born in Boston, Massachusetts, on the 8th of October 1765. He was a nephew of James Otis, and the son of Samuel Allyn Otis (1740-1811), who was a member of the Confederation Congress in 1787-1788 and secretary of the United States Senate from its first session in 1789 until his death. Young Otis graduated from Harvard College in 1783, was admitted to the bar in 1786, and soon became prominent as a Federalist in politics. He served in the Massachusetts House of Representatives in 1766-1767, in the National House of Representatives in 1777-1801, as district-attorney for Massachusetts in 1801, as speaker of the state House of Representatives in 1803-1805, as a member of the state Senate from 1805 to 1811, and as president of that body in 1805-1806 and 1808-1811, as a member of the United States Senate from 1817 to 1822, and as mayor of Boston in 1829-1832. He was strongly opposed to the War of 1812, and was a leader in the movement culminating in the Hartford Convention, which he defended in a series of open letters published in 1824, and in his inaugural address as mayor of Boston in 1829-1832. He was an influential, a popular social leader and an eloquent speaker—at the age of twenty-three he was chosen by the town authorities of Boston to deliver the Independence Day oration—Otis yet lacked conspicuous ability as a statesman. He died in Boston on the 28th of October 1848.

OTIS, JAMES (1725-1783), American patriot, was born at West Barnstable, Massachusetts, on the 5th of February 1725. He was the eldest son of James Otis (1702-1778), fourth in descent from John Otis (1581-1657), a native of Barnstable, Devon, and one of the first settlers (in 1635) of Hingham, Mass. The elder James Otis was elected to the provincial General Court in 1738, was its speaker in 1760-1762, and was chief justice of the Court of Common Pleas from 1741 until 1776; he was a prominent patriot in the colony of Massachusetts. The son graduated at Harvard in 1743; and after studying law in the office of Jeremiah Gridley (1702-1767), a well-known lawyer with Whig sympathies, rose to great distinction at the bar, practising first at Plymouth and after 1750 at Boston. In 1760 he published Rudiments of Latin Prosody, a book of authority in its time. He wrote a similar treatise upon Greek prosody; but this was never published, because, as he said, there was not a font of Greek letters in the country, nor, if there were, a printer who could have set them up. Soon after the accession of George III. to the throne of England in 1766, the British government
decided upon a rigid enforcement of the navigation acts, which had long been disregarded by the colonists and had been almost wholly disregarded since the War of the English and Spaniards. The Acts of Assistance issued in 1755 were about to expire, and it was decided to issue new ones, which would empower custom house officers to search any house for smuggled goods, though neither the house nor the goods had to be specifically mentioned in the writs. Much opposition was aroused in Massachusetts, the legality of the writs was questioned, and the Superior Court consented to hear argument. Otis held the office of advocate-general at the time, and it was his duty to appear on behalf of the government. He refused, resigned his office, and appeared for the people against the issue of the writs, Gridley appearing on the opposite side.

The case was argued in the Old Town House of Boston in February 1761, and the chief speech was made by Otis. His plea was fervid in its denunciation of the proceedings and the rights of the colonists. Going beyond the question at issue, he urged the more fundamental question of the relation between the English in America and the home government, and argued that even if authorized by act of parliament such writs were null and void.

The young orator was elected in May of the same year a representative from Boston to the Massachusetts General Court. To that position he was re-elected nearly every year of the remaining active years of his life, serving there with his father. In 1766 he was chosen Speaker of the House of Representatives, but the choice was negative.

In September 1762 the younger Otis published A Vindication of the Conduct of the House of Representatives of the Province of Massachusetts Bay, in defence of the conduct of the House in sending to the governor a message (drafted by Otis) rebuking him for acting as the right of the colonists. He also wrote various state papers addressed to the colonies to enlist them in the common cause, or sent to the government in England to uphold the rights or set forth the grievances of the colonists. His influence at home in controlling and directing the movement of events which led to the War of Independence was universally felt and acknowledged; he never received so frequent an answer, denounced, or applauded in parliament and the English press before 1760 as the recognized head and chief of the rebellious spirit of the New England colonists. In 1765 Massachusetts sent him as one of her representatives to the Stamp Act Congress at New York, which had been called by a Committee of the Massachusetts General Court, of which he was a member; and here he was a conspicuous figure, serving on the committee which prepared the address sent by that body to the British House of Commons.

In 1769 he denounced in the Boston Gazette certain customs commissioners who had charged him with treason. Thereupon he became involved in an altercation in a public-house with Robinson, one of the commissioners; the altercation grew into an affray, in the course of which Otis received a blow on the head, which is considered to have caused his subsequent mental derangement. He was mulcted in £2000 damages, but in view of his having made a written apology, Otis declined to take this sum from him. From 1769 almost continuously until his death Otis was harmless insane, though he had occasional lucid intervals, serving as a volunteer in the battle of Bunker Hill in 1775 and arguing a case in 1778. He was killed by lightning (it is said that he had often expressed a wish that he might die in this way) at Andover, Mass., on the 23rd of May 1783.

Otis's political writings were chiefly controversial and exercised an enormous influence, his pamphlets being among the most effective presentations of the arguments of the colonists against the arbitrary measures of the British ministry. His more important pamphlets were A Vindication of the Conduct of the House of Representatives of the Province of Massachusetts Bay (1762); The Rights of the British Colonies Asserted and Proved (1764); A Vindication of the British Colonies against the Aspersions of the Halifax Gentleman in his Letter to a Rhode Island Friend—a letter known at the time as the "Halifax Lieut." (1765); and Considerations on Behalf of the Colonists in a Letter to a Noble Lord (1765).

The best biography is that by William Tadlor (Boston, 1823); the best account of his life is Frank Otis (Boston, 1847). The best account of Otis's characteristics and influence as a writer may be found in M. C. Tyler's Literary History of the American Revolution (New York, 1897). See also the notes on the Writs of Assistance in Otis's Massachusetts Reports, 1763-1772 (Boston, 1805). Otis's speech at the trial of which was reprinted from both race notes taken by John Adams, appears in Appendix A of vol. ii. of C. F. Adams's edition of the Works of John Adams (Boston, 1850).

OTLEY, a market town in the Otley parliamentary division of the West Riding of Yorkshire, England, 13 m. N.W. of Leeds on the Midland and the North-Eastern railways. Pop. of urban district (1901) 9230. It is picturesquely situated on the south bank of the Wharfe, at the foot of the precipitous Chevin Hill, 925 ft. in height. In ancient times a large and excellent building-stone is quarried, which was used for the foundations of the Houses of Parliament in London, and is despatched to all parts of England. The church of All Saints has Norman portions, and a cross and other remains of pre-Norman date were discovered in restoring the building. There are interesting monuments of members of the Fairfax family and others. Worsted spinning and weaving, tanning and leather-dressing, paper-making and the making of printing-machines are the principal industries. The scenery of Wharfedale is very pleasant. In thedale, 7 m. below Otley, are the fine ruins of Harewood Castle, of the 14th century. The neighbouring church contains a noteworthy series of monuments of the 15th century in alabaster.

OTRANTO, the.ss and archiepiscopal see of Apulia, Italy, in the province of Lecce; 24 m. S.E. by rail, 40 ft. above sea-level. Pop. (1901) 2295. It is beautifully situated on the east coast of the peninsula of the ancient Calabria (q.v.). The castle was erected by Alphonso of Aragon; the cathedral, consecrated in 1088, has a rose window and side portal of 1281. The interior, a basilica with nave and two aisles, contains columns said to come from a temple of Minerva and a fine mosaic pavement of 1166, with interesting representations of the months, Old Testament subjects, &c. It has a crypt supported by forty-two marble columns. The church of St. Pietro has Byzantine frescoes. Two submarine cables start from Otranto, one for Valona, the other for Corfu. The harbour is small and has little trade.

Otranto occupied the site of the ancient Hydrus or Hydruntum, a town of Greek origin. In Roman times it was less important than Brundusium as a point of embarkation for the East, though the distance to Apollonia was less than from Brundusium. It remained in the hands of the Byzantine emperors until it was taken by Robert Guiscard in 1068. In 1480 it was utterly destroyed by the Turkish fleet, and has never since recovered its importance. About 30 m. S.E. lies the promontory of St. Maria di Leuca (so called since ancient times from its white cliffs), the S.E. extremity of Italy, the ancient Promontorium Iapygium or Salintentum. The district between this promontory and Otranto is thickly populated, and very fertile. (T. As.)

OTTAKAR I. (d. 1230), king of Bohemia, was a younger son of Vladislav II (1174) and a member of the Premysl family, hence he is often called a Premysl. His early years were passed amid the anarchy which then prevailed everywhere in his native land; after several struggles, in which he took part, he was recognized as ruler of Bohemia by the emperor Henry VI. in 1192. He was, however, soon overthrown, but renewing the fight in 1196 he forced his brother, King Vladislaw III., to abandon Bohemia to him and to content himself with Moravia. Although confirmed in the possession of his kingdom by the German king, Philip, duke of Swabia, Ottokar soon deserted Philip, who thereupon declared him deposed. He then joined the rival German king, Otto of Brunswick, afterwards the emperor Otto IV., being recognized as king of Bohemia both by Otto and by his ally, Pope Innocent III. Philip's consequent invasion of Bohemia was a great success. Ottokar, having been compelled to pay a fine, again ranged himself among Philip's partisans and still later was
among the supporters of the young king, Frederick II. He united Moravia with Bohemia in 1222, and when he died in December 1230 he left to his son, Wenceslaus I., a kingdom united and comparatively peaceable.

Ottakar II., or Premysl Ottakar II. (c. 1230–1278), king of Bohemia, was a son of King Wenceslaus I., and through his mother, Kunigunde, was related to the Hohenstaufen family, being a grandson of the German king, Philip, duke of Swabia. During his father's lifetime he ruled Moravia; but when in 1248 some discontented Bohemian nobles acknowledged him as their sovereign, trouble arose between him and his father, and for a short time Ottakar was imprisoned. However, in 1251 the young prince secured his election as king of Bohemia. To strengthen his position by marrying Margaret (d. 1267), sister of Duke Frederick II., the last of the Babenberg rulers of the duchy and widow of the German king, Henry VII. Some years later he repudiated this lady and married a Hungarian princess. Both before and after he became king of Bohemia in succession to his father in September 1253 Ottakar was involved in a dispute with Bela IV., king of Hungary, over the possession of Styria, which duchy had formerly been united with Austria. By an arrangement made in 1254 he surrendered part of it to Bela, but when the dispute was renewed he defeated the Hungarians in July 1260 and secured the whole of Styria for himself, owing his formal investiture with Austria and Styria to the German king, Richard, earl duke of Austria. Both his kingship and success were due to his remarkable position and to the Prussians. In 1269 he inherited Carinthia and part of Carniola; and having made good his claim, contested by the Hungarians, on the field of battle, he became the most powerful prince in Germany when an election for the German throne took place in 1273. But Ottakar was not the successful candidate. He refused to acknowledge his victorious rival, Rudolph of Habsburg, and urged the pope to adopt a similar attitude, while the new king claimed the Austrian duchies. Matters reached a climax in 1276. Placing Ottakar under the ban of the empire, Rudolph besieged Vienna and compelled Ottakar in November 1276 to sign a treaty by which he gave up Austria and the neighbouring duchies, retaining for himself only Bohemia and Moravia. Two years later the Bohemian king tried to recover his lost lands; he found allies and collected a large army, but he was defeated by Rudolph and killed at Dürnkrut on the March on the 26th of August 1278. Ottakar was a founder of towns and a friend of law and order, while he assisted trade and welcomed German immigrants. Clever, strong and handsome, he is a famous figure both in history and in legend, and is the subject of a tragedy by F. Grillparzer, König Ottakars Glück und Ende. His son and successor was Wenceslaus II.

See O. Lorenz, Geschichte König Ottakars ii. (Vienna, 1866); A. Huber, Geschichte Österreichs, Band II. (Gotha, 1883); and F. Palacky, Geschichte von Böhmen, Band I. (Prague, 1844).

Ottawa Rima, a stanza of eight iambic lines, containing three rhymes, invariably arranged as follows:—a b a b a a b c. It is an Italian invention, and we find the earliest specimens of its use in the poetry of the fourteenth century. Boccaccio employed it for the Teseide, which he wrote in Florence in 1340, and for the Filostrato, which he wrote at Naples some seven years later. These remarkable epics gave to ottava rima its classic character. In the succeeding century it was employed by Politiani, and by Boiardo for his famous Orlando Innamorato (1486). It was Pulci, however, in the Morgante Maggiore (1487), who invented the peculiar mock-heroic, or rather half-serious, half-burlesque, style with which ottava rima has been most commonly identified ever since and in connexion with which it was introduced into England by Frere and Byron. The measure, which he had recognized as the normal one for all Italian epic poetry, was presently adopted with extraordinary charm and variety by Berni, Ariosto and Tasso. The merits of it were not perceived by the English poets of the 16th and 17th centuries, although the versions of Tasso by Carew (1594) and Fairfax (1600) and of Ariosto by Harrington (1591) preserve its external construction. The stanzaic forms invented by Spenser and by the Fletchers have less real relation to ottava rima than is commonly asserted, and it is quite incorrect to say that the author of the Fairy Queen adopted ottava rima and added a ninth line to prevent the sound from being monotonously iterative. A portion of Browne's Britannia's Pastoral is composed in pure ottava rima, but this is the only important specimen in original Elizabethan literature. Two centuries later a very successful attempt was made to introduce in English poetry the flexibility and gaiety of ottava rima by John Hookham Frere, who had studied Pulci and Casti, and had caught the very movement of their diverting measure. His Whistlecraft appeared in 1817. This is a specimen of the ottava rima of Frere:

But chiefly, when the shadowy moon had shed
O'er woods and waters her mysterious hue,
Their passive hearts and vacant fancies led
With high and aspiring thoughts towards new,
Till their brute souls with inward working bred
Dark hints that in the depths of instinct grew
Subject—not from Locke's associations,
Nor David HarteI's doctrine of vibrations.

Byron was greatly impressed by the opportunities for satire involved in Frere's experiment, and in October 1817, in imitation of Whistlecraft, but keeping still closer to Pulci, he wrote Beppo. By far the greatest monument in ottava rima which exists in English verse is the Six Feet, a narrative poem of the fifteenth century which was adapted to this measure, which was peculiarly adaptable to the purposes of his genius, in The Vision of Judgment (1822). Meanwhile Shelley also became attracted by it, and in 1826 translated the Hymns of Homer into ottava rima. The curious burlesque epic of William Tennant (1784–1848), Auster Fair (1812), which preceded all these, is written in what would be ottava rima if the eighth line were not an alexandrine. The form has been little used in other languages than Italian and English. It was employed by Boscna (1490–1542), who imitated Bembo vigorously in Spanish, and the very fine Aracneca of Ercilla y Zúñiga (1533–1593) is in the same measure. Lope de Vega Carpio wrote plentifully in ottava rima. In Portuguese poetry of the 16th and 17th centuries this measure obtained the sanction of Camoens, who wrote in it his immortal Lusíadas (1572). Ottava rima has been attempted in German poetry by Uhland and others, but not for pieces of any considerable length.

(O. G.)

Ottawa, a tribe of North American Indians of Algonquian stock, originally settled on the Ottawa river, Canada, and later on the north shore of the upper peninsula of Michigan. They were driven in 1650 by the Iroquois beyond the Mississippi, only to be forced back by the Dakotas. Then they settled on Manitousln Island, Lake Huron, and joined the French against the English. During the War of Independence, however, they fought for the latter. Some were moved to Indian Territory (Oklahoma), but the majority live to-day in scattered communities throughout lower Michigan and Ontario.

Ottwa, the largest tributary of the river St Lawrence; ranking ninth in length among the rivers of Canada, being 685 m. long. It flows first westward to Lake Temiscaming; thence south-east and east. The principal tributaries on the left bank are the Rouge (115 m.), North Nation (60), Lieve (205), Gatineau (240), Coulonge (135), Dumoine (80); and on the right bank, the South Nation (90), Mississippi (105), Madawaska (130) and Petawawa (93). Canals at Ste Anne, Carillon and Grenville permit the passage of vessels drawing 9 ft., from Montreal up to the city of Ottawa. At Ottawa the river is connected with Lake Ontario by the Rideau Canal. The Chaudière Falls, and the Chats and other rapids, prevent continuous navigation above the capital, but small steamers ply on the larger navigable stretches. The Montreal, Ottawa and Georgian Bay Canal is designed to surmount these obstructions and provide a navigable channel from Georgian Bay up French river, through Lake Nipissing and over the height of land to the Ottawa, thence down to Montreal, of sufficient depth to enable vessels drawing 20 or 21 ft. to carry cargo from Chicago, Duluth, Fort William, &c. to Montreal, or, if necessary, to Europe, without breaking bulk. Except the suggested Hudson Bay route, this canal would form
The Ottawa was first explored by Samuel de Champlain in 1613. Champlain describes many of its tributaries, the Chaudière and Rideau Falls, the Long Sault, Chats and other rapids, as well as the character of the river and its banks, with minuteness and reasonable accuracy. He places the Chaudière Falls in 45° 38', the true position being 45° 27' west. The Long Sault Rapids on the Ottawa, about Deschenes Bay, are upstream and the capital were the scene of one of the noblest exploits in Canadian history, in 1661 the young Sieur des Ormeaux with sixteen comrades and a handful of Indian allies deliberately gave their lives to save New France from an invasion of the Iroquois. They intercepted the war party at the Long Sault, and for nearly a week held them at bay. When finally the last Frenchman fell under a shower of arrows, the Iroquois were thoroughly disheartened and returned crestfallen to their own country. For a hundred and fifty years thereafter the Ottawa was the great highway from Montreal to the west for explorers and fur-traders.

The portage paths around its cataracts and rapids were worn smooth by the moccasined feet of countless voyageurs; and its wooded banks rang with the inimitable chantsons of Old Canada, laden with the recollection of the voyageur’s song as he pushed down the same stream. Throughout the 19th century the Ottawa was the thoroughfare of the lumbermen, whose immense rafts were carried down from its upper waters to Montreal and Quebec.

OTTAWA, a city of Carleton county, province of Ontario, and the capital of the Dominion of Canada, on the right bank of the Ottawa river, 101 m. W. of Montreal and 217 m. N.E. of Toronto. The main tower of the parliament building is in 45° 25' 28" N., and 75° 42' 03" W.

The city stands for the most part on a cluster of hills, 60 to 155 ft. above the river. It is on the main line of the Canadian Pacific railway, which affords direct communication with Montreal by two routes, the North Shore and the Short Line, and one route, the Grand Trunk, and the Grand Trunk railway lead to Brockville, on the St Lawrence river, passing through the town of Smith’s Falls where connexion is made with the direct line from Montreal to Toronto; to Prescott, also on the St Lawrence; northward through the Gatineau valley to Maniwaki, in the heart of a famous sporting country, and westward to Waltham, on the north side of the Ottawa. The Grand Trunk offers a third route to Montreal, and another line of the same railway leads to Parry Sound, on Georgian Bay. The Ottawa and New York (New York Central) runs to Cornwall, on the St Lawrence, thence to New York. Electric railways afford communication with all parts of the city and extend eastward to Rockliffe Park and the rifle ranges, westward to Britannia, on Lake Deschenes, and through the outskirts of the town of Hull to Aylmer and Victoria Park. During the summer months steamers ply down the Ottawa to Montreal, and by way of the Rideau canal and lakes to Kingston on the St Lawrence. A road bridge, partially destroyed in the great fire of 1900, connects Ottawa with Hull; a railway bridge spans the river above the Chaudière Falls; and the Royal Alexandria Bridge, below the falls, carries both steam and electric railway tracks, as well as roadways for vehicular and passenger traffic. The site of the city is exceedingly picturesque. For 3 m. it follows the high southern bank of the Ottawa, from the Chaudière Falls, whose mist-crowned cauldron is clearly visible from the summit of Parliament Hill, to and beyond the Rideau Falls, so named by early French explorers because of their curling-like appearance. The Rideau, a southern tributary, industries as well as for the development of electric light and power, for the lighting of the city and the running of the electric railways.

The people of Ottawa possess a number of public parks, both within and outside the city, partly the result of their own foresight, and partly due to the labours of the Government Improvement Commission. Parliament Hill itself constitutes a park of no mean proportions, one of the noted features of which is the beautiful Lover’s Walk, cut out of the side of the cliff half way between the river and the summit. The grounds above contain

OTTAWA from the north. Above the Chaudière Falls the river is broken by the Deschenes Rapids, and beyond these again it expands into Lake Deschenes, a favourite summer resort for the people of the city. To the north lie the Laurentian Hills, broken by the picturesque Gatineau Valley.

The crowning architectural feature of the city is the splendid group of Gothic buildings on the summit of Parliament Hill, whose limestone bluffs rise 150 ft. sheer from the river. The three blocks of these buildings form sides of a great quadrangle, the fourth side remaining open. The main front of the central or Parliament building is 470 ft. long and 40 ft. high, the Victoria Tower (180 ft. high) rising over the principal entrance. Behind and connected with the Parliament building is an admirably proportioned polygonal hall, 90 ft. in diameter, in which the library of parliament is housed. The corner stone of the main building was laid by the then prince of Wales in 1860. The buildings forming the eastern and western sides of the quadrangle are devoted to departments of the Dominion government. To the south, but outside the grounds of Parliament Hill, stands the Langevin Block, a massive structure in brown sandstone, also used for departmental purposes. The increasing needs of the government have made it necessary in the last few years to add an effort has been made to bring as many of these as possible into a harmonious group. The Archives building and the Royal Mint stand on the commanding eminence of Nepean Point, to the eastward of Parliament Hill, the Rideau Canal lying between. Two large departmental buildings occupy ground south of the Archives building and facing Parliament Hill, one containing the Supreme Court as well as the Federal Department of Justice. At the foot of Metcalfe Street, south of Parliament Hill, stands the Victoria Museum, with the department of mines, with the splendid collections of the Geological and Natural History Museum, the departmental library, and the National Art Gallery. The Dominion Observatory stands outside the city, in the grounds of the Central Experimental Farm. Plunging down to the river south of the city, east of the canal, and immediately south of Rideau Street, and a large hotel (Grand Trunk Railway), the Chateau Laurier, at the southern end of Major’s Hill Park. Other prominent buildings are the city hall, post office, Carnegie library, normal and model schools, government printing bureau, county court house, the Basilica or Roman Catholic cathedral, and Christ Church cathedral (Church of England), the Roman Catholic university of Ottawa and the collegiate institute.

The city charities include four large general hospitals, two of which are under Protestant auspices; one is controlled by Roman Catholics; the fourth is devoted to contagious diseases. Ottawa is the seat of the Church of England bishop of Ottawa, and of the Roman Catholic bishop of Ottawa. Several of the philanthropic and educational orders of the latter church are established here, in nunneries, convents or monasteries. As elsewhere in Ontario, the educational system is divided into public schools (undenominational), and separate schools (Roman Catholic), the latter supported by Roman Catholic taxpayers, the former by all other members of the community. The collegiate institute is common to both, and is used as a preparatory school for the universities.

Ottawa has been a great seat of the lumber trade, and the manufacture of lumber still forms an important part of the industrial life of the city, but the magnificent waterpowers of the Chaudière and Rideau Falls are now utilized for matches, flour-mills, machine shops, and many other industries as well as for the development of electric light and power, for the lighting of the city and the running of the electric railways.

The people of Ottawa possess a number of public parks, both within and outside the city, partly the result of their own foresight, and partly due to the labours of the Government Improvement Commission. Parliament Hill itself constitutes a park of no mean proportions, one of the noted features of which is the beautiful Lover’s Walk, cut out of the side of the cliff half way between the river and the summit. The grounds above contain
statues of Queen Victoria, as well as of Sir John Macdonald, Alexander Mackenzie, Sir George Cartier and other Canadian political leaders. On the eastern side of the canal is Major's Hill Park, maintained by the government. Below Sandy Hill, on the banks of the Rideau, rises Strathcona Park, another piece of landscape gardening constructed out of what was once an unsightly swamp. Crossing the bridges above the Rideau Falls, and passing the heavily wooded grounds of Rideau Hall, the official residence of the governor-general, we come to Rockcliffe Park, beyond which lies the government rifle ranges. Rockcliffe Park is the easternmost point of an ambitious scheme of landscape gardening planned by the Improvement Commission. From here a driveway extends to Rideau Hall; thence it crosses the Rideau river to a noble thoroughfare cut through the heart of Lower Town, and known as King Edward Avenue. Crossing the canal by the Laurier bridge, the driveway turns south and follows the west bank of the canal for 4 m. to the Central Experimental Farm, an extensive tract of land upon which experiments in model farming are carried out by government specialists, for the benefit of Canadian farmers. From the Experimental Farm the driveway will be carried around the western side of the city to the banks of the Ottawa, connecting by light bridges with a group of islands above the Chaudière Falls which are to be converted into a park reserve.

Ottawa is governed by a mayor, elected by the city at large; a board of control consisting of four members, similarly elected and a board of 16 aldermen, 2 elected by each of the 8 wards. The city returns 2 members to the Dominion House of Commons and 2 to the provincial legislature.

The population, of which one-third is French-speaking, the remainder English-speaking, the incorporation of a small German element, has increased rapidly since the incorporation of the city in 1854. It was 59,028 in 1901; 67,532 in 1906; and in 1911, including the suburbs and the neighbouring town of Hull, over 100,000.

The earliest description of the site of Ottawa is that of Samuel de Champlain, in his Voyages. In June 1613, on his way up the river, he came to a tributary on the south side, "at the mouth of which is a marvellous fall. For it descends a height of twenty or twenty-five fathoms with such impetuosity that it makes an arch nearly four hundred paces broad. The savages take pleasure in passing under it, not wetting themselves, except from the spray that is thrown off." This was the Rideau Falls, but a good deal must be made for exaggeration in Champlain's account. Continuing up the river, he says, "a fall, a league from there, which is half a league broad and has a descent of six or seven fathoms. There are many little islands. The water falls in one place with such force upon a rock that it has hollowed out in course of time a large and deep basin, in which the water has a circular motion and forms large eddies in the middle, so that the savages call it Asticou, which signifies boiler. This cataract produces such a noise in this basin that it is heard for more than two leagues." The present name, Chaudière, is the French equivalent of the old Indian name. For two hundred years and more after Champlain's first visit the Chaudière portage was the main thoroughfare from Montreal to the great interior of the fur country; but it was not until 1800 that a permanent settlement was made. In the year Philemon Wright, of Woburn, Massachusetts, built a home for himself at the foot of the portage, on the Quebec side of the river, where the city of Hull now stands; but for some time the precipitous cliffs on the south side seem to have discouraged settlement there. Finally about 1820 one Nicholas Sparks moved over the river and cleared a farm in what is now the heart of Ottawa. Seven years later Colonel John By, R.E., was sent out to build a canal from a point below the Chaudière Falls to Kingston on Lake Ontario. The canal, completed at a cost of $2,500,000, has never been of any great commercial importance; it has never been called upon to fulfil its primary object, as a military work to enable gun-boats and military supplies to reach the lakes from Montreal without being exposed to attack along the St Lawrence frontier. The building of the canal created a fairly sized settlement at its Ottawa end, which came to be known as Bytown. As the lumber trade developed Bytown rapidly increased in wealth and importance. In 1834 it was incorporated as a city, the name being changed to Ottawa; and four years later Queen Victoria selected Ottawa as the capital of Canada. Ottawa was admirably situated for a capital from a political and military point of view; but there is reason to believe that the deciding factor was the pressure exerted by the four other rival claimants, Montreal, Quebec, Toronto and Kingston, any three of which would have fiercely contested the selection of the fourth. The first session of parliament in the new capital was opened in 1865.
Ottawa. The semi-centennial of this debate was celebrated in 1908, when the Illini Chapter, Daughters of the American Revolution, caused a suitably inscribed boulder weighing 23 tons to be set up in Washington Park as a memorial.

OTTAWA, a city and the county-seat of Franklin county, eastern Kansas, U.S.A., situated on the Osage (Marais des Cygnes) river, about 58 m. (by rail) S.W. of Kansas City. Pop. (1900) 6934, of whom 333 were foreign born; (1905, state census) 7727. It is served by the Atchison, Topeka & Santa Fe (which has large repair shops here) and the Missouri Pacific railways. There is a Carnegie library, and Forest Park, within the city limits, is a popular meeting place of conventions and summer gatherings, including the annual Ottawa Chautauqua Assembly. Ottawa University (Baptist) was established here in 1856, as the outgrowth of Roger Williams University, which had been chartered in 1860 for the education of Indians on the Ottawa Reservation, and had received a grant of 20,000 acres from the Federal government in 1862. The university comprises an academy, a college, a school of fine arts and a commercial college, and in 1900 had 406 students. Ottawa has an important trade in grain and live-stock; soft coal and natural gas are found in the vicinity; the manufactures include flour, windmill-pre-fence, furniture, bricks, brooms and foundry products. Ottawa was settled in 1834, and was first chartered as a city in 1866.

OTTER (O. Eng. oto, otor, a common Teutonic word, cf. Dutch and Ger. Otter, Dan. odder, Swed. utter; it is to be referred to the root seen in Gr. ὄκα, water), a name properly given to the well-known European carnivorous aquatic mammal (Lutra vulgaris, or L. lutra), but also applicable to all the members of the lutrine section of the family Mustelidae (see CARNIVORA). The otter has an elongated, low body, short limbs, short broad feet, with five toes on each, connected together by webs, and all with short, moderately strong, compressed, curved, pointed claws. Head rather small, broad and flat; muzzle very broad; when at rest its back is black; eyes small and black; ears short and rounded. Tail a little more than half the length of the body and head together, broad and strong at the base, and gradually tapering to the end, somewhat flattened horizontally. The fur is of fine quality, consisting of a short soft whitish grey under-fur, brown at the tips, interspersed with longer, stiffer and thicker hairs, shining, greyish at the base, bright rich brown at the points, especially on the upper-parts and outer surface of the legs; the throat, cheeks, under-parts and inner surface of the legs brownish grey throughout. Individual otters vary in size. The total length from the nose to the end of the tail averages about 32 ft., of which the tail occupies 1 ft. 3 or 4 in. The weight of a full-sized male is from 18 to 24 lb., that of a female about 4 lb. less.

As the otter lives almost exclusively on fish, it is rarely met with far from water, and usually frequents the shores of brooks, rivers, lakes and, in some localities, the sea itself. It is a most expert swimmer and diver, easily over-taking and seizing fish in the water; but when it has captured its prey it brings it to shore to devour. When lying upon the bank, it holds the fish between its fore-paws, commences at the head and then eats gradually towards the tail, which it is said to leave. The female produces three to five young ones in March or April, and brings them up in a nest formed of grass or other herbage, usually placed in a hollow place in the bank of a river, or under the shelter of the roots of some overhanging tree. The otter is found in localities suitable to its habits throughout Great Britain and Ireland, though less abundantly than formerly, for, being destructive to fish, it is rarely allowed to live in peace when its haunts are discovered. Otter-hunting with packs of hounds of a special breed, and trained for the purpose, is a pastime in many parts of the country. It was formerly the practice to kill the otter with long spears, which the huntsmen carried; now the quarry is picked up and "tailed," or run into by the pack.

The otter ranges throughout the greater part of Europe and Asia; and a closely allied but larger species, L. canadensis, is extensively distributed throughout North America, where it is pursued for its fur. An Indian species, L. nair, is trained by the natives of some parts of Bengal to assist in fishing, by driving the fish into the nets and the otters are taught to catch the fish, being let into the water for the purpose attached to a long cord.

Otters are widely distributed, and, as they are much alike in size and coloration, their specific distinctions are by no means well defined. Besides those mentioned above, the following have been described, L. californica, North America; L. felina, Central America, Peru, and Chili; L. brasilensis, Brazil; L. maculicollis, South Africa; L. whiteleyi, Japan; L. chinensis, China and Formosa, and other species. Some, with the feet only slightly webbed, and the claws exceedingly small or altogether wanting on some of the toes, and also with some difference in dental characters, have been separated as a distinct genus, Aonyx. These are L. inuquius from South Africa and L. cinerea from India, Java, and Sumatra.

More distinct still is the sea-otter (Latax, or Enhydra, lutris). The entire length of the animal from nose to end of tail is about 4 ft., so that the body is considerably larger and more massive than that of the English otter. The skin is peculiarly loose, and stretches when removed from the animal. The fur is remarkable for the preponderance of the beautifully soft woolly under-fur, the longer stiffer hairs being scanty. The general colour is deep liver-brown, silvered or frosted with the hoary tips of the longer stiffer hairs. These, however, removed when the skin is dressed for commercial purposes.

Sea-otters are only found upon the rocky shores of certain parts of the North Pacific Ocean, especially the Aleutian Islands and Alaska, extending as far south on the American coast as Oregon; but, owing to the persecution to which they are subjected for the sake of their valuable skins, their numbers are greatly diminishing. The otters are captured by spearing, clubbing, nets and bullets. They do not feed on fish, like true otters, but on clams, mussels, sea-urchins and crabs; and the female brings forth but a single young one at a time, apparently at any season of the year. They are excessively shy and wary; young cubs are often captured by the hunters who have killed the dam, but all attempts to rear them have hitherto failed.

See Elliott Coues, Monograph on North American Fur-bearing Animals (1877).

OTTERY ST MARY, a market town in the Honiton parliamentary division of Devonshire, England, 15 m. E. by N. of Exeter, on a branch of the London & South-Western railway. Pop. of urban district (1901) 3492. It is pleasantly situated in the rich valley of the small river Otter. The parish church, the finest in the county, is cruciform, and has the unique feature of transeptal towers, imitated from Exeter Cathedral. The northern has a low spire. The church, which is Early English, with Decorated and Perpendicular additions, contains several ancient tombs. The manor of Ottery belonged to the abbey of Rome in the time of Edward the Confessor. The church was dedicated in 1260 by Walter Bronescombe, bishop of Exeter; and c. 1335 Bishop John Grandisson, on founding
a secular college here, greatly enlarged the church; it has been thought that, by copying the Early English style, he is responsible for more of the building than is apparent. The town has a large agricultural trade. It is the birthplace of Samuel Taylor Coleridge (1772); and W. M. Thackeray stayed in the vicinity in youth, his knowledge of the locality appearing in *Pendennis. Ottignies*, a town of Belgium, in the province of Brabant. It is an important station on the main line from Brussels to Namur, and forms the point of junction with several cross lines. It has extensive modern flower and vegetable gardens. Pop. (1904) 2105.

**OTTO**, king of Greece (1815-1867), was the second son of Louis I, king of Bavaria, and his wife Teresa of Saxe-Altenburg. He was born at Salzburg on the 1st of June 1815, and was educated at Munich. In 1832 he was chosen by the conference of London to occupy the newly-erected throne of Greece, and on the 6th of February 1833 he landed at Nauplia, then the capital of independent Greece. Otto, who was not yet eighteen, was accompanied by a council of regency composed of Bavarians under the presidency of Count Joseph Ludwig von Arnspersg (1787-1853), who as minister of finance in Bavaria had succeeded in restoring the credit of the state at the cost of his popularity. The task of governing a semi-barbarous people, but recently emancipated, divided into bitter factions, and filled with an exaggerated sense of their national destiny, would in no case have been easy; it was not facilitated by the bureaucratic methods introduced by the regents. Though Arnspersg and his colleagues did a good deal to introduce system and order into the infant state, they contrived to make themselves hated by the Greeks; and with sufficient reason. That the regency refused to respond to the demand for a constitution was perhaps natural, for the experiments of constitutional experiments in emancipated Greece had not been encouraging. The result, however, was perpetual unrest; the regency, too, was divided into a French and a Russian party, and distracted by personal quarrels, which led in 1834 to the recall by King Louis of G. L. von Maurer and Karl von Abel, who had been in bitter opposition to Arnspersg. Soon afterwards the Mainotes were in open revolt, and the money obtained from foreign loans had to be spent in organizing a force to preserve order. On the 1st of June 1835 Otto came of age, but, on the advice of his father and under pressure of Great Britain and of the house of Rothschild, who all believed that a capable finance minister was the supreme need of Greece, he retained Arnspersg as chancellor of state. The expenses of the state were more than doubtful; for the expenses of government, of which the conversion of Athens into a dignified capital was not the least, exceeded the resources of the exchequer, and the state was only saved from bankruptcy by the continual intervention of the powers. Though King Louis, as the most exalted of Philhellenes, received an enthusiastic welcome when he visited Greece in the winter of 1835, his son's government grew increasingly unpopular. The Greeks were more heavily taxed than under Turkish rule; they had exchanged government by the sword, which they understood, for government by official regulations, which they hated; they had escaped from the sovereignty of the Moslems into that of a foreigner, that of a devout Catholic, to their heretic. Otto was well intentioned, honest and inspired with a genuine affection for his adopted country; but it needed more than mere amiable qualities to reconcile the Greeks to his rule.

In 1837 Otto visited Germany and married the beautiful and talented Princess Amalie of Oldenburg. The union was unfruitful, and the new queen made herself unpopular by interfering in the government. Meanwhile, at the instance of the Swiss Philhellenic Eynard, Arnspersg had been dismissed by the king immediately on his return, but a Greek minister was not put in his place, and the granting of a constitution was still postponed. The attempts of Otto to conciliate Greek sentiment by efforts to enlarge the frontiers of his kingdom, e.g. by the suggested acquisition of Crete in 1841, failed of their object and only succeeded in embroiling him with the powers. His power rested wholly on Bavarian bayonets; and when, in 1843, the last of the German troops were withdrawn, he was forced by the outbreak of a revolutionary movement in Athens to grant a constitution and to appoint a ministry of native Greeks.

With the grant of the constitution Otto's troubles increased. The Greek parliament, like its predecessors during the War of Liberation, was the battleground of factions divided, not by national issues, but by their adherence to one or other of the great powers who made Greece the arena of their rivalry for the control of the Mediterranean. Otto thought to counteract the effects of political corruption and incompetence by overriding the constitution to which he had sworn. The attempt would have been perilous even for a strong man, a native ruler and an Orthodox believer; and Otto was none of these. His prestige, moreover, suffered from the "Pacifico incident" in 1850, when Palmerston caused the British fleet to blockade the Peiraeus, to exact reparations for an injustice done to a Levantine Jew who happened also to be a British subject. For the ill-advised intervention in the Crimean War, which led to a second occupation of the Peiraeus, Otto was not responsible; his consent had been given under protest as a concession to popular clamour. His position in Greece was, however, becoming untenable. In 1861 a student named Drusius attempted to murder the queen, and was hailed by the populace as a modern Harmodes. In October 1862 the troops in Acaulia under General Theodore Sivos declared for the king's deposition; those in Athens followed suit; a provisional government was set up and summoned a national convention. The king and queen, who were at sea, took refuge on a British war-ship, and returned to Bavaria, where they were welcomed by King Louis, and lived in the former bishop's palace of Bamberg. Here, on the 26th of July 1867, Otto died. He had become strangely persuaded that he held the throne of Greece by divine right; and, though he made no effort to regain it, he refused to acknowledge the validity of the election of Prince George of Denmark.

**OTTO I.** (912-973), surnamed the Great, Roman emperor, eldest son of King Henry I, the Fowler by his second wife Matilda, said to be a descendant of the Saxon hero Widukind, was born on the 23rd of November 912. Little is known of his early years, but he probably shared in some of his father's campaigns. In 929 he married Edith, daughter of Edward the Elder, king of the English, and sister of the reigning sovereign æthelstan. It is said that Matilda wished her second son Henry to succeed his father, as this prince, unlike his elder brother, was born the son of a king. However this may be, Henry named Otto his successor, and after his death in July 936 Otto was chosen German king and crowned by Hildebert, archbishop of Mainz. This ceremony, according to the historian Widukind, was followed by the election of the new king, which the new king was invested upon by the dukes of Lorraine, Bavaria, Franconia and Swabia. Otto soon showed his intention of breaking with the policy of his father, who had been content with a nominal superiority over the duchies; in 937 he punished Eberhard, duke of Franconia, for an alleged infringement of the royal authority; and in 938 deposed Eberhard, who had recently become duke of Bavaria. During these years the Bohemians and other Slavonic tribes ravaged the eastern frontier of Germany, but although one expedition against them was led by the king in person, the defence of this district was left principally to agents. Trouble soon arose in Saxony, probably owing to Otto's refusal to give up his half-brother, Thangmar, who, although the king's senior, had been passed over in the succession as illegitimate. Thangmar, aided by an influential Saxon noble named Wichmann, and by Eberhard of Franconia, seized
the fortress of Eresburg and took Otto's brother Henry prisoner; but soon afterwards he was defeated by the king and killed whilst taking sanctuary. The other conspirators were pardoned, but in 930 a fresh revolt broke out under the leadership of Ildefons, and Giselbert, duke of Lorraine. Otto gained a victory near Xanten, which was followed by the surrender of the fortresses held by his brother's adherents in Saxony, but the rebels, joined by Eberhard of Franconia and Archbishop Frederick of Mainz, continued the struggle, and Giselbert of Lorraine transferred his allegiance to Louis IV., king of France. Otto's precarious position was saved by a victory near Andernach when Eberhard was killed, and Giselbert drowned in the subsequent flight. Henry took refuge with Louis of France, but was soon restored to favour and entrusted with the duchy of Lorraine, where, however, he was unable to restore order. Otto therefore crossed the Rhine and deprived his brother of a plot to murder the king, which was discovered in time, and the good offices of his mother secured for him a pardon at Christmas 941. The deaths of Giselbert of Lorraine and of Eberhard of Franconia, quickly followed by those of two other dukes, enabled Otto to unite the stem-duchies more closely with the royal house. In 944 Lorraine was given to Conrad, son of the Red, who in 947 married the king's daughter Liutgard; Franconia was retained by Otto in his own hands; Henry married a daughter of Arnulf, duke of Bavaria, and received that duchy in 947; and Swabia came in 949 to the king's son Ludolf, who had married Ida, a daughter of the late duke, Hermann. During these years the tribes living between the Elbe and the Oder were made tributary, bishoprics were founded in this district, and in 950 the king himself marched against the Bohemians and reduced them to dependence. Strife between Otto and Louis IV. of France had arisen when the French king sought to obtain authority over Lorraine and aided the German rebels in 950; but after the German king had undertaken an expedition into France, peace was concluded in 951, when Louis became a prisoner in the hands of his powerful vassal Hugh the Great, duke of France; Otto attacked the duke, who, like the king, was his brother-in-law, captured Reims, and negotiated a peace between the two princes; and in subsequent struggles between them his authority was several times invoked.

In 945 Berengar I., margrave of Ivrea, left the court of Otto and returned to Italy, where he soon obtained a mastery over the country. After the death in 950 of Lothair, king of Italy, Berengar sought the hand of his widow Adelaide for his son Adalbert; and Henry of Bavaria and Ludolf of Swabia had already been meddling independently of each other in the affairs of northern Italy. In response to the appeal from the duchies, Otto crossed the Alps in 957. He had been deposed as king of the Lombards; but the title was regained by a widower since 946, married Adelaide and negotiated with pope Agapetus II. about his reception in Rome. The influence of Alberic, prince and seneschal of the Romans, prevented the pope returning a favourable answer to the king's request. But when Otto returned to Germany in 952 he was followed by Berengar, who did homage for Italy at Augsburg. The chief advisers of Otto at this time were his wife and his brother Henry. Henry's influence seems to have been resented by Ludolf, who in 946 had been formally designated as his father's successor. When Adelaide bore a son, and a report gained currency that Otto intended to make this child his heir, Ludolf rose in revolt and was joined by Conrad of Lorraine and Frederick of Mainz. Otto fell into the power of the rebels at Mainz and was compelled to agree to demands made by them, which, however, he promptly revoked on his return to Saxony. Ludolf and Conrad were declared deposed, and in 953 war broke out in Lorraine and Swabia, and afterwards in Saxony and Bavaria. Otto failed to take Mainz and Augsburg; but an attempt on the part of Conrad and Ludolf to gain support from the Magyars, who had seized the opportunity to invade Bavaria, alienated many of their supporters. Otto's brother Bruno, archbishop of Cologne, was successful in restoring the royal authority in Lorraine, so that when Conrad and Frederick soon afterwards submitted to Otto, the struggle was confined to Bavaria. Ludolf was not long in following the example of Conrad; and with the capture of Regensburg in 955 the rising ended. Conrad and Ludolf retained their estates, but their dominions were not restored to them. Meanwhile the Magyars had renewed their ravages and were attacking Augsburg. Otto marched against them, and in a battle fought on the Lechfeld on the 10th of August 955 the king's troops gained a brilliant victory which completely freed Germany from these invaders; while in the same year Otto also defeated the Slavs who had been ravaging the Bavarian frontier.

About this time the king seems to have perceived the necessity of living and ruling in closer union with the church, a change of policy due perhaps to the influence of his brother Bruno, or forced upon him when his plans for uniting the duchies with the royal house brought rebellion in their train. Lands and privileges were granted to prelates, additional bishoprics were founded, and some years later Magdeburg was made the seat of an archbishop. In 960 Otto was invited to come to Italy by Pope John XII., who was hard pressed by Berengar, and he began to make preparations for the journey. As Ludolf had died in 957 and Otto, his only son by Adelaide, had been chosen king at Worms, the government was entrusted to Bruno of Cologne, and Archbishop of Mainz, as regent of the kingdom. Reaching Pavia at Christmas 961, the king promised to do homage and sent the church. He then proceeded to Rome, where he was crowned emperor on the 2nd of February 962. After the ceremony he confirmed the rights and privileges which had been conferred on the papacy, while the Romans promised obedience, and Pope John took an oath of fidelity to the emperor. But as he did not long observe his oath he was deposed at a synod held in St Peter's, after Otto had compelled the Romans to swear they would elect no pope without the imperial consent; and a nominee of the emperor, who took the name of Leo VIII., was chosen in his stead. A pestilence drove Otto to Germany in 965, and finding the Romans again in arms on his return in 966, he allowed his soldiers to pillage and seize plunder and punished the leaders of the rebellion. His next move was against the Greeks, who were firmly established in southern Italy, but seeking to attain his objects by negotiation, sent Liudprand, bishop of Cremona, to the eastern emperor Nicephorus II. to arrange for a marriage treaty between the two empires. Nicephorus refused to admit the validity of Otto's title, and the bishop was roughly repulsed; but the succeeding emperor, John Zimisces, was more reasonable, and Theophano, daughter of the emperor Romanus II., was married to the younger Otto in 972. The same year witnessed the restoration of peace in Italy and the return of the emperor to Germany, where he received the homage of the rulers of Poland, Bohemia and Denmark; but he died suddenly at Memleben on the 7th of May 973, and was succeeded by his son Henry at Magdeburg.

Otto was a man of unflagging perseverance and relentless energy, with a high idea of his position. His policy was to crush all tendencies to independence in Germany, and this led him to grant the stem-duchies to his relatives, and afterwards to ally himself with the church. Indeed the necessity for obtaining complete control over the church was one reason which induced him to obtain the imperial crown. By this step the pope became his vassal, and a divided allegiance was rendered impossible for the German clergy. The Roman empire of the German nation was indeed less universal and less theocratic under Otto, its restorer, than under Charlemagne, but what it lacked in splendour it gained in stability. His object was not to make the state religious but the church political, and the clergy must first be trained in the arts of the king, and secondly compose an ecclesiastical order. He shared the piety and superstition of the age, and did much for the spread of Christianity. Although himself a stranger to letters he welcomed scholars to his court and eagerly seconded the efforts of his brother Bruno to encourage learning; and while he neither feared nor shirked battle, he was always ready to secure his ends by peaceable means. Otto was of tall and commanding presence, and although subject to violent bursts of passion, was liberal to his friends and just to his enemies.

BIBLIOGRAPHY.—See Wulfsheim, Res gestae Saxonicae; Liudprand of Cremona, Historia Ottonis; Flodard of Rheims, Annales;

**OTTO II.** (955–983). Roman emperor, was the son of the emperor Otto the Great, by his second wife Adelaide. He received a good education under the care of his uncle, Bruno, archbishop of Cologne, and his illegitimate half-brother, William, archbishop of Mainz. He was chosen German king at Worms on May 61, crowned at Aix-la-Chapelle on the 26th of May 961, and on the 25th of December 967 he was crowned joint emperor at Rome by Pope John XIII. On the 14th of April 972 he married Theophano, daughter of the eastern emperor Romanus II., and after sharing in various campaigns in Italy, returned to Germany and became sole emperor on the death of his father in May 973. After suppressing a rising in Lorraine, difficulties arose in southern Germany, probably owing to Otto’s refusal to grant the duchy of Swabia to Henry II., the Quareksme, duke of Bavaria. The first conspiracy was easily suppressed; and in 974 an attempt on the part of Harold III., king of the Danes, to throw off the German yoke was also successfully resisted; but an expedition against the Magyars, led by the king himself, in 975 was a failure owing to the outbreak of further trouble in Bavaria. In 976 Otto deposed Duke Henry, restored order for the second time in Lorraine, and made another expedition into Bohemia in 977, when King Boleslaus II., promised to return to his earlier allegiance. Having crushed an attempt made by Henry to regain Bavaria, Otto was suddenly attacked by Lothair, king of France, who held Aix in his possession for a few days; but when the emperor retaliated by invading France he met with little resistance. He was, however, compelled by sickness among his troops to raise the siege of Paris, and on the return journey the rear-guard of his army was destroyed and the baggage seized by the French. An expedition against the Poles was made in 979 with success, but, when Lothair renounced his claim on Lorraine the emperor was prepared for a journey to Italy. In Rome, where he restored Pope Benedict VII., he held a splendid court, attended by princes and nobles from all parts of western Europe. He was next required to punish inroads of the Saracens on the Italian mainland, and in September 981 he marched into Apulia, where he met at first with considerable success; but an alliance between the Arabs and the Eastern Empire, whose hostility had been provoked by the invasion of Apulia, resulted in a severe defeat on Otto’s troops near Stilo in July 982. Without revealing his identity, the emperor escaped on a Greek vessel to Rossano. At a diet held at Verona, largely attended by German and Italian princes, a fresh campaign was arranged against the Saracens. Proceeding to Rome, Otto secured the election of Peter of Pavia as Pope John XIV. Just as the news reached him of a general rising of the tribes on the eastern frontier of Germany, he died in his palace in Rome on the 7th of December 983. He left a son, afterwards the emperor Otto III., and three daughters. He was buried in the atrium of St Peter’s, and when the church was rebuilt his remains were removed to the crypt, where his tomb may still be seen. Otto, who is sometimes called the “Red,” was a man of small stature, by nature brave and impulsive, and by training an accomplished knight. He was generous to the church and aided the spread of Christianity in many ways.

says he was ensnared and poisoned by Stephanus, the widow of Crescentis. The mystic erratic temperament of Otto, alternating between the most magnanimous schemes of empire and the lowest depths of self-debasement, was not conducive to the welfare of his dominions, and during his reign the conditions of Germany deteriorated. He was liberal to the papacy, and was greatly influenced by the eminent clerics with whom he eagerly associated.

**OTTO IV.** (c. 1182–1218), Roman emperor, second son of Henry the Lion, duke of Saxony, and Matilda, daughter of Henry II., king of England, was most probably born at Argenton in central France. His father died when he was still young, and he was educated at the court of his uncle Richard I., king of England, under whose leadership he gained valuable experience in war, being appointed duke of Aquitaine, count of Poitou and earl of Yorkshire. When the emperor Henry VI. died in September 1197, some of the princes under the leadership of Adolph, archbishop of Cologne, were anxious to find a rival to Philip, duke of Swabia, who had been elected German king. After some delay they chose Waldemar II., who was chosen king at Cologne on the 9th of June 1198. Hostilities broke out at once, and Otto, who drew his main support from his hereditary possessions in the Rhineland and Saxony, seized Aix-la-Chapelle, and was crowned there on the 12th of July 1198. The earlier course of the war was unfavourable to Otto, whose position was weakened by the death of Richard of England in April 1199; but his cause began to improve when Pope Innocent III. declared for him and placed his rival under the ban in April 1201. This support was purchased by a capitulation signed by Otto at Neuss, which ratified the independence and decided the boundaries of the States of the Church, and was the first authentic basis for the practical authority of the pope in central Italy. In 1200 an attack made by Philip and Brunswick was beaten off, the city of Worms was taken, and subsequently the aid of Ottakar I., king of Bohemia, was won for Otto. The papal legate Guido worked energetically on his behalf, several princes were persuaded to desert Philip and by the end of 1203 his success seemed assured. But after a period of reverses, Otto was wounded during a fight in July 1206 and compelled to take refuge in Cologne. Retiring to Denmark, he obtained military assistance from King Waldemar II., and a visit to England procured monetary aid from King John, after which he managed to maintain his position in Brunswick. Preparations were made to drive him from his last refuge, when he was saved by the murder of Philip in June 1208. Many of the supporters of Philip now overtures to Otto, and an attempt to set Henry I., duke of Brabant having decided, led to a fresh election and was chosen German king at Frankfurt on the 11th of November 1208 in the presence of a large gathering of princes. A general reconciliation followed, which was assisted by the betrothal of Otto to Philip's eldest daughter Beatrix, but as she was only ten years old, the marriage was deferred until the 22nd of July 1212. The pope who had previously recognized the victorious Philip, hastened to return to the side of Otto; the capitulation of Neuss was renewed and large concessions were made to the church.

In August 1206 the king set out for Italy. Meeting with no opposition, he was received at Viterbo by Innocent, but refused the papal demand that he should concede to the church all the territories which, previous to 1207, had been in dispute between the Empire and the Papacy, consenting, however, not to claim supremacy over Sicily. He was crowned emperor at Rome on the 4th of October 1209, a ceremony which was followed by fighting between the Romans and the German soldiers. The pope then requested the emperor to leave Roman territory; but he remained near Rome for some days, demanding satisfaction for the losses suffered by his troops. The breach with Innocent soon widened, and in violation of the treaty made with the pope Otto attempted to recover for the Empire all the property which Innocent had annexed to the Church, and rewarded his supporters with large estates in the disputed territories. Having occupied Tuscany he marched into Apulia, part of the kingdom of Frederick of Hohenstaufen, afterwards the emperor Frederick II., and on the 18th of November 1210 was excommunicated by the pope. Regardless of this sentence Otto completed the conquest of southern Italy, but the efforts of Innocent were successful in arousing considerable opposition in Germany, where the rebels were also supported by Philip Augustus, king of France. A number of princes assembles at Nuremberg declared Otto deposed, and invited Frederick to fill the vacant throne. Returning to Germany in March 1212, Otto made some headway against his enemies until the arrival of Frederick towards the close of the year. The death of his wife in August 1212 had weakened his hold on the southern duchies, and he was soon confined to the district of the lower Rhine, although supported by money from his uncle King John of England. The final blow to his fortunes came when he was decisively defeated by the French at Bouvines in July 1214. He escaped with difficulty from the field and took refuge at Flanders, where some of his supporters were willing to recognize him; and in 1216 he left Cologne for Brunswick, which he had received in 1202 by arrangement with his elder brother Henry. The conquest of Hamburgh by the Danes, and the death of John of England, were further blows to his cause. On the 10th of May 1218 he died at the Harzburg after being loosed from the ban by a Cistercian monk, and was buried in the church of St Blasius at Brunswick. He married for his second wife in May 1214 Marie, daughter of Henry I., duke of Brabant, but left no children.

**OTTO OF FREISING** (c. 1114–1158), German bishop and chronicler, was the son of Bruno, lord of Friesing, and Agnes, daughter of the emperor Henry IV. By her first husband, Frederick I. of Hohenstaufen, duke of Swabia, Agnes was the mother of the German king Conrad III., and grandmother of the emperor Frederick I.; and Otto was thus related to the most powerful families in Germany. The notices of his life are scanty and the dates somewhat uncertain. He studied in Paris, where he took an especial interest in philosophy, is said to have been one of the first to introduce the philosophy of Aristotle into Germany, and he served as provost of a new foundation in Austria. Having entered the Cistercian order, Otto became abbot of the Cistercian monastery of Morimond in Burgundy about 1136, and soon afterwards was elected bishop of Freising. This diocese, and indeed the whole of Bavaria, was then governed by the family of the Hohenstaufen, and the church was in a deplorable condition; but a great improvement was brought about by the new bishop in both ecclesiastical and secular matters. In 1147 he took part in the disastrous crusade of Conrad III. The section of the crusading army led by the bishop was decimated, but Otto reached Jerusalem, and returned to Bavaria in 1148 or 1149. He enjoyed the favour of Conrad's successor, Frederick I.; was probably instrumental in settling the dispute over the duchy of Bavaria in 1156; was present at the famous diet at Besançon in 1157; and, still retaining the dress of a Cistercian monk, died at Morimond on the 22nd of September 1158. In 1157 a statue of the bishop was erected at Freising.

Otto wrote a Chronicon, sometimes called De duabus civitatibus, an historical and philosophical work in eight books, which follows to some extent the lines laid down by Augustine and Orosius.
OTTLE OF NORDHEIM—OTWAY

Written during the time of the civil war in Germany, it contrasts Jerusalem and Babyl, the heavenly and the earthly kingdoms, but also contains much valuable information about the history of the time. The chronic, which was held in very high regard by contemporaries, goes down to 1146, and from this date until 1209 has been continued by Otto, abbot of St Blasius (d. 1223). It is better known as Otto's Gesta Friderici imperatoris, written on the request of Frederick I., and prefaced by a letter from the emperor to the author. The Gesta is in four books, the first two of which were written prior to, and not during or after, the papal Ragewin, or Rahewin; it has been argued that the third book and the early part of the fourth were also the work of Otto. Beginning with the quarrel between Pope Gregory VII. and the emperor, it is the first book; and, indeed, the history of the second half of the kingdom of the Hohenstaufen, and of some minor inaccuracy, the Gesta has been rightly described as a "model of historical composition." First printed by John Cuspinian at Strassburg in 1515, Otto's writings are now found in the Monumenta Germaniae historica. Band xx. (Hanover, 1868), and have been translated into German by H. Kohl (Leipzig, 1881-1886). The Gesta Friderici has been published separately with introduction and notes by W. Waife (New York, 1881). It is also available in a separate translation by Austria (Historia Austriae). See J. Hasagen, Otto von Freising als Geschichtsphilosoph und Kirchenpolitiker (Leipzig, 1900); J. Schmiedin, Die geschichtsphilosophischen Ideen der ersten Reichskirchenphilologie (Freiburg, 1906); W. Wattenbach, Deutschlands Geschichtsquellen. Band ii. (Berlin, 1894); and for full bibliography, A. Potthast, Bibliotheca historica (Berlin, 1896). (A. W. H.)

OTTO OF NORDHEIM (d. 1083), duke of Bavaria, belonged to the rich and influential Saxon family of the counts of Nordheim, and having distinguished himself in war and peace alike, received the duchy of Bavaria from Agnes, widow of the emperor Henry III., in 1061. In 1062 he assisted Anno, archbishop of Cologne, to seize the person of the German king. Henry IV.: led a successful expedition into Hungary in 1063; and took a prominent part in the government during the king's minority. In 1064, he went to Italy to settle a papal schism, was largely instrumental in securing the banishment from court of Adalbert, archbishop of Bremen, and crossed the Alps in the royal interests on two other occasions. He neglected his duchy, but added to his personal possessions, and in 1066 shared in two expeditions in the east of Germany. In 1070 Otto was accused by a certain Eino of being privy to a plot to murder the king, and it was decided he should submit to the ordeal of battle with his accuser. The duke asked for a safe-conduct to and from the place of meeting, and when this was refused, he declined, and appeared there with a small retinue of Bavarians, while his Saxons were plundered. He obtained no support in Bavaria, but raised an army among the Saxons and campaigned on a plunder against Henry until 1071, when he submitted; in the following year he received back his private estates. When the Saxon revolt broke out in 1073 Otto is represented by Bruno, the author of De bello SaxonicO, as delivering an inspiriting speech to the assembled Saxons at Wormsleben, after which he took command of the insurgents. By the peace of Gerstungen in 1074 Bavaria was restored to him; he shared in the Saxon rising of 1075, after which he was again pardoned and made administrator of Saxony. After the excommunication of Henry IV. in 1076 Otto attempted to mediate between Henry and the Saxons, but when these efforts failed he again placed himself at their head. He assented to the election of Rudolph, count of Rheinfelden, as German king, when his restoration to Bavaria was assured, and by his skill and bravery inflicted defeats on Henry's forces at Melrichstadt, Flarhein and Hohemölsen. He remained in arms against the king until his death on the 11th of January 1083. Otto is described as a noble, prudent and warlike man, and he possessed great abilities. His repeated pardon showed that Henry could not afford to neglect such a powerful personality, and his military talents were repeatedly displayed. By his wife Richenza, widow of Hermann, count of Werla, he left three sons and three daughters.

See W. von Giesebrecht, Geschichte der deutschen Kaiserzeit, Band iii. (Leipzig, 1881-1890); H. Mehmel, Otto von Nordheim, Herren von Bayern (Göttingen, 1879); E. Neumann, De ottone de Nordheim (Breslau, 1871); S. Riecker, Geschichte Bayerns (Gottha, 1876); and A. Vogeler, Otto von Nordheim (Göttingen, 1880).

OTTONIAN, a form of court which usually has a head but no back, though sometimes it has neither. It may have square or semicircular ends, and as a rule it is what upholsterers call a "bag chair," with the back and seat being made on the same order of ideas as the divan (q.v.). Its name indeed betokens its Oriental origin. It was one of the luxurious appointments which Europe imported from the East in the 18th century; the first mention that has been found of it is in France in 1729. In the course of a generation it made its way into every boudoir, but it appears originally to have been much larger than at present. The word is also applied to a small foot-stool covered with carpet, embroidery or beadwork.

OTTUMWA, a city and the county-seat of Wapello county, Iowa, U.S.A., on both sides of the Des Moines river, in the S.E. part of the state, about 85 m. S.E. of Des Moines. Pop. (1900) 18,197; of whom 1759 were foreign-born; (1910 census) 22,012. It is served by the Chicago, Burlington & Quincy, the Chicago, Milwaukee & St Paul, the Chicago Rock Island & Pacific, and the Wabash railways. The site on which it is built forms a succession of terraces receding farther and farther from the river. In the city are a Carnegie library, a city hospital and St Joseph's Academy. Ottumwa is the headquarters of the Ottumwa Division of the Southern Federal Judicial District of Iowa, and terms of United States District and Circuit courts are held there. The city is one of the richest coal regions of the state, and ranks high as a manufacturing centre, pork-packing, and the manufacture of iron and steel, machinery and agricultural and mining implements being the leading industries. The value of the factory product in 1905 was $16,374,183, an increase of 105% since 1900. Ottumwa was first settled in 1843, was incorporated as a town in 1851, and first chartered as a city in 1857.

OTWAY, THOMAS (1652-1685), English dramatist, was born at Totton, near Midhurst, Sussex, on the 3rd of March 1652. His father, Humphrey Otway, was at that time curate of Totton, but Otway's childhood was spent at Woolbeding, a parish 3 m. distant, of which his father had become rector. He was educated at Winchester College, and in 1669 entered Christ Church, Oxford, as a commoner, but left the university without a degree in the autumn of 1672. At Oxford he made the acquaintance of Anthony Cary, 5th viscount Falkland, through whom, he says in the dedication to Cato Maris, he first learned to love books. In 1675 he joined a company of actors with Mrs Aphra Behn, who in 1672 cast him for the part of the old king in her Forc'd Marriage, or The Jealous Bridegroom, at the Dorset Garden Theatre, but he had a bad attack of stage fright, and never made a second appearance. In 1675 Thomas Betterton produced at the same theatre Otway's first dramatic attempt, Alcibiades, which was printed in the same year. It is a poor tragedy, written in heroic verse, but was saved from absolute failure by the actors. Mrs Barry took the part of Draxilla, and her lover, the earl of Rochester, recommended the author of the piece to the notice of the duke of York. He made a great advance on this first work in Don Carlos, Prince of Spain (licensed June 15, 1676; an unedited edition probably belongs to the same year). The material for this rhymed tragedy Otway took from the novel of the same name, written in 1672 by the Abbé de Saint-Réal, the source from which Schiller also drew his tragedy of Don Carlos. In it the two characters familiar throughout his plays make their appearance. Don Carlos is the impetuous, unstable youth, who seems to be drawn from Otway himself, while the queen's part is the gentle pathetic character repeated in his more celebrated heroines, Monimia and Belvidera. "It got more money," says John Downes (Roscius Anglicanus, 1708) of this play, "than any preceding modern tragedy." In 1677 Betterton produced two adaptations from the French by Otway, Titus and Béreuce (from Racine's Bérénice), and the Cheats of Scapin (from Molière's Fourberies de Scapin). These were printed
OUBLIETTE—OUDENARDE

377
together, with a dedication to Lord Rochester. In 1678 he
produced an original comedy, Friendship in Fashion, popular at
the moment, though it was hissed off the stage for its gross
indecency when it was revived at Drury Lane in 1749. Mean-
while he had conceived an overwhelming passion for Mrs Barry,
who filled many of the leading parts in his plays. Six of his
letters to her survive, the last of them referring to a broken
appointment in the Mill. Mrs Barry seems to have deserted
with Otway, but she had no intention of permanently offending
Rochester. In 1679, driven to desperation by Mrs Barry,
Otway obtained a commission through Charles, earl of Plymouth,
a natural son of Charles II., in a regiment serving in the Nether-
lands. The English troops were disbandled in 1679, but were
left to find their way home as best they could. They were also
paid with depreciated paper, and Otway arrived in London late
in the year, ragged and dirty, a circumstance utilized by Rochester
in his "Sessions of the Poets," which contains a scurriulous attack
on his former protégé. Early in the next year (February 1680)
was produced at Dorset Garden the first of Otway's two tragic
masterpieces, The Orphan, or The Unhappy Marriage, Mrs Barry
playing the part of Monimia. Written in blank verse, which
shocked and shocked the Shakespearian taste of the time, due to the
tragic pathos, of which Otway was a master, in the characters of Castalio
and Monimia. The History and Fall of Caius Marius, produced in
the same year, and printed in 1692, is a curious grafting of Shake-
peare's Romeo and Juliet on the story of Marius as related in
Plutarch's Lives. In 1680 Otway also published The Poet's
Complaint of his Muse, or A Satyr against Libels, in which
he retaliated on his literary enemies. An indifferent comedy,
The Soldier's Fortune (1681), was followed in February 1682 by
Venice Preserved, or A Plot Discover'd. The story is founded on
the Histoire de la conjuration des Espagnols contre la Venise en
1635, by the Abbé de Saint-Réal, but Otway modified the story
considerably. The character of Belvidera is his own, and the lead-
ing parts in the latter half of the play, taken up by the
 ambassador, is given in the play to the historically insignificant
Pierre and Jaffier. The piece has a political meaning, enforced in
the prologue. The Popish Plot in Otway's mind, and Anthony,
1st earl of Shaftesbury, is caricatured in Antonio. The
play won instant success. It was translated into almost every
modern European language, and even Dryden said of it:
"Nature is there, which is the greatest beauty." The Orphan
and Venice Preserved remained stock pieces on the stage until
the 18th century, and the leading actresses of the period played
Monimia and Belvidera. One or two prefaces, another weak
comedy, The Atheist (1684), and two posthumous pieces, a poem,
Windsor Castle (1685), a panegyric of Charles II., and a
History of the Triumvirates (1686), translated from the French,
complete the list of Otway's works. He apparently ceased to
struggle against his poverty and misfortunes. The generally
accepted story regarding the manner of his death was first given
in Theophillus Cibber's Lives of the Poets. He is said to have
emerged from his retreat at the Bull on Tower Hill to beg
for bread. A passer-by, learning who he was, gave him a
guinea, with which Otway hastened to a baker's shop. He began
too hastily to satisfy his ravenous hunger, and choked with the
first mouthful. Whether this account of his death be true or not,
it is certain that he died in the utmost poverty, and was buried on
the 16th of April 1685 in the churchyard of St Clement Danes.
A tragedy entitled Heroick Friendship was printed in 1686 as
Otway's work, but the ascription is unlikely.

The Works of Mr Thomas Otway were in some account of his life and
writings, published in 1712, was followed by other editions (1757,
1768, 1812). The standard edition is that by T. Thornton (1813).
A selection of his plays was edited for the Mermaid series (1801 and
1803) by Roderic Noel. See also E. Gosse, Seventeenth Century
Studies (1883); and Genest, History of the Stage.

OUBLIETTE, a French architectural term (from oubli, to
forget), used in two senses of a dungeon or cell in a prison or
castle which could only be reached by a trap-door from another
dungeon, and of a concealed opening or passage leading from a
dungeon to the meat or river, into which bodies of prisoners
who were to be secretly disposed of might be dropped. Viollet le
Duc (Dict. de l'architecture) gives a diagram of such an oubliette
at the castle of Pierrefonds, France. Many so-called "oublie-
ettes" in medieval castles were probably outlets for the disposal
of drainage, refuse, &c., which at times may have served for the
getting rid of prisoners.

OUCH, a brooch, clasp or buckle, especially one ornamented
with jewels, enamels, &c., and used to clasp a cope or other
ecclesiastical vestment. It is also used, as in Exod. xxxix. 6, of
the gold or silver setting of jewels. The name is derived from
the misdivision of a substantive and the indefinite article, being
properly "nouche," "a nouche" being divided into "an ouche,"
as a napon into an apron, a nadder into an adder, and, reversely,
a cwt, i.e. cft, into a newt. "Nouche" was adapted into O. Fr.,
whence English took the word, from the Late Lat. nausea, brooch;
probably the original is Celtic, cf. Oj. Irish nasc, ring, naugaim,
fasten.

OUDENARDE (Flemish Oudenarde), a town of Belgium
in the province of East Flanders, 18 m. S. of Ghent. Pop. (1904)
6572. While it is best known for the great victory gained by
Marlborough and Eugene over the French under Vendôme in
1708, Oudenarde has many features of interest. The town hall,
which took ten years to build (1725-1735), has after that of Louvain
the most elaborately decorated façade in Belgium. It was
designed by H. van Peede and G. de Rondé, and is in tertiary
Gothic style. The belfry tower of five storeys with three terraces,
surmounted by a golden figure, is a striking feature. The council
chamber contains a fine oak door and Gothic chimney-piece,
both c. 1530. There are also two interesting old churches, St
Walburga, partly of the 12th and partly of the 14th century,
and Notre Dame, dating from the 13th century. The former
contains several fine pictures by Crayer and other old Flemish
masters.

The Battle of Oudenarde (June 30th-July 11th 1708) was fought
on the ground north-west and north of the town, which was then
regularly fortified and was garrisoned by a force of the Allies.
The French army under the Duke of Burgundy and Marshal
Vendôme, after an abortive attempt to invest Oudenarde, took
up a defensive position north of the town when Marlborough and
Eugene, after a forced march, arrived with the main Allied
army. The advanced guard of the Allies under General (Lord)
Cadogan promptly crossed the Schelde and annihilated an out-
flanking party of French troops, and Cadogan established himself
on the ground he had won in front of the French centre. But
the Allied main army took a long time to defile over the Schelde
and could form up (on the left of Cadogan's detachment) only
slowly and by degrees. Observing this, Burgundy resolved to
throw forward his right towards Oudenarde to engage and hold
the main body of the Allies before their line of battle could be
formed. This effected, it was hoped that the remainder of the
French army could isolate and destroy Cadogan's detachment,
which was already closely engaged with the French centre.
But he miscalculated both the endurance of Cadogan's men
(amongst whom the Prussians were conspicuous for their tenacity)
and the rapidity with which in Marlborough's and Eugene's
hands the wearied troops of the Allies could be made to move.
Marlborough, who personally directed the operations on his
left wing, not only formed his line of battle successfully, but also
began seriously to press the forces that had been sent to check
his deployment. Before long, while the hostile left wing still
remained inactive, the unfortunate troops of the French centre
and right were gradually hemmed in by the whole force of the
Allies. The decisive blow was delivered by the Dutch marshal,
Oliver, who was sent by Marlborough with a large force (the last
remaining of the Allies) to make a wide turning movement
round the extreme right of the French, and at the proper time
attacked them in rear. A belated attempt of the French left
to intervene was checked by the British cavalry, and the pressure
on the centre and right, which were now practically surrounded,
continued even after nightfall. A few scattered units managed to
escape, and the left wing retreated unmolested, but at the cost
of about 3000 casualties the Allies inflicted a loss of 6000
killed and wounded and 9000 prisoners on the enemy, who were,
moreover, so shamed that they never recovered their confidence to the end of the campaign. The battle of Oudenarde was not the greatest of Marlborough's victories, but it afforded almost the best illustration of his military character. Contrary to all the rules of war then in vogue, he fought a piecemeal and unpremeditated battle, with his back to a river, and with wearied troops, and the event justified him. An ordinary commander would have avoided fighting altogether, but Marlborough saw beyond the material conditions and risked all on his estimate of the moral superiority of his army and of the weakness of the French leading. His conduct of the battle, once it had opened, was a model of the "partial" victory—the destruction of a part of the enemy's army. Under these circumstances, which were in the 17th and 18th centuries the tactician's ideal, and was sufficient to ensure him the reputation of being the best general of his age. But it is in virtue of having fought at all that he passes beyond the criteria of the time and becomes one of the great captains of history.

**OUDINÉ, EUGÈNE ANDRÉ** (1810–1885), French sculptor and medalist, was born in Paris in 1810, and devoted himself from the beginning to the medallist's branch of sculpture, although he also excelled in monumental sculpture and portrait busts. Having carried off the grand prize for medal engraving in 1831, he had a sensational success with his "Wounded Gladiators," which he exhibited in the same year. He subsequently occupied official positions as designer, first at the Inland Revenue Office, and then to the Mint. The great medals that are struck in commemoration of the annexation of Savoy by France, and that on the occasion of the peace of Villainfranca. Other remarkable pieces are "The Apotheosis of Napoleon I," "The Amenité," "Le Duc d'Orléans," "Berthotet," "The Universal Exhibition," "The Second of December, 1851," "The Establishment of the Republic," "The Battle of Ienkerman," and "Napoleon's Tomb at the Invalides." For the Hotel de Ville in Paris he executed fourteen bas-reliefs, which were destroyed in 1871. Of his monumental works, many are to be seen in public places in and near Paris. In the Tuileries gardens is his group of "Daphnis et Hebé"; in the Luxembourg gardens the "Queen Bertha"; at the Louvre the "Buffon"; and in the courtyard of the same palace the "Bathsheba." A monument to General Espagne is at the Invalides, and a King Louis VIII at Versailles. Oudiné, who may be considered the father of the modern medal, died in Paris in 1887.

**OUDINOT, CHARLES NICOLAS** (1767–1847), duke of Reggio, marshal of France, came of a bourgeois family in Lorraine, and was born at Bar-le-duc on the 25th of April 1767. He had a passion for a military career, and served in the regiment of Médoc from 1784 to 1787, when, having no hope of promotion on account of his non-noble birth, he retired with the rank of sergeant. The Revolution changed his fortunes, and in 1792, on the outbreak of war, he was elected lieutenant-colonel of the 3rd battalion of the volunteers of the Meuse. His gallant defence of the little fort of Bitsch in the Vosges in 1792 drew attention to him; he was transferred to the regular army in November 1793, and after serving in numerous actions on the Belgian frontier he was promoted general of brigade in June 1794 for his conduct at the battle of Kaiserslautern. He continued to serve with the greatest distinction on the German frontier under Hoche, Pichegru and Moreau, and was repeatedly wounded and once (in 1795) made prisoner. He was Masséna's right hand all through the great Swiss campaign of 1799—first as a general of division, to which grade he was promoted in April, and then as chief of the staff—and won extraordinary distinction at the battle of Zürich. He was present under Masséna at the defence of Genoa, and so distinguished himself at the combat of Montabano that Napoleon presented him with a sword of honour. He was made inspector-general of infantry, and, on the restoration of the empire, given the Grand Cross of the Legion of Honour, but was not included in the first creation of marshals. He was at this time elected a member of the chamber of deputies, but he had little time to devote to politics. He took a conspicuous part in the war of 1805 in command of the famous division of the "grenadiers Oudinot," formed of picked troops and organized by him, with which he seized the Vienna bridges, received a wound at Hollährn, and delivered the decisive blow at Austerlitz. In 1806 he won the battle of Ostrolenka, and fought with resolution and success at Friedland. In 1808 he was made governor of Erfurt and count of the Empire, and in 1809, after displaying brilliant courage at Wagram, he was promoted to the rank of marshal. He was made duke of Reggio, and received a large money grant in April 1810. Oudinot administered the government of Holland from 1810 to 1812, and commanded the II. corps of the Grande Armée in the Russian campaign. He was present at Lützen and Bautzen, and when holding the independent command of the corps directed to take Magdeburg (see NAPOLEONIC CAMPAIGNS). He was then superseded by Ney, but his misfortune was too great to be repaired, and Ney was defeated at Dennewitz. Oudinot was not disgraced, however, holding important commands at Leipzig and in the campaign of 1814. On the abdication of Napoleon he rallied to the new government, and was made a peer by Louis XVIII., and, unlike many of his old comrades, he did not desert to his old master in 1815. His last active service was in the French invasion of Spain in 1823, in which he commanded a corps and was for a time governor of Madrid. He died as governor of the Invalides on the 13th of September 1847. Oudinot was not, and made no pretence of being, a great commander, but he was a great general of division. He died his one son of the beau-ideal of an infantryman, energetic, thoroughly gallant, and capable of battle as resolute and skilful as any of the marshals of Napoleon.

Oudinot's eldest son, CHARLES NICOLAS VICTOR, 2nd duke of Reggio (1794–1863), lieutenant-general, served through the later campaigns of Napoleon from 1809 to 1814, being in the latter year promoted major for gallant conduct. Unlike his father he was a cavalryman, and as such held command of the cavalry school at Saumur (1822–1830), and the inspector-generality of cavalry (1836–1848). He is chiefly known as the commander of the French expedition which besieged and took Rome in 1849 and re-established the temporal power of the pope. After the coup d'état of the 2nd of December 1851, in resistance to which he took a prominent part, he retired from military and political life, dying at Paris on the 7th of June 1863.

The 2nd duke wrote *Aperçu historique sur la dignité de maréchal de France (1833): Considérations sur les ordres militaires de Saint Louis, etc. (1833): L'Emploi des troupes aux grands travaux d'utilité publique (1839): De la Cavalerie et du casernement des troupes à cheval (1840): Des Remontes de l'armée (1840); and a brief account of his Italian operations of 1849.*

**OUGHTRIRED, WILLIAM** (fl. 1555–1600), English mathematician, was born at Eton, and educated there and at King's College, Cambridge, of which he became fellow. Being admitted to holy orders, he left the university about 1603, and was presented to the rectory of Albury, near Guildford in Surrey; and about 1658 he was appointed by the earl of Arundel to instruct his son in mathematics. He corresponded with some of the most eminent scholars of his time on mathematical subjects; and his house was generally full of pupils from all quarters. It is said that he expired in a sudden transport of joy upon hearing the news of the vote at Westminster for the restoration of Charles II.

He published, among other mathematical works, *Clavis Mathematicae* in 1631, in which he introduced new signs for certain mathematical operations (see ALGEBRA); a treatise on navigation entitled *Circles of Proportion*, in 1612; works on trigonometry and dialling, and his *Opuscula Mathematica*, published posthumously in 1676.

**OUIDA**, the pen-name—derived from a childfsh attempt to pronounce "Louisa"—of Maria Louise de la Ramée (1839–1908), English novelist, born at Bury St Edmunds, where her birth was registered on the 7th of January 1839. Her father, Louis de la Ramée, was a bookseller, and the family settled in London. An early age she went to live in London, and there began to contribute to the *New Monthly* and *Bentley's Magazine*. In 1860 her first story, afterwards republished as *Hold in Bondage* (1863), appeared in the *New Monthly* under the title of *Granville de Vigne*, and this was followed in quick succession by *Strathmore*...
OUNCE—OURO PRETO

(1863), Chandos (1866) and Under Two Flags (1867). The list of Ouida's subsequent works is a very long one; but it is sufficient to say that, together with Mottke (1860), those already named are not only the most characteristic, but also the best. In a less dramatic genre, her Bimbii: Stories for Children (1882) may also be mentioned; but it was by her more flamboyant stories, such as Under Two Flags and Mottke, that her popular success was achieved. By purely literary critics and on grounds of morality or taste Ouida's novels may be condemned. They are generally flashy, and frequently unmusical. It is impossible, however, to dismiss books like Chandos and Under Two Flags merely on such grounds. The emphasis given by Ouida to motives of sensual passion was condemned in many quarters as an original gift for situation and plot; and it also with genuine descriptive power, which, though disfigured by inaccurate observation, literary solecisms and tawdry extravagance, enabled her at her best to construct a picturesque and powerful story. The character of "Cigarette" in Under Two Flags is full of fine touches, and this is not an isolated instance. In 1874 Ouida made her home in Florence, and many of her later novels have an Italian setting. She contributed from time to time to the magazines, and wrote vigorously on behalf of anti-vivisection and on Italian politics; but her views on these subjects were marked by characteristic violence and lack of judgment. She had made a great deal of money by her earlier books, but had spent it without thought for the morrow; and though in 1906 she was awarded a Civil List pension, she died at Viareggio in poverty on the 25th of January 1908.

OUNCE. (1) Through O. Fr. ounce, modern once, from Lat. uncia, twelfth part, of weight, of a pound, of measure, of a foot, in which sense it gives the O.Eng. ounce, inch), a unit of weight, being the twelfth part of a pound troy, = 480 grains; inavoirdupois = 437.5 grains, \( \frac{1}{12} \) of a pound. The fluid ounce is a measure of capacity; in the United Kingdom it is equivalent to an avoirdupois ounce of distilled water at 62° F.; in the United States of America it is the 128th part of the gallon, = \( \frac{1}{12} \) gill, = 43.633 grains of distilled water at its maximum density (see Weights and Measures). (2) A name properly applied to the Felis uncia or snow leopard (q.v.). It appears to have been originally used of various species of lynx, and is still sometimes the name of the Canada lynx. The word appears in O. Fr. and Ital. as ounce and onza and lancia respectively, and it was usually explained as being due to the confusion of the 1 with the article, lonce and lanza being changed to Ponce or Ponta, and the t subsequently dropped. If this be so the word is the same as "lynx," from the popular Lat. lyncia = lynxica, Gr. λύγξ. On the other hand once and onza may be nasalized forms of γιψ, the Persian name of the panther.

Oundle, a market-town in the Northern parliamentary division of Northamptonshire, England, 33\(^{\circ}\) 51\(\frac{1}{2}\) N.E. of Northampton by a branch of the London & North-Western railway. Pop. of urban district (1901) 2494. It is picturesquely situated on an eminence, two sides of which are touched by the river Nene, which here makes a deep bend. The church of St. Peter is a fine building with Early English, Decorated and Perpendicular porticoes, with a chancel and lumpy spire. Oundle School, one of the best English public schools, was founded under the will of Sir William Laxton, Lord Mayor of London (d. 1536). There are about 200 boys. The school is divided into classical and modern sides, and has exhibitions to Oxford and Cambridge universities. A second-grade school was instituted out of the foundation in 1878. Oundle has a considerable agricultural trade.

Wilfrid, archbishop of York, is said to have been buried in 711 at a monastery in Oundle (Undale) which appears to have been destroyed shortly afterwards, and was certainly no existence at the time of the Conquest. The manor, with a market and tolls, was among the possessions confirmed in 972 by King Edgar to Bishop Eadric of Peterborough, to whom it still belonged in 1086. The market was then worth 20s. yearly and is shown by the quo warrante rolls to have been held on Saturday, the day being changed to Thursday in 1835. After the Dissolu-
which one of its less influential members, an alfores (ensign) of cavalry named Joaquim José da Silva Xavier, nicknamed "Tira-dentes" (teeth-puller), was executed in Rio de Janeiro in 1792. The conspiracy originated in a belief that the Portuguese crown was about to enforce payment of certain arrears in the mining tax known as the "royal fifties," and its object was to set up a republic in Brazil. Although a minor figure in the conspiracy, Tira-dentes was made the scapegoat of the thirty-two men arrested and sent to Rio de Janeiro for trial, and posterity has made him the proto-martyr of republicanism in Brazil.

**Ouse**, the name of several English rivers. (1) The Great Ouse rises in Northamptonshire, in the slight hills of the Vale of Ancaster, and falls only about 500 ft. in a course of 170 m. (excluding lesser windings) to its mouth in the Wash (North Sea). With an easterly direction it flows past Brackley and Buckingham and then turns N.E. to Stony Stratford, where the Roman Watling Street forded it. It receives the Tove from the N.W., and the Ouzel from the S. at Newport Pagnell. It then follows an extremely sinuous course past Olney to Sharnbrook, where it turns abruptly S. to Bedford. A north-easterly direction is then resumed past St Neot's to Godmanchester and Huntingdon, where the river trends easterly to St Ives. Hitherto the Ouse has watered an open fertile valley, and there are many beautiful wooded reaches between Bedford and St Ives, while the river abounds in innumerable islands. Above St Ives the river debouches suddenly upon the Fens; its fall from the watercourse to the mouth, a distance of 35 m. by the old course, is little more than 20 ft. (the extensive system of artificial drainage cuts connected with the river is considered under FENS). From Earith to Denver the waters of the Ouse flow almost wholly in two straight artificial channels called the Bedford Rivers, only a small head passing, under ordinary conditions, along the old course, called the Old West River. This is joined by the Cam from the S. 4 m. above Ely. In its northward course from this point the river receives from the E. the Lark, the Little Ouse, or Brandon river, and the Wissey. Below Denver sluice, 16 m. from the mouth, the Ouse is tidal. It flows past King's Lynn, and enters the Wash near the S.E. corner. The river is locked up to Bedford, a distance of 74 m. by the direct course. In the lower part it bears a considerable traffic, but above St Ives it is little used, and above St Neot's navigation has ceased. The drainage area of the Great Ouse is 2697 sq. m.

(2) A river of Yorkshire. The river Ure, rising near the N.W. boundary of the county in the heart of the Pennines, and traversing the lovely valley famous under the name Wensleydale, unites with the river Swale to form the Ouse near the small town of Boroughbridge, which lies in the rich central plain of Yorkshire. The course of the Swale, which rises in the north of the county on the eastern flank of the Pennines, is mostly through this plain, and that of the Ouse is wholly so. It flows S.E. to York, thence for a short distance S. by W., then mainly S.E., between Selby and Brackley and Boroughbridge, and the great estuary so formed being known as the Humber. The course of the Ouse proper, thus defined, is 61 m. The Swale and Ure are each about 60 m. long. Goole is a large and growing port, and the river bears a considerable traffic up to York. There is also some traffic up to Boroughbridge, from which the Ouse Navigation (partly a canal) continues up to Ripon. The Swale is not navigable. The chief tributaries are the Nidd, the Wharfe, the Don and the Aire from the W., and the Derwent from the N.E., but the detailed consideration of these involves that of the hydrography of the greater part of Yorkshire (q.v.).

All, especially the western tributaries, traverse beautiful valleys, and the Aire and Don, with canals, are of importance as affording communications between the manufacturing districts of south Yorkshire and the Humber ports. The Derwent is also navigable. The drainage area of the Ouse is 4133 sq. m. It is tidal up Naburn locks, a distance of 37 m. from the junction with the Trent, and the total fall from Boroughbridge is about 40 ft.

(3) A river of Sussex, rising in the Forest Ridges between Horsham and Cuckfield, and draining an area of about 200 sq. m., mostly in the Weald. Like other streams of this locality, it breaches the South Downs, and reaches the English Channel at Newhaven after a course of 30 m. The eastward drift of beach-building material formerly diverted the mouth of this river from its present place to a point to the east near Seaford. The Ouse is navigable for small vessels to Lewes, and Newhaven is an important harbour.

**Ouseley, Sir Frederick Arthur Gore** (1825-1888), English composer, was the son of Sir Gore Ouseley, ambassador to Persia, and nephew to Sir William Ouseley, the Oriental scholar. He was born on the 12th of August 1825 in London, and manifested an extraordinary precocity in music, composing an opera at the age of eight years. In 1844, having succeeded to the baronetcy, he entered at Christ Church, and graduated B.A. in 1846 and M.A. in 1849. He was ordained in the latter year, and, as curate of St Paul's, Knightsbridge, served the parish of St Barnabas, Lima, until 1857. In 1859 he took the degree of Mus.B. at Oxford, and four years afterwards that of Mus.D., his course being the oratorio St Polycarp. In 1855 he succeeded Sir Henry Bishop as professor of music in the University of Oxford, was ordained priest and appointed precentor of Hereford. In 1856 he became vicar of St Michael's, Tenbury, and warden
of St. Michael's College, which under him became an important educational institution both in music and general subjects. His works include a second oratorio, 

### Ouseley, Sir W.—Outram

**OUTLAWRY**, the process of putting a person out of the protection of the law; a punishment for contemptuously refusing to appear when called in court, or evading justice by disappearing. It was an offence of very early existence in England, and was punished by the execution of those who could not pay the *werg* or blood-money to the relatives of the deceased. By the Saxon law, an outlaw, or *laughleasman*, lost his *libera lex* and had no protection from the frank-pledge in the decennary in which he was sworn. He was, too, a *frendlesman*, because he forfeited his friends; for if any of them rendered him any assistance, they became liable to the same punishment. He was, at one time, said to be *caput lupinum*, or to have a wolf's head, from the fact that he might be knocked on the head like a wolf by any one that should meet him; but so early as the time of Bracton an outlaw might only be killed if he defended himself or ran away; once being outlawed, he was henceforward liable to be tried for any other offence. The party guilty of outlawry suffered forfeiture of chattels in all cases, and in cases of treason or murder forfeiture of real property: for other offences he lost the profits of land during his lifetime. In cases of treason or felony, outlawry was followed also by corruption of blood. An outlaw was *civiliter mortuus*. He could not sue in any court, nor had he any legal rights which could be enforced, but he was personally liable upon all causes of action. An outlawry might be reversed by proceedings in error, or by application to a court. It was finally abolished in civil proceedings in 1879, while in criminal proceedings it has practically become obsolete, being unnecessary through the general adoption of extradition treaties. A woman was said to be *waisted* rather than outlawed.

In Scotland outlawry or fugitation may be pronounced by the supreme court in the absence of the panel on the day of trial. In the United States outlawry never existed in civil cases, and in the few cases where it existed in criminal proceedings it has become obsolete.

**OUTRAGE** (through O. Fr. *ultrage*, *ultrage*, *ultrage*, from Lat. *ultrā*, beyond, exceeding, cf. Ital. *ultraggi*; the meaning has been influenced by connexion with "rage," anger), originally extravagance, violence of behaviour, language, action, &c., hence especially a violent injury done to another.

**OUTRAM, Sir James** (1803–1863), English general, and one of the heroes of the Indian Mutiny, was the son of Benjamin Outram of Butterley Hall, Derbyshire, civil engineer, and was born on the 29th of January 1803. His father died in 1805, and his mother, a daughter of Dr. James Anderson, the Scottish writer on agriculture, removed in 1810 to Aberdeen. From Udny school the boy went in 1818 to the Marischal College, Aberdeen; and in 1819 an Indian cadetship was given him. Soon after his arrival at Bombay his remarkable energy attracted notice, and in July 1820 he became acting adjutant to the first battalion of the 12th regiment on its embarkation at Poona, an experience which he found to be of immense advantage to him in his after career. In 1825 he was sent to Khandesh, where he trained a light infantry corps, formed of the wild robber Bilis, gaining over them a marvellous personal influence, and employing them with great success in checking outrages and cattle-kidnapping. Keane on his return to bombay and his principal source of danger to civil and military administration, he was sent to the semi-independent state of the Deccan and the Satpuras, and in 1838 he was sent to Gujerat to make a report on the Malé Kantha district, and for some time he remained there as political agent. On the outbreak of the first Afghan War in 1838 he was appointed extra aide-de-camp on the staff of Sir John Keane, and besides many other brilliant deeds performed an extraordinary exploit in capturing a banner of the enemy before Ghazni. After conducting various operations against the Afghans the following year he was promoted major and appointed political agent in Lower Sind, and later in Upper Sind. Here he strongly opposed the policy of his superior, Sir Charles Napier, which led to the annexation of Sind. But when war broke out he heroically defended the residency at Hyderabad against 8000 Baluchis; and it was Sir C. Napier who then described him as "the Bayard of India." On his return from a short visit to England in 1843, he was, with the rank of brevet lieutenant-colonel, appointed to a command in the Maharatta country, and in 1847 he was transferred from Satara to Baroda, where he incurred the resentment of the Bombay government by his fearless exposure of corruption.
In 1854 he was appointed resident at Lucknow, in which capacity two years later he carried out the annexation of Oudh and became the first chief commissioner of that province. Appointed in 1857, with the rank of lieutenant-general, to command an expedition against Persia, he defeated the enemy with great slaughter at Khushab, and conducted the campaign with such rapid decision that peace was shortly afterwards concluded, his services being rewarded by the grand cross of the Bath.

From Persia he was summoned to June in India, with the brief explanation— "We want all our best men here." It was said of him at this time that "a fox is a fool and a lion a coward by the side of Sir J. Outram." Immediately upon his arrival in Calcutta he was appointed to command the two divisions of the Bengal army occupying the country from Calcutta to Cawnpore, and to the military control was also joined the commission of Oudh. After the mutiny had assumed such proportions as to compel him to fall back on Cawnpore, which he only held with difficulty, although a speedy advance was necessary to save the garrison at Lucknow. On arriving at Cawnpore with reinforcements, Outram, "in admiration of the brilliant deeds of General Havelock," conceded to him the glory of relieving Lucknow, and, waiving his rank, tendered his services to him as a volunteer. During the advance he commanded a troop of volunteer cavalry, and performed exploits of great brilliancy at Mangalwar, and in the attack at the Alambagh; and in the final conflict he led the way, charging through a very tempest of fire. The volunteer cavalry unanimously voted him the Victoria Cross, but he refused the choice on the ground that he was ineligible as the general under whom they served. On the 24th of March, 1860, he arrived at Lucknow; he then conducted the evacuation of the residency so as completely to deceive the enemy.

In the second capture of Lucknow, on the commander-in-chief's return, Outram was entrusted with the attack on the side of the Gumi, and afterwards, having recrossed the river, he advanced "through the Chattar Manzil to take the residency," thus, in the words of Sir Colin Campbell, "putting the finishing stroke on the enemy." After the capture of Lucknow he was gazetted lieutenant-general. In February 1858 he received the special thanks of both houses of parliament, and in the same year the dignity of baronet with an annuity of £1000. When, on account of shattered health, he returned finally to England, and in 1858, a movement was set on foot to mark the sense entertained, not only of his military achievements, but of his constant exertions on behalf of the natives of India, whose "weal," in his own words, he made his first object. The movement resulted in the presentation of a public testimonial and the erection of statues in London and Calcutta. He died on the 11th of March 1863, and was buried in Westminster Abbey, where the marble slab on his grave bears the pregnant epitaph "The Bayard of India."

See Sir F. J. Goldsmid, James Outram, a Biography (2 vols., 1880), and L. J. Trotter, The Bayard of India (1903).

**Oval (Lat. ovum, egg), in geometry, a closed curve, generally more or less egg-like in form. The simplest oval is the ellipse; more complicated forms are represented by the notation of analytical geometry in the 4th degree. Those of the 4th degree, known as bicircular quartics, are the most important, and of these the special forms named after Descartes and Cassini are of most interest. The Cartesian ovals presented themselves in an investigation of the section of a surface which would refract rays proceeding from a point in a medium of one refractive index into a point in a medium of a different refractive index. The most convenient equation is \( \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \), where \( x, y \) are the distances of a point on the curve from two fixed and given points, termed the foci, and \( a, b \) are constants.

The curve is obviously symmetrical about the line joining the foci, and has the important property that the normal at any point divides the angle between the radii to into segments whose ratio is equal in the two opposite segments. The Cassinian oval has the equation \( x^2 + y^2 = a^2 \), where \( x, y \) are the radii of a point on the curve from two given foci, and \( a \) is a constant. This curve is symmetrical about two perpendicular axes. It may consist of a single closed curve or of two curves, according to the value of \( a \); the transition between the two types being a figure of 8, better known as Bernoulli's lemniscate (q.v.).

See Curve; also Salmon, Higher Plane Curves.

**Ovar, a town of Portugal, in the district of Aveiro and at the north-eastern extremity of the Lagoon of Aveiro (q.v.); 21 m. S. of Oporto by the Lisbon-Oporto railway. Pop. (1900) 10,462. Ovar is the centre of important fisheries and has some trade in wine and timber. It is visited by small coasting vessels which ply to and from north-west Africa. Millet, wheat and vegetables—especially onions—are the chief products of the low-lying and unhealthy region, in which Ovar is situated.

**Ovariotomy, the operation for removal of one or of both of the female ovaries (for anatomy see Reproductive System). The progress of modern surgery has been conspicuously successful in this department. From 1701, the date when Houston of Carluke, Lanarkshire, carried out his successful partial extirpation, progress was arrested for some time, although the Hunters (1780) indicated the practicability of the operation. In 1809 Ephraim M'Dowell of Kentucky, assisted by the lectures of John Bell, his teacher in Edinburgh, performed ovariotomy, and, continuing to operate with success, established the possibility of surgical interference. He was followed by others in the United States. The cases brought forward by Lizar of Edinburgh were not sufficiently encouraging; the operation met with great opposition; and it was not until Charles Clay, Spencer Wells, and Plumbe Jones subsequently showed that there was a firm basis for ovariotomy, that the operation was regarded as justifiable. Improved methods were introduced, and surgeons vied with another in trying to obtain good results. Eventually, by the introduction of the antiseptic system of treating wounds, this operation, formerly regarded as one of the most grave and anxious in the domain of surgery, came to be attended with a lower mortality than any other of a major character.

To give an idea of the terrible record associated with the operation in the third quarter of the 19th century, a passage may be quoted from the English translation of the Life of Pasteur: "As it was supposed that the infected air of the hospitals might be the cause of the invariably fatal results of the operation, the Assistant Public were hired to hold an isolated house in the Avenue de Meudon, near Paris, a salubrious spot. In 1863, ten women in succession were sent to that house; the neighbouring inhabitants watched those ten patients entering the house, and a short time afterwards their ten coffins being taken away." But as time went on, the published statistics showed an increasing success in the practice of almost every operator. Spencer Wells states that in his first five years one patient in three died; in his second and third five years one in four; in his fourth five years one in five; in 1876-1877, one in ten. After the introduction of antiseptics (1878-1884) he lost only 10-9% of his operation cases, but this series showing a marked absence of septic complications. These figures have been greatly improved upon in later years, and at the present time the mortality may be taken at somewhere about 5-7 or 0%.

Of the ovaries is performed when the ovaries are the seat of cystic and other morbid changes; for fibroid tumours of the womb, in which case, by operating, one hastens the menstruation and causes the tumours to grow smaller; and in cases where dysmenorrhoea is wearing one can only relieve the use of the patient, less severe treatment having proved ineffectual. Ovariotomy, by which is meant removal of the ovaries with the view of producing a curative effect upon some other part, was introduced in 1872 by R. B. Barby of Georgia (1828-1894). The operation is sometimes followed by loss of sexual feeling, and has been said to unsex the patient, hence previous objections have been urged against it. The patient and her friends should clearly understand the object of the operation, and that the operation is likely to be gained very little. Less, the ovaries are sometimes removed with the hope of checking the progress of inoperable cancer of the breast.

From the time that the operation of ovariotomy was first established as being capable of removal, there has been much disputation as to how the pedicle of the ovary, which consists of a fold of peritoneum (the broad ligament) with included blood-vessels, should be treated. Some operators were in favour of tying it with strong silk, and bringing the ends of the ligatures outside.
the abdomen. Others were in favour of having a strong metal clamp upon those structures, or of scoring them with the actual cautery, while others claimed that the best results were to be obtained by firmly tying the pedicle, cutting the ligatures short, dropping the pedicle into the abdomen and closing the wound. This last method is now most universally adopted.

(O. E. *)

OVATION (Lat. ovatio), a minor form of Roman "triumph." It was awarded either when the campaign, though victorious, had not been important enough for the higher honour; when the war was not entirely put an end to; when it had been waged with unworthy foes; or when the general was not of rank sufficient to give him the right to a triumph. The ceremonial was on the whole similar in the two cases, but in an ovation the general walked or more commonly rode on horseback, wore a simple magisterial robe, carried no sculpere and wore a wreath of myrtle instead of laurel. Instead of the adlocutio, which was at the conclusion of the ceremony. The word is not, however, derived from avis, sheep, but probably means "shouting" (cp. aiata) as a sign of rejoicing.

OVEN (O. Eng. 0ven, Ger. Ofen, cf. Gr. irwos, oven), a close chamber or compartment which may be raised to a considerable temperature by heat generated either within or without it. In English the term generally refers to a chamber for baking bread and other food substances, but it is also used of certain appliances employed in manufacturing operations, as in cooking coal or making pottery. See HEATING.

OVERBECK, JOHANN FRIEDRICH (1780-1860), German painter, the reviver of "Christian art" in the 19th century, was born in Lübeck on the 4th of July 1780. His ancestors for three generations had been Protestant pastors; his father was doctor of laws, poet, mystic pietist and burgomaster of Lübeck. Within a stone's throw of the family mansion in the Königstrasse stood the gymnasium, where the uncle, doctor of theology and a voluminous writer, was the master; there the nephew became a classic scholar and an instructor in art. He was a member of the famous Raphaelite painters of Italy. At the end of four years, differences had grown so irreconcilable that Overbeck and his band of followers were expelled from the academy. True art, he writes, he had sought in Vienna in vain—"Oh! I was full of it; my whole fancy was possessed by Madonnas and Christs, but nowhere could I find response." Accordingly he left for Rome, carrying his half-finished canvas "Christ's Entry into Jerusalem," as the charter of his creed—"I will abide by the Bible; I elect it as my standing-point.

Overbeck in 1850 entered Rome, which became for fifty-nine years the centre of his unremitting labour. He was joined by a goodly company, including Cornelius, Wilhelm Schadow and Philip Veit, who took up their abode in the old Franciscan convent of San Isidoro on the Pincian Hill, and were known among friends and enemies by the descriptive epithets—"the Nazarites," "the pre-Raphaelites," "the new-old school," "the German-Roman artists," "the church-romantic painters," "the German patriotic and religious painters." Their precept was hard and honest work and holy living; they eschewed the antique as pagan, the Renaissance as false, and built up a severe revival on simple nature and on the serious art of Perugino, Pinturicchio, Francia and the young Raphael. The characteristics of the style thus evolved were nobility of idea, precision and even hardness of outline, scholastic composition, with the addition of light, shade and colour, not for allurement, but chiefly for perspicuity and completion of motive. Overbeck was mentor in the movement; a fellow-labourer writes: "No one who saw him or heard him speak could question his purity of motive, his deep insight and abounding knowledge; he is a treasury of art and poetry, and a saintly man." But the struggle was hard and poverty its reward. Helpful friends, however, came in Niebuhr, Bunsen and Frederick Schlegel. Overbeck in 1831 joined the Roman Catholic Church, and thereby he believed that his art received Christian baptism.

Faith in a mission begat enthusiasm among kindred minds, and timely commissions followed. The Prussian consul, Bartholdi, had a house on the brow of the Pincian, and he engaged Overbeck, Cornelius, Veit and Schadow to decorate a room in the Berlin gallery (now in the Berlin gallery) from the story of Joseph and his Brethren. The subjects which fell to the lot of Overbeck were the "Seven Years of Famine" and "Joseph sold by his Brethren." These tentacular wall-pictures, finished in 1818, produced so favorable an impression among the Italians that in the same year Prince Massimo commissioned Overbeck, Cornelius, Veit and Schnorr to cover the walls and ceilings of his garden pavilion, near St John Lateran, with frescoes illustrative of Tasso, Dante and Ariosto. To Overbeck was assigned, in a room 15 ft. square, the illustration of Tasso's Jerusalem Delivered; and of eleven compositions, the largest and most noteworthy, occupying one entire wall, is the "Meeting of Godfrey de Bouillon and Peter the Hermit." The completion of the frescoes—very unequal in merit—after ten years' delay, the overtaxed and enfeebled painter delegated to his friend Joseph Führich. The leisure thus gained was devoted to a thoroughly congenial theme, the "Vision of St Francis," a wall-painting 20 ft. long, figures life-size, finished in 1839, for the church of St Maria degli Angeli near Assisi. Overbeck and the brethren set themselves to revive the ancient art of fresco and of monumental painting; they adopted the old methods, and their success led to memorable revivals throughout Europe.

Fifty years of the artist's laborious life were given to oil and easel paintings, of which the chief, for size and import, are the following: "Christ's Entry into Jerusalem" (1824), in the Marien Kirche, Lübeck; "Christ's Agony in the Garden" (1835), in the great hospital, Hamburg; "Lo Spas on the (1836), Raczynski gallery, Berlin; the "Triumph of the hallock, and the Arts" (1843), in the Stadl Institut, Frâches of wood and (1846), in the Marien Kirche, Lübeck; the Zee, however, west Thomas" (1851), in the possession of country is low-lying and London; the "Assumption of the Made pasture lands. Cattle-Cathedral." Christ delivered from is consequently the chief a ceiling in the Quirinal. Palacacy and of the people are engaged and a direct attack on the Italian tier river system of the province now covered by a canvas adorned of hills. The first of these works are marked by religious fervent he Markelo to the Lemer study, with a dry, severe handling, a the Vecht and Regge, and Overbeck belongs to eclectical schoolre and the Salland streams ranks among thinkers, and his pen was at the Zwolle to form pencil. OVERBURY—OVERTURE

1869, aged eighty, and lies buried in San Bernardo, the church within which he worshipped.

There are biographies by J. Beavington Atkins (1882) and Howitt (1886).

OVERBURY, SIR THOMAS (1581–1613). English poet and essayist, and the victim of one of the most sensational crimes in English history, was the son of Nicholas Overbury, of Bourton-on-the-Hill, and was born in 1581 at Compton Scorton, near Ilminster, in Warwickshire. In the autumn of 1595 he became a gentleman-commoner of Queen’s College, Oxford, took his degree of B.A. in 1598 and came to London to study law in the Middle Temple. He found favour with Sir Robert Cecil, travelled on the Continent and began to enjoy a reputation for an accomplished mind and free manners. About the year 1601, being in Edinburgh on a holiday, he met Robert Carr, then an obscure page to the earl of Dunbar; and so great a friendship was struck up between the two youths that they came up to London together. The early history of Carr remains obscure, and it is probable that Overbury secured an introduction to Court before his young associate contrived to do so. At all events, when Carr attracted the attention of James I, in 1606, by breaking his leg in the tilt-yard, Overbury had for some time been servitor-in-ordinary to the king. He was knighted in June 1608, and in 1609 he travelled in France and the Low Countries. He seems to have followed the fortunes of Carr very closely, and “such was the warmth of the friendship, that they were inseparable...nor could Overbury enjoy any felicity but in the company of him he loved [Carr].” When the latter was made Lord Rochester in 1610, the intimacy seems to have been sustained, and when, in 1611 the Court became aware of the mutual attraction between Rochester and the infamous and youthful countess of Essex, who seemed to have bewitched the handsome Scots adventurer. To this intrigue Overbury was from the first violently opposed, pointing out to Rochester that an indulgence in it would be hurtful to his preferment, and that the woman, even at this early stage in her career, was already “noted for her injury and immodesty.” He went so far as to use, in describing her, a word which was not more just than scandalous. But Rochester was now infatuated, and he repeated to the countess what Overbury had said. It was at this time, too, that Overbury of Lichfield circulated widely in MS, the poem called “His finally to neglect the picture of the virtues which a young woman possesses; the sense entertain woman before he has the rashness to marry but of his constant aointed to Lady Essex that Overbury’s object whose “weal,” in his eyes to open the eyes of Rochester to her. The movement resulted in two resolved itself into a deadly duel and the erection of statues between the mistress and the friend. On the 11th of March 1603/4 Overbury into such a trap as Abbey, where the marble statue to the king, and she succeeded epitaph “The Bayard of Ithron into the Tower on the 22nd See Sir F. J. Goldsmid, Jamown at the time, and it is not certain and L. J. Trotter, The Boyacicipated in this first crime, or whether

OVAL (Lat. ovum, egg), at the queen, a foolish phrase, had more or less egg-like in “the friends; she had called Overbury more complicated for.” It is, indeed, apparent that Overbury analytical geometry by success, and was no longer a favourite degrees. Those of them, however, was not satisfied with having are the most important was determined that “he should return no after Descartes and Cr She had Sir William Wade, the honest ovals presented them, removed to make way for a creature of a surface which wore Elvis or Helwys; and a gasoler, of whom in a medium of od that he was “a man well acquainted with medium of a differs,” was set to attend on Overbury. This equation is eved by Mrs Turner, the widow of a physician, the curve from twartly called Franklin, pined the miserable poet it was a constant in the form of copper vitriol. But his con- line joining thistood the timid doses they gave him, and he normal at any pitiful sufferings until the 15th of September segments whose five violent measures put an end to his existence. has the equation rz Rochester, now earl of Somerset, married the curve from two Lady Essex. More than a year passed before suspicion was roused, and when it was, the king showed a hateful disinclination to bring the offenders to justice. In the celebrated trial which followed, however, the wicked plot was all discovered. The four accomplices were hanged; the countess of Somerset pleaded guilty but was spared, and Somerset himself was disgraced. Meanwhile, Overbury’s poem, The Wife, was published in 1614, and ran through six editions within a year, the scandal connected with the murder of the author greatly aiding its success. It was abundantly reprinted within the next sixty years, and it continued to be one of the most widely popular books of the 17th century. Combined with later editions of The Wife, and gradually adding to its bulk, were “Characters” (first printed in the second of the 1614 editions), “The Remedy of Love” (1620), and “Observations in Foreign Travels” (1626). Later, much that must be spurious was added to the gathering snowball of Overbury’s Works. Posthery has found the praise of his contemporaries for the sentimental and graceful manner of Overbury extravagantly expressed. The Wife is smooth and elegant, but uninspired. There is no question that the horrible death of the writer, and the extraordinary way in which his murderers were brought to justice, gave an extravagant claim to his writings. Nor can we be quite sure that Overbury was in fact such a “glorious constellation” of all the religious virtues as the 17th century believed. He certainly kept very bad company, and positive evidence of his goodness is wanting. But no one was ever more transcendentally canonized by becoming the victim of conspirators whose crimes were equally detestable and unpopular.

OVERDOOR, the name given to any ornamental moulding placed over a door. The overdoor is usually architectural in form, but is sometimes little more than a moulded shelf for the reception of china or curiosities.

OVERMANTEL, the name given to decorative cabinet work, or journery, applied to the upper part of a fireplace. The overmantel is derived from the carved panelling formerly applied to chimney-pieces of importance, but the word is now generally restricted to a movable fitment, often consisting of a series of shelves and niches for the reception of ornaments.

OVERSOUL (Ger. Überschale), the name adopted by Emerson to describe his conception of that transcendent unity which embraces subject and object, mind and matter, and in which all the differences in virtue of which particular things exist are resolved into a whole that is in harmony with the various doctrines of the absolute, and to the Isola of Plato.

OVERSTONE, SAMUEL JONES LOYD, 1ST BARON (1796–1883). English banker, the only son of the Rev. Lewis Loyd, a Welsh dissenting minister, was born on the 25th of September 1796. He was educated at Eton and Trinity College, Cambridge. His father, who had married a daughter of John Jones, a banker of Manchester, had given up the ministry to take a partnership in his father-in-law’s bank, and had afterwards founded the London branch of Jones, Loyd & Co., afterwards incorporated in the London and Westminster Bank. Loyd, who had joined his father in the banking business, succeeded to it on the latter’s retirement in 1844. He conducted the business so successfully that on his death he left personal property of over £2,000,000. He sat in parliament as liberal member for Hythe from 1819 to 1826, and unsuccessfully contested Manchester in 1832. As early as 1832 he was recognized as one of the foremost authorities on banking, and he enjoyed much influence with successive ministries and chancellors of the exchequer. He was created Baron Overstone in 1850. He died in London on the 17th of November 1853, leaving one daughter, who married Robert James Loyd-Lindsay, afterwards Lord Wantage.

OVERT ACT (O. Fr. oert, from outrir, to open), in law, an open act, one that can be clearly proved by evidence, and from which criminal intent can be inferred, as opposed to mere intention to commit a crime (see Intention). The term is more particularly employed in cases of treason (q.v.), which must be demonstrated by some overt or open act.

OVERTURE (Fr. ouverture, opening), in music, the instrumental introduction to a dramatic or choral composition. The
of an overture thus has no existence until the 17th century. The toccata at the beginning of Monteverdi's Orfeo is a barbaric flourish of every procurable instrument, alternating with a melodic section entitled riformella; and, in so far as this constitutes the first instrumental movement prefixed to an opera, it may be called an overture. As an art-form the overture began to exist in the works of J. B. Lully. He devised a scheme which, although he himself did not always adhere to it, constitutes the typical French overture up to the time of Bach and Handel (whose works have made it classical). This French overture consists of a slow introduction in a marked "dotted rhythm" (i.e., exaggerated iambic, if the first chord is disregarded), followed by a lively movement in fugato style. The slow introduction was always repeated, and sometimes the quick movement concluded by returning to the slow tempo and material, and was also repeated (see Bach's French Overture in the Klavierübung). Höchst erwünschtes Freudenfest are in overture form; and, in the first of the two cantatas entitled Nun komm der Heiden Heiland, Bach has ingeniously adapted the overture form to the treatment of a choral.

With the rise of dramatic music and the sonata style, the French overture became unsuitable for opera; and Gluck (whose remarks on the function of overtures in the preface to Alceste are historic) based himself on Italian models, of loose texture, which admit of a sweeping and massively contrasted technique (see Svammerdy). By the time of Mozart's later works the overture in the sonata style had clearly differentiated itself from strictly symphonic music. It consists of a quick movement (with or without a slow introduction), in sonata form, loose in texture, without repeats, frequently without a development section, but sometimes substituting for it a melodic episode in slow time. Instances of this substitution are Mozart's "symphony" in G (Küchel's catalogue 318), which is an overture to an unknown opera, and his overtures to Die Entführung and to Lo Spasí deluso, in both of which cases the curtain rises at a point which throws a remarkable dramatic light upon the peculiar form. The overture to Figaro was at first intended to have a similar slow middle section, which, however, Mozart struck out as soon as he had begun it. In Beethoven's hands the overture style and form increased its distinction from that of the symphony, but it no longer remained inferior to it; and the final version of the overture to Leonora (that known as No. 3) is the most gigantic single orchestral movement ever based on the sonata style.

Overtures to plays, such as Beethoven's to Collin's Coriolan, naturally tend to become detached from their surroundings; and hence arises the concert overture, second only to the symphony in importance as a purely orchestral art-form. Its derivation associates it almost inevitably with external poetic ideas. These, if sufficiently broad, need in no way militate against musical integrity of form; and Mendelssohn's Hebrides overture is as perfect a masterpiece as can be found in any art. The same applies to Brahms's Tragic Overture, one of his greatest orchestral works, for which a more expository title would be misleading as well as unnecessary. His Academic Festival Overture is a highly organized working out of German student songs.

In modern opera the overture, Vorspiel, Einleitung, Introduction, or whatever else it may be called, is generally nothing more definite than that portion of the music which takes place before the curtain rises. Tanzhutke is the last case of high importance in which the overture (as originally written) is a really complete instrumental piece prefixed to an opera in tragic and continuous dramatic style. In lighter opera, where sectional forms are still possible, a separable overture is not out of place, though even Carmen is remarkable in the dramatic way in which its overture foreshadows the tragic end and leads directly to the rise of the curtain. Wagner's Vorspiel to Lohengrin is a short self-contained movement founded on the music of the Grail. With all its wonderful instrumentation, romantic beauty and identity with subsequent music in the first and third acts, it does not represent a further departure from the formal classical overture than that shown fifty years earlier by Mühls's interesting overtures to Ariodant and Ulrich, in the latter of which a voice is several times heard on the stage before the rise of the curtain. The Vorspiel zu Die Meistersinger, though very enjoyable by itself and needing only an additional tonic chord to bring it to an end, really loses incalculable in refinement by so ending in a concert room. In its proper position its otherwise disproportionate climaxes leads to the rise of the curtain and the engaging of the listener's mind in a crowd of dramatic and spectacular sensations amply adequate to account for that long introductory instrumental crescendo. The Vorspiel to Tristan has been very beautifully finished for concert use by Wagner himself, and the considerable length and subtility of the added page shows how little calculated for independent existence the original Vorspiel was. Lastly, the Parsifal Vorspiel is a dream sequence, through which quiet music flows by Wagner in a few extra bars, ushers itself with the utmost elasticity and force as a prelude to some vast design. The orchestral preludes to the four dramas of the King owe their whole meaning to their being mere preparations for the rise of the curtain; and these works can no more be said to have overtures than Verdi's Falstaff and Strauss's Salome, in which the curtain rises at the first note of the music. (D. F. T.)

OVERYSEL, or Overyssel, a province of Holland, bounded S. and S.W. by Gelderland, N.W. by the Zuider Zee, N. by Friesland and Drente, and E. by the Prussian provinces of Hanover and Westphalia respectively; area 1291 sq. m.; pop. (1904) 359,443. It includes the island of Schokland in the Zuider Zee. Like Drente on the north and Gelderland on the south, Overyssel consists of a sandy flat relieved by hlocks, and is covered with waste stretches of heath and patches of wood and high fen. Along the shores of the Zuider Zee, however, west of the Zwolle-Leeuwarden railway, the country is low-lying and covered for the most part with fertile pasture lands. Cattle-rearing and butter and cheese making are consequently the chief occupations, while on the coast many of the people are engaged in making mats and besoms. The river system of the province is determined by two main ridges of hills. The first of these extends from the southern border at Markelo to the Lemeler hill (262 ft.) near the confluence of the Vecht and Regge, and forms the watershed between the Regge and the Salland streams (Saela, whence Saliis, Ialsa, Yssel), which unite at Zwolle to form the Ijssel, which descends the ridge of hills extending from the south-eastern division of the province called Twente, from Enschede to Ootmarsum, and divides the basin of the Almeloche Aa from the Dinkel and its streams. The river Vecht crosses the province from E. to W. and joins the Zwarte Water, which communicates with the Zuider Zee by the Zwolsche Diep and with the Yssel by the Willemsoarta. Everywhere along the streams is a strip of fertile grass-land, from which agriculture and cattle-rearing have gradually spread over the sand-grounds. A large proportion of the sand-grounds, however, is waste. Forest culture is practised on parts of them, especially in the east, and pags are largely bred. The deposits of the Salland and the Dinkel streams are found to contain iron ore, which is extracted and sent as an article of export to Germany. Peat-digging and fen reclamation have been carried on from an early period, and the area of high fen which formerly covered the portion of the province to the north of the Vecht in the neighbourhood.
of Dedemsvaart has been mostly acclaimed. This industry is now most active on the eastern borders between Almelo and Hardenberg, while in the West, the carpet-making industry has declined. The reason for its isolated settlement here is to be found in the former general practice of weaving as a home craft and its organization as an industry by capitalist Baptist refugees who arrived in the 19th century.

The chief town of the province is Zwolle, and other thriving industrial centres are Deventer, famous for its carpets and cake, and Almelo, Enschede, Hengelo and Oldenzaal in Twente. The railway system of the province is supplemented by steam tram-lines between Zwolle, Dedensvaart and Hardenberg.

OVID [PUBLIUS OVIDIUS NASO] (43 B.C.-A.D. 17), Roman poet, the last of the Augustan age, was born in 43 B.C., the last year of the republic, the year of the death of Cicero. Thus the only form of political life known to Ovid was that of the absolute rule of Augustus and his successor. His character was neither strengthened nor sobered, like that of his older contemporaries, by personal recollection of the crisis through which the republic passed into the empire. There is no sense of political freedom in his writings. The spirit inherited from his ancestors was that of the Italian country districts, not that of Rome. He was born and brought up in the Herulian region of his native district. The synagogue preserved the exact day of the month at Sulmo, now Sulmona, a town of the Paeldini, picturesquely situated among the mountains of the Abruzzi; its wealth of waters and natural beauties seem to have strongly affected the young poet’s imagination (for he often speaks of them with affectionate admiration) and to have quickened in him that appreciative eye for the beauties of nature which is one of the chief characteristics of his poems. The Paeldini were one of the four small mountain peoples whose proudest memories were of the part they had played in the Social War. But in spite of this they had no old race-hostility with Rome, and their opposition to the senatorial aristocracy in the Social War would predispose them to accept the empire. Ovid’s father was of equeridi family, born by birth to the same social class as Tibullus and Propertius, that of old hereditary landowners; but he was more fortunate than they in their immunity, which his native district enjoyed from the confiscations made by the triumvirs. His vigorous vitality was apparently a gift transmitted to him by heredity; for he tells us that his father lived till the age of ninety, and that he performed the funeral rites to his mother after his father’s death. While he mentions both with the piety characteristic of the old Italian, he tells us little more about them than that “their thrift curtailed his youthful expenses.” And that his father did what he could to dissuade him from poetry, and force him into the more profitable career of the law. He and his brother had been brought early to Rome for their education; when they attended the lectures of two most eminent teachers of rhetoric, Arelius Fuscus and Porcius Latro, to which influence is due the strong rhetorical element in Ovid’s style. He is said to have attended these lectures eagerly, and to have shown in his exercises that his gift was poetical rather than oratorical, and that he had a distaste for the severer processes of thought.

Like Pope, “he lisped in numbers,” and he wrote and destroyed many verses before he published anything. The earliest edition of the Amores, which first appeared in five books, and the Heroides were given by him to the world at an early age. “Virgil” he informs us, “he had only seen”; but Virgil’s friend and contemporary Aemilius Murer used to read his didactic poems to him; and even the fastidious Horace some-

1 Trist. iv. 10. 13. 2 Am. i. 3. 10. 3 Trist. iv. 10. 26 “et quod temptabam scribere, versus erat.”

times delighted his ears with the music of his verse. He had a close bond of intimacy with the younger poets of the older generation. Thus, in book iv., he laments in one of the few pathetic pieces among his earlier writings, and Propertius, to whom he describes himself as united in the close ties of comradeship. The name of Maecenas he nowhere mentions. The time of his influence was past when Ovid entered upon his poetical career. But the veteran politician Messalla, the friend of Tibullus, together with his powerful son Cotta Messallinus and Fabius Maximus, who are mentioned together by Juvenal, along with Maecenas as types of munificent patrons of letters, and other influential persons whose names are preserved in the Epistles from Pontus, encouraged his literary efforts and extended to him their support. He enjoyed also the intimacy of poets and literary men, chiefly of the younger generation, whose names he enumerates in Book iv. 16, though, with the exception of Domitius Marsus and Grattius, they are scarcely more than names to us. With the older poet, Maec, he travelled for more than a year. Whether this was immediately after the completion of his education, or in the interval between the publication of his earlier poems and that of the Medea and Ars amatoria is unknown, but it is in his later works, the Fasti and Metaphorases, that we chiefly recognize the impressions of the scenes he visited. In one of the Epistles from Pontus (io 10) to his fellow-traveller there is a vivid record of the pleasant time they had passed together. Athens was to a Roman what Rome is to an educated Englishman of the present day. Ovid speaks of having gone there under the influence of literary eminences and literary men, and he mentions the spot where the supposed site of Troy. The two friends saw together the illustrious cities of Asia, which had inspired the enthusiasm of travel in Catullus, and had become familiar to Cicero and Horace during the years they passed abroad. They spent nearly a year in Sicily, which attracted him, as it had attracted Lucretius and Virgil, by its manifold charm of climate, of sea-shore and inland scenery, and of legendary and poetical association. He recalls with a fresh sense of pleasure the incidents of their tour, and the endless delight which they had in each other’s conversation. We would gladly exchange the record of his life of pleasure in Rome for more of these recollections. The highest type of classic Roman culture shows its affinity to that of modern times by nothing more clearly than the enthusiasm for travel among lands famous for their natural beauty, their monuments of art and their historical associations.

When settled at Rome, although a public career leading to senatorial position was open to him, and although he filled various minor judicial posts and claims to have filled them well, he had no ambition for such distinction, and looked upon pleasure and poetry as the occupations of his life. He was three times married; when little more than a boy to his first wife, whom he naively describes as unworthy of himself; but he was soon separated from her and took a second wife, with whom his union, although through no fault of hers, did not last long. She was probably the mother of his one daughter. Later he was joined to a third wife, of whom he always speaks with affection and respect. She was a lady of the great Fabian house, and thus connected with his powerful patron Fabius Maximus, and was a friend of the empress Livia. It therefore seems likely that he may have been admitted into the intimacy of the younger society of the Palatine, although in the midst of his most fulsome flattery he does not claim ever to have enjoyed the favour of Augustus. His liaison with his mistress Corinna, whom he celebrates in the Amores, took place probably in the period between his first and second, or between his second and third marriages. It is doubtful whether Corinna was, like Catullus’ Lesbia, a lady of recognized position, or whether she belonged to

1 Juven. vii. 95. 2 Lucian, i. 726. “quae cum magna modis multi miranda videtur gentilis humanis regio visendique fertur.” 3 Suét. (Donatus), Viti Virg. 13 “quamquam secessu Campaniae Silvesiacum quodam primum uteretur.” 4 Trist. iv. 10. 69-70.
the same class as the Chloes and Lalages of Horace's artistic fancy. If we can trust the poet's later apologies for his life, in which he states that he had never given occasion for any serious scandal, it is probable that she belonged to the class of libertines. However that may be, Ovid is not only a less constant but a less laudable critic than his great predecessors Catullus, Tibullus and Propertius. His art is at the same time a development of more serious feeling or of irony. In his complete emancipation from all restraint he goes beyond them, and thus reflects the tastes and spirit of fashionable Rome between the years 20 B.C. and the beginning of our era. Society was then bent simply on amusement; and, as a result partly of the loss of political interests, women came to play a more important and brilliant part in its life than they had done before. Julia, the daughter of the emperor, was by her position, her wit and beauty, and her reck-less dissipation, the natural leader of such a society. But the discovery of her intrigue (2 B.C.) with Julius Antonius, the son of Mark Antony, was deeply resented by Augustus as being at once a shock to his affections and a blow to his policy of moral reform. Julia was banished and disinherited; Antonius and her many lovers were punished; and the Roman world awaked from its feal paradise of pleasure. Nearly coincidently with this scandal appeared Ovid's Ars amatoria, perhaps the most immoral work ever written by a man of genius, though not the most demoralizing, since it is entirely free from morbid sentiment. By its brilliancy and heartlessness it appealed to the prevailing taste of the fashionable world; but its appearance excited deep resentment in the mind of the emperor, as is shown by his edict, issued ten years later, against the book and its author. Augustus had the art of dissembling his anger; and Ovid appears to have had no idea of the storm that was gathering over him. He still continued to enjoy the society of the court and the fashionable world; he passed before the emperor in the annual procession among the ranks of the equites; and he developed a richer vein of genius than he had shown in his youthful poems. But the public were aware that public opinion had been shocked, or professed to be shocked, by his last work; and after writing a kind of apology for it, called the Remedia amoris, he turned to other subjects, and wrote during the next ten years the Metamorphoses and the Fasti.

He had already written the Heroides, in which he had imparted a modern and romantic interest to the heroines of the old mythology, and a tragedy, the Medea, which must have afforded greater scope for the dramatic and psychological treatment of the passion with which he was most familiar. In the Fasti Ovid assumes the position of a national poet by imparting poetical life and interest to the ceremonial observances of the Roman religion. He is the author of the romantic tales that were so strangely blended with the ceremonial, and he conceives and presents in them a picture of the summer festivals and ceremonies of Rome that he succeeds in the part assumed by him. The Metamorphoses is a narrative poem which recounts legends in which the miraculous involved transformations of shape. Beginning with the change from Chaos to Cosmos, legends first Greek and then Roman are passed in review, concluding with the metamorphosis of Julius Caesar into a star and a promise of immortality to Augustus. The long series of stories, which consist to a large extent of tales of the love adventures of the gods with nymphs and the daughters of men, is strongly tinged with Alexandrine influence, being in fact a succession of epipha in the Alexandrine manner. This work, which Ovid regards as his most serious claim to immortality, had not been finally revised at the time of his disgrace, and in his despair he burnt it; but other copies were in existence, and when he was at Tomi it was published at Rome by one of his friends. He often regrets that it had not received its final revision. The Fasti also was broken off by his exile, after the publication of the first six books, treating of the first six months of the year.

Ovid assigns two causes for his banishment, his Ars amatoria, and an actual offence. What this was is not known, but his frequent references to it enable us to conjecture its character. He tells us that there was no breach of law on his part; he distinctly disclaims having been concerned in any treasonable plot: his fault was a mistake of judgment (error), an unpre meditated act of folly. He had been an unintentional witness of some culpable act committed by another or others—of some act which nearly affected the emperor, and the mention of which will likely prove offensive to him. Ovid himself had reaped no personal gain from his conduct. Though his original act was a pardonal error, he had been prevented by timidity from uttering for it subsequently by taking the straight road out of course. In a letter to an intimate friend, to whom he had been in the habit of confiding all his secrets, he says that had he confided this one he would have escaped condemnation.

