organism is susceptible to, and can respond to, the action of external conditions. There is every reason to believe that plants are as "irritable" to varying external conditions as they are to light or to gravity. A change in its external conditions may act as a "stimulus," evoking in the organism a response of the nature of a change in its form. As Darwin has pointed out, this response may be direct or indirect. In illustration of the indirect response, the evolution of the Bryophyta and of more highly organized plants may be briefly considered. It is generally admitted that life originated in water, and that the earliest plants were Algae. The study of existing Algae, that is of plants that have continued to live in water, shows that under these conditions no high degree of organization has been reached, although some of them have attained gigantic dimensions. The primitive water-plants were succeeded by land-plants, a land-flora being gradually established. With the transition from water to land came the progressive development of the sporophyte which is the characteristic feature of the morphology of the Bryophyta and of all plants above them in the scale of life (see Bower, Origin of a Land-Flora). This evolution of the sporophyte is no doubt to be correlated with the great change in the external conditions of life. There is no conclusive ground for regarding the action of this change as having been direct, it is more reasonable to regard it as indirect, having acted as a general stimulus to which the ever-increasing complexity of the sporophyte was the response.

Adaptation.—The morphological and physiological differentiation of the plant-body has, so far, been attributed to (1) "the nature of the organism," that is to its inherent tendency towards higher organization, and (2) to the "indirect results" of the external conditions: acting as a stimulus which excites the organism to variation, but does not direct the course of variation. The "definite results" of the action of external conditions have still to be considered.

It is a familiar observation that climatic and edaphic (nature of soil) conditions exert an influence upon the form and structure of plants (see Plants: Ecology of). For instance, some xerophytes are dry and hard in structure, whilst others are succulent and fleshy. This so-called direct effect of external conditions upon the form and structure of the body differs from the indirect effect in that the resulting variations bear a relation, of the nature of adaptation, to those conditions; the effect of the condition is to cause variation to occur, but to cause variation in a particular direction. Thus all existing xerophytes (excepting the Algae) are considered to have been derived from land-plants which have adapted themselves to a watery habitat. The effect can also be demonstrated experimentally: thus it has been observed that a xerophyte grown in moist air will lose its characteristic adaptive features, and may even assume those of a hygrophyte.

Climatic and edaphic conditions are not, however, the only ones to affect the structure and composition of the body or its parts; other conditions are of importance, particularly the relations of the plant to animals and to other plants. For instance, the "normal stage" of carnivorous plants (Drosera, Nepenthes, &c.) did not, presumably, arise as an adaptation to the insects, which began as organs of quite another kind which became adapted to their present function in consequence of having been accidentally caught. It is also probable that the various forms of the angiospermous flower, with its many specialized mechanisms for pollination, may be the result of insect-visits, the flowers becoming adapted to certain kinds of insects, and the insects having undergone corresponding modification. Parasites, again, were derived from normal autotrophic plants, which, as the parasitic habit became more pronounced, acquired the corresponding characteristics of form and structure; there is, in fact, the group of hemi-parasites, plants which still retain autotrophic characters though they are root-parasites.

Though adaptation to the environment seems sometimes to be considered, especially by neo-Lamarckians, as equivalent to, or at least as involving, the evolution of higher forms from lower, there does not appear to be any evidence that this is the case. The effect of external conditions is confined to the modification in various directions of members or organs already existing, and one very common direction is that of reduction or entire disappearance of parts: for instance, the foliage-leaves of certain xerophytes (e.g. Cactaceae, Euphorbiaceae), of parasites, and of saprophytes. Moreover, had the evolution of plants proceeded along the line of adaptation, the vegetable kingdom could not be subdivided, as it is, into the morphological groups Thallophyta, Bryophyta, Pteridophyta, Phanerogama, but only into physiological groups, Xerophyta, Hygrophyta, Tropophyta, &c.

In endeavouring to trace the causation of adaptation, it is obvious that it must be due quite as much to properties inherent in the plant as to the action of external conditions; the plant must possess adaptive capacity. In other words, the plant must be irritable to the stimulus exerted from without, and be capable of responding to it by changes of form and structure. Thus there is no essential difference between the "direct" and the "indirect" action of external conditions, the difference is one of degree only. In the one case the stimulus induces indefinite variation, in the other definite; but no hard-and-fast line can be drawn between them.

Adaptive characters are often hereditary, for instance, the seed of a parasite will produce a parasite, and the same is true of a carnivorous plant. On the other hand, adaptations, especially those evoked by climatic or edaphic conditions, may only be shown by the seedling if grown under the appropriate external conditions; here what is hereditary is not the actual adaptation, but the capacity for responding in a particular way to a certain set of external conditions.

Summary.—The general theory of differentiation propounded in this article is an attempt at an analysis of the factors termed by Darwin "the nature of the organism" and "the nature of the conditions." It is assumed, as an inevitable conclusion from the facts of evolution, that plant-protoplast possesses (1) an inherent tendency towards higher organization, and (2) that it is irritable to external conditions, or to changes in them, and can respond to them by changes of form which may be either indefinite or definite (adaptive). Thus it is that the variations are produced upon which natural selection has to work.

Material Cause of Differentiation.—It may be inquired, in conclusion, if there are any facts which throw light upon the internal mechanism of differentiation, whether spontaneous or induced; if it is possible to refer it to any material cause. It may be replied that there are such facts, and though they are but few as yet, they suffice to suggest an hypothesis that may eventually prove to be a law. Sachs was the first to formulate the theory that morphological differences are the expression of differences in material composition. He considered, for instance, that stems, leaves, roots and flowers differ as they do because the plastic substances entering into their structure are diverse. This view he subsequently modified to this—that a relatively small proportion of diverse substance in each of these parts would suffice to account for their morphological differences. This modification is important, because it transfers the formative influence to the enzymes, the material being inorganic. This hypothesis that the diverse constituents are produced (whether spontaneous or as the result of stimulation) as secretions by the protoplasm. It is an obvious inference that if a small quantity of a substance can affect the development of an entire organ it probably acts after the manner of an enzyme. Beyerinck has, in fact, gone so far as to speak of "formative enzymes."

It is not possible to go into all the facts that might be adduced in support of this view: one case, perhaps the most pregnant, must suffice. Beyerinck was led to take up the decided position just mentioned by his researches into the conditions determining the formation of plant-galls as the result of injury by insects. He found that the development of a gall is due to temporary modification of the substance, not necessarily thought, in consequence of the deposition of an egg by the insect, but of the injection of a poisonous substance which has the effect of stimulating the protoplasm to develop a gall instead of normal
structure. If this be so, it may justifiably be inferred that both normal and abnormal morphological features may be due to the presence of enzymatic substances secreted by the protoplasm that determine the course of development. At any rate this hypothesis suggests an explanation of many hitherto inexplicable facts. For instance, it has been pointed out in the article on the reproduction of plants that the effect of the fertilization of the female cell in the ovule of a phanerogem is not confined to the female cell, but extends more or less widely outside it, inducing growth and tissue-change. The ovule develops into the seed; and the gynaeceum and even more remote parts of the flower, develop into the fruit. The facts are familiar, but there is no means of explaining them. In the light of Sach's theory the interpretation is this, that the act of fertilization causes the formation in the female cell of substances which are transmitted to adjacent structures and stimulate them to further development.

**LITERATURE.**—As the scope of this article limits it to the general principles of the morphology of plants, comparatively few facts have been adduced. Full morphological and organographical details are given in the articles on the various groups of plants, such as the Algae, Bryophyta, Pteridophyta, Angiosperms, Gymnosperms, &c. The following works also bear on the subject: Schimper, Plant-Geography (Clarendon Press, Oxford); Goebel, Organography (Clarendon Press, Oxford); Bower, The Origin of a Land-Floora (Macmillan); Beyerinck, "Ueber Cellkern," Bot. Zeitung, 1888.

**DISTRIBUTION OF PLANTS**

Common experience shows that temperature is the most important condition which controls the distribution of plants. Those of warmer countries cannot be cultivated in British gardens without protection from the rigours of winter; still less are they able to hold their own outside in an unfavourable climate. Temperature, then, is the fundamental limit which nature opposes to the indefinite extension of any one species. Buffon remarked "that the same temperature might have been expected, all other circumstances being equal, to produce the same beings in different parts of the globe, both in the animal and vegetable kingdoms." Yet lawns in the United States are destitute of the common English daisy, the wild hyacinth of the woods of the United Kingdom is absent from Germany, and the foxglove from Switzerland. We owe to Buffon the recognition of the limitation of groups of species to regions separated from each other by natural barriers. If by natural barriers man he surmount these, they often dominate with unexpected vigour the native vegetation amongst which they are colonists. The curdweed and milk thistle, both European plants, cover tracts of country in South America with impenetrable thickets in which both man and beast may be hopelessly lost. The watercress blocks the rivers of New Zealand into which it has been introduced from Europe. The problem, then, which plant-distribution presents is twofold: it has first to map out the earth's surface into "regions" or "areas of vegetation," and secondly to trace the causes which have brought them about and led to their restriction and to their mutual relations.

The earliest attempt to deal with the first branch of the inquiry may be called physiognomical. They endeavoured to define "aspects of vegetation" in which the "forms" exhibited an obvious adaptation to their climatic surroundings. This has been done with success and in great detail by Grisebach, whose Vegetation der Erde from this point of view is still unsurpassed. With it may be studied Advantage the unique collection at Kew of pictures of plant-life in its broadest aspects, brought together by the industry and munificence of Miss Marianne North. Grisebach declined to see anything in such "forms" but the production by nature of that which responds to external conditions and can only exist as long as they remain unchanged. We may agree with him, but there is a point of view is obsolete without rejecting as valueless the admirable accumulation of data of which it admittedly fails to give any rational explanation. A single example will be sufficient to illustrate this. The genus Senecio, with some 1000 species, is practically cosmopolitan. In external habit these exhibit adaptations to every kind of climatic or physical condition: they may be mere weeds like groundsel or ragworts, or climbers masquerading like ivy, or succulent and almost leafless, or they may be shrubs and even trees. Yet throughout they agree in the essential structure of their floral organs. The cause of such agreement is, according to Grisebach, shrouded in the deepest obscurity, but it finds its obvious and complete explanation in the descent from a common ancestor which he would unhesitatingly reject.

From this point of view it is not sufficient, in attempting to map out the earth's surface into "regions of vegetation," to have regard alone to adaptations to physical conditions. We are compelled to take into account the actual affinity of the plants inhabiting them. Anything short of this is merely descriptive and empirical, and affords no rational basis for inquiry into the mode in which the distribution of plant-life has been brought about. Our regions will not be "natural" unless they mark out real discontinuities both of origin and affinity, and these we can only seek to explain by reference to past changes in the earth's history. We arrive thus at the "essential aim of geographical botany," which, as stated by Schimper, is "an inquiry into the causes of differences existing among the various floras." To quote further: "Existing floras exhibit only one moment in the history of the earth's vegetation. A transformation which is sometimes rapid, sometimes slow, but always continuous, is wrought by the reciprocal action of the innate variability of plants and of the variability of the external factors. This change is due partly to the migrations of plants, but chiefly to a transformation of the plants covering the earth. This transformation is due to new characters arising through variation. If the new characters be useful, they are selected and perfected in the descendants, and constitute the so-called 'adaptations' in which the external factors acting on the plants are reflected." The study of the nature of these adaptations, which are often extremely subtle and by no means merely superficial, is termed Ecology (see above).

The remark may conveniently find its place here that plants which have reached a high degree of adaptive specialization have come to the end of their tether: a too complicated adjustment has deprived them of the elasticity which would enable them to adapt themselves to any further change in their surroundings, and they would pass away with conditions with which they are hopelessly bound. Vast floras have developed, thus found their grave in geologic change. That brought by man in destroying forests and cultivating the land will be no less effective, and already specimens in our herbaria alone represent species no longer to be found in a living state. Extinction may come about indirectly and even more surely. This is easy to happen with plants dependent on insects for their fertilization. Kronfeld has shown that aconites are dependent for this on the visits of a Bombus and cannot exist outside the area where it occurs.

The actual and past distribution of plants must obviously be controlled by the facts of physical geography. It is concerned with the land-surface, and this is more symmetrically disposed than would at first sight appear from a glance at a map of the world. Lyell points out that the eye of an observer placed above a point between Pembroke and Wexford, lat. 52° N. and long. 6° W., would behold at one view the greatest possible quantity of land, while the opposite hemisphere would contain the greatest quantity of water. The continental area is on one side of the sphere and the oceanic on the other. Love has shown (Nature, Aug. 1, 1907, p. 328) that this is the result of physical causes and that the existence of the Pacific Ocean "shows that the centre of gravity of the earth does not coincide with the centre of figure." One half of the earth has therefore a greater density than the other. But "under the influence of the rotation the parts of greater density tend to recede further from the axis than the parts of less density . . . the effect must be to produce a sort of furrowed surface." The furrows are the great ocean basins, and these would still persist even if the land surface were enlarged to the 1,400 fathoms contour. These considerations
preclude the possibility of solving difficulties in geographical distribution by the construction of hypothetical land-surfaces, an expedient which Darwin always stoutly opposed (Life and Letters, ii. 74–78). The furrowed surface of the earth gives the land-area a star-shaped figure, which may from time to time have varied in outline, but in the main has been permanent. It is eccentric as regards the pole and sends tapering extensions towards the south. Sir George Darwin finds a possible explanation of these in the screwing motion which the earth would suffer in its plastic state. The polar regions travelled a little from west to east relatively to the equatorial, which lagged behind.

The great primary divisions of the earth’s flora present themselves at a glance. The tropics of Cancer and Capricorn cut off with surprising precision (the latter somewhat less so) the tropical zone from the north and south temperate zones. The north temperate region is more sharply separated from the other two than the south temperate region from the tropical.

I. NORTH TEMPERATE REGION (Iliolaric.)—This is the largest of all, circumglobal, and but for the break at Bering Straits, would be, as it has been in the past, continuous in both the old and new worlds. It is characterized by needle-leaved Coniferae, its catkin-bearing (Amentaceae) and other trees, deciduous in winter, and its profusion of herbaceous species.

II. SOUTH TEMPERATE REGION.—This occupies widely separated areas in South Africa, South America, New Zealand and South Australia. These are connected by the presence of peculiar types, Proteaceae, Restiaceae, Rutaceae, &c., mostly shrubby in habit and on the whole somewhat intolerant of a moist climate. Individual species are exceptionally important as determiners of climatic conditions in area.

III. TROPICAL REGION.—This is characterized by the presence of giant Monocotyledons, palms, Musaceae and bamboos, and of evergreen leaf-petioles, fruits and trees. Herbaceous plants are rare and mostly ephemeral.

A consideration of these regions makes it apparent that they are to a large extent adaptive. The boreal is cold, the austral warm, and the temperate zone has developed as a whole in needle-leaved Coniferae, which is of great importance. In its sequel the vegetation of the others would be intolerant. If we take with Drude the number of known families of flowering plants at 240, 92 are generally dispersed, 17 are more restricted, while the remainder are either restricted to polar regions or to separate regions. Of these the boreal, 22 austral and 69 tropical. If we add to the latter the families which are widely dispersed, we find that the tropics possess 161 or almost exactly two-thirds of the large groups comprised in the world’s vegetation.

M. Casimir de Candolle has made an independent investigation, based on Hooker and Bentham’s Genera plantarum. The result is unfortunately (1910) unpublished, but he informs the present writer that the result leads to the striking conclusion, that it is unceasing with the added detail, ‘‘quand nous ne voyons plus que reste affaiblis dans nos regions tempe-rées. In attempting to account for the distribution of existing vegetation, we must take into account palaeontological evidence. The results arrived at may be read as a sequel to the article on Palaeobotany.

The vegetation of the Palaeozoic era, till towards its close, was apparently remarkably homogeneous all over the world. It was characterized by arborecent vascular Cryptogams and Gymnosperms of a type (Cordaitae) which have left no descendants beyond it. In the southern hemisphere the Palaeozoic flora appears ultimately to have been profoundly modified by a lowering of temperature and the existence of glacial conditions over a wide area. It was replaced by the Glossopteris flora which is assumed to have originated in a vast continental area (Gondwanaland), of which remnants remain in South Africa, South America and Antarctica.

The Glossopteris flora gradually spread to the northern hemisphere and intermingled with the later Palaeozoic flora which still persisted. Both groups were replaced by the Lower Mesozoic flora, which again is thought to have had its birth in Gondwanaland, and in which Gymnosperms played the leading part taken formerly by vascular Cryptogams. The abundance of Cycadean plants is one of the outstanding features. They attained the highest degree of structural complexity in the Jurassic and Cretaceous, for which the idea although somewhat thought out in a more typical floral organization. Though now on the way to extinction, Cycadeae are still widely represented in the southern hemisphere, and Ganarea, which have a counterpart in the Mesozoic era. Amongst Conifers the archaic genera, and Araucaria still persist. Once widely distributed in the Jurassic period throughout the world, they are now dying out; the former is restricted to New Zealand, the latter by some ten species confined to the southern hemisphere, once perhaps their original home. With them may be associated the anomalous Sciadophyta of Japan.

So far the evolution of the vegetable kingdom has proceeded without any conspicuous break. Successive types have arisen in ascending sequence, taken the lead, and in turn given way to others. But the later period of the Mesozoic era saw the almost sudden advent of a fully developed angiospermous vegetation which rapidly occupied the earth’s surface, and which it is not easy to link with the earlier flora. The transition owed much to the continued modification which is profoundly different, and which was probably correlated with a simultaneous development of insect life. This was accompanied by a vegetative organization of which there is no obvious precedent in the fossil record. The angiospermous vegetation, which such seem to characterize some of the older periods, have ceased to be, and plants are distributed more markedly according to geographical provinces or other zones. The field of evolution has now been transferred to the mesophyllous phase. Many Angiosperms become dominant in all known plant-bearing Upper Cretaceous deposits, their origin dates even earlier. In Europe many Palaeozoic genera such as the Lycopodiaceae (in the Lycopodium and Lophocarpus, the first of which was long accepted as the oldest dicotyledonous plant. Other Angiosperms, such as Diotyledons, though of uncertain affinities, as many of the older genera, have now been detected in North America. The Cenomanian rocks of Florida are rich in representatives of all the angiospermous orders. Each has been compared with that existing at present in Australia. Upper Cretaceous formations in America have yielded a copious flora of a warm-temperate climate from which it is evident that at least the generic types of numerous not closely related existing dicotyledons trees had already come into existence. It may be admitted that the identification of fragmentary leaf-reminiscent is almost precarious. Even, however, with this reservation, it is difficult to resist the mass of evidence that there has been a vast increase in the diversity of vegetation of the globe had already in its main features been constituted at this period much as it exists at the present moment. These include trees, beeches (scarcely distinguishable from existing species), birches (the oldest known), and Fagus, Tulipan and Eucommia, which, thinned out by losses, practically exists to this day in the mesophyllous phase, in area. It is one essentially similar but adapted to slightly cooler conditions as far north as the latitude of Greenland.

The tertiary era opens with a climate in which during the Eocene period something like existing tropical conditions must have obtained in the northern hemisphere. The remains of palms (Sabal and Nipa) as well as of other large-leaved Monocotyledons are preserved. The constant and wide distribution of the Lycopsids (Lepidodendron, Sigillaria and Lepidomitrium) and the deciduous cypress (Taxodium distichum) are found in Europe. Starkie Gardner has argued with much plausibility that the Tertiary flora which have been found in the far north must have been Eocene, and that the Miocene flora of Europe and that of Coniferae (including the living spruce, poplars and willows, such as would be found now 25° to 30° south. The flora of the islands of lat. 70° contained Sequoia, pines, maples and magnolias, and closely agrees with the Miocene flora of central Europe. Of this copious remains have been found in Switzerland and have been investigated with great ability by O. Heer. They point to a climate cools still remaining, and the vegetation of the northern hemisphere: palms and tropical types disappear. The Tertiary flora of Australia and New Zealand, representing the Miocene, is fully tropical and limit of Miocene types, ultimately leaving the flora pretty much as it now exists. This, as will be explained, did not take place to anything like the same extent in North America, the vegetation of which still preserved in the Miocene flora, and that of the United States, and the flora of America and Japan, still lingered, as did Oceana, now profusely developed in the tropics, but in temperate regions only existing in the Canaries: the evergreen oaks, so characteristic of the Miocene, are still represented, while the flora of the United States, and of the European flora was apparently little different from that now existing, though some warmer types such as the water-fruit (Tropa natala) had a more northern extension. The glaciation and effects of the Pleistocene have continued the present temperate types accompanied by a southern extension of the arctic flora. But its operation was in general measure. The Miocene flora found refugees in favoured localities from which it at close, the result was a mere restriction and later a renewal of its extension on the mountains. During the milder interglacial period some southern types, such as Rhododendron ponticum, still held their own, but were gradually extinguished. The evidence which has thus been briefly summarized, points unmistakably to the conclusion that existing vegetation originated in the northern hemisphere and under climatic conditions corresponding to what would now be termed sub-tropical. To occupy a continuous circumpolar area which allowed free communication between the old and new worlds. The gradual differentiation of their flora.
has been brought about rather by extermination than specialization, and their distinctive facies by the development and multiplication of new and stronger types.

The distribution of mountain barriers in the Old and New Worlds is in striking contrast. In the former they run from east to west; in the latter from north to south. In the Old World the boreal zone is divided from the tropical by mountainous barriers, and in these fossil records of escape for the Miocene vegetation when the climate became more severe. Thus in the Mediterranean region the large groups of palms, figs, myrtles and other species are separated by single surviving species. The great tropical family of the Guttiferae is, however, left there, and in the New World it becomes tropical in South America and Malaya. If we turn to herbaceous plants, Hemsley has pointed out that of the thirteen genera found in New Zealand and Australia only one, Ranunculus, occurs there in the Old World, and then only in the extreme north.

While the tropics preserve for us what remains of the pre-Tertiary or, at the latest, Eocene vegetation of the earth, which formerly had a much wider extension, the flora of the North Temperate Region is often described as the fossil of the Miocene flora. Engler therefore calls it Arcto-Tertiary. We must, however, agree with Starkie Gardner that it is only Miocene as regards its present position, which was originally farther north, and that its actual origin was much earlier. There has been in effect a successive shifting of zones of vegetation southwards from the pole. Their distinctive and adaptive characteristics doubtless began to be established as soon as the phanerogamic flora was constituted. Thereupon each set of the modern flora of the Old World must be regarded as a fossil of ancient vegetation which has come back to the surface from subterranean depths or has been re-established in a colder climate. Thus the vegetation of New Zealand is a fossil of the pleistocene and may be regarded as an attempt to bring the paleotropical flora back to the surface. We can see it in a very typical species such as Myrtus communis, which is characteristic of the chamaephyte vegetation of the Mediterranean region, and which has now been re-established in the New Zealand flora. The same is true of the floras of the Faroe Islands, which have been recovering from subterranean depths.

The primary regions of vegetation, already indicated, and their subordinate provinces may now be considered in more detail.

1. NORTH TEMPERATE REGION.—Many writers on the distribution of animals prefer to separate this into two regions of "primary rank" that stand by themselves: the Palaearctic and the Nearctic. This is not quite satisfactory, for it is necessary to establish either an exclusive possession or a marked predominance of types in the one which are correspondingly deficient in the other. This cannot apparently be done for birds; Newton accordingly unites the two into the Holartic region. It equally fails for plants. To take, for example, one of the most characteristic features of the Palaearctic region, its catkin-bearing deciduous trees: in North America we find precisely the same genera as in the Old World—oaks, chestnuts, beeches, hazels, hornsbeams, birches, alders, willows and poplars. Or to take the small but well-defined group of five American piñons, we find them growing side by side at Kew under identical conditions: we have the Weymouth pine (Pinus Strobus) in eastern North America, E. monticola and the sugar pine (P. Lambertiana) in California, P. monophylla in Oregon, and Silbera, P. Peuce in Greece, the Bhotan pine (P. excelsa) in the Himalayas, and two other species in Japan. Amongst broad-leaved trees Juglans has a similar Holarctic range, descending to the subtropical regions; and so on. Thus we find that every feature which one of us (H.G.) had previously taken to be characteristic of a certain genus or species is, in many cases, shared with a corresponding genus or species in the other region, so that it becomes quite impossible to establish either an exclusive possession or a marked predominance of types in either which are correspondingly deficient in the other.

The flora of the northern temperate region is divided into at least four main subdivisions. The first of these is Europe, which includes the British Isles. This region is the most species-rich of the northern temperate region, and is also the most important in terms of its terrestrial biota. It is characterized by a high diversity of flowering plants, including many species of ferns, mosses, liverworts, and lichens. The region is also home to many species of insects, including butterflies, moths, and bees. The flora of Europe is also characterized by a high degree of endemism, with many species found nowhere else in the world. The region is also home to many species of birds, including many species of songbirds, such as the blackbird and the robin, and many species of migratory birds, such as the common chiffchaff and the common sandpiper. The region is also home to many species of mammals, including many species of deer, such as the red deer and the roe deer, and many species of small mammals, such as the rabbit and the vole. The region is also home to many species of reptiles, including many species of snakes, such as the adder and the grass snake, and many species of lizards, such as the grass snake and the sand lizard.

The second subdivision of the northern temperate region is North America, which includes the United States, Canada, and Mexico. This region is characterized by a high diversity of flowering plants, including many species of ferns, mosses, liverworts, and lichens. The region is also home to many species of insects, including butterflies, moths, and bees. The flora of North America is also characterized by a high degree of endemism, with many species found nowhere else in the world. The region is also home to many species of birds, including many species of songbirds, such as the robin and the blue jay, and many species of migratory birds, such as the common chiffchaff and the common sandpiper. The region is also home to many species of mammals, including many species of deer, such as the elk and the moose, and many species of small mammals, such as the rabbit and the vole. The region is also home to many species of reptiles, including many species of snakes, such as the gopher snake and the black rat snake, and many species of lizards, such as the sagebrush lizard and the chuckwalla.
1. The Arctic-Alpine sub-region consists of races of plants belonging originally to the general flora, and recruited by subsequent advent. They have been specialized and have acquired the capacity of endurance to survive long dormant periods, sometimes even unbroken in successive years by the transitory activity of the brief summer. It is continuous round the pole and roughly is bounded by the same circle as the arctic circle. Mammals and birds of cold have been shown to be capable of withstanding the temperature even of liquid hydrogen. Arctic plants make their brief growth and reach high temperatures before the bluebells and 癒花 from above fro the Aletsch glacier at a height of 10,700 ft. Ball found the temperature one inch below the surface to be 83°, and he collected ‘over forty species in flower.’ Taking the whole arctic flora at 762 species, Henkel, the German correspondent to the 'Scandinavian lands.' The arctic flora contains no genus that is peculiar to it, and only some fifty species that are so. Christ has objected to terming the arctic flora Scandinavian, but the name implies nothing more than that Scandinavia has been its chief seat of preservation.

A detailed examination of mountain floras shows that a large local element is present in each besides the arctic. The one is in fact the result of isolated conditions, and is termed the alpine flora, which is the other. Thus Saxifraga cernua is regarded as an alpine form of the lowland S. granulata. Comparing the Alps with the Pyrenees, according to Ball, each has about half its flora common to the other: ‘the Alps have 172 endemic species and at least 15 genera that are not found in the Pyrenees, while the latter range counts about 100 endemic species with several (six or seven) genera not found in the Alps.’ Drude has accordingly suggested the substitution of the term ‘high-alpine flora’ for the ‘alpine flora.’ Its meaning has, however, become synonymous and is consecrated by usage.

The repetition of the same species in the arctic regions and in the high mountains of the North Temperate region is generally attributed to the exchange which took place during the glacial period. This was first suggested by Edward Forbes in 1846, though the idea had earlier suggested by Darwin. The mountain floras are characterized by the presence of species known to Christor from deposits connected with the boulder clay. And Reid has shown that during the glacial period the existing flora was replaced by an arctic one represented by such plants as Betula nana, Betula pubescens and Betula tortuosa. At the same time the then existing alpine floras descended to lower levels, though we may agree with Ball that they did not necessarily become extinct at higher ones as long as any land-surface remained uncovered by ice. The principle of the gradual change of the flora in the course of the glacial period, together with the presence of the mountains accompanied by an arctic continent, though doubtless many species of the latter, such as Salix polaris, failed to establish themselves. Christ, while admitting an ancient endemic element, insisted that the true alpine flora was the result of something in the flora of the Old World, he thinks must have reached Europe by way of Greenland from north-east America.

2. The Intermediate sub-region comprises the vegetation of the last glacial period, as represented by the steps of the Old World, the prairies of the New and the forest region of both. The former support a copious herbaceous flora, the characteristics of which in the Old and New Worlds have been already briefly summarized. In the former that of the northward extension of the Arctic flora seems to have been rather steady. From after the close of the glacial epoch, the south being closed to it. In the New world no southern barriers existed and it is more difficult to draw a line between them and the sub-arctic. The dominant characteristics of the arborous vegetation are, besides deciduous and amoniferous trees, Coniferae, especially the more recent tribe of Abietineae—pines, silver-foe, hemlocks, spruces and larches, of which, unlike the older types, no representative crosses the tropic. The prominent deciduous trees of Europe appear to be of eastern origin, and the progress of western migration has been rather slow. There are, however, some distinct species, such that the Scots fir, which is now extinct, was abundant in Denmark in the Roman period. It was succeeded by the sessile-fruit oak, which in turn succeeded to the deciduous pines, the pines being the same form of the same species as the Pinus sylvestris of modern times. Quercus Robur has left no trace in the flora of Europe and it is most nearly allied to east Asiatic species. The oak in turn has been almost superseded in Denmark by the beech, which, though it existed in the glacial period, was more abundant in the south, though it existed there in the pre-glacial period, but is not native in either Scotland or Ireland. Its eastern limit in Europe is a line from Königsberg to the Caucasus; thence through China it is con-
species are known out of a probable total of not less than 12,000, and of these more than half are endemic. The number of species to which the single genus Eucalyptus (which includes Womet) has given rise for the larger part of the flora of a single country, has not been determined. Maximowicz finds that 40% of the plants of Manchuria are common to Europe and Asia, but the proportion falls sharply to 16% in the case of Japan. The Ternstroemiaceae which makes its appearance with the Mediterranean-Oriental subregion is still more remote. China has 52 species, but it has only a single Pterula, while Astrapogon is reduced to 35 species. There are two species of Pteria and four of Liquidambar. The affinity to Asia is thus not very apparent, but it is strongly marked and has long been known to be in China. Japan has 66 species of Quercus, but of these only 17 can be considered as native. Aesculus, 42 of Aesc, 33 Magnoliaceae (including two species of Liriodendron), 12 Anonaceae, 71 Ternstroemiaceae (including the tea genus), 49 Styraceae, and 11 Hamamelidaceae, western representative in Madeira. Trachycarpus and Rhipis are characteristic palms, and Cycadeae are represented by Cycas.

The American sub-region has as its northern boundary the parallel of lat. 36° as far as New Mexico and the Pacific coast at lat. 40°. The eastern and western halves are contrasted in climate—the former being moist and the latter dry—but have been distinguished by some zoologists as distinct sub-regions. They are in fact something of a type characteristic of sub-regions 3 and 4 in the Old World. The absence of marked natural boundaries makes any precise north and south limitation difficult. But it has been possible to distinguish the genera of the American flora, a tribe of Conference of great antiquity. Taxodium (with some allied species) in the north-west of the United States and Mexico is represented by the deciduous cypress (T. distichum), which extends from Florida to Texas. The two species of Sequoia, the redwood of the Pacific basin, are native to the states of California and Oregon, and there is a solitary Zania amongst Cycads. The western dry areas have the old-world leguminous Astragalus and Prosopis (Mesquite), but are especially characterized by the northward extension of the new-world tropical Cactaceae, Mammillaria, Cereus and Opuntia, by succulent Amaryllidaceae such as Agave (of which the so-called "American aloes" is a type), and by arborescent Liliaceae such as Yucca. Amongst palms Washingtonia and Bactrea and Erythea (all of the Marquesa group) are represented by various species, including the coast Cypressea Lawsoniana replaces the northern Thuya gigantea, and a laurel (Umbellularia of isolated affinity) forms forests. California and New Mexico are each a species of Platanus, a dying-out genus. Elsewhere it is only represented by F. occidentalis, the largest tree of the Atlantic forests from Maine to Oregon, and by F. orientalis in the eastern Mediterranean. Otherwise the Californian flora is entirely distinct from that of the New World in the main confined to the higher groups, such as families and large genera; the smaller genera and species are entirely different. No genus or species of palm, for example, is common to the Old and New Worlds. The same is true of the genera of the Compositae which are scattered through the tropics of both worlds, one reaching Poylonya.

The African sub-region. —Western Arabia must be added to the African continent, which, with this exception and possibly a former European connexion in the far west, has had apparently from a very early period an almost insular character. Bentham remarks (Journ. Linn. Soc. xiii. 492): "Here, more perhaps than in any other part of the globe, in Compositae as in so many other orders, we may fancy we see the scattered remains of ancient races dwindling down to their last representatives." It is remarkable that the characters of the Mediterranean flora of the world have spread and developed southwards, are conspicuous absent from the African tropical flora. It has no Magnoliaceae, no maples, Pomaceae, or Vacciniaceae, no Rhododendron and Gillenia. The species of the latter genus are confined to the Far East and its nearest allies. In the Leguminosae, Quercus, in particular, which from Tertiary times has been a conspicuous northern type and in Malayan tropical conditions other species which are widely divergent. Palms are strongly developed, and the Corystidae are entirely absent. But the Mascarene Islands and Seychelles the Borassae are exclusively African. Aroideae are poorly represented compared with either South America or Malayasia. A peculiar feature in which tropical Africa stands alone is that at least one-fifth and probably more of the species are confined to the eastern large sub-region of the continent and presumably stretch right across it. The eastern coast is most marked on the eastern side: the Himalayan Gloriosa will suffice as an example, and of more tropical types Phoenix and Caladium. That the forest flora of Madagascar, though including an endemic family Chamaeaceae, is essentially tropical African, and the upland flora south temperate.

2. The Indo-Malayan sub-region includes the Indian and Malay peninsula, the Celebes, the Philippines, Java, Sumatra and the Sundas, the West coast of Madagascar, as well as, perhaps, the land between the Eastern Cordillera and the Himalayas. The flora of India and Ceylon is mainly represented by species from Hindustan, Java, and the Philippines, with New Guinea and Polynesia, excluding the Sandwich Islands. Probably in point of number of species the preponderant family is Orchideae, though, as Hemslay remarks, they do not make the characteristic of the flora. In particular, the vegetation." In Malay and eastward the forests are rich in arboraceous firs, laurels, myrtles, nutmegs, oak and bamboo. Dipterocarpaceae and Nepenthaceae only extend with a few outliers into the American sub-region. Amongst the other families the Piperaceae are deficient. Amongst palms Arecaee and Calmaceae are preponderant. Cycads are represented by Cycas itself, which in several species has its seat in India to Polynesia. In India proper, with a dry climate, grasses and Leguminosae take so in the number of species. But it has few distinctive botanical features. In the north-west it meets the Mediterranean-Oriental region and in the north-east a new China-Mongol sub-region, while south India and Ceylon have received a Malayan contribution. Bengal has no Cycas, oaks or nutmegs. Apart from the occurrence of Cycas, the Asiatic character of the Polynesian flora is illustrated by the distribution of Miconia, Melastomataceae, and the genera and species of that family which the species belong to represented in one or other of the Indian peninsulas. South America, and South Indian sub-region is perhaps richer in peculiar and distinctive types than either of the preceding. As in the Indo- Malayan sub-region, epiphytic orchids are probably most numerous in point of species, but the genera and even sub-tribes are far more restricted in their range than in the Old World. Sub-tribes with 74 genera of Vandeae are confined to South America, though varying in range of climate and altitude. Amongst arborescent families Leguminosae and Euphorbiaceae are prominent; Hovea belongs to the latter and is widely distributed in various species in the Amazon basin, and yields Para and other kinds of rubber. Amongst Rubiaeceae, Cineonchaceae with some outliers in the Old World have their headquarters at cooler levels. In Brazil the myrtles are represented by certain genera, such as Myrtaceae, and Melastomataceae, which, poorly represented in the Old World, have attained here so prodigious a development in genera and species, that Ball looks upon it as the seat of origin of the family. Amongst Ternstroemiaceae, the singular Maragraceae are endemic. So also are the Vochysiaceae allied to the "milkworts." Cactaceae are widely spread and both northwards and southwards extend into temperate zones. Amongst the more characteristic species of the genus Cactaceae, the main American species, are confined to the Central and South American, and Brazilian. Aroids of which the coco-nut, which has perhaps spread thence into Polynesia and elsewhere, are on the northern borders of the Amazonas. The genera of the family which are so common to tropical and South Africa, Madagascar and Brazil. Aroids, of which the tribes are not restricted in their distribution, have two large endemic genera, Philodendron and Anthurium. Amongst the myrtles, the physic-nut genera, Eugenia, Myrcia, the Canones, Aracaria, limited to the southern hemisphere, has scarcely less antiquity; Pinus reaches as far south as Cuba and Nicaragua.

The flora of the Hawaiian Islands has complicated relations. Out of the six indigenous plants, 80% are endemic, but Hillebrand finds that a large number of are American affinity.

III. The South Temperate Region contrasts remarkably with the northern. Instead of large continuous areas, in which local characters are supported by the species occupying each part of the globe, in Compositae as in so many other orders, we may fancy we see the scattered remains of ancient races dwindling down to their last representatives." It is remarkable that the characters of the Mediterranean flora of the world have spread and developed southwards, are conspicuous absent from the African tropical flora. It has no Magnoliaceae, no maples, Pomaceae, or Vacciniaceae, no Rhododendron and Gillenia. The species of the latter genus are confined to the Far East and its nearest allies. In the Leguminosae, Quercus, in particular, which from Tertiary times has been a conspicuous northern type and in Malayan tropical conditions other species which are widely divergent. Palms are strongly developed, and the Corystidae are entirely absent. But the Mascarene Islands and Seychelles the Borassae are exclusively African. Aroideae are poorly represented compared with either South America or Malayasia. A peculiar feature in which tropical Africa stands alone is that at least one-fifth and probably more of the species are confined to the eastern large sub-region of the continent and presumably stretch right across it. The eastern coast is most marked on the eastern side: the Himalayan Gloriosa will suffice as an example, and of more tropical types Phoenix and Caladium. That the forest flora of Madagascar, though including an endemic family Chamaeaceae, is essentially tropical African, and the upland flora south temperate.

1. The South African sub-region has a flora richer perhaps in number of species than any other; and these are often extremely local and restricted to a small area, which may be as small as a few square miles. Many species, which, as already pointed out, is explicable by the arrest of further southern expansion. Hemslay remarks that "the southern genus Erica, which covers thousands of square miles in Europe with its allied genera, is represented in South Africa by a comparatively small area in South Africa." There is an interesting connexion with Europe through the so-called Iberian flora. Bentham (Pres. add. Linn. Soc. 1869, p. 45) points out that many European species are only found with 79 genera of Cinnamomum, &c. are some of them more nearly allied to corresponding Cape species than they are to each other; and many of the somewhat higher races, groups of species and genera, have evidently diverged from stocks.
now unrepresented anywhere but in South Africa. This flora extends from Ireland to the Canaries and reappears on the highlands of Angola. On the eastern side the southern flora finds representatives in Abyssinia, including Protea, and in South Africa, Cycad  dracorex capense occurring on Kilimanjaro. This is the northernmost representative of the Rutaceous Diosmeae, which are replaced by Australia, the Boronieae. The Proteaceae genus, such as Araucaria and Podocarpus, is a single species, and its genus *Pelargonium* has a few Mediterranean representatives, and one even occurs in Asia Minor. In these cases it is a question whether we are tracing an ascending or descending stream. Descending streams in migration, however, were not so much. Whether the southern flora of South Africa has only two palms (*Phoenix* and *Hyphaene*). In the Gnetaceae *Welwitschia* it possesses a vegetable type whose extraordinary peculiarities make it seem amongst contemporary vegetation much as some strange, but hideous animal form would if suddenly endowed with life. Conifers are scantily represented by *Callitris* and *Podocarpus*, which is common to all three sub-regions; and Cycads by the endemic *Encephalartos* and *Macrozamia*. 2. The Australian sub-region consists of Australia, Tasmania, New Caledonia and New Zealand, and, though partly lying within the tropic is most naturally treated as a whole. They are linked together by the climate of their liminal regions, and take the place of the nearly allied heaths in South Africa. The most prominent order in Australia is Leguminosae, including the acacias with less than four in New Zealand, and with only one genus in Australia, *Eucalyptus*, which forms three-fourths of the forests, and *Melaleuca*; both are absent from New Caledonia and New Zealand; a few species of the former extend to New Guinea and one of the latter to Malaysia. *Eucalyptus* in Australia is a good example of an Indo-Malayan type. Amongst Conifers, *Podocarpus* is found throughout, *Agathis* is common to Australia, New Zealand and New Caledonia; *Araucaria* to the first and last; and *Cycads*. Australia and New Zealand are the chief homes of the latter. 3. New Caledonia and New Zealand. The exotic genus *Helicia* reaches as far north as China, but whether it is starting or returning must be as in other cases be left an open question. While the flora of New Caledonia is rich in species (3000), that of New Zealand is poor (1400). While so many conspicuous Australian elements are wanting in New Zealand, one-eighth of its flora belongs to the same. *Eschweilera* and *Grevillea* are the chief additions. *Acaena, Gunnera, Fuchsia* and *Calceolaria*. By the same path it has received a remarkable contribution from the North Temperate region; such familiars to *Ranunculus, Epilobium* and *Veronica* form more than 9% of the flowering plants. And it is interesting to note that while the tropical forms of *Quercus* failed to reach Aus- tralia from Malay, the temperate *Fagus* crept in by a back door. Three genera of the natives of species are endemic to them, and how they are to be quite unable to resist the invasion of new-comers, and already 600 plants of foreign origin have succeed in establishing themselves. 4. The Andine sub-region extends from Peru to the Argentine; it is the southernmost of the three and the richest in the flora of the world. As already explained, the path of communication between the north- ern and southern hemispheres has always more or less open, and the temperate flora of southern Africa does not exhibit the isolation characteristic of the region, and it is to the World. Talking, however, the Andean flora as typical, it contains a very marked endemic element; Balf finds that half the genera and four-fifths of the species are limited to it; on the other hand, that half the species of the whole world, Apart from *Solanum*, such a genus as *Potentilla, Gentiana, Barisia* and *Gnaphalium*. The relation to the other sub-regions is slight. Ericaceae are wholly absent, and it has but a single *Epacris* in Fueguia. Proteaceae are more marked in *Grevillea* and *Prostanthera*, and one species of *Zygophyllum* is found in Chile. But on the other hand, it is the headquarters of *Muti- siaeae*, represented in South Africa by such genera as *Oldenburghia* and *Gorbera* and by *Trichocline* in Australia, *Tropoeolus* takes the place of the nearly allied South African *Pelargonium*. There has been an interchange between it and the *Mexico-American* sub-region, but as usual the northern has been preponderant. *Prosopis* extends to the Argentine; other characteristic genera are *Oenothera, Godetia Collomia, Heliotropium* and *Eriocitum.* In the ascending stream may be mentioned—*Laurea*, a small genus of *Zygophyllum* with some species in Patagonia and Chile, which its contacts, and *N. mexicana*, the creosote plant of the Colorado desert, where it forms dense scrub; *Acana*; the *Loasaceae*, of which *Metalicia* reaches North America, *Petunia* and *Lippia*. Compositae compose a large proportion of the Andean flora, which is a greater proportion than in any in the world. *Baccharis*, with some 250 species, ranges over the whole continent from the Straits of Magellan and with seven species, to California. *Meliaceae*, copiously represented in tropical South America, are feeble in Peru and Chile, which is Afghanistan. A few Cactaceae extend to Chile. Of *Cupuliferae, Quercus* in three species only reaches Colombia, but *Fagus*, with only one single one in North America, is widespread from Chile southwards and extends to New Zealand and Tasmania. The Magnolaceae genun *Drimys*, with a single species in the new world, follows the same track. *Bromeliaceae* are represented by *Rhodestachys* and the tempo- ral *Aechmea* in South America, and in the latter the more nearly related *Wettinia* occurs in Peru, *Trihitrix* in Chile with the monotypic *Jubaea, Juania*, also monotypic, is confined to Juan Fernandez. Amongst *Coniferae, Podocarpus* is common to this and preceding sub-regions; *Libocedrus* extends from California to New Zealand and *New Caledonia; Fitzroya* is found in Chile and *Tasmania*; and *Araucaria* in its most familiar species occurs in Chile. 5. The Antarctic-Alpine region is the complement of the Arctic region, but like the latter, its scattered distribution in isolated points of land, remote from great continental areas, from which, during migrations like those occurring the glacial period in the northern hemisphere, it could have been recruited, at once accounts for the great proportion of species found in the Southern Hemisphere, and the world. On the whole, it consists of local species of some widely distributed northern genera, such as *Carex, Poa, Ranun- culus* and *Asclepiadaceae*, the smaller plants, and generally, characteristic of the separate localities. The monotypic *Pringlea antiscorbutica*, the "Kerguelen Island cabbage," has no near ally in the southern hemisphere, but is closely related to the northern *Cochlearia*. Such a summary of the salient facts in the geographical distribution of plants sufficiently indicates the tangled fabric of the earth's existing floral covering. Its complexity reflects the corresponding intricacy of geographical and geological evolution. If the surface of the globe had been systematically divided into all the land, and these had become distributed in bands bounded by parallels of latitude, the character of vegetation would depend on temperature alone; and as regards its aggregate mass, we should find it attaining its maximum at the equator and sinking to its minimum at the poles. Under such circumstances the earth's vegetation would be very different from what it is, and the study of plant distribution would be a simple affair. It is true that the earth's physical geography presents certain broad features to which plants are adapted. But within these there is the greatest local diversity of moisture, elevation and isolation. Plants can only exist, as Darwin has said, where they must, not where they can. New Zealand was poorly stock with a weak flora; the more robust and aggressive one of the north temperate region was ready at any moment to invade it, but was held back by physical barriers which human aid has alone enabled it to surpass. Palaeontological evidence conclusively proves that the surface of the earth has been successively occupied by vegetative forms of increasing complexity, rising from the simplest algae to the most highly organized flowering plants. We find the ultimate explanation of this in the facts that all organisms vary, and that their variations are inherited and, if useful, perpetuated. Structural complexity is brought about by the superposition of new variations on preceding ones. Continued existence implies continued change, and such a process becomes more and more refined, the corresponding structural organization becomes more elaborate. Inheritance preserves what exists, and this can only be modified and added to. Thus Asclepiadaceae and Orchidaceae owe their extraordinary floral complexity to adaptation to insect fertilization. All organisms, then, are closely adapted to their surroundings. If these change, as we know they have changed, the organisms must change too, or perish. In some cases they survive by migration, but this is often prohibited by physical barriers.
These, however, have often protected them from the competition of more vigorous invading races. *Papus*, starting from the northern hemisphere, has more than held its own in Europe and Asia, but has all but died out in North America, finding conditions favourable for a fresh start in Australasia. The older types of Gymnosperms are inelastic and dying out. Even *Pinus* has found the task of crossing the tropics insuperable.

The whole story points to a general distribution of flowering plants from the northern hemisphere southwards. It confirms the general belief on geological grounds that this was the seat of their development at the close of the Mesozoic era. It is certain that they originally existed under warmer conditions of climate than now obtain, and that progressive refrigeration has supplied a powerful impulse to migration. The tropics eventually became, what they are now, great areas of preservation. The Northern Temperate region was denuded of its floral wealth, of which it only retains a comparatively scanty wreck. High mountain levels supplied paths of communication for stocking the South Temperate region, the floras of which were enriched by adapted forms of tropical types. Such profound changes must necessarily have been accompanied by variations in the floras, which were perpetually thinned by falling out on the way. Further development was, however, not stopped, but in many cases stimulated by migration and settlement in new homes. The northern *Quercus*, arrested at the tropic in the new world, expanded in that of the old into new and striking races. And it cannot be doubted that the profusion of Melastomaceae in South America was not derived from elsewhere, but the result of local evolution. There is some evidence of a returning stream from the south, but as Hooker and A. de Candolle have pointed out, it is insignificant as compared with the outgoing one. Darwin attributes this to the fact that "the northern forms were the more powerful" (*Origin of Species*, 5th ed., p. 458).

The result of migration is that races of widely different origin and habit have had to adapt themselves to similar conditions. This has brought about superficial resemblance in the floras of different countries. At first sight a South African *Euphorbia* might be mistaken for a South American *Cactus*, an *Aloe* for an *Agave*, a *Senecio* for ivy, or a New Zealand *Veronica* for a European *Salicornia*. A geographical botany based on such resemblances is only in reality a study of adaptations. The investigation of these may raise and solve interesting physiological, but throw no light on the facts and genetic relationship which a rational explanation of diversity requires. That study a population and sort it into soldiers, sailors, ecclesiastics, lawyers and artisans, we may obtain facts of sociological value but learn nothing as to its racial origin and composition.

In the attempt that has been made to map out the land surface of the earth, probable community of origin has been relied upon more than the possession of obvious characters. That sub-regions framed on this principle should show interrelations and some degree of overlapping is only what might have been expected, and, in fact, confirms the validity of the principle adopted. It is interesting to observe that though deduced exclusively from the study of flowering plants, they are in substantial agreement with those now generally adopted by zoologists, and may therefore be presumed to be on the whole "natural."

**Planeudes—Plassey**

The author of numerous works; notably a Greek grammar in the form of a question and answer, the *Epitome* of Moschopulus, with an appendix on the so-called "political" verse; a treatise on syntax; a biography of Aesop and a prose version of the fables; and certain Greek authors; two hexameter poems, one a eulogy of Claudius Ptolemaeus (Leonard, 1582) and another an account of the skinning of an ox into a mouse; a treatise on the method of calculating in use amongst the Indians (ed. C. J. Gerhardt, Halle, 1865); and scholia to the first two books of the *Arithmeticon* of Diophantus. His numerous translations from the Latin included Cicero's *Somnium Scipionis* with the commentary of Macrobius: Caesar's *Gallic War*; Ovid's *Heroides* and *Metamorphoses*; Boethius, *De consolatione philosophiae*; Augustine, *De trinitate*. These translations were very popular during the middle ages as textbooks for the study of Greek. It is, however, as the editor and compiler of the collection of minor poems known by his name (see *Anthology* *Greek*) that he is chiefly remembered.

**Plaque**, a French term for a small flat plate or tablet, applied particularly to rectangular or circular ornamental plates or tablets of bronze, silver, lead or other metal, or of porcelain or ivory. Small plaques, *plastiques*, in low relief in bronze or lead, were produced in great perfection in Italy at the end of the 15th and beginning of the 16th centuries, and are copies of ancient engraved gems, earlier goldsmith work and the like.

**Plasencia**, a city of Spain and an episcopal see, in the north of the province of Caceres. Pop. (1900), 8208. Plasencia is situated on the river Jerte, a tributary of the Tagus, and at the foot of the sierras of Bejar and Vera. The place has some interest on account of its fine walls, built in 1197 by Alphonso VIII. of Castile, and its cathedral, begun in 1498, a favourite specimen of the ornate Gothic of its period. The Hieronymite convent of Yuste, the scene of the last years of the emperor Charles V. (1500-1558), is 24 m. east.

**Plassey** (Paalas), a village of Bengal on the river Bhagirathi, a tributary of the Ganges, on the west side of the river. June 23rd, 1756, over the forces of the nawab Suraj-ud-Dowlah. The fall of Clutta and the "Black Hole" atrocity led to instant action by the East India Company, and Clive, with many troops as could be spared, undertook a campaign against the nawab, and soon reoccupied Clutta. Long and intricate negotiations, or rather intrigues, followed, and at the time of the battle the loyalty of most of the nawab's generals had been effectually undermined, though assistance, active or passive, could hardly be counted on. With this doubtful advantage, Clive, with 1100 European and 2200 native soldiers, and 10 field-pieces, took the field against the nawab, who had 50,000 men, 55 heavy guns, and some French artillery under M. de St. Fris. Only the river Bhagirathi separated Clive's little force from the entrenched camp of the enemy, when the English leader, for once undecided, called a council of war. Clive and the majority were against fighting, Major Eyre Coote, of the 39th Foot, and a few others for action. Coote's. soldiers advised powerfully Clive, and after deep consideration he altered his mind and issued orders to cross the river. After a fatiguing march, the force bivouacked in a grove near Plassey early on the 23rd. The nawab's host came out of its lines and was drawn up in a huge semicircle almost enclosing the little force in the grove, and St Fris's gunners on the right wing opened fire. Clive replied, and was soon subjected to the converging fire of 50 heavy guns. For hours the unequal fight was maintained,
PLASTER—PLASTER-WORK

until a rainstorm stopped it. The English covered up their guns, but the enemy took no such precaution. Mr. Mudin, the only loyal general of the nawab's army, thinking that Clive and his troops were as useless as his own, made a disastrous cavalry charge upon them; he lost his own life, and his colleagues then had the game in their hands. Mir Jagar persuaded the nawab to retire into the entrenchments. St F rais stood fast until one of Clive's officers, Major Kilpatrick, successfully drove him in. Clive followed up this success by cannonading the camp at close range. But the rank and file of the native army, ignorant of the treachery of their leaders, made a furious sortie. For a time Clive was hard pressed, but his cool generalship held its own against the undisciplined valour of the enemy, and, noticing Mir Jagar's division in his rear made no move against them, he marched straight at the nawab's camp. After a short resistance, made chiefly by St F rais, the whole camp fell into his hands. At a cost of 23 killed and 40 wounded this day's work decided the fate of Bengal. The historic grove of mangoes, in which Clive encamped on the previous night, has been entirely washed away by changes in the course of the river; but other relics of the day remain, and a monument has recently been erected.

PLASTER, a mixture of lime, hair and sand, used to cover rough walling of lathework between timbers (see PLASTER-WORK); also a fine white plaster of gypsum, generally known as "lathing plaster." The word (also as "plastic") is used in medicine of adhesive mixtures employed externally for the protection of injured surfaces, for support of weak muscular or other structures, or as counter-irritants, soothing applications &c.

The ultimate derivation of the word is the Gr. ἐμπλαστήριον or ἐμπλαστᾶν in the medical sense, from ἐμπλάω, to daub or smear.

PLASTER OF PARIS, a variety of calcined gypsum (calcium sulphate) which forms a hard cement when treated with water (see CEMENT). The substance obtained its name in consequence of being largely manufactured in the neighbourhood of Paris.

PLASTER-WORK, in building. Plastering is one of the most ancient of handicrafts employed in connexion with building operations, the earliest evidence showing that the dwellings of primitive man were erected in a simple fashion with sticks and plastered with mud. Soon a more lasting and slightly material was found and employed to take the place of mud or slime, and that perfection in the compounding of plastering materials was approached at a very remote period is made evident by the fact that some of the earliest plastering which has remained undisturbed excels in its scientific composition that which we use at the present day. The pyramids in Egypt contain plasterwork executed at least four thousand years ago (probably much earlier) and yet existing, hard and durable, at the present time. From recent discoveries it has been ascertained that the principal tools of the plasterer of that time were practically identical in design, shape and purpose with those used to-day. For their finest work the Egyptians used a plaster made from calcined gypsum just like the "plaster of Paris" of the present time, and their methods of plastering on reeds resemble in every way our "lath, plaster, float and set" work. Hair was introduced to strengthen the "stuff," and the whole finished somewhat under an inch thick. Very early in the history of Greek architecture we find the use of plaster of a fine white lime stucco. Such has been found at Mycenae. The art had reached perfection in Greece more than five centuries before Christ, and plaster was frequently used to cover temples externally and internally, in some cases even where the building was of stone or marble. It formed a splendid ground for decorative painting, which at this period of Grecian history had reached a very high degree of beauty. The temple of Apollo at Bassae, built of yellow sandstone about 470 B.C., is an excellent example. Pavements of thick, hard plaster, stained with various pigments, were commonly laid in Greek temples. The Roman architect Vitruvius, in his book on architecture written about 16 B.C., gives detailed information concerning the methods of making plaster and the manner of using it. The lime used for stucco," he writes, "should be of the best quality and tempered a long time before it is wanted for use. The Greeks, besides making their stucco with thin paste but also plaster polished with chalk or marble, caused the plaster when set to be beaten with wooden staves by a great number of men. Some persons cutting slabs of such plaster from ancient walls use them for tables and mirrors." Pliny the elder tells us that "no builder should employ lime which had not been slaked at least three years," and that "the Greeks used to grind their lime very fine and beat it with pestles of wood." In England the walls of large houses and mansions were formerly plastered above the wainscotting and coloured, while the ornamented plaster ceilings of the time of Henry VIII., Elizabeth and James I., are still the admiration of lovers of the art. Still earlier than this there were in Italy the magnificent ceilings of the fortified palaces with smaller buildings, comprising small dwelling-houses and cottages, the general application of plaster is of comparatively late date; for wainscoted walls and boarded ceilings or naked joints alone are frequently found in houses of not more than a century old both in England and on the Continent.

In the more common operations of plastering, comparatively few tools and few materials are required, but the workman efficient in all branches of the craft will possess a very large variety of implements. The materials of the workman are: laths, lime, sand, hair, plaster of paris, and a variety of cements, together with various ingredients to form colouring washes, &c.

Wood laths are narrow strips of some straight-grained wood, generally Baltic or American fir, in lengths of from two to four or five feet to suit the distances at which the timbers of a floor or partition are set. Laths are about 4 by 1 inch, wide, and are made in three thicknesses; "single" (1 to 4 in. thick), "lath and a half" (1 in. thick), and "double" (1 to 0 in. thick). The thicker laths should be used in ceilings, to stand the extra strain, and the thinner variety in vertical work such as partitions, except where the latter will be subjected to rough usage, in which case thicker laths become necessary. Laths are usually nailed with ordinary nails about 3 in. long, and a small key for the plaster. Laths were formerly all made by hand. A large quantity, however, are now made by machinery and are known as sawn laths, those made by hand being called rent or riven laths. Rent laths give the best results, as they split in a line with the grain of the wood, and are stronger and not so liable to twist as machine-made laths, some of the hives of which are usually cut in the process of sawing. Laths must be nailed so as to break joint in bays three or four feet wide so as to prevent the cracked edges of the other sections from catching. Any swelling of the lathing in this way, the tendency for the plaster to crack along the line of joints is diminished and a better key is obtained. Every lath should be nailed at each end and wherever it crosses a beam. All the laths should be straight and free from warping. If the lath is lathed, that is, have a fillet or double lath nailed along the centre upon which the laths are then nailed. This is done to preserve a square corner when the lath is liable to warp and are sometimes battened and lathed in order to form an air cavity between the damp wall and the plastering.

Lathing of metal, either of wire or in the form of perforated sheets, is now extensively used on account of its fire-proof and lasting quality. There are very many kinds of this material made in different designs under various patents, the best-known in England being the Jhillim, the Bostwick, and the Expanded Metal lathing. The two last-named are also widely used in America.

Lathing nails are usually of iron, cut, wrought or cast—and in the better class of work they are galvanized to prevent rusting. Zinc nails are also sometimes used.

The lime principally used for internal plastering is that calcined from chalk or other nearly pure limestone, and is known as fat, pure, or rich lime. Hydraulic limes, which are referred to in the articles BRICKWORK and MORTAR, are also used by the plasterer, chiefly for external work. Perfect slaking of the calcined lime before being used is very important, and a particular care is taken with the material in order to prevent and blister the work. Lime should therefore be run as soon as the building is begun, and at least three weeks should elapse between the operation of running the lime and its use.

In the use of lime in plastering a very considerable quantity, gives tenacity to the material. Ox-hair, which is sold in three qualities, is the kind usually specified; but horsehair, which is shorter, is sometimes substituted in its stead or mixed with the ox-hair in the lower qualities. Good hair should be long, strong, and free from grease and dirt, and before use must be well beaten to separate the lumps. In America, goats' hair is frequently used;
though it is not so strong as ox-hair. The quantity used in good work is one pound of hair to two or three cubic feet of coarse stuff.

Manila hemp fibre has been used as a substitute for hair. As a result of several experiments, it was ascertained that its strength as compared with that of ox-hair was found to be about 30 per cent. for nine months after it was found in China. This fibre has, however, not been used generally for this purpose.

Substitutes
Mortar slabs made with Manila hemp fibre broke at 105 lb. per sq. in., whilst slabs made with 1 lb. 3 oz. per cubic foot of ox-hair broke at 130 lb. per sq. in. The mortar was composed of cement, red sand, and water in the proportion of 1:4.5:2.

Making Screeds
Another method of using Manila fibre is as follows: Two barrels of mortar were made up of equal proportions of lime and sand, one containing the usual quantity of goats' hair, and the other Manila fibre. After setting, the mortar in the former was found to have a coefficient of friction of 0.52, and in the latter 0.58. This indicates that Manila fibre is quite as effective as the goats' hair.

Lime plastering is composed of lime, sand, hair and water in proportions varying according to the nature of the work to be done. The raw materials used are good materials, well mixed and skillfully applied, and are essential. The process is usually applied in successive coats or layers, until the desired thickness is obtained. The great advantage of lime is that it is a good insulator, and is therefore useful in buildings, such as outhouses, where a rough surface is required. It is also a good sound deadener, and is used for this purpose in many buildings.

The process is as follows: For the first coat a layer of well-haired coarse stuff, about 1/4 in. thick, is put on with the trowel. The second coat is applied in the same manner, but the work is then smoothed and brushed smooth. The third coat is then applied in the same manner, but the work is then finished and the surface is left smooth. The fourth coat is then applied, and the work is then finished and the surface is left smooth.

Stucco is a term loosely applied to nearly all kinds of external plastering, whether composed of lime or of cement. In this present time it has fallen into disfavour, but in the early days of its use it was quite common. For external work Portland cement is undoubtedly the best material on account of its strength, durability, and weather resisting qualities. In the first place, it is stronger than the best kind of common lime or the best kind of plaster of Paris. Common stucco for external work is usually composed of one part hydraulic lime and three parts sand. The wall should be sufficiently rough to form a key and well wetted to prevent the moisture being absorbed by the plaster.

Rough stucco is used to imitate stonework. It is worked with a hand float covered with rough felt, which forms a sand surface on the plaster. Lines are ruled before the stuff is set to represent the joints of stonework. "Trowelled stucco," the finishing coat of this work, consists of three parts sand to two parts fine stuff. A very fine smooth surface is produced by means of the hand float. "Baitard stucco" is of similar composition, but less labour is expended on it. The coats are trowelled on at once, and then trowelled. "Coloured stucco" is used for external work. The desired tint is obtained by mixing with the lime various pigments of different colours. These are usually mixed in varying proportions, greens by green enamel, reds by using litharge or red lead, and blues by mixing oxide or carbonate of copper with the other materials.

Sgrafitto (Italian for "scratched") is the term given to the "scratched" ornament in plaster work. It is the oldest form of surface decoration, and at the present day it is much used on the Continent of Europe, especially in Germany and Italy, in both external and internal situations. The material used was clay, and the process is as follows: The process is carried out in this way: A first coat of rendering Portland cement and sand, in the proportion of one to three, is laid on about 1/4 in. thick; then follows the colour coat, a patchwork effect being the object. For the second coat, a rough patchwork of the same material is laid on, and this is followed by the finishing coat. When this coat is nearly dry, it is finished with a smooth-smoothing, 1/4 to 1/2 in. thick, of Parian, selenitic or other fine cement or lime, only as much as can be finished in one day being laid on. By means of a trowel and a brush, the design is transferred to the plastered surface. 

Background of the finished coat, consisting of the original plaster beneath, and following this the outlines of the rest of the wall are then ruled with a line through the outer skimming to the underlying tinted surface. Sometimes the coats are in three different colours, such as brown a rough, or with black and white or red as the finishing coats. For the pigments used for this work include Indian red, Turkey red, Antwerp blue, German blue, umber, ochre, purple brown, bone black or oxide of manganese for black. Combinations of these colours are made to produce effects of light and shade.

Lime plastering is composed of lime, sand, hair and water in proportions varying according to the nature of the work to be done. It is made up of good materials, well mixed and skillfully applied. The process is usually applied in successive coats or layers, until the desired thickness is obtained. The great advantage of lime is that it is a good insulator, and is therefore useful in buildings, such as outhouses, where a rough surface is required. It is also a good sound deadener, and is used for this purpose in many buildings.

The process is as follows: For the first coat a layer of well-haired coarse stuff, about 1/4 in. thick, is put on with the trowel. The second coat is applied in the same manner, but the work is then smoothed and brushed smooth. The third coat is then applied, and the work is then finished and the surface is left smooth. The fourth coat is then applied, and the work is then finished and the surface is left smooth.
PLATA, RIO DE LA

stuff, or lime putty, is pure lime which has been slaked and then mixed with a semi-fluid composition and all commercial establishments has developed into a soft paste. For use in setting it is mixed with fine washed sand in the ratio of one to three.

For cornices and for setting when the second coat is not allowed time to dry or for special compositions it must be rigid. This is often "gauged" stuff, composed of three or four parts of lime putty and one part of plaster of Paris, mixed up in small quantities immediately before use. The plaster in the material causes it to set rapider out if it is present in too large a proportion the work will crack in setting.

The hard cements used for plastering, such as Parian, Keene's, and Martin's, are laid generally in two coats, the first one being a rolled or "patent" coating and the second or setting coat of neat cement about ⅛ in. thick. These and similar cements have a gypsum as a base, to which a certain proportion of another substance, such as alum, borax or caustic soda, is added and the whole is heated to a certain temperature. The plaster they contain causes them to set quickly with a very hard smooth surface, which may be papered or painted within a few hours of its being finished.

The Plata, 73 or 74, 31 of the London Council (General Powers) Act 1890 set forth the description and quality of the substances of which plastering is to be made for use in buildings erected under its jurisdiction.

Plain, or unpouched, slabs are formed with a running mould of zinc cut to the required profile. Enrichments may be added after the main outline moulding is set, and are cast in moulds made of gelatine or plaster. For a cornice mould, with the support of the usual one on the wall, the other on the ceiling, upon which the mould is worked to and fro by one workman, while another man roughly lays on the plaster to the mould, the former must be of the angle, and the second, laid off with joint rule made of sheet steel of various lengths, three or four inches wide, and about one eighth inch thick, with one end cut to an angle of about 30°. In some cases the whole is let into a square block of hardwood.

Cracks in plastering may be caused by settlement of the building, and by the use of inferior materials or by bad workmanship, but apart from these causes, and taking the materials and workmanship of the plaster to be perfect, it may yield to the too fast drying of the work, caused through the laying of plaster on dry walls which suck from the composition the moisture required to enable it to set, by the application of external heat or of cold air, or through a coat of plaster on which has been properly set, the cracking in this case being caused by unequal contraction, or by the use of too small a proportion of sand.

For partitions and false-ceilings, plastering is now in very general use when work has to be finished quickly. For ceilings they require simply to be nailed to the joists, the joints being made with plaster, and the whole finished with a thin setting coat. In some cases, with fire-proof floors, for instance, the slabs are hung up with wire hangers so as to allow a space of several inches between the soffit of the concrete floor and the ceiling. For partitions the slabs frequently have the edges tongued and grooved to hold them in place; otherwise they are often laid vertically, so that, when grouted in with semi-fluid plaster, the whole partition is bound together, as it were, with plaster dowels. Where very great strength is required the work may be reinforced by small square iron rods cast in the slabs. This is a very rigid partition which is at the same time fire-resisting and of light weight, and when finished measures only from two to four inches thick. The slabs may be obtained either with a keyed surface, which requires fixing with a semi-fluid coat when the partition or ceiling is in position, or a smooth finished face, which may be papered or painted immediately the joints have been carefully made. Partitions are also formed with one or other of the forms of metal lathing previously referred to, fixed to iron uprights and plastered on both sides. So strong is the result that partitions of this class only two or three inches thick were used for temporary celling in the great new sessions house in the Old Bailey, London.

Fibrous plaster is given by plasterers the suggestive name "stick and rag," and this is a rough description of the material, for it is composed of plaster laid upon a backing of canvas stretched on wood. It is much used for mouldings, circular and enriched casings to columns and girders and ornamental work, which, being worked in the shop and only fixed or otherwise fitted in position, saves the delay often attendant upon the working of ornament in position.

Desachy, a French modeller, took out in 1856 a patent for "pasting" and "gauing" mouldings and "stick and rag," the latter being "an art, with surfaces of plaster," with the aid of plaster, glue, wood, wire, and canvas or other woven fabric. The modern use of this material may be said to have started then, but the use of fibrous plaster, as it was then called, was practised by Cadiz and Rio Grande do Sul, in the Christian era; for ancient coffins and mummies still preserved prove that linen stiffened with plaster was used for decorating coffins and making masks. Cennino Cennini, writing in 1437, says that fine linen soaked in the same semi-fluid composition of plaster laid on wood was used for forming grounds for painting. Canvas and mortar were in general use in Great Britain up to the middle of the last century. This work is also much used for temporary work, such as exhibition buildings.

The principal books of reference on the subject are: W. Millar, Plastering, Plain and Ornamental, 1862, 3d. ed., London; Limes, Cement, Mortar and Masons; Rivington, Notes on Building Construction, Part III. "Building Materials"; the works on architecture of Robert and James Adam.

PLATA, RIO DE LA, or River Plate, a funnel-shaped estuary, on the east side of South America, extending W.N.W. from the sea about 270 m. The discovery of the South Sea by Balboa, then governor of Castilla del Oro, of which Darien was the capital, created a lively desire to learn something of its coast-line, and the year following, in 1514, the Spanish monarch concluded a navigation contract with Juan Diaz de Solis, then Piloto Mayor, to search for a strait connecting the Atlantic with the newly found ocean, explore the coasts of the latter and communicate with Pedrarias de Avila, the new governor of Castilla del Oro; and, if it were found to be an island, to report to the superior authorities of Cuba. De Solis set sail from the port of Lepe on the 8th of October 1515, reached the Bay of Rio de Janeiro on the 1st of January 1516, and continuing southward to lat. 35° entered the great estuary now known as the Plata, which, for a short period of time, was called the de Solis or the de Avila. It is believed that this estuary, with the vicinity of the island of Martin Garcia, near the mouth of the Paraná river, de Solis was ambushed and killed in the early part of 1516 by Guarani Indians while attempting to capture some of them. In the first months of 1520 Magellan explored the Rio de la Plata, and afterwards, in the same year, discovered and navigated the straits which bear his name. This discovery led to the voyage of Sebastian Cabot, who fitted out an expedition in 1526 to reach the Spice Islands by the Magellan route. Owing, however, to shortness of provisions and the insubordination of his men Cabot abandoned his proposed voyage to the Moluccas, and, ascending the Mar Dulce, discovered the Paraná river and reached a point on the Paraguayian shore of the present city of Asuncion. Here he met many Guarani Indians wearing silver ornaments, probably obtained in trade across the Gran Chaco, from the frontier of the Inca Empire. In exchange for beads and trinkets Cabot acquired many of these ornaments and sent them to Spain as evidence of the richness of the country in precious metals and the great importance of his discoveries. The receipt of these silver baubles caused the name of Rio de la Plata to be applied to the third (perhaps the second) greatest river of the Western Continent.

The extreme breadth of the river at its mouth is 136 m. It narrows quickly to 57 m. at Montevideo, and at its head, where it receives the united Paraná and Uruguay rivers, its width is 912 m. At its mouth it is divided into two branches, an elevated and rocky, while the southern or Buenos Airean one is very low. The whole estuary is very shallow, and in no place above Montevideo exceeds 36 ft. in depth when the river is low. The bottom generally consists of enormous banks of sand covered with from 10 to 20 ft. of water, and there is a continuous and intricate channel, of about 22 ft. depth only, to within 14 m. of the port of Buenos Aires. The remaining distance has a depth of 18 ft. in the uncertain channel. The Plata is simply the estuarine receptacle of two mighty streams, the Uruguay and Paraná, which drain the Plata basin. This has an area of 1,108,000 sq. m., or over two and one-half times that of the Pacific slope of the Andes, and comprises the most fertile, healthiest and best part of Brazil, a large portion of the Argentine Republic, the whole of Paraguay and south-eastern Bolivia, and most of Uruguay.

The Uruguay river has a length of about 1000 m. Many small streams from the western slope of the Brazilian Serra do Mar unite, in about 27° 45' S. To form this river, which flows W.N.W., serving as the boundary between the states of Santa Catarina and Rio Grande do Sul, as far as 59° W., near which it receives a considerable tributary from the north, called the Pepri-gauzi. Between 27° 38' and 33° 54' S. three important tributaries join it from the east—the Igu-gauzi, the Ibiei and the Negro, the last being its main affluent.

The Uruguay River Basin and Affluents.
The Pepiri-guaçu was one of the limits between the possessions of Portugal and Spain. Its lower course is about 250 ft. wide, but higher up it narrows to about 30 ft., and runs with great violence between high wooded banks. It is navigable for canoes for about 20 ft. above Ponta Gorda, on the delta of several large islands at its confluence with the Uruguay. Its head-waters are in the southern part of Rio Grande do Sul, but the main river belongs entirely to the state of Uruguay, which it leaves among the mountains, long and south-west. Its lower reaches are navigable for craft of moderate draught.

From the time the Uruguay leaves the coast range of Brazil it runs for a long mouth, as though through a beautiful, open, billy country, but afterwards it enters the interior, where the river Pepiri-guaçu it turns suddenly to the south-west, and continues this course to its junction with the Paraguary, at the mouth of the Grande, as far down as 27° 30' S., where the river is 2300 ft. wide and from 10 to 20 ft. deep. The Uruguay is much obstructed by rocky barriers. Four miles below its confluence with the Pepiri-guaçu it has a cataract, about 8 m. long, with a total fall of 26 ft. at low water. The river near the Pepiri-guaçu is 1500 ft. wide, but about 14 m. before reaching the cataract its width is reduced to 600 ft. The water is deep from the banks to the middle, and the precipitous cliffs of black rock only 70 ft. apart. Above Punta Gorda, which is the Salto Grande, which has a length of 15 m. of rapid, the greatest single fall being 12 ft., and the difference of level for the entire length of the falls reaches the average of 20 ft. The fall of the falls, excepting a length of 1 m. of them, are submergible. Nine miles below the Salto Grande is the Salto Chico, which bars navigation during six months of the year, but in flood-time may be passed in order to reach the principal head-waters, but probably not before the end of June. Thence to Salto Chico the river is navigable for vessels of 45 ft. draught as far as the Salto Chico, and of 14 ft. up Puyandé for a greater part of the year. Fray Bentos may be reached all the year round by any vessel that can ascend the Paraguay. Above this navigable reach, and below Punta Gorda, is the river Cuyabá, which forms a large and important tributary, and contributes about 30% of the total volume of the Paraguay river, at its confluence with the Paraguay, and thence 600 more to the Plata estuary. Its average width for the latter length is from 1 to 3 m. Its Rio Grande branch descends from the mountain heights of the heart of Brazil, and is navigable for canoes for many miles of the upper river and its branches, which are met with from time to time. The Uruguay has its annual floods, when the river, which is in its bed at the foot of the Salto, is attained to by a Lyons of July and continue to November, attaining their maximum during September and October. At the narrow places the river rises as high as 30 ft., but its average rise in the rainy season is 16 m., during which the river may be navigated by canoes or small sailing vessels. The Paraguay, on the other hand, generally rises as red sandstone, at times very coarse and then again of extremely fine composition. Except in floods, it is a clear-water stream, and even at its highest levels carries comparatively little silt.

The Paraná (the “Mother of the Sea” in Guarani) drains a vast area of central Brazil. It is formed by the union of the Rio Grande and Paraná, which is about 1600 m. long from the source to the junction of these two streams, and about 1500 m. long from the junction to the mouth of the Paraguay, and thence 600 more to the Plata estuary. Its average width for the latter length is from 1 to 3 m. Its Rio Grande branch descends from the mountain heights of the heart of Brazil, and is navigable for canoes for many miles of the upper river and its branches, which are met with from time to time. The Paraguay, on the other hand, generally rises as red sandstone, at times very coarse and then again of extremely fine composition. Except in floods, it is a clear-water stream, and even at its highest levels carries comparatively little silt.

The Paraná, its branches and affluents are the main streams receiving the drainage of the southern slopes of the Chiapuq sierras, but represent mainly the south-west overflow of the vast morass of Xarayús. The principal of these lakes, naming them from north to south, are the Ubaraba, the Gaiba, Mandioré and the “Bahía” de Caceres. The Ubaraba is the largest. The northern division of the lake belongs entirely to Brazil, but the southern one, which is about three-tenths of its area, is in Bolivia, according to the treaty of 1867. It is in great part surrounded by high ground and hills, but its southern coast and a goodly portion of its surface are of excellent agricultural soil and historic. Here, in 1543, the conquistador, Martínez de Irala, founded the “Puerto de los Reyes,” with the idea that it might become the port for Peru; and from Lake Gaiba several expeditions, under the Spanish colonial days, made their way by canoe down the Paraná to the frontier of the empire of the Incas. At the Puerto de los Reyes Bolivia laid out a town in December 1900, in the forebien hope that the “Fort” may serve as an outlet for that commercially suffocated country; but the river is not yet an equally good accessible point for Bolivia on the Paraná River. South of the São Lourenço, the first river of importance which enters the Paraguay from the east is the Taquarey, about 19° S. of the south of the Serra Catarinense, and is the largest affluent of the Matto Grosso table-land. South of this stream about 50 m. a considerable river, the Mondrego, with many branches, draining a great expanse of country on both sides of the boundary, forms a tributary to the Paraguay; and still farther south, near 21° S., the Apá tributary, which forms the boundary between Paraguay and Brazilian Matto Grosso.
The Plata, or Rio de la Plata, is of more importance from its length than from its volume. It rises among the Bolivian Andes north of Potosí and south-west of Sucre, races down the mountains to their base, crosses the Chaco plains, and pours into the Paraguay. The river is navigable for a great part of its course, with branch of importance until it reaches about 21° S., where it is joined from the south-west by the river Pelaya, upon which Tupiza, the most southerly city of Bolivia, is situated. The Pelaya rises upon the foot-hills of the Bolivian Andes, and, following its course across the inland Andean range, turns northwards and then eastwards to unite with the Plata moyo, which it is said at least to equal in volume. Just below the junction is the fall of Guaraní-Parana. The river, which has its mouth at the point of the mouth of the Bermejo, and the distance in a straight line is 480 m., although by the course of the river, which is extremely tortuous, it is about double that distance. According to the notes which I have received from the engineer of the S. & O. line, the right channel is navigable at 21° 51' S., but again becomes a single stream at 23° 43', the right channel being the greater in volume. It is probable that between 23° and 24° S. it throws E.S.E. three great arms to the north-west, but as far as my resources go, I have not been able to explore, but the lower parts have been examined for 100 to 200 m. up the Paraguay. Enumerating from north to south, they are called the Esperanza, the Montelindo and the Mact. From 18° to 20° S., and sometimes, as far as 21° S., it possesses a vast swamp about 100 m. in diameter, through which there is no principal channel. This swamp, or perhaps shallow lagoon, is probably partly drained by the river Confuso, which reaches the Paraguay between the streams Pelya and Plata moyo. A navigable channel between the Fontana, the junction being at 24° 56' S., is also probably a drainage outlet of the same great swamp.

For the first 100 m. below the junction, the Parapendi the Plata moyo is navigable all the year round, but it so distributes its waters through its many tributaries, and loses so much from infiltration and in swamps, and by evaporation from the numerous lagoons it forms on its course, that its course is usually low before it reaches the Paraguay. From Sucre to the Andean margin of the Chaco, a distance of about 350 m. by the river, the fall is at least 8000 ft.—a sufficient indication that its upper course is useless for purposes of navigation.

The missionaries in 1556 first reported the existence of the Plata moyo, which for a long period of time was known as the Araguay. In 1721 Patiño and Rodriguez partially explored it, and since then numerous attempts have been made to explore its true nature, which have failed; and several of them have ended in disaster and loss of life, so that the Plata moyo now has a sinister reputation.

The Bermejo river flows parallel to the Plata moyo, and is navigable 10 m. above the junction with this. The Bermejo, its numerous sources are on the eastern front of the inland Andes, between the Bolivian town of Tarjua and the Argentine city of Jujuy. Its principal tributary is the San Lorenzo, which, after being augmented by several small streams, takes the name of Rio de Tarjua. This running east, and then taking a general south-easterly course, joins the Bermejo at 25° S., and after ascending 266 m. in two days, and Thence, flying southwards, the Bermejo finally, in 23° 50' S., receives its main affluent, the San Francisco, from the south-west. The latter has its source in about 22° 30' S., and, under the name of Rio Garona, runs south-westward, towards the Bermejo, after receiving the waters of several tributaries, as the Jujuy, the Asuncion, as Jujuy. It then turns eastwards for 50 m., and is joined by the Lavidayen from the south-west. These two streams form the San Francisco, which, from its junction, runs north-eastwards to the Bermejo, and, after ascending 300 m. in five days, and then descending 127 m. in two days, and then running parallel to the Bermejo, it is joined by the Florentino, a few miles above the junction of this with the Paraná.

The Paraná is divided into several branches and is particularly large near Buenos Aires. From the entrance of the Plata moyo into the Paraguay, it is joined by the Bermejo, which is the greater in volume. Its right-hand branches are its two main tributaries, the Bermejo and the Plata moyo. Its left-hand branches are the Pelaya and the Paraguay. The Bermejo is the greater in volume of the two. The Plata moyo is the greater in length and the greatest in width.

The Salado, about 250 m. south-west of an approximate parallel to the Bermejo 23° 20' S., and a great tributary of the Paraguay received from the west below its confluence with the Paraguay. Its extreme head-waters are in the Argentine province of Santa Fe, and drain a large broken Andean region lying between 21° and 23° S., and discharges into the Paraguay, the rivers Santa Maria and Calchaquí, which unite near the town of San Carlos and form the river Guachipas. Having received the Salado, the Guachipas runs north-eastwards about 100 m., and then it changes its name to the Juramento, which is retained until the river reaches the Chaco plains at the base of the foot-hills of the Andes.

Here it becomes the Salado, a name it preserves for the remainder of its course. It joins the Paraná near Santa Fe in 31° 35' south and 60° 41' west. Explorers of the Salado, inclusive of Capt. Page in 1855, claim that its lower half is navigable, but that the many efforts which have been made to utilize it as a commercial route have all resulted in failure.

As the Plata moyo, the Bermejo and the Salado wander about the country, ever in search of new channels, they ebb and flow away, and it is only that a railroad has been laid across it, that it does not pour it into the Paraguay and Paraná rivers. The engineers Pellechini estimates that the soil annually subtracted from the territory of the Chaco by the Bermejo alone equals 6,400,000 cubic yards. In its course it is crossed by the river Paraguay, the Paraná washes the western foot of a series of sandstone bluffs for 30 miles. Thence for 240 m. the bordering hills are about 800 ft. high, and it at Goya runs sharply south, and after the river joins the Paraná, it is navigable for about 80 m. south-east, and then runs along the course of the fertile region of the Rio de la Plata estuary, which is marginated by the wide bank of the Paraná. The Paraná is a precipitous bluff of reddish clay, varying from 35 to 75 ft. above mean river level. It is being gradually undermined, and tumbles into the salt desert below. The Paraná is 440 m. wide at its mouth, and its depth to the bottom is 80 m. In April the Paraná washes the western bank of the Paraguay, and the Paraná has an average current of 2 1/2 m. an hour, and the river varies in width from 10 to 10 m., at low water; but in floods it seems almost a continuous lake, broadening to 10 and 30 m. and burying many of its numerous islands and marginal swamps under a vast sheet of water, and obliterating its many parallel lateral channels and intricate systems of connecting canals.

In the middle Paraná, from the mouth of the Iguazú to the mouth of the Paraguay river, there are nine islands, some of them large, rocky and high above the river. From Paraguay to the city of Rosario, it has received many of its islands of great area; and again below Rosario they soon increase in number and size until the Plata estuaries is reached. In flood-time the upper portion of the tree being out of water, they are at times an appearance of floating forest. Then the river often makes wild work with its banks, and builds up or sweeps away entire islands, leaving deep channels instead. Mouchez in 1857, searching for two islands the position of which he had fixed in the previous year, found them almost doubled in size.

The Paraná delta is 40 m. across, almost in a straight line (north to south). Through this the river finds its way to the Plata by eleven outlets, large and small. Of these, the two principal ones being the Paraná-guazú and the Paraná de las Palmas.

The fall of the mean flow of the Mississippi river at New Orleans is 675,000 cuf. per second, and its flood maximum about 1,000,000 cuf. The minimum of the Plata past Buenos Aires is 534,000, the maximum 2,145,000. It may therefore be fairly assumed that the eastern end of the great Paraná River is not superior and may be inferior, to that of the Plata.

The Paraná is navigable at all times as far up as the São Lourenço river by craft drawing 3 ft. of water, and to within a few miles of Asunción, the capital of Paraguay, by vessels drawing 9 ft. The city of Paraguay may always be reached with a draught of 12 and Rosario with 15 ft. of water.

The commercial development of the Paraguay basin may be considered as a port of the future. The Paraguay is developing, which marks the beginning of independent rule in its republics; for 1854, when the steamboat and the railway first began to play a part in this quarter of the world, and in 1898 and 1899, the Louisiana Purchase Exposition, the western quarter of the continent. In Buenos Aires, for example, the foreign trade (entered and cleared) in 1822 aggregated 107,170 tons; in 1854, 342,453 tons; in 1899, 546,363 tons; and in 1899 the foreign trade, including a portion of Buenos Aires, was 5,625,088 tons. But taking into account all the Argentine ports, except
those which lie to the south of the Plata, there was for the six years ending with 1899 an annual average of 14,000,000 tons for the overseas commerce and 11,000,000 tons for the river and coasting trade. On the other, or northern, bank of the stream the chief port is Montevideo; and its foreign commerce increased from an aggregate of 50,000 tons in 1822 to 150,000 tons in 1854, and to 4,006,000 in 1898, the river and coasting trade having increased from 50,000 tons in 1822 to 150,000 tons in 1854 and to 3,915,421 tons in 1898. The total foreign trade of the Brazilian ports in 1898 was increased from over 157,000 tons in 1822 to nearly 18,100,000 tons in 1898. Its growth since the opening of the 20th century has been phenomenal and it is an economic giant. The Andes on the west, the interior of South America on the north, the rivers, and the mountains on the east of the Plata basin are obstacles which compel the rich and varied products of at least 1,500,000 sq. m. of fertile country to seek access to the ocean by a single avenue—the Plata estuary.

PLATEA, or PLATAE, an ancient Greek city of Boeotia, situated close under Mt Cithaeron, near the passes leading from Peloponnesus and Attica to Thebes, and separated from the latter city's territory by the river Asopus. Though one of the smallest Boeotian towns, it stubbornly resisted the centralizing policy of Thebes. In 549 B.C. it invoked Sparta's help against its powerful neighbour, but was referred by king Cleomenes to Athens (for the date, see Grote's History of Greece, ed. 1897, p. 82, note 4). The Athenians secured Plataea's independence and maintained its enduring friendship. In 490 the Plataeans sent their full levy to the assistance of the Athenians at Marathon, and during the invasion of Lacedaemonians they joined eagerly in the national defence. At Artemisium they volunteered to man several Athenian ships, and subsequently abandoned their town to be burnt by Xerxes. In 479 they fought against the Persians under Mardonius in the decisive battle which bears the name of the city. In this campaign the Persian commander, retreating from Attica before the combined Peloponnesian and Athenian levy, had encamped in the Asopus plain in order to give battle on ground suited to his numerous cavalry. The Greeks under the Spartan regent Pausanias at first kept them out beyond the spurs of Cithaeron, but, encouraged by successful skirmishing, advanced towards the river and attempted a flanking movement so as to cut Mardonius off from his base at Thebes. The operation miscarried, and in their exposed condition the Greeks were severely harried by the enemy's horse, which also blocked the Cithaeron passes against their supply columns. Pausanias thereupon ordered a night retreat to the hilly ground near Plataea, but the movement was badly executed; for whereas the Peloponnesians in the centre retired beyond their proper station, the Spartans and Athenians on the wings were still in the plain at daybreak. The Persians immediately fell upon these isolated contingents, but the Spartan infantry bore the brunt of the attack with admirable steadiness, and both parties at last retired north of their original line of advance, the Persians upon the camp. When this was stormed the enemy's resistance collapsed, and Mardonius's army was almost annihilated. This great victory was celebrated by annual sacrifices and a Festival of Liberation (Eleusithera) in every fourth year at Plataea, whose territory moreover was declared inviolate.

In spite of this guarantee Plataea was attacked by Thebes at the beginning of the Peloponnesian War (431) and formally besieged by the Peloponnesians (429-37). The garrison after capitulating was put to death, and the city razed by the Thebans. The remaining Plataeans received a qualified franchise in Athens, and in 421 were settled on the territory of Scione. Expelled by Lycurgus in 404 they returned to Athens, until in 387 Sparta restored them in their native town as a check upon Thebes. The city was again destroyed by Thebes in 373, and the inhabitants once more became citizens of Athens. Plataea was rebuilt by Philip and Alexander of Macedon, and during the rest of antiquity enjoyed a safe but obscure existence. It continued to flourish in Byzantine and Frankish times. The walls of the town, which at various periods occupied different portions of the triangular ledge on which it stood, remain partly visible. Recent excavations have discovered the Heraeum; but the temple of Athena the Warlike, built from the Persian spoils and adorned by the most famous artists, has not been identified.

PLATE. The word "plate" (connected with Gr. πλάτης, flat, Late Lat. planta = lamina, and Span. plata, silver), in the sense to which it is restricted in the following article, is employed to denote works in silver or gold which belong to any class other than those of personal ornaments or coins. As implying a thin sheet of metal, the term has come to be used in various technical connexions, and has been transferred by analogy to other materials (e.g. glass). A "plate," as the common name for the table utensil (of whatever material), derives its usage partly from the metal prototype and partly from an etymological connexion with French plat, dish, Latin plattus, flat. (See also Pewter; Sheffield Plate; Metal-Work.)

On account of the ease with which gold can be worked and the pure state in which it is usually found, it is probable that this was the first metal used by man; and it is certain that, in some countries at least, he attained to the most marvellous skill in its manipulation at a time when the other arts were in a very elementary condition. As an instance of this we may mention a sword of the bronze age, found in a barrow near Stonehenge, and placed in the museum at Devizes. The hilt of this sword is covered with the most microscopically minute gold mosaic. A simple design is formed by fixing tesserae, or rather pins, of red and yellow gold into the wooden core of the handle. Incredible as it may appear, there are more than two thousand of these gold tesserae to the square inch. The use of silver appears to belong to a rather later period. As the art, though a widely spread metal in almost all parts of the world, it is usually found in a less pure state than gold, and requires some skill to smelt and refine it. Though both these precious metals were largely and skilfully used by prehistoric races, they were generally employed as personal ornaments or decorations for weapons. Except in Scandinavian countries, but little that can be called "plate" has been discovered in the early barrows of the prehistoric period in western Europe.

Ancient Egypt.—An enormous amount of the precious metals were brought annually as tribute to the Egyptian kings; according to Diodorus, who quotes the authority of Herodotus, the yearly produce of the royal gold and silver mines amounted to 32 millions of mines—that is, about 333 millions sterdling of modern money. Though this estimate is probably an exaggeration, the amount must have been very great. The gold chiefly came from the Nubian mines in the western desert in the Wadi 'Alaki and the neighbouring valleys. A map of these mines, dating from the time of Rameses II. (1300 B.C.), has been preserved. Silver was not mined in Egypt itself, and came mostly from Asia Minor even at the earliest period. Then gold was comparatively common, silver a great rarity. Later, gold mines have been relatively more abundant than silver, and the difference in value between them was very much less than it is now.

In the language of the hieroglyphs silver is called "white gold," and gold is the generic name for money—unlike most languages, in which silver usually has this special meaning—a fact which points strongly to the priority of the use of gold, which archaeological discoveries have rendered very probable. Among the treasures of the "royal tombs" at Abydos, dating to the 1st and 2nd Dynasties, much gold was found, but no...
silver. On the walls of one of the tombs at Beni Hassan there is an interesting representation of a gold- and silver-smith’s workshop, showing the various processes employed—weighing, melting, or soldering with the blow-pipe, refining the metal, and polishing the almost finished bowl or vase. Owing to the Egyptian practice of burying with their dead personal ornaments and jewelry, rather than other possessions less intimately connected with the person of the deceased, but few specimens of either gold or silver plate have survived to our times, whereas the amount of gold jewelry that has been discovered is very large, and shows the highest degree of skill in working the precious metals. We can, however, form some notion of what the larger works, such as plates and vases in gold and silver, were like from the frequent representations of them in mural sculpture and paintings. In many cases they were extremely elaborate and fanciful in shape, formed with the bodies or heads of griffins, horses, and other animals real or imaginary. Others are simple and graceful in outline, enriched with delicate surface ornament of leaves, wave and guilloche patterns, hieroglyphs, or sacred animals. Fig. 1 shows a gold vase of the time of Tethmosis (Thothmes) III. (Dynasty XVIII., about 1500 b.c.), taken from a wall-painting in one of the tombs at Thebes. The figure on its side is the hieroglyph for “gold.” Others appear to have been very large and massive, with human figures in silver or gold supporting a great bowl or crater of the same metal. Vases of this type were, of course, manufactured in Egypt itself, but many of those represented in the Theban tombs were tribute, mostly of Phoenician workmanship. Already as early as the time of Tethmosis III., when, as we know, the Phoenician cities had already existed for centuries, we find the ships of Aravd, of Byblos and of Tyre well known in the harbours of the Delta, and even bringing tribute of foreign vases to the river quays of Thebes itself. We cannot doubt that much of the precious plate of gold and silver used by the Egyptians at this time and specifically described as foreign tribute was made in Egyptian or Egyptizing style by Phoenician artists. But plate of really foreign type as well as origin was also brought to Egypt at this time by the Phoenician “Kefti ships” from Kefti, the island of Crete, where the “Minoan” culture of Cnossos and Phaestus was now at its apogee. Ambassadors from Kefti also brought gold and silver vases as presents for the Egyptian king, and on the walls of the tomb of Senmut, Queen Hatshepsut’s architect, at Thebes, we see a Keftian carrying a vase of gold and silver which is the duplicate of an actual vase discovered at Cnossos by Dr Arthur Evans. The art of the “Minoan” and “Mycenaean” goldsmiths exercised considerable influence upon that of the Egyptians; under the XXth Dynasty, about 1250 B.C., we find depicted on the tomb of Rameses III., golden stirrup-vases (Bügelkannen) of the well-known Mycenaean type, and in that of Imadu, an officer of Rameses IX., golden vases imitating the ancient Cretan shape of the cups of Vaphio. In fact, it is more than probable that the Egyptians and Phoenicians manufactured plate of “Minoan” and “Mycenaean” types long after the ancient culture of Crete and the Aegean had come to an end. In the time of Rameses III., about 1000 B.C., a clearly defined Asiatic influence appears in the decoration of some of the gold plate. A gold basket represented in the tomb of this king at Thebes, has on its side a relief of the sacred tree between two beasts, an Asiatic idea.

The chief existing specimens of Egyptian plate are five silver phialae (bowls), found at the ancient Thebus in the Delta, and now in the Cairo Museum (Nos. 482–486 in the catalogue). These are modelled in the form of a lotus blossom, most graceful in design, but are apparently not earlier than the 4th century B.C. Of the splendid toretic art of a thousand years before, of which we gain an idea from the wall-paintings mentioned above, but few actual specimens have survived. The Louvre possesses a fine gold patera, 63 in. across, with figures of fishes within a lotus border in repoussé work; an inscription on the rim shows it to have belonged to Thutii, an officer of Tethmosis III. (Mém. soc. ant. de France, xxiv. 1858). Thutii’s bowl is a typical specimen of the Egyptian plate of the XVIIIth Dynasty, and its design is precisely that of the hundreds of blue glassed faience bowls which were made at the time, and of which some perfect specimens and many fragments (especially from Deir el-Bahri) are in our museums. These were imitated from metal originals, just as most of the early Cretan pottery vessels were.

A splendid bronze bowl, which shows us what some of the finer gold and silver plate was like, was found in the tomb of Hetaai, a dignitary of the XVIIIth Dynasty, at Thebes a few years ago, and is now in the Cairo Museum (No. 3553 in von Bissing’s catalogue). The engraved decoration, representing birds and animals in the papyrus-marshes, is very fine and evidently of native Egyptian work. The silver bowl at Berlin, said by di Cesnola to have come from Athinou in Cyprus, is certainly of XVIIIth Dynasty date, but, though purely Egyptian in style, more probably of Phoenician than Egyptian workmanship.

Assyrian and Phoenician Plate.—The art of making gold and silver plate, whether it originated in Egypt and passed thence to Crete or not, was evidently on its own ground in Egypt and in Minoan Crete. In Asia it was an exotic art, introduced from Egypt through the Phoenicians. In fact, it may be doubted whether any of the bronze imitations of plate found in Assyria are of Assyrian manufacture; they are probably Phoenician imports. The British Museum possesses a fine collection of these bowls, mostly found in the palace at Nimrud, and so dating from the 9th and 8th centuries (reigns of Assur-nazir-pal to Sargon). Though they are made of bronze, and only occasionally ornamented with a few silver studs, they are evidently the production of artists who were accustomed to work in the precious metals, some of them in fact being almost identical in form and design with the silver phialae found at Curium and elsewhere in Cyprus. They are ornamented in a very delicate and minute manner, partly by incised lines, and partly by the repoussé process, finally completed by chasing. Their designs consist of a central geometrical pattern, with one or more concentric

![Fig. 1. Gold Vase, from wall-paintings at Thebes.](image1.png)

![Fig. 2. Silver Bowl, about 7 in. in diameter, found in a tomb in Cyprus, with repoussé reliefs of Egyptian and Assyrian style.](image2.png)
Bulls, for instance, are usually represented as with a single mighty horn, curving to the front (in the style of the ancient Babylonian seals), rather than with both horns showing, in Egyptian fashion. When figures and men are shown, the principal groups are purely Assyrian imitations of Assyrian temple-reliefs, in fact—such as the sacred tree between the two attendant beasts, or the king engaged in combat and vanquishing a lion single-handed; while mingled with these are figures and groups purely Egyptian in style, such as the hawk-headed deity, or a king slaying a whole crowd of captives at one blow. Occasionally one sees traces of the ancient Mycenaean influence, or perhaps rather of the young Ionian art which had now arisen out of the ashes of that of Mycenae. These Phoenician imitations are still good imitations. But a century or so later we meet with them again on the silver bowls and dishes from Cyprus, in which the imitations have become had. The same mixture of subjects was still in vogue, but confusion has been superadded to mixture, and we find kings in Assyrian robes and Egyptian wigs slaying Syrian dragons with Egyptian wings, and so on. Fig. 2 gives a silver dish from Curium containing examples of the above-mentioned subjects. It is a characteristic specimen of this mixed Phoenician art, of which di Cesnola seems to have collected a remarkable number of examples. In addition to the numerous silver phialae some few vases with spiral decoration, made of pure gold. To the same period as these bowls from Crete belong the similar specimens of Phoenician plate from Etruscan graves at Prerenza and Cervetri in Italy. Those from the Regolini-Galassi tomb can hardly be earlier than the 6th century, so that this peculiar Mischkunst of the later type may well be dated to the 7th-5th centuries.

Prehistoric Greece: "Minoan" and "Mycenaean" Periods.—In the early history of the goldsmith's art no period is more important than that of the Greek Bronze age, the period of the prehistoric civilization which we call "Minoan" and "Mycenaean," which antedated the classical civilization of Greece by many centuries, and was in fact contemporary and probably coeval with the ancient culture of Egypt. In Greece during this, her first, period of civilization, metal-work was extensively used, perhaps more extensively than it ever was in the history of later Greek art. So generally was metal used for vases that even as early as the "Middle Minoan" period of Cretan art (some 2000 years B.C.) the pottery forms are obvious imitations of metal-work. The art of the metal-worker dominated and influenced that of the potter, a circumstance rarely noted in Egypt, where, in all probability, the toleotic art was never so much patronized as in Minoan Greece, although beautiful specimens of plate were produced by Egyptian and Phoenician artists. Also but few of these have come down to us, and we are forced to rely upon pictured representations for much of our knowledge of them. It is otherwise in early Greece. We possess in our museums unrivalled treasures of ancient toleotic art inr precious metals from Greece, which date from about 2500 to 1400 B.C., and as far as mass and weight of gold are concerned are rivalled only by the Scythian finds. These are the well-known results of the excavations of Schliemann at Troy and Mycenae and of others elsewhere. They do not by any means suffer in point of additional interest from the fact that they were made and used by the most ancient Greeks, the men of the Heroic age, probably before the Greek language was spoken in Greece.

The most ancient of these "treasures" is that discovered by Schliemann in 1873 buried, apparently in the remains of a box, deep in the fortification wall of Hissarlik the ancient Troy. It consists of vases and dishes of gold and silver, and of long tongue-shaped ingots of silver. In consonance with the early date (perhaps about 2500 B.C.) to which they are probably to be assigned (Schliemann ascribes them to the second Trojan city) these objects are all of simple type, some of the vases being unornamented jugs with tubular suspension-handles on the sides. Here we have metal imitating stonework, as, later, pottery imitates metal. These are of silver. A unique form in gold is a boat-shaped cup with handles at the sides (Plate L, fig. 23), at Berlin, which weighs 600 grammes. One vase is of electrum (one part of silver to four of gold).

A treasure of much the same date (the second "Early Minoan" period, about 2500 B.C. or before) was discovered in May 1908 in graves on the island of Mochlos, off the coast of Crete, by R. B. Seager. This is, however, of funerary character, like part of the treasures discovered in the shaft-graves of Mycenae, and, while including diadems, golden flowers, olive branches, chains, and so forth, for the adornment of the dead, does not include much gold used by the deceased during life.

The much later Mycenaean treasures include both funerary objects of thin gold and objects of plate that had actually been used. Among the former should be especially noted the breastplates, diadems and masks which were placed on the bodies of the chieftains whom Schliemann, great in faith as in works, honestly believed to be Agamemnon and his court (and he may not have been very wrong). Among the latter we may mention the small flat objects of gold plate, little sphinxes and octopuses modelled in relief, small temples with doves, roundels with spiral designs, and so on, which were ornaments for clothing, and the golden plate decorations of weapon-handles. The greatest beauty of the usual bulls' head with the gold rosette on its forehead is the beautiful shape, which may perhaps have been stamped single-handed, a beautiful object of price, or silver were brought by Minoan ambassadors as presents to the Egyptian court in the reign of Thothmes III. Gold and silver vases were found both in the shaft-graves, in the treasure-pit close by, and in chamber tombs at Mycenae. The most usual shape in the shaft-tombs is that well known to us from the vases of Vaphio, described below; among other types may be mentioned specially the ἄγανα ἄβυξτωμα with doves feeding above its handles (Plate I., fig. 21; from a restored reproduction).—sce χρυσόν νόμισμα φρουρίων ταύρων κατόρθωσιν ταυροθνητον; the golden jug with spiral decoration from the fourth grave; and the cup with lions of Egyptian appearance chasing each other round its bowl, found in grave 5. The fragment of a silver vase with a scene in high relief of slingers and bowmen defending their town against besiegers from grave 4 (Plate L., fig. 22), is an object unrivalled in ancient art. On this, as on the bull's head, we have gold overlaid on silver (with an intermediate plating of copper); on a silver cup from the same grave we find gold inlay, and on another silver cup, from a chamber-tomb, enamel and gold inlaid. How the Minoan goldsmith could combine silver with gold and the two with bronze we see on the marvellous inlaid dagger-blades from Mycenae, with their pictures in many-coloured metals of lion-hunts, cats chasing birds, and so forth, which show that he was perhaps the greatest master of all time in this art.

We speak of him as "Minoan," because most of the metal objects found at Mycenae are, if not of actual Minoan workmanship and imported from Crete, at any rate designed in accordance with the Minoan taste of the "Great Palace Period" (Late Minoan i. and ii.) at Cnossus. They are only "Mycenaean" in the sense that they were found at Mycenae. Of the art of the gold vase maker in the Mycenae period properly speaking (Late Minoan iii.) we obtain an idea from the pictures of golden Bügelkränze with inlaid designs of zigzags, &c., represented on the walls of the tomb of Rameses III. at Egyptian Thebes. The objects from the Mycenaean shaft-graves are much older than this, as are also those from the next treasure we shall mention, that from Aegina, now in the British Museum. The gold cups and other objects of this treasure, with their fine but simple decoration, are certainly to be ascribed to the best Minoan period, although when first published Dr A. J. Evans was inclined to assign them to so late a date as c. a.D. 800. They are surely some seven hundred years older, having no characteristic of the decadent "sub-Mycenaean" period, as
Dr. Evans would doubtless now agree. These objects were probably found in a tomb.

Dr. Evans's excavations at Cnossus, those of the Italians at Phaistos and Hagia Triada and those of the British school at Palaiokastro have not produced any very striking examples of the Minoan goldsmith's art in his own country, though splendid bronze bowls and vases have been found, which give us a good idea of what the plate must have been like, as do also the gilt steeple imitations of plate mentioned below. One of the bronze vases from Cnossus exactly resembles one of gold and silver which was brought to Egypt by the ambassador in Queen Hatshepsut's time (tresco in the tomb of Senmut). But we possess a fine silver cup (of the Middle Minoan period) from the American excavations at Gournia, and two examples of the finest Minoan gold plate, which were discovered outside Crete, in the famous "Vaphio cups," with their embossed representations of bull-netting, which have been illustrated so often as triumphs of ancient art (Plate I, figs. 24, 25). These are of Cretan workmanship, though found in Laconia, and are no doubt contemporary with the vases of black steeple with reliefs showing a harvest-home procession, gladiatorial combats, and a king receiving or bidding farewell to a warrior with his armed followers, which have been found by the Italians at Hagia Triada in Crete. These were originally overlaid with gold leaf, and are undoubtedly imitations in a cheap material of golden embossed vases of the same style as those found at Vaphio. For some time came the objects of gold and the silver plate found by the expedition of the British Museum at Enkomi in Cyprus, which perhaps represent a somewhat later phase of Minoan art, but certainly cannot now any longer be regarded as belonging to the very late period to which they were at first assigned. One silver vase found at Enkomi is of the "Vaphio" shape, which first appears in Cretan pottery as early as the Middle Minoan period, contemporary with the XIIth Egyptian Dynasty (c. 2000 B.C.), and even then is clearly an imitation of a metal original. Slightly modified, this type remained late in use, as we find it represented among other gold vases on the walls of the tomb of Imish or Imadou, an Egyptian official of the time of Rameses IX. (c. 1100 B.C.) at Thebes. But some, at least, of the Enkomi finds must be earlier than this.

The Egyptian representations of Minoan vases of gold and silver in the tomb of Senmut at Thebes (c. 1500 B.C.) and of later Mycenaean golden Bügelkanne in that of Rameses III. (c. 1150 B.C.) have been mentioned already. During the age of Mycenaean and sub-Mycenaean decadence the art of the Greek goldsmith necessarily passed through a period of eclipse, to arise again, with the other arts, in rich and luxurious Ionia probably. The Homeric poems preserved for later days a traditional echo of the glorious works of the metal-workers of the Heroic age.

Etruscan Plate.—The Etruscans were specially renowned for their skill in working all the metals, and above all in their gold work. Large quantities of exquisite gold jewelry have been found in Etruscan tombs, including, in addition to smaller objects, sceptres, wreaths of olive, and plates decorated with filigree-work and animal figures, which were used as personal ornaments (breastplates, girdles, diadems, &c.). In the Museo Kircheriano in Rome is a magnificent specimen of the last form of ornament; it is covered with nearly a hundred little statuettes of lions arranged in parallel rows; and the Vatican (Museo Gregoriano) possesses a very fine collection of similar objects from the "Regolini-Galassi" tomb at Caere. Little, however, that can be classed under the head of plate has yet been found.

Hellenic Plate.—The period of "geometrical" art which followed the Mycenaean age was one of decline in material prosperity and artistic skill. We possess some specimens of the work then produced in the precious metals in the gold diadems placed on the head of corpses interred at Athens (Archaeologische Zeitung, 1884, pls. viii., ix; cf. Athenische Mittheilungen, 1896, p. 367; and G. Perrot and C. Chipiez, Histoire de l'art dans l'antiquité, vii. 245). The period of Oriental influence is represented by the finds of gold ornaments made at Camirus in Rhodes (see Greek Art, fig. 11). Fig. 3 shows a silver cup, with gold mounts, also found at Camirus, apparently a work of the same early date. A remarkable find of gold objects was made in 1882 at Vettesfelde in Brandenburg; the principal piece was a gold fish (see Greek Art, fig. 10) with ornaments in relief. These objects recall by their style early Ionic art, but were probably produced in one of the Black Sea colonies, since similar objects have been found, together with later work, in Crimean graves (see below), and exchanged for the amber of the Baltic coasts. Cnossus especially encouraged the art, and paid enormous sums for silver vases and cups to the most renowned artists of his time, such as Glaucus and Theodorus the Samian.

The British Museum possesses a fine specimen of archaic Greek plate, found at Agrigentum in Sicily. This is a gold phial or bowl, about 5 in. across, with central boss or omphalos (φυλαχ χρυσόφαλος) which seems once to have contained a large jewel. Round the inside of the bowl are six figures of oxen repoussé in relief, and at one side a crescent, formed by punched dots. A delicate twisted moulding surrounds the edge; the workmanship of the whole is very skilful (see fig. 4).

Pliny (N. H. xxxiii. 154 sqq.) gives a brief valuable account of the art of silver chasing (cadatura, Gr. ῥωπευτικόν).

In the best times of Greek art the chief works in gold and silver seem to have been dedicated to religious purposes, and to have been seldom used for the ostentation of private individuals. Vessels for the use of the temples, tripods in gold or silver

of the richest work, and statues of the gods were the chief objects on which the precious metals were lavished.\footnote{The gold eagles on the sacred omphalos at Delphi were notable examples of this; see Pindar, \textit{Pyth.} iv. 4.}

The gold used by the Greeks probably came from Asia Minor or Egypt, while the mines of Laurium, in the mountains which form the promontory of Sunium in Attica, supplied an abundant amount of silver for many centuries. According to Pliny, the last-mentioned cup, which weighed 2 oz., was sold for 10,000 denarii (\$350). It is worthy of note that a large number of the artists named by Pliny were natives of Asia Minor; and

Pheidias was the first sculptor who produced works of great merit in the precious metals; he mentions a number of other Greek artists who were celebrated for this class of work, but does not give their dates. The chief of these were Mentor and Mys (both of the 5th century B.C.), Acragas, Boethus, the sculptors Myron and Stratoniceus, as well as the well-known Praxiteles and Scopas. In Pliny's time many works in gold and silver by these artists still existed in Rhodes and elsewhere. Among later workers he specially mentions Zopyrus, who made two silver cups, embossed with the scene of the judgment of Orestes by the Areopagite court,\footnote{It has been thought that a silver cup in the Corsini collection of Ulysses and Diomedes carrying off the Palladium. Enormous prices were given by wealthy Romans for ancient silver plate made by distinguished Greek artists; according to Pliny, the last-mentioned cup, which weighed 2 oz., was sold for 10,000 denarii (\$350). It is worthy of note that a large number of the artists named by Pliny were natives of Asia Minor; and} and Pytheas, who made a bowl with reliefs.

It is very probable that the Asiatic school of silversmiths had at least as much influence on Roman caelatura as that of Alexandria, whose importance has been overrated by Schreiber.

The finest extant examples of Greek plate are those found in the tumuli of south Russia, especially in the neighbourhood of Kerch, the ancient Panticaeum. Fig. 5 shows a silver vase found in 1862 at Nikopol in the tomb of a native Scythian prince. The native horse-tamers of the steppes are represented on the shoulder with wonderful naturalism, and the work is beyond doubt that of an Athenian artist of the 4th century B.C. Splendid examples of gold-work were found in the tumulus of Kuloba, about 65 kilometres from Kerch, which was excavated in 1839 and found to be the burial-place of a Scythian prince and his wife. The jewelry and plate found in this tomb, which were clearly of Greek origin, comprised (amongst other objects) an electrum vase 13 cm. high, representing Scythians in their native costume, one of whom is extracting a neighbour's tooth, another binding up a wound, a third stringing a bow, besides several silver vases and two gold medallions with reproductions of the head of the Athana Parthenos of Pheidias. In these Scythian tombs are often found golden crowns in the form of oak leaves, some of which belong to late Roman times. The finest extant example of a gold wreath, however, is that discovered at Armanto in south Italy and preserved in the Antiquarium at Munich; it bears an inscription of the 4th century B.C., showing that it was dedicated by a certain Kreithonios. In 1812 Dr Lee discovered at Ithaca a beautiful crater, 23 cm. high (see fig. 6), and a phiale or patera, 63 cm. across, both of silver, repoussé and chased, with very rich and graceful patterns of leaves and flowers picked out with gilding.\footnote{These are probably not later than the 5th century B.C. Many silver mirror-cases, with repoussé figure-subjects in high relief, have been found at various places; as, for instance, one with a beautiful seated figure of Aphrodite found at Tarentum and now in the British Museum.} These are probably not later than the 5th century B.C. Many silver mirror-cases, with repoussé figures in high relief, have been found at various places; as, for instance, one with a beautiful seated figure of Aphrodite found at Tarentum and now in the British Museum.\footnote{Ibid. xxxiv. 265-272.}

The Victoria and Albert Museum contains an exquisite little silver vase, found in the bowl of Apollo at Vicarello in Italy (fig. 7), enriched with a band in low relief of storks devouring serpents executed with gem-like minuteness and finish—probably not later than the 3rd century B.C. The British Museum has a little vase of similar form and almost equal beauty, though perhaps later in date; it is decorated with bands of vine branches in a graceful flowing pattern, and is partly gilt.

**Greek-Roman Plate.**—During the last century of the Republic the growing luxury and ostentation of the wealthy Romans found expression in the collection of elaborate specimens of plate.

The works of the old Greek masters were the most highly prized, but contemporary artists, such as Pasiteles, also attained distinction in this branch of art. Amongst the numerous finds of silver plate made in modern times we may distinguish (a) temple treasures made up of votive offerings, such as the treasure of Bernay in France (dep. Eure), discovered in 1830 and preserved in the Cabinet des Médailles, which belonged to the shrine of Mercurius Canetonennis; (b) private collections.

**Plate.**

whose decoration recalls that of the Ara Pacis Augustae (see Roman Art), and a clyix with a seated figure of Athena in high relief, soldered on to the centre of the bowl, which appears to be of Greek workmanship. Such detachable figures were termed *emblemata*; in the Bosco Reale treasure is a cup with such a bust, typifying the province of Africa. Great value was also set upon *crustae*, i.e. bands of *repousse* work forming an outer covering to a smooth silver cup (cf. the Rothschild vases, Roman Art). Such works commonly have Latin inscriptions incised on the foot giving the weight of the piece, the cup and *emblemata* being weighed separately. The artistic value of Roman plate is discussed under Roman Art.

Among later specimens of Roman plate the most remarkable is the gold *patera*, nearly 10 in. in diameter, found at Rennes in 1777, and now in the Paris Bibliothèque—a work of the most marvellous delicacy and high finish—almost gem-like in its minuteness of detail. Though not earlier than about 210 A.D., a slight clumsiness in the proportion of its embossed figures is the only visible sign of decadence. The outer rim is set with sixteen fine gold coins—*aurii* of various members of the Antonine family from Hadrian to Geta. The central *emblemata* or medallion represents the drinking contest between Bacchus and Hercules, and round this medallion is a band of *repousse* figures showing the triumphal procession of Bacchus after winning the contest. He sits triumphant in his leopard-drawn car, while Hercules is led along, helplessly intoxicated, supported by bacchantes. A long line of nymphs, fauns and satyrs complete the circular band.

Late Roman plate is also represented by a series of large silver dishes, to which the same *missorium* is often, though perhaps wrongly, applied. These were used for presentations by emperors (whose portraits they sometimes bear) and distinguished officials. Three are preserved in the Cabinet des Médailles of the Bibliothèque Nationale at Paris—the "shield of Scipio," found in the Rhone near Avignon, about 26 in. in diameter, with a relief representing the restoration of Briseis to Achilles;¹ the "shield of Hannibal,"² chiefly remarkable for its size (it is 72 cms. in diameter and weighs 10 kilogrammes); and a third, decorated with a group of Hercules and the Nemean lion.³ Other well-known examples of this form of art are the ¹ C. S. Reinaud in Gazette des beaux-arts (1896).
³ Cf. E. Piot, in Gazette archéologique (1886).
the shield of Theodosius at Madrid (fig. 9), which represents the emperor seated between Valentinian II. and Arcadius; the shield of Valentinian at Geneva; the shield of Aspar at Florence; and a fine dish found at Aquileia, now at Vienna.  

The British Museum contains some fine specimens of late Roman silver work, found on the Esquiline in 1703 (cf. Visconti, Una Suppellettile d'argento, Rome, 1825; the objects are published and described in Mr. Dalton's Catalogue of the Early Christian Antiquities in the British Museum, pp. 61 sqq., pls. xii.-xx.). The most remarkable of these are: (i) a silver casket decorated in repoussé, with the inscription SECONDE ET PROJECTA VIVATIS IN CRISTO, doubtless a wedding gift to a couple bearing the names of Secundus and Projecta, whose portraits appear in a medallion on the centre of the lid; (ii) four statuettes representing personified cities—Rome, Constantinople, Antioch and Alexandria (cf. F. Gardiner in J. H. S., 1888, ix. 77 sqq.). This treasure appears to belong in the main to the 5th century A.D., though some minor pieces may be earlier.

BIBLIOGRAPHY.—A general account will be found in Smith's Dictionary of Antiquities, 3rd ed., s. v. "Caetaria" (without illustrations), and in Durm s and Sigg's Dictionnaire des antiquités, under the same heading (with illustrations). The passages in ancient writers which refer to the art will be found in Oberbeck's Antike Schrifftüellen Nos. 2167-2205; Pliny's account is most conveniently studied in K. Jca-Blake and E. Sellers, The Elder Pliny's Chapters on the History of Art, pp. 2 sqq. The finds made in southern Russia were published in the Antiquités du Bosphore cimmérien (St Petersburg, 1854); the Complete rendus de la comm. des antiquités de la Scythie (1866-1737). The first of these works, which is very rare, has been republished on a reduced scale by M. Salomon Reinach, in his Bibliothèque des monuments figurés (Paris, 1892) with notes; and all the more important objects are figured in Antiquités de la Russie méridionale, by Kondakoff, Tolstoy and Reinach (Paris, 1891-1892). For Graeco-Roman plate-metalwork, most important works are Héron de Villefosse's publication of the Bosco Reale treasure, in the Monuments Prot, vol. viii. (cf. the articles by the same author and M. Théodent on "Les Trésors de la valise d'argent trouvé en Gaule," Gazette archéologique, 1883-1884), and Der hildesheimer Silberfund, by H. Perinée and F. Winter (Berlin, 1901). Reference should also be made to T. Schreiber, "Die alexandrinische Toreiktis," (Abhandlungen der sächs. Gesellschaft der Wissenschaften, 1894, vol. xiv.), whose theories are somewhat exaggerated; and A. Odobescu, Le Trésor de Petroas (1889-1900), which deals with a find of barbaric plate and jewellery made in Russia, but gives much information on the history of the art. For early Greek work, see R. Schneider, "Goldtypen des griechischen Orientes," (Abhandlungen der gietschischen Gesellschaften, 1890, p. 204), and A. Furtwängler, Der Goldfund von Vetelesfield (1883). For Etruscan metal-work, see J. Martin, L'Art étrusque, ch. xvii. An interesting popular account of ancient work in precious metals may be found in T. E. Populer's Handbook to the Greek and Roman Antiquities in the British Museum, pp. 569 sqq. (H. S. J.)

Oriental, African Plate, &c.—Some very curious pieces of plate, both in gold and in silver, have been found in northern India in which country the goldsmith's art is of great antiquity; these appear to be of native workmanship, but the subjects with which they are embossed, and the modelling of the figures, show that they were produced under late Roman influence, or in some cases possibly even Greek influence in a highly degraded state, handed down from the time of Alexander's Indian conquests. A fine gold casket (Buddhist relic) said to date from about 50 B.C. is worthy of note.  

The British Museum is an Indian silver dish (3rd-4th century A.D.) and an earlier one, ascribed to c. A.D. 200.  

Under the Sassanian kings of Persia (from the 3rd to 6th centuries) very massive and richly decorated gold vases, bowls, and bottles were made (fig. 10). Those which still exist show a curious mingling of ancient Assyrian art with that of Rome in its decline. Reliefs representing winged lions, or the sacred tree between its attendant beasts, alternate with subjects from Roman mythology, such as the rape of Ganymede; but all are treated alike with much originality, and in a highly decorative manner. A fine example of Persian work of the early 10th century (dated 817) is the circular gold dish, richly enamelled, which is in the Victoria and Albert Museum, where a large collection of Oriental plate may be studied. Here may be seen a gold rose-water sprinkler of gold, entirely covered with richly enamelled flowers, Mogul work, 17th century; fine Burmese gold work found in A.D. 1484-1485 in a Buddhist temple, Rangoon; remarkable gold ornaments of the Burmese regalia; and a large elephant howdah, from the Punjab, made of silver, parcel gilt, the top covered with silver plates of large repoussé foliage. Tibetan craftsmen work is represented by numerous vessels for sacred and domestic purposes, mostly of metal, partially mounted in silver, which display the skill of the Tibetans in the 10th century. Of the skill of the Hindus as goldsmiths, abundant evidence is afforded by the Kamayana and Mahabharata, though very little of their ancient gold and silver work has survived. In India the people of the Cashmere valley have long been famous for their natural superiority as craftsmen, as was Lucknow for its utensils of gold and silver, much of it richly enamelled in the 18th and 19th centuries. Chanda in the Central Provinces was once celebrated for its skilled goldsmiths, and the plate of Cutch and Gujarat in the Bombay Presidency has enjoyed a well-deserved reputation. The uncontaminated indigenous designs of the Sind goldsmiths' work call for special notice. Indian plate, as is quite natural, has often been influenced by European designs: for instance, the beautiful gold and silver work of Cutch is Dutch in origin, while the ornate throne of wood covered with plates of gold, early 19th century, used by Ranjit Singh (at South Kensington) also displays European influence. Much of the Siamese decorative plate of the 18th and 19th centuries is of silver-gilt and nielloed. In the Rijks museum, Amsterdam, is a collection of silver dishes, boxes of gold and silver, jewelry, &c., all of excellent workmanship, from Lombok. African goldsmiths' work is represented in the British Museum by the gold ornaments from Ashanti, where there are also some gold ornaments from graves in Central America and Colombia. Ancient Abyssinian work can be studied at the Victoria and Albert Museum in the gold chalice, gold crown of the Abuna of Abyssinia, another more ornate crown of silver-gilt, a fine shield with silver-gilt filigree, and other objects.

The gold and silver work of Russia resembles in style that of Byzantium at an early period. Shrines and other magnificent pieces of plate in the treasury of the cathedral at Moscow (see Weltmann, Le Trésor de Moscou, 1861), though executed at the end of the 15th and 16th century, are similar in design to Byzantine work of the 11th or 12th century, and even since then but little change or development of style has taken place.

The caliphs of Bagdad, the sultans of Egypt, and other Moslem rulers were once famed for their rich stores of plate,
which was probably of extreme beauty both in design and workmanship. Little or nothing of this Moslem plate now remains, and it is only possible to judge of its style and magnificence from the fine works in brass and other less valuable metals which have survived to our time.

Towards the end of the 10th century the Rhine valley became the centre of a school of goldsmiths, who produced splendid examples of their work—a mixture of Byzantine art with their own original designs. The book-covers, portable altars and other objects, preserved at Trier and Aix-la-Chapelle, are notable examples produced at that centre. The magnificent book-cover from Echternach, now at Gotha, is of the school of Trier.

Early Medieval Plate.—The Gothic, Gaulish and other semi-barbarian peoples, who in the 6th century were masters of Spain, France and parts of central Europe, produced great quantities of work in the precious metals, especially gold, often of great magnificence of design and not without some skill in workmanship. The Merovingians encouraged the art of the goldsmith by spending immense sums of money on plate and jewelry, though only two examples of their great wealth in church vessels have survived—the gold chalice and paten of Gourdon, now at Paris. Fine examples of Carolingian work, which was mainly wrought in the monasteries in the north of the Frankish dominions and on the Rhine, may be studied in the covers for the Gospels, in the Bibliothèque Nationale in Paris. In 1837 a large number of pieces of very massive gold plate were found at Petrossa in Rumania; much of this was unfortunately broken up and melted, but a considerable portion was saved, and is now in the museum at Bucharest. These magnificent objects are all of solid gold, and consist of large dishes, vases, ewers, baskets of open work, and personal ornaments (fig. 11). Some of them show a strong Roman influence in their design, others are more purely barbaric in style. To the first of these classes belongs a very fine phiale or patera, 10 in. in diameter. In the centre is a seated statuette of a goddess, holding a cup, while all round, in high relief, are standing figures of various male and female deities, purely Roman in style. Though the execution is somewhat clumsy, there is much reminiscence of classical grace in the attitudes and drapery of these figures. A large basket and other pieces, made of square bars of gold arranged so as to form an open pattern of stiff geometrical design, have nothing in common with the vessels in which Roman influence is apparent, and can hardly be the work of the same school of goldsmiths. The date of this Petrossa treasure is supposed to be the 6th century. The celebrated Gourdon gold cup and tray now preserved in Paris belong to about the same date. They are very rich and magnificent, quite free from any survival of classic influence, and in style resemble the Merovingian gold work which was found in the tomb of Childeric I. The cup is 3 in. high, shaped like a miniature two-handled chalice; its companion oblong tray or plate has a large cross in high relief in the centre. They are elaborately ornamented with inlaid work of turquoise and garnets, and delicate filigree patterns in gold, soldered on.

In the 6th century Byzantium was the chief centre for the production of large and magnificent works in the precious metals. The relics of the great wealth of Justinian and his successors filled the churches of Byzantium, not only with enormous quantities of gold and silver chalices, shrines, and other smaller pieces of ecclesiastical plate, but even large altars, with tall pillared baldacchini over them, fonts, massive candelaabra, statues, and high screens, all made of the precious metals. The wealth and artistic splendour with which St Peter's in Rome and St Sophia in Constantinople were enriched is now almost inconceivable. To read the mere inventories of these treasures dazzles the imagination—such as that given in the Liber pontificiorum of Anastasius Bibliothecarius, which includes the long list of treasures given by Constantine to St Peter's before he transferred his seat of empire to Byzantium (330), and the scarcely less wonderful list of gold and silver plate presented to the same basilica by Pope Symmachus (498–514). Some early Byzantine plate of the 6th century is in the British Museum; an inscribed paten of the 10th and 11th centuries is in Halberstadt Cathedral in Germany, and numerous ecclesiastical vessels are in the Treasury of St Mark's, Venice.

Early in the medieval period France and other Western countries were too little behind Italy and Byzantium in their production of massive works, both secular and religious, in the precious metals. At this time every cathedral or abbey church in Germany, France and even England began to accumulate rich treasures of every kind in gold and silver, enriched with jewels and enamel; but few specimens, however, still exist of the work of this early period. The most notable are Charlemagne's regalia and other treasures at Aix-la-Chapelle, a few preserved at St Peter's in Rome, and the remarkable set of ecclesiastical utensils which still exist in the cathedral of Monza near Milan—the gift of Queen Theodelinda in the early part of the 7th century. The treasure of Nagy-Szent-Miklos, consisting of several vessels of gold, of Hungarian origin (8th–9th century), is in the Imperial Museum at Vienna.

The existing examples of magnificent early work in the precious metals mostly belong to a somewhat later period. The chief are the gold and silver altar in Sant' Ambrogio at Milan, of the 9th century; the "Pala d'Oro," or gold retable, in St Mark's at Venice, begun in the 10th century; the silver altar-front in St Domenico's Church at Palermo; the shrine of silver-gilt (with later additions) in the church of St Simeon at Zara, Dalmatia, by Francesco di Antonio of Sesto near Milan, 1350; and the gold altar-frontal given by the emperor Henry II. and his wife Cunigunde, at the beginning of the 11th century, to the cathedral at Basel. The last is about 4 ft. high by 6 ft. long, repoussé in high relief, with figures of Christ, the three archangels, and St Benedict, standing under an arcade of round arches; it is now in the Musée Cluny in Paris. A similar gold frontal, of equal splendour, was that made for the archbishop of Sens in 999. This was melted down by Louis XV. in 1760, but fortunately a drawing of it was preserved, and is published by Du Sommerard (Album, 9th series, pl. xiii.). Reliquaries of great splendour were made of the precious metals, one of the most notable being that containing the skulls of the three kings in Cologne Cathedral. This shrine, which resembles in form a building of two storeys, was wrought in the 12th century. The covers of the Textus in the Victoria and Albert Museum are highly important examples of goldsmiths' work; they are of gold and silver, decorated with enamel and set with stones, probably dating from the 12th century.

Celtic.—The skill in metal-working of the Celtic people in the British Islands, especially in Ireland, in Pagan and Christian times, is well known, and need hardly be emphasized here. While much has perished, much happily remains in proof of their extraordinary skill in working gold and silver, particularly in jewelry. The most remarkable specimen of their technical skill and artistic perception is the famous Ardagh chalice of the 9th–10th century (in the museum at Dublin) (Plate II., fig. 31), which is composed chiefly of silver, with enrichments of gold and gilt bronze, and with exquisite enameles. The interlaced ornament is a feature of Celtic work, and may further be studied in the celebrated Tara brooch, one of the finest among the enameled pieces, which despises as well as in other exquisite examples of jewelry. Further evidence of Celtic skill is forthcoming in the shrines for the sacred bells in Ireland, not to mention other ecclesiastical

---

2 See D'Ancourt, Histoire de l'art (1823).
3 Arch. Jour., xiv. 8.
4 Archaeologia, xxx. 144–148.
ornaments. These are of great beauty, and the silver shrine of the bell of St Patrick (1091-1165) displays the interlaced scroll ornament in a striking degree. With the introduction of Gothic art into Britain the special characteristics of Christian Celtic art in Ireland gradually died out.

Anglo-Saxon—Judged by the examples of Anglo-Saxon jewelry discovered, the Anglo-Saxon craftsmen brought their art to a high state of perfection, though hardly equal in merit to the Celtic. A large quantity of their metal-work is of bronze, frequently enriched with gold and enamel. Happily, there is preserved one priceless specimen of the goldsmith's art of this period—namely, the famous Alfred jewel of gold, now in the Ashmolean Museum at Oxford, with a portrait, believed to be of Alfred the Great, in cloisonné enamel. Another notable specimen is the Ethelwulf ring in the British Museum. Though ecclesiastical vessels, doubtless of the precious metals, appear in Anglo-Saxon illuminated manuscripts, the only piece of plate of that time at present known is the plain silver cup of the latter part of the 9th century, found with gold and silver jewelry and pennies at Trehwiddle in Cornwall, which is now in the British Museum. There is, however, an important example of metal-work embellished with silver plates—namely, the portable altar of St Cuthbert at Durham.

A most valuable description of the various methods of work practised by gold- and silversmiths in the 11th and 12th centuries is given by the monk Theophilius in his Diversarum artium schedula (Hendriec's ed. 1847). He minutely describes every possible process that could be employed in making and ornamenting elaborate pieces of ecclesiastical plate—such as smelting, refining, hammering, chasing and repoussé work, soldering, casting (by the 'cire perdue' process), wire-drawing, gilding with mercury amalgam, and the application of niello, enamel and gems. The silversmith of those days, as in classical times, was not only a thorough artist with a complete sense of beauty and fitness in his work, but he was also a craftsman of the most varied fertility of resource, and made himself thoroughly responsible for every part of his work and every stage through which it passed—a most striking contrast to the modern subdivision of labour, and eagerness to produce a show of neatness without regard to real excellence of work, which is the curse of all 19th-century handicrafts, and one of the main reasons why our modern productions are in the main neither works of true art nor objects of real lasting utility.

Italian Plate.—Before the latter part of the 15th century, large pieces of silver work were made more for ecclesiastical use than for the gratification of private luxury. The great silver shrine in Orvieto Cathedral, made to contain the blood-stained corporal of the famous Bolsena miracle, is one of the chief of these. It is a very large and elaborate work in solid silver, made to imitate the west front of a cathedral, and decorated in the most sumptuous style of the period, covered with religious and secular relief, and a wonderful series of miniature-like pictures embossed in low relief and covered with translucent enamels of various brilliant colours. This splendid piece of silver work was executed about 1438 by Ugolino da Siena, one of whose other works, a fine reliquary, is also at Orvieto. The other most important pieces of silver work in Italy are the frontal and retable of St James in the cathedral at Pistoia and the altar of San Giovanni at Florence. On these two works were employed a whole series of the chief Tuscan artists of the 14th and 15th centuries, many of whom, though of great reputation in other branches of art, such as painting, sculpture on a large scale, and architecture, did not disdain to devote their utmost skill and years of labour, to work which we now as a rule consign to craftsmen of the smallest capacity. The following celebrated artists were employed upon the altar at Florence: Antonio Pollaiuolo, Michelozzo, Verrocchio, as well as less prominent artists, Betto Geri, Leonardo di Ser Giovanni and Betto di Francesco Betti.

Among the distinguished names of Florentines who during the space of one century only, the 15th, worked in gold and silver, the following may be given to suggest the high rank which this class of work took among the arts: Brunelleschi, Ghiberti, Donatelio, Luca della Robbia, the two Pollaiuoli, Verrocchio, Michelozzo, Ghildasio, Botticelli, Lorenzo di Credi, Baccio Baldini and Francia. The cities of Italy which chiefly excelled in this religious and beautiful class of silver work during the 14th and 15th centuries were Florence, Siena, Arezzo, Pisa, Pistola, Bologna, where there are fine 14th-century silver reliquaries executed by Jacopo Roseto da Bologna for the heads of St Dominic and St Petronio in the church of St Stefano, Perugia, where Paolo Vanni, Rossetto and others worked in the 14th and early 15th centuries, and Rome.

Owing to the demoralization and increase of luxury which grew in Italy with such startling rapidity during the early years of the 16th century, the wealth and artistic skill which in the previous centuries had been mainly devoted to religious objects were diverted into a different channel, and became for the most part absorbed in the production of magnificent pieces of plate—vases, ewers, dishes, and the like—of large size, and decorated in the most lavish way with the fanciful and over-luxuriant forms of ornament introduced by the already declining taste of the Renaissance. This demand created a new school of metal-workers, among whom Benvenuto Cellini (1500-1571) was perhaps the ablest and certainly the most prominent. His graphic autobiography makes him one of the foremost and most vivid figures of the wonderful 16th century, in which often the most brilliant self-indulgence was mingled with the keenest enthusiasm for art. The large salt-cellar made for Francis I., now at Vienna, is the only piece of plate which can be definitely assigned to Cellini. The splendid Farnese casket, with crystal plaques engraved by Giovanni di Bernardi, in the Naples Museum, has been wrongly attributed to Cellini. His influence on the design of plate was very great, not only in Italy and France, but also in Germany. During the 17th century fine pieces of plate were produced in Italy, many of them still retaining some of the grace and refinement of the earlier Renaissance. The papal treasure, containing priceless examples of the goldsmith's art, was almost entirely depleted by Pius VI. to pay the indemnity demanded by Napoleon. The tiara of Julius II. by Caradosso, and the splendid morse of Clement VII. by Benvenuto Cellini, coloured drawings of which are preserved in the Print Room, British Museum, are among the objects then destroyed.

A valuable source of study of Italian plate (now destroyed) is contained in the three volumes of drawings, executed between 1753 and 1764, by Grauenbroch, in the Museo Correr at Venice.

Germany.—From very early times Germany was specially famed for its works in the precious metals, mostly for ecclesiastical use. In the 15th century a large quantity of secular plate was produced of beautiful design and skilful workmanship. Tall-covered cups on the left, ornamented with open work, filled in with translucent enamels. German or Flemish, series of bosses something like a pineapple, beautified and tankards, enriched with Gothic cresting and foliage, are

---

3 See Eugène Plon, Benvenuto Cellini, 3a ed., &c. (1885); also Cellini's own work, Dell' Oreficeria (1550).
among the most important pieces of plate. During the 16th century Augsburg and Nuremberg, long celebrated for their silver work, developed a school of craftsmen whose splendid productions have often been ascribed to the great Cellini himself. In the first decade of the 16th century, Paul Müllner, a Nuremberg goldsmith, furnished Frederick the Wise with several silver-gilt reliquaries for his collection at Wittenberg. Later in the same century came the Jamnitzer family of Nuremberg, chief among them being Wenzel Jamnitzer, one of whose masterpieces, an enamelled silver centre-piece, belongs to the baroness James de Rothschild of Paris. Mathaeus Wallbaum of Augsburg was another celebrated goldsmith of the 16th century. His chief works are religious ornaments of ebony mounted in silver, and the Pommercher Kunstschrank in the Kunstgewerbe Museum, Berlin. But the chief German goldsmith of the 16th century was Anton Eisenhoit 1 of Warburg, who wrought the fine crucifix (1580), the chalice and other ecclesiastical vessels which belong to the Fürstenberg family. Other notable craftsmen of this period were Hans Petzolt and Melchior Bayr, the latter having made the silver altar (with scenes from the Life of Christ after Dürer) of the 13th century; the cup given by the emperor Frederick III. and Mathias Corvinus to Vienna in 1462, and the splendid ewer of Goslar, 1477, are notable specimens of early German work. Both these objects are the only public collections of German plate worthy of notice are the ‘Waddesdon’ 2 in the British Museum, and the Victoria and Albert Museum. Prior to its dispersal among its five daughters, the late baron Carl von Rothschild’s collection at Frankfurt-on-Main was the most extensive private collection in existence. The Gutmann collection, acquired by Mr J. Pier- pont Morgan, contains many rare pieces, as does that of the baronesses Alphonse and Salomon de Rothschild in Paris.

Many of the most beautiful vessels of crystal, agate, &c., formerly attributed to Italian artists, were carved and engraved and set in beautiful enamelled gold and silver mounts, in southern Germany, in the 16th and 17th centuries. At the end of the 17th and the beginning of the 18th centuries household plate and other ornaments were frequently decorated with painted enamels, mostly originating from Augsburg. Dinglinger of Dresden and his school at about this time exercised considerable influence in the production of ornaments in pearl and other materials, elaborately carved, mounted and enamelled.

Several specimens exist of the models of cups required of candidates for the rank of master-craftsmen in the second half of the 16th century. One of these, at the Victoria and Albert Museum, is believed to have been wrought by Martin Rehlein of Nuremberg in 1572-1575.3

Many of the famous 15th and 16th century artists—such as Martin Schön, Israel von Mecken, Aedgerever, Aldtordor, Brosamer, Peter Flöter, the Behams, Hopfer and Hans Holbein the younger, supplied the silversmiths with designs for plate. Several of Holbein’s original designs, including one for the gold cup probably wrought by his friend, John of Antwerp, for Queen Jane Seymour, are in the Print Room, British Museum, where there is also an original design for a table fountain by the celebrated artist, Albrecht Dürer. Virgil Solis of Nuremberg (1524-1562) was especially fertile in designing plate, and he executed a large series of etchings of designs for vases, cups, ewers, tazze, &c.4 Many of the German silver ewers and basins resemble those made in pewter at the end of the 16th century by François Briot and Gaspar Enderlein, who migrated from Switzerland to Germany.

Switzerland.—This country produced several silversmiths whose work in the main follows that of the German school. The three historical beakers in the national library at Zurich were made in that city from money sent out as gifts from England by the three English bishops, Jewel of Salisbury, Horn of Winchester, and Parkhurst of Norwich, in appreciation of the hospitality afforded them during their exile at Zürich, in the reign of Queen Mary I.5 Important plate was wrought at Berne, Rapperswill and other Swiss towns.

Russia.—In no country is the ecclesiastical and secular plate of greater interest than in Russia, where so many different influences have been at work in its designs and decoration—Byzantine, Oriental, Gothic, Renaissance, &c. The “golden age” of ecclesiastical art was undoubtedly the 17th century, when the churches and monasteries were being enriched with many priceless ornaments in the precious metals. Enamels of great richness—which had been introduced there by Hungarian artists—niello and precious stones were employed in the decoration. A drinking-cup or bowl exclusively Russian in form and character, known as bratina, was largely made (see the fine one of gold, enamelled and set with precious stones, in the royal collection at Vienna), as was a smaller bowl, called czarka, with a single handle. Another secular vessel, particularly Russian, is the kosz, a pointed or boat-shaped bowl with a long handle. Much of the domestic plate after Peter the Great’s time was influenced by that of western countries, particularly Germany.

Poland.—Though not without a character of its own, the

PLATE

eclesiastical plate of Poland 1 came under the influence both of Germany and Hungary. Many of the sacred vessels and late medieval times are decorated with enamels and niello. In the
17th century eclesiastical vessels encrusted with corals are met with, such as those given by Michael Wisniowiecki, king of
Poland, to the church of Czeuostochowa. A magnificent 17th-
century chalice of gold, beautifully enamelled, given by the
bishop of Plock and Breslau, son of Sigismund III., is in Plock
cathedral. Many important pieces of plate still exist in churches
in Poland, though a Polish origin is not claimed for them; for
instance, the 10th-century chalice at Trzemeszno, where there
is also another chalice of about the same period. The cathedral
of Cracow contains many priceless examples, such as the 14th-
century gold cross given by Casimir the Great; the gold crucifix
of Mathias Corvinus, and the gold reliquary, 16th century, of
St Stanislas, bishop of Cracow.

France.—France, like England, has suffered grievous losses
in its plate, though it can show a larger array of medieval
church vessels than can England. The chief specimens of
medieval plate are the 9th-century casket and the seated
statuette of St Foy (10th century) in the treasure of Conques;
the cross of Laon (c. 1200) in the Louvre; the chiorium (early
13th century) in the treasury of Sens; the cross of the same
period in Aniens Cathedral; the caskets of St Taurin (c. 1250);
the reliquary of St Epine, given by St Louis; the virgin
appy of Roncevaux (Navarre, 14th century); and the virgin
given by Queen Jeanne d’Evreux to St Denis in 1339. One of
the most cherished possessions of the British Museum is the
celebrated gold and enamel cup of the kings of England, French
work of the 14th century. No doubt the visit to Paris of Cellini
exercised a great influence in the goldsmith’s art there, though,
unfortunately, no examples have survived. The extravagances
of Louis XIV. and his court led to the destruction of all the royal
plate of France, as did the Revolution of 1789 of vast quantities
of domestic plate. It was not until the early part of the 18th
century that any signs of revival are visible in the art of the
silversmith. Chief among the Paris goldsmiths of that time are
Claude Ballin the younger, Thomas Germain, and, later in the
century, Francois Thomas Germain, who made the royal plate
of Portugal and several pieces for the court of Russia.

The Low Countries.—Flemish silversmiths of the late medieval
period were as skilful as they were in the Renaissance. So
little Flemish plate remains that pictures of the Flemish school
are recommended as the chief sources of study of ecclesiastical
vessels. A fine covered silver beaker, decorated with open
work and translucent enamel in the South Kensington Museum,
and another covered with figures and foliage in niello, in the
print room of the British Museum, are the earliest examples of
Flemish plate of the 15th century. A large triptych, 13th
century, is in the Rothschild bequest to the Louvre. Ornate
rosewater ewers and basins, which came in with the Renaissance,
such as the important pair dated 1555 in the Louvre, were
made at Antwerp and other places.

The Utrecht silversmith, Paul van Vianen (early 17th century)
rought many fine pieces of plate, including the silver bas-reliefs
in the Rijks Museum at Amsterdam, where there are five fine
bas-reliefs in silver by the Belgian silversmith, Mathias Melin.
Two other members of the same family, Adam and Christian
van Vianen, were also prominent silversmiths of this time.
An earlier Dutch silversmith, Christian van Vianen of Utrecht,
made the vessels for the altar of St. George’s Chapel, Windsor,
for Henry VIII.

Two important pieces of Dutch plate are the covered tazza-
shaped cup of William the Silent, date about 1573, belonging
to the earl of Yarborough, 2 and another large cup of the same
form (1595), known as the “Breda cup,” in the possession of
the Hoohenlohe family. Considerable quantities of plate were
produced at Amsterdam (where Johann Lutma the elder—d.
1660—was a well-known silversmith), Haarlem, the Hague and
many other places. The numerous 17th-century Dutch pictures
of still-life and other subjects afford opportunities for the study
of tazze, beakers and other domestic vessels in silver. Hendrik
Janssens, a Dutch engraver of about 1640, executed many designs
for goldsmiths and jewelers.

Spain and Portugal.—Spanish plate was largely influenced
in the middle ages by that of France and Flanders and the art
of the Moors. But little medieval plate exists in Spain, most of
it having been destroyed at the time when a taste for more
elaborate ornaments sprang up as a result of the introduction of
fresh wealth from the colonies in the New World. The following
elements may be singled out: a cross of wood, covered with gold
filigree work, set with stones (A.D. 808), in Oviedo Cathedral,
where there is also a larger cross of wood and gold, dating from
later in the same century. A Moorish casket of wood covered
with thin silver plates, in the Almudena Cathedral. The reliquary
of Alphonso III. and his queen (A.D. 866-868 covered with
embossed silver plate of the symbols of the evangelists; the 11th-
century chalice at Silos; chalices of the 13th and early 14th
centuries in the cathedrals of Santiago and Toledo; and Don
Martin’s great armchair, of wood covered with elaborate
silver-gilt plates, in Barcelona cathedral. The Spanish
monstrosities of the 15th century are noticeable because of the
Flemish influence displayed, while those of the early part of the
16th century, such as that by the celebrated silversmith, Enrique
Puig, in the cathedral of Cordova, is remarkable for its ornate
character. The latter’s grandson, Juan de Arfe y Villafane
(who wrote De varia commensuration, 1538, on silverwork and
other arts) became a chief maker of these magnificent
monstrosities; for instance, the celebrated example in Seville
cathedral. He was associated with Pacheco in executing
statues. About the 15th century Barcelona became famed as a
centre for the silversmith’s art, and the Libros de pasantia, or
silversmith’s examination books, still preserved in that city, contain a
large number of designs for jewel-work. Seville likewise had an
important gild of silversmiths, as did the following cities: Toledo,
Valladolid, Burgos, Cordova and Salamanca. The celebrated
family of Becerril wrought fine plate at Cuenca in the 16th
century. Many chalices and some domestic plate of the 16th
and early 17th centuries are embossed with small enamelled
disks, some of which show Saracenic influence in details. The
Victoria and Albert Museum possesses a fine collection of
Spanish goldsmith’s work.

Portuguese plate displays in its Gothic features a very florid
style, in imitation of that adopted by architects in the reign of
Don Manuel (1495-1521). A typical example of this extravagance
of Gothic motives may be seen in the monstrance of Belem,
which was made from gold brought from the East by Vasco da
Gama.

Austria and Hungary.—Austrian plate is, like that of Switzerland,
largely based on German models. The ecclesiastical plate of
Hungary in the 15th and 16th centuries is celebrated for its
enamelled work of a flowered design enclosed in filigree wire—
introduced from Italy. This enamelled decoration was con-
tinued in the 17th century, but without the filigree wire, and it
is then described as “Transylvanian.” Much of the secular
plate of the 16th and 17th centuries in north and east Hungary
is influenced by German plate, while that in Transylvania is
frequently inspired by Oriental design.

English.—There is a good deal of importance attached to
English medieval plate by Continental peoples, as there was to
the magnificent English illuminated MSS., and, later, to the
embroidered vestments, opus Anglicum. But, unfortunately,
the ruthless destruction of plate during the Wars of the Roses,
the Reformation and the Great Rebellion has spared but few
medieval pieces to which we can point. Under the name of
Protestantism every ecclesiastical vessel with a device savouring
of “popish superstition” was instantly destroyed. The inven-
tories of the great cathedrals and religious houses plainly reveal
their marvellous wealth in gold and silver vessels.

Norfolk is richer than any other county in pre-Reformation
cchalices and patens. 3 The well-known “Gloucester” candlestick,

PLATE

though composed of inferior metal, is an illustration of the fine plate wrought in England in the 12th century, while the ancient anointing spoon of the sovereigns of England at the Tower of London is an historical relic of the end of the 14th century (with the bowl altered for Charles II.). The earl of Carysfort is the fortunate possessor of a silver-gilt censer of about 1375 and an incense ship, of about 1400, found in Whittlesea Mere in 1550, and formerly belonging to Ramsey Abbey. Only one pre-Reformation English gold chalice has survived, which with its paten and a silver crozier was given to Corpus Christi College, Oxford, by its founder, Bishop Foxe (Plate II., fig. 26). Both bear the London date-letter for 1507–1508. Another historical relic which has come down to the present day, though in a restored form, is the gold ampulla of about the end of the 14th century in the Tower of London. The universities of Oxford and Cambridge, though sadly depleted of their plate, can still show some notable pieces. The earliest example at each is a drinking horn, both of the 14th century, at Queen's College, Oxford, and Corpus Christi College, Cambridge. Other notable horns are the Pusey horn; the celebrated Bruce horn, with the seals of John of Gaunt attached, and one at Christ's Hospital.

Mazer bowls, made of wood mounted in silver and even in gold, and frequently engraved with scriptural and other inscriptions (see Plate II., fig. 28), were popular drinking vessels in England in medieval times. Many of these have survived, the earliest specimen being one of Edward II. at Harbledown hospital. They ceased to be made after the reign of Elizabeth (Archæologia, i. 120). Medieval coco-nut cups, mounted in silver, are of frequent occurrence in England, the best known examples being in the possession of the colleges at Oxford and Cambridge and several of the city companies. As has been mentioned before, but few examples of early plate exist; the following is a brief list of some of the most notable pieces, other than those previously enumerated: the "Sokborn" cup (c. 1450), and the "Anathema" cup (1481–1482) at Pembroke College, Cambridge; the Leigh cup (1499) at Mercers' Hall; the ivory and silver cup (1525–1526) of the duke of Norfolk; the pastoral staff (c. 1567) at New College, Oxford; the Richmond cup (c. 1510) at Armourers' Hall; the "election cup" (c. 1520) at Winchester College; and the Foundress' plate, consisting of a fine covered cup (1455–1440), two salts (c. 1500), a beaker and cover (1507–1508), and a salt (1507–1508) at Christ's College, Cambridge. Of Elizabeth's reign, the finest examples are probably the salt of the Vintners' Company (Plate II., fig. 27), and the rosewater dish and ewer of the duke of Rutland. Stoneware jugs, as the well-known example (1581) from West Malling, Kent, and Chinese porcelain vessels were elaborately mounted in Elizabethan times, a goodly proportion of the former having been done by goldsmiths at Exeter.

The Celtic races of both England and Ireland appear to have possessed great wealth in gold and silver, but especially the former. It seems, however, to have been mostly used in the manufacture of personal ornaments, such as torques, fibulae and the like. A magnificent suit of gold armour, repoussé with simple patterns of lines and dots, was found some years ago at Mold in Flintshire, and is now in the British Museum. The amount of old jewelry found in Ireland during the past century has been enormous; but, owing to the unfortunate law of "treasure-trove," by far the greater part was immediately melted down by the finders. Little of this period that can be called plate has been discovered in the British Isles—unlike Denmark and other Scandinavian countries, where the excavation of tombs has in many cases yielded rich results in the way of massive cups, bowls, ladles and horns of solid gold, mostly decorated with simple designs of spirals, concentric circles, or interlaced grotesques. Others are of silver, parcel-gilt, and some have figure subjects in low relief (fig. 15). In like manner, during the Saxon period, though gold and silver jewelry was common, yet little plate appears to have been made, with the exception of shrines, altar-frontals and vessels for ecclesiastical use, of which every important church in England must have possessed a magnificent stock. With regard to English secular plate, though but few early examples still exist, we know from various records, such as wills and inventories, that the 14th century was one in which every rich lord or burgher prided himself on his fine and massive collection of silver vessels; on festive occasions this was displayed, not only on the dinner-table, but also on sideboards, arranged with tiers of steps, one above the other, so as to show off to advantage the weighty silver vases, flagons and dishes with which it was loaded. The central object on every rich man's table was the "nef"—a large silver casket, usually (as the name suggests) in the form of a ship, and arranged to contain the host's napkin, goblet, spoon and knife, with an assortment of spices and salt. No old English "nefs" are now known. Great sums were often spent on this large and elaborate piece of plate, e.g., one made for the duke of Anjou in the 14th century weighed 348 marks of gold. The English silversmiths of this period were highly skilled in their art, and produced objects of great beauty both in design and workmanship. One of the finest specimens of Edward III.'s plate which still exists is a silver cup belonging to the mayor and corporation of King's Lynn. It is graceful and chalice-like in form, skilfully chased, and decorated in a very rich and elaborate way with coloured translucent enamels (fig. 16) of ladies and youths, several with hawks on their wrists. Silver salt-cellers were among the most elaborate pieces of plate produced during the 15th century. Several colleges at Oxford and Cambridge still possess fine specimens of these (fig. 17); a favourite shape was a kind of hour-glass form richly ornamented, made between about 1490 and 1525.

![FIG. 15.—Silver Cup, 4½ in. high, with embossed gold band; found in a grave in the east of Zealand (Denmark). This cup dates from the earlier part of the Iron Age.](image1)

![FIG. 16.—Silver Cup, with translucent enamels. Probably English work of the 14th century.](image2)

![FIG. 17.—Silver-gilt Salt-cellar, 14½ in. high. Given to New College, Oxford, in 1493.](image3)
But few existing specimens of English plate are older than the beginning of the 15th century. Among the few that remain the principal are those—such as the two large silver-gilt ones found in the coffin of an archbishop of York, now used for holy communion in the cathedral, and a fine silver chalice from the church of Berwick St James, Wilts, now in the British Museum. Both this and the York chalices are devoid of ornament, and, judging from their shape, appear to be of the first half of the 15th century, which is the date of the fine medieval chalice and paten found near Dolgelly some years ago (the latter now believed in some quarters to be of German origin). Several Tudor cups are in existence: the celebrated one of 1521 (Plate II., fig. 30), an earlier one, 1500; two covered ones of about 1570 and one by Robert Wymewesold, respectively; one (1572) at Corpus Christi College, Oxford, and the Bodkin cup (1523) of the Corporation of Portsmouth. A very early beaker (1496) is in a private collection, as is also a small Tudor bowl (1523-1526). The earliest known chalices of silver include the Gourdon chalice and paten, the St Gozlin chalice at Nancy (10th century); the 12th-century specimen in the abbey of Wilten in Tirol.

It is interesting to note the various changes of form through which the ecclesiastical chalice passed from early Christian times till the 16th century. It was at first an ordinary secular cup with two handles, classical in form and of large capacity, because the laity as well as the clergy received the wine. The double handles were of practical utility in passing the cup round like a modern "loving cup." The first alteration was the omission of the handles, so that it took the form of a large hemispherical bowl, with a round foot, and a knop for security in holding it. For some centuries it appears to have been the custom for the priest to hold the chalice, while the communicant sucked the wine through a silver tube or "fistula." Some of the most magnificent early examples of this form of chalice have the bowl mounted in bands, set with jewels, and enriched with minute filigree work—a design which appears to have been taken from those cups, such as the four magnificent examples in the treasury of St Mark's at Venice, which have their bowl cut out of crystal, onyx or some other precious stone. The finest example of this class are the Ardagh chalice, now in the Dublin Museum, and the chalice of St Remigius, in Reims cathedral; both are most magnificent specimens of the taste and skill of 10th to 11th century goldsmiths. In the 12th and 13th centuries the design becomes simpler; there is a distinct shaft, extending above and below the knop; and on the foot is marked a cross, not found in the earlier ones, to show which side the priest is to hold towards himself at celebration. The next alteration in the form of chalice, which occurred in the 14th century, was to make the foot not circular in plan but polygonal or lobed, so that the cup might not roll when laid on its side to drain, after it had been rinsed out. This form lasted in most countries till about 1500, and in England till the Reformation. Then in the previous two or three centuries had been slowly reduced in size, owing to the gradually introduced practice of refusing the wine to the laity, was suddenly made more capacious, and the form was altered to the shape shown in fig. 18, in order that the Protestant "communion cup" might bear no resemblance to the old Catholic "massing chalice." This was ordered to be done in 1562 (see Arch. Journ. vol. 4, p. 53). The best account of the evolution in the form of English medieval chalices and patens is by W. H. John Hope and T. M. Fallow, in Archaeologia, vol. xlii.

Secular plate during the 15th and 16th centuries was frequently similar in style to that made in Germany, though the English silversmiths of the latter century never quite equalled the skill or artistic talent of the great Nuremberg and Augsburg silvers-workers. In the 17th century, during the reigns of James I. and Charles I., many fine pieces of plate, especially tall cups and tankards, were made of very graceful form and style. The greater part of these and all earlier plate, especially the fine collections belonging to the universities, were melted down during the Civil War. In Charles II.'s reign returning prosperity and the increase of luxury in England caused the production of many magnificent pieces of plate, often on a large scale, such as toilet services, wine-coolers, and even fire-dogs and other furniture. These are very florid in their ornament, much of it under Dutch influence, and mostly have lost the beautiful forms of the century before (fig. 19 and Plate II., fig. 29). In the earlier part of the 18th century the designs of English plate were to some extent influenced by the introduction of French ornaments by the large band of French silversmiths who sought refuge in England after the revocation of the edict of Nantes. Chief among these Frenchmen (though probably not a refugee himself) was Paul Lamerie, who produced a large number of notable specimens, the largest of which is a fine wine-cooler in the Winter Palace, St Petersburg. Through the greater part of the reign of George III. English plate is more remarkable for its plain solidity than for artistic merit. With the advent, however, of the talented architects, the brothers Adam, came a taste for plate with classical characteristics. The South Kensington Museum has a small, though fine, collection of plate, varying in size, from a pair of wine-glasses to a magnificent tea service.

**PLATE**

![Fig. 18.—Elizabethan Chalice.](image)

**Fig. 19.**—Covered Cup of Solid Gold, 6 in. high, c. 1660-1670. Given to Exeter College, Oxford, by George Hall, Bishop of Chester, in date from 1770 to 1788, in the Adam style. Many of Flaxman's designs were produced in plate, among the most important being the "Shield of Achilles," in silver-gilt, at Windsor Castle. Thomas Stothard, the painter, executed several designs for goldsmith's work for Rundell and Bridge.

**The Assay of Gold and Silver Plate.**—The primitive method of testing the purity of the metal was by marking a streak with it on the touchstone, and comparing the colour of the mark with that made by various pieces of gold or silver of known degrees of purity. Assay by cupellation is now employed for silver: a piece of the silver to be tested is melted with some lead in a cupel or bone-ash crucible; the lead is oxidized, and rapidly sinks into the bone-ash, carrying with it any other impurities which are present. The residue of pure silver is then weighed, and by its loss shows how much alloy it contained. Gold is now tested by an elaborate chemical process by which the trial bit is dissolved in acid, and then thrown down in the form of precipitate, which can be examined by a careful quantitative analysis (see ASSAYING).

The standard of purity required in the time of Edward I. was, for gold, that it should be of the "Paris touch," i.e. 191 carats out of 24. Before then 22 carats was the standard. Silver was to be "of the sterling alloy," viz. 11 oz. 2 dwt. to the pound. Except for a time during the 17th century this standard of silver has been kept up, and is still required by law.

**Hall-marks on Silver.**—In the 15th century the English Gild of Gold- and Silver-smiths had grown into great importance, and had acquired monopolies and many special privileges. In order to keep the standard up to the required purity the system of requiring each article to be stamped with certain marks was introduced by royal command. The first of these was the

PLATE

---

PLATEAU

PLATEAU (a French term, older platé, for a flat piece of wood, metal, &c., from flat, flat), in physical geography, an elevated region of level or gently undulating land-surface, the term being synonymous with a "table-land." The most clearly defined plateaux have plain flanks contrasted with their level summits, but the term does not necessarily connote a steep ascent from the surrounding country. Indeed, it is applied to such diverse forms as the high-lying plains encircled by the higher elevations of the Andes, and to those of the west of North America, which rise almost imperceptibly from the low central plains. A plateau may have its origin either in the upheaval of strata which preserve their original horizontal position during the process, or in the prolonged denudation of an originally broken surface. The two forms are distinguished respectively as Plateaus of Deposition and Plateaus of Erosion.

PLATED WARE, articles chiefly intended for table use consisting of an inferior metal or alloy covered by one of the precious metals, with the object of giving them the appearance of gold or silver. Before the introduction of electro-plating the method employed for silver-plating (the invention of which in 1742 is associated with the name of Thomas Bolsover, of Sheffield) was to fuse or burn together, by a flux of borax, a thin sheet of silver on each side of an ingot of base metal, generally copper, or German silver, which is an alloy of copper. The silver plates were firmly wired to the ingot, which was then placed in a heated furnace and brought nearly to the fusing-point of the silver. The artisan knew the exact moment to withdraw the ingot. When cold it was rolled down, to a sheet, and from such sheets "silver-plated" articles were made. Articles like dish-covers were originally only silver-plated on one side, and after being worked into shape were tinned inside with pure tin. In Birmingham bar-copper was the base metal used; where bare of silver this showed blood-red. The Sheffield manufacturers, on the other hand, used shot-copper mixed with brass (an alloy of copper and zinc) in the proportion of 40 to 60. In this way they got rid of the redness of the copper and rendered it harder, and their product is the "old Sheffield plate" (q.v.) that has become famous all over the world. This method of plating rapidly declined with the introduction of the newer process of electro-plating (q.v.), by which it has been superseded.

Plating with nickel is extensively used for bedsteads and other articles of upholstery, and for various parts of bicycles, steamships, railway carriages, &c. Steel sheets are also plated with nickel for cooking purposes, and iron is plated with brass.

PLATEN-HALLERMUND, AUGUST, Graf von (1760-1835), German poet and dramatist, was born on the 24th of October 1760 at Ansbach, the son of the Oberförstermeister in the little principality of that name. The latter, together with other Franconian principalities, having shortly after his birth become incorporated with Bavaria, he entered the school of cadets (Kadettenhaus) in Munich, where he showed early promise of poetical talent. In 1816 he passed into the royal school of pages (königliche Paggerie), and in 1814 he was appointed lieutenant in the regiment of Bavarian life-guards. With it he took part in the short campaign in France of 1815, being in bivouac for several months near Mannheim and in the department of the Yonne. He saw no fighting, however, and returned home with his regiment towards the close of the same year. Possessed of an intense desire for study, and findingarrison life distasteful and irksome, he obtained a long leave of absence, and after a tour in Switzerland and the Bavarian Alps, entered the university of Würzburg in 1818 as a student of philosophy and philology. In the following year he migrated to that of Erlangen, where he sat at the feet of F. W. J. von Schelling, and became one of his most devoted pupils. In 1819 he published a little volume of poems—Ghasden (1821), each consisting of ten to twenty verses, in which he imitates the style of Rückert—Lyrische Blätter (1821); Spiegel der Unlos (1822); Vermischte Schriften (1822); and Neue Ghasden (1823). These productions attracted the attention of eminent men of letters, among them Goethe, both by reason of their contents, which breathe the spirit of the East, and also of the purity and elegance

PLATEAU, JOSEPH ANTOINE FERDINAND (1801-1883), Belgian physicist, was born at Brussels on the 14th of October 1801, and died on the 15th of September 1883 at Ghent, where he had been professor of physics from 1835. He was a pupil and friend of L. A. J. Quetelet, who had much influence on the early part of his career. The more original investigations of Plateau refer chiefly to portions of one or other of two branches of science—physiological optics and molecular forces. We owe to him the "stroboscopic" method of studying the motion of a vibrating body, by looking at it through equidistant radial slits in a revolving disk. In 1839 he imprudently gazed at the midday sun for 20 seconds, with the view of studying the after effects. IV. The result was blindness for some days, succeeded by a temporary recovery; but for the next fourteen years his sight gradually deteriorated, and in 1843 he became permanently blind. This calamity did not interrupt his scientific activity. Aided by his wife and son, and afterwards by his son-in-law G. L. van der Mensbrughe, he continued to the end of his life his researches on vision—directing the course of the experiments which they made for him, and interpreting the bearing of the results. He also published a valuable analytical catalogue of all the more important memoirs which had been written, from the earliest times to the end of the 18th century, on his favourite theme of subjective visual phenomena. But even more extraordinary was the wealth of mental fuel which he drew from the physical forces, embracing hundreds of novel experiments whose results he saw only with others' eyes. These form the subject of his great work Statique expérimentale et théorique des liquides soumis aux seules forces moléculaires (2 vols., 1873), a valuable contribution to our knowledge of capillary phenomena. His son, Félix Auguste Joseph Plateau (b. 1841), became professor of zoology and comparative anatomy at Ghent in 1870.
PLATERSPIEL—PLATINUM

of their form and diction. Though he was at first influenced by the school of Romanticism, and particularly by Spanish models, yet the plays written during his university life at Erlangen, Der gläserne Pantoffel, Der Schatz des Rhamptoni, Beginnere, Treue um Treue, Dr. Varnum, with other poems, show a clearness of style and a connection foreign to the Romantic style. His antagonism to the literature of his day became more and more pronounced, and he ventured his indignation at the want of art shown by the later Romanticists, the inanity of the lyricists, and the bad taste of the so-called fate tragedies (Schicksalsfragöden), in the witty “Artisticophanie” comedies Die verwünschte Gabel (1826) and Der romantische Oedipus (1828).

The want of interest, amounting even to hostility, with which Platen’s enthusiasm for the purity and dignity of poetry was received in many literary circles in Germany increased the poet’s indignation. He left Germany, which he henceforth made his home, living at Florence, Rome, and Naples. His means were slender, but, though frequently necessitous, he felt happy in the life he had chosen, that of a “wandering rhapsodist.” Der romantische Oedipus earned for him the bitter enmity of Karl Immermann and Heinrich Heine, and in the literary feud which ensued Heine launched the most baseless calumnies at the poet, which had the effect of prejudicing public opinion against him. But he retained many stanch admirers, who delighted in the purity of the subject matter of his productions and their beauty of form and diction. In Naples, where he formed the friendship of August Kopsch, the poet and painter, were written his last drama Die Lia von Cambray (1843) and the delightful epic fairy-tale Die Aabassiden (1830; 1834), besides numerous lyrical poems, odes and ballads.

He also essayed historical work in a fragment, Geschichten des Königreichs Neapel (1838), without, however, achieving any marked success. In 1832 his father died, and after an absence of eight years Platen returned to Germany for a while, and in the winter of 1832–1833 lived at Munich, where he revised the first complete edition of his poems, Gedichte (1833). In the summer of 1834 he returned to Italy, and, after living in Florence and Naples, proceeded in 1835 to Sicily. Dread of the cholera, which was at that time very prevalent, induced him to move from place to place, and in November of that year he was taken ill at Syracuse, where he died on the 5th of December 1832. Like Heine himself, Platen failed in the drama, but his odes and sonnets, to which must be added his Polenlieder (1831), in which he gives vent to his warm sympathy for the Poles in their rising against the rule of the Tsar, are in language and metre so artistically finished as to rank among the best classical poems of modern times.

Platen’s Gesammelte Werke were first published in one volume in 1839, and have been frequently reprinted; a convenient edition is that edited by K. Goethe in Con 1851, and in the Wilhelmsblter (4 vols., 1852). His Tagebuch (1796–1825), was published in its entirety by G. von Laubmann and L. von Scheffler (2 vols., 1896–1900). See J. Minckwitz, Graf Platen als Mensch und Dichter (1883); P. Besson, Platen, étude biographique et littéraire (1894); O. Greulich, Platen’s Literaturkomödien (1901); A. Fries, Platen-Forschungen (1903); and R. Unger, Platen in seinem Verhältnis zu Goethe (1903).

PLATERSPIEL, BLATTERSPIEFE, a medieval simplified bagpipe, consisting of an inscription tube, a bladder and a chanter, the double reed in its socket at the top of the chanter being concealed within the bladder. In the platerspiel we recognize the early medieval chorus, a word which in medieval Latin was frequently used also for the bagpipe. In the earlier forms of platerspiels of which we possess illustrations, such as the well-known example of the 13th century reproduced by Martin Gerbert from MS. at St Blasius, the bladder is unusually large, and the chanter has, instead of a bell, the grotesque head of an animal with gaping jaws. At first the chanter was a straight conical tube terminating in a bell, as in the bagpipe. The later instruments have a pipe of larger calibre more or less curved and bent back as in the cromorne. One of these appears in the 13th-century Spanish MS., known as the Contigas de Santa Maria in the Escorial, together with a platerspiel having two pipes, a chanter and a drone side by side. Another is figured by Virgön (1511).

There was practically no technical difference between the bent platerspiel and the cromorne, the only distinction being the form and size of the air-chamber in which the reed was set in vibration by the compressed air forced into it through the inscription tube or the raised slit respectively of the two instruments. The earlier form of platerspiel is found at the end of the 15th century, in the magnificent Book of Hours, known as the Sforza Book (Brit. Mus.). An interesting allusion to the platerspiel occurs in an old English ballad. Eight shepherds were playing on various instruments, the next had an open bagpipe, the next had one pipe made of one bladder and of one reed, the third play it on one trumpet, etc., from which it is evident that the platerspiel retained its individuality and did not become merged in the bagpipe.

PLATFORM (Fr. plateforme, i.e. ground plan), a word now generally confined to a raised flat structure or stage, temporary or permanent, erected in a building or in the open air, from which speeches, addresses, lectures, &c., can be delivered at a public or other meeting. Similar structures of wood, brick or stone, are used in railway stations at such a level above the rails as to enable passengers to have easy access to the carriages; and in fortification the word is used of the raised level surface on which guns are mounted. The earlier uses of the word, such as for a plane geometrical figure, the ground plan of a building, and figuratively, for a plan, design, scheme, &c., are now obsolete. In a figurative sense the term is applied to a common basis on which members of a political party may agree, and especially in the United States to the declaration made by a party at a national or state convention.

PLATINUM [symbol Pt, atomic weight 195.0 (O=16)], a metallic chemical element. The name, derived from platina, the diminutive of Span. plata (silver), was first given to a mineral, platinum ore or native platinum, originally discovered in South America, from the resemblance to silver. Russia furnishes about 95% of the world’s annual supply of platinum.

Native platinum occurs usually in small metallic scales or flat grains, sometimes in the form of irregular nuggets, and occasionally, though rarely, in small crystals belonging to the cubic system. Grains of platinum have been found embedded, with chrome, in serpentinite derived from an olivine-rock, the metal having probably separated out from an original basanite magma. It is used to some extent also in veins in syenitic and other rocks.

Usually, however, platinum is found in detrital deposits, especially in auriferous sands, where it is associated with osmiridium (known also as iridium), chrome, magnetite, corundum, zircon, &c. The platinum has a steel grey or silver-white colour and a metallic lustre; is often magnetic, sometimes with polarity; has a hardness of about 4·5 and a specific gravity varying with its composition from 14 to 19. Native platinum usually contains more or less iron and copper, often gold, and invariably a small proportion of some of the allied metals—iridium, osmium, ruthenium, rhodium and palladium. From the associated metals it was named by J. F. L. Hausmann polyezene (Greek pols many, and pures, a guest), whilst from its occurrence as a white metal in auriferous alluvia it is sometimes known to miners as “white gold.”

Platina del Pindo was the name by which native platinum was first introduced into Europe from South America about the middle of the 18th century. Although it appears to have been known locally much earlier, the attention of scientific men in Europe was first directed to it by Antonio de Ulloa y Garcia de la Torre, a Spaniard who joined a French scientific expedition to Peru in 1735, and published in 1748 an account of his journey, in which he refers to platinum, though not making the name of the metal itself known. Sir William Watson, an English physician, had, however, in 1744 received some grains of the mineral, probably from the

same locality, though brought by way of Jamaica; and it was he who first described it in 1750 as a new metal.