In writing to another friend he warns him against the danger of courting too high society. This offence, which excited the anger of Augustus, was connected in some way with the publication of the Ars amatoria, since that fact was resented by the emperor in his sentence. All this points to his having been mixed up in a scandal affecting the imperial family, and seems to connect him with one event, coincident with the time of his disgrace (a.d. 9), the death of the younger Julia, grand-daughter of Augustus, with D. Silanus. Mentioning the Facti, Augustus deeply felt these family scandals, looking upon them as a sort of treason and sacrilege. Julia was banished to the island of Trimerium, off the coast of Apulia. Silanus withdrew into voluntary exile. The chief punishment fell on Ovid, who was banished. The poet at the worst could only have been a confidant of the intrigue; but Augustus must have regarded him and his works as, if not the corrupter of the age, at least the most typical representative of that corruption which had tainted so direly even the imperial family. Ovid's form of banishment was the mildest possible (relegatio); it involved no deprivation of civic rights, and left him the possession of his property. He was ordered to remove to the half-Greek, half-barbaric town of Tomi, near the mouth of the Danube. He recounts vividly the agony of his last night in Rome, and the history of his November voyage down the Adriatic and up the Gulf of Corinth to Lacinium, where he crossed the isthmus and took ship again from Cenchreae to Samothrace, whence in the following spring he proceeded overland through Thrace to his destination. For eight years he bore up in his dreary solitude, suffering from the unhealthiness of the climate and the constant alarm of inroads of barbarians. In the hope of procuring a remission of his punishment he wrote poetical complaints, first in the series of the five books of the Tristia, sent successively to Rome, addressed to friends whose names he suppresses; afterwards in a number of poetical epistles, the Epistulae ex Ponto, addressed by name to friends whom he was likely to have influence at court. He believed that Augustus had softened towards him before his death, but his successor Tiberius was inexorable in his appeals. His chief consolation was the exercise of his art, though as time goes on he is painfully conscious of failure in power. But although the works written by him in exile lack the finished art of his earlier writings, their personal interest is greater. They have, like the letters of Cicero to Atticus, the fascination exercised by those works which have been given to the world under the title of Confessions; they are a sincere literary expression of the state of mind produced by a unique experience—that of a man, when well advanced in years but still retaining extraordinary sensibility to pleasure and pain, withdrawn from a brilliant social and intellectual position, and cast upon his own resources in a place and among people affording the dreariest contrast to the brightness of his former life. His friends and correspondents are to be regarded as equally sincere expressions of his affection or admiration for his correspondents is another question. Even in those addressed to his wife, though he speaks of her with affection and respect, there may perhaps be detected a certain ring of insincerity in his conventional comparisons of her to the Penelope and Laodamias of ancient legend. Had she been a Penelope or Laodamia she would have accompanied him in
his exile, as we learn from Tacitus was done by other wives in the more evil days of which he wrote the record. The letters, which compose the *Tristia* and *Epistulae ex Ponto*, are addressed either to his wife, the emperor, or the general reader, or to his patrons and friends. To his patrons he writes in a vein of supplication, beseeching them to use their influence on his behalf. To his mother he writes with a tenderness which he has not in the language of familiarity, and often of affectionate regard; he seeks the sympathy of some, and speaks with bitterness of the coldness of others, and in three poems he complains of the relentless hostility of the enemy who had contributed to procure his exile, and whom he attacked in the *Ibis*. There is a note of true affection in the letter to the young lyric poetess Perilla, of whose genius and beauty he speaks with pride, and whose poetic talents he had fostered by friendly criticism. He was evidently a man of gentle and genial manners; and, as his active mind induced him to learn the language of the new people among whom he was thrown, his active interest in life enabled him to gain their regard and various marks of honour. One of his last acts was to revise the *Fasti*, and re-edit it with a dedication to Germanicus. The closing lines of the *Epistulae ex Ponto* sound like the despairing sigh of a drowning man who had long struggled alone with the waves:—

"Omnia perdilimus: tantummodo vita relieta est,
Priebeat ut sensum materiamique maiali."

Shortly after these words were written he died in his sixty-first year in A.D. 17, the fourth year of the reign of Tiberius.

The temperament of Ovid, as indicated in his writings, is more in common with the suppleness of the later Italian than with the strength and force of the ancient Roman. That stamp of her own character and understanding which Rome impressed on the genius of those other races which she incorporated with herself is fainter in Ovid than in any other great writer. He ostentatiously disclaims the manliness which in the republican times was regarded as the birthright not of Romans only but of the Sabellian races from which he sprang. He is as devoid of dignity in his abandonment to pleasure as in the weakness with which he meets calamity. He has no depth of serious conviction, no vein of sober reflection, and is sustained by no great or elevating purpose. Although the being of a supernatural world fill a large place in his writings, they appear stripped of all sanctity and mystery. It is difficult to say whether the tone of his references to the gods and goddesses of mythology implies a kind of half-believing return to the most childish elements of paganism, or is simply one of mocking unbelief. He has absolutely no reverence, and consequently inspires no reverence in the reader. He is not the poet's fault, for the life, variety and subtlety of nature, he has no sense of her mystery and majesty. The love which he celebrates is sensual and superficial, a matter of vanity as much as of passion. He prefers the pictorial attraction of falsehood and fickleness to the charm of truth and constancy. Even where he follows the Roman tendencies in his art he perverts them. The *Fasti* is a work conceived in the prosaic spirit of Roman anticarianism. It is redeemed from being prosaic by the picturesqueness and vivacity with which the legends are told. But its conception might have been more poetical if it had been penetrated by the religious and patriotic spirit with which Virgil invests ancient ceremonies, and the mysticism with which he accepts the revelations of science. In this respect the contrast is great between the reverential treatment which the trivialities of legend and science receive in the *Georgics* and *Aeneid*, and the literal definiteness of the *Fasti*.

These defects in strength and gravity show a corresponding result in Ovid's writings. Though possessing diligence, perseverance and literary ambition, he seems incapable of conceiving a great and serious whole. Though a keen observer of the superficial aspects of life, he has added few great thoughts to the intellectual heritage of the world. But with all the levity of his character he must have had qualities which made him, if not much esteemed, yet much liked in his own day, and which are apparent in the genial amiability of his writings. He claims for himself the virtues highly praised by the Romans, *liberalitas* and *candor*—the qualities of social honour and kindly sincerity. There is no indication of anything base, ungenerous or morose in his relations to others. Literary *candor*, the generous appreciation of all sorts of excellence, he possesses in a remarkable degree. He heartily admires everything in literature, Greek or Roman, that had any merit. In him more than any of the Augustan poets we find words of admiration applied to the rude genius of Ennius and the majestic style of Accius. It is by him, not by Virgil or Horace, that Lucretius is first named and his sublimity is first acknowledged. The image of Catullus that most haunts the imagination is that of the poet who died so early—

*Hedera iuvanella cinetus*.

Temporibus as he is represented by Ovid coming to meet the shade of the young Titiullus in *Elysium*. To his own contemporaries, known and unknown to fame, he is as liberal in his words of recognition. He enjoyed society too in a thoroughly amiable and unenvious spirit. He lived on a friendly footing with a large circle of men of letters, poets, critics, grammarians, and, but he showed none of that sense of superiority which is manifest in Horace's estimate of the "tribes of grammarians" and the poetasters of his day. Like Horace too he courted the society of the great, though probably not with equal independence; but unlike Horace he expressed no contempt for the humbler world outside. With his irony and knowledge of the world it might have been expected that he would become the social satirist of his age. But he lacked the censorious and critical temper, and the admixture of gall necessary for a successful satirist. In his exile he did retaliate on one enemy and persistent detractor in the *Ibis*, a poem written in imitation of a similar work by Callimachus; but the *Ibis* is not a satire, but an invective remarkable rather for recondite learning than for epigrammatic sting.

But Ovid's chief personal endowment was his vivacity, and his keen interest in and enjoyment of life. He had no grain of discontent in his composition; no regrets for an ideal past, or longings for an imaginary future. The age in which he lived was, as he tells us, that in which more than any other he would have wished to live. He is its most gifted representative, but he does not seem above it. The great object of his art was to amuse and delight it by the vivid picture he presented of its fashions and pleasures, and by creating a literature of romance which reflected them, and which could stimulate the curiosity and fascinate the fancy of a society too idle and luxurious for serious intellectual effort. The sympathy which he felt for the love adventures of his contemporaries, to which he probably owed his fall, quickened his creative power in the composition of the *Heroides* and the romantic tales of the *Metamorphoses*. None of the Roman poets can people a purely imaginary world with such spontaneity and fertility of fancy as Ovid. In heart and mind he is inferior to Lucretius and Catullus, to Virgil and Horace, perhaps to Tibullus and Propertius; but in the power and range of imaginative vision he is surpassed by no ancient and by few modern poets. This power of vision is the counterpart of his lively sensuous nature. He has a keener eye for the apprehension of outward beauty, for the life and colour and forms of nature, than any Roman or perhaps than any Greek poet. This power, acting upon the wealth of his varied reading, gathered with eager curiosity and received into a singularly retentive mind, has enabled him to depict with consummate skill and sympathetic legendary scenes of the most varied and picturesque beauty. If his tragedy, the
Medea, highly praised by ancient critics, had been preserved, should we have been able to judge whether Roman art was capable of producing a great drama. In many of the Heroides, and in several speeches scattered through his works, he gives evidence of true dramatic creativeness. Unlike his great predecessor Catullus, he has little of the idyllic in his art, or whatever of idyllic there is in it is lost in the rapid movement of his narrative. But he is one among the poets of all times, who can imagine a story with the most vivid inventiveness and tell it with the most unflaging animation. The faults of his verse and diction are those which arise from the vitality of his temperament—too facile a flow, too great exuberance of illustration. He has as little sense of the need of severe restraint in his art as in his life. He is not without mannerism, but he is quite unaffected, and, however far short he might fall of the highest excellence of verse or style, it was not possible for him to be rough or harsh, dull or obscure.

As regards the school of art to which he belongs, he may be described as the most brilliant representative of Roman Alexandrinism. The latter half of the Augustan age was, in its social and intellectual aspects, more like the Alexandrine age than any other era of antiquity. The Alexandrine age was characterized by a sense of refinement and luxury, of outward magnificence and literary dilettantism flourishing under the fostering influence of an absolute monarchy. Poetry was the most important branch of literature cultivated, and the chief subjects of poetry were mythological tales, various phases of the passion of love, the popular aspects of science and some aspects of the beauty of nature. These two were the chief subjects of the later Augustan poetry. The higher feelings and ideas which found expression in the poetry of Virgil, Horace and the writers of an older generation no longer acted on the Roman world. It was to the private tastes and pleasures of individuals and society that Roman Alexandrinism had appealed both in the poetry of Catullus, Cianna, Calvus and their school, and in that of Tristia, Cn., and Propertius. Ovid was the last of this class of writers.

He has written works naturally into three divisions, those of his youth, of middle life and of his later years. To the first of these divisions belong the amatory poems: (1) the three books of Amores (originally five, but reduced in a later recension to three) relating to his amours with his mistress Corinna; (2) the Medicamina faciei, or, as it is sometimes called Medicamina faciei, a fragment of a hundred lines on the use of cosmetics; (3) the three books of the Ars amatoria, rules for men and women by which they may gain the affections of the other sex; (4) the Remedia amoris (one book), a kind of recapitulation of the Ars amatoria. To the second division belong (5) the fifteen books of Fasti, originally printed in the form of a calendar, the Fasti, which was originally intended to be in twelve books, but which breaks off the account of the Roman calendar with the month of June. To the third division belong (7) the five books of the Tristia, (8) the Ibis, an invective against an enemy who had assisted to procure his fall, written in elegiac couplets probably soon after his exile; (9) the four books of Epistulae ex Ponto. Of these the first three were published soon after the Tristia, while the fourth book is a collection of scattered poems published by some friend soon after the author's death. The Halieutica is a didactic fragment in hexameters on the natural history of fishes, of doubtful genuineness, though it is certain that Ovid did begin such a work at the close of his life.

In his extant works Ovid confined himself to two metres—the elegiac couplet and the iambic. The great mass of his poetry is written in the first; while the Metamorphoses and the Halieutica are composed in the second. Of the elegiac couplet he is the acknowledged master. By fixing it into a uniform mould he brought it to its highest perfection; and the fact that the great mass of elegiac verse written subsequently has endeavoured merely to reproduce the echo of his rhythm is evidence of his pre-eminence. In the direct expression and illustration of feeling his elegiac metre has more ease, vivacity and sparkle than that of any of his predecessors, while he alone has communicated to it, without altering its essential characteristic of recurrent and regular pauses, a fluidity and rapidity of movement which make it an admirable vehicle for pathetic and picturesque narrative. It was impossible for him to give to the hexameter greater perfection, but he imparted to it also a new character, wanting indeed the weight and majesty and impressiveness of Virgil, but rapid, varied, animated in complete accord with the spirit, situation, and conditions of his imagination. One other proof he gave of his irresistible energy by composing during his exile a poem in the Cletic (Gothic) language in praise of Augustus, Tiberos and the imperial family, the loss of which, whatever it may have been to literature, is much to be regretted in the interests of philology.

It was in Ovid's writings that the world of romance and wonder created by Greek imagination was first revealed to modern times. The vivid fancy, the transparent lucidity, the liveliness, ease and directness through which he reproduced his models made his works the most accessible and among the most attractive of the recovered treasures of antiquity. His influence was first felt in the literature of the Italian Renaissance. But in the most creative periods of English literature he seems to have been read more than any other ancient poet, not even excepting Virgil, and it was on minds such as those of Marlowe, Spenser, Shakespeare, Milton and Dryden that he acted most powerfully. His influence is equally unmistakable during the classical era of Addison and Pope. The most successful Latin verse of modern times has been written in imitation of him; the faculty of literary composition and feeling for ancient Roman culture has been largely developed in the great schools of England and France by the writing of Ovidian elegiacs. His works afforded also abundant stimulus and materials to the great painters who flourished during and immediately after the Renaissance. Thus his first claim on the attention of modern readers is the influence which he has exercised on the development of literature as a whole. But, if his works are to retain an importance second only to those of Virgil and Horace.

He is interesting further as the sole contemporary exponent of the last half of the Augustan age, the external aspects and inner spirit of which is known from the works, not of contemporary historians or prose-writers, but from its poets. The successive phases of Roman feeling and experience during this critical period are revealed in the poetry of Virgil, Horace and Ovid. Virgil throws an idealizing and religious halo around the hopes and aspirations of the nascent empire. Horace presents the most complete image of its manifold aspects, realistic and ideal. Ovid reflects the life of the world of wealth and fashion under the influence of the new court, its material prosperity, its refinement of taste and intricacy of distinction, and the study of the Roman world in its social and moral relations his place is important as marking the transition between the representation of Horace, in which the life of pleasure and amusement has its place, but is subordinate to the life of reflection and serious purpose, and that life which reveals itself in the cynicism of Martial and the scornful indignation of Juvenal. He is the last true poet of the great age of Roman literature, which begins with Lucretius and closes with him. No Roman poet writes with such vivacity and fertility of fancy; in respect of these two qualities we recognize in him the countryman of Cicero and Livy. But the type of genius of which he affords the best example is more familiar in modern Italian than in ancient Roman literature. While the serious spirit of Lucretius and Virgil is realized by Dante, the mirthful and versificated version of the light-hearted gaiety and brilliant fancy of Ovid.

Bibliography.—The life of Ovid was first treated systematically by J. Masson, Ovidii vita ordine chronologico digesta (1780) (often reprinted, e.g. in Burmann's edition). Modern literature on this subject will be found in Teuffel's History of Roman Literature (Eng. trans., ed. 2) 1247, and S. G. Owen's edition of Tristia, bk. 1. The very numerous manuscripts of Ovid are chiefly of late date, 13th to 15th century. The earliest and best are: for the Heroides a Paris MS. of the 9th, a Wolfenbüttel MS. of the 12th and an Eton

1 The influence of Ovid on Shakespeare is shown conclusively by T. S. Baynes, Shakespeare Studies (1894), p. 195 f.
OVIEDO, a maritime province of northern Spain, bounded on the N. by the Bay of Biscay, E. by Santander, S. by Leon and W. by Lugo. Pop. (1900) 627,069; area, 4,205 sq. m. In popular speech Oviedo is often called by its ancient name of Asturias, which only ceased to be the official title of the province in 1833, when the Spanish system of local government was reorganized. An account of the physical features, history and inhabitants of this region is given under Asturias (q.v.). Oviedo is rich in forests, local, streams and waterfalls, which have largely contributed to its modern industrial development. The climate is generally mild, but overcharged with humidity, and in the higher regions the winters are protracted and severe. The broken character of the surface prevents anything like extensive agricultural industry, but abundant pasturage is found in the valleys. The wheat crop frequently fails. Rye succeeds better, and is often mixed with the maize which forms the principal food of all but the higher classes. Chestnuts—here, as elsewhere in Spain, an important article of diet— are very abundant on the hills, and the trees supply valuable timber. Apples are abundant, and cider forms the common drink of the people; but little attention is paid to vines. The horses of Oviedo rank among the best in Spain. Wild deer, boars and bears were formerly common among the mountains; and the sea-coasts, as well as the streams, abound with fish, including salmon and lampreys, which are sent to the markets of Madrid. Large quantities of sardines and tunny are also cured and exported. Although no trace exists of the gold for which Asturias was celebrated under its Roman rulers, Oviedo possesses valuable coal measures, which are worked at Langreo, Mieres, Santo Firme, Siero and elsewhere. More than 1,400,000 tons of coal were produced in 1903, besides a considerable amount of iron, mercury and cinnaobar. The copper mines near Avilés and Cangas de Onís, and the copper works which long supplied the pans of Leon and Castile with kettles, pots and similar utensils, have lost most of their importance, but lead, magnesia, arsenic, cobalt, lapis lazuli, alum, antimony, jet, marble and rock-crystal are found in various parts of the province, while amber and coral are gathered along the coast. There are manufactures of fine textiles, coarse cloth and ribbons in Salas, Pliego, Casas and Avilés; of paper in Panton; of porcelain and glass in Giójón, Avilés and Pola de Surro; of arms in Oviedo and Trubía; while foundries and works for the manufacture of agricultural implements, rails and pig-iron are numerous. An important highway is the 18th-century Camino real, or royal road, leading from Giójón to Leon and Madrid, which cost so much that the emperor Charles V. inquired if it were paved with silver. A railway from Madrid to Oviedo, Giójón and Avilés runs through some of the most difficult parts of the Cantabrian chain, and there are also several branch railways, including numerous narrow-gauge lines.

OVIEDO, an episcopal city and capital of the Spanish province of Oviedo; 16 m. S. of the Bay of Biscay, on the river Nalon, and on the Leon-Gijón Oviedo-Trubia and Oviedo-Infiesto railways. Pop. (1900) 48,103. Oviedo is built on a hill rising from a broad and picturesque valley, which is bounded on the north-west by the Sierra de Naranco. The four main streets of Oviedo, which meet in a central square called the Plaza Mayor or Plaza de la Constitución, are the roads connecting Giójón and Leon (northern and southern) and Santander and Orado (east and west). The streets are clean and well lighted; the projecting roofs of the houses give a chatarrán effect, and some portions of the old Calle de la Platería are highly picturesque. In the Plaza Mayor is the handsome Casa Consistorial or town hall dating from 1662; the Jesuit church of San Isidro (1578), and some ancient palaces of the Asturian nobility are architecturally interesting. The university was founded by Philip III. in 1604; connected with it are a fine library and physical and chemical museums. The Gothic cathedral, founded in 1388, occupies the site of a chapel founded in the 8th century, of which only the Camara Santa remains. The west front has a fine portico of ornamented arches between the two towers. The interior contains some fine stained glass, but has been much disfigured with modern rocco additions. The Camara Santa (dating from 1538) contains the famous altar of Oviedo, a 15th-century Bible, the chest of cedar, overlaid with silver reliefs of scenes of the life of Christ, the Virgin and the apostles. In it are preserved some highly sacred relics, two crosses dating from the 8th and 9th centuries.
and other valuable pieces of gold and silver plate. The cathedral library has some curious old MSS., including a deed of gift made by Alphonso II. of Asturias in 812, and a collection of illuminated documents of the 11th century, called the Libro gótico. On the Sierra de Naranco is the ancient Santa Maria de Naranco, originally built by Ramiro I. of Asturias in 850, a palace, and afterwards turned into a church. Higher up the hill is San Miguel de Lino, also of the 9th century; and on the road to Gijón, about a mile outside the town, is the Santullano or church of St Julian, also of very early date. There are a number of monasteries, and there are a literary and scientific institute, a meteorological observatory, a school for teachers, a school of art, adult classes for artisans, an archaeological museum and several public libraries. Oviedo is the centre of a thriving trade in agricultural products; its other industries are marble-quarrying, and the manufacture of arms, cotton and woollen fabrics, iron goods, leather and matches.

Oviedo, founded in the reign of Fruela (762), became the fixed residence of the kings of the Asturias in the time of Alphonso II., and continued to be so until about 924, when the advancing reconquest of Spain from the Moors led them to remove their capital to Leon. From that date the history of the city was comparatively uneventful, until the Peninsula War, when it was twice captured by the French—under Ney in 1809 and under Bonnet in 1810.

OVIEDO Y VALDÉS, GONZALO FERNÁNDEZ DE (1478—1557). Spanish historian, was born at Madrid in August 1478. Educated at the court of Ferdinand and Isabella, in his thirtieth year he became page to their son, the Infante Don John, was present at the siege of Granada, and there saw Columbus previous to his voyage to America. On the death of Prince John (4th of October 1497), Oviedo went to Italy, and there acted as secretary to Gonzalo Fernandez de Cordoba. In 1514 he was appointed supervisor of gold-smeltings at San Domingo, and on his return to Spain in 1525 was appointed historiographer of the Indies. He paid five more visits to America before his death, which took place at Valladolid in 1557.

Besides a romance of chivalry entitled Clarisnilé (1510) Oviedo wrote two extensive works of permanent value: La General y natural history de las Indias and Las Quinaguenas de la noblesa de España. The former work was first issued at Toledo (1526) in the form of a summary entitled La Natural historia de las Indias; the first part of La Historia general de las Indias appeared at Seville in 1555; but the complete work was not published till 1851—1855, when it was edited by J. A. de los Rios for the Spanish Academy of History. Though written in a diffuse style, it embodies a mass of curious information collected at first hand, and the entire Seville edition was widely read in the English and French versions published by Eden and Poole respectively in 1555 and 1556. Las Casas describes it as "containing almost as many lies as pages," and Oviedo undoubtedly puts the most favourable interpretation on the proceedings of his countrymen; but, apart from a patriotic bias which is too obvious to be misleading, his narrative is both trustworthy and interesting. In his Quinaguenas he indulges in much lively gossip concerning early contemporaries; this collection of quaint, moralizing anecdotes was first published at Madrid in 1880, under the editorship of Vicente de la Fuente.

OVOLANDO (adapted from It. ovolando, diminutive of ovo, an egg; other foreign equivalents are Fr. œuf, ekine, quart de rond; Lat. ovis), in architecture, a convex moulding known also as the echnus, which in Classic architecture was invariably carved with the egg and tongue. In Roman and Italian work the moulding is called by workmen a quarter round. It must not be confounded with the echnus of the Greek Doric capital, as this was of a more varied form and of much larger dimensions than the ovoland, which was only a subordinate moulding.

OWATONNA is a city and the county-seat of Steele county, Minnesota, U.S.A., and the county seat of the county, part of the state, about 67 m. S. of Minneapolis and St Paul. Pop. (1900) 5651, of whom 1160 were foreign-born; (1905, state census) 5631. It is served by the Chicago, Milwaukee & St Paul, the Chicago & North-Western, the Chicago, Rock Island & Pacific and the Minneapolis, Rochester & Dubuque (electric) railways. Four fine steel bridges span the river at or near the city. Among the public buildings are a handsome county court-house, a city hall, an armory, a city hospital and a public library. Owatonna is the seat of the Pillsbury Academy (Baptist), the Sacred Heart Academy (Roman Catholic) and the Canfield Commercial School, and immediately west of the city is the State Public School for Dependent and Neglected Children (1886). The city’s commercial importance is largely due to its situation in a rich dairying and farming district, for which it is the shipping centre. It has also various manufactures. There are valuable mineral springs in the vicinity. The municipality owns and operates the waterworks. Owatonna was settled about 1855, was incorporated as a village in 1867, was chartered as a city in 1878, and received a new charter in 1909. Its name is a Sioux word meaning “straight,” the river having been previously named Straight river.

OWEGO, a village and the county-seat of Tioga county, New York, U.S.A., on the Oviedo Creek and on the N. side of the Susquehanna river, 21 m. W. of Binghamton. Pop. (1910, U.S. census) 4633. It is served by the Erie, the Lehigh Valley and the Delaware, Lackawanna & Western railways; a branch of the last connects with Ithaca, N.Y. Owego occupies the site of an Indian (probably Tuscarora) village named “Ah-wa-ga,” which was destroyed by General James Clinton in 1770. The name, of which “Owego” is a corruption, is said to mean “a place where a river runs.” A white settlement and trading post were set up here in 1785, and the village of Owego was incorporated in 1827.

OWEN, SIR HUGH (1804—1881). Welsh educationist, was born near Tal-yfod Ferry, Anglesey, on the 11th of January 1804. Educated at a private school at Carnarvon, he became clerk in 1825 to a barrister in London. In 1836 he entered the office of the Poor Law Commission, eventually becoming chief clerk of the Poor Law Board, and retiring in 1872 to devote himself exclusively to educational work. As early as 1835 he had become secretary for an association to start a National school in Islington, and in 1843 he had published A Letter to the Welsh People on the need of educational activity, which was widely read. Successful in arousing the interest of the British and Foreign School Society, he became in 1846 honorary secretary of its newly-formed branch, the Cambrian School Society. He was one of the founders of the Bangor Normal College, for the training of teachers, and of the University College of Wales at Aberystwith, of which for many years he was honorary secretary and treasurer. He was for three years a member of the London School Board. His scheme for secondary education, formulated in 1881, was almost wholly adopted after his death in the Welsh Intermediate Education Act of 1886. The revival of the Honourable Cymrodorion Society, the National Eisteddfod Association and the Social Science Section of the National Eisteddfod was due to Owen. He was knighted in recognition of his service to Welsh education in August 1881, but died at Mentone on the 20th of November. A bronze statue was erected at Carnarvon in 1888 by public subscription.

OWEN, JOHN [OVENUS of AUVENES] (c. 1560—1622). Welsh epigrammatist, was born at Plas Dhu, Carnarvonshire, about 1560. He was educated under Dr Bilson at Winchester School, and at New College, Oxford. He was a fellow of his college from 1584 to 1591, when he became a schoolmaster, first at Trelleck, near Monmouth, and then at Warwick, where he was master of the school endowed by Henry VIII. He became distinguished for his perfect mastery of the Latin language, and for the humour, felicity and point of his epigrams. The Continental scholars and wits of the day used to call him "the British Martial." He was a staunch Protestant, and could not resist the temptation of turning his wit against the Roman Catholic Church. This practice caused him to be placed on the Index librorum prohibitorum in 1564, and led a rich old uncle of the Roman Catholic communion to cut him out of his will. When the poet died in 1622, his countryman and relative, Bishop Williams of Lincoln, who is said to have supported him in his later years, erected a monument to his memory in St Paul's cathedral with a Latin epitaph. Owen's Epigrammata are divided into twelve books, of which the first four were published in 1606, and the rest at four different
times. Owen frequently adapts and alters to his own purpose the lines of his predecessors in Latin verse, and one such borrowing has become celebrated as a quotation, though few know where it is to be found. It is the first line of this epigram:—

"Tempora mutantur, nos et mutamur in ilis; Quo modo? fit semper tempore pejor homo."

(Lib. I. ad Edordum Noël, epig. 58.)

This first line is altered from an epigram by Matthew Bonborius, one of a series of mottoes for various emperors, this one being for Louis I.

"Omnia mutantur, nos et mutamur in ilis: Ila vices quasdam rest habet, illa vices."

There are editions of the Epigrammatas by Elsevir and by Didot; the best is that edited by Renouard (2 vols., Paris, 1795). Translations into English, either in whole or in part, were made by Vickers (1619); by Peck, in his Parastisi Puerteriam (1669); and by Harvey, in his Parastisi Puerteriam (1687). The first English epigrammatist, owed much to Owen, and translated his works into Spanish in 1674. French translations of the best of Owen's epigrams were published by A. L. Lebrun (1709) and by Kérivalent (1819).

OWEN, JOHN (1616–1683), English Nonconformist divine, was born at Statham in Oxfordshire in 1616, and was educated at Queen's College, Oxford (B.A. 1632, M.A. 1635), noted, as Fuller tells us, for its metaphysicians. A Puritan by training and conviction, in 1637 Owen was driven from Oxford by Bishop's statutes, and became chaplain and tutor in the family of Sir Robert Dormer and then in that of Lord Lovelace. At the outbreak of the civil troubles he sided with the parliament, and thus lost both the place and the prospects of succeeding to his Welsh royalist uncle's fortune. For a while he lived in Charterhouse Yard, in great unsettlement of mind on religious questions, which was removed at length by a sermon preached by a stranger in Aldermanbury Chapel whither he had gone to hear Edmund Calamy. His first publication, The Display of Arminianism (1649), was a spirited defence of rigid Calvinism. It was dedicated to the committee of religion, and gained him the living of Fordham in Essex, from which a "scandalous minister" had been removed. When he published his Second Discourse of his parish and writing only The Duty of Pastors and People Distinguished until 1646, when, the old incumbent dying, the presentation lapsed to the patron, who gave it to some one else. He was now, however, coming into notice, for on the 20th of April he preached before the Long parliament. In this sermon, and still more in his Country Essay for the Practice of Church Government, which he appended to it, his tendency to break away from Presbyterianism to the more tolerant Independent or Congregational system is plainly seen. Like Milton he saw little to choose between "new presbyter" and "old priest," and disliked a rigid and arbitrary polity by whatever name it was called. He became pastor at Coggeshall in Essex, where a large independent church was then established. La Fargue, the French atmosphere. His adoption of Congregational principles did not affect his theological position, and in 1647 he again attacked the Arminians in The Death of Death in the Death of Christ, which drew him into long debate with Richard Baxter. He made the friendship of Fairfax while the latter was besieging Colchester, and urgently addressed the army there against religious persecution. He was chosen to preach to parliament on the day after the execution of Charles, and succeeded in fulfilling his delicate task without directly mentioning that event. Another sermon preached on the 19th of April, a vigorous plea for sincerity of religion in high places, won not only the thanks of parliament but the friendship of Cromwell, who carried him off to Ireland as his chaplain, that he might regulate the affairs of Trinity College. He pleaded with the House of Commons for the religious interest of Ireland as some years earlier he had pleaded for those of Wales. In 1650 he accompanied Cromwell on his Scottish campaign. In March 1651 Cromwell, as chancellor of Oxford, gave him the deanship of Christ Church, and made him vice-chancellor in September 1652; in both offices he succeeded the Presbyterian Edward Reynolds.

During his eight years of official Oxford life Owen showed himself a firm disciplinarian, and infused a new spirit of thoroughness into dons and undergraduates alike, though, as John Locke testifies, the Aristotelian traditions in education suffered no change. With Philip Nye he unmasked the popular astrologer, William Lilly, and in spite of his share in condemning two Quakers to be whipped for disturbing the peace, his rule was not intolerant. 1 Anglican services were conducted here and there, and at Christ Church itself the Anglican chaplain remained in the college. While little encouragement was given to a spirit of free inquiry, 2 it is unhistorical to say that Puritanism at Oxford was simply "an attempt to force education and culture into the leaden moulds of Calvinistic theology. It must be remembered, too, that Owen, unlike many of his contemporaries, found his chief interest in the New Testament rather than the Old. During his Oxford years he wrote Justitia Divina (1653), an exposition of the dogma that God cannot forgive sin without an atonement; Coniunction with God (1657), which has been called "a piece of wire-drawn mysticism"; Doctrine of the Saints' Perseverance (1654), his final attack on Arminianism; Vindecacae Evangelicae, a treatise written by order of the Council of State against Socinianism as expounded by John Biddle; On the Mortification of Sin in Believers (1658), an introspective and analytic work; Schism (1657), one of the most readable of all his writings; Of Temptation (1658), an attempt to recall Puritanism to its cardinal spiritual attitude from the springing anarchy of sectarianism and the pharisaism which had followed on popularity and threatened to destroy the early simplicity.

Besides all his academic and literary concerns Owen was continually in the midst of affairs of state. In 1651, on October 24 (after Worcester), he preached the thanksgiving sermon before parliament. In 1652 he sat on a council to consider the condition of Protestantism in Ireland. In October 1653 he was one of several ministers whom Cromwell summoned to a consultation as to church union. 3 In December the degree of D.D. was conferred upon him by his university. In the parliament of 1654 he sat, but only for a short time, as member for Oxford university, and, with Baxter, was placed on the committee for settling the "fundamentals" necessary for the toleration of Independents in the Instrument of Government. In the same year he was chairman of a committee on Scottish Church affairs. He was, too, one of the Triers, and appears to have behaved with kindness and moderation in that capacity. As vice-chancellor he acted with readiness and spirit when a Royalist rising in Wiltshire broke out in 1655; his adherence to Cromwell, however, was by no means slavish, for he drew up, at the request of Desborough and Pride, a petition against his receiving the kingship. Thus, when Richard Cromwell succeeded his father as chancellor, Owen lost his vice-chancellorship. In 1658 he took a leading part in the conference of Independents which drew up the Savoy Declaration.

On the death of Cromwell Owen joined the Wallingford House party, and though he denied any share in the deposition of Richard Cromwell, he threw all his weight on the side of a simple republic as against a protectorate. He assisted in the restoration of the Rump parliament, and, when Monk began his march into England, Owen, in the name of the Independent churches, to whom Monk was supposed to belong, and who were keenly anxious as to his intentions, wrote to dissuade him from the enterprise.

In March 1660, the Presbyterian party being uppermost, Owen was further deprived of his deanship, which was given back to Reynolds. He retired to Statham, where he wrote various controversial and theological works, in especial the laborious Theologumena Panteologica, a history of the rise and progress of theology, the version in which many of the contents held his intellectual temperament. He thus incurred the impenitent enemy of other Nonconformists. In 1661 was published the celebrated Fiat Lux, a work by the Franciscan monk John 1 H. L. Thompson, Christ Church ("Oxford College Histories") pp. 79 seq.

Owen made a very unhappy attack on Brian Walton's Polybiot Biblia: 2

2Probably drew up the scheme for a national church surrounded by bodies of tolerated dissent which was presented to parliament. See D. Masson, Milton, iv. 390, 566.
Vincent Cane, in which the oneness and beauty of Roman Catholicism are contrasted with the confusion and multiplicity of Protestant sects. At Clarendon's request Owen answered this in 1662 in his Animadversions; and so great was its success that he was offered preferment if he would conform. Owen's condition for making terms was liberty to all who agree in doctrine with the Church of England; nothing therefore came of the negotiation.

In 1663 he was invited by the Congregational churches in Boston, New England, to become their minister, but declined. The Conventicle and Five Mile Acts drove him to London; and in 1666, after the Fire, he, like other leading Nonconformists, was forbidden to preach on his own property. He was seized and thrown into prison, and a congregation, composed chiefly of the old Commonwealth officers. Meanwhile he was incessantly writing; and in 1667 he published his Catechism, which led to a proposal, "more acute than diplomatic," from Baxter for union. Various papers passed, and after a year the attempt was closed by the following laconic note from Owen: "I am still a well-wisher to these mathematics." It was now, too, that he published the first part of his vast work upon the Epistle to the Hebrews, together with his exposition of Psalm 130 and his searching book on Indwelling Sin.

In 1669 Owen wrote a spirited remonstrance to the Congregationalists in New England, who, under the influence of Presbyterianism, had shown themselves peculiarly eager to take advantage of the opportunities given by the Conventicle and Five Mile Acts. He was feted in the same cause. In 1670 Samuel Parker's Ecclesiastical Polity attacked the Nonconformists in a style of clumsy intolerance. Owen answered him (Truth and Insoucian Vindicated); Parker replied with personalities as to Owen's connexion with Wallingford House. Then Andrew Marvell with banter and satire finally disposed of Parker in The Rehearsal Transposed. Owen himself produced a tract On the Trinity (1669), and Christian Love and Peace (1672).

At the revival of the Conventicle Acts in 1679, Owen was appointed to draw up a paper of reasons which was submitted to the House of Lords in protest. In this or the following year Harvard College invited him to become its president; he received similar invitations from some of the Dutch universities.

When Charles issued his Declaration of Indulgence in 1672, Owen drew up an address of thanks. This indulgence gave the dissenters an opportunity for increasing their churches and services, and Owen was one of the first preachers at the weekly lectures which the Independents and Presbyterians jointly held at Princes' Hall in Broad Street. He was held in high respect by a large number of the nobility (one of the many things which point to the fact that Congregationalism was by no means the creed of the poor and insignificant), and during 1674 both Charles and James held prolonged conversations with him in which they assured him of their good wishes to the dissenters. Charles gave him 1000 guineas to relieve those upon whom the severe laws had chiefly pressed, and he was even able to procure the release of John Bunyan, whose preaching he ardently admired. In 1674 Owen was attacked by William Sherlock, dean of St Paul's, whom he easily vanquished, and from this time until 1680 he was engaged upon his ministry and the writing of religious works. The chief of these were On Apostasy (1675), a sad account of religion under the Restoration; On the Holy Spirit (1675-1678) and The Doctrine of Justification (1677).

In 1680, however, Stillington having on May 11 preached his sermon on "The Mischief of Separation," Owen defended the Nonconformists from the charge of schism in his Brief Vindication. Baxter and Howe also answered Stillington, who replied in The Unreasonableness of Separation. Owen again answered this, and then left the controversy to a swarm of eager combatants. From this time to his death he was occupied with continual writing, disturbed only by suffering from stone and asthma, and by an absurd charge of being concerned in the Rye House Plot.

XX. 153

of August 1683, just twenty-one years after he had gone out with so many others on St Bartholomew's day in 1662, and was buried on the 4th of September in Bunhill Fields.

For engraved portraits of Owen see first edition of S. Palmer's Nonconformists' Memorial and Virtue's Sermons and Tracts (1721). The chief authorities for the life are Owen's Works; W. Orme's Life of Owen; H. A. Wood's Almenon Owen; J. S. Toulmin Smith's Life; D. Neal's History of the Puritans; T. Edwards' Gargantua; and the various histories of the Independents. See also The Golden Book of John Owen, a collection of extracts prefixed by a study of his life and age, by James Moffatt (London, 1904).

OWEN, SIR RICHARD (1804-1892), English biologist, was born at Lancaster on the 20th of July 1804, and received his early education at the grammar school of that town. In 1820 he was apprenticed to a local surgeon and apothecary, and in 1824 he proceeded as a medical student to the University of Edinburgh. He left the university in the following year, and completed his medical course in St Bartholomew's Hospital, London, where he came under the influence of the eminent surgeon, John Abernethy. He then contemplated the usual professional career; but his bent was evidently in the direction of anatomical research, and he was induced by Abernethy to accept the position of assistant to William Clift, conservator of the museum of the Royal College of Surgeons. This congenial occupation soon led him to abandon his intention of medical practice, and his life henceforth was devoted to purely scientific work, and the formation of a series of catalogues of the Hunterian collection in the Royal College of Surgeons; and in the course of this work he acquired the unrivalled knowledge of comparative anatomy which enabled him to enrich all departments of the science, and specially facilitated his researches on the remains of extinct animals. In 1836 he was appointed Hunterian professor in the Royal College of Surgeons, and in 1849 he succeeded Clift as conservator. He held the latter office until 1856, when he became superintendent of the natural history department of the British Museum. He then devoted much of his energies to a great scheme for a Natural Museum of Natural History, which eventually resulted in the removal of the natural history collections of the British Museum to a new building at South Kensington, the British Museum (Natural History). He retained office until the completion of this work in 1884, when he received the distinction of K.C.B., and thenceforward lived quietly in retirement at Sheen Lodge, Richmond Park, until his death on the 18th of December 1892.

While occupied with the cataloguing of the Hunterian collection, Owen did not confine his attention to the preparations before him, but also seized every opportunity of dissecting fresh subjects. He was especially favoured with the privilege of investigating the animals which died in the Zoological Society's gardens; and when that society began to publish scientific proceedings in 1831, he was the most voluminous contributor of anatomical papers. His first notable publication, however, was his Memoir on the Pearly Nautilus (London, 1832), which was soon recognized as a classic. Henceforth he continued to make important contributions to every department of comparative anatomy and zoology for a period of over fifty years. In the sponges Owen was the first to describe the now well-known "Venus's flower basket" or Evpidicella (1841, 1857). Among Entozoa his most noteworthy discovery was that of Trichina spiralis (1835), the parasite infesting the muscles of man in the disease now termed trichinosis (see also, however, the article on Paget, Sir James). Of Brachiopoda he made very special studies, which much advanced knowledge and settled the classification which has long been adopted. Among Mollusca, he not only described the pearly nautilus, but also Spirula (1859) and other Cephalopoda. He also discussed the universally-accepted subdivision of this class into the two orders of Dibranchiata and Tetrabranchiata (1832). The problematical Arthropod Limulus was also the subject of a special memoir by him in 1873.

Owen's technical descriptions of the Vertebrata were still more numerous and extensive than those of the invertebrate
animals. His Comparative Anatomy and Physiology of Vertebrates (3 vols., London, 1866-1868) was indeed the result of more practical research than any similar work since Cuvier's Leçons d'anatomie comparée. He not only studied existing forms, but also devoted great attention to the remains of extinct groups, and immediately followed Cuvier as a pioneer in vertebrate paleontology. Early in his career he made exhaustive studies of teeth, both of existing and extinct animals, and published his profusely illustrated work on Odontography (1840-1843). He discovered and described the remarkably complex structure of the teeth of the extinct animals which he named Labyrinthodonts. Among his writings on fishes, his memoir on the African mud-fish, which he named Protosilurus, laid the foundations for the recognition of the Dipnoi by Johannes Müller. He also pointed out later the serial connexion between the teleostean and ganoid fishes, and gave the earliest account of the Dipnoi. Most of his work on reptiles related to the skeletons of extinct forms, and his chief memoirs on British specimens were reprinted in a connected series in his History of British Fossil Reptiles (4 vols., London, 1840-1884). He published the first important general account of the great group of Mesozoic land-reptiles, to which he gave the now familiar name of Dinosauria. He also first recognized the curious early Mesozoic land-reptiles, with affinities both to amphibians and mammals, which he termed Anomodontia. Most of these were obtained from South Africa, beginning in 1835 (Dicyodon), and eventually furnished materials for his Catalogue of the Fossil Reptilia of South Africa, issued by the British Museum in 1876. Among his writings on birds, his classical memoir on the Aepyornis (1836-1837) first described, and gave the first account of the giant flightless bird of New Zealand, other memoirs on Aepyornis, Notornis, the dodo, and the great auk, may be specially mentioned. His monograph on Archaeopteryx (1863), the long-tailed, toothed bird from the Bavarian lithographic stone, is also an epoch-making work. With regard to living mammals, the more striking of Owen's contributions relate to the monotremes, marsupials, and the anthropoid apes. He was also the first to recognize and name the two natural groups of typical Ungulata, the odd-toed (Perissodactyla) and the even-toed (Artiodactyla), while describing some fossil remains in 1838. Most of his writings on mammals, however, deal with extinct forms, to which his attention seems to have been first directed by the remarkable fossils collected by Darwin in South America, Toxodon, from the pampas, while described, furnishes clear evidence of an extinct generalized hoof animal, a “pachyderm with affinities to the Rodentia, Edentata, and Herbivorous Cetacea.” Owen's interest in South American extinct mammals then led to the recognition of the giant armadillo, which he named Glyptodon (1839), and to classic memoirs on the giant ground-sloths, Mylodon (1842) and Megatherium (1846), besides other important contributions. At the same time Sir Thomas Mitchell's discovery of fossil bones in New South Wales provided material for the first of Owen's long series of papers on the extinct mammals of Australia, which were eventually reprinted in book-form in 1877. He discovered Diprotodon and Thylosaurus, besides extinct kangaroos and wombats of gigantic size. While occupied with so much material from abroad, Owen was also engaged for an exhaustive work on similar fossils from the British Isles, and in 1844-1846 he published his History of British Fossil Mammals and Birds, which was followed by many later memoirs, notably his Monograph of the Fossil Mammalia of the Mesoazoic Formations (Palaeont. Soc., 1871). One of his latest publications was a little work entitled Antiquity of Man as deduced from the Discovery of a Human Skeleton during Excavations of the Docks at Tilbury (London, 1884). Owen's detailed memoirs and descriptions require laborious attention in reading, on account of their nomenclature and ambiguous modes of expression; and the circumstance that very little of his terminology has found universal favour causes them to be more generally neglected than they otherwise would be. At the same time it must be remembered that he was a pioneer in concise anatomical nomenclature; and, so far at least as the vertebrate skeleton is concerned, his terms were based on a carefully reasoned philosophical scheme, which first clearly distinguished between the use of broad terms, such as the names of “analogy” and “homology,” Owen's theory of the Archetype and Homologies of the Vertebrate Skeleton (1848), subsequently illustrated also by his little work On the Nature of Limbs (1849), regarded the vertebrate frame as consisting of a series of fundamentally identical segments, each modified according to its position and functions. Much of it was fanciful, and failed when tested by the facts of embryology, which Owen systematically ignored throughout his work. However, though an imperfect and distorted view of certain great truths, it possessed a distinct value at the time of its conception. To the discussion of the deeper problems of biological philosophy he made scarcely any direct and definite contributions. His generalities rarely extended beyond the fact of comparative anatomy, the[...]

Robert Owen (1771-1858), English social reformer, was born at Newtown, Montgomeryshire, in North Wales, on the 14th of May 1771. His father had a small business in Newtown as saddler and ironmonger, and there young Owen received all his school education, which terminated at the age of nine. After serving in a draper’s shop for some years he settled in Manchester. His success was very rapid. When only nineteen years of age he became manager of a cotton mill in which five hundred people were employed, and by his administrative intelligence and energy soon made it one of the best establishments of the kind in Great Britain. In this factory Owen used the first large-scale American sea-island cotton ever imported into the country; it was the first sea-island cotton from the Southern States. Owen made remarkable improvement in the quality of the cotton spun; and indeed there is no reason to doubt that at this early age he was the first cotton-spinner in England, a position entirely due to his own capacity and knowledge of the trade. In 1794 or 1795 he became manager and one of the partners of the Chorlton Twist Company at Manchester. During a visit to Glasgow he had fallen in love with the daughter of the proprietor of the New Lanark mills, David Dale. Owen induced his partners to purchase New Lanark; and after his marriage with Miss Dale he settled there, as manager and part-owner of the mills (1816). Eventually he became one of the largest owners of cotton factories in Manchester, he had already formed the intention of conducting New Lanark on higher principles than the current commercial ones.

The factory of New Lanark had been started in 1784 by Dale and Arkwright, the water-power afforded by the falls of the Clyde being the great attraction. Connected with the mills were about two thousand people, five hundred of whom were children, brought: most of them, at the age of five or six from the poorhouses and charities of Edinburgh and Glasgow. The children especially had been well treated by Dale, but the general condition of the people was very unsatisfactory. Many of them were the lowest of the population, the respectable country people refusing to live among the vices of the factories; theft, drunkenness, and other vices were common; education and sanitation were alike neglected; most families...
lived only in one room. It was this population, thus committed to his care, which Owen now set himself to elevate and ameliorate. He greatly improved their houses, and by the unsparing and benevolent exertion of his personal influence trained them to habits of order, cleanliness and thrift. He opened a store, where the people could buy goods of the soundest quality at little more than cost price; and the sale of drink was placed under the strictest supervision. His greatest success, however, was in the education of the young—by which he devoted his utmost attention. He was the founder of infant schools in Great Britain; and, though he was anticipated by reformers on the continent of Europe, he seems to have been led to institute them by his own views of what education ought to be, and without hint from abroad. In all these plans Owen obtained the most gratifying success. Though at first regarded with suspicion as a stranger, he soon won the confidence of his people. The mills continued to be a great commercial success, but it is needless to say that some of Owen's schemes involved considerable expense, which was displeasing to his partners. Tired at last of the restrictions imposed on him by men who wished to conduct the business on the ordinary principles, Owen formed a new firm, who, content with 5% of return for their capital, were ready to give free scope to his ideas. In this form for manufacture, the industrial system of Robert Owen and the well-known Quaker, William Allen, were partners. In the same year Owen first appeared as an author of essays, in which he expounded the principles on which his system of educational philanthropy was based. From an early age he had lost all belief in the prevailing forms of religion, and had thought out a creed for himself, which he considered an entirely new and original discovery. The chief points in this philosophy were that man's character is made not by him but for him; that it has been formed by circumstances over which he had no control; that he is not a proper subject either of praise or blame;—these principles leading up to the practical conclusion that the great secret in the right formation of man's character is to place him under the proper influences—physical, moral and social—from his earliest years. These principles—of the responsibility of man and of the effect of early influences—are the keynotes of Owen's whole system of education and social amelioration. As we have said, they are embodied in his first work, *A New View of Society, or Essays on the Principle of the Formation of the Human Character*, the first of these essays (there are four in all) being published in 1813. It is needless to say that Owen's new views theoretically belong to a very old system of philosophy, and that his originality is to be found only in his benevolent application of them. For the next few years Owen's work at New Lanark continued to have a national and even a European significance. His schemes for the education of his workpeople attained something like completion on the opening of the institution at New Lanark in 1810. He was a zealous supporter of the factory legislation resulting in the act of 1819, which, however, greatly disappointed him. He had interviews and communications with the leading members of government, including the premier, Lord Liverpool, and with many of the rulers and leading statesmen of Europe. New Lanark itself became a much-frequented place of pilgrimage for social reformers, statesmen, and royal personages, including Nicholas, afterwards emperor of Russia. According to the unanimous testimony of all who visited it, the results achieved by Owen were singularly good. The manners of the children, brought up under his system, were beautifully graceful, genial and uncostrained; health, plenty, and contentment prevailed; drunkenness was almost unknown, and illegitimacy was extremely rare. The most perfect good feeling subsisted between Owen and his workpeople, and all the operations of the mill proceeded with the utmost smoothness and regularity; and the business was a great commercial success.

Hitherto Owen's work had been that of a philanthropist, whose great distinction was the originality and unceasing unselfishness of his methods. His first departure in socialism took place in 1817, and was embodied in a report communicated to the committee of the House of Commons on the poor law. The general misery and stagnation of trade consequent on the termination of the great war was engrossing the attention of the country. After clearly tracing the special causes connected with the war which had led to such a deplorable state of things, Owen pointed out that the permanent cause of distress was to be found in the competition of human labour with machinery, and that the only effective remedy was the united action of men, and the subordination of machinery. His proposals for the treatment of pauperism were based on these principles. He recommended that communities of about twelve hundred persons each should be settled on quantities of land from 1000 to 1500 acres, all living in one large building in the form of a square, with public kitchen and mess-rooms. Each family should have its own private apartments, and the entire care of the children till the age of three, after which they should be brought up by the community, their parents having access to them at meals and all other proper times. These communities might be established by individuals, by parishes, by counties, or by the state; in every case there should be effective supervision by duly qualified persons. Work, and the enjoyment of its results, should be in common. The size of his community was doubt partly suggested by his village of New Lanark; and he soon proceeded to advocate such a scheme for the United States, and for the western part of France. In its fully developed form—and it cannot be said to have changed much during Owen's lifetime—it was as follows. He considered an association of from 500 to 3000 as the fit number for a good working community. While mainly agricultural, it should possess all the best machinery, should offer every variety of employment, and should, as far as possible, be self-contained. "As these towns," as he also called them, "should increase in number, unions of them federatively united shall be formed in circles of tens, hundreds and thousands," till they should embrace the whole world in a common interest.

His plans for the cure of pauperism were received with great favour. *The Times* and the *Morning Post* and many of the leading men of the country counseled them; one of his most steadfast friends was the solicitor-general of the U.S.A., Mr. Clay. He had indeed gained the ear of the country, and had the prospect before him of a great career as a social reformer, when he went out of his way at a large meeting in London to declare his hostility to all the received forms of religion. After this defiance to the religious sentiment of the country, Owen's theories were in the popular mind associated with infidelity, and were hereforeward suspected and discredited. Owen's own confidence, however, remained unshaken; and he was anxious that his scheme for establishing a community should be tested. At last, in 1825, such an experiment was attempted under the direction of his disciple, Abram Combe, at Orbiston near Glasgow; and in the next year Owen himself commenced another at New Harmony (q.v.), Indiana, U.S.A. After a trial of about two years, both failed completely. Neither of them was a pauper experiment; but it must be said that the members were of the most motley description, many worthy people of the highest aims being mixed with vagrants, adventurers, and crotchety, wrong-headed enthusiasts. After a long period of friction with William Allen and some of his other partners, Owen resigned all connexion with New Lanark in 1828. On his return from America he made London the centre of his activity. Most of his means having been sunk in the New Harmony experiment, he was no longer a flourishing capitalist, but the head of a vigorous propaganda, in which socialism and secularism were combined. One of the most interesting features of the movement at this period was the establishment in 1832 of an equitable labour exchange system, in which exchange was effected by means of labour notes. The usual means of exchange and the usual middlemen being alike superseded. The word "socialism" first became current in the discussions of the Association of all Classes of all Nations, formed by Owen in 1835. During these years also his secularistic teaching gained such influence among the working classes as to give occasion for the statement in the *Westminster Review* (1839) that his principles were the actual creed of a great portion of them. His views on marriage, which were certainly lax, gave
just ground for offence. At this period some more communicative experiments were made, of which the most important were that at Ralabine, in the county of Clare, Ireland, and that at Tytherly in Hampshire. It is admitted that the former (1831) was a remarkable success for three and a half years, till the proprietor, having ruined himself by gambling, was obliged to sell out. Tytherly, begun in 1839, was an absolute failure. By 1826 the only permanent result of Owen's agitation, so zealously carried on by public meetings, pamphlets, periodicals, and occasional treatises, was the co-operative movement, and for the time even that seemed to have utterly collapsed. In his later years Owen became a firm believer in spiritualism. He died at his native town on the 17th of November 1858. Robert Dale, William, David Dale and Richard, all of whom became citizens of the United States, ROBERT DALE OWEN, the eldest (1801-1877), was for long an able exponent in his adopted country of his father's doctrines. In 1836-39 and 1841-52 he was a member of the Indiana House of Representatives and in 1843-47 was a Representative in Congress, where he drafted the bill for the founding of the Smithsonian Institution. He was elected a member of the Indiana Constitutional Convention in 1850, and was instrumental in securing to widows and married women control of their property, and the adoption of a common free school system. He later succeeded in passing a state law giving greater freedom in divorce. From 1853 to 1858 he was United States minister at Naples. He was a strong believer in spiritualism and was the author of two well-known books on the subject: Footfalls on the Boundary of Another World (1859) and The Debatable Land Between this World and the Next (1872). Owen's third son, DAVID DALE OWEN (1807-1869), was in 1839 appointed United States geologist, and made extensive surveys of the north-west, which were published by order of Congress. The youngest son, RICHARD OWEN (1810-1890), was a professor of natural science in Nashville University.

Of R. Owen's numerous works in exposition of his system, the most important are the New View of Society; the Report communicated to the Committee on the Poor Law; the Book of the New Moral World; and Resolution in the Mind and Practice of the Human Race. See Life of Robert Owen written by himself (London, 1857), and Threading my Way, Twenty-seven Years of Autobiography, by Robert Dale Owen (London, 1874). There are also Lives of Owen by A. J. Booth (London, 1860), W. L. Sargent (London, 1860), Lloyd Jones (London, 1889), F. A. Packard (Philadelphia, 1866) and F. Podmore (London, 1906). See also H. Simon, Robert Owen: sein Leben und seine Bedeutung für die Gegenwart (Jena, 1908); E. Dolleins, Robert Owen (Paris, 1905); C. J. Holyoake, History of Co-operation in England (London, 1906); and the article COMMUNISM.

OWENS, JOHN (1790-1850), English merchant, was born at Manchester in 1790, the son of a prosperous merchant. Early in life he became a partner in his father's business and was soon noted for his ability as a cotton buyer. His business prospered, and the firm traded with China, India, South America and the United States, dealing in many other commodities. His sudden fortune he suggested leaving to his friend and partner George Faulkner (1790-1860), already a rich man. But by the latter's advice he bequeathed it to trustees for the foundation of a college (Owens College, Manchester, opened 1851, now part of Victoria University), based upon his own ideas of education. He died in Manchester on the 20th of July 1846. His bequests to friends and charities amounted to some £55,000, while for the college he left £96,654. Among the conditions for its foundation the most important was that which disannounced any sort of religious test for students or teachers.

OWENSBORO, a city and the county-seat of Daviess county, Kentucky, U.S.A., on the Ohio river, 112 m. by rail W.S.W. of Louisville. Pop. (1890) 9,875; (1900) 13,060; of whom 3604 were negroes; (1910 census) 16,011. The city is served by the Illinois Central, the Louisville & Nashville, and the Louisville, Henderson & St. Louis railways, and by steamboat lines to river ports. At Owensboro are the Owensboro College for women (nonsect.), opened in 1898, Saint Francis Academy, and a Roman Catholic school for boys. Two miles S. of the city is Hickman Park (20 acres), a pleasure resort, and E. of the city is a summer Chautauqua park. Owensboro is situated in a good agricultural region; coal, iron, building stone, clay, oil, lead and zinc abound in the vicinity; and the city has a notably large trade in tobacco (especially strip tobacco) and has various manufactures. The value of the city's factory products increased from $1,740,128 in 1900 to $4,187,700 in 1905, or 140-6%. The municipality owns and operates its electric-lighting plant and water-works. Owensboro was settled about 1785, and for several years was commonly known as Yellow Banks; in 1816 it was laid out as a town and named Rosborough, and two years later the present name was adopted in honour of Colonel Abraham Owen (1794-1820), a Virginian who removed to Kentucky in 1785, served in several Indian campaigns, and was killed in the battle of Tippecanoe. Owensboro was incorporated as a city in 1856.

OWEN SOUND, a town and port of entry in Ontario, Canada, and capital of Grey county, situated 90 m. N.W. of Toronto, on Georgian Bay. Pop. (1901) 8776. It is the terminus of branches of the Canadian Pacific and Grand Trunk railways, and of the Canadian Pacific and other steamship lines plying to ports on Lakes Huron and Superior. Its harbour is one of the best on Lake Huron, and navigable by lake vessels of the largest size. It is a flourishing town, containing shipbuilding yards, and manufactories of mill machinery, agricultural implements, furniture and sewing-machines, flour-mills, saw-mills and large grain elevators.

OWENA (O. Eng. Ute, Swed. Ugel, Ger. Eule—all allied to Lat. Uloa, and evidently of imitative origin), the general English name for every nocturnal bird of prey, of which group nearly two hundred species have been recognized. The owls form a very natural assemblage, and one about the limits of which no doubt has for a long while existed. They were formerly placed with the Accipitres or diurnal birds of prey, but are now known to belong to a different group of birds, and are placed as a suborder Strigiformes of Coracidiform birds, their nearest allies being the goatsuckers. The subdivision of the group has always been a fruitful matter of discussion, owing to the great resemblance obtaining among all its members, and the existence of safe characters for its division has only lately been at all generally recognized. By the older naturalists, it is true, owls were divided, as was first done by F. Willughby, into two sections—one in which all the species exhibit tufts of feathers on the head, the so-called "ears" or "horas," and the second in which the head is not tufted. The artificial and therefore untrustworthy nature of this distinction was shown by Isidore Geoffroy St-Hilaire (Ann. Sc. Naturels, xxi. 104-203) in 1830. The later work of C. L. Nitzch on pterylography and of A. Milne-Edwards on osteology has led to a division of the family Strigidae into the sub-families Striginae, in which the unnotched sternum has its broad keel joined to the furcula, and Butontinae, in which the sternum is notched posteriorly, the clavicles do not always meet to form a furcula, nor meet the sternum. The Striginae contain the screech- or barn-owls (Strix) and the partly intermediate H côtidius of Madagascar, whilst all the other genera are now placed with the Butontinae.

Among owls are found birds which vary in length from 5 in. —as Glauconis cobanensis, which is therefore much smaller than a Skylark—to more than 2 ft., a size that is attained by many species. Their plumage, none of the feathers of which possesses an athershaft, is of the softest kind, rendering their flight almost noiseless. But one of the most characteristic features of this whole group is the rufi, consisting of several rows of small and much curved feathers with stiff shafis—originating from a fold of the skin, which begins on each side of the base of the beak, runs above the eyes, and passing downwards round behind the ears turns forward, and ends at the chin, and serving to support the longer feathers of the "disk," or space immediately around the eyes, which extend over it. A considerable number of species of owls, belonging to various genera, and natives of countries most widely separated, are remarkable for exhibiting two phases of coloration—one in which the prevalent browns have a more or less rusty-red tinge, and the other in which they incline to grey. Another characteristic of
owls is the reversible property of their outer toes, which are when perching quite backwards. Many forms have the legs and toes thickly clothed to the very claws; others have the toes, and even the tarsi, bare, or only sparsely beset by bristles. Among the bare-legged owls those of the Indian *Ketupa* are conspicuous, and this feature is usually correlated with their fish-catching habits; but certainly other owls that are not known to catch fish present much the same character.

Among the multitude of owls there is only room here to make further mention of a few of the more interesting. First must be noticed the tawny owl—the *Strix striata* of Linnaeus, the type, as has been above said, of the whole group, and especially of the Stigrine section as here understood. This is the *Surnia aluco* of some authors, the *chat-kaunt* of the French, the species whose tremulous hooting "tu-whit, to-who," has been celebrated by Shakespeare, and, as well as the plaintive call, "keewick," of the young after leaving the nest, will be familiar sounds to many readers, for the bird is very generally distributed throughout most parts of Europe, extending its range through Asia Minor to Palestine, and also to Barbary—but not belonging to the Ethiopian Region or to the eastern half of the Palaearctic. It is the largest of the species indigenous to Britain, and is strictly a woodland bird, only occasionally choosing any other place for its nest than a hollow tree. Its food consists almost entirely of small mammals, chiefly rodents; but, though on this account most deserving of protection from all classes, it is subject to the stupid persecution of the ignorant, and is rapidly declining in numbers.

Its nearest allies in North America are the *S. nebula* and *S. agricola* (the former is illustrated in Fig. 1), with much mottled plumage, and a several of forms, one of which, the *S. occidentalis* of California and Arizona, is figured above; but none of them seem to have the "merry note" that is uttered by the European species.

Common to the most northerly forest-tracts of both continents (for, though a slight difference of coloration is observable among the American examples and those from the Old World, it is impossible to consider it specific) is the much larger *S. cinerea* or *S. lapponica*, whose iron-grey plumage, delicately mottled with dark brown, and the concentric circles of its facial disk make it one of the most remarkable of the group. Then may be noticed the genus *Bubo*—containing several species

All owls have the habit of casting up the indigestible parts of the food swallowed in the form of pellets, which may often be found in abundance under the owl-roost, and reveal without any manner of doubt what the prey of the birds has been. The result in nearly every case shows the enormous service they render in destroying rats and mice. Details of many observations to this effect are recorded in the *Bericht über die XV. Versammlung der Deutschen Ornithologen-Gesellschaft* (pp. 30-34).

This species bears confinement very well, and propagates freely the virginus,

397

The Nearctic and Palaearctic forms are sufficiently distinct—the latter, *B. igneus*; the *duc* or *grand duc* of the French, ranging over the whole of Europe and Asia north of the Himalayas, while the former, *B. virginianus*, extends over the whole of North America. A contrast to the generally sombre colour of these birds is shown by the snowy owl, *Nyctea scandiaca*, a circumpolar species, and the only one of its genus, which disdains the shelter of forests and braves the most rigorous arctic climate, though compelled to migrate southward in winter when no sustenance is left for it. Its large size and white plumage, more or less mottled with black, distinguish this from every other owl. Then may be mentioned the birds commonly known in English as "horned" owls—the *hibous* of the French, belonging to the genus *Asio*. One, *A. otus* (the *Otus vulgaris* of some authors), inhabits woods, and, distinguished by its long tufts, usually borne erected, would seem to be common to both America and Europe—though experts profess their ability to distinguish between examples from each country. Another species, *A. accipitrinus* (the *Otus brachyotus* of many authors), has much shorter tufts on its head, and they are frequently carried depressed so as to escape observation. This is the "woodcock-owl" of English sportsmen, for, though a good many are bred in Great Britain, the majority arrive in autumn from Scandinavia, just about the time that the immigration of woodcocks occurs. This species frequents heaths, moors and the open country generally, to the exclusion of woods, and has an enormous geographical range, including not only all Europe, North Africa and northern Asia, but the whole of America—reaching also to the Falklands, the Galapagos and the Sandwich Islands—for the attempt to separate specifically examples from those localities only shows that they possess more or less well-defined local races. Commonly placed near *Asio*, but whether really akin to it cannot be stated, is the genus *Scops*, of which nearly forty species, coming from different parts of the world, have been described; but this number should probably be reduced by one half. The type of the genus *S. gis*, the *petit duc* of the French, is a well-known bird in the south of Europe, about as big as a thrush, with very delicately pencilled plumage, occasionally visiting Britain, emigrating in autumn across the Mediterranean, and ranging very far to the eastward.

Farther southward, both in Asia and Africa, it is represented by other species of very similar size, and in the eastern part of North America by *S. asiatic* of which there is a tolerably distinct western form, *S. kennicotti*, besides several local races. *S. asiatic* is one of the owls that especially exhibits the dimorphism of coloration above mentioned, and it was long before the true sexual difference was discovered. At first the two forms were thought to be distinct, and therefore some authors believed that the ruddy birds were the young of the greyer form which was called *S. naesia*; but now the "red owl" and the "mottled owl" of the older American ornithologists are known to be one species. One of the most remarkable of American owls is *Sootyto cunicularia*, the bird that in the northern part of the continent inhabits the burrows of the prairie dog, and in the southern those of the biscaha, where the latter occurs—making holes for itself, says Darwin, where that is not the case—rattle-snares being often also joint tenants of the same abodes. The odd association of these animals, interesting as it is, cannot here be more than noticed, for a few words must be said, ere we leave the owls of this section, on the species which has associations somber yet most important to the bird of Pallas Thesane, the emblem of the city to which science and art were so well welcome. There can be no doubt, from the many representations on coins and sculptures, as to their subject being the *Carine noctua* of modern ornithologists, but those who know the grotesque actions and ludicrous expression of this venerable buffoon of birds can never

---

1. This species bears confinement very well, and propagates freely the virginus. To it belong the historic owls of Arundel Castle.

2. See the remarks of Mr Ridgway in the work before quoted (B. N. America, iii, 9, 10), where also response is made to the observations of Mr Allen in the Harvard Bulletin (ii, 338, 339).
cease to wonder at its having been seriously selected as the symbol of learning, and can hardly divest themselves of a suspicion that the choice must have been made in the spirit of sarcasm. This little owl (for that is its only name—though it is not even the smallest that appears in England), the chevêche of the French, is spread throughout the greater part of Europe, but it is not a native of Britain. It has a congener in C. brama, a bird well known to all residents in India.

Finally, we have owls of the second section, those allied to the screech-owl, Strix flammea, the Effraie¹ of the French. This, with its discordant scream, its unusual and its hissing, is far too well known to need description, for it is one of the most widely-spread of birds, and is the owl that has the greatest geographical range, inhabiting almost every country in the world. It is found in Sweden and Norway, America north of lat. 45°, and New Zealand being the principal exceptions. It varies, however, not incomparably, both in size and intensity of colour, and several ornithologists have tried to found on these variations more than half-a-dozen distinct species. Some, if not most of them, seem, however, hardly worthy to be considered geographical races, for their differences do not always depend on locality. R. Bowdler Sharpe, with much labour and in great detail, has given his reasons (Cat. B. Brit. Museum, ii. 291-309; and Ornith. Miscellany, i. 269-298; ii. 1-27) for acknowledging four "subspecies" of S. flammea, as well as five other species. Of these last, S. tenebricosa is peculiar to Australia, while S. novaeholllandiae inhabits also New Guinea, and has a "subspecies," S. castanops, found only in Tasmania; a third, S. candida, has a wide range from Fiji and northern Australia through the Philippines and Formosa to China, Burmah and India; a fourth, S. capensis, is peculiar to South Africa; while S. thomensis is said to be confined to the African island of St Thomas. To these may perhaps have to be added a species from New Britain, described by Count Salvadori as Strix awantia, but it may possibly prove on further investigation not to be a strigine owl at all. (A. N.)

OWLING, in English law, the offence of transporting wool or sheep out of the kingdom, to the detriment of the staple manufacture of wool. The name is said to owe its origin to the fact that the offence was usually carried on at night-time, when the owls were abroad. The offence was stringently regulated by a statute of Edward III. (1336-7), while many subsequent statutes also dealt with it. In 1566 the offence was made punishable by the cutting off of the left hand and nailing it in a public place. By a statute of 1660 the ship and cargo were to be forfeited. In the reign of George I. (1717-1721) the penalty was altered to transportation for seven years. The offence was abolished in 1824.

OWSOSSO, a city of Shiawassee county, Michigan, U.S.A., on Shiawassee river, about 79 m. N.W. of Detroit and 28 m. N.E. of Lansing. Pop. (1900) 8696, of whom 1396 were foreign-born: (1906 estimate) 9360. It is served by the Michigan Central, the Grand Trunk, and the Ann Arbor railways, and is a division point of the last. It is situated in the coal area of Michigan, and has various manufactures, including beet-sugar, for which Owosso is an important centre. The value of the city's factory products increased from $2,055,052 in 1900 to $3,109,232 in 1905, or 51.3%. The municipality owns and operates its water-works. Owosso was settled about 1834 and chartered as a city in 1859.

Ox, strictly speaking, the Saxon name for the males of domesticated cattle (Bos taurus), but in a zoological sense employed so as to include not only the extinct wild ox of Europe but likewise bovine animals of every description, that is to say true oxen, bison and buffaloes. The characteristics of the sub-family Bovinae, the typical section of the family Bovidae, are given in the article Bovidae (q.v.); for the systematic position of that family see Pecora.

In the typical ox, as represented by the existing domesticated breeds (see CATTLE) and the extinct aurochs (q.v.), the horns are cylindrical and placed on an elevated crest at the very vertex of the skull, which has the frontal region of great length. The aurochs was a black animal, with a lighter dorsal streak, and horns directed upwards in the shape of a pitchfork, black at their tips, but otherwise whitish. The fighting bulls of Spain, the black Pembroke cattle of Wales, with their derivatives the white park-cattle of Chillingham in Northumberland, are undoubtedly the direct descendants of the aurochs. The black Kerry breed and the blue or brown Scotch cattle are more or less nearly related; and a similar kinship is claimed for the Siemetal cattle of Switzerland, although their colour is white and fawn. Short-horns are a modern derivative from cattle of the same general type. Among other British breeds may be mentioned the Devons and Herefords, both characterized by their red colour; the long-horned and Sussex breeds, both with very large horns, showing a tendency to grow downwards; and the ayrshire. Polled, or hornless, breeds, such as the polled Angus and polled Suffolk, are of interest, as showing how easily the horns can be eliminated, and thus indicating a hornless ancestry. The white cattle formerly kept at Chartley Park, Staffordshire, exhibit signs of affinity with the long-horn breed. The Channel Island cattle, which are either black or fawn, would seem to be nearly allied to the Spanish fighting breed, and thus to the aurochs. The great white or cream coloured cattle of Italy, Austria, Hungary and Poland, which have very long black-tipped horns, are also probably not far removed from the aurochs stock.

On the other hand, the great tawny draught cattle of Spain seem to indicate mixture with a different stock, the horns having a double curvature, quite different from the simple one of the aurochs type. There are reports as to these cattle having been formerly crossed with the humped eastern species; and their characteristics are all in favour of such an origin. Humped cattle are widely spread over Africa, Madagascar and India, and form a distinct species, Bos indicus, characterized by the presence of a fleshy hump on the shoulders, the convexity (instead of concavity) of the first part of the curve of the horns, the very large size of the dewlap, and the general presence of white rings round the fetlocks, and light circles surrounding the eyes. The voice and habits of these cattle are also markedly different from those of European cattle. Whether humped cattle are of Indian or African origin cannot be determined, and the species is known only in the domesticated condition. The largest horns are found in the Gallia cattle, in which they attain enormous dimensions. In Europe the name zebu is generally applied to the Indian breed, although no such designation is known in India itself.

A third type is apparently indicated by the ancient Egyptian cattle, which were not humped, and for which the name Bos asyphalus has been suggested. The cattle of Ankole, on the Uganda frontier, which have immense horns, conform to this type.

A second group of the genus Bos is represented by the Indomalay cattle included in the sub-genus Bibos (see Bantik, Gaor and Gaival); they are characterized by the more or less marked flattening of the horns, the presence of a well-marked ridge on the anterior half of the back, and the white legs.

Fig. 2.—Strix flammea.
more distinct are the bison, forming the sub-genus BISON, represented by the European and the American species (see Bison), the forehead of the skull being much shorter and narrower, and the horns not arising from a crest on the extreme vertex, while the number of ribs is different (14 pairs in bison, 13 in yak). Very close to this group, if indeed really separable, is the Tibetan yak (g.v.), forming by itself the sub-genus Psephoglos.

The most widely different from the true oxen are, however, the buffaloes (see Buffalo), which have consequently the most claim to generic distinction. From all other Bosinae they differ by the triangular section of their horns. They are divisible into two groups, an African and an Asiatic, both of which are generally included in the sub-genus, or genus, Bubalis, although the latter are sometimes separated as Buffalae. The smallest member of the group is the anoa (g.v.) of Celebes.

As regards the origin of the ox-tribe we are still in the dark. The structure of their molar teeth affords them to the antelopes of the Oryx and Hippotragus groups; but the early bison lack horns in the female, whereas both sexes of these antelopes are horned.

Remains of the wild ox or aurochs are abundant in the superficial deposits of Europe, Western Asia, and Northern Africa; those from the brick-earths of the Thames valley indicating animals of a measure about the same as the modern European bison. It is a huge bison, generally regarded as specifically distinct from the living European animal and termed Bos (Bison) priscus. In the Pleistocene of India occurs a large ox (Bos namadicus), possibly allied to the aurochs, and in the same formation are found remains of a bufalo, allied to, but distinct from the living Indian species. Large oxen also occur in the Lower Pliocene of India, although not closely allied to the living kinds; while in the same formation are found remains of bos (or ? yak) and to the same formation is also referred a large oxen, the last of the females in the females. In other respects they appear to come nearest to the bison. Remains of extinct bison, some of gigantic size, occur in the superficial formations of North America as far south as Texas. See R. Lydekker, Wild Oxen, Sheep and Goats (London, 1898).

**Oxalic Acid**, H₂C₂O₄·2H₂O, one of the oldest known organic acids. Schedde prepared it by oxidizing sugar with nitric acid, and showed it to be identical with the ascorbic acid obtained from wood-sorrel. It is found in the form of its acid potassium salt in many plants, especially in wood-sorrel (Oxalis acetosella) and in varieties of Rumex; as ammonium salt in guano; as the calcium salt in the wall-plaster of barns; as the sodium salt in species of Sedum and as a white calcium salt in varieties of Verbena. It is also present in urine and in urinary calculi. It is formed in the oxidation of many organic compounds (e.g. sugar, starch and cellulose) by nitric acid, and also by the fusion of many oxygen-holding compounds with caustic alkalis, this latter method being employed for the manufacture of oxalic acid. In this process cellulose (in the form of sawdust) is made into a paste with a mixture of strong caustic potash and soda solution and heated in iron pots from 200-250°C. The somewhat dark-coloured mass is lixiviated with a small amount of warm water in order to remove excess of alkali, the residual alkaline oxalates converted into insoluble calcium oxalate by boiling with milk of lime, the lime salt separated, and decomposed by dilute sulfuric acid. It is obtained by the action of sulfur dioxide and carbonic acid upon wood. The oxalate from soft woods is the best material for use in this process. It may be obtained synthetically by heating sodium in a current of carbon dioxide to 30°C; or by the oxidation of ethylene glycol; by heating sodium formate to 400°C (V. Merz and W. Weith, Ber., 1882, 15, p. 1513), and by the spontaneous hydrolysis of an aqueous solution of cyanogen gas.

The hydrated acid crystallizes in prisms which effloresce in air, and are readily soluble in water. It loses its water of crystallization at 100°C, and begins to sublime at about 150-160°C, whilst on heating to a still higher temperature it partially decomposes into carbon dioxide and formic acid, or into carbon dioxide, carbon monoxide and water; the latter decomposition being also brought about by heating oxalic acid with concentrated sulfuric acid. The anhydrous acid melts at 180-5°C. (E. Bamberger, Ber., 1888, 21, p. 9901) and is frequently used as a condensing agent. Phosphorus pentoxide, for example, decomposes into oxalic monoxide and dioxide, the reaction being the one generally applied for the purpose of preparing phosphorus oxychloride. When heated with glycerin to 106°C, it yields formic acid and carbon dioxide; above this temperature, allyl alcohol is formed. Nascent hydrogen reduces it to glycolic acid. Potassium permanganate in acid solution oxidizes it to carbon dioxide and water; the manganese salt has a catalytic accelerating effect on the decomposition.

Oxalic acid is very poisonous, and by reason of its great similarity in appearance to Epsom salts, it has been very frequently mistaken for this substance with, in many cases, fatal results. The antitoxides for oxalic acid poisoning are milk of lime, chalk, whiting, or even wall-plaster, followed by evacuation, brought about by an enema or calomel. Only the salts of the alkali metals are soluble in water. Beside the ordinary acid and neutral salts, a series of salts called quadraxalates is known, these being salts containing one molecule of acid salt, in combination with one molecule of acid, one of the most common being "salt of sorrel," K₂H₂C₂O₄·2H₂O. The oxalates are readily decomposed on heating, leaving a residue of carbonate, or oxide of the metal. The silver salt decomposes with explosive violence, leaving a residue of the metal.

Potassium ferrous oxalate, FeK₂(C₂O₄)₂·H₂O, is a strong reducing agent and is used as a photographic developer. Potassium ferric oxalate, FeK₂(C₂O₄)₃, decomposes to oxides on heating owing to the fact that its solution is rapidly decomposed by sunlight, 2FeK₂(C₂O₄)₃ = 2FeK₂(C₂O₄)₂ + K₂CO₃ + 2CO₂. Ethyl oxalate, (COOH₂C₂O₄)₂, prepared by boiling anhydrous ethanoic acid with the ferric oxalate, is a white powder which melts at 186°C.

An impure oxalic acid, a liquid boiling at 70°C, has been obtained by the action of phosphorus pentachloride on oxalic acid. Oxamic acid, HO₂C-CONH₂, is obtained by heating ammonium oxalate with phosphorus pentoxide at 180°C. Oxamic acid is used in the extraction of blood from bones by acids and by alkalis.

**Oxalate**, [C₂O₄]²⁻, is regarded by the fact that its solution is rapidly decomposed by sunlight, 2FeK₂(C₂O₄)₃ = 2FeK₂(C₂O₄)₂ + K₂CO₃ + 2CO₂. Ethyl oxalate, (COOH₂C₂O₄)₂, prepared by boiling anhydrous ethanoic acid with the ferric oxalate, is a white powder which melts at 186°C.

An impure oxalic acid, a liquid boiling at 70°C, has been obtained by the action of phosphorus pentachloride on oxalic acid. Oxamic acid, HO₂C-CONH₂, is obtained by heating ammonium oxalate with phosphorus pentoxide at 180°C. Oxamic acid is used in the extraction of blood from bones by acids and by alkalis.

**Oxalis**, in botany, a large genus of small herbaceous plants, comprising, with a few small allied genera, the natural order Oxalidaceae. The name is derived from Gr. åëvés, acid, the plants being acid from presence of acid calcium oxalate. It contains about 220 species, chiefly South African and tropical and South American. It is represented in Britain by the wood-sorrel, a small stemless plant with radical trefoil-like leaves growing from a creeping scaly rootstock, and the flowers borne singly on an axillary stalk; the flowers are regular with five sepals, five obovate, white, purple-veined, free petals, ten stamens and a central five-lobed, five-celled ovary with five
OXAZOLES—OXENBRIDGE

free styles. The fruit is a capsule, splitting by valves; the seeds have a fleshy coat, which curls back elastically, ejecting the true seed. The leaves, as in the other species of the genus, show a "sleep-movement," becoming pendulous at night.

Oxalis crenata, Oca of the South Americans, is a tuberous-rooted half-hardy perennial, native of Peru. Its tubers are comparatively small, and somewhat acid; but if they be exposed in the sun from six to ten days they become sweet and flowery. In Chile and England they can only be grown by starting them in heat in March, and planting out in June in a light soil and warm situation. They grow freely enough, but few tubers are formed, and these of small size. The fleshy stalks, which have the acid flavor of the family, may, however, be used in the same way as rhubarb for tarts. The leaves may be eaten in salads. It is easily propagated by cuttings of the stems or by means of sets like the potato.

Oxalis Depepi or O. tetraphylla, a bulbous perennial, native of Mexico, has scaly bulbs, from which are produced fleshy, tapering, white, semi-transparent roots, about 4 in. in length and 3 to 4 in. in diameter. They strike down into the soil, which should therefore be made light and rich with abundance of decayed vegetable matter. The bulbs should be planted about the end of April, 6 in. apart, in rows 1 ft. farther, being only just covered with soil and having a situation with a southern aspect. The roots should be dug up before they become affected by frost, but if protected they will continue to increase in size till November. When taken up the bulbs should be stored in a cool dry place for replanting and the roots for use. The roots are gently boiled with salt and water, the tender kinds of O. aurea, purple; O. Bovei, crimson; O. emerus, white or pale rose; O. floribunda, rose; O. lasiandra, pink; O. latifolia, creamy yellow; O. variabilis, purple, white, red, and O. rubra, violet.

OXAZOLES, a group of organic compounds containing a ring complex (shown below) composed of three carbon atoms, and one oxygen and one nitrogen atom; they are isomeric with the isoxazoles (q.v.). They are obtained by condensing a halogen derivatives of ketones with acid-amides (M. Levy, Ber. 1887, 20, p. 2576; 1888, 21, p. 2195).

\[
\begin{align*}
R-C & \xrightleftharpoons{\text{OH}+\text{Br} \cdot \text{CH}} \text{OH}+\text{Br} \cdot \text{CH} \rightarrow R-C \xrightleftharpoons{\text{N}} \text{N} \cdot \text{C} \cdot \text{N} \\
\text{by the action of concentrated sulphuric acid on nitrites and benzoin (F. Japp, Jour. Chem. Soc. 1803, 63, p. 460); and by} \\
\text{passing hydrochloric acid gas into a mixture of aromatic aldehydes} \\
\text{and their cyanoanthanes (E. Fischer, Ber. 1896, 29, p. 205).} \\
\end{align*}
\]

They are weak bases, and the ring system is readily split by evaporation with hydrochloric acid, or by the action of reducing and oxidizing agents.

The dihydro-oxazoles or oxazolines are similarly formed when \(b\)-halogen alkyl amides are condensed with aldehydes or ketones (Ber. 1889, 22, p. 2220), or by the action of alkaline on the compounds formed by the interaction of ethylene chlorohydrin on nitrites. They are strong bases characterized by a quinoline-like smell. The amino-oxazolines are known as alkylcyanogenes and are formed by the action of potassium cyanate on the hydrobromides of the bromo-derivatives of the oxazoles (q.v.). They are strong bases. Tetracyan-oxazolines result from the action of aldehydes on amino-alcohols (L. Knorr, Ber. 1901, 34, p. 3384). The above types of compounds may be represented by the following formulæ:

\[
\begin{align*}
N &= CH \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot CH_2 \\
N &= NH \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot CH_2 \\
\text{oxazole} &= \text{oxazoline} \\
\text{o} &= \text{amine-o} \\
\text{oxazolines} &= \text{oxazolines.}
\end{align*}
\]

The benzoxazoles are formed when ortho-aminophenols are condensed with organic acids (A. Ladenburg, Ber. 1876, 9, p. 1524; 1877, 10, p. 1115), or by heating aldehydes and ortho-aminophenols at high temperature (G. L. Berthelot and A. Vauquelin, C. R. 1821, 131, p. 251). They are mostly crystalline solids which distil unchanged. When warmed with acids they split into their components. They behave as weak bases. By the condensation of ortho-aminophenols with phenoxy or thiophenox, ox and thio-derivatives are obtained, the (OH) and (SH) groups being situated in the \(\mu\) position, and these compounds on treatment with amines yield amino derivatives.

OXE, PEDER (1520–1575), Danish Finance Minister, was born in 1520. At the age of twelve he was sent abroad to complete his education, and resided at the principal universities of Germany, Holland, France, Italy and Switzerland for seventeen years. On his return he found both his parents dead, and was appointed the guardian of his eleven young brothers and sisters, in which capacity, promising by the spoliation of the church, he accumulated immense riches. His extraordinary financial abilities and pronounced political capacity soon found ample scope in public life. In 1552 he was raised to the dignity of Rigsråd (councillor of state); in 1554 he successfully accomplished his first diplomatic mission, by adjusting the differences between the elector of Saxony and the margrave of Brandenburg. The same year he held the post of governor of Copenhagen and shared with Byrge Trolle the control of the treasury. A few years later he incurred the royal disfavour for gross malversation in the administration of public property, and failing to compromise matters with the king, fled to Germany and engaged in political intrigues with the adventurer Wilhelm von Grumbach (1502–1567) for the purpose of dethroning Frederick II. In favour of Christina of Lorraine, the daughter of Christian II. But the financial difficulties of Frederick II. during the stress of the Scandinavian Seven Years' War compelled him, in 1566, to recall the great financier, when his confiscated estates were restored, and he was made his posthumous heir to the office and dignities. A change for the better immediately ensued. The finances were speedily put on an excellent footing, means were provided for carrying on the war to a successful issue (one of the chief expediens being the raising of the Sound tolls) and on the conclusion of peace Oxe, as lord treasurer, not only reduced the national debt considerably, but redeemed a large portion of the alienated crown-lands. He reformed the coinage, developed trade and commerce and introduced numerous agricultural reforms, especially on his own estates, which he was never weary of enlarging, so that on his death he was the wealthiest landowner in Denmark. Oxe died on the 24th of October 1575, after contributing more than any other statesman of his day, to raise Denmark for a brief period to the rank of a great power. See P. Oxe’s leve og levnet (Copenhagen, 1675); Danmarks riges historie, vol. 3 (Copenhagen, 1897–1905).

OXENBRIDGE, JOHN (1608–1674), English Nonconformist divine, was born at Daventry, Northamptonshire, on the 30th of January 1608, and was educated at Emmanuel College, Cambridge, and Magdalen Hall, Oxford (B.A. 1628, M.A. 1631). As tutor of Magdalen Hall he drew up a new code of articles referring to the government of the college. He was deprived of his office in May 1634, and began to preach, with a similar disregard for constituted authority. After his voyages to the Bermudas he returned to England (1641), and after exercising an itinerant and unattached ministry settled for some months in Great Yarmouth and then at Beverley. He was minister at Berwick-on-Tweed when in October 1652 he was appointed a fellow of Eton College. There in 1658 he preached the funeral
sermon of Francis Rous, the provost, and thence in 1660 he was elected. He returned to his preaching at Birkbeck-on-Tweed, but was expelled by the Act of Uniformity in 1662, and after spending some time in the West Indies settled (1670) at Boston, Massachusetts, where he was ordained minister of the First Church. He died on the 28th of December 1674. A few sermons are all that he published. His first wife (d. 1658) was "a scholar beyond what was usual in her sex," and Andrew Marvell, who was their friend, wrote an epitaph for her tomb at Eton which was defaced at the Restoration; his second wife (d. 1699) was Frances Woodward, daughter of the famous vicar of Bray; his third was a widow whom he met at Barbados.

OXENFORD, JOHN (1812-1877), English dramatist, was born at Camberwell on the 12th of August 1812. He began his literary career by writing on finance. He was an excellent linguist, and the author of many translations from the German, notably of Goethe's Dichtung und Wahrheit (1845) and Eckermann's Conversations of Goethe (1850). He did much by his writing to spread the fame of Schopenhauer in England. His first play was My Fellow Clerk, produced at the Lyceum in 1835. This was followed by a long series of pieces, the most famous of which was perhaps the Porter's Knot (1858) and Twice Killed (1853). About 1850 he became dramatic critic of The Times. He died in Southwark on the 21st of February 1877.

Many references to his pieces will be found in The Life and Reminiscences of E. L. Blanchard (ed. C. Scott and C. Howard, 1891).

OXENHAM, HENRY NUTCOMBE (1820-1888), English ecclesiologist, son of a master at Harrow, was born there on the 15th of November 1829. From Harrow he went to Balliol College, Oxford. He took Anglican orders in 1854, but became a Roman Catholic in 1857. At first his thoughts turned towards the priesthood, and he spent some time at the London Oratory and at St Edmund's College, Ware, but being unable to surrender his belief in the validity of Anglican orders, he proceeded to no further than minor orders in the Roman Church. In 1863 he made a prolonged visit to Germany, where he studied the language and literature, and formed a close friendship with Döllinger, whose First Age of the Christian Church he translated in 1866. Oxenham was a regular contributor to the Saturday Review. A selection of his essays was published in Short Studies in Ecclesiastical History and Biography (1884), and Short Studies, Ethical and Religious (1885). He also translated in 1876 the 2nd vol. of Bishop Hefele's History of the Councils of the Church, and published several pamphlets on the reunion of Christendom. His Catholic Doctrine of the Atonement (1869) and Catholic Eclogues (1876) are his chief works. Oxenham died at Kenington on the 23rd of March 1888.

See J. Gillow's Bibliographical Dictionary of English Catholic, vol. v. An interesting obituary notice on Oxenham was written by W. St. John Okeley of Manchester, for the Manchester Guardian, and published in pamphlet form (Manchester, 1888).

OXENSTJERNA, an ancient Swedish senatorial family, the origin of which can be traced up to the middle of the 14th century, which had vast estates in Södermanland and Uppland, and began to adopt its armorial designation of Oxenstjerna ("Ox forehead") as a personal name towards the end of the 16th century. Its most notable members were the following.

1. COUNT AXEL GUSTAFSSON (1583-1654), chancellor of Sweden, was born at Pöno in Uppland, and was educated with his brothers at the universities of Rostock, Jena and Wittenberg. On returning home in 1603 he was appointed kammerjunker to King Charles IX. In 1606 he was entrusted with his first diplomatic mission, to Mecklenburg, was appointed a senator during his absence, and henceforth became one of the king's most trusted servants. In 1610 he was sent to Copenhagen to prevent a war with Denmark, but was unsuccessful. This embassy is important as being the beginning of Oxenstjerna's long diplomatic struggle with Sweden's traditional rival in the north, whose fate was to influence his whole life. Throughout his life Oxenstjerna was a member of Gustavus Adolphus's council of regency. High aristocrat as he was, he would at first willingly have limited the royal power. An oligarchy guiding a limited monarch was ever his ideal government, but the genius of the young king was not to be fettered, so Oxenstjerna was content to be the colleague instead of the master of his sovereign. On the 6th of January 1612 he was appointed chancellor. His controlling, organizing hand was speedily felt in every branch of the administration. For his services as first Swedish plenipotentiary at the peace of Knäred, 1613, he was richly rewarded. During the frequent absences of Gustavus in Livonia and Finland (1614-1616) Oxenstjerna acted as his vice-regent, when he displayed manifold abilities and an all-embracing activity. In 1620 he headed the brilliant embassage despatched to Berlin to arrange the nuptial contract between Gustavus and Mary Eleonora of Brandenburg. It was his principal duty during the king's Riga expedition to prepare everything necessary, including men and money. By this time he had become so indispensable that Gustavus, in 1622, bade him accompany him to Livonia, where Oxenstjerna was appointed governor-general and commandant of Riga. His services in Livonia were rewarded with four castles and the whole bishopric of Wend. He was entrusted with the peace negotiations which led to the truce with Poland in 1623, and succeeded, by skillful diplomacy, in averting a threatened rupture with Denmark in 1624. On the 7th of October 1626 he was appointed governor-general of the newly-acquired province of Prussia. In 1629 he concluded the very advantageous truce of Altmark with Poland. Previously to this (September 1628) he arranged with Denmark a joint military operation of the Imperial and Swiss forces from falling into the hands of the Imperialists. After the battle of Breitenfeld (September 7th, 1631) he was summoned to assist the king with his councils and co-operation in Germany. During the king's absence in Franconia and Bavaria in 1632 he was appointed legates in the Rhine lands, with plenipotentiary authority over all the German generals and princes in the Swedish service. Although he never fought a battle, he was a born strategist, and frustrated all the efforts of the Spanish troops by his wise regulations. His military capacity was strikingly demonstrated by the skill with which he conducted large reinforcements to Gustavus through the heart of Germany in the summer of 1632. But it was only after the death of the king at Lützen that Oxenstjerna's true greatness came to light. He inspired the despairing Protestants both in Germany and Sweden with fresh hopes. He reorganized the government both at home and abroad. He united the estates of the four upper circles into a fresh league against the common foe (1634), in spite of the envious and foolish opposition of Saxony. By the patent of the 12th of January 1633 he had already been appointed legate plenipotentiary of Sweden in Germany with absolute control over all the territory already won by the Swedish arms. No Swedish subject, either before or after, ever held such an unrestricted and far-reaching authority. Yet he was more than equal to the extraordinary difficulties of the situation. To him both warriors and statesmen appealed invariably as their natural and infallible arbiter. Richelon himself declared that the Swedes owed to the "immeasurable source of well-matured counsels." Less original but more sagacious than the king, he had a firmer grasp of the realities of the situation. Gustavus would not only have aggrandized Sweden, he would have transformed the German empire. Oxenstjerna wisely abandoned these vaulting ambitions. His country's welfare was his sole object. All his efforts were directed towards procuring for the Swedish crown adequate compensation for its sacrifices. Simple to austerity in his own tastes, he nevertheless recognized the political necessity of impressing his allies and confederates by an almost regal show of dignity; and at the abortive congress of Frankfort-on-Main (March 1634), held for the purpose of uniting all the German Protestants under the Swedish flag, Oxenstjerna appeared in a carriage drawn by six horses with German princes in the same condition. But from first to last his policy suffered from the slenderness of Sweden's material resources, a cardinal defect which all his art and tact could not altogether conceal from the vigilance of her enemies. The success of his system
postulated an uninterrupted series of triumphs, whereas a single reverse was likely to be fatal to it. Thus the frightful disaster of Nördlingen (September 6th, 1634; see Sweden: History) brought him, for an instant, to the verge of ruin, and compelled him, for the first time, so far to depart from his policy of independence as to solicit direct assistance from France. But, well aware that Richelieu needed the Swedish armies as much as he himself needed money, he refused at the conference of Compiègne (1635) to bind his hands in the future for the sake of some slight present relief. In 1636, however, he concluded a fresh subsidy-treaty with France at Wismar. The same year he returned to Sweden and took his seat in the Regency. His presence at home overawed all opposition, and such was the general confidence inspired by his superior wisdom that for the next nine years his voice, especially as regarded foreign affairs, was omnipotent in the council of state. He drew up beforehand the plan of the Danish War of 1643-1645, so brilliantly executed by Lennart Torstensson, and had the satisfaction of severely crippling Denmark by the peace of Brömsebro (1645). His later years were emblazoned by the jealousy of the young Queen Christina, who thwarted the old statesman in every direction. He always attributed the exiguity of Sweden's gains by the peace of Osnabrück to Christina's undue interference. Oxenstjerna was opposed at first to the abdication of Christina, because he feared mischief to Sweden from the unruly and adventurous disposition of her appointed successor, Charles Gustavus. The extraordinary consideration shown to him by the new king ultimately, however, reconciled him to the change. He died at Stockholm on the 28th of August 1654.

See Axel Oxenstjernas skrifter och brefverk (Stockholm, 1888 etc.); Axel, de Manu, Oxenstjerna och Richelieu à Compiègne (Paris, 1878).

2. Count Johan Axelsson (1611-1657), son of the foregoing, completed his studies at Upsala in 1631, and was sent by his father on a grand tour through France, the Netherlands and Great Britain. He served under Count Gustavus Horn in the Thirty Years' War from 1632, and was subsequently employed by his father in various diplomatic missions, though his instructions were always so precise and minute that he was little more than the executor of the chancellor's wishes. He was one of the commissioners who signed the truce of 1635 with Poland, and in 1639, much against his father's will, was made a senator. Along with Salvius he represented Sweden at the great peace congress of Osnabrück, but as he received his instructions direct from his father, whereas Salvius was in the queen's confidence, the two "legates" were constantly at variance. From 1650 to 1652 he was governor-general of Pomerania. Charles X. made him earl marshal.

3. Gabriel Gustafsson (1587-1646), brother of (1), was from 1612 to 1618 the chief adviser of Duke John, son of King John III., and Gustavus Adolphus's competitor for the Swedish throne. After the duke's death he became, virtually, the locum-teneunt of the chancellor (with whom he was always on the most intimate terms) during Axel's frequent absences from Sweden. He was also employed successfully on numerous diplomatic missions. He was most usually the intermediary between his brother and the riksdag and senate. In 1634 he was created lord high steward. His special department, "Svea Hofret," the supreme court of justice, was ever a model of efficiency, and he frequently acted as chancellor and lord high treasurer as well.

See Gabriel Gustafssons bref till Riks Konvok Axel Oxenstjerna, 1611-1640 (Stockholm, 1890).

4. Count Bengt or Benedict Gabrielsson (1623-1702), was the son of Axel Oxenstjerna's half-brother, Gabriel Bengtsson (1586-1656). After a careful education and a long residence abroad, he began his diplomatic career at the great peace congress of Osnabrück. During his stay in Germany he made the acquaintance of the count palatine, Charles Gustavus, afterwards Charles X., whose confidence he completely won. Two years after the king's accession (1643), Oxenstjerna was sent to represent Sweden at the Kreisag of Lower Saxony. In 1655 he accompanied Charles to Poland and was made governor of the conquered provinces of Kulm, Kujavia, Masovia and Great Poland. The firmness and humanity which he displayed in this new capacity won the affectionate gratitude of the inhabitants, and induced the German portion of them, notably the city of Thorn, to side with the Swedes against the Poles. During Charles's absence in Denmark (1657), Oxenstjerna, in the interim appointed Riksdag's chancellor, took the reins of power for ten months, and the terms of capitulation ultimately obtained by him were so advantageous that they were made the basis of the subsequent peace negotiations at Oliva, between Poland and Sweden, when Oxenstjerna was one of the chief plenipotentiaries of the Swedish regency. During the domination of Magnus de la Gardie he played but a subordinate part in affairs. From 1662 to 1666 he was governor-general of Livonia. In 1674 he was sent to Vienna to try and prevent the threatened outbreak of war between France and the empire. The connections which he formed and the sympathies which he won here had a considerable influence on his future career, and resulted in his appointment as one of the Swedish envoys to the congress of Nijmegen (1676). His appointment was generally regarded as an approximation on the part of Sweden to Austria and Holland. During the congress he laboured assiduously in an anti-French direction; a well-justified distrust of France was, indeed, henceforth the keynote of his policy, a policy diametrically opposed to Sweden's former system. In 1680 Charles XI. entrusted him absolutely with the conduct of foreign affairs, on the sole condition that peace was to be preserved, an office which he held for the next seventeen years to the very great advantage of Sweden. His leading political principles were friendship with the maritime powers (Great Britain and Holland) and the emperor, and a close anti-Danish alliance with the house of Holstein. Charles XI. appointed Oxenstjerna one of the regents during the minority of Charles XII. The Paternal proclivities of the new king filled the prudent old chancellor with alarm and anxiety. His protests were frequent and energetic, and he advised Charles in vain to accept the terms of peace offered by the first anti-Swedish coalition. Oxenstjerna has been described as "a shrewd and subtle little man, of gentle disposition, but remarkable for his firmness and tenacity of character."

See F. F. Carlson, Sveriges historia under Koningarne af Pflaizkhuset (Stockholm, 1883, 1888); O. Sjögren, Karl den eldte och Svenska folket (Stockholm, 1897); and Negotiations of the Count d'Avaux pendant les années 1663, 1697-1698 (Utrecht, 1882, &c.).

(R. N. B.)

OXFORD, EARLS OF, an English title held successively by the families of Vere and Harley. The three most important earls of the Vere line (see Vere) are noticed separately below. The Vere held the earldom from 1142 until March 1703, when it became extinct on the death of Aubrey de Vere, the 26th earl. In 1711 the English statesman Robert Harley (see below) was created earl of Oxford; but the title became extinct in this family on the death of the 6th earl in 1853.

OXFORD, EDWARD DE VERE, 17th Earl, of (1550-1664), son of John de Vere, the 16th earl, was born on the 12th of April 1550. He matriculated at Queen's College, Cambridge, but he removed later to St John's College, and was known as Lord Bolebec or Bulbeck until he succeeded in 1562 to the earldom and to the hereditary dignity of great chamberlain of England. As one of the royal wards the boy came under the care of Lord Burghley, at whose house in London he lived under the tutorship of his maternal uncle, Arthur Golding, the translator of Ovid. His violent temper and erratic doings were a constant source of anxiety to Burghley, who nevertheless in 1571 gave him his eldest daughter, Anne, in marriage. Oxford more than once asked for a military or a naval command, but Burghley hoped that his good looks together with his skill in dancing and in feats of arms would win for him a high position at court. His accomplishments did indeed secure Elizabeth's favour, but he offended her by going to Flanders without her consent in 1574, and more seriously in 1582 by a duel with one of her gentlemen, Thomas Knyvet. Among his other escapades was a futile

1 Fe. in the Vere line.
plot to rescue from the Tower Thomas Howard, 4th duke of Norfolk, with whom he was distantly connected. In 1579 he
tested Sir Philip Sidney by calling him a "puppy on the tennis court at Whitehall." Sidney accordingly challenged
Oxford, but the queen forbade him to fight, and required him to
apologize on the ground of the difference of rank between
the disputants. On Sidney's refusal and consequent disgrace
Oxford is said to have schemed to murder him. The earl sat
on the special commission (1586) appointed for the trial of Mary
queen of Scots; in 1589 he was one of the peers who tried
Philip Howard, earl of Arundel, for high treason; and in 1601
he took part in the trial of Essex and Southampton. It has
been suggested that Oxford was the Italianized Englishman
ridiculed by Gabriel Harvey in his Speculum Tascanum. On
his return from a journey to Italy in 1575 he brought back various
inventions for the toilet, and his estate was rapidly dissipated
in satisfying his extravagant whims. His first wife died in 1588,
and from that time Burghley withdrew his support. Oxford
being reduced to the necessity of seeking help among the poor
men of letters whom he had at one time or another befriended.
He was himself a lyric poet of no small merit. His fortunes
were partially retrieved on his second marriage with Elizabeth
Trentham, by whom he had a son, Henry de Vere, 18th earl of
Oxford (1593-1625). He died at Newington, near London, on
the 24th of June 1604.

His poems, scattered in various anthologies—the Paradise of
Dainty Devices (1572); The Phoenix Nest, England's Helicon;—and elsewhere, were collected by Dr A. B. Grosart in
vol. iv. of the Fuller Worthies Library (1876).

OXFORD, JOHN DE VERE, 13TH EARL OF (1443-1513), was
second son of John, the 12th earl, a prominent Lancastrian,
who, together with his eldest son Aubrey de Vere, was executed
in February 1462. John de Vere the younger was himself
attained, but two years later was restored as 13th earl. But
his loyalty was suspected, and for a short time at the end of 1468
he was in the Tower. He sided with Warwick, the king-maker,
in the political movements of 1469, accompanied him in his
exile next year, and assisted in the Lancastrian restoration of
1470-1471. As constable he tried John Tipoft, earl of Worcester,
who had perjured his father nine years before. At
the battle of Barnet, Oxford was victorious in command of the
Lancastrian right, but his men got out of hand, and before
they could be rallied Warwick was defeated. Oxford escaped
to France. In 1473 he organized a Lancastrian expedition,
which, after an attempted landing in Essex, sailed west and
seized St Michael's Mount in Cornwall. It was only after a
four months' siege that Oxford was forced to surrender in
February 1474. He was sent to Hames near Calais, whence,
ten years later, in August 1484, he escaped and joined Henry
Tudor in Brittany. He fought for Henry in his command at
Busoworth, and was rewarded by restoration to his title, estates
and hereditary office of Lord Chamberlain. At Stoke on the
16th of June 1486 he led the van of the royal army. In 1492
he was in command in the expedition to Flanders, and in 1497
was foremost in the defeat of the Cornish rebels on Blackheath.
Bacon (Hist. of Henry VII. p. 192, ed. Lumby) has preserved
a story that when in the summer of 1498 Oxford entertained the
king at Castle Hedingham, he assembled a great number of his
retainers in livery; Henry thanked the earl for his reception,
but fined him 15,000 marks for the breach of the laws. Oxford
was high steward at the trial of the earl of Warwick, and one of
the commissioners for the trial of Sir James Tyrell and others
in May 1502. Partly through ill-health he took little part after-
wards in public affairs, and died on the 10th of March 1513. He
was twice married, but left no children.

Oxford is frequently mentioned in the Paston Letters, which
include twenty written by him, mostly to Sir John Paston the
younger. See The Paston Letters, ed. J. Gairdner: Chronicles of
London, ed. C. L. Kingsford (1905); Sir James Ramsay, Lancaster
and York; and The Political History of England, vols. iv. and
v. (C. L. K.) (1906).

OXFORD, ROBERT HARLEY, 1ST EARL OF (1661-1724),
English statesman, commonly known by his surname of Harley,
elsest son of Sir Edward Harley (1624-1700), a prominent land-
owner in Herefordshire, and grandson of the celebrated letter-
writer Lady Brilliana Harley (c. 1600-1643), was born in Bow
Street, Covent Garden, London, on the 5th of December 1661.
His school days were passed at Shilton, near Burford, in Oxford-
shire, in a small school which produced at the same time a lord
high treasurer (Harley), a lord high chancellor (Simon Harcourt)
and a lord chief justice of the common pleas (Thomas Trevor).
The principles of Whiggism and Nonconformity were instilled
into his mind at an early age, and if he changed the politics of his
ancestors he never formally abandoned their religious opinions.
At the Revolution of 1688 he followed the Stuart side, and
the group of horse in support of the cause of William III., and
took possession of the city of Worcester in his interest. This
recommended Robert Harley to the notice of the Boscawen family, and
to his election, in April 1689, as the parliamentary representative
of Tregony, a borough under their control. He remained its
member for one parliament, when he was elected by the con-
stituency of New Radnor, and he continued to represent it until
his elevation to the peacque in 1711.

From the first Harley gave great attention to the conduct of
public business, bestowing especial care upon the study of the
forms and ceremonies of the House. His reputation marked
him out as a fitting person to preside over the debates of the
House of Lords from the general election of February 1701 until the
dissolution of 1705 he held with general approbation the office
1 i.e. in the Harley line.
of speaker. For a part of this period, from the 13th of May 1704, he combined with the speakership the duties of a principal secretary of state for the northern department, discharging in that office the Tory earl of Nottingham. In 1705 Harley first made use of Defoe's talents as a political writer, and this alliance with the press proved so successful that he afterwards called the genius of Swift to his aid in many pamphlets against his opponents in politics. While he was secretary of state the union with Scotland was effected. At the time of his appointment as secretary of state Harley had given no outward sign of dissatisfaction with the Whigs, and it was mainly through Marlborough's good opinion of his abilities that he was admitted to the ministry. For some time, so long indeed as the victories of the great English general cast a glamour over the policy of his friends, Harley continued to act loyally with his colleagues. But in the summer of 1707 it became evident to Godolphin that some secret influence behind the throne was shaking the confidence of the queen in her ministers. The sovereign had resented the intrusion into the administration of the impetuous earl of Sunderland, and had persuaded herself that the safety of the church depended on the fortunes of the Tories. These convictions were strengthened in her mind by the new favourite Abigail Hill (a cousin of the duchess of Marlborough through her mother, and of Harley on her father's side), whose soft and silky ways contrasted too favourably in the eyes of the queen with the haughty manners of her old friend, the duchess of Marlborough. Both the duchess and Godolphin were convinced that this change in the disposition of the queen was due to the sinister conduct of Harley and his relatives; but he was for the present permitted to remain in his office. Subsequent experience showed the necessity for his dismissal and an occurrence subsequent to Harley's resignation in which he was involved, for carrying out their wishes. An ill-paid and poverty-striken clerk, William Gregg, in Harley's office, was detected in furnishing the enemy with copies of many documents which should have been kept from the knowledge of all but the most trusted advisers of the court, and it was found that through the carelessness of the head of the department the contents of such papers became the common property of all in his service. The queen was thereupon informed that Godolphin and Marlborough could no longer serve in concert with him. They did not attend her next council, on the 8th of February 1708, and when Harley proposed to proceed with the business of the day the duke of Somerset drew attention to their absence, when the queen found herself forced (February 17) to accept the resignations of both Harley and St John.

Harley went out of office, but his cousin, who had now become Mrs Masham, remained by the side of the queen, and contrived to convey to her mistress the views of the ejected minister. Every device which the defeated ambition of a man whose strength lay in his aptitude for intrigue could suggest for hastening the downfall of his adversaries was employed without scruple, and not employed in vain. The cost of the protracted war with France, and the danger to the national church, the chief proof of which lay in the prosecution of Sacheverell, were the weapons which he used to influence the masses of the people. Marlborough himself might be demanded of, but his relations were replying from their peers in turn. When the greatest of these, Lord Godolphin, was ejected from office, five commissioners to the treasury were appointed (August 10, 1710), and among them figured Harley as chancellor of the exchequer. It was the aim of the new chancellor to frame an administration from the moderate members of both parties, and to adopt with but slight changes the policy of his predecessors; but his efforts were doomed to disappointment. The Whigs refused to join in an alliance with the man whose rule began with the retirement from the treasury of the finance minister idolized by the city merchants, and the Tories, who were successful beyond their wildest hopes at the polling booths, could not understand why their leaders did not adopt a policy more favourable to the interests of their party. The clamours of the widder spirits, the country members who met at the "October Club," began to be re-echoed even by those who were attached to the person of Harley, when, through an unexpected event, his popularity was restored at a bound. A French refugee, the ex-abbé de la Bourlie (better known by the name of the marquis de Guiscard), was being examined before the privy council on a charge of treachery to the nation which had befriended him, when he stabbed Harley in the breast with a penknife (March 8, 1711). To a man in good health the wounds would not have been serious, but the minister had been for some time indisposed—a few days before the occurrence Swift had penned the prayer "Pray God preserve his health, everything depends upon it"—and the joy of the nation on his recovery knew no bounds. Both Houses presented an address to the crown, suitable response came from the queen, and on Harley's reappearance in the Lower House the speaker made an oration which was spread broadcast through the country. On the 23rd of May 1711 the minister became Baron Harley of Wigmore and earl of Oxford and Mortimer; on the 29th of May he was created lord treasurer, and on the 25th of October 1712 became a Knight of the Garter. Well might his friends exclaim that he had "grown by persecutions, turnings out, and stabbings."

With the sympathy which this attempted assassination had evoked, and with the skill which the lord treasurer possessed for conciliating the calmer members of either political party, he passed through several months of office without any loss of reputation. He rearranged the nation's finances, and continued to support her generals in the field with ample resources for carrying on the campaign, though his emissaries were in communication with the French king, and were settling the terms of a peace independently of England's allies. After many weeks of vacillation and intrigue, when the negotiations were repeatedly broken off by the pride of bringing intestine, the preliminaries were signed, and in spite of the opposition of the Whig majority in the Upper House, which was met by the creation of twelve new peers, the much-vexed treaty of Utrecht was brought to a conclusion on the 31st of March 1713. While these negotiations were under discussion the friendship between Oxford and St John, who had become secretary of state in September 1710, was fast changing into hatred. The latter had resented the rise in fortune which the stabs of Guiscard had secured for his colleague, and when he was raised to the peerage with the title of Baron St John and Viscount Bolingbroke, instead of with an earldom, his resentment knew no bounds. The royal favourite, whose husband had been called to the Upper House as Baron Masham's niece, her old friend and relation for her more vivacious rival. The Jacobites found that, although the lord treasurer was profuse in his expressions of good will for their cause, no steps were taken to ensure its triumph, and they no longer placed reliance in promises which were repeatedly made and repeatedly broken. Even Oxford's friends began to complain of his habitual dilatoriness, and to find some excuse for his apathy in ill-health, aggravated by excess in the pleasures of the table and by the loss of his favourite child. By slow degrees the confidence of Queen Anne was transferred from Oxford to Bolingbroke; on the 27th of July 1714 the former surrendered his staff as lord treasurer, and on the 1st August the queen died.

On the accession of George I. the defeated minister retired to Herefordshire, but a few months later his impeachment was decided upon and he was committed to the Tower on the 16th of July 1715. After an imprisonment of nearly two years the prison doors were opened in July 1717 and he was allowed to resume his place among the peers, but he took little part in public affairs, and died almost unnoticed in London on the 21st of May 1724. He married, in May 1685, Edith, daughter of Thomas Foley, of Witney Court, Worcester. She died in November 1691. His second wife was Sarah, daughter of Simon Middleton, of Edmonton. His son Edward (1680-1711), who succeeded to the title, married Henrietta (d. 1755), daughter and heiress of John Holles, duke of Newcastle and his only child, a daughter, Margaret (1715-1758), married William Bentinck, 2nd Duke of Portland, to whom she brought Welbeck Abbey and the London property which she inherited from her mother. The earldom
then passed to a cousin, Edward, 3rd earl (c. 1690–1755), and eventually became extinct with Alfred, the 6th earl (1809–1853).

Harley's statesmanship may seem both intrigue and finesse, but his character is set forth in the brightest colours in the life of Pope and the prose of Swift. The Irish dean was his discriminating friend in the hours of prosperity, his unwavering advocate in adversity. The books and manuscripts which the 1st earl of Oxford and his son collected were among the glories of their age. The manuscripts became the property of the nation in 1743 and are now in the British Museum; the books were sold to a bookseller called Thomas Osborne in 1742 and described in a printed catalogue of five volumes (1743–1745). Dr Johnson writing an account of the library. A selection of the rarer pamphlets and tracts, which was made by William Oldys, was printed in eight volumes (1744–1749), with a preface by Johnson. The best of the Oxford manuscripts (1881). In the recollection of the Harleian manuscripts the Harleian library and the Harleian Miscellany, the family name will never die.

OXFORD, a city, municipal and parliamentary borough, the county town of Oxfordshire, England, and the seat of a famous university.¹ Pop. (1901) 40,336. It is situated on the river Thames, 51 m. by road and 63⁴/₉ m. by rail W.N.W. of London. It is served by the main northern line of the Great Western railway, and by a branch from the London & North-Western system at Bletchley; while the Thames, and the Oxford canal, running north from it, afford water communications. The ancient nucleus of the city stands on a low gravel ridge between the Thames and its tributary Cherwell, and is overlooked by modern thoroughfares. Several branches and backwaters by flat meadows. Modern extensions of Oxford cross both rivers, the suburbs of Osney and Botley lying to the west, Grandpont to the south, and St Clement's to the east beyond the Cherwell. The north is a large modern residential district. The low meadow land is bounded east and west by well-wooded hills, rising rather abruptly, though only to a slight elevation, seldom exceeding 500 ft. Several points on these hills command celebrated views, such as that from Bagley Hill to the S.W., or from Elsfield to the N.E., from which only the inner Oxford is visible, with its collegiate buildings, towers and spires—a peerless city.

Main roads from east to west and from north to south intersect the city. The principal roads are a town called Carfax,¹ and form four principal streets, High Street (east), Cornmarket street (west), Cornmarket Street (north) and St Aldate's (south).² Cornmarket Street is continued northward by Magdalen Street, and near their point of junction Magdalen Street is intersected by the thoroughfare formed, from west to east, by George Street, Broad Street, Holywell Street and Long Wall Street, the last of which sweeps south to join High Street not far from Magdalen Bridge over the Cherwell. This thoroughfare is thus detailed, because it approximately indicates the northern and northernmost confines of the ancient city. The old walls indeed (of which there are many fragments, notably a very fine range in New College garden) indicate a somewhat smaller area than that defined by these streets. Their line, which slightly varied, as excavations have shown, in different ages, bent southward from Cornmarket Street, where stood the north gate, till it reached the enceinte of the castle, which lies at the west of the old city.

¹See also Universities.
²This word, which occurs elsewhere in England, means a place where four roads meet. Its ultimate origin is in the Latin quadrifrons, four-faced. Earlier English forms are carfak, carefore. The modern French is carrefour.
³In the common speech of the university some streets are never spoken of as such, but, e.g., as " the High," " the Corn" (i.e. Cornmarket), " the Broad." St Aldate's is pronounced St Olds, and the Cherwell (pronounced Charwell) is called the Char.

flanked on one side by a branch of the Thames. From the castle the southern wall ran east, along the modern Brewers' Street; the south gate of the city was in St Aldate's Street, where it is joined by this lane, and then continued along the north side of Christ Church Meadow, and north and west of the castle, a gate, which stood in High Street near the junction of Long Wall Street. Oxford had thus a strong position: the castle and the Thames protected it on the east; the two rivers, the walls and the water-meadows between them on the south and east; and on the north the wall and a deep ditch, of which vestiges may be traced, as between Broad and Ship Streets.

An early rivalry between the universities of Oxford and Cambridge led to the circulation of many groundless legends respecting their foundation. For example, those which connected Oxford with "Brute the Trojan," King Memnon (1009 A.D.), and the Druids, are not found before the 13th century. The town is as a fact much older than the university. The historian, John Richard Green, epitomizes the relation between the two corporations when he shows ¹ that "Oxford had already seen five centuries of borough life before a student appeared within its streets. . . . The university found Oxford a busy, prosperous borough, and reduced it to a cluster of lodging-houses. It found it among the first of English municipalities, and it so utterly crushed its freedom that the recovery of some of the commonest rights of self-government has only been brought about by recent legislation." A poor Romano-British village may have existed on the peninsula between Thames and Cherwell, but no Roman road of importance passed within 3 m. of it. In the 8th century an indication of the existence of Cherwell is in the legend of St Frideswide, a holy woman who is said to have died in 735, and to have been buried on the site of the present cathedral. Coins of King Alfred have been discovered (though not at Oxford) bearing the name Osunafo or Orsnafreda, which seems to prove the existence of a mint at Oxford. It is clear, at any rate, that Oxford was already important as a frontier town between Mercia and Wessex when the first unquestionable mention of it occurs, namely in the English Chronicle under the year 912, when Edward the Elder "took to himself London and Oxford. The name points to a ford for oxen across the Thames, though some have connected the syllable "ox" with a Celtic word meaning "water," comparing it with Ouse, Osney and Oxford. The first mention of the townsman of Oxford is in the English Chronicle of 1013, and that in the Anglo-Saxon Chronicle, which mentions the town paid from the 11th century to the 13th by abbots of the monastery passing that town. Notice during that century prove the growing importance of Oxford. As the chief stronghold in the upper Thames valley it sustained various attacks by the Danes, being burned in 979, 1002 and 1010, while in 1013 Sweyn took hostages from it. It had also a considerable political importance, and several genots were held here, as in 1015, when the two Danish thanes Sigefrith and Morkere were treacherously killed by the Mercian Edric; in 1029, when Canute chose Oxford as the scene of the confirmation of his "Edgar's law" by Danes and English; in 1056, when Harold I. was chosen king, and in 1065. But Oxford must have suffered heavily about the time of the Conquest, according to the Domesday Survey (which for Oxford is unusually complete, a great pity, however, in Oxford "visions" 106 out of 207) and houses (475 out of 721) were ruined or unoccupied. The city, however, had already a market, and under the same hand of the Norman sheriff Robert d'Olli (c. 1070–1110) it prospered steadily. He made heavy exactions on the townsfolk, though it may be noted that they withheld from him Port Meadow, the great meadow of 440 acres which is still a feature of the low riverside tract north of Oxford. But d'Olli did much for Oxford, and the strong tower of the castle and possibly that of St Michael's church are extant relics of his building activity. His nephew, another Robert, who held the castle after him, founded in 1129 the most notable building that
Oxford has lost. This was the priory (shortly afterwards the abbey) of Osney, which was erected by the branch of the Thames next to the castle stands. In its finished state it had a splendid church, with two high towers and a great range of buildings, but only slight fragments may now be traced. About 1130 Henry I, built for himself Beaumont Palace, the site of which is indicated by Beaumont Street, and the same king gave Oxford its first known charter (not still extant), in which mention is made of a gild merchant. This charter is alluded to in another of Henry II, in which the citizens of Oxford and London are associated in the possession of similar customs and liberties. The most notable historical incident connected with the city in this period is the escape of the empress Matilda from the castle over the frozen river and through the snow to Abingdon, when beseged by Stephen in 1142.

It is about this time that an indication is first given of organized teaching in Oxford, for in 1133 one Robert Pullen is said to have instituted theological lectures here. No earlier facts are known concerning the origin of the university, though it may with probability be associated with schools connected with the ecclesiastical foundations of Osney and St Frideswide; and the tendency for Oxford to become a centre of learning may have been fostered by the frequent presence of the court at Beaumont. A chancellor, appointed by the bishop of Lincoln, is mentioned in 1214, and an early instance of the subordination of the town to the university is seen in the fact that the townsfolk were required to take oaths of peace before this official and the archdeacon. It may be mentioned here that the present practice of appointing a chancellor, in whose hands the whole administration, excepting the chancellor, did not come into vogue till the end of the 15th century. In the 13th century a number of religious orders, which here as elsewhere exercised a profound influence on education, became established in Oxford. In 1221 came the Dominicans, whose later settlement (c. 1260) is attested by Blackfriars Street, Preacher's Bridge and Friars' Wharf. In 1224 the Franciscans settled near the present Paradise Square. In the middle of the century the Carmelites occupied part of the present site of Worcester College, but their place here was taken by the Benedictines when, about 1315, they were given Beaumont by Edward II, and removed there. The Austin Friars settled near the site of Wadham College; for the Cistercians Reewley Abbey, scanty remains of which may be traced near the present railway stations, was founded c. 1250. During the same century the political importance of Oxford was maintained. Several parliaments were held here, notably the Mad Parliament of 1258, which enforced the enactment of the Provisions of Oxford. Again, the later decades of the 13th century saw the initiation of the collegiate system. Merton, University and Balliol were the earliest foundations under this system. The paragraphs below, dealing with each college successively, give the dates and circumstances of foundation for all. As to the relations between the university and the city, in 1238 a charter of Henry III. afforded students considerable privileges at the expense of the townsfolk, in the way of personal and financial protection. Moreover, the chancellor already possessed jurisdiction over courts; even over the townsfolk he shared jurisdiction with the mayor. Not unnaturally these peculiar conditions engendered rivalry between "town and gown"; rivalry led to violence, and after many lesser encounters a climax was reached in the riot on St Scholastica's and the following day, February 10th and 11th, 1354/5. Its immediate cause was trivial, but the townsfolk gave rein to their long-standing animosity, severely handled the scholars, killing many, and paying the penalty, for Edward III. gave the university a new charter enhancing its privileges. Others followed from Richard II. and Henry IV. A charter given by Henry VIII. in 1533 at the instigation of Wolsey conferred such power on the university that traders of any sort might be given its privileges, so that the city had no jurisdiction over them. In 1571 was passed the act of Elizabeth which incorporated and reorganized the universities of Oxford and Cambridge. In 1635 a charter of Charles I. confirmed its privileges to the university of Oxford, of which William Laud had become chancellor in 1609. Vestiges of these exaggerated powers (as distinct from the more equitable division of rights between the two corporations which now obtains) long survived. For example, it was only in 1825 that the ceremony of reparation enforced on the municipality after the St Scholastica riots was discontinued.

During the reign of Mary, in 1555, there took place, on a spot in Broad Street, the famous martyrdom of Ridley and Latimer. Cranmer followed them to the stake in 1556, and the three are commemorated by the ornate modern cross, an early work of Sir G. G. Scott (1841), in St Giles Street beside the church of St Mary Magdalen. A period such as this must have been in many ways harmful to the university, but it recovered prosperously under the care of Elizabeth and Wolsey. During the civil war, Oxford, as a city, suddenly acquired a new prominence as the headquarters of the Royalist party and the meeting-place of Charles I.'s parliament. This importance is not incomparable with that which Oxford possessed in the Mercian period. However the frontier shifted, between the districts held by the king and by the parliament, Oxford was always close to it. It was hither that the king retired after Edgehill, the two battles of Newbury and Naseby; from here Prince Rupert made his dashing raids in 1643. In May 1644 the earl of Essex and Sir William Waller first approached the city from the east and south, but failed to enclose the king, who escaped to Worcester, returning after the engagement at Coppedey Bridge. The final investment of the city, when Charles had lost every other stronghold of importance, and had himself escaped in disguise, was in June 1646. On 16th of June, the day of Naseby, Fairfax. Throughout the war the secret sympathies of the citizens were Parliamentarian, but there was no conflict within the walls. The disturbances of the war and the divisions of parties, however, had bad effects on the university, being subversive of discipline and inimical to study; nor were these effects wholly removed during the Commonwealth, in spite of the care of Cromwell, who was himself chancellor in 1651-1657. The Restoration led to conflicts between students and citizens. Charles II. held the last Oxford parliament in 1681. James II.'s action in forcing his nominees into certain high offices at last brought the university into temporary opposition to the crown. Later, however, Oxford became strongly Jacobite. In the first year of George I.'s reign there were serious Jacobite riots, but from that time the city becomes Hanoverian in opposition to the university, the feeling coming to a head in 1755 during a county election, which was ultimately the subject of a parliamentary inquiry. But George III., visiting Oxford in 1785, was well received by both parties, and this visit may be taken as the termination of the purely political history of Oxford. Details of the history of the university may be gathered from the following description of the colleges, the names of which are arranged alphabetically.

**All Souls College** was founded in 1437 by Henry Chichele (q.v.), archbishop of Canterbury, for a warden, 40 fellows, 2 chaplains, and clerks. The charter was issued in the name of Henry VI., and it has been held that Chichele wished, by founding the college, to expiate his own support of the disastrous wars in France during the reign of Henry V. and the ensuing regency. Fifty fellowships in all were provided for by the modern statutes, besides the honorary fellowships to which men of eminence are sometimes elected. Some of the fellowships are held in connexion with university offices; but the majority are awarded on examination, and are among the highest honours in the university offered by this method. The only undergraduate members of the college are four bible-clerks, so that the college occupies a peculiar position as a society of graduates. The college has its beautiful original front upon High Street; the first quadrangle, practically unaltered since the foundation, is one of the most characteristic in Oxford. The chapel has a splendid reredos occupying the whole eastern wall, with tiers of figures in niches. After the original figures had been destroyed during the Reformation the reredos was plastered over, but

---

1 Here and in some other colleges this title is connected with the duties of reading the Bible in chapel and saying grace in hall.
when the plaster was removed, Sir Gilbert Scott found enough remains to render it possible to restore the whole. The second quadrant is divided from Radcliffe Square by a stone screen and cloister. From the eastern range of buildings twin towers rise in graduated stages. On the north side is the library. The whole is in a style partly Gothic, partly classical, fantastic, but not without dignity. The architect was Sir Christopher Wren's pupil, Nicholas Hawksmoor; the building was spread over the first half of the 18th century. The fine library originated in a bequest of Sir Christopher Codrington (d. 1710), and bears his name. One of the traditional customs surviving in Oxford is found at All Souls. Legend states that a mallard was discovered in a drain while the foundations were being dug. A song (probably Elizabethan) on this story is still sung at college gaudies, and later it is pretended to hunt the bird. With such a foundation as All Souls, a great number of eminent names are naturally associated (see Montagu Burrows, Worthies of All Souls, 1874).

Balliol College is one of the earliest foundations. About 1263 John de Baliol (see BALIOL, family) began, as part of a pension, to maintain certain scholars in Oxford. Dervorguila, his wife, developed his work after his death in 1266 by founding the college, whose statutes date from 1282, though not brought into final form (apart from modern revision) until 1504. There are now twelve fellowships and fifteen scholarships on the old foundation. Two fellowships, to be held by members already holding fellowships of the college, were founded by James Hozier, second Lord Newlands, in 1606, in commemoration of Benjamin Jonson's death. These are in a deuce on Broad Street, Magdalen Street, and St Giles Street, and are the most part modern, and mainly by Anthony Waterhouse, Anthony Salvin and William Butterfield. The college has a high reputation for scholarship. Its master and fellows possess the unique right of electing the visitor of the college. In 1887 Balliol College absorbed New Inn Hall, one of the few old halls which had survived till modern times. In the time of the civil wars a royal mint was established in it.