Native platinum was discovered in 1819 in the gold washings of Verkhnyaja Tagil, in the Urals, but it was not until 1822 that its true nature was recognized. The chief Russian localities are in the districts of Nizhne Tagilsk and Goroblagodatsk, where it is found in shallow drift deposits, containing pebbles of serpentine, which represent the original matrix. The last district has acquired importance in recent years. Although the platinum-bearing gravels usually contain a very small proportion of the metal, the average in 1895 being only 1/200 of the ton, rich discoveries have occasionally been made in the history of the workings, and nuggets of exceptional size have been unearthed. The largest recorded specimens are one of 350 oz. from Nizhne Tagil, and another of 720 oz. from the Goroblagodatsk district.

In 1831, platinum ore was recognized in the gold-bearing deposits of Borneo, where it had previously been regarded as worthless, being known to the natives as mas kodok (frog gold). Although recorded from various parts of the island, its occurrence seems to be definitely known only in Tanah-Laut, in the south-east of Borneo. In Australia, platinum ore has been found near Fife (near Condobolin), New South Wales; whilst in New Zealand it occurs in sands and gravels in the Thames gold-field, the Takaka River and the Gorge River flowing into Awarua Bay. Many localities in North America have yielded platinum, generally in beach sands or in auriferous alluvia, and in some cases the deposits are of commercial importance. The metal is found in Alaska, British Columbia, Oregon (Douglas county) and California (Butte county, Trinity county, Del Norte county). It has been recorded also from the states of New York and North Carolina. In a nickeleriferous sulphide ore worked at Sudbury, in Ontario, platinum has been discovered in the form of an arsenide (PtAs), which has been called sperrylite by H. L. Wells, who analysed it in 1889, and named it after F. L. Sperry, of Sudbury. It belongs to the pyrites group, and is interesting as being the only known mineral in which platinum occurs in combination except as alloy.

Native platinum seems to be a mineral of rather wide distribution, but in very sparse quantity. The sands of the Rhine, derived from Alpine rocks, have been found to contain platinum in the proportion of approximately 0.0004%. It has also been found in the sands of the Ivalo River in Lapland; it is recorded from Røros in Norway; and it was detected by W. Mallet in some of the gold-sands of the streams in Co. Wicklow, Ireland.

The table shows the official amount (in ounces Troy) of platinum produced in Russia for certain years, the actual amounts are much larger:

(Rothwell's Mineral Industry, 1908.)

Platinum may be extracted from its ore by both wet and dry processes. In the latter method, due to H. Sainte-Claire-Deville and H. J. Debray, the ore is smelted in a furnace constructed of two blocks of lime, and the metallic button so obtained is re-melted in a reverberatory furnace with galeena or litharge, the lead platinum alloy being then cupelled, and the platinum fused into an ingot by re-smelting in a lime furnace (see Dingler's Polytech., 1833, p. 153; J. Chem., 1839, 154, p. 388, 1841, 185, p. 205). The platinum so obtained is not pure, but Wollaston's wet method the ore is dissolved in aqua regia, the osmiridum, ruthenium and rhodium being left unattacked, and the platinum and palladium precipitated as ammonium chloride in the presence of an excess of acid. The double chloride is then washed, dried and ignited, leaving a residue of metal. G. Matthey (Chem. News, 1879, 39, p. 175) obtains pure platinum from the rock powders by double amalgamation and treating the rhodium ammonium chloride by fusing with potassium and ammonium bisulphates into rhodium sulphate, which is then removed by extraction with water, when a residue of finely divided platinum remains. The German firm of Herius (in the way he has brought it with aqua regia and water under pressure, evaporate the solution to dryness, and heat the residue to 125°C. A clear aqueous extract of the residue is then subjected to hydrochloric acid and precipitated with ammonium chloride. The double chloride is ignited and the finely divided platinum so obtained is fused in the oxyhydrogen blowpipe.

Platinum is a greyish-white metal which is exceedingly malleable and ductile; the addition of a small quantity of iridium hardens it and diminishes its ductility very considerably. Its specific gravity is 20.5 to 21.71, and its mean specific heat from 0 to 100°C is 0.0323 (J. Viole, Comptes rendus, 1877, 85, p. 543); W. P. White (Amer. Jour. Sci., 1899, 8, p. 334) gives the general formula S = 0.97. The specific heat at 0°C. Its temperature of fusion is in the neighbourhood of 1700 to 1800°C, various intermediate values have been obtained by different investigators (see J. A. Harker, Chem. News, 1905, 91, p. 262; C. Féry and C. Chéneveau, Comptes rendus, 1909, 104, p. 401; also C. W. waist and G. H. Burgess, ibid., 1909, 148, p. 1177). Its latent heat of fusion is 27.18 calories (Viole, loc. cit.). The metal has been obtained in the crystalline condition by distillation in the electric furnace, or by decomposing its fluoride at a red heat (H. Moissan). Platinum, like palladium, absorbs large quantities of hydrogen and other gases, the occluded gas then becoming more "active", for this reason platinum is used largely as a catalytic agent. An electrolytic form of the metal, now in use, may be obtained. Spongy platinum is produced when ammonium platinocloride is ignited; platinum black on the reduction of acid solutions of platinum salts; and colloidal platinum by passing an electric arc between two platinum wires under the surface of pure water (G. Bredig, Zeit. phys. Chem., 1901, 37, pp. 1, 323). Platinum is practically unoxidizable; it combines directly with phosphorus, arsenic, antimony, silicon, boron, and fluorine, and with almost all other metals. It is practically unaffected by all acids, dissolving only in aqua regia or in mixtures which generate chlorine. When fused with alkaline hydroxides in the presence of air it forms platinates. It is readily attacked by fused nitrates, and by potassium cyanide and potassium ferrocyanide. All the platinum compounds when heated strongly decompose, and leave a residue of the metal. Of platinum salts, in the true sense of the word, none exist; there is no carbonate, nitrate, sulphate, &c; halide salts, however, are known, but are obtained in an indirect manner.

Platinum monoxide, PtO, obtained by heating the corresponding hydrate, is a dark-coloured powder which is easily reduced to the metal (L. Wöhler, Ber., 1903, 36, p. 3473). The hydrated form, PtO.H2O, is obtained by decomposing by the addition of caustic soda, or by adding caustic soda to a boiling solution of potassium platinocloride, K2PtCl4, the precipitate being rapidly washed and dried in vacuo (L. Wöhler, Zeit. anorg. Chem., 1903, 40, p. 151). PtO is a black powder when freshly prepared, but it is soluble in concentrated acids, but when dried it is insoluble. It is an acidic oxide, the dioxide being both acidic and basic. It behaves as a strong oxidising and reducing agent. C. Engler and L. Wöhler (Zeit. anorg. Chem., 1901, 29, p. 168) have shown that PtO is a black containing occluded oxygen, is soluble in dilute hydrochloric acid and also liberates iodine from potassium iodide, and that the ratio between the amount of platinum dissolved and the amount of oxygen occluded agrees with the formation of a compound corresponding to the formula PtO. Platinum dioxide (platinic
oxide, } \text{PtO}_2 \cdot 4\text{H}_2\text{O} \text{, is obtained by adding an excess of caustic soda solution to a boiling solution of chlorplatinic acid, the hot solution being diluted and neutralized with acetic acid. ated hydrogen a dark brown precipitate, soluble in excess of ammonia sulphide. Potassium iodide gives a brown solution with gradual formation of a precipitate. When the characteristics precipitates with potassium and ammonium chlorides. The platinum salts are brown or colourless solids which, when heated in vacuo or in a current of air, decompose slowly with liberation of moisture forming gold brown chlorplatinic acid, \text{PtCl}_4 \text{. } \text{Platinum trioxide, } \text{PtO}_3 \text{, is obtained as } \text{K}_2\text{Pt}_2\text{O}_7 \text{ by electrolyzing a solution of platonic acid in potash, this compound gives a precipitate of the platinum as a brown, easily decomposable powder (L. Waller and F. Martin, } \text{Ber.}, 1909, 42, p. 3323).
product, K₂Pt(CN)₂Cl₂H₂O. It combines directly with iodine. Barium platinocyanide, BaPt(CN)₄.4H₂O, is prepared by the action of baryta water on the copper salt; by dissolving platinum in barium cyanide under the influence of an alternating current; by the addition of barium cyanide and is soluble in hot water. It is employed for the manufacture of fluorescent screens used for the detection of X-rays.

The platinum salts combine with ammonia to form numerous derivatives which can be considered as salts of characteristic bases. The purple compound of this type was isolated in 1828 by Magnus, who obtained a green salt by the action of ammonia on platinum bichloride. Two series of these salts are known, one in which the metal corresponds to bivalent platinum, the other in which it corresponds to tetravalent platinum. The general formula of the groups in each series are shown below, the method of classification being that due to Werner.

In the above table X represents a monovalent radical and R a monovalent radical. In preparing compounds of this kind the action of the baryta water is by T. Cleve, Bull. soc. chim. 1867 et seq.; S. M. Jörgensen, Journ. prakt. Chem. 1877 et seq.; C. W. Blomstrand, Ber. 1871 et seq.; and A. Werner, Zeit. anorg. Chem. 1803 et seq. A very complete account of the various compounds is given by A. Werner, Ber. 1897, 40, p. 15.

Platinum also forms a series of complex phosphorus compounds. A typical compound is platinum phosphorus percloro-derivative of the action of ammonia on platinum bichloride, which may be obtained as orange-red deltahedral crystals. The atomic weight of platinum was determined by K. Seubert (Ann. 1888, 297, p. 1; Ber. 1888, 21, p. 2179) by analyses of ammonium and potassium platinchlorides, the value 194.86 being obtained.

PLATO, the great Athenian philosopher, was born in 427 B.C., and lived to the age of eighty. His literary activity may be roughly said to have extended over the first half of the 4th century B.C. His father's name was Aristocles, said to have been a descendant of Codrus; and his mother's family, which claimed descent from Solon, included Critias, one of the thirty tyrants, and other well-known Athenians of the early 4th century B.C. That throughout his early manhood he was the devoted friend of Socrates, that in middle life he taught those who resorted to him in the grove named Academus, near the Cephissus, and that founded the first great philosophical school, that (with alleged interruptions) he continued to preside over the Academy until his death, are matters of established fact. It is said by Aristotle that he was at one time intimate with Cratylus the Heracletean. Beyond this we have no authentic record of his outward life. That his name was at first Aristocles, and was changed to Plato because of the breadth of his shoulders or of his style or of his forehead, that he wrestled well, that he wrote poetry which he burnt on hearing Socrates, fought in three great battles, that he had a thin voice, that (as is told of other Greek philosophers) he travelled to Cyrene and conversed with priests in Egypt, are statements of Diogenes Laërtius, which rest on more or less uncertain tradition. The express assertion—which this author attributes to Hermocrates—that after the death of Socrates Plato and other Sophists went to South France, has no stronger claim to authenticity. But the fact cannot be regarded as certain, still less the elaborate inferences which have been drawn from it. The romantic legend of Plato's journeys to Sicily, and of his relations there with the younger Dionysius and the prinvely but unfortunate Dion, had obtained some degree of consistency before the age of Cicero, and at an unknown but probably early time was worked up into the so-called Epistles of Plato, now all but universally discredited. Nor is there sufficient ground for supposing, as some have done, that an authentic tradition is perceptible behind the myth.

The later years of the Peloponnesian War witnessed much mental disturbance and restlessness at Athens. More than at any time since the age of Cleisthenes, the city was divided, and a man's foes were often men of his own tribe or deme. Contention in the law courts and rivalries in the assembly had for many men a more absorbing interest than questions of peace and war. Hereditary traditions had relaxed their hold, and political principles were not yet formulated. Yet there was not less scope on this account for personal ambition, while the progress of decline, the necessity of conciliating the people, and the apportionment of public offices by lot had a distracting and, to reflecting persons, often a discouraging effect. For those amongst whom Plato was brought up this effect was aggravated by the sequel of the oligarchical revolution, while, on the other hand, for some years after the restoration of the democracy, a new stimulus had been imparted, which, though of short duration, was universally felt. These events appear in two ways to have encouraged the diffusion of ideas. The ambitious seem to have welcomed them as a means of influence, while those who turned from public life to more private and speculative disputations. However this may have been, it is manifest that before the beginning of the 4th century B.C. the intellectual atmosphere was already charged with a new force, which although essentially one may be differently described, according to the mode of its development, as (1) rhetorical and (2) theoretical and "sophistical." This last word indicates the channel through which the current influences were mostly derived. A new want, in the shape both of interested and of disinterested curiosity, had insensibly created a new profession. Men of various fatherlands, some native Athenians, but more from other parts of Hellas, had set themselves to supplement the deficiencies of ordinary education, and to train men for the requirements of civic life. More or less consciously they based their teachings on the philosophical dogmas of an earlier time, when the speculations of Xenophon, Heraclitus or Parmenides had interested only a few "wise men." Those great thoughts were now to be expounded, so that "even cobbler might understand." The self-appointed teachers found a rich field and abundant harvest among the wealthier youth, to the chagrin of the old-fashioned Athenian, who sighed with Aristophanes for the good old days when men knew less and listened to their elders and obeyed the customs of their fathers. And such distrust was not wholly unfounded. For, amidst much that was graceful and improving, these novel questionings had an influence that, besides being unsettling, was aimless and unreal. A later criticism may discern in them the two great tendencies of naturalism and humanism. But it may be doubted if the sophist was himself aware of the direction of his own thoughts. For, although Prodicus or Hippias could debate a thesis and moralize with effect, they do not appear to have been capable of speculative reasoning. What passed for such was often either verbal quibbling or the pushing to an extreme of some isolated abstract notion. That prudens quaestio which is dimension scientiae had not yet been put. And yet the hour for putting it concerning human life was fully come. For the sea on which men were drifting was profoundly troubled, and would not sink back into its former calm. Conservative reaction was not less hopeless than the dreams of the theorists were. In random talk, with gay, irresponsible energy, the youth were debating problems which have exercised great minds in Europe through all after time.

Men's thoughts had begun to be thus disturbed and eager when Socrates (q.v.) arose. To understand him is the most necessary preliminary to the study of Plato. There is no reason to doubt

1 See Laws, vii, 814 c.
2 Some epigrams in the Anthology are attributed to him.
3 This is told on the authority of Aristoxenus. But Plato cannot have been at Delium.

4 It had been the policy of Pericles to invite distinguished foreigners to Athens.

5 Thetet. 180 D.
the general truth of the assertion, which Plato attributes to himself by questioning other men. He was really doing for Athenians, whether they would or no, what the sophist professed to do for his adherents, and what such men as Protagoras and Prodicus had actually done in part. One obvious difference was that he would take no fee. But there was another and more deep-lying difference, which distinguished him not only from the contemporary sophists but from the thinkers of the previous age. This was the Socratic attitude of inquiry. The sceptical movement had confused men's notions as to the value of ethical ideas. If "right is one thing in Athens and another in Sparta, why strive to follow right rather than expediency? The laws put restraint on nature, which is prior to them. Then why submit to law?" And the ingenuities of rhetoric had stirred much unreasonable speculation. Every case seemed capable of being argued in opposite ways. Even on the great question of the ultimate constitution of things, the conflicting theories of absolute immutability and equal change appear to be equally irrefragable and equally untenable. Men's minds had been confused by contradictory voices—"One crying "All is motion," another "All is rest;" one "The absolute is unattainable," another "The relative alone is real"; some upholding a vague sentiment of traditional right, while some declared for arbitrary convention and some for the law "of nature." Some held that virtue was spontaneous, some that it was due to training, and some paradoxically denied that either vice or falsehood had any meaning. The faith of Socrates, whether instinctive or inspired, remained untroubled by these jarring tones. He did not ask "Is virtue a reality?" or "Is goodness a delusion?" But, with perfect confidence that there was an answer, he asked himself and others "What is it?" (cf. p. 45); or, more particularly, as Xenophon says, "What is a state? What is a statesman? What is just? What is unjust? What is government? What is it to be a ruler of men?" In this form of question, however simple, the originality of Socrates is typified; and by means of it he laid the first stone, not only of the fabric of ethical philosophy, but of scientific method, at least in ethics, logic and psychology. Socrates never doubted that if men once knew what was best, they would also do it. They erred, he thought, from not seeing the good, and not because they would not follow it if seen. This is expressed in the Socratic dictum: "Vice is ignorance;" "Virtue is knowledge." This lifelong work of Socrates, in which the ideas, psychology and logic were contained, was idealized, developed, dramatized—first embodied and then extended beyond its original scope—in the writings of Plato, which may be described as the literary outcome of the profound impression made by Socrates upon his greatest follower. These writings (in pursuance of the importance given by Socrates to conversation) are all cast in the form of imaginary dialogue. But in those which are presumably the latest in order of composition this imaginative form interlaces but little with the direct expression of the philosopher's own thoughts. The many-coloured veil at first inseparable from the features is gradually worn thinner, and at last becomes almost imperceptible. Plato's philosophy, as elaborated in his dialogues, is at once an intellectual and a mystical aspect; and both are dominated by a pervading ethical motive. In obeying the Dialogues. Socratic impulse, his speculative genius absorbed and harmonized the various conceptions which were present in contemporary thought, bringing them out of their dogmatic isolation into living correlation with one another, and with the life and experience of mankind. His poietical feeling and imagination, taking advantage of Pythagorean and Orphic suggestions, surrounded his abstract reasonings with a halo of mythology which made them more fascinating, but also more difficult for the prosaic intellect to comprehend. Convinced through the conversations of Socrates that truth and good exist and that they are inseparable, persuaded of the unity of virtue and of its dependence upon knowledge, he set forth upon a course of inquiry, in which he could not rest until the discrepancies of ordinary thinking were not only exposed but accounted for, and resolved in relation to a comprehensive theory. In this "pathway towards reality," from the consideration of particular virtues he passed to the contemplation of virtue in general, and thence to the nature of universals, and to the unity of knowledge and being. Rising still higher on the road of generalization, he discussed the problem of unity and diversity, the one and the many. But in these lofty speculations the facts of human experience were not lost to view. The one, the good, the true, is otherwise regarded by him as the moral ideal, and this is examined as realized both in the individual and in the state. Thus ethical and political speculations are combined. And as the method of inquiry is developed, the leading principles both of logic and of psychology become progressively more distinct and clear. Notwithstanding his high estimate of mathematical principles, to him the type of exactness and certitude, Plato contributed little directly to physical science. Though he speaks with sympathy and respect of Hippocrates, he had no vocation for the patient inductive observation of natural processes, through which the Cynic physicians, though they obtained few lasting results, yet founded a branch of science that was destined to be beneficently fruitful. And he turned scornfully aside from the Atomists, Leucippus and Democritus, whose first principle, the basis of so much in modern physics, appeared to him to be tainted with materialism. Yet his discursive thought, as in later years he held high intercourse with Archytas and other contemporary minds, could not fail, unlike his master's, to include a theory of the Cosmos in its purview. In this regard, however, the poet-philosopher brought imagination to the aid of reason, thus creating a new mythology, of which the Timaeus is the most conspicuous example. Amidst great diversity, both of subject and of treatment, Plato's dialogues are pervaded by two dominant motives, a passion for human improvement and a persistent faith in the power and supremacy of mind. What is commonly known as his doctrine of Ideas is only one phase in a continuous progress towards the realization of a system of philosophy in which the supreme factor is reason guiding will. But the objectivity, which from the first was characteristic of all Greek thinking, and his own power of poetic presentation, obscured for a time, even for Plato himself, the essential spirituality of his conceptions, and at one time even threatened to arrest them at a stage in which the universal was divorced from the particular, the permanent from the transient, being from becoming, and in which the first principles of reality were isolated from one another as well as from the actual world. Gradually the veil was lifted, and the relation between the senses and the intellect, phenomena and general laws, the active and the contemplative powers, came to be more clearly conceived. The true nature of abstraction and generalization, and of predication and inference, began to be discerned, and speculation was verified through experience. The ideas were seen as categories, or forms of thought, under which the infinite variety of natural processes might be comprised. And thus the dialogues present, as in a series of dissolving views, a sort of model or compendium of the history of philosophy. Plato's thought was nowhere distinctly formulated, nor are the views forwarded in his dialogues always consistent with each other, but much especially of his later thought is systematized, and as it were crystallized in the treatises of Aristotle; by whom the point of view which Plato had approached, but not finally attained, was made the starting-point for more precise metaphysical determinations and carried into concrete theories having the stamp of a more rigid logical method. The departments of ethics and politics, of dialectic and of psychology, of physics and metaphysics, thus came to be more clearly distinguished, but something was lost of the unity and intensity of spiritual insight which had vitalized these various elements, and fused them in a dynamic harmony. The student of philosophy, whatever may be the modern system to which he is most inclined, sensational, intuitional, conceptual, transcendental, will find his account in returning

1 See Caird, Hegel, p. 168.
to this well-spring of European thought, in which all previous movements are absorbed, and from which all subsequent lines of reflection may be said to diverge. As was observed by Jowett (St Paul, 1855), "the germs of all ideas, even of most Christian ones, are to be found in Plato."

Two great forces are persistent in Plato: the love of truth and zeal for human improvement. In the period culminating with the Republic, these two motives, the speculative and the practical, are combined in one harmonious working. In the succeeding period, without excluding one another, they operate with alternate intensity. In the varied course of his long literary career, the metaphysical "doctrine of ideas" which has been associated with Plato's name underwent many important changes. But pervading all these there is the same constant belief in the supremacy of reason and the identity of truth and good. From that abiding root spring forth a multitude of thoughts concerning the mind and human things—turning chiefly on the principles of psychology, education and political reform—thoughts which, although unverified, and often needing correction from experience, still constitute Plato the most fruitful of philosophical writers. While general ideas are powerful for good or ill, while abstractions are necessary to science, while mankind are apt to crave after perfection, and ideals, either in art or life, have an acknowledged value, so long the renown of Plato will continue. "All philosophic truth is Plato rightly divined; all philosophic error is Plato misunderstood" is the verdict of one of the keenest of modern metaphysicians. Plato's followers, however, have seldom kept the proportions of his teaching. The diverse elements of his doctrine have survived the spirit that informed them. The pythagorizing mysticism of the Timaeus has been more prized than the subtle and clear thinking of the Theaetetus. Logical inquiries have been hardened into a barren ontology. Semi-mythical statements have been vulgarized and mystical fancies perpetuated without the genuine thought which underlay them. A part (and not the essential part) of his philosophy has been treated as the whole. But the influence of Plato has extended far beyond the limits of the Platonic schools. The debt of Aristotle to his master has never yet been fully estimated. Zeno, Chrysippus, Epicurus borrowed from Plato more than they knew. The moral ideal of Plutarch and that of the Roman Stoics, which have both so deeply affected the modern world, could not have existed without him. Neopythagoreanism was really a crude Neoplatonism. And the Sceptics availed themselves of weapons either forged by Plato or borrowed by him from the Sophists. A wholly distinct line of infiltration is suggested by the mention of Philo and the Alexandrian school (cf. section in Arabian Philosophy, ii. 266c, 9th edition), and of Clement and Origen, while Gnostic heresies and even Talmudic mysticism betray perversions of the same influence. The effect of Hellenic thought on Christian theology and on the life of Christendom is a subject for a volume, and has been pointed out in part by E. Zeller and others (cf. Neoplatonism). Yet when Plotinus in the 3rd century (after hearing Ammonius), amidst the revival of religious paganism, founded a new spiritualistic philosophy upon the study of Plato and Aristotle combined, this return to the fountain head had all the effect of novelty. And for more than two centuries, from Plotinus to Proclus, the great effort to base life anew on the Platonic wisdom was continued. But it was rather the ghost than the spirit of Plato that was so "unshaped." Instead of striving to reform the world, the Neoplatonist sought after a retired and cloistered virtue. Instead of vitalizing science with fresh thought, he lost hold of all reality in the contemplation of infinite unity. He had skill in dealing with abstractions, but laid a freehold upon the actual world. "Hermes Trismegistus" and "Dionysius Areopagita" are names that mark the continuation of this influence into the middle ages. The pseudo-Dionysius was translated by Eriurgeon in the 9th century.

Two more "Platonic" revivals have to be recorded—at Florence in the 15th and at Cambridge in the 17th century. Both were enthusiastic and both uncritical. The translation of the dialogues into Latin by Marzillo Picino was the most lasting effect of the former movement, which was tinged with the unscientific air of the Renaissance. The preference still accorded to the Timaeus is a fair indication of the tendency to bring fumum ex fulgore which probably marred the discussions of the Florentine Academy concerning the "chief good." The new humanism had also a sentimental cast, which was alien from Plato. Yet the effect of this spirit on art and literature was very great, and may be clearly traced not only in Italian but in English poetry.

The "Cambridge Platonists" have been described by Principal Tulloch in his important work on Rational Theology in England in the 17th century, and again by Professor J. A. Stewart in the concluding chapter of his volume on the Myths of Plato. Their views were mainly due to a reaction from the philosophy of Hobbes, and were at first suggested as much by Plotinus as by Plato. It is curious to find that, just as Socrates and Ammonius (the teacher of Plotinus) left no writings, so Whichcote, the founder of this school, worked chiefly through conversation and preaching. His pupils exercised a considerable influence for good, especially on English theology; and in aspiration if not in thought they derived something from Plato, but they seem to have been incapable of separating his meaning from that of his interpreters, and Cudworth, their most consistent writer, was at once more systematic and less scientific than the Athenian philosopher. The translations of Sydenham and Taylor in the 18th century and the beginning of the 19th are proofs of the continued influence of Platonism in England.

The critical study of Plato begins from Schleiermacher, who did good work as an interpreter, and tried to arrange the dialogues in the order of composition. His attempt, which, like many efforts of constructive criticism, went far beyond what could be justified by the evidence, was vitiated by the ground-fallacy of supposing that Plato had from the first a complete system in his mind which he partially and gradually revealed in writing. At a considerably later time Karl Friedrich Hermann, to whom all students of Plato are indebted, renewed the same endeavour on the far more plausible assumption that the dialogues faithfully reflect the growth of Plato's mind. But he also was too sanguine, and exaggerated the possibility of tracing a connection between the outward events of Plato's life and the progress of his thoughts. This great question of the order of the dialogues, which has been debated by numberless writers, is one which only admits of an approximate solution. Much confusion, however, has been obviated by the hypothesis (first hinted at by Ueberweg and Friederich Socher, among others) that the Sophists and Politicus, whose genuineness had been called in question by Joseph Socher, are really intermediate between the Republic and the Laws. The allocation of these dialogues, not only on grounds of metaphysical criticism, but also on philological and other evidence of a more tangible kind, supplies a point of view from which it becomes possible to trace with confidence the general outlines of Plato's literary and philosophical development. Reflecting at first in various aspects the impressions received from Socrates, he is gradually touched with an inspiration which becomes his own, and which seeks utterance in half-poetical forms. Then first the ethical and by and by the metaphysical interest becomes predominant. And for a while this last is all absorbing, as he confronts the central problems which his own thoughts have raised. But, again, the hard-won acquisitions of this dialectical movement must be fused anew with imagination and applied to life. And in a final effort to use his intellectual wealth for the subvention of human need the great spirit passed away.

It may not be amiss to recapitulate the steps through which the above position respecting the order of the dialogues has become established. Lovers of Hegel had observed that the point reached in the Sophists in defining "not being" was dialectically in advance of the Republic. But Kantian interpreters might obviously have said
the same of the Parmenides: and Grote as a consistent utilitarian 
looked upon the Protagoras as the most mature production of 
Plato's genius. It seemed desirable to find some criterion that 
was not bound up with philosophical points of view. Dr 
Thompson, the Master of Trinity College, Cambridge, had 
vindicated the genuineness of the Sophistes against the objections 
of Socher, but had not accounted for the peculiarities of language, 
which that acute critic had perceived. By comparing those 
peculiarities with the style of the Laws, Plato's latest work, and 
with that of the Timaeus and Critias, which presupposed the 
Republic, Lewis Campbell argued in 1867 that the Sophistes and 
Politics, with the Philebus, were in chronological sequence 
intermediate between the Republic and the Laws. Thus a 
father defence of their authenticity was at the same time 
a long step towards the solution of the problem which Schleier- 
macher had proposed. Many years afterwards the more 
detailed stylistic investigations of W. Dittenberger, Constantin 
Ritter and others arrived independently at the same conclusion. 
It was vehemently supported by W. Lutoslawski in his work on 
Plato's Logic, and has been frankly accepted with ample acknow- 
ledgments by the high authority of Dr Theodor Gomperz (see 
especially the Notes to his Greek Thinkers, iii. 310, 315 of 
English translation).

The Works of Plato

The Platonic dialogues are not merely the embodiment of 
the mind of Socrates and of the reflections of Plato. They are 
the portraiture of the highest intellectual life of Hellas in the time 
of Plato—a life but distantly related to military and political 
events, and scarcely interrupted by them. Athens appears as 
the centre of the excitable Hellenic mind, profoundly stirred by 
the arrival of great sophists, and keenly alive to the questions of 
Socrates, although in the pages of Plato, even more than in 
reality, he only "whispers with a few striplings in a corner." 
For, in the Platonic grouping, the agora, which was the chief 
scene of action for the real Socrates, retires into the background, 
and he is principally seen consortig with his chosen companions, 
who are also friends of Plato, and with the acquaintances whom 
he makes through them. The scene is narrowed (for the Academy 
was remote from the bustle of resort, and Plato judged the Hellenic 
world securely from the vantage-ground of partial retirement)— 
but the figures are distinct and full of life. In reading the dia-
logues we not only breathe the most refined intellectual atmos-
phere, but are also present witnesses of the urbanity, the freedom, 
the playfulness, the generous warmth of the "best society" in 
Athens. For Plato has a numerous repertory of dramatis 
personae, who stand in various relations to his chief character— 
the impetuous Chaerephon, Apollodorus the inseparable weak 
brother, old Crito the true-hearted, Phaedo the beloved disciple, 
Simmias and Cebes, who have been with Philolaus, the graceful 
and ingenious Phaedrus, the petulant Philebus, Theaetetus of 
the philosophic nature, who is cut off in his prime, and the 
corrigible Alcibiades; then Plato's own kinsmen—Glaucion the 
irrepressible in politics, in quarrel and in love; Adeimantus, solih 
and grave; Critias in his phase of amateur philosopher, and not as 
what he became (Charmides); nor in his prime of youth; but in 
his first bloom of different youth; and many others who 
appear as mere acquaintances, but have an interest of their own— 
the accomplished Agathon, the gay Aristophanes, Eryx-
machus the all-worthy physician; Meno, light of spirit; Callias, 
entertainer of sophists; Callias the wilful man of the world; 
Cephalus the aged father of Lysias; and Nicias the honored 
soldier. All these appear, not as some of them do on the page of 
history, in sanguinary contention or fierce rivalry, but as peaceful 
Athenians, in momentary contact with Socrates, whose electric 
touch now benumbs and now exhilarates, and sometimes goads 
to frenzy of love or anger. Still more distantly related to him, 
as it were standing in an outer circle, are the imposts of 
Gorgias and Protagoras, surrounded with the lesser lights of 
Hippias, Prodicus and Polus. Thrasymachus, Euthydemus, 
Dionysodorus hang round like comic masks, adding piquancy 
to the design. The adversaries Anaxius and Meletus are allowed 
to appear for a moment, but soon vanish. The older philosophers, 
though Socrates turned away from them, also make their entrance 
on the Platonic stage. Parmenides with his magnificent depth 
is made to converse with the imaginary Socrates, who is still 
quite young. A stranger from Elca plays an important part 
in some later dialogues, and Timaeus the Pythagorean is introduced 
discoursing of the creation of the world. In these dialogues 
Socrates is mostly silent; in the Philebus he has lost himself in 
Plato; and in the twelve books of the Laws, where an unnamed 
Athenian is the chief speaker, even the Platonic Socrates finally 
disappears.

Now, in evolving his philosophy from the Socratic basis, 
Plato works along three main lines—the ethical and political, 
the metaphysical or scientific, and the mystical. All three are 
often intimately blended, as in the close of Rep., bk. vi., and even 
where one element is uppermost the others are not wholly 
suppressed. But this distinction, like that sometimes made in 
modern philosophy between the good, the true and the beautiful, 
is one which, if not unduly pressed, may be usefully borne in 
mind.

Having noted this once for all, we pass to the more detailed 
consideration of the several dialogues.

I. Laches, Charmides, Lysis.—In this first group Socrates is 
dealing tentatively with single ethical notions. The result 
in each case is a confession of ignorance, but the subject has been so 
handled as to point the way to more fruitful discussions in the 
future. And suggestions are casually thrown out which 
anticipate some of the most far-reaching of Plato's subsequent 
contemplations.

The Laches is a vigorous sketch, in which the characters of the 
soldier, the aged citizen, and the prudent general are well 
preserved; and Socrates is seen conversing with his 
elders, although with reference to the treatment of 
the young. The question raised is the definition of courage; 
and the humour of the piece consists in showing that three men, 
all of whom are unquestionably brave, are unable to give an 
account of bravery, or to decide whether courage is an animal 
instinct or a mental accomplishment.

Similarly, in the dialogue which bears his name, the temperate 
Charmides, of whom all testify that (as Aristophanes has it),' he 
fills up the gracious mould of modesty,' is hopelessly 
embarrassed when challenged by the Socratic method. 
Plato puts in his words of the mouth of Socrates, that he 
meets his task with a graceful and temperance which he possesses, and which, as Socrates assures him, is a 
priceless gift. The Charmides contains some hints of Platonic 
notions, such as that of knowledge as self-consciousness, and of 
virtue as "doing one's own business."

The graceful little dialogue which bears the name of Lysis 
ends, like the two former, with a confession of failure. Socrates, 
Lysis and Menexenus are all friends, and think 
highly of friendship, yet after many efforts they 
are unable to tell "what friendship is." Yet some of the sug-
gestions which are here laid aside are afterwards allowed to 
reappear. The notion that "what is neither good nor evil loves 
the good because of the presence of evil" is expanded and 
emphasised in the Symposium. And the conception of an ideal 
object of friendship, an áthô ðiôv (though rejected as in the 
criticism of Aristotle by the characteristic redactus ad in finitum), 
is destined to have a wider scope in the history of Platonism.

II. Protagoras, To, Meno.—The previous dialogues have 
marked the distinction between unconscious and conscious 
morality, and have also brought out the Socratic tendency to 
deny virtue with the knowledge of good. Now, the more 
strongly it is felt that knowledge is inseparable from virtue 
the more strage and doubtful appears such unconscious excellence 
as that of Laches, Charmides or Lysis. Hence arises the 
fundamental "box of ruffles" as "Virtue is not taught, and that 
which is commonly regarded as virtue springs up spontaneously 
or is received unconsciously by a kind of inspiration."

Protagoras, in the dialogue named after him, is the professor of 
popular, unscientific, self-complacent excellence; while 

---

1 Nub. 995, τοῖς αὐτοῖς μικρὰς τάγματα ἀπαθής.
Socrates appears in his life-long search after the ideal knowledge of the best. The two men are naturally at cross purposes.

Protagoras. Protagoras contends that virtue is taught by himself and others more or less successfully, and is not one but many. Socrates disputes the possibility of teaching virtue (since all men equally profess it, and even statesmen fail to give it to others), but he affirms that, if it can be taught, virtue is not money, but one. The discussion disclosed the former doctrine inconclusively. But in the course of it Plato vividly sets forth the natural opposition between the empiric and scientific points of view, between a conventional and an intellectual standard. He does full justice to the thesis of Protagoras, and it is not to be supposed that he was contented to remain in the attitude which he has here attributed to Socrates. In his ideal state, where the earlier training of the best citizens is a refinement on the actual Hellenic education, he has to some extent reconciled the conceptions which are here dramatically opposed.

The preparations for the encounter and the description of it include many life-like touches—such as the eagerness of the young Athenian gentleman to hear the sophist, though he would be ashamed to be thought a sophist himself; the confusion into which the house of Callias has been thrown by the crowd of strangers and by the self-importance of rival professors; the graceful dignity of the man who has been forty years a teacher, the graphic description of the whole scene, the characteristic speeches of Prodicus and Hippias (from which some critics have elicited a theory of their doctrines), and the continued irony with which Socrates bears them all in hand and soothes the great man after disillusioning him.

In the argument there are two points which chiefly deserve notice. (1) Protagoras, in accordance with his relative view of things (which Plato afterwards criticized in the Theaetetus), claims not to teach men principles but to improve them in those virtues which Providence has given to all civilized men. (2) Socrates in postulating a scientific principle, which he expressly reserves for future consideration, would have it tested by the power of calculating the amount of pleasure. Grote dwells with some compunction on the "utilitarianism" of Socrates in the Protagoras. And it is true that a principle of utility is here opposed to conventional sentiment. But this opposition is intended to prepare the way for the wider and deeper contrast between an arbitrary and conventional morality and the indivisibility of all civilised reason. And when Plato (in the Gorgias and Philebus) endeavours to define the art of measurement, which is here anticipated, it is not wonderful that differences here unthought of should come into view. The contrast should not be found converted into a principle from the good. In all three dialogues he is equally asserting the supremacy of reason.

On the first view of that transcendental knowledge which is to be the key at once to truth and good, philosophy is apt to lose her balance, and to look with scorn upon "the trivial round, the common task," and the respectable commonplace of "ordinary things." The same is repeated in the Phaedrus by Socrates himself, and in the unconscious wisdom also has a value. And Plato, who, when most ideal, ever strives to keep touch with experience, is fully convinced of the reality of this lower truth, of this unphilosophic virtue. But he is long puzzled how to conceive of it. For, if knowledge is all in all, what are we to make of wisdom and goodness in those who do not know? Protagoras had boldly spoken of honour and right as a direct gift from Zeus, and Socrates, in the Io and Meno, is represented as adopting an hypothesis of inspiration in order to account for these unacknowledged graces of the soul.

Socrates has observed that rhapsoths and even poets have no definite knowledge of the things which they so powerfully represent (cf. Apol. 22; Phaed. 245 A.; Rep. iii. 308 A.). He brings the rhapsoth Io to admit this, and to conclude that he is the inspired medium of a magnetic influence. The Muse is the chief magnet, and the poet is the first of a series of magnetic rings. Then follow the rhapsoths and the actor, who are rings of inferior power, and the last ring is the hearer or spectator.

The Meno raises again the more serious question, Can virtue be taught? Socrates here states explicitly the paradox with which the Protagoras ended. "Virtue is knowledge; therefore virtue can be taught. But virtue is not taught. Therefore (in the highest sense) there can be no virtue.” And he repeats several of his former reasons—that Athenian statesmen failed to teach their sons, and that the education given by sophists is unsatisfying. (The sophists are here denounced by Anytus, who is angered by Socrates' ironical praise of them.) But the paradox is softened in two ways: (1) the absence of knowledge does not preclude inquiry, and (2) though virtue cannot be taught, yet there is a sense in which virtue exists.

1. Meno begins in gaiety of heart to define virtue, but is soon "suffused with the sanctity of the word " (ἀλήθεια). He asks "How can one inquire about that which he does not know? " Socrates meets this "enistic" difficulty with the doctrine of reminiscence (ἀναμνήσεως). All knowledge is latent in the mind from birth through kindred (or association of ideas) and may be recovered, if only a beginning is made. Findar and other poets have said that the soul is immortal and that she has passed through many previous states. And Socrates now gives a practical illustration of the truth of this deduced from these paradoxes. He elicits, from a Greek slave of Meno's, the demonstration of a geometrical theorem. About the middle of the process he turns to Meno and observes that the slave (who has made a false start) is now becoming conscious of ignorance. He then gradually draws from the man, by leading questions, the positive proof.

2. Though virtue is not yet defined, it may be affirmed "hypothetically" that, if virtue is knowledge, virtue can be taught. And experience leads us to admit two phases of virtue, one a mode of life based on scientific principle, which hitherto is an ideal only; the other sporadic, springing of itself, yet of divine origin, to which it is true that it is easy to be fast through demonstration of the cause or reason. But if there were a virtuous man who could teach virtue he would stand amongst his fellows like Teiresias amongst the shades.

Socratic mystical account of ordinary morality is in keeping with the semi-mythical defense of the process of inquiry—that all knowledge is implicit in the mind from birth.

III. Euthyphro, Apologia, Crito, Phaedo.—There is no ground for supposing that these four dialogues were written consecutively, or that they belong strictly to the same period of Plato's industry. But they are linked together for the reader by their common reference to the trial and death of Socrates; no one of them has been proved to be in the author's earliest or latest manner; and they may therefore fitly end the series of dialogues in which the personal traits of the historic Socrates are most apparent. And Plato's own peculiar doctrines are as yet but partially disclosed.

The little dialogue known by the name of Euthyphro might have been classed with the Laches, Charmides and Lysis, as dealing inconclusively with a single notion. But, Euthyphro, although slight and tentative in form, it has an undertone of deeper significance, in keeping with the gravity of the occasion. Plato implies that Socrates had thought more deeply on the nature of piety than his accusers had, and also that his piety was of a higher mood than that of ordinary religious men.

Euthyphro is a soothsayer, well-disposed to Socrates, but not one of his particular friends. They meet at the door of the king Archer, whether Socrates has been summoned for the "persecution" (ἀνακαταλείψεως) preliminary to his trial. Both men are interested in cases of alleged impiety. For Euthyphro's business is to impeach his father, who has inadvertently caused the death of a criminal labourer. The prophet feels the duty of purging the stain of blood to be more imperative the nearer home. Socrates is struck by the strong opinion thus evinced respecting the nature of piety and detains Euthyphro at the entrance of the court, that he may change his mind. He flings at the old man's "unclearness" and so forms him against Meletus. He leads his respondent from point to point, until the doubt is raised whether God loves holiness beyond the holy, or if it is holy beyond love of God. Does God will what is righteous, or is that righteous which is willed by God? Here they find themselves wandering round and round. Socrates proves himself an involuntary Daedalus who makes opinions move, while he is locked fast in the frame of his opinions, and so he rates against Meletus. "The holy is a portion of the just." But what portion? "Due service of the gods by prayer and sacrifice." But how does this affect the gods? "It pleases them." Again we are found to be running a circular circle.

"Thus far has Socrates proceeded in placing religion on a moral foundation. He is seeking to realize the harmony of religion and

1 The origin of this traditional belief is very obscure. The Greeks themselves were apt to associate it with Pythagoras and with the Orphic 3 mysteries.
2 Hom. Odyssey. vi. 345, Odys. vii. 184, 185, 319, &c.
3 Thuc. i. 47 (the case where the triangle is isosceles).
morality, which the great poets Aeschylus, Sophocles and Pindar had unconsciously anticipated, and which is the universal want of all men. To this the soothsayer adds the ceremonial element, atmosphere of the gods. Williamother interrogated by Socrates as to the nature of this 'attention to the gods,' he replies that piety is an affair of business, a science of giving and asking and the like. Socrates points out the anthropomorphic of these notions. But it is evident—and it has been noted by the reader—that the phraseology of the gods is the service of the spirit and co-operation with them in all things true and good, he stops short; this was a lesson which the soothsayer could not have been made to understand, and which even Socrates left untaught.

In Plato's *Apology* the fate of Socrates is no longer the subject of mere allusions, such as the rage of Anytus at the end of the *Apology*. *Meno*, and the scene and occasion of the *Euthyphro*.

He is now seen face to face with his accusers, and with his countrymen who are condemning him to death. What most aggravated his danger (after life-long impunity) is thus stated by James Riddell, in the introduction to his edition of the dialogue: "The *dikēsēa*" (clemency) of "the restored people did not last long, and was naturally succeeded by a sensitive and fanatical zeal for their revived political institutions. Inquiry into the foundations of civil society was obviously rather perilous for the inquirer at such a time. Socrates knew the power and influence of the gods, according to Xenophon (Mem. iv. c. 8, § 14), he prepared no defence supposing that his whole life had been a preparation for that hour."

The tone of the Platonic *Apology* is in full accordance with that saying; it is too elaborate a work of art to be taken literally as a report of what was actually said. Jowett well compares it to "those speeches of Thucydides in which he has embodied his conception of the lofty character and policy of the great Pericles." Yet it is significant that Plato is said to have been present at the defence, as he is also said to have been absent at the last scene of the *Phaedo*. Some of the topics may have been actually used by Socrates, and the recollection of his very words may have run through the jury's head.

The Platonic *Apology* is in three parts: (1) before conviction, (2) after conviction and before sentence, (3) after the sentence.

1. Socrates cares not for acquittal. But he does care to explain his life. And he selects those aspects of it which there is hope of making his audience understand. That he partly succeeded in this is shown by the large number of those (220 out of 500) who voted for his acquittal.

2. His answer to Meletus, as least important, is reserved for the midnight hour. Meletus addresses himself first to "other accusers"—comic poets and the rest, who have prejudiced his reputation by falsely identifying him with the physical philosophers and the sophists. What then is the strange pursuit which has given to Socrates so great an influence and power (plastic)? It is the usual attempt, to which he was first impelled by the oracle at Delphi, and which he has followed ever since as a religious mission. The god said "Socrates, I am of greater growth than you."

3. Meletus, he was of great or small. So he went in search of some one wiser than himself, but could find none, though he found many who had a religious instinct. And he inferred that the god must mean "He is wisest who, like Socrates, is most aware of his own ignorance." This unconscious quest has left him in great poverty, and has made him enemies, who are represented by Anytus, Meletus and Lycon. And their enmity is further embittered by the pleasure which young men take in seeing pretence unmasked, and in imitating the true service of refutation. Hence has arisen the false charge that Socrates is a corrupter of youth.

4. Here he turns to Meletus. "If I corrupt the youth, who does then corrupt them?" Meletus. "The laws, the judges, the Athenians generally." Cf. *Protagoras* and *Meno*. "Strange, that only here should one be to corrupt and many to improve; or that any one should be so intimated as to wish to be corrupted."

5. Socrates is an atheist. "He believes the sun to be a stone." "You are accusing Anaxagoras. I have said that I knew nothing of such theories. And you accuse me of introducing novel notions about divine things (theories) and whatever things (beings) and divine beings (saviours) and how in divine beings, if not in gods who are their authors?"

6. That is a sufficient answer for his present accuser. He returns to the general long-standing defamation, which both his death and slander have often and again will be the death of many a man.

Yet if spared he will continue the same course of life, in spite of the danger. A crowd of witnesses and death have not checked death when the Athenians posted him, so now he will remain at the post where he is stationed by the god. For to fear death is to assume pretended knowledge.

One thing is certain. A worse man cannot harm a better. But if it be a worse man (Socrates) who will do this, for they will lose the stimulus of his exhortations—and his poverty is a sufficient witness that he was sincere. Not that he would engage in politics. If he had done that he would have perished long ago. Meletus, or his independent vote against the battle of Arginusae, and for disobeying the murderous command of the Thirty Tyrants.

But have not Socrates's disciples, Alcibiades, Critias, Charmides, provoked the citizens? He has no disciples. Any one, bad or good, may come and hear him, and the talk which is his life-work is not unamusing. But why are no witnesses brought to substantiate this view? There could be no more witnesses. If he was to be put to death, he would be angry if he had used his influence for harm. But these men's confidence in Socrates is unshaken.

He will not appeal ad misericordiam. That would be a disgrace (or *apology*) of good (rightly or not) has been required wise, and to admit such an appeal in any case is a violation of the juror's oath.

Socrates has told the Athenians the whole truth, so far as a mixed audience of them could receive it. Elaboration and subtile conjecture could have no place in the Hellenic court; nor could universal truth towards which he was leading men be made intelligible to a new audience while the clemency was running. But his tone and attitude must have made a strong appeal to the better nature of his hearers. With Meletus he "played rather than fought," but he has shown clearly that he has no fear of death, that he chooses to obey God rather than man, and that for very love of the Athenians he would be ready to die.

2. One convicted on a capital charge had the right of pleading before sentence in mitigation of the penalty proposed by his accuser. Socrates was convicted by fewer votes than he himself wanted. The indicative of the trial did not have not for the speeches of Anytus and Lycon the defendant would have been triumphantly acquitted. Could he but have conversed with his judges more than once, he might have removed their prejudices. In no spirit of bravado, therefore, but in simple justice to himself, he meets the claim of Meletus that he shall be punished with death by the counterclaim that he shall be maintained in the Prytaneum as a public benefactor. He cannot ask that as he may for a good, he shall be commuted for imprisonment or exile, which are certainly evils. A fine would be no evil; but he has no money—he can offer a mina. Here Plato and other interpreters, and with them friendly hands, help him. Perhaps money may carry the day.

3. He is sentenced to death, and the public business of the court is ended. But while the record is being entered and the magistrates are thus occupied, Socrates is imagined as addressing (a) the majority, and (b) the minority in the court.

(a). To those who have condemned him he speaks in a prophetic tone. "For the sake of depriving an old man of the last drop of life they have given Athens a bad name. He would not run away, and he has no wish to die. But his accusers are overthrown by unrighteousness, and must reap the fruits of it.

(b). Nor will the Athenians find the desired relief. Other reprovers, whom Socrates has hitherto restrained, will now arise, not in a friendship for Socrates, but as enemies, to escape reproof is to reform their lives."

4. To the minority, who would have acquitted him, he speaks with gentle solemnity. Set them to know their comfort that the divinity has not punished him throughout his life. This indicates that death is not an evil. And reason shows that death is either a long untroubled sleep, or removal to a better world, where there are no unjust judges.

No evil can happen to a good man either in life or after death. Wherefore Socrates will not be angry with his condemners, who have done him no harm, although they meant him anything but good. He will only ask them to do the sons of Socrates as Socrates has done to them."

Is the love of truth consistent with civic duties? Is the philosopher a good citizen? Are questions which are sure to arise where the truth involves practical improvement.

In the *Apology* Socrates appears as an intrepid reformer; the *Crito* gives an impressive picture of him as a loyal and law-abiding Athenian.

Execution had been delayed during the annual mission to Delos (during which no one could be put to death). But the returning vessels must be loaded. Socrates was interrogated, and his answers are given. The execution men, after they had interrogated him, shut him up and found him sleeping peacefully. Presently he awoke, and Crito told him of the approach of the fatal ship. Socrates replies by telling him to go to sleep."

"The third day hence to Pithia shall thou come" and it would seem that the day after to-morrow will really be the day for going home."

Cf. Gorg. 531; Rep. vi. 496.
The soul is uncompounded, incorporeal, invisible, and therefore indissoluble and immutuable.

The soul commands, the body serves; therefore the soul is akin to the divine.

The soul, if pure, departs to the invisible world, but, if tainted by communion with the body, she lingers hovering near the earth, and the elements of the body hold her, being the proof that she is even the believer that true philosophy has purified alone rises ultimately to the gods. The lesson is impressively applied.

b. A pause ensues; and Simmias and Cebes are invited to express their doubts. For, as the swan dies singing, Socrates would die discoursing.

a. Simmias desires not to rest short of demonstration, though he is willing to make the highest attainable probability the guide of life.

If the soul is the harmony of the body, what becomes of her "when the lute is broken"?

b. A pause ensues; and Simmias and Cebes are invited to express their doubts. For, as the swan dies singing, Socrates would die discoursing.

If the soul is the harmony of the body, what becomes of her "when the lute is broken"?
and his friends and a period of "retreat," in which their eyes are turned from earthly things to dwell on the eternal. The theory of ideas here assumes its most transcendent aspect, and it is from portions of this dialogue and of the Phaedrus and Timaeus that the popular conception of Platonism has been principally derived. But to understand Plato rightly it is not enough to study isolated passages which happen to charm the imagination; nor should single expressions be interpreted without regard to the manner in which he presents the truth elsewhere.

It has already been shown (1) that Socratic inquiry implied a standard of truth and good, undiscovered but endlessly discoverable, and to be approached inductively; and (2) that in Plato this implicit assumption becomes explicit, in the identification of virtue with knowledge (Lach, Charm.) as an art of measurement (Protag.), and in the vision (towards the end of the Lysis) of an absolute object of desire. The Socratic "self-knowledge" has been developed (Charm.) into a science of mind or consciousness, apart from which no physical studies can be fruitful. (3) Co-ordinate with these theoretical tendencies there has appeared in Plato the determination not to break with experience. In the Phaedo, a long step is made in the direction of pure idealism. The ordinary virtue, which in the Protagoras and Meno was questioned but not condemned, is here rejected as unreal, and the task proposed to the philosopher is less to understand the world than to escape from it. The universal has assumed the form of the ideal, which is supposed, as elsewhere in Plato, to include mathematical as well as moral notions. The only function of perception is to awaken in us some reminiscence of this ideal. By following the clue thus given, and by searching for clearer images of truth in the world of mind, we may hope to be emancipated from sensation, and to lay hold upon the sole object of pure reason.

It is obvious that when he wrote the Phaedo Plato conceived of universals as objective entities rather than as forms of thought. The notion of "ideal colours" (though occurring in the myth) is an indication of his ontological mood. Yet even here the έστια are not consistently hypostatized. The notion of "what is best" has a distinctly practical side, and the "knowledge through reminiscence" is in one aspect a process of reflection on experience, turning on the laws of association. It is also said that objects "partake" of the ideas, and some concrete natures are regarded as embodiments or vehicles of some of them. Still if regarded as a whole, notwithstanding the scientific attitude of Socrates, the Phaedo is rather a meditation than an inquiry—a study of the soul as self-existent, and of the mind and truth as coeternal.

IV. Symposium, Phaedrus, Cratylus.—Socrates is again imagined as in the fullness of life. But the real Socrates is becoming more and more inextricably blended with Platonic thought and fancy. In the Apology there is a distinct echo of the voice of Socrates; the Phaedo gives many personal traits of him; but the dialogues which are now to follow are replete with original invention, based in part, no doubt, on personal recollections. The Symposium admits both of comparison and of contrast with the mythological and mystical or spiritual. The Symposium is spiritual, but the spirituality in either is of a different order. That is here immanent which was there transcendent; the beautiful takes the place of the good. The world is not now to be annihilated, but rather transfigured, until particular objects are lost in universal light. Instead of flying from the region of growth and decay, the mind, through intercourse with beauty, is now the active cause of production. Yet the life of contemplation is still the highest life, and philosophy, the truest jouy.

The leading conception of the Symposium has been anticipated in the Lysis, where it was said that "the indifferent loves the good because of the presence of evil." The banqueters (including Socrates), who are met to celebrate the tragic victory of Agathon, happen not to be disposed for hard drinking: They send away the flute-girl and entertain each other with the praise of Love. Phaedrus tells how Love inspires to honourable deeds, and how Alcestis and Achilles died for Love. Pausanias rhetorically distinguishes the earthy from the heavenly Love. The physician Erasmus, adapting the distinction, yet holds that Love has a tendency to follow the higher Love in each particular sphere. So Empedocles had spoken of Love as overcoming previous discord. For opposites cannot be united. Heraclitus in the Clitonymia and Eleatic myth, describes the origin of Love as an imperfect creature's longing for completion. The original double human beings were growing impious, and Zeus split them in twain, even since which act the two halves will never come together. Agathon, in his speech for or rather signs, of Love and his works. He is the youngest, not the eldest of gods, living and moving delicately wherever bloom is and in the hearts of men—the author of all virtue and of all good works. And what is this love? He said, love is obeyed by gods and men in all stages of change, it is the power to be of one mind at feasts—pilot, defender, saviour, in whose footsteps all should follow, chanting strains of love.

Socrates will not attempt to rival the poet, and begins by stipulating that he may never use the word "love" in a previous sense, or rather distinction between Love and his works, but points out that, since desire implies want, and the desire of Love is toward beauty, Love, as was truly said of Eros, is not beautiful. So much being established in the Socratic manner, he proceeds to unfold the mystery once revealed to him by Diotima, the Mantinean wise woman. Love is neither beautiful nor ugly, neither wise nor foolish, neither god nor mortal, but it is good. Love is the midpoint between good and evil, in the same way that the mean is midway between contrary qualities. Love is not the reflection of the mean, but is the reality, the true good. Love is a word which is supposed, not knowing nor quite ignorant. That is to say, he is a "philosopher." For knowledge is the most beautiful thing, and love is of the beautiful.

But what does love desire of the beautiful? The possession is enough. But there is one kind of love—called "being in love"—which desires beauty for a peculiar end. The lover is seeking, not his "other half," but possession of the beautiful and birth in beauty. For there is a season of puberty born in both and in the human nature longs to create, and it cannot, save in presence of beauty. This yearning is the earnest of immortality. Even in the bird's devotion to its mate and to its young there is a craving after the beauty conceived by the human mind, and the most beautiful is not merely one of the body, but in the mind. Nay the sciences themselves also come and go (here the contrast to the Phaedo is at its height). But the eternal charm of continuity is still the love of fame.

The love of fame is a somewhat brighter image of immortality than the love of offspring. Creative souls would bring into being not children of their body, but good deeds. And such a one is a noblest fall in love with a fair mortal is a world of mind is filled with enthusiasm and begett noble thoughts. Homer, Hesiod, Lycurgus, Solon, were such genial minds. But they stopped at the threshold (cf. Prot., Meno), and saw not the higher mysteries, which are reserved for the souls of the rare and beautiful. The natures, laws, to universal beauty. The true order is to advance from one to all fair forms, then to fair practices, fair thoughts, and lastly to the single thought of absolute beauty. In that community, beholding the perfectly beautiful, the mind can bring forth realities and become the friend of God and be immortal, if mortal man may.

Alcibiades here breaks in and is vociferously welcomed. He is crowned a lover when, on perceiving Socrates, he declares that he will crown him too. Then he announces himself king of the feast, and insists upon hard drinking (though this will make no difference to Socrates). Eryximachus demands from the newcomer a speech in praise of love. But Alcibiades will praise no one else when Socrates is near. And with the freedom of one who is deep in wine he proceeds with his strange encomium of "this Marsyas." In this he uniting the lover and the painter in one. By his voice he charms more powerfully than they do by their piping. The eloquence of Pericles has no effect in comparison with his. His words alone move Alcibiades to shame, and fascinate him until he stops his ears and runs from him." I often wish him dead. Yet that would break my heart. He brings me to my wit's end."

And, as carved Sileni are made to encase images of gods, so this Silenus-mask entreats things divine. It affects ignorance and suspense, and makes us think to be beautiful; for he brings nothing for outward shows, and his temperament (συνοροόμενος) is wonderful." To prove this Alcibiades reveals his own heart-secret (He is not ashamed to speak it among his friends). He remains the constant partner of Socrates. And this makes it abundantly manifest that in their widely rumoured intercourse (cf. Phaedo, init.) Socrates had never cared for anything but what was best for his younger friend. A somewhat different view is shown by Socrates at Potidaea, his strange persistence in solitary meditation—standing absorbed in thought for a day and a night together—and his intrepid conduct in the retreat from Delium (cf. Laches). "The talk of Socrates is of pack-asses and
cublers, and he is ever saying the same things in the same words; but one who lifts the mask and looks within will find that no other words have meaning." Alcibiades ends by warning his companions against the wiles of Socrates.

Some raffish fellows, and they are invaded by another band of revellers, who compel them to drink still more deeply. The soberly inclined (led by Eryximachus) slink off, and Aristodemus, the reporter of the scene, only remembers further that when he awoke at cock-crow, the soul was still conversing with Agathon and Aristophanes, and showing them that tragedy and comedy were essentially one. He talked them both asleep, and at daybreak went about his usual business.

The philosopher of the Symposium is in the world and yet not of it, apparently yielding but really overcoming. In the Phaedrus, the soul was exalted to "live upon her servant's loss," as in Shakespeare's most religious sonnet; this dialogue tells of a "soul within" in the spirit of some more recent poetry. By force of imagination rather than of reason, the reconciliation of becoming (ταύρος) with being (οὐλος), of the temporal with the eternal, is anticipated. But through the bright haze of fancy and behind the mask of irony, Socrates still appears the same strong, pure, upright and beneficent human being as in the Apology, Crito and Phaedo.

The impassioned contemplation of the beautiful is again imagined as the beginning of philosophy. But the "limitless fancy" (θάλαμος) is the home of "mud forms, beheld by unembodied souls, and remembered here on earth through enthusiasm, proceeding by dialectic from multitude impressions to one rational conception, and distinguishing the "lines and veins" of truth. The Phaedrus records Plato's highest "hour of insight," when he willed the various tasks hereafter to be fulfilled. In he soars to a pitch of contemplation from whence he takes a comprehensive and keen-eyed survey of the country to be explored, marking off the blind alleys and paths that lead astray, laying down the main roads and chief branches, and taking note of the erroneous wanderings of others. Reversing the vulgar adage, he files that he may walk.

The transcendent aspiration of the Phaedo and the mystic glow of the Symposium are here combined with the notion of a scientific process. No longer asking, as in the Protagoras, Is virtue one or many? Plato rises to the conception of a scientific one and many, to be contemplated through dialectic—no barren abstraction, but a method of classification according to nature. This method is to be applied especially to psychology, not merely with a speculative, but also with a practical aim. For the "birth in beauty" of the Symposium is here developed into an art of education, of which the true rhetoric is but the means, and true statesmanship an accidental outcome.

The Symposium, Phaedrus, is devoted, to some extent under the influence of that which he criticizes. The art of rhetoric, which he so often travestied had a lasting effect upon his style. Readers of his latest works are often reminded of the mock grandiloquence of the Phaedrus. But in this dialogue the poetical side of his genius is at the height. Not only can he express or imitate anything, and produce any effect at will, but he is standing behind his creation and disposing it with the most perfect mastery, preserving unity amidst profuse variety, and giving harmony to a wildness bordering on the grotesque.

The person of Socrates is here deliberately modified. He no longer (as in the Symposium) teaches positive wisdom under the pretense of repeating what he has heard, but is himself caught by an exceptional inspiration, which is accounted for by the unusual circumstance of his finding himself in the country and alone with Phaedrus. He has been hitherto a stranger to the woods and fields, which would tempt him away from studying himself through intercourse with men. But by the promise of discourse—especially of talk with Phaedrus—he may be drawn anywhither.

Phaedrus has been charmed by a discourse of Lysias, which after some coy excuses he consents to read.

It is a frigid erotic dialogue, in which one not in love pleads for preference over the lover. Socrates hints at criticism, and is challenged to produce something better on the same theme.

1. Distinguishing desire from true opinion, he defines love as desire prevailing against truth, and then expatiates on the harmful tendencies of love as so defined. But he becomes alarmed at his own unэтional eloquence, and is about to remove, when the "divine token" warns him that he must first recite a "palinode" in praise of love. The "palinode" is the divinity of love.

2. Love is madness; but there is a noble madness, as is shown by soothsayers (called μαστός) from μαστός]. And of the higher madness there are forms. But this is necessary to understand psychology. The soul is self-existent and self-moving, and therefore eternal. And her form is like a pair of winged steeds with their charioteer. Individuals both steeds are good, but in human souls one of them is good. Now before entering the body the soul lost her wings, which in her unembodied state were nourished by beauty, wisdom, goodness, and all that is divine. For at the festival of souls, in which they would have been protected, they would have been too strong for the charioteer to see imperfectly.

3. The mind of the prophet alone has wings. He is ever being initiated into the perfection of his soul. But the vulgar deem him mad and rebuke him; they do as so see that he is inspired.

4. This divine madness (the fourth kind of those above mentioned) is the the way through which the mind to the mind was not seen; her loneliness would have been transporting if she had a visible form. The struggle of the higher passion with the lower is then described with extraordinary vividness, under the image of the divided soul. But the dialectic, in the main, is a step to the philosopher, and is a philosophic friendship, at once passionate and absolutely pure.

5. From his "palinode," Socrates returns to Lysias, who is advised to leave speech-writing for philosophy.

6. Lysias remarks that the speech-writer is despised by the politician. Socrates replies that speech-writing and politics are one concern. The real difference is between those who base their teaching on philosophy, and those who do it for the love of art. For example, if the first speech of Socrates is compared with that of Lysias, the one is found to distinguish and define, the other not; the one observes order in discourse, the other "begins where the other leaves off." And the one puts the whole soul speech should be an organic whole, a "creature having hands and feet." So in the "palinode" there was a classification of the kind, of madness, which led the way to a possibly true though partly string art. This approximation to truth in the midst of much thought was due to the observation of two principles, generalization and division (αναγωγή· διάλογος). Whoever sees the one and many in nature, him Socrates follows and walks in his footsteps. And he was a god. In comparison of dialectic, so is conceived, the rigid rules of Lysias, Thrasymachus, Theodorus, Eunuch, Tisias, Gorgias, Polus and Protagoras are futile and absurd.

And the conditions of teaching (or true rhetoric) are not the same. Whether the soul be single or many, complex or simple, and if multiform what are its parts and kinds, are questions which the teacher must have already solved. And he must likewise have classified his arguments; for his art is to have the ability to divers souls. An art of speaking that should fulfill this condition is non-existent. Yet how can even verisimilitude be attained without knowledge of truth? But the art of writing is kindred to the art of speech. But Socrates maintains that oral teaching through the living contact of mind with mind has many advantages over written composition, which is, comparatively speaking, a dead thing. Men may write for argument in order to recapitulate and so extend the truth, but the serious occupation of the true thinker and teacher is the communication of truth through vital contact with others like-minded in the creation of "thoughts that breathe" in spirits conscious of their own life.

In conclusion, a friendly hint is given to Isocrates that he may do better than Lysias if he will but turn his attention to philosophy. The Phaedrus anticipates much that Plato afterwards slowly elaborated, and retains some things which he at last eliminated. (1) The influence of the Socratic method, which is an aspect of truth which reappears in the Sphinges and other later dialogues. It has been thought strange that it should be found so early as in the Phaedrus. But does not this remark imply an unwarrantable assumption, viz. that Plato's idealism took its departure from the being of Parmenides? Is it not rather the fact that his own theory was formulated before the Megarian ascendency led him to examine the Eleatic doctrine, and that it was by a tendency from the first inherent in Platonism that that doctrine was modified in his final teaching? (2) The
outlines of method which are thrown out at white heat in the Phaedrus are a preparation for the more sober treatment of the matter in the dialectical dialogues. In these, however, the conception of rhetoric is somewhat altered through contact with Eleaticism. (3) The Phaedrus aims, not merely at realizing universals, but at grasping them in and through particulars. This is an ideal of knowledge which was "lost as soon as seen," but one which in some of his latest dialogues, such as the Politicus and Philebus, Plato again endeavored to work out. (4) The Phaedrus contains the elements of that true psychology into which the ontological theory of the ideas is gradually transmuted in Plato's more advanced writings, when the difficulties of his ideal doctrine in its cruder forms have been clearly felt and understood. (5) Plato here appears as a professor of education prescribing oral intercourse to authorship. In this paradox he at once exalts the work of Socrates and avows his own vocation as teacher. The passage throws an interesting light upon the form of dialogue in which his works are cast. But it is not to be supposed that he remained long unconscious of the influence he was destined to wield by writing. In executing a great task like the Republic, he practically diverged from the untenable view asserted here; and in the Laws he recommends his longest and least dramatic work as a suitable basis for the education of the future. (6) It must always appear strange, even to those most familiar with the conditions of Hellenic life, that in portraying the idealizing power of passionate love Plato should have taken his nearest parallel not in the central emotions of man, but in the passage that leads from sex to the driving of the old charioteer. On this subject he has sung his own "palinode" in the Laws, which he intended as his final legacy to mankind. Not that he ceased to exalt genius and originality above mere talent, or to demand for philosophy the service of the heart as well as the head, nor yet that friendship was less valued by him in later years. All this remained unchanged. And in the Republic the passion of love is still distantly referred to as the symbol of ideal aspiration. But a time came when he had learned to frown on the aberration of feeling which in the Symposium and Phaedrus he appears to regard as the legitimate stimulus of intellectual enthusiasm. And already in the Theaetetus not love but wonder is described as the only beginning of philosophy.

While calling attention to this change of sentiment, it is right to add that Platonic love in the "erotic" dialogues of Plato is very different from what has often been so named, and that nothing even in the noble passage of the Laws above referred to casts the slightest shadow of blame on the Socrates of the Symposium. Such changes are, amongst other things, a ground for caution in comparing the two steeds of the Phaedrus with the spirit (_device) and desire (endevoi) of the Republic and Timaeus. The Phaedrus, in common with these dialogues, asserts the existence of higher and lower impulses in human nature, but there is no sufficient ground for supposing that when Plato wrote the Phaedrus he would have defined them precisely as they are defined in the Republic.

The Cratylus is full of curious interest as marking the highest point reached by the "science of language" in antiquity; but, as this dialogue "hardly derives any light from Plato's other writings," so neither does it reflect much light on them. It deals slightly with the contrast between Heraclitanism and Eleaticism, the importance of dialectic, the difficulty about the existence of falsehood, and ends with a brief allusion to the doctrine of ideas—but these topics are all more fully discussed elsewhere.

Three persons maintain different views respecting the nature and origin of language. Hermogenes affirms that language is conventional, Cratylus (the Heraclitean) that it is natural. Socrates, meditating between these somewhat antagonistic views, declares that language is "the word" and other institutions is rational, and therefore (1) is based on nature, but (2) modified by convention.

In his dialectical treatment of the subject, Socrates displays the rhetoric of wild etymologies in reliance on the "inspiration" of Euthyphro. Presently a distinction appears between primary and secondary words. Many primary words convey the notion of measurement and change; and follows that the legislator or word-maker held Heraclitan views. Socrates thus far presses on Hermogenes the view of Cratylus. Then turning to Cratylus he asks if there are no false names. "False language," Cratylus argues, is "impossible." What rhetoric is true language must be inadequate, so that we have a right to criticize the word of the word-maker. And the facts indicate an element of meaningless convention. Nor was the original word-maker consistently Heraclitean. For some important words point not to motion but to rest.

But the question returns—are we sure that the theory of nature which the word-maker held was true? This difficulty cannot be tackled by verbal arguments. In seeking to resolve it we must consider, not words, but things. If there is a true beauty and a true good, which are immutable, and if these are accessible to knowledge, that world of truth can have nothing to do with flux and change.

V. Gorgias, Republic.—In the Symposium and Phaedrus Plato largely redeems the promise implied in the Phaedrus, where Socrates tells his friends to look among themselves for a charmer who may soothe away the fear of death. But he was pledged also to a stern duty by the warning of Socrates to the Athenians, in the Apology, that after he was gone there would arise others for their reproof more harsh than he had been. To this graver task, which he had but partially fulfilled with the light satire upon Lysias or the gentle message to Isocrates, the philosopher now directs his powers, by holding up the mirror of what ought to be against what is, the principles of truth and right against the practice of men. For the good has more than one aspect. The beautiful is right, and at one time action becomes the just. And to the question, What is just? are closely allied those other questions of Socrates—What is a state? What is it to be a statesman?

In the Gorgias Plato asserts the absolute supremacy of justice through the dramatic portraiture of Socrates in his opposition to the world; in the Republic he strives at greater length to define the nature of justice through the imaginary creation of an ideal community.

In the Gorgias the Platonic Socrates appears in direct antagonism with the Athenian world. The shadow of his fate is impending. Cherephon (who is still alive) understands him, but to the other interlocutors, Gorgias, Polus, Callicles, he appears perversely paradoxical. Yet he effectively dominates them all. And to the reader of the dialogue this image of "Socrates contra mundum" is hardly less impressive than that other image of Socrates confronting death.

1. Gorgias asserts that rhetoric is an art concerned with justice, and that persuasion is the secret of power.
   a. Socrates, after suggesting some ironical doubts, declares that rhetoric is an art, but a knack of pleasing; in other words "the counterfeiter of a subsection of statesmanship." This oracular definition rouses the interest of Gorgias, and Socrates proceeds with the following "generalization and division":—

   ![Diagram]

   Flattery influences men through pleasure without knowledge. And the rhetor is a kind of confectioner, who can with difficulty be distinguished from the sophist.

   b. Rhetoric, then, is not an art. And persuasion is not the secret of power. Here Socrates maintains against Polus the three paradoxes:
   1. The tyrant does what he chooses but not what he wishes; it is less evil to suffer wrong than to do wrong;
   2. It is better for the wrongdoer to be punished than to escape punishment.
   3. The only use of rhetoric, therefore, is for self-accusation, and (if it is ever permissible to do harm) to prevent the punishment of one's enemy.

2. Callicles here loses patience and breaks in. He propounds his theory, which is based on the opposition of nature and custom,
"There is no natural right but the right of the stronger. And natural nobility is to have strong passions and power to gratify them. The lawful is a word that cowards use, Devised at first to keep the strong not from awe.

Socrates entangles him in an argument in which it is proved that pleasure is different from good, and that there are good and bad pleasures.

Now the question is whether the life of philosophy, or the life which Callicles defends, is conducive to good. And it has been shown that rhetoric is one of a class of pursuits which minister to pleasure without discriminating what is good.

Callicles again becomes to the strong not Themistocles, Cimon, Pericles labour for their country's good? Socrates then renews his demonstration, proving that if the just man is wronged he wrongs the wronger, not with him, and that it is work of the wronger. In an age of an avoidance of this greatest evil not rhetoric avails anything, nor any of the arts which save life (seeing that life may be used well or ill), nor even such an art of politics as Themistocles, Cimon, or Pericles knew, but his ideas.

And Cogitatie question may well have haunted Plato when he planned the Republic, the greatest of his works. For that which lay deepest in him was not mere speculative interest or poetic fervour, but the practical enthusiasm of a reformer. The example of Socrates had fired him with an ideal of wisdom, courage, temperance and righteousness, which under various guises, both abstract and concrete, has appeared and reappeared in the following dialogues. But the more vividly he conceived of this ideal life, the more keenly he felt its falsity in the present world—that of the restored Athenian democracy. For to a Greek mind above all else was life without the social environment, and justice, of all virtues, could least be realized apart from a community. Hence it became necessary to imagine a form of society in which the ideal man might find himself at home, a state to which the philosopher might stand in harmonious relationship, no longer as an alien sojourner, but as a native citizen, not standing aloof in lonely contemplation, but acting with the full consent of other men and ruling in the right of wisdom. Plato did not regard his own republic as a barren dream. He believed that sooner or later in the course of time a state essentially resembling his ideal commonwealth would come into being. Still more firmly was he convinced that until then mankind would not attain their highest possible development. To ignore this real aspect of his most serious work is to lose much of the author's meaning. Yet it is hardly less erroneous to interpret a great imaginative creation *au pied de la lettre*, as if examining a piece of actual legislation. Even in his *Laws*, a far more prosaic writing, Plato himself repeatedly protests against such criticism. In his most aspiring flights he is well aware of the difference between the imaginary and actual embodiment of an ideal, although as a literary artist he gives to his creations, whether in anticipation or retrospect, an air of sober reality and matter-of-fact. He is more in earnest about principles than about details, and has more wholeheartedly set himself to go forward more confidently with regard to moral than to political truth. He may have been wholly unconscious of the Inconsistencies of his scheme, but it would not have greatly disconcerted him to have discovered them, or to have been told that this or that arrangement would not "work." He would have trusted the correction of his own rough draft to the philosopher-kings of the future.

The Republic falls naturally into five portions. (1) Bk. i. is preliminary, raising the main question about justice. (2) Bks. ii., iii., iv. contain the outlines of the perfect state, including the education of the "guardians," and leading up to the definition of justice (2) in the state, and (3) in the individual. (3) Bks. v., vi., vii. (which to some critics present the appearance of an afterthought) are more successively concerned with the political and legal provisions (1) of communism (for the guardians only), (2) that philosophers shall be kings, (3) of higher education for the rulers (viz. the philosopher-kings). This third provision occupies bks. viii., ix., x. (which some consider an outgrowth from bk. vi.). (4) Bks. vii. and ix., resuming the general subject from bk. iv., present the reverse of the mouth by showing the declension of the state and individual through four stages, until in the life of tyranny is found the image of ideal injustice, as that of justice was found in the life of the perfect state. (5) Bk. x. forms a concluding chapter, in which several of the preceding enactments are reviewed, and the work ends, like the *Gorgias*, with a vision of judgment.

Thus the main outlines of the scheme are contained in bks. ii., iii., iv., v., vi., vii. And yet bks. v., vi., vii. form the central portion, a sort of inner kernel, and are of the highest significance.

In speculating about the composition of the Republic (as is the fashion of some interpreters) it is important to bear in mind the general character of Plato's writings.

"The conception of unity," says Jowett, "really applies in very different degrees to different kinds of art—to a statue, for example, far more than to any kind of literary composition, and to the various parts of latterly, and the outer parts of the body. The dialogue appear to be a style of composition in which the requirement of unity is most stringent; nor should the idea of unity derived from one sort of art be hastily transferred to another. . . . Plato subjects himself to no rule of this sort. Like every great artist he gives unity of form to the different and apparently distracting topics which he brings together. He works freely, and is not to be supposed to have arranged every part of the dialogue before he began to write. And making together the frame of his discourse loosely and imperfectly, and which is the warp and which the woof cannot always be determined."

It should be added, that as Dialectic was still a "world not realized," and he was continually conscious of using imperfect methods, he was not solicitous to bind himself to any one method, or to watch carefully over the logical coherence of his work. "Sailing with the wind of his argument," he often tacks and veers, changing his method with his subject-matter, much as a poet might adopt a change of rhythm. Absorbed as he is in each new phase of his subject, all that precedes is cancelled for the time. And much of what is to come is deliberately kept out of view, because ideas of high importance are reserved for the place where their introduction will have most effect. Another cause of apparent inconsequence in Plato is what he himself would call the use of hypothesis. He works less deductively and more from masses of generalized experience than Platonists have been ready to admit. And in the Republic he is as much engaged with the criticism of an actual as with the projection of an ideal condition of society. If we knew more of the working of Attic institutions as he observed them, we should often understand him better.

These general considerations should be weighed against the inequalities which have led some critics to suppose that the "first sketch of the state" in bks. ii.-iv. is much earlier than the more exalted views of bks. v.-vii. If in these later books new conditions for choosing the future rulers are allowed to emerge, if in discussing the higher intellectual virtues the simple psychology of bk. iv. is lost sight of (it reappears in the *Timaeus*), if the "knowledge of the expedient" at first required falls far short of the conception of knowledge afterwards attained, all this is quite in keeping with Plato's manner elsewhere, and may be sufficiently accounted for by artistic and dialectical reserve. It can hardly be an altogether fortuitous circumstance that the calumny (which has all, as some think, the appearance of an outgrowth from bk. vi.) introduces the declaration that philosophers must be kings and kings—philosophers—comes in precisely at the central point of the whole long work.

The great principle of the political supremacy of mind, though thus held back through half the dialogue, really dominates the whole. It may be read between the lines all through, even in the institution of gymnastic and the appraisement of the cardinal...
vices. It is a genuine development of Socratic thought. And it is this more than any other single feature which gives the Republic a prophetic significance as "an attempt towards anticipating the work of future generations."

Other aspects of the great dialogue, the Doric framework, so inevitable in the reaction from Ionian life, the traces of Pythagoreanism in general, the style and expression, the ideas. The characters of the interlocutors in their bearing on the exposition, have been fully treated by recent writers, and for brevity's sake are here passed over.

Here other points, however, which must not be omitted, because they are more intimately related to the general development of Plato's thought.

The question raised by Proclus has been raised before and since, whether the proper subject of the Republic is justice or the state. The doubt would be more suggestive if in a somewhat different form: Is Plato more interested in the state or the individual? Not only is this a point of principle, but it could lead locally on particulars in all of them they are inseparable, is an obvious answer. And it is almost a truism to say that political relations were prior to ethical in the mind of a Greek. Yet if in some passages the political analogy reacts on more moral, especially in the later and more mature writing, Socrates could be more readily stamped on individual lives than on communities of men (see especially Rep. vii. 528 A, ix. 592).

2. The other point of the question is used to enforce the requirement of political unity and simplicity (see especially v.v. 462 C. This is also to be referred, however, to Plato's general tendency to strain after abstractions. He had not yet reached a point of view that he could look candidly on particulars in the light of universal principles. He recurs often to experience, but is soon carried off again into the abstract region which to him seemed higher and purer. It has been said that Plato flies as well as walks, but this hardly expresses the whole truth, for he flies and walks at the same time, and is in the air and on firm ground in successive "instants" (Jowett). Plato's scheme of communism was to be partly by Dorian institutions and partly by an improved establishment of individualism. But it is a commonplace of general consideration that the state is a higher and more abstract unity than the family. The lower obligation must give way to the higher; the universal must overrule the particular. In this way, the subordination of music to state discipline, and the importance attached to rhythm and harmony in education, had likewise a connexion with Sparta and the Pythagoreans. Seneca, severally, Plato's deliberate attitude towards poetry and art could hardly be other than it is. Philosophy, while still engaged in generalization, could not assign to the imagination its proper function. "Aesthetics could not enter into her province," he says in the Philebus, "any more than the propositions of poetry and philosophy had seemed to be melted in a dominant tone, but this was only a fond anticipation. Plato, if man ever did, so had felt the siren charm, but he is now embarked on a more serious business and will be under the impression of truth and good is grasped, vainfancy must be subdued and silent."

3. In the early education of the guardians a place is found for the unconscious virtue acquired through habit, which the Protagoras has shown to be a very powerful factor for the constitution of character. But if Plato were cross-questioned as to the intrinsic value of habits so induced as a preservative for his pupils against temptation, he would have replied, "I do not pretend to have removed them from their path. Enough of evil still surrounds them to test their moral strength. I have but cleared the way."

5. In a singular fact, and worth the attention of those who look for system in Plato, that the definition of justice here so laboriously set out, viz. the right division of labour between the three classes in the state and between the three corresponding faculties in the individual soul, is nowhere else repeated or applied, although the tripartite division of the soul recurs in the Timaeus, and of great importance to the arguments of the Politicus and the Laws.

6. Before leaving the Republic, it is important to mark the stage which has now been reached by Plato's doctrine of ideas. The metaphysics of the Republic on this subject are by no means everywhere consistent.

a. Towards the end of bk. v. philosophers are defined as lovers of the whole, who recognize the unity of justice, goodness, beauty, in itself, as distinguished from the many just or good or beautiful things. The former are said to be objects of knowledge, the latter of opinion, which is intermediate between knowledge and ignorance. Knowledge is of being, ignorance of the non-existent, opinion of that which is and is not.

b. In bk. vi. there is a more elaborate statement, implying a more refined scheme, of the relation of the three classes to one another. The form of good and all existence is "a riper conception than "the love of each thing as a whole." Ignorance and nonentity have now disappeared, and the scale is graduated from the most evanescent impression of sense to the highest reach of absolute knowledge. And in the highest region there is again a gradation, rising to the form of good, and descending from it to the true forms of all things. In the application of this scheme of the three classes to the three main divisions of knowledge there are still further refinements. The psychological analysis becomes more subtle, and more stress is laid on the connexion of ideas.

c. The doctrine reverts to a cruder aspect in bk. x., where we are told of an ideal bed, which is one only and the pattern of all the many actual beds.

d. A yet different phase of idealism presents itself in bk. ix. (sub fin.), in the mention of a "pattern" of the perfect state laid up in heaven which the philosopher is to make his rule of life.

What is said above concerning Plato's mode of composition has some bearing on these inconsistencies of expression. And that一致性 it is no mere accidental fact that these different phases are not an untenable hypothesis. But that Plato, in preparing the way for what he had in contemplation, should content himself with provisional expression of ideas if he had to outgrow them, as in the Phaedo (as in bk. x.) he should go back to a crude or even childish form of his own theory, is equally conceivable and in accordance with his manner elsewhere. Socrates in the Parmenides is answering to a narrower circle of readers, in which Plato grapples directly with the central difficulties of his own theory of knowing and being. It is not necessary to assume that all of these are later than the Republic. The position of the Euthydemus and Parmenides in the order of composition is very uncertain. The Theaetetus has points of affinity with the Republic. The Sophist, Politicus and Philebus are in a later style. But, on account of their cognate subject-matter, these six dialogues may be conveniently classed together in a group by themselves. And the right place for such a group is intermediate between the Republic and the Laws.

The essential object of the definition, the identity of virtue and knowledge, the existence of an absolute good, which would be universally followed if universally known, and of a standard of truth which is implied in the confession of ignorance, were postulates underlying the Socratic process, which in so far made no claim to be a "philosophy without assumptions." These postulates, when once apprehended, drew Plato on to speculate concerning the nature, the object and the method of knowledge. Now, so far as we have hitherto followed him, his speculation has either been associated with ethical inquiry, or has been projected in a poetical and semi-mythical form. In the Phaedrus however, the vision of ideas was expressly conjoined with an outline of psychology and an explanation of knowledge. And, while the opposition of ideas to phenomena and of knowledge to opinion has been repeatedly assumed, it has also been implied that there is a way between them, and that the truth can only be approached by man through interrogation of experience. For it is nowhere supposed that the human inquirer is from the first in a position to deduce facts from ideas. Much rather, the light of the ideas is one which sufficiently breaks in upon experience as man struggles towards the universal.

But it is not less true that the metaphysical aspirations from which Socrates had seemed to recall men's thoughts had been reawakened in consequence of the impulse which Socrates...
himself had given. From asking, Is virtue one? Can virtue be taught? Plato passes on to ask, What is unity? What are knowledge and being? From criticizing imperfect modes of teaching virtue, he has begun to speculate about the right and wrong uses of the intellect, and from dramatic portraits of the individual characters, he turns himself to the ideal conception of the Sophist. He has entered upon the "longer way," and is no longer contented with mere "hypotheses." With this demand for scientific precision his conception of the ideas themselves is modified, and he strives anew to conceive of them in relation to one another, to the mind, and to the world. As the balance of ethical truth was restored by admitting an unconscious (or inspired) conformity to reason, so now a fresh attempt is made on the intellectual side to bridge the gulf between sense and knowledge.

This endeavour involves, not only an expansion of the method of Socrates, but an examination of the earlier philosophies from which Socrates had turned away. Their influence on Plato has been traceable in the preceding dialogues, though, except in the case of Pythagoreanism (Gorg., Phaed., Rep.) it has been mostly indirect and casual. But in these dialectical dialogues he manifests his serious conviction that the contemporary fallacies which formed the chief hindrance to inquiry were deeply rooted in forms of thought created by earlier thinkers, above all by Heraclitus and Parmenides. To the exclusiveness of their first principles as held by their followers Plato attributed the barrenness and impracticable unreality of many discussions, which put shadow-fighting and controversy in the place of real investigation, and led men to think that truth was unattainable. He therefore enters into conversation, as it were, with the great minds of former times, and in the spirit of Socrates compels each of them to yield up his secret, and to acknowledge a supplemental truth. To this effort he may very probably have been stimulated by the dialectical activity of his Socratic friends at Megara, whose logical tastes had drawn them towards Elaticism. But, unlike them, while strengthening his metaphysical theory, he was also led to give to his political speculations a more practical turn.

The Euthydemus is a treatise "De Sophistis Elenchis" in the form of a fable, and may serve to introduce the five other dialogues, as the encounter with Thrasymachus, Euthydemus. The Republic. Under the mask of mockery there is more of concentrated thought, and more of bitterness, in this dialogue than in the Protagoras or the Gorgias.

A sample of educational dialectic—in which Socrates draws out of young Cleinias the admissions (1) that a philosophy is needed, (2) that the highest philosophy is a science of kindcraft, which remains for the present undefined—is contrasted with a series of ridiculous sophisms, propounded by Dionysodorus and his brother Euthydemus, in which absolute and relative notions, whether affirmative or negative, object and subject, universal and particular, substance and attribute, action and modality, are capriciously confused. Crito, to whom Socrates narrates the scene, is moved to contempt. But Socrates warns him not on this account to despair of philosophy. In conclusion, Isocrates, or some one else, who prematurely mixes up philosophy with practical politics, is cautioned against spoiling two good things.

Such puzzles as—How can I learn either what I know or what I do not know? How can things become what they are not? Is falsehood or denial possible?—although treated jocularly here, will be found returning afterwards to "trouble the mind's eye."

Plato appears in the same act to have become aware of his affinity with Parmenides, and to have been led to reconsider the Parmenides. foundations of his own doctrine. The one being Parmenides was a more abstract notion than justice, beauty or the good. And the Zenonian method had more pretension to exactness than the Socratic. But it remained barren, because contented to repeat its own first essays in the destructive analysis of experience, without rising to the examination of its own first principles. For this higher criticism, of which he himself also stood in need, Plato looks up from the disciples to the master Parmenides. The appeal to him is put into the mouth of Socrates, as a very young man, who has found for himself a theory of ideas and would gladly see the Zenonian process applied to the notions of sameness, difference, likeness, unlikeness, unity and being.

Parmenides, whom Plato treats with tender reverence not unmixed with irony, proposes to the youth a series of questions which reveal the crudity of the doctrine of elon. (1) Are there ideas of trivial things? (2) How do things "partake" of them? (3) Must not idealism proceed in infinitum? (4) If ideas are thoughts, do they and their participants think? (5) If they are patterns, and things resemble them, must there not be a pattern of the resemblance, and so on in infinitum? (6) If absolute, are they thinkable by man?

These difficulties are real, and yet to deny ideas is to destroy philosophy. (As the paradoxical doubts in the Protagoras do not shake the faith of Socrates in the existence of good, so neither does Plato here intend for a moment to derogate from the belief in the existence of the One and the True.)

Parmenides advises Socrates to arm himself for the further pursuit of truth (1) by the higher application and (2) by the extension or multiplication of the method of the (1). The Protagoras, led to apply abstractions. (2) It is not enough to show the inferences which may be drawn from the admission of an hypothesis, but account must also be taken of the inferences which follow from its negation.

Parmenides exemplifies his suggestion by examining his own first principle in conversation with a youth who, while a contemporary of Socrates, is a namesake of Plato's pupil Aristotle. Not content with the affirmative and negative hypotheses, he pursues either along two lines, according as either term of the proposition is emphasized, and this not only as regards the hypothesis of unity, but also as applied to the alternative hypothesis of plurality. The result, as in the Protagoras, is purely destructive, and the dialogue ends abruptly without a word of reply from Socrates.

The second part of the Parmenides may be regarded as an experiment in which Plato "assays to go" in Elatic armour. Yet the strange web is "shot" with colours of original thought. The mode of conceiving time and becoming, and the vision of nothingness towards the end, may be noted as especially Platonic. These passages may be regarded in the same light as the wise words of Protagoras or the sober truths which occur among the wild fancies of the Parmenides. The interpreter should not miss the nest out to be set on the unstable basis of the Heraclitean flux. By an elaborate criticism of both theories knowledge is at last separated from the relativity of sense; but the subsequent attempt to distinguish on abstract grounds between true and false opinion, and to define knowledge as true opinion with a reason (cf. Memo), proves ineffectual. Plato still shows traces of Megarian influence. But the disjunctive method of the Parmenides is not resumed. The indirect proofs are so arranged as to exhibit the skill of Socrates in "bringing to the birth" the germ of a thought in a richly endowed and "pregnant" young mind.

Theophrastus is the embodiment of the philosophical nature described in Rep. bk. vi., and has already been trained by Theodorus of Cyrene in geometry and the other preparatory sciences of

---
The Theaetetus marks a great advance in clearness of metaphysical and psychological expression. See for example the passage (184-186) in which the independent function of the mind is asserted, and it is laid down that the truth of experience is made to be seen. There is a distinctly fresh and critical and historical method in philosophy, while the perfection of style continues unpaired, and the person of Socrates is as vividly represented as in any dialogue.

Notwithstanding the persistence of an indirect and negative method, the spirit of this dialogue also is the reverse of sceptical. "Socrates must assume the reality of knowledge or deny himself" (107 A). Perhaps in no metaphysical writing is the balance more firmly held between experience, imagination and reflection. Plato would seem to have made a compact with himself to abstain rigidly from snatchings at the golden fruit that has so often eluded his grasp, and to content himself with laboriously "cutting steps" towards the summit that was still unascended.

With Plato, as with other inventive writers, a time seems to have arrived when he desired to connect successive works in a series. Thus in planning the Sophistes he linked it to the Theaetetus (which had been written without any such intention), and projected a whole tetralogy of dialectical dialogues, Theaetetus, Sophistes, Politicus, Philosopher, of which the last piece seems never to have been written.

After an interval, of which our only measure is a change of style, the philosopher returns to the great central question of knowledge and being. The obstacle in his path, on which he has often played with light satire, dramatic portraiture and indirect allusion, is not to be made the object of a seriously planned attack. He has made his approaches, and the enemy's fortress is to be forthwith sapped and overthrown. This hostile position is not merely the "Sophistik" which, as some tell us, is an invention of the Germans, and as Plato himself declares is only the reflection or embodiment of the average mind, but the fallacy of fallacies, the prime falsehood (σεραίος πραξόν) of all contemporary thought. This is nothing else than the crude absoluteness of affirmation and negation which was ridiculed in the Euthydemus, and has been elsewhere mentioned as the first principle of the art of controversy? For dramatic purposes this general error is personified, and the word "sophistik," which has somehow become the λόγος νηρών of the Platonic school, thus for the first time fixedly acquires the significance which has since clung to the name. That Plato himself would not adhere pedantically to the connotation here implied is shown by the admission, at the opening of the dialogue, that amongst other disguises under which the philosopher walks the earth the sophist is one.

In the Sophistes, as in the Parmenides, a new method is introduced, and again by an Eleatic teacher. This method is repeated with improvements in the Politicus, and once more referred to in the Philoagus. It bears a strong resemblance to the "synagogés" and "diharizmata" of the Phaedrus, but is applied by the "friend from Eléa" with a degree of pedantry which Socrates nowhere betrays. And the two methods, although kindred, have probably come through different channels—the classifications of the Phaedrus being Plato's own generalization of the Socratic process, while the dichotomies of the Sophistes and Politicus are a caricature of Socrates cast in the Megarian mould. Plato seems to have regarded this method as an implement which might be used with advantage only when the cardinal principles on which it turned had been fully criticized.

1. After various attempts to "catch the sophist," he is defined as the maker of an unreal likeness of truth. Here the difficulty begins, as the definition implies the experience of the unreal, i.e. of not-being. In our extremity it is necessary to "lay hands on our father Parmenides."

2. The contradictions attendant on the notion of "being," whether held by Parmenides or his opponents or by the "less exact" thinkers who came after them, are then examined, and in an extremely subtle and suggestive passage (246-249) an attempt is made to mediate between idealism and materialism. The result is to define the consummate being as exempt from change it cannot be devoid of life and motion. "Like children, 'Give us both,' say we."

3. This leads up to the main question: (a) are different notions incompatible, or (b) do they indifferently coexist, or (c) is there communion of some kinds and not of others? The last view is alone tenable, and is confirmed by experience. And of the true combination and separation of kinds the philosopher judges.

4. Then it is asked (in order to "bind the sophist") whether being is predicable of not-being.

But the kinds of kinds (or categories) are now examined, viz. being, rest, motion, sameness, difference. Rest and motion are mutually incomunicable, but difference is no less universal than being itself. For everything is "other" than the rest, i.e. not. Thus positive and negative are not only coextensive.

5. And, in spite of Parmenides, we have discovered the existence, and also the nature, of not-being. It follows that the mere pursuit of contradictions is childish and useless and wholly incompatible with a philosophic spirit.

Negation, falsity, contradiction, are three notions which Plato from his height of abstraction does not hold apart. His position is the converse of the Sphinozistic saying, "Omnia determinatio est negatio." According to him, every negative implies an affirmative. And his main point is that true negation is correlative to true affirmation, much as he has said in the Phaedrus that the dialectician separates kinds according to the "lines and veins of nature." The Sophistes is a standing protest against the error of marring the finely-graduated lineaments of truth, and so destroying the vitality of thought.

The idealists whom the Eleatic stranger treats so gently have been identified with the Megarians. But may not Plato be reflecting on a Megarian influence operating within the Academy?

The Politicus, Philosopher, Timaeus and Laws.

In passing on to consider the statesman, true and false, the Eleatic stranger does not forget the lesson which has just been learned. While continuing his method of dichotomies, he is careful to look on both sides of the question, and he insists on dividing the form between this and not-this when another mode of classification is more natural. A rule not hitherto applied is now brought forward, the rule of proportion or right measure (σωματικόν αὐθαίρετον), as distinguished from arbitrary limitations. Nor is formal logical treatment any longer felt to be adequate to the subject in hand, but an elaborate myth is introduced. On the ethical-political side also a change has come over Plato. As he has stripped his ideas of transcedental imagery, so in reconsidering his philosopher-king he turns away from the smiling optimism of the Republic and looks for a scientific statesmanship that shall lay a strong grasp upon the actual world. He also feels more sweepingly the gulf between the demagogues and other rulers of Hellas. The author of the Politicus must have had some great quarrel with mankind. But so far as they will receive it he is still intent on doing them good.

1. The king is first defined as a herdsman of men, who as "slow bipeds" are distinguished from the pig and the ape. But the king is not all in all to his charges, as the herdsman is. The definition confuses human with animal; the universe is like a top, which God first winds in one direction and then leaves to spin the other way. In the former or divine cycle all was spontaneous, and mankind who had all the qualities of men, were always like kings. Therefore the immediate care of the state they were happy, if they used their leisure in interrogating nature. But in this reign of Zeus it is far otherwise. Men have to order their own ways and try to imitate in some far-off manner the all-but-forgetting divine rule.

3. Therefore in our present definition the term "superintendent" must be substituted for "herdsman."

What special kind of superintendent is true statesmanship?

1 Rep. vi. 493. 2 ἀνθρώπινον. 3 Soph. 265 D.
PLATO

4. By way of an example, the art of weaving is defined. The example shows that kingcraft has first to be separated from other kindred arts, both causally and conceptually into two categories which exhaust social functions. Eight are eliminated, and the ninth, the class of ministers, remains. Of these (a) slaves, (b) hirelings, (c) traders, (d) officials, (e) priests are again parted off, although the last are only distinguished from the first, when (f) a strange medley of monstrous creatures come into view. Some are fierce like lions, some crafty like the fox, and some have mixed natures like centaurs and satyrs. These are the actual rulers of mankind, more so than the sophists himself. And they too must be separated from the true king.

5. The familiar tripartite distinction of monarchy, oligarchy, democracy, is doubled by introducing into each the distinction involved in the presence or absence of wealth, and in the observance or non-observance of law. But no one of the six carries in itself a scientific principle.

The true government is the rule, not of many, but of one or of a few. “And they may govern, whether poor or rich, by free-will or compulsion, and either with or without law, so long as they govern scientifically.

6. The respondent, a youthful namesake of Socrates, is shocked at the remark that the true ruler may govern without law.

This leads to a discussion of the nature of law, which is compared to the prescription left by a physician. If present, he might dispense with his own rule. So the presence of a competent ruler is better than the sovereignty of law, which makes no allowance for nature or circumstance, but tyrannically forces its own way. Imagine medicine, navigation, &c., similarly conducted. He is sovereign by nature. But what would become of civilization? Yet if law is disregarded by rulers who are unscientific and warped by self-interest, this leads to far worse evils. Tyranny becomes the prevalence of one element over another. Hence, in the continued absence of the true ruler, the best course, though only second best, is the strict observance of law. And he who so rules in humble imitation of the scientific governor may be truly called a king, although if the divine lawgiver were to appear his living would supersedes the law.

7. As it is, though cities survive many evils, yet many are shipwrecked because of the ignorance of those at the helm. The order of badness in the state is

   1. Constitutional monarchy.
   2. Constitutional oligarchy.
   3. Law-abiding democracy.
   4. Law-breaking democracy.
   5. Tyranny.

8. It remains to separate from the true ruler those who co-operate with him as subordinates, the general, the judge, the orator. His own peculiar function is an art of weaving strength (the warp) with gentleness (the woof) when education has prepared them—and this (1) by administration, (2) by marriage.

The four preceding dialogues have shown (1) the gradual transformation of the Platonic ideas (while still objective) into forms of thought, (2) the tendency to group them into series of categories, (3) a corresponding advance in psychological classification, (4) an increasing importance given to method, (5) the inclination to inquire into processes (γενεσί) as well as into the nature of being.

Meanwhile Plato’s approach to the Eleatics, though in the way of criticism, has brought into prominence the notions of unity, being, sameness, difference, and has left somewhat in abeyance the idea of good. To this “highest of all studies” Plato now returns, equipped with his improved instruments, and ready to forge new ones in the same laboratory, or in some other, should occasion serve. His work in the Parmenides is ended, this aspect of an element of difference pervading all things—in other words, of an indeterminate element underlying all determinations. This brings him again into relation with the Pythagoreans, who had similarly asserted the combination of finite and infinite in the universe. Taking advantage of their help, he gains a more advanced (but still ideal) conception of the concrete harmony of things, and approaches the definition of that which in the Republic he but shadowed forth. With this most serious inquiry there is combined (as in the Sophistes and Politicus) an ironical and controversial use of dialectic, by which the juggler and false pretender (who is in this case the godless of pleasure), after claiming the highest place, is thrust down to the lowest.

It must be admitted that the style of the Philebus is far from brilliant, or even clear. In the effort of connecting abstractions Plato’s movement is more laboured than in his first glad realization of them.

Instead of attempting here to follow the windings of the dialogue, it must suffice to state the main result. Neither pleasure nor knowledge is the highest good, and the good eludes definition; but the shrine, or habituation, of the good is a complex life of which the elements are, in order of merit: (1) measure, the cause of all right action; (2) beauty, the effect, and (β) reality, the inseparable condition; (γ) intelligence; (δ) science, and right opinion; (ε) pure pleasure unaccompanied with pain. “Not all the animal kingdom shall induce us to put pleasure first.”

The Philebus introduces us to the interior of the Academy in the lifetime of the master. More than any other of the dialogues it recalls Aristotle’s description of Plato’s teaching. But, while his followers seem early to have fallen under the dominance of the latest phase of his doctrine, Plato himself, even in the Philebus, is still detached from any servitude to the creations of his own mind. He manipulates them as the medium for expressing his fresh thoughts, but they are not yet crystalized into a system.

“I will remind you,” Socrates, “of what has been omitted,” says Protagoras at the conclusion of this dialogue. The last (presumably) of Plato’s metaphysical writings thus fitly ends with a confession of incompleteness. But if, as Renan says, “the most fatal error is to believe that one serves one’s country by calumniating those who founded it,” neither is it for the interest of science to ignore these imperfect anticipations. By methods elaborated in the course of centuries, and far more sure than any which Plato had at his command, mankind have gained an extent of knowledge which he dreamt not of. But the Greek metaphysician is none the less a pioneer of knowledge, while the special sciences of ethics and psychology had been carried from infancy to adolescence in a single lifetime.

VII. Timaeus, Critias [Hermocrates].—As the Sophistes and Politicus were written in continuation of the Theaetetus, so, at some uncertain time, Plato conceived the design of writing a great trilogy, for which the ideal state depicted in the Republic should be the point of departure. The grand outline there sketched by Socrates was now to be filled up by Critias and Hermocrates. The form set up by reason should be made alive, “the airy burghers” should be seen “making history.” As a prelude to this magnificent celebration, Timaeus, the Pythagorean philosopher, who is present at the Panathenaic, is invited to discuss the origin of all things, and to bring the glorious theme to the creation of man. What should have followed this, but is only commenced in the fragment of the Critias, would have been the story, not of a fall, but of the triumph of reason in humanity.

In the Philebus (59 A, cf. 62 D) Plato speaks with a touch of contempt of the life-long investigation of nature, as being concerned only with this visible universe, and immersed in the study of phenomena, whether past, present or to come, which admit of no stability and therefore of no certainty. “These things have no absolute first principle, and can never be the objects of reason and true science.”

Yet even this lower knowledge is there admitted as an element of that life which is the habituation of the good. And there are not wanting signs in his later dialogues that Plato’s imagination had again been strongly drawn towards those physical studies which, as the Phaedo shows, had fascinated him in youth. That nature and the world proceed “according to God and not according to chance” is the belief of the Eleatic stranger, to which he perceives that Theaetetus will be irresistibly drawn as he grows older (Soph. 265 D). In the midst of dialectical abstractions, the processes of actual production (γενεσί) have been increasingly born in mind. And the myth in the Politicus turns on cosmological conceptions which, although differing from those in the Timaeus, and more accordant with Plato’s bitterest mood, yet throw a new light on the deeper current of

1 See, however, Polit. 272 C, D.
2 See Jowett, Intro. to the Timaeus.
his thoughts. In the same passage (272 C) there occurs the first clear anticipation of an `interrogatio naturae'.

The impulse in this new direction, if not originated, was manifestly reinforced, through closer intercourse with the Pythagorean school. And the choice of Timaeus the Pythagorean as chief speaker is an acknowledgment of this obvious tenet. In that of the dialogue there occur ideas apparently borrowed from the Athenians, whom Plato apparently ignored, this fact ought probably to be referred to some early reaction of Atomic on Pythagorean doctrine. It is important to observe, however, that not only the Timaeus, but the unfinished whole of which it forms the introduction, is profoundly an imaginative creation. For the legend of prehistoric Athens and of Atlantis, whereof Critias was to relate what belonged to internal policy and Hermocrates the conduct of the war, would have been no other than a prose poem, a "mythological lie," conceived in the spirit of the Republic, and in the form of a fictitious narrative. And, therefore, when Timaeus professes to give only a probable account of shadowy truths, he must be taken at his word, and not criticized in too exact a spirit. His descriptions have much the same relation to the natural philosophy of Plato's time that Milton's cosmology has to the serious investigations of Galileo or Copernicus—except that all physical speculation hitherto partook in some measure of this half-mythological character, and that Plato's mind, although working in an unfamiliar region, is still that of a speculative philosopher.

As Farmanides, after demonstrating the nonentity of present and decay, was yet impelled to give some account of this non-existent and unintelligible phenomenal world, so too, in a similar and somewhat similarly worded way, Plato, although warned off by Socrates, must needs attempt to give a probable and comprehensive description of the visible universe and its creation. In doing so he acknowledges an imperfect truth in theories which his dialectic had previously set aside. In examining the earlier philosophers he has already transgressed the limits prescribed by Socrates, and the effort to connect ideas has made him more and more conscious of the gap between the ideal and the actual. He cannot rest until he has done his utmost to fill up the chasm—calling in the help of imagination where reason fails him. His dominant thought is still that of a deduction from the "reason of the best," as in the Phaedo, or "the idea of good," as in the Republic. But the description and the absolute optimism were by this time considerably modified, and, although not confounding "causes with conditions," as he once accused Anaxagoras of doing, he yet assigns more scope to "second causes" than he would then have been willing to attribute to them. This partly comes of ripening experience and a deepening sense of the persistency of evil, and partly from the feeling—which seems to have grown upon him in later life—of the distance between God and man.

Timaeus begins by assuming (1) that the universe being corporeal is caused and had a beginning, and (2) that its mysterious author made it after an everlasting pattern. Yet, being bodily and visible, it can only be made the subject, humanly speaking, of probable discourse. Thus much being premised, he proceeds to unfold: (a) the work of mind in creation, (b) the effects of necessity, including the sightless necessity, and the attributes of Physiology, and (d) an outline of Pathology and Medicine. To give a full account of such a comprehensive treatise is beyond our scope, and the Timaeus, however great and interesting, has been well described as a "poetical description of Platonic Platonism. A very few scattered observations are all that there is space for here.

1. In the mythology of the Timaeus some of the conceptions with the personal clearness in the Sophist and Philebus resume an ontological form. Thus, in compounding the soul-stuff of the universe, the father of all takes of continuous and discrete and fuses them into an essence (the common result of the Anything). Again he takes of the same stuff and other (cf. the Sophist), overcoming their inherent repugnance by his sovereign act.

2. The notion of an economy or reservation in Plato has been often exaggerated and misapplied. It is difficult for him to terminable obscurity in speaking of the creation of the Earth. It is clear, though Plato does not say so, that she is meant to have been created together with the Heaven and together with Time, and so before the other "gods within the heaven," i.e. the sun and moon and five planets, and it is a plausible supposition that she is the "artificer of day and night," by interposing her bulk to the motion (as Aristotle thought it), cannot be, as Grote supposed, a motion concomitant with that of the outer sphere, but either some far slower motion, perhaps assumed in order to account for the shifting of the sun and moon, or the motion of which (as in the case of the "motion of the same." She clings to the centre, as her natural abode. And the diurnal motion of the heavens is due to the mechanical force of the world extending from the centre of the poles and comprehending all.

3. Immortality is in the Timaeus dependent on the will of the Eternal. And the sublime idea of eternity is here first formulated. This same word only the "archetypal" philosophy, which Plato is supposed to have introduced among the works of reason, because the final cause of these higher senses is to give men perception of number, through contemplation of the measures of time.

It has been commonly said that the four elements of the Timaeus are geometrical figures, without content. This is not true. For what purpose does Plato introduce, "besides the archetype and the created form, a third kind, dim and hard to conceive, a sort of limbo or matrix of creation? If not to fill up the triangles, which are elements of elements, and to be the vehicle of the forms compounded of them? It has been supposed that this "nurse of generation" is identical with "space," and it cannot be said that they are clearly kept apart by Plato. But he had a distinct nomenclature for either, and, although gravity is explained away (so that his molecules, unlike Clerk Maxwell's, may be called imponderable), yet of the filling pentagon, or the formation of the cube, there is implied.

2. The difference of size in the triangles and varying sharpness of their outlines are ingenious though inadequate expedients, adopted in order to account for qualitative difference and physical change.

3. Lastly, the author, in the second part of the Timaeus, the physical cosmogony in the Timaeus, perhaps, for the first time, broaches the conception of antipodes.

4. More distinctly than in the Philebus, bodily pleasure is explained by "a sudden and sensible return to nature (cf. Ar. Rhet. VIII. 1.)

5. Natural philosophers are warned against experimenting on the mixture of colours, which is a divine process and forbidden to man (Tim. xi). Ancient science was at a loss for a theory of colour.

1. Plato tends more and more in his later writings to account for moral evil by physical conditions, thus arriving at the Socratic principle of the involuntariness of vice by a different road.

2. In the Timaeus the soul is a sort of spirit, for the inferior gods, but they also create the lower and mortal parts of the human soul: the principle of anguish which is planted in the breast, within hearing of reason, and that of appetite which is lodged below the diaphragm of a person like an elephant, so that the crib and the liver for a "soothing" looking-glass to soothe or terrify it when tempted to break loose.

3. The brain-pan was left bare of protecting flesh because the soul was made who forms and might be for us a precarious life with capability of reason, in preference to a long secure existence with obstruction of thought.

4. The nails are a rudimentary provision for the lower animals, into which some degeneration and increase afterwards is transformed.

5. Vegetables have sensation but not motion.

6. By way of illustrating the very curious account here given of inspiration, it is erected as an example of what is supposed to be the attraction of the magnetic is really due to rotatory motion and displacement: a remarkable anticipation (Tim. 80c).

7. When the original particles wear out, and the bonds of soul and body in the marrow give way, and the spirit of life is made to fly away. This is the painless death of natural decay.

8. Plato also has changed his mind about the treatment of disease, and shows even more respect for regimen and diet than in the Republic. Diseases are a kind of second nature, and should be treated accordingly.

9. It is also a remark in contrast with the Republic, that over study leads to head complications, which physicians ascribe to chill and find intractable.

Lastly, it is one of the curious irregularities in the composition of the Timaeus that the creation of woman and the relation of the sexes to each other are subjects reserved to the end, because this is the place given to the power and action of a man who is the first transmigration from the form of man. This order is probably not to be attributed to Plato's own thought, but to some peculiarity of Pythagorean or Orphic tradition.

VIII. The Laws.—The two series of dialogues, the dialectical and the imaginative—Sophists, Politicus, Philosophers, Timaeus, Critias, Hermocrates—were left incomplete. For Plato had concentrated his declining powers, in the evening of
PLATO

his life, upon a different task. He was resolved to leave behind
him, if he could so far overcome the infirmities of age, a code
of laws, conceived in a spirit of concession, and such as he still
hoped that some Hellenic state might sanction. The motive
for this great work may be gathered from the Politicus. The
physician in departing is to give a written prescription, adapted
as far as possible to the condition of those from whom he goes
away. This is the second-best course, in the absence of the
philosopher-king. And, as the Hellenic world will not listen
to Plato's heroic remedy, he accommodates his counsel to their
preconceptions. He returns once more from abstract
discussions to study the application of ideas to life,
and, though, by the conditions of the problem, his course is
"nearer earth and less in light," this long writing, which is said
to have been posthumous, has a peculiar interest. The ripeness
of accumulated experience and the mellowness of wise contemplation
make up for the loss of prophetic insight and poetic
charm.

The form of dialogue is still retained, and an aged Athenian
freely criticizing both, and refining on them from a higher
point of view. "The praise of obedience, the authority assigned
to elders, the prohibition of dowries, the enforcement of marriage,
the common meals, the distribution and indelibility of land,
the institution of the Crypto, the freedom of bequest to a
favourable son, the dislike of city walls—all reflect the custom of
Sparta." . . . The use of the lot, the scrutiny of magistrates,
the monthly courses of the council, the pardon of the forgiven
homicide, most of the regulations about testaments and the
guardianship of orphans, the degrees of consanguinity recognized
by law, correspond to Athenian laws and customs" (Jowett).

The philosopher's own thoughts come out most strongly in the
"prudles" to the laws, and in the regulations concerning
education, marriage and the punishment of impiety (i.e. 1st,
atheism; 2nd, denial of providence; 3rd and worst, immoral
superstition). The difficulty which is met in the Politicus by
the abandonment of the world for a time, and in the Timaeus
by the lieutenantcy of lower gods, here leads to the hypothesis
of an evil soul. The priority of mind (often before asserted)
and the increasing importance attached to numbers are the chief
indications of Plato's latest thoughts about the intelligible
world, but it must be remembered that the higher education,
(answering to Rep. vi., vii.) is expressly reserved. Had Plato
written his own Epinomis, the proportions of the whole work
(not then "acephalous") might have been vastly changed.

The severity of the penalties attached to the three forms of
heresy, especially to the third and worst of them, has led to the
remark that Plato, after asserting "liberty of prophesying"
became intolerant and bigoted in his old age (Grote). But
the idea of toleration in the modern sense was never distinctly
present to the mind of any ancient philosopher. And, if in the
Laws the lines of thought have in one way hardened, there are
other parts clearly showing that Plato wished to accommodate the
"second-best" constitution a provision, which was
not admissible in the "perfect state," for possible changes and
readaptations in the future. The power of self-reformation is
hedged round indeed with extreme precautions; and no young
or middle-aged citizen is ever to hear a word said in depreciation
of any jot or tittle of the existing law. But it should be
provided, however guardedly, that select commissioners, after
travelling far and wide, should bring back of the fruit of their
observations for the consideration of the nocturnal council, and
that a power of constitutionally amending the laws should thus
be admitted into the state, is sufficiently remarkable, when the
would-be finality of ancient legislation is considered. Plato
even comes near to the reflection that "constitutions are not made,
but grow" (iv. 790 A).

Plato in the Laws desires finally from impersonating Socrates.
For he found, as he had some while ago in his master in spirit than when
be composed the Phaedrus. The sympathy with common life,
the acceptance of Greek religion, the deepening humanity,
no less essentially Socratic than the love of truth which breathes
in every page. And some particular aspects of Socratism
reappear, such as the question about courage and that
concerning the unity of virtue.

Doubtful and Spurious Works.—Of the dialogues forming part of the
"Platonic canon," and not included in the preceding survey,
the Lesser Hippasus, First Alcibiades and Menexenus are the
most Platonic, though probably not Plato's. The Greater
Hippias and the Chiliasm are also admitted to have some
plausibility. The Socratic Alcibiades (on Prayer), the Hipparchus,
touching on Peisistratus and Homer (on Exile), the Epinomis,
Eratosthenes, Theaeteth, Areages, are generally condemned,
though most of them are very early forgeries or academic exercises.
And the Axioueus (though sometimes prized for its subject,
"the contempt of death"), the De justo, De virtute, Demodocus,
Sisyphus, Eryxias (a not-uninteresting treatise on the use of
money), together with the so-called Definitions, were rejected
in ancient times, and are marked as spurious in the MSS.

Editions.—(1) Complete: Aldine, Ven., 1513; H. Stephanus,
5 Vols. (1579), with Latin version by Serranus (i.e. De Serre, the real editor)
The paging of this edition is preserved, with reference to the margin of most subsequent editions): G. Stallbaum,
12 vols., 1821-1825; G. Stallbaum, the text in i vol. (1852); C. F. Heineken, in 5 vols. (1865-1868); E. D. Dobson,
The Zurich edition by Baiter, Orelli and Winkelmann (1839-1842); Hirschig and Schneider, in Didot's series (1856-1873); M. von
Schantz, with critical notes (1875-1887); J. Burnet (Oxford, 1902). (2) Partial: L. F. Heindorf, Lyric, Charides, Hippasus Major, Phaedrus,
Gorgias, Theaeteth, Cratylus, Parmenides, Euthydemus, Phaedo, Sophist, Protagoras; Philebus, C. Badham, E. Poste
(1861), R. G. Bury; Apologia, J. Riddell (with Digest of Platonic Idiomas) (1861); Protagoras, Wayte (1854); 7Theaeteth, L. Campbell (1861); B. Kennedy; Sophist and Politicus, L. Campbell (1867); Phaedo, W. Geddes, Archer Hind; Timeaus, Archer Hind (1888); Parmenides,
Waddell (1864); Mene, J. Adam, Seymour Thompson; A. Apologia, C. Riddell; Euthyphro, J. Stock; Euthyphro; Symposium, Euthydemus, Laches, C. Badham; Parmenides, Stallbaum, Maguire, Waddell, Leges, F. Ast (1814), C. (in two volumes) (1866); Republic, Jowett and Campbell (1894).
(3) I. Adam (1902).

Translations.—Latin: A Latin version of the Timaeus by
Chadwick existed in the middle ages and was known to Dante.
It was printed at Paris in 1520 (Teubner, 1876). The complete
rendering by Maraviglio (1696) formed the basis of other Latin
translations, such as that of Serranus (1822), which accompanied
the edition of Stephanus. It was printed in the Basel edition of
1534; English: (1) Complete: Sydney and Taylor (1804); Jowett (1871-1892). (2) Partial: Republc, Davies and Vaughan,
Jowett (in a separate volume; 3rd ed., 2 vols. 1908); Philibesc, E. Poste; Georgius, Cope; Timeaus, Archer Hind (in his edition); G. R. Thompson; Symposium, Euthydemus, Laches, C. Badham; Parmenides, Stallbaum, Maguire, Waddell, Leges, F. Ast (1814), C. (in two volumes) (1866); Republic, Jowett and Campbell (1894). (4) I. Adam (1902).

PLATO, Athenian comic poet of the Old Comedy, flourished between 429-389 B.C. According to Suidas, he was the author of thirty comedies. Some of these deal with political matters. Such were the Cephon and Hyperbolus, directed against the well-known demagogues, and the Symmachia, referring to a coalition formed by Nicias, Alcibiades and Phaeaex to rid of Hyperbolus by ostracism. His later plays treat the vices and failings of mankind in the spirit of burlesque and parody. Such were the Sophistae, akin to the Clouds of Aristophanes; the Cinesias, an attack on a contemporary poet; the Festivals, satirizing the useless expenditure and extravagance common on such occasions; mythological subjects—Adonis, Europe, Io, the Auts (on the Aeginetan legend of the change of ants into men); Phaon, the story of the Lesbian ierryman, who was presented by Aphrodite with a marvellous ointment, the use of which made women madly in love with him. See T. Kock, Comicorum atticorum fragmenta, i. (1880); A. Meineke, Poetarum comicorum grecorum fragmenta (1882).

PLATON, LEVSHIN (1737-1812), Russian divine, was born at Chashnikowo near Moscow, and educated in the academy of that city. In 1763 the empress Catherine II. invited him to instruct her son Paul in theology, and he became one of the court chaplains. Three years afterwards Platon was appointed archimandrite of the Trinity monastery of the royal church of Moscow, in 1770 archbishop of Tver, and in 1787 archbishop of Moscow and metropolitan. He died in 1812, one of his last acts having been to write an encouraging letter to the emperor Alexander I. in view of the French invasion. Platon was a brilliant and learned man, and the author of several works which enjoyed a high reputation in their time, including A Short History of the Russian Church, which has been translated into English.

PLATONIC LOVE, a term commonly applied to an affectionate relation between a man and a woman into which the sexual element does not enter. The term in English goes back as far as Sir William Davenant's Platonick Lovers (1650-1658); E. Dietrich, from Plato's Symposium, of the love of the idea of good which lies at the root of all virtue and truth. Eroticus was used, e.g. by Marsille Flinclo (14th century), as a synonym for amor socraticus, referring to the affection which subsisted between Socrates and his pupils.

PLATOON (Fr. peloton, from Fr. polete, a ball or pellet; cf. Ger. Haufe, heap), a small group of soldiers. In the early 17th century it was a definite tactical unit of infantry, corresponding to the modern section or half company. In the 18th century the battalion, irrespective of its organization into companies, was told off on parade into six, eight or ten platoons of equal strength. "Platoon fire" was the systematic and regulated fire of platoon volleys, the platoons firing one after the other. Hence a "platoon" sometimes means a volley.

The fire of a long line of infantry was as a rule conducted on the same principles, each battalion of the front line employing platoon fire, which is often picturesquely described as a "rolling platoon fire," or "rolling volleys." The word is obsolete in the British army, but is used in the United States, and, in various forms, in the armies of France and other Latin nations.

PLATT, THOMAS COLLIER (1833-1910), American politician, was born in Owego, Tioga county, New York, on the 10th of July 1833. He studied in 1849-1852 at Yale, from which he received the honorary degree of A.M. in 1876. He made money in lumbering out West, and returning to Owego became a banker and railway director. He helped to organize its Republican party in Tioga county, and in 1872-1873 was a representative in Congress. In 1877 he was chairman of the state Republican Convention at Rochester. On the 10th of January 1881 he was elected United States senator, but resigned, with his colleague, Roscoe Conkling, on the 16th of May following, chiefly because President Garfield, in spite of their protest, had appointed as collector of the port of New York, Judge William H. Robertson, a political opponent. Within ten years he became the acknowledged Republican "boss" of the state, and he again served in the United States Senate from 1897 to 1903. But his power waned steadily after about 1903. He died in New York city on the 6th of March 1910.

PLATTE (so named, from the French, because of its shallowness), or NEBRASKA, a river system of Colorado, Wyoming and Nebraska, tributary to the Missouri river, which enters immediately north of Plattsmouth, Nebraska, 18 m. below Omaha, in about 41° 3' N. lat. Including the North Platte it is about 900 m. long from its headwaters, with a drainage basin for the entire system of 90,000 sq. m. The Platte proper is formed by the junction of the North Platte and the South Platte, sometimes called the North and South Forks of the Platte, immediately below the city of North Platte in Lincoln county, Nebraska. The North Platte and South Platte rise respectively in North Park and South Park in Colorado. The tributaries of the main stream all flow in from the north; the most important being the Loup, which empties immediately east of Columbus in Platte county, and the Elkhorn, which joins the Platte in Douglas county, due west of Omaha.

See J. C. Stevens, Surface Water Supply of Nebraska (Washington, 1899).

PLATTNER, KARL FRIEDRICH (1800-1858), German metallurgical chemist, was born at Kleinwaltersdorf, near Freiberg in Saxony, where both his father and grandfather had been miners. A poor working miner, found the means to have him educated first at the Bergschule and then at the Berg- akademie of Freiberg, and after he had completed his courses there in 1820 he obtained employment, chiefly as assayer, in connexion with the royal mines and metal works. Having taken up the idea of quantitative mouth-blowpipe assaying, which was then almost unknown—except that E. Harkort (1797-1835) in 1827, while a student in Freiberg Academy, had worked out a blowpipe assay for silver—he succeeded in devising trustworthy methods for all the ordinary useful metals; in particular his modes of assaying for nickel and cobalt quickly found favour with metallurgists. He also devoted himself to the improvement of the blowpipe analysis, and summed up his experience in a treatise Die Proberkunst mit dem Läthner (1832), which became a standard authority. In 1840 he was made chief of the royal department of assaying. Two years later he was deputed to complete a course of lectures on metallurgy at the Bergakademie in place of W. A. Lampadius (1772-1842), whom he subsequently succeeded as professor. He died at Freiberg on the 22nd of January 1858.

In addition to many memoirs on metallurgical subjects he also published Die metallurgischen Rostprozesse (theorisch betrachtet) (1828), and posthumously Vorlesungen über allgemeine Wissenschaften (1860).

PLATTSBURG, a city, port of entry and the county-seat of Clinton county, New York, U.S.A., situated on the west shore of Lake Champlain, at the mouth of the Saranac river, 168 m.
PLATTSMOUTH—PLATYELMIA

(by rail) N.E.E. of Albany. Pop. (1890), 7010; (1900), 8434, of whom 1953 were foreign-born; (1910, census), 11,138. It is served by the Delaware & Hudson railway, and has steamers connexions with lake ports. Its situation in the region of lakes and mountains and its delightful climate have made it a summer resort. Among its institutions are the Samuel F. Vilas Home (for aged and infirm women); the Home for the Friendless of Northern New York (1874), for the care of homeless children; the Plattsburg State Normal and Training School, the D'Youville Academy for girls (founded in 1860, chartered in 1871), under the direction of the Grey Nuns; the College St Pierre (Roman Catholic, 1903), and the Champlain Valley Hospital. The barracks, a mile away, is an important military post. Columbia, 2 m. south, is the seat of the Catholic summer school. Plattsburg has a fine harbour and is the port of entry of the Champlain customs district; in 1900 its exports were valued at $15,169,502 and its imports at $8,167,527. Among the city's manufactures are lumber, wool pulp, paper, shirts, sewing-machines and automobiles. The total value of the factory products in 1905 was $1,056,702.

Plattsburg was incorporated as a village in 1795, and derived its name from Zephaniah Platt (1740-1807), who had led a colony of settlers to this place from Long Island; it became a city in 1902. About Valcour Island (5 m. south-east of Plattsburg) on the 11th of October 1776, a British fleet under Captain Thomas Pringle and an American flotilla under Benedict Arnold engaged in the first conflict between American and British fleets, the British being victorious. On the outbreak of the War of 1812 the village became the headquarters of the American army on the northern frontier. On the 11th of September 1814, in Plattsburg (or Cumberland) Bay, Captain George Downie, commanding a British flotilla, was defeated by an American flotilla commanded by Commodore Thomas Macdonough, losing his life in the engagement (see CHAMPLAIN, LAKE).

PLATTSMOUTH, a city and the county-seat of Cass county, Nebraska, U.S.A., situated in the valley and on the bluffs of the Missouri river near the mouth of the Platte. Pop. (1900), 4064, of whom 979 were foreign-born. It is served by the Chicago, Burlington & Quincy, and the Missouri Pacific railway systems. There are railway car-shops, and a considerable trade is done in grain and cattle. A trading-post licensed by the United States government was opened here in 1833, and a town platted in 1854. Plattsburgh was first incorporated as a city in 1855, being one of the oldest settlements and cities of the state.

PLATYELMIA, a phylum of the animal kingdom which comprises three classes, the Planarians, Trematodes (q.v.) and Cestodes. It is the group of animals in which the act of creeping has first become habitual. In association with this movement in a definite direction the body has become vermiciform and bilaterally symmetrical. One end of the body, through contact, during locomotion, with fresh tracts of medium and other forms of stimuli, has become more specialized than the rest, and here the nervous system and sense-organs are more densely aggregated than elsewhere, forming a means of controlling locomotion and of correlating the activities of the inner organs with the varying stimuli that impinge upon the body. The form and habits of the group vary widely. The Planarians are free-living animals, the Trematodes are parasitic upon and within animals, and the Cestodes are wholly endoparasitic.

Structure.—The chief features which Platyelmia possess in common are the following. The body is not metamerically segmented and is composed of a muscular tunic covered externally by a more or less modified cellular layer. Within this muscular tunic lies a parenchymatous tissue which may be uniform (Cestodes) or differentiated into a central or digestive, and a peripheral portion (some Turbellaria), or into a central and peri-digestive sac (Trematodes), while the peripheral portion is separated from it by a space lined in some forms by a flattened epithelium (most Planarians). It is characteristic of the group that the mouth should be the only means of ingress to and egress from the digestive sac and that no true perivisceral space or coelom exists in the sense in which these terms are used in higher Invertebrates. The peripheral parenchyma gives rise to protonephridia, that is to coiled tubes commencing in pyriform cells containing a flame-like bundle of cilia provided with branched outgrowths, and communicating with the exterior by long convoluted canals which open at the surface of the body. These protonephridia are the excretory organs. The nervous system, though centralized at one end of the body, contains diffuse nerve-cells in the course of its tracts, which are disposed in two or more longitudinal bands, interconnected by transverse bands. The Platyelmia are hermaphroditic and the reproductive organs are complex. The male organs consist of paired testes communicating by delicate canals with a protractible penis. This organ is generally single but sometimes paired and occasionally multiple. It is frequently armed with spines, hooks or stylets, and is further complicated by the addition of a nutritive secretion (the prostate gland) which may open at its base or pass separately by a special duct to the exterior. There is some reason to believe that this complicated and variable apparatus is used for stabbing the body of another animal and that beginning as a weapon for catching prey it has become adapted for hypodermal impregnation and only gradually adapted for insertion into the bursa copulatrix. The female organs are no less complex. They consist of solid or tubular ovaries which may be single, double or multiple. In the majority of Platyelmia the primitive ovary becomes divided into fertile and sterile portions, i.e. into distinct ovarian and vitellarian regions. The yolk prepared by the latter is conducted by one or more specialized ducts to the oviduct and the point of union is distinguished by the opening of a "shell-gland" which secretes a membrane around the conjunct mass of ovum and yolk. From this junction there proceeds an oviduct or "uterus" (paired or single) which before opening to the exterior expands to form a muscular protrusible pouch—the bursa copulatrix. Frequently also from this junction of the ovaries and the vitellaria a median tube is given off which either opens to the exterior or into the intestine, in the latter case it appears to serve as means of conveying superficial yolk to the gut, where it may serve as food.

Inter-relationships.—The inter-relationships of the three members of the Platyelmia are of a more doubtful nature than is the unity of the phylum. The Turbellaria undoubtedly form the most primitive division, as is shown by their free-living habits, ciliation and sense-organs. The Trematodes are somewhat modified in accordance with their ecto- or endoparasitic life, but they exhibit such a close similarity of structure with the Turbellaria that their origin from Planarians can hardly be doubted, and indeed the Trematophaoidae (see PLANARIANS) form an almost ideal annectant group linking the ectoparasitic Trematodes and Rhabdocoel Planarians. The Cestodes, however, are separated by three distinct phyllobranchiate forms with the other Platyelmia. Their adaptations to parasitic life in vertebrate animals appear to have involved such modifications of structure and development that their affinities are quite problematical. The entire absence of any trace of a distinct alimentary tract, the loss of true regenerative power, the peculiar gametic segmentation of the body into hundreds of "proglottides" budded off from

(From Cambridge Natural History. "Worms, &c.," by permission of Macmillan & Co., Ltd.)

FIG. 1.—Free-swimming Larva (Miller's Larva) of a Polyclad Planarian to illustrate the trochosphere-hypothesis of the origin of Planarians. The larva is seen in optical section, and its distinguishing feature is the ciliated lobed band (el, sl, dl), which corresponds to the pre-oral ciliated band of a trochosphere-larva. It is here drawn out into eight processes, of which six are shown, their continuity being expressed by the dotted line.

| br. | Brain. |
| dr. | Glands. |
| ep. | Epidermis. |
| mo. | Mouth. |
| par. | Parenchyma. |
one extremity, and the absence of any morphologically distinct anterior extremity, are adaptations to the wholly parasitic life of this class. Their structure is similar to that of Trematodes, from which in the opinion of most zoologists they have been derived.

Affinities.—As the Turbellaria (Planarians) are the most primitive division of the Platyelmia, the problem of the affinities of this phylum resolves itself into that of the relationships of the Turbellaria. With regard to the origin of this class two divergent views are still held. On the one hand the Turbellaria are considered to be an offshoot of the early Coelomate stock, on the other they are held to be descendants of a simpler two-layered stock. The former hypothesis with its variants may be called the Trocho sphere-hypothesis, the latter the Gastraea-hypothesis. The Trochosphere-hypothesis (2), (3) is based chiefly on the occurrence in certain Polyclad Turbellaria, of a larval form (Müller’s larva) which is comparable to a certain stage (pro-trochula) in the development of the Trochosphere-larva. This Trochosphere is the characteristic larva of Mollusca, Annelida and some Cephalopods; and the Rottfei appear to remain throughout life as modified Trochospheres. It is a true-shaped, free-swimming organism provided with a proral banner of cilia, an apical senseorgan, a simple gut, protonephridia and schizocoel. The importance of this resemblance between the Polyclad larva and the Trochosphere-larva of higher invertebrates is increased if the widely adopted view (held on other grounds) that the Polyclads are the most primitive of the Turbellaria, is soundly based. The grounds for this view are the radial symmetry of several Polyclads and the supposed origin of gonads and excretory flame-cells from the walls of gut, the occurrence of nematomes in the most radically constructed Polyclads, and lastly the presence of two peculiar animals Ctenoplana and Coeloplana, which suggests a transition from Ctenophora to Polyclads. At the present time, however, none of these grounds is incontestable. It is only during the last 20 years ago (4). The argument has come to rest on the agreement between the cell-lineage of Polyclads and that of certain Mollusca and Annelids. This resemblance is considered by Hufrech (5) to be of importance for concluding that the Polyclads are an offshoot, and possibly a degenerate offshoot, from the early Coelomate stock.

The Gastraea-hypothesis is founded on quite other considerations. In effect (6) it traces the Turbellaria to small two-layered organisms containing an outer ciliated epidermis and a central syncytial tissue. Such an organism is found in the peculiar Trichoplax, Lokhamiella, &c. The early stages of most animals pass through such a stage, which is known as a “planula.” From such beginnings the evolution of the Turbellaria leads first through the Acoelous forms in which the central syncytium is partly differentiated into digestive, muscular and skeletal tissue, then to the more specialized Rhabdocoela, and so through the Allocoela to the Turbellaria and finally to the Polyclads. The careful study of the development of one Acoelous form and of certain Rhabdocoels has strengthened this hypothesis by showing that no definite enteron or at least a first laid down enteron of a certain embryonic tract becomes digestive tract, others excretory, others again muscular.

A study of the development of Rhabdocoela (7) has led to the important discovery that the rudiment of the gonads and that of the pharynx are the first rudiments to appear, and that the alimentary tract is derived independently of them. This segregation of the germ cells and their independence of the intestinal sac is an indication that the origin of these cells is not coincident with the enteron, and until we have really clear information as to the evolution of the complex genitalia of the higher Turbellaria we cannot hope to understand the presence of such highly modified structures in animals of an otherwise low grade or organization.

PLATYPUS. The duck-billed platypus (Platypus anatina) was the name assigned to one of the most remarkable of known animals by George Lesson (1833), who had the good fortune to notice the scientific world in the Naturalist’s Miscellany (vol. x., 1799). In the following year it was independently described by Blumenbach (Voigt’s Magazin, ii. 205) under the name of Ornithorhynchus paradoxus. Shaw’s generic name, although having priority to that of Blumenbach, could not be retained, as it had been used at a still earlier time (1793) by Herbst for a genus of Coleoptera. Ornithorhynchus (Gr. ορνιθ- bird, and ρηγας, bill) is therefore now universally adopted as the scientific designation, although duck-billed platypus (Gr. πατης, flat, and τοψ, foot) may be conveniently retained as a vernacular appellation. The common name is called “water-mole,” but its affinities with the true moles are of the slightest and most superficial description.

The anatomical differences by which the platypus, and its only allied the echidnas, are separated from all other mammals, so as to form a distinct sub-class, are described in the article MONOTREMATA, where also will be found the main distinctive characters of the two existing representatives of the group. It is there stated that the early stages of the development of the young are not yet fully known. Sir R. Owen, and later E. B. Poulton, showed that the ovum of the platypus was large compared with that of other mammals, while the young were found to be filled with yolk, and strongly established the fact that Platypus as well as Echidna is oviparous. Two eggs are produced at a time, each measuring about three-fourths of an inch in its long and half an inch in its short axis, and enclosed in a strong, flexible, white shell.

The platypus is pretty generally distributed in situations suitable to its aquatic habits throughout the island of Tasmania and the southern and eastern portions of Australia.
The length of the animal when fully grown is from 18 to 20 in. from the extremity of the beak to the end of the tail, the male being slightly larger than the female. The fur is short, dense and rather soft to the touch, and composed of an extremely fine and close under-fur, and of longer hairs which project beyond this, each of which is very slender at the base, and expanded, flattened and glossy towards the free end. The general colour is deep brown, but paler on the under parts. The tail is short, broad and depressed, and covered with coarse hairs, which in old animals generally become worn off from the under surface. There are no true teeth in the adult, though the young possess a set which are shed after being worn down by friction with food and sand, their purposes being afterward served by horny prominences, two on each side of each jaw—those in the front narrow, longitudinal, sharp-edged ridges, and those behind broad, flattened and molariform. The upper surface of the lateral edges of the mandible has also a number of parallel fine transverse ridges, like those on the bill of a duck. In the cheeks are tolerably capacious pouches, which appear to be used as receptacles for food.

The limbs are strong and short, each with five well-developed toes provided with strong claws. In the fore feet the web not only fills the interspaces between the toes, but extends considerably beyond the ends of the long, broad and somewhat flattened nails, giving great expanse to the foot when used for swimming, though capable of being folded back on the palm when the animal is burrowing or walking on the land. On the hind foot the nails are long, curved and pointed, and the web extends only to their base. On the heel of the male is a strong, curved sharply pointed, movable horny spur, directed upwards and backwards, attached by its expanded base to the accessory bone of the tarsus. This spur, which attains the length of nearly an inch, is traversed by a minute canal, terminating in a fine longitudinal slit near the point, and connected at its base with the duct of a large gland situated at the back part of the thigh. The whole apparatus is so exactly analogous in structure to the poison-gland and tooth of a venomous snake as to suggest a similar function, and there is now evidence that it employs this organ as an offensive weapon.

The platypus is aquatic in its habits, passing most of its time in the water or close to the margin of lakes and streams, swimming and diving with the greatest ease, and forming for the purpose of sleeping and breeding deep burrows in the banks, which generally have two orifices, one just above the water level, concealed among long grass and leaves, and the other below the surface. The passage at first runs obliquely upwards in the bank, sometimes to a distance of as much as 50 ft., and expands at its termination into a cavity, the floor of which is lined with dried grass and leaves, and in which, it is said, the eggs are laid and the young brought up. Their food consists of aquatic insects, small crustaceans and worms, which are caught under water, the sand and small stones at the bottom being over turned with their bills to find them. They appear at first to deposit what they have thus collected in their cheek pouches, and when these are filled they rise to the surface and quietly triturate their meal with the horny teeth before swallowing it. Swimming is effected chiefly by the action of the broad forepaws, the hind feet and tail taking little share in locomotion in the water. When asleep they roll themselves into a ball, as shown in the figure. In their native haunts they are extremely timid and wary, and very difficult to approach, being rarely seen out of their burrows in the daytime. Mr A. B. Crowther, who supplemented the often quoted observations of Dr George Bennett upon the habits of these animals in confinement, states: "They soon become very tame in captivity; in a few days the young ones appeared to recognize a call, swimming rapidly to the hand padding the water; and it is curious to see their attempts to procure a worm enclosed in the hand, which they greedily take when offered to them. I have noticed that they appear to be able to smell whether or not a worm is contained in the closed hand to which they swim, for they desisted from their efforts if an empty fist was offered." (W. H. F.; H. Sc.)

PLAUAEN, a town of Germany, in the kingdom of Saxony, on the Weisse Elster, 60 m. south of Leipzig, on the railway to Hof and Munich and at the junction of lines to Eger and Gera. Pop. (1890), 47,009; (1900), 73,801; (1909), 105,583. It was formerly the capital of Vogtland, or Voigtländ, a territory governed by the imperial Vogt, or bailiff, and this name still clings in popular speech to the hilly district in which the town lies. Of its three Evangelical churches the most prominent is the fine Gothic church of St John, with twin spires, which was restored in 1886. Other buildings of note are the town hall, dating from about 1350, and the old castle of Hradisch, now used as a law court. Plauen is now the chief place in Germany for the manufacture of embroidered white goods of all kinds, for the finishing of woven cotton fabrics, known as Plauen goods, and for the making of lace. Plauen was probably founded by the Slavs. First mentioned in 1122, it passed under the authority of Bohemian in 1327 and came to Saxony in 1466, remaining permanently united with the electorate since 1560. The manufacture of white goods was introduced by Swabian, or Swiss, immigrants about 1570. The advance in its material prosperity has been especially rapid since the incorporation of Saxony in the German Zollverein.

See Fiedler, Die Stadt Plauen im Volke (Plauen, 1874); and Beiträge zur Geschichte der Stadt Plauen (Plauen, 1876); Metzner, Pflaster durch Plauen (1902); and the publications of the Alter- tumsverein Plauen (1873), etc.

PLAUTUS, TITUS MACCIUS (originally perhaps Maccus; cf. Asin. Pro!. 11), the great comic dramatist of ancient Rome, was born at Sarissi in Umbria according to the testimony of Festus, who calls him Umbere Sarisinius, and Jerome. The date of his death was 184 B.C. (Cicero, Brutus, xvi, 56). The date of his birth depends upon an inference based on the statement of Cicero (De senectute, xiv, 50) that he was an old man when he wrote his Tristulentus and Pseudolus. The latter play was

1Some doubt has been expressed as to whether the eggs are extruded or hatched within the body. At a scientific meeting of the Zoological Society of London, on the 17th of December 1903, Mr Oldfield Thomas read a letter from Mr G. Metcalfe of old Orytinobrychus have ever been obtained except by the dissection of the mother. Mr Thomas laid stress on what had been advanced on the other side (Philosophical Transactions, clxxxviii, 463), Professor Spencer (Nature, xxx, 152) and Mr J. Douglas Ogilby (Catalogue of Australian Mammals, p. 1, Sydney, 1902), but expressed the hope "that further inquiries might be made by naturalists in Australia as to the actual finding of such eggs in the burrows, so that this most interesting point might be finally settled."
produced in 91 B.C.; hence we get 254–251 B.C. as the approximate date of his birth. The only record that we possess as to his death is found in an Augustan poet, III. 5, 14 (based on Varro), the historical character of which is doubted by Lee (Plautinische Forschungen, p. 60, sq.). According to this statement he left his native town at an early age and settled at Rome, where he got employment in a theatre, though it is not clear in what capacity. The words of Gallius in *opus artificium scenaticum*, are interpreted by F. Marx as indicating that Plautus was a member of the theatrical staff of Livius Andronicus. At Rome he saved a little money, and embarked on some mercantile enterprise, probably abroad. Having lost his money he returned to Rome penniless, and was driven to support himself by manual labour in a mill (cum...ad circumvagendas molas quis...trudidit, Plautin. op. cit. p. 250). In this *patrium* he wrote three of his plays (the *Saturio*, the *Addictus* and another). The masterly work of his hands, so far as can be ascertained from the scanty evidence which we have, to the latter half of his life; 206 n.C. is the approximate date of the *Miles gloriosus*; cf. line 211 seq., *quae bini custodes...occubant* (present tense), which alludes to the imprisonment of Naevius, an event which cannot be proved to be earlier than 206 B.C.

The defects of construction and the absence of "canica" in the *Miles* also point to this as one of his early plays. On the other hand it is hardly likely that all his comedies (which greatly exceeded in number the extent twenty) were produced during the last twenty years of his life. Radermacher assigns the *Asinaria* to a date as early as 412 B.C. Of the extant plays the *Cistellaria* and the *Stichus* must be associated with the *Miles* as comparatively early works; for the former was clearly produced before (though not long before) the conclusion of the Second Punic War, see l. 201 seq.; and the *Stichus* is proved by its didascalia to have been produced in 200 B.C. The *Pseudolus* and the *Truculentus* fall within the last seven years of his life. The dates of the rest of the extant plays, here given in alphabetical order, are quite uncertain, namely, *Amphitruo*, *Aulularia*, *Bacchides*, *Cascia*, *Curtulio*, *Epulicus*, *Menaechmi*, *Mercator* (probably later than the *Rudens*, as shown by F. Marx), *Mostellaria*, *Persa*, *Poenulus*, *Rudens*, *Triunvirus* (later than 194 B.C.; cf. neti adules in l. 990). Of the *Vidularia* we possess only the fragments contained in the Codex Ambrosianus.

The plays of Plautus are all based on Greek originals. To what extent he is dependent on these originals, and how far he departed from them, we shall perhaps never know exactly. But such evidence as we have points to a pretty close imitation on the part of the Roman poet: there are passages in which he does not hesitate to take over from his originals allusions which can hardly have been intelligible to a Roman audience, e.g. the reference to Stratonicus, a musician of the time of Alexander the Great (Rudens, 93); and in the delineation of character we have no reason to suppose that he improved on his models (cf. Aul. Gell. ii. 23). Even the prologues, which later researches have shown to be in the main by the hand of Plautus himself, though certain passages were clearly added at a later date, e.g. *Cas. prol.* 5–20, may in most cases have formed part of the Greek original. Plautus must therefore be regarded as primarily a translator or adapter, so far as our present knowledge goes. Where he varies his plot on lines of his own by amalgamating the plots of two distinct Greek comedies (e.g. in the *Miles* and the *Poenulus*) the result is generally not happy; and the romanization of the plays by way of allusions to towns in Italy, to the streets, gates and markets of Rome, to Roman magistrates and their duties, to Roman laws and the business of Roman laundresses, has, comitia and senate, &c., involves the poet in all the difficulties of attempting to blend two different civilizations. The inconsistence of his attitude is shown by his use, side by side, of the contemptuous expressions *barbarus* (applied to the Romans) and *pergraecati* (applied to the Greeks). In some passages the poet seems to take delight in casting dramatic illusions to the winds (e.g. *Pseudolus*, 730; *Poenulus*, 550).

But as a translator Plautus is nothing less than masterly. His command of the art is such that his plays read like original works, and it may be at least said that some of his characters stand out so vividly from his canvas that they have ever since served as representatives of certain types of humanity, e.g. Euclio in the *Aulularia*, the model of Molière’s miser. Alliteration, assonance, plays upon words and happy coinages of new terms, give his plays a charm of their own. “To read Plautus is to be once for all disabused of the impression that Latin is a dry and uninteresting language” (Skutsch, in *Die Cultur der Gegenwart*, 1905). It is a mistake to regard the Latin of Plautus as “vulgar” Latin. It is essentially a literary idiom, based in the main upon the language of intercourse of the cultivated Roman society of the day (cf. Cic. De oratore, iii. 12, 43; cf. also *S. T. V.*, i. 199, sq.).

As to the number of his plays we have no doubt hear expressions which, while they are quite in keeping with the characters to whom they are allotted, would have shocked the ears of polite society in the 2nd century B.C.

The characters in his plays are the stock characters of the new comedy of Athens, and they remind us also of the standing figures of the *Fabulae attellaneae* (Maccus, Bucco, Dossenus, &c.). We may miss the finer insight into human nature and the delicate humour in drawing character which Terence presents to us in his reproductions of Menander, but there is wonderful life and vigour and considerable variety in the Plautine embodiments of these different types. And the careful reader will take note of occasional touches of serious thought, as in the enumeration of the ten deadly political sins (*Persa*, 555 seq.) and allusions to ethical philosophy (*Pseud. 972 seq.; Stich. 124; Trin. 305 seq., 320 seq., 363 seq., 447; Rud. 761, 1235–1248, &c.). Virtue is often held up for admiration, and vice painted in revolting colours or derided. The plots of Plautus also are more varied than those of Terence. We have from him one mythological burlesque, the *Amphitruo*, and several plays dealing with domestic subjects like the *Captivi*, *Cistellaria*, *Rudens*, *Stichus* and *Triunvirus*; but most of his plays depend for their main interest on intrigue, such as the *Pseudolus*, *Bacchides*, *Mostellaria*, *In the Menæchmi* and, as a subordinate incident, in the *Amphitruo* we have a “comedy of errors.”

In one respect Plautus must be regarded as distinctly original, viz. in his development of the lyrical element in his plays. The new comedy of Greece was probably limited for the most part to scenes written in the metres of dialogue; it remained for Plautus, as Leo has shown, to enliven his plays with *canica* modelled on the contemporary lyric verse of Greece or Magna Graecia, which was in its turn a development of the dramatic lyrics of Euripides. A new light has been thrown on the *parakolouthoi* of the *Curculio* (147–153) by the discovery of the Alexandrian erotic fragment published by Grenfell and Hunt (Oxford, 1896). The lyrical metres of Plautus are wonderfully varied, and the textual critic does well not to attempt to limit the possibilities of original metrical combinations and developments in the Roman comician. Recent investigation has considerably extended the list of his *numeri immerni*.

Plautus was a general favourite in the days of republican Rome. Cicero, though he found fault with the iambics of the Latin comedians generally as *obei*, “prosaic” (*Orator*, iv. 184), admired Plautus as *elegans*, *urbanus*, *ingeniosus*, *facetus* (*De offic. i. 29, 104*). To the fastidious critics of the Augustan age, such as Horace, he seemed rude (cf. *Ars Poetica*, 270–274), just as Addison declared Spenser to be no longer fitted to please “a cultivated age.” In another passage (*Epist. ii. 1, 170–176*) Horace accuses him of clumsiness in the construction of his plays and the drawing of his characters, and indifference to everything excepting immediate success: *gestiti enim suumnum in locules demiteri, post hoc securum cadat an recto siet fabula tale*. That there are many inconsistencies and signs of carelessness in his work has been proved in detail by Langen. But that he found many admirers, even in the Augustan age, Horace himself bears witness (ibid. i. 58), where he says that Plautus was regarded as a second Epicharmus: *Plautus ad exemplum Sicili′i properare Epicaram* —a passage which is important as suggesting that
Plautus was under some obligation to the Sicilian representatives of the old Dorian comedy; cf. Varro’s remark (in Frisian ix. 32), deinde ad Siculos se applicavit. It is probable that Plautus may have been working on the lines of the old comedy in the tell-tale names which he is so fond of inventing for his characters, such as Polymachaeroplagides (Pseud. 588), Pyrgopolines (Mil. 56), Thensaurouchrynsicriochyrsides (Capt. 282)—names which stand in remarkable contrast to the more commonplace Greek names employed by Terence.

In the middle ages Plautus was little regarded, and twelve of his plays (Bacchides—Truculentus) disappeared from view until they were discovered (in the MS. called D) by Nicholas of Klagenfurt 1429. Apparently some early archetype had been divided between D and B, which only the first (containing eight plays, Amphiitruo—Episticus) suffered an oblivion or destruction. After the revival of learning Plautus was reinstated, and took rank as one of the great dramatists of antiquity; cf. Shakespeare, Hamlet, i. ii. 420, where Polonius says, “The best actors in the world . . . Seneca cannot be too heavy nor Plautus too light.”

MANUSCRIPTS.—The chief MSS. of Plautus belong to two families, which are proved by the errors which they have in common to be descended from a single source (Sicher, Nova questiones plauti- tiae, ‘Philologus’ 1856, 223), which represents, with certain fragmentary pamlums of the Albertian Library at Milan (A, 4th century a.d.), discovered in 1815 by Cardinal Mai and now accessible to Plautists, the chief source of Plautus (see Sfeiyert (1898); ii.), that represented by the Palatine MSS. (B, 16th-12th cent.) viz. B, now in the Vatican, containing all the twenty plays preceded by the spurious Querulae; C, now at Heidelberg, containing the last two works. Plautine—Truculentus; D, now in the British Museum, containing the Amphitruo, Asinaria, Astularia, half of the Captivi, and the last twelve plays; to the same family belong the following less important MSS.: E, (at Milan), V (at Leiden), J (in the British Museum). EDITIONS.—The editio princeps, based mainly on a transcript of D, was printed at Venice, 1472; the first scientific text, based on D, with a list of Camerarios, completed 1522, in whose footsteps followed Lamberti’s Metrificata, which is the only one (apart from 1576; Taubmann, 1606—1621; Pareus (a meritorious edition), 1619 and 1623; Guyet, edited by Marolles, 1653; Gronvius (the ‘Vitruvius Plautianus’), 1657; and others, 1837—1847. A new era began with the great critical edition of certain plays by Ritschl, 1838—1854; in which a collation of A was used; a revised and completed form of this work was commenced by Ritschl himself and continued by his disciples Goetz and Schoell, 1871—1894; and of this an entirely rewritten editio minor by Goetz and Schoell appeared in 1893—1896 (continued by a 2nd ed., 1897—1899), which has given the most useful edition for a critical study of the text, exhibiting, as it does, the MS. tradition with only such emendations as are securely established by the results of modern investigation. The other modern editions of Plautus are those of Fry and Frickeisen (containing ten plays, for his time), 1893; Ussing (with a commentary), 1875—1887, 2nd ed. of vol. i., 1888; Leo (a very important work), 1895—1896; Lindsay, 1904—1905. Among modern editions of separate plays with commentaries the following are the most useful: Amphiitruo by Palmer, 1890, and Havet, 1893; Asinaria by Gray, 1894; Astularia by Wagner, 1866 and 1876; Captivi by Brix, 6th ed., revised by Niemeyer, 1910; an English edition of this work by Sommensen (with introduction on prosody), 1898; same play by Lindsay (with metrical introduction), 1900; Episticus by Gray, 1893; Menacechmi by Brix, 4th ed., revised by Niemeyer, 1901; Miles gloriosus by Lindsay, 1895; ed. by Niemeyer, 1901; by Tyrrell, 3rd ed., 1894; Mostellaria by Lorenz, 2nd ed., 1886; Sommensen, 2nd ed., 1907; Psedolus by Lorenz, 1876; Rudens by Sommensen, 1891, editio minor (with a metrical appendix), 1901; Trinummus (with a metrical introduction), 1893; ed. by Brix 5th ed., revised by Niemeyer, 1907; by Gray, 1897; Truculentus by Spencler and Studemund, 1898.

Good characteristics of Plautus, from the literary point of view, are his method of selection, his readiness to adapt the works of others, and Wight Duff, in his Literary History of Rome (1909). A summary of recent critical works bearing on the text and interpretation is given in Scriptorum Plautianorum: Admiraibilia (in Bursian’s Jahres- berichte über die Fortschritte der Humanitätskunde, 1883—1885, 1886—1889, 1890—1904, continued by Lindsay, 1895, 1906. Important contributions to textual criticism are contained in: Frickeisen’s Neue plautinische Exzerne (1894), and his collected Opuscule philosophico-historico-studiorum: Studi et scriptores latinos (vol. i. 1873, vol. ii. 1891); Langen, Beiträge (1877) and Plautinische Studien (1886); Leo, Plautinische Forschungen (1893); Lindemann, Kleine Verzeichnisse (1897). Benet’s Plautine Emendations were published by Sommensen partly in his edition of the Captivi (1880), partly in the Anecdota oxoniensia series (1883).

METRE AND PROSODY.—The most important treatises (apart from those mentioned under ‘Editions’) are Müller, Plautinische Syntax (1890); Schering, die Meistern der prosodischen Versarten (1882); Klotz, Grundzüge altrömischer Prosode (1892), Forschungen zur lateinischen Grammatik und Metrik (1892), Lamentation, und Syntaxe (Satura Viadrima) (1866), continued by the same author in his work called Die Prosodie der klassischen Plautina und die hellemistische Lyrik (1897); Maurer, Bechers, Hrnseck, and Verschaffelt im aulichen Latein (1899); Ahlberg, De procopiealeticum (1900), De correlative tambara Plautina (1901); Jacobsson, Quasi- terentianische Syntaxe (1903), and Recension der lateinischen Laien Accent (1896).‘Studies in Latin Metric and Metric’ (in Trans. Amer. Phil. Ass. 1904), ‘Plautina Syntax’ (1905, continued in Amer. Phil. Journ. 1906), a work on cognates of Plautine Syntax has been announced by Exon; Sudhans, ‘Der Auflagen der plautinischen Cantica’ (1906).

SYNTAX.—The most recent works bearing on Old Latin syntax, and Plautine Syntax in particular, is based on the Plattner Die Sprache der Menadchen (1906). Lindsay, Syxianus of Plautus (1907); Sommensen, The Syntax of the Latin Subject (1910). A work by H. Thomas, entitled A catalogue raisonné of the Subjective in Plautus, in support of the theory of the unity of origin of the Latin Subjunctive, is announced as in preparation.

LEXICA.—The only completed lexicon (apart from the Indices of Naudet, 1832, and Weine, 1838) is that of Pares (2nd ed., 1834). Weine, Der Laien Accent (1900; apparently not to be continued) and Lodige (1901, in preparation). The latter work, when completed, will be indispensable.

PRODUCTIONS AND ADAPTATIONS.—A comprehensive view of the influence of Plautus on Shakespeare is given in W. W. W. (probably William Warner), first printed in 1595, which Elzevires, Das. und R., and adheres partly to the Shakespeare’s Parallels and Ben Jonson’s Captain Bobadell) but also in most of the literatures of modern Europe. Shakespeare’s Taming of the Shrew has been influenced in several respects (including the names Tranio and Grumio) by the Mostellaria. Ben Jonson produced a skilful amalgamation of the Aulularia and the Captivi in his early play The Case is Altered (written before 1599). Thomas Heywood adapted The Amphisbaena in his Silver Age (1813), the Rudens in his Captivi (licensed 1624). Dryden’s Amphitryon or the Two Sossias (1660) is based partly on the Amphitruo, partly on Molière’s adaptation thereof; Fielding’s The History of Sir承包er’s monopoly rather than on the Aulularia, and his Intriguing Chamberlain’s House or Sir Lavee rather than on the Mostellaria. There was no English translation, strictly so called, of any play of Plautus in the 16th or 17th century, except that of the Captivi by W. W. (probably William Warner), first printed in 1595, which Shakespeare may possibly have used (in MS.) for his Comedy of Errors. A translation of the whole of Plautus in ‘familiar blank verse ‘ by Bonnell Thornton, in Shakespeare’s Plays, 1623, 2nd ed., 1769—1774. Five plays have been translated in the metres of the original by Sugden (1893).

(É. A. So.)

PLAY, a word of which the primary meaning is that of free or active movement or exercise. The O. Eng. plegan or plegian, from which comes the substantive plega, play, is apparently cognate with Ger. plegen, to take care or charge of, and Pflege, care, and the connotation of the sense is to be found in the primary meaning, that of exercise or active movement. In its primary meaning "play" is used of the rapid changing movement of light and colour, and also figuratively of thought or fancy, and specifically of the free movement of parts of a mechanism on each other, of a joint or limb, &c. To play a musical instrument is to move the fingers upon it, and until the 18th century the verb was intransitive, and "on" or "upon" was always used with the name of the instrument. The very general use of the word for sport, game or amusement, is an early and easy development from the meaning of active movement or exercise as a recreation after work; that of a dramatic performance (see DRAMA) is very early; the New English Dictionary quotes from King Alfred’s Oratius (c. 893).
The primitive play instinct or play impulse in man has been much discussed in recent years by psychologists in connexion with child-study. See J. Sully, On Laughter, 1902, &c.; also Aesthetics. See generally Carl Gros, The Play of Animals (1898) and The Play of Man (1901); and Baldwin’s Dict. of Philosophy, s.v.

PLAYA (a Spanish word meaning “shore”), the name applied in America to a level plain formed of the deposits of a river which has no outlet to the sea or a lake. If at seasons of high water a narrow stream comes and temporarily converts it into a lake, which subsequently dries up in hot weather, the tract this left dry is called a playa. The barren Black Rock Desert in north-western Nevada, about 100 m. in length by 15 in breadth, is typical.

PLAYFAIR, JOHN (1748–1819), Scottish mathematician and physicist, was born at Benvie, Forfarshire, where his father was parish minister, on the 10th of March 1748. He was educated at home until the age of fourteen, when he entered the university of St Andrews. In 1766, when only eighteen, he was candidate for the chair of mathematics in Marischal College, Aberdeen, and, although he was unsuccessful, his claims were admitted to have been high. He entered upon application for the chair of natural philosophy in his own university, but stood second, and, in 1773, he was offered and accepted the living of the united parishes of Liff and Benvie, vacant by the death of his father. He continued, however, to carry on his mathematical and physical studies, and in 1782 he resigned his charge in order to become the tutor of Ferguson of Raith. By this arrangement he was able to be frequently in Edinburgh, and to cultivate the literary and scientific society for which it was at that time specially distinguished; and through Maskelyne, whose acquaintance he had first made in the course of the celebrated Scheffelon experiments in 1774, he also gained access to the scientific circles of London. In 1785 when Dugald Stewart succeeded Ferguson in the Edinburgh chair of moral philosophy, Playfair succeeded the former in that of mathematics. In 1802 he published his celebrated volume entitled Illustrations of the Huttonian Theory of the Earth. To its publication the influence exerted by James Hutton on the progress of geological knowledge is largely due. In 1805 he exchanged the chair of mathematics for that of natural philosophy in succession to Dr John Robison, whom also he succeeded as general secretary to the Royal Society of Edinburgh. He took a prominent part, on the liberal side, in the ecclesiastical controversy which arose in connexion with Lord Cockburn’s appointment to the post he had vacated, and published a satirical Letter (1806) which was greatly admired by his friends. He was elected F.R.S. in 1807. He died in Edinburgh on the 20th of July 1819.

A collected edition of Playfair’s works, with a memoir by James G. Playfair, appeared at Edinburgh in 4 vols. 8vo. His writings include a number of essays contributed to the Edinburgh Review from 1804 onwards in the Phl. Trans. (including his earliest publication, “On the Arithmetic of Impossible Quantities,” 1779, and an “Account of the Lithological Survey of Schehallion,” 1811) and in the Transactions of the Royal Society of Edinburgh (“On the Causes which affect the Accuracy of Barometrical Measurements,” &c.), also the articles “Aepinus” and “Physical Astronomy,” and a “Dissertation on the Progress of Mathematical and Physical Science since the Revival of Learning in Europe,” in the Encyclopaedia Britannica (Supplement to fourth, fifth and sixth editions). His Elements of Geometry first appeared in 1795 and have passed through many editions; his Outlines of Natural Philosophy (2 vols., 1812–1816) consist of the propositions and formulee which were the basis of his class lectures. Playfair’s contributions to pure mathematics were not considerable, his paper “On the Arithmetic of Impossible Quantities,” that on “The Causes which affect the Accuracy of Barometrical Measurements,” and his Elements of Geometry, all already referred to, being the most important. His lives of Matthew Stewart, Hutton, Robison, many of his reviews, and above all his “Dissertation” are of the utmost practical importance.

PLAYFAIR, LYON PLAYFAIR, 1st BARON (1818–1898), was born at Chunar, Bengal province, on the 21st of May 1818. He was sent to Europe by his father at an early age, and received his first education at St Andrews. Subsequently he studied medicine at Glasgow and Edinburgh. A short visit to India (1837–1838) was followed by his return to Europe to study chemistry, which had always attracted him. This he did at University College, London, and afterwards under Liebig at Giessen, where he took his doctor’s degree. At Liebig’s request, Playfair translated into English the former’s work on the Chemistry of Agriculture, and represented Liebig at a meeting of the British Association at Glasgow. The outcome of his studies was his engagement in 1841 as chemical manager of the Primrose print-works at Clitheroe, a post which he held for rather more than a year. In 1843 he was elected honorary professor of chemistry to the Royal Institution of Manchester, and soon afterwards was appointed a member of the Royal Commission on the Health of Towns, a body whose investigations may be said to have laid the foundations of modern sanitation. In 1846 he was appointed chemist to the geological survey, and thenceforward was constantly employed by the public departments in matters of sanitary and chemical inspection. The opportunity of his life came with the 1851 Exhibition, of which he was one of the special commissioners. For his services in this connexion he was made C.B., and his work had the additional advantage of bringing him into close personal relations with the Prince Consort, who appointed him gentleman usher in his household. From 1856 to 1860 he was professor of chemistry at Edinburgh University. In 1868 he was elected to represent the universities of Edinburgh and St Andrews in parliament, and retained his seat till 1885, from which date until 1892 he sat as member for Leeds. In 1873 he was made postmaster-general, and in the following year, after the dissolution of parliament, was applied to by the incoming Tory government to preside over a commission to inquire into the working of the civil service. Its report established a completely new system, which has ever since been officially known as the “Playfair scheme.” The return of Mr Gladstone to power in 1880 afforded opportunity for Playfair to resume his interrupted parliamentary career, and from that time until 1893 he acted as chairman of committees during a period when the obstructive tactics of the Irish party were at their height. On his retirement from the post he was made K.C.B. In 1892 he was created Baron Playfair of St Andrews, and a little later was appointed lord-in-waiting to the queen. In 1893 he was given the G.C.B. In spite of failing health the last years of his life were full of activity, one of his latest public acts being his suggestion that Queen Victoria’s Diamond Jubilee of 1897 should be commemorated by the completion of the South Kensington Museum. He died in London after a short illness. He was married, and buried at St Andrews. He was three times married. He was the author of a number of papers on scientific and social topics, a selection from which he published in 1889 under the title of Subjects of Social Welfare.

A memoir by Sir Wemyss Reid was published in 1899.

PLEADING (Fr. plaider, plaideyer), the term applied in English law to the preparation of the statement of the facts on which either party to a criminal prosecution or a civil action founds his claim to a decision in his favour on the questions involved in the proceeding; and also to the document in which these statements are embodied. The term “pleadings” is used for the collected whole of the statements of both parties; the term “plead” for each separate part of the pleadings. The term “pleading” (planled) is now applied in England customarily to the defence made by an accused person. To “plead” is to make a pleading or plea. All systems of law agree in making it necessary to bring the grounds of a claim or defence before the court in a more or less definite and technical form.

Roman System.—In Roman law the action passed through three stages (see ACTION), and the manner of pleading changed with the action. In the earlier historical period, that of the legis actions, the pleadings were verbal, and made in court by the parties themselves, the proceedings imitating as far as possible the natural

1 In Scots and ecclesiastical law the word “plea” is used as to the statements of both parties to a cause.
2 In French law plaider and plaideyr are still applied to the oral arguments of counsel, and in English popular speech “to plead” has much the same sense.
conducted of persons who had been disputing, but who suffered their quarrel to be appeased (main, Ancien Law, ch. x.). The use of technical language in pleading at that time came to a head. As Gaius tells us, the party who made even the most trivial mistake would lose his suit. This excessive reverence for formality is a universal characteristic of archaic law. In the second half of the eleventh century, the formula, which was decided upon by the praetor in writing from the statements of the parties before him. The formula was a short summary of the facts in dispute in technical language, with instructions to the judge, and corresponded to what would now be called the submission or terms of reference to an arbitrator chosen by the parties. The part of the formula which contained the plaintiff’s claim was called the assumpsit. Any equitable defence, however, was set up by means of an exceptio, which was either peremptory, denying the right of the plaintiff to recover at all, or dilatory, denying only that the action could be brought at the time, or by the particular plaintiff. The plaintiff might meet the exceptio by a repeticatio, the defendant on his side might set up a duplicatio, and the plaintiff might traverse the duplicatio by a triplicatio. The parties might proceed even further, but beyond this point the pleadings had no special names. Actions bonae fidei implied every exceptio that could be set up; in other actions the exceptio must be specially pleaded. From the formula the judex derived his whole authority, and he was liable to an action, for exceeding it. He could not amend the formula, that could only be done by the praetor. In the third period the formula did not exist, the plaintiff’s claim appeared in the summons (duplicatio) and the defendant might take the position that he pleased, all actions being placed on the footing of actions bonae fidei. The issue to be tried was determined by the judge from the oral statements of the parties.

English System.—The English system of pleading seems to have drawn largely from, if it was not directly based upon, the Roman. Bracton (temp. Henry III.) uses many of the Roman technical terms. Pleading was oral as late as the reign of Henry VII. Pleadings were often drawn up on the spot, and could be drawn up in writing, perhaps at first more for the purpose of entry on the court records than for the instruction of the court (see 2 Reeves, History of English Law, p. 396). The French language was used until 1362, after which English was used for oral pleading, but Latin for enrolment, except for a short period during the Commonwealth. Latin was the language of written pleadings at common law until 1731. The period of the Roman formula has its analogue in the period of the original writ in England.1 The writ was at first a formal commission from the Crown to a judicial officer to do justice between the parties, the claim being made by a count (comit, narratio). The issue of the writ was by the prerogative of the Crown, and the plaintiff might not begin the suit until the Provisions of Oxford (1258) forbade the issue of fresh writs except “writs of course” (de cursu) without the consent of the council. Gradually the writ came to absorb the court and included the plaintiff’s claim and sometimes the nature of his evidence. The defendant pleaded to the writ. The writ became the universal form of instituting proceedings in the king’s court, irrespective of the method of trial which followed, and probably grew fixed in form about the reign of Henry II. (see Bigelow, History of Procedure, ch. iv.). At a later date the writ again tended to approach its earlier form and to split into two parts—the writ of summons and the declaration or plaintiff’s claim. The writ of summons was addressed to the defendant, and not, as the original writ, to a judicial officer. The pleadings became the act of the party, differing in this from Roman law, in which they were a judicial act. The writs became precedents for the forms of action, which, like the writs, were limited in number. The plaintiff’s declaration was a substantial repetition of the writ. In the writ, as in the formula, the slightest failure in form was as a rule fatal.2 The assigning of a writ of a particular frame and scope to each particular cause of action, the appropriating process of one kind to one action and of a different kind to another, these and the like distinctions rendered proceedings very nice and complex, and made the conduct of an action a matter of considerable difficulty (2 Reeves, Hist. of English Law, p. 147). Fines were levied for mistakes in pleading, non-liability to which was sometimes granted by charter as a favour.3

1 The original writ was so called to distinguish it from the judicial writ, which was a part of the process of the court. The judicial writs still exist, e.g. writs of certiorari or fieri facias.

2 The ingenuity of the pleader showing itself chiefly in framing special as opposed to general pleas, the term “special pleading” grew to be used for the whole proceedings of which it was the most important part.

3 In Chancery the “English Bill,” so called from its being in the English language, had existed, according to G. Spence, as early as the reign of Henry V. (Equitable Jurisdiction, i. 348).

Bullen and Leake, Precedents of Pleading (3rd ed., 1868).
forms or required special statement. The declaration corresponds to the Roman formula and intention.

2. Plea by the defendant to the counts of the declaration. The plea corresponds to the Roman exceptio.

3. Replication by the plaintiff to the plea. In this pleading the plaintiff usually took issue upon the statements in the defence; but he might do what was termed "new assign," e.g. complain of acts in excess of a justification alleged in the plea.

4. Plea by the defendant to the replication, answering to the Roman duplicatio.

5. Surrofender by the plaintiff to the rejoinder, answering to the Roman triplicatio.

6. Rebutter by the defendant to the surre joinder.

Nos. 4, 5 and 7 were rarely necessary, as the parties usually carried on the correspondence at the first instance.

Forms of pleading were described as temporary or dilatory (Roman law), directed either to the jurisdiction of the court or to the abatement or defeat of the action for defects of form.

In bar, also described as peremptory, which answered the allegations of the preceding pleadings with one single answer in the declaration, not to the substance of the claim or plea or to a mere defect in the mode of statement. When the pleadings had reached a stage at which they were in the contradiction on matters of fact, they concluded by joinder of issue, upon which the record was made up, and the action was ripe for trial.

Pleas fell into the following classes:

1. Pleas described as temporary or dilatory (Roman law), directed either to the jurisdiction of the court or to the abatement or defeat of the action for defects of form.

2. In bar, also described as peremptory, which answered the allegations of the preceding pleadings with one single answer in the declaration, not to the substance of the claim or plea or to a mere defect in the mode of statement.

The claim in either case the reply and subsequent pleadings were now seldom permitted, Besides, pleadings are now allowed only in the pleadings of a new action. In actions for damages by collision between ships each party must as a general rule file a sealed document called a preliminary act containing details as to the time and place of collision, the speed, tide, lights, etc. The case may be tried on the preliminary act without pleadings, but if there are pleadings the act may not be unsealed until they are completed and certain grants given. The documents were peculiar to the court of admiralty, but may now be used in all divisions of the chancery courts. The High Court of Admiralty in cases of tenancy has adopted the Admiralty Rules of procedure. The case of "record" is supplied for the pleadings of a new action, and the judgment of the officer entering the judgment (O. 36, r. 30; O. 41, r. 1).