Brasenose College (commonly written and called B.N.C.) was founded by William Smith, bishop of Lincoln, and Sir Richard Sutton of Presbury, Cheshire, in 1509. Its name, however, perpetuates the fact that it took the place of a much earlier community in the university. There were several small halls on its site, all dependent on other colleges or religious houses except one—Brasenose Hall. The origin of this hall is not known, but it existed in the middle of the 12th century. In 1334 certain students, wishing for peace from the faction-fights which were then characteristic of their life in Oxford, migrated to Stamford, where a doorway remains of the house then occupied by them as Brasenose Hall. From this an ancient knocker in the form of a nose, which may have belonged to the hall at Oxford, was brought to the college in 1809. It presumably gave name to the hall, though a derivation from Brastium (Latin for a brew-house) was formerly upheld. The original foundation of the college was for a principal and twelve fellows. This number is increased by supernumerary fellowships. Of a number of scholars from Brasenose Hall, several are confined to certain colleges, notably Manchester Grammar School. William Hulme (1601) established a foundation which provides for twelve scholars and a varying number of exhibitioners on entrance, and also for eight senior scholarships open under certain conditions to members of the college already in residence. The main front of the college faces Radcliffe Square; the whole of this and the first quadrangle, excepting the upper storey, is of the time of the foundation; and the gateway tower is a specially fine example. The hall and the chapel, with its fine fan-tracery roof, date from 1663 and 1666, and are attributed to Sir Christopher Wren. In both is seen a curious attempt to combine Gothic and Grecian styles. Modern buildings (by T. G. Jackson, from the firms of Robert Adam and Robertqty) author of The Anatomy of Melancholy, became an undergraduate of the college in 1593; Reginald Heber in 1800; Walter Pater became a fellow in 1864.

Christ Church, in point of the number of its members the largest college of the foundation in Oxford, is also eminent owing to its unique connection with the history of which involves that of the see of Oxford. Mention has been made of the priory of St Frideswide and its early foundation, also of the later but more magnificent foundation of Osney Abbey. Both of these were involved in the sweeping changes initiated by Wolsey and carried on by Henry VIII. Wolsey projected the foundation of a college on an even grander scale than that of the present house. In 1524-1525 he obtained authority from Pope Clement VII. to suppress certain religious houses for the purpose of this new foundation. These included St Frideswide's, which occupied part of the site which Wolsey intended to use. The new college, under the name of Cardinal College, was licensed by the king in 1525. Its erection began immediately. The monastic buildings were in great part destroyed. Statutes were issued and appointments were made to the new of St Frideswide's foundation in 1529 Wolsey fell from power. Cardinal College was suppressed, and in 1532 Henry VIII. established in its place another college, on a reduced foundation, called King Henry VIII's College. Oxford had been, and was at this time, in the huge diocese of Lincoln. But in 1542, on the suppression of Osney Abbey, a new see was created, and the abbey church was made its cathedral. This arrangement obtained only until 1545, when both the new cathedral church and the new college which took the place of Wolsey's foundation were surrendered to the king. In 1546 Henry established the collegiate foundation which now (subject to certain modern alterations) exists. It comprises buildings now (1879) of four colleges of eight canons and 150 students, to which number one was added in 1674. The church of St Frideswide's foundation became both the cathedral of the diocese and the college chapel. The establishment was thus at once diocesan and collegiate, and it remains so, though now the foundation consists of a dean, six canons, and the usual cathedral staff, a reduced number of students (corresponding to the fellows of other colleges) and scholars. Five of the canons are university professors. The disciplinary administration of the collegiate part of the foundation is under the immediate supervision of two students who hold the office of censors. Queen Elizabeth established the connexion with Westminster School by which not more than three scholars are elected thence each year to Christ Church. There is also a large number of valuable exhibitions. The great number of eminent men associated with Christ Church can only be indicated here by the statement that its books have borne the names of several members of the British and other royal families, including that of King Edward VII. as prince of Wales and of Frederick VIII. of Denmark as crown prince; also of twelve prime ministers during the 19th century. The stately front of Christ Church is upon St Aldate's Street. The great gateway is surmounted by a tower begun by Woseley, but only completed in 1682 from designs of Sir Christopher Wren. Though somewhat incongruous in detail, it is of singular and beautiful form, being octagonal and surmounted by a cupola. It contains the great bell "Tom" (dedicated to St Thomas of Canterbury), which, though recast in 1680, formerly belonged to Osney Abbey, was blown up, and at five minutes past nine o'clock in the evening it is rung by hand, to indicate the hour of closing college gates, the number being that of the former body of students. The gate, the tower, and the first quadrangle are all commonly named after this bell. Tom Quadrangle is the largest in Oxford, and after various restorations approximates to Wolsey's original design, though the cloisters which he intended were never built. On the south side lies the hall, entered by a staircase under a magnificent fan-tracery roof dating from 1648. The hall itself is one of the finest refectories in England; its roof is of ornate timberwork (1529) and a splendid series of portraits of eminent olimoni of the house adorn the walls, together with Holbein's portraits

1 As a whole it is therefore properly to be spoken of as Christ Church, not Christ Church College. In the common speech of the university it has become known as The House, though all the colleges are technically "houses."
of Henry VIII. and Wolsey. With the hall is connected the great kitchen, the first building undertaken by Wolsey. An entry through the eastern range of the quadrangle forms the west portal of the Cathedral Church of Christ.

The cathedral, of which the nave and choir serve also as the college chapel, is the finest English cathedral, but is of high architectural interest. The plan is cruciform, with a northward extension from the north choir aisle, comprising the Lady chapel and the Latin chapel. It has been described as the noblest and most beautiful church of the 13th century built for a religious house. In the east end of the north choir aisle and Lady chapel may be seen two blocked arches, rude, narrow and low. Excavations outside the wall in 1887 revealed the foundations of a northern transept, and in this wall, therefore, there is clearly a remnant of the small Saxon church, with its eastern triple-apsed termination. In 1902 the transept was restored, and the north arcade of the quadrangle was completed in the form of an arcade five bays wide, in the order of Ethelred II. Some Danes took refuge in the tower of St Frideswide’s church, which was fired to ensure their destruction. In 1094 the king undertook the rebuilding of the church, which was all destroyed by fire.

There is full reason to believe that he had assistance from his brother-in-law, Richard II., duke of Normandy, and that much of his work remains, notably in the west wing of the aisles. About 1300, however, there was an extensive Norman restoration of the nave and the arcades between the nave and aisles. The arcades of the choir and of the nave, which was shortened by Wolsey for the purpose of his collegiate building, have massive pillars and round arches. Within these arches, then, above them, a blind arcade forms the triforium, and below this a lower set of arcades. The outer order of the main arcade is composed of Norman stone-vaulted aisles conform in height with these lower arches. All this is a clerestory with passage. The east end is a striking Norman restoration by Sir Gibbs Scott. The rest of the nave and transept is in a richly decorated Decorated window. The north choir aisle is the fragments which have been discovered and roughly reconstructed of St Frideswide’s shrine, of marble, with foliage beautifully carved and symmetrical. The nave of the Latin chapel is of various dates, but mainly of the 14th century. The north windows contain contemporary glass; the east window is a rich early work of Sir E. Burne-Jones, set in stonework of an inharmonious Venetian design. There are other beautiful windows by Burne-Jones at the east ends of the aisles and Lady chapel, and at the west end of the south nave aisle. The corresponding window of the north aisle is a curious work by the Dutch artist Abraham van Linschoten, and is the earliest dated work of this period. The side aisle of the nave contains a remarkable arrangement of the collegiate seats in the cathedral, the nave and choir being occupied by modern carved pews or stalls running east and west, and the position of the organ in this aisle, a feature of the old plan, is retained to the interior of the building. Small cloisters adjoin the cathedral on the south, and an ornate Norman doorway gives access from them to the chapter-house, a beautiful Early English room. Above the cloisters on the south rises the ‘old library,” essentially the monastic refectory, which has suffered conversion into dwelling and lecture-rooms.

To the north-east of Tom Quadrangle is Peckwater Quadrangle, named from an ancient hall on the site, and built from the design of the versatile Dean Henry Aldrich (1793) with the exception of the library (1716-1761), which forms one side of it. The whole is classical in style. The library contains some fine pictures by Cima, Holbein, Van Dyck and others, and sculpture by Rysbrack, Roubillac, Chantrey and others. The small Canterbury Quadrangle, to the east, was built in 1773-1783, and marks the site of the Canterbury College or Hall, founded by Archbishop Islip in 1663, and absorbed in Henry VIII.’s foundation. To the south of the hall and old library are the Master’s Meadow Buildings (1862-1865), overlooking the beautiful Christ Church Meadows, whose avenues lead to the Thames and Cherwell.

Corpus Christi College (commonly called Corpus) was founded in 1516 by Richard Fox, bishop of Winchester (1500-1528). He at first intended his foundation to be a seminary connected with St Swithin’s priory at Winchester, but Hugh Oldham, bishop of Exeter, foresaw the dissolution of the monasteries and advised against this. Fox had especially in view the object of classical education, and his foundation, besides a president, 20 fellows and 20 scholars, included 3 professors—in Greek, Latin and theology—whose lectures should be open to the whole university. This arrangement fell into desuetude, but was revived in 1854, when fellowships of the college were annexed to the professorial chairs of Latin and jurisprudence. The foundation now consists of a president, 16 fellows, 26 scholars and 3 exhibitioners. The college has its front upon Merton Street. The first quadrangle, with its gateway tower, is of the period of the foundation, and the gateway has a vaulted roof with beautiful tracery. In the centre of the quadrangle is a curious fragment of a Roman sarcophagus, with an old T-shaped window, called the ‘Turl’ (Turl or Thordol Gate) in the city wall, to which the street led.

The Turl takes its name from a postern (Turl or Thordol Gate) in the city wall, to which the street led.
Richard Newton, formerly a Westminster student of Christ Church, became principal, and in 1740, in spite of opposition from Exeter, he obtained a charter establishing Hertford as a college. The foundation, however, did not prosper, and by an inquisition of 1816 it was declared to have lapsed in 1805. With part of its property the university was able to endow the Hertford scholarship in 1834. Magdalen Hall, which had become independent of the college of that name in 1602, acquired the site and buildings of the dissolved Hertford College and occupied them, but was itself dissolved in 1874, when its principal and scholars were incorporated as forming the new Hertford College. An endowment was provided by Thomas Charles Baring, the third Earl of Northbrook, for the three professors and their senior and junior clerks and dean and bursar. The foundation now consists of a principal, 17 fellows and 40 scholars. Of the college buildings, which face those of the Bodleian library and border each side of New College Lane, no part is earlier than Newton's time. Modern buildings by T. G. Jackson (1903) incorporate remains of the little early Perpendicular chapel of Our Lady at Smith Gate (incorrectly called St Catherine's), which probably stood on the outer side of the town ditch. There is a striking modern chapel.

Jesus College has always had an intimate association with Wales. Queen Elizabeth figures as its foundress in its charter of 1577, but she was inspired by Hugh ap Price (Price), a native of Brecon, who endowed the college. The original foundation was for a principal, 15 fellows, and 30 scholars, and a principal or a proctor of less than 8 or more than 14 fellows, and there are 24 foundation scholarships, besides other scholarships and exhibitions, mainly on the foundation of Edmund Meyrick, a native of Merionethshire, who entered the college in 1656 and was a fellow in 1662. Not only his scholarships but others also are restricted (unless in default of suitable candidates) to persons born or educated in Wales, or of Welsh parentage. At Jesus, as at Exeter, there are also some "King Charles I." scholarships for persons born or educated in the Channel Islands. The college buildings face Turl Street; the front is an excellent reconstruction of 1856. The chapel dates from 1621, the hall from about the same time, and the library from 1677, being erected at the expense of the eminent principal (1661-1673) Sir Leoline Jenkins. He and his predecessor, Sir Eubule Thelwall (1621-1630), were prominent in raising the college from an early period of depression.

Keble College is modern; it received its charter in 1876. It was erected by subscription as a memorial to John Keble (q.e.). Its stated object was to provide an academical education combined with economical cost in living and a "training based upon the principles of the Church of England." The college is governed by a warden (who has full charge of the internal administration) and a council. There is a staff of tutors, and a number of scholarships and exhibitions on private foundations. The buildings lie somewhat apart from other collegiate buildings towards the north of the city, facing the university parks, which extend from here down to the river Cherwell. They are from the designs of William Butterfield, and are principally in variegated brick. The chapel has an elaborate scheme of decoration in mosaic; and the library contains a great number of books collected by Keble, and Holman Hunt's picture, "The Light of the World."

Lincoln College was founded in 1427 by Richard Fleming, a canon of Lincoln. It was an outcome of the reaction against the doctrines of Wycliffe, of which the founder of the college, once their earnest supporter, was now an equally earnest opponent. He died (1431) before his schemes were fully carried out, and the college was struggling for existence when Thomas Rotherham, then bishop of Lincoln and visitor of the college, re-endowed it in 1448. The foundation consists of a rector, 12 fellows and 14 scholars. The buildings face Turl Street. The hall dates from 1386, but its west wing within was added in 1700. The chapel in the back quadrangle, is an interesting example of Perpendicular work of very late date (1690). The interior is wainscoted in cedar, and the windows are filled with Flemish glass introduced at the time of the building. There is a modern library building in a classic Jacobean style, completed in 1906; the collection of books was originated by Dean John Forest, who also built the hall. Among the eminent associates of this college was John Wesley, fellow 1726-1751.

Magdalen College (pronounced Maudlcn; in full, St Mary Magdalen) was founded in 1458 by William of Waynflete, bishop of Winchester and lord chancellor of England. In 1448 he had obtained the patent authorizing the foundation of Magdalen Hall. In the college he provided for a president, 40 fellows, 30 denaries,1 and, for the chapel, chaplains, clerks and choristers. To the college he attached a grammar-school with a master and usher. The foundation now consists of a president, from 30 to 40 fellowships, of which 5 are attached to the Waynflete professorships in the university,7 senior demyships up to 8 and junior demyships up to 8, and is endowed with property to the yearly value of 1,000 marks. The choir, 80 choral scholars, and the choristers are maintained, and the choral singing is celebrated. In order to found his college, Waynflete acquired the site and buildings of the hospital of St John the Baptist, a foundation or refoundation of Henry III, for a master and brethren, with sisters also, for "the relief of poor scholars and other miscarble persons." The Magdalen buildings, which are among the most beautiful in Oxford, have a long frontage on High Street, while one side rises close to or directly above a branch of the river Cherwell. The chief feature of the front is the bell-tower, a structure which for grace and beauty of proportion is hardly surpassed by any other of the Perpendicular period. It was begun in 1492, and completed in about thirteen years. From its summit a Latin hymn is recited every morning annually. Numerous suggestions have been made as to the origin of this custom; it may have been connected with the inauguration of the tower, but nothing is certainly known.

The college is entered by a modern gateway, giving access to a small quadrangle, at one corner of which is an open pulpit of stone. This was connected with the chapel of St John’s Hospital, which was incorporated in the front range of buildings. Adjoining this is the west front of the college chapel.3 This chapel was begun in 1474, but has been much altered, and the internal fittings are in the main excellent modern work (1833 seq.). At the north-west corner of the entrance quadrangle is a picturesque remnant of the later buildings of Magdalen Hall. To the west is the modern St Swithin’s quadrangle, the buildings of which were designed by G. F. Bodley and T. Garner, and begun in 1850, and to the west again a Perpendicular building erected for Magdalen College school in 1840. To the east lies the main quadrangle, called the cloister quadrangle, from the cloisters which surround it. These have been in great part reconstructed, but in accordance with the plan of the time of the foundation. Above the west walk rises the beautiful “founder’s” tower, low and broad. On this side also is the valuable library. The south walk is bounded by the chapel and the hall, which lie in line, adjoining each other. The hall is a beautiful room, improved in 1906 by the substitution of an open timber roof for one of plaster erected in the 18th century. The panelling dates mainly from 1541; there is a tradition that the part at the west end came from the dissolved Reading Abbey. A curious series of figures which surmount the buttresses on three sides of the cloisters date from 1708-1700. Some are apparently symbolical, others scriptural, others again heraldic.

To the north of the cloister quadrangle (a garden with broad lawns intervening) stand the so-called New Buildings, a massive classical range (1733). To the north and west of these extends the Grove or deer park, where the first deer were established probably c. 1720; to the east, across a branch of the Cherwell, is the meadow surrounded by Magdalen Walks, part of which is called Addison’s Walk after Joseph Addison (demy and fellow). Perhaps the most notable period in the history of the college is that of 1667-1688, when the fellows resisted James II’s attempt to force a president upon them, in place of their own choice, John Hough (1657-1743), successively bishop of Oxford,2

1 Singular demy, the last syllable accented. They correspond to the scholars of other colleges. The name is derived from the fact that their allowance was originally half (demi-) that of fellows.

2 Waynflete himself had founded three readerships, in natural and moral philosophy and in theology.

3 It actually faces about N.W.; the same deviation applies to other buildings described.
Lichfield, and Worcester. Cardinal Wolsey was a fellow of the college about the time when the bell-tower was building, but the attribution of the design to him, or even of any active part in the erection, is not borne out by evidence. Among alumni of the college were William Camden, Sir Thomas Bodley, John Hampden, at the time of whose matriculation (1610) Magdalen was strongly Puritan, Joseph Addison, Dr Sacheverell, and for a short period Gibbon the historian. Mention should be made of the eminent president, Martin Joseph Routh, who was elected to the office in 1791, and held it till his death in his 100th year in 1854. Magdalen College school had new buildings opened for it in 1894.

*Merion College is of peculiar interest as regards its foundation, which is generally dated as the first on the present collegiate model, at some time before 1264. Walter de Merton, a native of Merion, Surrey, devoted estates in that county to the maintenance of scholars in Oxford. Thus far he followed an established practice. In 1264 he founded at Malden a “house of scholars of Merion” for those who controlled the estates in the interest of the scholars, who should study preferably at Oxford, though any centre of learning was open to them. By 1268 the Oxford community had acquired the present site of the college; in 1270 new statutes laid down rules of living and study, and in 1274 the whole foundation was established under a final set of statutes at Oxford—i.e. the society ceased to be administered from the house in Surrey. The society was under a warden, and certain other officers were established, but no list was set on the number of fellows. The foundation now consists of a warden, from 10 to 26 fellows, and 20 or more postmasterships. The postmasters of Merton correspond to the scholars of other colleges; they had their origin in the *portionistas* (i.e. foundations who had a smaller portion or enowment than fellows), instituted in 1336 on the foundation of John Wylyot (fellow 1334, chancellor 1349). The college is adjacent to Corpus, with its front upon Merton Street, and some of its buildings are of the highest interest, notably the chapel and library. The chapel consists of a choir and transepts with a tower at the crossing; but a nave, though intended, was never built. The choir is of the purest Decorated workmanship (dating probably from the last decade of the 13th century), with beautiful windows exhibiting most delicate tracery. The transepts show the appearance of Perpendicular work, but there is also work of the earlier style in them; the massive tower is wholly of the later period (c. 1450). The library, which lies on two sides of the so-called “mob” quadrangle, dates from 1377-1378, and was mainly the gift of William Rede, bishop of Chichester (1360-1386). It occupies two beautiful rooms and is of great interest from its early foundation and the preservation of its ancient character. The treasury is a small room coeval with the foundation, with a curious high-pitched ashlar roof. The other buildings, which are of various dates, are mainly disposed about four quadrangles, including that of St Alban’s Hall, which, possibly dating from the early part of the 15th century, was incorporated with Merton College in 1444. The college has retained an original door with ironwork, but the building is in great part modernized. A beautiful garden lies east of the buildings, being separated from the meadows to the south by part of the old city wall. Modern buildings (1907) have a frontage upon Merton Street; others (1864) overlook the meadows. Traditionally the names of Roger Bacon, Duns Scotus and Wycliffe have been associated with this college. Anthony Wood (1632-1695), the antiquary and historian of the university, was a postmaster of the college.

*New College was founded by William of Wykeham in 1379. The founder’s name for it, which it still bears in its corporate title, is the College of St Mary of Winchester. But there was already a St Mary’s College (Oriel). Wykeham’s house thus soon became known as the New College, and the substantive is still retained in the ordinary speech of the university, whereas in mentioning the titles of other colleges it is generally omitted.

1 He was chancellor of the kingdom in 1261-1263, and again in 1272-1274, justiciar in 1271 and bishop of Rochester in 1274. He died in 1277.

Wykeham designed an exclusive connexion between his Oxford college and his school at Winchester. This connexion is maintained in a modified form. Wykeham’s foundation was for a warden, and 70 fellows and scholars, with chaplains and a choir. The present foundation consists of a warden, and not more than 36 fellows, while to the scholarships 6 elections are made annually from Winchester and 4 from elsewhere. The choir is maintained, as at Magdalen. Five of the fellowships were attached to university professorships, of which three (logic, ancient history and physics) are called Wykeham professorships. The buildings of New College remain in great measure as designed by the founder, and illustrate the magnificence of his scheme. The main gateway tower fronts New College Lane. The chapel and cloisters were erected in 1369, and the warden’s house, which consisted of a domestic quadrangle. The period of building was that of the development of the Perpendicular style. In shape the chapel was the prototype of a form common in Oxford, consisting of a choir, with transepts forming an ante-chapel, but with no nave. The remarkable west window in monochrome was erected, c. 1373, from a design by Sir Joshua Reynolds. The reredos, with its tiers of figures in niches, had a history similar to that at All Souls, being plastered over in 1567. In the same way, too, it was restored c. 1800; but previously James Wyatt had discovered traces of the original, and had unsuccessfully attempted the restoration of the niches in plaster, carrying out also, as elsewhere in Oxford, other extensive alterations of which the original beauty was demanded by later taste. Portions of the old work were preserved, the tower being erected in 1379-1380. At the north-east corner of the college grounds there is a large house, the residence of the provost (Sir Gilbert Scott). In the chapel is preserved the beautiful pastoral staff of the founder, and there is a fine series of memorial brasses, mainly of the 15th century, in the ante-chapel. To the west of the chapel are the cloisters, consecrated in 1400, and the detached tower, a tall massive building on the line of the city wall. As already mentioned, a fine remnant of this wall adds to the picturesque of the college garden. The hall was completed in 1368, and has a Tudor screen and wainscoting. The garden quadrangle, the east side of which is open to the gardens, dates from 1682-1708. On the north side of the college precincts, facing Holywell Street, are extensive modern buildings by Sir G. G. Scott and B. Clampneys. In 1642, when Oxford was playing its prominent part in the Civil War, the tower and cloisters of New College became a royalist magazine.

*Oriel College was founded by Edward II. in 1326. The originator of the scheme and the prime mover in it was Adam de Brome, the king’s almoner, who in 1324 had obtained royal licence to found a college; but in 1326 he surrendered his rights to the king, who issued charter and statutes, and created Brome the first provost. This foundation was for a provost and 10 fellows, but a number of bequests extending over nearly a century from 1445 enabled additional fellowships to be established. The foundation, however, now consists of the provost, 12 fellows and 2 professorial fellows, with at least 12 scholars and a number of exhibitioners. St Mary Hall, which had been the manse of St Mary’s church, was given with the church to the college by the founder, and was opened as a hall with a principal of its own. It was, however, incorporated with the college in 1902. Oriel College was dedicated to St Mary the Virgin, and the name by which it is now known appears first in 1339. It was derived from a tenement called *La Oriole* (but the origin of this name is unknown), which had occupied part of the college site, had belonged to Eleanor of Provence, wife of Edward I., and had been given by her to her chaplain, James of Spain (Jacobus de Ispania). The buildings of Oriel, which face Oriel Street, are not coeval with the foundation. The first quadrangle, with its elaborate battlements, dates from 1620-1637. The inner quadrangle has buildings of 1719, 1729 and later dates. The modern extension on Cecil Rhodes’s foundation faces High Street. Early in the 19th century a number of eminent men associated with Oriel gave the college its well-known connexion with the “Oxford Movement.” Edward Copleston, elected fellow in 1795, became provost in 1814. In 1811 John Keble and Richard Whately were elected fellows,
the one from Corpus; the other had been at Oriel. Again in 1815 Thomas Arnold, afterwards headmaster of Rugby, was elected from Corpus, with Renn Dickson Hampden of Oriel. Later fellows were John Henry Newman (1822) and Edward Pusey (1823). James Anthony Froude entered the college in 1835; Matthew Arnold became a fellow in 1845. Cecil John Rhodes matriculated in 1873, and, besides his foundation of Rhodes scholarships, made a large bequest to the college.

Pembroke College was founded in 1624. Thomas Tedsale (1547–1600) of Glyndebourne, left money for the support of scholars in Oxford, indicating Balliol College as his preference, but not insisting on this. Richard Wightwick (d. 1630), rector of East Isley, Berkshire, added to Tedsale's bequest, and though Balliol College desired to benefit by it, James I. preferred to figure as the founder of a new college with these moneys. Pembroke, which was named after William Herbert, earl of Pembroke, then chancellor of the university, was thus developed out of Broadgates Hall, which had long been eminent as the residence of students in law. The original college foundation was for a master, 10 fellows and 10 scholars, but a number of scholarships and exhibitions has been added by benefactors. Of the scholarships some are awarded by preference to candidates possessing certain qualifications, notably, that of a scholar in education or divinity, who was to benefit by his bequest. The buildings of Pembroke lie south and west of St Aldate's Church, opposite Christ Church; they surround two picturesque quadrangles, but are in great part modern. The college preserves some relics of Samuel Johnson, who entered it in 1728.

Queen's College was founded in 1340–1341 by Robert de Eglesfield, chaplain of Philippa, queen-consort of Edward III., and was named in her honour. Her son, Edward the Black Prince, was entered on the books of the college, and Henry V. received education here. Several queens were among the benefactors of the college—Henrietta Maria, Caroline, Charlotte. The queen-consort is always the patroness of the college. The foundation consisted of a sum of money from the late 13th century and about 23 scholars. There was formerly an intimate connexion between this college and the north of England. Five scholarships, called Eglesfield scholarships, are now given by preference to natives of Cumberland or Westmorland, and the Hastings exhibitions founded by Lady Elizabeth Hastings (1682–1730) are open only to candidates from various schools in these counties and in Yorkshire. This connexion dates from the foundation. Eglesfield (d. 1340) was probably a native of Eglesfield in Cumberland, and provided that the 12 fellows or scholars of his foundation were preferably to be natives of this county or Westmorland. During the time of Wycliffe, who while rector of Lutterworth resided for two years in the college, the foundation was by a ruling of the visitor (the archbishop of York) actually confined to the two counties mentioned, and so remained until 1854. The buildings date mainly from the close of the 17th century and the beginning of the 18th. They front High Street with a massive classical screen, flanked by the ends of the east and west ranges of buildings of the front quadrangle, and surmounted in the centre by a statue of Queen Caroline under a cupola. The buildings are the work of Sir Christopher Wren and Nicholas Hawksmoor. The library contains a valuable collection, especially of historical works, and is fitted with wood-carving by Grinling Gibbons. There is also here an interesting contemporary statue in wood of Queen Philippa. The chapel retains several medieval windows from the former Gothic chapel, and some stained glass painted by Abraham van Lint (1615). The college preserves two early customs—on Christmas day a dinner is held at which a boar's head is carried in state into the hall, and an appropriate ancient carol is sung; and on New Year's day a threaded needle, with the motto "Take this and be thrifty," is presented to members in the college hall. The origin of this custom is traced to a rebus on the founder's name—"aiguille et fil" (needle and thread).

St John's College was founded in 1555 by Sir Thomas White, Kt., alderman of London (1492–1567). It occupied the site of a house for Cistercian students in the university, founded by Archbishop Chicheley in 1437 and dedicated to St Bernard of Clairvaux. White's foundation was originally for a president, 50 fellows and scholars, and a chaplain, choir, &c., for the chapel. White established the intimate connexion which still exists between this college and the Merchant Taylors' school in London, in the foundation of which, as a prominent officer in the Merchant Taylors' Company, he had a share. The college foundation now consists of a president, from 14 to 18 fellows, and 50 scholars, of which 15 are appropriated to the Merchant Taylors' school, and 4 senior scholarships, similarly appropriated. The buildings incorporate some of Chicheley's work, as in the front upon St Giles's Street, with its fine gateway. Similarly, in the front quadrangle, the hall and chapel belonged to the house of St Bernard, though subsequently much altered. A passage with a rich fan-traceried roof gives access from the front to the back quadrangle, on the south and east sides of which is the library. The south wing dates from 1566, the east from 1631. The latter is of the greater interest; it was built at the charge of William Laud, and the designs have been commonly attributed to Inigo Jones. The north and west sides of the quadrangle, of the same period, have cloisters. The union of the classical style, which predominates elsewhere with the character of the Old English style, which is originally for the college, makes this quadrangle architecturally one of the most interesting in Oxford, as the college gardens, which its east front overlooks, are among the most picturesque. The most notable period of the history of the college is associated with Laud, who entered the college in 1580, was elected a fellow in 1593, became president in 1611 and chancellor of the university in 1629. Relics of him are preserved in the library, and he is buried in the chapel, together with White, the founder, and William Juxon, president 1621–1633, and afterwards archbishop of Canterbury.

Trinity College was founded in 1555 by Sir Thomas Pope, Kt. (d. 1559), of Tittenhanger, Hertfordshire. He acquired and used for his college the ground and buildings of Durham College, a small hall-house of Durham University, founded originally for the 13th century (see Durham, City). Trinity is therefore one of the instances of collegiate foundation forming a sequel to the dissolution of the monasteries, for Durham had been surrendered in 1540. Pope's foundation provided for a president, 12 fellows and 12 scholars. There are now 16 scholarships and a number of exhibitions. There are also some scholarships in natural science, on the foundation (1873) of Thomas Millard, whose bequest also provides for a lecturer and laboratory. The front quadrangle of Trinity lies open to Broad Street; on its east side are modern buildings (by T. G. Jackson, 1887), on the north, the president's house and the chapel in a classic style, dating from 1604. It contains a rich alabaster tomb of Pope, the founder, and his third wife, and has a fine carved screen and altar-piece by Grinling Gibbons. The remainder of the building, forming two small quadrangles north of the chapel, includes parts of the old Durham college, but these have been much altered. Gardens extend to the east. John Henry Newman was a commoner of this college; Edward Augustus Freeman, the historian, and William Stubbs, bishop of Oxford, were among its fellows.

University College (commonly abbreviated Univ.) has claimed to find its origin in a period far earlier than that to which the earliest historical notice of the university itself can be assigned. In a petition to Richard II., respecting a dispute as to property the members of the "mickel universite hall in Oxford" quote King Alfred as the founder of the house, for 26 divines. The date of 873 was claimed, and in 1872 a centenary celebration was held by the college. Moreover, in 1727 a dispute as to the mastership of the college led to an appeal to the Court of King's Bench to determine the right of visitation, and it was found that this right rested with the crown (as it now does) on the ground of the foundation by Alfred. Leaving tradition, however, it is found that William of Durham, archdeacon of Durham, dying in 1240, bequeathed money to the university to support masters at Oxford. In 1253 the university acquired its first
tenement on this bequest; further acquisitions followed; and in 1280 an inquiry was held as to the disposition of the bequest, and statutes were issued to the society on Durham's foundation, the university finding it necessary to make provision for its individual governance. This intimate connexion between the university and the early development of a college has no parallel, and to it the college owes its name. The college, as it may now be called, developed slowly, further statutes being found necessary in 1292 and 1311; unlike other foundations which were established, with a definite code of statutes from the outset, by individual founders. It is possible, however, to maintain that the founders of Merton and Balliol were influenced in their will by that of William of Durham. The foundation consists of a master, 13 fellows and 16 scholars, and there are large number of exhibitions. The buildings have a long frontage upon High Street. The oldest part of the buildings was begun in 1334. The chapel, built not long after, was altered in Decorated style by Sir Gilbert Scott, but contains fine woodwork of 1604, and windows by Abraham van Linge (1631). The old library dates from 1665-1670, but a new library was built by Scott, in Decorated style, and contains great statues of Lord Eldon and Lord Stowell, members of the college, the design of which was by Sir Francis Chantrey. The hall dates from 1637, but has been greatly altered. The extension of the college has necessitated that of its buildings in modern times. A chamber built for the purpose of containing a statue by Onslow Ford, of Percy Bysshe Shelley, presenting him lying drowned. The poet entered the college in 1810.

Wadham College was founded in 1612 by Nicholas Wadham (d. 1609) of Meriftield, near Ilminster, Somersetshire, and Dorothy his wife, who as his executrix carried out his plans. The original foundation consisted of a warden, 15 fellows, 15 scholars, with 2 chaplains and 2 clerks. It now consists of a warden, 8 to 10 fellows and 18 scholars. The college, which has its frontage upon Parks Road, occupies the site of the house of the Austin Friars. No part of their buildings is retained. The erection of the college occupied the years 1610-1613, and while the buildings are in the main an excellent example of their period, the chapel (as distinct from the antechapel) is of peculiar interest. This appears and was long held to be pure Perpendicular work of the 15th century, but the record of its building in 1611 is preserved, and as the majority of the buildings seem to have been natives of Somersetshire it is supposed that in the chapel they closely imitated the style which is so finely developed in that county. The buildings of Wadham have remained practically unchanged since the foundation, either by alteration of the existing fabric or by addition. Beautiful gardens lie to the east and north of them; the warden's garden is especially fine. In the quadrangle is a clock designed by Christopher Wren, who entered the college in 1649. It was in this year that John Wilkins, warden (1648-1659), initiated a weekly philosophical club, out of the meetings of which grew the Royal Society, which received its charter in 1662.

Worcester College was founded in its present form in 1714, out of a bequest by Sir Thomas Cookes, Bart. (d. 1701) of Bentley Pauncefoot, Worcestershire. On part of the site, in 1583, Gloucester Hall had been founded for Benedictine novices from Gloucester. After the dissolution of the monasteries, the buildings were used by Robert King, first bishop of Oxford, as a palace (1542); later it was acquired by Sir Thomas White, founder of St John's College, and again became a hall. This fell into difficulties, and was in great poverty when the present foundation superseded it. Cookes's foundation provided for a provost, 6 fellows and 6 scholars; there are now from 6 to 10 fellows, and from 10 to 18 scholars. Four of the scholarships are appropriated to Bromsgrove school, of which Cookes was a benefactor. The frontage of the buildings, in Worcester Street, is in a classical style, but the quadrangle retains some of the old buildings of Gloucester Hall. The gardens, with their lake, are fine.

The academical halls, which were of very early origin, were originally in the nature of lodging-houses, in which students lived under a principal chosen by themselves. But they were gradually absorbed by the colleges as these became firmly established. The only remaining academical hall is that of St Edmund, which is said to have been founded in 1226, and to derive its name from Edmund Rich, archbishop of Canterbury, who is known to have taught at Oxford, and was canonized in 1248. The hall came into the possession of Queen's College in 1557, and the principal is nominated by that society. The buildings, which form a small quadrangle east of Queen's College, date mainly from the middle of the 18th century. There are three private halls of residence—those of the professors of civil and of natural history of 1852, which provides for such establishment by any member of the university under certain conditions and under licence from the vice-chancellor. Non-collegiate students, i.e. members of the university, possessing all its privileges without being members of any college, were first admitted in 1868. As a body they are under the care of a deanship and the supervision of a censor. Women are admitted to lectures and university examinations but not to its degrees; they have four colleges or halls—Somerville College (1879), Lady Margaret Hall (1879), St Hugh's Hall (1886) and St Hilda's Hall (1893). Among foundations independent of university jurisdiction and intended primarily for the teaching of theology are the Pusey House (1854, founded by John Henry Newman), the Non-collegiate Hall (1876) and Wycliffe Hall (1878), both theological colleges; Mansfield College (Congregational, founded to take the place of Spring Hill College, Birmingham, in 1880) and Manscehester College (1893), also a nonconformist institution. The buildings of Mansfield, especially the chapel, should be noticed as of very good design in Decorated and Perpendicular styles. None of these houses is a residence for undergraduates. There is a theological college at Cuddesdon, near Oxford, where also is the bishop of Oxford's palace.

A notable group of buildings connected with the university stands between Broad Street and Hertford Street, and between Exeter and Brasenose and All Souls colleges. Among these the principal are the old schools buildings, which form a fine quadrangle, and are now mostly occupied by the Bodleian Library, more extensive accommodation for the schools (examinations, &c.) being provided in the modern range of buildings facing High Street and King Street, completed in 1852 from the designs of T. G. Jackson. The erection of the old schools buildings, which was begun in 1615 and continued in the late Gothic with classical details. On the inner face of the gateway towers are the five Roman orders, in tiers, one above another. The windows, parapet and rich pinnacles, however, are Gothic. The elegance of the buildings is increased by the addition of schools to the celebrated library which bears his name. The main chamber of the Bodleian Library is entered from the quadrangle. The library (see LIBRARIES) was opened in 1602. The central part of the room dates from 1486, when it was completed to contain the library given to the university by Humphrey, duke of Gloucester (d. 1417). This library was destroyed in the time of Edward VI. Bodley added the east wing, the west wing followed in 1634-1640, being built to house the collection of John Selden, one of the principal of many benefactors of the library. The whole forms a most beautiful room, enhanced by the finely painted ceiling and the fine carved plasterwork of the manner of Inigo Jones. The ceiling, however, consists mainly of pinnacles, each of which is divided into compartments by widely splayed arches, and adorned with rich tracery and carved pendants. The Convocation House, below the west wing of the library, and entered from the west end of the hall, has a roof with fan tracery. To the north of these buildings, flanking Broad Street, are the Sheldonian Theatre, the old building of the Clarendon Press and the Old Ashmolean building. The Sheldonian was built in 1664 at the charge of Sir Christopher Wren. The building is one of the most perfect of the 17th century. The design of the arches to the windows is in the form of a double arch, with an archive in the middle. The windows are divided into compartments by widely splayed arches, and adorned with rich tracery and carved pendants. The Convocation House, below the west wing of the library, and entered from the west end of the hall, has a roof with fan tracery. To the north of these buildings, flanking Broad Street, are the Sheldonian Theatre, the old building of the Clarendon Press and the Old Ashmolean building. The Sheldonian was built in 1664 at the charge of Sir Christopher Wren. The building is one of the most perfect of the 17th century. The design of the arches to the windows is in the form of a double arch, with an archive in the middle. The windows are divided into compartments by widely splayed arches, and adorned with rich tracery and carved pendants. The Convocation House, below the west wing of the library, and entered from the west end of the hall, has a roof with fan tracery.
early established in its upper part. This institution bears the name of the Clarendon Press from the fact that it was founded partly from the proceeds of the sale of the earl of Clarendon's History of the World. It was founded by Robert Petty and Philip Johnson Henry, the second earl. In 1713 it occupied the building erected for it close to the theatre: in 1830 it was moved to the larger buildings it now occupies in Walton Street. Printing in Oxford dates from 1732. The presses were transferred to Broad Street in 1752, and have been there ever since, except for a move to the Banbury Road from 1832 onwards, and only carried on spasmodically until 1855, when the first university printer was Joseph Barnes. All the subsidiary processes of type-founding, stereotyping, &c., are carried on in the buildings of the Clarendon Press, which contains more than 100,000 volumes of books. The press is to a large extent a commercial firm, in which the university has a preponderating influence, governing it through a supervisory committee and providing the capital. The rooms of the university, as is the adjacent Old Ashmolean building, which originally (1683) contained the Ashmolean museum, described hereafter, and now affords rooms for the School of Geography (1899). A similar function is served by the Radcliffe Library, whose additions to the Bodleian Library, the collection of medieval and scientific works it contained being removed to the University Museum. The exterior gallery round the dome is celebrated as a view-point.

To the south of the Radcliffe Library, bordering High Street, is the church of St Mary the Virgin, commonly called the University church, on a site which is traditionally said to have been occupied by a church even from King Alfred's time. Its principal feature is a fine tower, of which the spire, with its graceful finial, is a part of the 13th century. The body of the church, however, is mainly an excellent example of Perpendicular work. The main entrance from High Street is beneath a classical porch erected in 1657 by Robert Danvers, the third earl, and is flanked by two statues of the Virgin and Child above it was alluded to in the inscription of the archbishop. On the north side of the chancel is a building of earlier date than the present church; it is Decorated, of two storeys, and has a spire, and is in good condition. It is the most remarkable feature of housing a library before the foundation of the University, of which the two splendid libraries, consisting of about 60,000 volumes, were in the hands of the university in 1861; it reported in 1852, and it was the constitution of the university Act was passed. This act provided for the appointment of commissioners who (1852) made statutes for each college, excepting Keble and Lincoln, the first and second of which are the chief constituent colleges of the university.

The Ashmolean Museum was added in 1835, and in connexion both with the university and the town was founded in 1677 by the bequests of Charles Drury Edward Fortnum (1820-1899) should be remembered. The nucleus of this collection was formed by John Tradescant, a traveller and botanist (1606-1662), who left it to Elias Ashmole, the first solicitor of the university, which now represents the whole to the university in 1679. When the museum was moved from the Old Ashmolean building, the collection was in great part distributed; hence, books were sent to the Bodleian Library and the University Museum, while the other part formed the basis of the Ashmolean Museum in High Street. The Ashmolean Museum now contains excellent collections of Egyptian, Greek, Roman and British antiquities, and many other objects, among which perhaps the most widely famous is the Alfred bowl, an ornament of crystal, enamelled and gold, bearing King Alfred’s name, and found at Athelney. The University Museum is an extensive building close to the parks, opposite Keble College. Its foundation was the outcome of the necessity of keeping pace in the development of the sciences with the Universities of Europe, and to this end it was founded in 1850. The University Museum is a large building, containing the department of natural history, and the museum. It was built in 1862, and contains the following departments:—medicine and public health, comparative anatomy, physiology, bacteriology, zoology, experimental philosophy, physics, chemistry, geology, geology, and botany, with the Pitt-Rivers ethnographical museum, which had its origin in the collection of Augustus Henry Lane Fox Pitt-Rivers, presented to the university in 1882. Additional buildings contain the Radcliffe Library and various laboratories. The university observatory is in the park, not far from the museum, but an older observatory is that called the Radcliffe (1772-1795), built by the trustees of the Radcliffe bequest. The Radcliffe Observatory, in Woodstock Road, opposite Magdalen College, by the banks of the Cherwell, is the beautiful botanical garden founded by Henry Danvers, earl of Danby, in 1652, with which are connected the botanic gardens of Oxford. In 1837 the University of Oxford was incorporated as a body corporate by an act of the University of Oxford Act (1837). The University of Oxford Act (1837) passed. This act provided for the appointment of commissioners who (1852) made statutes for each college, excepting Keble and Lincoln, the first and second of which are the chief constituent colleges of the university. The highest officer of the university is the chancellor, who is elected by the members of collation, but is generally a distinguished member of the university. He does not take part in the daily work of the university, but is the vice-chancellor, who is, therefore, practically the head. He is nominated annually by the chancellor, and must be the head of a college. He appoints four pro-vice-chancellors, also heads of colleges, to exercise his authority in case of necessity. The high steward is appointed for life, with the duty of trying grave criminal cases when the accused is a resident member of the university. Two proctors are appointed annually by two of the colleges in rotation; their term of office is six years, and they are ex-officio members of the university in statu papilli when these are not within the jurisdiction of their colleges. They are assisted by four pro-proctors. The principal duty of the public orator is that of presenting those who are entitled to an honorary degree with a scroll inscribed in the name of the university on ceremonial occasions. The registrar acts as the recorder of the various administrative bodies of the university, and the secretary to the Board of Visitors for the promotion of research and teaching, and the board of visitors, the board of governors, and the board of examiners, &c., are appointed for terms of six years by the council of the university. The council takes the initiative in promoting,
discussing and submitting to Convocation all the legislation of the university. The Ancient House of Congregation consists of "regents," i.e. doctors and masters of arts for two years after the term in which they take their degrees, professors, heads of colleges and other such officers as may be appointed. The regents are concerned with education and discipline in the university, but it now has practically no functions beyond the granting of degrees. It lost its wider powers under the act of 1854, when the Congregation of the College was established. The regents, however, are certain officials all members of Convocation who have resided for a fixed period within one mile and a half of Carfax, approves or amends legislation submitted by the Hebdomadal Council previously to its submission to the regents. In the meantime, there are boards of curators for the Bodleian Library, the university chest and other institutions, delegates of the commonwealth for the university, the commissioners for the admission and examination of students, and other similar boards. This was followed by the five Regius professorships of divinity, civil law, medicine, Hebrew and Greek, founded by Henry VIII. in 1546.

There are for the above-mentioned colleges, as already seen, consist of a head, whose title varies in different colleges, fellows (who form the governing body) and scholars. To these are to be added the commoners, who are not "on the foundation," i.e. those either who receive no emoluments, or who live on their own private means or on emoluments derived from external sources or by endowments, and are connected with the scholars. The college officer who is immediately concerned with the disciplinary surveillance of members of the college in situ papalii is the dean (except at Christ Church). Each undergraduate (who has already passed an examination for admission to a university or college) is called by his college, who, as regards his studies, under the immediate supervision of one of the fellows as tutor. The university terms are four—Michaelmas (which begins the academic year, and is therefore the term in which the annual election of the presidents of the colleges is held), Hilary or Lent, Easter and Trinity. The last two run consecutively without interval, and for certain purposes count as one; they are kept by three weeks' residence in each, while the two first are kept by six weeks' residence in each, though the term begins speaking on the last day of the first week, i.e. on the 22nd of each month. The examinations required to be passed in order to obtain the first or bachelor's degree may be summarized thus:—

(a) Examinations, usually taken pervy early in the course of study. Examinations in many cases granted when a candidate has passed a certificate examination held by university examiners at the school where he has been educated.

(b) First public examination or School of Molest. This takes place after the ordinary public examination or final school (in this case in literae humaniores is commonly called "Greats") usually takes place at the end of the fourth year of residence. Pass schools and honour schools are in the Latin language in the latter year of residence, and in classes according to merit. No further examination or other exercise is required for the degree of master of arts. Among the numerous scholarships and prizes offered by the university (as distinct from the colleges) a few of the most noted may be mentioned—the Craven, the Oxford and the Ireland classical scholarships on the foundation respectively of John, Lord Craven (d. 1648), who also founded the travelling fellowships which bear his name for the study of antiquities, and of John Ireland, dean of Christ Church, the scholarship commemorating Edward, earl of Derby (chancellor 1852–1866); the law scholarship commemorating John, first earl of Eldon; the chancellor's prizes in Latin verse and English prose (initiated by the chancellor of the university, John Wyndham, in 1531, and by Lord Grenville, 1809); the Newdigate prize for English verse, founded by Sir Roger Newdigate (1806); the Gaisford prizes in Greek verse and prose (1856), commemorating Thomas Gaisford, dean of Christ Church, the chancellor of the university; the scholarship commemorating Thomas Arnold, headmaster of Rugby school; and the theological foundations of Edward Bouvier Pusey and Edward Ellerton, left by the late Lord Magdalen, of which the scholarships, such as the others, are awarded to persons who are already graduates of the university (who must in some cases already have taken a degree); they thus differ from college scholarships, which are generally open only to matriculants. The scholars of the Oxford and Rhodes scholarships (see Rhodes, Cecil) stand alone. They are an adaptation of the college scholarship to a special purpose, and are not in the award of any one college. Arrangements exist whereby members of the two first-mentioned foundations, the Oxford and Corpus Christi, may, under certain conditions, be received as students of any university and from certain colonial and Indian universities. The number of persons who matriculate at Oxford University is about 850 annually.

The principal social functions in the university take place in the colleges, of which there are ten (including Christ Church and Trinity), the college right-armed; bunging races are held, and also, more especially, in "Commemoration Week," at the close of the same term, when the university ceremonies connected with the "College History" and "College History" series (London, 1887); C. W. Boase, Oxford, in "Historic Towns" series (London, 1887); Oxford and Oxford Life, ed. J. Wells (London, 1892).

Oxford, a village in Butler county, Ohio, U.S.A., about 40 m. N.W. of Cincinnati. Pop. (1890) 1022; (1900) 2000. Oxford is served by the Cincinnati, Hamilton & Dayton railway. It is the seat of Miami University (co-educational; chartered in 1809, opened as a grammar school in 1818, and organized as a college in 1824), which had 40 instructors and 1976 students in 1909. At Oxford also are the Oxford College for Women, chartered in 1852, and various other changes of name. The Oxford Female Academy (1830); and the Western College for Women (chartered in 1904), an outgrowth of the Western Female Seminary (opened in 1855). The first settlement on the site was made about 1800.

Oxford, Provisions of, the articles constituting a preliminary scheme of reform enacted by a parliament which met at Oxford (England) on the 21st of June 1258. King Henry III. had promised on the 2nd of May that the state of his realm should be rectified and reformed by twenty-four counsellors who were to meet at Oxford for this purpose five weeks later. Twelve of these counsellors were chosen by the king, and twelve by the earls and barons. When the parliament met, the king and the twenty-four counsellors were his equal and independent ministers. The king, however, took the initiative, and the twenty-four, the initiative being thus reversed, were not equal, but men of the king's own selection, and one of them, the chancellor, was the king's chief minister. Meanwhile it was provided that the sheriffs and the three great officers of state were to hold office for a year only, and to render accounts at the expiration of their terms of office. On the 24th of August in pursuance of a provision by the parliament the king directed four knights in each county to inquire into the trespasses and wrongs which had been committed by sheriffs, bailiffs and other officials. For many of the grievances of the barons the Oxford parliament provided no remedy; and they were only partly redressed by the Provisions of Westminster in the autumn of 1259. The king declared his adhesion to the Provisions of Oxford on the 15th of October by declarations in English, French and Latin, and by the papal dispensation from his oath of observance, he entirely repudiated them. The barons, however, insisted on his obligation
to observe the provisions, and the dispute was eventually referred to the arbitration of Louis IX. of France, who formally annulled them on the 23rd of January 1264, but expressly declared that his decision was not to invalidate the privileges, liberties and laudable customs of the realm of England, which had existed before the time of the provisions.

No official record of the Provisions of Oxford has been preserved, and the above account is based on a report published in the Oxford Mercury and extracts entered in the Annals of Burton Abbey, which are probably not exhaustive, nor in correct order. See the *Annales monastici* vol. i. (Burton), edited by H. R. Luard for the Rolls series (2nd ed., London Commission edition); W. Stubbs, *Constitutional History and Select Charters*, and Charles Bémont, *Simo de Montfort* (1884).

**Oxfordia, in geology, the name given to a series of strata in the middle Oolites which occur between the Corallian beds and the Cornbrash; the division is now taken to include the Oxford Clay with the underlying Callovian stage (q.v.).** The argillaceous beds were called "Clunch Clay and Shale" by William Smith (1815–1816); in 1818 W. Buckland described them under the unwieldy title "Oxford, Forest or Fen Clay."

The term Oxfordian was introduced by d'Orbigny in 1842. The name is derived from the English county of Oxford, where the beds are well developed, but they crop out almost continuously from Dorsetshire to the coast of Yorkshire, generally forming low, broad valleys. They are well exposed at Wyomouth, Oxford, Bedford, Peterborough, and in the cliffs at Scarborough, Red Cliff and Gristhorpe Bay. Rocks of this age are found also in Uig and Skye.

The Oxford Clay is usually bluish or greenish-grey in colour, weathering brown or yellow; in the lower portions it is somewhat more ferruginous. The beds frequently tend to be calcareous and bituminous, while in places there is a considerable amount of lignite. Septaria of large size are common, they have been cut and polished at Radipole and Melbury Osmund in Dorsetshire, where they are known as Melbury marble or "pargetones"; they were used to form table-tops, &c. In Yorkshire the Oxford Clay is usually a grey sandy shale. In the central and southern English counties the Oxford Clay is divisible as follows:

- **Upper zone (1)**
  - *Chalky, sandy, and ironstone nodules.* Chalks with pyritized fossils (subzone of *Liasoceras* Lambeii).
  - *Lower zone of Cardioceras eruciforme.* Shales with pyritized fossils (subzone of *Cosmoreras* Jason).

- **Upper zone contains also Gryphaea dilatata (large forms), Serpula vertebrales, Belemnites hastatus, Aspidoceras parataramum, Cardioceras vertic Subzone of Cardioceras eruciforme.*

- **Lower zone yields Reineckia aneps, Pilococeras athleta, Quarnerostra Marats, Cosmoreras Jason, Cerithium muricatum, and a small form of Gryphaea dilatata.**

The remains of fishes and saurian reptiles have been found. The Oxford Clay is dug for brick-making at Wyomouth, Trowbridge, Chippenham, and other places in Wiltshire.

The "Oxfordian" of the continent of Europe is divided according to A. de Laparrot into an upper (Argovian) and a lower (Neuvizyen) substage. In the former he includes part of the English Coralline Oxfordian (q.v.). The upper part of the lower Oxford Clay is placed in the Divescian or upper substage of the Callovian. In north-west Germany the Oxford Clay is represented by the Hersumber beds. Most of the European formations on this horizon are clays and marls with occasional limestone and ironstone beds.

See Jurassic, Callovian, Corallian. (J. A. H.)

**Oxfordshire** (or Oxon), an inland county of England, bounded N.E. by Northamptonshire, N.W. by Warwickshire, W. by Gloucestershire, S.S.W. and S.E. by Berkshire, and E. by Buckinghamshire; area 755-7 sq. m. The county lies almost wholly in the basin of the upper Thames. This river forms its southern boundary for 71 m., from Kelmscott near Lechlade (Gloucestershire) to Remberham below Henley-on-Thames, excepting for very short distances at two points. The main stream is the boundary line, but from Oxford upward the river often sends out branches through the flat watermeadows. The principal tributaries joining the Thames on the Oxfordshire side do not in any case rise within the county, but have the greater part of their courses through it.

These tributaries are as follows, pursing the main river downwards. (1) The Windrush, rising in Gloucestershire, follows a narrow and pleasant valley as far as Witney, after which it meanders in a broad meadow bordering the Berkshire and Oxfordshire counties, and enters the Thames at Newbridge. (2) The Evenlode, also rising in Gloucestershire, forms the western county boundary for a short distance, and follows a similar but more beautiful valley to the Thames below Eynsham. From the north it receives the Glynme, which joins it on the confines of Blenheim Park, where the woodland scenery is of peculiar richness. (3) Cherwell, also rising in Oxfordshire, enters the county after a course of 10 m. of the eastern boundary, and with a straight southerly course joins the Thames at Oxford. From the east it receives the Ray, which drains the flat land of the Oakley Moor. (4) The Thames, rising in Buckinghamshire, runs south-west and westward with several meanders to the eastern boundary, after which it turns south to join the Thames near Dorchester. Above the point of junction the Thames is often meandering. The north-eastern boundary is formed by the Great Ouse (which descends into the Northamptonshire and Huntingdonshire valley), here a very slight stream, some of whose head-feeders rise within Oxfordshire.

The low hills which lie south of the Windrush, and those between it and the Evenlode (which attain a greater height) are foothills of the Cotswold range, the greater part of which lies in Gloucestershire. Between the Windrush and Evenlode is a flat bed of Wychwood Forest, one of the ancient forests of England, which was a royal forest from the time of John, and was disafforested in 1862. Its extent was 32,535 acres of forest proper. The hills continued north of the Evenlode (but not under the name of Cotswold) at an average elevation over 500 ft. The range terminates at Edge Hill, just outside the county in Warwickshire. The hills bordering the Cherwell basin on the east are of slight elevation, until, running east from Oxford into Buckinghamshire, a considerable line of heights is found north of the Thames valley, reaching 560 ft. in Shotover hill, overlooking Oxford. Across the south-east of the county stretches the bold line of the Chiltern Hills, running N.E. and S.W. On the western brow, Nettleton Common, an extensive plateau, reaches at some points nearly 700 ft. of altitude. This district was probably once a forest, now covered with wood, and there are still many fine beeches, oaks and ash trees. W. Camden in his survey of the British Isles (1586) mentions forests as a particular feature of Oxfordshire scenery, and there are traces still left of natural woodland in various parts of the lower country.

The Thames flows through a deep gap from about Goring downwards, between the Chilterns and the Berkshire Downs. Here, as above at Nuncham and other points, the sylvan scenery is fine, and Henley and Goring are favourite riverside resorts on the Oxfordshire shore. The western feeders of the Thames and Cherwell have much rich woodland in their narrow valleys, and the sequestered village of Great Tew, on a tributary of the Cherwell river, may be singled out as having a situation of classic beauty.

**Geology.**—The influence of the rocky substratum upon the character of the scenery and soil is clearly marked. It is sufficiently point, on the one hand, to the dry chalky upland of the Chiltern Hills and the oolitic limestone hills in the north-west, or the Cornbrash district was probably once a forest, now covered with wood, and there are still many fine beeches, oaks and ash trees. W. Camden in his survey of the British Isles (1586) mentions forests as a particular feature of Oxfordshire scenery, and there are traces still left of natural woodland in various parts of the lower country.

Bridge, Woodstock and Shipston; it forms a broad plateau between Middle Aston and Bicester. Inland also lie the Oxford Clay Plain at Isis, Charlton, Merton and Blackfield Hill; the Yoxford Forest, known as "the home of the Hartle" and Home to the series of limestone caves which thin out eastward and become argillaceous. The Great Oolite limestone, with the "Stonesfield Slate" at the base and underlying the clay, is quarried for building stone at Hornton, and for road metal in many places, and, as it contains a considerable amount of iron oxide, it has been extensively worked for iron at Adderbury, Fauxler and elsewhere. The Upper Lias clays occur in many localities as insignificant outcrops. The Lower Lias clays have been exposed by the Evenlode near Charlbury and by the Cherwell in the upper part of its valley. A hard shelly limestone called Banbury marble occurs in parts of this Lias. Glacial drift is sparingly scattered over the south-western part of the county, but is more plentiful in the north-eastern portion. Valley gravels are associated with the main stream courses and gravel, clay-wittlings and brick earth rest upon much of the chalk slope. Coastal Measures have been proved at a depth of about 1,200 ft. near Burford.

Climate and Agriculture.—The climate is healthy and generally dry except in the low ground bordering the Thames, as at Oxford; but colder than the other southern districts of England, especially in the extreme south-east, the division of which is the most exposed, than in the uplands than in more northerly situations at a lower elevation. In the northern districts there is a strong yet friable loam, well adapted for all kinds of crops. The centre of the county is occupied for cultivation by a good friable but not richly decomposed sandstone, chalk and limestone. A large district in the south-east is occupied by the chalk of the Chiltern Hills, partly wooded pasture arable, and partly used as pasture. The remainder of the county is occupied by a variety of miscellaneous soils ranging from coarse sand to heavy tenacious clay, and occasionally very sandy. Nearly seven-eighths of the area of the county is under cultivation. The staple grain crops is nearly equally divided between barley, oats and wheat. There is a considerable acreage under beans. More than half the acreage under green crops is occupied by turnips, and very little by potatoes. In Oxfordshire the streams there are very rich meadows for grazing, but those on the Thames and Cherwell are subject to floods. The dairy system prevails in many places, but the milk is manufactured into butter, little cheese being made. The improved shorthorn is the most common breed, but Alderney and Devonshire cows are largely kept. Of sheep, Southdowns are kept on the lower grounds, and Leicesters and Cotswolds on the hills. Pigs are extensively reared, the country is much given to pork and bacon.

Manufactures.—Blankets are manufactured at Witney, and tweed, girders and horsecloths at Chipping Norton. There are paper mills at Shiplake, Sandford-on-Thames, Wolvercot and Eysey, using water power; and brick and tile works along the main streams of the Thames. Agricultural implements and portable engines are made at Banbury, and gloves at Woodstock, the last a very ancient industry. Banbury has long been celebrated for the manufacture of coarse woollens and linens. The county is raised (from the middle Lias), and the quarries and clays for brick-making are important, as already indicated. A large number of women and girls are employed in several of the towns and villages in the lace manufacture.

Communications.—The northern line of the Great Western railway, leaving the main line at Didcot Junction in Berkshire, runs north through the county. Oxfordshire is well served for the Worcester line, running north-west by the Evenlode valley, with branches from Chipping Norton junction into Cherwell (Glenthorn), and across the north-west of the county to the north of Oxford. The Great Central railway has a branch from its main line at Woodford in Northamptonshire to Banbury, the north and south express uses the Great Western route southward. Branches of the London and North Western railway from Bicester, Woodstock and Bicester to Banbury, and the Oxford and Midland line, which branches to the south from Oxford and ultimately connects with the Grand Junction and Warwick canals.

Population and Administration.—The area of the ancient county is 483,626 acres, with a population in 1891 of 185,240 and in 1901 of 181,120. The area of the administrative county is 486,673 acres. The municipal boroughs are Banbury (pop. 12,608), Chipping Norton (3780), Henley-on-Thames (5984), Oxford, a city and the county town (40,336) and Woodstock (1684). The urban districts are Bicester (3023), Caversham (6580), Thame (2011), Wheatley (3872), Witney (3574). Bampton (1867) and Burford (1146) in the west, and Wantling (1154) in the south-east, are the other principal country towns. The county is in the Oxford circuit, and assizes are held at Oxford. It has one court of quarter-sessions, and is divided into 17 petty sessions divisions. The borough of Banbury and the city of Oxford have separate courts of quarter-sessions and commissions of the peace, and the borough of Henley-on-Thames has a separate commission of the peace. The total number of civil parishes in 304. Oxfordshire is in the diocese of Oxford, and contains 244 ecclesiastical parishes or districts, wholly or in part. The ancient county is divided (since 1855) into three parliamentary divisions; Banbury or northern, Woodstock or mid, and Henley or southern, each returning one member. It also includes part of the parliamentary borough of Oxford, returning one member, in addition to which the university of Oxford returns two members.

History.—The origin of the county of Oxford is somewhat uncertain; like other divisions of the Mercian kingdom, the older boundaries were entirely wiped out, and the district was renamed after the principal town. The boundaries, except for the southern one, which is formed by the Thames, are artificial. There are fourteen hundreds in Oxfordshire, among them being five of the Chiltern Hundreds. The freeholders over these five belonged to the manor of Benson, and in 1109 to Robert de Harcourt, a name which is still to be found in the county in the Harcourts of Stanton-Harcourt and Nuneham. The county includes small portions of Berkshire and Buckinghamshire, which lie in the hundreds of Bampton and Ploughley respectively. There has been little change in the county boundary; but acts of William IV. and Victoria slightly increased its area.

The district was overrun in the 6th century by the victorious West Saxons, who took Benson and Eysey, as may be seen in the Saxon Chronicle for 571. In the 7th century, the Saxons held all the northern border of the Thames, and during the 8th century this district twice changed hands, falling to Wessex after the battle of Burford, and to Mercia after a battle at Benson. As part of the Mercian kingdom it was included in the diocese of Lincoln. A bishopric had been established at Dorchester as early as 634, when Birinus, the apostle of Wessex, was given an episcopal seat there, but when a bishop was established at Winchester this bishopric seems to have come to an end. Before the Mercian conquest in 777, Oxfordshire was in the diocese of Sherborne. In 873 the jurisdiction of Dorchester reached to the Humber, and when the Danes were converted it extended over Leicestershire and Lincolnshire, Oxfordshire forming about an eighth of the diocese. At the Conquest there was no alteration, but in 1093 the see was transferred to Lincoln. In 1542 a bishopric of Osney and Thame was established, taking the see of Oxford, the last bishop of which was created Bishop of Oxford in 1546. The new bishopric of Oxford was established. The ecclesiastical boundaries remain as they were when archdeacons were first appointed—the county and archdeaconry being conterminous—and the county being almost entirely in the diocese of Oxford. The Danes overran the county during the 11th century; Thurlkill's army burnt Oxford in 1010, and the combined armies of Sweyn and Olaf crossed Watling Street and ravaged the district, Oxford and
Winchester submitting to them. In 1018 Danes and Englishmen chose Edgar's law at an assembly in Oxford, and in 1362, on Canute's death, his son Harold was chosen king. Here also took place the stormy meeting following the assembly (gemot) at Northampton, in which Harold allowed Tostig to be outlawed and Morkere to be chosen earl in his place, thus preparing the way for his own downfall and for the Norman Conquest. The destruction of houses in Oxford recorded in the Domesday Survey may possibly be accounted for by the ravages of the rebel army of Eadwine and Morkere on this occasion, there being no undisputed mention of a siege by William. Large possessions in the county fell to the Conqueror, and also to his rapacious kinsman, Odo, bishop of Winchester. The bishop of Lincoln also had extensive lands therein, while the abbeys of Abingdon, Osney and Godstow, with other religious houses, held much land in the county. Among lay tenants in chief, Robert D'Oilly, heir of Wigod of Wallingford, held many manors and houses in Oxford, of which town he was governor. The importance of Oxford was already well established; the shire moot there is mentioned in Canute's Oxford laws, and it was undoubtedly the seat of the county court from the first, the castle being the county gaol. The principal historical events between this period and the Civil War belong less to the history of the county than to that of the city of Oxford (q.v.). The dissolution of the monasteries, though it affected the country greatly, caused no general disturbance.

When King Charles I. won the first battle of the Civil War at Edgehill (23rd of October 1642), Oxford at once became the material and moral stronghold of the royalist cause. Every manor house in the district became an advanced work, and from Banbury in the north to Marlborough in the west and Reading in the south the walled towns formed an outer line of defence. For the campaign of 1643 the rôle of this strong position was to be the detention of the main parliamentary army until the royalists from the north and the south could converge on the town, after which the united royal forces were to close upon London on all sides, and in the operations of that year Oxfordshire successfully performed its allotted functions. No serious breach was made in the line of defence, and more than once, notably at Chalgrove Field (18th of June 1643), Prince Rupert's cavalry struck hard and successfully. In the campaign of Newbury which followed, the parliamentary troops under Essex passed through north Oxfordshire on their way to the relief of Gloucester, and many confused skirmishes took place between them and Rupert's men; and when the campaign closed with the virtual defeat of the royalists, the fortresses of the county offered them a retreat which Essex was powerless to disturb. The following campaign witnessed a change in Charles' strategy. Realizing his numerical weakness he abandoned the idea of an envelopment, and decided to use Oxfordshire as the stronghold from which he could strike in all directions. The commanding situation of the city itself prevented any serious attempt at investment by dividing the enemy's forces, but material wants made it impossible for Charles to maintain permanently his central position. Plans were continually resolved upon and cancelled on both sides, and eventually Essex headed for the south-west, leaving Waller to face the king alone. The battle of Cropredy Bridge followed (20th of Jan.), and the victorious king turned south to pursue and capture Essex at Lostwithiel in Cornwall. In the remaining operations of 1643 Oxfordshire again served as a refuge and as a base (Newbury and Donnington). With the appearance on the scene of Cromwell and the New Model Army, Oxfordshire was in a state of constant fluctuation. On the 20th of April 1645, the future Protector carried out a daring cavalry raid. He caught and scattered the royalists unawares at Islip; then he pursued the fugitives to Bletchingdon and terrified the governor into surrendering. He swept right round Oxford, fought again at Banpton, and finally rejoined his chief, Fairfax, in Berkshire. A few days later Charles again marched away northwards, while Fairfax was ordered to besiege Oxford. In spite of the difficulties of the besiegers Charles was compelled to turn back to relieve the city, and the consequent delay led to the campaign and disaster of Naseby. Yet even after Naseby the actual position of Oxfordshire was practically unshaken. It is true that Abingdon with its parliamentary garrison was a standing menace, but the districts east of the Cherwell and Thames, and the triangle bounded by Oxford, Faringdon and Banbury, still retained its importance, till early in 1649 the enemy closed from all sides on the last stronghold of royalism. Stow-on-the-Wold witnessed the final battle of the war. On the 9th of May Baumber surrendered, and two days later Oxford itself was closely invested. On the 24th of June the city capitulated, and three days later Wallingford, the last place to give in, followed its example.

The war left the county in an exceedingly impoverished condition. Its prosperity had steadily declined since the early 14th century, when it had been second in prosperity in the kingdom, owing its wealth largely to its well-watered pastures, which bred sheep whose wool was famous all over England, and to its good supply of water power. Salt is mentioned as a product of the county in Domeday Book. Various small industries grew up, such as plash-making at Banbury, leather works at Bampton and Burford, gloves at Woodstock, and malt at Henley. Glass was made at Benson and Stokenchurch in the reign of Henry VI., and the wool trade continued, though not in so flourishing a state, Witney retaining its fame in blanket-making. The pestilence of 1349, the conversion of arable into pasture land, and the enclosure of common land in the early 16th century had led to agricultural depression and discontent. In 1530 the enclosure of Otmoor led to serious riots, in which the people gathered in Oxford at St Giles' fair joined. The county was represented in parliament in 1280 by two members.

Antiquities.—The remains of castles are scanty. The majority of them were probably built for defence in the civil strife of Stephen's reign (1137–1153), and were not maintained after the end of the wars. The castle at Woodstock was in ruins at the beginning of a campaign of the Earl of Wiltshire against the king; the castle of the earl of Shrewsbury at Bampton, the seat of Aylmer de Valence in 1313. Among remains of former mansions there may be noted the 14th century Greys Court near Henley-on-Thames. Minister Lovell, on the Windrush above Witney, and Ryecote, between Thame and Oxford. Minister Lovell, the extensive ruins of which make an exquisite picture by the river-side, was the seat of Francis, Lord Lovel, who, being the son of a Lancastrian father, incurred the hatred of that party by serving Richard III., and afterwards assisted the cause of Lambert Simnel, mysteriously disappearing after the battle of Stoke. The remains of Ryecote (partly incorporated with a farm-house) are of fine Elizabethan brick and tile, and in the chapel attached to the manor house there is remarkable Jacobean woodwork, the entire fittings of the church, including the canopied pew and altar-table, being of this period. Here Elizabeth was kept in 1554, before her accession, and afterwards resided as queen. Of ancient mansions still inhabited, the finest is Broughton Castle near Banbury, dating from 1301. Others are Shirburn Castle, begun in 1377, but mainly Perpendicular of the next century; Stanton Harcourt, dating from 1450, with a gatehouse of 1540, a vast kitchen, and Pope's Tower, named from the poet, who stayed here more than once. Mapledurham, on the Thames above Reading, is a fine Tudor mansion of brick; and Water Eaton, on the Cherwell above Oxford, is a singularly perfect Jacobean house of stone, with a chapel of the same period resembling pure Perpendicular. Of other mansions in the county Blenheim Palace, at Woodstock, must be mentioned. The former Burford House (now replaced by a Georgian building), near Wheatley, was the scene in 1646 of the wedding of Ireton, the soldier of Cromwell, with his leader's daughter Bridget. The influence of such a centre of learning as the university was naturally very great upon the ecclesiastical history of the neighbourhood. A large number of monastic foundations arose; such as those of Augustinian canons at Bicester, Caversham, Cold Norton, Dorchester, Osney (a magnificent foundation just outside the walls of Oxford) and Wroxton; of Cistercians,
at Bruen and Thame; of Benedictines, at Cogges, Eyesham, Milton; of Mathurins, at Nuffield; of Gilbertines, at Clattercote; of Templars, at Sandford-on-Thames. There was at Gosford one of the only two preceptors of female Templars in England. Of all these, excepting the abbey church at Dorchester, remainscantsy. A few domestic buildings remain at Studley; the boundary walls still stand of Godstow Nunnery on the Thames, the retreat and burial-place of Rosamund Clifford of 1176. The abbey church belongs to II.'s famous courtship; and there are traces of Revely Abbey within Oxford.

In ecclesiastical architecture Oxfordshire, apart from Oxford itself, is remarkably rich, but there is no dominant style, nearly all the churches being of mixed dates. In fact, of the most important churches only Iffley, Adderbury and Minster Lovell need be taken as examples. The church of Iffley, formerly on the banks of the Thames 1 m. S. of Oxford, is one of the finest examples of normal Oxford in England, with a highly ornate west front. Adderbury 4 m. S. of Banbury, is a great cruciform Decorated church with a massive central tower and spire. Minster Lovell, also cruciform, is pure Perpendicular; its central tower is supported, with beautiful and unusual effect, on four detached piers. For the rest, one feature common to several is to be noticed. The short un규나리 of the Oxford cathedral was among the earliest, if not the first, constructed in England, and served as a model from which were probably developed the splendid central spires of the great churches at Winney, Hampton, Shipton-under-Wychwood and Bradwell. There are some remarkable monastic foundations in Oxfordshire, such as King's Sutton (across the border in Northamptonshire), which are locally proverbial as typifying length, strength and beauty. Bloxham church, marked Decorated with Norman portions and a re-modelled Early English west front, is one of the most beautiful in the county. In the west Burford (Norman and later) is noteworthy, and in the porch of the fine Norman church of Little Haddingley is preserved a beautiful large wooden statue of a horseman and his hound. At South Leigh are remarkable mural paintings of the 15th century. About 5 m. N. of Oxford there are Kidlington (Decorated) with a beautiful needle-like Perpendicular spire, and Isisip, which, as the birthplace of Edward the Confessor, retains a connexion with his Abbey of Westminster, the Dean and Chapter of which are lords of the manor and patrons of the living. In the south-east, Dorchester church, with its wave of transitional Norman, has a curious Decorated tower surmounted by a vestry and the minstrels' gallery of the patriarch. At Cuddesdon there is another large cruciform church, Norman and later. Ewelme church (Perpendicular) is remarkable for the tomb of Alice, Duchess of Suffolk (1475), gorgeous with tracery and gilded canopy, and that of Sir Thomas Chaucer (1454), ornamented with enamelled coats of arms. Here William de la Pole, Duke of Suffolk, founded in 1436 the picturesque hospital and free school still standing.

GENERAL HISTORY OF OXFORDSHIRE (Oxford, 1677, 2nd ed. 1705); Shelton, Engraved Illustrations of the Principal Antiquities of Oxfordshire, from drawings by T. Mackenzie (Oxford, 1835); Sir T. Phillips, Oxfordshire Pedigree (Evesham, 1825); J. Haywood, History of Oxfordshire (Oxford, 1898); and Oxfordshire Antiquary (Oxford, 1869).

OXIDE--OXIMES

In chemistry, a binary compound of oxygen and other elements. In general, oxides are the most important compounds with which the chemist has to deal, a study of their composition and properties permitting a valuable comparative investigation of the elements. It is possible to bring about the direct combination of oxygen with most of the elements (the presence of traces of water vapour is generally necessary according to the researches of H. B. Baker), and when this is not so, indirect methods are available, except with bromine and fluoride (and also with the heavier alkali metals, &c., which so far have yielded no oxides). Most of the elements combine with oxygen in several proportions, for example nitrogen has five oxides: N₂O, NO, N₂O₅, NO₂, N₂O₃; for classificatory purposes, however, it is advantageous to assign a typical oxide to each element, which, in general, is the highest having a basic or acid character. Thus in Group I. of the periodic system, the typical oxide is Mo₂, of Group II. MO, of Group III. MoO₃, of Group IV. MO₃, of Group V. MoO₄, of Group VI. MO₅.

Five species of oxides may be distinguished: (1) basic oxides, (2) acidic oxides, (3) neutral oxides, (4) peroxides, (5) mixed hydrides (acid oxides with acids or salts). Basic oxides combine with acids or bases to form salts; similarly acidic oxides combine with basic oxides to form salts also. The former are more usually yielded by the metals (some metals, however, form oxides belonging to the other groups), whilst the latter are usually associated with the non-metals. An oxide may be both acidic and basic, i.e. combine with bases as well as acids; this is the case with elements occurring at the transi-

On the combination of oxygen with elements, it is often seen that a more basic compound is formed, e.g. aluminium and zinc. Neutral oxides combine neither with acids nor bases, and are often used to give a base or acid. A typical member is nitric oxide; nitrous and nitric oxides may also be put in this class, but it must be remembered that these oxides may be regarded, in some measure at least, as the decomposition products of other oxides. Although, at the same time, it is impossible to obtain these acids by simple combination of these oxides. Peroxides in most cases are defined as oxides containing more oxygen than the typical oxide. The failure of this definition to embrace all compounds, under that name, is obvious. Group II. is peculiar in containing two oxides, one typical and one peculiar, having peroxides in properties, but it is also the typical oxide of Group IV. to which lead belongs. All peroxides have oxidizing properties. Peroxides may be basic or acidic. Some basic oxides yield hydroxides (i.e. basic oxides with bases), e.g. lead(IV) oxide (lead chloride from hydrochloric acid), and may combine with lower acidic oxides to form salts of the normal base with the higher acidic oxide. Examples are BaO₂ + H₂SO₄ = BaSO₄ + H₂O; 2MnO₂ + 2H₂O = Mn₂O₃ + 2H₂O; 2H₂O + Cl₂ = H₂Cl₂ + Cl₂; PbO₂ + SO₃ = PbSO₄ (i.e. PbO + SO₂). Two species of basic peroxides may be distinguished: (1) the superoxides or peroxides, containing the oxygen atoms in a chain, e.g. Na₂O₂·O₃; (2) the polyperoxides, having the oxygen atoms doubly linked to the metallic atom, e.g. Mn₂O₃·O₃; and giving oxygen with sulphuric acid and chlorine with hydrochloric acid. L. Marino (Zeit. anorg. Chem., 1907, 56, p. 233) pointed out that manganese and lead dioxide behaved differently with sulphur dioxide, the former giving dithionate and the latter sulphate, and suggested the following formulæ: 

\[ \text{Mn}_2\text{O}_3 + \text{O}_2 \rightarrow \text{Mn}_2\text{O}_4 \] 

\[ \text{Mn}_2\text{O}_4 + \text{O}_2 \rightarrow \text{Mn}_2\text{O}_5 \] 

oxidation and reduction. In the narrow sense "oxidation" may be regarded as the combination of a substance with oxygen, and conversely, "reduction" as the abstraction of oxygen; in the wider sense oxidation includes not merely the addition of oxygen, but also of other electro-negative elements or groups, or the removal of hydrogen or an electro-positive element or group. In inorganic chemistry oxidation is associated in many cases with an increase in the oxidation number of the element. The process, as a rule, simply brought about by heat or some other form of energy, we may regard an oxidizing agent as a substance having a strong affinity for electro-positive atoms or groups, and a reducing agent as having a strong repulsive power. When both a reducing and an oxidizing agent are introduced into a solution, they will both combine and processes the oxidizing agent suffers reduction and the reducing agent oxidation.

Some substances undergo simultaneous oxidation and reduction when treated in a particular manner; this is known as self- or autooxidation. For example, on boiling an aqueous solution of a hypochlorite, a chlorate and a chloride results, part of the original salt being oxidized and part reduced: 2NaClO₃ = NaClO₄ + NaClO; similarly phosphorus and hypophosphorous acids give phosphoric acid and phosphine, whilst nitric acid gives nitric acid and nitric oxide: 2H₃PO₃ = 3H₂PO₄ + P₃H₅; 2HNO₃ = HNO₂ + NO; HNO₂ = H₂O + NO + O₂. One of the most remarkable autodoxides is that of cabbage, which is Cannizzaro's reaction wherein an aromatic aldehyde gives an acid and an alcohol: 2CH₃CHO + H₂O = C₆H₅COH + CH₃CH₂OH.

The important oxidizing agents include: oxygen, ozone, peroxides, nitric acid, hypochlorous acid and its salts, and those of chlorine, bromine and iodine, and also chromic and permanganic acid. The important reducing agents include hydrogen, hydrides such as those of iodine, sulphur, phosphorus, &c., carbon, many metals, potassium, sodium, aluminium, magnesium, &c., salts of lower oxycacids, lower salts of metals and lower oxides.

OXIMES, in organic chemistry, compounds containing the grouping > C: N: O: OH, derived from aldehydes and ketones by condensing them with hydroxylamine. Those derived from aldehydes are known as aldoximes, those from ketones as ketoximes. They were first prepared by V. Meyer in 1882 (Ber., 1882, 15, pp. 1324, 1525, 2778). They are either colourless liquids, which boil without decomposition, or crystalline solids; and are both basic and acidic in character. On reduction by sodium amalgam in glacial acetic acid solution they yield primary amines. They are hydrolysed by dilute mineral acids
yielding hydroxylamine and the parent aldehydes or ketones. The aldoximes are converted by the action of dehydrating agents into nitriles: RCH : NOH → R : C = N + H₂O. The ketoximes by the action of acetyl chloride undergo a peculiar intramolecular re-arrangement known as the Beckmann transformation (E. Beckmann, *Ber.*, 1886, 19, p. 989; 1887, 20, p. 2380), yielding as final products an acid-amide or anilide, thus: R(C : N)OH + R'C'R'' → R : CONHR'H.

As regards the constitution of the oximes, two possibilities exist, namely: >C = NOH, or >C = NH, and the first of these is presumably correct, since on alkylation and subsequent hydrolysis an alky hydroxylamine of the type NH₂OR is obtained, and consequently it is to be presumed that in the alkyoxime oxime the alkyl group is attached to oxygen, and the oxime itself therefore contains the hydroxylamine part of the oxime. The aldoximes and of unsymmetrical aromatic ketones frequently exist in isomeric forms. This isomerism is explained by the Hantzsch-Werner hypothesis (*Ber.*, 1890, 23, p. 11), in which the assumption is made of the Beckmann rearrangement (*Ber.*, 1891, 24, p. 131; thus: R : C = NH + R'C'R'' = R : CONHR'H (R' and OH, _"syn"_).

Oxime oxides are usually rather more difficult to prepare than aldoximes, and are generally on account of the presence of a fairly concentrated alkaline solution. They may also be prepared by the reduction of pseudo-nitriles (R. Scholl, *Ber.*, 1896, 29, p. 87), the reaction probably being:

RR : C(NO₂)NO → RR : C(NH₂)OH + RR : C(NO₃)OH + H₂O.

Oximes are also obtained by the action of hydroxylamine hydrochloride on the aldehydes in presence of sodium carbonate; the oxime being then usually extracted from the solution by ether. They may be prepared in large quantities by the action of hydrazoic acid on the aldehydes. Hydroxylamine hydrochloride, and the oxime hydrochlorides separate from the gaseous solution of hydrazoic acid, the former nitro compound with stannous chloride and concentrated hydrochloric acid, by the reduction of unsaturated nitro compounds with aluminium amalgam or zinc dust in the presence of dilute acetic acid (L. Bouveault, *B. C.* 1892, 134, p. 1144; R.C.1906, 9, p. 116; C. 1906, 2, p. 22) or with the action of iron: CH₃CH₂ : NOH → CH₂ = CH : NOH, and by the action of alkali, kollides on the sodium salt of hydroxylamine (A. Angeli, *Rend. Acad. d. Lint.*, 1905, 5, (14), p. 411, the cycle of reactions probably being as follows:

NO₂ + NOH → NO₂H + NOH, HNO₂ + NOH → HNO₃ + HNO₂ + NOH → HNO₂ + HNO₂ + NOH → HNO₃ + HNO₂ + NOH → HNO₂ + HNO₂ + NOH → HNO₃ + HNO₂ + NOH

**Formaldehyde oxime**, (CH₂ : NOH), was obtained by W. R. Dunstan (*Jour. Chem. Soc.*, 1893, 73, p. 110), by the addition of hydroxylamine hydrochloride to an aqueous solution of formaldehyde in the presence of sodium carbonate; the resulting solution was extracted with ether and the oxime hydrochloride precipitated by gaseous hydrochloric acid, the precipitate being then dissolved in water, the solution exactly neutralized and distilled. It boils at 83-85 °C, and is converted into a solid polymer, probably (CH₂ : NOH)₈, by heating. In the absence of water, it forms salts of the type (CH₂ : NOH : H)₈ with acids. It behaves as a powerful reducing agent, and on hydrolysis with dilute mineral acids is decomposed into formaldehyde and hydroxylamine, together with some formic acid and ammonia, the amount of each product formed depending on the amount of water present, &c.

Formaldehyde oxime is a liquid, by the addition of hydroxylamine hydrochloride to an aqueous solution of formaldehyde in the presence of sodium carbonate; the reacting solution was extracted with ether and the oxime hydrochloride precipitated by gaseous hydrochloric acid, the precipitate being then dissolved in water, the solution exactly neutralized and distilled. It boils at 83-85 °C, and is converted into a solid polymer, probably (CH₂ : NOH)₈, by heating. In the absence of water, it forms salts of the type (CH₂ : NOH : H)₈ with acids. It behaves as a powerful reducing agent, and on hydrolysis with dilute mineral acids is decomposed into formaldehyde and hydroxylamine, together with some formic acid and ammonia, the amount of each product formed depending on the amount of water present, &c.

This latter reaction is probably due to some of the oxime existing in the form of the monomer, CH₂ = NOH + H₂O = CH₂OH + NOH. Acetyl- and benzoyl-formaldehyde oximes are derivatives of the threefold polymer form. The oxime being, however, decomposed by concentrated hydrochloric acid and one of sodium carbonate to stand for some time in a desiccator.

Acetaldehyde oxime, (CH₃ : NOH), crystallizes in needles which melt at 47 °C. On continued fusion the melting point gradually sinks to 10 °C. Acetaldehyde oxime is obtained when one molecular proportion of hydroxylamine hydrochloride is warmed with four molecular proportions of hydroxylamine hydrochloride and one with water. It crystallizes in prisms which melt at 30 °C. A chloro acetaldehyde oxime, CH₂ : CH₂ : NOH, melts at 98 °C. Acetylated acetaldehyde oxime, with two molecular proportions of hydroxylamine hydrate with a chloro formic acid and one of sodium carbonate to stand for some time in a desiccator.

Glutaraldehyde oxime, (CH₃ : NOH), obtained from glyoxal and hydroxylamine, or by boiling amido dichloride with excess of hydroxylamine hydrochloride and water, melts at 178 °C, and is readily soluble in hot water.

**Sucinic aldehyde dioxide**, HON : CH₂CH₂ : CH : CH₂ : NOH, is obtained by boiling an alcoholic solution of pyrrol with hydroxylamine hydrochloride and anhydrous sodium carbonate (G. Ciamician, *Ber.*, 1896, 29, p. 531). It melts at 173 °C.; and on reduction with sodium and alcoholic solutions of tetramethyleneamine, solution of caustic potash solutions it to ammonia and succinic acid.

Acetoxime.—The oxime (benz-anti-aldoxime) is formed by the action of hydroxylamine on benzaldehyde. It melts at 35 °C., and boils at 117 °C. (14 mm.). Acids convert it to the β-oxime (benz-syn-aldoxime) which melts at 125 °C. When distilled under diminished pressure on the β-form reverts to the α-modification (see Beckmann, *Ber.*, 1887, 20, p. 2766; 1886, 22, p. 495, 513; 1887, 513.

**Formaldehyde oxime** is obtained by the action of hydroxylamine hydrochloride on mesityl oxide, the hydrochloride so formed being decomposed by sodium carbonate. It crystallizes in plates which melt at 48-49 °C., and boil at 92 °C. (9 mm.). When boiled for some time with caustic soda, it is converted into hydroxy-mesityl oxime, which boils at 83-84 °C. (9 mm.). Both forms are volatile in steam. The oxime, on long continued boiling with a concentrated solution of hydrochloric acid, is partially decomposed with formation of some acetone and oxime (C. 1891, 29, p. 1851; 1892, 32, p. 1331). By the direct action of hydroxylamine on a methyl alcohol solution of mesityl oxide in the presence of sodium metal it is converted into mesityl oxime, H₂C : C(NH₂)OH : CH₃COOH, which is formed by the Beckmann reaction, and is converted into oximes, and these latter with dilute mineral acids are transformed into acyl amino-acids; thus from cyclohexanone, α-aminocaproic acid (ε-lemucine) may be obtained:

CH₃CH₂ : CH₂ : CH₂ : CH₂ : CH₂ : CH₂ : C : NOH → CH₃CH₂ : CH₂ : CH₂ : CH₂ : CH₂ : CH₂ : C : NH → CH₃CH₂ : CH₂ : CH₂ : CH₂ : CH₂ : CH₂ : C : N

An ingenious application of the fact that oximes easily lose the elements of water and form nitriles was used by A. Kohl (*Ber.*, 1893, 26, p. 739) in the "breaking down" of the sugars. Glucose-oxime on warming with acetic acid solution, on the addition of concentrated sulphuric acid, it is converted into aceticanilide. Benzophenone oxime oxime, CH₃ : (NO₂)CH₂ : NH₂, exists only in one modification which melts at 150 °C.; whereas the unsymmetrical benzophenones each yield two oximes. O. Wallach (*Ann.*, 1900, 312, p. 171) has shown that the saturated cyclic ketones yield oximes which by an application of the Beckmann reaction are converted into isoximes, and these latter with dilute mineral acids are transformed into acetyl amino-acids; thus from cyclohexanone, α-aminocaproic acid (ε-lemucine) may be obtained:

OXUS, or AMU DARYA, one of the great rivers of Central Asia. Prior to the meeting of the commissions appointed for the determination of the Russo-Afghan boundary in 1885, no very accurate geographical knowledge of the upper Oxus regions existed, and the course of the river itself was but roughly mapped. Russian explorers and natives of India trained for geographical reconnaissance, and employed in connexion with the great trigonometrical survey of India, had done so much towards clearing away the mists which enveloped the actual course of the river, that all the primary affluents were known, although their relative value was misunderstood, but the nature of the districts which bordered the river in Afghan Turkestan was so imperfectly mapped as to give rise to considerable political complication in framing the boundary agreement between Great Britain and Russia. From Lake Victoria (Sor-Kul) in the Pamirs, which originally remained as the true source of the river, to Khamiab, on the edge of the Andkhil district of Afghan Turkestan, for a distance of about 680 m., the Oxus forms the boundary between Afghanistan and Russia. For another 550 m. below Khamiab it follows an open and sluggish course till it is lost in the Sea of Aral, being spanned at Charjui, 150 m. below Khamiab, by the wooden bridge which carries the Russian railway from Merv to Samarkand. The level of Lake Victoria is 1,340 ft. above sea. At Khamiab the river is probably rather less than 300 ft.

For many years a lively geographical controversy circled about the sources of the Oxus, and the discussion derived some political significance from the fact that the true source, wherever it might be found, was claimed as a point in the Russo-Afghan boundary. The Pamirs, the heads of all the chief tributaries of the river, lay hidden. By the Pamir boundary commission of 1855 established the following topographical facts in connexion with this question. The elevated mountain chain which is now called the Nicolas range, which divides the Great from the Little Pamir, is a region of vast glaciers and snow-fields, from which the lakes lying immediately north and south derive the greater part of their water-supply. On the north the principal glacial tributary of Lake Victoria forms, within the folds of the gigantic spurs of the Nicholas mountains, a series of smaller lakes, or lakelets, before joining the great lake itself. On the south a similar stream starting farther east, called Burgutal (denoting the position of a difficult and dangerous pass across the range) sweeps downwards towards Lake Chakmaktin. The lake itself lies at the foot of the Pir Ham, where there are warm springs on the bed of Lake Victoria, as such springs are of frequent occurrence in the Pamirs; but there is no indication of them in the Chakmaktin basin, and the latter lake must be regarded rather as an incident in the course of the Aksu — a widening of the river channel in the midst of this high-level, glacier-formed valley than as the fountain-head of the infant stream. There are indications that the bed of Lake Victoria, as well as that of Chakmaktin, is rapidly silting, and that the shores of the latter are gradually receding farther from the foot of the hills. The glacial origin of the Pamir valleys is everywhere apparent in their terrace formations and the erratic blocks and boulders that lie scattered about their surface. It is probable that the lakes themselves are evidence of this. Finally, a comparatively recent delivernce from the thraldom of the ice covering, which has worn and rounded the lower ridges into the smooth outlines of undulating downs.

Another important source of the river (considered by Curzon to be the chief source) is to be found in the enormous glaciers which lie about the upper or main branch of the Ab-i-Panja (called the Ab-i-Wakhjir or Wakhjan), which rises under the mountains enclosing the head of the Taghdumbash Pamirs. Although the superficial area of glacial ice from which the Ab-i-Wakhjir derives the greater part of its volume is not equal to that found on the Nicolaz range, it is quite impossible to frame any estimate of comparative depth or bulk, or to separate the volume of its contributions at any time from those which, combined, derive their origin from the Nicolaz range. If the Aksu (or Murghab) and the Pamir river from Lake Victoria are to be considered in the light of independent tributaries, it is probable that the Ab-i-Panja contributes as large a volume of glacial water as the Oxus proper from Lake Victoria. From the point where the rivers of the Great and Little Pamirs join their forces at Kala Panja to Ishkashim, at the elbow of the great bend of the Oxus northwards, the river valley has been surveyed by Woolthorpe; and the northern slopes of the Hindu Kush, which near Ishkashim extend in slopes of barely 10 m. in length from the main watershed to the river banks, have been carefully mapped. These slopes represent the extent of Afghan territory which exists north of the Hindu Kush between Kala Panja and the north end of the Pamirs and the Pamir river passes through the narrow rock-bound valleys of Shignan and Roshan ere it sweeps north and west through the mountains and defiles of Darwaz. By the terms of the boundary agreement with Russian Turkestan, the Oxus and Darwaz are to be considered as forming a part of the districts of Shignan, Shigan and Bokhara, which formerly maintained an uncertain claim over a part of the territory on the left bank of the river. All this part of the Oxus, until the river once again emerges from the Bokhara hills to the open plains stretching from Badakshan on the north, falls within the area of Russian surveys, with which a junction from India has been effected both on the Pamirs and in Turkestan. The narrow, cramped valley of the river between Ishkashim and Kala Wamar, the river which rises in the Little Pamir, and which is called Aksu, Murghab, or Bartang, joins the Oxus from the east. It is on this river that the Russian outpost, Murghab (or Panirski), is situated, at an elevation of 12,150 ft. above sea. Fort Murghab is connected by a good military road with Osh. At this point the measures of the Oxus are as follows:—

- To the head of the Aksu at Lake Chakmaktin, 260 miles.
- To the head of the most easterly tributary of Lake Victoria, 23 miles.
- To the head of the chief glacial stream of the Aksu, about 130 miles.
- Distance of the Aksu from Kala Wamar, about 10 miles.

For 120 m. the two latter are united in the mainstream of the Oxus, the volume of which has been further increased by the united forces of the Ghund and Shakhddara draining the Alchir Pamir and the heights of Shigan. The narrow cramped valley of the river between Ishkashim and Kala Wamar is hedged in on the west by a long ridge flanking the highlands of Badakshan; on the east the buttresses and spurs of the Shigan mountains (of which the strike is north-south) are joined to the Pamirs, which, parallel to that of the main Hindu Kush watershed, overhang its channel like a wall, and afford but little room either for cultivation or for the maintenance of a practicable road. Yet the lower elevation (for this part of the Oxus stream is not more than about 7000 ft. above sea-level) and comparatively mild climate give opportunities to the industrious Tajik population for successful agriculture, of which they are not slow to avail themselves. A true and straight road from the Kala Panja opposite the Ghund (or Suchan) debouchment, which is practicable for mules. There are no bridges, and the transit of the river from bank to bank can only be effected by the use of inflated skin boats. The true bed of the river is often much narrowed, and the difficulties of the river route increase. Between Kala Wamar (6850 ft.) and Kala Khum (4400 ft.), where the Oxus again bends southwards, its course to the north-west is also at this part through the lowlands of the Ghund, which is from north-east to south-west, following the usual conformation of all this part of high Asia. Thus its chief affluent from the north-east, the Wanj and the Yez Ghulam, drain valleys which are comparatively open, and which are said to be splendidly fertile.
OXUS

Kala Khum the river is 480 ft. wide, narrowing to 350 ft. in the narrowest gorge. Its level varies with the obstructions formed by the ice-capturing as much as 28 ft. when its upper channels are blocked.

The climate of eastern Bohkara and Darwaz is delightful in summer, and Dr Regel writes of its Alpine scenery and flora in terms of «most perfect and harmonious»; the northern valley of the Oxus, and the Surkhab to the north of Darwaz, which form an important part of the province of Karategin, maple, ash, hawthorn, pistachio, and juniper grow freely in the mountain districts. Poplar is a little before the town of Khawaja Salar, which is widely cultivated. About the cliffs and precipices of the Panja valley near Kala Khum the wild vine, cressus, and pomegranate are to be found, and the plane tree and mulberry flourish in groups near the Oxus, while in the villages the plane is the standard coro nates village gardens.

The houses are built of stone and mortar, and above the thatched straw roof which surmounts the double-storied buildings the square water-tower rises gracefully. Every village at an elevation possesses a water-tower, and on the whole the Aryan Tajiks of this northern section of the Oxus valley seem to be well provided with most of the comforts, if not the luxuries, of life. Their language is the language of Bohkara and Samarkand. Bohkaran supremacy was re-established in 1802, when Kala Khum was occupied by Bokharian troops. Since then the right bank of the river has been politically divided from the left, and the latter now belong to Afghanistan. From Kala Khum, which lies north of the great bend of the Oxus round Badakshan, the river flows south-western course for another 50 m. through a close poplar-grove, beyond which are the more open valley to the south of Kolab. It now becomes a river of the plains from which the mountains on either side stand back. The topography of Darwaz south of the river is not accurately known, but it is clear that its course, 400 m. in length before it enters the Oxus, is accompanied by a belt of poplar-grove, divided by the Oxus, which joins nearly opposite to the lateral valleys of the Oxus. The river, which is called Pungi-Shiwa, or Shiwa, but not much is known about it. Another of about equal length, starting from the same central water-parting of this mountain block, and included within the Oxus bend, follows a transverse course through the Oxus valley near its debouchment into the more open Kolab plains, where the course of the Oxus again assumed a direction parallel to the mountain sides. All that we know about this river (which is called Bacchus) is that it is called through successive mountain ranges, which renders its course impracticable as a roadway. It is necessary to avoid the river, and to pass by mountain tracks which surround a series of local spurs or offsets from the central plateau, in order to reach the Oxus. The existence of this route, which traverses the Darwaz mountains eastwards to west, cutting off the northern bend of the Oxus, and connecting those easterly routes which intersect the Oxus valley near Lake Shiwa with Kolab in eastern Bohkara, is important. (See BADAKSHAN.)

From about the point where the Oxus commences to separate the valley of the Surkhab from those of the districts of Rustak and Kataghan, the channel of the river is no longer confined within walls of mountains of volcanic and schistose formation. The Kolab and the Volunteers (or a tributary) flow into it in broad muddy streams from the highlands of Karategin, and the river at once commences to adopt an uncertain channel wherever the out-stretched arms of the hills fail to confine it within definite limits. It divides its waters, splitting into many channels, leaving broad central islands; and as the width increases, and the depth during dry seasons diminishes, opportunities for fords become comparatively frequent. Between Kala and Kata Kesari, immediately north of the Bolghar, there is a sand bar, with a line of dead gulls, known as "gazars" or fords, and there are probably more.

The great mighty affluents from Karategin on the north, the Kabad, Shingan, shiwa, and the Darbant are all of them very considerable tributaries from Bohkara, and in the valley of the Oxus, which the well-known trade centre of Shirbad is built, some 20 m. north of the river. Near the junction of the river with the Oxus, on the opposite side of the river to the present city of Termez, on the northern or east bank, there is the ancient city of Old Termez, or Old Termez, the district of which, forming part of an old bridge, is the connecting link between Bokhara and Mazar hereabouts. A Russian branch railway is said to have been recently built across the narrow Ganges from one side to the other.

From the south two very remarkable affluents of the Oxus join their streams to the main river between Kolab and the Mazrak crossings. The Kokecha and the Khanabad (or Kunzud) and the river northwestwards, and the valley of the Kokcha leads directly from the Oxus to Faizabad, the capital of Badakshan, and its head is close above Ishkashim at the southern elbow of the great Oxus bend, a low head of only 5900 ft. dividing its waters from those of the main river. This undoubtedly was a section of the great central trade route of Asia, which once connected Ferghana and Herat with Kashgar and China. (See BADAKSHAN.) Both these rivers tap the northern slopes of the mountain chains, and flow through adistrict of extreme coldness and wildness of Karafistan. The Khankabad, or Kunduz, is also called Khurghen, and the Khurghen, all the rivers of Central Asia are known by several names. To the west of the Khurghen no river finds their way into the Oxus. Through the plains of Afghan Turkest all the drainage from the southern hills is arrested and lost in the desert sands.

The only island of any size in the bed of the river is the island of P结束
OXUS

desert. Under Russian auspices a considerable strip of alluvial soil on the left bank has been brought under cultivation, measuring 4 or 5 m. in width, and there is more cultivation on the banks of the Oxus now than there is in the Merv oasis itself, but it is confined to the immediate neighbourhood of the river, for no affluents of any considerable size exist. The river is navigable below Charjui, and takes its place as an important unit in the general scheme of Russian frontier communications. It is now a regular steamer service, twice a week in summer and once a week in winter, as far as Pata Kasar. The steamers are flat-bottomed paddle boats drawing 3 ft.

An important feature in connexion with the course of the Oxus is the discussion that has arisen with regard to its former debouchment into the Caspian Sea. On this point much recent evidence has been collected, and it appears certain that there was a time in the post-Pliocene Age when a long gulf of the Caspian Sea protruded eastwards nearly as far as the longitude of Merv, covering the Karau Kum sands, but not the Kara Kum plateau to the north of the sands, which is separated from the sands by a distinct sea beach. At the same time another branch of the same gulf protruded northwards in the direction of the Aral, probably as far as the Sary Kumish depression, which lies to the west of the Khivan delta of the Oxus, separated from it by wide beds of loess, clays and gravel, covering rocks of an unknown age. The Murghab river and the Hari Rud, which terminate in the oases of Merv and Sarakhs, almost certainly were gulfs of the Karau Kum gulf, but it is not clear whether the Oxus was ever definitely connected with the other. In any case it appears to be much doubt about the connexion between the Khivan oasis and the northern extremity of the Sary Kamish. In this discussion the names of Kaullars, Lessar, Annenkov, Konshin and other Russian geographers are conspicuous. The conclusions are ably summed up by P. Kropotkin in the September number of the Journal of the Royal Geographical Society for 1898.

History.—In the most remote ages to which written history carries us, the regions on both sides of the Oxus were subject to the Persian monarchy. Of their populations Herodotus mentions the Bactrians, Chorasmians, Sogdians and Sacae as contributing their contingents to the armies of the great king Darius. The Oxus figures in Persian romantic history as the limit between Iran and Turan, but the substratum of settled population to the north as well as the south was probably of Iranian lineage. The valley is connected with many early Magian traditions, according to which Zoroaster dwelt at Balkh, where, in the 7th century B.C., his proselytizing efforts first came into operation. Buddhism eventually spread widely over the Oxus countries, and almost entirely displaced the religion of Zoroaster in its very cradle. The Chinese traveller Huen Tsang, who passed through the country in A.D. 630-644, found Termez, Khulm, Balkh, and above all Bamiyan, amply provided with monasteries, stupas and colossal images, which are the striking characteristics of prevalent Buddhism; even the Pamir highlands had their monasteries.

Christianity penetrated to Khorasan and Bactria at an early date; episcopal sees are said to have existed at Merv and Samarkand in the 4th and 5th centuries, and Cosmas (c. 545) testifies to the spread of Christianity among the Bactrians and Huns.

Bactria was a long a province of the empire which Alexander the Great left to his successors, but the Greek historians give very little information of the Oxus basin and its inhabitants. About 250 B.C. Diotothus, the "governor of the thousand cities of Bactria," declared himself king, simultaneously with the revolt of Arraces which laid the foundation of the Parthian monarchy. The Graeco-Bactrian dominion was overwhelmed entirely about 126 B.C. by the Yue-chi (q.v.), a numerous people who had been driven westwards from their settlements on the borders of China by the Hsiung (q.v.). From the Yue-chi arose, about the Christian era, the great Indo-Scythian dominion which extended across the Hindu Kush southwards, over Afghanistan and Sind. The Oxus was one of their chief rivers. In Northern India the Haithalath (Epiphalites, q.v.) of the Oxus, who are supposed to be descendants of the Yue-chi, were shat by an invasion of the Turkish khakan; and in the following century the Chinese pilgrim Huen Tsang found the former empire of the Haithalath broken up into a great number of small states, all acknowledging the supremacy of the Turkish khakan, and several having names identical with those which still exist. The whole group of states he calls Tukhara, by which name in the form Tokharistan, or by that of Haithalath, the country continued for centuries to be known to the Mahomedans. At the time of his pilgrimage Chinese influence had passed into Tokharistan and Transoxiana. Yezdegerd, the last of the Sassanid kings of Persia, who died in 651, when defeated and hard pressed by the Moslems, invoked the aid of China; the Chinese emperor, Taitsung, issued an edict organizing the whole country from Ferghana to the borders of Persia into three Chinese administrative districts, with 156 military cantonments, an organization which, however, probably only existed on paper.

In 711-712 Mahomedan troops were conducted by Kotaila, the governor of Khorasan, into the province of Khwarizm (Khiva), after subjugating which they advanced on Bokhara and Samarkand, the ancient Sogdiana, and are said to have even reached Ferghana and Kshgar, but no occupation then ensued. In 1015-1025 the government of Khwarizm was bestowed by Sultan Mahmud of Ghazni upon Aluntush, one of his most distinguished generals.

Tokharistan in general formed a part successively of the empires of the Sassanid dynasty (terminaled A.D. 999), of the Ghaznevid dynasty, of the Seljuks of Persia and of Khwarizm, of the Ghuzz, or some other Khwarizmian dynasty, and of the Khans of Khwarizm. The last dynasty ended with Sultan Jalal-ul-din, during whose reign (1227-1231) a division of the Mogul army of Jenghiz Khan first invaded Khwarizm, while the khan himself was besieging Bamiyan; Jalal-ul-din, deserted by most of his troops, retired to Ghazni, where he was pursued by Jenghiz Khan, and again retreating towards Hindustan was overtaken and driven across the Indus.

The commencement of the 16th century was marked by the rise of the Uzbek rule in Turkestan. The Uzbegs were no race, but an aggregation of fragments from Turks, Mongols and all the great tribes constituting the hosts of Jenghiz and Batu. They held Kunduz, Balkh, Khwarizm and Khorasan, and for a time Badakshan also; but Badakshan was soon won by the emperor Babar, and in 1520 was bestowed on his cousin Suleiman, who, by 1555 had established his rule over much of the region between the Oxus and the Hindu Kush. The Mogul emperors of India occasionally interfered in these provinces, notably Shah Jahan in 1646; but, finding the difficulty of maintaining so distant a frontier, they abandoned it to the Uzbek princes. About 1765 the wazir of Ahmad Shah Abdali of Kabul invaded Badakshan, and from that time until now the domination of the countries on the south bank of the Oxus from Wakhun to Balkh has been a matter of frequent struggles between Afghans and Uzbegs.

The Uzbek rule in Turkestan has during the last fifty years been rapidly dwindling before the growth of Russian power. In 1863 Russia invaded the Khokand territory, taking in rapid succession the cities of Turkestan, Chimket and Tashkend. In 1866 Khodjed was taken, the power of Khokand was completely crushed, a portion was incorporated in the new Russian province of Turkestan, while the remainder was left to be administered by a native chief almost as a Russian feudatory; the same year the Bokharans were defeated at Irdjar. In 1867 an army assembled by the amir of Bokhara was attacked and dispersed by the Russians, who in 1868 entered Samarkand, and became virtually rulers of Bokhara. In 1873 Khiva was invaded, and as much of the khanate as lay on the right bank of the Oxus was incorporated into the Russian empire, a portion being afterwards made over to Bokhara. Russia acquired the right of the free navigation of the Oxus throughout its entire course, on the borders of both Khiva and Bokhara and Tajik; and on the left bank of the Oxus, down to the Russian boundary line at Ichka Yar, is now in the hands of Bokhara, including Karategin—which the Russians have transferred to it from Khokand—and Darwaz at the entrance to the Pamir highlands.
OXYGEN

Numerous methods have been devised for the manufacture of oxygen. The more important are as follows: by decomposing strongly heated sulphuric acid in the presence of a contact substance; by heating an intimate mixture of one part of sodium nitrate with two parts of zinc oxide (T. H. Pepper, Dingler’s Journ. 1845, 167, p. 390): 2ZnO + 4NaNO₃ = 2Zn(ONa)₂ + Na₂O + O₂, produced by the use of cuprous chloride which combines with clay and water; and finally, red heat and water and heated in a current of air at 100-200°C. yields oxygen, which latter yields oxygen when heated to 400°C (A. Mallet, Comptes rendus, 1857, 64, p. 226; 1865, 66, p. 349); by the electrolysis of solutions of sodium hydroxide, using nickel electrodes; by heating calcium plumbate (obtained from litharge and calcium carbonate) in a current of carbon dioxide (G. Kassner, Monat. Scient., 1890, pp. 503, 614); and from air by the process of Tessié du Motay (Ding. Journ., 1870, 166, p. 230), in which air is drawn over a heated mixture of manganese dioxide and sodium hydroxide, the sodium manganate so formed being then heated to about 450°C in a current of steam, the following reversible reaction taking place: 4NaOH + 2MgO + O₂ = 2Na₂MgO + 2H₂O. Oxygen is largely prepared by Bin’s process (Mém. soc. des Ingin. cit., 1887, p. 50) in which barium monoxide is heated in a current of air, forming the dioxide, which when the retorts are exhausted yields up oxygen and leaves a residue of monoxide; but this method is now being superseded, its place being taken by the fractional distillation of liquid air (The Times, Engin. Suppl., April 14, 1909, p. 13) as carried out by the Linde method (Eng. Pat. 1411; 1902).

Oxygen is a colourless, odourless and tasteless gas. It is somewhat heavier than air, its specific gravity being 1.0523 (A. Leduc, Comptes rendus, 1866, 123, p. 805). It is slightly soluble in water and more so in alcohol. It also dissolves quite readily in some molten metals, especially silver. Oxygen does not burn, but is the greatest supporter of combustion known, nearly all the other elements combining with it under suitable conditions (cf. Oxime). These reactions, however, do not take place if the substances are in the absence of oxygen.

The importance and prevalence of the use of oxygen is due in part to the fact that the oxygen used in combustion is formed by the chemical action of air containing oxygen on the substance burned. This action is known as “combustion” or “oxygenation”. The oxygen used in combustion is usually regarded as a compound of oxygen with another element or as a mixture of the two elements. Oxygen is also used in the manufacture of various compounds, such as hydrogen peroxide, which is derived from water and oxygen, and ozone, which is derived from nitrogen and oxygen.

In the production of steel, oxygen is used in the form of oxygen-enriched air, which is passed through the molten steel to remove impurities.

In the production of oxygen, it is necessary to use a method that will yield a pure and uncontaminated product. One method involves the use of liquid air, which is produced by the fractional distillation of liquid oxygen. This method is known as the Linde process, and is widely used in the production of oxygen.

The properties of oxygen gas are such that it is highly reactive with many elements, and is therefore used in many industrial processes. It is used in the production of various chemicals, such as nitric acid, and is also used in the production of steel, where it is used to remove impurities from the molten metal. Oxygen is also used in the production of various other materials, such as fertilizers and pharmaceuticals.

In conclusion, oxygen is a highly reactive gas that is used in many industrial processes. Its properties make it an essential component of many products, and its use is expected to continue to increase in the future.

T. H. H.
OXYHYDROGEN

It brought also a somewhat larger dose of chloroform and, under these conditions of administration, the oxygen was rendered more readily available. The atom of oxygen is probably quadrivalent. The atomic weight of oxygen is now generally taken as 16, and as such is used as the standard by which the atomic weights of the other elements are determined, owing to the fact that most elements combine with oxygen more readily than with hydrogen (see ELEMENT). Oxygen is widely used in medical practice as well as in surgery. Inhalations of the gas are of service in pneumonia, bronchitis, heart disease, asthma, angina and other conditions accompanied by cyanosis. They often inactivate the cyanosis, and render the end less distressing. Oxygen is also administered in chloroform poisoning, and in threatened death from the inhalation of coal gas or nitrous oxides. It is of value in cyanide and opium poisoning. By the employment of the poison, when the mode of administration is by an inhaler attached to an inhalation bag, which serves to break the force with which the oxygen issues from the cylinders in which it is sold in a compressed form. It can be prepared mixed with other gases, such as carbonic acid, or a great quantity a temporary condition of apnoea (cessation of breathing) is produced, the blood being fully charged with the gas. Oxygen may be applied locally as a disinfectant to localised surfaces by the use of the peroxide of hydrogen, which readily parts with its oxygen; a solution of hydrogen peroxide therefore forms a valuable spray in diptheria, tonsillitis, laryngeal tuberculosis and oesophagus. It can also be used with advantage in inoperable urinary cases, and is used in the gynaecological and suppurative conditions of the ear. It relieves the pain of warts and warts. Internally hydrogen peroxide is used in various diseased conditions of the gastro-intestinal tract, such as dyspepsia, diarrhoea and enteric fever. The B.P. preparation Liquor Hydrogenii Peroxidi dose 1/2 to 2 drs. is synonymous with the Aqua Hydrogenii Dioxi of the U.S.P. and the ten-volume solution termed eau oxygénée in France. It is customary to use oxygen in combination with chloroform, or nitrous oxide in order to produce insensibility to pain (see ANAESTHETICS).

OXYHYDROGEN FLAME—OXYHYDROGEN FLAME, the flame attending the combustion of hydrogen and oxygen, and characterized by a very high temperature. Hydrogen gas readily burns in oxygen or air with the formation of water. The quantity of heat evolved, according to Julius Thomsen, is 34,116 calories for each gram of hydrogen burned. This heat-disturbance is quite independent of the mode in which the process is conducted; but the temperature of the flame is dependent on the circumstances under which the process takes place. It obviously attains its maximum in the case of the firing of pure "oxygen" gas (a mixture of hydrogen with exactly half its volume of oxygen, the quantity it combines with in becoming water, German Kauml-gas). It becomes less when the "oxygen" is mixed with excess of one or the other of the two reacting gases, or an inert gas such as nitrogen, because in any such case the same amount of heat spreads over a larger quantity of matter. Many forms of oxyhydrogen lamps have been invented, but the explosive nature of the gaseous mixture rendered them all more or less dangerous. It acquired considerable application in platinum works, this metal being only fusible in the oxyhydrogen flame and the electric furnace; and also for the production of limelight, as in optical (magic) lanterns. But these applications are being superseded by the electric furnace, and electric light.

OYAMA, IWAO, PRINCE (1852—1903), Japanese field-marshal, who was a distinguished soldier. He was the eldest brother sided in the Satsuma insurrection of 1877, but he nevertheless remained loyal to the imperial cause and commanded a brigade against the insurgents. When war broke out between China and Japan in 1894, he was appointed commander-in-chief of the second Japanese army corps, which, landing on the Liaotung Peninsula, carried Port Arthur by storm, and subsequently crossing to Shantung, captured the fortress of Wei-hai-wei. For these services he received the title of marquess, and, three years later, he became field-marshal. When (1904) his country became embroiled in war with Russia, he was appointed commander-in-chief of the Japanese armies in Manchuria, and in the sequel of Japan's victory the mikado bestowed on him (1907) the rank of prince. He received the British Order of Merit in 1906.

OVER AND TERMINER, the Anglo-French name, meaning "to hear and determine," for one of the commissions by which a judge of assize sits (see ASSIZE). By the commission ofoyer and terminer the commissioners (in practice the judges of assize, though other persons are named with them in the commission) are appointed to hear and determine the crimes and delictious inquiry into all felonies, insurrections, and misdemeanours whatever committed in the counties specified in the commission, and to hear and determine the same according to law. The inquiry is by means of the grand jury; after the grand jury has found the bills submitted to it, the commissioners proceed "to hear and determine" by means of the petty jury. The words over and terminer are also used to denote the court which has jurisdiction to try offences within the limits to which the commission of oyer and terminer extends.

By the Treatise Act 1708 the crown has power to issue commissions of oyer and terminer in Scotland for the trial of treason and other crimes and misdeemours in which the Queen's Justiciary must be in any such case present. An indictment for either of the offences mentioned may be removed by certiorari from the court of oyer and terminer into the court of justiciary. In the United States the name of oyer and terminer is the name given to courts of criminal jurisdiction in some states, e.g. New York, New Jersey, Pennsylvania, and Georgia.

OYSTER. The use of this name in the vernacular is equivalent to that of Ostrea (Lat. from Gr. ὀστρεω, oyster, so called from its shell, ὀστρηον, bone, shell) in zoological nomenclature; there are no genera so similar to Ostrea as to be confounded with it in ordinary language. Ostrea is a genus of Lamellibranch molluscs. The degeneration produced by sedentary habits in all lamellibranchs has in the oyster reached its most advanced stage. The valves of the shell are closed by a single large adductor muscle, the anterior adductor being absent. The muscular projection of the ventral surface called the foot, whose various modifications characterize the different classes of Mollusca, is almost entirely absorbed. The two valves of the shell are unequal in size, and of different shape; the left valve is larger, thicker and more convex, and on it the animal rests in its natural state. This valve, in the young oyster, is attached to some object on the sea-bottom; in the adult it is sometimes attached, sometimes free. The right valve is flat, and smaller and thinner than the left. In a corresponding manner the right side of the animal's body is somewhat less developed than the left, and to this extent there is a departure from the bilateral symmetry characteristic of Lamellibranchs.

The organization of the oyster, as compared with that of a typical lamellibranch such as Amedon (see Lamellibranchia), is brought about by the reduction of the anterior part of the body accompanying the loss of the anterior adductor, and the enlargement of the posterior region. The pedal ganglia and auditory organs have disappeared with the foot, at all events have never been detected; the cerebral ganglia are very minute, while the parieto-splanchnic are well developed, and constitute the principal part of the nervous system.

According to Spengel, the pair of ganglia near the mouth, variously called labial or cerebral, represent the cerebral pair and pleural pair of a gastropod combined, and the parieto-splanchnic pair correspond to the visceral ganglia, the commissure which connects them with the cerebro-pleural representing the common nerve of molluscs. Each of the visceral ganglia is connected or combined with an olfactory ganglion underlying an area of specialized epithelium, which constitutes the olfactory organ, the osphradium. The heart and pericardial chamber in the oyster lie along the anterior face of the adductor muscle,
OYSTER

almost perpendicular to the direction of the gills, with which in Anodonta they are parallel. In Anodonta and the majority of lamellibranchs the ventricle surrounds the intestine; in the oyster the two are quite independent, the intestine passing above the pericardium. The renal organs of the oyster were discovered by Hook to agree in their morphological relations with those of other lamellibranchs.

The generative organs of the oyster consist of a system of branching cavities on each side of the body lying immediately beneath the surface. All the cavities of a side are ultimately in communication with an efferent duct opening on the surface of the body a little above the line of attachment of the gills. The genital opening on each side is situated in a depression of the surface into which the renal organ also opens. The genital products are derived from the cells which line the cavities of the genital organ, and are therefore in water containing less than 3% salt; and hence they are absent from the Baltic. The chief enemies of oysters are the dog-whelk, Purpurula lapillus, and the whelk-tingle, Murex crinaceus, which bore through the shells. Starfishes devour large numbers; they are able to pull the valves of the shell apart and then to digest the body of the oyster by their everted stomach. Clione, the boring sponge, destroys the shells and so injures the oyster; the boring annelid Leucodore also excavates the shell.

The wandering life of the larvae makes it uncertain whether any of the progeny of a given oyster-bed will settle within its area and so keep up its numbers. It is known from the history of the Limmford beds that the larvae may settle 5 m. from their place of birth.

The genus Ostrea has a world-wide distribution, in tropical and temperate seas; seventy species have been distinguished. Its nearest allies are Pima among living forms, Eligius among fossils. For the so-called pearl-oyster see PEARL.

Industry.—Oysters are more valuable than any other single product of the fisheries, and in at least twenty-five countries are an important factor in the food-supply. The approximate value of the world's oyster crop approaches £4,000,000 annually, representing over 30,000,000 bushels, or nearly 10 billion oysters. Not less than 150,000 persons are engaged in the industry, and the total number dependent thereon is fully half a million. The following table shows in general terms the yearly oyster product of the world:

United States.—The oyster is the chief fishery product in the United States. The states which lead in the quantity of oysters taken are Maryland, Virginia, New York, New Jersey and Connecticut; the annual value of the output in each of these is over $1,000,000. Other states with important oyster interests are Rhode Island, Connecticut, and Louisiana. Louisiana oyster fisheries give employment to over 50,000 fishermen, who man 4000 vessels, valued at $4,000,000, and 23,000 boats, valued at $14,000,000; the value of the 11,000 dredges and 37,000 tongs, rakes and other appliances used is $565,000. The quantity of oysters taken in 1888 was 26,853,760 bushels, with a value of $12,667,405. The output of cultivated oysters in 1899 was about 9,800,000 bushels, worth $6,700,000.

Canada.—Oyster banks of some importance exist in the Gulf of St Lawrence and on the coast of British Columbia. All of the grounds have suffered depletion, and cultural methods to maintain the supply have been instituted. The oyster output of the Dominion has about increased 200,000 bushels in a single year, and in 1898 was 134,140 bushels, valued at $217,024.

United Kingdom.—The natural oyster beds of Great Britain and Ireland have been among the most valuable of the fishery resources. British oysters have been famous from time immemorial. The most important oyster region is the Thames estuary, the site of extensive planting operations. The present supply is largely from cultivated grounds. Important oyster-producing centres are

XX. 140
Whitstable, Colchester and Brightlingsea. The oysters landed on the coasts of England and Wales in 1898 numbered 35,809,000, valued at £122,320, and in 1899, 36,097,800, valued at £143,841. The Scottish fishery has its centre at Inverary and Ballantrae, and in 1905 yielded 218,000 oysters, valued at £865. Public oyster grounds of Ireland in 1903 produced 2,532,800 oysters, valued at £5030. The fishery is of the highest importance at Greenwich and Mowvile. Planting is carried on in seven counties; the oysters taken from cultivated beds in 1903 numbered 2,687,500 oysters, valued at £5420.

The industry owes its importance to the attention given to oyster cultivation. In the fishery on public grounds in 1896 only 6370 oysters were engaged, employing 1627 vessels and boats, valued at 1,473,443 francs, and apparatus worth 211,405 francs. In the same year 5377 kilos were sold, valued about 320,000 bushels, valued at 414,830 francs. In the parks, claires and reservoirs the private culture of oysters has attained great perfection. Fully 30,000 men, women and children are employed, and the net values in 1896 was 1,526,417,968 oysters, worth 17,537,778 francs. The principal centre is Arcachon.

Oyster Culture.—The oyster industry has passed from the hands of the fisherman into those of the oyster culturist. The oyster being sedentary, except for a few days in the earliest stages of its existence, is easily exterminated in any given locality; since, although it may not be possible for the fisherman to rake up from the bottom every individual, wholesale methods of capture soon result in covering up or otherwise destroying the oyster banks or reefs, as the communities of oysters are technically known. The most important oyster industry of America and that of Europe lies in the fact that in Europe the native beds have long since been practically destroyed, perhaps not more than 60 or 7% of the oysters of Europe passing from the native beds directly into the hands of the consumer. It is probable that 60 to 75% are reared from the spat in artificial parks, the remaining having been laid down for a time to increase in size and flavour in shoal waters along the coasts. In the United States, on the other hand, from 30 to 40% are carried from the native beds directly to market. The oyster fishery is everywhere, except in localities where the natural beds are nearly exhausted, carried on in the most reckless manner, and in all directions oyster grounds are becoming deteriorated, and in some cases have been entirely destroyed. At present the oyster is one of the cheapest articles of diet in the United States; and, though it can hardly be expected that the price of American oysters will always remain so low, still, taking into consideration the great wealth of the natural beds along the entire Atlantic coast, it seems certain that a moderate amount of protection would keep the price of seed oysters far below European rates, and that the immense stretches of submerged land especially suited for oyster planting may be utilized and made to produce an abundant harvest at much less cost than that which accompanies the complicated system of culture in vogue in France and Holland.

The simplest form of oyster culture is the preservation of the natural oyster-beds. Upon this, in fact, depends the whole future of the industry, since it is not probable that any system of artificial breeding can be devised which will render it possible to keep up a supply without at least occasional recourse to seed oysters produced under natural conditions. It is the opinion of almost all who have studied the subject that any natural bed may in time be destroyed by overfishing (perhaps not by removing all the oysters, but by breaking up the colonies, and delivering over the territory which they once occupied to other kinds of animals), by burying the breeding oysters, by covering up the projections suitable for the reception of spat, and by breaking down, through the action of heavy dredges, the ridges which are especially fitted to be seats of the colonies.1

1 Even Huxley, the most ardent of all opponents of fishery legislation, while denying that oyster beds can be increased by dredging, practically admitted that a bed may be reduced to such a condition that the oyster will only be able to recover its former state by a long struggle with its enemies and competition—in fact that it must re-establish itself much in the same way as they have acquired possession of new grounds in Jutland, a process which, according to his own statement, occupied thirty years (Lecture at the Royal Institution, May 11th, 1883, printed with additions in the English Illustrated Magazine, i. pp. 47-55, 112-121).

In immense oyster-beds in Pocomoke Sound, Maryland, have practically been destroyed by over-dredging, and many of the other beds of the United States are seriously damaged. The same is doubtless true of all the beds of Europe. It has also been demonstrated that under proper restriction great quantities of mature oysters, and seed oysters as well, may be taken from any region of natural oyster-beds without injurious effects. Parallel cases in agriculture and forestry will occur to every one. Möbius, in his most admirable essay Die Austern und Die Austernzucht, has pointed out the proper means of preserving natural beds, declaring that, if the average profit from a bed of oysters is to remain permanently the same, a sufficient number of mother oysters must be left in it, so as not to diminish the capacity of maturing. He further shows that the productive capacity of a bed can only be maintained in one of two ways: (1) by diminishing the causes which destroy the young oysters, in which case the number of breeding oysters may safely be decreased; this, however, is practicable only under such favourable conditions as occur at Arcachon, where the beds may be kept under the constant control of the oyster-culturist; (2) by regulating the fishing on the natural beds in such a manner as to make them produce permanently the highest possible average quantity of oysters. Since the annual increase of half-grown oysters is estimated by him to be four hundred and twenty-one to every thousand full-grown oysters, he claims that not more than 42% of these latter ought to be taken from a bed during a year.

The Schleswig-Holstein oyster-beds are the property of the state, and are leased to a company whose interest it is to preserve their productiveness. The French beds are also kept under government control. Not so the beds of Great Britain and America, which are as a general rule open to all comers, except when some close-time regulation is in force. Huxley has illustrated the futility of 'close-time' in his remark that the prohibition of taking oysters from an oyster-bed during four months of the year is not the slightest security against its being stripped clean during the other eight months. "Suppose," he continued, "that in a country infested by wolves, you have a flock of sheep, keeping the wolves off during the lambing season will not afford much protection if you withdraw shepherd and dogs during the rest of the year." The old close-time laws were abolished in England in 1866, and returned to in 1876, but no results can be traced to the action of parliament in either case. Huxley's conclusions as regards the future of the oyster industry in Great Britain are doubtless just as applicable to other countries—that the only hope for the oyster consumer lies in the encouragement of oyster-culture, and in the development of some means of breeding oysters under such conditions that the spat shall be safely deposited. Oyster culture can evidently be carried on only by private enterprise, and the problem for legislation to solve is how to give such rights of property upon those shores which are fit for oyster culture as may encourage competent persons to invest their money in that undertaking. Such property right should undoubtedly be extended to natural beds, or else an area of natural spawning territory should be kept under constant control and surveillance by government, for the purpose of maintaining an adequate supply of seed oysters.

The extension of the area of the natural beds is the second step in oyster culture. As is well known to zoologists, and as has been very lucidly set forth by Möbius, the location of oyster banks is sharply defined by absolute physical conditions. Within certain definite limits of depth, temperature and salinity, the only requirement is a suitable place for attachment. Oysters cannot thrive where the ground is composed of moving sand or where it is deep; consequently, since the size and number of these places are very limited, only a very small percentage of the young oysters can find a resting-place, and the remainder perish. Möbius estimates that for every oyster brought to
market from the Holstein banks, 1,045,000 are destroyed or die. By putting down suitable "culch" or "stools" immense quantities of the wandering fry may be induced to settle, and are thus saved. As a rule the natural beds occupy most of the suitable space in their own vicinity. Unoccupied territory may, however, be prepared for the reception of new beds, by spreading sand, gravel and shells over muddy bottoms, or, indeed, beds may be kept up in locations for permanent natural beds, by putting down mature oysters and culch just before the time of breeding, thus giving the young the chance to fix themselves before the currents and enemies have had time to accomplish much in the way of destruction.

The collection of oyster spat upon artificial stools has been practised from time immemorial. As early as the 7th century, and probably before, the Romans practised a kind of oyster culture in Lake Avernus, which still survives to the present day. Stools from these experiments were spread on the bottoms of these salt-water lakes, and around these are arranged circles of stakes, to which are often attached bundles of twigs. Breeding oysters are piled upon the rookeries, and their young become attached to the stakes and twigs provided for their reception, where they are allowed to remain until ready for use, when they are plucked off and sent to the market. A similar though ruder device is used in the Poquonock river in Connecticut. Birch trees are thrown into the water near a natural bed of oysters, and the trunks and twigs become covered with spat; the trees are then dragged out upon the shore by oxen, and the young fry are broken off and laid down in the shallows to increase in size. In 1858 the methods of the Italian lakes were repeated at St. Brieuc under the direction of Professor P. Coulomb. From these experiments the art of artificial breeding, as practised in France has been developed. There is, however, a marked distinction between oyster culture and oyster-breeding.