In the county courts proceedings are commenced by a plaint, followed by an ordinary or default summons. No "pleas" are necessary. In some cases special pleadings are necessary, and special pleading is called up certain special defences such as set-off or infancy, or statutory defences, without the consent of the plaintiff, unless he has given timely notice in writing of his intention to set up the special defence. This system is made workable by insisting on the insertion of adequate defences or particulars of the nature of the claim in the plaint. In cases where a special defence is not required considerable inconvenience is caused by uncertainty as to the line of defence.

In some of the local civil courts of record which have survived the creation of the county courts, the pleadings are still in the form recognized by the Common Law and the Supreme Court Rules. In all actions such grounds of defence or reply as if not raised would be likely to take the opposite party by surprise, or would raise issues of fact not arising out of the "acts dehors" of pleading, must be specially pleaded. Such are compulsory pleadings from the Statute of Westminster, the Statute of Limitations, the Supreme Court Rules and the Criminal Law. The Supreme Court Rules do not apply to proceedings in Crown suits or in the Crown Court (O. 105, r. 1). The provision of the High Court in chancery courts are in the Chancery Forms, Acts, and Rules. The Acts and Rules of chancery in particular are known as "the Chancery Acts, rules and forms, and are as a general rule known as "the Chancery Acts, rules and forms." The court is described as the "Chancery Court," and the manner of applying for its jurisdiction is described as "the Chancery court." The court is described as the "Chancery Court," and the manner of applying for its jurisdiction is described as "the Chancery court."
PLEASURE—PLEBS

libellus accusationis) was usually in writing, and contained a formal statement of the offence. In some cases oral accusations were allowed. The pleading of the accused seems to have been informal. In English criminal cases the expression “pleadings” is limited to those tried on indictment or information before a jury. In matters dealt with by justices of the peace there are informations sometimes in writing, but they are never regarded as “pleadings.” English criminal pleading has been less affected by legislation than civil pleading, and retains more of what is called the common law system. Cases in which the Crown was a party early became known as “pleas of the Crown” (placita coronae), as distinguished from “common pleas” (communia placcia), or pleas between subject and subject—that is to say, ordinary civil actions. Pleas of the Crown originally included all matters in which the Crown was concerned, such as exchequer cases, franchises and liberties, but gradually became confined to criminal matters, strictly to the greater crimes triable only in the king’s courts. In criminal pleading the Crown states the case in an indictment or information. The answer of the accused is a plea, which must be pleaded by the defendant immediately after the indictment is read. Except in certain cases of misdemeanour tried in the High Court (High Court Rules, 1906). The plea, according to Blackstone, is either to the jurisdiction, a demurrer, in abatement, special in bar, or the general issue. The last is the only plea that often occurs in practice; it consists in the answer (usually oral) of “guilty” or “not guilty” to the charge. A demurrer is strictly not a plea at all, but an objection on legal grounds. Pleas to the jurisdiction or in abatement do not go to the merits of the case, but allege that the court has no jurisdiction to try the particular offence, or that there is a misnomer or some other technical ground for stay of proceedings.

The powers of amendment given in 1831 (14 & 15 Vict. c. 100) and the procedure by way of arrest in cases of misdemeanour have not been used to modify these pleas of no practical importance. The special pleas in bar are autrefois convict or autrefois acquit (alleging a previous conviction or acquittal for the same crime) and pardon (see PARDON). The plea of autrefois attaint has fallen out of use since the abolition of attainder by the Forbears Act 1870.

There are also special pleas of justification to indictments for defamatory libel under the Libel Act 1843; and to indictments for non-repair of highways and bridges the accused may plead that the liability to repair falls upon another person. These special pleas are usually, and in some cases must be, in writing. When there is a special plea in writing the Crown puts in a repugnancy in writing.

IRELAND.—The practice as to civil and criminal pleading in Ireland is substantially the same as in England, though to some extent based on different statutes and rules of court.

SCOTLAND.—In Scotland an action in the Court of Session begins by a summons on the part of the pursuer, to which is annexed a conditio, conditioned that the action is in fact on the merits and not merely a device for ousting the law. The plea in law, or statement of the legal rule or rules relied upon (introduced by the Court of Session Act 1825), are subjoined to the conditio. The term libel is also used (as in Roman law) as a general term to express the claim of the pursuer or the accusation of the prosecutor. The statement of the defenser, including his pleas in law, is called his defences. They are either written or oral. The common practice was to plead in writing as in England, but the same end is attained by adjustment of the pleadings and the closing of the record. Large powers of amendment and revival are given by the Court of Session Act 1868. In the sheriff court pleadings are very similar to those in the Court of Session. They are commenced by a petition, which includes a conditio and a note of the pursuer’s pleas in law. The defenser may upon notice lodge defences. The procedure is now governed by the Sheriff and Courts Act 1850. The “pleas of the Crown” is confined to Scotland for four offences—murder, rape, robbery and fire-raising. The criminal procedure of Scotland was also unified and amended in 1887. The old procedure by criminal leas has been abolished, and prosecutions for the public interest whether in the high court of justiciary or before the sheriff with a jury are by indictment in the name of His Majesty. Under Scots law a defendant from England in Scotland is not found by a grand jury, except in cases of high treason, and resembles rather the extrajudicial information of English law. Until 1897 it was in the form of a summary, the major proposition stating the nature of the charge and the alleged offence committed and that it constitutes the crime named in the major, the conclusion that on conviction of the panel he ought to suffer punishment. Under the present practice it is in the second person and to the action and to the act committed, to the act of 1887, which also makes specific provisions for simplification, and if need be for amendment (s. 70). A copy of the indictment with a list of the witnesses and the productions must be served on the accused. There are two diets, the first, known as the diet of indictment. At the first, held before the sheriff, the accused (termed the panel) may plead guilty or raise preliminary objections to the relevancy of the indictment, &c., or otherwise (such as want of power to plead or to make a reply). If the diet is closed without prejudice, or after they are overruled, may plead not guilty. The second diet is the diet of trial. If the trial is before the sheriff his rulings on the first diet are final; if before the court of justiciary his rulings may be reviewed. At the second diet, besides his plea of not guilty, the panel may rely on certain special defences, e.g., insanity or alibi, but only if his special and written plea was tendered and pleaded to a jury. There is no change in the form of pleading in Scotland.

BRITISH DOMINIONS BEYOND SEAS.—In most of the Australian states, and in Ontario and New Zealand, civil pleadings are governed by rules adopted from the English Judicature Acts. In New South Wales the system of criminal procedure is based on the Procedure Act 1911. There are no special pleading in New Zealand, and civil procedure is subject to the English Procedure Act 1830. The New York Civil Code of 1848 established a uniform procedure called the civil action, applicable indifferently to common law and equity. The pleadings are called complaint, answer (which includes counterclaim) and reply. The defendant has the right to request an interrogatory of any witness, and the complaint bears the name of petition. In inferior courts, such as courts of justices of the peace, the pleadings are more simple, and in many cases oral. In states which do not adopt the amended procedure the pleading is much the same as it was in the days of Blackstone, and the old double jurisdiction of common law and equity still remains. Criminal pleading is on the lines of the common law system of England. (W. F. C.)

PLEASURE (through Fr. plaisir from Lat. placere, to please; Gr. ἑπάθος), a term used loosely in ordinary language as practically synonymous with "enjoyment." As such it is applied equally to what are known as the "higher" or "intellectual" pleasures, and the "lower" or "sensuous" pleasures. The term is properly applied to the subliminal Delights of the Soul, or the "Higher Pleasures" (see HEDONISM; ETHICS). Aristotle took a middle view, holding that pleasure, though not the end of virtuous action yet necessarily follows upon it (ἐπιγενόμενον τί τέλος).

PLEBS (from the root seen in Lat. plenus, full; cf. Gr. πλῆθος) the "multitude," or unprivileged class in the early Roman state. For the origin and history of this order see PATRICIANS and NOBILITY. Its disqualifications were originally based on
PLEDGE—PLEISTOCENE

descent; but after the political equalization of the two orders the name was applied to the lower classes of the population without reference to their descent. Under the empire the word is regularly used in the city proletariat, or of the commons as distinct from knights and senators.

PLEDGE 1 or PAWN, in law “a bailment of personal property as a security for some debt or engagement” (Story on Bailments, § 286). The term is also used to denote the property which constitutes the security. Pledge is the *pignus* of Roman law, from which most of the modern law on the subject is derived. It differs from hypothec and from the more usual kind of mortgage in that the pledge is in the possession of the pledgee; it also differs from mortgage in being confined to personal property. A mortgage of personal property in most cases takes the name and form of a bill of sale. The chief difference between Roman and English law is that certain things, e.g. wearing apparel, furniture, and implements of tillage, could not be pledged in Roman law and while there is no such restriction in English law. In the case of a pledge, a special property passes to the pledgee, sufficient to enable him to maintain an action against a wrongdoer, but the general property, that is the property subject to the pledge, remains in the pledgor. As the pledge is for the benefit of both parties, the pledgee is bound to exercise only ordinary care over the pledge. The pledgee has the right of selling the pledge if the pledgor make default in payment at the stipulated time. No right is acquired by the wrongful sale of a pledge except in the case of property passing by delivery, such as money or negotiable securities. In the case of a wrongful sale by a pledgee, the pledgee cannot recover the value of the pledge, but is entitled to a tender of the amount due.

The law of Scotland as to pledge generally agrees with that of England, as does also that of the United States. The main difference is that in Scotland and in Louisiana a pledge cannot be sold unless with judicial authority. In some of the American states the common law as it existed apart from the Factors' Acts is still followed; in others the factor has more or less restricted power to give a title by pledge.

See also FACTOR AND Pawning.

PLEHEV, VIACHESLAF KONSTANTINOVICH (1846–1904), Russian statesman, was born of Lithuanian stock in 1846. He was educated at Warsaw and studied law at the university in St Petersburg before he entered the bureaucracy in the department of justice, in which he rose rapidly to be assistant solicitor-general in Warsaw, then solicitor-general in St Petersburg, and in 1881 director of the state police. As assistant to the minister of the interior he attracted the attention of Alexander III. He received the title of secretary of state in 1894, became a member of the council of the empire, and in 1902 succeeded Sipaioglu as minister of the interior. Plehev carried out the “Russification” of the alien provinces within the Russian Empire and drove out all alien elements in Poland, in Lithuania and especially in Finland. He despoiled the Armenian Church, and was credited with being accessory to the Kishinev massacres. His logical mind and determined support of the autocratic principle gained the tsar’s entire confidence. He opposed commercial development on ordinary European lines on the ground that it involved the existence both of a dangerous proletariat and of a prosperous middle class equally inimical to autocracy. He was thus a determined opponent of M. de Witte’s policy. An attempt was made on his life early in 1904, and he was assassinated on the 25th of July of the same year by a bomb thrown under his carriage as he was on his way to Peterhof to make his report to the tsar on the assassination, Sazonov, was a member of the fighting organization of the socialist revolutionaries.

PLEIAD (Gr. *Pleiad*), in Greek literature, the name given (by analogy from Pleiades, below) by the Alexandrian critics to seven tragic poets who flourished during the reign of Ptolemy.

Philadephus (285–247 B.C.). In French literature, in addition to the Pleiad of Charlemagne, there were two famous groups of the kind. The first, during the reign of Henri III. (1574–1589), the chief member of which was Pierre de Ronsard, sought to improve the French language and literature by enthusiastic imitation of the classics; the second, under Louis XIII. (1601–1643), consisted of authors who excelled in the composition of Latin verse.

PLEIADES, in Greek mythology, the seven daughters of Atlas and Pleione, and sisters of the Hyades. Owing to their grief at the death of their sisters or at the sufferings of their father, they were changed into stars. In another account, the Pleiades and their mother met the hunter Orion in Bocotia, and the sight of them inflamed his passion. For five years he pursued them through the woods, until Zeus translated them all—Pleione and her daughters, Orion, and his dog—to the sky. The Pleiades rose in the middle of May and set at the end of October, and their connexion with spring and autumn explains the legend. As bringers of the fertilizing rains of spring, which have their origin in the west, they are the daughters of Atlas; as the forerunners of the storms of autumn, they are represented as being driven onward by Orion in pursuit. The word is probably connected with πλειόνω, either in the sense of “many in number,” since the stars formed a close group, resembling a bunch of grapes (hence sometimes called βότρυς), or as “more in number” than their sisters. Others derive the name from πλεῖον (to sail), because navigation began at the time of their rising. They are probably alluded to in Homer (Odyssey, xii. 65) as the doves (πτηματε) who brought ambrosia from the west to Zeus. One of these doves was always lost during the passage of the Planctae (wandering rocks), referring to the fact that one of the seven Pleiades was always invisible. This was Merope, who hid her light from shame at having had intercourse with a mortal, Sisyphus. All the Pleiades became the ancestresses of divine or heroic families. They were called Vergiliiae (probably connected with ver, spring) by the Romans.

See Hesiod, Works and Days, 383; Apollodorus iii. 10; Diod. Sic. iii. 60; Thucyd. iii. 23; Hyginus, Astronom. ii. 217; Ovid, Fasti, iv. 195, v. 592.

PLEIADES, ATLANTIDES or VESTIGIAE, in astronomy, a group of stars situated in the constellation Taurus. They are supposed to be referred to in the Old Testament (Job. ix. 9, xxxviii. 31). This group is particularly rich in bright stars, and is full of nebulosity, but there are few fainter stars than in equal areas of the surrounding sky; the central star is Alcyone (3rd magnitude); Pleione and Atlas are also of the 3rd magnitude.

PLEISTOCENE, in geology, the epoch which succeeded the Pliocene; it is the last of the Tertiary periods, and hence the lower subdivision of the quaternary or modern era. The name was introduced by Sir C. Lyell in 1839 (from Gr. πλεῖον, most, and αὐθώ, recent), the rocks of this period containing a higher percentage of living forms than the youngest of the Tertiary formations. By many writers “Pléistocene” has been regarded as synonymous with “Glacial Period” or the “Diluvium” of some geologists. In the northern hemisphere the protracted period of glaciation, with its predominating influence upon modern topography and faunal distribution, was undoubtedly the outstanding feature of the time. The phenomena of the Glacial period (q.v.), which was by no means strictly limited to the northern latitudes, are dealt with under that head, but there are certain other characteristics of the Pleistocene period which bear no direct relationship to glaciation, and these will be dealt with here.

The gradual inception of colder conditions in the northern hemisphere which led up to the more extreme conditions of glaciation clearly began in the latter part of the Pliocene period, and the effects of this cooling are seen not only in northern Europe and America but as far south as the Mediterranean. The result of this is that there is a certain indefiniteness as to the exact base line to be adopted for the Pleistocene formations; thus the Forest Bed of Cromer and certain beds in Sicily and Italy are by some authors placed in this period and by others...
in the Pliocene (q.v.). Again it is clear that in parts of northern Europe, Siberia and North America, the conditions characteristic of a glacial period are still existent; even in Scotland and Norway the last traces of glacial action are remarkably fresh, and the last remnants of great glacial centres still linger in the Alps and other lofty southern mountains. Many of the formations of this period can be shown by their fossil contents to belong to early quaternary time, but since so many of these deposits are now composed of mixed character, and the fossils present in any one spot have been determined by local geographical conditions which have assisted or retarded the migration of certain forms, it is a matter of extreme difficulty—one may say impossibility—to reduce the Pleistocene formations to any generally applicable chronological order. For similar reasons it is impossible to define the upper limit of the formations of this period, and to say where the Pleistocene ends and where the Recent or Holocene period begins.

The composition and distribution of the Pleistocene fauna and flora present many points of extreme interest. The feature of greatest importance is that man existed somewhere and in some condition before and in this period; but no really satisfactory proof has so far been forthcoming which will set back his first appearance in the Pleistocene period. (The Proconsul cebus found by E. Dubois in Java is regarded as of Pliocene age.)

The presence of the remains of man or of his works might reasonably be taken as a criterion of the Pleistocene age of a deposit—when this has been ascertained and verified, and after the remains have been borne in mind that historical time is continually being set back by archaeological research, and further, the difficulty of employing artifices of stone as chronological indicators is shown by the fact that the oldest stone implements known in Europe and that different local races of early men must have been in diverse stages of development in Pleistocene as in later ages. It is, therefore, only with the utmost caution that chronological subdivisions of the period, such as those mentioned below, based upon the form and degree of finish of stone implements, can be used in anything but local correlations unless the evidence is supported by other fossil remains.

Next to the appearance of man the most striking characteristic of the land fauna was the existence of numerous large-bodied mammals; Elephas antiquus, for instance, attained a more excessive bulk than any other Pleistocene mammoth or since, the woolly rhinoceros, the great hippopotamus, the cave bear, cave lion and giant deer were all larger than their living representatives. No less striking is the disappearance of these large forms together with highly specialized creatures such as Machaerodus within the same period, through the action of the same causes which had removed the bulky and specialized reptiles of an earlier geological period. The only large species in the Pleistocene are Elephas antiquus, E. primigenius (mammoth), R. antiquitatis (tichorhinus) (the woolly rhinoceros), R. mercuri (especially in Silesia), R. lepto-
hirius (south-east Europe), Elasmotherium (Silesia and southern Russia), and Hippopotamus major, Bos primigenius (auruchi, extinct in historical time), Bison priscus, Bison europaeus (still living in the Caucasus and Lithuania), Bos (Bubalus) pallasi (north Europe), camels in southern Russia and Rumania, Equus fossils and varieties, Camelus (Megalotherium) giganteus (giganteus) (the great Irish ‘elk’ and its varieties); Camelus elaphus, C. aegyptiacus, R. ringeri terandus and R. groenlandicus (reindeer), Capreolus capreolus, Capre aegyptiacus, Ovis aries, Ovis muschatus, Felis spelaeus, Hyaena spelaea, Ursus spelaeus, Mammuthodon, Megaloceros, Mammuthus, Smilodon, Spelmodus, Almaciga, Artocyon, Castor fiber, Lagomys, Trogontherium. In North America there were numerous mammals common to Europe and North Asia, including the musk-
ox, the wolf and bear; the mastodon held on into this period in America but not in Europe; there were also lamas, tapires, camels (Camelus aegyptiacus), Mammatherium, Mylodon, Procyon, Alces. In South America as at first a very characteristic endemic fauna including Megatherium, Mylodon, Pachyderium, Eremotherium, Liocyon, Toxodon, Platystemum, Glyptodon, Macroatherium, Capybara, Rhea, to which were added later, Mastodon, Mammatherium, Lama and other North American forms. In Antarctica a very distinct fauna of large marsupials and monotremes lived in the Pleistocene period including, Phascolus, Diprotodon, Thylacoleo, Nototherium and a large extinct Echidna; placental mammals were not then known in any part of southern hemisphere. In all these regions, Pleistocene, and certain extinct lemuroid creatures have left their remains.

The advance and retreat of glacial conditions in northern latitudes had a marked influence upon animal and plant life, and was the means of determining the distribution of many of the species of mammals and plants; some were driven permanently southward, some northern forms still lived isolated on the higher mountain regions, others like the reindeer and musk-ox returned northward as soon as the conditions permitted. The apparently curiously admixture of what are now often regarded as tropical or sub-tropical

forms (lion, hyena, rhinoceros and elephants) with cold-temperate or arctic genera presents no real difficulty, since their distribution was doubtless merely a matter of food supply; and some of these, like the woolly rhinoceros and mammoth, were provided with a thick hairy pelt.

Although in the main the arrangement of land and sea was little different from that which obtains at the present time, one or two features existed in the Pleistocene period which had a considerable influence on faunal migration. For instance, the absence of the Bering Straits permitted free communication between Europe and North America, and the absence of the Straits of Dover allowed a similar interchange between Great Britain and France; while an extension of the sea in the Caspian region and of the Arctic Sea in northern Russia acted as a barrier to free passage between Europe and Asia in those regions.

The formations of Pleistocene age, other than those of direct glacial origin, include deposits on the floors of caves in limestone and dolomite rocks, calcareous sinter (travertine or tufa) formed by springs, ancient river and lake alluvial and lacustrine terraces, elevated marine beaches, submerged forests, ancient lake deposits and peat beds, laterite, loess and sand dunes.

Some of the prevalent styles of classifying the deposits of the glacial formations of this period are mentioned in the article Glacial Period. The following subdivisions are often employed by European geologists; a younger division, Reindeer time = Magdalénien1 stage; a middle division, Mammoth time = Salzurten stage; and an older division, Elephas antiquus time = Cheltenham stage. While some authors include all the above in the "glacial period," others would place the Magdalénien in a post-glacial division. The terms Magdalénien; &c., are really archaeological, based upon the characters of the implements found in the deposits, and like the similar words "olithe" and "paleoolithic" they are of little value in geological chronology unless they are supported by paleontological evidence.

See E. Geinitz, Das Quartär von nord Europa (Stuttgart, 1904), with very full references; T. C. Chamberlin and R. D. Salisbury, Geology, vol. iii. (New York, 1906), for references to American authorities.

PLESONAS (Gr. πλεονασμός, from πλεονάζω, to abound or be superfluous, πλοῖον, comparative of πλοῦς, many, great), redundant or superfluity in speaking or writing, or an unnecessary word or phrase. The word, more usually in the Latin form "pleonasmus," is used in pathology of an abnormal growth or formation.

PLESIOSAURUS, an extinct marine reptile belonging to the Order Sauropterygia, which characterized the Mesozoic period and had an almost world-wide distribution (see REPTILES). The animal is best known by nearly complete skeletons from the Lias of England and Germany. It was named Plesiosaurus (Gr. more-lizard) by W. D. Conybeare in 1821, to indicate that it was much more nearly a normal reptile than the strange

(From a memoir by Professor W. Dames in the Abhandlungen der k. preuss. Akad. d. Wiss.)

Plesiosaurus guilei-imperatoris, restored.

Ichthyosaurus, which had been found in the same Liassic formation a few years previously. It has a small head, a long and slender neck, a round body, a very short tail, and two pairs of large, elongated paddles. The snout is short, but the gape of the mouth is wide, and the jaws are provided with a series of conical teeth in sockets, much like those of the living gavial

In Pleistocene times there were an enormous number of large mammals, including mammoths, mastodons, woolly rhinoceroses, and various other species. Some of these species were as large as elephants, and some of the smaller species were as large as horses. The Pleistocene period was characterized by a series of glacial cycles, during which large areas of the Earth were covered with ice. This had a significant impact on the distribution of animal and plant life, as many species migrated to more southerly regions to escape the cold. The Pleistocene period also saw the development of modern humans and the emergence of distinct human cultures. The Pleistocene period ended around 10,000 years ago, marking the start of the Holocene period.
of Indian rivers. The neck, though long and slender, must have been rather stiff, because the bodies of the vertebrae are nearly flat-ended, while they bear short ribs: It could not have been bent in the swan-fashion represented in many restorations. The other vertebrae are also almost flat-ended and firmly united, but there is no sacrum. The ribs are single-headed, and in the middle of the trunk, between the supports of the paired limbs, they meet a dense plastron of abdominal ribs. The short tail is straight and rapidly tapering, but one specimen in Berlin suggests that it was provided with a rhomboidal flap of skin in a vertical plane. The bones in the ventral wall of the body which support the paired limbs are remarkably expanded, and those of the pectoral arch have often been compared with the corresponding bones of turtles. The limbs are elongated paddles, with five complete digits, of which the constituent bones (phalanges) are unusually numerous. The only traces of skin hitherto discovered suggest that it was smooth. The reptile must have been almost exclusively aquatic, feeding on cuttlefishes, fishes and other animal prey. It propelled itself chiefly by the paddles, scarcely by the tail.

The typical species is Plesiosaurus dolichodeirus, from the Lower Lias of Lyme Regis, which attains a length of about three metres. Other species from the same formation seem to have measured five to six metres in length, and there are species of allied genera from the Upper Lias which are probably still larger. A fine large skeleton from the Upper Lias of Wurttemberg, now in the Berlin Museum, is named Plesiosaurus guillardi-sempeterisorum (see figure above). Cryptoclidus, known by complete skeletons from the Oxford Clay of Peterborough, differs very little from Plesiosaurus. The Cretaceous Cimoliosaurus, found in North and South America, Europe and New Zealand, is also very similar. The fossilized remains of the stomach in some of the later Plesiosaur shows that these reptiles swallowed stones for digestive purposes like the existing crocodiles.

PLEURISY, or PLEURITIS (Gr. πλεύρα = ribs), inflammation of the pleura, caused by invasion by certain specific microorganisms. (See Respiratory System: Pathology.) Secondary pleurisies may occur from extension of inflammation from neighbouring organs.

The morbid changes which the pleura undergoes when inflamed consist of three chief conditions or stages of progress. (1) Inflammatory congestion and infiltration of the pleura, which may spread to the tissues of the lung on the one hand, and to those of the chest wall on the other. (2) Exudation of lymph on the pleural surfaces. This lymph is of variable consistency, sometimes composed of thin and easily separated pellicles, or of extensive thick masses or strata, or again showing itself in the form of a tough membrane. It is of greyish-yellow colour, and microscopically consists mainly of coagulated fibrin along with epithelial cells and red and white blood corpuscles. Its presence causes roughening of the two pleural surfaces, which, slightly separated in health, may now be brought into contact by bands of lymph extending between them. These bands may break up or may become organized by the development of new blood vessels, and adhering permanently may obliterate throughout a greater or less space the pleural sac, and interfere to some extent with the free play of the lungs. (3) Effusion of fluid into the pleural cavity. This fluid may vary in its characters.

The chief varieties of pleurisy are classified according to the variety of the effusion, should effusion take place. (1) Some pleurisies do not reach the stage of effusion, the inflammation being restricted to the termination of the pleura. This is termed dry pleurisy. (2) Fibrinous or plastic pleurisy. In this variety the pleura is covered by a thick layer of granular, fibrinous material. Fibrinous pleurisy is usually secondary to acute diseases of the lung such as pneumonia, cancer, abscess or tuberculosis. (3) Sero-fibrinous pleurisy. This is the most common variety, and produces the condition commonly known as pleurisy with effusion. The amount may vary from an almost inappreciable quantity to a gallon or more. When large in quantity it may fill to distension the pleural sac, bulge out the thoracic wall externally, and compress the lung, which may in such cases have all its air displaced and be reduced to a mere fraction of its natural bulk. Other organs, such as the heart and liver, may in consequence of the presence of the fluid be shifted away from their normal position. In favourable cases the fluid is absorbed more or less completely and the pleural surfaces again may unite by adhesions; or, all traces of inflammatory products having disappeared, the pleura may be restored to its normal condition. When the fluid is not speedily absorbed it may remain long in the cavity and compress the lung to such a degree as to render it incapable of re-expansion as the effusion passes slowly away. The consequence is that the chest wall falls in, the ribs become approximated, the shoulder is lowered, the spine becomes curved and internal organs permanently displaced, while the affected side scarcely moves in respiration. Sometimes the unabsorbed fluid becomes purulent, and an empyema is the result.

The symptoms of pleurisy vary; the onset is sometimes obscure but usually well marked. It may be ushered in by rigors, fever and a sharp pain in the side, especially on breathing. Pain is felt in the side or breast, of a severe cutting character, referred usually to the neighbourhood of the nipple, but it may be also at some distance from the affected part, such as through the middle of the body or in the abdominal or iliac regions. On auscultation the physician recognizes sooner or later "friction," a superficial rough rubbing sound, occurring only with the respiratory acts and ceasing when the breath is held. It is due to the coming together during respiration of the two pleural surfaces which are roughened by the exuded lymph. The pain is greatest at the outset, and tends to abate as the effusion takes place. A dry cough is almost always present, which is particularly distressing owing to the increased pain the effort excites. At the outset there may be dyspnoea, due to fever and pain; later it may result from compression of the lung.

On physical examination of the chest the following are among the chief points observed: (1) On inspection there is more or less bulging of the side affected, should effusion be present, obliteration of the intercostal spaces, and sometimes elevation of the shoulder. (2) On palpation with the hand applied to the side there is diminished expansion of one-half of the thorax, and the normal vocal fremitus is abolished. Should the effusion be on the right side and copious, the liver may be felt to have been pushed downwards, and the heart somewhat displaced to the left; while if the effusion be on the left side the heart is displaced to the right. (3) On percussion there is absolute dullness over the seat of the effusion. If the fluid does not fill the pleural sac the floating lung may yield a hyper-resonant note. (4) On auscultation the natural breath sound is inaudible over the effusion. Should the latter be only partial the breathing is clear and somewhat harsh, with or without friction, and the voice sound is aegophonic. Posteriorly there may be heard tubular breathing with aegophony: These various physical signs render it impossible to mistake the disease for other maladies the symptoms of which may bear a resemblance to it, such as pleurexia.

The absorption or removal of the fluid is marked by the disappearance or diminution of the above-mentioned physical signs, except that of percussion dullness, which may last a long time, and is probably due in part to the thickened pleura. Friction may again be heard as the fluid passes away and the two pleural surfaces come together. The displaced organs are in this position restored to their position, and the compressed lung re-expanded. Frequently this expansion is only partial.

In most instances the termination is favourable, the acute symptoms subsiding and the fluid (if not drawn off) becoming absorbed, sometimes after reaccumulation. On the other hand it may remain long without undergoing much change, and thus a condition of chronic pleurisy becomes established.

Pleurisy may exist in a latent form, the patient going about for weeks with a large accumulation of fluid in his thorax, the
PLEURO-PNEUMONIA—PLEVNA

ordinary acute symptoms never having been present in any marked degree. Cases of this sort are often protracted, and their results unsatisfactory as regards complete recovery. In the treatment of early pleurisy, pain may be relieved by a hypodermic of morphia or the application of leeches. A purgative is essential. Fixation of the affected side of the thorax by strapping with adhesive plaster gives great relief. The ice-bag is useful in the early stages, as in pneumonia. The open-air treatment of cases is recommended, as the majority of the cases are of tuberculous origin. When effusion has taken place counter irritation and the exhibition of iodide of potassium are useful. Dry diet and saline purgatives have been well spoken of. The most satisfactory method of treatment is early and if necessary repeated aspiration of the fluid. The operation (horacentesis) was practised by ancient physicians, but was revived in modern times by Armand Trousseau (1801-1867) in France and Henry I. Bowditch (1868-1892) in America; by the latter an excellent instrument was devised for emptying the chest, which, however, has been displaced in practice by the still more convenient aspirator. The chest is punctured in the lateral or posterior regions, and in most cases the greater portion or all the fluid is safely drawn out. In many instances not only is the removal of distending symptoms speedy and complete, but the lung is relieved from pressure in time to enable it to resume its normal function.

In cases of chronic pleurisy after the failure of repeated aspirations, Samuel West reports well of free incision and drainage. He has reported cases of recovery of fifteen, eighteen or more months standing. Sir James Barr has advocated the treatment of these cases by the withdrawal of the fluid and the substitution of sterilized air and solution of supra-renal extract; others have introduced physiological salt solution or formalin solution into the cavity, after the removal of the fluid. Vaquez injects bichromate of potash into the cavity and reports a number of cases in which it prevented recurrence.

PLEURO-PNEUMONIA, or LUNG-PLAGUE, a contagious disease peculiar to cattle, generally affecting the lungs and the lining membrane of the chest, producing a particular form of lobar or lobular pleuro-pneumonia, and, in the majority of cases, transmitted by the living diseased animal, or, exceptionally, by mediate contagion. It cannot be communicated to animals other than those of the bovine race. Inoculation of healthy cattle with the fluid from the diseased lungs produces, after a certain interval, characteristic changes at the seat of inoculation, and though it does not develop the lung lesions always observed in natural infection, yet there is a local anatomical similarity or identity. Though numerous investigations have been made, the nature of the infective agent remains doubtful. In 1888 Arloing, of Lyons, described various bacilli obtained from the lesions, but the pathogenic organism of lung-plague has not been discovered.

The earliest notices of this disease testify that it first prevailed in central Europe, and in the 18th century it was present in certain parts of southern Germany, Switzerland and France, and had also appeared in upper Italy. Though Valentine described an epizooty occurring among cattle in 1603 in Hesse, doubts have been entertained as to whether it was this malady. It was not until 1760 that it was definitely described as prevailing in Franche-Comté by the name of "marie." From that date down to 1789 it appears to have remained more or less limited to the Swiss mountains, the Jura, Dauphiné and Voges, Piedmont and upper Silesia; it showed itself in Champagne and Bourbonnais about the time of the Revolution, when its spread was greatly accelerated by the wars that followed. In the 19th century its diffusion was accurately determined. It invaded Prussia in 1802, and soon spread over north Germany. It was first described as existing in Russia in 1824; it reached Belgium in 1827, Holland in 1833, the United Kingdom in 1841, Sweden in 1847, Denmark in 1848, Finland in 1850, South Africa in 1854, the United States—Brooklyn in 1843, New Jersey in 1847, Brooklyn again in 1850 and Boston in 1850; it was also carried to Melbourne in 1858, and to New South Wales in 1860; New Zealand and Tasmania received it in 1864, but it was eradicated in both countries by the sanitary measures adopted. It was carried to Asia Minor, and made its presence felt at Damascus. It prevails in various parts of China, India, Africa and Australia, and until quite recently it existed in every country in Europe, except Scandinavia, Holland, Spain and Portugal. In Great Britain cases occurred in 1897.

Symptoms.—The malady lasts from two to three weeks to as many months, the chief symptoms being fever, diminished appetite, a short cough of a peculiar and pathognomonic character, with quickened breathing and pulse, and physical indications of lung and chest disease. Towards the end there is great debility and emaciation, death generally ensuing after hectic fever has set in. Complete recovery is rare.

The pathological changes are generally limited to the chest and its contents, and consist in a peculiar marble-like appearance of the lungs on section, and fibrinous deposits on the pleural membrane, with oftentimes great effusion into the cavity of the thorax.

Willems of Hasselt (Belgium) in 1852 introduced and practised inoculation as a protective measure for this scourge, employing for this purpose a lymph obtained from a diseased lung. Since that time inoculation has been extensively adopted, not only in Europe, but also in Australia and South Africa, and its protective value has been generally recognized. When properly performed, and when certain precautions are adopted, it would appear to confer temporary immunity from the disease. The usual seat of inoculation is the extremity of the tail, the virus being introduced beneath the skin by means of a syringe or a worsted thread impregnated with the lymph. Protection against infection can also be secured by subcutaneous or intravenous injection of a culture of Arloing's pneumo-bacillus on Martin's bouillon, and by intravenous injection of the lymph from a diseased lung, or from a subcutaneous lesion produced in a calf by previous inoculation.

PLEVNA (Bulgarian Pleven), the chief town of the department of Plevna, Bulgaria; 85 m. N.E. of Sofia, on the Tutchiniza, an affluent of Vid, which flows north into the Danube and on the Sofia-Varna railway (opened in 1899). Pop. (1906), 21,208. A branch line, 25 m. long, connects Plevna with Samovit on the Danube, where a port has been formed. After the events of 1877, it was almost entirely forsaken by the Turks, and most of the mosques have gone to ruin; but, people now mainly by Bulgarians, it has quite recovered its prosperity, and has a large commerce in cattle and wine.

Battle of 1877.—Plevna, prior to the Russo-Turkish War of 1877 (see Russo-Turkish Wars) a small and unknown town without fortifications became celebrated throughout the world as the scene of Osman Pasha's victories and his five months' defence of the entrenched camp which he constructed around the town, a defence which upset the Russians' plans and induced them to devote their whole energies to its capture. Osman Pasha left Widin on the 13th of July with a column consisting of 10 battalions, 6 squadrons and 6 batteries, a total of 12,000 men and 54 guns. Hearing that he was too late to relieve Nikopol, he pushed on to Plevna, where there was a garrison of 3 battalions and 4 guns, under Atouf Pasha.

Passing through Plevna on the afternoon of the 19th of July he at once took up a position, previously selected by Atouf Pasha, on the hills covering the town to the north and east. The column had been joined en route by 3 battalions from the banks of the Danube, so that Osman's command now consisted of 25 battalions. He was none too soon. General Schilder-Schuldr, commanding the 5th division of the IX. corps, which had just captured Nikopol, had been ordered to occupy Plevna, and his guns were already in action. The Turkish batteries came into action as soon as they arrived and returned the fire. A desultory artillery duel was carried on till nightfall, but no attack was made by the Russians on the 19th. Osman distributed his troops in three sections: on the Janik Balr, facing north, there were 13 battalions and 4 batteries, with advanced posts of 2 battalions.
and 1 battery each, at Opanetz and Bukova, facing east and north-east, 5 battalions and 10 guns were posted on the eastern end of the Janik Bair; to the hills south of the Bulgareni road 4 battalions and 2 batteries were allotted, and on either side of the road, under cover, in rear of them, most of the cavalry was placed. The remaining troops formed a general reserve, which was posted on the hill just east of the town. The hills to the north and east of Plevna were perfectly bare. The Turks had covered the 115 m. from Widin in seven days, in trying heat, and were exhausted, but a few trenches were thrown up.

On the 20th of July at 5 a.m., having made no preliminary reconnaissance, the Russian commander brought his guns into action, and, after a short bombardment, advanced his infantry in four separate columns. On the north flank they pressed into Bukova, and also succeeded in driving back the Turkish right wing; but in both cases Turkish reinforcements arrived and with vigorous counter-attacks pressed back the Russians, with the result that by noon they were in full retreat, having lost 2800 men out of a total of 8000. The Turks lost 2000. Osman made no attempt to reap the fruits of his victory by pursuit. He at once drew up plans for the fortification of the position, and the troops were employed night and day constructing redoubts and entrenchments. A plentiful supply of tools and daily convoys of stores reached Plevna from Orchanie, and on the 24th of July Osman's strength was increased by 14 battalions and a battery from Sofia. In order to secure his line of communications, on the 25th of July he sent a force of 6 battalions and 1 battery under Adil Pasha to occupy Rifaat (Lovats), where they entrenched themselves.

The Plevna garrison now numbered 20,000 (35 battalions, 8 squadrons, 57 guns and 400 mounted irregulars), who were organized in two wings with a general reserve. Adil Pasha commanded the left wing consisting of 12 battalions, 3 batteries and 2 squadrons, and held the ground from the Vid bridge to Grivitza. Hassan Sabri Pasha commanded the right wing, of equal strength, covering from Grivitza to the south. The remainder, as general reserve, was posted on the crest and slopes of the hill east of the town, with one battalion in Plevna itself. The west front was not fortified till October. Trenches were

in four separate columns. On the north flank they pressed into Bukova, and also succeeded in driving back the Turkish right wing; but in both cases Turkish reinforcements arrived and with vigorous counter-attacks pressed back the Russians, with the result that by noon they were in full retreat, having lost 2800 men out of a total of 8000. The Turks lost 2000. Osman made no attempt to reap the fruits of his victory by pursuit. He at once drew up plans for the fortification of the position, and the troops were employed night and day constructing redoubts and entrenchments. A plentiful supply of tools and daily convoys of stores reached Plevna from Orchanie, and on the 24th of July Osman's strength was increased by 14 battalions and a battery from Sofia. In order to secure his line of communications, on the 25th of July he

4 ft. deep and the redoubts had a command of 10 to 16 ft., with parapets about 14 ft. thick. In addition to the trenches to the flanks, there were in some cases two lines of trench to the front, thus giving three tiers of fire.

In accordance with orders from the Russian headquarters at Tirnova, a fresh attack was made by General Krüdener on the 30th of July. He had been reinforced by three brigades of infantry and one of cavalry under General Shakovskoi, and his force numbered over 30,000 with 176 guns. After a preliminary cannonade the infantry advanced at 3 p.m., as before in widely spread columns. The columns attacking from the north and north-east were repulsed with heavy loss. Shakovskoi advancing from Radischevo, his left flank safeguarded by Skobelev from
the neighbourhood of Krishn, temporarily occupied two redoubts, but a heavy counter-stroke by the Turkish reserves forced him back with serious loss. The Russians retreated, the northern column to Tristenik and Karakag, the southern to Poradim. Their losses amounted to 7,300, while the Turkish losses exceeded 2,000. Had the Turkish garrison of Lovcha been called in, the result would have been still more disastrous to the Russians.

The victory was decisive, but Osman again failed to pursue. His troops were elated by success, the moral of the enemy severely shaken, the undefended Russian bridge over the Danube was within 40 m. of him, but he lost his opportunity, and committed himself with strengthening his defensive works. It is said that he was tied down to Plevna by orders from Constantinople.

The Russians now concentrated all their available forces against Plevna and called in the aid of the Rumanians. By the end of August they had assembled a force of 74,000 infantry, 10,000 cavalry and 440 guns, including 24 siege guns, about 100,000 men in all. On the 30th of August Osman moved out of Plevna with all his cavalry, 3 batteries of artillery and 19 battalions of infantry, and on the 31st attacked the Russians about Pelishat. He returned to Plevna the same evening.

The Turks lost 1,300 and the Russians 1,000 men. The Russians determined to occupy Lovcha, and so cut Osman's communications before again attacking Plevna. After three days' fighting this was accomplished by Skobelev, acting under Imretinski, with a force of 20,000 men, on the 3rd of September. Osman moved out to the relief of the garrison that day with a strong column, but, finding he was too late, returned to Plevna on the 6th. The survivors from Lovcha were re-formed into 3 battalions, including which Osman had been reinforced by 13 battalions, 23 batteries of artillery and 11 squadrons of cavalry. His strength was now 30,000, with 72 guns, 46 batteries, 19 squadrons and 12 batteries. This force was organized in 4 approximately equal commands, the northern, south-eastern, and southern, and a general reserve.

The Russians moved to their preliminary positions on the night of September 6th-7th. Their plan was for the Rumanians, the IX. and IV. corps and Imretinski's column to attack the north-east, south-east and south fronts simultaneously. An artillery bombardment began at 6 a.m. on the 7th of September, was carried on till 3 p.m. on the 11th, when the infantry advanced. The Rumanians took one Grivitsa redoubt; Skobelev occupied two redoubts on the south front, but the centre attack on the Radishovo front failed. On the 12th the Turks recaptured the southern redoubts, the Rumanians remained in possession of the Grivitsa redoubt, but the Russian losses already amounted to 12,000, and they withdrew, and entrenched themselves on a line Verbitsa-Radishevo, with cavalry on either flank to the Vid. The Turkish losses totalled 5,000, of which only a few hundred were caused by the artillery fire of the first few days. There was no question of pursuit. The Russians were greatly superior in numbers and the Turks were completely exhausted.

Several causes contributed to the Russian defeat. The Russian bombardment, at range beyond the powers of their guns and lacking the co-operation of the infantry to give them a target, had been useless. No reconnaissance had been made of the position. The infantry attacks were not simultaneous, and were beaten in detail, besides which, they were spread over the whole of a strongly fortified front in equal strength, instead of being pressed home at definite points. The lack of unity of command, in that the commander-in-chief interfered with the dispositions and conduct of the operations as arranged by the commander of the Plevna forces also militated against the Russian success.

This was the last open-force attack on Osman's lines. General Todleben, the defender of Sevastopol, was now entrusted with the conduct of the siege, and he determined to complete the investment, which was accomplished by the 24th of October, Osman's request to retire from Plevna having been refused by Constantinople. Supplies eventually gave out and a sortie on the night of the 9th-10th of December failed, with the result that he and his army capitulated.

Plevna is a striking example of the futility of the purely passive defence, which is doomed to failure however tenaciously carried out. Osman Pasha repelled three Russian attacks and practically held the whole Russian army. It remained for the other Turkish forces in the field to take the offensive and by a vigorous counterstroke to reap the fruits of his successes. Victories which are not followed up are useless. War without strategy is mere butchery.

The position of Plevna, threatening the Dniester, and the Turkish position in Bessarabia, was extremely important, but there was no necessity for the Russians to attack the position. On the eastern flank an army stronger than Osman's and the fortress of Rustchuk was nearer the bridge than Plevna, but they did not consider it necessary to attack them. They might have contained Osman's force as they did the army under Mehemet Ali, and either awaited his attack or attacked when he evacuated the position. They failed to realize the resisting force of improvised fortifications and the strength conferred by extensive and well-placed entrenchments, and desiring their adversary made direct frontal attacks on a well- fortified position, instead of aiming at a flank or the rear. The part played by Plevna in the war was due in the first place to the imaginary importance set by the Russians on its capture, and later to their faulty procedure in attack on the one hand, and to the skill evinced by the Turks in fortifying and defending the position on the other.

PLEYEL, IGNAZ JOSEPH (1757—1831), Austrian musician, was born at Ruppersthal, near Vienna, on the 1st of June 1757, the twenty-fourth son of a poor village schoolmaster. He studied the pianoforte under Van Hal (known in England as Vanhall), and in 1772 learned composition from Haydn, who became his dearest friend. He was appointed temporary maître de chapelle at Strasburg in 1783, receiving a permanent appointment to the office in 1789. In 1791 he paid a successful visit to London. He narrowly escaped the guillotine on returning to Strasburg, and was only saved by the existence of a letter which he had written, in which the inspiration could fairly be claimed to be on the side of liberty; so that he was permitted to remain until 1795, when he migrated to Paris. Here he opened a large music shop, published the first complete edition of Haydn's quartets, and founded, in 1807, the pianoforte manufactory which still bears his name. The latter years of his life were spent in agricultural pursuits. The July revolution of 1830 inflicted upon him a severe shock, and on the 14th of November 1831 he died in Paris.

MARIA PLEYEL, née Moke (1811-1875), the wife of his eldest son, Camille, was one of the most accomplished pianists of her time.

PLEIGHT, an homonymous word now used chiefly with two meanings, (1) pledge, and (2) condition or state. The first appears more generally in the verbal form, "to plight one's troth," &c., and the second with a direct or implied sense of misfortune. The derivations of the two words show they are quite distinct in origin. The O. Eng. plijht meant danger or risk, hence risk of obligation (cf. Ger. Pflicht, Du. plicht, care, duty). The root pleht- or pleg- is probably also to be seen in the much disputed word "pledge." The M. Eng. pliht or plijt, on the other hand, is an adaptation of O. Fr. ploi, fold, and therefore a doublet of "plait," but appears in the 14th century with the neutral sense of condition or state in general.
PLIMMER, A.—PLINY, THE ELDER

PLINITY, Andrew (c. 1763–1837), English miniature painter, was the son of a clock-maker at Wellington. Disliking his father’s business, he and his brother Nathaniel joined a party of gypsies and wandered about with them, eventually reaching London, where he presented himself to Mrs Cosway in 1783 and was engaged by her as studio boy. His skill in painting was quickly detected by Cosway, who sent him to a friend to learn drawing, and then received him into his own studio, where he remained until 1785, when he set up for himself in Great Maddox Street. It was of this artist that Cosway said “Andrew will be my Elisha,” adding with characteristic vanity, “if I am not constrained to carry my mantle up to Paradise with me.” Plimer married Joanna Louisa Knight, whose sister, Mary Ann, was his pupil and a well-known artist. He had five children, only one of whom, Louisa, married. He exhibited many times in the Royal Academy, residing for a while in Exeter, travelled a good deal through England, and died at Brighton and was buried at Hove. His miniatures are of great brilliance and in considerable demand among collectors. They are to be distinguished by the peculiar wavy treatment of the hair and by the large full expressive eyes Plimer invariably gave to his female sitters, eyes resembling those of his own wife and daughters.

See Andrew and Nathaniel Plimer, by G. C. Williamson (London, 1903).

PLIMSSOL, Samuel (1824–1898), British politician and social reformer, was born at Bristol on the 10th of February 1824. Leaving school at an early age, he became a clerk, and rose to be manager of a brewery in Yorkshire. In 1853 he endeavoured to set up a business of his own in London as a coal merchant. The venture proved a failure, and Plimsoll was reduced to destitution. He has himself related how for a time he lived in a common lodging-house on 7s. 9d. a week. Through this experience he learnt to sympathise with the struggles of the poor; and when the success of his enterprise placed him in possession of a competence, he resolved to devote his leisure to the amelioration of their lot. His efforts were directed more especially against what were known as “cofin-ships”—uneasyworthy and overloaded vessels, often heavily insured, in which unscrupulous owners were allowed by the law to risk the lives of their crews. Plimsoll entered parliament as Liberal member for Derby in 1868, and endeavoured in vain to pass a bill dealing with the subject. In 1872 he published a work entitled Our Seamen, which made a great impression throughout the country. Accordingly, on Plimsoll’s motion in 1873, a royal commission was appointed, and in 1875 a government bill was introduced, which Plimsoll, though regarding it as inadequate, resolved to accept. On the 22nd of July, the premier, Disraeli, announced that the bill would be dropped. Plimsoll lost his self-control, applied the term “villains” to members of the house, and shook his fist in the Speaker’s face. Disraeli moved that he be reprimanded, but on the suggestion of Lord Hartington agreed to adjourn the matter for a week to allow Plimsoll time for reflection. Eventually Plimsoll made an apology. The country, however, shared his view that the bill had been stifled by the pressure of the shipowners, and the popular agitation forced the government to pass a bill, which in the following year was amended into the Merchant Shipping Act. This gave stringent powers of inspection to the Board of Trade. The mark that indicates the limit to which a ship may be loaded is generally known as Plimsoll’s mark. Plimsoll was re-elected for Derby at the general election of 1880 by a great majority, but gave up his seat to Sir W. Harcourt, in the belief that the latter, as home secretary, could advance the sailors’ interests more effectively than any private member. Though offered a seat by some thirty constituencies, he did not re-enter the house, and subsequently became estranged from the Liberal leaders by what he regarded as their breach of faith in neglecting the question of shipping reform. He held for some years the presidency of the Sailors’ and Firemen’s Union, raised a further agitation, marred by obvious exagerration, about the horrors of the cattle-ships. Later he visited the United States with the object, in which he did good service, of securing the adoption of a less bitter tone towards England in the historical textbooks used in American schools. He died at Folkestone on the 3rd of June 1895.

PLINNIMMON (Plinlimmon, Pumpllumon, Plimmon, Pentiumon). Plumlonum is the name used locally: pump means: limon, chimney, flag or beacon; pen, head), a mountain of Wales of the height of 2465 ft., equidistant (about 10 m.) from Machynlleth and Llandiloos. Much inferior in elevation to Snowdon or Cadar Idris, Plinlimmon is certainly the most dangerous of the Welsh hills because of its quaking bogs. The scenery is comparatively poor, consisting chiefly of sheep-downs (in Montgomeryshire) and barren turlabies (in Cardiganshire). If the name means “five-beacons,” only three of these are high, with a carved (stone-pile, probably a military or other landmark, rather than the legendary barrow or tomb) on each of the three. Plinlimmon is notable as the source of five streams—three small: the Rheidol, the Llyn and the Clywedog; two larger and famous: the Wye (Guy) and the Severn (Hafren).

The morasses of Plinlimmon saw many a struggle, notably the war to the knife between Owen Cyfeiliog (b. c. 900), prince of Powys, and Hywel ab Cadogan. Here also Owen Glendower unfurled the banner of Welsh independence; from here, in 1401, he harassed the country, sacking Montgomery, burning Welshpool, and destroying Cwm Hir (long “combe,” or valley) abbey, of which some columns are said to be now in Llandiloos old church. On the side of Plinlimmon, some 2 m. from the Steddfugurig inn, is Blaen Gwy (the point of the Wye), the coarse of the streamlet being traceable up to Pont-rhyd-galed (the hard ford bridge), some 4 m. distant from the inn. Near this bridge are numerous barrows and cairns, on the right from Aberystwyth. There are slate quarries, with lead and copper mines. Machynlleth (perhaps Megloona in Roman times) has Owen Glendower’s “seneate house” (1402), and is known as the scene of Glendower’s attempted assassination by Dafydd Gam. Llyn pen rhaiadr (the waterfall-head pool), or Pistyll y llyn (pool spout), is some 6 m. south of Machynlleth. Llandiloos has a trade in Plinlimmon slates and minerals besides flannel and wool manufacturers.

PLINTH (Gr. πλίθη, a square tile), the term in architecture given to the lower mouldings of a podium, pedestal or skirting; also to any rectangular block on which a statue or vase is placed, and in the Classic Orders to the square block of moderate height, under the base mouldings of the column or pedestal.

PLINY, the Elder. Gaius Plinius Secundus (c. A.D. 23–79), the author of the Naturalis historia, was the son of a Roman eques by the daughter of the senator Gaius Caesarius of Novum Comum. He was born at Comum, not (as is sometimes supposed) at Verona: it is only as a native of Gallia Transpadana that he calls Catullus of Verona his conterraneus, or fellow-countryman, not his municeps, or fellow-townsman (Proc., § 1). Before A.D. 35 (N. H. xxxvili. 81) his father took him to Rome, where he was educated under his father’s friend, the poet and military commander, P. Pompeius Secundus, who inspired him with a lifelong love of learning. Two centuries after the death of his grandsire Pliny saw some of their autograph writings in his preceptor’s library (xiii. 83), and he afterwards wrote that preceptor’s Life. He makes mention of the grammarians and rhetoricians, Remmius Palamon and Arellius Fuscus (xiv. 49, xxiii. 152), and he may have been instructed by them. In Rome he studied botany in the garden of the aged Antonius Castor (xxv. 9), and saw the fine old lotus-trees in the grounds that had once belonged to Crassus (xvii. 9). He also viewed the
vast structure raised by Caligula (xxxvi. 111), and probably witnessed the triumph of Claudius over Britain (iii. 119; a.d. 44). Under the influence of Seneca he became a keen student of philosophy and rhetoric, and began practising as an advocate. He saw military service under Corbulo in Lower Germany (a.d. 47), taking part in the construction of the Chausse of the Maas and the Rhine (xvi. 2 and 5). As a young commander of cavalry (praefectus alae) he wrote in his winter-quarters a work on the use of missiles on horseback (de jaculatione equitii), with some account of the points of a good horse (viii. 162). In Gaul and Spain he learnt the meanings of a number of Celtic words (xxx. 40). He took note of sites associated with the Roman invasion of Germany, and, amid the scenes of the victories of Drusus, he had a dream in which the victor enjoined him to transmit his exploits to posterity (Plin. Epp. iii. 5, 4). The dream prompted Pliny to begin forthwith a history of all the wars between the Romans and the Germans. He probably accompanied his father's friend, Pomponius, on an expedition against the Chatti (a.d. 50), and visited Germany for a third time (57) as a comrade of the future emperor, Titus (Praef. § 3). Under Nero he lived mainly in Rome. He mentions the map of Armenia and the neighbourhood of the Caspian Sea, which was sent to Rome by the staff of Corbulo in a.d. 58 (vi. 40). He also saw the building of Nero's "golden house" after the fire of 64 (xxxvi. 111). Meanwhile he was completing the twenty books of his History of the German Wars, the only authority expressly quoted in the first books of the Annals of Tacitus (i. 60), and probably one of the principal authorities for the Germania. It was superseded by the writings of Tacitus, and, early in the 2nd century, the machus had little hope of finding a copy (Epp. xiv. 8). He also devoted much of his time to writing on the comparatively safe subjects of grammar and rhetoric. A detailed work on rhetoric, entitled Studiosus, was followed by eight books, Dubii sermonis (a.d. 67). Under his friend Vespasian he returned to the service of the state, serving as procurator in Gallia Narbonensis (70) and Hispania Tarraconensis (73), and also visiting the Provincia Belgica (74). During his stay in Spain he became familiar with the agriculture and the mines of the country, besides paying a visit to Africa (vii. 37). On his return to Italy he accepted office under Vespasian, whom he used to visit before daybreak for instructions before proceeding to his own business, after which he devoted all the rest of his time to the study (Plin. Epp. iii. 5, 9). He completed a History of his Times in thirty-one books, possibly extending from the reign of Nero to that of Vespasian, and deliberately reserved it for publication after his decease (N. H., Praef. 26). It is quoted by Tacitus (Ann. xiii. 20, xv. 53; Hist. iii. 29), and is one of the authorities followed by Suetonius and Plutarch. He also virtually completed his great work, the Naturalis historia. The work had been planned under the rule of Nero. The materials collected for this purpose filled rather than 160 volumes in a.d. 25, when Larcid Licinius, the praetorian legate of Hispania Tarraconensis, vainly offered to purchase them for a sum equivalent to more than £3,000. He dedicated the work to Titus in a.d. 77. Soon after his death he received from Vespasian the appointment of praefect of the Roman fleet at Misenum. On the 24th of August a.d. 70 he was stationed at Misenum, at the time of the great eruption of Vesuvius, which overwhelmed Pompeii and Herculanum. A desire to observe the phenomenon from a nearer point of view, and also to rescue some of his friends, from their perilous position on the shore of the Bay of Naples, led to his launching his galleys and crossing the bay to Stabiae (Castellamare), where he perished, in the fifty-sixth year of his age. The story of his last hours is told in an interesting letter addressed to his nephew twenty-seven years afterwards to Tacitus by the latter of Pliny's nephew and heir, the Younger Pliny (Epp. xvi. 16), who also sends to the former a correspondent an account of his uncle's writings and his manner of life (iii. 5):—

"He began to work long before daybreak. ... He read nothing without making extracts; he used even to say that there was no book so bad as not to contain something of value."

It was only the time when he was actually in his bath that was excepted from study. While travelling, as though freed from every other care, he devoted himself to study alone. ... In short, he deemed all time wasted that was not employed in study." The only fruit of all this unwearied industry that has survived to our own times is the Naturalis historia, a work which in its present form consists of thirty-seven books, the first book including a characteristic preface and tables of contents, as well as lists of authorities, which were originally prefixed to each of the twenty books of the separate parts. The order of these books are as follows: ii., mathematical and physical description of the world; iii.-vi., geography and ethnography; vii., anthropology and human physiology; viii.-xii., zoology; xii.-xxvii., botany, including agriculture, horticulture and materia medica; xxviii.-xxxii., medical zoology; xxxiii.-xxxvii., mineralogy, especially in its application to life and art, including chasing in silver (xxxiii. 154-157), statuary in bronze (xxxvii. 9), painting (xxxv. 15-149), modelling (151-158), and sculpture in marble (xxxvi.).

He apparently published the first ten books himself in a.d. 77, and was engaged on revising and enlarging the rest during the next ten years. The work has been generally established with little, if any, revision by the author's nephew, who, when telling the story of a tame dolphin, and describing the floating islands of the Vadimonic Lake, thirty years later (vii. 20, ix. 33), has apparently forgotten that both are to be found in his uncle's work (ii. 209, ix. 26). He describes the Naturalis historia, as a Natura historia, and characterizes it as a "work that is learned and full of matter, and as varied as nature herself." The absence of the author's final revision may partly account for many repetitions, and for some contradictions, for mistakes in passages borrowed from Greek authors, and for the insertion of marginal additions at wrong places in the text.

In the preface the author claims to have stated 20,000 facts gathered from some 2000 books and from 100 select authors. The extant lists of his authorities amount to many more than 400, including 146 of Roman and 347 of Greek and other sources of geography. The list of the narratives of the ancients is a separate book, and the subject matter of each book. This has been clearly shown by Heinrich Brun's Disputatio (Bonn, 1856).

Pliny's principal authority is Varro. In the geographical books Varro is supplemented by the topographical commentaries of Agrrippa which were completed by the emperor Augustus; for his zoology he relies largely on Aristotle and on Julia, the scholarly Mauretanian king; studium clavis was employed as a general guide in botany. Theophrastus is also named in his Indices. In the History of Art the original Greek authorities are Duris of Samos (born c. 340 B.C.), Xenocrates of Cyzicus (A.D. 105), and Antigonus (A.D. 113). The anecdotic element has been ascribed to Duris (xxxiv. 61, Lysippum Steyrumus Duris negat ullius fuisse desipulum, &c.): the notices of the successive developments of art, and the list of workers in bronze and painters, to Xenocrates; and a large amount of miscellaneous information to Antigonus. The last two authorities are named in connexion with Parrhasius (xxxv. 68, hanc ei gloriam concessere Antigonu Xenocrates, qui de pictura scriptore), while Antigonus is named in the Indices of xxxii.-xxxiii., as a writer on the 'lorette' art. Greek epigrams contribute their share in Pliny's descriptions of pictures and statues. One of the minor authorities for books xxxiv.-xxxviii. is Heliodorus (B. 150 B.C.), the author of a work in 126 books on the achievements of kings. The author is quoted in xxxiv. 403, and xxxviii. 153, and xxxvi.-xxxviii., an important place is assigned to Piseiates of Naples (B. 88 B.C.), the author of a work in five volumes on famous works of art (xxxvii. 40), probably relying also, as Pliny does, on the general agreement of authors about the order of their contents, and giving a list of miscellaneous information to Piseiates. The anecdotes ascribed to Piseiates is denied by Kallmann, who holds that Pliny used the chronological work of Apollo- dorsus, as well as a current catalogue of artists. Pliny's knowledge of the latter work is adduced as evidence that the author of this work was an ancient writer, though the various editions often quoted (e.g. xxxiv. 56, xxxv. 113, 156, xxxvi. 17, 39, 41). Varro probably dealt with the history of art in connexion with architecture, which was included in his Discipinae. For a number of his references he is regarded as having been inspired by his reading of the literature of art, especially that written in the adjacent islands, Pliny was indebted to the general, statesman, orator and historian, Gaius Licinius Mucianus, who died before a.d. 77. Pliny mentions the works of art collected by Vespasian in the Temple of the Sibyl at Rome in his other an account of the many items he was in a position to describe, as he was in a place where much of his information as to the position of such works in Rome is due to books, and not to personal observation. The main merit of his account of ancient art, the only classical work of its kind, is that it is a compilation ultimately founded on the lost text-books of Xenocrates and on the biographies of Duris and Antigonos."
PLINY, THE ELDER

He shows no special aptitude for art criticism; in several passages, however, he gives proof of independent observation (xxxiv. 38, 46, 63, xxxv. 17, 20, 116 seq.). He prefers the marble Laocoon in the palace of Titus to all the pictures and bronzes in the world (xxxvi. 37); in the temple near the Flaminian Circus he honours the Ares and the Aphrodite of Scopas, "which would suffice to give renown to any other spot." "At Rome indeed (he adds) the works of art are legion; besides, one effaces another from the memory and however well the study of ancient works distracts the mind, the overpowering claims of duty and business; for to admire art we need leisure and profound stillness" (ibid. 26-27).

Like many of the finest spirits under the early empire, Pliny was an adherent to the Stoics. He was acquainted with their noblest representative, Thrasea Paetus, and he also came under the influence of Seneca. The Stoics were given to the study of nature, while their moral teaching was agreeable to one who, in his literary work, was unselfishly eager to benefit and to instruct his contemporaries (Prof. 16, xviii. 2, xix. 1). He was also influenced by the Epicurean and the Academic and the revived Pythagorean schools. But his view of nature and of God is essentially Stoic. It was only (he declares) the weakness of humanity that had embodied the Being of God in many human forms endowed with human faults and vices (ii. 148). The Godhead was really one; it was the soul of the eternal world, displaying its beneficence on the earth, as well as in the sun and stars (i. 12 seq., 154 seq.). The existence of a divine Providence was uncertain (i. 19), but the belief in its existence and in the punishment of wrong-doing was salutary (i. 26); and the reward of virtue consisted in the increase of its own nature, and to resemble God in doing good to man (ii. 18, Deus est mortali iuvere mortalem, et haec ad aeternum gloriarm vis). It was wrong to inquire into the future and do violence to nature by resorting to magical arts (ii. 114, xxx. 3); but the significance of prodigies and portents is not denied (i. 92, 199, 232). Pliny's view of life is gloomy; he regards the human race as plunged in ruin and in misery (ii. 24, vii. 130). Against luxury and moral corruption he indulges in declamations, which are so frequent that (like those of Seneca) they at last pall upon the reader; and his rhetorical flourishes against practically useless inventions (such as the 37 of navigation) are wanting in good sense and good taste (xix. 6).

With the proud national spirit of a Roman he combines an admiration of the virtues by which the republic had attained its greatness (xvi. 14, xvii. 3, xxxv. 202). He does not suppress historical facts unfavourable to Rome (xxxiv. 139), and while he honours eminent members of distinguished Roman houses, he is free from Livy's undue partiality for the aristocracy.

The agricultural classes and the old landlords of the equestrian order (Cincinnatus, Curius Dentatus, Serranus and the Elder Cato) are to him the pillars of the state; and he bitterly laments the decline of agriculture in Italy (xvii. 31 and 35, latifundia perdideri Italian.) Accordingly, for the early history of Rome, he prefers following the praet-Augustan writers; but he regards the imperial power as indispensable for the government of the empire, and he hails the salutarius exors ex Vespasiani (xxxii. 51). At the conclusion of his literary labours, as the only Roman who had ever taken for his theme the whole realm of nature, he prays for the blessing of the universal mother on his completed work.

In literature he assigns the highest place to Homer and to Cicero (xvii. 37 seq.); and the next to Virgil. He takes a keen interest in nature, and in the natural sciences, studying them in a way that was then new in Rome, while the small esteem in which studies of this kind were held does not deter him from endeavouring to raise his fellow-citizens (xxvi. 13). The scheme of his great work is vast and comprehensive, being nothing short of an encyclopaedia of learning and of art so far as they are connected with nature or draw their materials from it. With a view to this work he studied the original authorities on each subject and was most assiduous in making excerpts from their pages. His indices auctorum are, in some cases, the authorities which he has actually consulted (though in this respect they are not exhaustive); in other cases, they represent the principal writers on the subject, whose names are borrowed second-hand for his immediate authorities. He frankly acknowledges his obligations to all his predecessors in a phrase that deserves to be proverbial (Prof. 21, plenun ingenii pudoris fateri po quas). He had neither the temperament for original investigation, nor the faculty of narrowing down his diverging thoughts, but it is obvious that one who spent all his time in reading and in writing, and in making excerpts from his predecessors, had none left for mature and independent thought, or for patient experimental observation of the phenomena of nature. But it must not be forgotten that it was his scientific curiosity as to the phenomena of the eruption of Vesuvius that brought his life of unwearied study to a premature end; and any criticism of his faults of omission is disarmed by the candour of the confession in his preface: nec dubitamus nulla esse quae et nos praeterierint; huius enim sumus et occupati officiis.

His life betrays the unhealthy influence of Seneca. It aims less at clearness and vividness than at epigrammatic point. It abounds not only in antitheses, but also in questions and exclamations, tropes and metaphors, and other mannerisms of the silver age. The rhetorical and artistic form of the sentence is sacrificed to a passion for emphasis that delights in deferring the point to the close of the period. The structure of the sentence is also apt to be loose and strangling. There is an excessive use of the ablative absolute, and ablative phrases are often appended in a kind of vague "apposition" to express the author's own opinion of an immediately previous statement, e.g. xxxv. 60, (Apelles), ut se praeclare, quod munum de tubulo scire tollere, memorabili præcepto nocere suepe nimitam diligentiam.

About the middle of the 3rd century an abstract of the general portion of Pliny's work was produced by Solinus; and, early in the 4th, the medical passages were collected in the Medicina Plintii. Early in the 8th we find Bede in possession of an excellent MS. of the whole work. In the 9th Alcuin sends to his friend Charlemagne a Great father of learning, Dentatus, and Decius gathers extracts from the pages of Pliny for his own Mensura orbis terrae (c. 825). Pliny's work was held in high esteem in the middle ages. The number of extant MSS. is about 200, but the best known is the ancient MSS. that at Bamberg contains only books xxxii.-xxxvii. Robert of Cricklade, prior of St. Frideswide at Oxford, dedicated to Henry II. a Defloratio consisting of nine books of selections taken from one of the MSS. of this class, which has been recently recognized as containing supplying us with the only evidence for the true text. Among the later MSS. the codex Vespertinum, formerly at Besançon (11th century), is the most valuable. It is divided into nine books according to the arrangement of the three books by Leiden respectively, while there is also a transcript of the whole of this MS. at Leiden.

In modern times the work has been the theme of a generous apparatus in several volumes. Among the most important are the E. T. (1848). Jacob Grimm, in the first paragraph of c. 37 of his Deutsche Mythologie, writing with his own fellow-countrymen in view, has commended Pliny for condescending, in the midst of his researches, to the science of the ancients, and for his diligence as a folk-lore of plants and animals, and has even praised him for the pains that he bestowed on his style. It may be added that a special interest attaches to his account of the manufacture of the papyrus (xiii. 68-83), and of the different kinds of purple dye (xx. 130), while his description of the notes of the nightingale is an elaborate example of his occasional felicity of phrase (xxix. 81 seq.). Most of the recent research on Pliny has been concentrated on the investigation of his authorities, especially those which he followed in his chapters on the history of art—the only ancient account of that subject which has survived.

The Latin inscriptions and letters C. Plin. has been re-produced by Cades (v. 211) from the original in the Vannutell collection. It represents an ancient Roman with an almost completely bared forehead and a double chin; and is almost certainly a portrait, of Pliny less perhaps than of the help. Busts of both the Plinii, clad in the garb of scholars of the year 1500, may be seen in the niches on either side of the main entrance of the cathedral church of Como. The elder Pliny's anecdotes of Greco<n> Roman inscriptions and dedication. Vase-inscribed with the subjects of the fresco which still adorn the interior of his former home at Arezzo.

PLINY, THE YOUNGER

Publius Caecilius Secundus, later known as Gaius Plinius Caecilius Secundus (A.D. c. 61–c. 113), Latin author of the Letters and the Panegyric on Trajan, was the second son of Lucius Caecilius, by Plinia, the sister of the Elder Pliny. He was born at Novum Comum, the modern Como, the date of his birth being approximately determined by the fact that he was in his 18th year at the death of his uncle in August A.D. 79 (Ep. vi. 20, 5). Having lost his father at an early age, he owed much to his mother and to his guardian, Verginius Rufus, who had twice filled the office of consul and had twice refused the purple (i. 8). He owed still more to his uncle. When the Elder Pliny was summoned to Rome by Vespasian in A.D. 72, he was probably accompanied by his nephew, who went through the usual course of education in Roman literature and in Greek, and at the age of fourteen composed a "Greek tragedy" (vii. 4, 2). He afterwards studied philosophy and rhetoric under Nicetas Sacerdos and Quintilian (vi. 6, 3, ii. 14, 9), and modelled his own oratorical style on that of Demosthenes, Cicero and Calvus (i. 2). The Elder Pliny inspired his nephew with something of his own indomitable industry; and in August 79, when the author of the Historia naturalis lost his life in the famous conflagration of Vesuvius, it was the Younger Pliny who went with the message of the Younger Pliny who first described the signs of the approaching visitation, and, some twenty-seven years later, it was the Younger Pliny who wrote a graphic account of the last hours of his uncle, in a letter addressed to the historianTacitus (vi. 16). By his will the Elder Pliny had made his nephew his adopted son, and the latter now assumed the nomen and praenomen of his adoptive father.

A year later he made his first public appearance as an advocate (viii. 8, 9), and soon afterwards became a member of the board of decemviri stiliibus judicandis, which was associated with the praetor in the presidency of the centumviral court. Early in the reign of Domitian he served as a military tribune in Syria (A.D. 81 or 82), devoting part of his leisure to the study of philosophy under the Stoic Euphrates (i. 10, 2). On returning to Rome he was nominated to the honorary office of sevir equitum romanorum, and was actively engaged as a pleader before the centumviri, the chancery court of Rome (vi. 12, 2).

His official career began in A.D. 89, when he was nominated by Domitian as one of the twenty quaestors. He thus became a member of the senate for the rest of his life. In December 91 he was made tribune, and, during his tenure of that office, withdrew from practice at the bar (i. 23). Early in 93 he was appointed praetor (iii. 11, 2), and, in his year of office, was the counsel for the impeachment of Bautilius Maternus (92, 93), the procurator of Hispania Baetica (iii. 4, 20, vii. 33). During the latest and darkest years of Domitian he deemed it prudent to withdraw from public affairs, but his financial abilities were recognized by his nomination in 94 or 95 to the praefectura aerae militaris (ix. 13, 11).

On the death of Domitian and the accession of Nerva he delivered a speech (subsequently published) in prosecution of Publicius Celsus, who had been foremost in the attack on Helvidius Priscus (ix. 13). Early in 98 he was promoted to the position of praefect of the public treasury in the temple of Saturn. After the accession of Trajan in the same year, Pliny withdrew from Tacitus in the impeachment of Marius Priscus for his maladministration of the province of Africa (ii. 11). The trial was held under the presidency of the emperor, who had already nominated him consul suffectus for part of the year A.D. 100. The formal oration of thanks for this nomination, described by Pliny himself as his gratiorum actio (iii. 12, 18 and 18, 1), is called in the MSS. the Panegyricus Traiano dic tus.

The following year was marked by the death of Silius Italicus and Martial, who are gracefully commemorated in two of his Letters (iii. 7 and 21). It is probable that in 103–104 he was promoted to a place in the college of Augurs, vacated by his friend Frontius (iv. 8), and that in 105 he was appointed curator of the river Tiber (v. 14, 2). In the same year he employed part of his leisure in producing a volume of hendecasyllabic verse (iv. 14, v. 10). He usually spent the winter at his seaside villa on the Latian coast near Laurentum, and the summer at one of his country houses, either among the Tuscan hills, near Tifernum, or on the lake of Como, or at Tusculum, Tibur or Praeneste.

It was probably in 104, and again in 106, that he was retained for the defence of a governor of Bitinia, thus becoming familiar with the affairs of a province which needed a thorough reorganization. Accordingly, about 111, he was selected by Trajan as governor of Bitinia, under the special title of "legate praeprofator with consular power." He reached Bitinia in September, held office for fifteen months or more, and probably died in 113.

His health was far from robust. He speaks of his delicate frame (gracilitas mea); and he was apt to suffer from weakness of the eyes (vii. 21) and of the throat or chest (ii. 11, 13). Frugal and abstemious in his diet (i. 15; iii. 12 and 12), studious and methodical in his habits (i. 6, v. 18, iii. 36 and 40), he took a quiet delight in some of the gentler forms of outdoor recreation. We are startled to find him telling Tacitus of his interest in hunting the wild boar, but he is careful to add that, while the beasts were at work, he sat beside the nets and was busily taking notes, thus combining the cult of Minerva with that of Diana (i. 6). He also tells the historian that, when his uncle left Misenum to take a nearer view of the eruption of Vesuvius, he preferred to stay behind, making an abstract of a book of Livy (vi. 20, 5).

Among his friends were Tacitus and Suetonius, as well as Frontinus, Martial and Silius Italicus; and the Stoics, Musonius and Helvidius Priscus. He was thrice married; on the death of his second wife without issue, Trajan conferred on him the jus trium liborum (A.D. 98), and, before 105, he found a third wife in the accomplished and amiable Calpurnia (iv. 10). He was generous in his private and his public benefactions (i. 19, ii. 4, 2, vi. 32). At his Tuscan villa near Tifernum Tiberinum (iv. 1, 4), the modern Città di Castello, he set up a temple at his own expense and adorned it with statues of Nerva and Trajan (x. 8). In his lifetime he founded and endowed a library at his native place (i. 8, v. 7), and, besides promoting local education (iv. 13), established an institute for the maintenance and instruction of the sons and daughters of free-born parents (vii. 18). By his will he left a large sum for the building and the perpetual repair of public baths, and the interest of a still larger sum for the benefit of one hundred freedmen of the testator and, ultimately, for an undetermined number.

On a marble slab that once adorned the public baths at Comum, his distinctions were recorded in a long inscription, which was afterwards removed to Milan. It was there broken into six square pieces, four of which were built into a tomb within the great church of Sant’ Ambrogio. Of these four fragments only one survives, but with the aid of transcriptions of the other three made by Cyriacus of Ancona in 1442, the whole was
PLINY, THE YOUNGER

restored by Mommsen [C.I.L. v. 5262]. It is to the following
effect:—
Galus Plinius Caelicius <Secundus>, son of Lucius, of the Ufentine tribe; consultor augur; legate-prourator of the province of Pontus and Bithynia; while consul proconsul for the province of Bithynia, was
brought into the said province by the emperor Nerva Trajan <Augustus, Germanicus, Dacius, pater patriae>; curator of the bed and banks of the Tiber and of the <wavers of the city>; prefect of the Treasury of Saturn; prefect of the Treasuries of the Clemens and of Constantine; tribune the plebs; emperor's quaestor, sevir of the <Roman> knights; military tribunal of the chirdic Gallic legion; <decevir> for the adjucation of <suits>; provided for the erection of baths at a cost of
250,000 sesterces (2400) and furthermore, for maintenance, 200,000 sesterces (L600); likewise, for the support of one hundred of his own freedmen, 5000 sesterces (12,000) (c. 152,000), the eventual accretions <whereof> he devised to the townsfolk for a public entertainment: ... likewise, in his life-
time he gave for the support of sons and daughters of the towns-
folk who were covered by his liberality, and for the maintenance of the library, 100,000 sesterces (2900).

With the exception of two mediocre sets of verses, quoted by himself (vii. 4 and 6), his poems have perished. His speeches
were apt to be prolix, and he defended their prolixity on principle (i. 20). He was apparently the first to make a practice of reciting
his speeches before a gathering of his friends before finally publishing them (iii. 18). The only speech that has survived is the
Panegyric on Trajan, first delivered by Pliny in the emperor's
presence, next recited to the orator's friends for the space of
days, and ultimately published in an expanded form (i. 20, iii.
27). He was afterwards maina and tribune (168) thus the book
were in strictly chronological order, that the letters in each book
were in general arranged in order of date, that all of them were
later than the death of Domitian (September 96), the letters written before that date are not arranged as is usual in the
previous volume (c. 92); ii. (100); iii. (101-102); iv. (105); v. and vi. (106); vii. (107); viii. (108); and ix. (not later than 109) and, lastly, that Pliny
was governor of Bithynia from A.D. 111-112 to 115. The letter which
is probably the earliest (i. 90) has since been assigned to the last
part of the reign of Domitian, and it has been suggested by Professor
Merrill that the nine books were published in three groups: i.-ii.
(168); iii.-v. (100); and vi.-vii. (106).

In his Letters Pliny presents us with a picture of the varied
interests of a cultivated Roman gentleman. The etiquette of
the imperial circle, scenes from the law-courts and the recreation-
room, the reunions of dillenati and philosophers, the busy life of
the capital or of the municipal town, the recreations of the
seaside and of the country—all these bring vividly before our
eyes. He elaborately describes his Laurentine and his Tuscan villa, and frankly tells us how he spends the day at each
(ii. 17, v. 6, ix. 36 and 40); expatiates on his verses and his speeches,
his holiday-tasks in Umbria (vii. 9, ix. 10), and his happy
memories of the Lake of Como (i. 10). He gives an account of a statue of Cornucopia he has recently purchased (iii. 6). He is interested in providing a teacher of
rhetoric for the place of his birth (iv. 13); he exults in the devo-
tion of his wife, Calpurnia (vi. 19); towards his servants he is an
indulgent master (vii. 16); he intercedes on behalf of the freed-
man of a friend (ix. 21), and, when a freedman of his own is in
delicate health, sends him first to Egypt and afterwards to the
Riveria (v. 19). He consults Suetonius on the interpretation of
dreams (i. 18); he presents another of his correspondents with a
batch of ghost-stories (vii. 27) or a marvellous tale about a tame
dolphin on the north coast of Africa (ix. 33). He discourses on
the beauties of the Cittumnum (viii. 8) and the floating islands
of Eolie Lake (viii. 20). He describes his trip to Vesuvius in connexion with the last days of the Elder Pliny
(vi. 16 and 20), giving elsewhere an account of his manner of
life and a list of his writings (iii. 3). He laments the death of
Silius Italicus (iii. 7), of Martial (iii. 21), and of Verginius Rufus
(i. 1), and of others less known to fame. He takes as his
models Cicero and Tacitus (vii. 20), whose name is so often (to
his delight) associated with his own (ix. 23). He rejoices to
learn that his writings are read at Lyon (ix. 11). He complains
of the inanity of circus-races (ix. 6), of the decay of interest in
public recitations (i. 13), of bad taste in matters of hospitality
and of the lack of the old freedom of speech in political and
social duties of Rome (i. 9). He lays down the principles that
should guide a Roman governor in Greece (viii. 24); he maintains
the cause of the oppressed provinces of Spain and Africa; and he
exposes the iniquities of the informer Regulus, the only living
man whom he attacks in his Letters, going so far as to denounce
him as omnium bipedum necissimus (i. 5, 14).

The Letters are models of graceful thought and refined expres-
sion, each of them dealing with a single topic and generally
ending with an epigrammatic point. They were imitated by
Symmachus (Macrobius v. 1, 7) and by Apollinaris Sidonius
(111-124). Indeed, the elements of the letters are so common
as to be found in every correspondence. Pliny, like all the corres-
donents of Augustus, is careful to avoid the strict adherence to Rati-
cious conscientiousness of the governor, and on the assiduity and
the high principle which animated the emperor.

On reaching the province, Pliny celebrates the emperor's birth-
day, and proceeds to examine the finances of Prusa. His request
for a surveyor to check the outlay on the public works is refused
on the ground that the emperor has hardly enough such distance
for the works he is carrying on in Rome. He asks the emperor to
sanction the repair of the ancient baths at Prusa, the building of
an aqueduct at Nicomedia and a theatre at Nicaea, and the covering
in of a stream that has become a public nuisance at Amasra.
When he consults the emperor as to the baths at Claudiopolis,
the emperor sensibly replies: "You, who are on the spot, will be best
able to decide this matter, and will make all the necessary
arrangements by Decius Chrysostom (the Bithynian friend of Nerva
and Trajan), the emperor betrays a not unnatural impatience in his
response: potius non haerere, mi Secundo cartissimae (82).
Pliny also asks for a decree that the status and maintenance of
deserted children (65), and on the custom of distributing public
doles on the occasion of interesting events in the life of a private
citizen. The emperor agrees that the custom might lead to a
political factioning and should therefore be strictly controlled
(117). Owing to a destructive fire at Nicomedia, Pliny suggests
the formation of a volunteer fire-brigade, limited to 150 members.
The emperor is afraid that the fire-brigade might become a
political faction, and Pliny had to be extremely cautious in the
provision of a fire-engine (34).

Trajan's fear of factions and clubs in these two last cases has
sometimes been connected with the question of his attitude
of the citizens of Bithynia (vii. 20). He describes how in Bithynia
that he had never
part taken in formal trials of Christians, and was therefore
unaligned with precedents as to the extent of the investigation,
and as to the degree of punishment. The treatment of might be
drawn between adults and those of tender years; and that
allowance might be made for any one who recanted. There was also the question whether any one should be punished simply for bearing the name of Christian or for only if he was found guilty of "crimes associated with that name. Hitherto, in the case of those who were brought before the courts before the third distinct times whether they were Christians, and, if they persisted in the admission, had ordered them to be taken to execution. Whatever might be the real character of their profession, he held that such persons as those ought to be suspected of being others no less "demented," who, being Roman citizens, would be sent to Rome for trial. Soon, as the natural consequence of these proceedings and of the consequences of Traces had been added, he had received an anonymous statement giving a list of accused persons. Some of them, who denied that they had ever been Christians, had consented to pray to the gods, to adore the image of the emperor, and to blaspheme Christ. Others had admitted that they were Christians, but presently denied it, adding that they had ceased to be Christians for some years. All of these worshipped the images of the gods and of the emperor, and blasphemed Christ. They accused that the sem and substance of their "fault" was that they had been accustomed to meet on a fixed day before daylight to sing in turns a hymn to Christ as God, and to bind themselves by a solemn oath (sacramento) to abstain from theft or murder, and from adultery, perjury and dishonesty: after which they were wont to separate and to meet again for a common meal. This, however, they had ceased to do as soon as Pliny had published "proclamations." In accordance with the emperor's edict. To ascertain the truth, he had also put to the torture two maid-servants described as deaconesses, but had discovered nothing beyond a pernicious and extravagant superstition. He had accordingly, with the help of郡matheus, had the three accused persons consulted. The question appeared to be worthy of such a consultation, especially in view of the number of persons of all ages and ranks, and of both sexes, who were impenitent. The contagion had spread through the ancient and Roman provinces and the emperors had been against it. Temples that had been well-built deserted were already beginning to be frequented, rites long intermitted were being renewed, and the trade in fodder for sacrificial victims was reviving. It might be inferred from this how large a number might be reckoned, if only room were granted for repentance.

Trajan in his reply (Ep. 97) expresses approval of Pliny's course of action in the case of the Christians brought before him. It was much better than to have them tried by the courts, and then, if found guilty, to have them punished. The persons in question were not to be hunted out, but if they were reported and were found guilty, they were to be punished. If, however, they had not been Christians, he was a Christian, and raised his denial by worshipping the gods of Rome, he was to receive pardon. But no attention was to be paid to "anonymous charges. It would be a bad precedent and unworthy of the spirit of the age.

The view that the Christians were punished for being members of a collegium or sodalitas (once held by E. G. Hardy, and still maintained by Professor Merrill) is hard to reconcile with Pliny's own statement that the Christians had promptly obeyed the emperor's decree against colleagues (§ 2). Further reasons against this view have been urged by Ramsay, who sums up his main results as follows: (1) There was no express law or formal edict against the Christians. (2) They were not prosecuted or punished for contravening any formal law of a wider character. (3) They were judged and condemned by Pliny (with Trajan's full approval) by virtue of the imperium delegated to him, and in accordance with the instructions issued to governors of provinces to search out and punish sacrilegious persons. (4) They had already been classed as outlaws, and the name of Christian in itself entailed condemnation. (5) This treatment was a principle of imperial policy, not established by the capricious action of a single emperor. (6) While Trajan felt bound to carry out the established principle his personal view was to some extent opposed to it. (7) A definite form of procedure had been established. (8) This procedure was followed by Pliny (W. M. Ramsay, The Church in the Roman Empire, p. 223).

It has been well observed by E. G. Hardy that the "double aspect of Trajan's rescript, which, while it theoretically condemned the Christians, practically gave them a certain security," explains "the different views which have since been taken of it; but by most of the church writers, and perhaps on the whole with justice, it has been regarded as favourable and as rather discouraging persecution than legalizing it (Pliny's Corres. ii. 97; Epp. 97)."

AUTHORITIES.—The correspondence with Trajan was apparently preserved in a single Paris MS.; Epp. 41-121 were first printed by Avantius of Verona (1602); and Epp. 1-40 by Aldus Manutius (1508). The original MS. has vanished; but the "copy" supplied to the printers of the Aldine text was discovered by Mr. E. G. Hardy in the Bodleian in 1888. The two letters on the Christians were known to Tertullian (Apol. c. 2). The attacks on the genuineness of the whole or part of the collection have been refuted by Wilde (Leipsic 1886).