In considering the oyster-culture in France it is necessary to distinguish the centres of production from the centres of rearing or fattening. The chief centres or regions of oyster production are two, (1) Arcachon, (2) Brittany. The basin of Arcachon has an area of 7,250 acres, and the bay has been submerged by the water of the riverbottoms water at low tide. The water is saltier than the sea. At the beginning of the 19th century there were only natural oyster beds in the basin, and these produced 75 million oysters per annum. But in the middle of the century the natural beds had been almost exhausted and the system of government control, letting "pars" to private tenants, and artificial cultivation was instituted. Certain beds in the basin are reserved and kept under government control. Culch is placed upon them therby they are reserved to the tenants upon them is allowed only at intervals of two or more years, when the authority thinks they are sufficiently stocked to permit of it. These beds supply spat for the private cultivators. The latter collect the spat from the beds of the public and also from those of the private centres, or from the mussel beds of the "bouches." One of the most important points in the system is the coating of the tiles with lime. It is necessary to detach the young oysters from the tiles when they are nearly a year old (déroquage); this can be done by introducing a slight current of water attached directly to the surface of the tile. The coating of lime or mortar is soft and brittle, and consequently the young oysters can easily be detached with a stout knife. The method of lining the tiles (abondage) consists in dipping them into a liquid composed of lime and water. Sometimes lime only is used, sometimes equal quantities of lime and sand, or lime and mud. Often it is necessary to repeat the dipping, and for the second coat hydraulic lime may be used.

The tiles coated with lime are set out on the shore near the low-water mark of spring tides, at the beginning of the spattering season. This is earlier in the south of France than in England; at Arcachon the collectors are put in position about the middle of June. Various methods are adopted for keeping the tiles in place and for arranging them in the position most favourable to the collection of spat. At Arcachon they are arranged in piles; each layer being transverse to the one below, so that the space formed by the concavity of the tile is kept open. A wooden frame-work often surrounds the heap of tiles to prevent them being scattered by the waves.

In Brittany, about April, the young oysters, from 3 to 1 in. in diameter, are collected and separated or déroquées. They are then placed in oyster cases (caisses ostréophiles) or in shallow ponds (claires) made on the fore-shore. The cases are about 8 in. deep, and are made of galvanized iron. The cases are 3 ft. long by 2 ft. wide, and galvanized wire netting, 6 in. by 6 in. in meshes, is fixed upon the posts driven into the ground, so that they are raised about 9 in. or 1 ft. from the latter. The young oysters grow rapidly in these cases, and have to be thinned out as they grow larger. When they have grown to the boxes a year they are large enough to be placed in the claires or simply scattered along the fore-shore.

In Brittany the chief seat of oyster production is the Gulf of Morbihan, where there are many small natural and artificial fore-shores suitable to the industry. Here the provision of mud is one of the chief obstacles, and for this reason the tile-collectors are usually fastened together by wire and suspended to posts (tulles) driven into the ground. The oysters are placed in the claires in July. The natural beds from which the supply of spat is derived are reserved, but apparently are insufficiently protected, so that much poaching goes on.

In the regions of production, Arcachon and Morbihan supply young oysters for "relying," i.e., rearing, not only to numerous places on the coast of France, but also to England, Ireland, and elsewhere. Among rearing districts Marenes and La Tremblade are specially celebrated. The claires are the oyster ponds, in which the green oysters, whose colour seems to be derived from a species of Distom which abounds in the claires.

In Holland the French system of oyster-culture is followed in the estuary of the Scheldt, with some modifications in detail. The tiles used are flat and heavy, and are placed on the foreshores in an oblique position resting on their edges and against each other. The tiles with the young oysters on them are placed in enclosures during the winter, and déroquage is carried out in the following spring.

In England the use of tiles has been tried on various occasions, in Cornwall on the river Fal, at Hayling Island and in Essex, but has nowhere become permanently established. The reasons for this are many and of varied kinds, but one of the strongest is that the labour required cannot be obtained at a sufficiently cheap rate. In many places oysters are simply imported from France and Holland and laid down to grow, or are obtained by dredging from the beds of the Thames below Hampton Court. At Weymouth the oysters are obtained from邢台 and scattered on the foreshores, and there are private or semi-private oyster fisheries, where the method of culture is to dredge up the oysters in autumn and place them in pits, where they are sorted out, and the suitable ones are selected for the market, just before the close season. The young oysters and all the rest that remain are scattered over the beds again, with quantities of culch, and in many cases the fishery is maintained by the local full of spat, without importation. In some places where the ground is suitable culch is spread over the foreshores also to collect spat. The genuine English "native" is produced in its greatest perfection in the Essex fisheries, and is probably the highest priced oyster in the world.

In addition to the literature quoted see also the following: "Rapport sur les recherches concernant l'ostréiculture par la Commission de la Société Néerlandaise de Zoologie (Leiden, 1883-1888);" "Sur quelques progrès de la culture des oystres en France" (1880); Bashford Dean, English Oystering, Dordrecht, 1883; Miss. B. Cunningham, Report of the Commissioner and Inspector of Fishery Subjects, in Report of the Privy Council (1899, 1900).

OYSTER BAY, a township of Nassau (formerly of Queens) county, New York, on Long Island, about 25 m. E.N.E. of Long Island City. Pop. (1890) 13,870, (1900) 16,334; (1910 census) 21,502. The township reaches from N. to S. across the island (here about 20 m. wide) in the shape of a rough wedge, the larger end being on Long Island Sound at the N.; on the northern shore is the triplicate Oyster Bay, whose western arm is Mill Neck creek, whose central branch is Oyster Bay harbor, and whose eastern arm is Babylon (Long Island Sound) harbor. A tripartite Sound separates the township of Oyster Bay from the town of Huntington. On the south side of the township is South Oyster bay, immediately east of the main body of the Great South bay; and between South Oyster Bay and the ocean lie several island beaches, the smaller and northernmost one being marshy, and the southern, Jones or Seafield beach, being sandy and having on the ocean side the Zach's inlet and Jones Beach life-saving stations. The township is served by four branches of the Long Island railroad; the Oyster Bay branch of the south shore to the village of Sea Cliff (incorporated in 1883; pop. 1910, 6694), on the E. side of Hempstead harbor, to Glen Cove, a large unincorporated village, immediately N.E. of Sea Cliff, to Locust Valley and to Mill Neck farther E., and to the village of Oyster Bay, the terminus of the branch, on Oyster Bay harbor; the Wading
River branch to Hicksville and to Syosset; a third branch to Farmingdale, which also has direct communication by railway with Hicksville; and the Montauk division to Massapequa, in the south-western part of the township on Massapequa Lake and Massapequa Creek, which empties into South Oyster Bay. The villages served by the railway are the only important settlements; those on the hilly north shore are residential. To the north of the village of Oyster Bay, on a long peninsular beach called Centre Island, are the headquarters of the Seawanahaka Yacht Club; and to the east of the same village, especially on the south-western shore between Oyster Bay and Long Island and Spring Harbor, are many summer residences with fine grounds. Massapequa, on the south shore, is a residential summer resort. The villages of Hicksville and Farmingdale are rural; the former has many German settlers. Jericho, N.E. of Hicksville, is a stronghold of the Hicksite Quakers, who are mostly wealthy landowners. In Locust Valley is Friends’ Academy (1876), a secondary school for boys and girls. There are a few truck farms in the township, potatoes, cabbages and cucumbers for pickling being the principal crops; “Oyster Bay asparagus” was once a famous crop. Oysters are cultivated on the Sound Shore and there are clam beds in Oyster Bay and South Oyster Bay. In the village of Glen Cove there is a large leather-belt factory.

David Pieterssen de Vries, in his Voyages from Holland to America, published in 1645, tells of having seen the blue-winged plover, or Oyester-catcher, as he explored in June 1639. In the same month Matthew Sinderland (or Sunderland) bought from James Forrett, deputy of William Alexander, earl of Stirling, “two little necks of land, the one upon the east side of Oyster Bay Harbor”; but Sunderland made no settlement. A settlement from Lynn, Mass., was attempted in 1640 but was prevented by Governor William Kieft. By the treaty signed at Hartford, Connecticut, on the 29th of September 1650 by the Commissioners of the United colonies of New England and those of New Netherland all land east of the west side of Oyster Bay was granted to the English, and all land west to the Dutch; but the Dutch placed Oyster Bay, according to a letter of Pieter Stuyvesant written in 1659, two and a half leagues further east than the New-Englander did. In 1653 an Indian deed granted land at Oyster Bay to Peter Wright and others of Salem and Sandwich, Mass., who made a permanent settlement here; in 1663 another sale was made to Captain John Underhill (d. 1672), who first went to Long Island about 1653, when he led a force which fought the only important engagement ever fought with the Indians on Long Island, in which the colonists destroyed the fortification at Fort Neck near the present Massapequa, of Tackapouha, chief of the Massapequans, an Algonquian tribe, whose name meant “great pond.” Oyster Bay was for a time closely connected politically with New Haven, but in 1664 with the remainder of Long Island it came under the New York government of Richard Nicolls, to whose success Underhill had largely contributed by undermining Dutch influence in that country.

In 1669 a Friends’ meeting-house was built at Jericho, the home of Elias Hicks, near the present Hicksville, the site of which was owned by his family and which was named in his honour; and the Dutch built their first church in Oyster Bay in 1732. The harbour of Oyster Bay was a famous smuggling port at the close of the 17th century, when there was a customs house here. The first settlement on the “ south side ” of the township was made about 1603, when the Massapequa Indians sold 6,000 acres at Fort Neck to Thomas Townsend, and his son-in-law Thomas Jones (1663–1713), who had fought for James II. at Boyne and Aghrim, who became a high sheriff of Queen’s county in 1704, and who was the founder of the family of Jones and Floyd-Jones, whose seat was Tryon Hall (built of South Oyster Bay stone, 1700); Thomas Jones (1731–1702), grandson of the first Thomas Jones, was a prominent Loyalist during the War of Independence and wrote a valuable History of New York during the Revolutionary War, first published in 1879.

The Oyester-Catcher, a bird’s name which does not seem to occur in books until 1731, when M. Catesby (Nat. Hist. Carolina, i. p. 83) used it for a species which he observed to be abundant on the oyster-banks left bare at low water in the rivers of Carolina, and believed to feed principally upon those molluscs. In 1776 T. Pennant applied the name to the allied British species, which he and for nearly two hundred years many other English writers had called the “Sea-Pie.” The change, in spite of the misnomer—for, whatever may be the case elsewhere, in England the bird does not feed upon oysters—met with general approval, and the new name has, at least in books, almost wholly replaced what seems to have been the older one. The Oyster-catcher of Europe is the Haematopus ostralegus or Linnaeus, belonging to the same family but differing in several respects from the American species. It was first mentioned by Catesby in 1723. The American oyster-catcher (Haematopus palliatus) is somewhat smaller than the European, and has the body and neck clothed with black feathers, and the upper parts of the wings with white ones. Its call is a musical cry of “ tu-lup,” “ tu-lup,” somewhat pettishly repeated, helps to draw attention to it. Its winter quarters, however, is very marvellous, and even at the breeding-season, when most birds throw off their shyness, it is not easily approached within three hundred yards. The American oyster-catcher builds its nest upon the shore by the sea, and lays three clay-coloured eggs, blotted with black, in a very slight hollow on the ground not far from the sea. As incubation goes on the hollow is somewhat deepened, and perhaps some haum is added to its edge, so that at last a very fair nest is the result. The young, as in all Limicolen, are at first clothed in down, so mottled in colour as closely to resemble the shingle to which, if they be not hatched upon it, they are almost immediately taken by their parents, and there, on the slightest alarm, they squat close to elude observation. This species occurs on the British coasts (very seldom straying inland) all the year round; but there is some reason to think that those we have in winter are natives of more northern latitudes, while our home-bred birds may leave us. It ranges from Iceland to the shores of the Red Sea, and lives chiefly on marine worms, crustacea and such molluscs as it is able to obtain. It is commonly supposed to be capable of prizing limpets from their rock, and of opening the shells of mussels; but, though undoubtedly it feeds on both, further evidence as to the way in which it procures them is desirable. J. E. Harting informed the present writer that the bird seems to lay its head sideways on the ground, and then, grasping the limpet’s shell close to the rock between the mandibles, use them as scissor-blades to cut the mollusc from its sticking-place. The Oyster-catcher is not highly esteemed as a bird for the table.

Differing from this species in the possession of a longer bill, in having much less white on its back, in the paler colour of its mantle, and in a few other points, is the ordinary American species, with at least three races, Haematopus palliatus. Except that its call-note, judging from description, is unlike that of the European bird, the habits of the two seem to be perfectly similar; and the same may be said indeed of all the other species. The Falkland Islands are frequented by a third, H. leucopus, very similar to the first, but with a black wing-lining and paler legs, while the Australian Region possesses a fourth, H. longirostris, with a very long bill as its name intimates, and no white on its
primaries. China, Japan and possibly eastern Asia in general have an Oyster-catcher which seems to be intermediate between the last and the first. This has received the name of H. ascutas; but doubts have been expressed as to its deserving specific recognition. Then we have a group of species in which the plumage is wholly or almost wholly black, and among them only do we find birds that fulfil the implication of the scientific name of the genus by having feet that may be called blood-red. H. niger, which frequents both coasts of the northern Pacific, has, it is true, yellow legs, but towards the extremity of South America its place is taken by H. uva, in which they are bright red, and this bird is further remarkable for its laterally compressed and much upturned bill. The South African H. capensis has also scarlet legs; but in the otherwise very similar bird of Australia and New Zealand, H. unicolor, these members are of a pale brick-colour.

OYSTERMOUTH, or THE MUMBLES, an urban district and seaside resort in the Gower division of Glamorganshire, south Wales, situated on the western bend of Swansea Bay, 43 m. S.W. of Swansea, with which it is connected by the steam-tramway of the Swansea and Mumbles Railway Company, constructed in 1804. The London and North-Western railway has also a station at Mumbles Road, 2½ m. N. of Oystermouth. Pop. (1901) 4,641. The castle, which belongs to the duke of Beaufort as lord of the seigniory of Gower, is an imposing ruin, nobly situated on a rocky knoll overlooking the bay. Its great vault and chapel with their traceried Gothic windows are fairly well preserved. The earliest structure (probably only a "peck-tower"), built in the opening years of the present century and probably by Maurice de Londres, was destroyed by the Welsh in 1215. The early English features of the square keep indicate that it was soon rebuilt, by one of the De Breos lords (see GOWER). In 1284 Edward I. stayed here two days as the guest of William de Breos, and from that time on it became the chief residence in Gower of the lords seignior and subsequently of their stewards, and their chancery was located here till its abolition in 1335. The parish church, which has an embattled tower, was restored in 1868, when fragments of Roman tessellated pavement were found in various parts of the churchyard. Roman coins were also found in the village in 1822 and 1837—all indicating that there had been a small settlement here in Roman times. The name of the castle appears in the Welsh chronicles as Ystum Llyswynarth, which, by the elision of the penultimate, was probably changed by false analogy into Oystermouth—the bay being noted for its oyster beds. Its church is mentioned in the cartulary of Gloucester (1141) as Ostreneuwe.

The village itself is straggling and uninteresting, but the high ground between it and the pretty bays of Langland and Caswell on the southern side of the headland fronting the open channel is dotted with well-built villas and commands magnificent views. The headland terminates in two rocky islands, which to sailors coming up the channel would appear like the breasts of "mammals," whence the comparatively modern name, The Mumbles, is supposed to be derived. On the outer of these rocks is a lighthouse, erected in 1764 and maintained by the Swansea Harbour Trust. The district is fit for a residence and is used as a seaside resort. A pier was erected by the Mumbles Railway Company at a cost of £12,000 in 1898. The fishing industry, once prosperous, has much diminished in importance, but there are still oyster-beds in the bay.

OZANAM, ANTOINE FRÉDÉRIC (1813-1853), French scholar, was born at Milan on the 23rd of April 1813. His family, which was of Jewish extraction, had been settled in the Lyonnais for many centuries, and had reached distinction in the third generation before Frédéric through Jacques Ozanam (1640-1717), an eminent mathematician. Ozanam's father, Antoine, served in the armies of the republic, but betook himself, on the advent of the empire, to trade, teaching, and finally medicine. The boy was betrothed in his fifth year, and strongly influenced by his masters, the Abbé Noirot. His conservative and religious instincts showed themselves early, and he published a pamphlet against Saint-Simianism in 1831, which attracted the attention of Lamartine. In the following year he was sent to study law at Paris, where he fell in with the Ampère family, and through them with Chateaubriand, Lucordaire, Montalembert, and other leaders of the neo-Catholic movement. Whilst still a student he took up journalism and contributed considerably to Bailly's Tribuno catholique, which became (November 1, 1833) L'univers. In conjunction with other young men he founded in May 1837 the celebrated charitable society of St Vincent de Paul, which numbered before his death upwards of two thousand members. He received the degree of doctor of law in 1836, and in 1838 that of doctor of letters with a thesis on Dante, which was the beginning of one of his best-known books. A year later he was appointed to a professorship of commercial law at Lyons, and in 1849 assistant professor of foreign literature at the University of Lyons. He travelled extensively, and in 1851 visited Italy on his wedding tour. At Fauriel's death in 1854 he succeeded to the full professorship of foreign literature. The short remainder of his life was extremely busy with his professorial duties, his extensive literary occupations, and the work, which he still continued, of district-visiting as a member of the society of St Vincent de Paul. During the revolution of 1848, of which he took an unduly sanguine view, he once more turned journalist for a short time in the Ére nouvelle and other papers. He travelled extensively, and was in England at the time of the Exhibition of 1851. His naturally weak constitution fell a prey to consumption, which he hoped to cure by visiting Italy, but he died on his return at Marseilles on the 8th of September 1853.

Ozanam was the leading historical and literary critic in the movement in France during the second half of the 19th century. He was more learned, more sincere and more logical than Chateaubriand; less of a political partisan and less of a literary sentimentalist than Montalembert. In contemporary movements he was an earnest and conscientious advocate of Catholic democracy and socialism and of the view that the church should adapt itself to the changed political conditions consequent to the Revolution. In his writings he dealt upon important contributions of historical Christianity, and maintained especially that, in continuing the work of the Caesars, the Catholic church had been the most potent factor in civilizing the invading barbarians and in organizing the life of the middle ages. He confessed that his object was "to prove the contrary thesis to Gibbon's," and, although any historian who begins with the most elaborated overcoat of history, from the 17th to the 19th century, is Ozanam no doubt administered a healthful antidote to the prevalent notion, particularly amongst English-speaking peoples, that the Catholic church had done far more to enslave than to elevate the human mind. His knowledge of medieval literature and his appreciative sympathy with medieval life admirably qualified him for his work, and his scholarly attainments are still highly esteemed.

His works were published in eleven volumes (Paris, 1862-1869). They include Deux chancellers d'Angleterre, Baron de Verulam et Saint Thomas de Cantorbéry (Paris, 1846); Dante et la philosophie catholique au XIIIe siècle (Paris, 1839; 2nd ed., enlarged 1848); Études germaniques (2 vols., Paris, 1847-1849), translated by A. C. Glynn as History of Civilisation in the Fifth Century (London, 1863); Documents inédits pour servir à l'histoire de l'Italie depuis le VIIIe siècle jusqu'au XIIe siècle (Paris, 1850); Les poètes franciscains en Italie au XIIIe siècle (Paris, 1852). His letters have been partially translated into English by A. Coates (London, 1872).

There are French lives of Ozanam by his brother, C. A. Ozanam (Paris, 1882); Mme. E. Humbert (Paris, 1880); C. Huit (Paris, 1882); M. de Lambel (Paris, 1887); L. Curnier (Paris, 1888); and B. Faulquier (Paris, 1903). German lives by F. X. Karcher (Paderborn, 1867) and E. Hardy (Mainz, 1878); and an interesting English biography by Miss K. O'Meara (Edinburgh, 1867; 2nd ed., London, 1878).

OZIERI, a town of Sardinia in the province of Sassari, from which it is 34 m. S.E.S. by rail. Pop. (1901) 9,533. It is situated 1280 ft. above sea-level on a steep slope, but faces north, and is not very healthy. In the centre of the town is a square with a well and a fountain of 1504, in the centre of which is the seat of the diocese of Bisarcio. The former cathedral of this diocese lies some distance to the N.W.; it is a fine Romanesque building of the 11th and 12th centuries. The district of Ozieri
is famous for its butter—the only butter made in Sardinia—cheese and other pastoral products; cattle are also bred here.

**OZOKERITE**, or OZOCERITE (Gr. ὄζοκρήτη, to emit odour, and ωπός, wax), mineral wax, a combustible mineral, which may be designated as crude native paraffin (q.v.), found in many localities in varying degrees of purity. Specimens have been obtained from Scotland, Northumberland and Wales, as well as from about thirty different countries. Of these occurrences the ozokerite of the island of Tchelenak, near Baku, and the deposits of Utah, U.S.A., deserve mention, though the last-named have been largely worked out. The sole sources of commercial supply are in Galicia, at Borysław, Dzwiniacz and Starunia, though the mineral is found at other points on both flanks of the Carpathians.

Ozokerite-deposits are believed to have originated in much the same way as mineral veins, the slow evaporation and oxidation of petroleum having resulted in the deposition of its dissolved paraffin in the fissures and crevices previously occupied by the liquid. As found native, ozokerite varies from a very soft wax to a black mass as hard as gypsum. Its specific gravity ranges from 85 to 95, and its melting point from 58° to 100° C. It is soluble in ether, petroleum, benzene, turpentine, chloroform, carbon bisulphide, &c. Galician ozokerite varies in colour from light yellow to dark brown, and frequently appears green owing to dichroism. It usually melts at 55° C. Chemically, ozokerite consists of a mixture of various hydrocarbons, containing 85 7% by weight of carbon and 14 3% of hydrogen.

The mining of ozokerite was formerly carried on in Galicia by means of hand-labour, but in the modern ozokerite mines owned by the Borysław Actien Gesellschaft and the Galizische Kreditbank, the workings of which extend to a depth of 300 metres, and 225 metres respectively, electrical power is employed for hauling, pumping and ventilating. In these mines there are the usual main shafts and galleries, the ozokerite being reached by level drivages along the strike of the deposit. The wax as it reaches the surface, varies in purity, and, in new workings especially, only hand-picking is needed to separate the pure material. In other cases much earthy matter is mixed with the material, and then the rock or shale having been eliminated by hand-picking, the “wax-stone” is boiled with water in large copper, when the pure wax rises to the surface. This is again melted without water, and the impurities are skimmed off, the material being then run into small conical cylindrical moulds and thus made into blocks for the market. The crude ozokerite is refined by treatment first with Nordhausen oil of vitriol, and subsequently with charcoal, when the ceresine or ceresin of commerce is obtained. The refined ozokerite or ceresine, which usually has a melting point of 60° C., is largely used as an adulterant of beeswax, and is frequently coloured artificially to resemble that product in appearance.

On distillation in a current of superheated steam, ozokerite yields a candle-making material resembling the paraffin obtained from petroleum and shale-oil but of higher melting-point, and therefore of greater value if the candles made from it are to be used in hot climates. There are also obtained in the distillation light oils and a product resembling vaseline (q.v.). The residue in the stills consists of a hard, black, waxy substance, which in admixture with india-rubber is employed under the name of okonite as an electrical insulator. From this residue a form of the material known as held-ball, used to impart a polished surface to the hand and soles of boots, is also manufactured.

According to published statistics the output of crude ozokerite in Galicia in 1906 and 1907 was as follows:

(B. R.)

**OZONE**', allotropic oxygen, O₃. The first recorded observations of the substance are due to Van Marum (1785), who found that oxygen gas through which a stream of electric sparks had been passed, tarnished mercury and emitted a peculiar smell. In 1840 C. F. Schönbein (Pogg. Ann. 30, p. 616) showed that this substance was also present in the oxygen liberated during the electrolysis of acidulated water, and gave it the name ozone (Gr. ὀζός, to smell). Ozone mixed with an excess of oxygen is obtained by submitting dry oxygen to the silent electric discharge at the temperature of liquid air, E. Briner and E. Durand (Comptes rendus, 1877, 145, p. 1272) obtained a 90% yield; by the action of fluorine on water at 6° C. (H. Moissan, Comptes rendus, 1889, 129, p. 570); by the action of concentrated sulphuric acid or barium peroxide or on other peroxides and salts of peracids (A. v. Baeyer and V. Villiger, Ber. 1901, 34, p. 355); by passing oxygen over some heated metallic oxides, and by distilling potassium permanganate with concentrated sulphuric acid in vacuo. It is also formed during many processes of slow oxidation. For a description of the various forms of ozonizers used on the large scale see N. Otto, Rev. gén. de chemie pure et appliqué, 1900, ii. p. 405; W. Elworthy, Elekt. Zeitschrift, 1904, ii. p. 1), and H. Guilleminot (Comptes rendus, 1903, 137, p. 1653). Ozone is also produced by the action of cathode and ultra-violet rays on oxygen. These methods of preparation give an ozone diluted with a considerable amount of unaltered oxygen; A. Ladenburg (Ber. 1898, 31, pp. 2508, 2830) succeeded in liquefying ozonized oxygen with liquid air and then by fractional evaporation obtained a liquid containing between 80 and 90% of ozone.

Ozone is a colourless gas which possesses a characteristic smell. When strongly cooled it condenses to an indigo blue liquid which is extremely explosive (see Liquefied Gases). In ozonizing oxygen the volume of the gas diminishes, but if the gas be heated to about 300° C, it returns to its original volume and is found to be nothing but oxygen. The same change of ozone into oxygen may be brought about by contact with platinum black and other substances. Ozone is only very slightly soluble in water. It is a most powerful oxidizing agent, which rapidly attacks organic matter (hence in preparing the gas, rubber connections must not be used, since they are instantly destroyed), bleaches vegetable colouring matters and acts rapidly on most metals. It liberates iodine from solutions of potassium iodide, the reaction in neutral solution proceeding thus: O₂ + 2KI + H₂O = O₃ + I₂ + 2KOH, whilst in acid solution the decomposition takes the following course: O₃ + 2H² + 2H₂O = 3I⁻ + 3H⁺ + 3OH⁻ (A. Ladenburg, Ber. 1901, 34, p. 1184). Ozone is decomposed by some metallic oxides, with regeneration of oxygen. It combines with many unsaturated carbon compounds to form ozonides (C. Harries, Ber. 1904, 37, pp. 839 et seq.).

The constitution of ozone has been determined by J. L. Soret (Ann. chim. phys., 1866 [4], 7, p. 113; 1868 [4], 13, p. 257), who showed that the diminution in volume when ozone is absorbed from ozonized oxygen by means of oil of turpentine is twice as great as the increase in volume observed when ozone is reconverted into oxygen on heating. This points to the gas possessing the molecular formula O₂. Confirmation was obtained by comparing the rate of diffusion of ozone with that of chlorine, which gave 24.8 as the value for the density of ozone, consequently the molecular formula must be O₃ (cf. B. C. Brodie, Phil. Trans., 1872, pt. ii. p. 435). More recently A. Ladenburg (Ber. 1901, 34, p. 631) has obtained as a mean value for the molecular weight the number 47-78, which corresponds with the above molecular formula. Ozone is used largely for sterilizing water.
The sixteenth letter of the English alphabet, the fifteenth in the Latin and the sixteenth in the Greek alphabet, the latter in its ordinary form having the symbol for x before o. In the Phoenician alphabet, from which the Western alphabets are directly or indirectly derived, its shape, written from right to left, is Ω. In the Greek alphabet, when written from left to right, it takes the form Π or Ω, the second form being much rarer in inscriptions than the first. Only very rarely and only in inscriptions of the 7th and 6th centuries B.C. are rounded forms Π, Ω found. In Italy the Etruscan and Umbrian form I (written from right to left), though more angular than the Phoenician symbol, resembles it more closely than it does the Greek. The earliest Roman form—on the inscription found in the Forum in 1390—is Greek in shape Ω, though the second leg is barely visible. The Roman Ω is identical with the rarer Greek form when time goes on the Roman form becomes more and more rounded Π, but not till Imperial times is the semi-circle completed so as to form the symbol in the shape which it still retains Π. The Semitic name Pâ became in Greek πα, and has in the course of ages changed but little. The sound of p throughout has been that of the breathed labial stop, as in the English pin. At the end of English words like lip the breath is audible after the consonant, so that the sound is rather that of the ancient Greek φ, i.e. p-h, not f, as φ is ordinarily now pronounced. This sound is found initially also in some dialects of English, as in the Irish pronunciation of pig as p-hig. For a remarkable interchange between p and qu sounds which is found in many languages, see under Q.

**Pärnl,** a town of the Cape Province, South Africa, 56 m. by rail E.N.E. of Cape Town. Pop. (1904), 11,293. The town is situated on the west bank of the Berg river, some 400 ft. above the sea. It stands on the coast plain near the foot of the Drakenstein mountains. West of the town the Pârl Berg rises from the plain. The berg is crowned by three great granite boulders, known as the Pârl, Britannia and Gordon Rock. The town is beautifully situated amid gardens, orange groves and vineyards. The chief public buildings are the two Dutch Reformed churches, the old church being a good specimen of colonial Dutch architecture, with gables, curves and thatched roof. Pârl is a thriving agricultural and viticultural centre, among its industries being the manufacture of wine and brandy, wagon and carriage building and harness making. South-east of the town are granite quarries. The wines produced in the district are among the best in South Africa, ranking second only to those of Constantia.

The Pârl is one of the oldest European towns in South Africa. It dates from 1687, the site for the new settlement being chosen by the governor, Simon van der Stel. It was named Pârl by the first settlers from the fancied resemblance of one of the boulders on the top of the hill, when glistening in the sun, to a gigantic pearl. Shortly afterwards several of the Huguenots who had sought refuge at the Cape after the revocation of the edict of Nantes were placed in the new settlement. The present inhabitants are largely descended from these Huguenots.

**Parnice,** a town of Russian Poland, in the government of Piotrkow, 30 m. N.W. of the town of Piotrkow, and 10 m. S.S.W. from Lodz railway station. Pop. (1897), 18,251. It lies amidst extensive forests round the head-waters of the Ner, which were the hunting grounds of the Polish kings. It has woollen, cloth and paper mills, and manufactures agricultural implements.

**Pâna,** or Pâbna, a town and district of British India, in the Rajshahi division of Eastern Bengal and Assam. The town is situated on the river Ichhamati, near the old bed of the Ganges. Pop. (1901), 18,424. The district of Pâna has an area of 1,530 sq. m. Pop. (1901), 1,420,461, showing an increase of 4.8% in the decade. It is bordered along its entire east face by the main stream of the Brahmaputra or Jamuna, and along its south-west face by the Ganges or Padma. It is entirely of alluvial origin, the silt of the annual inundations overlying strata of clay on sand. Apart from the two great bordering rivers, it is intersected by countless water-channels of varying magnitude, so that during the rainy season every village is accessible by boat and by boat only. Almost the whole area is one green rice-field, the uniform level being broken only by clumps of bamboos and fruit-trees, which conceal the village sites. The district is a modern creation of British rule, being first formed out of Rajshahi district in 1832, and possesses no history of its own. The two staple crops are rice and jute. Sirajganj, on the Brahmaputra, is the largest mart for jute in Bengal. The Eastern Bengal railway cuts across the south-west corner of the district to Sara, where a bridge crosses the Ganges. The district was affected by the earthquake of the 12th of June 1897, which was most severely felt at Sirajganj.

**Pâbst, Frederick** (1836-1904), American brewer, was born at Nicholaswirth, in Saxony, on the 28th of March 1836. In 1848 he emigrated with his parents to Chicago. There he became, first a waiter in an hotel, then a cabin-boy on a Lake Michigan steamer, and eventually captain of one of these vessels. In this last capacity he made the acquaintance of a German, Philip Best, the owner of a small but prosperous brewery at Milwaukee, and married his daughter. In 1862 Pâbst was taken into partnership in his father-in-law’s brewery, and set himself to work to study the details of the business. After obtaining a thorough mastery of the art of brewing, Pâbst turned his attention to extending the market for the beer, and, before long had raised the output of the Best brewery to 100,000 barrels a year. The brewery was eventually converted into a public company, and its capital repeatedly increased in order to cope with the continually increasing trade.

**Paca,** the Brazilian name for a large, heavily-built, short-tailed rodent mammal, easily recognized by its spotted fur. This rodent, Cœgogymus (or Agouti) paca, together with one or two other tropical American species, represents a genus near akin to the agoutis and included in the family Rodentia. Pacas may be distinguished from agoutis by their heavier and more compact build, the longitudinal rows of light spots on the fur, the five-toed hind-feet, and the peculiar structure of the skull, in which the cheek-bones are expanded to form large water-channels on the sides of the face, each enclosing a cavity on the side of the cheek. Their habits are very similar to those of agoutis, but when pursued they invariably take to the water. The young, of which seldom more than one is produced at a birth, remain in the burrows for several months. The flesh is eaten in Brazil. Males may be distinguished from females by the skull, in which the outer surface of the cheek-bones is roughened in the former and smooth in the latter sex. The paca-rana (Dinomys brancic), from the highlands of Peru, differs, among other features, by its well-developed tail and the arrangement of the spots. (See Rodentia.)

**Pacatus Drepanius, Latinus** (or Latinius), one of the Latin panegyrists, flourished at the end of the 4th century A.D. He probably came from Aginum (Agen), and received his education in the territory of the Nitiobrigi, and received his education in the rhetorical school of Burdigala (Bordeaux). He was the contemporary and intimate friend of Ausonius, who dedicated two of his minor works to Pacatus, and describes him as the greatest Latin poet after Virgil. Pacatus attained the rank of proconsul of Africa (A.D. 309) and held a confidential position at the imperial court. He is the author of an extant speech (ed. E. Bährns in Panegyrici latini, 1874, No. II) delivered in the senate house at Rome (356) in honour of Theodosius I. It contains an account of the life and deeds of the emperor, the special subject of congratulation being the complete defeat of the usurper Maximus. The speech is one of the best of its.
PACCHIA AND PACCHIAROTTO—PACHISI

kind. Though not altogether free from exaggeration and
flattery, it is marked by considerable dignity and self-restraint,
and is thus more important as an historical document than
similar productions. The style is vivid, the language elegant
but comparatively simple, exhibiting familiarity with the best
classical literature. The writer of the panegyric must be dis-
tinguished from Drepanius Florus, deacon of Lyons (c. 850),
author of some Christian poems and prose theological works.

See M. Schanz, Geschichte der römischen Litteratur (1904), iv. i.

PACCHIOTTI, GIROLAMO DEL and PACCHIAROTTO (or
PACCHIARROTTI), JACOPO, two painters of the Sienese school.
One or other of them produced some good pictures, which used
to pass as the performance of Perugino; rechristened from Perugino,
they were assigned to the Chiaro. Their work is sufficient to
prove that the good works are by G. del Pacchia, while nothing of
Pacchiarotti’s own doing transcends mediocrity. The mythical
Pacchiarotto who worked actively at Fontainebleau has no
authenticity.

Girolamo del Pacchia, son of a Hungarian cannon-founder,
was born, probably in Siena, in 1477. Having joined a turbulent
club named the Bardotti he disappeared from Siena in 1535,
when the club was dispersed, and nothing of a later date is
known about him. His most celebrated work is a fresco of the
“ Nativity of the Virgin,” in the chapel of S Bernardino, Siena,
graceful and tender, with a certain artificiality. Another
renowned fresco, in the church of S Caterina, represents that
saint with the Virgin and Child. He was knighted by the
Girondist minister, who, having raised her foot by miracle. In the National Gallery
of London there is a “ Virgin and Child.” The forms of G. del
Pacchia are fuller than those of Perugino (his principal model of
style appears to have been in reality Franciaciobio); the
drawing is not always unexceptionable; the female heads have
sweetness and beauty of feature, and some of the colouring has
noticeable force.

Pacchiarotto was born in Siena in 1474. In 1530 he took part
in the conspiracy of the Libertini and Popolani, and in 1534 he
joined the Bardotti. He had to hide for his life in 1535,
and was concealed by the Observantine fathers in a tomb in the
church of S Giovanni. He was stuffied in close to a new-buried
corpse, and got covered with vermin and dreadfully exhausted
by the close of the second day. After a while he resumed work;
he was exiled in 1530, but recalled in the following year, and in
that year or soon afterwards he died. Among the few extant
works with which he is still credited is an “ Assumption of the
Virgin,” in the Carmine of Siena. Other works rather dubious
attributed to him are in Siena, Buonconvento, Florence, Rome
and London.

PACE, RICHARD (c. 1482-1536), English diplomatist, was
educated at Winchester under Thomas Langton, at Padua,
and probably at Oxford. In 1500 he went with
Cardinal Christopher Bainbridge, archbishop of York, to Rome,
where he won the esteem of Pope Leo X., who advised Henry
VIII. to take him into his service. The English king had no
and in 1515 Pace became his secretary and in 1516 a secretary of
state. In 1515 Wolsey sent him to urges the Swiss to attack
France, and in 1519 he went to Germany to discuss with the
electors the impending election to the imperial throne. He was
made dean of St Paul’s in 1519, and was also dean of Exeter
and dean of Salisbury. He was present at the Field of the Cloth
of Gold in 1526, and in 1521 he went to Venice with the object
of winning the support of the republic for Wolsey, who was
anxious at this time to become pope. At the end of 1526 he
was recalled to England, and he died in 1536. His chief literary
work was De fruitus (Basel, 1517).

PACE (through O. Fr. pas, from Lat. passus, step, properly
the stretch of the leg in walking; hence used of the amount of
ground covered by each single movement, or generally of the
speed at which anything moves. The word is also used of a
measure of distance, taken from the position of one foot to that
of the other in making a single “ pace,” i.e. from 2¼ ft. (the
military pace) to 1 yard. The Roman passus was reckoned
from the position of the back foot at the beginning of the pace
to the position of the same foot at the end of the movement,
i.e. 5 Roman feet, 58½ English inches, hence the Roman mile,
nelle passus = 1646 yards.

For pacing in horse-racing see Horse-Racing.

PACHE, JEAN NICOLAS (1746-1823), French politician, was
born in Paris, of Swiss parentage, the son of the concierge of
the hotel of Marshal de Castries. He became tutor to the marshal’s
children, and subsequently first secretary at the ministry of
marine, head of supplies (munitionnaire général des vivres),
and comptroller of the king’s household. After spending several
years in Switzerland with his family, he returned to France at the
beginning of the Revolution. He was employed successively at the
ministries of the interior and of war, and was appointed on the 20th of September 1793 third deputy suppleant of Paris by the
Luxembourg section. Thus brought into notice, he was made minister of war in the following October. Pache was a Girondist himself, but aroused their hostility by his incompetence.

He was the most prominent of his school, and in the days preceding the revolution of war by Beauniville (Feb. 4, 1794) he was chosen mayor by theParisians. In that capacity he contributed to the fall of the Girondists, but his relations with Hébert and Chaumette, and with the enemies of Robespierre led to his arrest on the 10th of May 1794. He owed his safety only to the amnesty of the 25th of October 1795. After acting as commissary to the civil hospitals of Paris in 1799, he retired from public life, and died at Thin-le-Moutier on the 18th of
November 1823.

See L. Pierquin, Mémoires sur Pache (Charleville, 1800).

PACHECO, FRANCISCO (1571-1654), Spanish painter and
art historian, was born at Seville in 1571. Favourable specimens
of his style are to be seen in the Madrid picture gallery, and also
in two churches at Alcalá de Guadaira near Seville. He attained
great popularity, and about the beginning of the 17th century
opened an academy of painting which was largely attended.
Of his pupils by far the most distinguished was Velazquez,
who afterwards became his son-in-law. From about 1625 he
gave up painting and betook himself to literary society and
grew into one of the most prominent of his time, and in 1648
was elected an academical of the art of painting (Arte de la pintura: su antigüedad y grandeza, 1649), which is of considerable value for the information it contains on matters relating to Spanish art. He
died in 1664.

PACHISI (Hindi pachis, twenty-five), the national table-game
of India. In the palace of Akbar at Fatehpur Sikri the court of
the zenith is divided into red and white squares, representing a pachisi-board, and here Akbar played the game with his
courtiers, employing sixteen young slaves from his harem as
living pieces. This was also done by the emperors of Delhi in
their palace of Agra. A pachisi-board, which is usually
embroidered on cloth, is marked with a cross of squares, each limb
of the cross containing four squares or quarters, which are placed around a centre square. The outer rows each have ornaments on the fourth square from the end and the middle rows one on the end square, these ornaments squares forming “ castles,” in which
pieces are safe from capture. The castles are so placed that
from the centre square, or “ home,” whence all pieces start
go down the middle row and back on the outside and then to
the end of the next limb, will be exactly 25 squares, whence the
name. Four players, generally two on a side, take part. The
pieces, of which each player has four, are coloured yellow, green,
red and black, and are entered, one at a time, from the centre and
down move the middle row, then round the entire board and up
the middle row again to the home square. The moves are
regulated by six cowrie shells, which are thrown by hand down one
of the threads. The threads indicate the number of squares a
piece may move, as well as whether the player shall have a
“ grace,” without which no piece, if taken, may be re-entered.
A piece may be taken if another piece lands on the same square,
unless the square be a castle. The object of each side is to
get all eight pieces round and home before the opponents can do so.

See Games, Ancient and Oriental, by E. Falkner (London, 1892).

PACHMANN, VLADIMIR DE (1848– ), Russian pianist, was born at Odessa, where his father was a professor of music at the university. He was educated in music at Vienna, and from 1860 to 1882 only regularly performed in public, being engaged in the meanwhile in assiduous study. He then obtained the greatest success, particularly as a player of Chopin, his brilliance of execution and rendering being no less remarkable than the playfulness of his platform manner.

PACHMARNI, a hill-station and sanatorium for British troops in the Central Provinces of India. Pop. (1901), 3,620, rising to double that number in the summer. It is situated at a height of 900 ft. in the vicinity of the Satpura hills in Hoshangabad district, 32 m. by road from Piparia station on the Great Indian Peninsula railway. Though not free from fever in the hot season, it affords the best available retreat for the Central Provinces.

PAHOUMIS, ST (302–346), Egyptian monk, the founder of Christian cenobitical life, was born, probably in 292, at Esna in Upper Egypt, of heathen parents. He served as a conscript in one of Constantine's campaigns, and on his return became a Christian (314); he at once went to live an eremitical life near Dendera by the Nile, putting himself under the guidance of an aged hermit. After three or four years he was called (by an angel, says the legend) to establish a monastery of cenobites, or monks living in common (see Monasticon § 4). Pachomius spent the rest of his life in writing the great order he had created, which at his death included nine monasteries with some three thousand monks and a nunery. The order was called Tabennesi, from Tabennissi, near Dendera, the site of the first monastery. The most vivid account of the life and primitive rule is that given by Palladius in the Lausiac History, as witnessed by him (c. 410). Difficulties arose between Pachomius and the neighbouring bishops, which had to be composed at a synod at Esna. But St Athanasius was his firm friend and visited his monastery c. 330 and at a later period. Pachomius died (probably) in 346.

The best modern work on Pachomius is by P. Ladeuze, Le Cénotârtme pachomien (1898). There have been different opinions in regard to the dates; those given above are Ladeuze's, now commonly accepted. The priority of the Greek Life of Pachomius over the Coptic may be said to be established; the historical character and value of this life are now fully recognized. A good analysis of all the literature is supplied in Herrgott's Xenienkloéadie (ed. 3).

PACHUCA, a city of Mexico and capital of the state of Hidalgo, 55 m. direct and 68 m. by rail N.E. of the city of Mexico (P. 1900), 37,850. Pachuca's railway connections include the Mexican, the Hidalgo and the Mexican Oriental, besides which it has 5 m. of tramway line. The town stands in a valley of an inland range of the Sierra Madre Oriental, at an elevation over 8,000 ft. above the sea, and in the midst of several very rich mineral districts—Atotonilco el Chico, Capula, Potosí, Real del Monte, Santa Rosa and Tepetépan. It is said that some of these silver mines were known to the Indians before the discovery of America. Pachuca has some fine modern edifices, among which are the palace of justice, a scientific and literary institute, a school of mines and metallurgy, founded in 1877, a meteorological observatory and a public library. Mining is the chief occupation of its inhabitants, of whom about 7,000 are employed underground. Electric power is derived from the water power. The city's industrial establishments include smelting works and a large number of reduction works, among which are some of the largest and most important in the republic. It was here that Bartolomé de Medina discovered the “pato” process of reducing silver ores with quicksilver in 1557, and his old hacienda de beneficio is still to be seen. Pachuca was founded in 1534, some time after the mines were discovered. Here Pedro Romero de Terreros made the fortune in 1730 that enabled him to present a man of war to Spain and gain the title of Count of Regla. Pachuca was sacked in 1812, and so keen was the desire to possess its sources of wealth, in common with other mining towns, that mining operations were partially suspended for a time and the mines were greatly damaged. In 1824 the Real del Monte mines were sold to an English company and became the centre of a remarkable mining speculation—the company ruining itself with lavish expenditures and discontinuing work in 1848. The mines in 1909 belonged to an American company.

PACHYMERES, GEORGIUS (1242–c. 1310), Byzantine historian and miscellaneous writer, was born at Nicaea, in Bithynia, where his father had taken refuge after the capture of Constantinople by the Latins in 1204. On their expulsion by Michael Palaeologus in 1261 Pachymeres settled in Constantinople, studied law, entered the church, and subsequently became chief advocate of the church (πρωτοσπουδας) and chief justice of the imperial court (δικαστήριον). His literary activity was considerable, his most important work being a Byzantine history in 13 books, in continuation of that of Georgius Acropolita from 1261 (or rather 1255) to 1308, containing the history of the reigns of Michael and Andronicus Palaeologi. He was also the author of rhetorical exercises on hackneyed sophistical themes; of a Quadrivium (Arithmetic, Music, Geometry, Astronomy), valuable for the history of music and astronomy in the middle ages; a general sketch of Aristotelian philosophy; a paraphrase of the speeches and letters of Dionysius Arcopagita; and, including an account of the long and costly labours of the Augusteum, the column erected by Justinian in the church of St Sophia to commemorate his victories over the Persians.

The History has been edited by I. Bekker (1835) in the Corpus scriptorum hist. byzantinæ, also in J. P. Migne, Patrologia graeca, exlib. etc.; for editions of the minor works see C. Krumbacher, Geschichte der byzanitischen Literatur (1897).

PACIFIC BLOCKADE, a term invented by Hautefeuille, the French writer on International Maritime Law, to describe a blockade exercised by a great power for the purpose of bringing pressure to bear on a weaker state without actual war. That it is an act of violence, and therefore in the nature of war, is undeniable, seeing that it can only be employed as a measure of coercion by maritime powers able to bring into action such vastly superior forces to those the resisting state can dispose of that resistance is out of the question. In this respect it is an act of war, and any attempt to exercise it against a power strong enough to resist would be a commencement of hostilities, and at once bring into play the rights and duties affecting neutrals. On the other hand, the object and justification of a pacific blockade being to avoid war, that is general hostilities and disturbance of international traffic with the state against which the operation is carried on, rights of war cannot consistently be exercised against ships belonging to other states than those concerned. And yet, if neutrals were not to be affected by it, the coercive effect of such a blockade might be completely lost. Recent practice has been to limit interference with them to the extent barely necessary to carry out the purpose of the blockading powers.1

It is usual to refer to the intervention of France, England and Russia in Turkish affairs in 1827 as the first occasion on which the coercive value of pacific blockades was put to the test. Neutral vessels were not affected by it. This was followed by a number of other coercive measures described in the textbooks as pacific blockades. The first case, however, in which the operation was really a blockade, unaccompanied by hostilities, and which therefore can be properly called a “pacific blockade,” was that which in 1857 Great Britain exercised against New Granada. A British subject and consul of the name of Russell was accused of stabbling a native of the country in a street brawl. He was arrested, and after being kept in detention for some months he was tried and found guilty of carrying of arms and

1There is always the alternative of making the blockade an act of war. This was done in 1902–3, when Great Britain, Germany and Italy proclaimed a blockade of certain ports of Venezuela and the mouths of the Orinoco. The blockade in this case was not pacific, but was war with all its consequences for belligerents and neutrals (see Foreign Office notice in London Gazette of December 20, 1902).
sentenced to six years' imprisonment. The British government presented this treatment as "not only cruel and unjust towards Mr Russell, but disrespectful towards the British nation," and demanded the dismissal of the officials implicated and £5000 damages and "that the compensation for the cruel injuries which had been inflicted upon Mr Russell" (State Papers, 1837-1838, p. 183).

The New Granada government refused to comply with these demands, and the British representative, acting upon his instructions, called in the assistance of the West Indian fleet, but observed in his communication to the British naval officer in command that it was desirable to avoid hostilities, and to endeavour to bring about the desired result by a strict blockade only. This seems to be the first occasion on which it had occurred to anybody that a blockade without war might serve the purpose of war. This precedent was shortly afterwards followed by another somewhat similar case, in which from the 16th of April to the 28th of November 1838 the French government blockaded the Mexican ports, to coerce the Mexican government into acceptance of certain demands on behalf of French subjects who had suffered injury to their persons and damage to their property through insufficient protection by the Mexican authorities.

The blockade of Buenos Aires and the Argentine coast from the 28th of March 1839 to the 7th of November 1840 by the French fleet, a coercive measure consequent upon vexatious laws affecting foreign residents in the Argentine Republic, seems to have been the first case in which the operation was notified to the different representatives of foreign states. This notification was given in Paris, and at Buenos Aires, and to every ship approaching the blockaded places. This precedent of notification was, a few years later (1843), followed in another blockade against the same country by Great Britain and France, and in June 1844 by Great Britain against the port of Granada in Nicaragua. In 1850 Great Britain blockaded the ports of Greece in order to compel the Hellenic government to give satisfaction in the Don Pacifico case. Don Pacifico, a British subject, claimed £12,000 as damages for unprovoked pillage of his house by an Athenian mob. Greek vessels only were seized, and these were only sequestered. Greek vessels bona fide carrying cargoes belonging to foreigners were allowed to enter the blockaded ports.

Before the next case of blockade which can be described as "pacific" occurred came the Declaration of Paris (April 15, 1856), requiring that "blockades in order to be binding must be effective; that is to say, maintained by a force sufficient really to prevent the enemy from carrying on the commerce of the country." Some ill-defined measures of blockade followed, such as that of 1860, when Victor Emmanuel, then king of Sardinia, joined the revolutionary government of Naples in blockading ports in Sicily, then held by the king of Naples, without any rupture of pacific relations between the two governments; that of 1862, in which Great Britain blockaded the port of Rio de Janeiro, to exact redress for pillage of an English vessel by the local population, at the same time declaring that she continued to be on friendly terms with the emperor of Brazil; and that in 1880, when a demonstration was made before the port of Dulcigno by a fleet of British, German, French, American, Russian and Italian men-of-war, to compel the Turkish government to carry out the treaty pending this town to Montenegro, and it was announced that no war was given up by the Turkish forces if it would be blockaded.

The blockade which first gave rise to serious theoretical discussion on the subject was that instituted by France in 1884 in Chinese waters. On the 20th of October 1884 Admiral Courbet declared a blockade of all the ports and roadsteads between certain specified points of the island of Formosa. The British government protested that Admiral Courbet had not enough ships to render the blockade effective, and that it was therefore a violation of one of the articles of the Declaration of Paris of 1856; moreover, that the French government could only interfere with neutral vessels violating the blockade if there was a state of war. If a state of war existed, England as a neutral was bound to close her coaling stations to belligerents. The British government held that in the circumstances France was waging war and not entitled to combine the rights of peace and warfare for her own benefit. Since then Pacific blockades have only been exercised by the great powers as a joint measure in the limitation of the commerce of the belligerents, which has been that of peace; and in this respect the term is taking a new significance in accordance with the ordinary sense of the word "pacific."

In 1886 Greece was blockaded by Great Britain, Austria, Germany, Italy and Russia, to prevent her from engaging in war with Turkey, and thus forcing the powers to define their attitude towards the latter power. The instructions given to the British commander were to detain every ship under the Greek flag coming out of or entering any of the blockaded ports or harbours, or communicating with any ports within the limit blockaded; but if any parts of the cargo on board of such ships belonged to any subject or citizen of any foreign power other than Greece, and other than Austria, Germany, Italy and Russia, and had been shipped before notification of the blockade or after such notification, but under a charter made before the notification, such ship was not to be detained.

On the blockade of Crete in 1807 it was notified that "the admirals in command of the British, Austro-Hungarian, French, German, Italian, and Russian naval forces" had decided to put the island of Crete in a state of blockade, that "the blockade would be general for all ships under the Greek flag," and that "ships of the six powers or neutral powers may enter into the ports occupied by the powers and land their merchandise, but only if it is not for the Greek troops or the interior of the island," and that "these ships may be visited by the ships of the international fleet.

Since the adoption of the Hague Convention of 1897 respecting the limitation of the employment of force for the recovery of the contract debts, the contracting powers are under agreement "not to have recourse to armed force for the recovery of contract debts claimed from the government of one country by the government of another country as being due to its nationals," unless "the debtor state refuses or neglects to reply to an offer of arbitration, or after accepting the offer refuses any compromis from being agreed on, or after the arbitration fails to submit to the award" (Art. 1). Though this does not affect Pacific blockades in principle, it superseded them in practice by a new procedure for some of the cases in which they have hitherto been employed.

PACIFIC OCEAN. The largest division of the hydrosphere, lying between Asia and Australia and North and South America. It is nearly landlocked to the N., communicating with the Arctic Ocean only by Bering Strait, which is 36 m. wide and of small depth. The southern boundary is generally regarded as the parallel of 46° S., but sometimes the part of the great Southern Ocean (46° to 66½° S.) between the meridians passing through South Cape in Tasmania and Cape Horn is included. The north to south distance from Bering Strait to the Antarctic circle is 7000 m., and the Pacific attains its greatest breadth, 10,000 m., at the equator. The coasts of the Pacific are of varied contour. The American coasts are for the most part mountainous and unbroken, the chief indentation being the Gulf of California; but the general type is departed from in the extreme north and south, the southern coast of South America being mountainous, while that of Alaska is similarly broken in the south and becomes low and swampy towards the north. The coast of Australia is high and unbroken; there are no inlets of considerable size, although the small openings include some of the finest harbours in the world, as Moreton Bay and Port Jackson. The Asiatic coasts are for the most part low and irregular, and a number of seas are more or less completely enclosed and cut off from communication with the open ocean. Bering Sea is bounded by the Alaskan Peninsula and the chain of the Aleutian Islands; the sea of Okhotsk is enclosed by the peninsula of Kamchatka and the Kurile Islands; the Sea of Japan is shut off by Sakhalin Island, the Japanese Islands and the peninsula of Korea; the Yellow Sea is an opening between the coast of China and Korea;
the China Sea lies between the Asiatic continent and the island of Formosa, the Philippine group, Palawan and Borneo. Amongst the islands of the Malay Archipelago are a number of enclosed areas—the Sulu, Celebes, Java, Banda and Aratua seas. The Arafura Sea extends eastwards to Torres Strait, and beyond the sea is the Coral Sea, bounded by New Guinea, the islands of Melanesia and north-eastern Australia.

The area and volume of the Pacific Ocean and its seas, with the mean depths calculated therefrom, are given in the article OCEAN.

**Extent.**

The Pacific Ocean has been divided into three areas of the ocean—the Atlantic—the next largest division of the hydrosphere—and has more than double its volume of water. Its area is greater than the whole land surface of the globe, and the volume of its water is six times that of all the lakes, rivers and seas of the earth. The total land area draining to the Pacific is estimated by Murray at 7,500,000 sq. m., or little more than one-fourth of the area draining to the Atlantic. The American rivers draining to the Pacific, the Yukon, Columbia and Colorado, are the largest. The chief Asiatic rivers are the Amur, the Huang-ho and the Yangtsze-kiang: none of which enters the open Pacific directly. Hence the proportion of purely oceanic area to the total area is greater in the Pacific than in the Atlantic, the supply of detritus being smaller, and terrigenous deposits are not borne so far from land.

The bed of the Pacific is not naturally divided into physical regions, but for descriptive purposes the parts of the area lying between 120° E. and 120° W. of longitude are conveniently dealt with separately. The eastern region is characterized by great uniformity of depth; the 2000-fathom line keeps close to the American coast except off the Isthmus of Panama, whence an important trough, the Panama deeps, extends from the coast and again off the coast of South America in about 40° S., where a bank runs west and unites with the former. The bank then continues south to the Antarctic Ocean, in about 120° W. Practically the whole of the north of the Pacific is therefore shallower than 2000 fathoms deep, and the south-east has two roughly triangular spaces, including the greater part of the area, between 2000 and 3000 fathoms. Notwithstanding this great average depth, the deeps, or areas of 3000 fathoms and upwards, are not characterized by any great number of principal depressions. Five small deeps are recognized along a line close to the coast of South America and parallel to it, in the depression enclosed by the two banks mentioned—they extend from about 30° S. and 120° W. and are named the Peru deeps, the Paracou deeps, the Kuri-Paracou deeps, the Kriimmel deep, Byrd Channel, by H.M.S. "Penguin," near the Tonga Islands: and the Tucscorae deep, a long, narrow trough running immediately to the east of Kaukchatka, the Kurile Islands and Japan. A long strip within the Tucscorae deep forms the largest continuous area with a depth greater than 4000 fathoms. All the rest of the western Pacific is a region of quite irregular contour. The average depth varies from 1500 to 2500 fathoms, and from this level innumerable volcanic ridges and submarine volcanoes occur. The temperature of the water for the most part occupied by atolls and reefs of coral formation, while interspersed with these are depressions, mostly of small area, amongst which the deepest soundings have been obtained. The greatest depth known directly in the western Pacific is that of the Tonga Trench between Hawaii and the Philippines, sound ed in 1900 to the greatest depth yet known between Midway Islands and Guam (12° 14' N., 145° 40' E.) in 5296 fathoms, or almost exactly 6 m. The following table, showing the area of the floor of the Pacific (to 40° S.) and the volume of water at different levels, is due to Sir J. Murray:—

So far as our knowledge goes, the present contours of the open Pacific Ocean are almost as they were in Palaeozoic times, and in the intervening ages changes of level and form have been slight. The great oceans are divided into an open or central part, and an area now covered by the waters of the Pacific Ocean has often been described as dry land. Hence the Pacific basin may be regarded as a stable and homogeneous geographical unit, clearly marked off round nearly all its sides, and only partly by sounds and straits. The following table showing the length of coast in miles for given distances above the land along the sides of the continent. The red-clay region is characterized by the occurrence of manganese, which gives the clay a chocolate colour, and manganese nodules are found in vast numbers, along with sharks' teeth and the car-bones of the walrus. The 200-fathom line, which divides the open Pacific in a region between 15° N. to 10° S. and 140° E. to 150° W. occurring in seven distinct localities, and covering an area of about 3,000,000 sq. kilometres. The "Challenger" discovered an area of radiolarian ooze between 7°-12° N. and 117°-152° W. and another in 2°-10° S., 152°-153° W. Between these two areas, almost on the equator, a strip of globigerina ooze was found, corresponding to the zone of globigerina in the equatorial region of the Atlantic. Globigerina ooze covers considerable areas in the intermediate depths of the west and south Pacific—west of New Zealand, and along the parallel of 40° S. between 80°-88° W. and 160°-18° W.—but this deposit is not known in the north-west Pacific. The deposit of 'black mud' has a volume estimated at 38,312,000 sq. kilometres—about two-thirds of that in the Atlantic. Pteropod ooze occurs only in the neighbourhood of Fiji and other islands of the western Pacific, passing up into fine coral ashes in the south. The most important region is that between the Philippine and Mariana islands, and near the Aleutian and Galapagos groups, forming an exception to the general rule of its occurrence only in high latitudes. All the enclosed seas are characterized by a very small supply of terrigenous material.

Partly on account of its great extent, and partly because there is no wide opening to the Arctic regions, the normal wind circulation is on the whole less modified in the North Pacific than in the South Pacific, except in the Bering Sea. The monsoon of southern Asia controls the prevailing winds, its influence extending eastwards to 145° E., near the Ladrone, and southwards to the equator. The South Pacific the northwest monsoon of Australia affects a belt running east of New Guinea to the Solomon Islands. In the east the north-east trade -belt extends between 5° and 25° S.; the south-east trade crosses the equator, and its mean southern limit is 25° S. The trade-winds are generally weaker and less persistent in the Pacific than in the Atlantic, and the intervening belt of equatorial calms is broader. Except in the east of the Pacific, the south-east trade is only fully established after the equinox in November. In the northern hemisphere the trade-belt is cut across from north-west to south-east by a band twenty to thirty degrees wide, in which the trades alternate with winds from north-east and north, and with calms, the calms prevailing between 160° and 185° E.). This area, in which the south-east trade is interrupted, includes the Fiji, Navigator and Society groups, and the Pau motus. In the Marquesas group the trade-wind is constant. Within the southern monsoon region there is a gradual transition to the northern-west monsoon of New Guinea in low latitudes, and in higher latitudes to the north-east wind of the Queensland coast. The great warm and abundant rainfall of the island regions of the western Pacific, and, especially, the existence of the trade-winds, which by their displacement of the southern tropical maximum of pressure to the east; hence we have a permanent "South Pacific anticyclone" close to the coast of South America. The characteristic feature of the trade winds is the drizzling, often heavy, rain which marks the existence of a true monsoon region in the middle of the trade-wind belt. It is to be noted that the climate of the islands of the Pacific becomes more and more healthy the farther they are from the coast. In general, the islands of the group, where characterized by uniform high air-temperatures; the mean annual range varies from 1° to 9° F., with extremes of 24° to 27°, and the diurnal range from 9° to 16°. The monsoon region relative humidity, viz. 80-85 per cent, and the occasional storms of the western island groups there is no well-marked rainy season, but over the whole region the greater part of the rainfall takes place during the southern summer, even as far north as Hawaii. In the central and north Pacific we find a somewhat rainy climate in the windward sides of the islands, and a shorter rainy season at the season of highest sun on the lee side. Suchan describes the island-studded portion of the western Pacific as the most extensive region of the earth's surface characterized by uniform high air-temperatures; the winds of the North Pacific are under the control of an area of low pressure, which, however, attains neither the size nor the intensity of the "Iceland" depression in the north
Atlantic. The result is that north-westerly winds, which in winter are exceedingly dry, at times, but are of moderate violence, prevail in the centre, and south-westery and southerly winds off the American coast. In the southern hemisphere there is a transition to the low-pressure belt encircling the Southern Ocean, in which westerly and north-westerly winds continue all the year round.

The distribution of temperature in the waters of the Pacific Ocean has been fully investigated, so far as is possible with the existing means. In the South Pacific, where the temperature, at the surface, has been measured in the Equatorial Current, by Dr. Agassiz, the area of maximum temperature (over 20° C.) occurs over 10° on each side of the equator to the west of the ocean. On the eastern side temperature falls to 22° on the equator and is slightly higher than in the southern part of the basin. In the Northern Hemisphere, the surface temperature is generally warmer on the E. than on the W., but this condition is, on the whole, reversed in corresponding southern latitudes. In the intermediate levels, down to depths exceeding 2000 fathoms, a marked boundary appears, and the temperature remains more or less uniform, though the surface of water is generally cooler in the northern quarter, and is still distinctly greater in the Southern Hemisphere.

Temperature. The isothermal lines, in fact, suggest that in the vast area of the Pacific something corresponding to "the 20° C. line of the Atlantic," marks a local diminution of which may be of extreme value in relation to current inquiries concerning the upper air. In the greater depths temperature is extraordinarily uniform, 90% of the existing observations falling within 3° or 4° of the surface temperature, and the enclosed seas of the western Pacific temperature usually falls till a depth corresponding to that of the summit of the barriers that isolate them from the open ocean is reached, and below that point temperature is uniform in the north-going part of the waters of the South Sea, for example, a temperature of 10° C. is reached at 400 fathoms, and this remains constant to the bottom in 2500 fathoms.

The surface waters of the North Pacific are relatively fresh, the salinity being only of the order of 30 parts per million, in the winter, and a few parts higher in the summer. The saltest waters are found along a belt extending westwards from the American coast on the Tropic of Cancer to 160° E., then turning southwards to the equator. North of this salinity diminishes steadily, especially to the north-west, the Sea of Okhotsk showing the lowest salinity observed in any part of the globe. South and east of the axis mentioned salinity becomes less to just north of the equator, where it increases again, and the saltiest waters of the whole Pacific are found, as we shall expect, in the south-east trade-wind region, the maximum occurring in about 18° S. and 120° W. South of the Tropic of Capricorn the isohalines run nearly east and west, salinity diminishing quickly to the north of the equator. South of 40° S. the halocline is marked at a salinity of 34-8 p. m., corresponding closely with the bottom waters of the South Atlantic, but fresher than those of the North Atlantic.

The surface currents of the Pacific have not been studied in the same detail as those of the Atlantic, and their seasonal variations are little known except in the monsoon regions. Speaking generally, however, it may be said that for the most part under the direct control of the prevailing winds. The North Equatorial Current is due to the action of the north-east trades. It splits into two parts east of the Philippines, one division forming the Gulf Stream, to feed a drift circulation which follows the winds of the North Pacific, and finally forms the Californian Current flowing southwards along the American coast. Part of the equatorial stream, however, runs north-west along the islands, that forms the variable Mexican Current, which follows the coasts of Mexico and California close to the land. The Equatorial Counter-current flowing eastwards is largely assisted during the latter half of the year by the south-west monsoon, and from July to October the south-west winds prevailing east of 150° E. further strengthen the current, but later in the year the easterly winds weaken or even destroy it. The South Equatorial Current is produced by the south-east trades, and is modified by the prevailing local winds. On reaching the western Pacific part of this current passes southwards, east of New Zealand, and again east of Australia, as the East Australian Current, part northwards to join the Equatorial Counter-Current, and part westwards through the Banda and Molucca seas and through the China Sea towards the Indian Ocean. During the south-west monsoon this last branch is reversed, and the surface waters of the China Sea probably unite with the Kuro Siwo. Between these two main streams the drift of water is determined by the slight movement to the southward, known as the Oya Siwo, forms the analogue of the "Cold Wall of the Atlantic."

In the higher latitudes of the South Pacific, the surface movement forms part of the wind-drift of the Roaring Forties. The westerly winds, from the south-west of South America, the cold waters of the Humboldt or Peruvian Current corresponding to the Benguela Current of the South Atlantic, make their way northwards, ultimately joining the South Equatorial Current. The only movement in the depths is the slow creep of ice-cold water northwards along the bottom from the Southern Ocean; but this is more marked, and apparently penetrates further north, than in the Atlantic.

[END OF EXTRACT]

Islands of the Pacific

Up to a certain point, the islands of the Pacific fall into an obvious classification, partly physical, partly political. In the west there is the great looped chain which fringes the east coast of Asia, and with it encloses the series of seas which form parts of the ocean. The north of the chain, from the Kuriles to the Philippines, is enclosed by the Sea of Okhotsk, and this is continued by the Philippines (belonging to the United States of America) which link it with the vast archipelago between the Pacific and Indian oceans, to which the name Malay Archipelago is commonly applied. As the loop of the Kuriles depends from the southern extremity of Kamchatka, so from the east of the same peninsula another loop extends across the northern part of the ocean to Alaska, and helps to demarcate the Bering Sea; this chain is distinctly broken to the east of the Commander Islands, but is practically continuous thereafter under the name of the Aleutian Islands. Islands form a much less important feature of the American Pacific coast than of the Asiatic; between 48° N. and 38° S. there are practically none, and to the north and south of these parallels respectively the islands, west and large and numerous, are poorly defined, lying close under the mainland, enclosing no seas, and forming no separate political units. South-eastward of the Malay Archipelago lies "the largest island and the smallest continent," Australia; eastward of the archipelago, New Guinea, the largest island if Australia be regarded as a continent only. With Australia may be associated the islands lying close under its coasts, including Tasmania. Next follow the two great islands and attendant islets of New Zealand.

There now remains a vast number of small islands which lie chiefly (but not entirely) within an area which may be defined as extending from the Philippines, New Guinea and Australia to 150° W. and from tropic to tropic. These islands fall principally into a number of groups clearly enough defined to be well seen on a map of small scale; they are moreover divided, as will be shown, into three main divisions; but whereas they have enough characteristics in common to render a general view of them desirable, there is no well-recognized name to cover them all. The name Polynesia was formerly taken to do so, but belongs properly to one of the three main divisions, to which the name Eastern Polynesia was otherwise given; Oceania and Oceanica are variants of another term which has been used for the same purpose, though by no means generally. Moreover usage varies slightly as regards the limits of the three main divisions, but the accompanying table shows the most usual classification, naming the principal groups within each and distinguishing them according to the powers to which they are subject.

The following islands may be classified as oceanic, but not with any of the three main divisions; the Bonin Islands, north of the Marianas, belonging to Japan; Lord Howe and Norfolk Islands to
New South Wales); Easter Island (to Chile); the Galapagos Islands (to Ecuador). In an area to be defined roughly as lying about the Tropic of Cancer, between Hawaii and the Bonin Islands, there are scattered a few small islands and reefs, of most of which the position, if not the existence, is doubtful. Such are Patrocinio (about 28° 30' N., 177° 18' E.) and Ganges (39° 47' N., 154° 18' E.), among others which appear on most maps. Marcus Island, in 23° 10' N., 154° E., was annexed by Japan in 1899 with a view to its becoming a cable station.

The following paragraphs review the oceanic islands generally, and are therefore concerned almost entirely with the central and mid-western parts of the ocean. It is impossible to estimate the total number of the islands; an atoll, for instance, which may slide in the Marquesas, which afford a type of the extinct volcanic islands, as does Tahiti. In other areas, however, there is still volcanic activity, and in many cases volcanoes to which only tradition attributes eruptions can hardly be classified as extinct. Hawaii contains the celebrated active crater of Kilauea. In Tonga, in the New Hebrides, and in the long chain of the Solomons and the Bismarck Archipelago there is much activity. Submarine vents sometimes break forth, locally raising the level of the sea-bottom, or even forming temporary islands or shoals. Earthquakes are not uncommon in the volcanic areas. Most of the volcanic islands are lofty in proportion to their size. The peaks or sharp cones in which they

The above figures give a total land area for the whole region of 695,61 squ. m., with a population of 978,130; but they are for the most part merely approximate.

The islands may be divided broadly into volcanic and coral islands, though the physiology of many islands is imperfectly known. There are ancient rocks, however, in New Caledonia, which has a geological affinity with New Zealand; old sedimentary rocks are known in New Pomerania, besides granite and porphyry, and slate, sandstone and chalk occur in Fiji, as well as young volcanic rocks. Along with these, similarly, hornblende and diabase occur in the Pelew Islands and gneiss and mica.

¹ These are dependencies of New Zealand, as are also the following islands and groups which lie apart from the main Polynesian clusters, nearer New Zealand itself: Antipodes Islands, Auckland Islands, Bounty Islands, Campbell Islands, Chatham Islands, Kermadec Islands.

² Under British and French influence jointly.

frequently culminate, combined with the rich characteristic vegetation, are the principal features which have led all travellers to extol the beauty of the islands.

In the central and western Pacific the northern and southern limits of the occurrence of reef-forming corals are approximately 30° N. and 30° S. It may be added that this belt narrows greatly towards the east, mainly from the south, in sympathy with the northward flow of cold water off the coast of South America. But apart from this the limits are seen to accord fairly closely with the geographical definition of the area under consideration. Here the broad distinction has been drawn between volcanic and coral islands; but this requires amplification, both because the coral islands follow more than one type, and because the work of corals is in many cases associated with the volcanic islands in the form of fringing or barrier reefs. As to the distribution of coral reefs within the Pacific area, in Micronesia the northern Marianas (volcanic) are without reefs, which, however, are well developed in the south. The Pelew islands have extensive reefs, and the Caroline, Marshall and Gilbert islands are almost entirely coral. In Melanesia, as has been seen, the volcanic type predominates. Coral reefs occur round many of the islands (e.g. the Louisiade and Admiralty Islands).
groups, New Caledonia and Fiji), but in some cases they are wholly absent or nearly so (e.g. the eastern Solomon Islands and the New Hebrides). Of the Polynesian Islands, the Hawaiian chain presents the type of a volcanic group through which coral reefs are not equally distributed. The main island of Hawaii and Maui at the east end are practically without reefs; which, however, are abundant farther west. Round the volcanic Marquesas Islands, again, coral is scanty, but the Society Islands, Samoa, and Tonga have extensive reefs. The minor groups to the north of these (Ellice, Phoenix, Union, Manihiki and the America Islands) are coral islands. Christmas, one of the last-named, is reputed to be the largest lagoon island in the Pacific. The Tuamotu Archipelago is the most extensive of the coral groups.

The coral islands are generally of the form well known under the names of atoll, rising but slightly above sea-level, flat, and generally of annular form, enclosing a lagoon. Often, as has been said, the atoll is divided into a number of islets, but in some smaller atolls the ring is complete, and the sea-water gains access beneath the surface of the reef to the lagoon within, where it is sometimes seen to spout up at the rise of the tide. Besides the atolls there is a type of island which has been called the elevated coral island. The Loyalty Islands exhibit this type, in which former reefs appear as low cliffs, elevated above the sea, and separated from it by a level coastal tract. The island of Maré shows evidence of three such elevations, three distinct cliffs alternating with level tracts. For the much debated question as to whether these reefs are formed or drowned see CORAL REEFS. As to the local distribution of reefs, it has been maintained that in the case of active volcanic islands which have no reefs, their absence is due to subterranean heat. The contour of the sea-bed, however, has been shown to influence this distribution, the continuation of the slope of a steep shore beneath the sea being adverse to their formation, whereas on a gentler slope they may be formed.

Flora.—In considering the flora of the islands it is necessary to distinguish between the rich vegetation of the fertile volcanic islands and the poor vegetation of the coral islands. Those plants which are widely distributed are generally found to be propagated from seeds which can easily be carried by the wind or by ocean currents, or form the food of migratory birds. The tropical Asiatic element predominates on the low lands; types characteristic of Australia and New Zealand occur principally on the upper parts of the high islands. In Hawaii there are instances of American elements. In the volcanic islands a distinction may be observed between the windward and leeward flanks, the moister windward slopes being the richer. But although there the soil serves to smooth the contours of the rugged hills, ferns, mosses and shrubs growing wherever their roots can cling, and leaving only the steepest crags uncovered to form, as in Tahiti, a striking contrast to the bare, arid uplands of the leeward sides, where for the most part there is more or less bare rock with only the most important group among many plants of beautiful foliage, such as dracaenas and crotons. Flowering plants are numerous, and the natives often (as in Hawaii) greatly appreciate flowers, which thus add a feature to the pictures which is important in life, though they do not usually grow in great profusion. Fruits are abundant, though indigenous fruits are few; the majority have been introduced by missionaries and others. Oranges are often plentiful, also guava, passion fruit, custard-apples, mangoes and bananas. These last are of special importance, and the best kind, the Chinese banana, is said to have sprung from a plant given to the missionary John Willis and cultivated in Samoa. The natives live largely on vegetables and breadfruit, the most important plants which supply them being the taro, yam, banana, breadfruit, arrow-root, pandanus and coco-nut. The last constitutes a valuable article of commerce in the form of copra, from which palm oil is expressed; the natives make use of this in mixed dishes, and also of the soft half-green kernel and the coco-nut “milk,” the clear liquid within the nut. Their well-known drink, kava, is made from the roots of a flowering plant which grows plentifully in the coco-nut palm, pandanus and mangeloro. The low coral islands suffer frequently from drought; their soil is sandy and unproductive, and in some cases the natives attempt cultivation by excising trees or the plants under which they grow and other refuse.

Fauna.—The indigenous fauna of the islands is exceedingly poor in mammals, which are represented mainly by rats and bats. Pigs have been held to be indigenous on some islands, but were doubtless introduced by the navigators. Cattle and horses, whose introduction, are found to degenerate rather rapidly unless the supply of fresh stock is kept up. Birds are more numerous than mammals, among the most important kinds being the pigeons and doves, especially the fruit-eating pigeons. Megapodes are found in the Solomon Islands, the New Hebrides, Samoa, Tonga, the Carolines and the Marianas. The remarkable didunculus occurs in Samoa, and the primitive Charadrius decurtatus, which was compelled to change its habits dwelling in trees instead of on the ground. Insect life is rich in northern Melanesia; in southern Melanesia it is less so; in Fiji numerous kinds of insects occur, while in the Samoan islands, where they are almost wholly absent, the opposite is the case with the marine fauna. The small, soft-bodied worms which burrow in the lagoons of the Society Islands, and form an important article of food supply for the natives, who are generally expert fishermen. The fish fauna of the islands is formidable, and the lagoon contains for the most part small kinds. Among marine mammals, the dugong occurs in the parts about New Guinea and the Caroline Islands. Various sorts of whale are found, and the whaling industry reached the height of its importance about the middle of the 19th century. In considering the marine fauna the remarkable palolo or balato should be mentioned. Thisannel propagates its kind by rising to the surface and dividing itself. The occurrence of this process can be predicted exactly for one day, before sunrise. October and November are the months when they are most abundant, and in central and western parts of the islands, the fish which prey on it are appreciated by the natives as food the occasions of its appearance are of great importance to them.

History.—Not long after the death of Columbus, and when the Portuguese traders, working from the west, had hardly reached the confines of the Malay Archipelago, the Spanish Vasco Núñez de Balboa crossed America at its narrowest part and discovered the Pacific Ocean. The first discovery of the lagoon of Marquesas Islands in 1526, the belief in the short and direct westward passage from Europe to the East Indies was thus shaken, but it was still held that some passage was to be found, and in 1519-1521 Fernão de Magalhães (Magellan) made the famous voyage in which he discovered the strait which bears his name. Sailing thence north-westward for many weeks, over a sea so calm that he named it El Mar pacífico, he sighted only two small islands. These may have been Puka Puka of the Tuamotu Archipelago and Flint Island; but it may be stated here that the identification of islands sighted by the early explorers is often a matter of conjecture, and that therefore some islands of which the definite discovery must be dated much later had in fact been seen by Europeans at this early period. In this narrative the familiar names of islands are used, irrespective of whether they were given by the first or later discoverers, or are native names. Magellan reached the "Ladrones" (Marianas) in 1521, and voyage thence to the Philippines, where he was killed in a local war. In 1522-1524 various voyages of discovery were made on the west coast of America, partly in the hope of finding a strait connecting the two oceans to the region of the central isthmus. In 1525-1527 García Jofre de Loaysa sailed to the Moluccas, but, like Magellan, missed the bulk of the oceanic islands. About this time, however, the Portuguese sighted the north coast of New Guinea. Fuller knowledge of this coast was acquired by Alvaro de Saavedra (1548-1552), and among later voyages those of Ruy Lopez de Velazones (1542-1545) and Miguel Lopez de Legazpi (1564-1569) should be mentioned. These, however, like others of the period, did not greatly extend the knowledge of the Pacific islands, for the course between the Spanish American and Asiatic possessions did not lead voyagers among the more extensive archipelagos. For the same reason the British and Dutch fleets which sailed with the object of harrying the Spaniards, under Sir Francis Drake (1577-1580), Thomas Cavendish (1586-1593) and Oliver van Noort (1598-1601), were not, as regards the Pacific, of prime geographical importance. But the theory of the existence of a great southern continent was now also attracting voyagers. Alvaro Mendaña de Neira, after crossing a vast extent of ocean from Peru and sighting only one island, proceeded to the north of New Guinea. In 1595-1596 he made a second voyage, and though he did not again reach these islands, the development of which was his objective, he discovered the Marquesas Islands, and afterwards Santa Cruz, where, having attempted to found a settlement, he died. Thereafter his pilot, Pedro Fernandez de Quiros, set out with the remainder of the company to make for the Philippines, and on
the way discovered Ponaie of the Caroline Islands, some of which group, however, had been known to the Portuguese as early as 1527. Quiros returned to Europe, and, obtaining command of a fleet, made a voyage in 1605-1607 during which he observed some of the Paumotu and Society Islands, and later discovered the small Duff group of the Santa Cruz Islands, passing thence to the main island of the New Hebrides, which he hailed as his objective, the southern continent. One of his commanders, Luis Vaes de Torres, explored shortly after the Cook, and on the voyage of the Louisiade Archipelago and New Guinea, traversed the strait which bears his name between New Guinea and Australia, and reached the Philippines. In 1615-1617 two Dutchmen, Jacob Lemaire and Willem Cornelis Schouten, having in view both the discovery of the southern continent and the possibility of establishing relations with the East Indies from the east, took a course which brought them to the north part of the Paumotu Archipelago, thence to part of the Tonga chain, and ultimately to New Pomerania, after which they reached the East Indies. In 1642-1643 Abel Tasman, working from the east, discovered Van Diemen’s Land (Tasmania) and the west coast of New Zealand, subsequently reaching the Tonga Islands. Now for a while the title of discovery was taken by Tasman and for subsequently the buccaneers extended their activity to the Pacific, but naturally added little to general knowledge. William Dampier, however, making various voyages in 1690-1705, explored the coasts of Australia and New Guinea, and at the opening of the century both the French and the Dutch showed some activity. The Dutchman Jacob Roggeveen, in the course of a voyage round the world in 1722-1723, crossed the Pacific from east to west, and discovered Easter Island, some of the northern islands of the Paumotu Archipelago, and (as is generally supposed) a part of the Samoan group. The voyage of Commodore George (afterwards Lord) Anson in 1740-1744 was for purposes rather of war than of exploration, and Commodore John Byron’s voyage in 1765 had little result beyond gaining some additional knowledge of the Paumotu Archipelago. It is about this time that the coast of Peru was rediscovered, though the period of rediscovery set in fully. In the ensuing account a constant repetition of the names of the main archipelagoes will be found; it may of course be assumed that each successive voyager added something to the knowledge of them, but on the other hand, as has been said, islands were often rediscovered and renamed in cases where later voyagers took no account of the work of their predecessors, or where the earlier voyagers were unable clearly to define the positions of their discoveries. Moreover, rivalry between contemporary explorers of different nationalities sometimes caused them to ignore each other’s work, and added to the confusion of nomenclature among the islands.

In 1767 Samuel Wallis worked through the central part of the Paumotu, and visited Tahiti and the Maritans, while his companion Philip Carteret discovered Pitcairn, and visited Santa Cruz, the Solomon Islands and New Pomerania. The French were now taking a share in the work of discovery, and in 1768 Louis Antoine de Bougainville sailed by way of the central Paumotu, the Society Islands, Samoa, the northern New Hebrides, the south coast of New Guinea and the Louisiade and Bismarck archipelagoes. The next voyages in chronological order are those of the celebrated Captain James Cook (q.v.). Within the limits of the area under notice, his first voyage (1768) included visits to Tahiti and the Society group generally, to New Zealand and to the east coast of Australia, his second (1773-1774) to New Zealand, the Paumotu Archipelago, the Society Islands, Tonga and subsequently Easter Island, the Marquesas and the New Hebrides; and his third (1777-1778) to the Northern Norway group, and the Hawaiian Islands, of which, even if they were previously known to the Spaniards, he may be called the discoverer, and where he was subsequently killed. In 1786 Jean François Galaup de La Pérouse, in the course of the famous voyage from which he never returned, visited Easter Island, Samoa and Tonga. The still more famous voyage of William Bligh of the "Bounty" (1788) was followed by that of Captain Edwards of the "Pandora" (1791), who in the course of his search for Bligh discovered Rotumah and other islands. The Hawaiian Islands came within the purview of George Vancouver, following the course of Cook in 1791. In 1792-1793 Joseph Antoine d’Entrecasteaux, searching for traces of La Pérouse, ranged the islands west of Tonga. In 1797 Captain J. Wilson of the missionary ship "Duff" visited the Society group, Fiji, Tonga and the Marquesas, and added to the knowledge of the Paumotu and Caroline Islands. Another power entered on the field of exploration when the Russians sent a vessel under Krusenstern to the Pacific (1803). He was followed by Otto von Kotzebue (1816) and Fabian Gottlieb von Bellingshausen (1819-1821). The work of these three was carried out principally in the easternmost part of Polynesia. In 1818-1819 the French navigator Louis Claude Desales des Freycinet ranged from New Guinea through the Marianas to Hawaii. Two of his countrymen followed him in 1823-1829—Louis Isidore Duperrey and Dumont d’Urville. Kotzebue made a second voyage, accompanied by scientists, in 1823-1826. In 1826-1828 Frederick William Beechey was at work in the middle parts of the ocean, and Fedor Petrovich Count Lüke, the Russian circumnavigator, in the northern. In 1834 Dr Debeli Bennett made scientific researches in the Society, Hawaiian and Marquesan Islands, in 1835 Captain Robert Fitzroy was accompanied by Charles Darwin, and in 1836 sqq., Abel Aubert du Petit-Thouars was carrying on the work of the French in the Pacific. During his voyage of 1837-1840, Dumont d’Urville was again in Polynesia, working westward from the Paumotu and Marquesas Islands by Fiji and the Solomon, Loyalty and Louisiade groups to New Guinea. In 1839 sqq. the first important American expedition was made under Charles Wilkes, who covered a great extent of the ocean from Hawaii to Tonga, Fiji and New Zealand. Among later British explorers may be mentioned Captain J. Elphinstone Erskine (1849) and Captain H. M. Denham, and several important voyages for scientific research were made in the second half of the 19th century, including one from Austria under Captain Wilkes, another by Ulrich von Lütke, and discoveries in the vessel "Magenta" (1855-1868), which was accompanied by the scientist Dr Enrico Giglioli. The celebrated voyage of H.M.S. "Challenger" (1874-1875) and those of the American vessels "Tuscarora" (1873-1876) and "Albatross" (1888-1892) may complete the tale.

Whalers, sealers and traders followed in the wake of explorers, the traders dealing chiefly in copra, trepang, pearls, tortoiseshell, &c. The first actual settlers in the islands were largely men of bad character—deserting sailors, escapers from the penal settlements in Australia and others. It is not to be supposed that there were no orderly colonists, but that the natives suffered much at the hands of Europeans and Americans is only too clear. The class of traders who made a living by disgraceful means and attempted to keep a monopoly of the island for which they settled, became notorious under the name of "black-combers," and for each of the many dark chapters in Polynesian history there must have been many more unwritten. The kidnapping of natives for the South American and Australian labour markets was common. It cannot be denied that there has been actual deterioration of the native races, and elimination in their numbers, consequent upon contact with Europeans and Americans (see further, POLYNESIA). The romantic character of island-history has perhaps, however, tended to emphasize its dark side, and it is well to turn from it to recognize the work of the missionaries, who found in the Pacific one of their most extensive and important fields of labour, and have exercised not only a moral, but also a profound political influence in the islands since the London Missionary Society established its agents in 1797. Many of them, moreover, have added greatly to the scientific knowledge of the islands and their inhabitants. The imposition of strict rules of life upon the natives was in some instances carried too far; in others their conversion to Christianity was little more than nominal, but cases of this sort are overshadowed by the fine work of William Ellis and John Williams (c. 1818) and many of their successors.

The discovery of sandalwood in Fiji in 1804, and the establishment of a trade therein, made that group a centre of interest
in the early modern history of the Pacific islands. Moreover the London Missionary Society, having worked westward from its headquarters in Tahiti to Tonga as early as 1797, founded a settlement in Fiji in 1835. Meanwhile the white traders in Fiji had played an intimate part in the internal political affairs of the group, and in 1858 King Thakombau, being threatened with reprisals by the American consul on account of certain losses of property which he had sustained, asked for British protection, but did not obtain it. The British, however, were paramount among the white population, and as by 1870 not only American, but also German influence was extending through the islands (the first German government vessel visited Fiji in 1872), an attempt was urged on Great Britain by Australia and New Zealand. Meanwhile the labour traffic, which had been initiated, so far as the Pacific islands were concerned, by an unsuccessful attempt in 1847 to employ New Hebridean labourers on a settlement near the present township of Eden in New South Wales, had attained considerable proportions, had been improperly exploited and, as already indicated, had led the natives to retaliation, sometimes without discernment, a notorious example of this (as was generally considered) being the murder of Bishop Patteson in 1871. In 1872 an act was passed by the British government to regulate the labour traffic; Fiji was annexed in 1874, and in 1875 another act established the protectorate. In 1872 the French had formally annexed the Marquesses Islands; and subsequently they extend their sphere, as shown in the table at the outset of this article, both in the east of Polynesia and in the south of Melanesia. In some of the island-groups independent native states were recognized for some time by the powers, as in the case of Hawaii, which, after the deposition of the queen in 1893 and the proclamation of a republic in 1894, was annexed to the United States of America only in 1898, or, again, in the case of Tonga, which provided a curious example of the subordination of a native organization to unauthorized foreign influence. The partition of Polynesia was completed in 1899, when Samoa was divided by Germany and the United States. British influence in the Caroline Islands, Spanish navigators, the Carolines, Mariana and Pelew Islands had been recognized as Spanish territory until 1885, when Germany began to establish herself in the first-named group. Spain had never occupied this group, but protested against the German action, and Pope Leo XIII. as arbitrator awarded the Carolines to her. Thereafter Spain made efforts at occupation, but serious conflicts with the natives ensued, and in 1899 the islands were sold to Germany, which thus became the predominating power in Micronesia. When Germany acquired the Bismarck Archipelago in Melanesia the introduction of German names (New Pomerania, Neu Pomern, for New Britain; Neu Mecklenburg for New Ireland; Neu Langenburg for the Duke of York Island) in Micronesia, since the disasters of the early native states under British protection. Pitcairn, in accordance with its peculiar conditions of settlement, has a peculiar system of local government. The New Hebrides are under a mixed British and French commission. The Hawaiian Islands form a territory of the United States, and New Caledonia, which is a naval station, as is Tuvalu of the Samoan islands, where the commandant exercises the functions of governor. New Caledonia is a French colony under a governor, the other islands being attached under the title of the French Establishment in Oceania, and are administered by a governor, privy council, administrative council, &c., Papeete in Tahiti being the capital. The German possessions in Micronesia are governed by Wilhelm's Land (New Guinea) is Hertershohe in the Bismarck Archipelago. The administrative area includes the German Solomon Islands and the Caroline, Pelew and Mariana Islands, which in the past have not always been treated together, and the western Carolines and Marianas. The Marshall Islands form a "district" (Bezirk) within the same administrative area. The German Samoan Islands are under imperial government. In the oceanic area the ages of the different peoples which have occupied the islands are not well known. The Papuans and Negritos are branches of the one family. It is probable that the Polynesians of the Micronesias have occupied the islands for the same length of time as the Micronesians themselves. Whether the two families have a common ancestor in the Archipelago of Melanesia is much disputed. The Papuan and Negrito are alike branches of an aboriginal African race, and is a problem yet to be solved. But if their origin is unknown, there is little doubt that the Melanesians were the earliest occupants of the South Pacific. They are more numerous than the Micronesians by far, and undoubtedly constitute the oldest ethnic stock sometimes modified on the spot by crossings with migratory peoples (Malays, Polynesians); sometimes, as in the eastern Pacific, giving way entirely entirely to the aboriginal invaders. The Melanesians were divided into the Micronesian and the Micronesians together forming the Polynesians. These three main divisions of the islands are named Polynesia, Melanesia, Micronesia (p.e.).
and Chinese, may be said to converge. Careful investigations have supported the theory that Micronesia was peopled largely from the Philippines or some portion of the Malay Archipelago at a much later time than the neighboring islands of Melanesia. These, it seems, are probably of Malay stock much modified by early Polynesian crossings, and probably, within historic times, by Papuan and even Japanese and Chinese migrations. While their general physique approaches that of the Malays, they are often characterized by a stunted form and a dark complexion. In this review of the inhabitants of the Pacific islands an imaginary chronological line has been drawn round it, and the ancient stock included. But on the borders of the region, often without real boundary lines, are grouped other peoples, the true Malays, the Indonesians or pre-Malays with the Negritos to the westward and the Australians, who, generally speaking, form a distinct race. These details deferred information will be found under their several headings.

Prehistoric Remains.—One of the most obscure questions with which the ethnologist is occupied is the history of the different and widely separated parts of the oceanic region. The most remarkable of these are on Easter Island, where immense platforms built of dressed stone without mortar are found, together with stone images. Similar remains have been found on Pitcairn Island. On the island of Tongatabu in the Tonga group, there is a monument of great stone blocks which must have been brought thither by sea. In some of the Caroline Islands, again, there are extensive remains of stone buildings, and in the Marshall Islands stone monuments occur. No native traditions assign origin to these remains, nor has any complete explanation of their existence been offered.

We may omit the results of the various voyages of explorers, see their narratives, especially those of Captain Cook, and among the earlier Collections of voyages see especially Captain James Cook, Chronological History of the Discoveries in the South Sea or Pacific Ocean (London, 1784); idem—The voyages of Captain James Cook (London, 1807). Of general works (which are few) see C. E. Meinecke, Die Inseln des Stillen Ozeans (Leipzig, 1875); F. H. Guilmard, Australasie, vol. ii, revised by A. H. Keane, in Stanford's Compendium of Geography and Travel (London, London, London, London, London, 1885). Index to the Islands of the Pacific (Honolulu, 1906). Among other works (the majority of which deal only with parts of the region known to the writers from travel), see: J. A. Moorehouse, Voyages aux Iles du Groupement des Bismarck (1871); W. Moss, Through Archils and Islands (London, 1886); W. T. Wawn, The South Sea Islanders and the Queensland Labour Trade (1889); H. Guirriquet, Les Etablissements français en Océanie (Paris, 1891); B. F. B. Powell, In Savage Isles and Settled Lands (London, 1902); "questions of the region, 1865-1885," and that of the natives of the region, and the work of the Missionary Party in the region, 1830-1885,

PACKER, ASA (1805-1879), American capitalist, was born in Mystic, Connecticut, on the 29th of December 1805. In 1822 he became a carpenter's apprentice at Brooklyn, Susquehanna county, Pennsylvania. He worked as a carpenter in New York City for a time and then in Springville, Pennsylvania, but in 1833 settled at Mauch Chunk, in the Lehigh Valley, where he became the owner of a canal-boat (carrying coal to Philadelphia), and then established the firm of A. & R. W. Packer, which built canal-boats and locks for the Lehigh Coal & Navigation Company, probably the first through shippers to New York. He urged upon the Coal & Navigation Company the advantage of a steam railway as a coal carrier, but the project was not then considered feasible. In 1851 the majority of the stock of the Delaware, Lehigh, Schuykill & Susquehanna Railroad Company (incorporated in 1849), which became the Lehigh Valley Railroad Company in January 1853, came into his control, and between November 1852 and September 1855 a railway line was built for the Company, largely by Packer's personal credit, from Mauch Chunk to Easton. He built railways connecting the main line with coal-mines in Luzerne and Schuylkill counties; and he planned and built the extension (completed in 1868) of the line into the Susquehanna Valley and thence into New York state to connect at Waverly with the Erie railway. Packer also took an active part in politics. In 1841 and 1842 he was a member of the Pennsylvania House of Representatives; in 1843-1849 was county judge of Carbon County, a seat which was carried by the Democrats of the national House of Representatives; and in 1860 was the Democratic candidate for the governorship of Pennsylvania. In 1865 he gave $500,000 and 60 acres (afterwards increased to 115 acres) in South Bethlehem, Pennsylvania, for a technical school for the professions represented in the development of the Lehigh Valley; Lehigh University was chartered in 1866, and its main building, Packer Hall, was completed in 1869; he erected a library building in 1877 as a...
memorial to his daughter, Mrs Lucy Packer Linderman; and his will bequeathed $7,500,000 as an endowment for the university and $500,000 to the university library, and gave the university an interest (nearly one third) in his estate when finally distributed. He died in Philadelphia on the 17th of May 1879. The Packer Memorial Church (Protestant Episcopal) on the Lehigh University campus, given by his daughter, Mrs Mary Packer Cummings, was dedicated on the 14th of October 1887.

PACORUS, a Parthian name, borne by two Parthian princes.

1. PACORUS, son of Orodès I., was, after the battle of Carrhae, sent by his father into Syria at the head of an army in 52 B.C. The prince was still very young, and the real leader was his uncle, Labienus. He was defeated and killed by C. Cassius, and soon after Parthia was recalled by his father, because one of the satraps had rebelled and proclaimed him king (Dio Cass. xi. 8 sqq.; Justin xiii. 4; cf. Cicero, ad Fam. xv. 14; ad Att. vi. 1. 14). Father and son were reconciled, but the war against the Romans was always delayed. In the autumn of 45 Parthia and the Arabic chief of Alachaudonius came to the help of Q. Caecilius Bassus, who had rebelled against Caesar in Syria; but Parorus soon returned, as his troops were unable to operate in the winter (Cic. ad Att. xiv. 9. 3; Dio Cass. xlvii. 27). At last in 40 B.C. the Roman fugitive Titus Labienus induced Orodès to send a great army under the command of Pacorus against the Roman provinces. Pacorus conquered the whole of Syria and Phoenicia with the exception of Tyre, and plundered Antioch. He then proceeded against the depreded Hyrcanes, and made his nephew Antigonus king (Dio Cass. xlviii. 24 sqq.; Joseph. Ant. xiv. 13; Tac. Hist. v. 9). Meanwhile Labienus occupied Cilicia and the southern parts of Asia Minor down to the Carian coast (Dio Cass. xlviii. 26; Strabo xiv. 690). But in 39 P. Ventidius Bassus, the general of Mark Antony, drove him back into Cilicia, where he was killed, defeated the Parthians in Syria (Dio Cass. xlviii. 39 sqq.) and at last beat Pacorus at Gindaras (in northern Syria), on the 9th of June 38, the anniversary of the battle of Carrhae. Pacorus himself was slain in the battle, which effectually stopped the Parthian conquests west of the Euphrates (Dio Cass. xli. 10 sqq.; Justin xiii. 4; Plut. Anton. 24; Strabo xvii. 751; Velleius ii. 78; cf. Horace, Od. iii. 6. 9). In 37 he was slain in battle.

2. PACORUS, Parthian king, only mentioned by Dio Cass. xlviii. 17, Arian. ap. Suid. s. v. ORMEO, according to whom he sold the kingdom of Osroène 20 Agar VIII.; and Ammianus Marcellinus xxiii. 6. 23, who mentions that he enlarged Ctesiphon and built its walls. But from his numerous dated coins we learn that he was on the throne, with interruptions, from A.D. 78-95. He always calls himself Arsaces Pacorus. This mention of his proper name, together with the royal name Arsaces, shows that his kingdom was disputed by rivals. Two of them we know from coins—Vologases II., who appears from 77-79 and again from 111-146, and Artabanus III. in 80 and 81. Pacorus may have died about 105; he was succeeded by his brother Orodès II.

PACUVIUS, MARCUS (c. 220-193 B.C.). Roman tragic poet. He was the nephew and pupil of Ennius, by whom Roman tragedy was first raised to a position of influence and dignity. In the interval between the death of Ennius (166) and the advent of Accius, the youngest and most promising of the tragic poets, he alone maintained the continuity of the serious drama and perpetuated the character first imparted to it by Ennius. Like Ennius he probably belonged to an Oscan stock, and was born at Brundusium, which had become a Roman colony in 244.

Hence he never attained to that perfect idiomatic purity of style, which was the special glory of the early writers of comedy, Naevius and Plautus. Pacuvius obtained distinction also as a painter; and the elder Pliny (Nat. Hist. xxxv. 19) mentions a work of his in the temple of Hercules in the Forum boarium. He was less productive as a poet than either Ennius or Accius; and we hear of only about twelve of his plays, founded on Greek subjects (among them Αἰσθένε, Τευχέρ, Αριστοκράτης, Δολεροσθέ, Χρυσός, Νίπτρα, &c., most of them on subjects connected with the Trojan cycle), and one proœctæta (Paulus) written in connexion with the victory of Lucius Aemilius Paulus at Pydna (168), as the Clastidium of Naevius and the Ambraecia of Ennius were written in commemo-ration of great military successes. He continued to write tragedies till the age of eighty, when he exhibited a play in the same year as Accius, who was then thirty years of age. He retired to Tarentum for the last years of his life, and a story is told by Gellius (xiii. 2) of his being visited there by Accius on his way to Asia, who read his Ateœ to him. The story is probably, that of the visit of the young Terence to the veteran Caecilius, due to the invention of later gram-arians; but it is invented in accordance with the traditionary criticism (Horace, Ep. ii. 1. 54-55) of the distinction between the two poets, the older being elevated respectively by the accomplishment (doctus), the younger by vigour and animation (altus). Pacuvius’s epitaph, said to have been composed by himself, is quoted by Aulus Gellius (i. 24), with a tribute of admiration to its “modesty, simplicity and fine serious spirit”:—

Adulescens, tam eti propebas, te hoc saxum rogat Ut sese aspicias, deinde quod scriptum ‘st legas.
Hoc sunt poetae Pacuvii Marci sita.

Cicero, who frequently quotes from him with great admiration, appears (De optimo genere oratorum, 1) to rank him first among the Roman tragic poets, as Ennius among the epic, and Caecilius among the comic poets.

The fragments of Pacuvius quoted by Cicero in illustration or enforcement of his own ethical teaching, appeal, by the fortitude, dignity, and magnanimity of the sentiment expressed in them, to what was noblest in the Roman temperament. They are inspired also by a fervid and steadfast glow of spirit and reveal a gentleness and humanity of sentiment blended with the severe gravity of the original Roman character. So far too as the Romans were capable of taking interest in speculative questions, the tragic poets contributed to stimulate curiosity on such subjects, and they anticipated Lucrelius in using the conclusions of speculative philosophy as well as of common sense to assail some of the prevailing forms of superstition. Among the passages quoted from Pacuvius are several which indicate a taste both for physical and ethical speculation, and others which express the pretensions of religious imposture. These poets aided also in developing that capacity which the Roman language subsequently displayed of being an organ of oratory, history and moral disquisition. The literary language of Rome was in process of formation during the 2nd century B.C., and it was in the latter part of this century that the series of great Roman orators, with whose spirit Roman tragedy has a strong affinity, begins. But the new creative effort in language was accompanied by considerable crudeness of expression and word-formations and varieties of inflexion introduced by Pacuvius exposed him to the ridicule of the satirist Lucilius, and, long afterwards, to that of his imitator Persius. But, notwithstanding the attempt to introduce an alien element into the Roman language, which proved incompatible with its natural genius, and his own failure to attain the idiomatic purity of Naevius, Plautus or Terence, the fragments of his dramas are sufficient to prove the service which he rendered to the formation of the literary language of Rome as well as to the culture and character of his contemporaries.

Fragments in O. Ribbeck, Fragmenta saeculæe romanorum poëtarum (1897); vol. i. see also his Römische Tragödie (1785). Müller, De Pacuvii fabulis (1889); W. S. Teuffel, Caecilius Statius, Pacuvius, Attius, Afranius (1858); and Mommsen, History of Rome, bk. iv. ch. 13.

PAD. (1) Probably from the same root as “pod,” the husk or seed-covering in certain plants, a term used in various connexions, the sense being derived from that of a soft cushion, or cushion-like combination used either for protective purposes or as stuffing or stiffening in zoology. It is particularly used for the fleshy elastic protuberances on the sole of the foot of many animals such as the cat and dog, the camel, &c.; and of the similar cushion beneath the toes of a bird’s foot or of the tarsal cushion of an insect. In sporting phraseology the whole paw of a fox or other beast of chase is called the “pad.” A special technical use, somewhat difficult to connect with the above meanings, is
PADDINGTON, a municipality of Cumberland county, New South Wales, Australia, 3 m. S.E. of and suburban to Sydney. It is a busy industrial suburb, devoted to brewing, tanning, soap-boiling and various other manufactures. The town hall is one of the finest in the colony, and there is an excellent free library. Paddington returns one member to parliament. Pop. (1901), 22,034.

PADDINGTON, a north-western metropolitan borough of London, England, bounded by E. by Hampstead and Marylebone, S. by the city of Westminster, and W. by Kensington, and extending N. to the boundary of the county of London. Pop. (1901), 143,976. The best houses are found in the streets and squares of Bayswater, in the south-west, neighbouring to Hyde Park and Kensington (which is in the borough) and to Hyde Park, farther east. While in the north-east are broad avenues and "mansions" of residential flats. Bayswater Road, skirting the park and gardens, forms part of the southern boundary of the borough; Edgware Road forms the eastern; from this Harrow Road branches north-west, Bishop's Road and Westbourne Grove form a thoroughfare westward, and Queen's Road, Bayswater, leads south from there to Bayswater Road. The name of Paddington finds no place in Domescay—it may have been included in the manor of Tyburn—and the land belonged to the Abbey of Westminster at an early date. It was granted to the see of London by Edward VI. In the 18th century the picturesque rural scenery attracted artists, and even in the middle of the 19th the open country was reached by the carriage, standing on the Gad tongs, and the part West End (which is in the borough) contains no traces of antiquity. Bayswater is said to take its name from Baynard, a Norman, who after the Conquest held land here and had a castle by the Thames not far above the Tower of London, whence a ward of the city is called Castle Baynard. Many springs flowed forth here; the stream called Westbourne was near at hand, and water was formerly supplied hence to London. In the borough are the Paddington and the Queen's Park technical institutes; St. Mary's Hospital, Praed Street, with medical school; and Paddington Green children's hospital. The terminus of the Great Western railway, facing Praed Street, is called Paddington Station. The parliamentary borough of Paddington has north and south divisions, each returning one member. The borough council consists of a mayor, 12 aldermen, and 40 councillors.

PADDLE. (1) A verb, meaning to splash, dabble or play about in water with the feet or hands. (2) A species of oar, with a broad flat blade and short handle, used without a rowlock for propelling canoes or other lightly-built craft (see CANOE). (3) A small spade-like implement, apparently first used to clear a ploughshare from clods of earth. The verb seems to be a frequentative form of "pad," to walk, cognate with "path," or of "pat," to strike gently, an onomatopoeic word; it may have been influenced by the Fr. patouiller, in much the same sense. The verb may have given rise to "paddle," an oar, an easy transition in sense; but the New English Dictionary identifies this with the word for a small spade, which occurs earlier than the verb, and seems to have no connexion in sense with it. The implement was known in the 17th and 18th centuries also as "spaddle," a diminutive of "spade," but paddle occurs in the Paderwicki, Ignace Jan (1862— ), Polish pianist and composer, was born in Podolia, a province of Russian Poland. He studied music chiefly at Warsaw, Berlin and
PADSTOW, an urban district in the Clitheroe parliamentary division of Lancashire, England, 3 m. W. by N. of Burnley by the Lancashire and Yorkshire railway. Pop. (1901), 12,205. It lies in a wild and dreary district on the precipitous banks of the Calder. It possesses large cotton mills, and quarries and coal mines are worked in the immediate neighbourhood. The church of St Leonard, founded before 1451, was frequently altered before it was rebuilt in 1866-1868 in the Perpendicular style. Padstow in 1251 was a manor in the possession of Edmund de Lacy.

PADSTOW, small seaport and market town in the St Austell parliamentary division of Cornwall, England, on a branch of the London & South Western railway. Pop. of urban district (1901), 1566. It lies near the north coast, on the west shore, and 2 m. from the mouth of the estuary of the river Camel, a picturesque inlet which from Padstow Bay penetrates 6 m. into the land. The church of St Petrock, with a massive roadstone in the churcshyard, is mainly Perpendicular, with an Early English tower. Within are an ancient font, a canopied piscina, and a fine timber roof over the nave and aisles. Other interesting churches in the locality are those of St Petrock Minor, St Minver, St Michael, St Constantine, and, most remarkable of all, St Enodock's. This building, erected in the 15th century amid the barren dunes bordering the east shore of the estuary near its mouth, in place of a more ancient oratory, was long buried beneath drifts of sand. From a little distance, only the weather-beaten spire can be seen. A Norman font remains from the older foundation. A monastery formerly stood on the high ground west of Padstow, and according to tradition was founded by St Petrock in the 6th and razed by the Danes in the 10th century. Its site is occupied by Prideaux Place, an Elizabethan mansion, which contains among other valuable pictures Van Dyck's portrait of Queen Henrietta Maria. Pentive Point shelters Padstow Bay on the north-east, but the approach to the estuary is dangerous during north-westerly gales. Padstow, nevertheless, is a valuable harbour of refuge, although the river channel is narrow and much silted. Dredging, however, is prosecuted, the sand being sent inland, being useful as a manure through the carbonate of lime with which it is impregnated. The Padstow Harbour Association (1829) is devoted to the rescue of ships in distress, making no claims for salvage beyond the sums necessary for its maintenance. Padstow has fisheries and shipyards and some agricultural trade.

PADDICTON, a town in the district of Chichester, Sussex, Eng., 10 m. S.W. of Chichester. It was a favourite residence of the bishops of Chichester and was the diocesan capital until 1847. It contains the site of a hospital founded in 1267 by Bishop Hylton to receive pilgrims to the shrine of St Wilfrid, and near the site of which is the town's church of St Wilfrid. PADDICK, James, a British Member of Parliament, born in 1845. He was Member for Banbury (1880-92), for West Ham (1892-1906), and for Bath (1906-14). He was a prominent Liberal.
VICENZA; the Palazzo was begun in 1527 and finished in 1549; in 1360 Fra Giovanni, an Augustinian friar, covered the whole with one roof; originally there were three roofs, spanning the three chambers into which the hall was at first divided; the internal partition walls remained till the fire of 1429, when the Venetian architects who undertook the restoration removed them, throwing all three compartments into one and forming the present great hall. In the Piazza dei Signori is the beautiful loggia called the Cariatide, begun in 1485 and finished in 1526, and closed by it is the Palazzo del Capitaneria, the residence of the Venetian governors, with its great door, the work of Falconetto of Verona, 1532. The most famous of the Paduan churches is the basilica dedicated to Saint Anthony, commonly called II Santo; the bones of the saint rest in a chapel richly ornamented with carved marbles, the work of various artists, among them of Sansovino and Falconetto; the basilica was begun about the year 1230 and completed in the following century; tradition says that the building was designed by Niccola Pisano; it is covered by seven cupolas, two of them pyramidal. On the piazza in front of the church is Donatello's equestrian statue of Ezzelino da Romano. The basilica of Saint Mary near the city, known as the Madonna dell'Arena, whose inner walls are entirely covered with paintings by Giotto. Padua has long been famous for its university, founded by Frederick II in 1222. Under the rule of Venice the university was governed by a board of three patriarchs, called the Riformatori dello Studio di Padova. The list of professors and alumni is long and illustrious, containing, among others, the names of Bembo, Sperone Speroni, Venetus, Acquapendente, Galileo, Pomponazzi, Pole, Scaliger, Tasso and Sobieski. The place of Padua in the history of art is nearly as important as its place in the history of learning. The university attracted many distinguished artists, as Giotto, Lippo Lippi and Donatello; and from the first there was the school of Squarcione (1304-1474), whence issued the great Mantegna (1431-1506). The industry of Padua has greatly developed in modern times. Corn and saw mills, distilleries, chemical factories, breweries, candle-works, ink-works, foundries, agricultural machinery and automobile works, have been established and are flourishing. The trade of the district has grown to such an extent that Padua has become the central market for the whole of Venetia.

Padua claims to be the oldest city in north Italy; the inhabitants pretend to a fabulous descent from the Trojan Antenor, whose relics they recognized in a large stone sarcophagus exhumed in the year 1274. Their real origin is involved in that obscurity which conceals the ethnography of the earliest settlers in the Venetian plain. Padua early became a populous and thriving city, thanks to its excellent breed of horses and the wool of its sheep. Its men fought for the Romans at Cannae, and the city became so powerful that it was reported able to raise two hundred thousand fighting men. Abano in the neighbourhood was made illustrious by the birth of Livy, and Padua was the native place of Valerius Flaccus, Asconius Pedianus and Thrasea Paetus. Padua, in common with north-eastern Italy, suffered severely from the invasion of the Huns under Attila (452). It then passed under the Gothic kings Odonaco and Theodoric, and made submission to the Greeks in 540. The city was seized again by the Goths under Totila, and again restored to the Empire by Narses in 568. Following the course of events common to most cities of north-eastern Italy, the history of Padua falls under eight heads: (1) the Lombard rule, (2) the Frankish rule, (3) the period of the bishops, (4) the emergence of the commune, (5) the period of the despos, (6) the period of Venetian supremacy, (7) the period of Austrian supremacy, and finally (8) the period of united Italy. 

Under the Lombards the city of Padua rose in revolt (601) against Agilulph, the Lombard king, and after suffering a long and bloody siege was stormed and burned by him. The city did not easily recover from this blow, and Padua was still weak when the Franks succeeded the Lombards as masters of north Italy. (2) At the Diet of Aix-la-Chapelle (588) the duchy and march of Friuli, in which Padua lay, was divided into four counties, one of which took its title from that city. (3) During the period of imperial supremacy Padua does not appear to have been either very important or very active. The general tendency of its policy throughout the period of imperial supremacy was to be neither Venetian nor Roman; and its bishops were, for the most part, Germans. (4) But under the surface two important movements were taking place. At the beginning of the 11th century the citizens established a constitution, composed of a general council or legislative assembly and a credenza or executive; and during the next century they were engaged in wars with Venice and Vicenza for the right of water-way on the Bacchiglione and the Brenta—so that, on the one hand, the city grew in power and self-reliance, while, on the other, the great families of Camposampiero, D'Este and Da Romano began to emerge and to divide the Paduan district between them. The citizens, in order to protect their liberties, were obliged to elect a podestà, and their choice fell first on one of the D'Este family (c. 1175). The tenure of the podestà was clearly a part of the Lombard labors helped to strengthen the towns; but their ineradicable jealousy of one another soon reduced them to weakness again, so that in 1236 Frederick II. found little difficulty in establishing his vicar Ezzelino da Romano in Padua and the neighbouring cities, where he practised frightful cruelties on the inhabitants. When Ezzelino met his death, in 1259, Padua enjoyed a brief period of rest and prosperity: the university flourished; the basilica of the saint was begun; the Paduans became masters of Vicenza. But this advance brought them into dangerous proximity to Can Grande della Scala, lord of Verona, to whom they had to yield in 1311. (5) As a reward for freeing the city from the Scallas, Jacopo da Carrara was elected lord of Padua in 1318. From that date till 1405, with the exception of two years (1388-1390) when Gian Galeazzo Visconti held the town, nine members of the Carrarese family succeeded one another as lords of the city. It was a long period of restlessness, for the Carrarese were constantly at war; they were finally extinguished between the growing power of the Visconti and of Venice. (6) Padua passed under Venetian rule in 1405, and so remained, with a brief interval during the wars of the League of Cambrai, till the fall of the republic in 1797. The city was governed by two Venetian nobles, a podestà for civil and a captain for military affairs; each of these was elected for sixteen months. Under these governors the great and small councils continued to discharge municipal business and to administer the Paduan law, contained in the statutes of 1276 and 1362. The treasury was managed by two chamberlains; and every five years the Paduans sent one of their nobles to reside as nuncio in Venice, and to watch the interests of their native town. (7 and 8) After the fall of the Venetian republic the history of Padua follows the history of Venice during the periods of French and Austrian supremacy. In 1866 the battle of Königgratz gave Italy the opportunity to shake off the last of the Austrian yoke, when Venetia, and with Venetia Padua, became part of the united Italian kingdom.
PAEAN—PAEONIA

the Illinois Central railroad by a branch of the Nashville Chatta-
nooga & St Louis railway (of which it is the terminus), and by
steamboat lines to Pittsburg, Louisville, St Louis, New Orleans,
Nashville, Chattanooga, and other river ports. Paducah is in
a rich agricultural region, and its wholesale trade is probably
greater than that of any other city of the state except Louisville.
Its trade is largely in groceries, whisky, tobacco, hardware,
grains and live stock, vegetables and lumber. It is a large-light
leaf tobacco market, and is a headquarters for tow boats carrying
cargo down the Mississippi. The Illinois Central and the Nash-
ville, Chattanooga & St Louis railways have repair shops here;
and there are numerous manufactories, the value of the facto-
ry products increasing from $2,976,931 in 1900 to $4,443,223 in
1905, or 49.3 per cent. Paducah (said to have been named in honour
of an Indian chief who lived in the vicinity and of whom there
is a statue in the city) was settled in 1811, was laid out in 1827,
was incorporated as a town in 1836, and was chartered as a city
in 1836. The city was occupied by General U. S. Grant the 5th
of September 1861; on the 25th of March 1862 it was entered
by a Confederate force under General Nathan B. Forrest, who,
however, was unable to capture the fortifications and imme-
diately retreated.

PAEAN (Gr. ἡμών, Epic Παεαν), in Homer (I. u. 401, 890),
the physician of the gods. In other writers the word is a mere
epithet of Apollo (q.v.) in his capacity as a god of healing (cf.
ἱατρόματος ὀλοο), but it is not known whether Paean was origi-
nally a separate deity or merely an aspect of Apollo. Homer
leaves the question unanswered; Hesiod (cf. schol. Hom. Od. iv.
432) definitely separates the two, and in later poetry Paean is
invoked independently as a health god. It is equally difficult
to discover the relation between Paean or Paeon in the sense of
"healer" and Paean in the sense of "song." Farnell refers to
the ancient association between the healing craft and the sing-
ing of spells, and says that it is impossible to decide which is
the original sense of the word; that in the first place Paean
gave place to that of "hymn," from the phrase ἡμών ἡμών. Such
songs were originally addressed to Apollo (cf. the Homeric
Ἡμών ἡμών to Apollo 272, and notes in ed. by Sikes and Allen),
and afterwards to other gods, Dionysus, Helios, Asclepius. About
the 4th century the paean became merely a formula of adulation;
itself was either to import protection against disease and
misfortune, or to offer thanks after such protection had been
rendered. Its connexion with Apollo as the slayer of the python
led to its association with battle and victory; hence it became
the custom for a paean to be sung by an army on the march
and before entering into battle, when a fleet left the harbour,
and after a victory had been won. The most famous paeanes are
those of Bacchylides (q.v.) and Pindar (q.v.); the former is a hymn
(especially the Hyacinthia), at banquets, and later even at public
gods. In later times they were addressed not only to the gods,
but to human beings. In this manner the Rhodians celebrated Ptolemy I. of Egypt, the
Samians Lyander of Sparta, the Athenians Demetrios, the
Delphians Craterus of Macedon. The word "paean" is now
used in the sense of any song of joy or triumph.

Cornell Studies in Classical Philology (New York, 1900); L. R. Farnell,
 Cults of the Greek States.

PAEIIGNI, a people of ancient Italy, first mentioned as a
member of a confederacy which included the Marsi, Marrucini
and Vestini (qq.v.), with which the Romans came into contact
in the second Samnite War, 327 B.C. (Liv. viii. 70). On the
submission of the Samnites they all came into alliance with
Rome in 325-323 B.C. (Liv. ix. 43, x. 3, and Diod. xx. 101), the
Paelignians having fought hard (Diod. xx. 90) against even this
degree of subjection. Each of them was an independent unit,
and in none was there any town or community politically
separate from the tribe as a whole. Thus the Vestini issued
coins in the 3rd century; each of them appears in the list of the
allies in the Social War (Appian, B.C. i. 39, with J. Beloch, Der
 italische Bund unter römischer Hegemonie, p. 51). How purely
Italian in sentiment these communities of the mountain country
remained appears from the choice of the mountain fortress of
Corinium as the rebel capital. It was renamed Vetello, the
Oscan form of Italia, a name which appears, written in Oscan
alphabet, on the coins struck there in 96 B.C. (see R. S. Conway,
The Italian Dialects, p. 216).

The inscriptions we possess are enough to show that the
dialect spoken by these tribes was substantially the same from
the northern boundary of the Samnites to some place in the
Apennine valley not far from Ametenum (mod. Aquila), and that
this dialect closely resembled the Oscan of Lucania and Samnium,
though presenting some peculiarities of its own, which warrant,
perhaps, the use of the name North Oscan. The clearest of these
is the use of postpositions, as in Vestine Poinumia-n,
"in templo Ponomali"; pritom-e, i.e. in proximum, "on to
what lies before you." Others are the sibilation of consonantal i and
the assimilation of -di- to some sound like that of English j (de-
noted by B in the local variety of Latin alphabet), as in vididu,
"viam65, i.e. "ad-viam"; Musas=Lat. Mussedia; and the
loss of d (in pronunciation) in the ablative, as in actata f rata
fertil (i.e. acetate ferrill fnula), where the contrast of the last with
the other two forms shows that the -d was an archaism still
occasionally used in writing. The last sentence of the inter-
esting epitaph from which this phrase is taken may be quoted
as a specimen of the dialect; the stone was found in Pentima, the
ancient Corinium, and the very perfect style of the Latin alphabet
in which it written shows that it cannot well be earlier than
the last century B.C.: "Eite uss pritome paca, puus ecic leex lerafar, " ite vos porro pacati (cum bona pace), qui hoc
scriptum (libar, 3ed decl. neut.) legistis." The form lese (2nd
plur. perf. indic.) is closely parallel to the infection of the same
person in Sanskrit and of quite unique linguistic interest.

The name Paeligni may belong to the NO-class of Ethnica
(see SAENE), but the difference that it has no vowel before
the suffix suggests that it may rather be parallel with the
name of places of Lat. praeivgus. If it has any connexion with Lat.
pales, "concubine," it is conceivable that it meant "half-
breeds," and was a name coined in contempt by the conquering
Sabines, who turned the tota Maronca into the community of
the Marrucini (q.v.). But, when unsupported by direct evi-
dence, even the most tempting etymology is an unsafe guide.

For the history of the Paenii after 90 B.C. see the references
given in C. I. I. ix. 290 (Salmo, esp. Ovid, e.g. Fasti,
iv. 79, Amor. ii. 16; Florus ii. 9; Caes., B.C., i. 157) and 296
Corinium, e.g. Diod. Sic. xxxviii. 2, 4, Caes., B.C., i. 13.
None of the Latin inscriptions of the district need be older than Sulia,
but some of them both in language and script show the style of his
period (e.g. 3087, 3137); and, on the other hand, several
of the Greek inscriptions also bear a resemblance to the
normal letters of the Ciceronian period, there is little doubt
that, for religious and private purposes at least, the
Paenian dialect lasted down to the middle of the 1st century
B.C.

Paenian and this group of inscriptions generally form
a most important link in the chain of the Italic dialects, as
without them the transition from Oscan to Umbrian would
be completely lost. The unique collection of inscriptions and
antiquities of Pentima and the museum at Sulmona were both
created by the late Professor Antonio de Nino, whose brilliant
gifts and unspiring devotion to the antiquities of his native
district rescued every single Paenian monument that we
possess.

For further details and the text of the inscriptions, the place-
names, &c., see R. S. Conway, The Italian Dialects, pp. 253 sqq.,
and the earlier authorities there cited.

(R. S. C.)

PAEONIA, in ancient geography, the land of the Paeonians,
the boundaries of which, like the early history of its inhabitants,
are very obscure. The Paeonians are regarded as descendants
of the Phrygians of Asia Minor, large numbers of whom in early
times crossed over to Europe. According to the national legend
(Herodotus v. 16), they were Teuricians colonists from Troy,
and Homei (Hid. ii. 848) speaks of Paeonians from the Axios
fighting on the side of their Trojan kinsmen. Before the reign
of Darius Hystaspes, they had made their way as far east as Perinthos in Thrace on the Propontis. At one time all Mydonia, together with Cretanitik, was subject to them. When Xerxes crossed Chalcedon on his way to Thessalonica (Hesychus) he is said to have marched "through Paonian territory." They occupied the entire valley of the Axius (Vardar) as far inland as Stobi, the valleys to the east of it as far as the Strymon (Struma), and the country round Astibus and the river of the same name, with the water of which they anointed their kings. Emathia, the district between the Haliacmon (Bistritza) and Axius, was once called Paonia; and Pecia and Pelagonia were inhabited by Paonians. In consequence of the growth of the Macedonian power, and under pressure from their Thracian neighbours, their territory was considerably diminished, and in historic times was largely to the Strymon. The chief town and seat of the kings was Byalazra (Veles, Kuprolu on the Axius); in the Roman period, Stobi (Pusto-Gradsko). The Paonians included several sub-divisions, all later united under the rule of a single king. Little is known of their manners and customs. They adopted the cult of Dionysus, known amongst them as Dyalus or Dryalus, and Herodotus (iv. 33) mentions that the Thracian and Paonian women offered sacrifice to Queen Artemis (probably Bendis). They worshipped the sun in the form of a small round disk fixed on the top of a pole. A passage in Aeschyus (ix. p. 398) seems to indicate the acquaintance of their language with Mysian. They drank barley beer and various decoctions made from plants and herbs. The country was rich in gold and a beautiful kind of wood (or stone), which, when heated in blaze or water in contact with water) called σωκος (σωκος). The women were famous for their industry. In this connexion Herodotus (v. 12) tells the story that Darius, having seen at Sardis a beautiful Paonian woman carrying a pitcher on her head, leading a horse to drink, and spinning flax, all at the same time, inquired who she was. Having been informed that she was a Paonian, he sent instructions to Megabuxus, commander in Thrace, to deport two tribes of the nation without delay to Asia. At the time of the Persian invasion, the Paonians on the lower Strymon had lost, while those in the north maintained, their independence. They frequently made inroads into Macedonian territory, until they were finally subdued by Philip, who permitted them to retain their government by kings. The daughter of Audoleon, one of these kings, was the wife of Pyrrhus, king of Epirus, and Alexander the Great wished to bestow the hand of his sister Cynane upon Langarus, who had shown himself loyal to Philip. An inscription, discovered in 1857 at Olympia on the base of a statue, states that it was set up by the community of the Paonians in honour of their king and founder Dronion. Another king, whose name appears as Lyppeus on a fragment of an inscription found at Athens relating to a treaty of alliance is no doubt identical with the Lyceus or Lycepeus of Paonian coins (see B. V. Head, Historia numorum, 1857, p. 207). In 280 the Gallic invaders under Brennus ravaged the land of the Paonians, who, being further hard pressed by the Dardani, had no alternative but to join the Macedonians, whose downfall they shared. Upon the death of Philip II the territory of the Axius formed the second and third districts respectively of Macedonia (Livy xiv. 29). Under Diosclert Paonia and Pelagonia formed a province called Macedonia secunda or sualtatia, belonging to the prefecture of Illyricum.

See W. Tomaschek, "Die alten Tharker" in Sitzungsberichte der k. Akad. der Wissenschaften, xxviii. (Vienna, 1893); H. F. O. Abel, Madeirum varia, Prologus (Leipzig, 1847), and O. M. M. Strabon (36). For the Wo入手, die Abbauung und die alte Geschichte des makedonischen Volkes (Berlin, 1859); T. Desdevaux-Ducroz, Geographie ancienne de la Macedoine (Paris, 1863); see also Macedoniana.

PAONIUS, of Mende in Thrace, a Greek sculptor of the latter part of the 5th century. The statement of Pausanias that he executed one of the pediments of the temple of Zeus at Olympia is rejected by critics. But we possess an important work of Paonius in the Victory found in the German excavations at Olympia, and set up, according to the most probable view, in memory of the battle of Sphacteria (see Greek Art, fig. 36). It bears the inscription "Dedicated to Olympian Zeus by the Messenians and Naupactians as a tithe of the spoil of their enemies. Paonius of Mende made the statue, and was a successful competitor in the construction of the gable-figures for the temple." The gable figures last mentioned were doubtless gilt victories of bronze which stood on the gable, not in it. Pausanias seems to have misunderstood the phrase as implying that Paonius made one of the pedimental groups.

PAEOXY (botanically Paeonia; Nat. ord. Ranunculaceae q.c.) a genus of plants remarkable for their large and gorgeous flowers. There are two distinct species, one the strong-growing herbaceous kind, with fleshy roots and annual stems, derived mainly from Paeonia albigora and P. officinalis; the other called the tree paony or the "wood-growing," with half-woody permanent stems, which have sprung from the Chinese P. Moutan.

The herbaceous paeonies usually grow from 2 to 3 ft. in height, and have large much-divided leaves, and ample flowers of varied and attractive colours, and of a globular form in the double varieties which are those most prized in gardens. They usually blossom in May and June, and as ornaments for large beds in pleasure grounds, and for the front parts of shrubberies, few flowers equal them in gorgeous effect. A good moist loamy soil suits them best, and a moderate supply of manure is beneficial. They are impatient of frequent transplantings or repeated divisions for purposes of propagation, but when necessary they may be multiplied by this means, early in autumn, care being taken that a sound bud is attached to each portion of the tuber, before division.

The older varieties of P. albigora include candida, festa, fragrans, Humeti, Recesui, rubescens, vestalía, Whiteley, &c.; those of P. officinalis embrace albicans, amonunifióra, Baxteri, blanda, rosa, Sabini, &c. The garden varieties of modern times are, however, still more beautiful, the flowers being in many instances delicately tinted with more than one colour, such as buff with bronze centre, carmine with yellowish centre, rose with orange centre, white tinted with rose, &c.

The Siberian P. tenuifolia, with finely cut leaves and crimson flowers, is a graceful border plant, and its double-flowered variety is perhaps the most elegant of its race.

The Moutans or tree paeonies are remarkable for their sub-shrubby habit, forming vigorous plants sometimes attaining a height of 6 to 8 ft., and producing in May magnificent flowers which vary in colour from white to lilac, purple magenta, violet and rose. These are produced on the young shoots, which naturally bud forth early in the spring, and are in consequence liable to be affected by frost or frosty weather; and therefore a hot season and a dryish situation are desirable for their well-being; and they require perfect rest during winter. Small plants with a single stem, if well matured so as to ensure their blossoming, make very attractive plants when forced. They are increased by grafting in late summer or autumn on the roots of the herbaceous paeonies.

The yellow-flowered tree paeony (P. lutea) was introduced from China in 1857, but is still very rare. There are hundreds of varieties of both the herbaceous and tree paeonies, but as these have only a fleeting interest it is better to consult current catalogues for the latest types.

PAER, FERDINANDO (1771-1838). Italian musical composer, was born at Parma on the 1st of June 1771. He studied the theory of music under the violinist Ghiretti, a pupil of the Conservatorio della Pietà de’ Turchini at Naples. His first opera, La Locanda de’ vagabondi, was published when he was only sixteen; others rapidly followed, and his name was soon famous throughout Italy. In 1797 he went to Vienna, where his wife, the singer Riccardi, had obtained an engagement at the opera; here he produced a series of operas, including his La Camilla ossa il Sotterreno (1790) and his Achille (1804). In 1803 he was appointed conductor with the court of Dresden, where his wife was also engaged as a singer. and in 1804 the life appointment of Hofkapellmeister was bestowed upon him by the elector. At Dresden he produced, inter alia, II Sargino (1803),
an opera which obtained a wide popularity, and *Leonora* (1804),

based on the same story as Beethoven's *Fidelio*. In 1807

Napoleon while in Dresden took a fancy to him, and took him

with him to Warsaw and Paris at a salary of 28,000 francs.

In 1812 he succeeded Spontini as conductor of the Italian opera

in Paris. This post he retained at the Restoration, receiving

also the posts of chamber composer to the king and conductor

of the private orchestra of the duke of Orleans. In 1823 he

retired from the Italian opera in favour of Rossini. In 1831

he was elected a member of the Academy, and in 1832 was

appointed conductor of his orchestra by King Louis Philippe.

He died on the 3rd of May 1839.

Paër wrote in all 43 operas, in the Italian style of Paisiello

and Cimarosa. The two last works which include nine religious

compositions, thirteen cantatas, and a short list of orchestral

and chamber pieces, are of little importance; in any case the

superficial quality of his compositions was such as to secure

him popularity while he lived and after his death oblivion.

See R. Eitner, *Quellen-Lexikon* (Leipzig, 1902), vii. 277, sqq.,

where a list of his works is given.

**PAESTUM** (Gr. Πασέτων; mod. Pesto), an ancient Greek

city in Lucania, near the sea, with a railway station 24 m. S.E. of

Salerno, 5 m. S. of the river Silarus (Salso). It is said by Strabo

(v. 235) to have been founded by Trozenian and Achaean

colonists from the old colony of Sybaris, on the Gulf of

Tarentum; this probably happened not later than about 600 B.C.

Herodotus (i. 167) speaks of it as being already a flourishing city

in his time (about 528 B.C.), when the neighbouring city of Vella

was founded. For many years the city maintained its independence,

though surrounded by the hostile native inhabitants of Lucania.

Autonomous coins were struck, of which many specimens now

exist (see Numismatics). After long struggles the city fell into

the hands of the Lucanians (who nevertheless did not expel the

Greek colonists) and in 323 B.C. it became a Latin colony under

the Roman rule, the name being changed to the Latin form

Paestum. It successfully resisted the attacks of Hannibal;

and it is noteworthy that it continued to strike copper coins even

under Augustus and Tiberius. The neighbourhood was then

healthy, highly cultivated, and celebrated for its flowers; the

"twice blooming roses of Paestum" are mentioned by Virgil

(Geor. iv. 118), Ovid (Met. xxv. 708), Martial (iv. 41, iv. 101, iv. 50, 6),

and other Latin poets. Its present deserted and marauding state

is probably owing to the silting up of the mouth of the Silarus,

which has overflown its bed, and converted the plain into

unproductive marshy ground. Herds of buffaloes, and the few

peasants who watch them, are now the only occupants of this

once thickly populated and garden-like region. In 871 Paestum

was sacked and partly destroyed by Saracen invaders; in the 11th

century it was further dismantled by Robert Guiscard, and in

the 16th century was finally deserted.

The ruins of Posidonia are among the most interesting of the

Hellenic world. The earliest temple in Paestum, the so-called

Basilica, must in point of style be associated with the temples D and F at Selinus, and is therefore to be dated about

570-554 B.C. It is a building of unique plan, with nine columns

in the front and eighteen at the sides, 41 ft. in diameter. A line

of columns runs down the centre of the cella. The columns

have marked entasis, and the flutings end in a semicircle, above

which is generally a torus (always present in the so-called temple of Ceres). The capitals are remarkable, inasmuch as the necking

immediately below the echinus is decorated with a band of leaves, the arrangement of which varies in different cases. The columns

and the architraves upon them are well preserved, but there is

nothing above the frieze existing, and the cella wall has entirely

disappeared. Next in point of date comes the so-called temple of Ceres, a hexastyle peripteros, which may be dated about 540 B.C.

The columns are all standing, and the west and part of the east

pediment are still in situ; but of the cella, again, nothing is

left. The capitals are like those of the Basilica, but the details

are differently worked out. In front of this temple stood a

sacrificial altar as long as the temple itself.

The most famous of the temples of Paestum, the so-called

temple of Neptune, comes next in point of date (about 420 B.C.).

It is a hexastyle peripteros with fourteen columns on each side,

and is remarkably well-preserved, both pediments and the

epistyle at the sides being still in situ. No traces of the decora-
tions of the pediments and metopes have been preserved.

The cella, the outer walls of which have to a great extent disappeared, has two internal rows of seven columns 4½ ft. in diameter, upon which rests a simple epistyle, support ing a row of smaller columns, so that the interior of the cella was in two storeys.

The Temple of Peace is a building of the Roman period of the

2nd century B.C., with six Doric columns on the front, eight on the sides and none at the back; it was excavated in 1830 and is now entirely covered up. Traces of a Roman theatre and amphitheatre (?) have also been found. The circuit of the town walls, well built of squared blocks of travertine, and 16 ft. thick, of the Greek period, is almost entire; they are

about 3 m. in circumference, enclosing an irregular, roughly rectangular area. There were four gates, that on the east with a single arched opening being well-preserved. Outside the north gate is a street of tombs, in some of which were found arms, vases and fine mural paintings (now in the Naples Museum).

The following table gives the chief dimensions of the four temples

described above in feet:—

<table>
<thead>
<tr>
<th>Type of Temple</th>

(T. As.)

**PAEZ, JOSÉ ANTONIO** (1790-1873), Venezuelan president,

was born of Indian parents near Acarigua in the province of

Barinas on the 13th of June 1790. He came to the front in the

war of independence against Spain, and his military career, which

began about 1810, was distinguished by the defeat of the Spanish

forces at Mata de la Miel (1815), at Montecal and throughout

the province of Apure (1816), and at Puerto Cabello (1823). In

1829 he furthered the secession of Venezuela from the republic

of Colombia, and he became its first president (1830-1834).

He was again president in 1839-1843, and dictator in 1846; but

soon afterwards headed a revolution against his successor and was

thrown into prison. In 1850 he was released and left the
country, but in 1858 he returned, and in 1860 was made

minister to the United States. A year afterwards he again

returned and made himself dictator, but in 1863 was overthrown

and exiled. He died in New York on the 6th of May 1873.

His autobiography was published at New York in 1867-1869, and

his son Ramon Paez wrote *Public, Life of J. A. Paez* (1864).

**PAEZ, PEDRO** (1560-1622), Jesuit missionary to Abyssinia,

was born at Olmedo in Old Castile in 1564. Having entered the

Society of Jesus, he was set apart for foreign mission service,

and sent to Goa in 1588. Within a year he and a fellow mis-

sionary were dispatched from that place to Abyssinia to act as

spiritual directors to the Portuguese residents. On his way

thither, he fell into the hands of pirates at Dhofar and was

sent to Sanaa, capital of the Yemen, where he was detained
for seven years by the pasha as a slave. Having been redeemed by his order in 1596, he spent some years in mission work on the west coast of India, and it was not until 1609 that he again set out for Persia. In 1612, with the approval of his superiors, he sent for his children, then about twelve years of age, to accompany him on his journey to the headquarters of his order, in Fereana; he soon acquired the two chief dialects of the country, translated a catechism, and set about the education of some Abyssinian children. He also established a reputation as a preacher, and having been summoned to court, succeeded in vanquishing the native priests and in converting Za-Denghel, the negus, who wrote to the pope and the king of Spain for more missionaries, an act of zeal which involved him in civil war with the Abyssinian priests (who dreaded the influence of Paez) and ultimately cost him his life (Oct. 1604). Paez, who is said to have been the first European to visit the source of the Blue Nile, died of fever in 1622.

In addition to the translation of the Catechism, Paez is supposed to be the author of a treatise about the history of Ethiopia (ed. C. C. Becari in Rerum africanarum scriptores occidentales inediti a secundo VI. ad XIX. (1906).)

See A. de Baeckere, Bibliographie de la Compagnie de Jésus (ed. C. Sommervogel) vol. (1885); W. D. Cooley in Bulletin de la société de géographie (1872), 6th series, vol. iii.

PAGAN, a town and former capital, in Myingyan district, Upper Burma, 92 m. S.W. of Mandalay. It was founded by King Pyinbya in 847, and remained the capital until the extinction of the dynasty in 1298. Pagan itself is now a mere village, but hundreds of pagodas in various stages of decay meet the eye in every direction. The majority of them were built by King Anawrahta, who overcame the Peguan king, Manuha of Thaton. It was Anawrahta who introduced the Buddhist religion in Upper Burma, and who carried off nearly the whole Thaton population to band the pagodas at Pagan on the model of the Thaton originals. Many of these are of the highest architectural interest, besides being in themselves most imposing structures. Pagan is still a popular place of Buddhist pilgrimage, and a museum has been built for the exhibition of antiquities found in the neighbourhood. The population in 1901 was 6254.

PAGAN (Lat. paganus, of or belonging to a pagus, a canton, county district, village, commune), a heathen, one who worships a false god or false gods, or one who belongs to a race or nation which practises idolatrous rites and professed polytheism. In its early application paganus was applied by the Christian Church to those who refused to believe in the one true God, and still followed the Greek, Roman and other ancient faiths. It thus of course extended itself to any of his contemporaries and later, "pagan" and "paxim" (O. Fr. paximade, Late Lat. paganismus, heathenism or heathen lands) were particularly applied to Mahomedans, and sometimes to Jews. A special significance attaches to the word when applied to one who adopts that attitude of cultured indifference to, or negation of, the various theistic systems of religion which was taken by so many of the educated and aristocratic classes in the ancient Hellenic and Roman world.

It has long been accepted that the application of the name paganus, villager, to non-Christians was due to the fact that it was in the rural districts that the old faiths lingered. This explanation assumes that the use of paganus in this sense arose after the pastoral mission began and as the religion generally accepted in the urban as opposed to the pastoral districts. It is generally stated that an edict of the emperor Valentinian of 368 dealing with the religio paganorum (Cod. Theod. xvi. 2) contains the first documentary use of the word in this secondary sense. It has now been shown that the use can be traced much earlier.

Tertullian (c. 202; De corona militis, xi.), says: "A pud hunc (Christum) tam miles est paganus fidelis quam paganest miles infidelis." This gives the clue to the true explanation.

In classical Latin paganus is frequently found in contradistinction to miles or armatus (c. especially Tac. Hist. 1. 53; id. 1. 14; 88; hist. 24, 43, 77), where the opposition is between a regular enrolled soldier and the raw half-armied rustics who sometimes formed a rude militia in time of civil wars, or, more widely, between a soldier and a civilian. Thus the Christians who prided themselves on being "soldiers of Christ" (milites) could rightly term the non-Christians pagani. See also Gibbon, Decline and Fall of the Roman Empire (ed. Bury, 1866), ch. xx. note ad fin.

PAGANINI, NICOLÒ (1784-1840), Italian virtuoso on the violin, was born at Genoa on the 18th of February 1782. His father Antonio, a clever amateur, who was in the slave-trade, taught him the violin at a very early age, and he further lessons from the maestro di cappella of the cathedral of San Lorenzo. He first appeared in public at Genoa in 1793, with triumphant success. In 1795 he visited Parma for the purpose of taking lessons from Alessandro Rolla, who, however, said that he had nothing to teach him. On returning home, he studied more diligently than ever, practising single passages for ten hours at a time, and publishing compositions so difficult that he alone could play them. His first professional tour, through the cities of Lombardy, was made with his father in 1797. For some years he led a chequered career; he gambled at cards, and had to pawn his violin; and between 1801 and 1804 he lived in retirement, in Tuscany, with a noble lady who was in love with him. In 1805 however he started on a tour through Europe, astonishing the world with his matchless performances, and especially with his unprecedented playing on the fourth string alone. The princess of Lucca and Piombi, Napoleon's sister, made him her musical director, and he became a prominent figure at the court where his caprices and audacities were a byword. He abandoned this in 1813, and visited Bologna, Milan, and other cities, gaining further fame by his extraordinary virtuosity. In Venice, in 1815, he began a liaison with Antonia Bianchi, a dancer, which lasted till 1828; and by her he had a son Achilleino, born in 1816. Meanwhile the world rang with his praises. In 1827 the pope honoured him with the title of count; in 1829, and again in 1833, the French court made him a "chevalier qui est en amour avec le roi," and 1834, he extended his travels to Germany, beginning with Vienna, where he created a profound sensation. He first appeared in Paris in 1831; and on the 3rd of June in that year he played in London at the King's Theatre. His visit to England was preluded by the most romantic stories. He was described as a political victim who had been immured for twenty years in a dungeon, where he played all day long upon an old broken violin with one string, and thus gained his wonderful mechanical dexterity. The result of this and other foolish reports was that he could not walk the streets without being mobbed. He charged what for that time were enormous fees; and his net profits in England alone, during his six years of residence, amounted to something like £17,000. In 1832 he returned to Italy, and bought a villa at Capri. In 1833 he spent the winter in Paris, and in 1834 Berlioz composed for him his beautiful symphony, Harold en Italie. He was then at the zenith of his fame; but his health, long since ruined by excessive study, declined rapidly. In 1838 he suffered serious losses in Paris through the failure of the "Casino Paganini," a gambling-house which was refused a licence. The disasters of this year increased his malady—laryngeal phthisis—and, after much suffering, he died at Nice on the 17th of May 1840. His will left a fortune of £80,000 to his son Achilleino; and he bequeathed one of his violins, a fine Joseph Guarnerius, given him in early life by a kind French merchant, to the municipality of Genoa, who presented it as one of their treasures. Paganini's style was impressive and passionate, as befits a man of that degree. His cantabile passages moved his audience to tears, while his tours de force were so astonishing that a Viennese amateur publicly declared that he had seen the devil assisting him. His name stands in history as that of the most extraordinary executant ever known on the violin; and in spite of greater artists or no less remarkable later virtuosi, this reputation will remain with Paganini as the inaugurator of an epoch.

He was the first to show what could be done by brilliance of technique, and his compositions were directed to that end. He was an undeniable genius, and it may be added that he behaved and looked like one, with his tall, emaciated figure and long black hair.

There are numerous lives of Paganini; see the article and bibliography in Grove's Dictionary of Music.

XX. 15
PAGE, THOMAS NELSON (1853- ). American author, was born at Oakland Plantation, Hanover county, Virginia, on the 23rd of April 1853, the great-grandson of Thomas Nelson (1738-1780) and of John Page (1744-1808), both governors of Virginia, the former being a signer of the Declaration of Independence. After a course at Washington and Lee University (1871-1872), he studied law in Virginia (1874), and practised, chiefly in Richmond, until 1893, when he removed to Washington, D. C., and devoted himself to writing and lecturing. In 1884 he had published in the Century Magazine "Marse Chan," a tale of life in Virginia during the Civil War, which immediately attracted attention. He wrote other stories of negro life and character ("Meh Lady," "Unc' Edinburg's Drownin,'" and "Ole 'Stracted"), which, with two others, were published in 1887 with the title In Old Virginia, perhaps his most characteristic book. This was followed by Bejo de War (1888), dialect poems, written with Armstrong Churchill Gordon (b. 1853; On Newfound River (1891); The Old South (1891), social and political essays; Elsket and Other Stories (1892); The Burial of the Guns (1894); Pastime Stories (1893); The Old Gentlemen of the Black Stock (1897); Social Life in Old Virginia before the War (1897); Two Prisoners (1898); Red Rock (1898), a novel of the Reconstruction period; Gordon Keith (1903); The Negro: the Southerner's Problem (1904); Bred in the Bone and Other Stories (1904); The Coast of Bohemia (1906), poems; The Old Dominion: Her Making and her Manners (1907), a collection of essays; Under the Crust (1907), stories; Robert E. Lee, the Southerner (1908); John Marvel, Assistant (1909), a novel; and various books for children. He is at his best in those short stories in which, through negro character and dialect, he pictures the life of the Virginian gentry, especially as centred about the mutual devotion of master and servant.

PAGE, ROBERT M. (1818-1874). He was born in Albany, New York, on the 3rd of January 1818. He studied for the ministry at the Andover Theological Seminary in 1828-1830 and in later life became a Swedeborgian. He received his training in art from S. F. B. Morse and in the schools of the National Academy of Design, and in 1836 became a National Academician. From 1840 to 1860, he lived in Rome, where he painted portraits of his friends Robert and Elizabeth Browning. The first collection of Lowell's Poems (1843) was dedicated to Page, who was also a friend of W. W. Story. In 1857-1858 he was president of the National Academy of Design. He died at Tottenville, Staten Island, New York, on the 1st of October 1885. Besides numerous portraits he painted "The Battle of Mobile," was the first Consul of Russia; a "Holy Family," in the Boston Athenaeum; and "The Young Merchants," at the Pennsylvania Academy of the Fine Arts, Philadelphia. He modelled and painted several portraits of Shakespeare, based on the Becker "death mask." He wrote A New Geometrical Method of Measuring the Human Figure (1860).

PAGE. (1) A term used of a boy, lad or young male person in various capacities, positions or offices. The etymology is doubtful; the word is common to the Romanic languages; cf. O. Fr. and Span. page, Port. pagão, It. paggio. The Med. Lat. pagus has been commonly referred to Gr. παῖς, diminutive of παῖς, boy, but the connexion is extremely doubtful. Others refer the word to the pueri paedagogi, young slaves trained to become paedagogi (Gr. παῖδας ὁμιλοῦντας), or tutors to young boys attending school. Under the empire, numbers of such youths were attached to the imperial household for the purposes of ceremonial attendance on state occasions, thus occupying much the same position as that of the pages of a royal or noble household in medieval and modern times. In fact the term paedagogi became equivalent to pueri honorarii, qui in palatio ministerio principis militabant (so Du Cange, Glossarium, s.v.). Littre refers pagius to pagensis, i.e. rustic, belonging to the country districts (pagae), and addsuces from this the fact that the pagii were not necessarily boys or youths; and quotes from Claude Fauchet (1530-1601) the statement (Lib. I. Orig. milit. cap. i.) that up to the time of Charles VI. (1568-1643) and Charles VII. (1543-1560) "le mot de Page... semblait être seulement donné à des personnes, comme à garçons de pied." Skeat (Etym. Dic.) points out that the form of the word in Portuguese, pagen, indicates the derivation from paegensis. The word "page" was applied in English to a boy or youth who was employed, as an assistant to another servent, student, or apprentice, and it is possible that they were as an apprentice and learning his duties. In present usage the chief applications are: (a) to a boy or lad, generally wearing livery, and sometimes styled a "button," who is employed as a domestic servant; and (b) to a young boy who, dressed in fancy costume, forms part of the bridal procession at weddings. The word is also used (c) as the title of various officials of different rank in royal and other households; thus in the British royal household there are pages of honour, a page of the chambers, pages of the presence, and pages of the back stairs. These, no doubt, descend from the pueri paedagogi of the Roman imperial household through the young persons of noble or gentle birth, who, during the middle and later ages, served in the household of royal and noble persons, and received a training to fit them for their future position in society. In the times of chivalry the "page" was one who served a knight and was trained to knighthood, and ranked next to a squire. (See Knighthood and Valet.)

PAGEANT, in its most general sense a show or spectacle, the more specific meanings involved in the etymology of the word and its connexion with the history of the early mystery plays (see Drama). In its early forms, dating from the 14th century, the word is pagyn or pagen, the exscentric i or d, as in "individual," "person," etc., "individual" not appearing till later... The Med. Lat. equivalent is pagina, and this, or at least the root from which it is formed, must be taken as the source. The senses, however, in which the word is used, viz. stage, platform, or scene played on a stage, are not those of the classical Lat. pagina, a page of a book, nor do they apparently occur in the medieval Latin of any language other than English. Further, it is not clear which meaning comes first, platform or scene. If the last, then "scene," i.e. a division of a play, might develop out of "page" of a book. If not, then pagina is a fresh formation from the root pag of panger, to fix or fasten, the word meaning a fastened framework of wood forming a stage or platform; cf. the classical use of compagio, structure. Others take pagina as deriving from the Latinisation of Gr. παῖδας ὁμιλοῦντας, a word from the same root pag-. Du Cange (Glossarium) quotes a use in Med. Lat. of pagnia in this sense, Macchina lignea in qua statuat collocabuntur, and Cotgrave gives "Pegmate, a stage or frame whereon pageants be set or carried." As has been said, "pageant" is first found in the sense of a scene, a division or part of a play or of the platform on which such scene was played in the medieval drama. Thus we read of Queen Margaret at 1457 that at Coventry she saw "all the pageantes pledeye save domedaye which myght not be pledeye for lack of day," and in the accounts of the Smiths' girl at Coventry for 1450, five pence is paid "to bring the pagen into goseford-street." A clear idea of what these stages were like when the mystery plays became processional (processus), that is, were acted on separate platforms moving along a street, is seen in Archdeacon Roger's contemporary account, of the Chester plays about the end of the 16th century. "The manner of these plays weere, every company had his pageant, or parte, which pageantes weare a high scalfode with 2 roomes, and a higher and a lower, upon 4 wheeles" (T. Sharp, Dissertation on the Pageants or Mysteries at Coventry, 1825, which contains most of the early references to the word). The movable platform, filled with emblematic or allegorical figures, naturally played an important part in processional shows with no dialogue or dramatic action. An instance (1432) of the practice and the use of the word is found in the Munimenta guildhallae londinensis (ed. Riley), "Parabatur machina.... in cujus medio stabat,
gigas mirae magnitudinis ... ex utroque latere ... in eadem pagina erigebantur duo animalia vocata ontelixos." At Anne Boleyn's coronation, June 1, 1533, one "pageant" contained figures of Apollo and the Muses, another represented a castle, with "a heavenly roof and under it upon a green was a root or stock, whereunto sprang a multitude of white and red roses" (Arber, English Garner, ii. 47, quoted in the New English Dictionary). Such "pageants" formed a feature, in a somewhat degraded shape, in the annual lord mayor's show in London. The development in meaning from "moving platform" to that of a "processional spectacle" or "show" is obvious.

The 19th century has seen in England what may in some respects be looked on as a revival but in general as a new departure in the shape of semi-dramatic spectacles illustrative of the history of a town or locality; to such spectacles the name of "Pageant" has been appropriately given. Coventry in its procession in commemoration of Lady Godiva's traditional exploit, has since 1675 illustrated an incident, however mythical, in the history of the town, and many of the ancient cities of the continent of Europe, as Siena, Bruges, Nuremberg, &c., have had, and still have, at intervals a procession of persons in the costumes of various periods, and of figures emblematical of the towns' associations and history. The modern pageant is an innovation from a more complex pageant in which scenes of bright and interesting on an historical or artistic point of view such may be made. It consists of a series of scenes, representing historical events directly connected with the town or locality in which the pageant takes place. These are accompanied by appropriate dialogue, speeches, songs, &c., and with music and dances. The effect is naturally much heightened by the place of the performance, more particularly if this is the actual site of some of the scenes depicted, as at the Winchester Pageant (1908) where the background was formed by the ruins of Wolvesey Castle. The Sherborne pageant of 1903 was the first of the series of pageants. In 1905 and 1908 they became very numerous; of these the principal may be mentioned, those at Oxford, Bury St Edmunds in 1907; at Winchester, Chelsea, Dover and Pevensey in 1908; and that of the English Church at Fulham Palace 1909, a peculiarly interesting example of a pageant connected with an institution and not a locality.

The artistic success of a pageant depends on the beauty or historic interest of its site, the skilful choice of episodes and dramatic incidents, the grouping and massing of colour, and the appropriateness of the dialogue, speeches and incidental music. It is here that the skill and talent of the writer, designer or director of the pageant find scope. The name of the dramatist Louis N. Parker (b. 1852), the author of the Sherborne pageant, the earliest and one of the most successful, must always be associated with the movement, of which he was the originator.

More important, perhaps, than the aesthetic pleasure given is the educational effect produced not only on the spectators but also on the performers. The essence of the pageant is that all who take part are residents in the place and locality, that the costumes and accessories should be made locally, and that all classes and all ages should share in a common enthusiasm for the bringing back in the most vivid form the past history, often forgotten, in which all should feel they have an equal and common part. (C. W.)

PAGET, SIR JAMES, Bart. (1814-1899), British surgeon, born at Yarmouth on the 11th of January 1814, was the son of a brewer and shipowner. He was one of a large family, and his brother Sir George Paget (1809-1892), who became regius professor of physique at Cambridge in 1847, had a distinguished career in medicine and was made a K.C.B. He attended a day-school in Yarmouth, and afterwards was destined for the navy; but this plan was given up, and at the age of sixteen he was apprenticed to a general practitioner, whom he served for four and a half years, during which time he gave his leisure hours to botanizing, and made a great collection of the flora of East Norfolk. "At the end of his apprenticeship he published with one of his brothers a very careful Sketch of the Natural History of Yarmouth and its Neighbourhood. In October 1834 he entered as a student at St Bartholomew's Hospital. Medical students in those days were very much to themselves; there was no close supervision of their work, but it is probable that Paget gained rather than lost by having to fight his own way. He swept the board of prizes in 1835, and again in 1836; and in his first winter session he detected the presence of the Trichina spiralis, a minute parasite that infests the muscles of the human body. In May 1836 he passed his examination at the Royal College of Surgeons, and became qualified to practise. The next seven years (1836-1843) were spent in London, lodgings, and were a time of poverty, for he made only £15 at law practice, and his father, having failed in business, could not give him any help. He managed to keep himself by writing for the medical journals, and preparing the catalogues of the hospital museum and of the pathological museum of the Royal College of Surgeons. In 1836 he had been made curator of the hospital museum, and in 1838 demonstrator of morbid anatomy at the hospital; but his advancement there was hindered by the privileges of the hospital apprentices, and by the fact that he had been too poor to afford a house-surgery, or even a dressership. In 1841 he was made surgeon to the Finsbury Dispensary; but this appointment did not give him any experience in the fields of study in which he was most interested. It was not until 1848 that he was appointed lecturer on general anatomy (microscopic anatomy and physiology) at the hospital, and warden of the hospital college then founded. For the next eight years he lived within the walls of the hospital, in charge of about thirty students resident in the little college. Besides his lectures and his superintendentship the resident students, he had to enter all new students, to advise them how to work, and to manage the finances and the general affairs of the school. Thus he was constantly occupied with the business of the school, and often passed a week, or more, without going outside the hospital gates. In 1844 he married Lydia, youngest daughter of the Rev. Henry North. In 1847 he was appointed assistant-surgeon to the hospital, and Aris and Gale professor at the College of Surgeons. He held this professorship for six years and each year gave six lectures in surgical pathology. (The first edition of these lectures, which were the chief scientific work of his life, was published in 1853 as Lectures on Surgical Pathology.) In 1857 he was elected a Fellow of the Royal Society. In October 1857 he resigned the wardenship of the hospital. He had now become known as a great physiologist and pathologist; he had done for pathology in England what R. Virchow had done in Germany; but he had hardly begun to get into practice, and he had kept himself poor that he might pay his share of his father's debts—a task that it took him fourteen years to fulfil.

It is probable that no famous surgeon, not even John Hunter, ever founded his practice deeper in science than Paget did, or served so well for his work to come back to him. In physiology he had mastered the chief English, German, Dutch and Italian literature of the subject, and by incessant study and microscope work had put himself level with the most advanced knowledge of his time; so that it was said of him by R. Owen, in 1851, that he had his choice, either to be the first physiologist in Europe, or to have the first surgical practice in London, with a baronetcy. His physiological lectures at St Bartholomew's Hospital were the chief cause of the rise in the fortunes of its school, which in 1843 had gone down to a low point. In pathology his work was even more important. He fills the place in pathology that had been left empty by Hunter's death in 1793—the time of transition from Hunter's teaching, which was mainly of gross anatomy and histology, to that of the present century, which is based upon microscopic anatomy. This transition appears to be as follows: Paget was a first-year's student, and, by means of a pocket lens, found in the dissecting-room that the specks in the infected muscles were parasitic worms and not, as previously thought, speckles of bone. Thomas Worrell, the senior demonstrator, who was no pathologist, sent a piece of the same muscle to Owen, who authoritatively pronounced the specks to be parasites and gave them their scientific name. It is probable that Owen did not realize that Paget had already made the discovery, and it was naturally associated with the name of the professor.
which for all its greatness was hindered by want of the modern microscope, to the pathology and bacteriology of the present day. It is Paget's greatest achievement that he made pathology dependent, in everything, on the use of the microscope—especially the pathology of tumours. He and Virchow may truly be called the founders of modern pathology; they stand together, Paget's *Lectures on Surgical Pathology* and Virchow's *Cellular Pathology*. When Paget, in 1851, began practice near Cavendish Square, he had still to wait a few years more for success in professional life. The "turn of the tide" came about 1854 or 1855; and in 1858 he was appointed surgeon extraordinary to Queen Victoria, and in 1856 surgeon in ordinary to the prince of Wales. He had for many years the largest and most arduous surgical practice in London. His son's contributions to the science of surgery have been of equal importance. Cases sent to him for final judgment, with especial frequency, were those of tumours, and of all kinds of disease of the bones and joints, and all "neuropic" cases having symptoms of surgical disease. His supremacy lay rather in the science than in the art of surgery, but his name is associated also with certain great practical advances. He discovered the disease of the breast and the disease of the bones (osteitis deformans) which are called after his name; and he was the first at the hospital to urge enucleation of the tumour, instead of amputation of the limb, in cases of myeloid sarcoma.

In 1871 he nearly died from infection at a post-mortem examination, and, to lighten the weight of his work, was obliged to resign his surgeoncy to be his house. In 1872 he was created knight of the bath and knight of the order of the Thistle, and in 1874 he was made president of the Royal College of Surgeons, and in 1877 Hunterian orator. In 1878 he gave up operating, but for eight or ten years longer he still had a very heavy consulting practice. In 1881 he was president of the International Medical Congress held in London; in 1880 he gave, at Cambridge, a memorable address on "Elemental Pathology," setting forth the likeness of certain diseases of plants and trees to those of the human body. Besides shorter writings he also published *Clinical Lectures and Essays* (1st ed. 1875) and *Studies of Old Case-books* (1891). In 1883, on the death of Sir George Jessel, he was appointed vice-chancellor of the university of London. In 1886 he was appointed a member of the royal commission on vaccination. He died in London on the 29th of December 1890, in his eighty-fifth year. Sir James Paget had the gift of eloquence, and was one of the most careful and most delightful speakers of his time. He had a natural and unaffected pleasure in society, and he loved music. He possessed the rare gift of ability to turn swiftly from work to play; enjoying his holidays like a schoolboy, easily moved to laughter, keen to get the maximum of happiness out of very ordinary amusements, emotional in spite of incessant self-restraint, vigorous in spite of constant overwork. In him a certain light-hearted enjoyment was combined with the utmost reserve, unfailing religious faith, and the most scrupulous honour. He was all his life profoundly indifferent to politics, both national and medical; his ideal was the unity of science and practice in the professional life.

**PAGET OF BEAUDESERT, WILLIAM PAGET, 1ST BARON (1596-1663),** English statesman, son of William Paget, one of the sergeants-at-mace of the city of London, was born in London in 1596, and was educated at St Paul's School, and at Trinity Hall, Cambridge, proceeding afterwards to the university of Paris. Probably through the influence of Stephen Gardiner, who had early befriended Paget, he was employed by Henry VIII. in several important diplomatic missions; in 1532 he was appointed clerk of the signet and soon afterwards of the privy council. He became secretary to Queen Anne of Cleves in 1539, and in 1541 he was sworn of the privy council and appointed secretary of state, in which position Henry VIII. in his later years relied much on his advice, appointing him one of the council to act during the minority of Edward VI. Paget at first vigorously supported the protector Somerset, while counselling a moderation which Somerset did not always observe. In 1547 he was made comptroller of the king's house,

hold, chancellor of the duchy of Lancaster, and a knight of the Garter; and in 1549 he was summoned by writ to the House of Lords as Baron Paget de Beauesert. About the same time he obtained extensive grants of lands, including Cannock Chase and Burton Abbey in Staffordshire, and in London the residence of the bishops of Exeter, afterwards known successively as Lincoln House and Essex House, on the site now occupied by the Outer Temple in the Strand. He also obtained Beauesert in Staffordshire, which is still the chief seat of the Paget family. Paget shared Somerset's disgrace, being committed to the Tower in 1551 and degraded from the Order of the Garter in the following year, besides suffering a heavy fine by the Star Chamber for having profited at the expense of the Crown in his purchase of the duchy of Lancaster. He was, however, restored to the king's favour in 1555, and was one of the twenty-six peers who signed Edward's settlement of the crown on Lady Jane Grey in June of that year. He made his peace with Queen Mary, who reinstated him as a knight of the Garter and in the privy council in 1553, and appointed him lord privy seal in 1556. On the accession of Elizabeth in 1558 Paget retired from public life, and died on the 9th of June 1563.

By his wife Anne Preston he had four sons, the two eldest of whom, Henry (d. 1568) and Thomas, succeeded in turn to the peerage. The youngest son, Charles Paget (d. 1612), was a well-known Catholic conspirator against Queen Elizabeth, in the position of secretary to Archbishop James Beaton, the ambassador of Mary Queen of Scots. Together with the victorious Paget in Paris at times he also played the part of a spy and forwarded information to Walsingham and Cecil. Thomas, 3rd Baron Paget of Beauesert (c. 1540-1580), a zealous Roman Catholic, was suspected of complicity in Charles's plots and was attained in 1587. But the peerage was restored in 1604 to his son William (1572-1629), 4th Lord Paget, whose son William, the 5th lord (1606-1678), fought for Charles I. at Edgehill. William, the 6th lord (1637-1713), a supporter of the Revolution of 1688, was ambassador at Vienna from 1689 to 1693, and later at Constantinople, having much to do with bringing about the important treaty of Carlowitz in 1699. Henry, the 7th baron (c. 1665-1743), was raised to the peerage during his father's lifetime as Baron Burton in 1712, being one of the twelve peers created by the Tory ministry to secure a majority in the House of Lords, and was created earl of Uxbridge in 1714. His only son, Thomas Catesby Paget, the author of an *Essay on Human Life* (1734) and other writings, died in January 1742 before his father, leaving a son Henry (1719-1769), who became 2nd earl of Uxbridge. At the latter's death the earldom of Uxbridge and barony of Burton became extinct, the older barony of Paget of Beauesert passing to his cousin Henry Bayly (1744-1812), heir general of the first baron, who in 1784 was created earl of Uxbridge. His second son, Sir Arthur Paget (1771-1840), was an eminent diplomatist during the Napoleonic wars, Sir Edward Paget (1775-1840), the fourth son, served under Sir John Moore in the Peninsula, and was afterwards second in command under Lord Wellington; the fifth, Sir Charles Paget (1778-1839), served with distinction in the navy, and rose to the rank of vice-admiral. The eldest son Henry William, 2nd earl of Uxbridge (1768-1894), was in 1815 created marquess of Anglesey (q.v.).

**PAGHMAN, a small district of Afghanistan to the west of Kabul, lying under the Paghman branch of the Hindu Kush range. It is exceedingly picturesque, the villages clinging to the sides of the mountain gleans from which water is drawn for irrigation; and excellent fruit is grown.**

**PAGODA** (Port. *pagode*, a word introduced in the 16th century by the early Portuguese adventurers in India, reproducing phonetically some word which would possibly Pers. *but-kadak*, lit. "a house for an idol, or some form of Sansk. *bhagavat*, divine, holy), an Eastern term for a temple, especially a building of a pyramid shape common in India and the Far East and devoted to sacred purposes; in Buddhist countries, notably China, the name of a many-sided tower in which are kept holy relics. More loosely "pagoda" is used in the East to signify any non-Christian or non-Musulman place of worship. Pagoda or
pagod was also the name given to a gold (occasionally also silver) coin, of about the value of seven shillings, at one time current in southern India. From this meaning is derived the expression "the pagoda tree," as synonymous with the "wealth of the Indies," whence the phrase to "shake the pagoda tree." There is a real tree, the Plumeria acuminata, bearing the name. It grows in India, and is of a small and graceful shape, and bears yellow and white flowers tinged with red.

PAHARI (properly Pahāri, the language of the mountains), a general name applied to the Indo-Aryan languages or dialects spoken in the lower ranges of the Himalaya from Nepal in the east, to Chamba of the Punjab in the west. These forms of speech fall into three groups—an eastern, consisting of the various dialects of Khasa, the language of Nepal, the central, spoken in the north of the United Provinces, in Kumaon and Garhwal; and a western, spoken in the country round Simla and in Chamba. In Nepal, Khas-kura is the language only of the Aryan population, the mother tongue of most of the inhabitants being some form or other of Tibeto-Burman speech (see Tibeto-Burman Languages), not Indo-Aryan. As may be expected, Khas-kura is mainly differentiated from Central Pahari through its being affected, both in grammar and vocabulary, by Tibeto-Burman idioms. The speakers of Central and Western Pahari have not been brought into close association with Tibeto-Burmans, and their language is therefore purely Aryan.

Khas-kura, as its speakers themselves call it, passes under various names. The English generally call it Népăl or Naipäli (i.e. the language of Nepal), which is a misnomer, for it is not the principal form of speech used in that country. Moreover, the Nepalese employ a corruption of this very word to indicate what is really the main language of the country, viz. the Tibeto-Burman Névâri. Khas-kura is also called Gorkhâl, or the language of the Gurkhas, and Pahâri or Parbatîyâ, the language of the mountains. The number of speakers is not known, no census ever having been taken of Nepal; but in British India 143,721 were recorded in the census of 1901, most of whom were soldiers in, or others connected with, the British Gurkha regiments.

Central Pahari includes three dialects—Garhwalî, spoken mainly in Garhwal and the country round the hill station of Mussoorie; Jaunsârî, spoken in the Jaunsar tract of Dehra Dun and Kumaun, including the country round the hill station of Nâni Tail. In 1901 the number of speakers was 1,270,931.

Western Pahari includes a great number of dialects. In the Simla Hill states alone no less than twenty-two, of which the most important are Sirmourî and Koonâthlî (the dialect of Simla itself), were recorded at the last census. To these may be added Chambîâi and Churûhi of the state of Chamba, Mandelli of the state of Mandi, Gâdî of Chamba and Kangra, Kuluhi of Kulu and others. In 1901 the total number of speakers was 1,710,029.

The southern face of the Himalaya has from time immemorial been occupied by two classes of people. In the first place there is an Indo-Chinese element who came from Tibet in the north, and speak Indo-Chinese languages of the Tibeto-Burman family, while a few have abandoned their ancestral speech and now employ broken half-Aryan dialects. The other class consists of the great tribe of Khasas or Khaśiyâs, Aryan in origin, the Khasos of the Greek geographers. Who these people originally were and how they entered India, are questions which have been more than once discussed without arriving at any very definite conclusion. They are frequently mentioned in Sanskrit literature, were a thorn in the side of the rulers of Kashmir, and have occupied the lower Himalayas for many centuries. Nothing positive is known about their language, which they have long abandoned. Judging from the relics of it which appear in modern Pahari, it is probable that it belonged to the same group as Kashmiri, Lahnda and Sindhi. They spread slowly from west to east, and are traditionally said to have reached Nepal in the early part of the 12th century A.D.

In the central and western Pahari tracts local traditions assert that from very early times there was constant communication with Rajputana and with the great kingdom of Kauñāj in the Gangetic Doab. A succession of immigrants, the tide of which was materially increased at a later period by the pressure of the Mussulman invasion of India, entered the country, and founded several dynasties, some of which survive to the present day. These Rajputs intermarried with the Khasa inhabitants of their new home, and gave their rank to the descendants of these mixed unions. With the pride of birth these new-born Rajputs inherited the language of their fathers, and thus the tongue of the ruling class, and subsequently of the whole population of this portion of the Himalaya, became a form of Rajasthani, the language spoken in distant Rajputana.

The Rajput occupation of Nepal is of later date. In the early part of the 16th century a number of Rajputs of Udaipur in Rajputana, being oppressed by the Mussulmans, fled north and settled in Garhwal, Kumaon, and western Nepal. In A.D. 1559 a party of these conquered the small state of Gurkha, which is said about 70 m. north-west of Katmandu, the present capital of Nepal. In 1760, the Gurkha Shah, the then Rajput ruler of Gurkha, made himself master of the whole of Nepal and founded the present Gurkhal dynasty of that country. His successors extended their rule westwards over Kumaon and Garhwal, ad: as far as the Simla Hill states. The inhabitants of Nepal included not only Aryan Khasas, but also, as has been said, a number of Tibeto-Burman tribes. The Rajputs of Gurkha could not impose their language upon these as they did upon the Khasas, but, owing to its being the tongue of the ruling race, it ultimately became generally understood and employed as the lingua franca of this polyglot country. Although the language of the Khasas has disappeared, the tribe is still numerically the most important Aryan one in this part of the Himalaya, and it hence gave its name to its newly adopted speech, which is at the present day locally known as "Khas-kura." In the manner described above the Aryan language of the whole Pahari area is now a form of Rajasthani, exhibiting at the same time traces of the old Khasa language which it superseded, and also in Nepal of the Tibeto-Burman forms of speech by which it is surrounded. (For information regarding Rajasthani the reader is referred to the articles Indo-Aryan Languages; Prakrit; and Gujarati.)

Khas-kura shows most traces of Tibeto-Burman influence. The gender of nouns is purely sexual, and, although there is an onomatopoeic case derived from Rajasthani, it is so often confounded with the nominative, that in the singular number either can be employed for the other. Both these are due to Tibeto-Burman influence, but the non-Aryan idiom is most prominent in the use of the verb. There is an indefinite tense referring to present, past or future time according to the context, formed by suffixing the verb substantive to the root of the main verb, exactly as in some of the neighbouring Tibeto-Burman languages. There is a complete impersonal nominative conjugation which reminds one strongly of Tibetan, and, in colloquial speech, as in that tongue, the subject of any tense of a transitive verb, not only of a tense derived from the past participle, is put into the accusative case.

In Eastern and Central Pahari the verb substantive is formed from the root akh, as in both Rajasthani and Kashmiri. In Rajasthani its present tense, being derived from the Sanskrit present rāhemi, I go, does not change for gender. But in Pahari and Kashmiri it must be derived from the rare Sanskrit particle rēchitha, gone, for in these languages it is a participial tense and does change according to the gender of the subject. Thus, in the singular we have—

Here we have a relic of the old Khasa language, which, as has been said, seems to have been related to Kashmiri. Other relics of Khasa,

---

1 See ch. iv. of vol. ii. of R. T. Atkinson's Himalayan Districts of the North-Western Provinces of India, forming vol. xi. of the "Gazetteer of the North-Western Provinces" (Allahabad, 1884), and the Archaeological Survey of India, xiv. 125 sqq. (Calcutta, 1882).
again agreeing with north-western India, are the tendency to shorten long vowels, the practice of epanthethis, or the modification of a vowel by another epanthethis, and the necessity for a slight change in the prepa-

cence of aspiration. Thus, Khas sikau, Kumauni sikāu, but Hindi sikhā, to learn; Kumauni yāsd, plural yāsā, of this kind.

Regarding Western Pahari materials are not so complete. The spec-
stacts are not brought into connection with Thibet-Burma Pali, and hence we find no trace of these. But the signs of the influence of north-western languages are, as might be expected, still more apparent than farther east. In some dialects epanthethes is in full swing, even to the extreme of hemivowelization, as is the case in the

eastern Pali dialects (corresponding, perhaps, to the Pahari dialects of the third and fourth centuries B.C.). In other cases the epan-

thethis is the mixed origin of the postpositions defining the various cases. Thus, while the expression of the genitive is generally the Rajasthani r, that of the dative continually points to the Hindi kā or kāri. Very true is it that, the dative is the mixed origin of the genitive, and hence the genitive. While the genitive is more often the case, the more common ideas, words which can most readily be connected with the north-western and Pahālī groups.

(See also Aryan Languages.)

Khas-kurā has a small literature which has grown up in recent years. We may mention the Bīrīsskā, an anonymous collection of folk-tales, and a Rāmāvīna by Bhānu Bhātā. There are also several translations from Sanskrit. Of late years local scholars have done a good deal towards creating an interest in Central Pahari. Special mention may be made of Ganga Datt Uperti's Proverbs and Folklore of Kumaun and Garhwal (Ludiana, 1894); the same author's Diaries of the Kumaun Division (Almora, 1880); of the Khasi poet's Diaries, in which he recites the Dāra Khumbār Carta (Almora, 1892). A local poet who lived about a century ago. Gomāni Kavī by name, was the author of verses written in a peculiar style, and now much admired. Each verse consisted of a single dāta, the last line being the refrain. The publication of this collection was done by Rewa Datt Uperti, was published in the Indian Antiquary for 1899 (pp. 177 seq.) under the title of Gomāhī-kavī. Western Pahari has a literature. Portions of the Bible have been translated into Khas-kurā (under the name of "Nepale"), Kumauni, Garhwalī, Jauraui and Chambialī.

 Authorities.—S. H. Kellogg's Hindi Grammar (2nd ed., London, 1893) includes both Eastern and Central Pahari in its survey. For Khas see also A. Turnbull, Nepāli, i.e. Gorkhali or Parbatī Grammar (Darjeeling, 1901), and G. A. Grierson, "A Specimen of the Khas or Nafaalī Language," in the Zeitschrift der deutschen morgenländischen Gesellschaft, vol. xvii, part 2 (1870). There is no authority dealing with Western Pahari as a whole. A. H. Dacie's work, The Kulu Dialect of Hindi (Lahore, 1896), may be consulted for Kuluhi. See also T. Graham Bailey's Languages of the Northern Himalayas (Royal Asiatic Society, London, 1898). Vol. ii., pt. iv., of the Linguistic Survey of India contains full particulars of all the Pahari dialects in great detail.

PAHLAVI. or PERSEZ, the name given by the followers of Zoroaster to the character in which are written the ancient translations of their sacred books and some other works which they preserve (see PERSIAN: LANGUAGE). The name can be traced back for many centuries; the great epic poet Firdawsī (second half of the 10th century) repeatedly speaks of Pahlavi books as the sources of his narratives, and he tells us among other things that in the time of the first Kharrau (Chosroes I., A.D. 513-570) the Pahlavi character alone was used in Persia.1 The learned Ibn Mo'kaff (8th century) calls Pahlavi one of the languages of Persia, and seems to imply that it was an official language.2 We cannot determine what characters, perhaps also dialects, were called Pahlavi before the Arab period. It is most suitable to confine the word, as is now generally done, to designate a kind of writing—not only that of the Pahlavi books, but of all inscriptions on stone and metal which use similar characters and are written on essentially the same principles as these books.

At first sight the Pahlavi books present the strangest spectacle of mixture of speech. Puriyé Semitic (Arabic) words—and there are many besides tributaries, particles, demonstrative and even personal pronouns—stand side by side with Persian vocables. Often, however, the Semitic words are compounded in a way quite unSemitic, or have Persian termination. As read by the modern Zoroastrians, there are also many words which are neither Semitic nor Persian; but it is soon seen that this traditional pronunciation is untrustworthy. The character is cursive and very ambiguous, so that, for example, there is but one sign for m, n, and r, and one for ṣ, d, and g. This has led to mistakes in the received pronunciation, which for many words can be shown to have been at one time more correct than it is now. But apart from such blunders there remain phrases of Persian origin which are, in a real language, and the style which raged till recently as to whether Pahlavi is Semitic or Persian has been closed by the discovery that it is merely a way of writing Persian in which the Persian words are partly represented—to the eye, not to the ear—by their Semitic equivalents. This view, the development of which began with Westergaard (Zenswwesta, p. 20, note),3 is in full accordance with the true and ancient tradition. Thus Ibn Mo'ka'fa', who translated many Pahlavi books into Arabic, tells us that the Persians had about one thousand words which they wrote otherwise than they were pronounced in Persian.4 For bread he says they wrote ldm, i.e. the Aramaic lahmā, but they pronounced sn, which is the common Persian word for bread. Similarly sbr, the Aramaic be'ra, for bread was pronounced as the Persian gǎštā. We still possess a glossary which actually gives the Pahlavi writing with its Persian pronunciation.

This glossary, which besides Aramaic words contains also a variety of Persian words disguised in antique forms, or by errors due to the contracted style of writing, exists in various shapes, all of which, in spite of their corruptions, go back to the work to which the statement of Ibn Mo'ka'fa' had in view.5 Thus the Persians did the same thing on a much larger scale, as when in English we write f (libra) and pronounce "pound" or write & and pronounce "atd." No system was followed in the choice of Semitic forms. Sometimes a noun was written in its status absolutus, sometimes the emphatic ṣ was added, and this was sometimes written s, sometimes s or ṣ. Often the word was written in the perfect, another in the imperfect. Even various dialects were laid under contribution. The Semitic signs by which Persian synonyms were distinguished are sometimes quite arbitrary. Thus in Persian khwāša and khwāa both mean "self"; the former is written nrshā (nafshā or nafshakh), the latter bnsīh with the preposition ṣ prefixed. Personal pronouns are expressed in the dative (i.e. with preposition l prefixed), thus LK (lakh) for tu, "tha," LNS (lanā) for ama, "we." Sometimes the same Semitic sign stands for two distinct Persian words that happen to agree in sound; thus because bnsīh is Aramaic for "this," ḇnsīh represents not only Persian ṣ, "this," but also the interjection ṣ, i.e. "O." As pre-

1 We cannot assume, however, that the poet had a clear idea of what Pahlavi was.

2 The passage, in which useful facts are mixed up with strange notions, is given abridged in Fīhrīst, p. 13, more fully by Yākūt, iii, 925, but most fully and accurately in the unprinted Mafābī al-ālam.

3 Fīhrīst, p. 14, line 13 seq., cf. line 4 seq. The former passage was first cited by Quatremère, Jour. As. (1835), i. 256, and discussed by Clermont-Ganneau, Ibid. (1866), i. 430. The expressions it uses are always clear; perhaps the author of the Fīhrīst has condensed somewhat.

5 For examples of various peculiarities see the notes to Nöldeke's translation of the story of Ahrāshīr i Pādpān (Göttingen, 1879).
and so to write T for D in many cases, especially in foreign papers. That a word is written in an older form than that which is pronounced is a phenomenon common to many languages whose literature covers a long period. So in English we still write, though we do not pronounce, the guttural in through, and write laugh when we pronounce laf.

Much graver difficulties arise from the cursive nature of the characters already alluded to. There are some groups which may theoretically be read in hundreds of ways; the same little sign may be ו, א, א, א, א, א, א, and the ꌪ too may be either h or kh.

In older times there was still some little distinction between letters that are now quite identical in form, but even the Egyptian fragments of Pahlavi writing of the 7th century show on the whole the same type as our MSS. The practical inseparability of the two, however, they are of the greatest use. To get a conception of Pahlavi one cannot do better than read the Minūsī-Khrād in the Pahlavi with constant reference to the Pāzand.1 Critical labour is still required to give an approximate reproduction of the author's own pronunciation of what he wrote.

The coins of the latter Sassanian kings, of the princes of Tabaristan, and of some governors in the earlier Arab period, exhibit an alphabet very similar to Pahlavi MSS. On the older coins the several letters are more clearly distinguished, and in good specimens of well-struck coins of the oldest Sassanians almost every letter can be recognized with certainty. The same holds good for the inscriptions on gems and other small monuments of the early Sassanian period; but the clearest of all are the rock inscriptions of the Sassanians in the 3rd and 4th centuries, though in the 4th century a tendency to cursive forms begins to appear. Only r and LastError always quite alike. The character of the language and the system of writing is essentially the same on coins, gems and rocks as in MSS.—pure Persian, in part strangely disguised in a Semitic garb. In details there are many differences between the Pahlavi of inscriptions and the books. Persian endings added to words written in Semitic form are much less common in the former, so that the person and number of a verb are often not to be made out. There are also orthographic variations; e.g., long LastError in Persian forms is always expressed in book-Pahlavi, but not always in inscriptions. The unfamiliar contents of some of these inscriptions, their limited number, their bad preservation, and the imperfect way in which they are often imitated in inscriptions published3 leave many things still obscure in these monuments of Persian kings; but they have done much to clear up both great and small points in the history of Pahlavi.4

Some of the oldest Sassanian inscriptions are accompanied by a text belonging to the same system of writing, but with many variations in detail, and an alphabet which, though derived from the same source with the other Pahlavi alphabets (the old Aramaic), has quite different forms. This character is also used on the gems and seals. It has been called the Pāzand, &c. Olshausen tries to make it probable that this was the writing of Media and the other that of Persia. The Persian dialect in both sets of inscriptions is identical or nearly so.5

The name Pahlavi means Parthian, Pahlav being the regular Persian transformation of the older Parthava.6 This fact points to the conclusion that the system of writing was developed in Parthian times, when the great nobles, the Pahlavans, ruled and Media was their main seat, "the Pahlav country." Other linguistic, graphical and historical indications point the same way; but it is still far from clear how the system was developed. We know, indeed, that even under the Achaemenids Aramaic and sometimes were employed far beyond the Aramaic lands, even in official documents written in and around them had no characteristic feature, and might borrow the Aramaic letters as naturally as they subsequently borrowed those of the Arabs. But this does not explain the strange practice of writing Semitic words in place of so many Persian words which were to be read as Persian. It cannot be the invention of an individual, for in that case the system would have been more consistently worked out, and the appearance of two or more kinds of Pahlavi side by side at the beginning of the Sassanian period would be inexplicable. But we may remember that the Aramaic character first came to the Iranians from the region of the lower Euphrates and Tigris, where the complicated cuneiform character arose, and where it held its ground long after the Semitic forms had disappeared. It seems possible that very probably very few Persians could read and write. All kinds of strange things are conceivable in an Eastern character confined to a narrow circle. Of the facts at least there is no doubt.

The Pahlavi literature embraces the translations of the holy books of the Zoroastrians, dating probably from the 6th century, and certain other religious books, especially the Minūsī-Khrād and the Bundahish.7 The Bundahish dates from the Arab period. Zoroastrian priests continued to write the old language as a dead tongue and to use the old character long after the victory of a new empire, a new religion, a new form of the language (New Persian), and a new character. There was once a not quite inconsiderable profane literature, of which a great profusion of glossaries, particularly in historical books about the time before Islam.8 Very little profane literature still exists in Pahlavi; the romance of Ardashir has been mentioned above.

See E. W. West's "Pahlavi Literature," in Geiger and Kahn's Grundriss der iranischen Philologie (1869), vol. ii.; "The Extent, Language and Age of Pahlavi Literature" in Sitzungber. der k. Akad. der Wiss. Phil. u. hist. Klasse zu München, 1880 (pp. 164-186) and his Pahlavi Texts in Sacred Books of the East (1880-1897). The difficult study of Pahlavi is made more difficult by the corrupt state of our copies, due to ignorant and careless scribes.

Of glossaries, that of West (Bombay and London, 1874) is to be recommended; the large Pahlavi, Gujarati and English lexicon of Jamaspji Dustur Minocherji (Bombay and London, 1877-1882) is very full, but has numerous false or uncertain forms, and must be used with great caution. (Tr. N. P.)

PAIGNTON, a seaside resort in the Torquay parliamentary division of Devonshire, England, on Tor Bay, 23 m. S.W. of Torquay, on the Great Western railway. Pop. of urban district (1901), 8385. The church of St John is mainly Perpendicular.

1 The Book of the Mainiy-Khrad in the Original Pahlavi, ed. by Fr. Ch. Andreas, (Ziegl., 1862); idem, The Pāzand and Sanskrit Texts, by E. W. West (Stuttgart and London, 1871),

3See especially the great work of F. Stolze, Persepolis (2 vols., Berlin, 1882). It was De Sacy who began the decipherment of the inscriptions.

2Thus we now know that the ligature in book-Pahlavi which means in the original letters of which could not be made out, is for ḫ, between. It is to be read andar.

4Thus pus, son, is written instead of pūx, ḫuṣ, "before," is written ḫunṣ, but in the usual Pahlavi it is ḫuṣ, ḫunṣ.

5What the Flour (p. 13 seq.) has about various forms of Persian writing certainly refers in part at least to the species of Pahlavi. But the statements are hardly all reliable, and in the lack of trustworthy specimens little can be made of them.

6This was finally proved by Olshausen, following earlier scholars; see J. Olshausen, Parthia und Westpersien, 2 vols. (Copenhagen, 1851) and F. Justi (Leipzig, 1868); other Pahlavi books by Spiegel and Huy, by Hoshangli, and other Indian Fārsēes.

7One other book, the stories of Kalilag and Damag, in a Syriac version from the Pahlavi, the latter taken from the Sanskrit.
but has a late Norman doorway, and contains a carved and painted pulpit, and in the Kirkham chapel several interesting monuments of the Kirkham family, and a beautiful though damaged stone screen. Among other buildings and institutions are a novitiate of Marist Fathers, a science and art school, a pier with pavilion and concert rooms, and a yacht club. Little remains of an old palace of the bishops of Exeter apart from the 14th-century Bible Tower. Its last tenant was Bishop Miles Coverdale, who in 1535 published the first English translation of the whole Bible. The town owes its popularity to a firm expanse of sand, good bathing facilities, and a temperate climate.

PAIL, a bucket, a vessel for carrying water, milk or other liquids, made of wood or metal or other material, varying in size, and usually of a circular shape and somewhat wider at the top than the bottom. The word is of obscure origin. The present form points to the O. Eng. pael, but the sense, that of a small wine-measure, a gall, is difficult to connect with the present one. The earlier forms of the word in Mid. Eng. spell the word pæle, pale, and this rather points to a connexion with O. Fr. paele, payle, a small pan or flat dish, from Lat. patella, diminutive of patera, dish. The sense here also presents difficulties, "pail" in English being always a deep vessel.

PAILLERON, ÉDOUARD JULES HENRI (1834–1899). French poet and dramatist, was born in Paris on the 17th of September 1834, and died at Versailles on the 14th of March 1899. His first poem appeared at the age of 14. In 1850 he entered the first dragoon regiment and served for two years. With the artist J. A. Beaucé he travelled for some time in northern Africa, and soon after his return to Paris in 1850 he produced a volume of satires, Les Parasites, and a one-act piece, Le Parasite, which was represented at the Odéon. He married in 1862 the daughter of François Bulot, thus obtaining a share in the proprietorship of the Revue des deux mondes. In 1869 he produced at the Gymnase theatre Les Faux ménages, a four-act comedy depending for its interest on the pathetic devotion of the Magdalen of the story. L'Étincelle (1879), a brilliant one-act comedy, secured another success, and in 1881 with Le Monde où l'on s'ennuie Pailleron produced one of the most striking and successful pieces of the period. The play rivaled the contemporary academic society, and was filled with transparent allusions to well-known people. None of his subsequent efforts achieved so great a success. Pailleron was elected to the French Academy in 1882, and died on the 20th of April 1899.

PAIMPOL, a fishing port of western France, in the department of Côtes-du-Nord, 27¾ m. N.N.W. of St Brieuc by road. Pop. (1906), 3340. Paimpol is well known for its association with the Icelandic cod-fisheries, for which it annually equips a large fleet. Steam sawing and boat-building are carried on; grain, &c., is exported; imports include coal and timber. A tribunal of commerce and a school of navigation are among the public institutions.

PAIN (from Lat. poena, Gr. πόνος, penalty, that which must be paid: O. Fr. peine), a term used loosely (1) for the psychological state, which may be generally described as "unpleasantness," arising, e.g., from the contemplation of a catastrophe or of moral turpitude, and (2) for physical (or psycho-physical) suffering, a specific sensation localized in a particular part of the body. The term is used in both senses as the opposite of "pleasure," though it is doubtful whether the antithesis between physical and psychical pleasure can be equally well attested. The investigation of the pleasure-pain phenomena of consciousness has taken a prominent place in psychological and ethical speculation, the terms "hedonics" and "allogonics" (διαφυσις, pain of body or mind) being coined to express different aspects of the subject. So in aesthetics attempts have been made to assign to pain a specific psychological function as tending to increase pleasure by contrast (so Fechner); pain, e.g., is a necessary element in the tragic. Scientists have experimented elaborately with a view to the precise localization of pain-sensations, and "pain-maps" can be drawn showing the exact situation of what are known as "pain-spots." For such experiments instruments known as "aesthesiometers" and "algometers" have been devised. The great variety of painful sensations—throbbing, dull, acute, intermittent, stabbing—led to the conclusion among earlier investigators that pains differ in quality. It is, however, generally agreed that all pain is qualitatively the same, though subject to temporal and intensive modification. (See Psychology; Aesthetics; Nervous System; Sympathetic System.)

PAIN, BARRY (1867– ), English humorous writer, was educated at Cambridge, and became a prominent contributor to the Granta. James Payn inserted his story, "The Hundred Gates," in the Cornhill Magazine in 1889, and shortly afterwards he became a contributor to Punch and the Speaker, and joined the staffs of the Daily Chronicle and Black and White. His works include: In a Canadian Canoe (1891); papers reprinted from The Granta; Playthnings and Parodies (1892); The Kindness of the Celestial (1894); The Octave of Claudius (1897); Eliza (1900); Another English Woman's Love Letters (1901), &c. As a writer of parody and lightly humorous stories his name has become widely known.

PAINE, ROBERT TREAT (1731–1814). American politician, a signer of the Declaration of Independence, was born in Boston, Massachusetts, on the 11th of March 1731. He graduated at Harvard in 1749, and was admitted to the bar in 1750. In 1768 he was a delegate to the provincial convention which was called to meet in Boston, and conducted the prosecution of Captain Preston and his men for their share in the famous "Boston Massacre" of the 5th of March 1770. He served in the Massachusetts General Court in 1773–1774, in the Provincial Congress in 1774–1775, and in the Continental Congress in 1774–1778, and was speaker of the Massachusetts House of Representatives in 1777, a member of the executive council in 1779, a member of the committee which drafted the constitution of 1780, attorney-general of the state from 1777 to 1790, and a judge of the state supreme court from 1790 to 1804. He died in Boston on the 11th of May 1814.

See John Sanders, Biography of the Signers of the Declaration of Independence (1823).

His son, ROBERT TREAT PAINE (1780–1812), who was christened Thomas but in 1801 took the name of his father and of an elder brother who died without issue in 1794, was a poet of some repu tation, but his verses have long been forgotten. His best known productions are Adams and Liberty, a once popular song written in 1798, The Invention of Letters (1798), and The Ruling Passion, the Harvard Phi Beta Kappa poem of 1797.

His Works in Verse and Prose (Boston, 1812) contains a biographical sketch.

PAINE, THOMAS (1737–1809), English author, was born at Thetford, Norfolk, on the 9th of January 1737, the son of a Quaker staymaker. After several years at sea and after trying various occupations on land, Paine took up his father's trade in London, where he supplemented his meagre grammar school education by attending science lectures. He succeeded in 1760 in gaining an appointment in the excise, but was discharged for neglect of duty in 1765. Three years later, however, he received another appointment, at Lewes in Sussex. He took a vigorous share in the debates of a local Whig club, and in 1772 he wrote a pamphlet embodying the grievances of excisemen and supporting their demands for an increase of pay. In 1774 he was dismissed the service for absence without leave—indeed to escape his creditors.

A meeting with Benjamin Franklin in London was the turning point in his life. Franklin provided him with letters to his son-in-law, Richard Bache, and many of the leaders in the colonies' resistance to the mother country, then at an acute stage. Paine sold for America in 1774, and introduced him to Robert Aitken whose Pennsylvania Magazine he helped found and edited for eighteen months. On the 9th of January 1776 Paine published a pamphlet entitled Common Sense, a telling array of arguments for separation and for the establishment of a republic. His argument was that independence was the only consistent line to pursue, that "it must come to that some time or other," that it would only be more difficult the more it was delayed, and that independence was the surest road to union. Written
in simple convincing language, it was read everywhere, and the open movement to independence dates from its publication. Washington said that it "worked a powerful change in the minds of many men." Leaders in the New York Provincial Congress considered the advisability of answering it, but came to the conclusion that it was unanswerable. When war was declared, and fortune at first went against the colonists, Paine, who was then serving with General Greene as volunteer aide-de-camp, wrote the first of a series of influential tracts called The Crisis, of which the opening words, "These are the times that try men's souls," became a battle-cry. Paine's services were recognized by the legislature and he was commissioned by Congress to treat with the Indians, and a few months later to be secretary of the Congressional committee of foreign affairs. In 1779, however, he committed an indiscretion that brought him into trouble. He published information gained from his official position, and was compelled to resign. He was afterwards clerk of the Pennsylvania legislature, and accompanied John Laurens during his mission to France. His services were eventually recognized by the state of New York by a grant of an estate at New Rochelle, and from Pennsylvania and, at Washington's suggestion, from Congress he received considerable gifts of money.

In 1787 he sailed for Europe with the model of an iron bridge he had designed. This was publicly exhibited in Paris and London. He also appeared in France. In England he determined to "open the eyes of the people to the madness and stupidity of the government." His first efforts in the Prospects on the Rubicon (1787) were directed against Pitt's war policy, and towards securing friendly relations with France. When Burke's Reflections on the Revolution in France appeared, in 1790, Paine at once wrote his answer, The Rights of Man. The first part appeared on the 13th of March 1791, and had an enormous circulation before the government took alarm and endeavoured to suppress it, thereby exciting intense curiosity to see it, even at the risk of heavy penalties. Those who know the book only by hearsay as the work of a furious incendiary will be surprised at the dignity, force and temperance of the style; it was the circumstances which made it inflammatory. Pitt "used to say," according to Lady Hester Stanhope, "that Tom Paine was quite in the right, but then he would add, 'What am I to do? As things are, if I were to encourage Tom Paine's opinions we should have a bloody revolution.'" Paine was indicted for treason in May 1792, but before the trial came off he was elected by the department of Calais to the French convention, and escaped into France, followed by a sentence of outlawry. The first years that he spent in France form a curious episode in his life. He was enthusiastically received, but as he knew little of the language translations of his speeches had to be read for him. He was bold enough to speak and vote for the "detention of Louis during the war and his perpetual banishment afterwards," and he pointed out that the execution of the king would alienate American sympathy. He incurred the suspicion of Robespierre, was thrown into prison, and escaped the guillotine by an accident. Before his arrest he had completed the first part of the Age of Reason, the publication of which made an instant change in his position on both sides of the Atlantic, the indignation in the United States being as strong as in England. The Age of Reason can now be estimated calmly. It was written from the point of view of a Quaker who did not believe in revealed religion, but who held that "all religions are in their nature mild and benign" when not associated with political systems. Intermixed with the coarse unceremonious ridicule of what he considered superstition and bad faith are many passages of earnest and even lofty eloquence in favour of a pure morality founded on natural religion. The work was written during his ten months' imprisonment, was published after his release—represents the despair of the 18th century in the hands of a rough, ready, passionate controversialist.

At the downfall of Robespierre Paine was restored to his seat in the convention, and served until it adjourned in October 1795. In 1796 he published a long letter to Washington, attacking his military reputation and his presidential policy with inexcusable bitterness. In 1802 Paine sailed for America, but while his services in behalf of the colonies were gratefully remembered, his Age of Reason and his attack on Washington had alienated many of his friends. He died in New York on the 8th of June 1809, and was buried at New Rochelle, but his body was in 1819 removed to England by William Cobbett.

See the biography by Moncure D. Conway (1892).

PAINESVILLE, a city and the county-seat of Lake county, Ohio, U.S.A., on the Grand River, 3 m. S. of Lake Erie and about 35 m. N.E. of Cleveland. Pop. (1890) 5224, of whom 490 were foreign-born and 1748 negroes. It is served by the Lake Shore & Michigan Southern, the New York, Chicago & St Louis and the Baltimore & Ohio railways, and by electric lines to Cleveland, Fairport and Ashtabula. It is the seat of Lake Erie College (non-sectarian, for women), the successor of Willoughby Seminary (1847), whose buildings at Willoughby, Ohio, were burned in 1856; the college was opened as the Lake Erie Female Seminary in 1859, and became Lake Erie College and Seminary in 1868 and Lake Erie College in 1908. Painesville is situated in a farming and fruit-growing country, and has some manufactures. Three miles north, on Lake Erie, is the village of Fairport (pop. 1900, 5793), with a good harbour and coal and ore docks. The municipality owns and operates its tramway and street-lighting plants. Painesville was founded in 1806-1807 by settler and merchant, John Willoughby, conspicuous among whom was General Edward Paine (1746-1844), an officer from Connecticut in the War of Independence; it was incorporated as a village in 1834, and became a city in 1902 under the new Ohio municipal code.

PAINTER-WORK, in the building trade. When work is painted one or both of two distinct ends is achieved, namely the preservation and the coloration of the material painted. The compounds used for painting—taking the word as meaning a thin protective or decorative coat—are very numerous, including oil-paint of many kinds, distemper, whitewash, tar; but the word "paint" is usually confined to a mixture of oil and pigment, together with other materials which possess properties necessary to enable the paint to dry hard and opaque. Oil paints are made up of four parts—the base, the vehicle, the solvent and the driers. Pigment may be added to these to obtain a paint of any desired colour.

There are several bases for oil paint, those most commonly used for building work being white lead, red lead, zinc white and oxide of iron. White lead is by far the commonest of bases for paint. When pure it consists of about 75% carbonate of lead and about 25% of lead hydrate. It is mixed with 6 or 5% by weight of pure linseed oil, and in this form is supplied to the painter. Sulphate of baryta is the chief adulterant used in the manufacture of white lead. White lead has greater covering properties and is more durable than the other bases. It should therefore always be used in external painting. Paints having white lead for a base darken with age, and become discoloured when exposed to the fumes of sulphurised hydrogen, which exists to a greater or less extent in the air of all large towns. Zinc white, an oxide of zinc, is of a purer white colour than white lead. It is lighter, and does not possess the same durability or covering power. It is, however, useful in internal decoration, as it retains its colour well, even when subjected to the action of gases. Red lead is a lead oxide. It is used chiefly in the priming coat and as a base for some red paints. Like white lead, it is injured if exposed to acids or impure air, which cause discoloration and decay. Oxide of iron is used chiefly as a base in paints used for covering iron-work, the theory being that no destructive galvanic action can be set up, as might be the case with lead paint, when used on iron. A variety of red pigments are made from oxide of iron, varying in hue from a pale to a deep brownish-red. They are quite permanent, and may be used under any conditions.

The vehicle is a liquid in which the particles of the base are held in suspension, enabling a thin coat of paint to be formed, uniform in colour and consistency, and which on drying forms...
a kind of skin over the surface to which it is applied. For oil paint the vehicles used are oils; for distemper water is employed.

The oils used as vehicles are chiefly linseed oil, raw and boiled, and poppy-seed oil. Nut oils are occasionally used for inferior work because they are much cheaper. Linsced oil, the one most commonly used, is obtained from the seed of the flax by warming it and squeezing out the oil under hydraulic pressure. The resultant, which is of a transparent amber colour, is known as “raw” oil. It is used principally in interiors for light, bright colours, drying somewhat slowly and giving a firm elastic coat. The oil improves by keeping, and is sometimes “refined” with acids or alkalis. “Boiled” oil is the raw oil heated with driers, such as litharge or red lead, to a temperature from 350° to 300°F., at which it is maintained for three or four hours. It is thick and much darker in colour than the raw oil, drying much more quickly, with a coat hard and glossy but less elastic than that produced by raw oil. Poppy-seed oil is expressed from the seeds of the poppy plant. It does not possess the tenacity and quick-drying power of boiled linseed oil, but being of a very light colour, it is used for delicate work.

Turpentine is used as a solvent, diluent, or “thinner,” to bring the paint to a proper consistency so as to allow it to be spread in a thin even coat. When a flat dull surface is desired, turpentine alone is used with the base and the oil is omitted. The best turpentine comes from the pine forests of America. French turpentine is next in quality. Russian turpentine is the cheapest, and has usually a strong and unpleasant odour that renders it objectionable to work with. In consequence of the high price of turpentine of good quality, and the increasing difficulty of obtaining it, substitutes are coming into general use.

“Driers” are substances usually added to paint to hasten the process of oxidation, i.e., the drying, of the oil. Some pigments possess this quality, as red lead and white lead. The most notable driers are litharge, sugar of lead, patent driers, sulphate of zinc and manganese dioxide. Liquid driers, such as terebene, are also in use. Litharge, an oxide of lead, is in most general use. Sugar of lead is used, ground in oil, for light tints. Sulphate of zinc and manganese driers are used for paints in which zinc white is the base, which would be injured by lead driers.

“Pigments” are preparations of metallic, earthy or animal origin mixed into paint to give it colour. For oil paint they are usually ground in oil; for distemper they are sold as a finely ground powder. The ordinary pigments are white lead, zinc white, umbers, siennas, ochres, chrome, Venetian red, Indian red, lamp black, bone black, vegetable black, ultramarine, Prussian blue, vermilion, red lead, oxide of iron, lakes and varnishes. The term “enamel paint” was first given to a compound of zinc white, petrol and resin, which possessed on drying a hard glossy surface. The name is now applied to any coloured paint of this nature. Quick-drying enamels are spirit varnishes ground with the desired pigment. For slow-drying enamels oil varnishes form the vehicle.

Woodwork is often treated with a thin transparent-coloured liquid which changes the colour of the work without hiding the grain of the wood, and if the latter is good a very fine result is obtained. Sometimes the stain is produced by the combination of two or more chemicals applied separately, or soluble pigments may be mixed with a transparent vehicle and applied in the usual way. The vehicles for the pigments vary considerably, and include water, methylated spirit, size, turpentine and clear raw linseed oil. Varnish is made by dissolving certain gums in linseed oil, turpentine, spirit or water. They give a transparent protective coat to painted and stained surfaces or to wall-paper or plain woodwork. Varnishes usually dry with a very smooth, hard and shiny surface, but “flat” or “dead” surfaces which are without gloss may be obtained with special varnish.

The gums used for hard-wearing or carriage varnishes, such as those to be exposed to the weather and frequently cleaned and polished, are amber, copal and gum animal. Amber is a yellow transparent or cloudy gum found on the coasts of the Baltic, and particularly in Prussia. It makes a hard, durable and slow-drying varnish which does not darken with age. Copal gum is brought from the West India Islands and also from the East Indies. It makes the most durable varnish, and being tough and hard is generally used for external work. Gum animal, or “raw varnish,” is used on the coasts of the East Indies. It is hard, durable and quick-drying, but unless the varnish is carefully made it is liable to crack. Varnishes for inside work, or cabinet varnishes, are made with a variety of resins dissolved in linseed oil and turpentine. The resultant gives a hard, lustrous surface, somewhat less durable than that of carriage varnishes. Turpentine varnishes are made from soft gums, such as dammar, common resin and mastic; they are light in colour, cheap and not very durable. Lacquers or spirit varnishes are made from very soft gums, such as shellac and sandarach, dissolved in methylated spirit. They are used for internal work, drying quickly, and becoming hard and very brilliant. Surfaces formed with such varnishes are liable to chip easily and scale off. Oil paint is very much improved by the addition of some varnish; it causes it to dry harder and more quickly and with a fine lustrous surface.

The driers used for varnish are generally acetate of lead or litharge. An excess of varnish makes the varnish less durable and causes cracking. There are many kinds of French polishes, mixed in different ways, but most are composed of shellac and sandarach dissolved in spirit. It is applied to the perfectly smooth surface of hard woods with a pad of flannel or wadding wrapped in linen, and well rubbed in with a circular motion. A dull polish is procured by rubbing beeswax into the wood. It must be thoroughly rubbed in, a little turpentine being added as a lubricant when the rubbing works stiff. A thin coat of paint were applied over the bare knots of new wood it would be destroyed, or at least discoloured, by the exudation of resin from the knots. For the purpose of obviating this the knots are covered with two coats of a preparation called “knotting,” made by dissolving shellac in methylated spirit.

Putty is required for stopping nail-holes and small crevices and irregularities in woodwork. It is made of powdered whiting and linseed oil mixed together and kneaded into a stiff paste. For light work “hard stopping,” made of white lead and whiting, should be employed.

The tools and appliances of the painter are mixing pots, paint kettles to hold the colour for the painter at work, strainer, palette knife, scraping knife, hacking, stopping and chisel knives, the duster, sponge, putty-nice, blow-lamp, turpentine for burning off, and a variety of brushes, e.g., linter, the distemper brush, the fitch and camel-hair pencil for picking out small parts and lines, the sable and flogger for gilding, the stippler; for grained work several steel graining combs with coarse and fine teeth, graining brush of hogs' hair, pencil over-grainer, and other special shaped brushes used to obtain the peculiar characteristics of different woods. It is absolutely necessary for good work to use brushes of a fine quality, and although expensive at first cost, they are undoubtedly cheapest in wear.

Workmanship.—New woodwork requires to be knotted, primed, stopped, and in addition painted with three or four coats of oil colour. The priming coat is a thin coat of white lead and driers mixed with linseed oil and turpentine. Work should always be primed before the stopping is done. The second or “lead” coat is composed mainly of turpentine, linseed oil and white lead. The third coat is the ground for the finishing colour, and is made of white lead and linseed oil and turpentine, with enough pigment to bring it to a tint approaching the finishing colour. The remaining coat or coats is of similar composition. A “flattening” coat is made of white lead and turpentine with the desired pigment. One pound of colour will cover 4 sq. yds. in the first coat and 6 sq. yds. in the additional coat.

Graining.—Graining is understood among painters to be the imitating of the several different species of ornamental woods, as satinwood, rosewood, mahogany, oak and others. After
the necessary coats of paint have been put on to the wood a
ground is then laid of the required tint and left to dry. The
painter then prepares small quantities of the same colour with
a little brown, and boiled oil and turpentine, and, having mixed
this, spreads it over some small part of his work. The flat
hogs' hair brushes being dipped in the liquid and drawn down
the newly-laid colour, the shades and grainings are produced.
To obtain the mottled appearance the camels' hair pencils are
applied, and when completed the work is left to dry, and after-
wards covered by a coat or two of good copal varnish. Imitation
wine-waistcoat requires the use of combs of various degrees of
fineness to obtain the grain (whence the process is called combing
by some persons), and the flannel is got by wiping off the colour
with a piece of flannel. When dry, the disguise is completed to obtain a more
complete representation of the natural wood, and then varnished.
If the work be done in water-colour and not in oil, beer grounds
to act as a drier are mixed with the colour; this sets it ready for
varnishing. A "patent graining machine," a sort of roller with a
pattern upon it, is often used.

Marbling.—Marbling is the imitation of real marbles and
granes, some of which are represented by splashing on the
carefully prepared ground, which should have been painted and
often rubbed and polished to obtain an even surface; others
have to be painted in colours, and then well varnished.

Painting on Plaster Work.—Plastering should never be painted
until it is thoroughly dry. Portland cement is best left for a
year. A coat of lime washed with water will require four or five coats, Portland cement five or six. If plastered work is required to be painted immediately, it
should be executed in Keene's or Parian cement (see Plaster Work). A great deal more paint is of course absorbed by plaster than by wood, just as wood absorbs more than iron.

Painting on Iron.—Iron and steel work should receive a coat of
oxide paint at the manufacturer's works; additional coats are
added after erection. All rust should be previously removed by
means of wire brushes and paraffin or turpentine. The best
paints for external iron work are composed of oxide of iron and
red lead, mixed with linseed oil.

The following is an extract from the building by-laws of the
municipality of Johannesburg:

"All structural metal work shall be thoroughly cleaned from
scale and rust before painting. Faying surfaces in riveted work
shall be painted before putting them together. All surfaces of
steel or iron work inaccessible after erection shall be protected
as far as possible either by coating them with Smith's' or other
approved bituminous composition, or by filling the spaces which
they enclose with lime concrete."

Repainting Old Work.—Before beginning to repaint any
work of any description it must be thoroughly cleaned. If the
surface is in good condition it will be sufficient to scrub down
with good soap and water and afterwards sponge and wipe
dry. If the work has become rough it will often be necessary to use pumice stone to facilitate the operation of
the work. The pieces should be cut or rubbed to the flat
surface and vigorously applied with plenty of clean water.
It is essential that the work should be quite dry before any
paint is applied. If the old surface is much cracked and blistered no
amount of rubbing with pumice will enable the workman to
obtain a good ground for the new coats, and it will be necessary to
remove the old paint entirely. For this purpose painters most
frequently use a paint burner or torch which burns paraffin oil
under air pressure. This causes the paint to soften and blister under the heat, in which state it is readily scraped off by a blunt
knife. The old-fashioned grate filled with charcoal held close
to the surface by means of a long handle is now not often used.
There has recently been a considerable increase in the use of
chemical paint removers in paste or liquid form; as a rule these
contain some alkali, such as lime or caustic soda. The prepara-
tion is brushed on to the paint required to be removed, and in
the course of from ten minutes to half an hour the paint becomes
so soft that it can readily be scraped off.

Blistering and Cracking.—The blistering of painted surfaces
may be caused in several ways. If on iron, it may be the result of
a particle of rust which, not having been removed in the pro-
cess of cleaning, has increased in size and loosened the paint.
If on plaster, a particle of unskilled lime may have "blown,"
with a similar result. On wood, blistering is usually caused
by painting upon a wet surface or upon unseasoned wood.
Blisters may also be caused by the use of too much oil in paint
exposed to heat, or the application of one coat upon another
before the latter is properly dry. To prevent blistering a
method that has been tried with good results is to apply two
coats of water paint (washable distemper) and follow by two
corets of a colour or varnish. Cracking is caused by the use of
too much oil in the under coats and too little in the top coats.

Distemper.—New plaster-work must be quite dry before dis-
temper is applied. The work should be stopped (that is, any
irregularities filled up with plaster of Paris mixed with whiting
and water to a paste) and then rubbed perfectly smooth with
glass paper. Clairecole, a solution of thin size and whiting,
is then applied to render the plaster non-absorbent, and this
is followed by distemper of the desired colour. Distemper is made
by soaking whiting in clean water to a creamy consistency.
To this is added size which has been previously warmed, and
the pigment required to colour the mixture; the whole is then well
stirred and strained to remove any lumps. Many patient wash-
able distempers under fancy names are now on the market in the
form of a colour or powder, which simply require to be mixed with
water to be ready for use. If applied to woodwork distemper is apt
to flake off.

The "one-knot" brush for cornices and other mouldings and the
"two-knot" and "brass-bound" brushes for flat surfaces
are usually employed for distempering and whitewashing.

A granular surface is produced by stippling or dabbing the
surface with a stiff bristle brush specially made for this purpose.

Gilding, &c.—Very rich effects may be produced by painting
on the surface with a stiff bristle brush specially made for this purpose.

PAINTING, in art, the action of laying colour on a surface, or
the representing of objects by the laying of colour on a surface.
It is with painting in the last sense, considered as one of the fine
arts, that this article deals. In the first sense, in so far as
painting is part of building, it is treated above under the heading Painter-Work. The verb
"to paint" is derived through Fr. peindre (paint), the past
participle, was possibly the earliest part adopted, as is suggested
in the New English Dictionary), from Lat. pingere, to paint. From the past participle pictus comes picture, picture, and from the root pig, pigment. The ultimate meaning of the root is probably to decorate, adorn, and is seen in Gr. ποικίλος, many-coloured, variegated.

In Part I. of this article, after a brief notice of the general character of the art and an account of its earliest manifestations, a sketch is given of the course of its development from the ancient world to the Renaissance, and thence to modern times. (An account, by countries, of recent schools of painting will be found as an appendix at the end of Part III.) The point of view chosen is that of the relation of painting to nature, and it is shown how the art, beginning with the delineation of contour, passes on through stages when the effort is to render the truth of solid form, to the final period when, in the 17th century, the presentment of space, or nature in all her extent and variety, becomes the subject of representation. Certain special forms of painting characteristic of modern times, such as portraiture, genre painting, landscape, still-life, &c., are briefly discussed.

Part II. consists in tables of names and dates intended to afford a conspectus of the different historical schools of painting from the earliest time to the present day.

Part III. is devoted to a comprehensive treatment of the different technical processes of painting in vogue in ancient and modern times.

Authorities.—There is one elaborate general treatise on the whole art of painting in all its branches and connections. It is by W. H. Warrard, Maler und Malerei, 2 vols. (Paris, 1862). It is entitled Traté complet de la peinture, and is in nine substantial volumes, with an additional volume of plates. It begins with establishing the rules of the art for, and giving a dictionary of terms, lists of artists and works of art, &c. Vols. ii. and iii. give the history of the art in ancient, medieval and modern times. Vols. iv., v., vi., and vii. contain discussions on choice of subjects, design, composition, &c.; on proportions, anatomy, expression, drawing, perspective, and light and shade, and colour. In vol. viii., pp. 1-285 deal with colour, aerial perspective and execution; pp. 285-503 take up the different kinds of painting, history, portrait, landscape, genre, &c.; and pp. 503-661 are devoted to methods of composition, &c., and the choice of subject is continued through vol. ix. To encyclopaedia 125 pages are given, and 100 to painting in oil. A long discussion on painting grounds and pigments follows. While some of the processes of painting, in tempera, water-colour, enamel, mosaic, &c., are more briefly treated in about 200 pages, while the work ends with a notice of various artistic impediments. Vol. i. should be said, contains on 70 pages a complete synopsis of the contents of the successive volumes. The best general History of Painting, in the older sense of the word, is the first volume of the German Kunst und Weisheit der Welt (3rd ed., Munich, 1866; 4th ed., London, 1880, &c.), but it does not go beyond the 16th century A.D. See also the separate articles on China (Art), Japan (Art), Egypt (Art), Greek Art, Roman Art, &c.

Part I.—A Sketch of the Development of the Art §1. Constituents and General Character.—If we trace back to the parent stock the various branches that support the luxuriant modern growth of the graphic art, we see that this parent stock is in its origin twofold. Painting begins on the one side in outline delineation and on the other in the spreading of a coloured coating over a surface. In both cases the motive is at first utilitarian, or, at any rate, non-artistic. In the first the primary motive is to convey information. It has been noticed of certain savages that if one of them wants to convey to a companion the impression of a particular animal or object, he will draw with his finger in the air the outline of some characteristic feature by which it may be known, and if this do not avail he will sketch the same with a pointed stick upon the ground. It is but a step from this to delineation on some portable tablet that retains what is scratched or drawn upon it, and in this act a monument of the graphic art has come into being.

In the other case there are various motives of a non-aesthetic kind that lead to the covering of a surface with a coat of another substance. To the human body, the first object of interest to man is tender and is sensitive to cold. Wood, one of the earliest building materials and the one material for any sort of boat-building, is subject, especially when exposed to moisture, to decay. Again, the early vessel of clay, of neolithic date, because imperfectly burned, is porous. Now the properties of certain substances suitable for adhesive coatings on anything that needed protection or reinforcement would soon be noticed. Uncouth and oily substances like animal fat, mixed with ashes or some such material, are smeared by some savages on their bodies to keep them warm in cold regions and to defend them against insect bites in the tropics. Wax and resin and pitch, liquefied by the heat of the sun or by fire, would lend themselves readily for the coating of wood with a substance imperious to moisture. Vitreous glazes, first no doubt the result of accident, fused over the surface of the primitive clay vessel would give it the required impermeability. This is no more art than the mere delineation which is the other source of painting, but it begins to take on itself an aesthetic character when it is made to adjoin the former. There are physiological reasons why the colour red exercises an exciting influence, and strong colours generally, like glittering surfaces, make an aesthetic appeal. In prehistoric times the flesh was sometimes stripped from the skeleton of a corpse and the bones rubbed with red earth or ruddle, while the same easily procured colouring substance is used to decorate the person or the implement of the savage. In this sensibility to colour we find a second and distinct origin of the art of painting.

What a perspective does a glance back at the development of painting afford! Painting, an art that on a flat surface can suggest illusion the presence of solid forms with length, breadth and depth, this art of the sixteenth century was, so to speak, a magician-like power of representing the universe, and carry the eye from receding plane to plane till the persons or objects that people them grow too minute for the eye to discern; painting that can deck the world in Elysian brightness or veil it in the gloom of the Crucifixion, that intoxicates the senses with its revelation of beauty, or magician-like withdraws the veil from the mysterious complexity of nature; the art that can exhibit all this, and yet can suggest a hundredfold more than it can show, and by a line, a shade, a touch, can stir within us “thoughts that do often lie too deep for tears”—this Painting, the most fascinating, because most illustrous in its nature, of all the arts of form, is in its first origin at one time a mere display to attract attention, as if one should cry out “See here!” and at another time a prosaic answer to a prosaic question about some natural object, “What is it like?” The coat or streak or dab of colour, the informing outline, are not in themselves aesthetic products. The former becomes artistic when the element of arrangement or pattern is introduced. There is arrangement when the shape and size of the mark or marks have a studied relation to those of the surface on which they are displayed; there is pattern when they are combined among themselves so that while distinct and contrasted they yet present the appearance of a unity. Again, the delineation, serving at first a purpose of use, is not in itself artistic, and it is a difficult question in aesthetic whether any representation of nature that aims only at resemblance really
comes into the domain of art. It is of course acknowledged that a mere prosaically literal likeness of a natural object is not a work of art; but when the representation is of such a kind as to bring out the character of the object with discrimination and emphasis, to give the soul of it, as it were, and not the mere lineaments, then, logically or illogically, art claims it as its child. In the strict sense the delineation only becomes artistic when there is present the element of beauty in arrangement or composition. The insight and sympathy just referred to are qualities rather intellectual than artistic, and the really artistic element would be the tasteful fitting of the representation to the space within which it is displayed, and the harmonious relations of the lines or masses or tones or colours that it presents to the eye. In other words, in art the imitation will be the true imitation of beauty, and the individual elements of the artist in his handiwork, are essentially one, and none of them can be imagined as really existing without the others. It is not the case of a thought, envisaged pictorially, and deliberately clothed in an artistic dress, but of a thought that would have no existence save in so far as it is expressible in paint. This is the modern truth of the art, and the importance of the principle here involved will be illustrated in a later section, but it must be borne in mind that the painting to which this principle applies is a creation of comparatively modern times. As in music so in painting, it has been reserved for recent epochs to manifest the full capabilities of the art. Whereas the arts of architecture and sculpture, though they have found in the modern era new fields to conquer, yet grew to their full stature in ancient Hellas, those of music and painting almost in their infancy till the Renaissance. It was only in the 16th and 17th centuries that painters obtained such a mastery on the one hand over the forms of nature, and on the other over an adequate technique, that they were able to create works in which truth and beauty are one and the artistic speech exactly expresses the artistic idea. For this the painter had to command the whole resources of the science of perspective, linear and aerial, and all the technical capabilities of the many-sided processes of oil-paint. Till that stage in the development of the art was reached work was always on one side or another tentative and imperfect, but all through these long periods of endeavour there is one constant feature, and this is the effort of the artist to attain to truth in the representation of nature. No matter what was the character of his task or the material equipment of which he disposed, this ideal was worked for ever before his eyes, and hence it is that in the relation of the painter's work to nature we find that permanent feature which makes the development of the art from first to last a unity.

§ 3. Importance in the Art of the Representation of Exception.—If we regard painting as a whole, the imitation of nature may be established as its most distinctive characteristic and the guiding principle of its development. It must at the same time be understood that in the advanced criticism of painting, as it is formulated in modern times, no distinction is allowed among the different elements that go to make up a perfect production of the art. In such a production the idea, the form, the execution, the elements of the composition and the individual character of the artist in his handiwork, are essentially one, and none of them can be imagined as really existing without the others. It is not the case of a thought, envisaged pictorially, and deliberately clothed in an artistic dress, but of a thought that would have no existence save in so far as it is expressible in paint. This is the modern truth of the art, and the importance of the principle here involved will be illustrated in a later section, but it must be borne in mind that the painting to which this principle applies is a creation of comparatively modern times. As in music so in painting, it has been reserved for recent epochs to manifest the full capabilities of the art. Whereas the arts of architecture and sculpture, though they have found in the modern era new fields to conquer, yet grew to their full stature in ancient Hellas, those of music and painting almost in their infancy till the Renaissance. It was only in the 16th and 17th centuries that painters obtained such a mastery on the one hand over the forms of nature, and on the other over an adequate technique, that they were able to create works in which truth and beauty are one and the artistic speech exactly expresses the artistic idea. For this the painter had to command the whole resources of the science of perspective, linear and aerial, and all the technical capabilities of the many-sided processes of oil-paint. Till that stage in the development of the art was reached work was always on one side or another tentative and imperfect, but all through these long periods of endeavour there is one constant feature, and this is the effort of the artist to attain to truth in the representation of nature. No matter what was the character of his task or the material equipment of which he disposed, this ideal was worked for ever before his eyes, and hence it is that in the relation of the painter's work to nature we find that permanent feature which makes the development of the art from first to last a unity.

§ 4. General Scheme of the Development of the Art.—From this point of view, that of the relation of the work of the painter to nature, we may make a rough division of the whole history of the art into four main periods.

The first embraces the efforts of the older Oriental peoples, best represented by the painting of the Egyptians; the second includes the classical and medieval epochs up to the beginning of the 15th century; the third, the 15th and 16th centuries; and the fourth, the time from the beginning of the 17th century onwards. In the first period the endeavour is after truth of contour, in the second and third after truth of form, in the fourth after truth of space.

The Egyptian artist was satisfied if he could render with accuracy, and with proper emphasis on what is characteristic, the silhouettes of things in nature regarded as little more than flat objects cut out against a light background. The Greek and the medieval artist realized that objects had three dimensions, and that it was possible on a flat surface to give an indication of the thickness of anything, that is of its depth away from the spectator, as well as its length and breadth, but they cannot be said to have fully succeeded in the difficult task they set themselves. For this there was needful an efficient knowledge of perspective, and this the 17th century brought with it. During the 17th century the painter fully succeeds in mastering the representation of the third dimension, and during the next he exercises the power thus acquired in perfect freedom, producing some of the most convincing and masterly presentations of solid
forms upon a flat surface that the art has to show. During this period, however, and to a more partial extent even in the earlier classical epoch, efforts were being made to widen the horizon of the expression within the scope of its representation, not only solid objects in themselves, but such objects as a whole in space, in due relation to each other and to the universe at large. It was, however, for the masters of the 17th century perfectly to realize this idea of the art, and in their hands painting as an art of representation is widened out to its fullest possible limits, and the whole of nature in all its aspects becomes for the first time the subject of the picture.

§ 5. The Place of Classical Painting in the Development of the Art.—This limitation of classical painting to the representation of form may be challenged, for some hold that Greek artists not only attempted but succeeded in the task of portraying objects in space in due relation to each other and to the system of things as a whole, and that the painting was not merely an extension of that of the Italian painter of the 16th century. The view taken in this article will presently be justified, but a word may be said here as to Greek painting in general and its relation to sculpture. The main arguments in favour of the more exalted view of this phase of the art are partly based on general considerations, and partly on the existence of some examples which seem to show the artist grappling with the problems of space. The general argument, that because Greek sculptors achieved so much we must assume that the painters brought their art to the same level, is of no weight, because it has been already pointed out that painting and music are not in their development parallel to sculpture and architecture. Nothing, moreover, is really proved by the facts that painting was made by women and in higher estimation than its sister art, and that the painters gained great wealth and fame. Painting is a more attractive, more popular art than sculpture. It represents nature by a sort of trick or illusion, whereas sculpture with its three dimensions is more a matter of course. It is a puzzle how the object or scene, with its colours as well as its forms, can be made to appear on a few square inches of flat surface, and the artist who has the secret of the illusion is at once a man of mark. In Greece this was specially the case, because painting there made its appearance rather later than sculpture and so was from the first more conspicuous. Hence literary writers, when they refer to the arts generally, quote a painter rather than a sculptor. The people observed the painters, and these naturally made the most of themselves and of their art. The study of the representation of some of these shows that there was an atmosphere of relâche among the painters that must have affected the popular estimate, in an aesthetic sense, of their work. Then, too, popular criticism of painting has no standard. To the passer-by who watches the pavement artist, the result of his operations seems nature itself.

"Better than I saw not who saw the truth," writes Dante (Par. xii. 68) of incised outlines on a pavement, that cannot go very far in natural similarity. Vasari, though a trained artist, writes as if they "vied with nature" of certain works that, though excellent for their day, do not approach the modern type. We think ourselves that Raphael's labours are like nature till we see Correggio's, and that Venetian Venuses are "real flesh and blood" till we see the nymphs of the Faun. That these, however, is the expression "true to nature" is a relative one, and very little weight should be given to a merely popular or literary judgment on a question of the kind. Hence we must not assume that because ancient painting was extravagantly praised by those who knew no other, it therefore covered all the field of the art.

§ 6. The Earliest Representative Art.—Naturalistic design of a very effective kind appears at a very early stage of human development, and is practised among the most primitive races of the actual world, such as the Australians, the Bushmen of South Africa and the Eskimo. Of the existence of such art different explanations have been offered, some finding for the representations of natural objects motives of a religious or magical kind, while others refer them to some shadowy expression of a simple artistic delight in the imitation of objects of interest. The extraordinary merit, within certain limits, of this early naturalistic work can be accounted for on sociological lines. As Grosse has put it (The Beginnings of Art, p. 108), "Power of observation and skill with the hand are the qualities demanded for primitive painting. A time was when pictorial art, and the faculty of observation and handiness of execution at the same time the two indispensable requisites for the primitive hunter life. Primitive pictorial art, with its peculiar characteristics, thus appears fully comprehensible to us as an aesthetic exercise of two faculties which the struggle for existence has developed and improved among the primitive peoples." So far as concerns the power of seizing and rendering the characteristics of natural objects, some of the earliest examples of representative art in the world are among the best. The objects are animals, because these were the only ones that interested the early hunter, but tens of thousands of years ago the Palaeolithic cave-dwellers of western France drew and carved the mammoth, the reindeer, the aurochs, and the horse, with astonishing skill and spirit.

Fig. 6, Plate III, shows the famous sketch of a mammoth made by a prehistoric hunter and artist of western France. The task, the trunk, the little eye, the forehead, and especially the shaggy fell of the long-haired elephant, are all effectively rendered.

Figs. 1, 2 and 3, Plate I, show three examples of the marvelous series of prehistoric carvings and incised drawings, from the caves of southern France, published by the late Edouard Pictet. We note especially the remarkable effort to portray a stag turning its head, and the close observation displayed in the representation of the action of a running buck.

Even more striking are the Palaeolithic paintings discovered in the cave of Altamira at Santillane, near Santander in Spain. They are less and less than the carvings and sketches mentioned above, but they date from a time when what is now Great Britain was not yet divided from the continent by the Channel, when the climate of southern Europe was still cold, and when animals now extinct—such as the European bison—were still common. These paintings, boldly sketched in three colours, may be reckoned as some 50,000 years old. They display the same power of correct observation and artistic skill as the earlier carvings. Notice in the remarkable examples given on Plate II. the black patches on the bison's winter coat and the red colour of the hide where, with the progress of the spring, he has got rid of the long hair from the more prominent parts of his body by rubbing himself against the rocks. The impressionist character of these sketches is doubled partly due to the action of time; but also, in the case of the bison, has represented the action of the legs in running as well as standing in much the same way as might be done in a rapid sketch by a modern painter. The mystery of these astounding paintings is increased by the fact that they are found in a cave to which no daylight has ever penetrated, sometimes in places almost inaccessible to sight or reach, and that they are surrounded by symbols of which none can read the meaning (see the two lozenges in fig. 3, Plate I).

Palaeolithic art is, however, a phenomenon remote and isolated, and in the history of painting its main interest is to show how ancient is the striving of man after the accurate and skillful representation of nature. Modern savages on about the same plane of civilization do the same work, though they do so without equal artistic deftness, and Grosse reproduces (loc. cit., ch.vii.) some characteristic designs of Australians and Bushmen. Some of these are of single figures, but there are also "large associated groups of men and animals with the landscapes around them." The pictures consist in outlines engraved or scratched on stone or wood or previously blackened surfaces of hide, generally, though not always, giving profile views, and are sometimes filled in with flat tints of colour. There is no perspective, except to this extent, that objects intended to appear distant are sometimes made smaller than near ones. In the extended scenes the figures and objects are dispersed over the field, without any arrangement on planes or artistic composition, but each is delineated with spirit and in essential features with accuracy.

It is a remarkable fact, but one easily explained, that when men advances from the hunter stage to a more settled agricultural life

REDUCED FACSIMILES OF PAINTINGS OF THE PALABOLITHIC AGE FROM THE CAVE OF ALTAMIRA IN SPAIN
these spontaneous naturalistic drawings no longer appear. Neolithic man shows a marked advance on the capacity of his Palaeolithic predecessors in all the useful arts of life: his tools, his pottery, his weapons; but as an artist he was beyond comparison inferior. His attempts to draw men and beasts resulted in no more than conventional symbols, such as an intelligent child might scribble; of the Palaeolithic man’s taste for design, as shown in the carved work of the caves, or of his power of reproducing nature, there is not a sign. Keenness of observation and definiteness of hand are no longer developed because no longer needed for the purposes of existence, and representative art almost entirely gives way to a mere decoration. At this further stage the sociological motive of art is commemoration. It is in connexion with the tomb, the temple and the palace that in early but still fully organized communities art finds its field of operations. Such communities we find in ancient Egypt and Babylonia, while similar phenomena showed themselves in old Oriental lands, such as India and China.

§ 7. The Painting of Contour: Egypt and Babylonia.—In ancient Egypt we find this graphic delineation of natural objects, so spontaneous and free among the hunter tribes, reduced to a system and carried out with certain well-established conventions. The chief of these was the almost universal envisagiment in profile of the subject to be represented. Only in the case of subsidiary figures, might a front or a back view or a three-quarter face be acceded. To bring the human figure into profile it was conventionalized, as fig. 7, Plate III., will show. The subject is an Egyptian of high rank, accompanied by his wife and son, fowling in the marshes of the Delta. It is part of a wall-painting from a tomb at Thebes dating about 1500 B.C. The head, it will be seen, is in profile, but the eye is drawn full-face. The shoulders are shown in front view, though by the outline of the breast, with its nipple, on the figure’s right, and by the position far to the right of the navel, an indication is given that the view here is three-quarters. At the hips the figure is again in profile, and this is the position also of the legs. It will be observed that the two feet have the big toe on the same side, a device to escape the necessity of drawing the four toes as seen in the outside view of a foot. As a rule the action of these figures is made as clear as possible, and they are grouped in such a way that each is clearly seen, so that a crowd is shown either by a number of parallel outlines each a little in advance of the other suggesting a row seen in slight obliquity, or else by parallel rows of figures on lines one above the other. Animals are treated in the same way in profile, save that oxen will show the two horns, asses the two ears, as in front view, and the legs are arranged so that all are seen.

Within these narrow limits the Egyptian artist achieved extraordinary success in the truthful rendering of nature as expressed in the contours of figures and objects. If the human form be always conventionalized to the required flatness, the draughtsman is keen to seize every chance of securing variety. He fastens on the distinctive traits of different races with the zeal of a modern ethnologist, and in the case of royal personages he achieves success in individual portraiture. Though he could not render variety of facial expression, he made the action of the limbs express all it could. The traditional Egyptian gravity did not exclude humour, and some good caricatures have been preserved. Egyptian drawing of animals, especially birds (see fig. 7, Plate III.), has in its way never been surpassed, and the specific points of beasts are as keenly noted as the racial characteristics of human beings. Animals, domestic or wild, are given with their particular gait or pose or expression, and the accent is always laid on those features that give the suggestion of strength or swiftness or lithe agility which marks the species. The precision of drawing is just as great in the case of lifeless objects, and any set of chief, carefully-executed, hieroglyphic signs will give evidence of an eye and hand trained to perfection in the simpler tasks of the graphic art.

The representation of scenes, as distinct from single figures or groups, was not wholly beyond the Egyptian artist’s horizon. His most ambitious attempts are the great battle-scenes of the period of the New Empire, when a Seti or a Ramesses is seen

driving before him a host of routed foemen. The king in his chariot with the rearing horses is firmly rendered in the severe conventional style, but the crowd of fugitives, on a comparatively minute scale, are not arranged in the original clear fashion in parallel rows, but are tumbled about in extraordinary confusion all over the field, though always on the one flat plane. By another convention objects that cannot be given in profile are sometimes shown in ground plan. Thus a tank with trees round it will be drawn square in plan and the trees will be exhibited as if laid out flat on the ground, pointing on each side outwards from the tank.

In Babylonia and Assyria the mud-brick walls of palaces were coated with thin stucco, and this was in the interior sometimes painted, but few fragments of the work remain. On the exterior considerable use was made of decorative bands and panels of enamelled tiles, in which figure subjects were prominent, as we learn by the passage from Ezek. xiii., about “men poured upon the wall, the images of the Chaldeans portrayed with vermilion.” The best idea of Assyrian graphic design is gained from the slabs carved in very low relief, which contain annalistic records of the acts of the king and his people in war and peace. The human figure is treated here in a less conventional scheme, but at the same time with less variety and in a less spirited and interesting fashion than in Egypt. Such figures are shown either from the profile or front of the nobler beasts, notably the horse, the lion and the mastiff, there is an element of true grandeur that we seldom find in Egyptian design. Furthermore, the carver of the reliefs had a better idea of giving the impression of a scene than his brother of the Nileland, and in his representations of armies marching and fighting he introduces rivers, hills, trees, groups of buildings and the like, all of course delineated without perspective, but in far truer and more telling fashion than is the case with the scenes from the campaigns of Egyptian conquerors.

§ 8. Painting in Pre-historic Greece.—A new chapter in the history of ancient painting was opened by the discovery of relics of the art in the palaces and tombs of the Mycenaean period on the coasts and islands of the Aegean. The charming naturalistic representations of marine plants and animals on the painted vases are quite unlike anything which later Greek art has to offer, and exhibit a decorative taste that reminds us a little of the Japanese. What we are concerned with, however, are rather the examples of wall-painting in plaster found at Tiryns and Mycenae and in Crete. Of the former the first to attract notice was the well-known bull from Tiryns, represented in profile and in action, and accompanied by a human figure; but of far greater importance, because foreshadowing an advance in the pictorial art, are certain wall-paintings discovered more recently by Dr Evans at Cnossos in Crete. The question is not of the single figures in the usual profile view, like the already celebrated “Cup-bearer,” however important these may be from the historical side, but of the so-called “miniature” wall-paintings that are now preserved in the museum at Candia, in which figures on a small scale are represented not singly but in crowds and in combination with buildings and landscape features that seem to carry us forward to far more advanced stages of the art of painting. To borrow a few sentences from Dr Arthur Evans’s account of them on their first discovery (Annual of British School at Athens, vi. 45): “A special characteristic of these designs is the outline drawing in fine dark lines. This outline drawing is at the same time combined with a kind of artistic shorthand brought about by the simple process of introducing patches of reddish brown or of white on which groups belonging to one or other sex are thus delineated. In this way the respective flesh-tints of a series of men or women are given with a single sweep of the brush, their limbs and features being subsequently outlined on the background thus obtained.”

There is here, it is true, no perspective, but there is a distinct effort to give the general effect of objects in a mass, which corresponds curiously with the modern development of the art of painting called “impressionism.”

§ 9. The Painting of Form: Ancient Greece and Italy.—As
is well known, this early civilization in the Greek world of the second millennium B.C. was almost completely swept away, probably by the political cataclysm of about 1000 B.C. known as the Dorian Migration. Hellenic art proper, in its historical continuity, represents a new start altogether and the beginnings of it need not be sought earlier than about 800 to 700 B.C.

The art of painting had then completely lost touch with the graceful naturalism and with the broad generalization of the "Aegean" period, and is represented by figure designs on the so-called "geometric" or "Dipylon" vases of the most primitive kind. For a long time Greek painting is chiefly represented by work on the vases, but that this may be regarded as in the strict sense painting is shown by the fact that tablets or panels (piniakes) that would certainly be called pictures were being painted at the same time by the same technical methods, and in some cases by the same craftsmen, as the vases. As Klein remarks (Euphranorius, p. 252), "the most ancient material for Greek painting is clay in the form of the vase as well as of the pinax." Now we find in Pliny's account of the beginnings of Greek painting (Nat. Hist. xxxv. 15 seq.) certain stages indicated in the development of technique, and we are able to illustrate these stages from vases which correspond more or less in their chronological order with the succession of the stages in Pliny. The correspondence is not exact, and there are difficulties in the way of interpreting the statements from the monuments, but the two are certainly to be brought into connexion. According to Pliny the order of development seems to be (1) outlines; (2) outline in with flat tints, or (3) outlines with linear inner markings but no colour. Outline drawing is obviously always the first stage in the graphic art regarded as delineation, not decoration. The flat tints without inner markings are found on "Dipylon" vases of 800-700 B.C., and as for the inner markings, though there is a difficulty in the exact interpretation of Pliny's words, yet inner markings in the form of lines scratched on these silhouettes make their appearance very early. Two further stages are indicated by Pliny as the introduction of a red colour and the distinction between male and female figures by a painter named Eumarius of Athens. This would be by the use of white, which with red, an oxide of iron, appears on vases of about 600 B.C. Eumarus is also said to have "ventured to imitate all kinds of figures," and we cannot fail here to be reminded of the marvellous François vase at Florence (fig. 8, Plate III.) of the first half of the 6th century, which is of large size and is decorated with a wealth of figure designs from mythological sources that are among the most remarkable productions of the graphic art in existence. Human figures and animals are there displayed in an extraordinary variety of poses and illustrating all kinds of scenes, and the execution shows a firmness of hand and patience in the rendering of details to which no praise can do justice. The inner markings are rendered by lines with the most scrupulous care and finish. Cimon of Cleoneae is said to have followed Eumarus with certain improvements which are of the utmost significance for the future of the art in Greece. He is said to have introduced four innovations: (a) "Catagrapha," which Pliny explains as "profile figures" but which must mean something more than this, seeing that profiles had been in use from the first. "Foreshortenings" is a possible and an intelligible rendering which moreover corresponds with what is further ascribed to him; (b) the representation of "countenances in different positions, looking backwards or upwards or downwards." The other improvements, in giving (c) the details of anatomy and (d) "the wrinkles and folds of drapery," are not of so much importance as such advance is normal and necessary. The introduction of foreshortened views is the matter of real moment, for this is the point at which Greek painting comes into company with the older oriental traditions, and enters on a course of its own which leads directly to all the modern developments of the art.

The words of Pliny explaining the term "catagrapha" can be aptly illustrated from the vase paintings connected with the name of Epictetus. Epictetus was the leading figure among a company of Athenian vase decorators of the last decades of the 6th century B.C. and the beginning of the 5th, who ushered in the period of the most gifted and original masters of the craft. Their work is marked by efforts to give to the human figure a vigour and expressiveness it had never before attained, and to gain their end they essay all sorts of novel and difficult problems in drawing. In connexion with Pliny's words, Klein remarks (Euphranorius, p. 47) that on their vases "the running figures look behind them; those that are jumping, revelling or fighting look up; the lifting or bending ones look down." Some of the best vases decorated by this set of artists, who are the first to use the so-called "red-figured" technique instead of painting as the older masters had done in black on red, are for qualities of strength, variety and animation unequaled by any of their successors of the later periods, yet it is significant of the whole character of this ancient painting that they are always conspicuously more successful with profiles and objects in an upright plane at right angles to the line of sight than with any forms which involve foreshortening or perspective. They are masters of contour but are still struggling for the full command over form, and it is noteworthy that the generation of these greatest of the vase-painters had passed away before these difficulties of foreshortening had been conquered.

We have now followed on the vases the development of Greek painting up to about the time of the Persian wars, and it must be noted that in other forms, as on terra-cotta tablets or pinakes, on the flat edges of sarcophagi in the same material, and occasionally on marble slabs or stelae, the same technical characteristics are to be observed. Of painting on a monumental scale Greece proper has hitherto shown no trace, yet at this very juncture, in the decades immediately after the Persian wars, there suddenly makes his appearance one of the greatest representatives of monumental wall-painting known to the annals of the art. This is Polygnotus, who, with some worthy associates, displayed on the walls of public buildings at Athens and at Delphi a series of noble compositions on a large scale that won the admiration of the whole Hellenic community.

To find any remains of mural painting that may seem to lead up to Polygnotus and his school we have to pass beyond the bounds of Greece proper into Italy, where, alike in the Greek and Etruscan cities and also at Rome, painting in this form was practised from an early date. Pliny mentions paintings at Ardea older than the city of Rome, and some very ancient ones at Caere.

Two sets of early paintings, not actually on walls but on terra-cotta slabs meant for the coating of walls, have come to light in recent times at Cervetri, the ancient Caere, some of which, in the British Museum, were dated by the late A. S. Murray at about 600 B.C. (Journal of Hellenic Studies, x. 243), while others in the Louvre may be about half a century later. True wall-paintings, of possibly a still earlier date and certainly of more primitive design, were found in the Campana tomb at Veii (Dennis, Etruria, ch. i.). The paintings from Caere are executed on a white or yellowish "slip" in a few colors, and exhibit single figures in a frieze-like arrangement with little attempt at action and none at grouping. The flesh of the women is left the colour of the white ground, that of the men is painted a ruddy hue. To the 6th, and first half of the 5th century, belong wall-paintings in Italian tombs, which, whether in Greek cities or in Etruscan, show distinct signs of Hellenic influence. Some of these wall-paintings (Antike Denkmäler, i., Taf. 41-43) show considerable liveliness in colouring and in action, and a freedom and gaiety in female costume that remind us of what we read about the painting of Polygnotus (q.v.). The place of this great painter in the general history of the graphic art is given to him for his ethical greatness and the austere beauty of his single figures, where ancient writers extol. All we have to do here is fix his place in the development of painting by noting the stage at which he had arrived in the representation of nature.

The wall-paintings of Polygnotus and his school must have exhibited a large number of figures powerfully characterized in action and expression, not in a confused mass nor summarized as at Croesus, nor grouped together as in a modern composition.

nor yet arranged in formal rows one above the other, but distributed at different levels on the one plane of the picture, the levels being distinguished by summary indications of a landscape setting. Parts of some of the figures were hidden by risings of the ground. The general effect is probably represented by the paintings on the vase in the Louvre shown in fig 4, one side of which exhibits the destruction of the children of Niobe, and the other the Argonauts. Simplicity in design and ethical dignity in the single forms are here unmistakable. It is probable that Polygnotus had not fully mastered the difficulties of foreshortening with which the early "red-figure" masters were struggling, but later designs both on vases and elsewhere do show that in the 4th century at any rate these had been overcome. The drawing on the so-called Ficoroni Cista, and on the best of the Greek mirror-backs, may be instanced. The ancients recognized that in the latter part of the 5th century B.C. painting made a great technical advance, so that all that had gone before seemed archaic, while for the first time"the gates of art"were opened and the perfect masters entered in. The advance is in the direction of the representation not of form only but of space, and seems from literary notices to have implied a considerable acquaintance with perspective science. The *locus classicus*, one of great importance, is in Vitruvius. In the preface to his seventh book he writes of Agatharcus, a painter who flourished at Athens in the middle and third quarter of the 5th century, that he executed a scene-painting for Aeschylus, and wrote a treatise upon it which inspired the philosophers Democritus and Anaxagoras to take up the subject, and to show scientifically from the constitution of the eye and the direction of rays of light how it was possible in scenic paintings to give sure images of objects otherwise hard to fix correctly, so that when such objects were figured on an upright plane at right-angles to the line of sight some should appear to recede and others to come forwards. It would not be easy to summarize more aptly the functions of perspective, and if philosophers of the eminence of those just mentioned worked out these rules and placed them at the disposal of the artists, the transition from ancient to modern painting should have been accomplished in the 5th century B.C., instead of just two thousand years afterwards! So far however as the existing evidence enables us to judge, this was not actually the case, and in any case Agatharcus and the philosophers, painting pursued the even tenor of its way within the comparatively narrow limits set for it by the genius of ancient art (see Greek Art). It may be admitted that in many artistic qualities it was beyond praise. In beauty, in grace of line, in composition, we can imagine works of Apelles, of Zeuxis, of Protogenes, excelling even the efforts of the Italian painters, or only matched by the finest designs of a Raphael or a Leonardo. In the small encaustic pictures of a Pausias there may have been all the richness and force we admire in a Chardin or a Monticelli. We may even concede that the Greek artist tried at times to transcend the natural limits of his art, and to represent various planes of space in perspective, as in the landscape scenes from the "Odyssey," or in figure compositions such as the "Alexander and Darius at Issus," preserved to us in a mosaic, or the "Battle-piece" by Aristides that contained a hundred combatants. The facts, however, remain, first that the Greek pictures about which we chiefly read were of single figures, or subjects of a very limited and compact order with little variety of planes; and second, that the existing remains of ancient painting are so full of mistakes in perspective that the representation of distance cannot have been a matter to which the artists had really set themselves. The monumental evidence available on the last point is sufficient to override arguments to the contrary that may be built up on literary notices. No competent artist, or even teacher of drawing, who examines what is left of ancient painting, can fail to see that the problem of representing correctly the third dimension of space, though it may have been attacked, had certainly not been solved. It is of no avail to urge that these remains are not from the hands of the great artists but of mere decorators. In modern times the mere decorator, if he had passed through a school of art, would be as far above such childish blunders as a Royal Academician. We have only to consider dispassionately the photographic reproductions from ancient paintings (Herrmann, *Denkmäler der Malerkinds Altertums*, Munich, 1906, &c.) to see that the perspective researches of the philosophers had not resulted in a general comprehension among the artists of the science of receding planes. For example, in the famous wall-painting of "Zeus and Hera on Mount Ida"in the House of the Tragic Poet at Pompeii, the feet of the standing figure of the goddess are nearer to the spectator than the seat of her lord, but the upper part of her form is away on the farther side of him (see fig. 5, Plate IV.). No one who could draw at all would be capable now of such a mistake. In interiors the perspective of the rafters of a roof, of a table, the case, and in spite of the way the figures seems often to be determined rather by their relative importance in the scene than by their position on the planes of the picture. In the Pompeian landscape-piece of "Paris on Mount Ida"(Herrmann, No. 8) there is no sense of the relative proportions of objects, and a cow in the foreground is much smaller than Paris, who is a long way back in the composition. It is an additional confirmation of this view to find early Christian and early medieval painting confined to the representation of the few near objects, which the older Oriental artists had all along envisaged. If classical painters had really revolutionized design, as it was actually revolutionized in the 15th century of our era, and had followed out to their logical consequence the innovations of Agatharcus, we may be sure that the

![Fig. 4.—Vase painting in the Louvre, illustrating the style of Polygnotus.](image-url)

*Altertums*, Munich, 1906, &c.) to see that the perspective researches of the philosophers had not resulted in a general comprehension among the artists of the science of receding planes. For example, in the famous wall-painting of "Zeus and Hera on Mount Ida" in the House of the Tragic Poet at Pompeii, the feet of the standing figure of the goddess are nearer to the spectator than the seat of her lord, but the upper part of her form is away on the farther side of him (see fig. 5, Plate IV.). No one who could draw at all would be capable now of such a mistake. In interiors the perspective of the rafters of a roof, of a table, the case, and in spite of the way the figures seems often to be determined rather by their relative importance in the scene than by their position on the planes of the picture. In the Pompeian landscape-piece of "Paris on Mount Ida" (Herrmann, No. 8) there is no sense of the relative proportions of objects, and a cow in the foreground is much smaller than Paris, who is a long way back in the composition. It is an additional confirmation of this view to find early Christian and early medieval painting confined to the representation of the few near objects, which the older Oriental artists had all along envisaged. If classical painters had really revolutionized design, as it was actually revolutionized in the 15th century of our era, and had followed out to their logical consequence the innovations of Agatharcus, we may be sure that the
influence of these innovations would not have been wholly lost even in the general decline of the arts at the break-up of the Roman Empire of the West. In any case, the influence would have survived in Byzantine art, where there was no such cataclysm. Yet we fail to see in the numerous pictorial miniatures from the 8th century onwards, or in the mosaics or the wall-paintings of the same epoch, any more effective grasp of the facts of the third dimension of space than was possessed by the pre-Classical Egyptian.

All through the middle ages, therefore, the facts concerning painting with which we are here concerned remain the same, and the art appears almost exclusively concerned with the few selected objects and the single plane. The representation is at most of form and not of spatial effect, and hence the wall-paintings of the same theme may be considered under three heads: (1) the wall-paintings in the catacombs; (2) the pictorial decorations in books; (3) the mosaic pictures on the walls of the churches.

(1) The first are in themselves of little importance, but are of historical interest as a link of connexion between the wall-painting of classical times and the more distinctly Christian forms of the art. They are slightly executed and on a small scale, the earliest, as being more near to classical models, are artistically the best. (2) That form of painting devoted to the decoration and illustration of books belongs more to the art of ornament than to painting proper (see Illuminated MSS. and Illustration). (3) Early Christian mosaics are exact monuments of the graphic art, and are its best representatives during the centuries from the 5th to the 8th. A dignified simplicity in design suits their large scale and architectural setting, and the aim of the artist is to present in forms of epic grandeur the personages of the sacred narratives. They are shown as in repose or engaged in some typical but simple action; the backgrounds being as a rule plain blue or gold and the accessories of the simplest possible description.

The finest Christian mosaics is also the earliest. It is in the apse of S. Pudentiana, Rome, and displays Christ enthroned as teacher with the Apostles seated on each side of Him. It may date from the 4th century. Next to this the best examples are at Ravenna, in the tomb of Galla Placidia, the Baptistery, S. Apollinare Nuovo and S. Vitale, dating from the 5th and 6th centuries. The mosaic on the baptistry of the "Baptism of Christ" is the most artistic piece of composition and pictorial effect, and next to this comes the "Good Shepherd" of the tomb of Galla Placidia. The finest single figures are those of the white-robed saints between the windows of the nave of S. Apollinare Nuovo, and the most popular representations are the two processions of male and female saints lower down on the same walls. The famous mosaics in S. Vitale depicting Justianin and Theodora with courtiers in attendance, though historically interesting, are designed in a wooden fashion, and later mosaics at Palermo, Venice, Rome and other places are as a rule rather decorative than pictorial. Where the costly material of glass mosaic was not available, the churches of this period would show mural decorations of much more simple design and artistic character, though comparatively ineffective.

In monumental painting the interval between the early Christian mosaics and mural pictures and the revival of the 13th century is filled by a series of wall and ceiling paintings of Carolingian, Romanesque and early Gothic date, in Italy, Germany and England. The earliest of which account need be taken are those in the recently excavated church of S. Maria Antiqua by the Forum at Rome (Rushworth, in Papers of the British School at Rome, vol. 1., London, 1902), where there is a complete and, on the whole, well-preserved series consisting for the most part in single figures and simply composed scenes. Most of the work can be dated to the time of Pope John VII. at the beginning of the 8th century. Its style shows a mixture of Byzantine motives with elements that are native to Rome. It must be remembered that at the time Rome was strongly under Byzantine influence. Passing over some more fragmentary specimens, we may refer next to several series of mural paintings in and near the island of Reichenau at the western end of the lake of Constance, where a school of painting flourished in the latter part of the 10th century. The work here is quite as good as anything Italy has to show, and represents a native German style, based on early Christian tradition, with very little dependence on Byzantine models. The most interesting piece is the "Last Judgment" in the church of St George at Oberzell on Reichenau, where, in a very simple but dignified and effective form, we find the earliest existing representation of this standard theme of later medieval monumental art (F. X. Kraus, Wandgemälde der St. Georgskirche zu Oberzell auf der Insel Reichenau, Freiburg-i.-Br., 1884).

About a hundred years later, in the latter part of the 11th century, mural painting of the same theme was executed in the church of S. Angelo in Formis near Capua in southern Italy, the style of which shows a mixture of Latin and Byzantine elements (F. X. Kraus, Die Wandgemälde von S. Angelo in Formis, Berlin, 1853).

To the middle of the 12th century belongs one of the most complete and interesting cycles of mural wall-decoration, the display of a series of figures and scenes illustrating the eleventh chapter of Hebrews, in the chapter-house of the now secularized monastery of Bravueller, near Cologne, in the Rhineland. Here the pictorial effect is simple, but the decorative treatment in regard to the filling of the spaces and the lines of composition is excellent. The work is Romanesque in its severity (E. Ams in Ver Sacrum, Leipzig, 1879). Romanesque also, but exhibiting an increase in animation and expressiveness, is the painting of the ceiling of the nave of the fine church of St Michael at Hildesheim. In the general decorative effect, the distribution of the subjects in the spaces, the blending of figures and ornament, the work, the main subject of which is the Tree of Jesse, is a masterpiece. Two nude figures of Adam and Eve are for the period remarkable productions. The date is the close of the 12th century.

Succeeding examples show unmistakable signs of the approach of the Gothic period. In the wall-paintings of the nuns' choir of the church of Gurk in Carinthia, a certain grace and tenderness begin to make themselves felt, and the same impression we gain from the extensive cycle in the choir of the cathedral of Brunswick, from the first decades of the 13th century. The picture of Herod's birthday feast is typical of the style of German painting of the time; there is nothing about it in the least rude or tentative. It is neither childish nor barbarous, but very accomplished in a conventional style that is exactly suited from the decorative point of view to a mural painting. The story is told effectively but in quaint fashion, and several incidents of it are shown in the same composition. There is no attempt to represent the third dimension of space, or to give the perspective setting of the scene, but the drawing is easy and true and expressive. The studied grace in the bend of certain figures and the lively expressions of the faces are traits which prefigure Gothic art (see fig. 11. Plate III.).

In all these, though it were in their feeling were the wall-paintings in the chapel at Ramsedorf, opposite Bonn, dating from the beginning of the 14th century. They are only preserved in copies, but these enable us to see with what grace and feeling the slender figures were designed, how near to Angelico's came the tender angels making music where the virgin is receiving her celestial crown (E. Ams in Weerth, loc. cit.). From the end of the 14th century, Castle Runkelstein, near Bolzen in Tyrol, has preserved an extensive cycle of secular wall-paintings, much repainted, but of unique interest as giving an idea how a medieval residence of the kind might be adorned. The style is of native growth and no influence from south of the Alps is to be discerned (Janitschek, Geschichte der deutschen Malerei, Berlin, 1890, 998). In general, speaking, all these mural paintings consist in little more than outlines filled in with flat tints, neither modelling of the forms nor perspective effect in the setting is attempted, but the work so far as it goes is wholly satisfactory. There is no coarseness of execution nor anything in the forms,

The painting, when viewed at a distance, shows the painter's hand in the way he has made the background of the cloth and the folds expressed almost in the nature of a very slight interplay of light and shade. The figures are painted with a very minute and accurate feeling for the natural life, and the artist, whether he painted a picture of the "Adoration of the Lamb" in Ghent, the most magnificent masterpiece of the northern schools before the 14th century, and the earliest example of the then newly developed art of oil painting. Table No. 1, in Part II, of this article gives the names of the chief successors of the Van Eyck, and the school ends with the life and work of Quintin Matsys of Antwerp, in the first quarter of the 16th century. The spirit of the early Cologne school, and in the main of that of Flanders, is a mellifluous and devotional, but the artists of the latter school achieve extraordinary force and precision in their representation of the human form. The first painters of landscape, for their work, achieved more success than in their attempts to portray the truth of nature, the decorative instinct in the artist, the feeling for pattern, was a controlling element in the work, and the representation was conventionalized into a form that satisfied the ideal of beauty current at the time. Jan van Eyck was matter-of-fact in his realism, but avoided ugliness, whereas in Germany in the 15th and 16th centuries we find a tendency to exaggerate. The German art was, however, saved by the appearance of some artists of great genius who more than made up for the national insensibility to beauty by their earnestness and truth. Martin Schongauer of Colmar learnt his art from the painters of the Flemish Netherlands, and imbued something of the feeling for beauty which the successors of Hubert van Eyck had never wholly lost. After Schongauer German art culminates at Nuremberg in the person of Albrecht Dürer, and a little later in that of Hans Holbein the younger. Contemporaries with Dürer, Mathias Grünewald of Colmar exhibits a dramatic power in his creations that compensates for their exaggerated realism, and Bartholomäus Bruyn, of Cologne, prefigures the future success of the northern schools in portraiture. In Germany, however, the wars of religion in the 16th century checked the further growth of a national art. Holbein's migration to England is a significant sign of this, and German art in this phase of it may be said to come to an end in the person of Adam Elsheimer of Frankfurt, who introduced German painting at Rome about the year 1608. In the Netherlands the early religious school ends, and we see, with Quintin Matsys and the new generation of Flemish painters, the most profound and original art in the art of their own country. From the ranks of these so-called Italianizers in the Flanders of the 16th century proceeds a little later the commanding personality of Rubens.
interest has been lacking. In ancient Egypt, for example, and among the older Oriental peoples generally, schools of painting in the modern sense did not exist, for the arts were carried on on traditional lines and owed little, so far as records tell, to individual initiative. In ancient Greece, on the contrary, we find ourselves at once in an atmosphere of names and achievements which give all the glamour of personal and biographical interest to the story of art. In the early Christian and early medieval periods, we return again to a time when the arts were practiced in the same impersonal fashion as in the oldest days, but with the later medieval epoch we emerge once more into an era where the artist of genius, with his experiments and triumphs, his rivals and followers, is in the forefront of interest; when history is enlivened with anecdote, and takes light and shade from the changing fortunes of individuals.