For a critical edition of text, see H. Kiell (Leipzig, 1870), with full index of names by Mommsen; for plain text, Keil (1853), &c. C. F. W. Müller (1905); the best annotated editions are those of C. F. G. Schäfer (1885) and G. E. Georg (1786-1886); of the Letters alone, G. Korte (1874), and the less trustworthy edition of M. Döring (1845); of bks. i. and ii., Cowan (1893); of iii., Mayor and L. M. (1890, with life by G. H. Randall); of iv., Duff (1900); of the Pangenyes, C. G. Schwarz (1846); of the Correspondence with Trajan, E. G. Hardy (1889); of Selected Letters, E. T. Merrill (1903); best Eng. transl. by J. D. Lewis (1879).

On Pliny's life, see the works by J. Masson (Amsterdam, 1790); H. Schütz (Hof, 1876); and Giesen (Bonn, 1885). On the chronology of the letters, &c., Mommsen, in Hermes, iii. 31-114 (1868); transl. into French by Morel (1873); criticized by Stobbe (Philologus, 1879); Gemoll (Halle, 1872); C. Peter (Philologus, 1873; Asbach (Rhein. Mus., 1881); and Schultz (Berlin, 1899). For style, the works of H. Holstein (1862-1865); K. Kraut (1872); J. P. Lassogen (1872); and Morizot (Grenoble, 1888). On the villas, Burn's Rome and the Campagna (1871), 411-415; Hitchin's, in the Builder (Feb. 8, 1890); Winnefeld, in Jahrb. des arch. Inst. (1891), pp. 201-217; and Magoun, in Trans. Amer. Philol. Assoc. (1895).

For recent literature on Pliny and the Christians, see C. P. Arnold, Studies in Pliny (1891); Lightfoot, Apostolic Fathers, ii. (ed. 1886); Neumann, Der römische Staat und die allgemeine Kirche (1890); and Mommsen, in Häss. Zeitschrift (1896); W. M. Ramsay, The Church in the Roman Empire (ed. 1883), ch. 10, pp. 196-225; and E. G. Hardy, Christianity and the Roman Government (1895), reprinted in Studies in Roman History (1906), pp. 1-162; with the literature quoted in these works and in Schanz, Röm. Lit. § 641. (J. E. S.)

PLIOCENE

PLIOCENE (from the Gr. πλιώνειν, πλώνειν, και πλωῦν, recent), in geology, the name given by Sir C. Lyell to the formations above the Miocene and below the Pleistocene (Newer Pliocene) strata. During this period the great land masses of the earth were rapidly approaching to the configuration which they exhibit at the present day. The marine Pliocene deposits are limited to comparatively few areas; in Europe, in the beginning of the period, the sea washed the shores of East Anglia and parts of the south coast of England; it extended west into Belgium and Holland, and just touched here and there on the northern and north-western coasts of France; it sent an arm some distance up the valley of the Guadalquivir and formed small bays on several points of the southern coast of France; and up the Rhone basin a considerable gulf reached as far as Lyons. Early in the period the sea covered much of Italy and Sicily; but the eastward extension of the ancient Mediterranean in south-east Europe, through the Danube basin, the Aral, north Caucasian and Caspian regions, continued to suffer the process of conversion to lagoons and large lakes which had begun in the Miocene.
Generally all over the world the majority of Pliocene formations are non-marine, and the limited and local nature of the elevations since the inception of the period has exposed to view only the shallow marginal marine deposits. The principal exception to the last statement is to be found in the Pliocene of Italy and Sicily, where a continuous crustal depression permitted the accumulation of great thicknesses of material, which later on, towards the close of the period, were elevated some thousands of feet. With these depository movements are associated the Italian volcanoes; Etna certainly began its career beneath the sea, for its older tuffs are found interstratified with marine beds, and possibly some of the others had a similar origin. At the same time volcanic outbursts, some apparently comparable to that of Martinique in recent times, were taking place in central France, while far away in southern Sumatra thousands of feet of submarine tufts were being thrown out and deposited, and great lava flows were being erupted in Australasia.

Considerable differences of opinion are exhibited among geologists as to the lower limits of the Pliocene formations; this is partly to be accounted for by the absence of widely-spread marine deposits, and partly by the comparatively short time-differences in deposits and formations, and hence the similarity of the faunas of contiguous strata-groups in local vertical series of beds. Following A. de Lapparent (Traité de géologie, 5th ed., 1906), we shall regard the Pliocene as divisible into three stages: an upper Sicilian stage, a middle Astian stage, and a lower Plaisancian stage. Other writers, however, have selected a different nomenclature, which often involves a different grouping of the formations; thus E. Kayser in his Formationskunde (3rd ed., 1905) distinguishes three stages under the names Arman (upper), Astian (middle) and Messinian (lower) = Zanclean. The lower stage, however, includes the Pontian, Eppeheim, Flornesi and other formations which are here placed between one deposit and another, and hence the similarity of the faunas of contiguous strata-groups in local vertical series of beds. The Pliocene rocks of Britain now occupy but a small area in Norfolk, Suffolk and part of Essex; but from the presence of small outlying patches in Cornwall (St Erth and St Agnes), Dorsetshire (Dewlish) and Kent (Lenham), it is evident that the Pliocene Sea covered a considerable part of southern England. Moreover, these patches show by their present altitude above the sea that the Downs of Kent must have been elevated more than 80 ft., and the west coast of Cornwall 400 ft. since Pliocene times. The Pliocene rocks rest with strong unconformity upon the older strata in Britain. In the eastern counties the shelly, sandy beds are called "Crag," and in this same name have come popularly to be the general use for all the members of the series, and it is frequently employed as a synonym for Pliocene.

The English Pliocene strata are classified by the Geological Survey of England and Wales as follows:

- Yoldia (Leda) myalis bed (provisionally placed here).
- Forest-bed group and Dewlish gravels with Elephas meridionalis.
- Newer
  - Weybourne clay (and Chillesford clay?).
- Pliocene
  - Chillesford clay.
  - Norwich river and Scrubebia crag.
  - Red crag of Watton.
  - Red crag of Watton, Newbourn and Oakley.
  - St Erth and St Agnes beds.
- Old
  - Coralline crag.
  - Lenham beds (Diestian).
  - Box-stones and phosphatic beds with derived early Pliocene and other fossils.

The box-stones are rounded pieces of brown earthy sandstone containing casts of fossils; the phosphatic beds contain the phosphatized bones of whale, deer, mastodon, pig, tapir, rhinoceros, &c., and have given rise to a somewhat parallelism in the distribution of the conglomeration deposits underlie the red crag and sometimes the coralline crag. The last-named formation, known also as the "white" or "Suffolk crag," or as the "Bryozoan crag" (it was the presence of Bryozoa which led to the name "coralline"), is essentially a shelving bank, which was accumulated at a depth of from 20 to 40 fathoms. It is best exposed near Alderburgh and Gelgrave in Suffolk. The Red Crag are sandy, marine, shallow-water deposits, with an abundant fauna; they vary rapidly from point to point, and in general more southern localities are richer in southern (older) forms than those farther north. The Norwich crag (fluvo-marine or mammaliferous crag) is not always very clearly marked off from the Red Crag. Marine fresh-water and land shells are found in these beds, together with many mammalian remains, including Elephas antiquus, Mastodon antiquus, Ceratotherium, Equus antiquus, Ovibos antiquus, and other fish. The Forest-bed group or Cromer forest-bed is exposed beneath the boulder clay of the Norfolk coast; it contains transported stumps of trees and many plants still familiar to us. Many new and rare marine molluscs and a large number of mammals, many of which are extinct (Mus-heraenaus, Canis lupus, Ursus spelaeus, Hyaena crocuta, Hipposcopus amphibius, Rhinoceros etruscus, Elephas antiquus and E. meridionalis, Rhinoceros carchavus, Ovis aries, Ovis rupicapra, Ovis caballus and E. stenonis, Castor fiber, Talpa europaea and many others). The only record of Pliocene remains in the northern part of England consists of a few very rare remains found in a fissure in the limestone at Dove Holes, Derbyshire.

The Pliocene deposits of Britain and Holland and the northern extremity of France are closely related with those of Britain, though the latter are much thinner than the former. The line of demarkation can be traced from Lenham across the Channel at Calais and through Cassel to Diest. The newer marine Pliocene runs in a parallel belt to the north of the older beds through Antwerp. Belgian geologists have subdivided the local Pliocene into the following groups (from downwards); Poedrelian, Scaldiscian, Casterlian, Diestian. F. W. Harmer (Quarter. Journ. Geol. Soc., 1896 and 1900) proposed the following scheme for the Pliocene of Britain and the Low Countries:

- Cromerian = Forest-bed of Cromer.
- (Icno-)Cromerian = Chillesford beds and Weybourne crag.
- Lower marine.
- Amstelian = Red crag, comprising the Newbournian and Butleyan sub-stages.
- Waltonian = Walton crag and Poedrelian and Scaldiscian.
- Gemetian = Cretaceous crag and Casterlian.
- Lenhantian = Diestian.

In addition to the deposits just mentioned in French Flanders, the early Pliocene sea has left numerous small patches of marls and sands, here and there spread over vast areas. In some places these marls and sands are associated with fluvio-marine deposits, while elsewhere the marls and sands of Pliocene and Astian ages occur in the depression of Roussillon, followed by Sicilian marls and gravels. In Languedoc (Montpellier, Nîmes, Béziers) marine marls and sands are also associated with fluvio-marine deposits, while in the Alps, the marls and sands of Pliocene and Astian ages are comparable with the marine deposits of the later part of the Astian age. These marls and sands of Pliocene and Astian ages are often referred to in the literature as "crag." These deposits are composed of a mixture of gravel and sand, with some shelly fragments, and are often associated with a number of fossil marine mammals, such as whales, dolphins, and ichthyosaurs. The deposits are often found in association with other marine deposits, such as the Eocene and Miocene deposits, and are often interbedded with them. The deposits are often found in association with other marine deposits, such as the Eocene and Miocene deposits, and are often interbedded with them. The deposits are often found in association with other marine deposits, such as the Eocene and Miocene deposits, and are often interbedded with them.
marine origin in California are those of San Diego and Wild Cat. In the Rocky Mountains large lacustrine formations of considerable thickness, and certain conglomerates in Wyoming and Bishop Mountain are assigned to this age. The sands and clays with gypsum of Entre Rios in South America contain fossils of the Atlantic type.

Ligniteiferous shale with petroleum and great thickness of volcanic tuffs have been found in southern Sumatra. In New South Wales Pliocene river terraces and alluvial deposits are covered with Miocene and Pliocene lavas and from these "deep beds" or buried river beds much gold has been obtained. In Victoria great basaltic and doleritic flows have filled up the Pliocene river valleys, and marine beds have been found at elevations of 1000 ft. above present sea-level. Very similar deposits and volcanic rock, belonging to the Wanganui system of F. W. Hutton, are found in New Zealand.

TABLE OF PLIOCENE FORMATIONS.

See C. Reid, "The Pliocene Deposits of Britain" (Mem. Geol. Survey, 1890); E. T. Newton, "The Vertebrates of the Pliocene Deposits of Britain" (Mem. Geol. Survey, 1891) (both contain a bibliography); C. Reid, Origin of the British Flora (1891); and "Geological Literature" (Geol. Soc. Lond. Annual, since 1893). (J. A. H.)

PLOCK, or PLOTSK, a government of Russian Poland, on the right bank of the Vistula, having the Prussian provinces of West and East Prussia on the N. and the Polish governments of Lomza on the E. and Warsaw on the S. Its area is 4160 sq. m. Its flat surface, 350 to 500 ft. above the sea-level, rises gently towards the north, where it merges into the Baltic coast-ridge of the Pliocene lake district. Only a few hills reach 600 ft. above the sea, while the broad valley of the Vistula has an elevation of only 150 to 150 ft. In the west (district of Lipno) broad terraces, covered with forests, small lakes and ponds, and very poor in vegetation, descend from the Baltic lake-district towards the plains of Plock; and in the central district of Mlawa extensive marshes fill the upper basin of the Wkr. The Vistula borders the government on the south, almost all the way from Warsaw to Thorn, receiving the Skrwa and Wkr. The Drwęca, or Drewny, flows along the north-west boundary, while several small tributaries of the Narew drain the north-eastern district of Ciechanow. Peat-bogs, used for fuel, and marshes containing bog-iron, fill many depressions in the north, while the more elevated parts of the plains are covered with fertile clays, or a kind of "black earth." Lacustrine post-Glacial deposits fill all the depressions of the thick sheet of boulder clay, with Scandinavian erratic boulders, which extends everywhere over the Tertiary sands and marls—these last containing masses of silicated wood and lignite. Layers of gypsum are found in the hills beside the Vistula.

The estimated population in 1906 was 619,000. About one-third are Jews and 36,000 Germans. The government is divided into seven districts, of which the chief towns are Plock, Ciechanow, Lipno, Mlawa, Przasnysz, Rypin and Sierpc. Agriculture is the chief industry. The principal crops are rye, oats, barley, wheat and potatoes; beetroot is cultivated for sugar, especially on the large estates of the west, where modern machinery is used. Gardening and bee-keeping are extensively practised. In the north the property is much divided, and the landlords, very numerous in Ciechanow, are far from prosperous. The forests have been lavishly cut, but Plock is still one of the best wooded governments (20%) in Poland. Other occupations are provided by shipping on the Vistula, mining and various domestic industries, such as the fabrication of wooden cars, sledges and wheels, and textile industry. The manufactures include flour-mills, saw-mills, sugar factories, distilleries, tanneries, breweries,
agricultural implement works, match factories and ironworks. There is some export trade, especially in the Lipno district; but its development is hampered by lack of communications, the best being those offered by the Vistula. The railway from Warsaw to Danzig, via Ciechanow and Miława, serves the eastern part of the government.

After the second dismemberment of Poland in 1793, what is now the government of Plock became part of Prussia. It fell under Russian dominion after the treaty of Vienna (1815), and, in the division of that time into five provinces, extended over the western part of the present government of Łomża, which was created in 1864 from the Ostrołęka and Pultusk districts of Plock, together with parts of the province of Augustów.

PLOEN, or Ploen, a town of Schleswig, capital of the government of the same name, on the right bank of the Vistula 67 m. by the Vistula W.N.W. of Warsaw. Pop. 27,073. It has a cathedral, dating from the 12th century, but restored in 1903, which contains tombs of Polish dukes and of Kings Ladislaus and Boleslaw (of the 11th and 12th centuries). There is considerable navigation on the Vistula, grain, flour, wool and beetroot being exported, while coal, petroleum, salt and fish are imported.

PLOEN, a town of Germany, in Schleswig-Holstein, beautifully situated between two lakes, the large and the small Ploener-See, 20 m. S. from Kiel by the railway to Eutin and Lübeck. Pop. (1905), 3735. It has a palace built about 1630 and now converted into a cadet school, a gymnasion and a biological station. Tobacco, soap, soda, beer and furniture are manufactured, and there is a considerable trade in timber and grain. The lakes afford good fishing, and are navigated in summer by steamboats. Ploen is mentioned as early as the 11th century as a Wendsch settlement, and a fortified place. It passed in 1559 to Duke John the Younger, founder of the line of Holstein-Sonderburg, on the extinction of which, in 1701, it fell to Denmark, and in 1867, with Schleswig-Holstein, to Prussia. The sons of the emperor William II. received their early education here.

See H. Eggers, Schloss und Stadt Ploen (Kiel, 1877), and J. C. Kinder, Unmittelbarer Nachkomme der Romanen (1872)

PLOENNES, Luise von (1803-1872), German poet, was born at Hanau on the 7th of November 1803, the daughter of the naturalist Philipp Achilles Leisler. In 1824 she married the physician August von Ploennes in Darmstadt. After her death in 1847 she resided for some years in Belgium, then at Jegenheim on the Bergstrasse, but finally at Darmstadt, where she died on the 22nd of January 1872. Between 1844 and 1870 she published several volumes of verse, being particularly happy in ecstatic love songs, patriotic poems and descriptions of scenery. She also wrote two biblical dramas, Maria Magdalena (1879) and David (1873).

As a translator from the English, Luise von Ploennes published two collections of poems, Britanniia (1843) and Englische Lyrik der älteren Jahrhunderte (1863, 3rd ed., 1867).

PLOERMEL, a town of western France, capital of an arrondissement in the department of Morbihan, 36 m. N.N.E. of Vannes by rail. Pop. (1906), town, 2492; commune, 5424. The Renaissance church of St. Armel (16th century) is remarkable for the delicate carving of the North façade and for fine stained glass. It also possesses statues of John II. and John III., dukes of Brittany, which were transferred to the church from their tomb in an ancient Carmelite monastery founded in 1273 and destroyed by the Protestants in 1592 and again at the Revolution. The lower ecclesiastical seminary has an apartment in which the estates of Brittany held several meetings. Remains of ramparts of the 12th century and some houses of the 16th century are also of interest. Farm-implements are manufactured, slate quarries are worked in the neighbourhood, and there is trade in cattle, wool, hemp, cloth, &c. Ploermel (Plou Armel, people of Armel) owes its name to Armel, a hermit who lived in the district in the 6th century.

PLOESCI (Plescei), the capital of the province of Prabova, Rumania; at the southern entrance of a valley among the Carpathian foothills, through which flows the river Prabova; and at the junction of railways to Buzau, Bucharest and Hermannstadt in Transylvania. Pop. (1900), 42,687. As the name Ploesci (plesca, rainy) implies, the climate is moist. The surrounding hills are rich in petroleum, salt and lignite. There are cardboard factories, paper, tanneries and oil mills. Ploesci possesses schools of commerce and of arts and crafts, several banks, and many synagogues and churches, including the Orthodox church of St Mary, built in 1740 by Matthew Bassarab.

PLOMBIÈRES, a town of eastern France, in the départements of Vosges, on a branch line of the Eastern railway, 17 m. S. E. Epinal by road. Pop. (1906), 1882. The town is situated at a height of 1410 ft. in a picturesque valley watered by the Augonne. It is well known for its mineral springs, containing sodium sulphate and silicic acid, varying from 66° to 166° F. Plombières has a handsome modern church and a statue of the Archduke Louis Francis of Austria, in which various festivities, as well as other objects of interest, were figured and described. It was regarded as a model for many subsequent works. In 1677 Plott was elected F.R.S., and he was secretary for the Royal Society from 1682 to 1684. He was appointed in 1683 the first keeper of the Ashmolean Museum at Oxford, and in the same year he became professor of chemistry. In 1686 he wrote The Natural History of Staffordshire. Two years later he became historiographer-royal. He died on the 30th of April 1696.

PLOT, a term originally meaning a space of ground used for a specific purpose, especially as a building site, formerly in frequent usage in the sense of a plan, a surveyed space of ground; hence the literary sense of a plan or design. The word is of doubtful origin; there is a collateral form "plat," which appears in the 16th century, according to the New English Dictionary, under the influence of "plat," flat place, surface (Fr. plat, Late Lat. plattus, probably from Gr. πλατός, broad). Skeat (Etym. Dict.) refers "plot," in the sense of a space of ground, to the O. Eng. plaсe, Mid. Eng. pleĉ, later platĉ, patch. "Plot," in the sense of plan, scheme, would then be identical with "plot," a conspiracy, which may be a shortened form of "complot," a French word, also of doubtful origin, meaning in the 12th century "a compact body of men;" in the 14th century "deceitful."}

PLOTINUS (A.D. 204-270), the most important representative of Neoplatonism, was born of Roman parents at Lykopolos in Egypt. At Alexandria he attended the lectures of Ammonius Saccas (q.v.), the founder of the system, until 242, when he joined the Persian expedition of Gordian III., with the object of studying Persian and Indian philosophy on the spot. After the assassination of Gordian in 244, Plotinus was obliged to take refuge in Antioch, whence he made his way to Rome and set up as a teacher there. He soon attracted a large number of pupils, the most distinguished of whom were Amelius, Eustochius and Porphyry. The emperor Gallienus and his wife Salonia were also his enthusiastic admirers, and favoured his idea of founding a Platonic Commonwealth (Platonicopolis) in Campania (cf. Bishop Berkeley's scheme for the Bermuda islands), but the opposition of Gallienus's counsellors and the death of Plotinus prevented the plan from being carried out. Plotinus's wide popularity was due partly to the lucidity of his teaching, but perhaps even more to his strong personality. Assent developed into veneration; he was considered to be divinely inspired, and generally credited with miraculous powers. In spite of ill-health, he continued to teach and write until his death, which took place on the estate of one of his friends near Minturnae in Campania.
Under Ammonius Plotinus became imbued with the eclectic spirit of the Alexandrian school. Having accepted the Platonic metaphysical doctrine, he applied to it the Neo-Pythagorean principles and the Oriental doctrine of Emanation (q.e.). The results of this introspective mysticism were collected by him in a series of fifty-four (originally forty-eight) treatises, arranged in six "Enneads," which constitute the most authoritative exposition of Neoplatonism. This arrangement is probably due to Porphyry, whose editorial care they were consigned. There was also another ancient edition by Eustochius, but all the existing MSS. are based on Porphyry's edition.

The Enneads of Plotinus were first made known in the Latin translation of Marsilio Ficino (Florence, 1492) which was reprinted at Basel in 1580, with the Greek text of Petrus Pachydeus ("De Plotino," 1561) and a Latin translation by J. Alciatus ("De Platonis Vita," 1585). The first complete edition in modern times, with introduction and bibliography by G. R. S. Mead, appeared in 1883.

On Plotinus generally see article in Suidas; Eunapius vita pollo: and above all the Vita Plotini by his pupil Porphyry. Among modern works, see the treatises on the school of Alexandria by J. F. Simon, i. (1845), and E. Vacherot (1846); A. Richthoffen, Uber Leben und Geistesentwicklung des Plotin (Halle, 1864-1867); T. Whittaker, The Neoplatonists (1891); A. Drews, Plotin und der Unter- gang. Of Creuzer's Leben der Unwissenschaft (1897) and of Caird, Evolution of Religion in the Greek Philosophers (1904), ii. 210-257; Rufus M. Jones, Studies in Mystical Religion (1909). A detailed account of Plotinus's philosophical system and an estimate of its importance will be found in the article NEOPLATONISM, the works above referred to, and the histories of philosophy. For his list of categories, see CATEGORIES; also LOGOS; MYSTICISM; MAGIC.

PLough AND PLoughing. To enable the soil to grow good crops the upper layer must be pulverized and weathered. This operation, performed in the garden by means of the spade, is carried on in the field on a larger scale by the plough, which breaks the soil and by inverting the furrow-slice, exposes fresh surfaces to the disintegrating influence of air, rain and frost. The earliest recorded form of plough is found on the monuments of Egypt, where it is shown simply as a tongue of a wooden wedge tipped with iron and fastened to a handle projecting backwards and a beam, pulled by men or oxen, projecting forwards. Many references to the plough are found in the Old Testament, notably that in 1 Sam. xiii. 20: "All the Israelites went down to the Philistines to sharpen every man his share and his coulter." Descriptions of ploughs found in Hesiod's Works and Days and in Virgil's Georgics i. 160-175, show little development in the implement. The same may be said of the Anglo-Saxon ploughs. These are shown with coulter and share and also with wheels, which had in earlier times been fitted to ploughs by the Greeks and also by the natives of Cis-Alpine Gaul (Pliny, Hist. nat. xii. 15). A many-headed plough, with a number of plows, is often found represented in Anglo-Saxon drawings as subsidiary to the plough. All these types of ploughs are virtually hoes pulled through the ground, breaking but not inverting the soil. In the first half of the 18th century a plough with a short convex mould-board of wood was introduced from the Netherlands into England and, as improved at Rotherham in Yorkshire, became known as the Rotherham plough and enjoyed considerable vogue. At this period ploughs were made almost wholly of wood, the mould-board being cased with plates of iron. Small, of Berwickshire, brought out a plough in which beam and handle were of wrought iron, the mould-board of cast iron. The shares, when made of the same material, required constant sharpening; this necessity was removed by the device, patented by Robert Ransome in 1803, of chilling and so hardening the under-surface of the share; the upper surface, which is soft, then wears away more quickly than the chilled part, whereby a sharp edge is always assured. Nowadays the mould-board is of steel with a chilled and polished surface to give greater wearing qualities and to reduce friction. In the latter part of the 19th century there were numerous improvements but no fundamental alterations in the construction of the ordinary plough.

The working parts of the plough are the coulter, the share, and the mould-board. These are carried on the beam, to which are attached the handles or tillers at the back, and the hake or clevis and draught-chain at the front. The hake is notched at the joint, by moving the draught-chain higher or lower thereon, the plough is caused to go more or less deeply into the ground. It may also be adjusted to suit the height of the horses used. The hake moves laterally on a quadrant and it is thus possible to give the plough a tendency to left or right by moving the hake in the reverse direction. A frame is bolted to the beam and this carries the breast or mould-board to the fore-end of which the share is fitted. The side-cop, a plate of Newcastle Plough.
regulated by the shape and width of the share, working in combination with a proper shaped breast. A "crested" furrow is obtained by the use of a share, the wing of which is set at a higher altitude than the point, but this type of furrow is less generally found than the "rectangular" form obtained by a level-edged share, which leaves a flat bottom.

During the greater part of the 19th century the ideal of ploughing was to preserve the furrow-slice unbroken, and this object was attained by the use of long mould-boards which turned the slices gently and gradually, laying them over against one another at an angle of 45°, thus providing drainage at the bottom of the furrow, and exposing the greatest possible surface to the influences of the weather. Subsequently the digging plough came into vogue; the share being wider, a wider furrow is cut, while the slice is inverted by a short concave mould-board with a sharp turn which at the same time breaks up and pulverizes the soil after the fashion of a spade. Except on extremely heavy soils or on shallow soils with a subsoil which it is unwise to bring upon the surface, the modern tendency is in favour of the digging plough.

A ploughed field is divided into lands or sections of equal width separated by furrows. On light easy draining land 22 yds. is the usual width; on the heaviest lands it may be as little as 5 yds., and in the latter case the furrows will act as drains into which the water flows from the intervening ridges.1

Certain important variations of the ordinary plough demand consideration. The one-way plough lays the furrows alternately to its left and right, so that they all slope in the same direction. This is found advantageous on hill-sides where the work is easier if all the furrows are turned downhill; or from another point of view the furrows may be all laid uphill as to prevent the tendency for the soil to work down the slope.

One-way ploughs also leave the land level and dispense with the wide open furrows between the ridges which are left by the ordinary plough. They are made on different principles. One type comprises two separate ploughs, one right hand and one left, which revolve on the beam, one working, while the other stands vertically above it. In another the mould-board and share are shaped so that they can be swung on a swivel under the beam when the latter is lifted. A third type is made on the "balance" principle, two plough beams with mould-boards being placed at right angles to one another, so that while the right-hand plough is at work the left-hand is elevated above the ground.

Double-furrow or multiple ploughs are a combination of two or more ploughs arranged in echelon so as to plough two or more furrows. The weight of these implements necessitates some provision for turning them at the headlands, and this is supplied either by a bowl wheel, enabling the plough to be turned on one side, or by a pair of wheels cranked so that they can be raised by a lever when the plough is working. The double-furrow plough was known as early as the 17th century, but, till the introduction of the latter device by Ransome in 1873, cannot be said to have been in successful use.

The "sulky" or riding plough is little known in the United Kingdom, but on the larger arable tracts of other countries where quick work is essential and the character of the surface permits, it is in general use. In this form of plough the frame is mounted on three wheels, one of which runs on the land, and the other two in the furrow. The furrow wheels are placed on inclined axles, the plough beam being carried on swing links, operated by a hand lever when it is necessary to raise the plough out of the furrow. The land wheel and the forward furrow wheel are adjustable vertically with reference to the frame, for the purpose of controlling the action of the plough.

In the disk plough, which is built both as a riding and a walking plough, the essential feature is the substitution of a concavo-
convex disk, pivoted on the plough beam, for the mould-board and share of the ordinary plough. This disk is carried on an axle inclined to the line of draught, and also to a vertical plane. As the machine is drawn forward the disk revolves and cuts deeply into the ground, and by reason of its inclination crowds the earth outwards and thus turns a furrow. A scraper is

provided to keep the disk clean and prevent sticking. The controlling levers and draught arrangements are similar to those in the "sulky" plough. The advantage of this plough over the ordinary form is in the absence of sliding friction, and in the mellow and porous condition in which it leaves the bottom of the furrow.

Disk ploughs are unsuitable for heavy sticky soils and for stony land, but may be used with effect on stubbles and on land in a dry hard state. Perhaps their most common use is in ploughing on a large scale in conjunction with steam power.

Steam is employed as motive power when it is necessary to plough large areas in a short time. In the United Kingdom steam ploughing is generally carried on on the double-engine system (introduced by Messrs John Fowler about 1865), in which case two sets of ploughs are arranged on the one-way balance principle, so that while one set is at work the other is carried clear of the ground. In this arrangement, a pair of locomotive engines, each having a plain winding drum fixed underneath the boiler, are placed opposite to each other at the ends of the field to be operated upon; the rope of each of the engines is attached to the plough, or other tillage implement, which is drawn to and fro between them by each working in turn. While the engine in gear is colling in its rope and drawing the plough towards itself, the rope of the other engine is paid out with merely so much drag on it as to keep it from kinking or getting ravelled on the drum.

In the United States and elsewhere engines drawing behind them a number of ploughs, arranged in echelon and taking perhaps 30 ft. at a time, are frequently seen. * On smaller areas petrol motors with one or more ploughs attached are sometimes used. There is a large variety of ploughs which differ in their purpose from the ordinary plough.

The *ploughing* is an implement with a mould-board on each side, terminating in front in a flat point, and used for moulding up potatoes, and for throwing up the ridge on which to plant roots.

The sub-soil plough has the beam and body but not the mould-board of an ordinary plough. Following in the furrow of an ordinary plough it breaks through the sub-soil to a depth of several inches, making it porous and penetrable by plant roots. *Gripping* and draining ploughs are employed in opening the grips and trenches necessary both in surface and underground drainage.

See Davidson and Chase, *Farm Motors and Farm Machinery*; articles in L. H. Bailey's *Cyclopedia of American Agriculture* (New York, 1907) and *Standard Encyclopaedia* (London, 1908), &c.

**PLOVER**, a bird whose name (Fr. pluvier, O. Fr. plovier) doubtless has its origin in the Latin *pluvia*, rain (as witness the German equivalent *Regenpfeifer*, rain-fifer). P. Belon (1555) says that the name Pluvier is bestowed "pour ce qu'on le prend mieux en temps pluvieux qu'en nulle autre saison," which is not in accordance with modern observation, for in rainy weather plovers are wilder and harder to approach than in fine. Others have thought it is from the spotted (as though with rain-drops) upper plumage of two of the commonest species of plovers, to which the name especially belongs—the *Charadrius pluvialis* of Linnaeus, or golden plover, and the *Squatarola helvetica* of recent ornithologists, or grey plover. Both these birds are very similar in general appearance, but the latter is the larger and has an aborted hind-toe on each foot. Its axillary feathers are also black, while in the golden plover they are pure white. The grey plover is a bird of almost circumpolar range, breeding in the far north of America, Asia and eastern Europe, frequenting in spring and autumn the coasts of the more temperate parts of each continent, and generally retiring farther southward in winter—examples not unfrequently reaching Cape Colony, Ceylon, Australia and even Tasmania. *Charadrius pluvialis* has a much narrower distribution, though where it occurs it is much more numerous. Its breeding quarters do not extend farther than from Iceland to western Siberia, but include the more elevated tracts in the British Islands, whence in autumn it spreads itself, often in immense flocks, over the cultivated districts if the fields be sufficiently open. Here some will remain so long as the absence of frost or snow permits, but the majority make for the Mediterranean basin, or the countries beyond, in which to winter; and stragglers find their way to the southern extremity of Africa. Two other cognate forms, *C. virginiensis* and *C. fuscescens*, respectively represent *C. pluvialis* in America and eastern Asia, where they are also known by the same English name. The discrimination of these two birds from one another requires a very acute eye, but both are easily distinguishable from their European ally by their smaller size, their greyish-brown axillary feathers, and their proportionally longer

* But for this really unimportant distinction both birds could doubtless have been kept by ornithologists in the same genus, for they agree in most other structural characters.

* Schlegel (Mus. Pays-Bas, Curatres, p. 53) states that in some examples it seems impossible to determine the form to which they belong; but ordinarily American specimens are rather larger and stouter, and have shorter toes than those from Asia.
PLUCK—PLÜCKER

change of colour, greatly altering their appearance and equally affecting both sexes. In spring or early summer nearly the whole of the lower plumage from the chin to the vent, which during winter has been nearlypure white, becomes deep black. A corresponding alteration is at the same season observable in the underparts.

Though the birds just spoken of are those most emphatically entitled to be called plovers, the group of ringed plovers (see Killdeer and Lapwing), with its allies, has, according to usage, hardly less claim to the name, which is also extended to some other more distant forms that can here have only the briefest notice. Among them one of the most remarkable is the "Zick-zack" (so-called from its cry)—the ἔφοβος of Herodotus (see Humming-Bird), the Pluvianus or Hyas aegyptius of ornithologists, celebrated for the services it is said to render to the crocodile—a small bird whose plumage of delicate lavender and cream colour is relieved by markings of black and white. This belongs to the small family Glareolidae, of which the members best known are the courser, Cursorius, with some eight or ten species inhabiting the deserts of Africa and India, while one, C. gallicus, occasionally strays to Europe and even to England. Allied to them are the curious pratincoles (g.v.), also peculiar to the Old World, while the genera Thinocoris and Altisonis form an outlying group peculiar to South America, that is by some systematists regarded as a separate family Thinocoridae, near which are often placed the singular Sheathbills (g.v.). By most authorities the Stone-curlews (see Curlew), the Oyster-catchers (g.v.) and Turnstones (g.v.) are also regarded as belonging to the family Charadridae, and some would add the Avocets (Recurvirostra) and Stilts (g.v.), among which the Cavalier, or Crab-plover, Dromas ardeola—a form that has been handled about from one family and even order to another—should possibly find its resting-place. It frequents the sandy shores of the Indian Ocean and Bay of Bengal from Natal to Aden, and thence to Ceylon, the Malabar coast, and the Andaman and Nicobar Islands—a white and black bird, mounted on long legs, with webbed feet, and a bill so shaped as to have made some of the best ornithologists lodge it among the Terns (g.v.).

Though the various forms here spoken of as plovers are almost certainly closely allied, they must be regarded as constituting a very indefinite group, for hardly any strong line of demarcation can be drawn between the original family Ploceidae and the United, however, with both of the latter under the name of Limicola, after the method approved by the most recent systematists, the whole form an assemblage the compactness of which no observant ornithologist can hesitate to admit, even if he be uncertain of the exact kinship.

For "plucker's eggs" see Lapwing.

(A. N.)

PLUCK, to pull or pick off something, as flowers from a plant, feathers from a bird. The word in O. Eng. is plückan or pclean and is represented by numerous forms in Teutonic languages, e.g. Ger. pflicken, Dn. plukken, Dan. plække, &c. In sense and form a plausible identification has been found with Ital. placare, to pick grapes, hair, feathers, cf. Fr. tâcher, pick. These Romance words are to be referred to Lat. plácar, hair, which has also given "pereke" or "perig" and "plush." Difficulties of phonology, history and chronology, however, seem to show that this close similarity is only a coincidence. "Pluck," in the sense of courage, was originally a slang word of the prize-ring, and Sir W. Scott (Journal, Sept. 4, 1837) speaks of the "want of that article blackguardly called pluck." In butcher's parlance the "pluck" of an animal is the heart, liver and lungs, probably so called from their being "plucked" or pulled out of the carcass immediately after slaughtering. The heart being the typical seat of courage, the transfusion is obvious. In university colloquial or slang usage "pluck" is to refuse to pass a candidate on examination; the more usual colloquial word is now "to plough." At the granting of degrees at Oxford objection to a candidate could be taken for other reasons than failure at examination, and the person thus challenging drew the attention of the proctor in congregation by "plucking" a piece of black silk attached to the back of his gown.

PLÜCKER, JULIUS (1801-1868), German mathematician and physicist, was born at Elberfeld on the 10th of June 1801. After being educated at Düsseldorf and at the universities of Bonn, Heidelberg and Berlin he went in 1823 to Paris, where he came under the influence of the great school of French geometers, whose founder, Gaspard Monge, was only recently dead. In 1835 he resigned his professorship at Bonn, and after three years he was made professor extraordinary.

The title of his "Habilitationsschrift," Generale analyse appliquée à la géométrie descriptive et à la géométrie analytique, Plücker aimed at furnishing modern geometry with suitable analytical methods so as to give it an independent analytical development. In this effort he was as successful as were his great contemporaries Poncelet and J. Steiner in cultivating geometry in its purely synthetic form. From his lectures and researches at Bonn sprang his first great work, Analytisch-geometrische Entwickelungen (vol. i., 1828; vol. ii., 1831).

In the first volume of this treatise Plücker introduced for the first time the method of abridged notation which has become one of the characteristic features of modern analytical geometry (see Geometry, Analytical). In the first volume of the Entwickelungen he applied the method of abridged notation to the straight line, circle and conic sections, and he subsequently used it with great effect in many of his researches, notably in his theory of cubic curves. In the second volume of the Entwickelungen he clearly established on a firm and independent basis the great principle of duality.

Another subject of importance which Plücker took up in the Entwickelungen was the curious paradox noticed by L. Euler and G. Cramer, that, when a certain number of the intersections of two algebraical curves are given, the rest are thereby determined. Germain had shown that when a number of the intersections of the curves of the (p-t-q)th degree lie on a curve of the pth degree the rest lie on a curve of the qth degree. Plücker finally (Gergonne Ann., 1828-1829) showed how many points must be taken on a curve of any degree so that curves of the same degree (homogeneous) may be drawn through them, and proved that all the points, beyond the given ones, in which these curves intersect the given one are found. He further compared and contrasted, simultaneously with C. G. J. Jacobi, he extended these results to curves and surfaces of unequal order. Allied to the matter just mentioned was Plücker's discovery of the six equations connecting the numbers of singularities in algebraical curves (see Geometry, Analytical), a formula which marks the first place to Crelle's Journal (1834), vol. xii., and gave a further extension and complete account of his theory in his Theorie der algebraischen Curven (1839).

In 1833 Plücker left Bonn for Berlin, where he occupied a post in the Friedrich Wilhelm's Gymnasium. He was then called in 1834 as ordinary professor of mathematics to Halle. While there he published his System der analytischen Geometrie, auf neue Betrachtungsweisen gegründet, und insbesondere eine ausführliche Theorie der Curven dritter Ordnung entwickelt (Berlin, 1835). In this work he introduced the use of linear functions in place of the ordinary co-ordinates; he also made the fullest use of the principles of collineation and reciprocity. His discussion of curves of the third order turned mainly on the nature of their asymptotes, and depended on the fact that the equation to every such curve can be put into the form \(p_{1} p_{2} + p_{2} p_{3} = 0\). He gives a complete enumeration of them, including two hundred and nineteen species. In 1836 Plücker returned to Bonn as ordinary professor of mathematics. Here he published his Theorie der algebraischen Curven, which formed a continuation of the System der analytischen Geometrie. He worked out a method to exhibit the asymptotes and singularities of algebraical curves respectively; and extensive use is made of the method of counting constants which plays so large a part in modern geometrical researches.

From this time Plücker's geometrical researches practically ceased, only to be resumed towards the end of his life. It is true that he published in 1846 his System der Geometrie des
PLUM

Résumé in neuer analythischer Behandlungswise, but this contains merely a more systematic and polished rendering of his earlier results. In 1847 he was made professor of physics at Bonn; and from that time his scientific activity took a new and astonishing turn.

His first physical memoir, published in Poggendorffs Annalen (1847), vol. lxxiii., contains his great discovery of magnetic action. Then followed a long series of researches, mostly published in the *Philosophical Transactions of the Royal Society of London*. It became the standard of the art in which the new science was developed. Plücker himself worked out the theory of complexes of the first and second order, introducing in his investigation of the latter the famous complex surfaces of which he taught those models to be constructed which are now so well known to the student of the higher mathematics. He was engaged in bringing out a large work embodying the results of his researches in line geometry when he died on the 22nd of May 1868. The work was so far advanced that his pupil and assistant Felix Klein was able to complete and publish it (see Geometry, Line). Among the very numerous honours bestowed on Plücker by the various scientific societies of Europe was the Copley medal, awarded to him by the Royal Society two years before his death.

PLUM, the English name both for certain kinds of tree and also generally for their fruit. The plum tree belongs to the genus *Prunus*, natural order Rosaceae. Cultivated plums are supposed to have originated from one or other of the wild species of *P. domestica* (wild plum) or *P. insititia* (bullace). The young shoots of *P. domestica* are glabrous, and the fruit oblong; in *P. insititia* the young shoots are pubescent, and the fruit more or less glabrous. A third species, the common sloe or blackthorn, *P. spinosa*, has stout spines; its flowers expand before the leaves; and its fruit is very rough to the taste, in which particulars it differs from the two preceding. These distinctions, however, are not maintained with much constancy. *P. domestica* is a native of Anatolia and the Caucasus, and is considered to be the only species naturalized in Europe. *P. insititia* is wild in southern Europe, in Armenia, and along the shores of the Caspian. In the Swiss lake-dwellings stones of the *P. insititia* as well as of *P. spinosa* have been found, but not those of *P. domestica*. Nevertheless, the Romans cultivated large numbers of plums. The young shoots of *P. domestica* are sparsely armed with numerous, some of the groups, such as the green-plum, the damsons and the egg plums being very distinct, and sometimes reproducing themselves from seed. The colour of the fruit varies from green to deep purple, the size from that of a small cherry to that of a hen's egg; the form is oblong acute or obsite at both ends, or globular; the stones or kernels vary in like manner; and the flavour, season of ripening and duration are all subject to variation. From its hardihood the plum is one of the most valuable fruit trees, as it is not particular as to soil, and the crop is less likely to be destroyed by spring frosts. Prunes and French plums are merely plums dried in the sun. Their preparation is carried on in a large scale in Bosnia and Servia, as well as in Spain, Portugal and southern France.

Plums are propagated chiefly by budding on stocks of the Mussel, Brussels, St Julian and Fear plums. The damson, wine-sour and other varieties, planted as standards, are generally increased by suckers. For planting against walls, trees which have been trained for two years in the nursery are preferred, but maiden trees can be very successfully introduced, and by liberal treatment may be speedily got to a fruiting state. Any good well-drained loamy soil is suitable for plums, that of medium quality as to lightness being decidedly preferable. Walls with an east or west aspect are generally allowed to them. The horizontal mode of training the fan or half-fan forms are commonly followed; where there is sufficient height probably the fan system is the best. The shoots should be laid in nearly or quite at full length. The fruit is produced on small spurs on branches at least two years old, and the same spurs continue fruitful for several years. Standard plum trees should be planted 25 ft. apart each way, and dwarfs 15 or 20 ft. The latter are now largely grown for market purposes, being more easily supported when carrying heavy crops, fruiting earlier, and the fruit being gathered more easily from the dwarf bush than from standard trees.

The following is a selection of good varieties of plums, with their times of ripening:

**Dessert Plums.**

- Culinary Plums.

**Diseases.**—The Plum is subject to several diseases of fungal origin, which have widespread occurrence. The plum or bladder-plums is due to an ascomycetous fungus, *Esoecus pruni*, the mycelium of which lives parasitically in the tissues of the host plant, passes into the ovary of the flower and causes the characteristic malformation of the fruit which becomes a deformed, sometimes curved or flattened, wrinkled dry structure, with a hollow occupying the place of the stone; the bladder plums are yellow at first, subsequently dingy red. The reproductive spores are borne in sori (areolae) which form a dense layer on the surface, appearing like a fungus horn in July; they are scattered by the wind and propagate the disease. The only remedy is to cut off and burn the diseased branches.

Plum-leaf blister is caused by *Polyergus rubrum*, a psyllomy- ceteous fungus which forms thick fleshy reddish patches on the leaves.
The reproductive spores are formed in embedded flesh-shaped receptacles (perithecia) and scattered after the leaves have fallen. The spots are not often so numerous as to do much harm to the leaves, but when the disease is serious, diseased leaves should be collected and burned. Sloe and birch-cherries should be removed from the neighborhood of gardens as the various disease-producing insects and fungi live also on these species. The branches are sometimes attacked by weevils (Rhyncites) and the larvae of various moths, and saw-flies (chalcidoidea) feed on the leaves, and young branches and leaves are sometimes invaded by Aphides. Leaf-feeding beetles and larvae of moths are best got rid of by shaking the branches and collecting the insects. Slug-worms or saw-fly larvae require treatment by washing with soapsuds, tobacco and lime-water or hellebore solution, and Aphides by syringing from below and removing all surplus young twigs.

**PLUMBAGO** (from Lat. *plumbum*, lead), a name frequently applied to graphite (q.v.), in allusion to its resemblance to lead, whence it is popularly called “black-lead.” It was formerly held in repute in medicine, but is now regarded as having no medicinal properties of any value.

**PLUMBAGO DRAWINGS.** What we should now speak of as pencil drawings were in the 17th and 18th centuries usually known as drawings “in plumbago,” and there is a group of artists whose work is remarkable for their exquisite portraits drawn with finely pointed pieces of graphite and upon vellum. In some books of reference there are given portraits of engravers, and as such Horace Walpole describes several of them. There is no doubt that many of their fine pencil drawings were prepared for the purpose of engraving, but this is not likely to have been the case with all, and we have evidence of certain commissions executed, by Forster, for example, when the portrait was not required for the preparation of a plate. One of the earliest of this group of workers was Simon Van de Pass (1595–1647), and in all probability his pencil drawings were either for reproduction on silver tablets or counters or for engraved plates. A very few pencil portraits by Abraham Booteling, the Dutch engraver, have been preserved, which appear to have been first sketches, from which plates were afterwards engraved. They are of exceedingly delicate workmanship, and one in the present writer’s collection is signed and dated. By David Loggan (1635–1700), a pupil of Van de Pass, there also remain a few portraits, as a rule drawn on vellum and executed with the utmost dexterity and with marvellous minuteness, the lines expressing the intricacies of a lace ruffle or the curls of a wig being perfectly rendered. It is evident that these were not always prepared for engraving, because there is one representing Charles II., set in a beautiful gold snuff box, which was given by the king to the duchess of Portsmouth and now belongs to the duke of Richmond, and a similar portrait of Cromwell in the possession of Lord Verulam, while several others belong to Lord Caledon, and there are no engraved copies corresponding to these. On the other hand, a large drawing by Loggan in the writer’s collection, representing Charles II., is the sketch for the finished engraving and bears a declaration to that effect. An artist who is better known to the general collector is William Faithorne (1616–1691). He was the pupil of Sir Robert Peake, the engraver, but derived much of his skill from the time he spent with Nanteuil, whose involved minute style he closely followed, triumphing over technical difficulties with great success. There are important drawings by him in the Bodleian, at Welbeck Abbey and at Montagu House, and two fine portraits in the British Museum. Thomas Forster (b. 1605–1712) was one of the greatest draughtsmen in this particular form of portraiture. His drawings are both on vellum and on paper, as a rule on vellum. Of the details of his life very little is known. He engraved a few prints, but they are of the utmost rarity. His finest portraits are executed with very great refinement and delicacy, the modelling of the face being quite wonderful. It is in fact one of the marvels of this type of portraiture how such exquisite lines could have been drawn with the roughly cut pieces of graphite which were at the disposal of the artist. In some instances in Forster’s work the lines representing the modelling of the face are so fine as to be quite indistinguishable without the aid of a glass. His work can be studied at Welbeck Abbey, in the Holburne Museum at Bath, in the Victoria and Albert Museum and elsewhere. His earliest plates should be referred to, Robert and George White, father and son. The former (1645–1704) was a pupil of Loggan and a prolific engraver, and most of his drawings, executed on vellum, were for the purpose of engraving. George White, (c. 1684–1732) was taught by his father, and finished some of his father’s plates. His own pencil drawings are of even finer execution than those of Robert White. These three men, Forster and the two Whites, carefully signed their drawings and dated them. By Robert White there are remarkable portraits of Bunyan and Sir Matthew Hale in the British Museum, and his own portrait at Welbeck; and by John and his son there are other drawings in private collections, depicting Sir Godfrey Kneller, Archibald Tennyson and others.

The two Fabers (1662–1721 and 1695–1756) were from Holland, the elder having been born at the Hague, as he himself states on his portrait which was in Vertue’s collection. In addition to the portraits these two men usually added beautiful drawn inscriptions, often found within circles around the portraits and occasionally extending to many lines below them. The son was the greater artist and a famous mezzotinter. The portrait painter Jonathan Richardson (1665–1743) executed many fine drawings in pencil, examples of which can be seen in the British Museum. One of the best of these plumbago draughtsmen was a Scotsman, whose work is of the utmost rarity, David Paton, who worked in 1670. The chief of his drawings belong to the earl of Dysart and at Ham House, and two examples of his portraiture are in the possession of the Dalzell family. Of Paton’s history nothing is known save that he was a Catholic who worked for more than one Dominican house, a devoted adherent of the Stuart cause, and was attached to the court of Charles II., when the king was in Scotland. At that time he drew his remarkable portrait of the king now at Ham House. There are drawings of the same character as his, the work of George Glover (d. 1618) and Thomas Cecil (fl. 1639), but the Museum of extraordinary rarity among them evidently were first studies for engravings. Of Glover’s work the only signed example known is in the writer’s collection. A Swiss artist, Joseph Werner (b. 1637) or Waerner, drew well in pencil, adopting brown paper as the material upon which his best drawings were done, and in some cases heightening them with touches of white paint. The most notable of his portraits is one which is in the collection at Welbeck Abbey.

The earlier miniature painters also drew in this manner, notably Henry Perlee, who prepared designs for jewelers and also for Isaac and Peter Oliver in portraits. By Isaac Oliver there is a fine drawing in Lord Derby’s collection; and one by Peter, a marvellous likeness of Sir Bevil Grenville, in that of the writer. The later men, Hone, Grimaldi, Lang and Downman, also drew finely in plumbago. Other notable exponents of this delightful art were Thomas Worlidge (1700–1766), F. Steele (c. 1714), W. Robins (c. 1730), G. A. Wolfgang (1743–1775), George Vertue, the engraver (1684–1759), Johann Sebastian Bach (1723–1750) and the court painter Charles Banncks (c. 1636–1713). Dampier’s account of the “black lead” has remained in England for some years. (C. W. C.)

**PLUMBING,** properly working in lead (Lat. *plumbum*), now a term embracing all work not only in lead, but also in tin, zinc and other metals, connected with the installation, fitting, repairing, soldering, &c., of pipes for water, gas, drainage, on cisterns, roofs and the like in any building, i.e. the general work of a plumber. (See BUILDING and SERWERAGE.)
PLUMPTRE, EDWARD HAYES (1821–1891), English divine and scholar, was born in London on the 8th of August 1821. A scholar of University College, Oxford, he graduated with a double-first class in 1844, and in the same year he was elected fellow of Brasenose College. He was ordained in 1847, and shortly afterwards appointed chaplain and then professor of pastoral theology, at King's College, London. In 1863 he was given a prebendal stall at St Paul's, and from 1869 to 1874 he was a member of the committee appointed by Convocation to revise the authorized version of the Old Testament. He was Boyle lecturer in 1866–1867 ("Christ and Christendom"), and Grinfield lecturer on the Septuagint at Oxford 1872–1874. After successively holding the livings of Pluckley and Brickley in Kent, he was installed in 1881 as dean of Wells. He died on the 1st of February 1891.

Plumptre was a man of great versatility and attained high reputation as a translator of the plays of Sophocles (1865) and Aeschylus (1868), and of the Divina comedia of Dante (1880). In verse he main achievements were Lazarus (1864), and Master and Scholar (1866). Among his many theological works may be mentioned An Exposition of the Epistles to the Seven Churches of Asia (1877), The Spirits in Prison (1884), "The Book of Proverbs" (which he annotated in the Speaker's Commentary), the "Synoptic Gospels, Acts, and H. Corinthians," in Bishop Ellicott's New Testament Commentary, and Life of Bishop Ken (1888).

PLUNDER, to rob, to pillage, especially in war. The word came into English usage directly from Ger. plundern (derived from a substantive Plunder meaning "household stuff," bed-clothes, clothing, &c.), particularly with reference to the pillaging of the Thirty Years' War. Thomas May (History of the Long Parliament, 1647; quoted in the New English Dictionary) says: "Many Townes and Villages he (Prince Rupert) plundered, which is to say robb'd, for at that time first was the word plunder used in England, being borne in Germany." The New English Dictionary's earliest quotation is from the Swedish Intelligencer (1629).

PLUNKET, OLIVER (1639–1681), Irish Roman Catholic divine, was born at Loughcrue, Co. Meath. He was educated privately and at Rome, whither he went with Father Scarampi in 1645. From 1657 to 1669 he was professor of theology at the College of the Propaganda, enjoyed the friendship of the historian, Pallavicini, and acted as representative of Irish ecclesiastical affairs at Rome. Pope Clement IX. appointed him to the archbishopric of Armagh and primacy of Ireland in July 1669, and in November he was consecrated at Ghent, reaching Ireland in March 1670. Lord Berkeley of Stratton, the viceroy, showed him much kindness and allowed him to establish a Jesuit school in Dublin. Plunket showed amazing diligence in furthering the cause of his Church. He was in very straitened circumstances, the revenue of his see being only 623 in good years. The repressive measures following on the Test Act bore hardly upon him, and in December 1678 he was imprisoned in Dublin Castle for six weeks. Accused of a share in the Irish branch of the "Popish Plot," he was brought to London, and in June 1681 arraigned in the King's Bench, charged with conspiring to bring a French army to Carlingford. He made a good defence, but on the absence of evidence the jury acquitted him of treason, and on the 1st of July he was bailed and released as a prisoner.

PLUNKET, WILLIAM CONYNGHAM PLUNKET, 1ST BARON (1764–1854), Irish lawyer, orator and statesman, was born in the county of Fermanagh in July 1764. He was educated first by his father, a Presbyterian minister of considerable ability and reputation, and in 1779 he became a student of Trinity College, Dublin. He was conspicuous as the acknowledged leader of the Historical Society, the debating club of Trinity College, then full of young men of remarkable promise. Having entered Lincoln's Inn in 1784, Plunket was called to the Irish bar in 1787. He gradually obtained a considerable practice in equity; and was made a king's counsel in 1797.

The Irish Plunkets are distinguished by the spelling of the name from the Plunketts of the families of the barons Dunany (cr. 1439) and the earls of fingal (cr. 1628), though the earlier members of these houses are often given the spelling of Plunket.

In 1795 he entered the Irish parliament as member for Charlemont. He was an anti-Jacobin Whig of the school of Burke, not ungraciously filled with a fervent Irish patriotism. But he took a sincere admiration of the constitutional government of England as established in 1688; he even justified the ascendency it had given to the Established Church, although he thought that the time had arrived for extending toleration to Roman Catholics and dissenters. To transfer it to Ireland as thus modified, and under an independent legislature. was the only reform he sought for his country; he opposed the union because he thought it incompatible with this object.

When Plunket entered the Irish parliament, the Irish Whig party was almost extinct, and Pitt was feeling his way to accomplish the union. In this he was seconded ably by Lord Castlereagh, by the panic caused by a wild insurrection, and by the secession of Grattan from politics. When, however, the measure was brought forward, among the ablest and fiercest of its adherents was Plunket, whose powers as a great orator were now universally recognized. His speeches raised him immediately to the front rank of his party; and when Grattan re-entered the moribund senate he took his seat next to Plunket, thus significantly recognizing the place the latter had attained.

After the union Plunket returned to the practice of his profession, and became at once a leader of the equity bar. In 1803, after Emmet's rebellion, he was selected as one of the Crown lawyers to prosecute the unfortunate enthusiast, and at the trial, in summing up the evidence, delivered a speech of remarkable power, which shows his characteristic dislike of revolutionary outbursts. For this speech he was exposed to much unmerited obloquy, and more especially to the abuse of Cobbett, against whom he brought a successful action for damages. In 1805, in Pitt's second administration, he became solicitor-general, and in 1806 attorney-general for Ireland; and he continued in office when Lord Grenville came into power in 1806. Plunket held a seat in the Imperial parliament during this period, and there made several able speeches in favour of Catholic emancipation, and of continuing the war with France: but when the Grenville cabinet was dissolved he returned once more to professional life.

In 1812, having amassed a considerable fortune, he re-entered parliament as member for Trinity College, and identified himself with the Grenville or anti-Gallican Whigs. He was soon acknowledged as one of the first orators, if not the first, of the House of Commons. His reverence for the English constitution in church and state, his steady advocacy of the war with Napoleon, and his antipathy to anything like democracy made him popular with the Tory party. In 1822 Plunket was once more attorney-general for Ireland, with Lord Wellesley as lord-lieutenant. One of his first official acts was to prosecute for the "bottle riot," an attempt on his part to put down the Orange faction in Ireland. He strenuously opposed the Catholic Association, which about this time, under the guidance of O'Connell, began its agitation. In 1825 he made a powerful speech against it; thus the curious spectacle was seen of the ablest champion of an oppressed church doing all in his power to check its efforts to emancipate itself.

In 1827 Plunket was made master of the rolls in England; but, owing to the professional jealousy of the bar, who regarded an Irishman as an intruder, he resigned in a few days. Soon afterwards he became chief justice of the common pleas in Ireland, and was then created a peer of the United Kingdom. In 1830 he was appointed lord chancellor of Ireland, and held the office, with an interval of a few months only, until 1841, when he finally retired from public life. He died on the 4th of January 1854, and was succeeded by his eldest son, the bishop of Tuam (1792–1866) as 2nd baron. The 4th baron (1828–1897) was bishop of Meath and afterwards archbishop of Dublin and primate of Ireland, and an active ecclesiastical statesman; and his younger brother David Plunket (b. 1838), solicitor-general for Ireland in 1875–1877, and first commissioner of works in the Unionist administration of 1885–1892, was in 1895 created Baron
Rathmore. William Lee Plunkett, 5th baron (b. 1864), was governor of New Zealand from 1904 to 1910.

PLUNKETT, SIR HORACE CURZON (1854– ), Irish politician, third son of Edward, 16th baron Dunsany, was born on the 24th of October 1854, and was educated at Eton and University College, Oxford, of which college he became honorary fellow in 1909. He spent ten years (1879–1889) ranching in Montana, U.S.A., where, together with a substantial fortune, he acquired experience that proved invaluable in the work of agricultural education, improvement and development, to which he devoted himself on his return to Ireland in 1889. At first Plunkett resolved to hold himself aloof from party politics, and he set himself to bring together men of all political views for the advancement of the material prosperity of the Irish people. In 1894 he founded the Irish Agricultural Organization Society, which accomplished a work of incalculable importance by introducing co-operation among Irish farmers, and by proving to the latter the benefits obtainable through more economical and efficient management. But already in 1892 he had felt compelled to abandon his non-political attitude, and he entered parliament as Unionist member for South Dublin (county). Continuing, however, his policy of conciliation, Plunkett suggested in August 1893 that a few prominent persons of various political opinions should meet to discuss and frame a scheme of practical legislation. The outcome of this proposal was the formation of the "Recess Committee" with Plunkett as chairman, which included men of such divergent views as the earl of Mayo, Mr John Redmond, The O'Connor Don and Mr Thomas Sinclair. In July 1896 the Recess Committee issued a report, of which Plunkett was the author, containing valuable accounts of the systems of state aid to agriculture and of technical instruction in foreign countries. This report, and the growing influence of Plunkett, who became a member of the Irish Privy Council in 1897, led to the passing of an act in 1899 which established a department of agriculture and technical instruction in Ireland, of which the chief secretary was to be president ex officio. Plunkett was appointed vice-president, a position which gave him control of the department's operations. It was intended that the vice-president should be responsible for the department in the House of Commons, but at the general election of 1900 Plunkett lost his seat. An extensively signed memorial, supported by the Agricultural Council, prayed that he might not be removed from office, and at the government's request he continued to direct the policy of the department without a seat in parliament. He was created K.C.V.O. in 1903.

On the accession of the Liberal party to power in 1906, Sir Horace Plunkett was requested by Mr Bryce, the new chief secretary, to remain at the head of the department he had created. In the House of Commons, as a Unionist, Plunkett had incurred the hostility of the Nationalist party, whose resentment had been further excited by the bold statement of certain unpalatable truths in his book, Ireland in the New Century (1904), in which he described the economic condition and needs of the country and the nature of the agricultural improvement schemes he had inaugurated. A determined effort was therefore made by the Nationalists to drive from office the man who had probably done more than any one else of his generation to benefit the Irish people; and in moving a resolution in the House of Commons with this object in 1907, a Nationalist declared that his party "took their stand on the principle that the industrial revival could only go hand in hand with the national movement." The government gave way, and in the summer of 1907 Sir Horace Plunkett retired from office. Since the year 1900 a grant of about £20,000 had been made annually by the Department of Agriculture to the Irish Agricultural Organization Society; but the new vice-president, Mr T. W. Russell, who had been himself previously a member of the Unionist administration, withdrew in 1907 this modest support of an association with which Sir Horace Plunkett was so closely identified, and of which he continued to be the guiding spirit. In addition to the publication mentioned, Sir Horace Plunkett published Noblesse Oblige: An Irish Rendering (1908), and Rural Life Problems of the United States (1910).

PLURALISM (Lat. plus, plures, many, several), a term used generally in the sense of plurality (see below), and in philosophy for any theory which postulates more than one absolutely distinct being or principle of being, opposed to monism. Pluralistic systems are based on the difficulty of reconciling with the monistic principle the principles of variety and freewill. The chief difficulty which besets any such view is that if the elements are absolutely independent, the cosmos disappears and we are left with chaos: if, on the other hand, there is interrelation (as in Leucie's system), the elements are not ultimate in any intrinsically independent sense.

PLURAlITY (O. Fr. pluralité, Late Lat. pluralitas, plural number), in a general sense, a word denoting more than one; applied particularly to the holding of two or more offices by the same person (called then a pluralist). In ecclesiastical law, plurality or the holding of more than one benefice or preferment was always disallowed, and is now prohibited in England by the Pluralities Act 1836, as amended by the Pluralities Act 1859 and the Pluralities Acts Amendment Act 1859. By the latter act a provision was made that two benefices might be held together, by dispensation of the archbishop on the bishop, if the churches be within four miles of each other, and if the annual value of one does not exceed £2oo (see Benefice). It was formerly a practice to evade enactments against plurality by means of commendams, i.e. by committing or commending a benefice to a holder of other benefices until an incumbent should be provided for it. Commendams were abolished by the Ecclesiastical Commissioners Act 1836 (6 & 7 Will. IV. c. 77, § 18). See also Col v. Bishop of Coventry, 1613, Hob. 140 seq., where much learning on the subject will be found.

In elections, particularly where there are three or more candidates, and no one candidate receives an absolute majority of votes, the excess of votes polled by the first candidate over the second is often termed plurality, especially in the United States.

PLUSH (Fr. peluche), a textile fabric having a cut nap or pile the same as fustian or velvet. Originally the pile of plush consisted of mohair or worsted yarn, but now silk by itself or with a cotton backing is used for plush, the distinction from velvet being found in the longer and less dense pile of plush. The material is largely used for upholstery and furniture purposes, and is also much employed in dress and millinery.

PLUTARCH (Gr. Ploutarchos) (c. a.d. 46–120). Greek biographer and miscellaneous writer, was born at Chaeronea in Boeotia. After having been trained in philosophy at Athens he travelled and stayed some time at Rome, where he lectured on philosophy and undertook the education of Hadrian.1 Trajan bestowed consular rank upon him, and Hadrian appointed him procurator of Greece. He died in his native town, where he was archon and priest of the Pythian Apollo. In the Consolation to his Wife on the loss of his young daughter, he tells us (§ 2) that they had brought up four sons besides, one of whom was called by the name of Plutarch's brother, Lamprias. We learn incidentally from this treatise (§ 10) that the writer had been initiated in the secret mysteries of Dionysus, which held that the soul was imperishable. He seems to have been an independent thinker rather than an adherent of any particular school of philosophy. His vast acquaintance with the literature of his time is everywhere apparent.

The celebrity of Plutarch, or at least his popularity, is mainly founded on his forty-six Parallel Lives. He is thought to have written this work in his later years after his return to Chaeronea. His knowledge of Latin and of Roman history he must have partly derived from some years' residence in Rome and other

1 There seems no authority for this statement earlier than the middle ages.
on the Right Way of Hearing (ευγυμνος ακοινος) advocates the listening in silence to what is said, but also provides a practical reply to statements which may yet receive some addition or modification from the speaker (§ 4). The hearer is warned not to give too much weight to the style, manner or tone of the speaker (§ 7), not even if the speaker is the scroll's author, too popular to be displeased; Pindar does not 'Apologize, if he finds his faults reproofed by the lecturer (§ 16). He concludes with the maxim, 'to hear rightly is the beginning of living rightly,' which sums up what he has in view throughout his own profession as a lecturer.

How a Flatterer may be Distinguished from a Friend is rather long and uninteresting treatise. The ancient writers are full of examples to support their views against flatterers, who do not seem to exercise much influence in modern society. The really dangerous flatterer (§ 4) is not the parasite, but the pretender to a disinterested friendship—one who affects similar tastes, and so insinuates himself into your confidence. Your flatterer is better than a blunt dissembler, but flatter by as, when he occupies a good seat at a public meeting for the express purpose of resigning it to his patron (§ 15). A true friend, on the contrary, speaks freely on proper occasions. On each part of the subject, the author allows of no opinion. The citations, which are fairly numerous, are mostly from Homer.

How one may be Conscious of Progress in Goodness is addressed to Sosius Senecio, who was consul in the last years of Nerva, and more than once (99, 102, 107) under Trajan. If, says Plutarch, a man could become suddenly wise instead of foolish, he could not be ignorant neither of the changes in his condition nor of the changes in his mental processes. Gradual advance in virtue is like steady sailing on a wide sea, and can only be measured by the time taken and the forces applied (§ 3). Zeno tested advance by dreams (§ 12); if no excess is taken, he says very wisely, the impression left on the soul is the mind had been purged by reason and philosophy. When we love the truly good, and adapt ourselves to their looks and manners, and this even with the loss of worldly prosperity, then we are really making progress in virtue.

The voluminous and varied writings of Plutarch exclusive of the Lives are known under the common term Opera moralia. These consist of above sixty essays, some of them long and many of them rather difficult, some too of very doubtful genuineness. Their literary value is greatly enhanced by the large number of citations from lost Greek poems, especially verses of the dramatists, among whom Euripides holds by far the first place. The principal treatises in the Opera moralia are the following:

On the Education of Children (regarded as spurious by some) recommends (1) good birth, and sobriety in the father; (2) good disposition, and good training; (3) the head of a mother ought to nurse her own offspring, on the analogy of all animals; (4) the paedagogus must be honest and trustworthy; (5) all the advantages of life and fortune must be held secondary to education; (6) mere mob-oratory is no part of a good education; (7) philosophy should form the principal study, but not to the exclusion of the other sciences; (8) gymnastics are to be practised; (9) the parts of the body are to be treated with equal care. (10) In learning is to be avoided, and plenty of relaxation is to be allowed; (11) self-control, and not least over the tongue, is to be learned; (12) the grown-up youth should be under the eye and advice of his father, and all bad company avoided; flatterers included; (13) fathers should not be too harsh and exacting, but remember that they were themselves once young; (14) marriage is recommended, and without disparity of rank; (15) above all, a father should be an example of virtue to a son.

How a Young Man ought to Hear Poetry is largely made up of quotations from Homer and the tragic poets. The points of the essential morality of poetry as combining the true with the false, the praises of virtue and heroism, the withholding of blame well deserved and unworthy of gods, εις θεον τη δημοτικα φαινων, ου ειναι θεον (§ 21).

It is quite evident that the original order of the books has been altered in the series of Lives as we now have them.

1 Demosth. § 2. Plutarch's orthography of Roman words and names is important bearing on the question of pronunciation. A curious example (De fortun. Rom. § 5) is Virtutis et honoris, written Βεροτυτις et ονωρις. The Votiæ are οκονομικαν, ibid.

2 But it is evident that the original order of the books has been altered in the series of Lives as we now have them.
functions to act of themselves (§ 3). Another wise saying is that
idleness does not conduce to health (ὁδοθείς ἄθλητε τῷ μάκρῳ γευσίν
τεκτόνα, 15), and yet another that a man should learn by
experience his body's capabilities without always consulting a
physician (§ 26).

Advice to the Married is addressed to his newly wedded friends
Periander and Euthydemus. It is a plain, practical, and
consists chiefly of short maxims and anecdotes, with but few
quotations from the poets.

The Banquet of the Seven Wise Men (considered spurious by some)
is a dialogue of the same nature as the Symposia, containing
conversations that have come down to us. It is supposed to be
given by Periander in the public banquet-room (εἰδισμός) near
the house of Euthydemus, after the occasion of a sacrifice
to Aphrodite. The whole is thought by the principal guests being
also present. Like Plato's Symposium this treatise takes the form of a
narrative of what was said by the host to his guests in one of the
houses of the Charon. The dinner was simple, and in contrast with the
usual splendour of "tyrants" (§ 4). The conversation turns on vari-
nets of the size and distance from earth of the sun and moon (§ 10),
and from the contrast between ancient lunar theories and modern
mathematics. The cause of the moon's light, its peculiar colour,
the connexion of its phases, and the visibility of its eclipse are discussed
in this dialogue, the beginning and end of which are alike
abrupt. Some of the "guesses at truth" are very near the
truth, and it is suggested (§§ 21–22) that the moon, like the
earth, contains salt water, that it does not descend, and the appearance of the
"face" is nothing but the shadows of streams or of deep ravines.

On the Life of Vespasian (§ 1) is a dialogue proposed by
Plutarch (εἰδισμός) on a supposed lecture by Epicurus. An objection is raised to
the ordinary dealings of providence, that long-delayed punishment
encourages the sinner and disappoints the injured, the reply to which
(§ 5) more than satisfies the requirements of justice and
precipitate resentment, and that he is willing to give time for
reparation (§ 6). Moreover, he may wish to await the birth of
good progeny from erring parents (§ 7). Another fine reflection is
that "the gods are in their own country, and the death of a
man and thus the longer the life the greater is the share of misery (§ 9). The
treatise concludes with a long story about one Theophrastus, and
the treatment which he saw, during a trance, of the souls in the
other world.

On Fate (probably spurious) discusses the law of chance as against
the overruling of providence. This treatise ends abruptly; the point of
the whole is, that the will of the gods is all-powerful. The treatise
and its due influence in mundane affairs (§ 9), and that all things are constituted
for the best.

On the Gods of Secular Events is a long essay, and, like so many of the rest,
in the form of a dialogue. The essay contains an argument to
the conclusion that Jupiter and his two assistants, and his
supernatural visions in the cave of Trophonius, are related
at length in the Platonic style (§ 22), and the true nature of the
deities is revealed to him. They are the souls of the just, who still remain in
regard to mankind after their earthly existence, making
their efforts after virtue (§ 28). The dialogue ends with an interesting
narrative of the concealment of Pelopidas and some of the Thucian
conspirators against the Spartans in the temple of Charon.

On Exile is a fine essay, rendered more interesting by its
quotations from its numerous quotations from the poets, including several from the
Phaedrus. Man is not a plant that grows only in one soil; he
belongs to heaven rather than to earth, and wherever he goes there
are the same sun, the same seasons, the same providence, the
same laws of virtue and justice (§ 5). There is no discredit in being driven
from one's country; Apollo himself was banished from heaven and
compelled to live elsewhere. (§ 23)

The Consolation to his Wife, on the early death of their only
daughter Timoxena (§ 7), is a feeling and sensitive exhortation to
mourn as if with a father's grief.

Nine books of Symposiaca (ἐπιφανής) are an extended and
giving inquiries (Επιφανής) on a vast number of subjects. The general
process of treatment of these, in which great literary knowledge is
displayed, is analogous to the treatise of Galen.

The Amorous Man is a dialogue of some length, describing a con-
versation on the nature of love held at Helicon, pending a
quinquennial feast of the Thespians, who specially worshipped that deity
about A.D. 166. The treatment is extremely pleasant, and the
dialogue is printed with the other works of this series.
In § 24 mention is made of the emperor Vespasian. It is followed by
are short treatise entitled Love Stories, giving a few narratives of
romantic adventures of lovers.

Great length and learning work bears the rather obscure title
Romances, some of which are mere moral stories, and others, mainly
Romancen and Gracce, in two parts. In the former, which contains
one hundred and thirteen headings, the inquiry (some matter
political, religious or antiquarian) always commences with ἐπιφανής
(usually followed by ἐπιφανής), with alternative explanations. In
the Greek Questions the form of inquiry is more often ἐπιφανής, not
followed by ἐπιφανής. This treatise is of great interest and
importance to classical archaeology, though the inquiries are
occasionally difficult, and the answers are clearly wrong.

Parallels (spurious) are a series of similar incidents which occurred
respectively to Greeks and Romans, the Greek standing first and
the Roman counterpart following. Many of the character is
mythological, though Plutarch has been careful to remove all
moralising. (§ 59)

On the Fortune of the Romans discusses whether, on the whole,
good luck or valour had more influence in giving the Romans
the supremacy. This is followed by two discourses on the same
subject, in which Plutarch seems to indicate that fortune, or
e. What happened to the Athenians more for War or for Wisdom?
The conclusion is (§ 7) that it was not so much by the fame of their
poets as by the deeds of their heroes that Athens became renowned.
PLUTARCHE

Water

Plotin, Athens

Roman 667-668; Athens a 350-430), On Whether is two Plutarch salt 12; this is a good essay, much in the style of Aristotle's History of Animals.

The two most important contributions to Aristotleian literature since the time of Alexander of Aphrodisias. His example was followed by Syrias and others of the school. This critical spirit reached its greatest height in Proclus, the ablest exponent of this latter-day syncretism. Plutarch was versed in all the theurgic traditions of the school, and believed in the possibility of attaining to communion with the Deity by the medium of the theurgic rites. Unlike the Alexandrists and the early Renaissance writers, he maintained that the soul which is bound up in the body by the ties of imagination and sensation does not perish with the corporeal medium of the sensuous body. In psychology, while believing that Reason is the basis and foundation of all consciousness, he interposed between sensation and thought the faculty of Imagination, which, as distinct from both, is the activity of the soul under the stimulus of unceasing sensation. In other words, it provides the raw material for the operation of Reason. Reason is present in children as an inoperative potentiality, in adults as working upon the data of sensation and imagination, and, in its pure activity, it is the transcendental or pure intelligence of the soul.

See Marinus, Vita Procli, 6, 12; Zeller's History of Greek Philosophy, with Aides, etc., trans. J. H. Tufts, p. 252.

PLUTO (Πλούτος), in Greek mythology, the god of the lower world. His oldest name was Hadès, Aides or Aldonex, "the Unseen." He was the son of Cronus and Rhea, brother of Zeus and Poseidon. Having deposed Cronus, the brothers cast lots for the kingdoms of the heavens, the earth, and the infernal regions. The last, afterwards known as Hades from their ruler, fell to Pluto. Here he ruled with his wife Persephone over the other powers below and over the dead. He is stern and pitiless, deaf to prayer or flattery, and sacrifice to him is of no avail; only the music of Orpheus prevailed upon him to restore his wife Eurydice. His helmet, given him by the Cyclopes after their release from Tartarus, rendered him invincible (like the breast-plate of a German mythology). He is hated and feared by gods and men, who, afraid to utter his name, both in daily life and on solemn occasions make use of euphemistic epithets: Polydeuces (the receiver of many), Clymenus (the Illustrious), Eubulus (the giver of good counsel). Later, owing to his connexion with Persephone and under the influence of the Eleusinian mysteries, the idea of his character underwent a radical change. Instead of the life-hating god of death, he became a beneficent god, the bestower of grain, minerals, and other blessings produced in the depths of the earth. In this aspect he was called Pluto, the "giver of wealth" (a name that first occurs in the Attic poets of the 5th century), and at most of the centres of his cult he was so worshipped; at Elis alone he was Hades, the god of the dead. The plants sacred to him were the cypresses and narcissus; black victims were sacrificed to him, not white, like those offered to the other gods. In art he was represented like Zeus and Poseidon; his features are gloomy, his hair falls over his forehead; his attributes are a sceptre and Cerberus; he carries the key of the world below (cf. the epithet πολιτης, "keeper of the gate"), and is frequently in company with Persephone. He is sometimes represented as an agricultural god, carrying a cornu copiae and a two-pronged fork. Amongst the Romans Hades was usually called Dis pater (the "wealthy father") and Orcus, although the name Pluto is often used. Orcus, however, was rather the actual slayer, the angel of death, while Father Dis was the ruler of the dead. The Etruscan god of death was represented as a savage old man with wings and a hammer; at the gladiatorial games of Rome a man masked after this fashion removed the corpses from the arena. In Romanesque folklore Orcus (possibly English "ogre," q.v.) has passed into a forest-elf, a black, hairy, man-eating monster, upon whose house children lost in the woods are apt to stumble, and who sometimes shows himself kindly and helpful.

The "house of Hadès" was a dreadful abode deep down in the earth, and the god was invoked by rapping on the ground. According
To another view, the realm of Hades was beyond the ocean in the far west, which to the Greek was always the region of darkness and death, as the east of light and life. This is the view of Hades preserved in the *Odyssey*. Before this region, we find in another passage of the *Odyssey* (iv. 561 seq.) a picture of Elysium, a happy land at the ends of the earth, where rain and snow fall not, but the cool west wind blows and men live at ease. After Hades this happy land, the feeding home of the gods, and after that which is known as the Isles of the Blest (q.v.).

But in the oldest Greek mythology the "house of Hades" was simply the home of the dead, good and bad alike, who led a dim and shadowy reflection of life on earth.

See article "Hades" in Roscher’s *Lexikon der Mythologie*; Pellegrino Robert, *Griechische Mythologie* (1854); J. Farnell, *Culls of the Greek States*, vol. I, 1887; and *J. E. Harrison, Classical Review* (Feb. 1908), Hades is the under-world sun.

**Plutocracy.** (Gr. πολιτικα, from πολίς, wealth, and κράτος, power), government or power exercised by the possessors of wealth, power obtained by the mere possession of riches; hence a body or ruling class whose influence is due only to their money.

**Pluto Monkey,** a *guenon*, *Cercopithecus* (Mono) leucampyx, nearly allied to the *Mona* (q.v.), which takes its name from the black fur of the under-parts, passing into blackish grey on the head. The violet-coloured face, which has no beard, is fringed by large bushy whiskers and surmounted by a white band above the brows. The range of the species extends from the Congo and Angola to Nyasaland. (See Primate.)

**Plutus,** in Greek mythology, son of Iasion and Demeter, the personification of wealth (πολύδοσ). According to Aristophanes, he was blinded by Zeus because he distributed his gifts without regard to merit. At Thessalos there was a statue of Fortune holding the child Plutus in her arms; at Athens he was similarly represented in the arms of Peace; at Thebes he was represented standing beside Athena the Worker. Elsewhere he is represented as a boy with a cornus copae. He is the subject of one of the extant comedies of Aristophanes, the *Plutus*.

**Plymouth, Earls Of,** a title first borne by Charles (1657–1680), an illegitimate son of the English king Charles II. by Catharine Pegge, who was created earl in 1675. The title became extinct on his death in October 1680. In 1688 Thomas Windsor Hickman-Windsor, 7th Baron Windsor de Stannell (c. 1627–1687), who had fought for Charles I. at Naseby, was created earl of Plymouth. His father was Dixie Hickman of Kew, Surrey, and his mother, Elizabeth, was a sister of Thomas Windsor, 6th Baron Windsor de Stannell (1596–1641); having inherited the estates of his uncle he took the additional name of Stannell.

The title of the barony of Windsor de Stannell was terminated in his favour and he became the 7th baron. From 1661–1683 he was nominally governor of Jamaica. His grandson Other (1679–1725) was the 2nd earl, and the earldom became extinct when Henry, the 8th earl, died in December 1843. Called again out of abeyance, the barony of Windsor came in 1855 to Harriet, a daughter of Other Archer, the 6th earl (1780–1833), and the wife of Robert Henry Clive (1780–1854), a younger son of Edward Clive, 1st earl of Powis. She was succeeded in 1860 by her grandson, Robert George Windsor-Clive, who became the 14th Baron Windsor. After serving as paymaster-general in 1861–1862 and first commissioner of the Royal Naval Dockyard from 1902–1905, Lord Windsor was created earl of Plymouth in 1905.

The Samoan Islanders unite the two conceptions: the entrance to their spirit-land is at the westernmost point of the westernmost island, where the ghosts descend by two holes into the under-world. Long ago the inhabitants of the Fatu Hiva Channel believed that the entrance to the dwelling-houses of the dead was on the island of Hagai, and the story had that a shipwrecked sailor, who met with a strange death, and who was afterwards awakened, discovered that the crew and family of his vessel were gathered together in the same manner as the gods in the underworld. The entrance was marked by a hole called 'the Eye', which had a bushy top, and the head of the shipwrecked sailor was stuck in it. It was believed that the ghosts were hidden in the depths of the earth, and that they were always on the watch, ready to meet their friends on earth.

**Plymouth,** a municipal county (1888, extended 1896) and parliamentary borough and seaport of Devonshire, England, 231 m. W.S.W. of London. Pop. (1910), 126,266. It lies at the head of Plymouth Sound, stretching westward from the river Plym towards the mouth of the Tamar, from which it is separated by the township of East Stonehouse and the borough of Devonport, the two later constituting with it the "Three Towns." The prince of Wales is lord high steward of the borough, which is divided into 24 wards, under a mayor, 14 aldermen and 42 councillors. The parliamentary borough, returning two members, is not coextensive with the municipal borough, part of the latter being in the Tavistock (county) division of Devon.

The water frontage of the Three Towns consists of Plymouth Sound, with its inlets, in order from east to west, the Catwater, Sutton Pool, Mill Bay, Stonehouse Pool and the Hamoaze. The Catwater and Hamoaze are flanked on the east and west respectively by high ground, on which are built forts that command the harbour and its approaches. On the western side of the entrance to Catwater is the Citadel, founded in the reign of Henry VIII. and rebuilt by Charles II. The adjacent Hoe extends along the northern edge of the Sound, and from it can be had a splendid view, embracing the rugged Staddon Heights on the east, and the wooded slopes of Mount Edgcumbe on the west. To the north is seen the town of Plymouth rising up to the hills known as Mannanhead. On the site of an old Trinity House obelisk landmark is Smeaton’s lighthouse tower, removed from its original position on the Eddystone Reef in 1884. It is now used as a wind-recording station in connexion with the adjoining Meteorological Observatory. On the Hoe there stands the striking Drake statue by Sir Edgar Boehm, and the Armada Memorial, while at the north-east end is an obelisk monument to the memory of troops engaged in the South African War. A municipal bowling-green recalls a probable early use of the Hoe. Adjacent to the Citadel, at its south-west angle, is the Marine Biological Station, and, further west, projects the Promenade Pier. In the Sound is Drake’s (formerly St Nicholas’s) Island, now strongly fortified, at one time the property of the corporation, and serving in Stuart times as a place of imprisonment of certain Plymouth Baptist ministers. Few evidences, however, of the antiquity of the town remain. Below, and to the north-east of the Citadel, is the Barbican with its "Mayflower" commemoration stone, a large fish-buying trade being done on the adjacent quay, near which is the Custom House. From the Barbican winding streets lead past the old Guildhall (1800) which contains the corporation library, and its additional quarters in the new museum, opposite the technical and art schools, situated in the most northern part of the town. At a short distance west stands the new Guildhall, with the enlarged post office, central police station, law courts and municipal buildings in close proximity. Opened in 1874, the Guildhall is built in a bold, rather exotic, Early Pointed French style. The tower at the south-west end is 150 ft. high, and the building is ornamented with a series of coloured windows relating to events in the history of Plymouth or commemorating men and families connected with the town. The large hall contains a fine organ. In the mayor’s parlour is a contemporary portrait of Sir Francis Drake and some interesting relics of the town.

Near the eastern entrance to Guildhall Square is St Andrews, the mother church of Plymouth, erected on the site of a chapel dedicated to the Virgin. The church is typical of the Devonshire Perpendicular style of 1480–1520, but, though large, presents few features of artistic or archaeological interest. It underwent complete restoration in 1874. The burying-ground on the north side has been levelled, and on it erected a stone monument. The church, furnished with one of the finest organs in the west of England, contains the tombs of a son of Admiral Vernon, of Sir John Shelton (a former governor of the Citadel), and of Capt. Mathews of the hospital, as well as portraits of the bodies of Froshirer and Drake. Here Katherine of Aragon returned thanks for a safe voyage from Spain to Plymouth. In 1626 a second parish was formed with Charles
PLYMOUTH

Church (1658) at its head, the last-named being popularly known as New Church, in contradistinction to St Andrews or "Old Church." The New Church is an interesting specimen of Stuart "debased" Gothic architecture. South of Andrews church is the site of a Franciscan Friary with some early 15th-century remains. Near the church are a few old houses scattered along the crooked little streets going down to the water. These houses date from Elizabethan times, but are not of any unusual interest. The Citadel (now used as army headquarters and barracks) is a fine specimen of 17th-century military architecture. It is an irregular bastioned pentagon in trace. It possesses a fine florid classical gateway. In the centre stands a dignified Jacobean house, once the residence of the governor of Plymouth.

Plymouth is the seat of a Roman Catholic bishopric founded in 1851, the cathedral, in Wyndham Street, being completed in 1858 through the efforts of Bishop Vaughan, who was the second occupant of the see (until 1902). The building is in the Early English style, and adjoining are the bishop's house and the convent of Notre Dame. In the immediate vicinity is the only Presbyterian church in the Three Towns. Noteworthy among the many Nonconformist places of worship are the Baptist chapel (George Street), with its tablet recording the imprisonment of ministers on Drake's Island; Sherwell (Congregational) on the Tavistock Road, the most ornate in its style of architecture; the Wesleyan Methodist chapel in the main thoroughfare of the residential suburb of Mutley, unique among Methodist edifices in the town in respect of its fine spire. All the principal religious bodies have places for worship or for assembly in the town, and the borough has given, in popular speech, the name of "Plymouth Brethren" to one body.