There is a danger lest the human interest of such a period may lead us to forget the larger movements, impersonal and almost cosmic, which are all the time carrying these individuals and groups forward on their destined course. The history of painting cannot be understood if it be reduced to a notice, however full, of separate 'schools' or to a series of biographies, fascinating as these may be made of individual artists. Hence in what follows it is still the main course of the development of the art in its relation to nature that will be kept in view, while the information about names and dates and mutual relations of artists and schools, which is in its own way equally important, will be furnished in the tables constituting Part II. of this article.

What has just been said will prepare the reader for the fact that the first schools of painting here mentioned are those of Germany and Flanders, not those of Italy, though the latter are more important as well as actually prior in point of time.

§ 13. The Gothic Movement and the Proto-Renaissance, in their Influence on Painting north and south of the Alps.—The revival of art and nature and painting in the Italy of the last part of the 13th century was an event of capital importance, not only for that country but for the west at large. Its importance has, however, been exaggerated, when it has been said to imply the rediscovery of the arts after a period in which they had suffered an entire eclipse. So far as Italy is concerned, both sculpture and painting had in the previous period sunk to a level so low that they could hardly be said to exist, but at the same epoch in lands north of the Alps they were producing works of considerable merit. Romanesque wall-painting of the 12th century, as represented in some Rhineland churches and cloisters, is immeasurably better than anything of the same period south of the Alps. In the arts of constructing ornament the Romans remained for a long time in the northern peoples, and in every branch of decorative work with the exception of mosaic the craftsmanship of Germany and France surpassed anything that native Italian workmen could produce. By the middle of the 12th century the intellectual and social activity of the French people was accompanied by an artistic movement that created the most complex and beautiful architectural monuments that the world has seen. The adornment of the great French Gothic cathedral was as artistically perfect as its fabric was noble. For one, at any rate, of the effects at which the painter aims, that of glowing and sumptuous colour, nothing can surpass the stained-glass windows of the Gothic churches, while the exteriors of the same buildings were enriched with hundreds of statues of monumental dignity endowed with a grace and expressiveness that reflect the spirit of the age.

The Gothic age in France was characterized by humanity, tenderness and the love of nature, and there are few epochs in human history the spirit of which is to us more congenial. The 12th century, which witnessed the growth of the various elements of culture that combined to give the age its ultimate character, saw also a movement of revival in another sphere. The reference is to what has been aptly termed a "Proto-Renaissance," the characteristic of which was a fresh interest in surviving remains of classical antiquity. In more than one region of the west, where these remains were specially in evidence, this interest manifested itself, and the earliest sign of it was in Provence, the highly Romanized part of southern Gaul known par excellence as the "Province." To this is due the remarkable development of decorative sculpture in the first decades of the 12th century, which gave to that region the storied portals of St. Gilles, and of St. Trophime at Arles. Somewhat later, in the early part of the 13th, those portions of southern Italy under the direct rule of the emperor Frederick II. presented a similar phenomenon that has been fully discussed by M. Berthoux in his L'Art dans l'Italie méridionale (Paris, 1904). There were other centres of this same movement, and a recent writer enumerates no fewer than seven. The Gothic movement proper depended in no degree on the study of the antique, and in art the ornamental forms which express its spirit are naturalistic, not classical, while the fine figure sculpture above referred to is quite independent of ancient models, which hardly existed in the central regions of France where the Gothic movement had its being. Still the proto-Renaissance can be associated with it as another phase of the same awakening of intellectual life that marked the 12th century. Provence took the lead in the literary revival of the time, and the artistic movement that followed on this was influenced by the fact of the existence in those regions of abundant remains of classical art.

The Gothic movement was essentially northern in its origin, and its influence radiated from the Île de France. What has been described as the idyllic grace, the tenderness, that mark the works of the early Cologne school, and to some extent those of the early Flemings, were Gothic in their origin, while the feeling for nature in landscape that characterizes van Eyck, and the general tendency towards a realistic apprehension of the facts of things, may also be put down to the quickening of both thought and sympathy due to the Gothic movement. Hence it is that the northern schools of painting are noticed before the Italian because they were nearer to the source of the common inspiration. Among the schools of the West, however, exhibit, each in its own special forms, the same stir of a new intellectual, religious and artistic life. In Italy we meet with the same phenomena as in France, a proto-Renaissance, first in southern Italy and then, as we shall presently see, at Rome and at Pisa, and a religious and intellectual movement on Gothic lines that was embodied in the attractive personality of St Francis of Assisi. Francis was as perfect an embodiment of the Gothic temper as St Louis himself, and in his romantic enthusiasm, his tenderness, his humanity is in spirit more French than Italian.

§ 14. The Rise of the Italian Schools of Painting.—The revival of the arts in Italy in the latter part of the 13th century was the outcome of the two movements just noticed. The art of Niccolò Pisano is now recognized as a phase of the proto-Renaissance of southern Italy, whence his family was derived. It represents a distinct advance on the revived classical sculpture of Provence or Campania because Niccolò's artistic personality was a strong one, and he gives to his work the impress of the individual of genius. Throughout its history Italian art depends for its excellence on this personal element, and Niccolò's achievement is epoch-making because of his personal vigour, not because he reinvented a lost art. Towards the end of the 13th century, painting began to show the results of the same renewed study of antique models, and here again the revival is connected with the names of gifted individuals. Among these the most noteworthy are the Roman Pietro Cavallini and Duccio di Buoninsegna of Siena. The condition of painting in Italy in late medieval days has already been indicated. Cavallini and Duccio now produce, in two standard forms of the art, the mural painting of the "Last Judgment" and the enthroned Madonna with angels—works characterized by good taste, by largeness and suavity of treatment, and by an execution which, if still somewhat primitive and laboured, at any rate aims at beauty of form and colour. The recently uncovered fresco of the Last Judgment by Cavallini, executed about 1293 on the western wall of S. Cecilia in Trastevere at Rome, is classical in feeling and represents an immense advance on the older rendering of the same subject in S. Angelo in Formis (see § 10). The vast
enthroned Madonna in the Rucellai chapel of S. Maria Novella at Florence, ascribed by Vasari to Cimabue, is now assigned by many to Duccio of Siena, and presents similar attractive qualities. Cimabue, a Florentine contemporary of Giotto, and Duccio, is famed in story as the chief representative of the painting of this period, but we possess no certain works from his hand except his mosaic at Pisa. His style would probably correspond to that of the painters just mentioned. His chief importance for our purpose resides in the fact that he was the teacher of the Florentine Giotto.

If the artists just referred to represent a revived classicism rather than a fresh and independent study of nature, Giotto is essentially a creation of the Gothic movement and his close association with the Franciscan cycle of ideas brings this fact into clearer relief. Giotto is in no way dependent on the study of the antique, but relies on his own steady and penetrating outlook upon man and upon nature. He was a Gothic in his humanity, his sympathy, his love of truth, and he incorporates in his own person many of the most pleasing qualities of Gothic art as it had already manifested itself in France, while by the force of his own individual genius he raises these qualities to a higher level of artistic expression.

In the work of Giotto painting begins to enter on its modern era. The demonstrative element permanently takes the pre-eminence over the more decorative element we have called pattern-making. Though the pattern is always present, the elements of it become of increasing value in themselves as representations of nature, and the tendency henceforward for a couple of centuries is to exaggerate their importance so that the general decorative effect becomes subordinate. Giotto's greatness lay in the fact that he was possessed of holding the balance even among opposed artistic qualities. If he was interesting and convincing as a narrator, he had a fine eye at the same time for composition and balanced his masses with uncanny tact. Neither he nor any of the Florentine frescoists had much sense of colour, and at this stage of the development of painting compositions of light and shade were not thought of, but in line and mass he pleases the eye as much as he satisfies the mind by his clear statement of the meaning and intention of his figures and groups.

In putting these together he is careful above all things to make them tell their story, and primitive as he is in technique he is as accomplished in this art as Raphael himself. Moreover, he had already discovered the tendency of the human race among his countrymen as among the Germans, to over-emphasis of action and expression, and the grace and self-restraint which are among the most precious of artistic qualities. He never sacrifices beauty to force, nor on the other hand does he allow his sense of grace of line to weaken the telling effect of action or grouping. A good example of his style, and one interesting also from the comparative standpoint, is his fresco of "Herod's Birthday Feast" in S. Croce at Florence (fig. 13, Plate IV.). We contrast it with the earlier wall-painting of the same subject in the cathedral at Brunswick (fig. 11, Plate III.). Giotto has reduced the number of actors to the minimum necessary for an effective presentation of the scene, but has charged each figure with meaning, and has given it an actual place in the composition, as well as merely for form. The flatness of the older work has already been exchanged for an effective, if not yet fully correct, rendering of planes. The justice of the actions and expressions will at once strike the observer.

The Florentine school as a whole looks to Giotto as its head, because he embodies all the characteristics that made it great; but at the same time the artists that came after him in most cases failed by over-emphasis of the demonstrative element, and sacrificed beauty and sentiment to vigour and realism. The school as a whole is markedly intellectual, and as a result is at times prosaic, from which fault Giotto himself was saved by his Gothic tenderness and romance. His personality was so outstanding that it dominated the school for nearly a century. The "Giotteschi" is a name given to a number of Florentine painters whose labours cover the rest of the 14th century among whom only one, Andrea di Cione, called Orcagna, lifted himself to any real eminence.

At Siena the Gothic movement made itself felt in the next artist to generation after that of Duccio. Its chief representative was Simone Martini. With him Sienean art takes upon itself a character contrasting markedly with the Florentine. It is on the demonstrative side less intellectual, less vigorous, less secular; and a dreamy melancholy, a tenderness that is a little sentimental, take the place of the aliveness and force with which the personages in Florentine frescoes are endowed. On the other hand, in decorative feeling, especially in regard to colour, Sienean painting surpasses that of the Florentines. Simone was followed by a number of artists who answered to the Florentine "Giotteschi" and carry on the style through the century, but as Florence produces an Orcagna, so at Siena about the middle of the 14th century there appear in the brothers Lorenzetti two artists of exceptional vigour, who carry art into new fields. Ambrogio Lorenzetti, the younger of the brothers, is specially represented by some frescoes in the Public Palace at Siena of a symbolical and didactic kind, representing Good and Bad Government, from which is selected a figure representing Peace (fig. 14, Plate V.). Sienean sentiment is here very apparent.

Simone Martini's masterpiece had been a great religious fresco of an edifying kind on the wall of the chapel, and now in the rooms devoted to the secular business of the city Lorenzetti covers the walls with four large compositions on the subject named.

The painters of the Sienean school were on the whole faithful to the style indicated, and later on in the century they extend these features of the Sienese type in their imitations of the hill country of Umbria. In the cities of this region Taddeo di Bartoli, one of the best of the followers of Simone, worked about the end of the century, and early Umbrian art in consequence exhibits the same devotional character, the same dreaminess, the same grace and decorative charm, that are at home in Siena.

Elsewhere in Italy the art of the 14th century represents a general advance beyond the old medieval standard, but no outstanding personality made its appearance and there was nothing that can be strictly termed a revival. At Rome, where on the foundation of the noble design of Cavallini there might have been reared a promising artistic structure, the removal early in the 14th century of the papal court to Avignon in France led to a cessation of all effort.

The Fifteenth Century, and its Influence on the Development of Painting at Florence.—We come now to what was indicated in § 4 as the third of the main periods into which the history of painting may be divided. It is that in which, by the aid of the new agency of perspective, truth of form was for the first time perfectly mastered, and an advance was made in the rendering of the truth of space.

The opening of the 15th century in Italy is the most important epoch in the whole history of painting, for it was the real beginning of the modern era. Here Florence, the first home of Renaissance culture, unmistakably assumes the lead, and the new era is again opened by the agency of an individual of genius. The father of modern painting is the Florentine Masaccio. He not only established the new method and had it already made it great, but pointed the way towards the representation of the third dimension of objects and of space as a whole which had for so long been almost ignored. His short life course, for he died before he was thirty, only allowed him to execute one work of the first importance, the frescoes in the Brancacci chapel of the Carmine at Florence. There in the "Tribute Money" he told the story with all Giotto's force and directness, but with an added power in the creation of exalted types of human character, and in the presentation of solid shapes that seem to live before us. In the "Expulsion from Eden" he rose to greater heights. In the whole range of demonstrative art no more convincing, more moving, figures have ever been created than those of his first parents. Adam veiling his face in his hands, Eve throwing back her head and wailing aloud in agony, while in the foreshortened form of the angel that hovers above we
discern the whole future development of the art for a century to
come (see fig. 15, Plate V.). Above all qualities in Masaccio's
work we are impressed with the simplicity and the ease of the
work. The youthful artist possessed a reserve of power that,
had he lived, would have carried him at one bound to heights
that it took his actual successors in the school well nigh a
century to reach.

The 15th century at Florence presents us the picture of a
progressive advance on the technical side of art, in the course
of which various problems were attacked and one by one
vanquished, till the form of painting in the style recognized in
the school was finally perfected, and was then handed on to the great
masters of expression, such as Raphael and Michelangelo, who
used it as the obedient instrument of their wills. The efforts
of the artists were inspired by a new intellectual and social
movement of which this century was the scene. If the Gothic
movement in the 14th century had inspired Giotto and Simone
Martini, now it was the revived study of the antique, the true
Renaissance, that was behind all the technical struggles of the
artists. Painting was not, however, directly and immediately
affected by the study of antique models. This was only one
symptom of a general stir of intellectual life that is called by the
apt term "humanism." In the early Gothic epoch the move-
ment had been also in the direction of humanity, that is to say,
softness in manners and of the amenities and graces of life,
but it was also a strictly religious movement. Now, in the 15th
century, the inspiration of thought was rather pagan than
Christian, and men were going back to the ideas and institutions
of the antique world as a substitute for those which the Church
had provided for thirty generations. The direct influence of
these studies on art was chiefly felt in the case of architecture,
which they practically transformed. Sculpture was influenced
to a lesser degree, and painting least of all. It is not till the
century was pretty far advanced that classical subjects of a
mythological kind were adopted by artists like Botticelli and
Piero de Cosimo, the first figures borrowed from the antique
world being those of republican worthies displayed for purposes
of public edification.

The elements which the humanistic movement contributed
Florentine art are the following: (1) The scientific study of
perspective in all its branches, linear and aerial, including the
science of shadows. (2) Anatomy, the study of the nude form
both at rest and in action. (3) Truth of fact in details in
animate and inanimate subjects. (4) The technique of oil
painting. It must be observed that in this work the Florentines
were joined by certain Umbrians, who were not misled by
the Umbro-Sienese tradition already spoken of, but allied
themselves with the leaders of the advance who were fighting
under the banner of Masaccio.

Of the studies mentioned above by far the most important
was that of perspective. Anatomy and realism in details only
represented an advance along the lines painting had been
already following. The new technique of oil painting, though
of immense importance in connexion with the art as a whole,
affected the Florentines comparatively little. Their favourite
form of painting was the mural picture, not the self-contained
panel or canvas for which the oil medium was specially designed,
and for mural work fresco remained always supreme (see Part III.,
§ 35). In this mural work the introduction of scientific perspec-
tive effected something like a transformation. The essence
of the work from the decorative point of view had been its flatness.
It was primarily pattern-making, and nature had been represented
by contours which stood for objects without giving them their full
dimensions. When the artist began to introduce varying planes
of distance and to gain relief by light and shade, there was at
once a change in the relation of the picture to the wall. It no
longer agreed in its flatness with the facts of the surface of which
it formed the enrichment, but opposed these by its suggestion
of depth and distance. Hence while painting as a whole
advanced enormously through this effort after the truth of space,
yet decorative quality in this particular form of the art propor-
tionately suffered.

The study of perspective owed much to the architect and
scholar Brunelleschi, one of the oldest as well as ablest of the men
in whom the new movement of the 15th century was embodied.
Brunelleschi taught all he knew to Masaccio, for whose genius
he felt strong admiration; but the artist in whom the result of the
new study is most obviously is Paolo Uccello, a painter of
much power, who was born as early as 1397. Uccello, an
extant works testify, sometimes composed pictures mainly
with a view to the perspective effects for which they furnished
the opportunity. See fig. 16, Plate V., where in a fresco of a
cavalry skirmish he has drawn in foreshortened view the figure
of a warrior prone on the ground, as well as various weapons
and other objects under the feet of the horses. A fresco of "The
 Flood" at Florence is even more naive in its parade of the
painter's newly won skill in perspective science. The intar-
ists, or workers in inlaid woods, who were very numerous in Florence,
also adopted perspective motives for their designs, and these
testify to the fascination of the study during all the last part
of the century and the beginning of the next.

The advance in anatomical studies may be illustrated in
the person of Antonio Pollaiuolo. Masaccio had been as great
in this department of the painter's craft as in any other; and in
the Adam and Eve of the "Expulsion," and the famous nudes
shown in the fresco of "Peter Baptizing," he had given the
truth of action and expression as few have been able to render it;
but in the matter of scientific accuracy in detail more anatomical
study was needful, and to this men like Pollaiuolo now devoted
themselves. Pollaiuolo's "Martyrdom of St Sebastian," in
the London National Gallery, is a very notable illustration of the
efforts which a conscientious and able Florentine of the
period would make to master these problems of the scientific
side of art. (See fig. 17, Plate V.)

On the other hand, it is a fact that many of the men of this group it was not a
Florentine but the Umbrian Piero de' Franceschi that represents the
greatest achievement on the formal side of art. His theoreti-
cal studies were profound. He wrote a treatise on perspective,
representing an advance on the previous treatment of the
science by Alberti; and to this study of linear perspective Piero
united those of aerial perspective and the science of shadows. A
fresco of his at Arezzo entitled the "Dream of Constantine"
is epoch-making in presenting a night effect into the midst of
which a bolt of celestial radiance is hurled, the incidence of which
on the objects of the various planes of the picture has been care-
fully observed and accurately reproduced. (See fig. 18, Plate V.)
Piero ended his scientific accomplishments to a pupil,
also an Umbrian Florentine, Luca Signorelli of Cortona.
He achieved still greater success than Pollaiuolo in the
rendering of the nude form in action, but more conspicuously
than any others of this group he sacrificed beauty to truth,
and the nudes in his great series of frescoes on the Last Things
at Orvieto are anatomized like écorchés, and are in colour and
texture positively repellent. Luca's work is, however, of his
historical importance as leading on to that of Michelangelo.

A great power in the Florentine school of the 15th century
was Andrea del Castagno, an artist with much of the vigour, the
feeling for the monumental, of Masaccio, but without Masaccio's
saving gift of suavity of treatment. He is best represented by
some single figures representing Florentine worthies, whom he
has painted as if they were statues in niches. They formed
part of the decoration of a villa, and are noteworthy as wholly
secular in subject. There is a massiveness about the forms
which shows how thoroughly the 15th century Florentines were
mastering the representation of solid objects in all their three
dimensions. Other painters attracted attention at the time for
their realistic treatment of details. Vasari singles out Alessio
Baldovinetti.

The importance for art of the Florentine school of the 15th
century resides in these efforts for the perfection of painting
on the formal side, which its representatives were themselves
making and were inspiring in others. The general historian
of the art will dwell rather on this aspect of the work of
the school than on the numerous attractive features it offers to the

superficial observer. The Fra Angelico, the Filippo Lippi, the Benozzo Gozzoli, the Botticelli, the Filippino Lippis of the century express pleasantly in their work various phases of feeling, devotional, idyllic or prescriptive, and enjoy a proportionate popularity among the lovers of pictures. Exigencies of space preclude anything more than a mention of their names, but a sentence or two must be given to a painter of the last half of the century who represents better than any other the perfection of the monumetal style in fresco painting. This painter is Ghirlandajo, to whom is ascribed a characteristic saying: When disturbed in hopes of work about some domestic affair he exclaimed: "Trouble me not about these household matters; now that I begin to comprehend the method of this art I would fain they gave me to paint the whole circuit of the walls of Florence with stories." Ghirlandajo was entering into the heritage of technical knowledge and skill that had been laboriously acquired by his countrymen and their Umbrian comrades since the beginning of the century, and he spread himself upon the plastered walls of Tuscan churches with easy copiousness, in works which give us a better idea than any others of the time of how much can be accomplished in a form of art of the kind by sound tradition and a businesslike system of operation.

The mural painting of Ghirlandajo represents in its perfection one of the finest achievements of art. The effect is due to an extraordinary simplification of a nature and color-washes were the natural finish of the lime plaster on the wall, and that these were arranged in a colour-pattern pleasing to the eye. The demonstrative element, that is, the significance of these patches of colour as representations of nature, was however in the eyes of both painter and public the matter of primary importance, and this sense of nature was now carried as far as knowledge of anatomy and linear perspective rendered possible. Objects were rendered in their dimensions and were properly set on their planes and surrounded with suitable accessories, while aerial perspective was only drawn on to give a general sense of space without the eye being attracted too far into the distance. As a specimen of the monumental style nothing can compare with the "Burial of S. Fina" at S. Gimignano in Tuscany (see fig. 19, Plate V.). We note with what architectural feeling the composition is balanced, how simple and monumental is the effect.

§ 16. The Fifteenth Century in the other Italian Schools.—It has already been noticed that the painting of the 14th century in the Umbrian cities was inspired by that of Siena. Through the 15th century the Umbrian school developed on the same lines. Its artists were as a whole to express the placid religious sentiment with which the Siensie had inspired them, and advanced in technical matters almost unconsciously, or at any rate without making the pronounced efforts of the Florentines. While Piero de' Franceschi and Luca Signorelli vied with the most ardent spirits among the Florentines in grappling with the formal problems of the art, their countrymen generally preserved the old flatness of effect, the quiet poses, the devout expressions of the older school. This Umbro-Sienese art produced in the latter part of the century the typical Umbrian painter Perugino, whose chief importance in the history of his art is the fact that he was the teacher of Raphael.

An Umbrian who united the suavity of style and feeling for beauty of the Peruginesques with a daring and scientific mastery that were Florentine was Piero de' Franceschi's pupil, Melozzo da Forli. His historical importance largely resides in the fact that he was the first master of the so-called Roman school. As was noticed before in connection with the early Roman master, Pietro Cavallini, the development of the native Roman school was checked by the departure of the papal court to France for the best part of a century. After the return, when affairs had been set in order, the popes began to gather round them artists to carry out various extensive commissions, such as the decoration of the walls of the newly-erected palace chapel of the Vatican, called from its founder the Sistine. These artists were not native Romans but Florentines and Umbrians, and among them was Melozzo da Forli, who by taking up his residence permanently at Rome became the founder of the Roman school, that was afterwards adorned by names like those of Raphael and Michelangelo.

In the story of the development of Italian painting Melozzo occupies an important place. He carried further the notion of a perspective treatment of the figure that was started by Masaccio's angel of the "Expulsion," and preceded Correggio in the device of representing a celestial event as it would appear to a spectator who was looking up at it from below.

Franceschi, with his two pupils Luca Signorelli and Melozzo, are the most important figures in the central Italian art of the formative period. There is one other artist in another part of Italy whose personality bulks more largely than even theirs, and who, like them a disciple of the Florentines, excelled the Florentines in science and power, and this is the Paduan Mantegna.

We are introduced now to the painters of north Italy. Their general character differs from that of the Umbro-Sienese school in that their work is somewhat hard and sombre, and wanting in the naive and tenderness of the masters who originally drew their inspiration from Simone Martini. Giotto had spent some time and accomplished some of his best work at Padua in the earliest years of the 14th century, but his influence had not long endured. The earliest of the Umbrians who were to become prominent in the first half of the 15th century, was again brought to it by Donatello and Paolo Uccello, who were at work there shortly before 1450. At that time Andrea Mantegna was receiving his first education from a painter, or rather impresario, named Francesco Squarcione, who directed his attention to antique models. Mantegna learnt from Donatello a statuesque feeling for form, and from Uccello a scientific interest in perspective, while, acting on the stimulus of his first teacher, he devoted himself to personal study of the remains of antique sculpture which were common in the Roman cities of north Italy. Mantegna built up his art on a scientific basis, but he knew how to give the form a soul. His own personality was one of the strongest that we meet with in the annals of Italian art, and he stamped this on all he accomplished. No figures stand more firmly than Mantega's, none have a more plastic fullness, in none are details of accoutrement or folds of drapery more clearly seen and rendered. The study of antique remains supplied him with a store of classical details that he uses with extraordinary accuracy and effectiveness in his representations of a Roman triumph, at Hampton Court. Ancient art invested, too, with a certain austere beauty its forms of women or children, and in classical nudes there is a firmness of modelling, a suppleness in movement, that we look for in vain among the Florentines. Fig. 20, Plate VI., which shows a dance of the Muses with Venus and Vulcan, is typical. Mantegna was not only a great personality, but he exercised a powerful and wide-reaching influence upon all the art of north Italy, including that of Venice. His perspective studies led him in the same direction as Melozzo da Forli, and in some decorative paintings in the Camera degli Sposi at Mantua he pointed out the way that was afterwards to be followed by Correggio.

Mantegna's relations with the school of Venice introduce us to the most important and interesting of all the Italian schools save that of Florence. Venetian painting occupies a position by itself that corresponds with the place and history of the city that gave it birth. The connexions of Venice were not with the rest of Italy, but rather with the East and with Germany. Commercially speaking, she was the emporium of trade with both. Into her markets streamed the wealth of the Orient, and from her markets this was transferred across the Alps to cities like Nuremberg. From Germany had come a certain Gothic element into Venetian architecture in the 14th century, and a little later an influence of the same kind began to affect Venetian painting. Up to that time Venice had depended for her painters on the East, and had imported Byzantine Madonna pictures, and called in Byzantine mosaic-workers to adorn the walls and roof of her metropolitan church. The first sign of native activity is to be found at Murano, where,
in the first half of the 15th century, a German, Justus of Altemagna, worked in partnership with a Venetian family. A little later a stranger from another quarter executes important commissions in the city of the lagoons. This was an Umbrian, Gentile da Fabriano, who possessed the suavity and tenderness of his school.

The natural tendency of Venetian taste, nourished for centuries on opulent Oriental stuffs, on gold and gems, ran in the direction of what was soft and pleasing to the sense. The northern Gothic and the Umbrian influences corresponded with this and flattened the natural tendency of the people. For the proper development of Venetian painting some elements of Florence's strength and Venice was absolutely necessary, and this was imparted to the Venetian school by Mantegna through the medium of the Bellinis.

The Bellini were a Venetian family of painters, of whom the father was originally an assistant to Gentile da Fabriano, but lived for a while at Padua, where his daughter Nicolisa became the wife of Mantegna. With the two Bellini sons, Gentile and Giovanni, Mantegna became very intimate, and a mutual influence was exercised that was greatly to the benefit of all. Mantegna softened a little what had been termed his "iron style," through the assimilation of some of the suavity and feeling for beauty and colour that were engrained in the Venetians, while on the other hand Mantegna imparted some of his own sternness and Florentine science to his brothers-in-law, of whom the younger, Giovanni, was the formative master of the later Venetian school.

§ 17. The Painting of the Sixteenth Century: the Mastery of Form.—If we examine a drawing of the human figure by Raphael, Michelangelo, or Correggio, and compare it with the finest examples of Greek figure design on the vases, we note at once that to the ancient artist the form presented itself as a silhouette, and he had to put constraint on himself to realize its depth; whereas the moderns, so to say, think in the third dimension of space and every touch of their pencil presupposes it. The lovely "Aphrodite riding on a Swan," on the large Greek kylix in the British Museum, is posed in an impossible position between the wing of the creature and its body, where there would be no space for her to sit. The lines of her figure are exquisite, but she is pure contour, not form. In a Raphael nude the strokes of the chalk come forward from the back, bringing with them into relief the rounded limb which grows into plastic fullness before our eyes. Whether the parts recede or approach, or sway from side to side, the impression on the eye is equally clear and convincing. The lines do not merely limit a surface but caress the shape and model it by their very direction and comparative force into relief. In other words, these 16th-century masters for the first time perfectly realize the aim which was before the eyes of the Greeks; and Raphael, who in grace and truth and composition may have been only the peer of Apelles, probably surpassed his great predecessor in this easy and instinctive rendering of objects in their solidity.

In so far as the work of these masters of the culminating period, in its relation to nature, is of this character it needs no further analysis, and attention should rather be directed to those elements in Italian design of the 16th-century which have a special interest for the after development of the art.

Not only was form mastered as a matter of drawing, but relief was indicated by a subtle treatment of light and shade. Foreshortening as a matter of drawing requires to be accompanied by correct modulation of tone and colour, for as the form in question recedes from the eye, changes of the most delicate kind in the illumination and hue of the parts present themselves for record and reproduction. The artist who first achieved mastery in these refinements of chiaroscuro was Leonardo da Vinci, while Correggio as a colourist added to Leonardesque modelling an equally delicate rendering of the modulation of local colour in relation to the incidence of light, and the greater or less distance of each part from the eye. This represented a great advance in the rendering of natural truth, and prepared the way for the masters of the 17th century. It is not only by linear perspective, or the progressive diminution in size of objects as they recede, that the effect of space and distance can be compassed. This depends more on what artists know as "tone" or "values," that is, on the gradual degradation of the intensity of light and shadow, and the diminishing saturation of colours, or, as we may express it in a word that is not however quite adequate, aerial perspective. That which Leonardo and Correggio had accomplished in the modelling, lighting and tinting of the single form in space had to be applied by succeeding artists to space as a whole, and this was the work not of the 16th but of the 17th century, and not of Italians but of the masters of the Netherlands and of Spain.

§ 18. The Contribution of Venice.—Before we enter upon this fourth period of the development of the art, something must be said of an all-important contribution that painting owes to the masters of Venice.

The reference is not only to Venetian colouring. This was partly, as we have seen, the result of the temperament and circumstances of the people, and we may ascribe also to the peculiar position of the city another Venetian characteristic. There is at Venice a sense of openness and space, and the artists seem anxious on their canvases to convey the same impression of a large entourage. The landscape background, which we have already found on early Flemish panels, becomes a feature of the Venetian style of the third quarter of the century. There, the Venetians, who had often been called the "imitators of the Greeks," become the "imitators of the Flems" and treat their spaces in a broader and simpler fashion. An indispensable condition however for the rich and varied effects of colour shown on Venetian canvases was the possession by the painters of an adequate technique. In the third part of this article an account is given of the change in technical methods due, not so much to the introduction of the oil medium by the Van Eycks, as to the exploitation at Venice of the unsuspected resources which that medium could be made to afford. Giovanni Bellini, not Hubert van Eyck, is really the primal painter in oils, because he was the first to manipulate it with freedom, and to play off against each other, the various effects of opaque and transparent pigment. His noble picture at Murano, representing the Doge Barbarigo adoring the Madonna, represents his art at its best (see fig. 21, Plate VII.).

Bellini rendered possible the painters of the culminating period of Venetian art, Giorgione, Titian, Tintoretto, with others hardly less great. Giorgione was the first who made the art, as an art of paint not merely of design, speak to the soul. His melting outlines and the crisp clean touches that wake the piece to life; his glowing hues and the nearly neutrals that give them repose and quality; the intimate appeal of his dreamy faces, his refined but voluptuous forms, and the large freedom of his spaces of sky and distance, all combine to impress us with a sense of the poetry and mystery of creation that we derive from the works of no other extant painter. The "Concert" of the Louvre, fig. 22, Plate VII, is typically Giorgionesque.

Tintoretto, more intellectually profound, more passionate, writes for us his message in his stormy brush-strokes, now shaking us with terror, now lifting our souls on the wings of his imagination; but with him as with the younger master it is always the painter who speaks, and always in the terms of colour and texture and handling. Lastly, between the two, unapproachable in his majestic calm, stands Titian. Combining the poetry of Giorgione with much of Tintoretto's depth and passion, he is the first, and still perhaps the greatest, of the supreme masters of the painter's art. His masterpiece is the great "Presentation" of the Venice Academy, fig. 23, Plate VII. Painting, it is true, has to advance in its development beyond the ideals of Titian's century, but it loses on the ethical side more than on the technical side it wins, and without the Venetians the world would have never known the full possibilities of the art that began so simply and at so early a stage of human civilization.

§ 19. The Fourth Period: the Realization of the Truth of Space. Changed Relation of Painting to Nature.—By the 17th century the development of painting had passed through all its stages, and the picture was no longer a mere silhouette or a transcript
PAINTING

of objects against a flat background, but rather an enchanted mirror of the world, in which might be reflected space beyond space in infinite recession. With this transformation of the picture there was connected a complete change in the relation of the artist to nature. Throughout all the earlier epochs of the art that painter had concerned himself not with nature as a whole, but with certain selected aspects of nature that furnished him with his recognized subjects. These subjects were selected on account of their intrinsic beauty or importance, and as representing intrinsic worth they claimed to be delineated in the clearest and most substantial fashion. In the 17th century, not only was the world as a whole brought within the artist's view, but the darker and more elusive parts of his most reverent attention. In other words the art of the 17th century, and of the modern epoch in general, is democratic, and refuses to acknowledge that difference in artistic value among the aspects of nature which was at the basis of the essentially aristocratic art of the Greeks and Italians. It does not follow that selection is of any less importance in modern painting than it was of old; the change is that the basis of selection is not now a fixed intrinsic gradation amongst objects, but rather a variable difference dependent not on the object itself but on certain accidents of its position and lighting. The artist still demands that nature shall inspire him with her beauty, but he has learned that this beauty is so widely diffused that he may find it anywhere.

It may be remembered that John Constable, in his "Modern Painters," said the following of the "naturalist": 'What a strange system of eyes, that large number of unnecessary eyes in nature, for, as he explained it, let the actual form and character of an object be what it would, the angle at which it might be viewed, and the effect upon it of light and colour, could always make it beautiful. It is when objects and groups of objects have taken on themselves this pictorial beauty, which only the artistically trained eye can discern, that the modern painter finds himself in the presence of his "subject," and he knows that this magical play of beauty may appear in the most casual and unlikely places, in mean and squarish corners, and upon the most ordinary objects of daily life. Sometimes it will be a heap of litter, sometimes a maiden's face, that will be touched with this pictorial charm. Things to the common eye most beautiful may be barren of it, while it may touch and glorify a clod.'

The artist who was the first to demonstrate convincingly this principle of modern painting was Rembrandt. With Rembrandt the actual intrinsic character of the object before him was of small concern. Beauty was with him a matter of surface effect that depended on the combined influence of the actual local colour and superficial modelling of objects, with the passing condition of their lighting, and the greater or less clearness of the air through which they were seen. Behind the effect produced in this fortuitous fashion the object in itself vanished, so to say, from view. It was appearance that was important, not reality. Rembrandt's art was related essentially not to things as they were but as they seemed. The artists of the 18th century, whose careful delineation of objects gives them the title of the earlier realists, portrayed these objects in precise analytical fashion each for itself. More advanced painters regarded them not only in themselves but in their artistic relations as combining beauties of form and colour that together made up a pictorial effect. Rembrandt in his later work attended to the pictorial effect alone and practically annulled the objects, by reducing them to pure tone and colour. Things are not there at all, but only the semblance or effect of "impression" of things. Breath is in this way combined with the most delicate variety, and a new form of painting, now called "impressionism," has come into being.

To give back nature just as she is seen, in a purely pictorial aspect, is the final achievement of the painter's craft; but as the different aspects of nature and colour on its own account are extremely subtle, it is only by a skill of touch that seems like the most accomplished sleight of hand that the required illusion can be produced, and in this way the actual handling of the brush assumes in modern painting an importance which in the old days it never possessed. The effect is produced not by definite statements of form and colour, but by what Sir Charles Eastlake termed "the judicious unfinished of a consummate workman," through which "the flat surface is transformed into space." Frans Hals of Haarlem, who was born in 1580, was perhaps the first to reveal the artistic possibilities of a free suggestive handling in oil paint, and Van Dyck is said to have marvelled how Hals was able to sketch in a portrait "with single strokes of the brush, each in the right place, without altering them and without fusing them together." In the wonderful late Velazquez at Vienna, the portrait of the Infant Philipp Prosper as a child of two years old, the white drapery, the minute fingers, the delicate face from which look out other eyes, which are all indicated with touches so loosely thrown upon the canvas that seen near by they are all confusion—yet the life and truth are in them, and at the proper focal distance nature herself is before us. The touches combine to give the forms, the local colours, the depth, the solidity of nature, while at the same time the chief impression they convey is that of the opalescent play of changing tones and hues which, eluding the limitations of definite contours, make up to the painter's eye the chief beauty of the external world. Moreover it will be understood that this realization of the truth of space, which is the distinguishing quality of modern painting, does not mean that the artist is always to be rendering large views of sky and plain. The gift of setting objects in space, so that the artist can say, "Hals!" and have them, all indications and surroundings are absolutely correct and convincing, is shown just as well in a group of things close at hand as in a wide landscape. The backgrounds in the pictures by Velazquez of "The Surrender of Breda" and "Don Baltazar Carlos" at Madrid are magnificent in their limitless suggestion of the free spaces of earth and sky, but the artist's power in this respect is just as effectively shown in the creation of space in the interiors of "The Maids of Honour" and the "Spinners," and the skill with which he brings away the hand of the sitter from his white robe, in the "Innocent X." of the Doria Palace at Rome. The fact is that the scale on which the modern painter works, and the nature of his subjects, make no difference in the essential character of the result. A very few square feet of canvas were insufficient for Rubens to convey in his "Haarlem from the Dunes" the most sublime impression of infinity; and a Dutch interior by De Hooch gives us just as much feeling of air and distance as one of the vast panoramic landscapes of De Konink or Rubens.

§ 20. Impressionism.—The term "impressionism," much heard in artistic discussions of to-day, is said to date from a certain exhibition in Paris in 1871, in the catalogue of which the word was often used; a picture being called Impression de mon pot-a-feu, or Impression d'un chat qui se promène, &c. An influential critic summed up these impressions, and dubbed the exhibition "Salon des Impressionistes" (Muther, Modern Painting, 1896, ii. 718). It is a mistake however to suppose that the style of painting denoted by this term is an invention of the day, for, in so far as it is practised seriously and with adequate artistic powers, it is essentially the same style as that of some of the greatest 17th-century masters, such as Rembrandt and Velasquez. Modern investigation into the reasons of things has provided the system with a scientific basis and justification, and we can see that it really corresponds with the experimentally determined facts of human vision. The act of "seeing" may mean one or two different things. We may (1) allow our glance to travel leisurely over the field of vision, viewing the objects one by one, and forming a clear picture to ourselves of each in turn; or (2) we may try to take in the whole field of vision at a glance, ignoring the special objects and trying to frame before ourselves a view of the whole; or again we may (3) select a single point in the field of vision, and focus on that our attention, allowing the surrounding objects to group themselves in an indistinct general mass. We can look at nature in any one of these three ways; each is as legitimate as the others; but since in most ordinary cases we look at things in order to gain information about them, our vision is usually of the first or
analytical kind, in which we fix the objects successively, noting each by each their individual characters. As the object of painting is to reproduce what is seen as we see it, so in the majority of cases painting corresponds to this, our usual way, of viewing nature. That is to say, all painters of the early schools, and the majority of painters at all times, represent nature in a way that answers to this analytical vision. The treatment of groups of objects in the mass, though, as we have seen, occasionally essayed even in ancient times (see §§ 8, 9), does not become the painter’s ideal till the 17th century. We find then, and we find here and there among all the later periods of the art, efforts on the part of the artist to reproduce the effect of vision of the other two kinds, to show how objects look when regarded all together and not one by one, or how they look when we focus our attention on one of them but notice at the same time how all the others that are in the field of vision group themselves round in a penumbra, in which they are seen and yet not seen. The special developments of impressionistic art in recent times in France and England are dealt with in the article on IMPRESSIONISM (see also the appendix to this article on Recent Schools of Painting), but it is mentioned here as a style of painting that is the logical outcome of the evolution of the art which has been traced from the earliest times to the 17th century. For the particular pictorial beauty, on which the modern painter trains his eye, is largely a beauty of relation, and depends on the mutual effect on each other of the elements in a group. Unless these are looked at in the mass their pictorial quality will be entirely missed. The way in which corresponding to certain ways of looking at nature, is accordingly a necessary adjunct to the critique of modern painting since the 17th century.

§ 21. Painting in the Modern Schools.—The history of the art has been presented here as an evolution, the ultimate outcome of which was the impressionist painting of 17th-century masters such as Rembrandt and Velasquez. In this form of painting the artist is only concerned with those aspects of nature which give him the sense of pictorial beauty in tone and colour, and these aspects he reproduces on his canvas, not as a mere mirror would, but touched, pervaded, transfigured by his own artistic personality. It does not follow however that these particular ideals of the art have inspired modern painters as a body. No one who visits the picture exhibitions of the day, or even our galleries of older art, will fail to note that a good deal of modern painting since the 17th century has been academic and conventional, or prosaically natural, or merely popular in its appeal. With work of this kind we are not concerned, and accordingly, in the table (VIII.) which follows in Part II. of the article, the names with few exceptions are those of artists who embody the more radical aims that have been under discussion.

Of the schools of the 17th century that of Spain, owing much to the so-called Italian “naturalists,” produced the incomparable Velazquez with one or two notable contemporaries, and later on in the 18th century the interesting Goya; while the influence of Velasquez on Whistler and other painters of to-day is a more important fact connected with the school than the recent appearance in it of brilliant technical executants such as Fortuny.

The schools of Flanders and of France are closely connected, and both owe much to Italian influence. The land of Italy, rather than any works of Italian painters, has been the inspiration of the so-called classical landscapists, among whom the Lorrainer Claude and the French Poussin take the rank of captains of a goodly band of followers. In figure painting the Venetians inspire Rubens, and Raphael stands at the head of the academic draughtsmen and composers of “historical” pieces who have been especially numerous in France. Rubens and Raphael together formed Le Brun in the days of Louis XIV., David and Delaroche in the two succeeding centuries, and the modern decorative figure painters, such as Baudry, whose works adorn the public buildings of France. Flemish influence is also strong in the French painting in a gallant vein of the 18th century from the serious and beautiful art of Watteau (fig. 23, Plate VIII.) to the slighter productions of a Fragonard. Van Dyck, another Fleming of genius, is largely responsible for the British portraiture of the 18th century, which is affiliated to him through Kneller and Sir Peter Lely. There is something of the courtly elegance of Van Dyck in the beautiful Gainsborough at Edinburgh representing the Hon. Mrs Graham (fig. 25, Plate VIII.). On the whole, though the representative masters of these two schools are original, or at any rate personal, in technique, they are in their attitude towards nature largely dependent on the traditions established in the great Italian schools of figure-painting of the 16th century. The contrast when we turn from France and Flanders to Holland is extraordinary. This country produced at the close of the 16th century and in the first half of the 17th a body of painters who owed no direct debt at all to Italy, and, so far as appears, would have been what they were had Titian and Raphael and Michelangelo never existed. They took advantage, it is true, of the mastery over nature and over the material apparatus of painting which had been won for the world by the Italians of the 15th and 16th centuries, but there their debt to the peninsula ended, and in their outlook upon nature they were entirely original.

The Dutch school is indeed an epitome of the art in its modern phase, and all that has been said of this applies with special force to the painting of Holland. Democratic in choice of subject, subtle in observation of tone and atmosphere, refined in colour, free and yet personal in execution and yet perfect in finish, the Dutch painter of the first half of the 17th century represents the most varied and the most finished accomplishment in paint that any school can show. Such work as he perfected could not fail to exercise a powerful effect on later art, and accordingly we find a current of influence flowing from Holland through the whole course of modern painting, side by side with the more copious tide that had its fountain-head in Italy, Hogarth and Chardin and Morland in the 18th century, the Norwich painters and Constable in the 19th, with the French Barbizon landscapists who look to the last as their head, all owe an inestimable debt to the sincere and simple but masterly art of the countrymen of Rembrandt.

§ 22. The Different Kinds of Painting represented in the Modern Schools.—The fact that the Dutch painters have left us masterpieces in so many different walks of painting, makes it convenient that we should add here some brief notes on characteristic modern phases of the art on which they stamped the impress of their genius. The normal subject for the artist, as we have seen, up to the 17th century, was the figure-subject, generally in some connexion with religion. The Egyptian portrayed the men and women of his time, but the pictures, through their connexion with the sepulchre, had a quasi-religious significance. The Assyrian chronicled the acts of semi-divine kings. Greek artists, whether sculptors or painters, were in the majority of cases occupied with the doings of gods and heroes. Christian art, up to the 16th century, was almost exclusively occupied with devotional themes. In all this art, as well as in the more secular figure-painting of the modern schools, the personages represented, with their doings and surroundings, were of intrinsic importance, and the portrayal of them was in a measure an act of service and of honour. Portraiture is differentiated from this kind of subject-picture through stages which it would be interesting to trace, but the portrait, though secular, is always treated in such a way as to exalt or dignify the sitter. Another kind of figure-piece, also differentiated by degrees from the subject-picture of the loftier kind, is the so-called Genre Painting, in which the human actors and their goings-on are in themselves indifferent, trivial, or mean and even repellent; and in which accordingly, intrinsic interest of subject has disappeared to be replaced by an artistic interest of a different kind. Landscape, in modern times so important a branch of painting, is also an outcome of the traditional figure-piece, for at first it is nothing but a background to a scene in which human figures are prominent. Marine Painting is a branch of landscape art differentiated from this, but supplied at first in the same way with figure-interest.
Painting

The origin of Animal Painting is to be sought partly in figure-pieces, where, as in Egypt and Assyria, animals play a part in scenes of human life, and partly in landscapes, in which cattle, &c., are introduced to enliven the foreground. The Hunting Picture, combining a treatment of figures and animals in action with landscape of a picturesque character, gives an animalistic Rubens. The ideal character of Greek and later art, the occasional Dead Game may be regarded as its offshoot. This brings us to the important class of Still-Life Painting, the relation of which to the figure-piece can be traced through the genre picture and the portrait. As a natural scene in the background, so on the nearer planes, a judiciously chosen group of accessory objects adds life and interest to the representation of a personage or scene from human life. Later on these objects, when regarded with the eyes of an artist fully opened to the beauty of the world, become in themselves fit for artistic, eye, even ideal, treatment; and a Volon will by the magic of his art make the interior of a huge and polished copper caldron look as grand as if it were the very vault of heaven itself.

§ 25. Portraiture.—Attention has already been called in § 7 to the skill of the Egyptian artist in marking differences of species and race in animals and men. In the case of personages of special distinction, notably kings, individual lineaments were portrayed with the same freshness, the same accent of truth. There is less of this power among the artists of Assyria. The naturalism of Cretan and Mycenean art is so striking that we should expect to find portraiture represented among its remains, and this term may be fairly applied to the gold masks that covered the faces of bodies in the tombs opened by Dr Schliemann. In early (historical) Greek art some archaia vases show representations of named personages of the day, such as King Arkesilas of Cyrene, which may fall under the same heading, and portraiture was no doubt attempted in the early painted porphyry and alabaster. No portraiture in the background till the later period after Alex- ander the Great, whose effigy limned by Apelles was one of the most famous pictures in antiquity. Our collections of works of classical art have been recently enriched by a series of actual painted portraits of men and women of the late classical period, executed on mummy cases in Egypt, and discovered in Graeco-Egyptian cemeteries. An attempt has been made by comparison with coins to identify some of the personages represented with members of the Ptolemaic house; including the famous Cleopatra, but it is safer to regard them, with Flinders Petrie, as portraits of ordinary men and women of the earliest centuries A.D. Technically they are of the highest interest, as will be noticed in § 42. From the artistic point of view one notes their variety, their life-like character, as showing impressional of the human personality which some of them afford. There are specimens in the London National Gallery and British Museum.

During the early Christian and early medieval periods portraits always existed. The effigies of rulers appeared, for example, on their coins, and there are some creditable attempts at portraiture on Anglo-Saxon pieces of money. In painting we find the most continuous series in the illuminated MSS., where they occur in the so-called dedicatory pictures, in MSS. intended for royal or distinguished persons, where the patron is shown seated in state and perhaps receiving the volume. The object here, as Woltmann says, is always to try to be to give a true portrait of the exalted personage himself (Hist. of Painting, Eng. trans. i. 212). Julia Antioch, grand-daughter of Valentinian III., in the 6th century; the Carolingian emperor, Lothair, in the 9th; the Byzantine emperors, Basil II. in the 10th, and Nikephorus Botaniates in the 11th, &c., appear in this fashion. Some famous mosaic pictures in S. Vitale, Ravenna, contain effigies of Justinian, Theodora, and the Ravennees bishop, Maximian. In very many medieval works of art a small portrait of the donor or the artist makes its appearance as an accessory.

With the rise of schools of painting in the 14th and 15th centuries, especially in the north, the portrait begins to assume greater prominence. The living personage of the day not only figures as donor, but takes his place in the picture itself as one of the actors in the sacred or historical scene which is portrayed. A good deal of misplaced ingenuity has been expended in older and more modern days in identifying by guess-work historical figures in old pictures, but there is no doubt that such work was often introduced. Dante and some of his famous contemporaries make their appearance in frescoes ascribed to Giotto in the chapel of the Bargello at Florence. One is well with the face and form of the great Masaccio in the St Thomas with the red cloth, on the right of the group, in the fresco of the Tribute Money (see § 15). Dürer certainly paints himself as one of the Magi in his picture in the Uffizi. In Italy Ghirlandajo (see § 15) carried to an extreme this fashion, and thereby unduly secularized his biblical representations. The portrait proper, as an independent artistic creation, comes into vogue in the course of the 15th century both north and south of the Alps, and Jan van Eyck, Memlinc, and Dürer are in this department in advance of the Florentines, for whereas the latter almost confine themselves to flat profiles, Van Eyck introduces the three-quarter face view, which represents an improvement in the rendering of form. Mantegna and Antonello da Messina portray with great firmness, and to Uccello is ascribed an interesting series of portraits of his contemporaries. It is Gentile and Giovanni Bellini however who may be regarded as the fathers of modern portrait painting. Venetian art was always more secular in spirit than that of the rest of Italy, and Venetian portraits were abundant. Those by Gentile Bellini of the Sultan Mahoment II., and by Giovanni of the Doge Loredano are specially famous. Vasari in his notice of the Bellini says that the Venetian palaces were full of family portraits going back sometimes to the fourth generation. Some of the finest portraits in the world are the work of the great Venetians of the 16th century, for they combine pictorial quality with an air of ease and greatness which later painters find it hard to impart to their creations. Though greatly damaged, the Venetian portrait of Charles I. of England (Plate VIII.) is one of the very finest of existing works of the kind.

It is somewhat remarkable that of the other Italian painters who executed portraits the most successful was the idealist Raphael, whose papal portraits of Julius II. and Leo X. are masterpieces of firm and accurate delineation. Leonardo’s “Monna Lisa” is a study rather than a portrait proper.

The realistic vein, which, as we have seen, runs through northern painting, explains to some extent the extraordinary merit in portraiture of Holbein, who represents the culmination of the efforts in this direction of masters like Jan van Eyck and Dürer. Holbein is one of the greatest delineators that ever lived, and in many of his portraits he not only presents his sitter as a figure in contemporary costume but he brings with him, accessory objects, painted in an analytical spirit. His portraits are likenesses that has seldom been equalled. The portrait of Georg Gysius at Berlin represents this side of Holbein’s art at its best (fig. 27, Plate VIII.). Some fine portraits by Italianizing Flemings such as Antonio Moro (see Table I.) bring us to the notable masters in portraiture of the 17th century. All the schools of the period were great in this phase of the art, but it flowered more especially in Holland, where political events had developed in the people self-reliance and a strong sense of individuality. As a consequence the Dutch men and women of the period from about 1675 to 1675 were incessantly having their portraits painted, either singly or in groups. The so-called “corporation picture” was a feature of the times. This had for its subject some group that had been united in a company of a shoveler, or board or military mess. Such works are almost incredibly numerous in Holland, and their artistic evolution is interesting to trace. The earlier ones of the 16th century are merely collections of single portraits each treated for itself, the link of connexion between the various members of the group being quite arbitrary. Later on efforts, that were ultimately successful, were made to group the portraits into a single composition so that the picture became an artistic whole. Frans Hals of Haarlem, one of the most brilliant painters of the impressionist school that he did much to found, achieved remarkable success in the artistic
grouping of a number of portraits, so that each should have the desired prominence while yet the effect of the whole was that of a unity. His masterpieces in this department in the town-hall at Haarlem have never been equalled.

As portraitists the other great 17th-century masters fall into two sets, Rembrandt and Velazquez contrasting with Rubens and his pupil Van Dyck. The portraits of the two former are individualistic studies in which the sitter has been envisaged in an artistic aspect, retaining his personality though sublimated to a harmonious display of tone and colour. The Flemings are more conventional, and representing rather the type than the individual, are disposed to sacrifice the individuality of the sitter to their predetermined scheme of beauty. Both Velazquez and Rubens have left portraits of Isabel de Bourbon, first wife of Philip IV. of Spain, but whereas the Spaniard's version gives us an uncomely face but one full of character, that of the Fleming shows us merely the big-eyed buxom wench we are accustomed to meet on all his canvases. Rembrandt was much less careful than Velazquez or Holbein or Hals to preserve the individuality of the sitter. He did not however, like the Flemings, conventionalize to a type, but worked each piece into an artistic study of the sitter's character, to whom he might deal somewhat cavalierly with the actual facts of the piece of nature before him. The result, though incomparable in its artistic strength, may sometimes, in comparison with a Velazquez, seem laboured, but has one Rembrandt portraiture, that of Jan Six at Amsterdam, that is painted directly as a Hals, and with the subtlety of a Velazquez, while it possesses a richness of pictorial quality in which Rembrandt surpasses all his ancient or modern compers (see fig. 28, Plate IX.).

In the 18th century, though France produced some good limners and Spain Goya, yet on the whole England was the home of the best portraiture. Van Dyck had been in the service of Charles I., and foreign representatives of his style carried it into the tradition of his essentially courtly art, but there existed at the same time a line of native British portraitists of whom the latest and best was Hogarth. One special form of portraiture, the miniature (q.v.), has been characteristically English throughout. The greater English and Scottish portraitists of the latter part of the 18th century, headed by Reynolds, owed much to Van Dyck, and their work was of a pronounced pictorial character. Every portrait, that is to say, was before everything a work of art. Detail, either of features or dress, was not insisted on; and the effort was rather to generalize than to accentuate characteristic points. In a word, while the artist recognized the claims of the facts before him to adequate portrayal, he endeavoured to fuse all the elements of the piece into one lovely artistic unity, and so to be secured in his work the predominant quality of breadth. This style, handed on to painters of less power, died out in the first half of the 19th century in attenuated productions, in which harmony became emptiness. To this has succeeded in Britain, still the home of the best European portraiture, a more modern style, the dominant notes of which have been truth and force. While the older school was seen at its best when dealing with the softer forms of the female sex and of youth, these moderns excelled in the delineation of character in strongly-marked male heads, and some of them could hardly succeed with a woman's portrait. The fine appreciation of character in portraiture shown by Sir John Watson Gordon about the middle of the 19th century marked the beginning of this forcible style of the later Victorian period. Two former are to an age of keen intellectual activity, of science and of matter-of-fact. More recently still, with the rapid development in certain circles of a taste for the life of fashion and pleasure, the portrait of the showily-dressed lady has come again into vogue, and if any special influence is here to be discerned it may be traced to Paris.

§ 24. Genre Painting. The term "genre" is elliptical—it stands for genre bas, and means the "low style," or the style in which there is no grandeur of subject or scale. A genre piece is a picture of a scene of ordinary human life without any religious or historical significance, and though it makes its appearance earlier, it was in the Netherland schools of the first half of the 17th century that it was established as a canonical form of the art. In Egypt we have seen that the subjects from human life have almost always a quasi-religious character, and the earliest examples of genre may be certain designs on early black-figured vases of the 6th century B.C. in Greece. Genre painting proper was introduced at a later period in Greece, and attracted special attention because of its contrast to the general spirit of classical art. It had a special name about which there is some difficulty but which seems to denote the same as genre bas. In early Christian and early medieval painting genre can hardly be recognized, but it makes its appearance in some of the later illuminated MSS. and becomes more common, especially north of the Alps, in the 15th century. It really begins in the treatment in a secular spirit of scenes from the sacred story. These scenes, in Italy, but still more among the prosaic artists of the north, were made more life-like and interesting when they were furnished with personages and accessories drawn from the present world. Real people of the day were as we have just seen introduced as actors in the scriptural events, and in the same way all the objects and accessories in the picture were portrayed from existing models. It was easy sometimes for the spectator to forget that he was looking at biblical characters and at saints and to take the scene from the standpoint of actuality. Rembrandt, one of whose chief titles to fame is derived from his religious pictures, often treats a Holy Family as if it were a mere domestic group of his own day. It was a change sure to come when the religious significance was abandoned, and the persons and objects reduced to the terms of ordinary life. This of course represented a break with a very long established tradition, and it was only by degrees, and in Germany and Flanders rather than in Italy, that the change was brought about. Thus for example, St. 200, a famous example of Rembrandt's work, is a religious subject, but also as artificer with the impedimenta of the craft about him. The next stage, represented by a charming picture by Quintin Matsys at Paris, shows us a goldsmith, no longer a saint, but busy with the same picturesque accessories (fig. 29, Plate IX.). He has however his wife by his side and she is reading a missal which preserves to the piece a faint religious odour. Afterwards all religious suggestion is dropped, and we have the familiar goldsmith or money changer in his everyday surroundings, of which northern painting has furnished us with so many examples. 

Genre painting, however, is something a little more special than is here implied. The term must not be made to convey that all paintings by the late Italian "naturalists" of this kind; Caravaggio's "Card Players" at Dresden is a familiar example. These are too large in scale to come under this heading, and the same applies to the bodegones or pictures of kitchens and shops full of pots and pans and eatables, which, largely influenced by the Italian pictures just noticed, were common in Spain in the early days of Velazquez. Nor again are the large and showy subject pictures, which constitute the popular items in the catalogues of Burlington House and the Salon, to be classed as "genre." The genre picture, as represented by its acknowledged masters, is small in scale, as suits the nature of its subject, but is studied in every part and finished with the most fastidious care. The particular incident or phase of life portrayed is a rule of little intrinsic importance, and only serves to bring figures together with some variety of pose and expression and to motive their surroundings. It is rarely that the masters of genre charge their pictures with satiric or didactic purpose. Jan Steen in Holland and Hogarth in England are the exceptions that prove the rule. The interest is in the main an artistic one, and depends on the nice observance of relations of tone and colour, and a free and yet at the same time precise touch. All these qualities combine to lend to the typical genre picture an intimité, a sympathetic charm, that gives the masters of the style a firm hold on our affections. Probably the most

excellent painters of genre are Terborch, Metsu and Brouwer, the two first painters of the life of the upper classes, the last of peasant existence in some of its most unlovely aspects. The pictures of Brouwer are among the most instructive documents of modern painting. They are all small pictures and nearly all exhibit nothing but two or three boors drinking, fighting, or otherwise characteristically employed, but the artist's feeling for colour and tone, and above all his imitable touch, has raised each to the rank of a masterpiece. He is best represented in the Munich Pinacothek, from which has been selected fig. 30, Plate IX. Hardly less admirable are Teniers in Flanders: De Hooch, Ver Meer of Delft, Jan Steen, A. van Ostade, in Holland, while in more modern times Hogarth, Chardin, Sir David Wilkie, Meissonier, and a host of others carry the tradition of the Dutch school forward, doing in every way what had been done in the old days. Meissonier has the doubtful honour of having invented the sentimental figure-piece from ordinary life that delights the non-artistic spectator in our modern exhibitions.

§ 25. Landscape and Marine Painting. This is one of the most important and interesting of the forms of painting that belong especially to modern times. It is true that there is sufficient landscape in ancient art to furnish matter for a substantial book (Woermann, Die Landschaft in der Kunst der alten Völker, Munich, 1876), and the extant remains of Pompeian and Roman wall-painting contain a very fair proportion of works that may be brought under this heading. By far the most important examples are the hall-dozen or so of pictures forming a series of illustrations of the Odyssey, now in the Vatican library. These, of course, were executed at Rome in 1518, and are now in the Vatican. As we shall see it to have the case with the landscapes of the late medieval period, these have all figure subjects on the nearer planes to which the landscape proper forms a background, but the latter is far more important than the figures. In some of these Odyssey landscapes there is a feeling after space and atmospheric effect, and in a few cases an almost modern treatment of light and shade, which gives the works a prominent place among ancient productions which seem to prefigure the later developments of the art. In the rendering of landscape detail, especially in the matter of trees, nothing in antique art equals the pictures of a garden painted on the four walls of a room in the villa of Livia at Prima Porta near Rome. They are reproduced in Antike Denkmäler (Berlin, 1857, &c.). These may be the actual work of a painter of the Augustan age named Ludius or Studius, who is praised by Pliny (Hist. Nat. xxv. 116) for having introduced a style of wall decoration in which "villas, harbours, landscape, gardens, sacred groves, woods, hills, fish-ponds, straits, streams and shores, any scene in short that took his fancy" were depicted in lively and facile fashion. Pompeian wall paintings exhibit many pieces of the kind, and we find the same style illustrated in the low reliefs in modelled stucco, of which the specimens found near the Villa Farnesina, and now in the Terme Museum at Rome, are the best known.

In medieval painting landscape was practically reduced to a few typical objects, buildings, rocks, trees, clouds, &c., which stood for nature's discovery. Germany in particular came to the theory that landscapes are greater in pictorial fashion, as in a Byzantine Palter of the 10th century in the National Library at Paris. The beginning of the 16th century may be reckoned as the time when the modern development of landscape art had its origin, and Masaccio here, as in other walks of painting, takes the lead. Throughout the century the landscape background, always in strict subordination to the figure interest, is a common feature of Flemish and Italian pictures, but, in the latter especially, the forms of natural objects are very conventional, and the impression produced on the city-loving Tuscan or Paduan of the time by mountain scenery is shown by the fact that rocks are commonly shown not only as perpendicular but overhanging. Titian is the first painter who, as mountain-bred, developed the tendency towards lofty heights and affection (see the distance in fig. 22, Plate VII.), and the Venetians are the first to paint landscape with some breadth and sense of spaciousness, while, as we have seen, the Flemings, from Hubert van Eyck downwards, distinguish themselves by their minute rendering of details, in which they were followed later on by Dürer, who was fond of landscape, and by Altdorfer. Of Dürer indeed it has been said that some of his landscape sketches in water-colour are the first examples in which a natural scene is painted for its own sake alone. Some of the northern artists of the "Italianizing" school of the 16th century, such as Patinir, whom Dürer, about 1520, calls "Joachim the good landscape painter," Paul Bril later in the century, and Adam Elsheimer, who worked at Rome about 1600, with several of their contemporaries, must not be omitted in any sketch of the history of the art. South of the Alps, the late Italian Salvator Rosa treats the wilder aspects of nature with some imagination, power, and native feeling, but he may be said to be the pioneer of the modern development of landscape art in the 17th century, which was in part worked out in the Peninsula. What is known as "classical landscape" was perfected in the 17th century, and its most notable masters were the Lorrainer Claude Gellee and the French Poussin and Dughet, while the Italianizing Dutch painters Both and Berchem modify the style in accordance with the greater naturalism of their countrymen.

The landscapes of Claude are characteristic productions of the 17th century, because they convey as their primary impression that of space and atmosphere. The compositions, in which a few motives such as rounded masses of foliage are constantly repeated, are conventional; and there is little effort to give an impression of time, of the aspects of the day or year, of the climate. In this Claude is more a painter of classical landscapes than a painter of landscapes, and reproduce in telling fashion some of the larger and grander aspects of the material creation. There are generally figures in the foreground, and these are often taken from classical fables or from scripture, but instead of the landscape, as in older Italian art, being a background to the figures, these last come in merely to enliven and give interest to the scenery. The style, in spite of a certain conventionality which offences some modern writers on art, has lived on, and was represented in our own country by Richard Wilson, the contemporary of Reynolds; and in some of his work, notably in the Liber Studiorum, by Turner. Even Corot, though so individual a painter, owes something to the tradition of classical landscape.

The prevailing tendency of modern landscape art, especially in more recent times, has been in the direction of naturalism. Here the masters of the Dutch school have produced the canonical works that exercise a perennial influence, and they were preceded by certain northern masters such as the elder Brueghel, whose "Autumn" at Vienna has true poetry; Savary, Rognman, and Hercules Seghers. Several of the Dutch masters, even before the time of Rembrandt, excelled in the truthful rendering of the scenes and objects of their own simple but eminently paintable country; but it was Rembrandt, with his pupil de Konink and his rival in this department Jacob Ruysdael, who were the first to show how a perfectly natural and unconventional rendering of a stretch of country under a broad expanse of sky might be raised by poetry and "ideal feeling" to the highest pieces of painting. Great as was Rembrandt in what Bode has called "the landscape of feeling," the "Haarlem from the Dunes" of Ruysdael (fig. 31, Plate IX.) with some others of this artist's acknowledged successes, surpass even his achievement.

Nearer our own time Constable caught the spirit of the best Dutch landscapists, and in robust naturalism, controlled by art and elevated to the ideal region by greatness of spirit, he became a worthy successor of the masters just named, while on the other side he furnished inspiration to the French painters of the so-called Barbizon school, and through them to many of the present-day painters in Holland and in Scotland.

To fix the place of J. M. W. Turner in landscape art is not easy, for the range of his powers was so vast that he covered the whole field of nature and united in his own person the classical and naturalistic schools. The special merits of each of these phases of the art are united in this artist's "Crossing the Brook" in the National Gallery, that is probably the most
perfect landscape in the world (fig. 32, Plate IX.). In a good
deal of Turner’s later work there was a certain theatrical
strain, and at times even a garishness in colour, while his intense
idealism led him to strive after effects beyond the reach of human
art. We may however put out of view everything in Turner’s
aware to which reasonable exception may on these grounds be
taken, and there will still remain a body of work which for
extent, variety, truth and artistic taste is like the British fleet
among the navies of the world.

Among Turner’s chief titles to honour is the fact that he
portrayed the sea in all its moods with a knowledge and
sympathy that give him a place alone among painters of
marine. Marine painting began among the Greeks, who were
fond of the sea, and of the “Odyssey” and other classical land-
scapes are stronger on this side than the landscapes of the
Tuscans or Umbrians, who cared as little for the ocean as for
the mountains. The Venetians did less for the sea in their
paintings than might have been expected, and in northern
art not much was accomplished till the latter part of the
16th century, when the long line of the marine painters of Holland
is opened by Hendrick Cornelius Vroom, who founded a worthy
theme for his art in the defeat of the Spanish Armada. Simon
de Vlieger of Rotterdam, who was born about the beginning of
the 17th century, was the master of W. Van de Velde the younger
(1633–1707), who has never been equalled for his truthful rep-
resentation of calm seas and shipping. He painted innumerable-
pictures of the sea-fights of the time between the English and
the Dutch, those representing the victories of the Dutch being
in Holland, while at Hampton Court the English are triumphant.
There are exquisite artistic qualities in the painting of Van de-
velde, who is reckoned the canonical master in this branch of
art; but the few sea-pieces by Rubens, especially the “Dykes”
of the Louvre, and the “Stormy Sea” at Berlin, exhibit the
element under far more imaginative aspects. Besides Turner
there are many British artists of modern days who have won
fame in this branch of art that is naturally attractive to
islanders.

§ 26. Animal Painting.—In all early schools of representative
art from the time of the cave-dwellers downwards, the artist
has done better with animals than with the human figure,
and there is no epoch of the art at which the portrayal of
animals has not flourished. (On Egyptian and Assyrian animals
see § 7.) In Greece the representations of animals on coins are
so varied and so excellent that we may be sure that the
praise given to the pictures of the same creatures by contem-
porary artists is not overdrawn. In northern art animals have
always played an important part, and the motives of medieval
decoration are largely drawn from this source, while beast
symbolism brings them into vogue in connexion with religious
themes. In Italian and early Flemish and German art animals
are as a rule only accessories, though some artists in all these
schools take special delight in them; and when, early in the 17th
century, they begin to take the chief place, the motive is
often found in Paradise, where Adam and Eve lord it over the animal
creation. If De Vlieger and Rubens are the first to show the
sea in agitation, Rubens may have some credit for the revealing
and power of the animal nature in the violent
actions of the combat or the chase. In this his contemporary
Frans Snyders (1579–1657), and after Snyders Jan Fyt,
specialized, and the first named is generally placed at the head
of animal painters proper.

In Holland, in the 17th century, the animal nature presented
itself under the more contemplative aspect of the ruminants in
the lush water-meadows. True to their principle of doing every-
things in the best possible way, the Dutch paint
horse (Cuyp, Wouwerman) and cattle (Cuyp, Adrian Van de-
velde, Paul Potter) with canonical perfection, while Honthoekter
delineates live cocks and hens, and Weenix dead hares and
moor-fowl, in a way that makes us feel that the last word on
such themes has been spoken. There is a large white turkey by
Honthoekter in which the truth of mass and of texture in the
full soft plumage is combined with a delicacy in the detail of
the airy filaments, that is the despair of the most accomplished
modern executant.

But animals have been treated more nobly than when shown
in Flemish agitation or in Dutch phlegmatic calm. Leonardo
da Vinci was specially famed for his horses, which he may have
treated with something of the majesty of Phedias. Dürer
has a magnificent horse in the “Knight and Death,” but this is
studied from the Colleoni monument. Nearer our own time
the painter of Napoleonic France, Géricault, gave a fine reading
of the equine nature. Rembrandt’s drawings of lions are
most famous in his work, and in our own day in France and
England the lion and other great beasts have been treated
with true imaginative power.

§ 27. Still-Life Painting.—Like portraiture and landscape,
the painting of objects on near planes, or as it is called still-life
painting, is gradually differentiated from the figure-piece which
was supreme in the early, and has been the staple product in all,
the schools. Just as is the case with the other subsidiary
branches of painting, it appears, though only as a by-product,
in the history of ancient classical painting, passes practically
out of existence in medieval times, begins to come to a knowledge
of itself in the 15th and 16th centuries, and attains canonicy
in the Dutch school of the first half of the 17th century. Still-
life may be used in the characteristic form of painting of the
world, because the intrinsic worth of the objects
represented is a matter of complete indifference when compared
with their artistic treatment in tone, colour and texture. By
virtue of this treatment it has been noted (§§ 19, 20) that a study
of a group of ordinary objects, when seen and depicted by a
Rembrandt, may have all the essential qualities of the highest
manifestations of the art. There is no finer Rembrandt for
pictorial quality than the picture in the Louvre representing the
carcase of a flayed ox in a fleshier’s booth. As illustrating
the principle of modern painting this form of the graphic art
has a value and importance which in itself it could hardly
claim. It is needless to repeat in this connexion what has
been said on modern painting in general, and it will suffice
modern indicate briefly the history of this particular phase of
the art.

The way was prepared for it as has been noticed by the
minute and forcible rendering of accessory objects in the figure-
pieces and portraits of the early Flemish masters, of Dürer,
and above all of Holbein. The painting of flower and fruit pieces
without figure interest by Jan Breugel the younger, who was
born in 1601, represents a stage onward, and contemporary
with him were several other Dutch and Flemish specialists in
this department, among whom Jan David de Heem, born 1605,
and the rather older Willem Klaass Heda may be mentioned.
Their subjects sometimes took the form of a luncheon table
with vessels, plate, fruit and other eatables; at other times
of groups of costly vessels of gold, silver and glass, or of articles
used in art or science, such as musical instruments and the like; and
it is especially to be noted that the handling stops always
short of any illustrative reproduction of the actual textures of
the objects, while at the same time the differing surfaces of
stuff and metal and glass, of smooth-rinded apples and gnaled
lemons, are all most justly rendered. In some of these pieces
we realize the beauty of what Sir Charles Eastlake has called the
“combination of solidity of execution with vivacity and
grace of handling, the elasticity of surface which depends on
the due balance of sharpness and softness, the vigorous touch
and the delicate marking—all subservient to the truth of model-
ing.” In this form of painting the French 18th-century artist
Chardin, whose impacts was fuller, whose colouring more juicy
than those of the Dutch, has achieved imperishable fame (see
fig. 33, Plate X.); and the modern French, who understand
better than others the technical business of painting, have
carried on the fine tradition which has culminated in the work
of Volland. The Germans have also painted still-life to good
result, but the comparative weakness in technique of British
painters has kept them in this department rather in the back-
ground.
## Part II. § 28.—Schools of Painting

In the following Tables are included the main facts in the history of Painting since about A.D. 1000, with the artists of the first, second and third rank in their schools and periods. The relative importance of the artists is shown by the size of the capitals in which their names are printed. Facts and names of minor importance have in the interest of clearness been excluded. The names are given as commonly used, and where they differ from the headings of the separate biographical articles identification can be made by the Index. Words indicating localities are in italics.

### I. MEDIEVAL PAINTING & ITS OFFSHOOTS NORTH OF THE ALPS.

[From the Carolingian period till the 11th century Germany is the chief European centre of artistic production. From about 1150 to 1300 France takes the lead. Italy is in the background till about 1250.]

**ITALY.** (For Comparison.)

- S. ANGELO IN FORMIS, wall paintings of c. 1000.
- Byzantine panels imported.
- Proto-Renaissance, c. 1100-1300.
- Gothic characteristics in Giotto, 1267-1337.

### II. THE PROTO-RENAISSANCE AND THE REVIVAL OF ART IN ITALY.

**CONDITION OF THE ART OF PAINTING IN ITALY BEFORE THE REVIVAL.**

Wall Paintings of poor style, with hard black outlines, devoid of any feeling for beauty or truth to nature.

Panel Paintings, chiefly in the form of Enthroned Madonnas of Byzantine type, heavy but dignified; and painted Crucifixes, repulsive in aspect, with exaggeration of physical suffering, black outlines, green shadows, hatched lights.

[Best Italian Sculpture, e.g. by Antonio Canova at Pavia, c. 1700, greatly inferior to contemporary work in France.]

### REVIVAL FIRST SEEN IN SCULPTURE.

NICOLÒ PISANO inspired by the Proto-Renaissance of Southern Italy; his pupil at Pisa, 1260.

### REVIVAL OF PAINTING UNDER THE INFLUENCE OF THE PROTO-RENAISSANCE.

At Rome, Pietro Cavallini "Last Judgment" at S. Cecilia, Rome, c. 1251; at SIENA, Duccio di Buoninsegna, c. 1255-1315; (probably) Rucellai Madonna at Florence, and Madonna at Siena; at FLORENCE, Cimabue, teacher of Giotto.
PAINTING

III.

GOTHIC INFLUENCE ON THE ITALIAN REVIVAL.

FLORENCE.

GIOTTO, 1267-1337. Great in composition and in natural and dramatic treatment of sacred themes. Painting carried on on traditional lines by the Giottoques to the end of the century. At Florence painters’ company founded 1349.

TADDEO GADDI, STEFANO, MANO DI BANCO, BERNARDO BANDO, ANDREA ORCAGNA, ANCONIO GADDI, SPINETTO ARETINO, GIOVANNI DA MILANO, ANDREA DI FIRENZE, STARINIA, &c.

CONTEMPORARY PAINTING

IN OTHER PARTS OF ITALY.

Revival hardly begins in XIVth century. Best work done by ALLEGGRETO DI NUZZO DI Fabriano and ALTICHIERO OF Verona.

FRA ANGELICO DI FIESOLE, 1387-1455. Sums up the purely religious art of the Gothic period.

IV.

ITALIAN SCHOOLS OF THE FIFTEENTH CENTURY UNDER THE INFLUENCE OF THE RENAISSANCE.

Painting advances at Florence, declines at Siena. Other Italian schools begin to develop.

FLORENCE.

MASSELLINO DA PASCAGLIE, 1433-1472. Teacher of MASACCIO, 1401-1428. Great as Giotto, with added knowledge and unique sense of the monumental in design.

FILIPPO LIPPI, 1406-1469. Idyllic charm.

SANDRO BOTTICELLI, 1444-1420. Sentiment and beauty. Treats classical subjects.

ELISABETTO DI ASCI, 1460-1506. Grace, classical details. 

BENEDETTO di COZOLINO, 1424-1498. Copious in detail.

COSSIS ROSELLI, PIETRO DI COSIMO.

PAOLO UCELLO, 1397-1475. Dexterity devotee of Perspective.

ANDRÉ DEL CASTAGNO, c. 1390-1457. Vigour.

DOMENICO DELLE FLORE, 1420 (?)-1496. Inters oil paint.

ALESSIO BALDININETTI, 1417-1499, realistic.

ANT. POLLAIUOLI, 1459-1525. Anatomy, nude, oil.

ANDREA DEL VERROCCHIO, 1435-1488.

Great in sculpture. Teacher of Leonardo.

DOM. DEL GHIRLANDAJO, 1445-1504. Master of monumental style in fresco.

FRA BARTOLOMMEO, 1472-1557.

PERFECTION OF ART ON THE FORMAL SIDE.

Siena.

TADDEO BARTOLO, 1367-1422.

DOM. DI BARTOLO.

SANO DI PIETRO.

MAT. DI GIOVANNI.

FRAN. DI GIORGIO.

carry art through the century on the same lines as in the XIVth cent.

Decline of Sienese Art.

UMBRIA.

GENTILE DA Fabriano, c. 1370-1429. Visits Venice and Florence.

NICOLO ALONSO, BENEDETTO BOTTICELLO, FIORENZO DI LORENZO, DOM. BONIFACIO, &c., &c.

Exhibit Umbrian savour on Sienese lines. No progress.

PIERU DE’ FRANCESCHI, c. 1415-1492, teacher of MELOZZO DA FORLÌ, 1455.

and of LUCA SIGNORELLI, 1446-1523.

Realists of Florentine type. Progressive.

GIOVANNI SANTINO, 1404-1496. Father of Raphael.

PIETRO PERUGINO, 1446-1524.

Raphael’s master.

NORTH ITALY.

VENOVA.

VITTORE FINZI, 1476. Finest Italian medalist.

PADUA.

Native art begins with the school of Francesco PIZZOLI, 1384-1474.

Classical remains studied.

[MONTEBELLO & UCCELLO. Work at PADUA, c. 1448-]

From all these proceeds.

AND. MANTEGNA, 1431-1506.

Studies Tuscan Art and influences Venetian.

VICENZA.

MONTAGNA, 1472-1523.

FERRARA.

COSIMO TURA, 1438-1501.

LORENZO COSTA, 1460-1535.

BOLOGNA.

FRANC. FRANCIA, 1450-1517.

FENICE.

[GIENTE DI Fabriano. Works at FENICE, c. 1422-]

School of MURANO, influenced from Germany, and THE VENETIAN SCHOOL, c. 1440-1500.

CARLO CRIVELLI, d. c. 1490.

ANTONIO di BENEDETTA, 1430-1479.

In Venice, 1475-80.

Oil painting introduced, c. 1473.

CIMA DA CAVAZZONI, d. c. 1508.

VITTORE CARPACCIO, d. 1522.

THE BELLINI, Associated with Mantegna.

JACOPO D. 1470.

GENTILE, 1452.

C. 1507.

GIOVANNI, 1515.

F. Venice.

MONTEBELLO & UCCELLO.

VENEZA.

MONTAGNA, 1472-1523.

FERRUARA.

COSIMO TURA, d. c. 1506.

LORENZO COSTA, 1460-1535.

BOLOGNA.

FRANC. FRANCIA, 1450-1517.

GENTILE, 1452.

C. 1507.

GIOVanni, 1515.

V.

THE GREAT ITALIAN MASTERS OF THE SIXTEENTH CENTURY.

FLORENCE.

LEONARDO DA VINCI, 1452.

At Milan 1482-1499. "Last Supper" finished c. 1507.

1500

MICHELANGELO BUONARROTI, 1475-1564.

Dome of St Peter’s, c. 1560.

SEBASTIANO DEL PIETRO, 1485-1547.

GIOVANNI SANSO, 1515-1574.

GIOUCCO ROMANO, 1507-1546.

PERINO DEL VOGA, &c., &c.

Followers of Raphael.

1550

UMBRIA.

PERUGINO, SANZIO.

RAFFAEL SANZIO, 1483-1520.

PART III.—THE TECHNIQUE OF PAINTING

§ 29. The Materials of Painting.—Painting begins, as we have seen, on the one side in outline delineation, on the other in the spreading of a coating of colour on a surface. For both these the material apparatus is ready at hand. Drawing may have begun merely with lines in the air, but lasting designs were soon produced either by indenting or marking any soft substance by a hard point, or by rubbing away a comparatively soft substance, such as a pointed piece of burnt wood, on a rough surface of harder grain. Almost all the materials in use for drawing are of primitive origin. Charcoal, coloured earths and soft stones are natural or easily procured. Our plumage was known to Pliny (xxxiv. 18) and to Cennino (ch. 34), but it was not in common use till modern times. The black-lead pencil is first described as a novelty in 1565 (Quellenschriften edition of Cennino, p. 143). A metal point of ordinary lead or tin was used in medieval MSS. for drawing lines on parchment, or on a wooden surface previously whitened with chalk (Theophras- tus, II. ch. xvii.). Silver-point drawing is only a refinement on this. The metal point is dragged over a surface of wood or parchment that has been ground with finely powdered bone-dust, or, as in modern times, with a wash of Chinese white (Cennino, ch. 6 seq.; Church, 292), and through the usual abrasion of the metal it leaves a black line or a thin powder (xxviii. 95). When a coloured fluid was at hand a pointed stick might be used to draw lines with it, but a primitive pen would soon be made from a split reed or the wing-feather of a bird.

The coating of one substance by another of which the colour is regarded from the aesthetic standpoint is the second source of the art of painting. To manipulate the coating substance so that it will lie evenly; to spread it by suitable mechanical means; and to secure its continued adherence when duly laid, are by no means difficult. Nature provides coloured juices of vegetable or of animal origin, and it has been suggested that the blood of the slain or foemen smeared by the victor over his person was the first pigment. To imitate these by mixing powdered earths or other tinted substances in water is a very simple process. Certain reeds, the fibres of which spread out in water, were used as paint-brushes in ancient Egypt. A natural hare's-foot is still employed in theatrical circles to lay on a certain kind of pigment, and no great ingenuity would be required on the part of the hunter for the manufacture of a brush from the hair or bristles of the slain beast. In the matter of securing the adhesion of the coating thus spread, nature would again be the guide. Many animal and vegetable products are sticky and ultimately dry hard, while heat or moisture thins them to convenient fluidity. Great heat makes mineral substances liquid that harden when cold. Hence binding materials offer themselves in considerable abundance, and they are of so great importance in the painter's art that they form the basis of current classifications of the different kinds of painting.

§ 30. The Surfaces covered by the Painter.—Many important questions connected with the technique of painting depend on the nature of surfaces; for the covering coat—though from the present point of view only of interest aesthetically—may, as we have seen, originally serve a utilitarian purpose. The surface in question may be classed as follows: the human body; implements, vessels, weapons, articles of dress; objects of furniture, including books; boats and ships; walls and other parts of buildings; panels and other surfaces prepared especially or entirely to be painted on.

The differences among these from the present point of view are obvious. The body could not suitably be covered with a substance impervious to air and moisture; the coatings of a clay vessel and of a boat should on the other hand make them waterproof. The materials used in building often require protection from the weather. The painting on the prepared panel needs to resist time and any special influence due to location or climate. All such considerations are prior to the questions of colour, design, or aesthetic effect generally, in these coatings; and on them depend the binding materials, or media, with which the colouring substances are applied. The case of one particular surface much employed for pictorial display is exceptional. This is the wall-plaster so abundantly used for clothing an unsightly, rough, or perishable building material, like rubble or crude brick. This function it performs perfectly when left of its natural white or greyish hue, but its plain unbroken surface has seemed to demand some relief through colouring or a pattern, and the recognition of this led to one of the most important branches of the art, mural painting. Now lime-plaster, if painted on while it is still wet, retains upon its surface after it has dried the pigments used, although these have not been mixed with any binding material. On all other surfaces the pigments are mixed with some binding material, and on the character of this the kind of painting depends.

There is thus a primary distinction between the process just referred to and all others. In the former, pigments, mixed only with water, are laid on while the plaster is wet, and from this "freshness" of the ground the process is called by an Italian term, painting "a fresco" or "on the fresh," though in ordinary parlance the word "fresco" has come to be used as a noun, as when we speak of the "frescoes" of Giotto. Furthermore, as "fresco" is the wall-painter's process par excellence the word is used practically to signify a certain pictorial surface, a certain kind of picture, though this may have been executed by quite a different process. In contradistinction to painting "a fresco" all other processes are properly described by the Italian term "a tempera," meaning "with a mixture." The word is used as a noun in the sense of a substance mixed with another; but it is to be regarded as the imperative of the verb temperare, which both in Latin and Italian means "to divide or proportion duly," "to qualify by mixing," and generally "to regulate." Tempera means strictly "mix," just as "recipe," also employed as a substantive, is an imperative meaning "take." In ordinary parlance, however, the word tempera is confined to a certain class of binding materials to the exclusion of others, so that the more general term "media" is the best to employ in the present connexion. We go on, therefore, to consider these various media in relation to different surfaces and conditions.

§ 31. Binding Materials or Medii.—The fundamental distinction among media is their solubility or non-solubility in water, though, as will be seen presently, some possess both these qualities. The non-soluble media are (i) of mineral, (2) of vegetable origin. (1) Of the former kind are all vitreous pastes or pottery glazes, with which imperishable coloured surfaces or designs are produced on glazed tiles used in the decoration of buildings, on ceramic products, and in all processes of enamelling. Silicate of potash, employed to fix pigments on to mural surfaces of plaster in the so-called "stereochrome" or "water-glass" processes of wall painting (see § 37), is another mineral medium, too is paraffin wax. In the process called (unscientifically) "fresco secco," in which the painting is on dry plaster, lime is used as a binding material for the colours. Its action here is a chemical one (see § 36). (2) Non-soluble vegetable media are drying oils, resins, waxes (including paraffin wax, which is really mineral). In ancient times wax, and to some small extent also resins, were used as a protection against moisture, as in shipbuilding and some forms of wall-painting. Resins have always remained, but wax gradually went out of use in the earlier Christian centuries, and was replaced by the new medium, not used in classical times, of drying oil. In northern lands the desire to protect painted surfaces from the moisture of the air led to a more extensive use of oil than in the south. In the Netherlands that in the 15th century oil media were for the first time adopted in the regular practice of painting, which they have dominated ever since.

The soluble media are of animal and vegetable origin. Egg, yolk or white, or both combined, is the chief of the former. Next in importance are size, gained by boiling down shreds of parchment, and fish glue. Egg is the chief medium in what is specially known as "tempera" painting, while for the painting
technique in different lands at the various stages of the art, and what conditions were imposed on the artist by the nature of his materials. Lastly, there is the all-important process in which the binding materials are oils and varnishes, a process to which attaches so much historical and artistic interest, while a form of tempera painting that has been specially developed in modern colour media, that known as water-colour, may claim a concluding word.

§ 33. Historical Use of the Various Processes of Painting.—The extent and nature of the employment of these processes at different periods may have here a brief notice.

Tempera painting has had a far longer history and more extended use than any other. The Spaniard Pacheco, the father-in-law and teacher of Velazquez, remarks on the veneration due to tempera because it had its birthday with art itself, and was the process in which the famous ancient artists accomplished such marvels. In the matter of antiquity, painting with vitreous glazes is its only rival: glazed tiles formed, in fact, the chief polychrome decoration for the exteriors of the palaces of Mesopotamia, and were used also in Egypt; but all the wall-paintings in ancient Egypt and Babylonia and Mycenaean Greece, all the mummy cases and papyrus rolls in the first-named country are executed in tempera, and the same is true of the wall-paintings in Italian tombs. In Greece Proper paintings on terra-cotta fixed by fire were very common in the period before the Persian wars. When monumental wall-painting came to the front just after that event it was almost certainly in tempera rather than in fresco that Polygnotus and his companions executed their masterpieces. It has been doubted whether these artists painted directly on plaster or on wooden panels fixed to the wall, but the discovery in Greece of genuine mural paintings of the Mycenaean period has set these doubts at rest. In Italy tomb-paintings actually on plaster exist from the 6th century B.C. The earlier panel painters of the 5th and 4th centuries B.C. used also tempera processes, though their exact media are not recorded. About the time of Alexander there seems to have been felt a demand for a similar style of painting in which could be obtained greater depth and brilliancy of colour, with corresponding force in relief, than was possible in the traditional tempera; and this led to painting in a wax medium with which abundance of "body" could be secured. There are many puzzling questions connected with this ancient encaustic, but the discovery in recent years of actual specimens of the work, in the form of portraits on the late Egyptian mummy cases of the first centuries B.C. have assisted the study. Meanwhile a new technique to have come into being, a process of evolution for use on walls, for the fresco process, in a complete or modified form, was certainly in use among the Romans.

The history of the fresco process, as will presently be seen, is somewhat puzzling. Vitruvius and Pliny knew it, and it is mentioned in the Mount Athos Handbook, which incorporates the technical traditions of the art of the Eastern Empire; it appears also to have been in use in the Christian catacombs, but was not practised by the wall painters who adorned the early medieval churches south and north of the Alps. The difficulties of the process, and another reason to be noticed directly, may have led to its partial disuse in the West, but we find it again coming into vogue in Italy in the 13th and 14th centuries. In the early Christian centuries its place was taken in the monumental decoration of walls by mosaic inlays, and especially by glass mosaic, which is in itself an important form of wall-painting and may have put painting on plaster, and with it the fresco process, into the shade; notice will however presently be taken of a theory that seeks to establish a close technical connexion between mosaic work and the fresco painting, which, on the decline in the later medieval period of mosaic, came forward again into prominence.

The tempera processes were accordingly in vogue in early medieval times for wall-paintings (except to some extent in the East), for portable panels, and on parchment for the decoration and illustration of manuscripts. Meanwhile the
use of drying oils as painting media was coming to be known, and both on plaster and on wood these were to some extent employed through the later medieval period, though without seriously challenging the supremacy of tempera. From the beginning of the 15th century, however, oil painting rose rapidly in estimation, and from the end of that century to our own time it has practically dominated the art. Wall-painting in fresco continued to be practised till the last part of the 15th century, and has been revived and supplemented by various other monumental processes in the 19th, but even for mural work the oil medium has proved itself a convenient substitute. Water-colour painting in its present form is essentially an art of the last hundred years. The old tempera processes have been partly revived in our own time for picture-painting, but the chief modern use of tempera is in scene-painting, where it is more commonly called "distemper."

§ 34. Painting with Coloured Vitreous Pastes.—There is no single work that deals with the whole subject of this material and its different uses in transparent or opaque form in the arts, but details will be found in the special articles where these uses are described. (See CERAMICS; MOSAIC; ENAMEL; GLASS, STAINED.) On the subject of the substances and processes employed in the colouring of the various vitreous pastes information will be found in H. C. Cunynghame's Art Enamelling on Metals (and ed., London, 1906, ch. vi.), but the subject is a large and involved one.

Coloured vitreous pastes are among the most valuable materials at the command of the decorative artists, and are employed in numerous techniques, as for example for the glazes of ceramic products including wall or floor tiles; for painted glass windows; for glass mosaics, and for all kinds of work in enamels. The vitreous paste is tinge in the mass with various metallic oxides, one of the finest colours being a ruby red obtained from gold. Silver gives yellow, copper a blue green, cobalt blue, chromium green, nickel brown, manganese violet, and so on. Tin in any form has the curious property of making the vitreous paste opaque. It should be understood that though the vitreous substance and the metallic oxides are essentially the same in all these processes, yet the preparation of the coloured pastes has to be specially conditioned in accordance with the particular technique in view. There are generally various ways of producing reds and blues and greens, &c., from oxides of different metals. The material is generally lustrous, and it admits of a great variety in colours, some of which are highly saturated and beautiful. It is on the lustre and colour of the substance, rather than on the pictorial designs that can be produced by its aid, that its artistic value depends; but though this implies that it comes under the heading "ornament" rather than "painting," yet in certain forms and at particular periods it has been the chief medium for the production of pictorial results, and must accordingly have here a brief notice.

The difference between opaque and transparent coloured glass on the basis of a division among the arts that employ the material. If kept transparent the finest possible effect is obtained in the stained-glass window, where the colours are seen by transmitted light. The stained-glass window came into general use in the early Gothic period, and was a substitute for the wall-paintings which had been common in the Romanesque churches of the 11th and 12th centuries. Hence it is a form, and a very sumptuous and beautiful form, of the art of mural painting, representing that art in the later medieval buildings north of the Alps. In Italy, where the practice of wall-painting continued without a break from early medieval to Renaissance times, the stained-glass window was not a national form of art.

The effective use of opaque coloured vitreous pastes is in ceramics (pottery) and in glass mosaic. The terra-cotta plaque, or tile-painted with designs in glazes of the kind was, as we have seen (§ 7), one of the chief forms of exterior mural decoration in ancient Mesopotamia. The best existing examples were found not long ago on the site of the ancient Susa ("Shushan the palace" of Scripture) and are now in the Louvre. Human figures, animals, and ornaments, are represented not only in lively colours but also in relief; that is to say, each separate glaze brick had its surface, measuring about 12 in. by 9 in., modelled as well as painted for the exact place it had to occupy in the design. On these bricks there are formed small ridges in relief intended to keep the different liquid glazes apart before they were fixed by vitrification in the kiln. Chemical analysis has shown that the yellow colour is an antimoniat of lead, the white is oxide of tin, similar to the well-known opaque white glaze used by the Delia Robbia in Italy, the blues and greens are probably oxides of copper, the red a sub-oxide of copper (Semper, Der Spiegel, i, 332). This same region of the world has remained through all time a great centre for the production of coloured glazed tiles, but the use of "Persian," "Moresque," and other decorated plaques has been more ornamental than pictorial.

Glazed pottery only comes occasionally within the survey of the historian of painting. It does so in ancient Greece, because the earlier stages of the development of Greek painting can only be followed in this material; it does so, too, in a sense, in Italian faience and in some Oriental products, but these hardly fall within our view. The Greek vase was covered with a black glaze of extreme thinness and hardness, the composition of which is not known. Figure designs were painted in this on the natural clay of the vessel (see fig. 3, Plate IV.), or it was used for a background, the design being left the colour of the clay. The coloured oxides, the vitreous paste, were also employed to diversify the design and emphasize details, and these were also fixed by firing. A special kind of Greek vase was the so-called "polychrome lekuthos," a small upright vessel, the clay of which was covered with a white "slip" on which figure designs were painted in lively tints. The technique is not quite understood, but the colours were certainly fired. There is an article on "The Technical History of White Lecythi" in the American Journal of Archaeology for 1907; the processes are not, however, analysed.

In glass mosaic thin solid slabs of coloured vitreous pastes are broken up into little cubes of 1/4 in. to 1/2 in. in size and set in some suitable cement. The artist works from a coloured drawing and selects his cubes accordingly. Any number of shades of all hues can be obtained, and the modern mosaic workers of Italy boast that they dispose of some 25,000 different tints. As it is of the essence of the work to be simple and monumental in effect, a limited palette is all that is needed; and the mosaics recently executed in St Paul's in London are done in about thirty colours. The worker should have at hand appliances to cut to shape any particular cube wanted for a special detail.

The ancients used the art, and the finest existing ancient picture is in a mosaic, not indeed of glass pastes, but of coloured marbles. This is the famous "Battle of Issus" found at Pompeii. Glass mosaic came in under the early Roman Empire, but its chief use was in early Christian times, when it was the chief material for mural decoration of a pictorial kind. Ravenna is the place where this form of painting is most instructively represented, and the 5th and 6th centuries A.D. are the times of its greatest glory. At Rome and Constantinople there is fine early work, while that at Venice and Palermo is later. In the earliest and best examples the design is very simple, and a few monumental forms of epic dignity, against a flat background commonly of dark blue, represents the persons and scenes of the sacred narratives. The effect of colour is always sumptuous. Gold, especially for the backgrounds, is in later work freely employed.

The subject of enamelled work forms the theme of a separate article. Here it need only be said that pictures can be produced by painting on a ground, generally of metal, with coloured vitreous pastes that have been fixed by the process of grinding. Images in France has been the great centre of this art, but enamelling loses in artistic value when too exclusively pictorial result is aimed at.

§ 35. Fresco Painting.—Vitruvius (De Architectura, bk. vii. chs. 2, 3; age of Augustus), Mount Athos Handbook (Hermesia, chs. 54 seq.; date uncertain but based on early tradition); Cennino
This paste is mixed with sand or marble dust and laid on to the wall in the form of plaster this hydromat of lime in solution rises to the surface, and when the wet pigment is applied to this the liquid hydrate of lime or lime water, to use Professor Church's phrasing, "diffuse into the paint, soaks it through and through, and gradually takes up carbonic acid from the air, thus producing carbonate of lime, which acts as the binding material." (Church, p. 278). It is a mistake to speak of the plaster "setting into the wet plaster." It remains as a fact upon the surface, but it is fixed there in a sort of crystalline skin of carbonate of lime—the element originally basified when the lime was burned—that has now re-formed on the surface of the plaster. This crystalline skin gives a certain metallic lustre to the surface of a fresco painting, and is sufficient to protect the colours from the action of external moisture, though on the other hand there are many causes chemical and physical that may contribute to their decay. If, however, proper care has been taken throughout, and conditions remain favourable, the fresco painting is quite permanent, and as Vitruvius says (vii. 3, 7), "the colours, when they have been carefully laid upon the wet plaster, do not lose their lustre but remain as they are in perpetuity ... so that: a plaster surface that has been properly finished does not become rough through time, nor can the colours be rubbed off, that is unless they have been carelessly applied or on a surface that has lost its moisture."

In the passage from which these words are taken Vitruvius gives useful hints as to the aesthetics of the fresco technique. Italian writers on the subject, such as Vasari, are generally so taken up with the pictorial design represented on the wall that the more essential characteristics of the process in itself are lost sight of. To Vitruvius the work is coloured plaster, not a picture on plaster, and he shows how important it is that the plaster should be finished with a fine surface of glazing white so as to light up the transparent film of colour that clothes the picture. "Without such the result will be that a surface of Pompeian plastering, self-tinted "a fresco," is beautiful without there being any question of pattern or design.

This beauty and polish of Pompeian, and generally of ancient Roman plaster, has recently been made the ground for calling in question the view accepted for a generation past that it was merely lime plaster painted on "a fresco," and for substituting a totally different technical hypothesis. The reference is to the treatment of ancient wall-painting generally in the first part of Berger's Beiträge (2nd ed., 1904, pp. 58 seq.). This writer denies that the well-known classical wall-paintings in question are frescoes, and evokes with great ingenuity a wholly new theory of this branch of ancient technique. It is his view that the plaster was prepared by a special process in which wax and bitumen were mixed with a coating of clay and lime which was then brushed or painted on to a surface. In the wo- called "stucco-lustro" of the modern Italians.

The process in question is described by L. B. Alberti (De re aedificatoria, vi. 0), who says that when the plaster wall surface has been carefully smoothed it must be anointed with a mixture of wax, resin and oil, which is to be driven in by heat, and then polished till the surface shines like a mirror. This is a classical process referred to by Vitruvius under the name "ganosis," as applied to the nude parts of marble statues, possibly to tone down the cold whiteness of the material. Now Vitruvius, and Pliny, who probably follows him, do as a fact prescribe this same process for use on plaster, but only in the one special case of a wall painted "a fresco" with vermillion, which was not supposed to resist the action of the light unless "locked up," but was locked up with a coating of clay and lime.

Neither writer gives any hint that the process was applied to plaster surfaces generally, or that the lustre of these was dependent on a wax polish, and Vitruvius's description is so clear that if wax had been in use he would certainly have said so. Vitruvius prescribes so many successive coats of plaster, each one put on before the last was dry, and on the wet uppermost coat the colouring is laid. How can we with any reason substitute for this a method in which the plaster has to be made quite dry and then treated with quite a different material and
process? Furthermore, Berger holds the astonishing theory that on the self-coloured surfaces of Pompeian and Roman plastered walls the colour was not applied, as in the fresco process, to the surface of the final coat, but was mixed up with the actual material of the intonaco so that this was a coat of coloured plaster. This is of course a matter susceptible of ocular proof, but the actual fragments of ancient coloured stucco referred to by Berger afford a very slender support to the hypothesis, whereas everyone who, like the present writer, possesses such fragments can satisfy himself that in almost every case the colour coat is confined to the surface. The writer has a fragment of such stucco from Rome, coloured with vermillion, and here there is clear evidence that some substance has soaked into the plaster to the depth of an eighth of an inch, as will be seen in a case of this kind. The same appears to be the case with some specimens of Vitruvius and Pliny. The part thus affected is yellowish and harder than the rest of the plaster. A careful chemical analysis, kindly made for the purpose of this article by Principal Laurie of Edinburgh shows that, although the small quantity of the material available makes it impossible to attain certainty, yet the substance may possibly be wax with the slight admixture of some greasy substance. On the other hand all the writer's other specimens show the colour laid on to all appearance "a fresco." The evidence of the coloured plaster in the house of about the 2nd century B.C. on Delos is wholly against Berger's view. The writer has many specimens of this, and they are all without exception coloured only on the surface. It is true that there are certain difficulties connected with Pompeian fresco practice, but the description only of the process as a mixed process in Vitruvius and Pliny is so absolutely untenable that Berger's theory must without hesitation be rejected.

The history of the fresco technique remains at the same time obscure. Here again Berger offers an interesting suggestion which cannot be passed over in silence. If the Pompeian technique, as he believes, be a wax process on dry plaster, followed by some form of tempera, how did the fresco technique, which is known both in East and West in the later medieval period, take its rise? The early medieval age was not a time when a difficult and monotonic technique of the kind is likely to have been evolved, but Berger most ingeniously connects it with that of mosaic work. In mosaic the wall surface is at first rough plastered and second and temporarily a thin coat of cement is laid over it to receive and retain the cubes of coloured glass, only so much cement being laid each morning as the worker will cover with his tesserae before night. It was the practice sometimes to sketch in water-colours on the freshly laid patch of cement the design which was to be reproduced in mosaic, and Berger points to the incontestable fact that if this sketch were allowed to remain without being covered with the cubes it would really be a painting in fresco. This is the way he thinks that the fresco practice actually began, and the period would be that of the decline of mosaic work in the West as the middle ages advanced.

In spite of the attractiveness of these suggestions, we must reserve for later in this article the testimony of Vitruvius is conclusive for the knowledge by the Romans of the early empire of the fresco technique. Why do we not find evidence of it far earlier cannot be determined, but it is worth noting that the success of the process depends on the plaster holding the moisture for a sufficient time, and this it can only do if it be pretty thick. In ancient Egypt and Mesopotamia, for example, the plaster used as painting ground was very thin, and especially in those hot climates would never have lent itself to fresco treatment. On the other side, the decline, and perhaps temporary extinction, of the technique in the early middle ages may be reasonably explained by the general condition of the arts after the break-up of the Roman Empire of the West.

To return now to the technical questions from which this historical digression is to be excused, it will only remain to see that the process of painting in fresco must be a rapid one, for it must be completed before the plaster has had time to dry. Hence only a certain portion of the work in hand is undertaken at a time, and only so much of the final coat of plaster, called by the Italians intonaco, is laid by the plasterer as will correspond to the amount the artist has laid out for himself in the time allowed him by the condition of the plaster. At the end of this time the plaster not painted on is cut away round the outline of the work already finished, and when operations are recommenced a fresh patch is laid on and joined up as neatly as possible to the old. In the making of these joints the ancient plasterer seems to have been more expert than the Italians of the Renaissance, and the seams are often pretty apparent in frescoes of the 15th and 16th centuries, so that they can be discerned in a good photograph. When they can be followed, they furnish information which it is often interesting to possess as to the amount that has been executed in the time allowed. Judging by this test, Mr Heath Wilson, in his Life of Michelangelo, computed that on the works of the Sistine Michelangelo could paint a nude figure considerably above life size in two working days, the workmanship being perfect in every part. The colossal nude figures of young men on the cornice of the vault at most occupied four days each. The "Adam" (fig 34, Plate X.), was painted in four or perhaps in three. A day was generally occupied by the head of such figures, which were about 10 ft. high. Raphael, or rather his pupils, it is thus calculated, painted the Incendio del Borgo, containing about 350 sq. ft., in about forty days, the group of the young man carrying his father occupying three. The group of the Three Graces in the Villa Farnesina took five days at most. Lini, a most accomplished executant, could paint "naked figures" in an evening. Again, according to Mr Heath Wilson (Second Report, p. 37). It has been noticed as one of the difficulties about the Pompeian frescoes, that joints hardly occur, or at any rate that larger surfaces of plaster were covered by the painter at a single time than was the case among Renaissance artists, and a conjectural explanation has been offered based on the fact that the ancient plaster ground, laid on in many successive coats while in each case the previous one was still humid, was thicker and would hold more moisture than the more modern intonaco, and would accordingly allow the artist longer time in which to carry out his work. Alberti, Armenini, and Falomino only contemplate one or two thin coats over the original rough cast, while Cornelius and his associates, who revived the process early in the 19th century, speak of intonaco over the rough cast only about a quarter of an inch thick. A piece of plaster ground from Raphael's Loggia in the Vatican was found to be quite thin, and Donner calculated that the ancient grounds were on an average 3 in. thick, the modern only a little over 1 in. On such grounds work had necessarily to be finished within the day, and Cennino expressly says (ch. 67): "Consider how much you can paint in a day; for whatever you cover with plaster you must finish the same day." Hence almost invariably in Italian fresco practice every join means a new day's work. At Pompeii the plaster, it is thought, might have remained damp over night. In the Mount Athos Handbook tow was to be mixed with the plaster, undoubtedly to retard its drying.

This necessarily hasty sketch gives to well-handled frescoes a simplicity and look of directness in technique that are of the essence of the aesthetic effect of this form of the art. Hence Vasari is right when he extols the process in the words, "of all the ways in which painters work, wall-painting is the finest and most masterly, since it consists in doing upon a single day that which in other methods may be accomplished in several by going over again what has been done... there are many of our craft who do well enough in other kinds of work, as for example in oil or tempera, but fail in this, for this is in truth the most manly, the safest, and most solid of all ways of painting. Therefore let those who seek to work upon the wall, paint with a manly touch upon the fresh plaster, and avoid retouching it when dry" (Opera, ed. Lahnstein 1842, p. 132).

The process gives the artist another advantage in that his painting, being executed in the very material of the surface itself, seems essentially a part of the wall. It is lime painting on a lime ground, and fabric and enrichment are one. This
can be noted in the Sala del Constantino in the Vatican at Rome, one of the stanzas or suites of rooms decorated by Raphael and his associates. There are two figures here painted on the walls in oil, and though there is a certain depth and richness of effect accrued in this medium, they are too obviously something of a paltry night, while the figures in fresco seem an integral part of the wall.

Work of this kind, finished in each part at a sitting, is what the Italians call buon fresco or "true fresco," and it has always been, as it was with Vitruvius, the ideal of the art, but at many periods the painters have had to rely largely on retouches and reinforcements after the plaster was dry. Cennino devotes the 67th chapter of his Trattato to a description of the process, and expressly tells us that the method he recommends is the one traditional in the school of Giotto, of which he himself was a direct scion. He is fully alive to the importance of doing as much as possible while the ground is wet, for "to paint on the fresh—that is, a fixed portion on each day—is the best and most permanent way of laying on the colour, and the pleasantest method for the painter." As information derived from the early part of the 15th century had not sufficient skill to do all that was required at the one moment. Observations made on the works executed by various Italian masters from the 14th to the 16th century show great varieties in this matter of retouching, but the subject need not be dwelt on as it involves no principle. Every painter of worthy ambition, who had entered into the spirit of his craft, would desire to do all he could "on the fresh," and would be satisfied with, and indeed glory in, the conditions and limitations of the noble technique. Masaccio, even at the beginning of the 15th century, is remarkable for the amount of fine pictorial effect he secured without reliance on retouching. It was second-rate artists, like Pinturicchio, who delighted to furbish up their mural pictures with stucco reliefs and gilding and to add touches of more brilliant pigments than came within the Blaschetti, Giovanni, Massaccio, Ghirlandaio, Michelangelo, Luni, are among the fresco's proper, who represent the true ideals of the craft.

The following notes upon the methods of the work are derived partly from observation of extant works and partly from the older treatises, but reference has also been made to modern practice in Germany and Italy, as information derived from this last source may be found useful by those who are disposed to-day to make essays in the process.

To avoid loss of time it is essential that the necessary drawing should be sufficiently accomplished beforehand. In reality, a painter of the end of the 17th century, says, "everyone knows that before beginning to paint it is necessary to prepare a drawing and a well-studied coloured sketch, both of which are to be kept at hand in order to have something to stand on in the event of the execution" (First Report, p. 35). In Cennino's time it seems to have been the practice to square out the work full size from the sketch on to the surface of the rough cast before the intonaco was laid. This at any rate enabled the artist to see how his work as a whole would come in relation to the space provided for it, but the actual intonaco had to be laid piece by piece over this general sketch and the drawing of each portion repeated on the new surface. In the palmy days of Italian painting, however, as well as in modern times, the design has been drawn out on a full-sized cartoon, and this, or a tracing from it, has been transferred piece by piece to the freshly laid intonaco on which the painting is about to be done. The cartoon is not necessarily against the wall, but the outlines passed over with a blunt-pointed stylos of some hard material, that by dinting the paper impresses on the yielding plaster a line sufficient to guide the painter in his work; or the outlines of the cartoon may be pricked and "pounced" with a little bag of red or black powder that will leave a dotted outline on the wall.

The preparation of the intonaco itself is however a matter of much care. The lime should be as pure as possible and the water as clear as possible. Pure carbonate of lime—the travertine of Tivoli, recommended by Vasari, is perfect for the purpose—and after it is burnt should be slaked with water and thoroughly macerated so that it becomes a thick paste. The nature of the raw materials, the consistency of the paste, the method by which wet and dry are kept covered in from the air for a considerable period that varies according to different authorities from eight to twelve months to as long as fifteen years, and the arguments deduced from the necessity of the condition of the plaster, all agree on the necessity for this, but the exact scientific reason therefore does not seem to be quite clear. One advantage of the keeping is that the lime hydrate may take up a certain amount of carbonic acid, though not too much, from the air. Church painters were not more than "to air" the plaster, and the lime slaked in a water paste should be converted into the carbonate" (p. 19); but Faraday (Fifth Report, p. 25) was of opinion that through lapse of time there was brought about a molecular change that divided the carbonic acid into carbon and oxygen and that the oxygen was absorbed by the slaked lime and the plaster kept in a skated condition, but still caustic—that is, still deprived of most of its carbonic acid, for twelve years! For mixing the plaster the proportions of lime to sand or marble dust vary; Cennino recommends the proportion of one part of lime to two parts of sand, but it is not possible to rely on a sketch prepared from three of sand to one of lime. Whatever its exact constitution, the intonaco has to be carefully laid each morning over that part of the rough cast, previously well wetted, that corresponds to the area to be treated that day. For this purpose a good mixture of Vitruvian and Pompeian practice, which favours a polished surface, the moderns prefer a slight roughness or "tooth" on the intonaco. Painting should not begin, so Cornucon advised (First Report, p. 24), till "the surface is in such a state that it will barely receive the impression of the finger, but not so wet as to be in danger of being stirred up by the brush."

The pigments are ready mixed in little pots, on a tin palette with a rim round the edge, on a table, and in old Italian practice each colour was compounded in thrice shades—dark, middle and light. The water should be boiled or distilled, or should be rain-water; for spring-water often contains carbonate of lime that would "derange" the pigments. The correct water is one in which a chemical action that takes place during the process, the pigments have to be carefully selected. The palette of the fresco painter is indeed a very restricted one, and this is another reason of the broad tint being little used. On account of the effect of the water on the colours, such as the ochres raw or burned, can be used with safety; even the white has to be pure white lime (in Italian, bianco San-Giuliano), since lead white used in oil painting (Italian, bianca) is very quickly consumed in the air. The pigments are, in the main, included, "very few colours of organic origin withstanding the decomposing action of lime" (Chap. p. 286). The brushes are of hog-bristles or otter-hair or sable, and have to be rather long in the hair. Rigid rules are recommendable for this purpose, and it is always best to lay in the coat of the wall, and as a rule to be worked from below the nostrils, and round the chin, and bring down and fuse into these shadows the darkest of the three flesh-tints, with a dexterous blending of the wet pigments upon a surface that preserves their dampness. On the other side these half-tones are now modelled up into the lighter hues of the flesh. White may then be used in decided touches for the high lights, and the details of the eyes, while other parts are not too much searching after accidents of local colour. Modern fresco practice is that the tints first applied sink in and look faint, so that it is necessary sometimes to go over the surface repeatedly with the same colour and a thin varnish, which has a distinct effect of adding lustre. The colours thus dried in the air, and the surface the tints may be laid one over the other or fused at will, and may be "loaded in" some parts and in others thinly spread, the one essential being that a fresh and crisp effect is never lost. In certain cases to a certain softness in all tones, even those that give the strong high-lights, and so important is it that the plaster should not begin to dry, that it should be sprinkled if necessary with fresh water. This is most important, because when the plaster is in a state of the more apparent when they are compared with those strokes of reinforcement which may be put on "a tempera" after the work is dry. Armenian says that the shadows may be finished and deepened after the work is dry, and that the artist should put on with a soft brush with a medium of gum, size, white and yolke of egg diluted with vinegar. Such retouches are always hard and "wiry," and are as much as possible to be avoided.

As examples of execution in fresco no works are better than those of Luni. He painted rapidly and thinly, securing thereby a transparency of effect that did not however prejudice richness. Heath Wilson indeed says of his painting that it "may be
compared to that of Rubens; it is juicy, transparent, and clear; ... his execution is light and graceful." No sounder method could be taken for modern work. The high-water mark of achievement in fresco painting was however reached by a greater than Luini—by Michelangelo in his painting of the Sistine Chapel roof. Considering that since his boyhood he had had no practical experience of the fresco process, and refused the commission as long as he could because he was not a painter but a sculptor, Buonarroti's technical success in the manipulation of the difficult process is still more astounding than the aesthetic result of the work as a creation of imaginative genius. He had to paint for the most part lying on his back in a sort of cradle, and working with his arms above his head, and had no skilled assistants; yet there was no flaw in the work, that strikes us more than its freshness and air of easy mastery, as if the artist were playing with his task. The fusion of the lights and shadows through the most delicate half-tones is accomplished in that melting fashion for which the Italians used the term sfumato or "misty," while at the same time the touches are crisp and firm, the accent here and there decided; and the artist's incomparable mastery of form gives a massive solidity to the whole (see fig. 34, Plate X.)

In our own times and in English-speaking circles the fresco process has been discredited owing to the comparative failure of the experiments connected with the Houses of Parliament. On the condition of the frescoes there, as well as on that of the pictures in various other media, a series of Memoranda were made by Professor Church, and a select committee of the House of Lords took evidence on the subject as late as December 1896. Most of the frescoes executed in the fories and fifties of the 19th century had got into a deplorable state; but Church's belief was that the main cause of the decay was the sulphurous acid with which, owing to the consumption of coal and gas, the air of London is so highly charged. The action of this acid—a million tons of which are said to be belched out into the London atmosphere in every year—turns the carbonate of lime which forms the surface of the fresco into a sulphate, and it ceases to retain its binding power over the pigments. "The chemical change," he reports, "is accompanied by a mechanical expansion which causes a disruption of the ground and is the main cause of the destruction of the painting." It is a remarkable fact, however, that one of the frescoes in question, St John Tenniel's "St Cecilia," completed in 1850, painted very thinly and on a smooth surface, lasted well, and opposed "a considerable measure of successful resistance for nearly half a century on the part of a pure fresco to the hostile influence of the London atmosphere" (Church, Memorandum, iv. 1866).

Abroad, experience was more favourable. The earliest frescoes of the modern revival—those by Cornelius and his associates from the Casa Bartholdy at Rome—are in a fairly good state in the National Gallery at Berlin. Such too is the condition of Cornelius's large fresco in the Ludwigskirche at Munich. The best modern frescoes, from the artistic point of view, in all Europe are those of about 1850 by Alfred Rethel in the "St Cecilia," Graham and they are well preserved. The exterior frescoes on the Pinacotet at Munich have on the other hand mostly perished; but the climate of that city is severe in winter, and nothing else was really to be expected. We must not expect carbonate of lime to resist atmospheric influences which affect to a greater or less degree all mineral substances.

The process called "fresco-secco" is a method of lime painting on a plaster surface that has been allowed to dry. It is described by Theophilus in the *Scholia* of about A.D. 1100; and Mr. Charles F. Reynolds wrote of it as "extensively used in Italy at present and with great success." It is of course obvious that paintings must often be executed on walls the plastering of which is already dry, and on which the true fresco process is impracticable. Some kind of painting in tempera is thus needful, and "fresco-secco" uses for this the lime that is the very constituent of the plaster. The process is thoroughly to drench the dry surface of the plaster the night before with water with which a little lime or baryta water has been mixed, and to renew the wetting the next morning. The artist then fixes up his cartoon, pounces the outlines, and sets to work to paint with the same pigments as used in *boum fresco* mixed with lime or baryta water or with a little slaked lime. If the wall become too dry a syringing is used to wet it. The directions given by Theophilus (c. 115) correspond with this modern practice. When figures or representations of other things, he says, "are to be delineated on a dry wall, it must be covered with moistened lime water till it is thoroughly wet. On this wet ground all the colours must be laid that are required, and they must be all mixed with lime, and will dry with the wall so that they adhere to it." Mr. C. H. Wilson praises the work for its convenience, economy, and ease of execution, and notes that "for ornament it is a better method than real fresco, as in the latter art it is quite impossible to make the joinings at outlines owing to the complicated forms of ornaments," but says that "it is in every important respect an inferior art to real fresco. Paintings executed in this mode are ever heavy and opaque, whereas fresco is light and transparent." He declares also for its durability, but Professor Church states what seems obvious, that "the fixation of the pigments ... is less complete" than in real fresco though depending on the same chemical conditions and *Repetitio,* 43, p. 40 (translation in "Architecture," 26) § 37. *Stereochromy or Water-Glass Painting.*—(See Chemische-technische Bibliothek, Band ivxxvi., *Die Mineral-Malerei,* von A. Keim, Wien, &c., 1855; Rev. J. A. Rivington in Journal of the Society of Arts, No. 1630, Feb. 15, 1884; Mrs Lea Merritt and Professor Roberts Austin in Journal of the Society of Arts, No. 2246, Dec. 6, 1855; F. G. Cremer, Beiträge zur Technik der Monumental-Malereijahren, Düsseldorf, 1893.)

Akin to "fresco-secco," in that a mineral agent is used to secure the adhesion of the colouring matter to the plaster, is the process known as stereochemistry or water-glass painting. It is not a traditional process, but an outcome of comparatively modern chemical research, and is not yet a century old. It is based on the properties of the substance called water-glass, a silicate of potassium or of soda, perfected by the German chemist Von Fuchs about 1825. A process of painting called "stereochemistry" was soon after evolved, in which pigments of the same kind as those used in fresco, mixed only with distilled water and laid on a prepared plaster ground, were afterwards fixed and securely locked up by being drenched with this substance, which is equivalent to a soluble glass. Some of the mural paintings in the Houses of Parliament, notably those by Maclise, were executed in this process. Improvements were more recently effected in the process with which the names of Keim and Recknagel of Munich are connected, and in this form it has been used a good deal in Germany in the last quarter of the 19th century both in interiors and in the open air. For example, in 1881 Professor Schraudolph of Munich painted in this process the frescoes in one of the large halls of the Hofburg in Vienna, and water-glass painting was introduced to notice in England in a paper read before the Society of Arts by the Rev. J. A. Rivington on the 13th of February 1884, and printed in the Journal of the society, No. 1630. A more recent description is in F. G. Cremer's *Beiträge.*

The recipe for the preparation of the actual medium is as follows: 15 parts powdered quartz, 10 parts refined potash, 1 part powdered charcoal are mixed together and fused for 6 to 8 hours in a glass furnace. The resultant mass when cold is reduced to powder and boiled for 3 or 4 hours in an iron vessel with distilled water and yields a heavy syrup which freezes in a crystalline state and dissolves in water to give a heavy syrup in strong alkaline reaction. This can be diluted with water, and in the process is applied hot. The ground is very carefully prepared, and over a thoroughly sound and dry backing a thin coat of plaster is laid, composed of only 1 part lime to 5 or 8 parts selected sand and powdered marble with a slight admixture of infusorial earth. The object is to obtain a homogeneous porous ground that can be thoroughly permeated with the solution, and to help to secure this the tintonaco when dry.
PAINTING

is sprayed with hydrofluoro-silicic acid to dissolve away the crystalline skin of carbonate of lime formed on the surface and to "open the pores" of the plaster. The surface of the painting ground, which is left with a decided "tooth" upon it, is then well soaked with the solution to the "open the pores" of the plaster is found "hard but perfectly absorbent and ready for painting."

The pigments, which are practically the same as those used in oil painting, must be ground in dry powder in the undiluted medium, and then thoroughly mixed with oil colours. Solid painting with a good deal of body is recommended and pure oil of spike is freely used as painting medium. Pure spike oil may also be washed over the ground before painting to "melt the surface of the wall," or "prepare the mastic" of the oil colours painted into it. The spike oil is "the one common solvent of all the materials; ... the moment the painter's brush touches the surface (already softened, if necessary, for the day's work) it receives the colours, and on the rapid evaporation of the spike oil it closes them in, and thus the work is done." The oil of spike lavender, it may be noticed, is an essential oil prepared from Lavandula spica.

The church has suggested improvement in the composition of the medium by eliminating the "doubtful constituents"—linseed resin and bees' wax and substituting paraffin wax, one of the safest of materials, dissolved in non-refinable oil of turpentine. This oil is also dissolvent in spirit of wine, and with the same or better results as Mr Gambier Parry's medium.

§ 39. Oil Processes of Wall Painting.—The use of the oil medium for painting on plaster in medieval days opens up a much debated subject on which a word will be said in connexion with oil painting in general. In the later Renaissance period in Italy it came into limited use, and Leonardo essayed it in an imperfect form and with disastrous result in his Last Supper at Milan. Other artists, notably Sebastiano del Piombo, were more successful, and Vasari, who experimented in the technique, gives his readers recipes for the preparation of the plaster ground.

Mr Gambier Parry (ch. 98) had consisted in a coat of size or undiluted egg-white composed of one part of size and three parts of oil, and later on there was substituted for this several coats of hot boiled oil. This was still in common use in the 16th century, but Vasari himself had evolved a better recipe which he gives us in the 8th chapter of his Introduction to Painting. Over undercoatings of ordinary plaster he lays a stucco composed of equal parts of lime, pounded brick, and scales of iron mixed with white of egg and linseed oil. This is then ground with white oil toned down with a mixture of red and yellow easily drying pigments, and on this the painting is executed.

In Edinburgh and other places Mrs Traquair has recently carried out wall paintings on dry plaster with oil colours much thinned with turpentine. The ground is prepared with several coats of white oil paint, and the finished work is finally varnished with the best copal carriage varnish.

In most cases oil painting intended for mural decoration has been executed on canvas, to be afterwards attached to the wall. This is the case more especially in France, and also in America at the Boston public library and other places. The effort here is to get rid of the shiny effect of oil painting proper by eliminating as far as possible that which, however serves as the binding material of the pigments the procedure is a risky one. To suppress the oil and to secure a "matt" surface Mr E. A. Abbey employed at Boston and elsewhere, as a medium for painting with ordinary oil colours dissolved in spirit of wine and turpentine. In France Puvic de Chavannes used some preparation to secure a matt effect in his decorative oil painting on canvas.

§ 40. Tempera Painting on Walls.—This is a very ancient and widely diffused technique, but the processes of it do not differ in principle from those of panel painting in the same method. It is accordingly dealt with under tempera painting in general (§ 43).

It has been already mentioned that wax is employed in modern mural painting in order to secure a matt surface. Many pictures have been carried out with a wax medium on wood, and a regular wax medium that may or may not represent an ancient process. Hippolyte Flandrin executed his series of mural pictures in St Vincent de Paul and St Germain des Prés in Paris in a process worked out by Paillot de Montabert. Wax dissolved in turpentine or oil of spike is the main constituent of the medium with which the wall is saturated and the colours ground. Heat is used to drive the wax into the plaster.

A German recipe prepared by Andreas Müller in Düsseldorf has been used for mural paintings in the National Gallery, Berlin.
In this one part virgin wax is dissolved in two parts turpentine with a few drops of boiled linseed oil. The pigments are ground in boiled linseed oil with the addition of this medium. The plaster ground, well dried, is soaked with hot boiled oil and diluted with an equal quantity of turpentine. It is then ground with several coats of oil paint for a priming and smoothed with pumice stone. The painting can be executed in a thin water colour technique or with a full body, and dries lighter than when wet and with a dead surface.

Although in modern mural painting wax is employed to secure a matt surface, in ancient times it appears to have been valued rather from the depth and intensity it lent to colours when it was polished. It then represented an attempt to secure the same force and pictorial quality which in modern times are gained by the use of the oil medium. We are told of it by the ancients that it was a slow and troublesome process, and the name of it, meaning “burning in,” shows that the inconvenience of a heating apparatus was inseparable from it; yet it seems at the same time to have been a generally accepted technique, and Greek writers from Anacreon to Procopius treat “wax” as the standard material for the painter. Nay more, hardly a day now passes without every one of us bearing testimony in the words he uses to the importance of the technique in antiquity. The *Etymologieum magnum* of the 12th century makes the process stand for painting generally (ἐγκαυστικὴ ἔργα), and the name “encaustic” came to be applied not only to painting but also to sumptuous calligraphy. Then it was applied to writing in general. It was long held that the silly still caused more than *tacheion* and our own familiar “ink” (Eastlake, *Materials*, i. 151).

The technique of ancient encaustic has given rise to much discussion which till recently was carried on chiefly on a literary basis. Fresh material has been contributed by the discovery, in the eighties of the 19th century, in Egypt of a series of portraits on mummy cases, executed for the most part in a wax process, and dating probably from the first two or three centuries A.D. Previous to this discovery there was little material of a monumental kind, though what appears to be the painting apparatus of a Gallo-Roman artist in encaustic was found in 1847 at St Médard-des-Prés in La Vendée, and has been often figured. It should be stated at the outset that the modern process of dissolving wax in turpentine or an essential oil like oil of spike was not known to the ancients, who however knew how to mix resinous substances with it, as in the case of ship-painting (Pliny xi. 16; Dioscorides i. 68). They also saponified wax by boiling it with potash so as to form what was called “Punic wax” (Pliny xxii. 84 seq.), and this emulsion may be reduced with water, and at the same time combines with oil and with size, gum, egg and other temperas. Wax, Pliny says, may be coloured and used for painting—ad edendam simulitudines (loc. cit.)—but as the name “encaustic” implies, and as we gather from another of Pliny’s phrases, ceris pingere ac picturam inuere (xxxv. 122), heat was an essential part of the process. Hence the material must have been employed as a rule in a more or less solid form and liquefied each time for use, and not in the form of a diluted solution, or emulsion which could be made serviceable cold. It is true that the paint, as mixed with a little oil, is prescribed by Vitruvius (vii. 6, 3) as a solution for covering and locking up from the air a coat of the changeable pigment vermillon laid on a wall (see § 39), but the solution is used hot and driven in by application of a heating apparatus.

The accounts of the technique furnished to us by Pliny can be brought into connexion with the actual remains, and Berger and others have succeeded fairly well in imitating these by processes evolved from the ancient notices. It is unfortunate that the most important passage of Pliny (xxxv. 140) appears corrupt. It runs in the received text as follows: *Encausto pingendi duo fuere antiquitas genera, cera et in boho cestro, id est pericula, donee classes pingi coeepere. Hoc tertium accessit resolutis igni ceris penicillo utensulis, quae pictura navibus nec sole nec sole ventive corrumpitur.* Here three kinds of encaustic painting are mentioned, two old and one new (the comparative chronology of the processes need not come into question), and in the two last cases the distinction is that between two instruments of painting, the *cestrum* and the *penicillus* or brush. It is natural to suggest that instead of the word *ceres*, which, as wax is the material common to all encaustic processes, need not have been introduced and on manuscript authority may be suspected, some word for a third instrument of painting should be restored. Berger, with some philological likelihood, conjectures the word *cauterium*, which means properly a “branding-iron,” but which he believes to be a sort of hallowed spatula or spoon with a large and a small end by which melted waxes of different colours might be taken up, laid on a ground, such as a wooden panel, and manipulated in a soft state as pictorial effect required. Instruments of the kind were found in the Gallo-Roman tomb in La Vendée. The second kind of painting with the *cestum* or *verculum* was on ivory and must have been on a minute scale. The “cestum” was certainly a tool of corresponding size, and some have seen in it a sort of point or graver, such as that with which the incised outlines were made on the figured ivory plaques in the Kertch room at St Petersburg (see below); others a small lance-shaped spatula like the tools that sculptors employ for working on plaster. The brush, with which melted waxes could be laid in on washes, as was the case on ships, needs no explanation.