In addition to the Plymouth College (for boys), there are several educational institutions administered by the borough council, comprising a science, art and technical school, a mixed secondary school replacing the corporation grammar school of Elizabethan foundation, and intermediate day and evening school and numerous primary departments. The philanthropic institutions include the enlarged South Devon and East Cornwall hospital, eye infirmary, homeopathic hospital, blind institution and female orphan asylum.

The public recreation grounds, other than the Hoe, are few and small: Hartley Reservoir Grounds at the northern extremity of the town commands extensive moorland views; the Freedom Park, by its plan, unfinished monument, recalls the siege of Plymouth by the Royalists in 1646, and the Beaumont Park contains the temporary home of the nucleus for a museum and art gallery. The Victoria Park, reclaimed from a part of Stonehouse Creek, is under the joint administration of Plymouth, Stonehouse and Devonport.

The township of East Stonehouse, having Plymouth on the east, is separated from Devonport on the west by the Stonehouse Pool Creek, which is crossed by a toll-bridge and thoroughfare known locally as the "Half-penny Gate Bridge." A manor of the Mount Edgcumbe family, East Stonehouse, is an urban district, in the administrative county of Devon, with a council of 15 members, but is united for parliamentary purposes with Devonport, with which it returns two members. Within the boundaries of Stonehouse are the Royal Naval Hospital (1762), the Royal Marine Barracks (1793) in Durnford Street, and the Royal William Victualling Yard (1823). There are within the boundaries a portion of the last-named having frontage on the Hamsa, which separates the Devon from the Cornish portion of the Stonehouse manor.

The Stanehu(e) of Domesday Book ultimately passed into the hands of the Valletorts, whose hamlet of West Stonehouse stood on the Cornish side of the Tamar, for (to quote Carew's Survey) "certain old ruins yet remaining confirm the neighbours' report that near the water's side, there stood once a town called West stone house until the French (1550?) by fire and sword overthrew it."

St George's (1798) is the oldest of the three parishes of Stonehouse, and on the site of the present church stood the chapel of St George, in which, during the years 1681-1682, worshipped, in addition to the English congregation, one composed, as at Plymouth, of Huguenots who fled from France at the Revocation of the Edict of Nantes.

Facing the Sound are Stone Hall and the Winter Villa. The latter, occupied by the lords of the manor before the building of Mount Edgcumbe House, was originally a castellated building, and the latter was built primarily as an alternative residence for a countess of Mount Edgcumbe. A link with the past is the Mill Bridge Causeway, over what was the "Dead Lake," now a road, which, at the head of Stonehouse Creek, is the second approach to the Stoke Damerel portion of Devonport. Built in 1525, it possesses a toll-gate house at which payment from vehicles is still demanded.

In addition to the Victualling Yard, with its naval ordnance department, repairing shops and armoury, the Barracks, accommodating some 1500 men, and the Naval Hospital of 24 acres, abutting on the Creek, there are within the boundaries a great coal-mine, parts of the which are worked by the South Devon Company, seating over 2000 persons, the Devonport Corporation Electricity Works, a clothing factory and part of the Great Western Railway Docks. The stationary character of the township—which from its situation is incapable of expansion—is seen from the statistics of population:(1881), 15,041; (1901), 15,108; (1910), 15,111.

The "Port of Plymouth" in 1327 embraced Plympton, Modbury and Newton Ferrers, and received a customs grant...
from Richard II. In 1435 sixty-five cargoes were imported, and in the reign of Elizabeth it rose to be the foremost port in England. The 18th century saw a great development of trade with Virginia and the West Indies, resulting in the establishment of a sugar-refining industry that was maintained until a recent date.

In 1749 the "town's water" was carried to the Barbican to supply shipping. The port of Plymouth, as at present constituted, embraces the waters of Plymouth Sound and the Hamoaze, including all bays, creeks, lakes, pools, ponds and rivers as far as the tide flows within or to the northward of a straight line drawn across the entrance of Plymouth Sound from Penlee Point on the west to the Shagstone on the east. The chief water area within the limits of the port is the Sound with its inlets, the Catwater (200 acres), Sutton Pool, Mill Bay, Stonehouse Pool and the Hamoaze. The Sound itself covers an area of 4500 acres and is sheltered from south-west gales by the breakwater completed in 1841 at a cost of £1 million sterling. It lies 2½ m. south of the Hoe, and is nearly a mile long, 360 ft. wide at the base and 45 ft. at the top. Its cants bend inwards at angles of 120°; at the western end is a lighthouse and at the eastern extremity is a pyramidal beacon with a cage capable of accommodating several men.

The industrial development of Plymouth has been largely due to the Great Western and the London & South-Western railways. The former company has a main line entering the west through Devonport and going east to Exeter, having Dartmoor on the west; the latter company has a terminal station in the eastern quarter of the town, and its route to Exeter is by way of the Tamar valley, and the western and northern moorland districts.

The industries of Plymouth include ship manufacture, preparation of artificial manure and sulphuric acid and paper making. The water supply, inaugurated by Drake in 1590, and drawn from the Dartmoor watershed, is the most important municipal undertaking. The service of electricity both for lighting and tramway traction is in the hands of the town, but the gasworks belong to a private company.

Plymouth, the Sutton of Domesday, was afterwards divided into the town of Sutton Prior, the hamlet of Sutton Valletort and the tithe of Sutton Ralph, the greater part belonging to the priory of Plympton. The market, established about 1253, became in 1311 town property, with the mayor as clerk of the market. In 1291 the town first returned members to parliament. In the 14th century it was frequently the port of embarkation and of disembarkation in connexion with expeditions to France, and suffered considerably at the hands of the French. In 1442 the inhabitants petitioned for a charter, which, after an opposition from the priory, was granted by Henry VI. in 1439. In the discovery of the New World it played a part of great importance. Cockeram, a native of the town, sailed with John Cabot in 1497. Sir John Hawkins and his father William were also natives, the former being a port admiral and (in 1571) M.P. From Plymouth in 1577 Drake set out on his voyage round the world; in 1581 he became mayor and represented the borough in parliament during 1592-1593. Sir Humphrey Gilbert (M.P. 1571) sailed on his second colonizing expedition to America in 1583 from the port, and hither Drake brought the remnant of Raleigh's Virginia colony. Plymouth supplied seven ships against the Spanish Armada, and it owed to this fact that the English fleet awaited the coming of the Spaniards. A stone on a quay at the Barbican records the fact that this was the last port touched by the Pilgrim Fathers on their voyage to America.

During the Civil War Plymouth was closely invested by the Royalists, whose great defeat is commemorated by the monument at Freedom Park. It was the only town in the west that never fell into their hands. It early declared for William of Orange, in whose reign the neighbouring dockyard was begun.

(H. G. DE W.)

PLYMOUTH, a township and the county-seat of Plymouth county, Massachusetts, U.S.A., in the south-eastern part of the state, on Plymouth Bay, about 37 m. S.E. of Boston. Pop. (1905) 11,110; (1910) 12,141. It is served by the New York, New Haven & Hartford railway, by inter-urban electric lines and in summer by steamers to Boston. The harbour is well sheltered but generally shallow; it has been considerably improved by the United States government and also by the state, which in 1909 was making a channel 16 ft. deep and 150 ft. wide from deep water to one of the township's wharves. The township has an area of 107-3 sq. m., is 18 m. long on the water front and 1130 m. wide. Plymouth is a popular resort for visitors, having, in addition to its wealth of historic associations and a healthy summer climate, thousands of acres of hilly woodland and numerous lakes and ponds well stocked with fish. Morton Park contains 200 acres of woodland bordering the shores of Billington Sea (a freshwater lake).

Few, if any, other places in America contain so many interesting landmarks as Plymouth. The famous Plymouth Rock, a granite boulder on which the Pilgrims are said to have landed from the shallop of the "Mayflower," lies on the harbour shore near the site of the first houses built on Leyden Street, and is now sheltered by a granite canopy. Rising above the Rock is Cooper's hill where during their first winter in America the Pilgrims buried half their number, levelling the graves and sawing grain over them in the spring in order to conceal their misfortunes from the Indians. Some human bones found on this hill when the town waterworks were built in 1855 have been placed in a chamber in the top of the canopy over the Rock. Burial Hill (originally called Fort Hill, as it was first used for defensive purposes) contains the graves of several Pilgrims and of many of their descendants. The oldest stone bears the date 1681; many of the stones were made in England, and bear quaint inscriptions. Here also are a tablet marking the location of the old fort (1621), which was also used as a place of worship, a tablet showing the site of the watch-tower built in 1643, and a marble obelisk erected in 1825 in memory of Governor William Bradford. Pilgrim Hall, a large stone building erected by the Pilgrim Society (formed in Plymouth in 1820 as the successor of the Old Colony Club, founded in 1760) in 1824 and remodelled in 1880, is rich in relics of the Pilgrims and of early colonial times, and contains a portrait of Edward Winslow (the only extant portrait of a "Mayflower" passenger), and others of later worthies, and paintings illustrating the history of the Pilgrims; the hall library contains many old and valuable books and manuscripts—including Governor Bradford's Bible, and the Bible of Edward's Indian Bible, and the patent of 1623 from the Council for New England—and Captain Myles Standish's sword. The national monument to the Forefathers, designed by Hammatt Billings, and dedicated on the 1st of August 1889, thirty years after its corner-stone was laid, stands in the northern part of the town. It is built entirely of granite. On a main pedestal, 45 ft. high, stands a figure, 36 ft. high, representing the Pilgrim Faith. From the main pedestal project four buttresses, on which are seated four monolith figures representing Morality, Education, Law, and Freedom. On the faces of the buttresses below the statues are marble alto-reliefs illustrating scenes from the early history of the Pilgrims. On high panels between the buttresses are the names of the passengers of the "Mayflower." The court-house was built in 1820, and was remodelled in 1837. From it have been transferred to the fireproof building of the Registry of Deeds many interesting historical documents, among them the records of the Plymouth colony, the will of Myles Standish, and the original patent of the 23rd of January 1630 (n.s.).

Modern Plymouth has varied and important manufactures comprising cordage, woolens, rubber goods, &c. In 1905 the total value of the factory products was $11,115,713, the worsted goods and cordage constituting about nine-tenths of the whole product. The cordage works are among the largest in the world, and consume immense quantities of sisal fibre imported from Mexico and manila from the Philippine Islands; binder-twine
PLYMOUTH

PLYMOUTH BRETHREN

for binding wheat is one of the principal products. From 1900 to 1905 the capital invested in manufactures increased 83% and the value of the product 104%. Large quantities of cranberries are raised in the township. Plymouth is a port of entry, but its foreign commerce is unimportant; it has a considerable coasting trade, especially in coal and lumber. The town ship owns its waterworks.

Plymouth was the first permanent white settlement in New England, and dates its founding from the landing here from the "Mayflower" ship of an exploring party of twelve Pilgrims, including William Bradford, on the 21st of December (a. d.) 1620. The name of the place was originally that of the colonists called it New Plymouth, because they had sailed from Plymouth, England, and possibly because they were aware that the name of Plymouth had been given to the place six years before by Captain John Smith. When and how the town and the colony of Plymouth became differentiated is not clear. Plymouth was never incorporated as a township, but in 1633 the General Court of the colony recognized it as such by ordering that "the chief government be tyed to the town of Plymouth." In 1666 the colony submitted to Sir Edmund Andros, who had been commissioned governor of all New England, and chose representatives to sit in his council. Plymouth remained the seat of government of the colony after the colony was transplanted to the Colony, and with it the town of Plymouth, was united to Massachusetts Bay under the charter of 1691 (see MASSACHUSETTS: History). Part of Plymouth was established as Plympton in 1707, and part as Kingston in 1726.

BIBLIOGRAPHY.—For the sources of the early history of Plymouth consult (George) Mourz's Relation, or Journal of the Plantation of Plymouth (Boston, 1620, and numerous other editions); William Bradford's History of the Plymouth Plantation (Boston, 1658, and several later editions), the most important source of information concerning Plymouth before 1646; the Plymouth Colony Records (3 vols., Plymouth, 1880-1903); J. A. Young's Chronicles of the Pilgrim Fathers (Boston, 1841); and E. Arber's Story of the Pilgrim Fathers (London, 1897), the two last containing excerpts from the leading sources. Channing and W. W. Goodwin; the article by Herbert B. Adams in the Magazine of American History, xliii., sqq., and that by S. H. Gay in the Atlantic Monthly, xviii., 612 sqq.

PLYMOUTH, a borough of Luzerne county, Pennsylvania, U.S.A., on the north branch of the Susquehanna river, immediately west of and across the river from Wilkes-Barre, of which it is a suburb. Pop. (1920), 16,996. Plymouth is served by the Delaware, Lackawanna & Western railroad. The borough is finely situated in the Wyoming Valley among the rich anthracite coalfields of eastern Pennsylvania, and its inhabitants are chiefly engaged in the coal industry; in 1906 and 1907 (when it shipped 24,051,401 tons) Luzerne county shipped more anthracite coal than any other county in Pennsylvania. In 1905 the total value of the factory products was $905,758, 69.4% more than in 1900. Before the coming of white settlers there was an Indian village called Shawnee on the site of the present borough. The township of Plymouth was settled in 1760 by immigrants from New England—many originally from Plymouth, Litchfield county, Connecticut, whence the name—the under the auspices of the Susquehanna Company, which claimed this region as a part of Connecticut, and Plymouth became a centre of the contest between the "Pennamites" and the "Yankees" (representing respectively Pennsylvania and Connecticut), which grew out of the conflict of the royal charter of Pennsylvania (granted in 1681) with the royal charter of Connecticut (granted in 1662), a matter which was not settled until 1790. (See WYMOSING VALLEY.) In its earlier history the region was agricultural. Two brothers, Aljah and John Smith, origi

See H. B. Wright's Historical Sketches of Plymouth (Philadelphia, 1873).

PLYMOUTH BRETHREN, a community of Christians who received the name in 1830 when the Rev. J. N. Darby induced many of the inhabitants of Plymouth, England, to associate themselves with him for the promulgation of his opinions. Although small Christian communities existed in Ireland and elsewhere calling themselves Brethren, and holding similar views, the accession to the ranks of Darby so increased their numbers and influence that he is usually reckoned the founder of Plymouthism. Darby (born in Nov. 1800 in London; graduated at Trinity College, Dublin, in 1826; died April 29, 1882, at Bournemounth) was a curate in Wicklow 1825-1827, when he felt himself constrained to leave the Anglican communion; going to Dublin, he became associated with several devout people who met statutorily for public worship, and called themselves Brethren." Among these were A. N. Groves and J. G. Bellett, who deserve to rank among the founders of the movement. In 1830 Darby at Plymouth won over many people to his way of thinking, among them James L. Harris, a Plymouth clergyman, and the well-known Biblical scholar Samuel Prideaux Tregelles. The Brethren started a periodical, The Christian Witness, continued from 1834 as The Present Testimony, with Harris as editor and Darby as the most important contributor. During the next eight years the progress of the sect was rapid, and communities were founded in many of the principal towns in England.

In 1836 Darby went to reside in French Switzerland, and made many disciples. Congregations were formed in Geneva, at Lausanne, where most of the Methodist and other dissenters joined the Brethren, at Vevey and elsewhere in Vaud. His opinions also found their way into France, Germany, German Switzerland, and Italy; but French Switzerland has always remained the stronghold of Plymouthism on the Continent, and for his followers there Darby wrote two of his most important tracts, Le Ministère consideré dans sa nature et & la Prése et de la F. In the edition of the eglise. The revolution in the canton Vaud, brought about by Jesus in 1845, brought persecution to the Brethren in the canton and in other parts of French Switzerland, and Darby's life was in great jeopardy.

He returned to England, and his reappearance was followed by divisions among the Brethren at home. These divisions began at Plymouth. Benjamin Wills Newton, head of the community there, who had been a fellow of Exeter College, Oxford, was accused of departing from the testimony of the Brethren by reintroducing the spirit of clericalism. Unable to detach the congregation from the teacher, Darby began a rival assembly. The majority of the Brethren out of Plymouth supported Darby, but a minority remained with Newton. The separation became wider in 1847 on the discovery of supposed heretical teaching by Newton. In 1848 another division took place. The Bethesda congregation at Bristol, where George Müller was the most influential member, received into communion several of Newton's followers and justified their action. Out of this came the separation into Neutral Brethren, led by Müller, and Exclusive Brethren or Darbyites, who refused to hold communion with the followers of Newton or Müller. The Exclusives, who were the more numerous, suffered further divisions. An Irish clergyman named Samuel O'Malley Cluff had adopted views similar to those of Pearsall Smith, who preached a doctrine of sanctification called "Death to Nature" as an antidote to the supposed prevalent Laodiceanism, and when these were repudiated seceded with his followers. The most
important division among the Exclusives came to a crisis in 1881, when William Kelly and Darby became the recognized leaders of two sections who separated on a point of discipline. This was followed (1885) by the disruption of the strict Darbyite section, the communions being formed out of it upon points of doctrine.

There were thus six sections of Plymouthists: (1) the followers of B. W. Newton, who promulgated the prophetic views peculiar to their leader; (2) the Neutrals—open brethren, leaning to Baptist views and to the Congregationalist idea that each assembly should judge for itself in matters of discipline, headed by George Müller; (3) the Exclusives, the Darbyites, holding what may be described as a Pauline view of the Church, who claim to be the original Brethren, represented by J. B. Stoney and C. H. Mackintosh; (4) the Exclusives associated in Britain with C. E. Stuart, in America with F. W. Grant; (5) the Exclusives who followed W. Kelly, giving a general adhesion to Darby but with a tendency to place science above church action, holding the Pauline view of the Church modified by Johannine elements; and (6) the Exclusives who followed Cliffe. The fundamental principle of the Exclusives, "Separation from evil God's principle of unity," has led to many unimportant excommunications and separations besides those mentioned.

The theological views of the Brethren differ considerably from those of the Baptists. The Protist of divine origin, (see Teulon, History and Doctrines of the Plymouth Brethren), the make the baptism of infants an open question and celebrate the Lord's Supper weekly. Their distinctive doctrines are ecclesiastical. They are Separational, official ministry, whether on Episcopalian, Presbyterian or Congregationalist theories, is a denial of the spiritual priesthood of all believers, and sets aside the Holy Spirit's guidance. The gradual growth of this opinion, and perhaps the reasons for its separation of the brethren's earlier church. While a curate in Ireland he was indignant with Archbishop Magee, who had stopped the progress of mission work among Roman Catholics by imposing on all who joined the church the oath of allegiance to the established principles of the Church of England as are foreign to the spirit of Christianity as the papacy is ("Considerations addressed to the Archbishop of Dublin," &c., Coll. Works, i, 1). The pamphlet is dedicated to W. Kelly, in 1868, a pamphlet of prohibiting the preaching of the gospel within a parish where the incumbent was opposed to it, led him to consider the whole system a hindrance to the proper work of the church and therefore anti-Christian ("Thoughts on the present position of the Hone Mission," Coll. Works, i, 78). And the waste of power implied in the refusal to sanction lay preaching seemed to him to lead to the conclusion that an official ministry was a refusal of the gifts of the Spirit to the church. It is Dr. Darby's lifelong preaching," Coll. Works, p. 200. The movement, if it has had small results in the formation of a sect, has at least set churches to consider how they might make their machinery more elastic. Perhaps one of the reasons of the competition of the Allenites, since the Brethren began to find in the world that their mission is not to the heathen but to the "awakened in the churches.

This movement has a distinct interest for students of church history: (1) as illustrating again the desire of certain Christians to pass over the garnered experience of the centuries, and by going straight to the Bible to make a fresh start without any other authority, precedent or guidance (2) in its development alongside the Evangelical, Tractarian and Broad Church movements of the 19th century and its affinities with them all. A certain haphazardism that has always marked the Brethren is responsible for the present lack of brains. The earlier enthusiasm has waned, and no provision was made for proper theological study.

PLYMPTON ST MARY—NEUMATIC DESPATCH, the name given to a system of transport of written despatches through long narrow tubes by the agency of air pressure. It was introduced in 1853 by J. Latimer Clark, between the Central and Stock Exchange stations of the Electric and International Telegraph Company in London. The stations were connected by a tube 1½ in. in diameter and 220 yds. long. Carriers containing batches of telegrams, and fitting piston-wise in the tube, were sucked through it (in one direction only) by the production of a partial vacuum at one end. In 1858 C. F. Varley improved the system by using compressed air to force the carriers in one direction, a partial vacuum being still used to draw them in the other direction. This improvement enabled single radiating lines of pipe to be used both for sending and for receiving telegrams between a central station supplied with pumping machinery and outlying stations so not supplied.

Radial System.—In the hands of R. S. Culley and R. Sabine the radial system of pneumatic despatch was in 1870 brought to great perfection in connexion with the telegraphic department of the British post office, since that date the total length of tubes (which are employed for telegrams only) has been very largely increased (in 1909 there was in London a total length of
The pneumatic despatch

PNEUMATIC DESPATCH

40 m.), whilst in all large and also in very many smaller provincial towns there are installations; these are constantly being added to, as it is found more economical to transmit local message-work by tube rather than by wire, as skilled telegraphists are not required, but only tube attendants. In some cases only one tube is necessary, but three or four, or even more, are in use in some towns, according to local circumstances. Short tubes, known as "house tubes" are in use in a great number of offices; such tubes, which are worked either by hand-pumps (when the tubes are very short and the traffic considerable) or by power, are usually \( \frac{1}{10} \) in. in diameter, and are used for the purpose of conveying messages from one part of a telegraph instrument-room to another, or from the instrument-room to the public counter. The underground, or "street" tubes are chiefly 1\( \frac{1}{4} \) in. in diameter, and are also a number of 3\( \frac{1}{8} \)-in. tubes in use; those in the larger provincial towns (Birmingham, Bradford, Cardiff, Edinburgh, Glasgow, Grimsby, Liverpool, Manchester, Newport, Leeds, Newcastle, Southampton and Swansea) are 2\( \frac{1}{8} \) in. in diameter; but in Dublin, Gloucester, Lowestoft and Milford 14\( \frac{1}{8} \)-in. tubes are employed. There are fifty street tubes in London, varying in length from 100 to 2000 yds. (central office to the Houses of Parliament), and also seventy-five house tubes; the pumps for the whole system are worked by four 100 horse-power steam-engines. At Cardiff, Edinburgh, Gloucester, Leeds, Lowestoft, Newport, Southampton and Swansea the pumps are driven by electric motors; at Bradford and Grimsby gas-engines are used, and at Milford an oil-engine.

The tubes are in all cases of lead, the 2\( \frac{1}{4} \)-in. tubes weighing 8 lb per foot run and being made in lengths of 2\( \frac{1}{2} \) ft.; they are enclosed in 3\( \frac{1}{8} \)-in. cast-iron pipes made in lengths of 9 ft.

Great care is exercised in making the joints in the lead pipes. Before the tube is placed in its trench a strong chain is passed through it, and a polished steel mandrel, 6 in. long and slightly less in diameter than the diameter of the tube, is heated and attached to the chain, and pushed half its length into the end of the tube already laid; the new length of tube is then forced over the projecting end of the mandrel until the tube ends (which have been previously cut flat) butt perfectly together; an ordinary plumber's joint is then made. By this means the tube is made perfectly air-tight, and the mandrel keeps the surface of the tube under the joint as smooth as at any other part of its length. After the joint is completed the mandrel is drawn out by the chain attached to it; the next length is drawn on, and the above process repeated. The tubes are laid about 2 ft. below the surface of the ground.

The tubes radiate from the central to the branch offices, the principal offices having two tubes, one for "inward" and the other for "outward" traffic. At the smaller offices both the inward and the outward traffic is carried on through one tube. The "carriers" are made with gutta-percha bodies, covered with felt, the front of the carrier being provided with a buffer or piston formed of several disks of felt which closely fit the tube; the messages are prevented from getting out of the carrier by the end being closed by an elastic band, which can be stretched sufficiently to allow the message forms to be inserted. The 3\( \frac{1}{8} \)-in. carriers will hold 75 ordinary message forms, the 2\( \frac{1}{4} \)-in. carriers 25 forms, and the 1\( \frac{1}{8} \)-in. carriers 20 forms. The carriers are propelled in one direction (from the central to the branch office), and driven back in the opposite direction by "vacuum," the standard pressure and vacuum being 10 lb and 48 lb per sq. in. respectively, which values give approximately the same speed.

The time of transit of a carrier through a tube when the air pressure does not exceed 20 lb per square inch is given very approximately by the empirical formula:

\[
t = 0.00872 \sqrt{\frac{P_i}{P_0}}
\]

where \( t \) = length of tube in yards, \( d \) = diameter of tube in inches, \( P \) = effective air-pressure in pounds per square inch, \( t \) = transit time in seconds. For vacuum the formula is:

\[
t = 0.00825 \sqrt{\frac{P_i}{P_0}}
\]

where \( P \) = effective vacuum in pounds per square inch.

The horse-power required to propel a carrier is approximately, for pressure:

\[
H.P. = \left( 574 + 401P \right) \sqrt{\frac{P_0}{I}}
\]

for vacuum:

\[
H.P. = \left( 5187 + 21455P \right) \sqrt{\frac{P_0}{I}}
\]

For a given transit time the actual horse-power required is much less then the case of working with the air pressure, owing to the density of the air column moved being much less.

Thus, for example, the transit time for 10 lb pressure is the same as for 6\( \frac{1}{8} \) lb vacuum, but the horse-power required in the two cases is 5\( \frac{1}{8} \) more. A tube of 3\( \frac{1}{8} \) in. diameter, and worked at 10 lb per square inch pressure, will have a transit time of 2\( \frac{1}{2} \) minutes, and will theoretically require 3\( \frac{1}{2} \) horse-power to be expended in working it, although actually 25 \% more horse-power than this case must be allowed for, owing to losses through various causes. The transit time for a 2\( \frac{1}{8} \)-in. tube is 16\( \frac{1}{8} \) more than for a 3\( \frac{1}{8} \)-in. tube of the same length, when both are worked at the same pressure, but the horse-power required is 50 \% less; it is not advisable, therefore, to use a tube larger than is absolutely necessary to carry the volume of traffic required.

The somewhat complicated pattern of "double sluice valve" originally used at the central stations has been superseded by a simpler form, known as the "D" box—so named from the shape of its cross section. This box is of cast iron, and is provided with a close-fitting, brass-framed, sliding lid with a glass panel. This lid fits air-tight, and closes the box after a carrier has been inserted into the mouth of the tube; the latter enters at one end of the valve, and is then smoothed. A supply pipe, to which is connected a "W" cock, is joined to the box and allows communication at will either of the "pressure" or "vacuum" mains, so that the apparatus becomes available for either sending (by pressure) or receiving (by vacuum) a carrier. Automatic working, by which the air supply is automatically turned on in the introduction of the carrier into a tube and on closing of the D box, and is cut off when the carrier arrives, was introduced in 1900.

On the long tubes (over about 1000 yds.) a modification of the "D" box in its simplest form is necessary; this modification consists in the addition of a "sluice" valve placed at a distance of about 9 in. (i.e. rather more than the length of a carrier) from the mouth of the tube. The sluice valve, by means of an interlocking arrangement, is so connected with the sliding lid of the box that the lid cannot be moved to the open position unless the sluice valve has closed the tube, nor can the sluice valve be opened unless the sliding lid is closed. The object of this sluice valve is to prevent the back rush of air which would take place into the tube when the sliding lid is opened to take out a carrier immediately on the arrival of the latter; for although the vacuum may be turned off by the 3-way cock, yet, owing to the great length of the tube, equilibrium does not immediately take place in the latter, and the back rush of air into the vacuum when the lid is opened to extract the carrier will cause the latter to be driven backward in the tube. The sluice valve also prevents a similar, but reverse, action from taking place when pressure working is being carried on.

As a rule, only one carrier is despatched at a time, and no second carrier is inserted in the tube until the arrival of the first one at the farther end is automatically signalled (by an electric apparatus) to the despatching office. On some of the long tubes a carrier, when it passes the midway point in the tube, strikes a trigger and sends back an electrical signal indicating its passage; on the receipt of this signal a second carrier may be despatched. This arrangement has been almost entirely superseded by a signalling apparatus which by a clock movement actuates the "W" cock, indicating hand and box, and moves the latter to the "tube" carrier, a certain definite time (30 to 40 seconds) after a carrier has been inserted in the tube. By this arrangement carriers can be despatched one after the other at comparatively short intervals of time, so that several carriers (separated by distinct intervals) may be travelling through the tube simultaneously. It is necessary that the carriers be separated by a definite interval, otherwise they tend to overtake one another and become jammed.
in the tube. Although the stoppage of a carrier in a tube is of exceedingly rare occurrence, it does occasionally take place, through picks being driven into the tube by workmen executing repairs to gas or water pipes, but the locality of such a stoppage is easily determined by a simple inspection along the route of the tube. In no case is any special means of testing for the locality from the central office found necessary.

**Circuit System.** Another method of working, extensively used in Paris and other continental cities, is the circuit system, in which stations are grouped on circular or loop lines, round which carriers travel in one direction only. In one form of circuit system—that of Messrs Siemens—a continuous current of air is kept up in the tube, and rocking switches are provided by which carriers can be quickly introduced or removed at any one of the stations on the line without interfering with the movement of other carriers in other parts of the circuit. More usually, however, the circuit system is worked by despatching carriers, or trains of carriers, at relatively long intervals, the pressure or vacuum which gives motive power being applied only while such trains are on the line. On long circuits means are provided at several stations for putting on pressure or vacuum, so that the action may be limited to that section of the line on which the carriers are travelling at any time. In America, in New York, Boston and Philadelphia, tubes (Batcheller system) up to 8 in. in diameter are in use. The tubes are of cast iron made in 12-ft. lengths and are carefully bored; they resemble ordinary water pipe. Short bends are made in seamless brass tube carefully bent to a uniform radius of twelve times the diameter of the tube, the tube being slightly larger in diameter than the main tube. The sending apparatus, or transmitter, is similar to the Siemens switch before described, and consists of two sections of the tube supported in a swinging frame so arranged that either section can be brought into line with the main tube, in which a current of air is constantly flowing. One of these tube sections maintains the continuity of the main tube, while the other is swung to one side to receive a carrier. In despatching a carrier is placed in an iron trough and then pushed into the open tube section. The frame carrying the two tube sections is then swung until the section containing the carrier is brought into line with the main tube, when the carrier is swept along with the current of air. When the frame is swinging from one position to another the air is prevented from escaping by plates that cover the ends of the tube, and a by-pass is provided so that the current is not interrupted. An air-motor, consisting of a cylinder and piston, furnishes the power to swing the frame, the operation requiring an instant only. When the controlling lever is released and latched the frame swings, and as the carrier passes out of the apparatus it trips the lever, and the frame swings back automatically into position to receive another carrier. To prevent carriers from being despatched too frequently and overtaking each other a time lock is attached to the sending apparatus; this locks the controlling valve when a carrier is despatched, and keeps it locked for a given period of time, varying from five to fifteen or twenty seconds, according to the adjustment of the lock. The carrier is received at the farther end of the tube into an air cushion formed by closing the end of the tube with a sluice-gate, and allowing the carrier to be sent out on a branch pipe through slots in the tube arranged about 4 ft. in the rear of the sluice-gate. When a carrier arrives it passes over the slots, enters the air cushion and is brought to rest without injury or shock. The carriers are thin steel cylinders closed at the front end by a convex disk of the same material carrying a buffer of felt and leather; the rear end is closed by a hinged lid secured by a lock.

The shell of the carrier is 24 in. long and 7 in. in diameter for the 8-in. tube; it is secured by two bearing-rings of woven cotton fabric clasped between metal rings; the rings are renewed after about 2000 m. of travel. The tubes are worked at a pressure of 6 lb per sq. in., and for a distance of 4500 ft. require about 30 horse-power, the transit speed being 30 m. per hour.

In addition to its use for postal and telegraphic purposes the pneumatic despatch is employed for internal communication in offices, hotels, &c., and also in shops for the transport of money and bills between the cashier’s desk and the counters.

**PNEUMATIC GUN.** Air as a propellant has in recent years been applied to guns of large calibre, in which its comparatively gentle action has proved advantageous when high explosives contained in their shells are employed as projectiles. In 1883 Mr Meford of Ohio utilized an air pressure of 500 lb per sq. in. in a 2-in. gun, and succeeded in propelling a projectile 2100 yds. The arrangement was of the simplest form—a hose with an ordinary cock by which the air was admitted into the gun behind the projectile. The question was then taken up by Capt. E. L. Zalinski (1849-1909) of the United States Artillery, who in 1888 reduced the so-called "dynamite gun" to a practical shape and obtained excellent firing results.

The principal features of his system are: (1) An extremely ingenious balanced valve admitting the air pressure into the gun. This valve is opened and closed by a simple movement of the firing lever, and is capable of adjustment so that the propelling force, and consequently the range, can be regulated. (2) A light steel projectile carrying the bursting charge, and provided with a tail to which vanes are attached in order to give rotation. (3) Electric fuses of entirely original design. Each shell carries a wet battery, the current from which fires the charge on impact with any solid object, and a dry battery which becomes active after the shell has dived below the surface of the water and ignites the charge after the latter is capable of regulation. For safety all the electric circuits are made to pass through a disconnecter, which prevents them from being completed until the shell has been fired. The gun is a built-up smooth-bore tube, 15 in. or less in diameter. The full-calibre shell weighs 1000 lb, and carries a bursting charge of 600 lb of blasting gelatine, cut into the form of cheeses, fitting the shell envelope, and provided with a core of dry gun-cotton as a primer. Sub-calibre projectiles, 10 in. and 8 in., can be fired in their case, rotation is given by vanes or fins attached to the body of the shell. Air at 1000 lb pressure is stored in tubes close to the gun, and is supplied from primary reservoirs, to which it is directly

![Dynamite gun, mounted at Sandy Hook, New York Harbour.](image)
pumped at a pressure of about 2000 lb. There is, therefore, a considerable reserve of power available without pumping. Further, by injecting on the minerals of the rock many zeolites for the protection of New York and San Francisco. With a full-calibre shell (1000 lb) these guns have a range of 2400 yds.; with a sub-calibre 8-in. shell (250 lb) the maximum range is 6000 yds. The volume and velocity of the shell was remunerative. At 9000 yds., 75% of the projectiles fell in an area of 360 × 90 ft. When the gun was tried at Shoeburyness the accuracy was far greater than could be obtained with howitzer shells propelled by explosives. On account of the power of the shell under water, and thus securing a torpedo action, a direct hit upon a ship is not required, and the target offered is largely in excess of the deck plate. The gun, in fact, capable of replacing systems of submarine mines with economy, is without the great objection of interfering with a waterway.

The only employment of the dynamite gun afloat has been in the case of the U.S. gunboat "Vesuvius," carrying three in the bows. These guns are fixed at a constant angle of elevation, and the range is regulated by the air valve, training being given by the helm. Thus mounted on an unstable platform, the accuracy of fire obtainable must evidently be much less than on shore. The "Vesuvius" was employed during the Spanish-Austrian War of 1868, when a night attack on a position she approached the defences of Santiago under cover of darkness and discharged three projectiles. Fire delivered under such conditions could not be sufficiently accurate to injure coast defences; but the shells burst well, and made large craters. A small dynamite gun on a field-carriage was used in the land operations above Santiago in the same war.

**Pneumatics** (Gr. πνεύμα, wind, air), the branch of physical science concerned with the properties of gases and vapours (see Gases). A pneumatic trough is simply a basin containing water or some other liquid used for collecting gases.

**Pneumatolysis** (Gr. πνεύμα, vapour, and λύω, to set free), in petrology, the process of various gases and the effects produced by them on rock masses. In all volcanic eruptions the gases given off by the molten lavas are powerful agencies. The slabby clots of lava thrown out from the crater are so full of gas that when they cool they resemble spongy pieces of bread. The lava streams as they flow down the slopes of the volcano are covered with white steam clouds, while over the orifice of the crater hangs a canopy of vapour which is often darkened by fine particles of ash. Most authors ascribe volcanic explosions to the liberation of steam from the magma which held it in solution, and the enormous expansive powers which free water vapour possess at very high temperatures.

Of these gases the principal are water and carbonic acid, but by analysis of the discharges from the smaller fumaroles, for the active crater is generally too hot to be approached during an eruption, it has been ascertained that hydrogen, nitrogen, hydrochloric acid, boron, fluorine, sulphuretted hydrogen and sulphurous acid are all emitted by volcanoes. A recent lava flow has been likened to a great fumarole pouring out volatile substances at every crack in its slabby crust. Many minerals are deposited in these fissures, and among the substances produced in this way are ammonium chloride, ferric chloride and oxide, copper oxide (tenorite and cuprite) and sulphur. Cuprite in the mineral state is used as a red lake, and other secondary products are formed. These processes have been described as "juvenile" or "post eruptive," and it is believed that the amygdales which occupy the cavities of many porous lavas are not due really to weathering by surface waters percolating in from above, but to the action of the steam and other gases set free as the lava crystallizes. The zeolites are the principal group of minerals which originate in this way together with chlorite, chalcedony and calcite. The larger cavities (or geodes) are often lined with beautiful crystal groups of natrolite, scacite, thomsonite, stilbite, and other minerals of the order.

The active gases were evidently in solution in the magma as it rose to the surface. Some geologists believe it is of subterranean origin like the lava itself, and is an essential or original component of the magma. They point to the exist-

ence of gases in considerable quantity in meteorites, and, comparing the earth to a great aerolite, insist that it should contain gases in solution like the smaller masses of the same kind. Others hold it more probable that the water has percolated in from the surface, or seeing that many volcanoes stand near the sea margin and by their linear disposition may be disposed along fissures or lines of weakening in the crust, they argue that the water of the sea may have filtered down even through the solid rock, and that thus the gases were generated by contact with the intensely heated rock. The abundance of chlorides and hydrochloric acid is also in favour of a marine origin for the water. Against this we may place the fact that at great depths whence active magmas ascend the rocks are under so great pressures that every fissure is closed up; in fact in some of the deepest mines the quantity of water found in the workings is often exceedingly small. Probably there is some truth in both theories, but the balance of probability seems to incline in favour of the view that the water is an original and essential part of the magma and not an introduction from above.

Long after a lava has cooled down and become rigid the vapours continue to ooze out through its fissures, and around many volcanoes which are believed to be extinct there are orifices discharging gas in great quantities. This state of activity is said to be "solfataric," and a good example of it is the volcano called the Solfatara near Naples. The numerous "Soufrières" of the West Indies are further instances. The prevalent gas is steam with sulphurated hydrogen and carbonic acid. At the Grotto del Cane in the Phlegraean Fields (Italy) the carbonic acid rising from fissures in the bottom of a cave covers the floor as a heavy layer, and a dog placed in the interior of the cave becomes stupefied by the narcotic gas; such gas-springs have been called "fomettas." Around them there is often a deposit of sulphur, produced by oxidation of the sulphurated hydrogen, and the rocks are bleached, softened and decomposed. White crusts of alum, various sulphates, and sulphides such as pyrites, also carbonates of soda and other bases, are formed by the action of the acid vapours on the volcanic rocks. The final manifestation of volcanic activity in such a region may be the discharge of heated waters, which have ascended from the deep-seated magma far below the surface, and make their appearance as groups of hot springs; these springs persist long after the volcanoes which give rise to them have become extinct.

It is now believed by a large number of geologists and mining engineers that these ascending hot waters are of paramount importance in the genesis of some of the most important types of ores found in the earth's crust. Ancient deposits of copper, for example, are thought to contain distinct though very small quantities of the heavy metals; it is also established beyond doubt that veins of gold, silver, lead, tin and mercury most commonly occur in the vicinity of intrusive igneous masses. At Steamboat in Nevada, hot springs, probably of magmatic origin, are forming deposits of cinnabar. At Cripple Creek, Colorado, and in many other places gold-bearing veins occur in and around intrusive plugs of igneous rock. Tin ores in all parts of the world are found in association with the granite igneous rocks. In all cases the veins bear evidence of having been filled from below by hot waters set free during the cooling of the igneous intrusions. Volcanic rocks are consequently the parent sources of many veins of metallic ores. Andesite and andesites, which were brought into their present situations are the volatile products discharged as the magma crystallized. The process was no doubt a long one and is in many cases much prolonged, and the hot steam and water took part in it. Above 365 °C water is a gas under all pressures and the action is strictly pneumatolytic; below that temperature steam is changed to water by pressure and the action may be represented by the equation: H₂O(l) +(250 °C) = H₂O(g). In our ignorance of the temperatures and pressures prevailing at considerable depths we lack the means of classification. In what condition the metallic ores are dissolved and by what reactions they are precipitated is entirely a problem partly understood. The tin ores are so often associated with minerals containing boron and fluorine that it is quite probable that they were combined with these elements in some way, but they were deposited in nearly pure metallic form. Other precious metals such as silver, lead, silver, silver, copper, and iron occur with metallic hydrogen, carbonic acid and hydrochloric acid, probably of an important part in dissolving certain metals; and the alkaline carbonates, sulphides and chlorides have been shown by experiment to act also as solvents. In these ore deposits not only the heavy
metals are found, but often a much larger quantity of minerals such as calcite, barytes, fluor spar, quartz and tourmaline which serve as a matrix or gangue, and have been deposited by the same agencies, and often at the same time as the valuable minerals.

In their passage upwards and outwards through the rocks of the mine they carry off these gases and liquids not only deposit mineral in the fissures along which they ascend, but attack the surrounding rocks and alter them in many ways. The granite or other plutonic masses may be dissolved by the gas in a very extraordinary manner; it is especially liable to the transformations, probably because it is a high temperature mineral, not having yet completely cooled down. Around the tin-bearing veins in granite there is extensive replacement of felspar and biotite by quartz, feldspathoids, and fine micas (the last-named often rich in lithium). In this way certain types of altered granite are produced, such as greisen (q.v.) and schorl rock (see SCHORL). In the slates adjacent to the tin veins tourmalization also goes on, converting them into quartz, sericite, and tourmaline. The transformation into jadeite, jade, or any other of the several varieties of sericite clay is also a pneumatolytic process, and is often found along with tin veins or other types of mineral deposit; probably both fluorine and carbonic acid operated in this instance along with water.

Equally common and important is the silification of rocks near mineral veins which carry gold, copper, lead and other metals. Granites and felsites may be converted into hard cherty masses of silica. Limestones undergo this transformation very readily; at the same time they are regarded as rocks very favourable to the deposition of ores. Probably the great frequency—"with which they undergo silification and other types of metasomatic replacement processes"—of the mineral masses of the metamorphic rocks, in an area of valuable mineral deposit, is due to the influence of the process in them. The process known as "propylitization," which has extensively affected the andesites of the Hungarian goldfields, is believed to be also a consequence of the action of pneumatolytic gases. The little greenish or bluish rocks in the granite masses which have undergone this propylitization and whose original minerals are to a large extent replaced by quartz, epidote, chlorite, sericite and kaolin. Around granites intrusive into serpentine and other rocks containing much magnesia, there has been observed a phenomenon of "sericitization," or the deposit of talc and sericite in place of the original minerals of the rock. Some of the apatite veins of Canada and Norway accompany basic rocks of the gabbro group; it has been noticed that the apatite (which contains phosphoric phosphate and chlorine) was laid down by vapours or solutions containing those gases, which may play a similar part in the basic rocks to that taken by fluorine and boron in the pneumatolytic veins around granite. The very soft, friable, and the very semiprecious (q.v.), a lime alumina silicate, containing chlorine, often is substituted for lime-felspar.

These extensive changes adding the formation of mineral veins, have been observed in many cases, but in many plutonic masses pneumatolytic action has contributed to the formation of pegmatites (q.v.).

nPNEUMONIA (Gr. πνεύμων, lung), a term used for inflammation of the lung substance. Formerly the disease was divided into three varieties: (1) Acute Croupous or lobar pneumonia; (2) Catarrhal or Broncho-pneumonia; (3) Interstitial or Chronic pneumonia.

1. Acute Croupous or Lobar Pneumonia (Pneumonic Fever) is now classed as an acute infective disease of the lung, characterized by fever and toxemia; running a definite course and being the direct result of a specific infection in young organisms.

The microcoscus lanceolatus (pneumococcus, or diplococcus pneumoniae) of Fränkel and Weichselbaum is present in a large number of cases in the bronchial secretions, in the affected lung and in the blood. This organism is also present in many other infective processes which may complicate or terminate lobar pneumonia, such as pericarditis, endocarditis, peritonitis and empyema. The bacillus pneumoniae of Friedländer is also present in a proportion of cases, but is probably not the cause of true lobar pneumonia. Various other organisms may be associated with these, but they are to be regarded as in the nature of a secondary infection. Lobar pneumonia may be considered as an acute endemic disease of temperate climates, characterized by red blood corpuscles, and in many cases by white blood corpuscles, and in some cases by phthiseal corpuscles, and in others by a combination of these. It is a disease of the lung, but has been observed in other localities. The most common cause of death from the disease is congestion of the lungs, and the usual cause of death is pneumonia.

Lobar Pneumonia begins by the setting up of an acute inflammatory process in the alveoli. The changes which take place in the lungs are chiefly three: (1) Congestion, or engorgement, the blood-vessels being distended and the lung more voluminous and heavier than usual, and of dark red colour. Its air cell is still alveolar air, and which speedily coagulates, causing the lung to become firmly consolidated. In this condition the cells are entirely emptied of air, their blood-vessels are pressed upon by the exudation, and the lung substance, rendered brittle, sinks in water. The appearance of a section of the lung in this stage has been likened to that of a red grape, and the character of the exudation, consisting largely of coagulable fibrin, that the term croupous is due. (2) Grey Hepatisation, so called from its resemblance to liver tissue. In this stage there is poured into the air cells of the affected part an exudation consisting of amorphous fibrin together with epithelial cells and red and white blood corpuscles, the whole forming a viscid mass which occupies not only the cells but also the finer bronchi, and which speedily coagulates, causing the lung to become firmly consolidated. In this condition the cells are entirely emptied of air, their blood-vessels are pressed upon by the exudation, and the lung substance, rendered brittle, sinks in water. The appearance of a section of the lung in this stage has been likened to that of a red grape. (3) Abcessation or Necrosis, the lung cells are destroyed, the exudation becomes purulent in character, and the lung is filled with pus. In this stage the lung is filled with pus.
PNEUMONIA

perfusion, and increase of the vocal fremitus; while on auscultation the breath sounds are tubular or bronchial in character, with, in some instances, a distinct breath sound heard during both respiration and expiration. The stage of grey hepatization the percussion note is still dull and the breathing tubular, but crepitations of coarser quality than before are also audible. These various physical signs disappear more rapidly during resolution than during consolidation of the inflammation the febrile symptoms and rapid breathing continue. The patient during the greater part of the disease lies on the back or on the affected side. The pulse, which at first was full, becomes slow and soft on the pulse of the right arm and it is marked.

In favour of cases death may take place either from the extension of the inflammatory action, especially if the pneumonia is double, from excessive fever, from failure of the heart’s action or general strength at the period of the crisis, or again from the disease assuming from the first a cold, symmetrical form, or from the secondary affection of the kidneys, which is responsible for a large percentage of the fatal cases. The pneumonia has been found in the exudate. Secondary pneumonia usually follows the specific fever, as diptheria, enteric fever, measles and influenza, and are the result of a direct poisoning. Bacteriologically a number of different organisms have been found, together with the specific microbe of the primary disease; the striking features of primary lobar pneumonia are often masked in these types.

The treatment of acute pneumonia has of late undergone a marked change, and may be divided into 3 heads: (1) General hygienic treatment; (2) the treatment of special symptoms; (3) treatment by vaccines and sera. The same treatment of absolute rest should be carried out as in enteric fever; this absolute rest is necessary to limit the auto-inoculation by the absorption of toxins. Fresh air in abundance and even open-air treatment if possible has been attended with good results. Ice poultices over the affected part are useful in the relief of pain, while tepid sponging and tepid or cold baths may be freely given, and the patient’s strength supported by milk, soups and other light forms of nourishment. Stimulants may be called for, and strychnine and digitalin are the most valuable. In some cases the patient will be obliged to carry on. Many trials have been made with antipneumococcal serum, but it has not been shown to have a very marked effect in cutting short the disease. The polyvalent serum of Römer has given the best results. Much more favourable results have been obtained from the use of a vaccine. The results of vaccine treatment obtained by Boelke in 30 cases of severe pneumonia and one case of pneumococcal endocarditis are encouraging. The vaccine, to produce the best effects, should be made from the patient’s own pneumococcus, as it is evident there are different strains of pneumococci, the doses (5 to 50 million dead pneumococci) being regulated by the guide of the blood and spinal indices. The reaction to the preparation of the vaccine from the patient’s own organisms is the time (several days) which is required, valuable time being thereby lost; but the results are much more certain than with the use of a stock vaccine.

2. Broncho-Pneumonia (Cataarrhal or Lobular-Pneumonia or Capillary Bronchitis). An acme form of lobular pneumonia has been described, having all the characters of acute lobar pneumonia except that the pneumonic patches are disseminated. The term “broncho-pneumonia” is however here used to denote a widespread cataarrhal inflammation of the smaller bronchi which spreads in places to the alveoli and produces consolidation. All forms of broncho-pneumonia depend on the invasion of the lung by micro-organisms. No one organism has however been constantly found which can be said to be specific, as in lobar pneumonia; the influenza bacillus, micrococcus catarrhalis, pneumococcus, Friedländer’s bacillus and various staphylococci having been found. John Eyre, in Allbutt’s System of Medicine, gives 62% of mixed infection in the cases investigated by him. Broncho-pneumonia may occur as an acute primary affection in children, but is more usually secondary. It may be a sequence of infectious fevers, measles, diptheria, whooping cough, scarlet fever and sometimes typhoid fever. In these it occurs frequently and often a fatal complication. The large majority of the fatal cases are those of early childhood. In adults it may follow influenza or complicate chronic Bright’s disease or various other disorders. Broncho-pneumonia also may follow operations on the mouth or trachea, or the inhalation of foreign bodies into the trachea. It is a frequent complication of pulmonary tuberculosis.

The following changes take place in the lung: at first the affected patches are dense, non-crepitant, with a bluish appearance tending to become grey or yellow. Under the microscope the air vesicles and finer bronchi are crowded with the made up the inflammatory process, but there is no fibrous exudation and they present none of the characteristics of the true pneumonia. In favourable cases resolution takes place by fatty degeneration, liquefaction, and absorption of the cells, but on the other hand they may undergo caseous degenerative changes, abscesses may form, or a condition of chronic interstitial pneumonia be developed, in both of which cases the condition passes into one of pulmonary tuberculosis. Evidence of previous bronchitis is usually prominent in the lungs affected with catarhhal pneumonia. In the great majority of instances catarhhal pneumonia occurs as an accompaniment or sequel of bronchitis, either from the inflammation passing from the finer bronchi to the pulmonary air vesicles, or from its affecting portions of lung where it has undergone degeneration.

The symptoms characterizing the onset of catarhhal pneumonia in its milder form are the occurrence during an attack of bronchitis or the convalescence from measles or whooping cough, of a sudden and marked elevation of temperature, together with a quickened pulse and increased difficulty in breathing. The cough becomes short and painful, and there is little or no expectoration. The physical signs are not distinct, being mixed up with those of the antecedent bronchitis; but, should the pneumonia be extensive, there may be an impaired percussion note with tubular breathing and some bronchophony. Dyspnoea may be present in a marked degree; and death frequently occurs from paralysis of the heart. Broncho-pneumonia is a serious disease, the death-rate in children under the age of three has been 20%.

The treatment of broncho-pneumonia is mainly symptomatic. At the outset a mild purgative is given, and should the secretion accumulate in the bronchial tubes an emetic is useful. Inhalations are useful to relieve the cough, and circulatory stimulants such as strychnine are valuable, together with belladonna and oxygen. When orthopneoa and lividity are present, with distension of the right heart, venesection is necessary. The treatment of broncho-pneumonia by serum and vaccines is not so successful as in lobar pneumonia, owing to the difficulty of ascertaining the precise bacterial infection. The great danger of broncho-pneumonia is the subsequent development of pulmonary tuberculosis.

3. Chronic Interstitial Bronchitis (Cirrhosis of the Lung) is a fibroid change in the lung, chiefly affecting the fibrous stroma and may be either local or diffuse. The changes produced in the lung by this disease are marked chiefly by the growth of nucleated fibroid tissue around the walls of the bronchi and vessels, and in the intervesicular septa, which proceeds to such an extent as to invade and obliterate the air cells. The lung, which is at first enlarged, becomes shrunken, dense in texture and solid, any unaffected portions being emphysematous; the bronchi are dilated, the pleura thickened, and the lung substance often deeply pigmented, especially in the case of miners, who are apt to suffer from this disease. The other lung is always greatly enlarged and distended from emphysematous; the heart becomes hypertrophied, particularly the right ventricle; and there may be marked atheromatous changes in the
blood vessels. Later the lung becomes converted into a series of bronchiectatic cavities. This condition is usually present to a greater or lesser degree in almost all chronic diseases of the lungs and bronchi, but it is specially apt to arise in an extensive form from pre-existing catarrhal pneumonia, and not infrequently occurs in connexion with occupations which necessitate the habitual inhalation of particles of dust, such as those of colliery, smelting and the like. The prism, stonemasons, millers, &c., to which the term pneumonokoniosis is now applied (including rheumatosis, siderosis, chalicois and the so-called "grinder's rot").

The symptoms are very similar to those of chronic phthisis (see TUBERCULOSIS), especially increasing difficulty of breathing, particularly on exertion, cough either dry or with expectoration, sometimes chronic and febric. In the case of coal-miners the system is black from containing carbonaceous matter. The physical signs are deficient expansion of the affected side—the disease being more marked in the late stages of pulmonary phthisis with colliquative symptoms, increasing emaciation and death. Occasionally dropsy is present from the heart becoming affected in the course of the disease. The physical signs in many cases remaining for years in a stationary condition and even undergoing temporary improvement in mild weather, but the tendency is on the whole destructive.

PNOM-PENH-POBEDONOSTSEV

PNOM-PHEN, a town of French Indo-China, capital, since 1866, of the protectorate of Cambodia and seat of the residence-superior. Pop. about 60,000, consisting of Cambodians, Annamese, Chinese, Malays, Indians and about 600 Europeans. It is situated on the Mekong about 173 m. from its mouth at the landing place of the annual name. The Mekong branch connecting it with the Great Lake (Tonle-Saps). Its position makes it the market for the products of Cambodia, Laos, Upper Burma and part of Siam (dried fish, rice, cotton, indigo, cardamoms, &c.) The town is lighted by electricity. The palace of the king of Cambodia occupies a large space in the Cambodian quarter. The town gets its name from the Pon, a central hill surmounted by an ancient pagoda.

PO (anc. Padus, Gr. Íhados), a river of northern Italy, and the largest in the whole country, with a total length of about 310 m. direct from the source to the mouth, but, including its many windings, of some 417 m. The navigable portion from Carcivar to Milan is about 382 m. in length, of this portion 656 ft., and its minimum depth 7 ft. Owing to the prevalence of shallows and sandbanks, navigation is difficult.

The Po is the dominating factor in north Italian geography, north Italy practically consisting of the Po basin, with the surrounding slopes of the Alps and Apennines. For a description of its course, and a list of its principal tributaries see ITALY. The area of its basin, which includes portions of Switzerland and Austria, is estimated at 26,799 sq. m.

In the first 21 m. of its course, down to Revello (west of Saluzzo), the Po descends less than 750 ft., so that a fall of 452 ft. is 1000, forming a very remarkable contrast to its fall lower down. From the confluence of the Ticino its fall is about 0-3:1000; from the beginning of the delta below Ferrara, 0-08:1000. At Turin it has an average width of 400 to 415 ft., a mean depth of 43 to 53 ft., and a velocity of 1 to 3 ft. in the second. The mean depth from the confluence of the Ticino (altitude 217 ft.) downwards is 6 to 15 ft. The river is embanked from Plaisance, and continuously from Cremona, the total length of the embankments being 600 m., its confinement between these high banks, and to the great amount of sedimentary matter which the river brings down with it, its bed has been gradually raised, so that in its lower course it is in many places 35 ft. above the surface of the surrounding country. Confining the stream between its containing banks is the rapid growth of the delta. Lombardini calculated that the annual increase in the area of the Po delta during the period 1700 to 1860 amounted to 127 acres; but during the period 1600 to 1850 it rose to 324 acres. Marini1 estimated that between the years 1823 and 1893 the annual increase was at the average rate of 173 to 175 acres, and the total accretion at about 20 sq. m.; and the total amount of alluvium deposited last year was estimated at 86 to 89 m.4 He further estimated that the Po della Maestra advances 871 ft. annually, the Po della Tolle 262 ft., the Po della Gnoca 111 ft., and the Po di Gor 295 ft. The low ground between the river and the lower Adige and the sea is known as Poisine, a name the derivation of which is much discussed. It is generally applied only to the province of Rovigo, but is sometimes extended to the neighbourhood of Adria and Ferrara. All along its course the Po has its side channels or canals, which are, at some points, connected with several of its tributaries by canals, and at the same time other canals connect the tributaries and carry off their waters and the remains of the Po in the Filadelfia. It is probable that the large dikes of the great rivers constructed in the country. It is possible that even they may have begun by crude dikes the great system by which the waters are now controlled; at least it is certain that these works date their origin from the pre-Roman antiquity. Pliny refers them to the Etruscans. The reclaiming and protecting of the riparian lands went on rapidly under the Romans, and in several places the rectangular divisions of the ground, still remarkably distinct, show the military character of some of the agricultural colonies. During the time of the Barbarian invasions much of the protective system was allowed to fall into decay; but the latter part of the middle ages saw the works re-established, and great efforts were made to surround the large estates. The present arrangement were in existence by the close of the 15th century.

The earlier Roman writers speak of the region between the northern boundaries of Etruria and Umbria and the Alps as Gallia pagana. It was severely ravaged by the Italian pirates and then the Rubicon being the boundary on the east, and the Arno the boundary on the west, so that, for example, Luca remained outside the boundaries of Italy proper, even in 89 B.C. Romanization had, however, progressed considerably, the foundations of colonies and the construction of roads had gone on during the 2nd century, and the whole district as far as the Po was given to the Roman franchise in B.C. while the Transpadanes received Latin rights, and were fully enfranchised forty years later. The Alpine Gaul was apparently formed into a province by Sulla in 81 B.C. and continued to be so until the fall of the Republic. See P. M. G. Scipio, who was Bochedonius, &c. (Sic.) and the bottomless. The name Padus was taken from the Cets or the Veneti. Thus we find Bodicinomagus as a town name (Industria) on the upper course, and Flada (Padua, Caesaraugusta, 7) as a name of the mouths of the river. The name Phocis (Tri- danus) of Greek poetry was identified with it at a comparatively late period.

POACH (probably from Fr. poche, bag, or Eng. "pock," thrust into), to trespass on private property in pursuit of game or fish; also, generally, to catch game or fish by means or at times not permitted by the law, or in an unsportsmanlike manner (see Game Laws). The etymology is rather obscure, but a more or less independent sense of "poaching" an egg, i.e. looking by breaking open boiling water, the word appears to be from the same original.

POBÉDONOSTSEV, CONSTANTINE PETROVICH (1827—1907), Russian jurist, state official, and writer on philosophical and literary subjects. Born in Moscow in 1827, he studied at the School of Law in St. Petersburg, and entered the public service as an official in one of the Moscow departments of the senate. From 1860 to 1865 he was professor of Russian civil law in the Moscow University, and instructed the sons of Alexander II. in the theory of law and administration. In 1868 he became a senator in St. Petersburg; in 1872 a member of the Russian diplomatic mission at Constantinople; and in 1876 procurator of the Holy Synod. He always showed himself a uncompromising Conservative, and never shrank from expressing boldly his opinions. Consequently, in the so-called Liberal camp he was always denounced as an "obscursantist" and an enemy of progress. In the early years of the reign of Alexander III. (1885—1881), Pobédonostsev maintained, though keeping aloof from the Slavophils, that Occidental institutions were radically bad in themselves and totally inapplicable to Russia. Parliamentary methods of administration, modern judicial organization and procedure, trial by jury, freedom of the press, secular education—these were among the principal objects of his aversion. He 1 See G. Marini, in Atti ist. senato sci., 8th series, vol. viii. (1866—1867); and "L’Accrescimento del Delta del Po nel secolo XIX."

" in Riv. Georg. Ital. (1898), vol. v. ---
subjected all of them to a severe analysis in his Reflections of a Russian Statesman (English by R. C. Long, London, 1908).

To these dangerous products of Occidental rationalism he found a counterpoise in popular vis inertiae, and in the respect of the masses for institutions developed slowly and automatically during the past centuries of national life. Among the practical deductions drawn from these premises is the necessity of preserving the autocratic power, and of fostering among the people the traditional veneration for the Ritual of the national Church. In the sphere of practical politics he exercised considerable influence by inspiring and encouraging the Russification policy of Alexander III. (1881-1894), which found expression in an administrative Nationalist propaganda and led to a good deal of religious persecution. After the death of Alexander III. he lost much of his influence, for Nicholas II., while clinging to his father’s Russification policy and even extending it to Finland, disliked the idea of systematic religious persecution, and was not wholly averse from the partial emancipation of the Russian Church from civil control. During the revolutionary tumult which followed the disastrous war with Japan Pobédonostsev, being nearly 50 years of age, retired from public affairs on the death of Nicholas II.

POCHARD, Pockard, or Poker,¹ names properly belonging to the male of a species of duck (the female of which is known as the Dunbird), the Anas ferina of Linnaeus, and Nyroca ferina of later ornithologists—but names very often applied by writers in a general way to most of the group or sub-family Fuligulinae, commonly called Diving or Sea-ducks (see DUCK). The Pochard in full plumage is a very handsome bird, with a coppery-red head, on the sides of which sparkle the ruby irides of his eyes, relieved by the greyish-blue of the basal half of his broad bill, and the deep black of his breast, while his back and flanks appear of a light grey, being really a dull white closely barred by fine undulating black lines above and below are black, the quill feathers brownish-black, and the lower surface of a dull white. The Dunbird has the head and neck reddish-brown, with ill-defined whitish patches on the cheeks and chin; the back and upper tail-coverts are dull brown, and the rest of the plumage, except the lower tail-coverts, which are brownish-grey, resembles that of the Pochard. This species is very abundant in many parts of Europe, northern Asia, and North America, generally frequenting in winter the larger open waters, and extending its migrations to Barbary and Egypt, but in summer retiring northward and inland to breed. The American Pochard is slightly larger, has yellow eyes, and is now regarded as specifically distinct under the name of Nyroca americana; but America has a perfectly distinct though allied species in the celebrated canvas-back duck, N. vallisneria, a much larger bird, with a longer, higher and narrower bill, which has no blue at the base, and, though the plumage of both, especially in the females, is very similar, the male canvas-back has a darker head, and the black lines on the back and flanks are much broken up and farther asunder, so that the effect is to give these parts a much lighter colour, and from this has arisen the bird’s common though fanciful name. Its scientific epithet is derived from the fresh-water plant, a species of Vallisneria, usually known as the duck’s flax, this false flax being believed to acquire the delicate flavour that is held in so great a repute. The Pochard and Dunbird in Europe are in much request for the table (as the German name of the species, Tafelente, testifies) when they frequent fresh-water; birds killed on the seacoast are so rank as to be almost worthless.

Among other species nearly allied to the Pochard that frequent the northern hemisphere may be mentioned the Scaup-Duck, Fuligula maria, with its American representative F. affinis, in both of which the male has the head black, glossed with blue or green; but these are nearly always unattractive from the nature of their food, which is mostly gathered at low tide on the “scaps,” a large mass of water and the basins on which muskets and other sea-molluscs grow in many places termed. Then there are the Tufted Duck, F. cristata—black with a crest and white flanks—and its American equivalent F. collaris, and the White-eyed Pochard, F. fusca, and the P. fringillaria, both of which are similar to the Old World, and well known in India. In the southern hemisphere the genus is represented by three species, F. capensis, F. australis and F. novaehollandiae, whose full-blown names indicate the country each inhabits, and in South America exists a somewhat divergent form which has been placed in a distinct genus as Metopiana pectorosa.

Nearly classified with the Fuligulinae is the small group known as the Eiders, which differ from them in several respects: the bulb at the base of the trachea in the male, so largely developed in the members of the genus Fuligula, is here much smaller and wholly of bone; the males take a much longer time, two or even three years, to attain their full plumage, and some of the feathers on the head, when that plumage is complete, are always still, glistering and of a peculiar pale-green colour. This little group of hardy mostly over half a dozen species may be fairly considered to form a separate genus under the name of Somateria. Many authors indeed have—unjustifiably, as it seems to the present writer—broken it up into four genera. The American Eider, S. mollissima, is the largest of this group, and, beautiful as it is, it is painful to the King-Duck, S. spectabilis, and the little S. stelleri. A most interesting form generally, but obviously in error, placed among the Eiders is the Long-tailed Duck, Fuligula Archeri, of Asia, (or more probably Tachyeres) cinerus of Chile, the Falkland Islands and Straits of Magellan—nearly as large as a tame goose, and subject to the, so far as known, unique peculiarity of losing its power of flight while a duckling. In its adult state it is described by C. Darwin in his Journal of Researches, and its anatomy is the subject of an excellent paper in the Zoological Society’s Transactions (vol. 149-501, pls. xvii.-xix.) by R. O. Cunningham.

POCKET, a small bag, particularly a bag-like receptacle either fastened to or inserted in an article of clothing. As a measure of capacity “pocket” is now only used for hops; it equals 168 lb. The word appears in Mid. Eng. as pocke, and is taken from a Norman diminutive of O. Fr. poque, pouque, mod. poche, cf. “pouch.” The form “pocket” is now only used dialectically, or in such proverbial sayings as “a pig in a pocket,” and possibly in the “poke-bonnet,” the coal-scuttle bonnet fashionable during the first part of the 19th century, and now worn by the female members of the Salvation Army; more properly, of course, the name of a “pock,” or “pocket,” to thrust forward, dir. The origin of this is obscure. Dutch has poken, pook, a dagger; Swedish päk, a stick.

POCKET-GOPHER (i.e. pouched rat), the name of a group of, chiefly North, American rat-like rodents, characterized by the possession of large cheek-pouches, the openings of which are external to the mouth; while their inner surface is lined with fur. The cheek-teeth, which comprise two pairs of premolars and three of molars in each jaw, are in the form of simple prisms of enamel, which do not develop roots. The fore and hind limbs are of approximately equal length, but the second and third front-claws are greatly enlarged, and all the claws are furnished at the base with bristles. The eyes are small, and the external ears rudimentary.

Pocket-gophers, which typify a family, the Geomyidae, spend the whole of their time underground, and are specially organized for such a mode of existence, their powerful claws being adapted for digging, while their toes on the toes prevent the earth from “passing between them.” The pouches are employed to loosen the ground, like a fork; and the little rodents are able to move both backwards and forwards in their runs. The cheek-teeth are employed in carrying food, which consists largely of roots. In the typical genus Geomys the upper incisors are grooved, but in the allied Thomomys they are smooth. The common pocket-gopher, Geomys bursarius, of the Mississippi Valley measures about one and a half inches, with a tail about ten inches long, which is rufous brown and greysly beneath. A well-known representative of the second genus is Thomomys talpoides, which is considerably smaller than the former. To the farmer and the gardener pocket-gophers are an unmitigated source of annoyance. (See Rodentia.)

POCKET-MOUSE, the name of a number of small jerboa-like, chiefly North, American rodents belonging to the family Geomyidae, and constituting the genus Perognathus and Heteromys. They are nearly allied to the American kangaroo-rats (see

¹The derivation of these words, in the first of which the ch is pronounced hard (though Dr Johnson made it soft), and the o in all of them generally long, is very uncertain. Congreve has pocheuiller (modern French pocheuiller), which he renders "Shoueler," nowadays the name of a kind of duck, but in his time meaning the bird we commonly call Spoonbill (q.v.). Littre gives pochard as a popular French word signifying drunkard.
POCOCK—PODĚBRAD

KANGAROO-RAT), but differ in having rooted molar teeth. The typical pocket-mouse P. fasciatus, which is a native of Montana, Missouri, and Wyoming, is a sandy-coloured rodent marked with black lines above and with white beneath, and measuring about 6 in. in length, this length being equally divided between the head and body and the tail. (See Rodentia.)

POCOCK, SIR GEORGE (1706–1792), British admiral, son of Thomas Pocock, chaplain in the navy, was born on the 6th of March 1706, and entered the navy under the protection of his maternal uncle, Captain Eyresham Master (1685–1724), in the "Superbe" in 1718. He became lieutenant in April 1725, commander in 1733, and post-captain in 1738. After serving in the West Indies he was sent to the East Indies in 1754 as captain of the "Cumberland" (58) with Rear-Admiral Charles Watson (1714–1757). Watson's squadron co-operated with Clive in the conquest of Bengal. In 1755 Pocock became rear-admiral, and was promoted vice-admiral in 1756. On the death of Watson he took the command of the naval forces in the eastern seas. In 1758 he was joined by Commodore Charles Stevens (d. 1761), but the reinforcement only raised the squadron to seven small line-of-battle ships, being in possession of a near naval force from their islands in the Indian Ocean into the Bay of Bengal to the assistance of Pondicherry. To intercept the arrival of these reinforcements for the enemy now became the object of Pocock. The French force was indeed of less intrinsic strength than his own. Count D'Aché (1700–1779), who commanded, had to make up his line by including several Indiamen, which were only armed merchant ships. Yet the number of the French was superior and Pocock was required by the practice of his time to fight by the old official fighting instructions. He had to bring his ships nimbly to a line against the enemy, and to preserve his formation while the engagement lasted. All Pocock's encounters with D'Aché were indecisive. The first battle, on the 29th of April 1758, failed to prevent the Frenchmen from reaching Pondicherry. After a second and more severe engagement on the 3rd of August, the French admiral returned to the Mauritius, and when the monsoon set in Pocock went round to Bombay. He was back early in spring, but the French admiral did not return to the Bay of Bengal till September. Again Pocock was unable to prevent his opponent from reaching Pondicherry, and a well-contested battle between them on the 10th of September 1759 proved inconclusive. The French admiral was nearly bankrupt, and D'Aché could get no stores for his squadron. He was compelled to return to the islands, and the English were left in possession of the Coromandel and Malabar coasts. Pocock went home in 1760, and in 1761 was made Knight of the Bath and admiral. In 1762 he was appointed to the command of the naval forces in the combined expedition which took Havana. The siege, which began on the 7th of June, and lasted till the 13th of August, was rendered deadly by the climate. The final victory was largely attributable to the vigorous and intelligent aid which Pocock gave to the troops. His share in the prize-money was no less than £24,607. On his return to England Pocock is said to have been disappointed because another officer, Sir Charles Saunders (1713–1775), was chosen in preference to himself as a member of the admiralty board, and to have resigned in consequence. It is certain that he resigned his commission in 1766. He died on the 3rd of April 1792. His monument is in Westminster Abbey.

POCOCKE, EDWARD (1604–1661), English Orientalist and biblical scholar, was born in 1604, the son of a Berkshire clergyman, and received his education at the free school of Thame in Oxfordshire and at Corpus Christi College, Oxford (scholar in 1620, fellow in 1628). The first-fruits of his studies was an edition of the Bodleian MS. of the New Testament (2 Peter 2 and John 20) which were not in the old Syriac canon, but were in circulated in European editions of the Peshito. This was published at Leiden at the instigation of G. Vossius in 1630, and in the same year Pocock sailed for Aleppo as chaplain to the English factory. At Aleppo he made himself a profound Arabic scholar, and collected many valuable MSS. At this time Wm. Laud was bishop of London and chancellor of the university of Oxford, and Pococke became known to him as one who could help his schemes for enriching the university. Laud founded an Arabic chair at Oxford, and invited Pococke home to fill it, and he entered on his duties on the 10th of August 1636; but next summer he sailed again for Constantinople to prosecute further studies and collect more books, and remained there for about three years. When he returned to England Laud was in the Tower, but had taken the precaution to place the Arabic chair in a permanent footing. Pococke does not seem to have been an extreme churchman or to have meddled actively in politics. His rare scholarship and personal qualities raised him up influential friends among the opposite party, foremost among these being John Selden and John Owen. Through their offices he was even advanced in 1648 to the chair of Hebrew, though as he could not take the engagement of 1649 he lost the emoluments of the post soon after, and did not recover them till the Restoration. These cares seriously hampered Pococke in his studies, as he complains in the preface to his Euthychius; he seems to have felt deeply the attempts to remove him from his parish of Childrey, a college living which he had accepted in 1645. In 1649 he published the Specimen historiae arabum, a short account of the origin and manners of the Arabs, taken from Barbebrasus (Abulfaragi), with notes from a vast number of MS. sources which are still valuable. This was followed in 1655 by the Porta Mosis, extracts from the Arabic commentary of Maimonides on the Mishna, with translation and very learned notes; and in 1656 by the annals of Euthychius in Arabic and Latin. He also gave active assistance to Brian Walton'spolyglot bible, and the preface to the various readings of the Arabic Pentateuch is from his hand. After the Restoration Pococke's political and pecuniary troubles were removed, but the reception of his Magnum opus—a complete edition of the Arabic history of Barbebrasus (Greg. Abulfaragii historia compendiosa dynastiarum), which he dedicated to the king in 1663, showed that the new order of things was not very favourable to profound scholarship. After this his most important works were a Lexicon heptaplodon (1669) and English commentaries on Micah (1677), Malachi (1677), Hosea (1685) and Joel (1691), which are still worth reading. An Arabic translation of Grotius's De veritate, which appeared in 1660, may also be mentioned as a proof of Pococke's interest in the propagation of Christianity in the East. This was an odd plan, which he had talked over with Grotius at Paris on his way back from Constantinople. Pococke married in 1646, and died in 1691. One of his sons, Edward (1648–1727), published several contributions to Arabic literature—a fragment of Abdallatif's description of Egypt and the Philosophus autodidactus of Ibn Tufail.

The theological works of Pococke were collected, in two volumes, in 1746, with a curious account of his life and writings by L. Twells.

PODĚBRAD, GEORGE OF (1420–1471), king of Bohemia, was the son of Victorin of Kunstat and Poděbrad, a Bohemian nobleman, who was one of the leaders of the "Orphans" or modern Taborites during the Hussite wars. He himself, as a boy of fourteen took part in the great battle of Lipan, which marks the downfall of the more advanced Taborites. Early in life, as one of the leaders of the Calixtine party, he defeated the Austrian troops of the German King Albert II., son-in-law and successor of King Sigismund. He soon became a prominent member of the national or Calixtine party, and after the death of Ptacek of Pirkstein its leader. During the minority of Ladislas, son of Albert, who was born after his father's death, Bohemia was divided into two parties—the Romanist or Austrian one, led by Ulrich von Rosenberg (1430–1452), and the national one, led by Poděbrad. After various attempts at reconciliation, Poděbrad decided to appeal to the justice of arms. He gradually raised an armed force in north-eastern Bohemia, where the Calixtine cause had most adherents and where his ancestral castle was situated. With this army, consisting of about 3000 men, he marched in 1448 from Kutna Hora to Prague, and obtained possession of the capital almost without resistance. Civil war, however, broke
out, but Podébrad succeeded in defeating the Romanist nobles. In 1451 the emperor Frederick III., as guardian of the young king Ladislav, entrusted Podébrad with the administration of Bohemia. In the same year a diet assembled at Prague also conferred on Podébrad the regency. The struggle of the Bohemians against Rome continued uninterruptedly, and the position of Podébrad became a very difficult one when the young king Ladislav, who was crowned in 1453, expressed his sympathies for the Roman Church, though he had recognized the compacts and the ancient privileges of Bohemia. In 1457 King Ladislav died suddenly, and public opinion from an early period accused Podébrad of having poisoned him. The Bohemian historians, Palacky, fifty years ago thoroughly supported this accusation, and, though it has recently been revived by German historians, it must undoubtedly be considered as a calumny. On the 27th of February 1458 the estates of Bohemia unani-

mously chose Podébrad as king; even the adherents of the Austrian party voted for him, not wishing at that moment to oppose the popular feeling, which demanded the election of a national sovereign. A year after the accession of Podébrad Pius II. (Aeneas Sylvius) became pope, and his incessant hostility proved one of the most serious obstacles to Podébrad’s rule. Though he rejected the demand of the pope, who wished him to consent to the abolition of the compacts, he endeavoured to carry-forward with the Roman see by punishing severely all the more advanced opponents of papacy in Bohemia. Podébrad’s persecution of the newly-founded community of the Bohemian brethren is certainly a blemish on his career. All Podébrad’s endeavours to establish peace with Rome proved ineffectual, and though the rule of Pius II. prevented him from carrying out his planned crusade against Bohemia, his successor was a scarcely less bitter enemy of the country. Though the rule of Podébrad had proved very successful and Bohemia had under it obtained a degree of prosperity which had been unknown since the time of Charles IV., the Calixtine king had many enemies among the Romanist members of the powerful Bohemian nobility. The malcontent nobles met at Zelena Hora (Grineberg) on the 28th of November 1465, and concluded an alliance against the king, bringing forward many—mostly untrue—accusations against him. The confederacy was from its beginning supported by the Roman see, though Podébrad after the death of his im-

placed enemy, Pius II., attempted to negotiate with the new pope, Paul II. These negotiations ended when the pontiff grossly insulted the envoys of the king of Bohemia. On the 23rd of December 1466 Paul II. excommunicated Podébrad and pronounced his deposition as king of Bohemia, forbidding all Romanists to continue in his allegiance. The emperor Frederick III., and King Matthias of Hungary, Podébrad’s former ally, joined the insurgent Bohemian nobles. King Matthias conquered a large part of Moravia, and was crowned in the capital of that country, Brno (Brünn), as king of Bohemia on the 3rd of May 1469. In the following year Podébrad was more successful in his resist-

ance to his many enemies, but his death on the 22nd of March 1471 put a stop to the war. In spite of the misfortunes of the last years of his reign, Podébrad’s memory has always been cherished by the Bohemians. He was the only king of Bohemia who belonged to that nation, and the only one who was not a Roman Catholic.

See H. Markgraf,  Über das Verhältniss des Königs Georg von Podébrad zu Papst Pius II. (1867); Jordan, Das Königshum Georgs von Podébrad (1861); A. Bachmann, Ein Jahr böhmischer Geschichte (1876), and Urbkund... zur oesterrische Geschichte... im Zeitalter Georgs von Podébrad (1879); E. W. Kanter, Die Ermordung König Ladislaus (1900); Novotny, Über den Tod König Ladislaus (1906). All histories of Bohemia, particularly that of F. Palacky (1836-1867), contain detailed accounts of the career of King George of Podébrad.

PODEŠTÁ (Lat. postes, power), the name given during the later middle ages to a high official in many Italian cities. Pode-

štás or rectors were first appointed by the emperor Frederick I. when about 1158 he began to assert his Imperial rights over the cities of northern Italy. Their business was to enforce these rights; from the first they were very unpopular, and their arbitrary behaviour was a factor in bringing about the formation of the Lombard league and the rising against Frederick in 1167.

Although the emperor’s experiment was short-lived podestás soon became general in northern Italy, making their appearance in most communes about 1200. These officials, however, were now appointed by the citizens or by their representatives. They exercised the supreme power in the city, both in peace and war, both in foreign and domestic matters, but they only held office for a period of a year. In order to avoid the intestine strife so common in Italian civic life, it soon became the custom to select a stranger to fill this position. Venetians were in frequent request for this purpose during the 12th and 13th cen-

turies, probably because at this time, at least, they were less concerned than other Italians in the affairs of the mainland. Afterwards in a few cases the term of office was extended to cover a period of years, or even a lifetime.

During the later part of the 12th and the whole of the 13th century most of the Italian cities were governed by podestás. Concerning Rome, Gregorovius says that in 1205 "the pope changed the form of the civic government; the executive power lying henceforward in the hand of a single senator or podestá, who, directly or indirectly, was appointed by the pope." In Florence soon after 1180 the chief authority was transferred from the consuls to the podestá, and Milan and other cities were also ruled by these officials. There were, moreover, podestás in some of the cities of Provence. Gradually the podestás became more despotic and more corrupt, and sometimes a special official was appointed to hear complaints against them; in the 13th century in Florence and some other cities a capitano del popolo was chosen to look after the interests of the lower classes. In other ways also the power of the podestás was reduced; they were confined more and more to judicial functions until they disappeared early in the 16th century.

The officials who were sent by the Italian republics to admin-

ister the affairs of dependent cities were sometimes called podestás. At the present day the cities of Trent and Trieste give the name of podestá to their chief magistrate.

The example of Italy in the matter of podestás was sometimes followed by cities and republics in northern Europe in the middle ages, notably by such as had trade relations with Italy. The officers thus elected sometimes bore the title of podestá or podestat. Thus in East Friesland there were podestás identical in name and functions with those of the Italian republics; sometimes each province had one, sometimes the federal diet elected a podestá-general for the whole country, the term of office being for a limited period or for life (see J. L. Motley, Dutch Republike, i. 44, ed. 1903).

Lists of the Italian podestás are given in Stokvis, Manuel d’histoire; vol. iii. (Leiden, 1869). See also W. F. Butler, The Lombard Comunes (1906).

PODGORITSA (Croatian, Podgorica), the largest town in Monten-

genoe; on the left bank of the river Moracha, and in a fertile valley which strikes inland for 18 m. from the shores of Lake Scutari to the mountains of central and eastern Montenegro. Pop. (1900), about 5500. Spread out on a perfectly flat plain, Podgorica has two distinct parts: the picturesque Turkish quarter, with its mosques and ruined ramparts, and the Monten-

egrin quarter, built since 1877, and containing a prison and an agricultural college. These quarters are separated by the river Ribnita, a tributary of the Moracha. A fine old Turkish bridge crosses the main street. Podgorica is the crossing of the plains and the north-eastern highlands a great quantity of tobacco, fruit, cereals, honey, silk, livestock and other commodities, which it distributes through Plavnitsa, its port on Lake Scutari, and through Ryeka to Cettigne and Cattaro. After being captured from Turkey in 1877, Podgoritsa was in 1878 recognized as Montenegrin territory by the Treaty of Berlin.

PODIUM (Gr. ποδίων, diminutive of ποδός, foot), the name in architecture for a continuous pedestal, or low wall on which columns are carried, consisting of a cornice or capping, a dado or die, and a moulded plinth. In the Etruscan and Roman temples
the whole structure was raised on a podium, with a flight of steps on the principal front, enclosed between the prolongation of the podium wall.

PODOLIA, a government of south-western Russia, having Volhynia on the N., Kiev and Kherson on the E. and S., Bessarabia on the S.W., and Galicia (Austria) on the W., from which it is separated by the Zbrucz, or Rodovcha, a tributary of the Dniester. It has an area of 16,219 sq. m., extending for 200 m. from N.W. to S.E. on the left bank of the Dniester. In the same direction the government is traversed by two ranges of hills separated by the Bug, ramifications of the Avrattyak heights. These hills nowhere exceed an elevation of 1185 ft. Two large rivers, which numerous tributaries, drain the government—the Dniester, which forms its boundary with Bessarabia and is navigable throughout its length, and the Bug, which flows almost parallel to the former in a higher, sometimes swampy, valley, and is interrupted at several places by rapids. The Dniester is an important channel for trade, corn, spirits and timber being exported from Mogilev, Kalus, Zhabnoi., Porog and other Podolian river-ports. The rapid smaller tributaries of the Dniester supply numerous flour-mills with motive power. The soil is also black in the Podol, and one of the most fertile governments of Russia. Forests cover nearly 15% of the total area. Marshes occur only beside the Bug. The climate is moderate, the average temperature of the year at Kamenets being 48°3" (24°5" in January, 69° in July).

The estimated population in 1906 was 3,543,700. It consists chiefly of Little Russians, Poles (34%), and Jews (12%). There are besides a few Armenians, some Germans, and 50,000 Moldavians. There are many Nonconformists (48,000) among the Russians, Tulchin being the seat of their bishops and a centre of propaganda. After Moscow, Podolia is the most densely inhabited government of Russia outside Poland. It is divided into twelve districts, the chief towns of which are Kamienets, Podolsky, the capital, Balta, Bratslav, Gaisin, Letichev, Litin, Mogilev-on-Dniester, Novaya-Ushitsa, Olopol, Prokurov, Vinnitsa and Yampol. The chief occupations of the people are agriculture and gardening. The principal crops are wheat, rye, oats, barley, maize, hemp, flax, potatoes, beetroot and tobacco. Podolia is famous for its cherries and mulberries, its melons, gourds and cucumbers. Nearly 67,000 gallons of wine are obtained annually. Large numbers of horses, cattle and sheep are bred, the cattle being famous. Bee-keeping is an important industry. Sugar factories, distilleries, flour-mills, woolen mills, tanneries, potteries, tobacco factories, flour-mills, and soap factories, have an annual output valued at £4,000,000. An active trade is carried on with Austria, especially through the Isakovets and Gusyatim custom-houses, corn, cattle, horses, skins, wool, linseed and hemp seed being exported, in exchange for wooden wares, linen, woolen stuffs, cotton, glass and agricultural implements. The trade with the interior is also carried on very briskly, especially at the twenty-six fairs, the chief of which are Balta and Yarmolintsy. Podolia is traversed by a railway which runs parallel to the Dniester, from Lemberg to Odessa, and has two branch lines, to Kiev (from Zhmerinka) and to Poltava (from Balta).