An examination of the portraits from the mummy cases (see fig. 33) makes it quite clear that the brush was used with coloured melted waxes to paint in the draperies and possibly to underpaint the flesh and hair, while the flesh was executed in a more *pastos* style, with waxes in a soft condition laid on and manipulated with some spatula-like instrument, which we may if we like call “cauterium” or “cestum.” The marks of such a tool are on several of the heads unmistakably in evidence, and may be seen in specimens in the London National Gallery. There is a difference of opinion however as to the constitution of the wax. Donner von Richter holds that the wax was “Punic,” i.e. a kind of emulsion, and was blended with oil and resinous balsams so as to be transformed into a soft paste which could be manipulated cold with the spatula. Heat for “burning in” (picturam inuere) he thinks was afterwards applied, with the effect of slightly fusing and blending the coloured waxes that had been in this way worked into a picture. Berger, on the other hand, believes that the coloured wax pastes were manipulated hot with the “cauterium,” which would be maintained in a heated condition, and that there was no subsequent process of “burning in.” Flinders Petrie is of opinion that, even in the

(From a photograph by W. A. Mansell & Co.)

**Fig. 35.—Mummy of Artemidorus with painted portrait,** inscribed “O Artemidoro, Farewell.” About A.D. 200 (Brit. Mus.)
case of the washes laid on with the brush, pure melted wax was employed and not a compound or emulsion, such as is generally assumed. Berger believes in a mixture of wax, oil and resin.

It is interesting to note that the distinguished modern painter, Arnold Böcklin, executed his picture of "Sappho" in coloured pastes composed of copal resin, turpentine and wax, manipulated with a curved spatula, and that he applied heat to fuse slightly the impasto. He believed he obtained in this way a brilliancy not to be compassed with oils.

The nature of the "cestron" technique on ivory is not known. The only existing artistic designs in ivory are executed by engraved lines, and these are sometimes filled in with coloured pastes. Exquisite work in this style exists in the Hermitage at St Petersburg, and there are examples in other museums, but this can hardly be called encaustic painting. A better idea of the perfectly executed miniature portraits of which Pliny tells us can be gained from the small medallion portraits modelled in coloured wax that were common at, the Renaissance period and are still executed to-day. In these however the smaller details are put in with the brush and pigment.

It is known from the evidence of the Erechtheum inscription that the encaustic process was employed for the painting of ornamental patterns on architectural features of marble buildings, but there is still considerable doubt as to the technique employed in such forms of decorative painting as the colouring of the white plaster that covered the surfaces of stonework on monumental buildings of inferior materials. Polychrome ornament on terracotta for architectural embellishment may have been formed by the glaze as in its vase paintings, but Pliny says that Agrigentum opus encausto finitur in his Thermae (xxxvi. 189).

The technique of the polychrome lecuthii and of the polychrome terracotta statuary is not certain.

The later history of wax painting after the fall of the Western Empire is of interest in connexion with the evolution of the painter's technique as a whole. Its possible relation to oil painting will be noticed later on. Here it is enough to note that the so-called Lucus MS. of the 8th century mentions the mingling of wax with colours, and the Byzantine Mount Athos Handbook, recording probably the practice of the 11th century, gives a recipe for an emulsion of partly saponific wax with size as a painting medium. A recipe of the 13th century quoted by Mrs Merrifield from the MSS. of Le Begue gives a similar composition that can be thinned with water and used to temper all sorts of colours.

§ 42. Tempera Painting. [Cennino's Trattato, in the English edition with terminal essays by Mrs Herringham (London, 1899), is the best work to consult on the subject. The Society of Painters in Tempera published in 1907 a volume of Papers on the subject. F. Lloyd's Practical Guide to Scene Painting and Painting in Distemper (London, 1879), is chiefly about the painting of theatrical scenery, and this subject is also dealt with in articles by William Telbin in the Magazine of Art (1889), pp. 92, 159.]

The binding substances used in the tempera processes may be classified as follows: (1) Size, preferably that made from boiling down cuttings of parchment. Fish-glue, gum, especially gum tragacanth and gum arabic (the Senegal gum of commerce): glue is used by many, in (i) the yolk alone, (ii) the white alone, (iii) the white contents of the egg beaten up, (iv) the same with the addition of the milk or sap of young shoots of the fig-tree, (v) the contents of the egg with the addition of about the same quantity of vinegar [(iv) was used in the south, (v) north of the Alps]. (2) Emulsions, in which wax or oil is mingled with substances which bring about the possibility of diluting the mixture with water. Thus oil can be made to unite mechanically (not chemically) with water by the interposition either of gum or of the yolk of egg. Of these materials it may be noted that a size or gum tempera is always soluble in water, and is moreover always of a rather thin consistency. The latter applies also to white of egg. On the other hand the yolk of an egg makes a medium of greater body, and modern artists, especially in Germany, have painted in it with a full impasto. The yolk of egg or the whole egg slightly beaten up may be used to temper powdered pigments without any dilution by means of water, and the stiffest body can in this way be obtained. The medieval artists seem however always to have painted with egg thinly, diluting the yolk with about an equal quantity of water. Their panels show this, and we can argue the same from the number of successive coats of paint, prescribed by Cennino and other writers. The former (ch. 162) mentions seven or eight or ten coats of colours tempered with egg alone, that must have been well thinned with water. This point will be returned to later on. The yolk of egg is really itself an emulsion as it contains about 30% of oil or fatty matter, though in its fluid state it combines readily with water. "Egg yolk," writes Professor Church (Chemistry, p. 71), "must be regarded as essentially a very tough and inert vehicle," and ultimately becomes a substance not unlike leather that is quite impervious to moisture. Hence while size tempera when dry yields to water egg tempera will resist it.

Sir William Richard gave a proof of this in evidence before a Committee of the House of Lords in November 1906, describing how he had exposed a piece of plaster painted with yolk of egg medium to all weathers for six months on the roof of a church and found it at the end perfectly intact. As to the milk of young fig-shoots, it is interesting to know from Principal Laurie ("Figments and Vehicles of the Old Masters," in Journal of the Society of Arts, Jan. 15, 1892, p. 172) that "fig-tree belongs to the same family as the India-rubber tree, and its juice contains caoutchouc." He says, "doubtless the mixture of albumen and caoutchouc would make a very tough and inert vehicle."

With regard to the historical use of these different media the medieval Italians used almost exclusively the yolk of egg medium, and this is also the favourite tempera of the moderns. In fact in Italy the word "tempera," as used by Vasari and other writers, generally means the egg medium. On the other hand size or gum was more common north of the Alps. It is in most cases very difficult to decide what temperas were in vogue in different regions and at the various epochs of the art, and the following must not be taken for more than an approximate statement of the facts. As far as it is known, the binding material in ancient Egypt was for the most part size, while Greek influence from about 600 B.C. onwards may have led to the use of wax emulsion (Punic wax). For paintings on mummy cases, and on papyrus scrolls, the medium may have been size or gum. Professor Church, writing in 1906, says, "it was an asa gum. The wall paintings of ancient Mesopotamia as well as those of India and the farther East generally were all in tempera, and it is noteworthy that recipes and technical practices of the East and of the West seem to be curiously alike. The exact media used are doubtful. The same doubt exists with regard to the exact processes of wall and panel painting in tempera in ancient Greece and Italy, in the East, in Byzantine times, and in the early middle ages both north and south of the Alps. The materials and processes mentioned by Pliny or in the various technical handbooks are on the whole clearly established, but it is very difficult to say in particular cases what was the actual technique employed. Any certainty in this matter must be based on the results not only of superficial examination but of analysis, and analysis can only be made on very small quantities of the materials that can be placed at the disposal of the chemist who is often impossible to arrive at a satisfactory diagnosis.

A story in Pliny (xxxv. 102) shows that the Greek panel painters, when not "encaustae," used a water tempera, but whether size or egg was its main constituent we do not know. Apelles is said to have covered his finished panels with a thin coat of what Pliny calls "stratum," which may have been a white of egg yolk, for spirit varnishes were not known in antiquity (Berger i. ii. 183), and the Greeks do not seem to have used drying oils nor varnishes made with these. Byzantine panel painting, according to the Mount Athos Handbook, was executed as a rule in an egg tempera (Berger iii. 73), and this technique was followed later on in Italy. For Greek and Etruscan (Italian) wall-paintings of the pagan period, for late Roman wall-paintings north of the Alps, and for Romanesque and Gothic wall-paintings,
we have to choose amongst the theories of size or egg tempera, wax tempera (emulsion), and the lime painting "fresco-secco," described by Théophilus. When the panel painting reached the 15th century we are on surer ground. For the north we have the technical directions of Theophilus, for the south those of Cennino. Théophilus (i. ch. xxvii.) prescribes a tempera of gum from the cherry tree, and, with some pigments, white of egg. The finished panel was to be covered with an oil varnish (vernition). Cennino prescribes a tempera of the yolk of egg alone, half and half with the pigments, which have been finely ground in water and are very liquid, so that there might be in the ultimate compound about as much water as egg. A tempera of the whole egg with the milk of fig-shoots he recommends, not for panels, but for retouching fresco-work on the wall when it is dry. Tempera panels painted with egg yolk are, like the gum tempera panels of Théophilus, "à secco," so that the oil varnish and the media were used all the fine tempera panels of the early Italian and early German schools of the 15th century, and these represent a limited, but within its bounds a very perfect and interesting, form of the painter's art.

A word or two may be said here about the various subsidiary processes connected with 14th and 15th century panel painting, which are of great interest as showing the conscientious, and indeed devotional spirit of the artist. The varnishing of the panels is one of the most characteristic. In the Dars(uuid) Cennino gives a list of the processes the panel painter has to go through, and in subsequent chapters he describes minutely each of these. The artist must "know how to grind colours, to use glaze, to apply it, to wash it with water, to give the ground a second and smooth the gesso, to make reliefs in gesso, to put on, to gild, to burnish, to mix tempera, to lay on groundings, to transfer by pouring through pricked lines, to sharpen lines with the stylus, to indent with little patterns, to cover, to engrave, to ornament the panel, and finally to varnish it." The preliminary operations, before the artist actually begins to "colour," or paint, will take him six years to learn, and it requires with the greatest care and accuracy. The gesso ground is spread over a wooden panel carefully compacted and linened and is glued down over its face, and over this is laid, in many successive coats, a gesso ground of slaked plaster of Paris mixed with size, with which the artist works. The whole panel is then burnished with it, and so appears almost dark (in the shadow) from its own refrigence. The delicate indented patterns which are so charming on the gilded grounds of the painted panels on East Anglian screens, such as that at Bury St. Edmunds, are executed in this way. The burnt edges of the gesso ground appear quite fresh, and this is one of the most beautiful parts of the art. In the actual painting, which is on the non-gilded part of the panel, the utmost attention is paid to the ornamentation of brocaded draperies, in which the student is taught with great care and accuracy. There is a whole series of rules which must be observed. The panel is laid on a stark table, the surface is perfectly smooth, and then the artist begins to prepare the ground for each subsequent colour. The ground is often mixed with various things, and the pigments are ground with oil, and mixed with oil. Directions for painting the flesh, which is to be done after the draperies and background, are precise. There is an under-painting in a monochrome of terre verte and white, and over this in successive coats of great thinness the flesh-tints are spread, every tint being laid in its right position on the face, the darkest flesh-tint being shaded down to the ground, and then the next tints are added. When the ground and the clay coats are superimposed, but the green ground is still to remain slightly visible. At last the lightest flesh-tint is used to obtain the effects of light and the shades are touched in with oil, and the whole panel is gilded. The varnishing process should be delayed for at least a year, and the varnish, which was evidently thick, is to be spread by the fingers over the painted surfaces, care being taken not to let the varnish go over a grey ground. The ground coat should be dry when it is dissolved, for there is a risk of the paint drying before it has机会 to dry. Cennino says that if the varnish be boiled it will dry without being placed in the sun.

The process thus described is not what we should call, in the modern fine-painting, for the production and conversion of the work and the great importance given to subsidiary details are quite opposed to the spirit of the art since the 16th century. Neverthless, the naive simplicity of the design and the exquisite delicacy of the drawing are charming. It is characteristic of the kind of work that the artist has loved and delighted in his work, and regarded his patient manipulation as a religious act. A modern artist in tempera specially praises the old work for its "brightness, transparency and purity of colour," qualities owing to the gradual bringing forward of the picture from a simple outline of extreme beauty. "This outline is never lost; its beautifully opposed and harmonising lines and masses are retained to the end, even strengthened and accentuated, giving great distinctness at a distance, even when the work is really dry. While the under-painting is the rapid drying of the medium, that prevents the fusing of the colours together in the impasto, which is possible in oil painting. Woltmann (History of Painting, Eng. transl. i. 406) thought that there was a mistake for "vernition" in the word "tempera," and not to prevent too rapid drying, and he wrote, "this method rendered possible a liquid and softly graduated handling, and though the Italian variety of tempera allowed greater depth in the shadows, than the French, it gave as much grace to the draperies, owing to the rapid drying of the egg-yolk, modelling was often secured by hatching, which is not so pleasing in its effect as the chiaroscuro of tempera. The artist, then, could paint over the other till the proper effect of shading is secured. On the whole quality of tempera is its transparency, which is referred to by Cennino when he says that the original under-painting of terra verta is never to be wholly obliterated."

The well-known group of the "Three Graces," from Botticelli's large panel of the "Allegory of Spring," at Florence, gives the quality of tempera painting very aptly (see fig. 36, Plate X.). There is a Society of Painters in Tempera in London, and some artists are enthusiastic in their admiration of the process for its purity, sincerity and permanence.

Under the heading "tempera" should be noticed another style of painting with a water-medium that is executed as a rule on a gesso-ground. It is called "secco" tempera, and is used for the purposes of temporary decoration on canvas or wood, so much used in the Italian cities of the Renaissance period, is of this kind. Large cartoons in colour for mural pictures or tapestry, of which Raphael's cartoons are the most famous examples, are other ex-
ample; while in modern times the technique is chiefly employed in theatrical scene painting. The pigments are tempered with size or gum, and body is given to them by whitening, pipe-clay or quincaillure, which annealed and cleared the surface. Each successive coat is laid on thinner than the one before, and the panel or the painted picture is wetted, and the immediate surface is rubbed with a sponge, to prevent too rapid drying, and to execute it effectively, as in the case of stage scenery, requires much skill and practice. "In the study of the art of distemper painting a source of considerable embarrassment to the inexperienced eye is that the colours, when wet present such a different appearance to what they do when dry." So writes F. Loyds, but W. Telbin, though he recognizes this difficulty, exults the process. A splendid material distemper! For atmosphere unequalled, and for strength as powerful as oil, in half an hour you can do with it that which in water or oil would take one or two days! The English word "distemper" and the French "gouache" are commonly applied to this style of painting, and are used almost interchangeably. The word "gouache" suggests house-decoration, "tempera" the work of the artist.

§ 44. Oil Painting.—(See Eastlake, Materials for a History of Oil Painting (London, 1847); Mérimée, De la peinture à l'huile (Paris, 1830); Berger, Beiträge zur Entwicklungs-Geschichte der Malerei, esp. iii. 221 sqq., and iv. (Munich, 1897), &c.; Dalbon; Les Origines de la peinture à l'huile (Paris, 1904); Ludwig, Über die Grundsätze der Ölmalerei (Leipzig, 1876); Lessing, Über das Alter der Ölmalerei, 1774.) Oil painting is an art rather of the north than of the south and east, for its development was undoubtedly furthered by the demand for moisture-resistant media in comparatively damp climate, and the drying oils on which the technique depends were but sparingly prepared in lands where olive oil, which does not dry, was a staple product.

Certain vegetable oils dry naturally in the air by a process of oxidation, and this drying or hardening is not accompanied by any considerable shrinking, nor by any change of colour; so that oil and substances mixed with it do not alter in volume nor in appearance as a consequence of the drying process. There may be a slow subsequent alteration in the direction of darkening or becoming more yellow; but this is another matter. Among these oils the most important is linseed oil extracted from the seeds of the flax plant, poppy oil from the seeds of the opium poppy, and nut oil from the kernels of the common walnut. The drying of these oils by painters in oil are prepared, and oil varnishes, also used by artists, are made by dissolving in them certain resins. Their natural drying qualities can be greatly aided by subjecting them to heat, and
Cennino Cennini’s treatise, written a little later, gives avowedly the recipes and processes traditional in the school of Giotto throughout the 14th century. He begins his account of oil painting with the remark that it was an art much practised by the “Germans,” thus bearing out what was said at the commencement of this section. He proceeds (chs. 90–94) to describe an oil technique for walls and for panels that sounds quite effective and modern. Linseed oil is to be bleached in the sun and mixed with liquid varnish in the proportion of an ounce of varnish to a pound of oil, and in this medium all colours are to be ground. “When you would paint a drapery with the three gradations,” Cennino proceeds, “divide the tints and place them each in its position with your brush of squirrel hair, fusing one colour with another so that the pigments are thickly layered. To wait certain days, come again and see how the paint covers, and repay the drapery needful. And in this way paint flesh or anything you please, and likewise mountains, trees and anything else.” In other chapters Cennino recommends certain portions of a painting in tempera to be put in oil, and nowhere does he give a hint that the work in oil gave any trouble through its unwillingness to dry. His medium appears, however, to have been thick, and perhaps somewhat viscous (ch. 92). This combination of oil paint and tempera on the same piece is a matter, as we shall presently see, of some significance.

In the De re aedificatoria of L. B. Alberti (written about 1450), vi. 9, there is a mention of “a new discovery of laying on colours with oil of linseed so that they resist for ever all injuries from weather and climate,” which may have some reference to so-called “German” practice. The next Italian writer who says anything to the purpose is
Filarete, who wrote a long treatise on architecture and the arts of design about 1494. It is published in the Vienna Quellen- schriften, neue Folge, No. III. Like Cennino, Filarete (loc. cit. p. 641) speaks of oil painting as specially practised in "Germany," and says it is a fine art when anyone knows how to compass it.

The medium is oil of linseed.

But, unless this very thickly he first engrossed, and that he afterwards was to be made very thin or a good

Trucous oil can be of different kinds, I do not quite know how; but it will be stood out in a

veded and clarify itself. I understand however that there is a quicker way of managing this—but let this pass, and let us go on.

To the method of painting," Filarete’s evident uncertainty about what, which may be that of the Strassburg MS. for producing oleum preciosum, and his reference to "Germany," inclines us to look elsewhere than to Italy for knowledge about the oil technique.

As a fact the evidence of the recipe books is borne out remarkably by that of other records which show that a great deal of oil painting of one kind or another went on in northern lands from the 13th century onwards. These records are partly in the form of accounts, showing large quantities of oil and resins furnished for the use of painters engaged in extensive works of decoration; and partly in the form of contracts for executing pictures "in good oil colours." It is true that oil might be merely employed in mordants for gliding or in varnishes, and for oil painting merely in house-decorator fashion over wood, or for colouring statues and reliefs in stone; nevertheless, with a use of proper critical methods, it has been possible for M. Dalbon and others to establish incontrovertibly the employment in artistic wall and panel-painting of drying oils and varnishes before the 15th century, both north and, to a lesser extent, south of the Alps. These passages have been too often quoted to be cited here. (See Eastlake, Materials, p. 46 seq.; Berger, Beiträge iii. 256 seq., &c.) The earliest of the accounts, an English one dated 1218, to the king (Henry III.) to his treasurer and chamberlains. Pay from our treasury to Odo the goldsmith and Edward his son one hundred and seventeen shillings and tenpence for oil, sandarac resin, and colours bought, and for pictures executed in the Queen’s Chamber at Westminster.

Another, about 1275 (temp. Edward I.) runs: "To Robert King, for one cartload of charcoal for drying the painting in the King’s Chamber, III. Vili. IV.

In Flanders in 1304 there is an account (Dalbon, p. 43): "Pour to les d’oille aci, faire destreme, la couleur," in 1323-1334 one for XIII libres d’oille de linnis ac faire couleurs" (p. 43). This was for the use of a certain painter Loys, who executed mural compositions of which some of the subjects are recorded. In the matter of contracts, Dalbon (p. 52) prints one of 1320 precisum, showing the painter Agnolo di Giunta, who says "meilleur maniere que il pourront estre faiz en peinture," and concluding, "et sevont toutes ces choses faiz a huile," and he points convincingly to such wording as a proof that the work here under consideration must be regarded as artistic figure-painting and not mere house decoration. Lastly, just before 1400, the painter Jehan Malouel receives in 1399 oil with colours for "la peinture de plusieurs tables et tableaux d’autel," for the Carthusian convent of Champmol near Dijon, which proves the use of oil for panel as well as for mural painting.

The further question about the survival of actual remains of work of the class just noticed is a very difficult one. There seems no reason why all this mural and panel work in oil of the 14th century should have perished, unless the medium was faulty, and, as is natural, many attempts have been made to identify extant examples as representing these early phases of the oil technique. Mural work we need not perhaps expect to find, for we know from the later experience of the Italians of the 16th century that it was difficult even then to find a safe method for oil painting on plaster. With panels preservation would be more likely, and it is always possible that some datable work of the kind may be identified that will carry the monumental history of oil painting back into the 14th century. An exhibition of early English painted panels was held in 1896 in the rooms of the Society of Antiquaries of London, and some good judges believed at the time that certain 14th-century panels from St. Michael at Plea, Norwich, were in oil, but this cannot be regarded as established.

If such then be the early history of oil painting, what attitude are we to adopt in face of the famous statement by Vasari that the technique was the invention of the Flemish painter Van Eyck in the year 1400? The statement was first made in the chapter of Vasari’s Lives of the Painters, sculptors, and architects (1559), and runs as follows: "E fu una bellissima invenzione, ed un gran’ commodità all’ arte della pittura, il trovare il colorito a olio. Di che fu primo inventore in Fiandra Giovanni da Brugia (Jan van Eyck). In the life of Antonello da Messina, in the same edition, Vasari dresses up the bare fact he here relates, and gives it the personal anecdotal turn that accords with his literary methods. Here the “invention” follows on the incident of the splitting of a tempera panel varnished in oil, that according to traditional practice Van Eyck had put out in the sun to dry. This artist then turned his attention to devising some means for avoiding such mischances for the future, and, in Vasari’s words, "being not less dissatisfied with the varnish than with the process of tempera painting, he began to devise means for preparing a kind of varnish which should dry in the shade, so as to avoid having to place his pictures in the sun. Having made experiments with many things both pure and mixed together, he at last found that linseid and nut oil, among the many which he had tested, were more drying than all the rest. These, therefore, boiled with other mixtures of his, made him the varnish which he had long desired." This varnish Vasari goes on to say he mixed with the colours and found that it "fit up the colours so powerfully that it gave a gloss of itself," without any after-coat of varnish.

Such is the famous passage in Vasari that has probably given rise to more controversy than any similar statement in the literature of art. The question is, in what did the "invention" of the Van Eycks, Hubert and Jan his younger brother, consist? and the first answer that would occur to anyone knowing alike the earlier history of the oil medium and Vasari’s anecdotal predilections is the answer “There was no invention at all.” The drying properties of linseed and nut oil and the way to increase these had long been known, as had also the preparation of sandarac oil-varnish, as well as a colourless (spirit) varnish of which there is mention in accounts prior to the 15th century (Dalbon, p. 93). The mixing of varnish with oil for a medium was also known, and indeed the oleum preciosum may be the real "invention" of which Alberti and Filarete had only vaguely heard, and of which the Van Eycks later on received the credit. The epitaphs for the tombs of the two Van Eycks make no mention of oil painting, but simply state that they were "the first to hold an image to a literal face". It might be hard to force anyone to take up the position that it was no improvement in technique that brought to the Van Eycks their fame in connexion with oil painting, but rather an artistic improvement that consisted in using a traditional process to execute pictures which in design, finish, beauty and glow of colour far surpassed everything previously produced in the northern schools. Pliny writes of the works of a Greek painter of about 400 B.C. that they were the first that had the power "to rivet the gaze of the spectator," and in like manner we may say of the "Adoration of the Lamb," by the Van Eycks, the titular firstfruits of the oil painter’s technique, that it impressed the world of its time so mightily through its artistic power and beauty as to elevate to a sort of mystic importance the very method in which the pains were mixed. There is much force in this view, but at the same time it is impossible to deny to the Van Eycks the credit of technical improvements. For one thing, an artist who has an exceptional feeling for colour, texture and delicacy of finish will certainly pay special attention to his technical media; for another, the Van Eycks had a reputation long before Vasari’s time for researches into these media. In 1436, fifteen years after the death of the younger brother, Bartolommeo Facio, of Spezia, wrote a tract De viris illustribus in which he speaks of a certain "Joannus Gallicus," who can be identified as Jan van Eyck, as specially "learned in those arts which contributed to the making of a picture, and was on that account credited
with the discovery of many things in the properties of colours, which he had learned from ancient traditions recorded by Pliny and other writers." Filarete (c.1464) also knew of the reputation of Jan van Eyck in connexion with the oil technique. Hence we may credit the Van Eycks with certain technical improvements on traditional practices and preparations in the oil technique, though these can hardly be termed "inventions," while their artistic achievement was great enough to force into prominence whatever in the technical department they had accomplished.

Another and a more important question remains behind: What was, in fact, the practice in the matter of oil painting in your style? As far as Van Eycks, it is evident that they were protected by them and their successors, and in general use up to the time of Vasari; and how was it related to the older widely diffused painting "a tempera"?

It is indisputable that the oil painting of the Van Eycks and the early Flemish school, together with that of the Florentines and Umbrians, and indeed of all the Italians up to Vasari's time, save the Venetians, Correggio, and some other north Italians, does not greatly differ in artistic effect, nor, as far as can be judged, in handling, from earlier or contemporary temperas.

For example, at Venice in the 15th century, Crivelli paints always in tempera, Cima in oils, but the character of their surface is almost the same, and if anything the tempera is richer in effect than the oil. The contrary is no doubt the case with the tempera "paintings" of the same period, in which, in the course of time, and when compared with the somewhat later "Dombild," also by Stephan Lochner, which is believed to be painted in oils, but the two are still in technical character very nearly akin. The fact is that tempera panels were usually coated with an oil varnish, necessarily of a somewhat warm tint, and we could hardly expect to distinguish them from oil pictures painted in or covered by varnish, unless there was a difference in the handling of the pigments. The method of handling appears however to be on the whole the same, and there are many who believe that in all essentials it is the same. Tempera panels, as we have learned from Cennino, were not only varnished but in parts might be painted in oils (ch. 143), and it is one view of the technique of the early Flemings that it was only an over-painting of oils over a preparation in tempera. Borger is of the opinion that the process was something between the two, that is to say, that it was oil tempera, the medium being an emulsion of oil and water through the intermediary of a gum. Such a medium would, as he points out (Beitrage, iii. 247 seq.), combine the thinness and limpidity in manipulation characteristic of a water tempera with the property of drying hard and impervious to moisture. This is of course only a theory. Of far more weight is the suggestion made by Principal Laurie, of Edinburgh, who has carried on for years a series of careful experiments in the various pigments and media employed in oil painting. As one result of these experiments he has found that the ordinary drying oils and oil varnishes do not, as used to be assumed, "lock up" or completely cover and protect pigments so as to prevent the access of moisture and the gases of the atmosphere, but that this function is far more effectually performed by hard pine-balsams, such as Canada balsam, dissolved in an essential oil and so made into a varnish or painting medium. In pictures by Van Eyck Principal Laurie has detected what he believes to be the use of pigments of a notoriously fugitive character, and he is convinced that the most effectual medium for preserving these in the condition in which they have come down to us would be a natural pine-balsam, with probably a small proportion of drying oil; he suggests therefore that the introduction of these ingredients may be the real secret of the Van Eyck technique. There is as yet no proof that the Van Eycks really used such a medium, though it is a preparation possible at their time, and when thinned by a process of emulsification with oil, as Dr Laurie suggests, would be a serviceable one; but they and the other early oil painters certainly used a method, and in all probability media, that did not differ greatly as regards manipulation from those in vogue in tempera.

From the aesthetic point of view therefore we have to regard early oil painting as only another form of the older tempera, expressing exactly the same artistic ideals and dominated by the same view of the relation of art to nature. To Vasari the artistic advantage of the oil medium was, first, its convenience, and, next, the depth and brilliancy it lent to the colours, which he says it "kindled," while at the same time it lent itself to a soft fusing of tints in manipulation, so that artists could give to their figures in this technique the greatest charm and beauty combined with a force that made them seem to standout in relief from the panel.

Such a description applies very justly to work like that of the Van Eycks in the Moration of the Lamb, or the later panels of Antonello da Messina, who, according to Vasari's often repeated story, introduced the technique of oil painting into Venice. The description does not however apply to the more sweeping, more passionate handling of the brush by the greatest of the Venetians such as Titian or Veronese, and still less to the oil painting of 17th-century masters like Rubens or Rembrandt or Velazquez. It is quite clear that whatever improvements in oil technique were due to the early Flemings, oil painting in the modern sense owes still more to the Venetians, who first taught the world the full artistic possibilities of the process. Giovanni Bellini, whose noble altarpiece in S. Pietro at Murano may be called, in a phrase once applied to another of his pictures, "the canon of Venetian art," is probably entitled to be called the father of modern oil painting. Beginning as a tempera painter in tempera, adopting the new process about 1475, Bellini seems to have been far too late to discover and have time to perfect it on it with all its possibilities indicated to Giorgione, Palma and Titian. That Venetian oil painting however, with all its brilliancy and freedom, was a child of the older tempera technique is shown by its characteristic method, which consisted in an under-painting in dead colour, over which were superimposed the transparent glazes that secured the characteristic Venetian richness of colouring. Now all the recent writers on the Van Eyck technique agree that, whatever were the exact media employed, the tempera tradition, and perhaps the tempera vehicles, were maintained for the underpainting. In the old tempera-panel technique of Cennino there was a monochrome underpainting in a greenish pigment, over which the flesh tints were spread in thin layers so as never completely to obliterate the ground. Such an underpainting in a few simple colours, black, white and red, was employed by Titian and others of the Venetians, and over it were laid the rich juicy transparent pigments, till "little by little he would have covered with real living flesh these first abstracts of his intention" (Boschini). There is some evidence that in many cases these underpaintings were in tempera, which would have the advantage of drying more quickly than underpaintings in oil, and Boschini (Le Ricche minere della pittura veneziana, 1674) expressly says that the blues in Venetian paintings, e.g. by Veronese, were painted often a guazzo.

There was a reason, however, why the Venetians would alter the traditional practice of the Flemish forerunners. The latter were almost entirely panel painters, while the Venetians used canvas. Now certain media, like the hard pine-balsams which Dr Laurie thinks were the basis of the Van Eyck medium, are suitable for the immovable surfaces of a well-grounded panel, but would be liable to crack on canvas which is more or less yielding. Hence the tougher oil vehicles were in advanced Venetian painting exclusively employed.

This distinction between the thin transparent pigments and those of an opaque body, which is as old as oil painting in any form, becomes in the hands of Bellini and the later Venetians the fundamental principle of the technique. The full advantage of this thinness and transparency is gained by the use of the pigments in question as "gazes" over a previously laid solid impasto. This impasto may be modelled up in monochrome or in any desired tints chosen to work in with the colours of the superimposed glazes. Effects of colour of great depth and brilliancy may thus be obtained, and after the glaze has been floated over the surface a touch of the thumb, where the underpainting is loaded and lights are required, will so far thin it as to let the underlying colour show through and blend with the deeper tint of the glaze in the shadows. Thus in the noble Veronese in
the London National Gallery, called the “Consecration of St Nicholas,” the kneeling figure of the saint is robed in green with sleeves of golden orange. This latter colour is evidently carried through as underpainting over the whole draped portions of the figure, but it is being then floated over and so manipulated that the golden tint shows through in parts and gives the high lights on the folds.

Again the relation of the two kinds of pigment may be reversed, and the full-bodied ones mixed with white may be struck into a previously laid transparent tint. The practice of painting into a wet glaze or rubbing was especially characteristic of the later Flemings, with Rubens at their head, and this again, though a polar opposite to that of the Venetians, is also derived from the earlier tempera, or modified tempera, techniques. The older tempera panels, when finished, were, as we have seen, covered with a coating of oil varnish generally of a warm golden hue, and in some parts they were, as Cennino tells us, glazed with transparent oil paint. Now Van Mander tells us in the introduction to his Schilderboek of 1604, verse 17, that the older Flemish and German oil painters, Van Eyck, Dürer and others, were accustomed, over a slightly painted monochrome of water-colour in which the drawing was carefully made out, to lay a thin coat of semi-transparent flesh tint in oil, through which the under-painting was still visible, and to use this as the ground for their subsequent operations. In the fully matured practice of Rubens this thin glaze became a complete painting of the shadows in rubbings of deep rich transparent oily pigment, into which the half-tones and the lights were painted while it was still wet. Descamps, in his Vie des peintres flamands (Paris, 1753), describes Rubens’s method of laying in his shadows without any use of white, which he called the poison of this part of the picture, and then painting into them with solid pigment to secure modelling by touches laid boldly side by side, and afterwards tenderly fused by the brush. Over this preparation the artist would return with the few decided strokes which are the distinctive signs-manual of the great master. The characteristic advantages of this method of work are, first, breadth, and second, speed. The under tint, often of a rich softumber or brown, being spread equally over the canvas makes its presence felt throughout, although all sorts of colours and textures may be painted into it. Hence the whole preserves a unity of effect that is highly pictorial. Further, as the whole beauty of the work depends on the skill of hand by which the solid pigment is partly sunk into the glaze at the shadow side, while it comes out drier and stronger in the lights, and as this must be done rightly at once or never, the practice of Rubens is a singularly rapid one. Exquisite are the effects thus gained when the under tint is allowed to peep through here and there, blending with the solid touches to produce the softest effects of tone and colour.

Of these two distinct and indeed contrasted methods of handling oil pigment, with solid or with transparent under-painting, that of the Flemings has had most effect on later practice. The technique dominated on the whole the French school of the 18th century, and has had a good deal of influence on the painting of Scotland. In general, however, the oil painting of the 17th and succeeding centuries has not been bound by any distinctive rules and methods. Artists have felt the temptation to use the resources of oil in a new and more than ever variable way, and it must be admitted that very good results have been achieved by the use of the simplest vehicles that have been known throughout the whole history of the art. If Rembrandt begin in the Flemish technique, Velazquez uses at first solid under-paintings of a somewhat heavy kind, but when these masters attain to full command of their media they paint apparently without any special system, obtaining the results they desired, now by one process and now again by another, but always working in a free untrammeled spirit, and treating the materials in the spirit of a master rather than of a slave. In modern painting generally we can no longer speak of established processes and methods of work, for every artist claims the right to experiment at his will, and to produce his result in the way that suits his own individuality and the special nature of the task before him.

§ 45. Water-Colour Painting—(Cosmo Monkhouse, The Earlier English Water-Colour Painters, and ed., London, 1897; Redgrave, A Century of Painters; and Hamerton, The Arts, contain chapters on this subject.)

Water-colour painting, as has been said, is only a particular form of tempera, in which the pigments are mixed with gum to make them adhere, and often with honey or glycerin to prevent them drying too fast. The surface operated on is for the most part paper, though “miniature” painting is in water-colour on ivory. The technique was in use for the illustrated papyrus rolls in ancient Egypt, and the illuminated MSS. of the medieval period. As a rule the pigments used in the MSS. were mixed with white and were opaque or “body” colours, while water-colour painting in the modern sense is mostly transparent, though the body-colour technique is also employed. There is no historical connection between the water-colour painting on the vellum of medieval MSS. and the modern practice. Modern water-colour painting is a development rather from the drawings, which the painters from the 15th to the 17th century were constantly executing in the most varied media. Among the processes employed was the reinforcement of an outline drawing with the pen by means of a slight wash of the same colour, generally a brown. In these so-called pen-andwash drawings artists like Rembrandt were fond of recording their impressions of nature, and the water-colour picture was evolved through the gradual development in importance of the wash as distinct from the line, and by the gradual addition to it of colour. It is true that we find some of the old masters occasionally executing fully-tinted water-colour drawings quite in a modern spirit. There are landscape studies in body-colour of this kind by Dürer and by Rubens. These are, however, of the nature of accidents, and the real development of the technique did not begin till the 18th century, when it was worked out, for the most part in England, by artists of whom the most important were Paul Sandby and John Robert Cozens, who flourished during the latter half of the 18th century. First the wash, which had been originally quite flat, and a mere adjunct to the pen outline, received a certain amount of modelling, and the advance was quickly made to a complete monochrome in which the firm outline still played an important part. The element of colour was first introduced in the form of neutral tints, a transparent wash of cool grey being used for the sky and distant hills, and the local colour of the rocks and the landscape generally. “The progress of English water-colour,” writes Mr Monkhouse, “was from monochrome through neutral tint to full colour.” Cozens produced some beautiful atmospheric effects with these neutral tints, though the rendering of nature was only conventional, but it was reserved for the second generation of English water-colour artists to develop the full resources of the technique. This generation is represented centrally by Thomas Girtin (1775-1802) and J. M. W. Turner (1775-1851), the latter of whom is by far the greatest representative of the art that has hitherto appeared. To Girtin, who died young and whose genius, like that of Masaccio, developed early, is due the distinction of creating water-colour painting as an art dealing with the tones and colours of nature as they had been seen in the open air. Turner, who was for a time an assistant to a water-colour artist who also wrote on the art, says of Girtin that he “prepared his drawings on the same principle which had hitherto been confined to painting in oil, namely, laying in the object upon his paper with the local colour, and shading the same with the individual tint of its own shadow. Previous to the practice of Turner and Girtin, drawings were shaded first entirely through, whatever their component parts—houses, cattle, trees, mountains, foregrounds, middle-ground and distances, all with black or grey, and these objects were afterwards stained or tinted, enriched or finished, as is now the custom to colour prints. It was the new practice, introduced by these distinguished artists, that acquired for designs in water-colours upon paper the title of paintings.”
Girtin "opened the gates of the art" and Turner entered in. If the palette of the former was still restricted, Turner exhausted all the resources of the colour box, and moreover enriched the art by adding to the traditional transparent washes the effects to be gained from the use of body colour. Body colours, however, were not only laid on by Turner with the solid impasto of the medieval illuminations. He was an adept at dragging thin films of them over a tinted ground so as to secure the subtle colour effects which can also be won in pastel. It would be useless to attempt any account of the technical methods of Turner. The information of the practitioners in the art, for as in modern oil painting so here, each artist has to strike as liberally as possible at liberty of any media and processes which seem to promise the result he has in view. The varieties of paper used in modern water-colour practice are very numerous, and the idiosyncrasy of each artist expresses itself in the way he will manipulate his ground; superinduce one over the other his transparent washes; load with solid body colour; sponge or scratch the paper, or adopt any of the hundred devices in which modern practice of painting is so rife.

G. B. B.

**RECENT SCHOOLS OF PAINTING.**

**British.**

At the beginning of the last quarter of the 19th century British art was held to be in a vigorous and authoritative position. During the years immediately preceding it had been developing with regularity and had displayed a vitality which seemed to be full of promise. It was supported by a large array of capable workers; it had gained the widest recognition from the public; and it was curiously free from those internal conflicts which diminish the strength of an appeal for popular appreciation. There were then few sharp divergences or subdivisions of an important kind. The leadership of the Royal Academy was generally conceded, and its relations with the mass of outside artists were little wanting in cordiality. One of the chief reasons for this understanding was that at this time an almost unprecedented approval was enjoyed by nearly all classes of painters. Picture-collecting had become a general fashion, and even the youngest workers received encouragement directly they gave evidence of a reasonable share of capacity. The demand was equal to the supply; and though the number of men who were adopting the artistic profession was rapidly increasing, there seemed little danger of over-production. Pictorial art had established upon all sorts of people a hold too strong, as it seemed, to be affected by change of fashion. All pointed in the direction of a permanent prosperity.

Subsequent events provided a curious commentary on the anticipations which were reasonable enough in 1875. The year is now seen to have been, not the beginning of an era of unexampled success for British pictorial art, but rather the culminating point of preceding activity. During the period which has succeeded we have witnessed a rapid decline in the popular interest in picture-painting and a marked alteration in the conditions under which artists have had to work. In the place of the former sympathy between the public and the producers, there grew up something which almost approached indifference to their best and sincerest efforts. Simultaneously there developed a great amount of internal dissension and of antagonism between different sections of the art community. As an effect of these two causes, a new set of circumstances came into existence, and the aspect of the British school underwent a radical change. Many art workers found other ways of using their energies. The slackening of the popular demand inclined them to experiment, and to test forms of practice which formerly were not accorded serious attention, and it led to the formation of detached groups, the members of which were always ready to contend over details of technical procedure. Restlessness became the dominant characteristic of the British school, with some intolerance of the popular lack of sympathy.

The first sign of the coming change appeared very soon after 1875. The right of the Royal Academy to define and direct the policy of the British school was disputed in 1877, when the Grosvenor Gallery was started "with the intention of giving special advantages of exhibition to artists of established reputation, some of whom have previously been imperfectly known to the public." This exhibition gallery was designed not so much as a rival to the Academy, as to provide a place where could be collected the works of those men who did not care to make their appeal to the public through the medium of a large and heterogeneous exhibition. As a rallying place for the younger painters, standing apart from their fellows in conviction and method, it had good reason for existence; and that it was not regarded at Burlington House as a rival was proved by the fact that among the contributors to the first exhibition were included Sir Francis Grant, the President of the Royal Academy, and such artists as Leighton, Millais, G. F. Watts, Alma-Tadema, G. D. Leslie and E. J. Poynter, who were at the time Academicians or Associates. With them, however, appeared such men as Burne-Jones, Holman Hunt, Walter Crane, W. B. Richmond and J. McNeill Whistler, who had not heretofore obtained the publicity to which they were entitled by the exceptional quality and intention of their work. There was doubtless some suggestion that the Academy was not keeping touch with the more important art movements, for shortly after the opening of the Grosvenor Gallery there began that attack upon the official art leaders which has been one of the most noteworthy incidents in recent art history in Great Britain. The initial stage of this conflict ended about 1886, when the vehemence of the attack had been weakened, partly by the withdrawal of some of the more prominent "outsiders," who had meanwhile been elected into the Academy, and partly by the formation of smaller societies, which afforded the more "advanced" of the younger men the opportunities which they desired for the exposition of their views. In a modified form, however, the antagonism between the Academy and the outsiders has continued. The various protesting art association continues to work in most matters independently of the Academy, but there is the common belief that the dominant influence of Burlington House has not been exercised entirely as it should be for the promotion of the best interests of British art, and that it maintains tradition as against the development of individualism and a "new style."

The agitation in all branches of art effort was not entirely without result even inside Burlington House. Some of the older academic views were modified, and changes seriously discussed, which formerly would have been rejected as opposed to all the traditions of the society. Its coldness under attack, and its ostentatious disregard of the demands made upon it by the younger and more strenuous outsiders, have veiled a great deal of shrewd observation of passing events. It may be said that the Academy has known when to break up an organization in which it recognized a possible source of danger, by selecting the ablest leaders of the opposition to fill vacancies in its own ranks; it has given places on its walls to the works of those
PAINTING

reformers who were not unwilling to be represented in the annual exhibitions; and it has, without seeming to yield to clamour, responded perceptibly to the pressure. They have not, however, checked the progress of the changing fashion by which the popular liking for pictorial art has been diverted into other channels, it has kept its hold upon the public, and has not to any appreciable extent weakened its position of authority.

It is doubtful whether a more definite participation by the Academy in the controversies of the period would have been of any use as a means of prolonging the former good relations between artists and the collectors of works of art. The change is the result of something more than the failure of one art society to fulfil its entire mission. The steady falling off in the demand for modern pictures has been due to a combination of causes which have been powerful, though it has not always been to the exclusion of the refinements which British painters have to work. For example, the older collectors, who had for some years anterior to 1875 bought up eagerly most of the more important canvases which came within their reach, could find no more room in their galleries for further additions; again, artists, with the idea of profiting to the utmost by the keenness of the competition among the buyers, had forced up their prices to the highest limits. But the most active of all causes was that the younger generation of collectors did not show the same inclination that had swayed their predecessors to limit their attention to modern pictorial art. They turned more and more from pictures to other forms of artistic effort. They built themselves houses in which the possibility of hating large canvases was almost precluded, not only in order to accommodate their own craftsmen and the decorator to supply them with what was necessary for the adornment of their homes. At first this modification in the popular taste was scarcely perceptible, but with every successive year it became more marked in its effect.

Latterly more money has been spent by one class of collectors upon pictures than was available even in the best of the times which have passed away; but this lavish expenditure has been devoted not to the acquisition of works by modern men, but to the purchase of examples of the old masters. Herein may often be recognized the wish to become possessed of objects which have a fictitious value in consequence of their rarity, or which are "sound investments." Evidence of the existence of this spirit of collecting is seen in the prevailing notion that one must acquire works which inadequately represent some famous master, or are even ascribed to him on grounds not always credible. The productions of minor men, such as Henry Morland, who had never been ranked among the masters, have received an amount of attention quite out of proportion to what merits they possess, if only they can be proved to be scarce examples, or historically notorious. All this implies in the creed of the art patron a change which has necessarily reacted on living painters and on the conditions of their art production.

These, then, are the conclusions to which we are led by a comparison of the movements which affected the British school between 1875 and 1890. The beginning of the 20th century was marked by a doleful wane in its spirit and in the vigour of its productions, and the trend was towards greater and greater mediocrity. The public had long since lost its enthusiasm for the novel and startling, and its taste had become increasingly discerning in the older works of modern times. It was thus willing to pay high prices for the productions of the past, leaving the moderns and the minor men to suffer. These latter, therefore, are held in the same proportion of esteem as the old masters were esteemed in the past. The public has been attracted by the excitement of the new, while it has failed to recognize the value of the old, and has lost its hold upon the tradition of the past. The British school has been compelled to meet the demands of the public by a compromise, and has been willing to sacrifice its own interests to the satisfaction of those of others. The result has been the decline of a school which had been characterized by a healthy and vigorous spirit, and which had been marked by a keenness of observation and an appreciation of the finer points of art. The British school has been compelled to suffer the consequences of its own success, and has been willing to sacrifice its own interests to the satisfaction of those of others.
by a sensuous love of colour for its own sake, were abandoned for more scientific statements. The colder and cruder tone-studies of the modern Frenchman became the models upon which the younger artists based themselves, and the standards against which they measured their own success. "Actuality" was gained, but much of the poetry, the delicacy, and the subtle charm which had distinguished British colourists were lost.

For some while there was a danger that the art of Great Britain might become hybrid, with the French strain predominating. So many students had succumbed to the fascination of a system of training which seemed to supply them with a perfect equipment on all points, that they were inclined to despise not only the educational methods of their own country, but also the individual characteristics of British taste. The result was that the exhibitions were full of pictures which presented English people and English landscape in a purely arbitrary and artificial manner, strictly in accordance with a French convention which was out of sympathy with British instincts, and indeed, with British facts. Ultimately a discreet middle course was found between the extreme application of the science of the French art schools and the comparative irresponsibility in technical matters which had so long existed in the British Isles. In the careers of men like Stanhope Forbes, H. S. Tuke, Frank Bramley, and other prominent members of the school, many illustrations are provided of the way in which this readjustment has been effected. Their pictures, if taken in a sufficiently long sequence, summarize in interesting way the movement which became active about 1875. They prove how valuable the interposition of France has been in the matter of artistic education, and how much Englishmen have improved in their understanding of the technique of painting.

One noteworthy outcome of the triumph of common sense over fanaticism must be mentioned. Now that the exact relation which French teaching should bear to British thought has been adjusted, an inclination to revive the more typical of the forms of pictorial expression which have had their vogue in the past is becoming increasingly evident. Picturesque domesticity is taking the place of theatrical sensation, the desire to select and represent what is more than ordinarily beautiful isousting the former preference for what was brutal and ugly, the effort to please is once again stronger than the intention to surprise or shock the art lover. Even the Pre-Raphaelite theories and practices are being reconstructed, and quite a considerable group of young artists has sprung up who are avowed believers in the principles which were advocated so strenuously in 1850.

To French intervention can be ascribed the rise and progress of several movements which have had results of more than ordinary moment. There was a few years ago much bawling together of men who believed strongly in the importance of asserting plainly their belief in the doctrines to which they had been converted abroad; and as a consequence of this desire for an offensive and defensive war against the foreign art, the groups were able to draw the boundaries of the British school. Each of these groups had some peculiar tenet, and each had a small orbit of its own in which it revolved, without concerning itself overmuch about what might be going on outside. Roughly, there were three classes into which the more thoughtful British artists could then be divided. One included those who were in the main French in sympathy and manner; another consisted of those who were not insensible to the value of the foreign training, but who did not wish to surrender entirely their faith in the British tradition; and the third, and smallest, was made up of a few individuals who were independent of all assistance from without, and had sufficient force of character to ignore what was going on in the art world. In this third class there was practically no common point of view; each man chose his own direction and followed it as he thought best, and each one was prepared to stand or fall by the opinion which he had formed as to the true function of the painter. Necessarily, in such a gathering there were several notable personalities who may fairly be reckoned among the best of English modern masters.

Perhaps the most conspicuous of the groups was the gathering of painters who established themselves in the Cornish village of Newlyn (p. 489). This group—"The Newlyn School," as it was called—was noted for the intense patriotism of its members. Many of its most cherished beliefs were considerably altered. In its beginning it was essentially French in atmosphere, and advocated not only strict adherence to realism in characterization, but a return to a more academic colour to tone-gradation, and the observance of certain technical details, such as the exclusive use of flat brushes and the laying on of pigments in square touches. The colony was formed, as it were, in an attempt to escape as the result of the influence of the British school, the order in which the adherents arrived may here be set on record. Edwin Harris came first, and was joined by the Rev. Henry E. Anglem. Shortly after came Ralph Todd, L. Sutters, Fred Hall, Frank Bramley and T. C. Gotch, and Percy Craft and Stanhope Forbes together. H. Detmuld and Chevalier Taylor next arrived; then Miss Elizabeth Armstrong (Mrs Stanhope Forbes), F. Bourdillon, W. Fortune and Norman Garstin. Ayerst Ingrams, H. S. Tuke, H. Martin and F. Millard were later visitors. Stanhope Forbes (b. 1857) was trained at the Lambeth School and at the Royal Academy, and afterwards in Bonnat's studio in Paris. His best-known pictures are "A Fish Sale on a Cornish Beach" (1885), "Soldiers and Sailors" (1891), "Forging the Anchor" (1892), and "The Smithy" (1894). He was elected A.R.A. in 1892, and became full Member in 1910. Frank Bramley (b. 1867) was among the first to feel the influence of the French school. He gained much popularity by his pictures, "A Hopeless Dawn" (1888), "For of such is the Kingdom of Heaven" (1891), and "After the Storm" (1896), and was elected an Associate in 1890 and full Member in 1895. He is one of the vanguard of the technical methods which he followed in his earlier period. T. C. Gotch (b. 1854) had a varied art training, for he worked at the Slade School, then at Antwerp, and finally in Paris under Jean Paul Laurens. He did not long remain in the Pre-Raphaelite creed, but diverged about 1890 into a kind of decorative symbolism, and for some years devoted himself entirely to pictures of this type. The other men who must be ranked as supporters of the school included many who were not in principle adherents to it, but who accepted the methods which were in the works of the leaders of the movement. They were faithful realists, sincere observers of the facts of life with which they were brought in contact, and quite earnest in their efforts to paint what they saw, withoul any modification or idealization.

Another group which received its inspiration directly from France was the Impressionist school (see IMPRESSIONISM). This group never had any distinct organization like that of the French Societé des Impressionistes, but among the members of it there was a general agreement on points of procedure. They biased themselves, more or less, upon the pictorial art of Pissaro, Renoir, Cassar, and Claude Monet, and owed not a little to the example of J. A. M. Whistler, whose own art may be said to be in a great measure a product of Paris. One of the fundamental principles of their practice was the submission of the subject to the play of transparency, and the rendering of graduated tints by the juxtaposition of touches of pure colour upon the canvas, rather than by attempting to match them by previously mixing them on the palette. In piece without paid painting effects can be obtained. The works of the British Impressionists have been seen mostly in the exhibitions of the New English Art Club. This society was founded in 1885 by a number of young artists who wished for facilities for exhibition of which they felt were denied to them in the other galleries. It drew the greater number of its earlier supporters from the men who had been trained in foreign schools, and adopted a list of famous names, even though it included the names of many of the best-known of the younger painters. It was the meeting-place of numerous groups which advocated one or other of the new creeds, for among its members or exhibitors have been W. B. Yeats, John Coslin, Rickenbacker, Solomon J. Solomon, Stanhope Forbes, T. C. Gotch, Frank Bramley, Arthur Hacker, Francis Bate, Moriat Lindner, J. L. Henry, W. W. Russell, George Thomson, Arthur Tomson, Henry Tonks, C. W. French, George Scharf, J. J. Linnell, W. W. Dickson, J. J. Shannon, W. L. Wyllie, H. S. Tuke, Maurice Greiffenhagen, G. P. Jacob Building, Alfred Parsons, Alfred East, J. Buxton Knight, C. H. Hannon, Mark Fisher, Walter Sickert, W. Strang, Frank Brangwyn, Robert Anning Bell, Fred Stone, Alfred Munnings, Fred Brown, Honor Wilson, A. J. Stott, J. E. Reid, Mount Loudon, T. B. Kennington, H. Muhrman, A. D. Peppercorn, George Clasen and J. A. M. Whistler, and a number of the Scottish artists, like J. Laver, J. J. Paterson, W. B. Whymper, and F. Christie and E. A. Hornel. A number of the men who have been more or less actively identified with it have been elected members of the Royal Academy, so that it may fairly claim to have exercised a definite influence upon the tendencies of modern art. It has certainly
PAINTING
[BRITISH]

done much to prove the extent of the foreign influence upon the British school of art.

In its wider sense the Impressionist school may be said to include now all those students of nature who strive for the representation of broad effects rather than minute details, who look at the subject beneath the surface, and for their sensitive management of light and tone matters which would be likely to interfere with the simplicity of the pictorial rendering. To it can be assigned a number of artists who have never adopted, or have definitely abandoned, the more obvious formulas of the classicisers and the Impressionists. These men were headed by J. M. N. Whistler (q.v.), born in America in 1834, and trained in Paris under Gleyre. His pictures have always been remarkable for their beauty of color composition, and have done much to elevate the rank of the art. The other notable names in this group are those of a landscape painter who studied for a while in Gleyre's studio, one of the ablest interpreters in England of effects of sunlight and breezy atmosphere; A. D. Peppercorn, a pupil of Gérôme, who makes landscapes a medium for the expression of a dignified sense of design and a carefully simplified appreciation of contrasts of tone; and P. Wilson Steer, an artist who began as a follower of Monet, and based upon his training in the École des Beaux Arts a style of his own, which he displays effectively in both landscapes and figure pictures.

The International Society of Sculptors, Painters, and Gravers, inaugurated in 1896, although not by its nature confined to British artists, has for the most part been controlled by them. The headquarters of the society, which has its home in London, succeeds in its object of setting before the British public the most modern and eccentric expressions of the art of the chief sculptors and painters of the world, and has contributed to the most part serious and interesting; but while the freedom of the artist is insisted on it is doubtful if the more exaggerated displays by rebellious painters and sculptors have had much influence. Among the sculptors the chief names are those of M. N. Whistler and Auguste Rodin, and the vice-presidents John Lavery and William Strang; these personalities, considered along with their views and their vigour, sufficiently indicate the spirit and thought of the society.

Generally speaking, the very large class of artists who fell only to a limited extent under the spell of French teaching includes much of the figure and landscape men and practically none of the sculptors. In a certain manner figure painting individual workers in improved technical methods have appeared, but most of these have gradually lost their distinctive character, and have been absorbed by the new styles and their followers. The Munich, the Academy and the Ecole des Beaux Arts, Paris, are still the scenes of the leading schools of the time, and the most numerous, and they mostly devote their energies to historical painting rather than to large canvases. Lady Butler (née Elizabeth Thompson), whose "Roll Call," exhibited in 1874, was the most attractive personal exhibition of the style of the same, and among which "Quatre Bras" (1875), "The Defence of Rorke's Drift" (1881), "The Camel Corp" (1891) and "The Dawn of Waterloo" (1895) are perhaps the most worthy of note. Ernest Crofts (b. 1847; A.R.A. 1878; R.A. 1896), trained in London and Dusseldorf, has taken a prominent position by such pictures as "Napoleon at Ligny" (1886), "Napoleon leaving Moscow" (1887), the Capture of a French Battery by the Zouaves under Gouraud (1890), and the Mzambe River (1891). The pictures of Governor-General Sir Henry Slade (b. 1835), are among the most charming and effective representations of historical battles. Occasional pictures have come also from A. C. Gow, R. Caton Woodville, W. B. Wollen, J. F. Beudet, John Charlton, and a few more who are better known for their portraits than for their historical works.

The number of artists who have devoted the greater part of their energies to portraiture has been steadily on the increase. Most of the men who have taken definite rank among the portrait painters have made reputations by their portraits also, but there are many others who have kept almost exclusively to this branch of practice. Into the first division come such noted artists as Sir John Millais, Sir E. J. Poynter, Sir Hubert Vosper, Sir James Jebusa, Sir L. Alma-Tadema, Sir W. B. Richmond, Seymour Lucas, the Hon. John Collier, S. J. Solomon, Arthur Hacker, Sir W. Q. Orchardson, A. M. N. Whistler, Frank Dicksee, Stanhope Forbes, William Frith, Sir Ken Wood, Sir P. V. Redgrave, S. J. Pope, Sir E. Bacon and Frank Holl. In the second must be reckoned J. S. Sargent (A.R.A. 1894; R.A. 1897), an American citizen (b. 1856), a pupil of Carolus Duran, who after 1885 was recognized as one of the most brilliant painters of the day; J. J. Shannon, also an American (b. 1862), trained at the South Kensington School, and elected an Associate in 1897, a graceful and accomplished artist, with a fine sense of color and a light touch; and J. W. Macbeth, born in 1857, trained in Paris, and elected an Associate in 1899, who carries on so soundly the better traditions of the British school; James Sout (b. 1820), elected an Academician in 1870, a strong worker in the line of genre pictures; Sir A. D. Bouguereau (b. 1839; A.R.A. 1877; R.A. 1881), trained in the Royal Academy Schools, an industrious and prolific worker; H. T. Wells (b. 1828; A.R.A. 1866; R.A. 1870), trained in London and Paris; A. M. N. Whistler, born in 1834; S. J. Solomon, born 1838; and many miniatures; W. Llewellyn (b. 1860), educated at the South Kensington School and in Cornson's studio in Paris, an able draughtsman and a thorough executant; C. W. Furse (q.v.), trained
first in the Slade School under Professor Legros and afterwards in Paris, whose early death removed a master of his art; and others like Walter Osborne, Richard Jack, Glyn Philpot and Gerald Kelly. Most of these have been of the school of the Barbizon coterie, who were interested in the rural landscapes and who had little or nothing to do with the suggestions of foreign teachers, a number of artists can be enumerated who have in common little besides a sincere desire to express their personal conviction of the advantage and necessity of truth in all things.

**Individual Artists.**

Among the most distinguished of modern artists, who stand out as the unquestioned chiefs of the school, Sir John Millais occupies a place in this group by virtue of his admirable exhibition of "A Barque in a Storm" (b. 1835), a painting of the highest quality. His subjects, many of them very sombre, are rendered with a powers of accurate draughtsmanship. To the same class of realists belonged Vicat Cole, R.A.; Bickert Foster, J. W. Oakes, A.R.A.; Keeley Halswelle, and perhaps Alfred W. Hunt, though in his case recoil from poetry, as it is sometimes termed, and goes in for picturesque effects. The romanticists and pastoral painters have in many cases been perceptibly affected by the example of the Barbizon school, but they owe much to such famous Englishmen as Cecil Lawson. Among the more interesting are: George Price Cowper, (b. 1849), who has made a point of the truth of his work in the depth of tone; R. W. Allen (b. 1852), who uses a robust technical method with equal skill in landscapes and coast subjects; J. Buxton Knight (b. 1842; d. 1908), a vigorous manipulator, with a romantic school of his own, in which the forms are an abstract expression of a sentiment, and are sometimes made to express the very depth of feeling. J. G. F. Cadogwan (A.R.A. 1907) and Miss Eleanor Fortescue-Brickdale, who in manner much like Byam Shaw, but yet does not sink her individuality in mere imitative effort.

**Landscape Painters.**

Landscape painters are the ones who have for the most part been little affected by the unrest which has caused so many new developments in figure-work. A love of nature has always been one of the best British characteristics, and it has proved itself to be strong enough to keep those artists who seek their inspiration out of doors from failing to any great extent under the control of particular fashions. Therefore there is in the school of "open-air" painting a general effect of truth and sincerity which the best painter of the older school, F. C. Nicholls, possesses in a high degree the faculty of imaginative expression, allied with humour that never degenerates into farce. His strongest preference is for symbolical subjects which embody something of the romance of the Middle Ages. Among his pupils are George Clausen, John F. C. Cadogwan (A.R.A. 1907) and Miss Eleanor Fortescue-Brickdale, who in manner much like Byam Shaw, but yet does not sink her individuality in mere imitative effort.

Among the most notable of the first class are H. W. B. Davis (b. 1833; A.R.A. 1873; R.A. 1877), the painter of a long series of "cattle" pictures done with a curious and persistent fidelity to the forms and habits of the working animal, and with much minuteness and exactness of detail, especially in the rendering of flowers; and Frank W. (b. 1850), who chooses as his subjects the homely scenes which delight the heart, and who has found an agreeable treatment of the subject of "Dignity and the Home". Among the second class, younger artists, such as R. A. Sayers, (b. 1853; A.R.A. 1875), trained in the Royal Academy and afterwards President of the Royal Society of Painters in Water-Colours, a graceful painter, with a tender colour feeling and an excellent technical style; Yeend King (b. 1855), trained partly in England, and partly in Paris under Bonnat and Cormon, a sound craftsman who made a reputation by landscapes in which are introduced groups of figures on a fairly large scale. Among the third class of decorative artists, J. W. Waterhouse (A.R.A. 1885; R.A. 1895), in many ways the most original and inspired of English imaginative painters; and, again, M. Greiffenhagen, F. Cayley Robinson and Mrs Swayne. Among this latter branch are several artists who are recent additions to the Slade School, and who have already shown promise. There are, besides, Leslie Thomson (b. 1854), whose art is especially sound and sincere; J. Amonier, a pastoral painter with very refined appreciation of subtleties of aerial colour; C. W. Wyllie, a painter of delicate vision and charm of presentation; J. S. Hill, who paints very fine and decorative landscapes in the manner of the French school, Penrose, R.A. (b. 1840; d. 1895), who ranks high in his class, and in whose pictures the impression is conveyed with a sense of poetic inspiration; Chas. E. Queen (b. 1854), who is much esteemed for his poetic and picturesque work; P. W. Marshall, a popular illustrator; C. E. Bogue, R.A. (b. 1838; d. 1906), whose well drawn and broadly painted pictures in oil and water-colour have been for many years appreciated by lovers of unaffected nature; Lionel S. Smythe (A.R.A. 1885; R.A. 1895), who produces very agreeable results of a poetic and imaginative character; W. Rusham Weston (b. 1854; d. 1895), whose poetic work is eminently musical, and shows a happy control of poetic and expressive tones. The subject matter of this group is nearly all in the forms of the open-air, and the methods are the most informal of those in vogue in the English school. The work of each is characterized by a restrained poetic feeling and a certain weight of poetic effect which is at the same time peculiarly musical in its ebb and flow, and which is always felt to be a true expression of a poetic and imaginative character.

**Realistic Landscape.**

Realistic landscape, on the contrary, is a purely superficial result. The absence of any common conception, or of any set pattern of landscape which would lead to uniformity of effort, has left the students of nature free to express themselves in a personal way. This is the true value of French training, as well as the infallibility of the dogmas which emanate from the Paris studios, have not, except in rare instances, demanded any radical remodelling of the British landscape school on French lines, as local conditions affecting the practice of art are very much more varied and complicated.

Among the most notable of the first class are H. W. B. Davis (b. 1833; A.R.A. 1873; R.A. 1877), the painter of a long series of "cattle" pictures done with a curious and persistent fidelity to the forms and habits of the working animal, and with much minuteness and exactness of detail, especially in the rendering of flowers; and Frank W. (b. 1850), who chooses as his subjects the homely scenes which delight the heart, and who has found an agreeable treatment of the subject of "Dignity and the Home". Among the second class, younger artists, such as R. A. Sayers, (b. 1853; A.R.A. 1875), trained in the Royal Academy and afterwards President of the Royal Society of Painters in Water-Colours, a graceful painter, with a tender colour feeling and an excellent technical style; Yeend King (b. 1855), trained partly in England, and partly in Paris under Bonnat and Cormon, a sound craftsman who made a reputation by landscapes in which are introduced groups of figures on a fairly large scale. Among the third class of decorative artists, J. W. Waterhouse (A.R.A. 1885; R.A. 1895), in many ways the most original and inspired of English imaginative painters; and, again, M. Greiffenhagen, F. Cayley Robinson and Mrs Swayne. Among this latter branch are several artists who are recent additions to the Slade School, and who have already shown promise. There are, besides, Leslie Thomson (b. 1854), whose art is especially sound and sincere; J. Amonier, a pastoral painter with very refined appreciation of subtleties of aerial colour; C. W. Wyllie, a painter of delicate vision and charm of presentation; J. S. Hill, who paints very fine and decorative landscapes in the manner of the French school, Penrose, R.A. (b. 1840; d. 1895), who ranks high in his class, and in whose pictures the impression is conveyed with a sense of poetic inspiration; Chas. E. Queen (b. 1854), who is much esteemed for his poetic and picturesque work; P. W. Marshall, a popular illustrator; C. E. Bogue, R.A. (b. 1838; d. 1906), whose well drawn and broadly painted pictures in oil and water-colour have been for many years appreciated by lovers of unaffected nature; Lionel S. Smythe (A.R.A. 1885; R.A. 1895), who produces very agreeable results of a poetic and imaginative character; W. Rusham Weston (b. 1854; d. 1895), whose poetic work is eminently musical, and shows a happy control of poetic and expressive tones. The subject matter of this group is nearly all in the forms of the open-air, and the methods are the most informal of those in vogue in the English school. The work of each is characterized by a restrained poetic feeling and a certain weight of poetic effect which is at the same time peculiarly musical in its ebb and flow, and which is always felt to be a true expression of a poetic and imaginative character.

**Marine Landscape.**

Marine landscape no one has appeared to rival Henry Moore, poetical creator, whose greater poetic aspirations have been seen; but good work has been done by the late Edwin Hayes, an Irish painter, whose powers showed no sign of failure up to his death in 1904, after some half dozen years of success. Among the living, W. A. M. Archer (b. 1889; R.A. 1907), trained in the Royal Academy Schools, who paints sea and shipping with intelligent understanding; T. Somerscales, a self-taught artist, with an intimate knowledge of the ocean derived from his own long life at sea; and H. W. B. Davis (b. 1841; A.R.A. 1898; R.A. 1910), trained at the Antwerp Academy and in the studio of Baron Leys, a powerful manipulator, with a preference for the dramatic aspects of his subject. J. C. Bevan, a pupil of Blanche, and W. R. Hosmer, who has made his pictures notable among the best productions of the British school. Mention must be made of John Brett (1830-1902; A.R.A. 1881), the one Pre-Raphaelite sea painter, and Hamilton Macalum...
PAINTING

[FRANCE]

The period between 1780 and the opening of the 20th century was singularly important in the history of France, and consequently of her art. The internal life of the people developed on new lines with a vigour that left a deep mark on the outcome of mental effort. Literature was foremost in this new movement. The novels of Balzac, Zola, Flaubert, the brothers de Goncourt, Duidey, Gue de Maupassant and the plays of Alexandre Dumas fils, filled as they are with the scientific spirit and social atmosphere of the time, have added a new note to art which was to culminate in the appreciation of the visible beauty and the spiritual poetry of the world around them, and helped them to view it with more attentive eyes, more insight and more emotion. The aim of art was also to emancipate itself, by the growing efforts of independent artists, from the slavery of tradition, and to devote itself to a more personal contemplation and knowledge of contemporary life under every aspect. Modern French art tends to become more and more the art of the people—a mixture of naturalism and poetry, deriving its inspiration, by preference, from the world of the working man; no longer appealing only to a restricted and more or less fastidious public, but, on the contrary, adapting its aesthetic or moral teaching to popular appreciation. The whole past was not, of course, wiped out. The younger generation had to learn and profit by the lessons taught by their great precursors. To understand the true character of this recent development of French art it is needful, therefore, to glance at the past.

We need not dwell on the individual authorities who constitute the official hierarchy of the contemporary French school; these masters belong for the most part, by the date of their best work, to a former generation. Starting in many cases from very opposite points, but reconciled and united by time, they carried on, during the last quarter of the 19th century, with more or less distinction, the inevitable evolution of their personal gifts.
We still see the works of some of the staunch Romantics: Jean Gignoux (d. 1892), Robert-Fleury (d. 1890), Jules Dupré (d. 1899), Lami (d. 1890), Cabat (d. 1893) and Isabey (d. 1886); and with these, though they did not follow quite the same road, may be named François (d. 1897) and Charles Jacque (d. 1894). Next to them, Meissonier (d. 1891) crowed into the last twenty years of his life a mass of work which, for the most part, enhanced his fame; and Rosi Bonheur (d. 1899), working in retirement up to the age of seventy-seven, went on her accustomed way under the leadership of her external changes. Albert, Harpignies, Ziem and Paul Flandrin survived. Among the generation which grew up under the Second Empire we find men of great intelligence and distinction: some, like Alexandre Cabanel (1824–1889), by pictures of historical genre, in a somewhat insipid and conventional style, but more particularly by female portraits, firm in flesh-painting and aristocratic in feeling; others, like Paul Baudry (1828–1886, q.v.), whose large decorative works, with their pure and lofty elegance, secured him lasting fame, and whose allegorical compositions were particularly remarkable; not less so his portraits, at first vivid, glowing and golden, but at the end of his life, under the influence of the new atmosphere, cooler in tone, but more eager, nervous and restless in feeling. Léon Gérôme (b. 1824, q.v.) was the originator, during the Second Empire, of the historic genre, whose somewhat arid instinct for archaeological precision and finish developed to better ends in sculpture during later years. William Bouguereau (b. 1825, q.v.) painted symbolical and allegorical subjects in a sentimental style. Jules Lefebvre (b. 1836) had a brilliant career as a portrait painter, combined, in his earlier years, with admirable studies of the nude. These were followed by Benjamin Constant (d. 1902), a clever painter of past ages in the East and of modern Oriental life, who latterly directed his powers of vigorous and rapid brushwork to portrait-painting; Fernand Cormon, the inventive chronicler of primeval Gaul, and a solid and learned portrait painter; Aime Morot, a man of versatile gifts, a painter of portraits full of life and ease. Then followed a generation of painters who gave the historic genre of the Second Empire the freshness with which it had been deprived. We find a group who betray a close affinity with the realist party—rejecting, like them, tradition at second-hand, though returning for direct teaching to some of the great masters: Léon Bonnat (b. 1833), educated in Spain, and preserving through a long series of official portraits an evident worship of the great realists of that nation; and again, under the same influence, Jean Paul Laurens (b. 1837), who has infused some return of vitality into historical painting by his clear and individual conceptions and realistic treatment. Jean Jacques Henner (b. 1829, q.v.), standing even more apart, lived in a Correggiolike dream of pale nude forms in dim landscape scenery; his love of exquisite texture, and his unvarying sense of beauty, with his refined dilettantism, link him on each side to the great groups of realists and idealists.

About the middle of the 19th century, after the vehement disputes between the partisans of line and the vorticists of colour, otherwise the Classic and the Romantic schools, when a younger generation was resting from these foibles, exhausted, weary, devoid even of any fine technique, two groups slowly formed on the opposite sides of the horizon—seers or dreamers, both protesting in different ways against the collapse of the French school, and against the alleged indifference and sceptical eclecticism of the painters who were regarded as the leaders. This was a revolt from the academic and conservative tradition. One was the group of original and nature-loving painters, keen and devoted observers of men and things, the realists, made illustrious by the three great personalities of Corot (q.v.), Millet (q.v.) and Courbet (q.v.), the real originators of French contemporary art. The other was the group of men of imagination, the idealists, who, in the pursuit of perfect beauty and an ideal moral standard, reverted to the dissimilar visions of Delacroix and Ingres, the ideals of rhythm as opposed to harmony, of style versus passion, which Théodore Chassériau had endeavoured to combine. Round Puvis de Chavannes (q.v.) and Gustave Moreau (q.v.) we find a group of artists who, in spite of the fascination exerted of their intelligence by the great works of the old masters, especially the early Florentines and Venetians, would not accept the old technique, but strove to record in splendid imagery the wonders of the spiritual life, or claimed, by studying contemporary individuals, to reveal the psychology of modern minds. Among them were Gustave Ricard (1821–1873), whose portraits, suggesting the mystical charm sometimes of Leonardo and sometimes of Rembrandt, are full of deep unuttered vitality; Élie Delaunay (1828–1901), serious and expressive in his heroic and allegorical compositions, keenly developing in his portraits; Eugène Fromentin (1820–1876), acute but subtle and silvery, a man of elegant mind, the writer of Les Maîtres d'autrefois, of Sakel and of Le Sahara, the discoverer—artistically—of Algeria. And round the loud and showy individuality of Courbet—healthy, nevertheless, and inspiring—a group was gathered of men less judicious, but more stirring, more truculent, thoroughly original, but not less reverent to the old masters than they were defiant of contemporary authorities. They were more even ardent for a strong technique, but the masters who attracted them were the Dutch, the Flemish, the Venetians, who, like themselves, had aimed at recording the life of their day. Among these was François Bonvin (1817–1887), who, following Granet, carried on the evolution of a subdivision of genre, the study of domestic life. Théodore Géricault, who, in his day, had been compared to his predecessors in France being Chardin and Le Nain. This class of subjects has not merely absorbed all genre-painting, but has become a very important factor in the presentment of modern life. Bonvin painted asylums, convent-life, studios, laboratories and schools. Alphonse Legros (q.v.), painter, sculptor and etcher, who settled in London, was of the same school, though independent in his individuality, celebrating with his brush and etching-needle the life of the poor and humble, and even of the vagabond and beggar. There were also Braquemond, the reviver of the craft of etching; Fantin-Latour, the painter of highly romantic Wagnerian dreams, figure compositions grouped after the Dutch manner, and flower-pieces of a peculiar kind; the dashingly energetic and daring and dashingly in their handling of the brush; Guillaume Régamey, one of the few military painters gifted with the epic sense; and even Carolus Duran, who, after painting “Murdered” (in the Lille Museum), combined with the professional duties of an official teacher a brilliant career as a portrait painter. A later member of this group, attracted to it by student friendship in the little drawing-school which under Lecoq de Boisbaudran competed in a modest way with the École des Beaux Arts, was J. C. Bazin, well known afterwards as a pronounced Realist. Finally, there was Manet, a connecting link between the realists and the impressionists. These two radiant focuses of imagination and of observation respectively were to be seen still intact during the later period, as represented by the most energetic of the masters who upheld them.

After the cataclysm of 1870, French art appeared to be reawakened by the disasters of the country; and at the great exhibition in Vienna in 1873 Count Andrassy exclaimed to Léon Bonnat, “After such a terrible crisis you are up again, and victorious!” Immense energy prevailed in the studios, and money poured into France in consequence. The output increased rapidly, and at the same time study became more strenuous, and ambition grew bolder and more manly. Renewed activity stirred in the public academies, and a crowd of foreign students came to learn. Two great facts give a characteristic stamp to this new revival of French art: I. In the class of imaginative painting, the renewed impulse towards monumental or decorative work. II. In the class of nature studies, the growth of landscape painting, which developed along two parallel lines—Impressionism; and III. the “Open-air” school.
House, the Cour des Comptes and a few churches—St Sulpice, St Vincent de Paul and St Germain des Prés—no serious attempts had been made in this direction. Excepting in the Hôtel de Ville, where Cabanel was winning his first laurels, and in the Opera House, a work that was progressing in silence, a few chapels only were decorated with paintings in the manner of easel pictures. But two famous exceptions led to a decorative revival: Pudis de Chavannes’s splendid scheme of decoration at Amiens (all, with the exception of the last composition, which is dated 1852, executed without break between 1861 and 1867), and his work at Marseilles at Poitiers; Baudry, with his ceiling in the Opera House, begun in 1866 but not shown to the public till 1874. There was also a movement for reviving French taste in the industrial arts by following the example of systematic teaching set by some foreign countries, more particularly by England. Decorative painting felt the same impulse. Philippe de Chennevières, curator of the Luxembourg Gallery and directeur des Beaux Arts (from 1874 till 1879), determined to encourage it by setting up a great rivalry between the most distinguished painters, like that which had stimulated the zeal of the artists of the Italian Renaissance. Taking up the task already attempted by Chenavard under the Republic of 1848, but abandoned in consequence of political changes, M. de Chennevières commissioned a select number of artists to decorate the walls of the Panthéon. The panels were to record certain events in the history of France, with due regard to the sacred character of the building. Twelve of the most noted painters were named, with a liberal breadth of selection so as to include the most dissimilar styles: Millet and Meissonier, of whom one refined the air of the French landscape, the other that of Pudis de Chavannes. The last-named was the first to begin, in 1878, and he too was the painter who put the crowning end to this great work in 1880. His pictures of the "Childhood of Ste Geneviève" (the patron saint of Paris), simple, full of feeling and of innocent charm, appropriate to a popular legend, with their air of Parisian landscape under a pallid sky, made a deep impression. Thenceforward Pudis de Chavannes had constantly growing influence over younger men. His magnificent work at Amiens, "Ludus pro Patria" (1881-1882), at Lyons and at Rouen, in the Sorbonne and the Hôtel de Ville, for the Public Library at Boston, U.S.A., and on to his last composition, "The Old Age of Ste Geneviève," upheld to the end of the 19th century the sense of lofty purpose in decorative painting. Besides the grandeur of the buildings of the movement, Philippe de Chennevières found other buildings to be decorated: the Luxembourg, the Palace of the Legion of Honour and that of the Council of State. The paintings in the Palais de Justice, the Sorbonne, the Hôtel de Ville, the College of Pharmacy, the Natural History Museum, the Opéra Comique, and many more, bear witness to this grand revival of mural painting. Every kind of talent was employed—historical painters, portrait painters, painters of allegory, of fancy scenes, of real life and of landscape. Among the most important were: J. P. Laurens and Benjamin Constant, Bonnat and Carolus Duran, Cormon and Humbert, Joseph Blanc and L. Olivier Merson, Roll and Gervex, Besnard and Carrière, Harpignies and Pointelin, Raphael Collin and others.

II. Impressionism. —In 1874 common cause was made by a group of artists drawn together by sympathetic views and a craving for independence. Various in their tastes, they concentrated from every point of the compass to protest, like their precursors the realists, against the narrow views of academic teaching. Some had romantic proclivities, as the Dutchman Jongkind, who played an important part in founding this group; others were followers of Daubigny, of Corot or of Millet; some came from the realistic party, whose influence and effort this new set was to carry on. Among these, Édouard Manet (1832-1883) holds a leading place; indeed, his influence, in spite of—or perhaps as a result of—much abuse, extended beyond his circle, like that of Millais, who was the first pupil of Cournot, and then, after Courbet, his real masters were the Spaniards—Velasquez, El Greco and Goya—all of whom he closely studied at the beginning of his career; but he soon felt the influence of Millet and of Corot. With a keen power of observation, he refined and lightened his style, striving for a subtle rendering of the exact relations of tone and value of light and atmosphere. With him, forming the original group, as represented by the Caillotte collection in the Luxembourg, we find some landscape painters: Claude Monet, the painter of pure daylight, and the artist who by the title of one of his pictures, "An Impression," gave rise to the denomination accepted by the group; Camille Pissarro, who at one time carried to an extreme the principle of dotting with pure tints, known as pointillisme, or dotwork; Sisley, Cézanne and others. Among those who by preference studied the human figure were Edgard Degas (q.v.) and Auguste Renoir. After long and violent antagonism, such as had already greeted the earlier innovators, these painters, in spite of many protests, were officially recognized both at the Luxembourg and at the great Exhibition of 1900. Their aims have been various, some painting Man and some Nature. In the former case they claim to have gone back to the principle of the greatest artists and tried to record the life of their own time. Manet, Degas and Renoir have shown us aspects of city or vulgar life which had been left to genre-painting or caricature, but which they have represented with the charm of pathos, or with the bitter irony of their own mood, frank transcripts of life with a feeling for style. For those who painted the scenery of nature there was an even wider field. They brought to their work a new visual sense, released from the clinging memories of past art; they endeavoured to fix the transient effects of moving life, changing under the subtlest and most fugitive influences, as the moderns see them; to call to the mind the elements of motion—sunshine, air and clouds—caring less for the exact transcript of motionless objects, which had hitherto been almost exclusively studied, such as the soil, trees and rocks, the inanimate features of the landscape. They introduced a fresh lightness of key, which had been too subservient to the relations of values; they discovered for their ends a new class of subjects essentially modern: towns, streets, railway stations, factories, coal-mines, ironworks and smoke, which they represent with an intelligent adaptation of Japanese art, taking new and audacious points of view, constantly varying the position of their horizon. This is indeed the very acme of naturalism, the last possible stage of modern landscape, covering the whole field of observation, doubling back to the starting-point of imagination. Notwithstanding—or because of—the outcry, of these views, peculiarities and tendencies so soon penetrated schools and studios. Three artists in particular became conspicuous among the most individual and most independent spirits: Besnard, who had taken the Grand Prix de Rome, and carried to the highest pitch his inexhaustible and charming fancy in studies of the figure under the most unexpected play of light; Carrière, a pupil of Cabanel, who sought and found in mysterious gloom the softened spirit of the humble, the warm caress of motherhood; and Raffaelli, a pupil of Gérôme, who brought to light the unrecognized picturesqueness of the lowest depths of humanity.
emoured of rustic life, he absorbed at an early stage, though not without hesitation, the love of atmospheric effects characteristic of Corot and of Manet. In his open-air heads and rural scenes he is seen as a conscientious nature worshipper, accurate and sincere, and, like Millet, imbued with a touch of mysticism which becomes even more evident in his immediate pupils. Rouen, to him there arose a little galaxy of painters, some more faithful to tradition, some followers of the best innovators, who firmly tread this path of light and modern life. These are Butteri, Duret and Renouf, Roll and Gervex, Dagnan-Bouveret, Friant, Adolphe and Victor Binet and many more.

Immediately after the Exhibition of 1889 an event took place which was not without effect on the progress of French art. This was the schism in the Salon. The audacious work of the Société Nationale des Beaux Arts, which left anything that the Impressionists could do far behind, had accustomed the eyes of the public to the most daring attempts, while the numerous contributions of foreigners, especially from the north, where art aimed solely at a direct presentation of daily life, was a fresh encouragement to the study of modern conditions and of the lower classes. But, at the same time, the encroachment on space at the Exhibition (where no limit of number was imposed) by mere studies, hastened the reaction against the extravagances of the degenerate followers of Courbet, Manet and Bastien-Lepage. Remonstrances arose against their perverse and narrow-minded devotion to "truth," or rather to minute exactitude, their pedantry and affectation of documentation; sometimes derived from some older colourists who had not renounced their former ideal, sometimes from younger men impelled unconsciously by literature, which had as usual preceded art in the revolt. The protest was seen, too, in a modified treatment of landscape, which took on the warmer colours of sunset, and in a choice of religious subjects, such as a Pardon, or a Last Supper, Friant, again, produced scenes of woe, "All Saints' Day" and "Grief"; and their younger successors, Henri Royer, Adler, Duvent and others, who adhered to this tradition, accommodated it to a more modern ideal, with more vivid colouring and more dramatic composition.

But the normal development could have no perceptible effect in modifying the purpose of painting. More was needed. A strong craving for imaginative work was very generally felt, and was revealing itself not merely in France but in Belgium, Scotland, America and Germany. This tendency ere long resulted in groups forming round certain well-known figures. Thus a group of refined dreamers, of poetic dilettanti and harmonious colourists, assembled under the leading of Henri Martin (a strange but attractive visionary, a pupil of Jean Paul Laurens and direct heir to Puvis de Chavannes, from whom he had much sound teaching) and of Aman-Jean, who had appeared at the same time, starting, but with more reserve, in the same direction. Some of this younger group affected no specific aim; the others, the larger number, leaned towards contemporary life, which they endeavoured to depict, especially its aspirations and according to the modern expression now in France of common usage—its "state of soul"—typified by melody of line and the eloquent language of harmonies. Among them should be named, as exhibitors in the salons and in the great Exhibition of 1900, Ernest Laurent, Ridel and Hippolyte Fournier, M. and Mme H. Dubem, Le Sidaner, Paul Steck, &c. On the other hand, a second group had formed of sturdy and fervent naturalistic painters, in some ways resembling the school of 1855 of which mention has been made; young and bold, sometimes over-bold, enthusiastic and emotional, and bent on giving expression to the life of their own day, especially among the people; not merely recording its exterior aspects but epitomizing its meaning by broad and strong synthetical compositions. At their head stood Cottet, who combined in himself the romantic fire and the feeling for orchestrated colour of Delacroix with the incisive realism and bold handling of Courbet; next, and very near to him, but more objective in his treatment, Lucien Simon, a manly painter and rich colourist. Both have left a significant group of herocidal or pathetic scenes from the life of Breton mariners. After them came René Ménard, a more lyrical artist, whose classical themes and landscape carried us back to Poussin and Dauchez, Prinot, Wéry, &c.

Foreign influences had meanwhile proved stimulating to the new tendencies in art. Sympathy with the populace derived added impulse from the works of the Belgian painters Constantin Meunier, Léon Frédéric and Struys; a taste for strong and expressive colouring was diffused by certain American artists, pupils of Whistler, and yet more by a busy group of young Scotsmen favourably welcomed in Paris. But the most unforeseen result of this reactionary movement was a sudden reversion to tradition. The cry of the realists of every shade had been for "Nature!" The newcomers raised the opposition cry of "The Old Masters!" And in their name a protest was made against the narrowness of the documentary school of art, a demand for some loftier scheme of conventionality, and for a fuller expression of life, with its complex aspirations and visions. The spirit of English Pre-Raphaelicism made its way in France by the medium of translations from the English poets Shelley, Rossetti and Swinburne, and the work of their followers Stephen Mallarmsé and Le Sâr Peladan; it gave rise to a little artificial impetus, which was furthered by the simultaneous but transient rage for the works of Burne-Jones, which were exhibited with his consent in some of the salons, and by the importation of William Morris's principles of decoration. The outcome was a few small groups of symbolists, the most famous being that of the Rose Croix, organized by Le Sâr Peladan; then there was Henri Martin, and the little coterie of exalted mystics, the art dealer, the late M. le bare de Bouthillière, in which Cottet was for a short time entangled. But few interesting names are to be identified: Dulac (d. 1890), who became known chiefly for his mystical lithographs in colour; Maurice Denis and Bonnard, whose decorative compositions, with their refined and harmonious colouring, are not devoid of charm; Vuillard, &c. But it was in the school and studio of Gustave Moreau (1826-1898, q.v.) that the fire of idealism burned most hotly. This exceptional man and rare painter, locked up in his solitude, endeavoured, by a thorough and intelligent assimilation of all the traditions of the past, to find and create for himself a new language—rich, nervous, eloquent, strong and resplendent—in which the spirit of his time could be expressed. He was not satisfied with every antique symbol, to represent in wonderful imagery all the serene magnificence and all the terrible struggles of the moral side of man, which he had explored to its lowest depths and most heroic heights in man and woman, in poetry and in death. Being appointed, towards the end of his life, to a professorship in the École des Beaux Arts, he regarded his duties as a real apostleship, and his teaching soon spread from his lecture-room and studio to those of the other masters. His own work, though hardly known to his pupils at the time, at first influenced their style; but, especially after his death, they were quickly disgusted with their own detestable imitation of subjects on which the master had set the stamp of his great individuality; they deserted the fabulous world of the Greek Olympian and the wonderful old myth and relented them to a passionate expression of modern life. Desvallières, indeed, remained conspicuous in his original manner; Sabatté, Maxence, Bréon, Besson and many more happily worked out their way on other lines.

In trying to draw up the balance-sheet of French art at the beginning of the 20th century, it was vain to try to enter its work under the old-world headings of History, Genre, Portraits, Landscape. All the streams had burst their channels, all the currents mingled. Historical painting, reinstated for a
time by Puvis de Chavannes and J. P. Laurens, in which Benjamin Constant and Corson also distinguished themselves, had but a few adherents who truly, analytically dealt with its dignified line in conventional landscape, like M. Tattegrain, or with the intellectual aid of archaeology, like M. Rochegrosse. At certain times, especially just after 1870, the memory of the war gave birth to a special genre of military subjects, under the distinguished guidance of Meissonier (q.v.), and the peculiar talents of Alphonse de Neuville (q.v.), of Détaille (q.v.) and Protails. This phase of contemporary history being exhausted, gave way to pictures of military manoeuvres, or colonial wars and incidents in recent history; it latterly went through a revival under a demand for subjects from the Empire and the Revolution, in consequence of the publication of many memoirs of those times. Side by side with "history," religious art formerly flourished greatly; indeed, next to mythology, it was a vital department of the Academy. Apart from the subjects set for academical competitions, there was only one little revival of any interest in this kind. This was a sort of neo-evangelical offshoot, akin to the literature and stress of religious discussion; and its leader, a man of feeling rather than conviction, was J. C. Cazin (d. 1903). Like Puvis de Chavannes, and under the influence of Corot and Millet, of Hobbema, and yet more of Rembrandt, he attempted to renew the vitality of history and legend by the added charm of landscape and the introduction of more human, more living and more modern, elements into the figures and accessories. Following him, a little group developed this movement to extravagance. The recognized leader at the beginning of the 20th century was Dagnan-Bouveret.

Through mythology and folklore, which we are brought back to real life, No one now thinks in France of seeking any pretext for displaying the nude beauty of woman. Henner, perhaps, and Fantin-Latour, were the last to cherish a belief in Venus and Artemis, in naiads and nymphs. Painters go direct to the point nowadays; when they paint the nude, it is apart from abstract fancies, and under realistic aspects. They are content with the model. It is the living female. The whole motor force of the time lies in the expression, under various aspects, of real life. This it is which has given such a soaring flight to the two most primitive forms of the study of life, landscape and portraiture. Portraits have in fact adopted every style that can possibly be imagined: homely or fashionable, singly or in groups, by the fire or out of doors, in some familiar attitude and expression: either of delicate grace, or synthetically broad, a literal transcript or a bold epitome of facts. As to landscape, no class of painting has been busier, more active or more productive. It has overflowed into every other channel of art, giving them new spirit and a new life. It has led the van in every struggle and won every victory. Never was army more numerous or more various than that of the landscape painters, nor more independent. All the traditions find representatives among them, from Paul Flandrin to René Ménard. Naturalists, impressionists, open-air painters, learned in analysis or potent in invention. We need only name Harpignies, broadly decorative; Pointelin, thoughtful and austere; and Cazin, grave and tender, to give a general idea of the strength of the school. But only one man, Victor Hugo, was always dear to the public.

Every quarter of the land has its painters: the north and the south, Provence and Auvergne, Brittany, dear to the young generation of colourists, the East, Algeria, Tunis—all contribute to form a French school of landscape, very living and daring, of which, as successors of Fromentin and Guillaumet, must be named Dinet, Marius Perret, Paul Leroy and Girardot. But it is more especially in the association of man and nature, in painting simple folk and their struggle for life amid their natural surroundings or by their homely hearth, in the glorification of humble toil, that the latest French art finds its most characteristic ideal life.

BELGIUM

Belgium fills a great place in the realm of art; and while its painters show a preference for simple subjects, their technique is broad, rich and sound, the outcome of a fine tradition. Since 1855 international critics have been struck by the unity of effect that pervades the works of the Belgian school, as evident especially by similarities of handling and colour. For the things which distinguish all Belgian painters, even in their most unpictorial divagations, are a strong sense of contrast or harmony of colouring, a free, bold style of brushwork, and a preference for rich and solid painting. It is the tradition of the old Flemish school. It would be more correct, indeed, to say traditions; for the modifications of each tendency, inevitably reviving when the success of another has exhausted itself, constantly show a reaction either to the domestic "Primitives" (or, as we might say, Pre-Raphaelites) of the Bruges school, or to the "decorative" painters of the later time at Antwerp, and no veneer of modern taste will ever succeed in masking this traditional perennial groundwork. In this way the prevailing and characteristic of the French painter Louis David may be accounted for; as acknowledged at Brussels at the beginning of the 19th century, it was a reaction in antagonism to the heavy and flabby work of the late Antwerp school, an unconscious reversion perhaps to the finish and minuteness of the early painters of Bruges. Indeed, in France, Ingres, himself David's most devoted disciple, was reproached with trying to revive the Gothic art of Jean de Bruges. Then, when David's followers produced only cold and feeble work, Wappers arose to restore the methods of another tradition, for which he secured a conspicuous triumph. Classical tinsel made way, indeed, for romantic tinsel. The new art was as conventional as the old, but it had the advantage of being capable to the twentieth century. The character that ever charactizes the nation, and it also admitted the presentation of certain historical personages who survived in the memory of the people. The inevitable reaction from this theatrical art, with its affectation of noble sentiments, was to brutal realism. Baron Henri Leys (q.v.) initiated it, and the crudity of his style gave rise to a belief in a systematic purpose of supplanting the Latin tradition by Germanic sentimentality. Leys's archaic realism was transformed at Brussels into a realism of observation and modern thought, in the painting of Charles de Groux. The influence of Leys on this artist was merely superficial; for though he, too, affected painful subjects, it was because they appealed to his compassion. The representation de Groux was destined to pioneer the school in a better way; at the same time the triumph of the authority of Courbet, the French realist, who had been for some time in Brussels, and that of the great landscape painters of the Fontainbleau school, had suggested to artists a more attentive study of nature and a remarkable reversions in technique to the older and firmer handling. At this time, among other remarkable men, Alfred Stevens appeared on the scene, the finished artist of whom Camille Lemonnier truly said that he was "the race of great painters, and, like them, careful of finish"—that is to say, "the eye, the hand and the brain all co-operated for the mysterious elaboration" of impasto, colour and chiaroscuro, and "the least touch was an operation of the mind." A brief period ensued during which the greater number of Belgian artists were carried away by this, the maturing spirit, the incipient period of the century, striving after brilliant efforts of colour which had characterized the painters of the last generation then gave way to a devout study of values; and at the same time it is to be noted that in Belgium, as in France, landscape painters were the first to discover the possibility of giving new life to the interpretation of nature by simplicity and sincerity of expression. They tried to render their exact sensations; and we saw, as has been said, "an increasingly predominant revelation of instinctive feeling in all classes of painting." Artists took an impartial interest in all they saw, and the endeavour to paint well eliminated the hope of expressing a high ideal; they now sought only to utter in a work of art the impression made on them by an external fact; and, too often, the strength of the effort degenerated into vulgarity.

These new influences, which, in spite of the conservative school, had by degrees modified the aspect of Belgian art in
general, led to the formation at Brussels of an association under the name of the Free Society of Fine Arts. This group of painters had a marked influence on the development of the school, and hand in hand with the popularization of its methods, caring more for formal practice than for theoretical means, it encouraged not merely the expression of deep and domestic feeling which we find in the works of Leys and de Groux, but also the desire to paint nature in the broad light of open air. The example of the Free Society found imitators; various artistic groups were formed to organize exhibitions where new works could be seen and studied irrespective of the influence of dealers, or of the conservatism of the authorities which was increasingly conspicuous in the official salons; till what had at first been regarded as a mere audacious and fantastic demonstration assumed the dignity of respectable effort. The "Cercle des Vingt" ("The Twenty Club") also exerted a marked influence. By introducing into its exhibitions works by the greatest foreign artists, it released Belgian art from the uniformity which some too patriotic theorists would fain have imposed. The famous "principle of individuality in art" was asserted there in a really remarkable manner, for side by side with the experiments of painters bent on producing certain effects of light hung the works of men who clung to literary or abstract subjects. Other groups, again, were formed on the same lines; but then came the inevitable reaction from these elaborations of quivering light and subtle expression, pushed, as it seemed, to an extreme. The youngest generation of Brussels painters, in revolt against the lights and ultra-refinements of their immediate predecessors, seem to take pleasure in a return to guts and bitumen, and to seek the violent effects so dear to the romantic painters of a past time.

Brussels is the real centre of art in Belgium. Antwerp, the home of Rubens, is resting on the memory of past glories, after vainly trying to uphold the ideal formerly held in honour by Flemish painters. And yet, so great is the prestige of this ancient reputation, that Antwerp even now attracts artists from every land, and more especially the dealers who go thither to buy pictures as a common form of merchandise. At Ghent the wonderful energy of the authorities who get up the triennial exhibitions makes these the most interesting provincial shows of their kind; other towns, as Liège, Tournay, Namur, Mons and Spa also have periodical exhibitions.

From 1830, in the early days of the Belgian school of painting, we find the course of the Brussels Gallery marked by a colour, with delicate gradations of light and shade. In this Wappers led the way. At a time when his teachers in the Antwerp Academy would recognize nothing but the heavy brown tones of old paintings, he rebelled against them by the vivacity of his daylight. But heroic and sentimental romanticism was already making way for the serious expression of domestic and popular feeling, and thenceforward the prominence assigned by genre, and yet more by landscape, led to a deeper and more direct study of the various aspects of nature. At the same time a special sense of colour was the leading characteristic of the artists of the time, and it was truly said that "the ambition to be a fine painter was stronger than the desire for serendipous excurse." Artists evidently aimed, in the first place, at a solid impasto and glowing colour; an undertone, roddy and golden, gleamed through the paler and more real hues of the over-painting. In this way we may certainly recognize the influence of the Dutch School. At the same time we may trace the influence of the grey tone prevalent in Manet's day in the effort to paint with more simple truth and fewer tricks of recipe, which became evident when the "Free Society" was founded at Brussels in 1830. From that period it seemed that the art of painting was on the point of returning to its true principles.

Among the artists who were then working the following must be named (with their best works in the Brussels Gallery): Alfred Stevens (q.v.), an incomparably charming painter, characterized by exquisite harmony of colour and marvellous dexterity with the brush. In the Brussels Gallery are his "The Lady in Pink," "The Studio," "The Widow," "A Painter and his Model," and "The Lady-Bird." Joseph Stevens, his brother, a master-painter of dogs, brings to his work a naive sense of colour, is represented by "The Dog-Market," "Brussels Morning," "A Dog before a Mirror"; Henri de Brackelee, the nephew and pupil of Leys, a fine painter of interiors, in warm and gay tone, is found in the "Baron Vriendt," "The Wedding Shop"; Lévin de Winne, a portrait painter, sober in style and refined in execution, by "Leopold I., King of the Belgians"; Florent Willems, archaic and elegant, by "The Wedding Dress"; Eugène Smit, a refined colourist, always with the thought of Venice in his mind, by "The Procession of the Festoons"; Louis Dubois, a powerful colourist with a full brush, striving to resemble Corot, by "Storks," "Fish"; Alfred Verwee, a fine animal painter, with special love for a shrewy slickness of texture, by "The Estuary of the Schelde" and "Group of Fishermen"; and lastly, Alfred Verhaeren, a pupil of L. Dubois, by some "Interiors"; Felicien Rops, an extraordinary artist, precise in drawing, sensual and incisive, by "A Parisienne"; Félix Ter Linden, a restless, refined name, by "A Sketch of a Lady"; and several others trying their hands at the brush, by "Captives." Amongst other painters may be named Camille van Camp, Gustave de Jonghe, Franz Verhas, and his brother Jan Verhas, the painter of the popular "School Feast" in the Brussels Gallery. In Jan van Eyck, we have a valuable coteries, represented by pictures in the Antwerp Gallery.

Of the Antwerp school, François Larmessin, dark and minute, hangs in the Brussels Gallery his "View from Edelgem," and there is also Théodore Verstraete, sentimental, or frounciful.

As painters of town scenery may be named F. Croquet, a draughtsman whose rather heavy treatment is represented in the Brussels Gallery by "The Grande Place at Brussels;" and J. B. Van More, a colourist chiefly, by "The Cathedral at Belem."

The flower painter, Jean Robic, has in the Brussels Gallery "Flowers and Fruit;" Jean Portraits, the painter of "A Box at the Theatre," at Budapest, is represented in the Brussels Gallery by "The Daughter of Sion Insulted;" Emile Wauters, a master of free and solid brushwork, equally in portraiture, historical composition and decorative portrait painting, by "The Madness of Hugo van de Goez;" Edouard Agnessens, a genuine painter, with breadth of vision and facile execution, by portraits; André Hennebicq, a painter of historical subjects, by "Labourers in the Campaign, Rome;" Isidore Verheyden, a landscapist and portrait painter, by "Woodcutters;" Eugène Verdely and Emile Charlet should be mentioned, and the landscape painter Henri van der Hecht, whose "On the Sandhills" is represented in the Brussels Gallery.

The principal landscape painters of what is known as the "neutral tint" school ("l'Ecole du gris") are: Théodore Baron, faithful to the stern features of Belgian scenery, represented in the Brussels Gallery by "A Peasant Woman"; the desolate landscapes of Heymans, a careful student of singular effects of light, by "Springtime;" Jacques Rosseels, a painter of the cheerful brightness of the Flemish country, by "A Heath," besides Isidore Meyers and Florent Crabels.

Some figure painters who may be added to this group are: Charles Herrmans, whose picture "Dawn" (Brussels Gallery), exhibited in 1875, betrays the ascendency of the principles upheld by the "Free Society of Fine Arts;" Jean de la Hove, who has since made portraits his special line; Emile Sacré; Léon Philippet, represented in the Brussels Gallery by "The Murdered Man;" and Jan Sobbaerts, a masterly painter, powerful but coarse, by "A Farm Interior." Three more artists were destined to greater fame: Constantin Meunier, a highly respected artist, equally a painter and a sculptor, known as the Millet of the Flemish workman, who has depicted with noble feeling his admiration and pity for one contemporary state of the human race, and who is represented in the Brussels Gallery by "The Peasants' War;" Xavier Mellery, who tries to express in works of high artistic merit the inner life of men and things, and who is represented in the Brussels Gallery by "The Peasants' War;" and Alexandre Struyys, a strong and clever painter, expressing his sympathy with poverty and misfortune in works of remarkable ability.

Besides these, Charles Verlat, a powerful and skilled artist, painted a vast variety of subjects; his teaching was influential in the Antwerp Academy. In the Brussels Gallery he is represented by "Godfrey de Bouillon at the Siege of Jerusalem." A picture of "Shepherdess" is represented by "A Child in the Barn;" the subject is to produce decorative work on an enormous scale, by "Canossa;" Albrecht de Vriendt, by "Homage done to Charles V. as a Child;" Juliana de Vriendt, by "A Christmas Carol," Victor Lagae, by...
"The Witch." Franz Vinck. Wilhelm Geets, Karl Ooons, and P. van der Ouderaa, endeavour to perpetuate, while softening down, the style of historical painting so definitely formulated by Leys. Finally, Joseph Stallaert, a painter of classical subjects, is represented in the "XX" in two fine works, one in charcoal and the other, in charcoal and of mystical art, as represented by Gustave Moreau; H. van der Velden, a well-known exponent of the new methods in applied art; J. Ensor, a whimsical nature loving strange combinations of objects in his pictures, and G. Vincé, a "Man of the Street." Th. van Rysselberghe, a clever painter, especially in the technique of dot painting (pointillisme); W. Schlobach, a remarkable colourist of uncertain tendencies; Henry de Groux, son of Ch. de Groux, and Jules de Groux, a son of Victor de Groux, in the "Aestheticism" of G. Vanaille, a painter of huge historical subjects; Ch. Mertens, a remarkable painter; F. J. Mortel, an interesting painter with a love of archaic methods (Brussels Gallery: "A Girl's Head"); A. Lévéque, an accomplished painter in water-colours; A. Eeckhout, the most successful draughtsman: J. Leempeels, elaborate and minute; H. Richir, a portrait painter; J. van den Eckhout, a clever pupil of Verheyden; J. Rosier, a skilful follower of Verlat; L. Abry, a painter of military subjects; and P. van der Borght, a landscape painter. The "La Chrysatide." Founded in 1875, and the "Essor" (the "Soaring") Club in 1876. In 1882, however, the "Essor" of the Beaux Arts was formed at Brussels with a view to organizing their own exhibitions. This was followed by the beginning of a fourth period, characterized by a freer sense of light and atmosphere. Apart from the exclusive tendency, inevitable under bureaucratic administration, the mere arrangement on an antiquated plan of the great art academies was uniaited to the display of works intended to serve as models of good taste and for the training of future artists. Hence it was that great many painters came to prefer smaller and more eccentric shows, leading to the fashion, which still persists, of exhibitions by clubs or associations. The Fine Arts Club at Brussels had long since afforded opportunities for showing the pictures of the Société Libre, founded in 1868, which were condemned by the authorities as tending to revolutionary tendencies; hence the artists formed in Brussels with a view to organizing their own exhibitions. The "Chrysatide" Club was founded in 1875, and the "Essor" (the "Soaring") Club in 1876. In 1882, however, the "Essor" of the Beaux Arts was formed at Brussels with a view to organizing their own exhibitions. The exhibition became a regular feature, almost a "whiteness;" a luminous effect was to be sought by a free use of brilliant colour with a very full brush. But ere long this method proved unsatisfactory, and attention was now directed towards a treatment and artistic temperament; the style, values; and again the influence of certain French painters was brought to bear—the one group headed by C. Monet, preparing for that of the French painter G. Seurat, the first who carried into practice the new style of painting that was to be known as pointillisme (the intimate juxtaposition of dots of colour). In 1884, in consequence of a division in the Essor Club, the "XX" Club was founded, who, though thus limiting their number, reserved the right of issuing yearly invitations, and thus testing the sympathy they felt for the most independent artists of Belgium and with those foreign painters with whom they had the most pronounced affinity. For ten years the exhibitions of the "XX," whose careful and artistic arrangements were in themselves admirable, were the fount of Belgium in discussions on art. The limit of its existence to ten years was determined when the club was formed; but as it was desirable that the principle of liberty in art should be kept up, and M. Odenaert, a painter of the "XX" Club, organized the exhibitions of the Libre esthétique and since 1894. Other clubs had been formed in Brussels: the Fine Arts Club, the "Soaring" Club and the "XX" Club of the Beaux Arts. In 1894 another breach in the Essor Club, which, growing very weak, was soon to disappear—as the "Art Union" and the Voorwaerts Club had done—led to the foundation of the Society for Art (pour l'Art); and in 1896 a party of that club established a salon of idealist art which favoured an exaggeration of the intellectual tendency already begun in the exhibitions of the "XX." Subsequently, in the exhibitions of the Sillon and of the Labor Club founded in 1898 a still more decided anti-academic composition. At Antwerp the influence of the local society—the "As Ic Kaa," the Independent Art Club, and the "XX"—was less sensibly felt; it was, however, enough to confirm certain wavers in artistic instruction. It would be impossible to classify into definite groups those painters whose first distinctive appearance was subsequent to the Historical Exhibition in 1880. Only an approximate grouping can be attempted by assigning each to the association in whose exhibitions he made the best display of what he aimed at expressing. Thus it was chiefly in the rooms of the Essor Club that works were shown by the following: L. Frédéric, a remarkable painter, combining French realism and impressionism; J. Mathieu, a painter of homely pathos, represented at the Brussels Gallery by "Chalk Sellers"; E. Hoetereckx, a painter of crowds in the streets and parks; F. Seghers, a pleasing colourist, who had made flower-painting his speciality; C. Fabry, "The Pool at Rouge-Cloître"; G. Verhaert, "Rocinante Work" (Brussels Gallery); and E. van Damme-Sylva, also as the marine painter, A. Marcotte. The landscape painters include J. de Cauwer, "Incidental in style. The Pool at Rouge-Cloître" (Brussels Gallery); C. Wollers, "Furrow"; W. Hausman, Herbo are known for their portraits. And there are E. van Gelder, J. Maynè, A. Crespin, a learned decorative painter and E. Duyck, a graceful draughtsman, A Dream (Brussels Gallery). As designers may be seen, C. Heina, a clever illustrator, and A. Lynen, of a thoroughly Brussels type, keenly observant and satirical. At the exhibitions of the "XX" were pictures by the following: Fernand Khnopff ("Memories," a pastel, in Brussels Gallery), Jules Egger, Henry Verhaert, who has a certain repose, and of mystical art, as represented by Gustave Moreau; H. van der Velden, a well-known exponent of the new methods in applied art; J. Ensor, a whimsical nature loving strange combinations of objects in his pictures, and G. Vincé, a "Man of the Street." Th. van Rysselberghe, a clever painter, especially in the technique of dot painting (pointillisme); W. Schlobach, a remarkable colourist of uncertain tendencies; Henry de Groux, son of Ch. de Groux, and Jules de Groux, a son of Victor de Groux, in the "Aestheticism" of G. Vanaille, a painter of huge historical subjects; Ch. Mertens, a remarkable painter; F. J. Mortel, an interesting painter with a love of archaic methods (Brussels Gallery: "A Girl's Head"); A. Lévéque, an accomplished painter in water-colours; A. Eeckhout, the most successful draughtsman: J. Leempeels, elaborate and minute; H. Richir, a portrait painter; J. van den Eckhout, a clever pupil of Verheyden; J. Rosier, a skilful follower of Verlat; L. Abry, a painter of military subjects; and P. van der Borght, a landscape painter. The "La Chrysatide." Founded in 1875, and the "Essor" (the "Soaring") Club in 1876. In 1882, however, the "Essor" of the Beaux Arts was formed at Brussels with a view to organizing their own exhibitions. The exhibition became a regular feature, almost a "whiteness;" a luminous effect was to be sought by a free use of brilliant colour with a very full brush. But ere long this method proved unsatisfactory, and attention was now directed towards a treatment and artistic temperament; the style, values; and again the influence of certain French painters was brought to bear—the one group headed by C. Monet, preparing for that of the French painter G. Seurat, the first who carried into practice the new style of painting that was to be known as pointillisme (the intimate juxtaposition of dots of colour). In 1884, in consequence of a division in the Essor Club, the "XX" Club was founded, who, though thus limiting their number, reserved the right of issuing yearly invitations, and thus testing the sympathy they felt for the most independent artists of Belgium and with those foreign painters with whom they had the most pronounced affinity. For ten years the exhibitions of the "XX," whose careful and artistic arrangements were in themselves admirable, were the fount of Belgium in discussions on art. The limit of its existence to ten years was determined when the club was formed; but as it was desirable that the principle of liberty in art should be kept up, and M. Odenaert, a painter of the "XX" Club, organized the exhibitions of the Libre esthétique and since 1894. Other clubs had been formed in Brussels: the Fine Arts Club, the "Soaring" Club and the "XX" Club of the Beaux Arts. In 1894 another breach in the Essor Club, which, growing very weak, was soon to disappear—as the "Art Union" and the Voorwaerts Club had done—led to the foundation of the Society for Art (pour l'Art); and in 1896 a party of that club established a salon of idealist art which favoured an exaggeration of the intellectual tendency already begun in the exhibitions of the "XX." Subsequently, in the exhibitions of the Sillon and of the Labor Club founded in 1898 a still more decided anti-academic composition. At Antwerp the influence of the local society—the "As Ic Kaa," the Independent Art Club, and the "XX"—was less sensibly felt; it was, however, enough to confirm certain wavers in artistic instruction. It would be impossible to classify into definite groups those painters whose first distinctive appearance was subsequent to the Historical Exhibition in 1880. Only an approximate grouping can be attempted by assigning each to the association in whose exhibitions he made the best display of what he aimed at expressing. Thus it was chiefly in the rooms of the Essor Club that works were shown by the following: L. Frédéric, a remarkable painter, combining French realism and impressionism; J. Mathieu, a painter of homely pathos, represented at the Brussels Gallery by "Chalk Sellers"; E. Hoetereckx, a painter of crowds in the streets and parks; F. Seghers, a pleasing colourist, who had made flower-painting his speciality; C. Fabry, "The Pool at Rouge-Cloître"; G. Verhaert, "Rocinante Work" (Brussels Gallery); and E. van Damme-Sylva, also as the marine painter, A. Marcotte. The landscape painters include J. de Cauwer, "Incidental in style. The Pool at Rouge-Cloître" (Brussels Gallery); C. Wollers, "Furrow"; W. Hausman, Herbo are known for their portraits. And there are E. van Gelder, J. Maynè, A. Crespin, a learned decorative painter and E. Duyck, a graceful draughtsman, A Dream (Brussels Gallery). As
the proud distinction of being the *enfant terrible* of modern exhibitions, and his works appear to belong rather to the art of the *main'cle de l'art* than to the 19th century. But those who will endeavour to enter into their artistic spirit will soon discover that Toorop is deserving of more than a mere shred of the shoulder; they will find that he is a great painter, who independently pursues original aims. At the present time all criticism of art is determined by the "line." All caprices and whims of the "line" are now ridden as much to death, and with the same enthusiasm, as were formerly those of "light." Toorop occupies one of the first places among those whose only aim consists in allowing the "line" to talk and make music. His astonishing power of physical expression may be noted. With what simple means, for example, he renders in his picture of the "Sphinx" all phases of hysterical desire; in that of "The Three Brides" nunlike resignation, chaste devotion and unbridled voluptuousness. If his mastery over gesture, the play of the eye, be remarked—how each feature, each movement of the hand and head, each raising and closing of the eyelid, exactly expresses what it is intended to express—Toorop's pictures will no more be scoffed at than those of Giotto, but he will be recognized as one of the greatest masters of the "line" that the 19th century produced.

GERMANY

The German school of painting, like that of France, entered on a new phase after the Franco-German War of 1870. An empire had been built up of the agglomeration of separate states. Germany needed no longer to gaze back admiringly at older and greater epochs. The historical painter became neglected. Not the heroic deeds of the past, but the political glories of the new empire were to be immortalized. This transition is particularly noticeable in the work of Adolf von Menzel. At the time of political stagnation he had recorded on his canvas the glories of Prussia in the past. Now that the present had achieved an importance of its own, he painted "The Coronation of King William at Königsberg" and "King William's Departure for the Army"; and ultimately he became the painter of popular subjects. The moody throng in the streets had a special fascination for him, and he loved to draw the crowd pushing its eager way to listen to a band on the market square. In the market, at the doors of a theatre, or the windows of a café. He discovered the poetry of the builder's yard and the workshop. In the "Moderne Cyklopen" (iron-works), painted in 1876, he left a monumental mark in the history of German art; for in this picture he depicts a simple incident in daily life, without any attempt at genre; and this was indeed the characteristic of his work for the next few years. Humorous anecdote, as represented by Knaus (b. 1829), Vautier (1829-1898), Defregger (b. 1835) and Grützner (b. 1846), found little acceptance. Serious representations of modern life were required; resort was made to all the expedients of the great painters, and the 'seventies were years of artistic study for Germany. Every great colourist in the past was thoroughly studied and his secrets discovered. In Germany, Wilhelm Leibl (b. 1844), holds the place of prominence. Like the French, Leibl, like Courbet, (q.v.), showed that the task of painting is not to narrate, but to depict by the most convincing means at its disposal. He even went farther than Courbet in close scrutiny of nature. With loving patience he strove to translate into colour everything that his keen eye observed: he studied nature with the devotion of the medieval artist. No feeling, strictly speaking, is discernible in his work. His greatest pictures are only of quiet life, with human accessories, and his painful accuracy divests his pictures of poetry. But when he first appeared, he was necessary. His painting of "Three Peasant Women in Church" is a grand documentary work of that period, whose first aim was to conquer the picturesque. Leibl taught artists to study detail, to master the secrets of flower, leaf and stalk.
A great number of pupils were encouraged by him to gain such a thorough mastery of every detail of technique as to be enabled to paint pictures that were thoroughly good in workmanship, irrespective of genre or anecdote. Among these, W. Trübner (b. 1851) stands pre-eminently as a painter. His works during the 'seventies are among the best painting done at Munich during that period; they are full and rich in colour, broad and bold in their treatment of the subject. A contemporary of his was Bruno Piglhein (b. 1848), a German Chaplin in this Courbet group, not heavy and matter-of-fact, but bold and witty. He revived the art of pastel painting and pointed the way to a new style in panoramic and decorative painting, whilst infusing beauty and grace into all his works.

The movement in applied art which began at this time is also part of the revolt of the German Empire led to a renaissance in German taste. The "old German dwelling-rooms," which now became the fashion, could only be hung with pictures in keeping with the style of the old masters, and this entailed a closer study and imitation of their works than had hitherto been customary. Wilhelm Diez (b. 1839) at the head of the group, was as well acquainted with the epoch from Dürer and Holbein to Ostade and Rembrandt as any art historian. In Hanburger (b. 1836) Adrian Brouwer lived once more; and in Löfftz (b. 1849) Quintin Matsys. Claus Meyer (b. 1846) imitated all the artistic tricks of Pieter de Hooch and Van der Neer of Delft. Holbein's costume studies were at first models for Fritz August Kaulbach (b. 1850). Later, he extended his studies to Dürer and Van Dyck. J. W. von Marées (b. 1839), Otto Lenbach (1827-1888) applied the beauty of tone beloved by the old masters to landscape, Von Lenbach's works show the zenith of old-master talent in Germany. He had educated himself as a copyist of classical masterpieces, and passed through a schooling in the study of old masters such as none of his contemporaries had enjoyed. The copies which, as a young man, he made for Count Schach in Italy and Spain are among the best the brush has ever accomplished. Titian and Rubens, Velasquez and Giorgione, were imitated by him with equal success. In like manner he gave to his own works their distinguished old-master charm. More than all other painters of historical subjects, Lenbach enjoys the distinction of having been the historian of his epoch. He gave the great men of the era of the emperor William I. the form in which they will live in German history, and beauty of colour is blended in all these pictures with their brilliant evidence of thought. The aspirations of a whole generation to restore the technique of the old masters found their realization in Lenbach.

Such was the position of things when there was imported from France the desire to paint light and sun. It was argued that the views which the old masters held concerning colour were so glaring contradiction to what the eye actually saw. The old masters, it was said, paid particular attention to the conditions of light and shade under which they did their work. The golden character of the Italian Renaissance was traceable to the old canals lighted by stained-glass windows. The light of the Netherlands were in keeping with the light and shadow of the artists' studios lighted by little panes, and due partly to the fact that their pictures were intended to hang in dimly, brown panelled chambers. But was this golden or brown light suitable for the 19th century? Were we not illogical, when for the sake of reproducing the tones of the old masters, we darkened our studios and shut out the daylight by coloured glass windows and heavy curtains? Was not light one of the greatest acquisitions of recent times? When the Dutch painted the world used only little panes of glass. Now the daylight streamed into our rooms through great white sheets of crystal. When our grandfathers there were only candles and oil lamps. Now we had gas and electric light. Instead of imitating the old masters, let us paint the coloristic charts that were unknown to them. Let us do honour to the new marvels of colour. With such arguments as were advanced in France, did artists in Germany adopt the plein-air and abandon older methods; and a development like that which took place in France after the days of Manet ensued in Germany also. Daylight, which had so long been kept down, was now to be reproduced as clear and bright. After the art of painting strong effects full of daylight had been grappled with, other and more difficult problems of light effects were attempted. After the full blaze of sunshine had been successfully reproduced, such effects as the haze of early morning, the sultry vaporous atmosphere of the thunderstorm, the mysterious night, the blue-grey dawn, the delicate colours of variegated Chinese lanterns, the scintillation of gas and lamplight, and the dreamy twilight in the interior were dealt with.

Max Liebermann (b. 1849) was the first to join the new departure. In Paris he had learnt technique. Holland, the country of the Van Gogh, was his home. He had long studied light effects, and its scenes of simple life provided him with many subjects. Perhaps the "Net Menders" in the Hamburg Kunsthalle is most typical of Liebermann's art. Frank Skarbina (b. 1849), who was the second to join the new movement in Berlin, proceeded to studies of twilight and artificial light effects.

Hans Herrmann (b. 1858), who settled himself on quays and ports; Hugo Volgel, who endeavoured to utilize scenes from contemporary life for decorative pictures; and the two landscape painters, Ludwig Dettmann (b. 1865) and Walther Leistikow (b. 1865), are other representatives of modern Berlin art. Carlsruhe, in the 'eighties, produced some modern pictures of great merit, when Gustav Schöneber (b. 1851) and Herrmann Baisch (b. 1869) had shown a decided love for their Dutch landscapes. In later years Count Leopold Kalkreuth (b. 1835) was greatly powerful conceived representations of peasant life belong to the best productions of German realism, and Victor Weishaupt (b. 1848), the animal painter, removed thence to Stuttgart, the residence also of Otto Reiniger (b. 1863), a landscape painter of great originality. At Dresden we find Gotthard Kuehle (b. 1850), long domiciled in Paris, who was one of the first to accept Manet's teaching. In North Germany, Worpsew became a German Barbizon; Ende (b. 1860), Vogeler, and Vinnen (b. 1856) also worked there. In Weimar, two landscape painters of great renown must be mentioned—Theodor Hagen (b. 1842) and Gleichen-Russwurm (b. 1866). As far back as the 'seventies they rendered ploughed fields, hills enveloped in this vapour, at sunrise, waving fields of corn, and apple trees in full bloom trembling in the rays of the evening glow with a delicate understanding of natural effects.

But Munich still remains the headquarters of German art, which is there the first of all interests and pervades all circles. Almost all those who are working in other German towns receive in that city their inspirations and have indeed remained its citizens in heart. The international exhibitions have given a great European tone and impulse to creative work. Among the elders, Albert von Keller (b. 1841) has perhaps the greatest originality. He is one of those who practised the art of the brush as long ago as the 'seventies, and painted, not for the sake of historical subjects or for genre, but for the sole love of his art, he painted everything, never restricted to any fixed programme, and never became trivial. He is perhaps in Germany the only painter of female portraits who has caught in his pictures a little of the charm that betrays itself in the expression and movements of the modern woman. In the works of Freiherr von Habermann (b. 1849) this refinement of sentiment, as expressed in colour, is combined with a still more decided shade of eccentricity. Already in his "Child of Sorrow," which hangs in the National Gallery at Berlin, he struck that painful chord that always remained his favourite. However different the subjects he has painted, a morbid note pervades them all.

In Heinrich Zügel (b. 1856), the Munich school possesses an old master who rivals the great Frenchmen in original power, Ludwig Dill (b. 1848), whom he now still must count as "Dachauer," in spite of his migration to Carlsruhe, had for some time past been famous as a painter of Venice, the lagoons and Chioggia, when the impressionist movement became for him the starting-point of a new development. He strove for still brighter light,
tried to realize the most subtle shades of colour, and raised himself from a painter of natural impressions to free and poetical lyricism. Arthur Langhammer (b. 1835), Ludwig Herterich, Leo Samberger (b. 1851), Hans von Bartels (b. 1856), Wilhelm Keller-Reutlinger (b. 1854), Beno Becker, Louis Gurlitt (b. 1858), Max Liebermann, and others that may be mentioned among the later Munich artists.

Fritz von Uhde (b. 1838) occupies a peculiar position as being the first to apply the principles of naturalism to religious art. Immediately before him, Eduard von Gebhardt (b. 1838) had gone back to the angular style of the old northern masters, that of Roger van der Weyden and Albert Dürer, believing he could draw the old Biblical events closer to present times by relating them in Luther's language and representing them as taking place in the most powerful epoch of German ecclesiastical history. Now that historical paintings had been dispossessed by modern and contemporary subjects, it followed also that scenes from the life of Christ had to be laid in modern times. "I do not assert that only the commonplace occurrences of everyday life can be painted. If the historical past be painted, it should be represented in human garb corresponding to the life we see about us, in the surroundings of our own country, peopled with the people moving before our very eyes, just as if the drama had only been enacted the previous evening." Thus wrote Bastien-Lepage in 1870, when creating his "Jeanne d'Arc," and in this sense did Uhde paint. But besides the charm of feeling expressed in the subllest hues, there is also the charm of the noble line.

At the time when, in England, Rossetti and Burne-Jones, and, in France, Puvis de Chavannes and Gustave Moreau, stepped into the foreground, in Germany Feuerbach (1829-1880), Marées (1837-1889), Thoma (b. 1830), and Böcklin (1827-1901) were discovered. Feuerbach's life was one series of privations and disappointments. His "Banquet of Plato," "Song of Spring," "Iphigenia," and "Pietà," and his "Meden," and "Battle of the Amazons," met with but scant recognition on their appearance. To some they appeared to lack sentiment, to others they were "not sufficiently German." When he died in Venice in 1886, he had become a stranger to his contemporaries. But posterity accorded him the laurel that his own age had denied him. Just those points in his pictures to which exception had been taken during his lifetime, the great solemn restfulness of his colouring and the calm dignity of his contours, made him appear contemptuously.

Hans von Marées fulfilled a similar mission in the sphere of decorative art; his likewise, was a talent that was not discovered until after his death. He is most in touch with Puvis de Chavannes. But the result was different. Puvis was recognized on his first appearance. Marées never had a chance of revealing his real strength. He was only 28 years of age when he first went to Rome; there in 1873, he was commissioned to paint some pictures for the walls of the Zoological Station at Naples. After that time, nothing more was heard of him until 1891, when four years after his death the works he had left behind him were exhibited and presented to the gallery of Schlesheim. The value of these works of art must not be sought in their technique. The art of Puvis rests on a firm realistic foundation, but Marées had finished his studies of nature too prematurely for the correctness of his drawing. In spite of this defect, there was, however, a charm which underlies them, and which they share in equal degree with those of Puvis. Like Puvis, Marées repudiated all illuminating efforts whereby forms might be brought into relief. He only retained what was intrinsically essential, the large lines in nature, as well as those of the human frame.

Next to these artists stands Hans Thoma, like one of the great masters of Dürer's time. In Marées and Feuerbach's works there is the solemn grandeur of the fresco; in those of Thoma there is nothing of Southern loveliness, but something of the homesomeness of the old German art of woodcut; nay, something philistine, rustic, patriarchal—the simplicity of heart and childlike innocence that entrance us in German folklore, in the paintings of Moritz von Schwind (1804-1871) and Ludwig Richter (1803-1884). He had grown up at Bernau, a small village of the Black Forest. Blossoming fruit-trees and silver brooks, green meadows and solitary peasants' cottages, silent valleys and warm summer evenings, grazing cattle and the cackle of the farmyard, all lived in his memory when he went to Weimar to study the painter's art. This pious faithfulness to the home of his birth and touching affection for the scenes of his childhood pervade all his art and are its leading feature. Even when depicting classical subjects, the mythological marvels of the ocean and centaurs, Thoma still remains the simple-hearted German, who, like Cranach, conceives antiquity as a romantic fairy tale, as the legendary period of chivalry.

Whether it be correct to place Böcklin (q.v.) in the same category with these painters, or whether he has a right to a separate place, posterity may decide. The great art of the old masters has weighed heavily upon the development of that of our own age. Even the idealists, who have been mentioned, trace their pedigree back to the old masters. However modern in conception, they are to all intents and purposes "old" as regards the form they employed to express their modern ideas. Böcklin has no ancestor in the history of art; no stroke of his brush reminds us of a leader. No one can think of tracing him back to the Academy of Düsseldorf, to Lessing, or Schörner, as his first teacher. Even less can he be called an imitator of the old masters. His works are the result of nature in her different aspects; they have not their origin in literary or historical suggestion. The catalogue of his conceptions, of landscape in varying moods, is inexhaustible. But landscape does not suffice to express his spiritual aspirations. Saracens storming flaming citadels, Tritons chasing the daughters of Neptune in the billowy waves; such were the subjects which appealed to him. He endowed all fanciful beings that people the atmosphere, that live in the trees, on lonely rocks, or that move and have their being in the slimy bottom of the sea, with body and soul, and placed a second world at the side of the world of actuality. Yet this universe of phantasy was too narrow for the master mind. If it be asked who created on the continent of Europe the most fervid religious paintings of the 19th century; who alone exhausted the entire scale of sensations, from the placidity of repose to the sublimity of heroism, from the gayest laughter to tragedy; who possessed the most solemn and most serious language of form and, at the same time, the most exquisite and most brilliant.—the name of Böcklin will most probably form the answer.

These masters were for their younger brethren the pioneers into a new world of art. It was momentous for the painter's art that in Germany, no less than in England and France, a new movement at this time set in—the so-called "arts and crafts." Hitherto the various branches of art had followed different courses. The most beautiful paintings were often hung in surroundings grievously lacking in taste. Now arose the ambition to make the room itself a work of art. The picture, as such, now no more stands in the foreground, but the different arts strive together to form a single piece of art. The picture is regarded as merely a decorative accessory.

Among the younger painters who were just mentioned, Max Klinger (1857) is the most brilliant. He had begun with the etching-needle, and by its aid gave us entire novels, crisp little dramas of everyday life. But this realism was only a preliminary phase enabling him to pass on to a great independent art of form. His great picture, "Christ in Olympus," combines beauty of form with deep philosophical meaning. Ibsen in 1873, in his Emperor and Galilean, talked of a "third realm," combining heathen beauty with Christian profundity. Klinger's "Christ in Olympus" strikes the beholder as the realization of this idea. Stuck (b. 1863) shares with him the Hellenic serenity of form, the classical simplicity. Apart from this, his pictures are thoroughly different. It might almost be said "Klinger is the Nazarene who stepped into Olympus"; the thoughtful, deep son of the North who carries profound physical
problems into the beauty-loving Hellenic worship of the senses. Stuck's art is, also, almost classical in its insensible rhythm, and petrified colorfulness. In his first picture (1889) "The Guardian of Paradise" he painted a slim wiry angel, who, like Donatello's "St. George," in calm confidence and self-assurance points the sword before him. And similar rigid figures standing erect in steadiness—always portraits of himself—recur again and again in his works. Even his religious pictures—the "Pieta" and "The Crucifixion"—are, in reality, antique. One would seek in vain in them for the piety of the old masters or the Germanic fervour of Ude. Grand in style and line, firm, solemn, in arrangement, they are yet hard and cold in conception.

Ludwig von Hofmann (b. 1861) stands next to him, a gentle, dreamy German. The Stuck's work everything is strong and rugged; here all is soft and round. That was the main weakness of sculpture and stiff heraldic lines: here all dissolved into variegated fairy tales, glowing harmonies. However classical he may appear, yet it is only the old yearning of the Germani for Hesperia—the song of Mignon—that rings throughout his works; the longing to emerge from the mist and the fog into the light, from the humdrum of everyday life into the remote fabulous world of fairydom, the longing to escape from sin and attain perfect innocence.

There are numerous others deserving of mention besides those already discussed. Josef Sattler (d. 1867), Melchior Lechter (b. 1851), and Otto Greiner (b. 1860), and likewise those who, such as Von Berlepsch (b. 1852) and Otto Eckmann (b. 1863), died without leaving any trace. But they are only names.

AUSTRIA-HUNGARY

In Austria the influence of Makart (1840-1884) was predominant in the school of painting during the last quarter of the 19th century. He personified the classical expression of an epoch, when a long period of colour-blindness was followed by an intoxication of colour. Whilst Piloty's ambition stopped short at the presentation of correct historical pictures, his pupil, Makart, felt himself a real painter. He does not interpret either deep thought or historical events, nor does he group his pictures together as parts of the art scene. His pictures are essentially that of a colourist. Whatever his subject may be, whether he depicts "The Plague in Florence," "The Nuptials of Caterina Cornaro," "The Triumphal Entry of Charles V.," "The Bark of Cleopatra," or "The Five Senses," "The Chase of Diana," or "The Chase of the Amazons," his pictures are romances of brilliant dresses and human flesh. A few studies of the nude and sketches of colour, in which he merely touched the notes that were to be combined into chords, were the sole preliminaries he required for his historical paintings. Draperies, jewels, and voluptuous female forms, flowers, fruit, fishes and marble—everything that is full of life and sensuous emotion, and shines and glitters, heheapsthe together into gorgeous still-life. And because his paintings he restored to Austrian art a long-lost national peculiarity, his appearance on the scene was as epoch-making as if some strong power had shifted the centre of gravity of all current views and ideas.

In estimating Makart, however, we must not dwell on his pictures alone. He did more than merely paint—he lived them. Almost prematurely he dreamed the beautiful dream which in later days came nearer realization, that no art can exist apart from life—that life itself must be made an art. His studio, not without reason, was called his most beautiful work of art. Whithersoever his travels led him—to Granada, Algiers, or Cairo—he made extensive purchases, and refreshed his eye with the luxurious splendid of rich silks and the soft lustrous hues of velvets. He made collections of carved ivory and Egyptian marbles, Groteskin colour and magnificent old cloths, antique sculpture, golden brocades with glittering embroideries, encrusted covoerts and the precious textures of the East, columns, pictures, trophies of all ages and all climes. He scattered money broadcast in striving to realize his dream of beauty—to pass upon all the world of Rubens, so bright in colour, so princely in splendour.

Uniting as he did these artistic qualities in his own person—not only because he was a painter, but because in no other besides did the great yearning for aesthetic culture find such powerful utterance—Makart exercised an influence in Austria far transcending the actual sphere of the painter's art. An intense fascination went forth from the little man with the black beard and penetrating glance. At that time Makart dominated not merely Viennese art, but likewise the whole cultured life of the capital. Not only the Makart hat and the Makart bouquet made their pilgrimage through the world, he became also the motive power in all intellectual spheres. When Charlotte Wolter acted Cleopatra in Messerschmidt's show, she only wore dresses specially sketched for her by Makart, but she also spoke in Makart's style, just as Hamler wrote in it. A veritable Makart fever had, indeed, taken possession of Vienna. No other painter of the 19th century was so popular, the life of none other was surrounded by such princely sumptuousness.

The scene when, during the festivals of 1879, he headed the procession of artists past the imperial box, mounted on a white steed glittering with gold, the Rubens hat with white feathers on his head, amidst the boisterous acclamations of the populace, is unique in the modern history of art. It is the greatest homage that a Philistine century ever offered an artist.

The life of August von Pettenkofer (1821-1886), who should, after Makart, be called the greatest Austrian painter of the last quarter of the 19th century, was passed much more modestly and serenely. He had grown up on one of his father's estates in Galicia, and had been a cavalry officer before becoming a painter. His place in Austria is that of Menzel in Germany. With Pettenkofer a new style appeared. The representation of modern subjects now began to take the place of historical painting, which had for so long a time been the ruling taste; not in the sense of the old-fashioned genre picture, but in that of artistic refined painting. Here, again, the distinctive Austrian note can be easily recognized. Pettenkofer's people are lazy, and yawn. All is contemplative and peaceful, full of dreamy, sleepy repose.

But neither Pettenkofer, nor Makart has found followers. The great movement which, originating with Manet, took place in other centres of art, passed Austria by without leaving a trace. Hans Canon (b. 1826), who in his pictures transported the characters of the "Gründerzeit" to Venice of bygone days, and reproduced them as Venetian nobles and ladies of quality, is also a painter of note. So likewise is Rudolf Alt (b. 1821), still active with the brush in 1902, a refined painter in watercolours, who reproduces the beauties of Old Vienna in his subtle architectural sketches. Leopold Karl Müller (1842-1892), who had lived in Cairo with Makart, found his sphere of art in the variegated world of the Nile, and his ethnographical exactness, combined with his delicate colouring, made him for a long while much in request as a painter of Oriental scenes, and a portraitist. In the circle of Eger's works. Emil Schindler was a great landscape painter, who often rose from faithful interpretation of nature to an almost heroic height. Heinrich von Angeli (b. 1840), again, furnished—as he continued to do—the European courts with his representative pictures, combining refined conception with smooth elegant technique. These are the only artists who during the 'eighties rose above local mediocrity. After Makart died in 1884, the sun of Austrian art seemed to have set. Stagnation reigned supreme.

Only since the "Secessions" from the old Society of Artists (Künstlergenossenschaft), which took place in 1886, has the former artistic life recommenced in Vienna. Theodor von Hermann, long domiciled in Paris, was the gifted initiator of the new movement, and succeeded in rousing a storm of discontent. They found a literary champion in their hero's father, who pleaded in eloquent language for a new Austrian culture. In November 1898 the
PAINTING

Secessionists opened their first exhibition in a building erected by Josef Olbrück on the Wienerzeil. At first the importance of these exhibitions lay almost exclusively in the fact that the Viennese were thus given an opportunity of making acquaintance with the famous foreign masters, Puvis de Chavannes, Segantini, Besnard, Brangwyn, Mieurmier, Khrnoff, Henri Martin, Vischer, who had until then been practically unknown in Austria, so that the public only then realized the inferiority of their countrymen's artistic work. Thus while acquainting the Viennese public with the strivings of European art, the Secession enabled at the same time to produce, in rivalry with foreigners, works of equal artistic merit. Leading foreign masters now joined the movement, and Vienna, which had so long stood aside, through inability to be represented worthily at international exhibitions, became once more a factor in contemporary European art.

Among the painters of the Secession, Gustav Klimt possesses, perhaps, the most powerful original talent. Refined portraits, subtle landscapes and decorative pictures, painted for the Tumba Palace and for the Vienna Hof Museum, first brought his name before the world. But he became famous in consequence of the controversy which arose around his picture "Philosophy." He had been commissioned to paint the large ceiling picture for the famous coffee-house in order instead of selecting a classical subject he essayed an independent work. The heavens open; golden and silvery stars twinkle; sparks of light gleam; masses of green cloud and vapour form clusters; naked human forms float about; a fiery head, crowned with laurel, gazes on the scene with large, serious eyes. Science climbs down to the sources of Truth; yet Truth always remains the inscrutable Sphinx. Klimt paid the penalty of his bold originality by his work remaining dark and incomprehensible to most people. It has, notwithstanding, an historical importance for Austria corresponding to that which similar works of Besnard have for France. It embodies the first attempt to place monumental painting upon a purely colouristic basis, and to portray allegorical subjects as pure visions of colour. After Klotz, Josef Engelhart (b. 1864) is deserving of notice. He is the true painter of Viennese life. On his first appearance his art was centred in his native place, and was strong in local colour, which was lacking in refinement. To acquire subtlety, he studied the great foreign masters and became a clever juggler with the brush, showing as much dexterity as any of them. Yet this virtuosity meant, in his case, only a good schooling, which should enable him to return with improved means to those subjects best suited to his talent. His works are artistic, but at the same time distinctly local.

Carl Moll (b. 1861) understands how to render with equal skill the play of light in a room and that of the sunbeams upon the sunlit green grass. The rural pictures of Rist produce a fresh, cool and sunny effect upon the eye; like a refreshing draught from a cool mountain spring—a piece of Norway on Austrian soil. Zettl's landscapes are almost too markedly Swiss in colour and conception. Julius von Kollmann worked a long time in Paris and London, and acquired, in intercourse with the great foreign painters—notably Carrière and Watts—an exquisitely refined taste, an almost hyperaesthetic sense for discreetly toned-down colour and for the music of the line. In Friedrich König, M. von Schwind's romantic vein is revived. Even the simplest scenes from nature appear under his hand as enchanted groves whispering secrets. Everything is true and, at the same time, dreamy and mysterious. The mythical beings of old German legends—dragons and enchanted princesses—peer through the forest thicket. Ernst Nowak (b. 1851), compared with him, is a sturdier painter, who knows his business well. He sings no delicate lyric. When one stands close by, his pictures appear like masonry—like reliefs. Seen from a distance, the blotsches of colour unite into large powerful forms. Bernatzik understands how to interpret with great subtlety twilight moods—moonshine struggling with the light of street lamps, or with the dawn. Ticky followed Henri Martin in painting solemn forest pictures. Ferdinand André leans towards the austere power of Millet. He tells us in his work of labour in the fields, of bronzed faces and hands callous with toil; and especially must his charcoal drawings be mentioned, in which the colour overlays the forms like light vapour, and which, small as they are, have a sculptural effect. Authenticiert—known for his female studies—and Hansich and Otto Friedrich (b. 1862), refined and subtle as landscape painters, must also be mentioned.

In rivalry with the Secession, the "Künstlergenossenschaft" has shown a fresh upward flight. Among figure painters, Delug, Goliz (b. 1857), Hirschl and Veith are conspicuous. Still greater fascination is exercised by landscape painters such as Asmesadan, Charlemont, &c., whose works show Austrian art in its most amiable aspect. Apart from Austrians proper, there are also representatives of the nationalities which compose "the monarchy of many tongues." Bohemia takes the lead with a celebrity of European reputation—Gabriel Max (b. 1840), who, although of Piloty's school and residing in Munich, never repudiated his Bohemian origin. The days of his youth were passed in Prague; and Prague, the medieval, with its narrow winding alleys, is the most mysterious of all Austrian cities, enveloped in the breath of old memories and bygone legends. From this soil Max drew the mysterious fragrance that characterizes his earlier work, the "Female Martyr on the Cross" (1860), strong in sweet sentiment, and with a captivating, half-enchancing keynote that has since remained distinctly his. Compendious historical painting received at Max's hands an entirely new nuance. The morbidity of the mortuary and the lunatic asylum, interspersed with spectres—something perverse, unnatural and heartrending—this is the true note of his art. His martyrs are never men—only delicate girls and helpless women. His colouring corresponds to his subjects. The sensations his pictures produce are akin to those which the sight of a beautiful girl lying in a mortuary, or the prison scene in Faust enacted in real life, might be expected to excite. He even applies the results of hypnotism and spiritualism to Biblical characters. In many of his pictures refinement in the selection of effects is missing. By over-production Max has himself vulgarized his art. Yet, despite his manner of depicting the mysteries of the realms of shadows, and the intrusion of the spirit-world into realism, he remains a modern master. A new province—the spectral—was opened up by him to art.

Hans Schwaiger is the real raconteur of Bohemian legends. He, likewise, passed his youth in a small Bohemian village, over which old memories still brooded. In Hradec, places upon which the gallows had stood were still pointed out. The lonely corridors and passages of the ruined castle were haunted by the shades of its old possessors. This is the mood that led Schwaiger to legend-painting. But underlying his fairy tales there are the gallows or the alchemy of Faust. The landscape with its gloomy skies, the wooden huts, turrets, dwarfed trees—such are ever the accompaniments of his figures.

Of the younger generation of painters, Emil Orlick (b. 1870) seems to be the most versatile. Having acquired technique in Paris and Munich, he practically discovered Old Prague to the world of art. The dark little alleys of the ancient town, swarming with life compressed within their narrow compass, fascinated him. In order to retain and convey all the impressions that crowded in upon him in such superabundant plenitude, he learned how to use the knife of the wood-carver, the needle of the etcher, and the pencil of the lithographer. His studio more resembles the workshop of a printer than the atelier of a painter. In the field of lithography he has attained remarkable results. Orlick has also made his own everything that can be learned from the Japanese. Besides these masters, Albert Hynais, the creator of decorative pictures almost Parisian in conception, must be mentioned. The landscape painters Wickener, Jansa, Slavicek, and Hudecek relate, in gentle melancholy tones of colour, the atmosphere and solitude of the wide plains of Bohemia.

In Poland, painting has its home at Cracow. Down to the year 1893 Johann Matejko was living there, in the capacity
of director of the Academy. His pictures are remarkable for their originality and almost brutal force, and differ very widely from the conventional productions of historical painters. At the close of the 19th century Axentowicz, Olga Hojanska, Mehofer, Stanislawsky and Wytkowski attracted attention. Although apparently laying much less stress on their Polish nationality than their Russian countrymen, their works proclaim the soul of the Polish nation, with its chivalrous gallantry and mute resignied grief, in a much purer form.

Hungary in the spring of 1899 lost him whom it revered as the greatest of its painters—Michael Munkaczy. Long before his death his brush had become idle. To the younger generation, which seeks different aims, his name has become almost synonymous with a wrongly-conceived old-masterly coloration, and with sensation painting and hollowness. "The Last Day of the Condemned Prisoner," his first youthful picture, contained the programme of his art. Then came "The Last Moments of Mozart," and "Milton dictating Paradise Lost." These titles summon up before our eyes a period of all that is false in eclectic art, dominated by Delaroche and Piloty. Even the simple subjects of the Gospel were treated by Munkaczy in Piloty's meretricious style. "Christ before Pilate," "Ecce Homo," "The Crucifixion"—all these are gala representations, costume get-up, and, to that extent, a pious lie. But when we condemn the faults of his period, his personal merit must not be forgotten. When he first came to the fore, ostentation of feeling was the fashion. Munkaczy is, in this respect, the genuine son of the period. He was not one of those who are strong enough to swim against the stream. Instead of raising others to his level, he descended to theirs. But he has the merit of having painted spectacular scenes, such as the period demanded, with genuine artistic power. Like Rahl, Ribot, Roybet and Makart, he was a maître-peintre, a born genius with the brush. Von Uhde and Liebermann were disciples of his school. And if these two painters have left that period behind them, and if independent natural sight has followed upon the imitation of the old masters, it is Munkaczy who enabled them to take the leap. (R. Mks.)

ITALY

Modern Italy has produced one artist who towers over all the others, Giovanni Segantini (q.v.). Segantini owes as little to his period of study in Milan as Millet did to his sojourn at Delacroche's school. Both derived from their teachers a complete mastery of technique, and as soon as they were in possession of all the aids to art, they discarded them in order to begin afresh. Each painted what he had painted as a youth. They dwelt far from the busy world—Millet in Barbizon, Segantini at Val d'Albola, 3000 feet above the sea-level. They are equally closely allied in art. Millet, who rejected all the artifice of embellishment and perceived only beauty in things as they are, learned to see in the human body a heroic grandeur, in the movements of peasants a majestic rhythm, which none before him had discovered. Although representing peasants, his works resemble sacred pictures, so grand are they in their sublime solemn simplicity. The same is true of Segantini's works. Like Millet, he found his vocation in observing the life of poor, humble people, and the rough grandeur of nature, at all seasons and all hours. As there is in Millet's, so also is there in Segantini's work a primitive, almost classical, simplicity of execution corresponding to the simplicity of the subjects treated. His pictures, with their cold silvery colouring, remind us of the wax-painting of old times and of the mosaic style of the middle ages. They are made up of small scintillating strokes; they are stony and look hard, like real stone, yet they do not touch in principle but not in effect, that of the pointillistes, permitted of his rendering what he wished to render, the stony crags of Alpine scenery, the thin scintillating air, the firm steel-like outlines. Finally, he passed from realistic subjects to thoughtful, Biblical and symbolical works. His "Annunciation," the "Divine Youth," and the "Massacre of the Innocents" were products of an art that had abandoned the firm ground of naturalism and aimed at conquering supernatural worlds. This new aim he was unable to realize. He left the "Panorama of the Engadine," intended for the Paris Exhibition, in an unfinished state behind him. He died in his 42nd year, his head full of plans for the future. Modern Italy lost in him its greatest artist, and the history of art one of the rare geniuses.

Few words will suffice for the other Italian painters. The soil that had yielded down to Tiepolo's days such an abundant harvest was apparently in need of rest during the 19th century. At the Paris Exhibition of 1867 About called Italy "the tomb of art," and indeed until quite recent times Italian painting had the character of mere pretty saleable goods. Francesco Vincenzo, Tito Conti, and Federigo Andreotti painted with tireless activity sleek drapery pictures, with Renaissance lords and smiling Renaissance ladies in them. Apart from such subjects, the comic, genre or anecdote ruled the fashion—somewhat coarse in colour and of a merrier tendency than is suitable for pictures of good taste. It was not until nearly the end of the 19th century that there was an increase in the number of painters who aim at real achievement. At the Paris Exhibition of 1900 only Detti's "Chest" and Signorini's "Cardinal" pictures reminded one of the comedy subjects formerly in vogue. The younger masters employ neither "drapery-mummeries" nor spicy anecdote. They paint the Italian country people with refined artistic discernment, though scarcely with the naturalism of northern nations. Apparently the calm, serious, ascetic, austere art initiated by Millet is foreign to the nature of this volatile, colour-loving people. Southern fire and delight in brilliant hues are especially characteristic of the Neapolitans. A tangle of baldacchinos, priests and choir boys, peasants making obeisance and kneeling during the passing of the Host, weddings, horse-races and country festivals, everything sparkling with colour and glowing in Neapolitan sunlight—such are the contents of Paolo Michetti's, Vincenzo Capri's, and Edoardo Dalbono's pictures. But Michetti, from being an adherent of this glittering art, has found his way to the monumental style. The Venetians acknowledge and honour as their leader Giacomo Favretto, who died very young. He painted drapery pictures, like most artists of the eighties, but they were never lackadaisical, never commonplace. The Venice of Canaletto and Goldoni, the magic city surrounded by the glamour of bygone splendour, rose again under Favretto's hands to fairylke radiance.

The older masters, Signorini, Tito Tommasi, Dall'oca Branca, who depict the Piedmontese landscape, the light on the lagoons, and the colour charm of Venetian streets with so refined a touch, have numerous followers, whose pictures likewise testify to the seriousness that again took possession of Italian painters after a long period of purely commercial artistic industry. Side by side with these native Italians two others have risen—Tito Signorini, who occupy an important place as interpreters of Parisian elegance and French art-history. Giuseppe de Nittiis (born in Naples; died in Paris 1884) was principally known by his representations of French street life. The figures that enlivened his pictures were as full of charm as his rendering of atmospheric effects was refined. Giovanni Boldini, a Ferrarese living in Paris, also painted street scenes, full of throbbing life. But he excelled, besides, as a portrait-painter of ladies and children. He realized the aim of the Parisian Impressionists, which was to render life, and not merely repose. He understood in a masterly fashion how to catch the rapid movement of the head, the fleeting expression, the sparkling of the eye, a pretty gesture. From his pictures posterity will learn as much of the sensuous life of the 19th century as Greuze has told us about that of the 18th.

Among those who have been the leaders of modern Italian art, not already mentioned, are Domenico Morelli, Giovanni Costa, landscape painter; Sartorio, an Italian Pre-Raphaelite; Pasini, painter of the East; Muzzioli, a follower of Alma-Tadema; Barabino, historical painter; and most striking and original of all, Monticelli, whose glow of colours was often
obtained, not only by palette-knife painting, but by squeezing the colour straight from the tubes on to the canvas.

See Ashton R. Willard, History of Modern Italian Art (London, 1898).

**SPAIN AND PORTUGAL**

Modern Spanish painting began with Mariano Fortuny (q.v.), who, dying as long ago as 1874, nevertheless left his mark even on the following generation of artists. During his residence in Paris in 1866 he had been strongly influenced by Melissonier, and subsequently selected similar subjects—scenes in 18th-century costume. In Fortuny, however, the French painter's elaborate finish is associated with something more intimate and personal in the treatment of the subject. He collected in his studio in Rome the most artistic examples of medieval industry. The objects among which he lived he also painted with incisive spirit as a setting for elegant figures from the world of Watteau and of Goya, which are thrown into his pictures with amazing dash and sparkle; and this love of dazzling kaleidoscopic variety has animated his successors. Academic teaching tries to encourage historical painting. Hence, since the 'seventies, the chief paintings produced in Spain have been huge historical works, which have made the round of European exhibitions and then been collected in the Gallery of Modern Art at Madrid. There may be seen "The Mad Queen Juana," by Pradilla; "The Conversion of the Duke of Gondomar," by Moxen Carbonell; also among his works, "The Last Days of Numantia," by Vera; "Ines de Castro," by Cabelló.

It is possible, of course, to discern in the love of the horrible displayed in these pictures an element of the national character, for in the land of bull-fights even painting turns to murder and sudden death, poison and the rope. However, at least we must admit the great power revealed, and recognize the audacious colouring. But in point of fact these works are only variants on those executed in France from the time of Delacroix to Jean Paul Laurens, and tell their story in the style that was current in Parisian studios in the 'sixties. What is called the national garb of Spain is mainly the cast-off fashion of Paris. After all this magnificient work Fortuny's rococo became the rage. The same painters who had produced the great historical pictures were now content to take up a brilliant and dazzling miniature style; either, like Fortuny himself, using small and motley figures in baroque subjects, or adapting the modern national life of Spain to the rococo style.

Here again we observe the acrobatic dexterity with which the painters, Pradilla especially, use the brush. But here again there is nothing essentially new—only a repetition of what Fortuny had already done twenty years before. The Spanish school, therefore, presented a very old-fashioned aspect at the Paris Exhibition of 1900. The pictures shown there were mostly wild or emotional. Bedouins fighting, an antique quadriga flying past, the inhabitants of Pompeii hastily endeavouring to escape from the lava torrent, Don Quixote's windmills, hanging to the sail of the windmill, and the terrors of the Day of Judgment were the subjects: Alvarez Dumont, Benlliure y Gil, Ulpiano Checa, Manuel Ramirez Ibáñez and Moreno Carbonero were the painters. Among the huge canvases, a number of small pictures, things of no importance, were scattered, which showed only a genre-like wit. Spain is a somewhat barren land in modern art. There painting, although active, is blind to life and to the treasures of art which lie unheeded in the road. Only one artist, Agrasot, during the 'seventies painted pictures of Spanish low life of great sincerity; and much later two young painters appeared who energetically threw themselves into the modern movement. One was Sorolla y Bastida, by whom there is a large fishing picture in the Luxembourg, and who seems to have both the spirit of the Dutch and the Northern painter; the other was Ignacio Zuloaga, in whom Goya seems to live again. Old women, girls of the people, and cocottes especially, he has painted with admirable spirit and with breadth. Spain, which has taken so little part in the great movement since Manet's time, only repeating in old-fashioned guise things which are falsely regarded as national, seems at last to possess in Zuloaga an artist at once modern and genuinely national.

Portugal took an almost lower place in the Paris Exhibition. For whereas the historical Spanish school has endeavoured to be modern to some extent, at least in colour, the Portuguese cling to the blue-plush and red-velvet splendours of Delaroché in all their crudity. Weak pictures of monks and of visions are produced in numbers, together with genre pictures depicting the popular life of Portugal, spiced to the taste of the tourist. There are the younger men who aim at availing themselves of the efforts of the open-air painters; but even as followers of the Parisian school, therefore, one may note what the same painters of many years ago through Bastien-Lepage, Puvis de Chavannes and Adrien Dumont. There is always a Frenchman behind the Portuguese, who guides his brush and sets his model. The only painter formed in the school is Carlos Reis, whose vast canvas "Sunset" has much in common with the first huge peasant pictures painted in Germany by Count Kalckreuth. One painter there is, however, who is quite independent and wholly Portuguese, a worthy successor of the great old masters of his native land, and this is Columbano, whose portraits of actors have a spark of the genius which inspired the works of Velazquez and Goya.

See A. G. Temple, Modern Spanish Painting (1908). (R. Mr.)

**DENMARK**

Denmark resembles Holland in this: that in both, nature presents little luxury of emphasized colour or accentuated majesty of form. Broad flats are everywhere to be seen—vague, almost indefinable, in outline. Danish art is as demure and staid as the Danish landscape. As in Holland, the painters make no bold experiments, attempt no pretentious subjects, no rich colouring, nothing sportive or light. Like the Dutch, the Danes are somewhat sluggishly tranquil, loving dim twilight and the swirling mist. But Denmark is a leaner land than Holland, less moist and more thinly inhabited, so that its art lacks the comfortable self-satisfied character of Dutch art. It betrays rather a tremulous longing, a pleasing melancholy and delight in dreams, a trembling dread of contact with coarse and stern reality. It was only for a time, early in the 'seventies, that a touch of cosmopolitanism affected Danish art. The phase of grandiose historical painting and anecdote genre was experienced there, as in every other country. In Karl Bloch (b. 1834), Denmark had a historical painter in some respects parallel with the German Piloty; and in Axel Helsted (b. 1847), a genre painter reminding us of Ludwig Knaus. The two artists Laurits Tuxen (b. 1853) and Peter Kröyer (b. 1851), who are most nearly allied to Manet and Bastien-Lepage, have a sort of elegance that is almost Parisian. Kröyer, especially, has bold inventiveness and amazing skill. Open-air effects and twilight moods, the glare of sunshine and artificial light, he has painted with equal mastery. In portraiture, too, he stands alone. The two large pictures in which he recorded a "Meeting of the Committee of the Copenhagen Exhibition, 1887," and a "Meeting of the Copenhagen Academy of Sciences," are modern works which in power of expression may almost compete with those of Frans Hals. Such versatility and facile elegance are to be found in no other Danish painter. At the period of historic painting it was significant that next to Bloch, the cosmopolitan, came Kristian Zahrtmann (b. 1843), who painted scenes from the life of Eleonora Christina, a Danish heroine (daughter of Christian IV.), with the utmost simplicity, and without any emotional or theatrical pathos. This touching feeling for home and country is the keynote of Danish art. The Dane has now no sentiment but that of home; his country, once so powerful, has become but a small one, and has lost its political importance. Hence he clings to the little that is left to him with melancholy tenderness. Viggo Johansen (b. 1851), with his gentle dreaminess, is the best representative of modern Danish home-life. He shows us dark sitting-rooms, where a quiet party has met around the tea-table. "An Evening at Home," "The Christmas Tree," "Grandmother's Birthday," are typical subjects, and all have the same fresh and fragrant
charm. He is also one of the best Danish landscape painters. The slivery atmosphere and sad, mysterious stillness of the island of Mon is applicable to all his landscapes: and even in their little world are the rest: Holsøe (b. 1866), Lauritz Ring (b. 1854), Haslund, Syberg (b. 1862), Irminger (b. 1850), and listed paint the pleasant life of Copenhagen. In Skagen, a fishing town at the extreme end of Jutland, we find painters of sea life: Michael Ancher (b. 1849), Anna Ancher (b. 1859), and C. Locher (b. 1851). The landscape painters Viggo Pederson (b. 1854), Philippsen (b. 1840), Julius Paulsen (b. 1860), Johan Rohde (b. 1850) have made their home in the villages round Copenhagen. Each has his own individuality and sees nature with his own eyes, and yet in all we find the same sober tone, the same gentle, tearful melancholy. The new Idealism has, however, been discerned in Denmark, Joakim Skovgaard (b. 1850), with the Joahnts of Picardy; and less subject of Bethesdah, is trying to endow Denmark with a monumental type of art. Harald Slott-Möller (b. 1864) and J. F. Willumsen (b. 1865) affect a highly symbolical style. But even more than these painters, who aim at reproducing ancient folk-tales through the medium of modern mysticism, two others claim our attention, into the infusion into the old tradition of a very modern view of beauty approaching that of Whistler and of Carrière: one is Einar Nielsen, whose portraits have a peculiar, refined strain of gentle Danish melancholy; the other, V. Hammerhøj, who has an exquisite sense of tone, and paints the magical effect of light in half-darkened rooms. Among the more noteworthy oil painters, Aug. Jerndorff and Otto Bacher (b. 1859) have been successful; and among the most decorative artists, L. Frölle; while Hans Tegner may be considered the greatest illustrator of his day. (R. Mr.)

SWEDEN

There is as great a difference between Danish and Swedish art as between Copenhagen and Stockholm. Copenhagen is a homely provincial town and life is confined to home circles. In Stockholm we find the whirl of life and all the elegance of a capital. It has been styled the Paris of the North, and its art also wears this cosmopolitan aspect. Düsseldorf, where in the sixties most painters studied their art, appeared to latter-day artists too provincial. Munich and, to a still greater extent, Paris became their "Alma Mater," Salmons (1843-1894) and Hagborg (b. 1852), who were first initiated into naturalism in Paris, adopted this city for a domicile. They paint the fishermen of Belgium and peasants of Picardy; and less subject of Bethesdah, they only clothe their Parisian models in a Swedish garb. Those who returned to Stockholm turned their Parisian art into a Swedish art, but they have remained cosmopolitan until this day. Whiles there is something prosy and homely about Danish art, that of Sweden displays nervous elegance and cosmopolitan polish. Simplicity is in her eyes humdrum; she prefers light and brilliant notes. There, a naturalness and simplicity allows us to forget the difficulties of the brush: here, we chiefly receive the impression of a cleverly solved problem. There, the greatest moderation in colour, a soft all-pervading grey: here, a cunning play with delicate tones and glazes—whims of nature. The most difficult in elegance is handled with obstient buoyancy. This tendency is particularly marked in the case of the landscape painters: Per Ekström (b. 1824), Niels Kreuger (b. 1850), Karl Nordström (b. 1863), Prince Eugen of Sweden (b. 1855), Axel Sjöberg Wallander (b. 1862), and Wahlgren (b. 1861). Nature in Sweden has not the idyllic softness, the veiled elegiac character, it displays in Denmark. It is more coquettish, southern and French, and the painters regard it also with French eyes.

As a painter of animals, Bruno Liljefors (b. 1866) created a sensation by his surprising pictures. Whatever his subjects—quails, capercaillies, dogs, hares, magpies or thrushes—he has caught the fleetest motions and the most transitory effects of light with most skill. Jorn Johan. With this exception, the Swedish painters cannot be classified according to taste. They are "virtuosi," calling every technical aspect of art their own—as well in fresco as in portrait painting. Oscar Björck (b. 1860), Ernst Josephson (b. 1851), Georg Pauli (b. 1855), Richard Bergh (b. 1858), Hanna Hirsch now Pauli (b. 1864) are by no means the least of the "fondness" of the young painters who have overflowed the borders of the country and have imbued it with the modern art of Europe.

NORWAY

We enter a new world when in picture-galleries we pass to the Norwegian from the Swedish section. From the great city we are transported to nature, solemn and solitary, into a land of silence, where a rude, sparse population, a race of fishermen, snatches a scanty sustenance from the sea. The Norwegians are themselves fisher-people, and the market in works of art. They sent mainly genre pictures telling of the manners and customs of their country, or landscapes depicting the phenomena of Northern scenery. Adolf Tidemand (1814-1876) introduced his countrymen—the peasants and fishermen of the Northern coast—to the European public. We are introduced to Norwegian Christmas customs, accompany the Norseman on his nocturnal fishing expeditions, join the "Brudefard" across the Hardanger fjord, sit as disciples at the feet of the Norwegian sacristan. Ferdinand Fagerlin (b. 1829) and Hans Dahl are two other painters who, educated at Düsseldorf and settled in Germany, introduced the style of Knas and Vautier to Norwegian art circles. Knud Bang (1865-1879), Hans Gude (b. 1855), Niels Bjørnson Møller, Morten-Müller (b. 1859), the best-known of the Norwegians, are known as excellent landscape painters, who have faithfully portrayed the majestic mountain scenery and black pine forests of their native land, the cliffs that enclose the fjords, and the sparkling snowfields of the land of the midnight sun. But the time when actuality had to be well seasoned, and every picture was bound to have a spice of genre or the attraction of something out of the common to make it palatable, is past and gone. As early as the sixties Bjørnson was president of a Norwegian society which made it its chief business to wage war against the shallow conventionalities of the Düsseldorf school. Ibsen was vice-president. In the works of the more modern artists there is no longer a single trace of Düsseldorf influence. Especially in 'eighties, when naturalism was at its zenith, we find the Norwegians its boldest devotees. They portrayed life as they found it, without embellishment; they did not trouble about plastic elegance, but painted the land of their home and its people in a direct, rough-hewn style. Like the people we meet in the North, giants with stalwart iron frames, callous hands, and sun-burnt faces, with their sun-westers and blue blouses, who resemble sons of a bygone heroic age, have the painters themselves—notably Niels Gustav Westen (b. 1859), Sven Jørgensen (b. 1861), Kolstoe (b. 1860), Christian Krohg—something primitive in the directness, in, one might almost say, the barbarous brutality with which they approach their subjects. They referred the most glaring effects of plein-air; they revelled in all the hues of the rainbow.

But these very uncouth fellows, who treated the figures in their pictures with such rough directness, painted even in those
days landscapes with great refinement; not the midnight sun and the precipitous cliffs of the fjords, by which foreigners were sought to be impressed, but austere, simple nature, as it lies in deathlike and spectral repose—lonely meers, whose surface is unruffled by the keel of any boat, where no human being is visible, where no sound is audible; the hour of twilight, when the sun has disappeared behind the mountains, and all is chill and dreamy, is in the power of every heart—low, waving fields; the spring, almost like winter, with its bare branches and its thin young shoots. Such were their themes, and painters like Amaldus Nilsen (b. 1838), Ellif Petersen (b. 1852), Christian Skredsvig (b. 1854), Fritz Thaulow (b. 1868), and Gerhard Munthe (b. 1849) arrested public attention by their exhibition of pictures of this character.

Latterly these painters have become more civilized, and have emancipated themselves from their early uncoutnousness. Jørgensen, Krogh, Kolstoe, Soot, Gustav Wenzel, no longer paint those herculic sailors and fishermen, those pictures of giants that formerly gave to Norwegian exhibitions their peculiar character. 

Elegance has taken possession of the Norwegian palette. This transformation began with Fritz Thaulow, and indeed his art threatened to relapse somewhat into routine, and even the ripples of his waters to sparkle somewhat coquetishly. Borgen (b. 1852), Hemng (b. 1871), Hjerløw (b. 1863), and Stenersen (b. 1862) were gifted recruits of the ranks of Norwegian painters, whilst Halfdan Strom (b. 1863), who depicts rays of light issuing from silent windows and streamings and quivering over solitary landscapes, dark blue streams and ponds, nocturnal skies, variegated female dresses, contrasting as spots of colour with dark green meadows, has a delicacy in colouring that recalls Cazin. Gerhard Munthe, who, as we have seen, first made a name by his delicate vernal scenery, has turned his attention to the classical side of art; and, finally, Erik Werenskjold (b. 1855), who was also first known by his landscapes and scenes of country life, afterwards gained success as an illustrator of Norwegian folk-lore.

RUSSIA

Until late in the 19th century modern Russian painting was unknown to western Europe. What had been seen of it in international exhibitions showed the traditions of primitive European art, with a distinct vein of barbarism. In the early 'fifties, painters were less bent on art than on political ambition; they used the brush as a means of propaganda in favour of some political idea. Peroff showed us the miserable condition of the serfs, the wastefulness and profligacy of the nobility. Vereschagin made himself the advocate of the soldier, painting the horrors of war long before the tsar's manifesto preached universal disarmament. Art suffered from this praiseworthy misapplication; many pictures were painted, but very few rose to the level of modern achievement in point of technique. It was only by the St Petersburg art journal Mir Iskustwa, and by a small exhibition arranged at Munich in 1862 by a group of Russian landscape painters, that it was realized that a younger Russian school had arisen, fully equipped with the methods of modern technique, and depicting Russian life with the stamp of individuality. At the Paris Exhibition of 1867 the productions of this young Russian school were seen with surprise. A florescence similar to that which literature displayed in Pushkin, Dostoievsky and Tolstoy seemed to be beginning for Russian painting. Some of these young painters rushed into art with unbridled zest, painting with primitive force and boldness. They painted historical pictures, almost barbaric but of striking force; representations of the life of the picture artist, deep and hopeless gloom; the poor driven by the police and huddled together in dull indifference; the popes trampling across the lonely steppes, prayer-book in hand; peasants muttering prayers before a crucifix. There is great pathos in "The Karamasow Brothers," or "The Power of Darkness." At the same time we feel that a long-inherited tradition pervades all Russia. We find a characteristic ecclesiastical art, far removed from the productions of the fin de siècle, in which the rigid tradition of the Byzantines of the 3rd century still survives.

And, finally, there are landscapes almost Danish in their bloodless, dreamy tenderness. Among the historical painters Elias Repin is the most impressive. In his pictures, "Ivan the Cruel," "The Cossacks' Reply to the Sultan," and "The Miracle of Saint Nicholas," may be seen—what is so rare in historical painting—genuine purpose and style. Terror is rendered with Shakespearean power; the boldness with which he has recon- structed the past, and the power of pictorial psychology, which has enabled him to give new life to his figures, are equally striking in "Sowing on the Volga" and "The Village Procession." He was the first to paint subjects of contemporary life, and the work, while thoroughly Russian, has high technical qualities—the sense of oppression, subjection and gloom is all-pervading. But he does not "point the moral," as Peroff did; he paints simply but sympathetically what he sees, and this lends his pictures something of the resigned melancholy of Russian songs. Even more impressive than Repin is Philippe Malfavine. He had rendered peasants, stalwart figures of powerful build; and, in a picture called "Laughter," Macbeth-like women, wrapped in rags of fiery red, are shown on the canvas with astonishing power.

Among religious painters Victor Vasnezov, the powerful decorator of the dome in the church of St Vladimir at Kiev, is the most distinguished figure. These paintings seem to have been executed in the very spirit of the Russian church; blazing with gold, they depend for much of their effect upon barbaric splendour. But Vasnezov has painted other things: "The Scythians," fighting with lance and battle-axe; horsemen making their way across the pathless steppe; and woods and landscapes pervaded by romantic charm, the home of the spirits of Russian legend. Next to Vasnezov is Michael Nesterov, a painter also of monks and saints, but as different from him as Zurbaran from the mosaic workers of Venice; and Valentin Serov, powerful in portraiture and fascinating in his landscape. It is to be remarked that although these artists are austere and unpollished in their figure-painting, they paint landscape with delicate refinement. Schischkin and Vassiliev were the first to paint their native land in all simplicity, and it is in landscape that Russian art at the present time still shows its most pleasing work. Savrasov depicts tender spring effects; Kuindish light birch-copies full of quivering light; Sudkovskiy interprets the solemn majesty of the sea; Albert Benois paints in water-colour delicate Finnish scenery; Apollinaris Vasnezov has recorded the dismal wastes of Siberia, its dark plains and endless primeval forest, with powerful simplicity. A special province in Russian art must be assigned to the Poles. It is difficult indeed to share to the full the admiration that is due for the Polish painters. It is there firmly believed that Poland has a school of its own, nothing to Russia, Austria or Germany; an art which embodies all the chivalry and all the suffering of that land. The accessories are Polish, and so are the costumes. Jan Chelminski, Wojciech Gerson, Constantine Gorski, Apolonius Kendzierski, Joseph Ryszkiwicz and Roman Zwoinicki are the principal artists. We see in their pictures a great deal of fighting, a great deal of weeping; but what there is peculiar to the Poles in the expression or technique of their works it is hard to discover.

Finland, on the other hand, is thoroughly modern. Belonging by descent to Sweden rather than to Russia, its painters' views of art also resemble those of the "Parisians of the North." They display no ungoverned power, but rather supple elegance. The play of light and the caprice of sunshine are rendered with much subtlety. Albert Edelfeldt is the most versatile artist of the group; Axel Gallen, at first naturalistic, developed into a decorative artist of fine style; Eero Jarenfeht charms with his airy studies and brilliant landscapes. Magnus Enckell, Pekka Halonen and Victor Vesterholm sustain the school with work remarkable for sober and tasteful feeling.

BALKAN STATES

Until quite recent times the Balkan States had no part at all in the history of art. But at the Paris Exhibition of 1900 it was noted with surprise that even in south-eastern Europe
there was a certain pulsation of new life. And there were also signs that painting in the Balkans, which hitherto had appeared only as a reflex of Paris and Munich art, would ere long assume a definite national character. At this Exhibition Bulgaria seemed to be the most backward of all, its painters still representing the manners and customs of their country in the style of the illustrated papers. Market-places are seen, where women with golden chains, half-naked, buy their jewelry, pining about; or cemeteries, with orthodox clergy praying and women sobbing; military pageants, wine harvests and horse fairs, old men performing the national dance, and topers jesting with brown-eyed girls. Such are the subjects that Anton Mitoff, Raymund Ulrich and Jaroslav Vesper paint. More original is Mvkicuva. In his most important work he represented the late princess of Bulgaria sitting on a throne, solemn and stately, in the background mosaics rich in gold, tall slim lilies at her side. In his other pictures he painted Biblical landscapes, battlefields wrapped in sulphurous smoke, and old Rabbits—all with a certain uncouth barbaric power. The Bulgarian painters have not as yet arrived at the aesthetic phase. One of the best among them, who paints delicate pale green landscapes, is Charalampli Ilieff; and Nikolaus Michailoff, at the Munich, has executed pictures, representing nymphs, that arrest attention by their delicate tone and their beautiful colouring.

Quite modern was the effect of the small Croatian-Slavonic Gallery in the Exhibition. Looking at the pictures there, the visitor might imagine himself on the banks of the Seine rather than in the East. The French saying, "Faire des Whistler, faire des Dagnan, faire des Carrière," is eminently applicable to their work. Vlaho Bukovak, Nikola Masic, Csink and Medovici all paint very modern pictures, and in excellent taste, only it is surprising to find upon them Croatian and not Parisian signatures. Precisely the same judgment must be passed with regard to Rumania. Most of the painters live in Paris or Munich, have studied at Dresden or the Munich, but the Rumanian has advanced masters there, and paint, as pupils of these masters, pictures just as good in taste, just as cosmopolitan and equally devoid of character. Iréné Deschly, a pupil of Carrière, illustrates the songs of Francois Coppée; Verona Gargouromin is devoted to the pale symbolism of Dagnan-Bouveret. Nicolas Grant paints bright landscapes, with apple trees with their pink blossoms, like Darnoye. Nicolas Gropeano appears as the double of Amelian with his female heads and pictures from fairy tales. Olga Koruca studied under Pusil de Chavannes, and painted Cleopatra quite in the tone of her master. A landscape by A. Segall was the only work that appeared to be really Rumanian, representing thatched cottages as a striking contrast to Rumania. No trace of modern influence has penetrated to her. There historical painting, such as was in vogue in France and Germany a generation ago, is the order of the day. Risto Voucanovitch paints his scenes from Servian history in brown; Paul Ivanovitch his in greyish plein-air. But in spite of this paté painting, the latter's works have no modern effect—as little as the sharply-drawn small landscapes of his brother Svatislav Ivanovitch. (R. Mr.)

United States

The history of painting in the United States practically began with the 19th century. The earlier years of the nation were devoted to establishing government, subduing the land and the aborigines, building a commonwealth out of primeval nature; and naturally enough the aesthetic things of life received not too much consideration. In Colonial times the graphic arts existed, to be sure, but in a feeble way. Painting was made up of portraits of prominent people; only an occasional artist was disposed towards historical pictures; but the total result added little to the sum of art or to the tale of history. The first artist of importance was J. S. Copley (1737-1815), with whom painting in America really began. Benjamin West (1738-1820) belongs in the same period, though he spent most of his life in England, and finally became President of the Royal Academy. As a painter he is not to be ranked so high as Copley. In the early part of the 19th century two men, John Trumbull (1756-1843), a historical painter of importance, and Gilbert Stuart (1755-1828), a pre-eminent portrait painter, were the leaders; and after them came John Vanderlyn (1776-1852), Washington Allston (1770-1843), Rembrandt Peale (1787-1860), W. Jarvis (1750-1834), Thomas Sully (born in England, 1783-1872)—men of importance in their day. The style of all this early art was modelled upon that of the British school, and indeed some of the men had studied in England under the mastership of West, Lawrence and others. The middle or second period of painting in the United States began with the landscape work of Thomas Doughty (1793-1856) and Thomas Cole (1801-1848). It was not a refined or cultivated work, for the men were in great measure self-taught, but at least it was original and distinctly American. In subject and in spirit it was perhaps too panoramic and pompous; but in the hands of A. B. Durand (1796-1866), J. F. Kensett (1818-1872) and E. F. Church (1826-1900), it was modified in scale and improved in technique.

A group of painters called the Hudson River school finally emerged. To this school some of the strongest landscape painters in the United States owe their inspiration, though in almost every case there has been the modifying influence of foreign study. Contemporary with Copley came the portrait painters Chester Harding (1792-1866), C. L. Elliott (1812-1869), Henry Inman (1802-1846), William Page (1811-1885), G. P. A. Healy (1813-1894), Daniel Huntington and W. S. Mount (1807-1868), one of the earliest genre painters. Foreign art had been followed to good advantage by most of these painters, and as a result some excellent portraits were produced. The excellence of the work was not, however, appreciated by the public generally because art knowledge was not at that time a public possession. Little was required of the portrait painter beyond a recognizable likeness. A little later the teachings of the Düsseldorf school began to have an influence upon American art through Leutze (1816-1888), who was a German pupil of Leisering, and went to America to paint historic pictures with the French school. But the foreign influence of the time to make the most impression came from France in 1855 with two American pupils of Couture—W. M. Hunt (1824-1879) and Thomas Hicks (1823-1890). Hunt had also been a pupil of Millet at Barbizon, and was the real introducer of the Barbizon painters to the American people. After his return to Boston his teaching and example had much weight in moulding artistic opinion. He, more than any other, turned the rising generation of painters towards the Paris schools. Contemporary with Hunt and following him were a number of painters, some self-taught and some schooled in Europe, who brought American art to a high standard of excellence. George A. Durrie (1821-1869), was a pupil of Sully. Cole also recommended work of much merit; and John La Farge and Winslow Homer were unquestionably the foremost painters in the United States at the opening of the 20th century. In landscape the three strongest men have passed away—A. H. Wyant, George Inness, and Homer Martin. Swain Gifford, Edward Gay, Thomas Moran, Jervis McEntee, Albert Bierstadt, are other landscape painters of note who belonged to the middle period and reflected the traditions of the Hudson River school to some extent. With the Centennial Exhibition at Philadelphia in 1876 a widespread and momentous movement in American art began to shape itself. The display of pictures at Philadelphia, the national prosperity, and the sudden development of the wealth of the United States had doubtless much to do with it. Many young men from all parts of the country took up the study of art and began going abroad for instruction in the schools at Munich, and, later, at Paris. Before 1880 some of them had returned to the United States and founded schools and societies of art, like the Art Students' League and the Society of American Artists. The movement spread to the Western cities, and in a few years museums and art schools began to appear in all the prominent towns, and a national interest in art was awakened. After 1870 the predominant influence, as regards technical training, was French. Many students still go to Paris to complete their studies, though there is a large body of accomplished painters teaching in the home schools, with satisfactory results as regards
the work of their pupils. From their French training, many of the American artists have been charged with echoing Parisian art; and the charge is partly true. They have accepted French methods because they think them the best, but their subjects and motives are sufficiently original.

Under separate biographical headings a number of modern American artists are noticed. Some of the greatest Americans however can hardly be said to belong to any American school. James McNeill Whistler, though American-born, is an example of the modern man without a country. E. A. Abbey, John S. Sargent, Mark Fisher and J. J. Shannon are American only by birth. They became resident in London and must be regarded as cosmopolitan in their methods and themes. This may be said with equal truth of many painters resident in Paris and elsewhere on the Continent. However good as art it may be, there is nothing distinctly American about the work of W. T. Dannat, Alexander Harrison, George Hitchcock, Gari Melchers, C. S. Pearce, E. L. Weeks, J. L. Stewart and Walter Gay. If they owe allegiance to any centre or city, it is to Paris rather than to New York.

During the last quarter of the 19th century much effort and money were devoted to the establishment of institutions like the Metropolitan Museum in New York, the Carnegie Institute at Pittsburg, and the Art Institute in Chicago. Every city of importance in the United States now has its gallery of paintings. Schools of technical training and societies of artists likewise exist wherever there are important galleries. Exhibitions during the winter season and at great national exhibitions give abundant opportunity for rising talent to display itself; and, in addition, there has been a growing public patronage of painting, as shown by the extensive mural decorations in the Congressional Library building at Washington, in the Boston Public Library, in many colleges, in churches, in courts of justice, in the reception-rooms of large hotels, in theatres and elsewhere.

PAISIELLO (or PAISELLO), GIOVANNI (1741-1816), Italian musical composer, was born at Tarento on the 9th of May 1741. The beauty of his voice attracted so much attention that in 1754 he was removed from the Jesuit college at Tarento to the Conservatorio di S. Onofrio at Naples, where he studied under Durante, and in process of time rose to the position of assistant master. For the theatre of the Conservatorio, which he left in 1763, he wrote some intermezzi, one of which attracted so much notice that he was invited to write two operas, La Papilla and Il Mondo al Rovescio, for Bologna, and a third, II Marchese di Tulipano, for Rome. His reputation being now firmly established, he settled for some years at Naples, where, notwithstanding the popularity of Piccini, Cimarosa and Guglielmi, of whom he was a contemporary, he produced a series of highly successful operas, one of which, L'Idolo cinse, made a deep impression upon the Neapolitan public. In 1772 he began to write church music, and composed a requiem for Gennaro Borbone. In the same year he married Cecilia Pallini, with whom he lived in continued happiness. In 1776 Paisiello was invited by the empress Catherine II. to St Petersburg, where he remained for eight years, producing, among other charming works, his masterpiece, Il Barbieri di Siviglia, which soon attained a European reputation. The fame of this delightful opera marks an epoch in the history of Italian art; for with it the gentle suavity cultivated by the masters of the 18th century died out to make room for the dazzling brilliance of a later period. When, in 1816, Rossini set the same libretto to music, under the title of Almaviva, it was hissed from the stage; but it made its way, nevertheless, and under its changed title, II Barbiere, is now acknowledged as Rossini's greatest work, while Paisiello's opera is consigned to oblivion—a strange instance of poetical vengeance, since Paisiello himself had many years previously endeavoured to eclipse the fame of Pergolesi by resetting the libretto of his famous intermezzo, La Sera padrona.

Paisiello quitted Russia in 1784, and, after producing Il Re Teodoro at Vienna, entered the service of Ferdinand IV. at Naples, where he composed many of his best operas, including Nina and La Molinara. After many vicissitudes, resulting from political and dynastic changes, he was invited to Paris (1802) by Napoleon, whose favour he had won five years previously by a march composed for the funeral of General Hoche. Napoleon treated him munificently, while cruelly neglecting two far greater composers, Cherubini and Méhul, to whom the new favourite transferred the hatred he had formerly borne to Cimarosa, Guglielmi and Piccini. Paisiello conducted the music of the court in the Tuileries with a stipend of 10,000 francs and 4800 for lodging, but he entirely failed to conciliate to the Parisian public, who received his opera Prispetre so coldly that, in 1803, he requested and with some difficulty obtained permission to return to Italy, upon the plea of his wife's ill health. On his arrival at Naples Paisiello was reinstated in his former appointments by Joseph Bonaparte and Murat, but he had taxed his genius beyond its strength, and was unable to meet the demands now made upon it for new ideas. His prospects, too, were precarious. The power of the Bonaparte family was tottering to its fall; and Paisiello's fortunes fell with it. The death of his wife in 1815 tried him severely. His health failed rapidly, and constitutional jealousy of the popularity of others was a source of worry and vexation. He died on the 5th of June 1816.
PAITA

that once formed the domains of the abbey. To the munificence of its citizens the town owes many of its finest public buildings. Opposite to the abbey church (see below) stands the town hall (1879-1882), which originated in a bequest by George Atkin Clark (1823-1873), and was completed by his relatives, the thread manufacturers of Anchor Mills. The new county buildings (1891) possess a handsome council hall, and the castellated municipal buildings (1818-1821) were the former county buildings; the sheriff court house (1855) in St James Street, and the free library and museum (including a picture gallery) at the head of High Street, were erected (1859-1872) by Sir Peter Coats (1806-1890). In Oakshaw Street stands the observatory (1883), the gift of Thomas Coats (1800-1883). Besides numerous board schools, the educational establishments include the John Neilson Endowed Institute (1852) on Oakshaw Hill, the grammar school (founded, 1576; rebuilt, 1864), and the academy for secondary education, and the technical college, in George Street. Among charitable institutions are the Royal Alexandra Infirmary, the Victoria Eye Infirmary (presented by Provost Mackenzie in 1849), the burgh asylum at Riccartonbar, the Abbey Poorhouse (including hospital and lunatic wards), the fever hospital and reception house, the Infectious Diseases Hospital and the Gleniffer Home for incurables. The Thomas Coats Memorial Church, belonging to the Baptist body, erected by the Coats family from designs by H. J. White, R.S.A., is one of the finest modern ecclesiastical structures in Scotland. It is an Early English and Decorated cruciform building of red sandstone, with a tower surmounted by a beautiful open-work crown. Of parks and open spaces there are in the south, Brodie Park (22 acres), presented in 1851 by Robert Brodie; towards the north Fountain Gardens (7½ acres), the gift of Thomas Coats and named from the handsome iron fountain standing in the centre; in the north-west, St James Park (40 acres), with a race-course (racing dates from 1620, when the earl of Abercorn and the Town Council gave silver bells for the prize); Dunn Square and Slessor Gardens (3 acres); Lennoxtown a mile and a half south-west, Tamlin and Plantation beyond the north-western boundary. There are the cemeteries at Hawkhead and at the west side of the town. Under the Reform Act of 1832 the burgh returns one member to Parliament. The town is governed by a council, with provost and bailies, and owns the gas and water supplies and the electric lighting. In the abbey precincts are statues to the poet Robert Tannahill (1774-1810) and Alexander Wilson (1766-1813), the American ornithologist, both of whom were born in Paisley, and, elsewhere, to Robert Burns, George Atkin Clark, Thomas Coats and Sir Peter Coats.

Paisley has been an important manufacturing centre since the beginning of the 18th century, but the early linens, lawns and silk-gauzes have been supplanted by the famous Paisley shawls (imitation cashmere), the sale of which at one time exceeded £1,000,000 yearly in value, have ceased to be woven. The manufacture of linen thread, introduced about 1720 by Christian Shaw, daughter of the laird of Bargarran, gave way in 1812 to that of cotton thread, which has since grown to be the leading industry of the town. The Ferguslie mills (J. & P. Coats) and Anchor mills (Clark & Company) are now the dominant factors in the combination that controls the greater part of the thread trade of the world and together employ 10,000 hands. Other thriving industries include bleaching, dyeing, calico-printing, weaving (carpets, shawls, tartans), engineering, tanning, iron and brass founding, brewing, distilling, and the making of starch, cornflour, soap, marmalade and other preserves, besides some shipbuilding in the yards on the left bank of the White Cart.

The abbey was founded in 1163 as a Cluniac monastery by Walter Fitzalan, first High Steward of Scotland, the ancestor of the Scottish royal family of Stuart, and dedicated to the Virgin, St James, St Milburga of Much Wenlock in Shropshire (whence came the first monks) and St Mirinus (St Mirren), the patron-saint of Paisley, who is supposed to have been a contemporary of St Columba. The monastery became an abbey in 1229, was destroyed by the English under Aymer de Valence, earl of Pembroke, in 1307, and rebuilt in the latter half of the 14th century, the Stuarts endowing it lavishly. At the Reformation (1561) the fabric was greatly injured by the 5th earl of Glencairn and the Protestants, who dismantled the altar, stripped the church of images and relics, and are even alleged to have burnt it. About the same date the central spire, 300 ft. high, built during the abbacy of John Hamilton (1511-1571), afterwards archbishop of St Andrews, collapsed, demolishing the choir and north transept. In 1553 Lord Claud Hamilton, then a boy of ten, was made abbot, and the abbacy and monastery were erected into a temporal lordship in his favour in 1557. The abbey lands, after passing from his son the earl of Abercorn to the earl of Angus and then to Lord Dundonald, were purchased in 1764 by the 5th earl of Abercorn, who intended making the abbey his residence, but let the ground for building purposes. The abbey church originally consisted of a nave, choir without aisles, and transepts. The nave, in the Transitional and Decorated styles, with a rich mid-Painted triforium of broad round arches, has been restored, and used as the parish church since 1862. The graceful west front has a deeply recessed Early Pointed doorway, surmounted by traceried windows and, above these, a handsome Decorated stained-glass window of fire lights. Of the choir only the foundations remain to indicate its extent; at the east end stood the high altar before which Robert III. was interred in 1406. Over his grave a monument to the memory of the Royal House of Stuart was placed here by Queen Victoria (1888). The restored north transept has a window of remarkable beauty. The south transept contains St Mirren's chapel (founded in 1409), which is also called the "Sounding Aisle" from its echo. The chapel contains the tombs of abbot John Hamilton and of the children of the 1st lord Paisley, and the recumbent effigy of Marjory, daughter of Robert Bruce, who married Walter, the Steward, and was killed while hunting at Knock Hill between Renfrew and Paisley (1316).

About 2 m. S. of Paisley are the pleasant braes of Gleniffer, sung by Tannahill, and 2½ m. S.E., occupying a hill on the left bank of the Leven, stand the ruins of Crookston Castle. The castle is at least as old as the 12th century and belonged to Robert de Croc, who witnessed the charter of the foundation of Paisley Abbey. In the following century it passed into the possession of a branch of the Stewarts, who retained it until the murder of Darnley (1567). Afterwards it changed hands several times, but was finally acquired from the Montrose family by Sir John Maxwell of Pollok.

The Romans effected a settlement in Paisley in A.D. 84, and built a fort called Vindolanda on the high ground (Oakshaw Hill) to the west of the White Cart. The place seems to have been first known as Paslet or Passelth, and was assigned along with certain lands in Renfrewshire to Walter Fitzalan, founder of the abbey. The village grew up round the abbey, and by the 15th century had become sufficiently important to excite the jealousy of the neighbouring burgh of Renfrew. To protect it from molestation Abbot Schaw (or Shaw) induced James IV., a frequent visitor, to erect it into a burgh of barony in 1488, a charter which gave it the right to return a member to the Scottish parliament.

See Chartulary of the Monastery of Paisley, published by the Maitland Club (1832); J. Cameron Lees, The Abbey of Paisley (1878); Swan, Description of the Town and Abbey of Paisley (1835); and Robert Brown, History of Paisley (1856).

PAITA, or PAYTA, a seaport of northern Peru, chief town of the province of Paity in the department of Piura. Pop. (1906 estimate), 3800. The town has one of the best natural harbours of the Peruvian coast, is a port of call for the regular mail steamers between Valparaiso and Panama, and is the port of the departmental capital, Piura, with which it is connected by a railway 60 m. long. It is also the Pacific terminus of the railway across the Andes to Puerto Limon, on the Maranon, or upper Amazon. Paity faces on the bay of Paity, and is sheltered from southerly winds by a headland called Punta Paity and by a large hill called the Silla de Paity. The water
supply is brought from the river Chira (17 m. distant). The exports include cotton, tobacco, petroleum, cattle, hides and straw hats. Patau dates from the early years of the Spanish Conquest, and was a prosperous port in colonial times. It was nearly destroyed by Lord Anson's fleet in 1741. 

PAJOL, CLAUDE PIERRE, Count (1772-1844), French cavalry general, was born at Besançon. The son of an advocate, he was intended to follow his father's profession, but the events of 1789 turned his mind in another direction. Joining the battalion of Besançon, he took part in the political events of that year, and in 1791 went to the army of the Upper Rhine with a volunteer battalion. He took part in the campaign of 1792 and was one of the stormers at Hochheim (1793). From Custine's staff he was transferred to the Army of Italy, and in 1795 he was with the Sambre and Rhine Campaigns (1794-96). After serving with Hoche and Massena in Germany and Switzerland (1797-99), Pajol took a cavalry command under Moreau for the campaign on the upper Rhine. In the short years of peace Pajol, now colonel, was successively envoy to the Batavian Republic, and delegate at Napoleon's coronation. In 1805, the emperor employed him with the light cavalry. He distinguished himself at Austerlitz, and, after serving for a short time in Italy, he rejoined the grande armée as a general of brigade, in time to take part in the campaign of Friedland. Next year (1806) he was made a baron of the Empire. In 1809 he served on the Danube, and in the Russian War of 1812 led a division, and afterwards a corps, of cavalry. He served the retreat, but his health was so broken that he was sent to the town of Besançon for a time. He was back again in active service, however, in time to be present at Dresden, at which battle he played a conspicuous part. In 1814 he commanded a corps of all arms in the Seine Valley. On the fall of Napoleon, Pajol gave in his adhesion to the Restoration government, but he rejoined his old master immediately upon his return to France. His (I) corps of cavalry played a prominent part in the campaign of 1815, both at Ligny and in the advance on the Wavre under Grouchy. On receiving the news of Waterloo, Pajol disengaged his command, and by a skilful retreat brought it safe and unscathed to Paris. There he and his men played an active part in the actions which ended the war. The Bourbons, on their return, dismissed him, though this treatment was not, compared to that meted out to Ney and others, excessively harsh. In 1830 he took part in the overthrow of Charles X. He suppressed, sternly and vigorously, émeutes in Paris in 1831 and 1832, 1834 and 1839. A general, and a peer of France, he was put on the retired list in 1842, and died two years later. His son, Count CHARLES PAUL VICTOR PAJOL (1821-1891), entered the army and had reached the rank of general of division when he was involved in the catastrophe of Metz (1870). He retired in 1877. Besides being a good soldier, he was a sculptor of some merit, who executed statues of his father and of Napoleon, and he wrote a life of his father and a history of the wars under Louis XV. (Paris 1881-1891). See Count C. P. V. PAJOL, Pajol général en chef (Paris, 1874). 

PAJOU, AUGUSTIN (1730-1809), French sculptor, was born in Paris on the 10th of September 1730. At eighteen he won the Prix de Rome; at thirty he exhibited his Pluton tenant Cerbère exilé (now in the Louvre). His portrait busts of Buffon and of Madame Du Barry (1773), and his statuette of Bossuet (all in the Louvre), are amongst his best works. When B. Poyet constructed the Fontaine des Innocents from the earlier edifice of P. Lescot (see GOUJON) Pajou provided a number of new figures for the work. Mention should also be made of his bust of Carlin Bertinanzi (1763) at the Comédie Française, and the monument of Marie Leczinska, queen of Poland (in the Square du Temple), which is so far as is known unique in Paris and the whole of the kingdom. In 1764 a statue of the Emperor Charles V was set up at Cadiz, and the following year Pajou was sent to the Levant to execute a statue of the Sultan of Tunis. In 1771 he was called to Peking, and at his death was in the service of the Chinese. Pajou's principal work after this was the large statue of the Emperess Mary, which was set up in the Place de la Concorde, Paris, in 1789. 

PAKOKKU, a district in the Mfubu division of Upper Burma, lies 150 miles south of Mandalay, the line of the Chin hills as a natural boundary. It has an area of 6210 sq. m. and a population (1907) of 356,480. The part of the district along the Irrawaddy and Chindwin rivers is alluvial. Beyond this, however, the country rises gradually to the low Shimadaung and Tangyi ridges, where it is very arid. To the westward there is a rapid drop to the well-watered valley of the Yaw River, and then a rise over broken, dry country before the valleys of the Myit-tha and Môn rivers are reached. The principal products are millet, sesameum and sugar produced from toddy-palms in the riverain districts, which also grow rice, grain, peas and beans. Tobacco and vegetables are also produced in some quantity, and maize is grown largely for the sake of the husk, which is used for native manufacture. The Yenangyaung and oil-fields, which produce quantities of petroleum, are in the south of the district, and iron used to be worked in a small way. There are 11,51 sq. m. of reserved forests in the
A good deal of teak and cutch is worked out. The cutch of the Yaw country is particularly esteemed. The average rainfall does not exceed 35 in. annually; and in many places water has to be carried from the West of the Pondicherry ridge, however, under the Chin hills, the rainfall exceeds 50 inches. The heat in May and June is very great, and the thermometer rises considerably above 100° F. in the shade.

The great majority of the population is Burmese, but in Yaw there is a peculiar race called Taungtha, who claim to be quite distinct from both Burmese and Chins. In 1901 the Taungthas numbered 5700.

The headquarters town, Pakokku, stands on the right bank of the Irrawaddy, and has grown into importance since the British occupation. It is the great boat-building centre of Upper Burma. The population in 1901 was 19,436. It may be described as the emporium of the trade of the Chinwind and Yaw river valleys.

The steamers of the Irrawaddy Flotilla Company call here regularly, and it is the starting-point for the vessels plying on the Chinwind.

PAL KRISTO DAS (1835-1884), Indian publicist, was born in Calcutta in 1835, of the Telii or oil-man’s caste, which ranks low in the Hindu social hierarchy. He received an English education at the Oriental Seminary and the Hindu Metropolitan College, and at an early age devoted himself to journalism. In 1861 he was appointed assistant secretary (and afterwards secretary) to the British Indian Association, a board of Bengal landlords, which numbered among its members some of the most cultured men of the day. At about the same time he became editor of the Hindu Patriot, originally started in 1853 and conducted with ability and zeal by Harish Chandra Mukerji until his death in 1858, when it was taken over by Dwarakanath Bandopadhyay, who was its editor until his death in 1866.

In 1863 he was appointed justice of the peace and municipal commissioner of Calcutta. In 1872 he was made a member of the Bengal legislative council, where his practical good sense and moderation were much appreciated by successive lieutenant-governors. His opposition, however, to the Calcutta Municipal Bill of 1876, which first recognized the elective system, was attributed to his prejudice in favour of the “classes” against the “masses.” In 1875 he received the decoration of C.I.E. In 1876 he was made an honorary member of the Bengal legislative council. In the discussions on the Rent Bill, which came up for consideration before the council, Kristo Das Pal, as secretary to the British Indian Association, necessarily took the side of the landlords.

The earliest palaces in Egypt are those built in the rear of the Temple of Karnak by Thothmes III, and near the Temple of Medinet Habu, both in Thebes; the earliest in Greece are those at Croesus and Phæstos in Crete (c. 1500 B.C.), and at Tiryns in the citadel (c. 1200 B.C.). The most remarkable series are those erected by the Assyrians at Nimroud, Koyunjik and Khorsabad (859-667 B.C.), which were followed by the Persian palaces at Persepolis and Susa; the Parthian palaces at Al Haldr and Diarbekr; and the Sassanian palaces of Persisistan, Firuzabad and Hamadan. The only palace known in the Greek style is that found at Palatiza in Macedonia. Of the Roman period there are many examples, beginning with those on the Palatine Hill commenced by Augustus, continued and added to by his successors, Tiberius, Caligula, Domitian, Hadrian and Septimus Severus, which covered an area of over 1,000,000 sq. ft. The villa of Hadrian was virtually an immense palace, the buildings of which exceeded 7 m. in length; of more modest proportions are the palace of Diocletian at Spalato and a fine example at Trèves in Germany. The palace of the Hebdonon at Constantinople, and a fragment at Ravenna of Theodoric’s work, are all that remain of Byzantine palaces. Of Romanesque work the only examples are those at Gelnhausen built by Barbarossa, and the Wartburg in Germany. In the Gothic style in Italy, the best known examples are the ducal palace at Venice, and the Palazzi Vecchio and del Podesta (Bargello) at Florence; in France, the palace of the popes at Avignon, and the episcopal palaces of Beaufays, Laon, Poitiers and Lisieux; in England, the bishops’ palaces of Wells, Norwich, Lincoln, portions of Edward the Confessor’s palace at Westminster, and Wolsey’s palace at Hampton Court; while such great country mansions as the “castles” of Alnwick, Kenilworth, Warwick, Rochester, Raglan and Stoketay, or Haddon Hall, come in the same category though the name is not employed. Belonging to the Mahomedan style are the palaces of the Alhambra and the Alcazar in Spain. Of the Renaissance period, numerous are the country palaces in Italy; the most important examples in Italy were those of the Vatican, the Quirinale and the Cancellaria, in Rome; the Caprarola near Rome; the palace of Caserta near Naples; the Pitti at Florence; the Palazzo del Te at Mantua; the court and eastern portion of the ducal palace of Venice, and the numerous examples of the Grand Canal; in France, the Louvre, the Tuileries (destroyed), and the Luxembourg, in Paris; Versailles and St Germain-en-Laye; and the châteaux of la Rocheflower, Fontainebleau, Chambord, Blois, Amboise, Chenonceaux and other palaces on the Loire; in Germany, the castle of Heidelberg, and the Zwinger palace at Dresden; in Spain, the palace of Charles V at Granada, the Escorial and the palace of Madrid; in England, the palace of Whitehall by Inigo Jones, of which only the banqueting hall was left standing, and the Windsor Castle at London; and in Scotland, the palaces of Holyrood and Linlithgow.

PALACIO VALDÉS, ARMANDO (1853- ). Spanish novelist and critic, was born at Entralgo, in the province of Asturias, on the 4th of October 1853. His first writings were printed in the Revista Europea. These were pungent essays, remarkable for independent judgment and refined humour, and found so much favour with the public that the young beginner was soon appointed editor of the Revista. The best of his critical work is collected in Los Oradores del Ateno (1878), Las Novelistas españoles (1878), Nuevos viajes de Parnaso y La Literatura en 1881 (1882), this last being written in collaboration with Leopoldo Alas. In 1881 he published a novel, El Señorío Octavio, which shows an unequalled power of self-expression, and the power of things to come. In Marta y Marfa (1883), a portrayal of the struggle between religious vocation and earthly passion, somewhat in the manner of Valera, Palacio Valdés achieved a very popular triumph which placed him in the first rank of contemporary Spanish novelists. El Idilio de un enfermo (1884), a most interesting fragment of autobiography, has scarcely met with the recognition which it deserves: perhaps because the pathos of the story is too unadorned. The publication of Pereda’s Sotileza is doubtless responsible for the conception of José (1889), in which Palacio Valdés gives a realistic picture of the manners and customs of seafaring folk, creates the two convincing characters whom he names José and Leonarda, and embellishes the whole with passages of animated description barely inferior to the finest penned by Pereda himself. The
emotional imagination of the writer expressed itself anew in the
charming story Ricerca (1886), one of whose attractive
dramatic characters develop into the hero of Maximiun (1887); and
from Maximiun, in its turn, is taken the novice who figures
as a professed nun among the personages of La Hermana San
Sulpicio (1888), in which the love-passages between Zelenero
Sanjurjo and Gloria Bermúdez are set off with elaborate,
romantic descriptions of Seville. El Cuarto poder (1888) is,
as its name implies, concerned with the details, not always edifying, of
journalistic life. Two novels issued in 1892, La symphonie
and L'œuf, were enthusiastically praised in foreign countries, but
in Spain their reception was cold. The explanation is to be
found in the fact that the first of these books is an avowed satire
on the Spanish aristocracy, and that the second was construed
into an attack upon the Roman Catholic Church. During the
acrimonious discussion which followed the publication of La
Espuma, it was frequently asserted that the artist had improvised
a fantastic caricature of originals whom he had never seen; yet
as the characters in Coloma's Pequeñas are painted in darker
tones, and as the very critics who were foremost in charging
Palacio Valdés with incompetence and ignorance are almost
unanimous in praising Coloma's fertility, it is manifest that the
indictment against La Espuma cannot be maintained. Subse-
sequently, Palacio's works gained the diacre and favor of the
Majors of Cádiz (1896) and in La Algéria del Capitán Ribot
(1898). In these novels, and still more in Tristán, ó el pesimismo
(1906), he frees himself from the reproach of undue submission
to French influences. In any case he takes a prominent place in
modern Spanish literature as a keen analyst of emotion and a
sympathetic, delicate, humorous observer. (J. F.-K.)

PALÁCKÝ, FRANTIŠEK [Francis] (1796-1876), Czech
historian and politician, was born on the 14th of June 1796 at
Hodsavice (Hotzendorf) in Moravia. His ancestors had been
members of the community of the Bohemian Brethren, and had
secretly maintained their Protestant belief throughout the
period of religious persecution, eventually giving their adherence
to the French revolution, and subsequently to the Roman
Catholic faith. Palácký's father was a schoolmaster and a man of some
learning. The son was sent in 1812 to the Protestant gymnasium at
Pressburg, where he came in contact with the philologist
Šafařík and became a zealous student of the Slav languages.
After some years spent in private teaching Palácký settled in
1823 at Prague. Here he found a warm friend in Dobrovský,
whose good relations with the Austrian authorities shielded him
from the hostility shown by the government to students of Slav
subjects. Dobrovský introduced him to Count Sternberg and
his brother Francis, both of whom took an enthusiastic interest
in Bohemian history. Count Francis was the principal founder
of the Society of the Bohemian Museum, devoted to the collection
of documents bearing on Bohemian history, with the object of
reawakening national sentiment by the study of the national
public interest in the movement was stimulated in 1823
by the new Journal of the Bohemian Museum (Časopis českého
Musee) of which Palácký was the first editor. The journal was
at first published in Czech and German, and the Czech edition
survived to become the most important literary organ of
Bohemia. Palácký had received a modest appointment as archi-
vist to Count Sternberg and in 1829 the Bohemian estates sought
to confer on him the title of historiographer of Bohemia, with a
small salary, but it was ten years before the consent of the Vienn-
ese authorities was obtained. Meanwhile the estates, with the
tardy assent of Vienna, had undertaken to pay the expenses
of publishing Palácký's capital work, The History of the Bohemian
People (3 vols., 1836-1867). This book, which comes down to the
year 1526 and the extinction of Czech independence, was founded
on laborious research in the local archives of Bohemia and in
the libraries of the chief cities of Europe, and remains the stan-
dard authority. The first volume was printed in German in
1836, and subsequently translated into Czech. The publication
of the work was hindered by the police-censorship, which was
especially active in criticizing his account of the Hussite move-
ment. Palácký, though entirely national and Protestant in
his sympathies, was careful to avoid an uncritical approval of
the Reformers' methods, but his statements were held by the
authorities to be dangerous to the Catholic faith. He was
therefore compelled to make excisions from his narrative and to
accept as integral parts of his work passages interpolated by the
censors. After the abolition of the police-censorship in
1848 he published a new edition, completed in 1876, restoring
the original form of the work. The fairest and most considerable
of Palácký's antagonists in the controversy aroused by his
works was Barthelemy Pothier, who in 1852, in a pamphlet
entitled Die Befreitung des deutschen Volkes, visited Vienna, and
there, under the name of Helfert, who received a benefit from Vienna to write his Huus und
Hieronynus (1853) to counteract the impression made by
Palácký's History. K. A. K. Höller, a German professor of
history at Prague, edited the historical authorities for the
period in a similar sense in his Geschichte der hussitischen
Bewegung in Böhmnen. Palácký replied in his Geschichte des
Hussitenkampfes und Professor Löffler (Prague, 1868) and Zur
böhmischen Geschichtsschreibung (Prague, 1871).

The revolution of 1848 forced the historian into practical
politics. He was deported to the Reichstag which sat at
Kroměříž (Kremser) in the autumn of that year, and was a
member of the Slav congress at Prague. He refused to take
part in the preliminary parliament consisting of representatives
of the Austrian government, but placed himself, the ground that
as a Czech he had no interest in German affairs. He was at
this time in favour of a strong Austrian empire, which should
consist of a federation of the southern German and the Slav
states, allowing of the retention of their individual rights.
These views met with some degree of consideration at Vienna, and
Palácký was even offered a portfolio in the Pillersdorf
cabinet. The collapse of the federal idea and the definitive
success of the party of reaction in 1852 led to his retirement
from politics. After the liberal concessions of 1860 and 1861,
however, he became a life member of the Austrian senate.
His views met with small support from the assembly, and with
the exception of a short period after the decree of September 1871,
by which he was made President of the Senate, he was not
active in political life. In 1882, on the retirement of a former
minister of education, he ceased to appear in the senate from 1861 onwards.
In the Bohemian Landtag he became the acknowledged leader of
the nationalistic-federal party. He sought the establishment of a
Czech kingdom which should include Bohemia, Moravia and
Silesia, and in his zeal for Czech autonomy he even entered into
an alliance with the Conservative nobility and with the extreme
Catholics. He attended the Panslavist congress at Moscow in
1867. He died at Prague on the 26th of May 1876.

Among his more important smaller historical works are: Würdi-
gung der alten böhmischen Geschichtsschreiber (Prague, 1830), dealing
with the lives of many of the early historians of Bohemia; For-
ner Czech students; Archiv český (6 vols., Prague, 1840-1872); Urkund-
lliche Beiträge zur Geschichte des Hussitenkrieges (2 vols., Prague,
1872-1874); Documenta magistri Johannis Huz silvan, doctrinum,
canam . . . illustrantis (Prague, 1864). With Salarik he wrote
Anfänge der böhmischen Dichtkunst (Pressburg, 1818) and Die
ältesten Denkmäler der böhmischen Sprache (Prague, 1840). Three
volumes of his Czech articles and essays were published as Redhost
(3 vols., Prague, 1874-1875). For accounts of Palácký see an article
by Saint Réne Taillandier in the Revue des deux mondes (April, 1855);

PALADIN ([Lat. palatinus], strictly a courtier, a member of
a royal household, one connected with a palace. From
being applied to the famous twelve peers of Charlemagne,
the word became a general term in romance for knights of great
prowess. Pulaemon, Quintus Remmius, Roman grammarian, a
native of Veneti, lived in the reigns of Tiburis and Claudius.
From Suetonius (De grammaticis, 23) we learn that he was
originally a slave who obtained his freedom and taught grammar
at Rome. Though a man of profligate and arrogant character,
he enjoyed a great reputation as a teacher; Quintilian and
Persius are said to have been his pupils. His lost Ars (Juvenal,
vi. 215), a system of grammar much used in his own time and
largely drawn upon by later grammarians, contained rules for
correct diction, illustrative quotations and treated of barbarisms
and solecisms (Juvenal vi. 432). An extant Ars grammatica
(discovered by Jovianus Pontanus in the 15th century) and
other unimportant treatises on similar subjects have been
wrongly ascribed to him.

See C. Marschall, De Remnant Palaeononis Libris grammaticis
(1841), and "The First Century" by H. Nettleship in
Journal of Phytology, vol. xii. (1886); J. E. Snydes, Hist.

PALAEOBOTANY. In the present article the subject of
vegetable palaeontology is treated from a broad view.
The science of botany is concerned with the vegetable
kingdom as a whole, and not merely with the flora now living.
The remains of the plants of former periods, which have come
down to us in the fossilized state, are almost always fragmentary,
and often imperfectly preserved; but their investigation is of
to a high degree importance to the botanist, as affording the only
direct evidence of the past history of vegetable organisms.
Since the publication of the Origin of Species the general accep-
tance of the theory of evolution has resulted in a great increase
in the number of such fossil plants as are of significance to
palaeontological data. The determination of the course of
development has now become the ultimate problem for the
systematist: this is an historical question, and the historical
documents available are the remains of the ancient organisms
preserved in the rocks. The palaeobotanist thus endeavours to
trace the history of plants in the past, with the hope of throwing
light on their natural affinities and on the origin of the various
species. His investigations must embrace not only the compar-
tive morphology and anatomy of fossil plants, but also their
distribution over the earth's surface at different periods—a part
of the subject which, besides its direct biological interest, has
obvious bearings on ancient climatology and geography.

Unfortunately, in the majority of cases of palaeobotanical research, some account must be given of the way in which the
evidence is presented, or, in other words, of the method of preservation of
vegetable remains. These fall under two main heads. On the
one hand, there is the mode of preservation which gives rise to casts,
moulds and generally impressions, exhibiting the superficial features
of the specimen. The great majority of vegetable fossils are of
this kind, and the term impression is used as a general term to
cover the various modes of fossilization. On the other hand, there
are specimens in which the tissues of the plant have been permeated
by some mineral in solution, which, subsequently setting hard,
has fixed and preserved the internal structure, often with astonishing
perfection of detail. This second method of fossilization is termed
petrifaction. In the case of incrustation the whole substance of
the fossilized specimen—e.g., a stem of Sigillaria—may be replaced
by mineral matter, such as sandstone or shale, giving a cast of the
whole, on the outer surface of which the external markings, such as
the bases of leaves and the scars left by their fall, are visible in their
natural form. Usually the organic substance remains as a thin
carbonaceous layer forming the surface of the cast, but some-
times as isolated fragments. Occasionally, the casts and moulds
course show the mould of the cast, with its elevations and depressions
reversed. In the case of thin, flat organs such as leaves, the whole
organ may remain, and the term inclusion is given. For petrifaction, leaving its
marks on the overlying and underlying layers. Hence it is not necessarily being any replacement of organic by inorganic
material; the whole leaf, for example, may remain, though reduced
to a carbonaceous film. In such carbonaceous impressions not
only are the form and markings, such as venation, perfectly pre-
served, but something of the actual structure may remain. The
cuticularized epidermis, especially, is often thus preserved, and may
be removed by the use of appropriate reagents and examined
microscopically. If sporangia and spores are present they also
persist in a perfectly recognizable form, and in fact much of our
knowledge of the fructification of fossil Ferns and similar plants is derived from spore and pollen fossils.

In many cases internal casts have been formed, some large cavity,
such as a fistular path, having become filled with mineral
substance, which has taken the impress of the surrounding structures, such as the wood. The common casts of Calamites are of this nature,
representing the form of the hollow medulla, and bearing on their
upper surface the print of the nodal constrictions and of the ridges
and furrows on the inner surface of the wood. The whole organic sub-
stance has disappeared, and the cavity is occupied by a mere carbonaceous layer. Mistakes have often arisen from confusing these
medulitary casts with those of the stem as a whole.

Although some information as to minute structure may often be
gained, the anatomical characters of the fossils preserved by petrifaction are the main source of our knowledge of the
structure of the characters of ancient plants. The chemical bodies
which have been preserved in the important part as agents of petrifaction are siliceous acid and calcium carbonate. Other substances,
such as magnesium carbonate, calcium sulphate and ferric oxide
have also been concerned, either as the chief constituents of petrifac-
tions, or mixed with other bodies. A large number of the most
important remains of plants with structure preserved are silicious;
it is the silica, for example, of the famous fossiliferous rocks of
the First Eocene, Autun, &c., in which the hands of Brongniart, Renaut and others have yielded such brilliant scientific
results. But over much of the world, and especially in the great
Mesozoic Gymnosperms from Great Britain, France, and especially
North America, are no less important. Calcareous specimens are
especially characteristic of the British Carboniferous formation;
the most delicate plant remains in this group have been thrown up
by their investigation by Witham, Binney, Williamson and others
has proved no less fertile. In the Coal Measures of England and of
certain German and Austrian districts (e.g. Langendreer in West-
phalia), and in Montana, in the United States, the hard vegetable fragments of every kind, occur in certain mines embedded in
the substance of the coal and representing its raw material in a petrified condition. Even the most delicate tissues, such as
those of the wood and phloem, are frequently preserved; the cambium
of the growing-point, are frequently preserved cell for cell,
both in calcareous and silicious material. As a rule, the petrified remains, all-important for the revelation of structure, are fragmen-
tinated, and give little idea of the habit or external characters of
plants from which they were derived. Hence they must be brought into
connection with the specimens preserved as casts or impressions,
in order to get a better conception of the plant as a whole. This
is often a difficult task, and generally the fragmentary nature of
practically all vegetable fossils is the chief hindrance to their in-
vestigation. Owing to this, it has become the common practice
of the palaeobotanist to separate detached parts of plants which may even have belonged to one and the same species.
Thus the roots of Sigillaria are called Stigmaria, detached
leaves Sigillariophyllium, and the fructifications Sigillariaebras.
The name Sigillariophyllium is given to the imperfectly preserved
and partly decorticated has been called "Many-leafed", while its
wooden cylinder has often been described under the name Diplazylon.
This naming of portions of plants, however objectionable, is often
necessary. It is, of course, impossible to give any kind of
name as the plant itself has disappeared, or to draw the form or
shape of the whole plant from the remains that have been left,
if the remains of but a few parts are present. This is in accordance
with the antithesis of the science, and the gradual disappearance of
the particles from the fossil is in accordance with the science.

The recent advance of fossil botany has depended in a very
large degree on the study of petrified specimens with their struc-
ture preserved; so far, at least, as the older strata are con-
cerned, it is, as a rule, only with the help of specimens showing
structure that any safe conclusions as to the affinities of fossil
plants can be arrived at.

The subject of Palaeozoic (q.v.) is treated elsewhere. Here it need
only be said that the masses of vegetable substance, more or less
carbonized and chemically altered, of which coal is composed,
freely contain cells and fragments of tissue in a condition,
which, if properly preserved and examined under a micro-
scope, give important conclusions the structure of the wood, fibres of
the bark, &c. These remnants, however, though interesting as
reveling something of the sources of coal, are too fragmentary
to be of any value in determining their affinities. On the other hand, the organized structure is sometimes excellently
preserved. In the Wealden of Belgium, for example, specimens
of Ferns and Coniferae occur, in the form of leaves, which can
be scraped from the rock, with a razor, and exhibit an almost
unaltered structure.

I. — Palaeozoic

The present section is concerned with the botany of the
Palaeozoic age, from the oldest rocks in which vegetable remains
have been found up to the close of the Permian period.

The Glossopteris flora of India and the southern hemisphere, the age
of which has been disputed, is now regarded as for the most part
Permico-Carboniferous, and, however, dealt with in the succeed-
ing section, in connexion with the Mesozoic floras. The various
groups of plants represented in the Palaeozoic rocks will be
considered in systematic order, after which some account will be
given of the succession and distribution of the various floras
during the period.

In dealing with the plants of such remote epochs, the relative
importance of the various groups, so far as they are known to
us, is naturally very different from that which they assume at
the present day. There is no evidence that the Angiospermae
flowering plants, now the dominant class, existed during the
Palaeozoic period; they do not appear till far on in the Mesozoic
ePOCH, and their earlier history is as yet entirely unknown. On
the other hand, fern-like seed-plants, known as Pteridosperms,
and Gymnosperms belonging almost entirely to families now extinct, were abundant, while the Pteridophyta attained a development2 exceeding anything that they can now show. Among the lower classes of plants we have scarcely any knowledge of Palaeozoic Bryophyta; Fungi were probably very little in evidence, except in the Algae which are better represented, well characterized specimens are scanty.

With few exceptions, the remains of Palaeozoic Algae are of comparatively little botanical interest. A vast number of "species" have been described, but, as has been said, the forms are mostly of a broadly fusiform character, and it is highly probable that a large proportion of such forms, if they may be called Algae at all, are really diatoms or other microscopic forms to which the term "diatom" would be more properly applied. The Algae have been divided into two main groups, the Siphonaceous and the Spongiaceous, and it may be observed that the fossils of the Spondylophorae have been occasionally found, but rarely, and have been described by various authors as belonging to the Spondylophora, a division of the Pteridophyta, and as having peculiar affinities to the Fungi. It is probable that the Spondylophora have been derived from other sources than the body which left the impression. The mere external form of the supposed Algae is rarely so characteristic as to afford satisfactory evidence of their nature. Some of the more definite forms, however, are of considerable interest, and may be briefly described. Of Cynophyceae, as we should expect, the Palaeozoic remains are very doubtful. Cocoloba, found by Renault in a coprolite of Permian age, was supposed to be a Cynophycean, but the plant is rarely preserved, and the impression is not so well defined as to be considered a characteristic of the class. In recent times, the Cynophyceae have been described from the Coal Measures, and it is probable that the Cynophyceae, together with the Monilophyceae, are true representatives of the Cynophyceae, and are present in the Palaeozoic strata.

The Palaeozoic Algae have been classified by various authors, including L. H. W. Penhallow, W. Smith, and J. B. Kidston. The Algae have been divided into the following classes: Siphonaceous, Spongiaceous, Cynophycean, Prosophycean, and Cryptophycean. The Siphonaceous Algae have been divided into the following orders: Siphonophorae, Coccophorae, and Monilophorae. The Spongiaceous Algae have been divided into the following orders: Spongiophorae, Coccophorae, and Monilophorae. The Cynophyceae have been divided into the following orders: Cynophorae, Coccophorae, and Monilophorae. The Prosophyceae have been divided into the following orders: Prosophorae, Coccophorae, and Monilophorae. The Cryptophyceae have been divided into the following orders: Cryptophorae, Coccophorae, and Monilophorae.

Professor Seward, however, has found a Zygospores in situ, terminating in an apparently fungal hypha; he suggests a possible comparison with the mould Mycozetum. Bodies closely resembling the perithecia of Sphaeraceous Fungi have often been observed on Palaeozoic rocks, and may probably belong to the group indicated.

Professor E. E. Weiss has obtained interesting evidence that the symbiotic association between roots and Fungi, known as " Mycorrhiza," already occurs amongst Carbonaceous plants, and indicates the long and inconspicuous character which we at present possess as to Palaeozoic Fungi do not as yet justify any inferences as to the evolution of these plants. The writer is not aware of any evidence for the occurrence of Palaeozoic Lichenophyta.

The important class of the Bryophyta, which, on theoretical grounds, is commonly regarded as more primitive than the Pteridophyta, is, as yet scarcely represented among Carbonaceous plants, and may probably belong to the group indicated.

The Carboniferous of Scotland Mr Kidston has found several specimens of a large dichotomous thallus, with a very distinct midrib; the specimens, referred to the provisional genus Thallites, much resemble the larger thalloid Liverworts. Similar fossils have been described from still older rocks. In one or two cases Palaeozoic plants, resembling the true Mosses in habit, have been discovered; the best example is the Musciula polytrichacea of Renault and Zeiller, from the Coal Measures of Commentry. In the absence, however, both of reproductive organs and of anatomical structure, it cannot be said that there is at present complete evidence for the existence of either Hepaticae or Musci in Palaeozoic times.

Our knowledge of the Vascular Cryptograms of the Palaeozoic period, though recent discoveries have somewhat reduced their relative importance, is still more extensive than of any other class of plants, and in fact it is here that the evidence of Palaeontology first becomes of essential importance to the botanist. They extend back through the Devonian, possibly to the Silurian system, but the systematic summary now to be given is based primarily on the rich materials afforded by the Carboniferous and Permian formations, from which our detailed knowledge of Palaeozoic plants has been chiefly derived.

In addition to the three classes, Equisetales, Lycopodiales and Filicales, under which recent Pteridophyta naturally group themselves, a fourth class, Sphenophyllales, has appeared in Palaeozoic times, clearly related to the Horsetails and more remotely to the Ferns and perhaps the Club-mosses, but with peculiarities of its own demanding an independent position. We further find that, whereas the Ferns of the present day form a well-defined and even isolated class, this was not the case at the time when the primary rocks were deposited. A great group of Palaeozoic fossils, showing evident affinity to Ferns, has proved to consist of seed-bearing plants allied to Gymnosperms, especially Cycads. This important class of plants will be described at the beginning of the Spermophyta under the name Pteridospermae. The arrangement which we shall adopt for the Pteridosperms is therefore as follows—

I. Equisetales. II. Sphenophyllales. III. Lycopodiales. IV. Filicales.

We must bear in mind that throughout the Palaeozoic period, and indeed far beyond it, vascular plants, so far as the existing evidence shows, were represented only by the Pteridosperms, Pteridopspermae and Gymnosperms. Although the history of the Angiosperms may probably go much further back than present records show, there is no reason to suppose that they were present, as such, amongst the Palaeozoic vegetation. Consequently, the Pteridosperms, Gymnosperms and their allies had the field to themselves, so far as regards the higher plants, and filled places in nature which have now for the most part been seized on by families of more modern origin. Hence it is not surprising to find that the early Vascular Cryptograms were, beyond comparison, more varied and more highly organized than their displaced and often degraded successors. It is among the fossils of the Palaeozoic rocks that we first learn the possibilities of Pteridophytic organization.

I. Equisetales.—This class, represented in the recent flora by the single genus Equisetum, with about twenty species, was one of the dominant groups of plants in Carboniferous times. The Calamariaceae, now known to have been the chief Palaeozoic representatives of the Horsetail stock, attained the dimensions of trees, reaching, according to Grand' Eury, a height of from 30 to 60 metres, and showed in all respects a higher and more varied organization than their recent successors.

Their remains occur in three principal forms of preservation. (1) Carbonaceous impressions of the leafy branches, the fructifications and other parts; (2) casts of the stem; these are usually considerably reduced in size, probably because of the organic tissues may be represented by a carbonaceous layer, on the outer surface of which the external features, such as the remains of leaves, can sometimes be traced. More usually, however, the leaves and fructifications and the collateral parts of the stem, roots, leaves and fructifications—showing the internal structure, more or less perfectly preserved. The correlation of these various parts with one another is never sufficiently clear; the leafy parts of wood, with its structure preserved, have sometimes been found, and have established their true relations. The position of the branches is shown both on casts and in petrified specimens, and has helped in their great distinction of which from Annularia and sometimes show enough of the external characters to allow of their correlation with impressions. Fructifications have often been found in connection with leafy shoots, and the anatomical structure of the axis in sterile and fertile specimens has proved a valuable means of identification.

In habit the Calamariaceae appear to have borne, on the whole, a resemblance to the modern Cryptograms, with short and not uncommonly dichotomously forked. Often evidence is there that, at least, of the Calamariaceae the leaves of each verticil were united at the base to form a sheath. The free lamina, however, was always considerably more developed in the Calamariaceae than in Cryptograms, the leafy shoots being considerably greater in size than in the corresponding parts of the modern allies. In a few cases, such as Equisetum, and perhaps others, the leafy shoots have been excessively branched, which may be interpreted as showing an enlarged and more highly developed secondary structure.

In all other respects, however, the Calamariaceae have been far less advanced than their modern successors. It is probable that many of the so-called secondary structures of the modern plants are of recent origin, and may be interpreted as representing the effects of mechanical pressure on the original structure, while the Calamariaceae, with their delicate and slender shoots and branches, may have simply been preserved in the act of growing. It is probable that the modern Cryptograms, so far as they are now represented, are the direct descendants of the Palaeozoic Calamariaceae, and that the evolution of the modern Cryptograms and the Calamariaceae has been one of a series of steps from poorly organized to highly developed structures. It is probable that the modern Cryptograms, so far as they are now represented, are the direct descendants of the Palaeozoic Calamariaceae, and that the evolution of the modern Cryptograms and the Calamariaceae has been one of a series of steps from poorly organized to highly developed structures.

(× 0½). B. Stamens more highly magnified; _e_, vascular bundle of filament; _f_, pollen-sac after dehiscence. (× 23) *After Raoul (Scott, "Studies").*
entirely of radial bands of tracheids interspersed with medullary rays. The pitting of the tracheids is more or less scalariform in character, and is limited to the radial walls. In favourable cases remains of the cambium are found, and phloem is also present in the normal position, but it does not seem to have attained any considerable thickness. In the old stems the primary cortex was replaced by periderm, giving rise to a thick mass of bark. In the specimen of Calamites from the stems of Calamites in the narrower sense (Arthropitys of the French authors), to which the specimens from the British Coal Measures mostly belong. Archaeoacalamites appears to have had a similar development of the bark, the specimen from the Lower Carboniferous of Burntisland, provisionally named Protocalamites pettorensis, centripetal wood was present in the stem. In Calamodendron (Upper Coal Measures) the wood has a more complex structure than in Calamites, the principal rays including masses of psychic tissue in addition to the usual parenchyma. Arthrodendron (Lower Coal Measures) approaches Calamodendron in this respect. The longitudinal course of the vascular bundles and their relation to the leaves in Calamariaceae generally followed the Equisetum type, though more variable and sometimes more complex. The attachment of the branches was immediately above the node, and usually between two foliar traces, as in the recent genus. Where the structure of the leaves is preserved it proves to be of an extremely simple type; the narrow lamina is traversed by a single vascular bundle, separated by a sheath from the surrounding palisade-parenchyma. Stomata of the same structure as in Equisetum have been detected in the epidermis. The roots (formerly described as a separate genus, Astromyelon) were borne directly on the nodes, not on short lateral branches as in Equisetum. They are at similar structure in all known Calamariaceae, the main roots having a large pith, while the rootlets had little or none. The structure is in all respects that typical of roots, as shown by the centripetal primary wood, and the alternation of xylem and phloem groups observable in exceptionally favourable young specimens. A striking feature is the presence of large, radiating intercellular cavities in the cortex, suggesting an aquatic habit. The young roots show a double endodermis, just as in the recent Equisetum.

A considerable number of Calamarian fructifications are known, preserved, some as carbonaceous impressions, others as petrified specimens, exhibiting the internal structure. In many cases the cones have been found in connexion with branches bearing characteristic Calamarian foliage. Almost all strobili of the Calamariaceae are constructed on the same general lines as those of Equisetum, with which some agree exactly; in most, however, the organization was very complex consisting in the insertion of whorls of sterile bracts, between those of the sporangiophores. In several cases heterophy, unknown among recent Equisetaceae, has been demonstrated in their Palaeeozoic representatives. Four main types of structure may be distinguished among Calamarian strobili.

1. Calamostachys, Schimper.

Angiosperms alternate regularly, with sterile bracts and one sporangiophore midway between the latter (fig. 2). The sporangiophores, which are usually half as numerous in each verticil as the bracts, have the same form as in Equisetum, but each bears four sporangia only. The spores are frequently found to be still united in tetrads. In some species, e.g. the British C. binneyana, numerous specimens have been examined and only one kind of spore observed; here, then, there is a strong presumption that the species was homosporous. In other cases, however, e.g. C. meander, Will., two kinds of spore occur, in different sporangia, but on the same strobilus and even on the same sporangiophore. The above description applies to the British and many in the megasporangium, have a diameter about three times that of the microsporangium. The abortion of certain spores, which is known to have taken place both in the homosporous C. binneyana and in the megasporangia of C. Casheona, may give some light on the origin of heterospory. The bracts were sometimes coherent in their lower part (e.g. C. binneyana), sometimes (e.g. C. Lindleyi) they formed a protection to the sterile whorl above. In some continental species (e.g. C. grandiflorus, C. hirsutus), radial membranous plates hung down from each verticil of bracts, forming compartments in which the subjacent sporangiophores were enclosed. The anatomy of the axis is essentially similar to that of a young Calamarian twig, with some variations in detail. Strobili of the Calamostachys type occur in connexion both with Eury, and Archoacalamites, Alstonia, and Protocalamites; they were inserted immediately above them, springing, as it were, from the axil of the sterile verticil (fig. 3, A). This singular arrangement has suggested doubts as to the correctness of the current interpretation of the equisetaceous sporangiophore as a modified leaf. In other respects the two genera agree; there is evidence for the occurrence of some strobili referred to Calamostachys. The anatomy of the axis is that of a young branch of a Calamite. According to Grand' Eury, the Calamostachys fructification was most commonly associated with Alstonia. These strobili the peltate scales, like the vegetative leaves of the plant, are in superposed verticils; each appears to have borne four sporangia (fig. 3, B). Other cones, however, namely, those known as Palaeostachya, have also been attributed to good ground as a Calamite genus. Equisetum Equisetaceae, though not strobiliferous, consist of intercalated bracts. It is probable that the succession of sterile sporangiophores was interrupted here and there by the intercalation of sterile bracts, which may also have been present, at long intervals, in Renult's species. Cones from the Middle Coal Measures, described by Kidston under the name of Palaeostachya hemmingwai, but probably belonging to one of the Calamariaceae, bear a striking external resemblance to those of a recent Equisetum.

2. Palaeostachya, Weiss. This form of strobilus, from the Coal Measures of Germany, is imperfectly known, and its relation to Calamariaceae is not certain. It is long strobili, which may be petaloid, but strap-shaped, were borne, as in C. E. Weiss first showed, immediately below the verticils of bracts, the position thus being the reverse of that in Palaeostachya.

The Palaeozoic Calamariaceae, though so far surpassing recent Equisetaceae, both in stature and complexity of organization, clearly belonged to the same class of Vascular Cryptograms. There is no satisfactory evidence for attributing Phanerogamic
affinities to any members of the group, and the view, of which Williamson was the chief advocate, that they form a homogeneous Cryptogamie family, is now fully established.

II. *Sphenophyllum.*—The class of *Sphenophyllum,* as known to us at present, is of limited extent, embracing the two genera *Sphenophyllum* and *Cheirostrobus,* which may serve as types of two families within the class. The characters of *Sphenophyllum* are known with some completeness, while our knowledge of *Cheirostrobus* is confined to the fructification; the former will therefore be described first.

1. *Sphenophyllum.*—The genus *Sphenophyllum,* of which a number of species have been described, ranging probably from the Middle Devonian, through the Carboniferous, to the Permian or even the Lower Triassic, consisted of herbaceous plants of moderate dimensions. The branchlets, which are somewhat branching, were ribbed, the ribs running continuously through the nodes, a fact correlated with the superposition of the whorled leaves, the number of which in each verticil was some multiple of 3, and usually 6. In the species on which the genus was founded the leaves, as the generic name implies, are cuneate and entire, or toothed on their anterior margin; in other cases they are deeply divided by dichotomy into narrow segments, or the whorl consists of a larger number (up to 30) of apparently simple, linear leaves, which may represent the segments of a smaller number. The different forms of leaf may occur on the same plant, the deeply divided foliage often characterizing the main stem, while the cuneate leaves were confined to the laterals. A comparison, formerly suggested, with the two forms of leaf in Batrachian Ranunculi has not proved to hold good; the idea of an aquatic habit is contradicted by the anatomical structure, and the hypothesis that the plants were water-dwelling is now rejected.

The species of *Sphenophyllum* have a graceful appearance, which has been compared with that of the trailing Calami of hedgerows. Branchlets spring from the nodes, though perhaps not truly axillary in position. The cones, more or less sharply differentiated, terminated certain of the branches.

The anatomy of the stem of *Sphenophyllum,* investigated by Renault, Williamson and others, is highly characteristic (fig. 5). The stem is traversed by a single xylem without pitch; the primary xylem is triangular in section, the spiral elements forming one or two groups at each angle, while the phloem occupied the sides, so that the structure resembles that of a triarch root. Two collateral bundles are developed in each angle of the stem, and forked, in passing through the cortex, to supply the veins of the leaf, or its subdivisions. The cortex is deeply furrowed on its outer surface. The primary structure is only found unaltered in the youngest stems; secondary growth by means of a cambium set in very early, xylem being formed internally and phloem externally in a perfectly normal manner. At the same time a deep-seated periderm arises by which the primary cortex was soon entirely cut off. The secondary wood in the Lower Carboniferous species, *S. speciosum,* has scalariform tracheids, and is traversed by regular medullary rays, but in the forms from later horizons the tracheids are reticulately pitted, and the rays are for the most part replaced by a network of xylem-parenchyma. There are no recent stems with a structure quite like that of *S. speciosum,* so far as the primary structure is concerned, the nearest approach is among the *Psilotaceae,* with which other characters indicate some affinity; these plants have also investigated the leaves; they were strongly constructed mechanically, and traversed by slender vascular bundles branching dichotomously.

Fructification.—Williamson thoroughly worked out, in petrified specimens, the organization of a cone which he named *Bowmanites Dawsoni.* It was subsequently demonstrated by him that this fructification belonged to *Sphenophyllum,* the cones of the well-known species *S. cuneiformis* having a practically identical structure. The type of fructification described by Williamson and now named *Sphenophyllum Dawsoni* resembles that of *Sphenophyllum,* but differs in external habit not unlike those of some Calamariae. The axis, which in structure resembles the vegetative stem in its primary condition, bears numerous verticils of bracts, those of each verticil being coherent in their lower part, so as to form a disc or cup, from the margin of which the free limbs of the bracts arise. The sporangium, which are about twice as numerous as the bracts, are seated singly on pedicels or sporangiophores springing from the upper surface of the bract-verticil, near its insertion on the axis (fig. 6). As a rule two sporangiophores belong to each bract. The sporangium is attached to the enlarged distal end of its pedicel, from which it hangs down, so as to suggest an anatropous ovule on its funiculus. Dehiscence appears to have taken place at the free end of the sporangium; the spores are numerous, and, so far as observed, of one kind only. Each sporangiophore is traversed throughout its length by a vascular bundle connected with that which supplies the subtending bract. This form of fructification appears, from Zeiller's researches, to have been common to several species of *Sphenophyllum,* but others show important differences. Thus *Bowmanites Romeri,* a fructification fully investigated by Solms-Laubach, differs from *S. Dawsoni* in the fact that each sporangiophore bears two sporangia, attached to a distal expansion approaching the peltate scale of the Equisetales. It is thus proved that the sporangiophore is not a mere sporangial stalk, but a distinct organ, in all probability representing a ventral lobe of the subtending bract. The recently discovered species, *Sphenophyllum* *speciosum,* while resembling *Bowmanites Romeri* in its peltate, bisporangiophores, is peculiar in the fact that both dorsal and ventral lobes of the sporophyll were fertile, dividing in a pinnate manner into several branches, each of which constitutes a sporangiophore. Thus the sterile bracts of other species are here replaced by sporangiophore-bearing organs. In *Sphenophyllum majus,* where the cones are less sharply defined, the forked bract bears 4, 5 or 6 sporangiophores, each of four sporangia at the bifurcations, but their mode of insertion has not yet been made out.

2. *Cheirostrobus.*—The family *Cheirostrobus* is only known from the petrified fructification (*Cheirostrobus petrovici*) derived from the Lower Carboniferous of Burntisland in Scotland. The excellence of the preservation of the specimens has rendered it possible to investigate the complete structure in detail. The cone of *Liocheiroinus* being 1.5 cm. in diameter; the stout axis bears numerous whorls of compound sporophylls, the members of successive verticils being superposed. The sporophylls, of which there are eleven or

---

1 In *S. speciosum* the leaves in a whorl were of unequal size.
PALAEOBOTANY

Calamarian fructification (fig. 7). The great length and slender proportions of the segments give the cone a peculiar character, but the relations of position appear to leave no doubt as to the homologies with the fructifications of the Sphenophyllales. In the sporangiophores, Bussemantien Römer occupies exactly the middle place between S. Dawsoni and Cheiroplectus. The axis of the cone in Cheiroplectus contains a polyarch stele, with solid wood, from the angles of which arise rhizophores, secondary xylem being supplied to the cortex, to supply the various segments of the sporophylls. In the peduncle of the strobilus secondary tissues are formed. While the anatomy has a somewhat Lycopodiaceous character, the appearance of the fructification is strongly Sphenophyllaceous; at the same time Calamarian affinities are indicated by the characters of the sporangiophores and sporangia.

The Sphenophyllales as a whole are best regarded as a synthetic group, containing certain characters of the Ferns and Lycopods with those of the Equisetales, while showing marked peculiarities of their own. Among existing plants their nearest affinities would appear to be with Psilotenia, as indicated not merely by the anatomy, but much more strongly by the way in which the sporangia are borne. There is good reason to believe that the ventral synangyum of the Psilotenia corresponds to the ventral sporangium of its group in the Sphenophyllales.

Professor Thomas of Auckland, New Zealand, has brought forward some interesting variations in Tmesipteris which appear to afford additional support to this view.

Pseudobornia.—Professor Nathorst has described a remarkable Devonian plant, Pseudobornia ursea (from Bear Island, in the Arctic Ocean), which shows affinity with the Lycopods and Sphenophyllales. The stem is articulated and branched, attaining a diameter of about 10 cm. The smaller branches bear the whorls of leaves, probably four in each verticil. The leaves are sometimes separate, and at other times occurring several leaves of the same deeply pinnaed, with five segments. When found detached these leaves were taken for the fronds of a Fern. The fructification consists of long, lax spikes, with whorled sporophylls, and indications of megsospores; but no detectable sporangia were found. The sporangia. The discoverer makes this plant the type of a new family, the Pseudoborniaceae. At present only the external characters are known.

III. Lycopodiaceae.—In Palaeozoic ages the Lycopods formed one of the dominant groups of plants, remarkable alike for the number of species and for the great stature which many of them attained. The best known of the Palaeozoic Lycopods were trees, reaching 100 ft. or more in height, but side by side with these gigantic representatives of the class, small herbaceous Club-mosses, resembling those of the present day, also occurred. Broadly speaking, the Palaeozoic Lycopods, whatever their dimensions, show a general agreement in habit and structure with our living forms, though often attaining a much higher grade of organization. We will first take the arborescent Lycopods, as in every respect the more important group. They may all be classed under the one family Lepidodendraceae, which is here taken to include Sigillaria.

Lepidodendraceae.—The genus Lepidodendron, with very numerous species, ranging from the Devonian to the Pennsian, consisted of large trees, with a tall upright thorny branches, clothed in leaves. It is clear that, in some cases the foliage is preserved intact; more often, however, especially in the main stem and larger branches, the leaves had been shed, leaving behind them their bases and leaf-scars, on which the characteristic sculpturing of the Lepidodendroid surface depends. The cones, often bearing large leaf-scar cushions, are often found on the smaller twigs, or, it is alleged, borne laterally on special branches of considerable dimensions. At its base the main stem terminated in dichotomous root systems or rhizophores, bearing numerous rootlets. To these underground organs the name Sigillaria is applied; these various elements being distinguished from the corresponding parts of Lepidodendron. The numerous described species of Lepidodendron are found on the peripheraries of the leaf-scars and, as shown on casts or impressions of the stem, the usually crowded leaf-cushions are spirally arranged, and present no obvious orthostichies, thus differing from those of Sigillaria. Each leaf-cushion is slightly prominent; towards its upper end is the diamond-shaped or triangular scar left by the fall of the actual leaf (fig. 8). On the scar are three prints, the central one alone representing the vascular bundle, while the lateral prints (parichnos) mark the position of merely parenchymatous strands. In the median line, immediately above the leaf-scar, is a print representing the ligule, or rather the pit in which it was seated. On the flanks of the cushion, below the scar, are two superficial prints, perhaps comparable to lenticels. In the genus Lepidodendron the leaf-cushions are more prominent than in Lepidodendron, and their greatest diameter is in the transverse direction; on the older stems the leaf-scar lies towards the lower side of the cushion. The genus Bothrodendron, going back to the Upper Devonian, differs from Lepidodendron in its minute leaf-scars and the absence of leaf-cushions, the scars being flush with the smooth surface of the stem. In the Lower Carboniferous of central Russia beds of coal occur consisting of the rutes of a Bothrodendron, which are not fossilized, but retain the consistency and chemical composition of similar tissues in recent plants.

The anatomy of Lepidodendron and its immediate allies is now well known in a number of species; the Carboniferous rocks of Great Britain are especially rich in petrified specimens, which formed the subject of Willomann's extensive investigations. The stem is in all cases monostelic; in most of the forms the central cylinder underwent secondary growth, and the distinction between primary and secondary wood is very sharply marked. In L. Hurcortii, however, the species earliest investigated (by Witham, 1833, and Bronniant, 1837), and in one or two other species, no secondary wood has yet been found. The primary wood of Lepidodendron forms a continuous cylinder, not broken up into distinct bundles; its development was clearly centripetal, the spiral elements forming more or less prominent peripheral groups. In the larger stems of most species there was a central pith, but in certain of the smaller branches, and throughout the stem in some species (L. rhodinum, L. selaginoides), the wood was solid. A single leaf-trace, usually collateral in structure, passed out into each leaf. The primary structure of the stem was thus of a simple type, resembling on a larger scale what we find in the upright stem of Selaginella sasnonis. In most species (e.g. L. selaginoides, L. Wunschianum, L. Veltheimianum) secondary growth in thickness took place, and secondary wood was added, the growth of the leaves in the centrifugal direction, showing a regular radial arrangement, with medullary rays between the series of tracheids (fig. 9). The tissue thus formed often attained a considerable thickness. While
primary phloem can be recognized with certainty in favourable cases, the question of the formation of secondary phloem by the cambium is not yet fully cleared up. In the Lepidodendron fuliginosum of Williamson, shown by its leaf-bases to have been a Lepidodendrales, the secondary wood consists of a megasporangium and consists largely of parenchyma. The same is the case in Lepidodendron obovatum, one of the few species in which both external and internal characters are known. The occurrence of secondary growth in these plants, demonstrated by Williamson, is a point of great interest. Some analogy among recent Lycopods is afforded by the stem of Isoetes, and by the base of the stem in Selaginella spinoa; in the fossils the process was of a more normal type, but some of its details need further investigation. The cortex, often sharply differentiated into sclerotic and parenchymatous zones, is bordered by the persistent leaf-bases. The development of periderm was a constant feature, and in this sense at least a phellogen, produced on the inner side of the formative layer, and no doubt subserving a mechanical function.

The structure of a Bothrodendron has recently been investigated and proves to be identical with that of the petrified stem which Williamson named Lepidodendron mundum. The anatomy is of the usual medullate Lepidodendroid type; no secondary growth has yet been detected in the stem.

The most interesting point in the structure of the leaf-base is the presence of a ligure, like that of Isoites or Selaginella, which was seated in a deep pit, opening on the upper surface of the cusps, just above the insertion of the leaf. The latter shows marked xerophytic adaptations; the single vascular bundle was surrounded by a sheath of short tracheids, and the stomata were sheltered in two deep furrows of the lower surface.

The cones of Lepidocarpon and Lepidostrobus are for the most part grouped under the name Lepidostrobus. These cones, varying from an inch or a foot in length, according to the species, were borne either on the ordinary twigs, or, as was conjectured, on the special branches (Lepidocarpon). The latter shows marked xerophytic adaptations; the single vascular bundle was surrounded by a sheath of short tracheids, and the stomata were sheltered in two deep furrows of the lower surface.

The upper sporangium contains numerous minute number of minute microspores; in each of the lower spores a very small number of sporangia four megasporangia are shown, which are attached to the inner wall, and are contained in an imma-

whether any homosporous Lepidostrobus existed, but there is reason to believe that here, as in the closely allied Lepidocarpon, sporangia and megasporangia were in some cases borne on different strobili. In other species (e.g. in the cone attributed to the Lower Carboniferous Lepidodendron Veltheimianum) the arrangement was that usual in Selaginella, the microsporangia and megasporangia being side by side in the same furrow (diagram, fig. 10). The genus Spencerites (Lower Coal Measures) differs from Lepido-

strubus mainly in the insertion of the sporangium, which, instead of being attached along the whole upper margin of the sporophyll, was connected with an outgrowth on its upper surface by a small neck of tissue towards the distal end. The spores of this genus are curiously winged, and intermediate in size between the micro-

sporangia and megasporangia of Lepidostrobus. The cones of Bothrodendron and another form named Mesostrobus are in some respects intermediate between Lepidostrobus and Spencerites. A more important devi-

ation from ordinary Lepidostrobus structure is shown by the genus Lepidocarpon, from the English Coal Measures and the Lower Carboniferous of Scotland. In this fructification the organization is at first altogether that of a Lepidodendron; in each megasporangium, however, only a single megasporangium came to maturity, occupying almost the whole of the strobilus by its development from a cavity (see fig. 12), but accompanied by the remains of its three abortive sister cells. As development grew up from the superior surface of the sporophyll, completing the development of the sporangium, except for a narrow crevice left open along the top. In favoured cases the prothallus is found preserved, within the functional megasporangium of the strobilus, known as the prothallus, or the prothallus, pr. Lepidocarpon affords a striking instance of homoplasty modific.

ation, for there is no doubt that the Lycopods were 2-0 on the line of descent of any existing Spermatophyta. In a male cone, probably belonging to Lepidocarpon, the microsporangia are provided with incomplete integuments.

Another case of a "seed-bearing" Lycopod has lately been discovered by Miss Benson in Menademia membranacea, a slender Selaginella-like plant from the Lower Coal Measures of New York (fig. 11). The megasporangium is enclosed in an integument, which completely envelopes it, leaving only a narrow micropyle at the distal end (fig. 13). The long tenacities of the integument may have served to facilitate pollination. The seed-like character of the organ is even more striking in Menademia than in Lepidocarpon. There seems to be no near affinity between these genera, in which the seed-habit must have arisen independently.

Sigillaria.—The great genus Sigillaria, the "species" of Lepido-

Lomaxii, Sporangium and sporophyll before deve-

erative, but has not yet been detected in earlier rocks. The Sigillariae, like the Lepidodendrales, were large trees, but must have differed from those of the previous group in habit, for they appear to have been sparingly or not at all, the leafy shoots, being large, formed some modern Xanthorrhoeae, in a great size, a, Lateral cushions on the sporophyll. Vascular bundle. B, Palisade layer of sporophyll. Xanthorrhoea, in a great size, a, Lateral cushions on the sporophyll. Vascular bundle. B, Palisade layer of sporophyll. Xanthorrhoea, in a great size, a, Lateral cushions on the sporophyll. Vascular bundle. B, Palisade layer of sporophyll.
In one great division of the genus—the Ensillariaceae—the stems are ribbed, each rib bearing a vertical row of leaf-scars; the ribbed Sigillariae were formerly divided into two sub-genera—*Rhyphoidepis*, *Sigillaria*.

2. Print of vascular bundle. 
3. Parichnos. 
4. Ligule. 

Ligulae are characteristic of the older Carboniferous strata, the Subsillariaceae of the Upper Coal Measures and Pennsylvanian. The leaf-scars throughout the genus show essentially the same prints as in Lepidodendron, differing only in details, and here also a ligule was present (Fig. 14). The anatomy of *Sigillaria* is not so well known as that of Lepidodendron, for specimens showing structure are comparatively rare, a fact which may be correlated with the infrequency of branching in the genus. The structure of a Clathrotrichia *Sigillaria* (S. Menardi), from the Permian of Autun, was accurately described by Brongniart as long ago as 1839, and a similar species, *S. spinulosa* (= S. Brardi) was investigated by Reinaud in 1875, but it was long before we had any trustworthy data for the anatomy of the ribbed forms. This gap in our knowledge has now been filled up, owing to Bertrand's investigation of a specimen referred by him to *S. elongata*, followed by the detailed researches of Kidston and Arber on Sigillariae, *Lepidodendron*, *Selaginellis*, etc. The structure of the ribbed Sigillariae, as at present known, essentially resembles that of a medullate *Lepidodendron*, though the ring of primary wood is narrower. Its outer margin is crenulated, the leaf-traces being given off from the middle of each of the secondary wood. Secondary wood was formed in abundance, precisely as in most species of *Lepidodendron*. In the Subsillariaceae species *S. Menardi* the primary wood is broken up into distinct bundles, while in *S. spinulosa* their separation is sometimes incomplete. The secondary cortex or periderm attained a great development, and in some cases shows considerable differentiation. On the whole, the anatomy of *Sigillaria* is closely related to that of the preceding group; and in fact a continuous series can be traced from the anatomically simplest species of *Lepidodendron* to the most modified *Sigillariae*. The leaves of *Sigillaria* are in some cases almost identical in structure with those of *Lepidodendron*, but in certain species (S. scutellata and *S. mamillaris*) there is evidence that they were of the *Sigillariopsis* type, the leaf being traversed by two parallel vascular strands, derived from the bifurcation of the leaf-trace.

The nature of the fructification of *Sigillaria* was first satisfactorily determined in 1854 by Zeller, who found the characteristic Sigillarian leaf-scars on the peduncles of certain large strobili (*Sigillaria*); these cones were shown by him to bear a strong general resemblance to *Lepidodendron*, differing somewhat in the form of the sporophylls and some other details. The megaspores (reaching 2 mm. in more diam) were found on the sporophylls by Zeller; the sporangia containing them were first observed by Kidston, in a species from the Coal Measures of Yorkshire. That the cones were heterosporous there can be no doubt, though little is known of the microsporangia. The structure of *Sigillaria* is closely related to that of the *Subsillariaceae* as well as of the ribbed species, has finally determined the question of the affinities of the genus, once keenly discussed; *Sigillaria* is now clearly proved to have been a genus of heterosporous Lycopsids, with the closest affinities to *Lepidodendron*.

*Stigmaria*.—On present evidence there is no satisfactory distinction to be drawn between the subterranean organs of *Sigillaria* and those of *Lepidodendron* and its immediate allies, though some progress in the identification of special forms of *Stigmaria* has recently been made. These organs, to which the name *Stigmaria* was given by Brongniart, have been found in connexion with the upright stems both of *Sigillaria* and *Lepidodendron*. In the Coal Measures they commonly occur in the underclay beneath the coal-seams. Complete specimens of the stumps show that from the base of the aerial stem four Stigmatic branches were developed, which took a horizontal off, which had a horizontal rootlet, and may be compared to the processes of *Lepidodendron* working at least twice. These main Stigmatic axes may be 2 to 3 ft. in diameter at the base, and 30 or 40 ft. in length. Their surface is studded with the characteristic scars of their appendages or trichlets, which radiated outwards, though the Stigmatic specimens of the main *Stigmaria* are frequent, and those of its rootlets extraordinarily abundant. The two parts are very different in structure: in the main axis, as shown in the common Coal Measure forms (Stigmaria brodiei), the centre was occupied by the birth, which was surrounded by a zone of wood, centrifugally developed throughout. In other species, however, the centripetal primary xylem is represented. Phloem, surrounding the wood, develops in a more or less circular manner; in mature specimens, the external circle is the great development of periderm. The rootlets, which by dichotomy, contain a slender monarch stele exactly like that in the roots of *Isoetes* and some *Selaginella* at the present day; and, however, a cylindrical stele surrounded by layers of lateral strands of xylem, connecting the stele with branchial plates in the outer cortex. The morphology of *Stigmaria* has been much discussed; possibly the main axes, which do not agree perfectly either with rhizomes or roots, may best be regarded as comparable with the rhizophores of *Selaginella*; they have also been compared with the embryonic stem, or protocorm, of certain species of *Lycopodium*; the homologies of the appendages with the leaves of Lycopsids *Selaginella* is a problem solved by some palaeobotanists that the aerial stems of *Sigillaria* arose as buds on a creeping rhizome, but the evidence for this conclusion is not yet convincingly laid.

*Lycopodietaceae*.—Under this name is included the fossil Lycopsids of herbaceous habit, which occur occasionally, from the Devonian onwards. One such plant, *Miadesmia*, has already been referred to in a preceding Lycopsid. In some Lycopodiaceae the leaves were all of one kind, while others were heterophyllous, like most species of *Selaginella*. The genus *Selaginilittes*, Zeller, is now used to include those forms in which the fructification has proved to be heterosporous. In *Selaginilittes zaimri* there was a definite strobili bearing both micro- and macrosporous cones, each of the latter from 16 to 24 megasporas were contained; in *Selaginilittes primus*, however, the number of megasporas was only 4, and the strobili were unbranched. *Selaginilittes elongatus*, another heterosporous species, is remarkable for having no differentiated strobili, a condition not known in the recent genus. The antiquity of the *Selaginella* type indicates that this great group of Lycopsids arose in connexion with the Lepidodendraeaceae, but sprang from a distinct and evidently ancient herbaceous stock. There is, however, some evidence that *Isoetes*, which in several respects agrees more nearly with the *Lepidodendraeaceae*, may actually be referred to their last and most general type (§ 11, Mesozoic). No homosporous Lycopodiaceae have as yet been recognized.

IV. Filicines.—Of all the Vascular Cryptogams the Ferns have been maintained their position down to the present day. Until recently it has been supposed that the class was well represented in the Palaeozoic period, and, indeed, that it was relatively, and perhaps absolutely far richer in species than in the recent flora. Within the last few years, however, the position has completely changed, and the majority of the supposed Palaeozoic
Ferns are now commonly regarded as more probably seed-bearing plants, a conclusion for which, in certain cases, there is already convincing evidence. The great majority of specimens of fossil fern-like plants are preserved in the form of carbonaceous impressions of fronds, often of remarkable perfection and beauty. The characters shown by such specimens, however, when, as is usually the case, they are in the barren state, are notoriously unstable, or of small taxonomic value, among recent plants. Hence palaeobotanists have found it necessary to adopt a purely artificial system of classification, based on form and venation of the frond, in the absence of adequate data for a more natural grouping. The two form-genera Pecopteris, Sphenopteris, Odontopteris, &c., are of this provisional nature. The majority of these fronds have now fallen under suspicion and can no longer be accepted as those of Ferns; the indications often point to their having belonged to fern-like Spermophyta, as will be shown below.

It has thus become very difficult to decide what Palaeozoic plants should still be referred to the Filices. The fructifications by themselves are not necessarily decisive, for in certain cases the supposed sporangia of Marattiacous Ferns have turned out to be in reality the microporangia or pollen-sacs of seed-bearing plants (Pteridosperms). It is, however, probable that a considerable group of the Ferns, which existed in Palaeozoic times, side by side with simpler forms. In one respect the fronds of many Palaeozoic Ferns and Pteridosperms were peculiar, namely, in the presence on their rachises, and at the base of their pinnae, of anomalous leaflets, often totally different in form and venation from the ordinary pinnules. These curious appendages (Aphlebiae), at first regarded as parasitic growths, have been compared with the feather outgrowths which occur on the rachis in the Cyatheaceous genus Hemipteris, and with the anomalous pinnules found in certain species of Gleichenia, at the points of bifurcation of the frond.

Marattiaceae.—A considerable number of the Palaeozoic fern-like plants fall under the more decisive of Marattiacous affinities; some account of this group will first be given. The reference of these ferns to the family Marattiaceae, so restricted in the recent flora, rests, of course, primarily on evidence drawn from the fructifications. Typically Marattiacous sori, consisting of exannulate sporangia united to form synangia, are frequent, and are almost always found on fronds with the character of Pecopteris, large, repeatedly pinnate leaves, resembling those of Cyatheaceae or some species of Nephroidium. In certain cases the anatomical structure of these leaves is known, and found to agree generally with that of recent coriaceous fern-fronds. The petiole was usually traversed by a single anastomosing stele, bipinnate in form, and of difference of form from the more complex petioles of recent Marattiaceae. There is evidence that in many cases these Pecopteroid fronds belonged to arborescent plants, the stems of which, thrown beyond the height of as much as 60 ft. These stems, known as Megaphyton, were a form of polystichous arrangement, are frequent, especially in the Permian of the Continent; when petrified, so that their internal structure is preserved, the name Psaronius is employed. The structure is often a complex one, the central region containing an elaborate system of numerous anastomosing steles, accompanied by sclerenchyma; the cortex is permeated or coated by a multitude of adventitious roots, forming a thick envelope to the stem. The whole structure bears a general resemblance to that of recent Marattiaceae, though differing in detail. We will now describe some of the fructifications, which are included under the generic name of Pecopteris, since, if having a more natural basis, tend to supersede the artificial groups founded on vegetative characters. The genus Asterotheca includes a number of Ferns, chiefly of Coal Measure age, with fronds of the Pecopteris type. The sori, or sporangia, ranged in two series on the under-side of the fertile pinnules, are circular, each consisting of 3 to 6 sporangia, attached to a central receptacle and partly united to each other (fig. 15, A); the sporangia are single, and show no evidence of the annulus. In Hutesia (fig. 15, H), characterized by the separation of the sporangia, may only represent an advanced stage of an Asterotheca. In Psychocarpus the fusion of the Synangium formation within the Synangium has been complete; but Sclerotheca resembles Asterotheca, but each sporangium is stalked. In all these genera there is an obvious similarity to the synangium of Kidstonia, while in some respects Marattia or Danaea is suggested. In the frond of the Pecopteroid genus, the synangium resembles those of Asterotheca, but each sporangium is provided with a band of enlarged cells of the nature of an annulus (fig. 15, D). As a similar differentiation, though less marked, appears in the recent genus Angiopteris, the presumption is in favour of the Marattiacous affinities of Sturtiella, which also shows some relation to the genus Coryneopteris (see below, Botryopteridaceae). In the genus Danaea, from the Coal Measures of the Saar, the synangia are much like those of the recent Danaea, each sporangium opening by an apical pore. In the Grand Eury of Sturr the sporangia appear to have been free from each other, as in Angiopteris. On the whole there is that good evidence for the frequency of Marattiacous in the Palaeozoic period, though the possibility that the fructifications may really represent the microsporangia of fern-like spermophytes must always be borne in mind. In a certain number of genera there the reference to Marattiacous is much more doubtful. In Dactylotyloca, for example (fig. 15, C), a Pecopteroid

(After various authors. Scott, Studlies.)