History. The country has been inhabited since the beginning of the Neolithic period. Herodotus mentions it as the seat of the Graeco-Scythian Alazones and the Scythian Neuri, who were followed by the Dacians and the Getae. The Romans left traces of their rule in the Wall of Trajan, which stretches through the modern districts of Kamienets, Ushitsa and Prokurov. During the great migrations many nationalities passed through this territory, or settled within it for some time, leaving traces in numerous archaeological remains. Nestor mentions that the Bujanes and Dulebes occupied the Bug, while the Tvertsi and Ugiches, apparently all four Slav tribes, were settled on the Dniester. These peoples were conquered by the Avars in the 7th century. Oleg, prince of Kiev, extended his rule over this territory—the Ponizie, or "lowlands," which became later a part of the principalities of Volhynia, Kiev and Galicia. In the 13th century the Ponizie was plundered by the Mongols; a hundred years afterwards Oligerd, prince of Lithuania, freed it from their rule, annexing it to his own territories under the name of Podolia, a word which has the same meaning as Ponizie. After the death of the Lithuanian prince Viatov, Podolia was annexed to Poland, with the exception of its eastern part, the province of Bratslav, which remained under Lithuania until its union (1569) with Poland. The Poles retained Podolia until the third division of their country in 1793, when it was taken by Russia.

PULSK, a town of Russia, in the government of Moscow, 26 m. S. of the city of Moscow, at the junction of the two main roads from Moscow to the Crimea and to Warsaw. Pop. (1881), 11,000; (1897), 3808. It is picturesquely built on the hilly banks of the Pakhra, here crossed by a suspension bridge for carriages as well as by the railway bridge. Down to 1781 the wealthy village of Podol was a dependency of the Danilov monastery in Moscow. Before the opening of the southern railway the caravans of wagons and sledges to and from Moscow used to halt here; the principal occupation of the inhabitants was inkeeping and supplying the caravans with provisions and other necessaries of travel. The limestone quarries, at the confluence of the Pakhra and the Moskva, furnish a capital building material; and there are a cement, lime and brick factory and a paper-mill.

PODOPHYLLIN, a drug obtained from the rhizome of the American mandrake or may apple, Podophyllum peltatum, an herbaceous perennial belonging to the natural order Berberidaceae, indigenous in woods in Canada and the United States. The plant is about 1 ft. high, bearing two peltate, deeply-divided leaves, which are about 5 in. in diameter, and bear in the axill a solitary, stalked, white flower, about the size and shape of the garden anemone, with six or more petals and twice as many hypogynous stamens. The fruit is ripe in July, and consists of a yellow or yellowish-yellow berry, containing three seeds, each surrounded by a pulpy outer coat or aril. The rhizome, as met with in commerce, occurs in cylindrical pieces 2 or 3 in. long and about 3/4 in. in diameter, of a chocolate or purplish-brown colour, smooth, and slightly enlarged where the juncture of the leafy stem is indicated by a circular scar on the upper and a few broken rootlets on the under side. The odour is heavy and disagreeable, and the taste acid and bitter.

Podophyllin is a resinous powder obtained by precipitating an alcoholic tincture of the rhizome by means of water acidulated with hydrochloric acid. It varies in colour from greyish to yellow or greenish-brown, the first-named being the better. The powder is soluble in alcohol and strong solutions of alkalis, such as ammonia. Its composition is somewhat complex. There are certainly at least two resins in it: a powerful resin called podophyll resin, consisting of them being soluble and the other insoluble in ether. Each of this contains an active substance, which can be obtained in crystalline form, and is known as podophyllotoxin. It is soluble in alcohol, ether, chloroform and boiling water. Alkalis decompose it into picro-podophyllelic acid and picro-podophyllin, minute traces of both of which occur in a free state in the rhizome. The acid is inert, but picro-podophyllin is the active principle. It is a crystalline body, soluble only in concentrated alcohol. Hence the instability of the pharmaceutical tinctura podophylli, which cannot be diluted before administration.

The properties of podophyllin resin vary with the reaction of the fluid in which it is in contact; where this is acid the drug is inert, the picro-podophyllin being precipitated.

The resin does not affect the unbroken skin, but may be absorbed from a raw surface, and will then cause purging. When taken internally it is both a secretory and an excretory cathartic, but so irritating and powerful that its use in cases of jaundice is generally undesirable. Its value, however, in certain cases of constipation of hepatic origin is undeniable. It acts chiefly on the biliary and auxiliary to aloes. The best method of prescribing podophyllin is in pill form. In toxic doses podophyllin causes intense enteritis, with all its characteristic symptoms, and severe depression, which may end in death. The treatment is symptomatic, there being no specific antidote.

POE, EDGAR ALLAN (1809-1849), American poet, writer of fiction and critic, was born at Boston, Massachusetts, on the 19th of January 1809. The family was of English origin, but was settled in Ireland, whence the poet's great-grandfather emigrated to Maryland. His grandfather, David Poe, served with credit as
soldier in the War of Independence, was known to Washington, and was the friend of Lafayette. His son David Poe was bred as a lawyer, but deeply offended his family by marrying an actress of English birth, Mrs Elizabeth Hopkins, the Arnold, and by himself going on the stage. In 1811 he and his wife died, leaving three children—William, Edgar, and a daughter Rosalie—who died destitute. William died young, and Rosalie became mad. Edgar was adopted by John Allan, a tobacco merchant of Scottish extraction, seemingly at the request of his wife, who was childless. The boy was indulged in every way, and encouraged to believe that he would inherit Mr Allan’s fortune. Mr Allan, having come to England in 1815, placed Edgar in a school at Stoke Newington, kept by a Dr Bransby. In 1820 Mr Allan returned to Richmond, Virginia, and Edgar was first placed at school in the town and then sent to the university of Virginia at Charlottesville in 1826. Here the effects of a very unwise training on a temperament of inherited neurotic tendency were soon seen. He was fond of athletics, and was a strong and ardent swimmer; but he developed a passion for gambling and drink. His disorders made it necessary to remove him, and he was taken away by Mr Allan, who refused to pay his debts of honour. He enlisted on the 26th of May 1829 at Boston, and served for two years in the United States army. As a soldier his conduct must have been exemplary, for he was promoted sergeant-major on the 1st of January 1829. It is to be noted that throughout his life, when under orders, Poe could be a diligent and capable subordinate. In May 1829 Mr Allan secured his discharge from the army, and in 1830 obtained a nomination for him to the West Point military academy. As a student he showed considerable faculty for mathematics, but his aloofness prevented him from being popular with his comrades, and he neglected his duty. When courtmartialed he made no answer to the charges, and was expelled on the 6th of March 1831. Mr Allan’s generosity was now exhausted. The death of his first wife in 1829 had doubtless removed an influence favourable to Poe. A second marriage brought him children, and at his death in 1834 he left his adopted son nothing. A last meeting between the two, shortly before Mr Allan’s death, led only to a scene of painful violence.

In 1827 Poe had published his first volume of poetry, Tamerlane and other Poems, at Boston. He did not publish under his name, but as “A Bostonian.” In 1831 he published a volume of Poems under his name at New York. His life immediately after he left West Point is very obscure, but in 1833 he lived at Baltimore with his paternal aunt, Mrs Clemm, who was throughout life his protector, and, if so far as extreme poverty permitted, his support. In 1835 he won a prize of $700 offered for the best story in the Baltimore Saturday Visor. In 1838 he have won the prize for the best poem if the judges had not thought it wrong to give both rewards to one competitor. The story, MS. found in a Bottle, is one of the most mediocre of his tales, but his success gave him an introduction to editors and publishers, who were attracted by his striking personal appearance and his fine manners, and were touched by his manifest poverty. From 1833 till his death he was employed on different magazines at Richmond, New York and Philadelphia. His famous poem “The Raven” was published first in 1845, and soon became extraordinarily popular; but Poe only got £1 for it. The facts of his life have been the subject of very ill-judged controversy. The acrimonious tone of the biography by Rufus Griswold, prefixed to the first collected edition of his works in 1850, gave natural offence, and attempts have been made to show that the biographer was wrong as to the facts. But it is no real kindness to Poe’s memory to deny the sad truth that he was subject to chronic alcoholism. He was not a boon companion, and never became callous to his vice. When it seized him he drank raw spirits, and was disordered by a very little. But when he was free from the maddening influence of alcohol he was gentle, well-bred, and a hard worker on the staff of a magazine, willing and able to write reviews, answer correspondents,propound riddles or invent and solve cryptograms. His value as a contributor and sub-editor secured him successive engagements on the Southern Literary Messenger of Richmond, on the New York Quarterly Review, and on Graham’s Magazine at Philadelphia. It enabled him in 1843 to have a magazine of his own, the Stylus. His mania sooner or later broke off all his engagements and ruined his own venture. In 1835 he married his cousin, Virginia Clemm, a beautiful girl of fourteen years of age. A false statement as to her age was made at the time of the marriage. She died after a long decline in 1847. Poe made two attempts to marry women of fortune—Mrs Whitman and Mrs Shelton. The first of these engagements was broken off. The second was terminated by his death in hospital at Baltimore, Md., on the 7th of October 1849.

His life and death had many precedents, and will always recur among Bohemian men of letters and artists. What was individual in Poe, and what alone renders him memorable, was his narrow but profound and original genius (see American Literature). In the midst of much hack-work and not a few failures in his own field he produced a small body of verse, and a handful of short stories of rare and peculiar excellence. The poems express a melancholy sensuous emotion in a penetrating melody all his own. The stories give form to horror and fear with an exquisite exactness of touch, or construct and unravel mysteries with extreme dexterity. He was a conscientious literary artist and good critic, but he was capable of great successes and good failures, though often commonplace and sometimes ill-natured, as when he attacked Longfellow for plagiarism, was trenchant and sagacious at his best.

BIBLIOGRAPHY.—The Life and Letters of Edgar Allan Poe, by J. A. Harrison (New York, 1902) and The Life of Edgar Allan Poe (Boston, new ed. 1909), by G. E. Woodberry, are the best biographies. The standard edition of his Works is that published in 1894-1895 at Chicago, in ten volumes, by E. C. Stedman and G. E. Woodberry. There have been many partial reprints. For Poe’s influence in France, which has been great, see C. Baudelaire, Histoire extraordinaires (Paris, 1880); S. Mallarmé, Poèmes d’Edgar Poe (Brussels, 1888); and Les Néoortés, by Arvéde Barine (Paris, 1899). (D. H.)

POERIO, ALESSANDRO (1802–1848), Italian poet and patriot, was descended from an old Calabrian family, his father, Baron Giuseppe Poerio, being a distinguished lawyer of Naples. In 1815 he and his brother Carlo accompanied their father, who had been identified with Murat’s cause, into exile, and settled at Florence. In 1818 they were allowed to return to Naples, and on the proclamation of the constitution in 1820 the Poerios were among the stoutest defenders of the newly-won freedom. Alessandro fought as a volunteer, under General Guglielmo Pepe, against the Austrians in 1821, but when the latter reoccupied Naples he fled to the king of the Two Sicilies; the constitution, the family was exiled and settled at Grätz. Alessandro devoted himself to study in various German universities, and at Weimar he became the friend of Goethe. In 1835 the Poerios returned to Naples, and Alessandro, while practising law with his father, published a number of lyrics. In 1848 he accompanied Pepe as a volunteer to fight the Austrians in northern Italy, and on the recall of the Neapolitan contingent Alessandro followed Pepe to Venice and displayed great bravery during the siege. He was severely wounded in the fighting round Mestre, and died on the 3rd of November 1848. His poetry “reveals the idealism of a tender and delicate mind which was diligent in storing up sensations and images that for others would have been at most the transient impressions of a moment.” But he could also sound the clarion note of patriotism, as in his stirring poem Il Risorgimento.

His brother Carlo (1803–1867), after returning to Naples, practised as an advocate, and from 1837 to 1848 was frequently arrested and imprisoned; but when King Ferdinand, moved by the demonstration of the 27th of January of the latter year, promulgated a constitution, he was made minister of education. Discovering, however, that the king was acting in bad faith, he resigned office in April and returned to Naples to take his seat in parliament, where he led the constitutional opposition. The Austrian victory of Novara (March 1849) set the king free to dissolve parliament and trample on the constitution, and on the 19th of July 1849 Poerio was arrested, tried, and condemned to
nineteen years in irons. Chained in pairs, he and other political prisoners were confined in one small room in the bagno of Nisida, near the lazaretto. The eloquent exposure (1831) of the horrors of the Nisida prison dungeons by Gladstone, who emphasized especially the case of Poerio, awakened the universal indignation of Europe, but he did not obtain his liberty till 1858. He and other exiles were then placed on board a ship bound for the United States, but the son of Settembrini, another of the exiles, who was on board in disguise, compelled the crew to land them at Cork, whence Poerio made his way to London. In the following year he returned to Italy, and in 1860 he was elected deputy to the parliament of Turin, of which he was chosen vice-president in 1861. He died at Florence on the 28th of April 1867.

**POETRY.** In modern criticism the word poetry (i.e. the art of the poet, Gr. ποιητής, maker, from ποιέω, to make) is used sometimes to denote any expression (artistic or other) of imaginative feeling, sometimes to designate a precise literary art, which ranks as one of the fine arts. As an expression of imaginative feeling, as the movement of an energy, as one of those great primal human forces which go to the development of the race, poetry in the wide sense has played as important a part as science, religion, art and other literatures (such as that of England) poetic energy and in others (such as that of Rome) poetic art is the dominant quality. It is the same with individual writers. In classical literature Pindar may perhaps be taken as a type of the poets of energy; Virgil of the poets of art. With all his wealth of poetic art Pindar's mastery over symmetrical methods never taught him to "sow with the hand," as Corinna declared, while his poetic energy always impelled him to "sow with the whole sack." In English poetical literature Elizabeth Barrett Browning typifies, perhaps, the poets of energy; while Keats (notwithstanding all his unquestionable inspiration) is mostly taken as a type of the poets of art. In French literature Hugo, notwithstanding all his mastery over poetic methods, represents the poets of energy.

In some writers, and these the very greatest—in Homer, Aeschylus, Sophocles, Dante, Shakespeare, Milton, and perhaps Goethe—poetic energy and poetic art are seen in something like equipoise. It is of poetry as an art, however, that we have mainly to speak here; and all we have to say upon poetry as an energy is that the critic who, like Aristotle, takes this wide view of poetry—the critic who, like him, recognizes the importance of poetry in its relations to man's other expressions of spiritual force, claims a place in point of true critical sagacity above that of a critic who, like Plato, fails to recognize that importance. And assuredly no philosophy of history can be other than inadequate should it ignore the fact that poetry has had as much effect upon human destiny as that other great human energy by aid of which, from the discovery of the use of fire to that of the electric light, the useful arts have been developed.

With regard to poetry as an art, most of the great poems of the world are dealt with elsewhere in this work, either in connexion with the names of the writers or with the various literatures to which they belong; consequently these remarks must be confined to general principles. Under _Vox_ the detailed questions of prosody are considered; here we are concerned with the essential principles which underlie the meaning of poetry as such.

All that can be attempted is to inquire into the position it takes up in relation to the other arts?

1. What is Poetry?—Definitions are for the most part alike unsatisfactory and treacherous; but definitions of poetry are proverbially so. Is it possible to lay down invariable principles of poetry, such as those famous "invariable principles" of William Lisle Bowles, which in the earlier part of the century awe the admiration of Southey and the wrath of Byron? Is it possible for a critic to say of any metrical phrase, stanza or verse, "This is poetry," or "This is not poetry"? Can he, with anything like the authority with which the man of science pronounces upon the natural objects brought before him, pronounce upon the qualities of a poem? These are questions that have engaged the attention of critics ever since the time of Aristotle. Byron, in his rough and ready way, answered them in one of those letters to his publisher John Murray, which, rich as they are in nonsense, are almost as rich in sense. "So far are principles of poetry from being invariable," says he, "that they never were nor ever will be settled. These principles mean nothing more than the predilections of a particular age, and every age has its own and a different from its predecessor. It is now Homer and now Virgil; once Dryden and since Sir Walter Scott; now Cornelle and now Racine; now Crébillon and now Voltaire." This is putting the case very strongly—perhaps too strongly. But if we remember that Sophocles lost the first prize for the _Oedipus tyrannus_; if we remember what in Dante's time (owing partly, no doubt, to the universal ignorance of Greek) were the relative positions of Homer and Virgil, what in the time of Milton were the relative positions of Milton himself, of Shakespeare, and of Beaumont and Fletcher; again, if we remember Jeffreys's famous classification of the poets of his day, we shall be driven to pause over Byron's words before dismissing them. Yet some definition, for the purpose of this essay, must be here attempted; and, using the phrase "absolute poetry" as the musical critics use the phrase "absolute music," we may, perhaps, without too great presumption submit the following—

**Absolute poetry is the concrete and artistic expression of the human mind in emotional and rhetorical language.**

This at least will be granted, that no literary expression can, properly speaking, be called poetry that is not in a certain deep sense emotional, whatever may be its subject-matter, concrete in its method and its diction, rhetorical in movement, and artistic in form.

That the expression of all real poetry must be concrete in method and diction is obvious, and yet this dictum would exclude from the definition much of what is called didactic poetry. With abstractions the poet has nothing to do, save to take them and turn them into concretions; for, as artist, he is simply the man who by instinct embodies in concrete forms that "universal idea" which Gravina speaks of—that which is essential and elemental in nature and in man; as poetic artist he is simply the man who by instinct chooses for his concrete forms metrical language. And the questions to be asked concerning any work of art are simply these—Is that which is here embodied really permanent, universal and elemental? and, Is the concrete form embodying it really beautiful—acknowledged as beautiful by the soul of man in its highest moods? Any other question is an impertinence.

As an example of the absence of concrete form in verse take the following lines from George Eliot's _Spanish Gypsy_:

"Speech is but broken light upon the depth Of the unspoken; even your loved words Float in the larger meaning of your voice As something dimmer."

Without discussing the question of blank verse cadence and the weakness of a line where the main accent falls upon a positive hiatus, "of the unspoken," we would point out that this powerful passage could not be written in _concrete_ form. The abstract method is substituted for the concrete. Such an abstract phrase as "the unspoken" belongs entirely to prose.

As to what is called ratiocinative poetry, it might perhaps be shown that it does not exist at all. Not by syllogism, but _per saltum_, must the poet reach in every case his conclusions. We listen to the poet—we allow him to address us in rhythm or in rhyme—we allow him to sing to us while other men are only
POETRY

allowed to talk, not because he argues more logically than they, but because he feels more deeply and perhaps more truly. It is for his listeners to be knowing and ratiocinative; it is for him to be gnomic and divinatory. To say that a thing is to be metrical or even rhythmical in movement, however, is what some have denied. Here we touch at once the very root of the subject. The difference between all literature and mere "word-kneading" is that, while literature is alive, word-kneading is without life. This literary life, while it is only bipartite in prose, seems to be tripartite in poetry; that is to say, while prose requires intellectual life and emotional life, poetry seems to require not only intellectual life and emotional life but rhythmic life, this last being the most important of all according to many critics, though Aristotle is not among these. Here indeed is the "fork" between the old critics and the new. Unless the rhythm of any metrical passage is so vigorous, so natural, and so free that it seems as though it could live, if need were, by its rhythm alone, has that passage any right to exist? and s'would it not, if the substance is good, be forthwith demirized and turned into prose? Thoreau has affirmed that prose, at its best, has high qualities of its own beyond the ken of poetry; to compensate for the sacrifice of these, should not the metrical gains of any passage he beyond all cavil?

This argument might be pressed farther still. It might seem bold to assert that, in many cases, the mental value of poetry may be increased by metrical or rhythmic forms and not words if it be true? The mental value of poetry must be judged by a standard not applicable to prose; but, even with regard to the different kinds of poetry, we must not compare poetry whose mental value consists partly in the suggestive richness of passion or symbol latent in rhythm (such as that of Sophocles sometimes, Pindar often, Shelley always), or latent in colour, such as that of some of the Persian poets. To discuss the question, Which of these two kinds of poetry is the more precious? would be led by us not driven to do, but that certain poems whose style is rhythm, and certain other poems whose style is colour, while devoid of any logical statement of thought, may be as fruitful of thoughts and emotions as bees in a honeycomb, though the fruit of the bees is not light.

The mental forces at work in the production of a poem like the Excursion are of a very different kind from the mental forces at work in the production of a poem like Shelley's "Ode to the West Wind." In the one case the poet's artistic methods, like those of the Greek architect, show, and are intended to show, the solid strength of the structure. In the other, the poet's artistic methods, like those of the Arabian architect, contradict the idea of solid strength—make the structure seem to have heads like the cloud pageant of heaven. But, in both cases, the solid strength is, and must be, there, at the base. Before the poet can begin he should ask himself what are these artistic methods natural to him; he should think himself whether his impulse is towards the weighty iambic movement whose primary function is to state, or towards those lighter movements which we still call, for want of more convenient words, anaepastic and dactylic, whose primary function is to suggest. Whenever Wordsworth and Keats pass from the former to the latter they pass at once into doggerel. Nor is it difficult to see why English anaepastic and dactylic verse must suggest, and not state, as even so comparatively successful a tour de force as Shelley's "Sensitive Plant" shows.

Consciousness is a primary virtue of all statement. The moment the English poet tries to "pack" his anaepastic or dactylic line with more metaphysical line he becomes insipid. His argument becomes rugged, harsh, pebbly—becomes so of necessity. Nor is this all: anaepastic and dactylic verse must in English be obtrusively alliterative, or the same pebbly effect begins to be felt. The anaepastic is so full of syllables that in a language where the consonants dominate the vowels (as in English), these syllables grate against each other, unless their corners are artfully bevelled by one of the elements; the anaepastic command of an English versifier—obtrusive alliteration, or an obtuse alliterative liquid—can only be made acceptable if the demands of form may be turned by the perfect artist to good account if his appeal to the listener's soul is primarily that of suggestion. The anaepastic is the command of an English versifier—obtrusive alliteration, or an obtuse alliterative liquid.
that is, invent, has his name for nothing," another group contends that it is not the invention but the artistic treatment, the form, which determines whether an imaginative writer is a poet or a writer of verse—contends, in short, that emotion is the basis of all true poetic expression, whatever be the subject matter, that thoughts must be expressed in an emotional manner before they can be brought into poetry, and that this emotive expression demands even yet something else, viz. style and form.

Although many critics are now agreed that "L'art est une forme," that without metre and without form there can be no poetry, there are few who would contend that poetry can exist by virtue of any one of these alone, or even by virtue of all these combined. Quite independently of verbal melody, though mostly accompanying it, and quite independently of the atmosphere floating around the poem through which he sees everything, an atmosphere which stamps his utterances as poetry; for instance, among all the versifiers contemporary with Donne there was none so rugged as he occasionally was, and yet such songs as "Sweetest love, I do not go for weariness of thee" prove how true a poet he was whenever he could master those technicalities which far inferior poets find comparatively easy. While rhythm may to a very considerable degree be acquired (though, of course, the highest rhythmical effects never can), the power of looking at the world through the atmosphere that floats before the poet's eyes is not to be learned and not to be taught. This atmosphere is what we call poetic imagination. But first it seems necessary to say a word or two upon that high temper of the soul which in truly great poetry gives birth to this poetic imagination.

The "message" of poetry must be more unequivocal, more thoroughly accentuated, than that of any of the other fine arts. With regard to modern poetry, indeed, it may almost be said that if any writer's verse embodies a message, true, direct and pathetic, we cannot stay to inquire too curiously about the degree of artistic perfection with which it is delivered, for Wordsworth's saying that "poetry is the language which comes from the heart goes to the heart," applies very closely indeed to modern poetry. The most truly passionate poet in Greece was no doubt in a deep sense the most artistic poet; but in her case art and passion were one, and that is why she has been so cruelly misunderstood. The most truly passionate nature, and perhaps the greatest soul, that in recent years has expressed itself in English verse is Elizabeth Barrett Browning; at least it is certain that, with the single exception of Hood in the "Song of_the, Shirt," no writer of the 19th century really touched English hearts with a hand so powerful as hers—and this notwithstanding violations of poetic form, or defective rhymes, such as would appal some of the contemporary versifiers of England and France who left in numbers for the honest [and nothing else come]." The truth is that in order to produce poetry the soul must for the time being have reached that state of exaltation, that state of freedom from self-consciousness, depicted in the lines:

"I started once, or seemed to start, in pain,
Resolved on noble things, and strove to speak,
As when a great thought strikes along the brain,
And flushes all the cheek."

Whatsoever may be the poet's "knowledge of his art," into this mood he must always pass before he can write a truly poetic line. For, notwithstanding all that may be said upon poetry as a fine art, it is in the deepest sense of the word an "inspiration." No man can write a line of genuine poetry without having been "born again" (or, as the true rendering of the text says, "born from above"); and then the mastery over those highest reaches of form which are beyond the ken of the mere versifier comes to him as a result of the change. Hence, with all Mrs Browning's metrical blemishes, the splendour of her metrical triumphs at her best.

For what is the deep distinction between poet and proseman? A writer may be many things besides a poet; he may be a warrior like Aeschylus, a man of business like Shakespeare, a courtier like Chaucer, or a cosmopolitan philosopher like Goethe; but the moment the poetic mood is upon him all the trappings of the world with which for years he may perhaps have been clothing his soul—the world's knowingness, its cynicism, its self-seeking, its ambition—fall away, and the man becomes an inspired child again, with ears attuned to nothing but the whispers of those spirits from the Golden Age, who, according to Hesiod, haunt and bless the degenerate earth. What such a man produces may greatly delight and astonish his readers, yet not so greatly as it delights and astonishes himself. His passages of pathos draw no tears so deep or so sweet as those that fall from his own eyes while he writes; his sublime passages overawe no soul so imperiously as his own; his humour draws no laughter so rich or so deep as that stirred within his own breast.

It might almost be said, indeed, that Sincerity and Conscience, the two axes that bring to the poet the wonders of the poetic dream, bring him also the deepest, truest delight of form. It might almost be said that by aid of sincerity and conscience the poet is enabled to see more clearly than other men the eternal limits of his own art—to see with Sophocles that nothing, not even poetry itself, is of any worth to man, invested as he is by the whole army of evil, unless it is in the deepest and highest sense good, unless it comes linking us all together by closer bonds of sympathy and pity, strengthening us to fight the foes with whom fate and even Nature, the mother who bore us, sometimes seem in league—to see with Milton that the high quality of man soul, which in English is expressed by the word virtues is greater than even the greatest poet he prized, greater than all the rhythms of all the tongues that have been spoken since Babel—and to see with Shakespeare and with Shelley that the high passion which in English is called love is lovelier than all art, lovelier than all the marble Mercuries that "await the chisel of the sculptor" in all the marble hills.

2. What Position does Poetry take up in Relation to the other Arts?—Notwithstanding the labours of Lessing and his followers, the position accorded by criticism to poetry in relation to the other arts has never been so uncertain and anomalous as in recent years. On the one hand there are critics who, judging from their perpetual comparison of poems to pictures, claim her as a sort of handmaid of painting and sculpture. On the other hand the disciples of Wagner, while professing to do homage to poetry, have claimed her as the handmaid of music. With regard to the relations of poetry to painting and sculpture, it seems necessary to glance for a moment at the saying of Simonides, as recorded by Pitharch, that poetry is a speaking picture and that painting is a mute poetry. It appears to have had upon modern criticism as much influence since the publication of Lessing's Laocoon as it had before. Perhaps it is some measures of excessive word-painting. Beyond this one saying, there is little or nothing in Greek literature to show that the Greeks recognized between poetry and the plastic and pictorial arts an affinity closer than that which exists between poetry and music and dancing. Understanding artistic methods more profoundly than the moderns, and far too profoundly to suppose that there is any special and peculiar affinity between an art whose medium of expression is marble and an art whose medium of expression is a growth of oral symbols, the Greeks seem to have studied poetry not so much in its relation to painting and sculpture as in its relation to music and dancing. It is matter of familiar knowledge, for instance, that at the Dionysian festival it was to the poet as "teacher of the chorus" (χοροδασκαλός) that the prize was awarded, even though the "teacher of the chorus" were Aeschylus himself or Sophocles. And this recognition of the relation of poetry to music is perhaps one of the many causes of the superiority of Greek to all other poetry in adapting artistic means to artistic ends. In Greek poetry, even in Homer's description of the shield of Achilles, even in the famous description by Sophocles of his native woods in the Oedipus colonus, such word-painting as occurs seems, if not inevitable and unconscious, so alive with imaginative feeling as to become part and parcel of the
dramatic or lyric movement itself. And whenever description is so introduced the reader of Greek poetry need not be told that the scenery itself rises before the listener's imagination with a vividness that would require very little of color, and no amount of detailed word painting in the modern fashion can achieve. The picture even in the glorious verses at the end of the eighth book of the Iliad rises before our eyes—seems actually to act upon our bodily senses—simply because the poet's eagerness to use the picture for merely illustrating the solemnity and importance of his story lends to the picture that very authenticity which the work of the modern word-painter lacks. That the true place of poetry lies between music on the one hand and prose, or loosened speech, on the other, was, we say, taken for granted by the one people in whom the artistic instinct was fully developed. No doubt they used the word music in a very wide sense, in a sense that might include several arts. But it is a suggestive fact that, in the Greek language, long before poetic art was called "making" it was called "singing." The poet was not σαυρίτος but δοῦδος. And as regards the Romans it is curious to see how every now and then the old idea that poetry is singing rather than making will disclose itself. It will be remembered for instance how Terence, in the prologue of Phormio, alludes to poets as musicians. That the ancients were right in this could well be shown by a history of poetry: music and the lyrical function of the poet began together, but here, as in other things, the progress of art from the implicit to the explicit has been traced. Every art has its special function, has a certain work which it can do better than any of its sister arts. Hence its right of existence. For instance, before the "sea of emotion" within the soul has become "curdled into thoughts," it can be expressed in inarticulate tone. Hence, among the fine arts, music is specially adapted for rendering it. It was perhaps a perception of this fact which made the Syrian Gnostics define life to be "moving music." When this sea of emotion has "curdled into thoughts," articulate language rhythmically arranged—words steeped in music and colour, but at the same time embodying ideas—can do what mere wordless music is able to achieve in giving it expression, just as unrhymed language, language mortised in a foundation of logic, that is to say prose, can best express these ideas as soon as they have cooled and settled and cleared themselves of emotion altogether. Yet every art can in some degree invade the domain of her sisters, and the nearer these sisters stand to each other the more easily and completely can this invasion be accomplished. Prose, for instance, can sometimes, as in the case of Plato, do some of the work of poetry (however imperfectly, and however tramelled by heavy conditions); and sometimes poetry, as in Pindar's odes and the waves of the Greek chorus, can do, though in the same imperfect way, the work of music.

The poems of Sappho, however, are a good case in point. Here the poet's passion is expressed so completely by the mere sound of her verses that a good recitation of them to a person ignorant of Greek would convey something of that passion to the listener; and similar examples almost as felicitous might be culled from Homer, from Aeschylus and from Sophocles. Nor is this power confined to the Greek poets. The students of Virgil have often and with justice commented on such lines as Aen. v. 481 (where the tawny bristled pine gives a rhythm to the gusts of wind about a tree are rendered as completely as though the voice were that of the wind itself). In the case of Sappho the effect is produced by the intensity of her passion, in the case of Homer by the intensity of the dramatic vision, in the case of Virgil by a supreme poetic art. But it can also be produced by the mere ingenuity of the artist, as in Edgar Poe's "Ulalume." The poet's object was "to create despair," and he has expressed it—hopeless gloom in the same way that the mere musician would have expressed it—that is to say, by monotonous reiterations, by hollow and dreadful reverberations of gloomy sounds—though as Poe himself points out that the whole piece was gained, in reality, to add gloomy ideas, in order to give to his work the intellectual coherence necessary for its existence as a poem. He even went out to do this, and he did it, and Ulalume properly introduced just like the same sort upon a listener knowing no word of English that it produces upon us.

On the other hand, music can trench very far upon the domain of articulate speech, as we perceive in the wonderful instrumentation of Wagner. Yet, while it can be shown that the place of poetry is scarcely so close to sculpture and painting as to music on the one side and loosened speech on the other, the affinity of poetry to music must not be exaggerated. We must be cautious how we follow the canons of Wagner and the more enthusiastic of his disciples, who almost seem to think that inarticulate tone can not only suggest ideas but express them—can give voice to the Verstand, in short, as well as to the Verwunderung of man. Even the Greeks did a fundamental distinction between melic poetry (poetry written to be sung) and poetry that was written to be recited. It is a pity that, while modern critics of poetry have understood, or at least have given attention to painting and sculpture, so few have possessed any knowledge of music—a fact which makes Dante's treatise De vulgari eloquio so important. Dante was a musician, and it seems to have had a considerable knowledge of the relations between musical and metrical laws. But he did not, we think, assume that these laws are identical.

If it is indeed possible to establish the identity of musical and metrical laws, it can only be done by a purely scientific investigation; it can only be done by a most searching inquiry into the subtle relations that we know must exist throughout the universe between all the laws of undulation. And it is curious to remember that some of the greatest masters of verbal melody have had no knowledge of music, while some have not even shown any love of it. All Greek boys were taught music, but whether Pindar's personal musical skill was of natural instinct and inevitable passion, or came from the accidental circumstance that his father was, as has been alleged, a musician, and that he was as a boy elaborately taught musical science by Lusus of Hermione, we have no means of knowing. Nor can we now learn much of Milton's musical knowledge resulted from a like exceptional "environment," or from the fact that his father was a musician. But when we find that Shelley seems to have been without the real passion for music, that Rossetti disliked it, and that Coleridge's apprehension of musical effects was of the ordinary nebulous kind, we must hesitate before accepting the theory of Wagner.

The question cannot be pursued here; but if it should on inquiry be found that, although poetry is more closely related to music than to any of the other arts, yet the power over verbal melody at its very highest is so all-sufficing to its possessor, as in the case of Shelley and Coleridge, that absolute music becomes a superfluity, this would only be another illustration of that intense egoism and concentration of force—the impulse of all high artistic energy—which is required in order to achieve the perfect miracles of art.

With regard to the relation of poetry to prose, Coleridge once asserted in conversation that the real antithesis of poetry was not prose but science. If he was right the difference in kind lies, not between the poet and the prose writer, but between the literary artist (the man whose instinct is to manipulate language) and the man of facts and of action whose instinct impels him to act, or, if not to act, to inquire. One thing is at least certain, that prose, however fervid and emotional it may become, must always be directed, or seem to be directed, by the reins of logic. Or, to vary the metaphor, like a captive balloon it can never really leave the earth.

Indeed, with the literature of knowledge as opposed to the literature of power poetry has nothing to do. Facts have no place in poetry until they are brought into relation with the human soul. But a mere catalogue of ships may become poetic if it tends to show the strength and pride and glory of the warriors who defended Troy; a detailed description of the designs upon a shield, however beautiful and poetical in itself, becomes still more so if it tends to show the skill of the divine artificer and the invincible splendour of a hero like Achilles. But mere dry exactitude of imitation is not for poetry but for loosened speech. Hence, most of the so-called poetry of Hesiod is not poetry at all. The Muses who spoke to him about "truth" on Mt Helicon made the common mistake of confounding fact with
POETRY

truth. And here we touch upon a very important matter. The reason why prose speech is loosened is that, untrammeled by the laws of metre, language is able with more exactitude to imitate nature, though when course of the muse is allowed, cannot, when actual sensible objects are to be depicted, compete in any real degree with the plastic arts in accuracy of imitation, for the simple reason that its media are not colours nor solids but symbols—arbitrary symbols which can be made to indicate, but never to reproduce, colours and solids. Accuracy of imitition is the first requisite of prose. But the moment language has to be governed by the laws of metre—the moment the conflict begins between the claims of verbal music and the claims of colour and form—then prosaic accuracy has to yield; sharpness of outline, mere fidelity of imitation, such as is within the compass of all the arts, and even the degree to be sacrificed. But, just as with regard to the relations between poetry and music the greatest master is he who borrows the most that can be borrowed from music, and loses the least that can be lost from metre, so with regard to the relations between poetry and prose the greatest master is he who borrows the most that can be borrowed from prose and loses the least that can be lost from verse. No doubt this is what every poet tries to do by instinct; but some sacrifice on either side there must be, and, with regard to poetry and prose, modern poets at least might be divided into those who make picturesque ness yield to verbal melody, and those who make verbal melody yield to picturesque ness. With one class of poems, as much as perhaps the melody, it is made subservient to outline or to colour; with the other class colour and outline both yield to metre. The chief aim of the first class is to paint a picture; the chief aim of the second class is to paint a poem. Weber, in driving through a beautiful country, could only enjoy its beauty by translating it into music. The same may be said of some poets with regard to verbal melody. The supreme artist, however, is he whose pictorial and musical power are so interwoven that each seems born of the other, as is the case with Sappho, Homer, Aeschylus, Sophocles, and indeed most of the great Greek poets. Among English poets (leaving the two supreme masters unmentioned) the chiefly melody born of colour seems to be that of Pope; and the chiefly colour born of the music and the music born of the colour. In French poetry the same triumph has been achieved in Victor Hugo's magnificent poem "En marchant la nuit dans un bois," which, as a rendering through verbal music of the witchery of nature, stands alone in the poetry of France. For there the poet conquers that crowning difficulty we have been alluding to, the difficulty of stealing from prose as much distinctness of colour and clearness of outline as can be imported into verse with as little sacrifice as possible of melody.

If poetry can in some degree invade the domain of prose, so on the other hand prose can at times invade the domain of poetry, and no doubt the prose of Plato—what is called poetical prose—is a legitimate form of art. Poetry, the earliest form of literature, is also the final and ideal form of all pure literature; and, when Landor insists that poetry and poetical prose are antagonistic, we must remember that Landor's judgments are mostly based on feeling, and that his hatred of Plato would be quite sufficient basis with him for an entire system of criticism upon poetical prose. As with Carlyle, there was a time in his life when Plato had serious thoughts of becoming a poet. And perhaps, like Carlyle, having the good sense to see its true function, he himself desisted from writing, and strictly forbade other men to write, in verse. If we consider this, and if we consider that certain of the great English masters of poetical prose of the 17th century were as incapable of writing in metre as their followers Richter and Carlyle, we shall hardly escape the conclusion on the one hand that the faculty of writing poetry is quite another faculty than that of producing work in the arts most closely allied to it, music and prose, but that on the other hand there is nothing antagonistic between the two. Value in Expositional Power.—There is one great point of superiority that musical art exhibits over metrical art. This consists, not in the capacity for melody, but in the capacity for harmony in the musician's sense. The finest music of Aeschylus, of Pindar, of Shakespeare, of Milton, is after all only a succession of melodic notes, and, in endeavouring to catch the harmonic intent of strophe, antistrophe and epode in the Greek choruses and in the true ode (that of Pindar), we can only succeed by pressing memory into our service. We have to recall by memory the waves that have gone before, and then to imagine their harmonic power in relation to the notes at present occupying the ear. Counterpoint, therefore, is not to be achieved with the metrist, even though he be Pindar himself; but in music this perfect ideal harmony was foreshadowed perhaps in the earliest writing. We know at least that as early as the 12th century counterpoint began to show a vigorous life, and the study of it is now a familiar branch of musical science. Now, inasmuch as "nature's own hymn" is and must be the harmonic blending of apparently independent and apparently discordant notes, among the arts whose appeal is through the ear that which can achieve counterpoint must perhaps rank as a pure art above one which cannot achieve it. We are of course speaking here of metre only. We have not space to inquire whether the counterpoint of absolute poetry is the harmony underlying a poem, or of course that—"in the emotion produced by a word being more persistent than the emotion produced by an inarticulate sound. But if poetry falls behind music in rhythmic scope, it is capable of rendering emotion after emotion has become disintegrated into thoughts, and here, as we have seen, it enters into direct competition with the art of prose. It can use the emphasis of sound, not for its own sake merely, but to strengthen the emphasis of sense, and can thus give a fuller and more adequate expression to the soul of man than music at its highest can give. With regard to prose, no doubt such writings as Plato's description of the chariot of the soul, his description of the island of Atlantis, or of Eve's visit to the place of departed souls, comes but a short way behind poetry in imaginative and even rhythmic appeal. It is impossible, however, to do more than touch upon the subject of the rhythm of prose in its relation to the rhythm of poetry; for in this matter the genius of each individual language has to be taken into account.

Perhaps it may be said that deeper than all the rhythm of art is that rhythm which art would fain catch, the rhythm of nature; for the rhythm of nature is the rhythm of life itself. This rhythm can be caught by prose as well as by poetry, such prose, for instance, as that of the English Bible. Certainly the rhythm of verse at its highest, such, for instance, as that of Shakespeare's greatest writings, is nothing more and nothing less than the metre of that energy of the spirit which surges within the bosom of him who speaks, whether he speak in verse or in impassioned prose. Being rhythm, it is of course governed by law, but it is a law which transcends in subtlety the conscious art of the metrist, and is only caught by the poet in his most inspired moods, a law which, being part of nature's own sanctions, can of course never be formulated but only expressed, as it is expressed in the melody of the bird, in the inscrutable harmony of the entire bird-chorus of a thicket, in the whisper of the leaves of the tree, and in the song or wall of wind and sea. Now it is not this rhythm of nature represented by that "sense rhythm" which prose can catch as well as poetry, that sense rhythm whose finest expressions are to be found in the Bible, Hebrew and English, and in the biblical movements of the English Prayer Book, and in the dramatic prose of Shakespeare at its best? Whether it is caught by prose or by verse, one of the virtues of the rhythm of nature is that it is translatable. Hamlet's peroration about man and Raleigh's apostrophe to death are as translatable into other languages as are the Hebrew psalms, or as is Manu's magnificent passage about the singleness of man:

"Single is each man born into the world; single he dies; single he receives the reward of his good deeds, and single the punishment of his evil deeds. When he dies his body lies like a fallen tree upon the earth, but his virtue accompanies his soul. Wherefore let man have a greater regard for that body, for he may be able to traverse that gloom which is so hard to be traversed."

Here the rhythm, being the inevitable movement of emotion and "sense," can be caught and translated by every literature under the sun. While, however, the great goal before the poet is to compel the listener to expect his caesural effects, the great goal before the writer of poetic prose is in the very opposite direction; it is to make use of the concrete figures and impassioned
diction of the poet, but at the same time to avoid the recognized and expected metrical bars upon which the poet depends. The moment the prose poet passes from the rhythm of prose to the rhythm of metre the apparent sincerity of his writing is destroyed.

As compared with sculpture and painting the great infinitum of poetry, as an "imitation" of nature, is of course that the medium is prose, and words are no words could, in the dramatic situation, have been spoken. It is not only Homer who is obliged sometimes to forget that passion when at white heat is never voluble, is scarcely even articulate; the dramatists also are obliged to forget that in love and in hate, at their tenser, words seem weak and foolish when compared with the silent and satisfying triumph and glory of deeds, such as the plastic arts can render. This becomes manifest enough when we compare the Niobe group or the Lao'coen group, or the great dramatic paintings of the modern world, with even the finest efforts of dramatic poetry, such as the speech of Andromache to Hector, or the speech of Priam to Achilles, nay such as even the cries of Cassandra in the Agamemnon, or the wailings of Lear over the dead Cordelia. Even when writing the words uttered by Oedipus, as the terrible truth breaks upon his soul, Sophocles must have felt that in the holiest chambers of sorrow and in the highest agonies of suffering reigns that awful silence which not poetry, but painting sometimes, and sculpture always, can render. What human sounds could render the agony of Niobe, or the agony of Lao'coen, as we see them in the sculptor's rendering? Not articulate speech at all; not words but wails. It is the same with hate; it is the same with love. We are not speaking merely of the unpacking of the heart in which the angry warriors of the Iliad indulge. Even such sublime writing as that of Aeschylus and Sophocles falls below the work of the painter. Hate, though voluble perhaps, as Clytemnestra's when hate is at that red heat glow which the poet can render, changes in a moment whenever that redness has been fanned to hatred's own last completion—whiteness as of iron at the melting-point—when the heart has grown far too big to be "unpacked" at all, and even the bitter epigrams of hate's own rhetoric, though brief as the terrier's snap before he fleashes his teeth, or as the short snarl of the tigeress as she springs before her cubs in danger, are all too slow and sluggish for a soul to which language at its tensest has become idle play. But this just with what cannot be rendered by an art whose medium consists solely of words.

It is in giving voice, not to emotion at its tensest, but to the variations of emotion, it is in expressing the countless shifting movements of the soul from passion to passion, that poetry shows in spite of all her infinities her superiority to the plastic arts. Hamlet and the Agamemnon, the Iliad and the Oedipus Tyrannus, are adequate to the entire breadth and depth of man's soul.

Varieties of Poetic Art.—We have now reached the inquiry: What varieties of poetic art are the outcome of the two kinds of poetic impulse, dramatic imagination and lyric or egotistical imagination? It would be impossible here to examine fully the subject of poetic imagination. In order to do so we should have to enter upon the vast question of the effect of artistic environment upon the development of man's poetic imagination; we should have to inquire how the instinctive methods of each poet and of each group of poets have been modified and often governed by the methods characteristic of their own time and country. We should have to inquire, for instance, how far such landscape as that of Sophocles in the Oedipus Colonus and such landscape as that of Wordsworth depends upon difference of individual temperament, and how far upon difference of artistic environment. Through the most thorough and exhaustive investigation of the poetic imagination, the question of artistic environment must be taken into account, the case of the Iliad is alone sufficient to show. Ages before Phrynichus, ages before an acted drama was dreamed of, a dramatic poet of the first order arose, and, though he was obliged to express his splendid dramatic imagination through epic forms, he expressed it almost as fully as if he had inherited the method and the stage of Sophocles. And if Homer never lived at all, then an entire group of dramatic poets arose in remote times whose method was epic instead of dramatic simply because there was then no stage. This, contrasted with the fact that in a single half-century the tragic art of Greece arose with Aeschylus, culminated with Sophocles, and decayed with Euripides, and contrasted also with the fact that in England at a certain time, almost the entire poetic imagination of the country found expression in the acted drama alone, is sufficient to show that a poet's artistic methods are very largely influenced by the artistic environments of his country and time. So vast a subject as this, however, is beyond our scope, and we can only point to the familiar instance of the troubadours and the trouvères and then pass on.

With the trouvère (the poet of the langue d'oil), the story or situation is always the end of which the musical language is the means; with the troubadour (the poet of the langue d'oc), the form is so beloved, the musical language so enthralling, that, however beautiful may be the story or situation, it is felt to be no more than the means to a more beloved and beautiful end. But then nature makes her own troubadours and her own trouvères irrespective of fashion and of time—irrespective of langue d'oc and langue d'oile. And, in comparing the troubadours with the trouvères, this is what strikes us at once—there are certain troubadours who by temperament, by original endowment of nature, ought to have been trouvères, and there are certain trouvères who by temperament ought to have been troubadours. Surrounding conditions alone have made them what they are. There are those whose impulse (though writing in obedience to contemporary fashions lyrics in the langue d'oc) is manifestly to narrate, and there are those whose impulse (though writing in obedience to contemporary fashions fabliaux in the langue d'oile) is simply to sing. In other words, there are those who, though writing after the fashion of their brother-troubadours, are more impressed with the romance and wonderfulness of the human life outside them than with the romance and wonderfulness of their own passions, and who delight in depicting the external world in any form that may be the popular form of their time; and there are those who, though writing after the fashion of their brother-trouvères, are far more occupied with the life within them than with that outer life which the taste of their time and country calls upon them to paint—born through the external as well as internal into verbal melody. Of the former class Pierre Vidal, of the latter class the author of Le Lay de la Voiscel, may be taken as the respective types.

That the same forces are seen at work in all literatures few students of poetry will deny—though in some poetical groups these forces are no doubt more potent than in others, as, for instance, with the great parable poets of Persia, in some of whom there is perpetually apparent a conflict between the dominance of the Oriental taste for allegory and subtle suggestion, as expressed in the Zoroastrian definition of poetry—"apparent pictures of unapparent realities"—and the opposite yearning to represent human life with the freshness and natural freedom characteristic of Western poetry.

Allowing, however, for all the potency of external influences, we shall not be wrong in saying that of poetic imagination there are two distinct kinds—(1) the kind of poetic imagination seen at its highest in Aeschylus, Sophocles, Shakespeare and Homer, and (2) the kind of poetic imagination seen at its highest in Pindar, Dante and Milton, or else in Sappho, Heine and Shelley. The former, being in its highest dramatic exercise unconditioned by the personal or lyrical impulse of the poet, might perhaps be called absolute, the latter, in some degree more or less conditioned by the personal or lyrical impulse of the poet, might be called relative dramatic vision. It seems impossible to classify poets, or to classify the different varieties of poetry, without drawing some such distinction as this, whatever words of definition we may choose to adopt.

For the achievement of all pure lyric poetry, such as the ode, the song, the elegy, the idyll, the sonnet, the stornello, it is
evident that the imaginative force we have called relative vision will suffice. And if we consider the matter thoroughly, in many other forms of poetic art—forms which at first sight might seem to require absolute vision—we shall, find nothing but relative vision at work.

Even in Dante, and even in Milton and Virgil, it might be difficult to trace the working of any other than relative vision. And as to the entire body of Asiatic poets it might perhaps be found (even in view of the Indian drama) that relative vision suffices to do all their work. Indeed the temper which produces true drama is, it might almost be said, a growth of the Western mind. For, unless it be Semitic, as seen in the dramatic narratives of the Bible, or Chinese, as seen in that remarkable prose story, The Two Fair Cousins, translated by Rémusat, absolute vision seems to have but small place in the literatures of Asia. The wonderfulness of the world and the romantic possibilities of fate, or circumstance, or chance—not the wonderfulness of the character to whom these possibilities befall—are ever present to the mind of the Asiatic poet. Even in so late a writer as the poet of the Shâh Nâmeh, the hero Irij, the hero Zal and the hero Zohreb are in character the same person, the virtuous young man who combines the courage of youth with the wisdom and forbearance of age. And, as regards the earlier poets of Asia, it was not till the shadowy demigods and heroes of the Asiatic races crossed the Caesar, and breathed a more bracing air, that they became really individual characters. But among the many qualities of man’s mind that were invigorated and rejuvenated by that great exodus from the dreamy plains of Asia is to be counted, above all others, his poetic imagination. The mere sense of wonder, which had formerly been an all-sufficing source of pleasure to him, was all-sufficing no longer. The wonderful adventure must now be connected with a real and interesting individual character. It was left for the poets of Europe to show that, given the interesting character, given the Achilless, the Odysseus, the Helen, the Priam, any adventure happening to such a character becomes interesting.

What then is this absolute vision, this true dramatic imagination which can hardly be found in Asia—which even in Europe cannot be found except in rare cases? Between relative and absolute vision the difference seems to be this, that the former only enables the poet, even in its very highest exercise, to make his own individuality, or else humanity as represented by his own individuality, live in the imagined situation; the latter enables him in his highest exercise to make special individual characters other than the poet’s own live in the imagined situation.

‘That which exists in nature,’ says Hegel, ‘is a something purely individual and particular. Art, on the contrary, is essentially destined to manifest the general.’ And no doubt this is true as regards the plastic arts, and true also as regards literary art, save in the very highest reaches of pure drama and pure lyric, when it seems to become art no longer—when it seems to become the very voice of Nature herself. The cry of Priam when he puts to his lips the hand that slew his son is not merely the cry of a bereaved and aged parent; it is the cry of the individual king of Troy, and expresses above everything else that most naïve, pathetic and winsome character. Put the words into the mouth of the irascible and passionate Lear and they would be entirely out of keeping.

It may be said then that, while the poet of relative vision, even in its very highest exercise, can only, when depicting the external world, deal with the general, the poet of absolute vision can compete with Nature herself and deal with both general and particular. If this is really the case, it may perhaps form a basis for a classification of poetry and of poets. That all poets must be singers has already been maintained. But singers seem to be divisible into three classes: first the pure lyricists, each of whom can with his one voice sing only one tune; secondly the epic poets, save Homer, the bulk of the narrative poets, and the quasi-dramatists, each of whom can with his one voice sing several tunes; and thirdly the true dramatists, who, having, like the nightingale of Gongora, many tongues, can sing all tunes.

It is to the first-named of these classes that most poets belong. With regard to the second class, there are not of course many poets left for it: the first absorbs so many. But, when we come to consider that among those who, with each his one voice, can sing many tunes, are Firdar, Firdausi, Jami, Virgil, Dante, Milton, Spenser, Goethe, Byron, Coleridge, Shelley, Keats, Schiller, Victor Hugo, the second class is so various that no generalization save such a broad one as ours could embrace its members. And now we come to class three, and must pause.

The third class is necessarily very small. In it can only be placed such names as Shakespeare, Aeschylus, Sophocles, Homer and (hardly) Chaucer.

These three kinds of poets represent three totally different kinds of poetic activity.

With regard to the first, the pure lyricists, the impulse is pure egoism. Many of them have less of even relative vision at its highest than the mass of mankind. The true lyricist becomes engaged with the emotions within to have any deep sympathy with the life around them. Of every poet of this class it may be said that his mind to him “a kingdom is,” and that the smaller the poet the bigger to him is that kingdom. To make use of a homely image—like the chaffinch whose eyes have been pricked by the bird-fancier, the pure lyricist is sometimes a warbler because he is blind. Still he feels that the Muse loves him exceedingly. She takes away his eyesight, but she gives him sweet song. And his song is very sweet, very sad, and very beautiful; but it is all about the world within his own soul—its sorrows, fears, loves, hopes, all the emotions that are called “the emotions within”.

With regard to the second class the impulse here is no doubt a kind of egoism too; yet the poets of this class are all of a different temper from the pure lyricists. They have a wide imagination; but it is still relative, still egoistic. They have splendid eyes, but eyes that never get beyond seeing general, universal humanity (typified by themselves) in the imagined situation. Not even to these is it given to break through that law of centrality by which every “me” feels itself to be the central “me”—the only “me” of the universe, round which all other spurious “me’s” revolve. This “me” of theirs they can transmute into many shapes, but they cannot create other “me’s”—nay, for egoism, some of them scarcely would, perhaps, if they could.

The third class, the true dramaticists, whose impulse is the simple yearning to create akin to that which made “the great Vishnu yearn to create a world,” are “of imagination all compact”—so much so that when at work “the divinity” which Lamblichus speaks of “seizes for the time the soul and guides it as he will.”

The distinction between the pure lyricists and the other two classes of poets is obvious enough. But the distinction between the quasi-dramatists and the pure dramaticists requires a word of explanation before we proceed to touch upon the various kinds of poetry that spring from the exercise of relative and absolute vision.

Sometimes, to be sure, the vision of the true dramaticists—the greatest dramaticists—will suddenly become narrowed and obscured, as in that part of the Oedipus tyrannus where Sophocles makes Oedipus ignorant of what every one in Thebes must have known, the murder of Laius. And again, finely as Sophocles has conceived the character of Electra, he makes her, in her dispute with Chrysothemis, give expression to sentiments that, in another play of his own, come far more appropriately from the lofty character of Antigone. In a parallel dispute with himself, examples of relative vision in its furthest reaches can be found in abundance everywhere, especially in Virgil, Dante, Calderon and Milton. Some of the most remarkable examples of that high kind of relative vision which may easily be mistaken for absolute vision may be found in those great prose epics of the North which Aristotle would have called poems. Here is one from the Volsunga Saga. While the brothers of Gudrun are about their treacherous business of murdering Sigurd, his husband, as he lies asleep in her arms, Brynhild, Sigurd’s former love, who in the frenzy of
"love turned to hate" has instigated the murderers to the deed, hovers outside the chamber with Gunnar, her husband, and listens to the wail of her rival who is wailing in Sigurd’s blood. At the sound of that wail Brynhild laughs:

"Then said Gunnar to her, Thou laughest not because thy heart roots are gladdened, or else why dost thou weep?"

This is of course very fine; but, as any two characters in that dramatic situation might have done that dramatic business, fine as it is—this sagaman gives us the general and not the particular—the vision at work is not absolute but relative at its very highest exercise. But our examples will be more interesting if taken from English poets. In Coleridge’s "Ancient Mariner" we find an immense amount of relative vision of so high a kind that at first it seems absolute vision. When the ancient mariner, in his narrative to the wedding guest, reaches the slaying of the albatross, he stops, he can proceed no farther, and the wedding guest exclaims:

"God save thee, Ancient Mariner,
From the fiends that plague thee thus I
Why look’st thou so sad?"

"With my cross-bow
I shot the albatross."

But there are instances of relative vision—especially in the great master of absolute vision, Shakespeare—which are higher still—so high indeed that not to relegate them to absolute vision seems at first sight pedantic. Such an example is the famous speech of Lady Macbeth in the second act, where she says:

"Had he not resembled
My father as he slept, I had done’t."

Marvellously subtle as is this speech, it will be found, if analysed, that it expresses the general human soul rather than any one special human soul. Indeed Leigh Hunt records the case of a bargeman who, charged with robbing a sleeping traveller in his barge, used in his confession almost identical words—"Had he not looked like my father as he slept, I should have killed as well as robbed him." Again, the thousand and one cases (to be found in every literature) where a character, overwhelmed by some sudden surprise or terror, asks whether the action going on is that of a dream or of real life, must all, on severe analysis, be classed under relative rather than under absolute vision—even such a fine speech, for instance, as that where Pericles, on discovering Marina, exclaims:

"This is the rarest dream that e’er dull sleep
Dost mock sad fools within;"

or as that in the third act of Titus Andronicus, where Titus, beholding his mutilated and ruined daughter, asks:

"When will this fearful slumber have an end?"

even here, we say, the humanity rendered is general and not particular, the vision at work is relative and not absolute. The poet, as representing the whole human race, throwing himself into the imagined situation, gives us what general humanity would have thought, felt, said or done in that situation, not what one particular individual and he alone would have thought, felt, said or done. Now what we have called absolute vision operates in a very different way. So vividly is the poet’s mere creative instinct at work that the ego sinks into passivity—becomes insensitive to all impressions other than those dictated by the vision—by the "divinity" which has "seized the soul." Shakespeare is full of examples. Take the scene in the first act of Hamlet where Hamlet hears for the first time, from Horatio, that his father’s ghost haunts the castle. Having by short sharp questions elicited the salient facts attending the apparition, Hamlet says to Horatio, "I would I had been there!" To this Horatio makes the very commonplace reply, "It would have much amazed you." Note the marvellously dramatic reply of Hamlet—"Very like, very like! Stayed it long?"

Suppose that this dialogue had been attempted by any other poet than a true dramatist, or by a true dramatist in any other mood than his very highest, Hamlet, on hearing Horatio’s commonplace remarks upon phenomena which to Hamlet were more subversive of the very order of the universe than if a dozen stars had fallen from their courses, would have burst out with: "Amazed me!" and then would have followed an eloquent declamation about the "amazing" nature of the phenomena and their effect upon him. But so entirely has the poet become Hamlet, so completely has "the divinity seized his soul," that all language seems equally weak for expressing the turbulence within the soul of the character, and Hamlet exclaims in a sort of meditative irony, "Very like, very like!" It is exactly this one man Hamlet, and no other man, who in this situation would have so expressed himself. Charles Knight has some pertinent remarks upon this speech of Hamlet; yet he misses its true value, and treats it from the general rather than from the particular side. Instances of absolute vision in Shakespeare crowd upon us; but we can find room for only one other. In the pathetic speech of Othello, just before he kills himself, he declares himself to be:

"One pot early jealous, but, being wrought,
Perplexed in the extreme."

Consider the marvellous "timbre" of the word "wrought," as coming from a character like Othello. When writing this passage, especially when writing this word, the poet had become entirely the simple English soldier-hero, as the Moor really is—he had become Othello, looking upon himself "as not easily jealous," whereas he was "wrought" and "perplexed in the extreme" by tricks which Hamlet would have seen through in a moment. While all other forms of poetic art can be vitalized by relative vision, there are two forms (and these the greatest) in which absolute vision is demanded, viz. the drama, and in that "Dramatic Imagina-
tion.

Very much of the dramatist’s work can be, and in fact is, effected by egoistic imagination, while true dramatic imagination is only called into play on comparatively rare occasions. Not only fine but sublime dramatic poems have been written, however, where the vitalizing power has been entirely that of lyrical imagination. We need only instance the Prometheus Bound of Aeschylus, the most sublime poem in the world. The dramas of Shelley too, like those of Victor Hugo and Calderon, are informed entirely by egoistic imagination. In all these splendid poems the dramatist places himself in the imagined situation, or at most he places there some typical conception of universal humanity. There is not in all Calderon any such display of dramatic imagination as we get in that wonderful speech of Priam’s in the last book of the Iliad, to which we have before alluded. There is not in the Cenci such a display of dramatic imagination as we get in the sudden burst of anger from the spoilt child of gods and men, Achilles (anger which alarms the hero himself as much as it alarms Priam), when the prattle of the old man has carried him too far. It may seem bold to say that the drama of Goethe is informed by egoistic imagination only—assuredly the prison-scene in Faust is unsurpassed in the literatures of the world. Yet, perhaps, it could be shown of the passion and the pathos of Gretchen throughout the entire play that it betrays a female character general and typical rather than individual and particular.

The nature of this absolute vision or true dramatic imagination is easily seen if we compare the dramatic work of writers without absolute vision, such as Calderon, Goethe, Ben Jonson, Fletcher and others, with the dramatic work of Aeschylus and of Shakespeare. While of the former group it may be said that each poet works by his imagination, of Aeschylus and Shakespeare it must be said that each in his highest dramatic mood does not work, but is worked by his imagination. Note, for instance, how the character of Clytemnestra grows and glows under the hand of Aeschylus. The poet of the Odyssey had distinctly said that Aegisthus, her paramour, had struck the blow, but the dramatist, having imagined the greatest tragic female in all poetry, finds it impossible to let a man like Aegisthus assist such a woman in a homicide so daring and so momentous. And
when in that terrible speech of hers she justifies her crime (ostensibly to the outer world, but really to her own conscience), the way in which, by the sheer magnetism of irresistible personality, she draws our sympathy to herself and her crime is unrivalled out of Shakespeare and not surpassed even there. In the Great Drama, in the Agamemnon, in Othello, in Hamlet, in Macbeth, there is a magic imagination at work whose laws are inexorable, are inevitable, as the laws by the operation of which the planets move around the sun. But in this essay our business with drama is confined entirely to its relations to epic.

Considering how large and on the whole how good is the body of modern criticism upon drama, it is surprising how poor is the modern criticism upon epic. Aristotle, comparing tragedy with epic, gives the palm to tragedy as being the more perfect art, and nothing can be more ingenious than the way in which he has marshalled his reasons. He tells us that tragedy as well as epic is capable of producing its effect even without action; we can judge of it perfectly, says he, by reading. He goes so far as to say that, even in reading as well as in representation, tragedy has an advantage over the epic, the advantage of greater clearness and distinctness of impression. And in some measure this was perhaps true of Greek tragedy, for as Müller in his Dissertations on the Eumenides has well said, the ancients always remained and wished to remain conscious that the whole was a Dionysian entertainment; the quest of a commonplace ἀπάχυ came afterwards. And even of Romantic Drama it may be said that in the time of Shakespeare, and indeed down through the 18th century, it never lost entirely its character of a recitation as well as a drama. It was not till melodrama began to be recognized as a legitimate form of dramatic art that the dialogue had to be struck from the dramatic action "at full speed"—struck like sparks from the roadster's shoes. The truth is, however, that it was idle for Aristotle to inquire which is the more important branch of poetry, epic or tragedy. Equally idle would it be for the modern critic to inquire how much romantic drama gained and how much it lost by abandoning the chorus.

Much has been said as to the scope and the limits of epic and dramatic poetry. If in epic the poet has the power to take the imagination of his audience away from the dramatic centre and show what is going on at the other end of the great web of the work, he can do this with greater convenience by the direct appeal of the characters, also by the introduction into the dramatic circle of messengers and others from the outside world. But, as regards epic poetry, is it right that we should hear, as we sometimes do hear, the voice of the poet himself as chorus bidding us contrast the present picture with other pictures afar off, in order to enforce its teaching and illustrate its pathos? This is a favourite method with modern poets and a still more favourite one with prose narrators. Does it not give an air of self-consciousness to poetry? Does it not disturb the intensity of the poetic vision? Yet it has the sanction of Homer; and who shall dare to challenge the methods of the great father of epic? An instance occurs in the Iliad v. 156, where, in the midst of all the stress of fight, the poet leaves the dramatic action to tell us what became of the inheritance of Phaenops, after his two sons had been slain by Diomedes. Another instance occurs in the Iliad v. 243–244, where the poet, after Helen's pathetic mention of her brothers, comments on the causes of their absence, "criticizes life" in the approved modern way, generalizes upon the impotence of human intelligence—the impotence even of human love—to pierce the darkness in which the web of human fate is woven. Thus spoke the poet (the poet tells us); but the life-giving earth already possessed them, there in Lacedaemon, in their dear native land—

Δέ φάνον τε νόει τ' θρόνον ἄνωθεν φωναίς αἰα

In Δαλαχασιμοί, αθήνα, ὄφειν ἐν ποταμῷ γαλη.

This, of course, is "beautiful exceedingly," but, inasmuch as the imagination at work is egotistic or lyrical, not dramatic; inasmuch as the vision is relative, not absolute, it does not represent that epic strength at its very highest which we call specially "Homeric," unless indeed we remember that with Homer the Muses are omniscient: this certainly may give the passage a deep dramatic value it otherwise seems to lack.

The deepest of all the distinctions between dramatic and epic methods has relation, however, to the nature of the dialogue. Aristotle failed to point it out, and this is remarkable until we remember that his work is but a fragment of a great system of criticism. In epic poetry, and in all poetry that narrates, the epic poet is the narrator. The drama has its Chaucer, its Gottfried von Strasburg, or Turoldis, the action, of course, moved by aid partly of narrative and partly by aid of dialogue, but in drama the dialogue has a quality of suggestiveness and subtle inference which we do not expect to find in any other poetic form save perhaps that of the purely dramatic ballad. In ancient drama this quality of suggestiveness and subtle inference is seen not only in the dialogue, but in the choral odes.

The third ode of the Agamemnon is an extreme case in point, where, by a kind of double entendre, the relations of Clytaemnestra and Aegisthus are darkly alluded to under cover of allusions to Paris and Helen. Of this dramatic subtlety Sophocles is perhaps the greatest master; and certain critics have been led to speak as though irony were heart-thought of Sophoclean drama. But the suggestiveness of Sophocles is pathetic (as Professor Lewis Campbell has well pointed out), not ironical. This is one reason why drama more than epic seems to satisfy the more intense of the reader, though this may be counterbalanced by the hardness of mechanical structure which sometimes disturbs the reader's imagination in tragedy.

When, for instance, a dramatist pays so much attention to the evolution of the plot as Sophocles does, it is inevitable that his characters should be more epic less dramatic. One has to say and do now and then certain things which they would not say and do but for the exigencies of the plot. Indeed one of the advantages which epic certainly has over drama is that the story can be made to move as rapidly as the poet may desire without these mechanical modifications of character.

The only kind of epic which Aristotle considered was Greek epic, between which and all other epic the difference is as great as if the Iliad alone is taken to represent Greek epic. The Greek epic In speaking of the effect that surrounding conditions seem to have upon the form in which the poetic energy of any time or country should express itself, we instance the Iliad as a typical case. The imagination vivifying it is mainly dramatic. The characters represent much more of the variety of the democratic; notwithstanding all the splendid works of Calverton, Marlowe, Webster and Goethe, it is doubtful whether a born dramatist the poet of the Iliad does not come nearer to Aeschylus and Shakespeare than does any other poet. His art is for making evidence speak, and has perhaps a fault in the Iliad considered as pure epic, and the unconscious way in which each actor is made to depict his own character is in the highest spirit of drama. It is owing to this peculiarity of the Greek drama it stands in the annals of art as the matrix of all dramatic literature. And this being the Odyssey, where, however, the dramatic vision is less vivid. It is owing to the dramatic imagination displayed in the Iliad that it is impossible to say, from internal evidence, whether the poem is to be classified with the epic of growth or with the epic of art. All epics are clearly divisible into two classes, first those which are a mere accretion of poems or traditional ballads, and second, those which, though based indeed on tradition or history, have become so fused in the mind of one great poet, so stained, therefore, with the colour and temper of that mind, as to become new crystallizations—inventions, in short, as we understand that word. Each kind of epic has its especial and peculiar advantages, and its peculiar and indeed necessary defects. In the one we get the freedom—apparently schemeless and motiveless—of nature, but, as a consequence, miss that hard core of thought which the poet is to bring in his epic, to prove by a definition of the heart of a man which the mind asks for as the core of every work of art. In the other this great requisite of an adequate central thought is found, but accompanied by a constriction, a holding artifice, the obtrusion of a rhetorical scheme, which would be intolerable to the natural mind unsophisticated by literary study. The flow of the one is as that of a river, the flow of the other as that of a spring. Yet, as has been already hinted, though the charms of Nature herself is that she never teases us with any obtrusive exhibitions of scheme, she doubtless has a scheme somewhere, she does somewhere hide a "hard accord of thought" of which the poem is the expression; and this being the epic art should have a scheme too; but in such a dilemma is she placed in this matter that the epic poet, unless he is evidently telling the
story for its own sake, scornful of purposes ethic or aesthetic, must
guarantee illusion.

Of the former class of epics are to be placed the great epics of
growth, such as the Mahabharata, the Nibelung story, &c.; among
the latter the Odyssey, the Aeneid, Paradise Lost, the Jerusalemite
liberation, the Iliad. In what classification are we to find a place for
the Iliad? The heart-thought of the greatest epic in all literature is
simply that Achilles was vexed and that the fortunes of the world
depend upon the will of a sulky and capricious hero. Not only does
the acute criticism of Wollf, it remains difficult for us to find a
place for the Iliad among the epics of growth. And why? Because
throughout the Iliad the dramatic imagination shown is of the first
order. It is here to urge a multiple perspective of view for the
poem, we must also suppose that ages before the time of
Pericles there existed a group of dramatists more nearly akin to the
masters of the Great Drama, Aeschylus, Sophocles and Shake-
speare, than to the Homeric and Virgilian time. When the poet,
the time he reaches the middle of his epic, forgets about this primary
intent, and gives us his own thoughts and reflections on things in
general. Fine as is the speech of Anchises to Aeneas in Elysium (Aeneid
IV), the aesthetic quality is, as the critic has put it, general. The
poem as developed in the previous books shows how entirely Virgil
lacked that artistic power shown in the Odyssey of making a story
become the natural and inevitable outcome of an artistic idea.

In the Iliad there is the artistic reiteration of Virgil, but
and with even less attention to a central thought than Virgil exhibits.
Firdausi relies for his effects upon the very qualities which
characterize the opposite type of art but is least naturalistic and
and not an artificial flow of the story; so much indeed that, if the
Shah Namâz were studied in connexion with the Iliad on the one
and with the Kalender on the other, it might throw a light upon
the whole art of epic poetry. There may be an aggregation of
the national ballad poems and the work of a single
artificer. That Firdausi was capable of working from a centre
not only artistic but philosophical his Vasif and Zalqatsha shows; and if
we consider the separate artistic reiteration, of the Shah Namâz
of ancient times, what indeed has been that temper during the whole of
the Mahomedan period, the subtle temper of the parable poet—the
Shah Namâz, with its direct appeal to popular sympathies, is a
striking example of this literature.

With regard, however, to Virgil's defective power of working
from an artistic motive, as compared with the poet of the
Odyssey, this is an essential unity has come to the end of the second
book) to the
point upon which the entire epic movement turns, the escape of
Satan from hell and his journey to earth for the ruin of man:

"At last his sail-broad vans
Spreads for flight, and, in the surging smoke
Up the gray clouds, vies with many a league,
As in a cloudy chair, ascending rides
Audacious; but, that seat soon failing, meets
Vast vacancy; all unwonted
With down-plunging vains, plumb down he drops
Ten thousand fathoms deep, and to this hour
Down had been falling, had not, by ill change,
A tempest, in the surge of some tumultuous cloud,
Instinct with fire and nitre, hurried him
As many miles aloft."

In Milton's case, however, the truth is that he made the mistake
of trying to disturb the motive of the story for artistic purposes—
a fatal mistake, as we shall see when we come to speak of the
Nibelung story, but one that has never shown itself to the older
race.

Though Vondel's mystery play of Lucifer is, in its execution,
riphorical more than poetical, it did, beyond all question, influence
Milton. The present is the time for to write Paradise Lost. The famous
line which is generally quoted, as bears the matter:

"Better to reign in hell than serve in heaven."

seems to have been taken bodily from Vondel's play, and Milton's
entire epic shows a study of it. While Marlowe's majestic move-
ments alone are traceable in Satan's speech (written some years
before the rest of Paradise Lost, when the dramatic and not the
epic mode of expression was in vogue) Vondel's may have
been an inspiration to Milton in his peculiar scheme of Satan's view of
human progress. Defective as the play is in execution, it is, for
otherwise in motive. This motive, if we consider it aright, is
nothing less than an explanation of man's anomalous condition
on earth, as distinguished from the state of that spirit or angel who,
lacking the edifying thought of the fathers—"and in order that he may advance by means
of these very manacles which imprison him, in order that he may ascend by the
staircase of the world, the ladder of fleshy conditions, above him, through others and
above his head. As regards the Odyssey, however, we need scarcely say that its motive
is merely artistic, not philosophic. And now we come to philosophical
motive.

The artist's power of thought is properly shown not in the
direct enunciation of ideas but in mastery over motive. Here
Aeschylus is by far the greatest figure in Western poetry—a proof
perhaps among many proofs of the Oriental strain of his genius.
"Art for art's sake" is a phrase that may be misleading, for
organic vitality in every part, is of more importance than even
motive, and in this freedom and easy abandonment the concluding
ballad of the Oresteia is as different as with such a play as
Othello or Lear. Notwithstanding the splendid exception of
Aeschylus, the truth seems to be that the faculty of developing a
poetical narrative from a philosophic thought is Oriental, and on
the part of the Occidental is defective. Of course, there are
exceptions, such as the first three hundred lines without shifting (in the curse of Prometheus)
into a Manicheanism as pure as that of Mamen himself:

"Heap on thy soul, by virtue of this curse,
Ill deeds, that in the minds of others, beholding good;
Both infinite as is the universe."

According to the central thought of the poem human nature,
through the heroic protest and struggle of the human mind typified
by Prometheus, can at last dethrone that supernatural terror and
tyranny (Jupiter) which the human mind had itself installed. But,
after its dethronement (when human nature becomes infinitely
perfectible), how can the supernatural tyranny exist apart from
the human mind that imagined it? How can it be as "infinite as
the universe"?

The motive of Paradise Lost is assailed with much vigour by
Victor Hugo in his poem Religions et Religion. But when Hugo,
in the interests of the "defeated Milton", sets up an entirely French "Dieu" et
everything that man was to just in him, we perceive how pardonable it was 
when he came to see it as an objection. Comparing such defect of mental grip and such nebulosity of thought
as it is by Mamonhild and Hugo, with the strength displayed by
the Subi poetry generally.

There is, however, one exception to this rule that Western poetry
is thus a body of human nature as to its...
of the epic of growth with those of the epic of art. Though not written in metre, it may usefully be compared with the epics of Greek and Roman origin, the Iliad and the Odyssey, of the Middle Ages, the Kalevala, by Elias Lonnrot, who compiled it from the hundreds of songs and folk tales that he collected from the peasants, the “bloweth where it listeth,” it listeth to move by law. Its action is that of free will, but free will at play within a ring of necessity. Within this ring there throbs all the warm and passionate life of the folk, the social and personal issues that from that world it is enlised by a coridon of curses—by a zone of defiant flames more impregnable than that which girdled the beautiful temple of Ashtar at Haidrull. Natural laws, familiar emotions, social institutions, Tamburlaine, Cæsar, Claudius, and Caligula, are at work everywhere; the people of the Kalevala are necessarily the people of the poet himself, but the Kalevala is a poem of the poet himself, and if the poet himself were the superman, the contents of his mind, the circumstances of whose existence is that of a woman’s finger, encircles the whole minic world of the sagaman as the Midgard snake encircles the whole minic world of human existence. The gods, the heroes, the people, are, of course, many causes, some of them traceable and some of them beyond all discovery—causes no doubt akin to those which gave birth to many of the beauties of other epics of growth. Originally, the Kalevala was a poem of the poet himself, it has been said, and that what has been the artistic effect of the separation of the two! Again, there were several different versions of the story of Brynhild. The sagaman, finding all these versions too interesting and too much beloved to be discarded, adopted them all—worked them up into one legend, so that, in the Völsunga Saga we have a heroine possessing all the charms of goddess, demi-goddess, earthly princess and Amazon—a heroine surpassing perhaps in fascination all other heroines that have ever figured in poetry.

It is when we come to consider such imaginative work as this that we are compelled to pause before challenging the Aristotelian doctrine that there is a limit to what may seem possible or probable.

In speaking of the Nibelungen story we do not, of course, speak of the German version, the Nibelensagen, a fine epic still, though a degradation of the elder form. Between the two the differences are so considerable as to be indeed an excellent illustration of what has been said upon the disturbance of motive in epic, and indeed in all poetic art. It is not merely that the endings of the three principal characters, Sigurd (Siegfried), Gudrun (Kriemhild) and Hagen (Hagen of the Mouthish) are entirely different; it is that the Icelandic version, by missing the blood-bath at Fafnir’s lair, loses the pathetic situation of Gudrun’s becoming afterwards an unwilling instrument of her husband’s death; it is not merely that, on the other hand, the German version, by omitting the early love passages between Brynhild and Sigurd at Hindelg, misses entirely the tragic meaning of her story and the terrible hate that is left in Sigurd’s heart; but the essential character of each version is so exactly the opposite of that of the other that, while the German story is called (and very properly) “Kriemhild’s Revenge,” the story of the Völsunga Saga might, with equal propriety, be called Forgiveness.

If it be said that, in both cases, the motive shows the same Titanic temper, that is because the Titanic temper is the special characteristic of the North-Western mind. The temper of the Scandinavian nations indeed was a temper that energy which succeeds in the modern development of the great racial struggle for life. Although there is no epic, Eastern or Western, capable of expressing it, the temper is a force that isCaucasus. But it is not supposed that the warring of conflicting forces which is the motive of Eastern epic has much real relation to the warring of conflicting forces which is the motive of Western epic.

And, as regards the machinery of epic, there is, we suspect, a deeper significance than is commonly apprehended in the fact that the Satan or Shaitan of the Eastern world becomes in Vondel and Miltons sublime Titan who attracts to himself the admiration which in Eastern poetry belongs entirely to the authority of heaven.

In Asia, save perhaps among the pure Arabs of the desert, underlying all religious forms, there is apparent a temper of resignation to the irreligious authority of heaven. And as regards the Aryans it is probable that the Titanic temper—the temper of revolt against authority—did not begin to show itself till they had moved across the Caucasus. But what conditions of social life and social feeling gave the most fruitful ground to the Nordic temper? While the more nor-west the more vigorously this temper asserted itself, the prouder grew man in his attitude towards the gods, till at last in the Scandinavian cycle he became their equal and struggled along side them, and the result of his struggle in the heaven against the assaults of hell. Therefore, as we say, the student of epic poetry must not suppose that there is any real parallel between the attitude of Vishnu (as Rama) towards Saraman or Rama, and the attitude of Zeus towards Herakles. From Zeus to the vours and the gods to the main hero, that is to say, the gods Homer, Aeschylus, Sophocles. But, although we could hardly expect to find it among those whose language, complex of syntax and alive with self-conscious inflexions, bespeaks the scientific knowledness of the Western mind, to call the temper of the Great Lyric broadly “Asiatic” would be rash. It seems to belong as a birthright to those descendants of Shem who, yearning always to look straight into the face of God and live, could (when the Great Lyric was sung) see not much else.

Though two of the artistic elements of the Great Lyric, unconsciousness and power, are no doubt plentiful enough in India, the element of grace is lacking for the most part. The great poetic work of the Nordic races is compared with Semitic hymns. And as to the Persians, they, it would seem, have the grace always, the power often, but the unconsciousness almost never. This is inevitable if we consider for a moment the chief characteristic of the Persian imagination—an imagination whose wings are not so much “bright with beauty” as heavy with it—heavy as the wings of a golden pheasant—steeped in beauty like the “tiger-moth’s deep darned wings.” Now beauty of this kind does not go to the making of the Great Lyric. Then there comes that poetry which, being ethnically Semitic, might be supposed to exhibit something or at least of the Western temper—the Arabian. But, whatever may be said of the oldest Arabic poetry, with its deep sense of fate and pain, it would seem that nothing can be more unlike than the Hebrew temper and the Arabian temper as seen in later poets. It is not with Hebrew but with Persian poetry that Arabian poetry can
be usefully compared. If the wings of the Persian imagination are heavy with beauty, those of the later Arabian imagination are bright with beauty—brilliant as an Eastern butterfly, quick and agile as a dragon-fly or a humming-bird. To the eye of the Persian poet, the hues of earth are (as Firdausi says of the garden of Afrasiab) "like the tapestry of the kings of Ormus, that is so costly and rich with the flowers and the charming freshness of roses." And to the later Arabian no less than to the Persian the earth is beautiful; but it is the clear and sparkling beauty of the earth as she "wakes up to life, greeting the Sabæan morning"; we feel the light more than the colour. But it is neither the Persian's instinct for beauty nor the Arabian's quenchless wit and exhaustless animal spirits that go to the making of the Great Lyric; far from it. In a word, the Great Lyric, as we have said, cannot be assigned to the Asiatic temper generally any more than it can be assigned to the European temper.

In the poetry of Europe, if we cannot say of Pindar, devout as he is, that he produced the Great Lyric, what can we say of any other European poet? The truth is that, like the Great Drama, so straight and so warm does it seem to come from the heart of man in his highest moods that we scarcely feel it to be literature at all. Passing, however, from this supreme expression of lyrical imagination, we come to the artistic ode, upon which subject the present writer can only reiterate here what he has more fully said upon a former occasion. Whatever may have been said to the contrary, enthusiasm is, in the nature of things, the very basis of the ode; for the ode is a mono-drama, the actor in which is the poet himself; and, as Marmontel has well pointed out, if the actor in the mono-drama is not affected by the sentiments he expresses, the ode must be cold and lifeless. But, although the ode is a natural poetic method of the poet considered as prophet—although it is the voice of poetry as a fine frenzy—it must not be supposed that there is anything lawless in its structure. "Pindar," says the Italian critic Gravina, "launches his verses upon the bosom of the sea; he spreads out all his sails; he confronts the tempest and the rocks; the waves arise and are ready to engulf him; already he has disappeared from the spectator's view; when suddenly he springs up in the midst of the waters, and reaches happily the shore." Now it is this Pindaric dis
course which the lyric unreason, and the sublime verse, which has led poets to attempt to imitate him by adopting an unre
strait as to form. Although no two odes of Pindar exhibit the same metrical structure (the Aeolian and Lydian rhythms being mingled with the Doric in different proportions), yet each ode is in itself obedient, severely obedient, to structural law. This we feel; but what the law is, no metricist has perhaps ever yet been able to explain.

It was a strange misconception that led people for centuries to use the word "Pindaric" and irregular as synonymous terms; whereas the very essence of the odes of Pindar (of the few, alas! which survive to us) is their regularity. There is no more difficult form of poetry than this, and for this reason: when in any poetical composition the metres are varied, there must, as the present writer has before pointed out, be a reason for such freedom, and that reason is properly subjective—the varying form must embody and express the varying emotions of the singer. But when these metrical variations are governed by no subjective law at all, but by arbitrary rules supposed to be evolved from the practice of Pindar, then that very variety which should aid the poet in expressing his emotion crystallizes it and makes the ode the most rigid of all compositions. Great as Pindar undoubtedly is, it is deeply to be regretted that no other poet survives to represent the triumphal ode of Greece—the decoration of his subject matter are so wide, and his volubility is so great.

In modern literature the ode has been ruined by theories and experiments. A poet like La Mothe, for instance, writes execrable odes, and then writes a treatise to prove that all odes should be written on the same model. There is much confusion of mind prevalent among poets as to what is and what is not an ode. All odes are, no doubt, divisible into two great classes: those which, following an arrangement in stanzas, are commonly called regular, and those which, following no such arrangement, are commonly called irregular.

We do not agree with those who assert that irregular metres are of necessity inferior. In many cases the more pointed metre imparts to the effect of a poem a finish that is说不出

As for the purpose of accentuating and marking off each shade of emotion as it arises, it may be asked if any demands of stanza. But since the irregularity of makeshift, when we use the word Made, and his imitators, and the irregularity of the "fine frenzy" of such a poem, for instance, as Coleridge's Kubla Khan, there is a difference in kind. Strange and unique as it all but in this unique figure Kubla Khan, descriptive of imaginative landscape, that an English poet has at last conquered the crowning difficulty of writing in irregular metres. Having broken away from all restraints of couplet and stanza—having caused his rhymes and pauses to fall just where and just when the emotion demands that they should fall, scoring the exigencies of makeshift no less than the exigencies of stanza—he has found what every writer of irregular English odes has desired, a method of treatment by which it can be made to come in vain, and to the same time as incalculable, as the music of the winds or of the sea.

The prearranged effects of sharp contrasts and antithetical move
ments which as some have been able to compass, do not of course come under the present definition of irregular. Stanzas are metres at all. If a metrical passage does not gain immensely by being written independently of stanza, no gains this richness and power from the great charm of the music of all verse, as distinguished from the music of prose, is inevitableness of cadence. In regular metres we enjoy the pleasure of feeling that the rhymes will inevitably fall under the stress of couplet or stanza. But if the passage flows independently of these, it must still flow inevitably—it must, in short, show that it is governed by another and a yet deeper force, the inevitableness of emotional expression. The lines must be long or short, the rhymes must be arranged after this or after that interval, not because it is convenient so to arrange them, but because the emotion of the poet inexpressibly demands these and no other arrangements. When, however, Coleridge came to try his hand at irregular odes, such as the odes of the Departing Year and "To the Duchess of Devonshire," he certainly did not succeed.

Wordsworth's magnificent "Ode on Intimations of Immortality," the sole impromptu of it, but it is a grave one, is that the length of the lines and the arrangement of the rhymes are not always inevitable; they are, except on rare occasions, governed not by emotional expression, but by the exigencies of metre. But, for instance, what emotional necessity was there for the following rhyme-arrange

"My heart is at your festival,
My head with its thoughts.
The fulness of your bliss I feel—I feel it all.
Oh, evil day! if I were sullen,
While earth herself is adorning,
This fair morning;
And the children are culling,
On every side,
In a thousand valleys far and wide,
Fresh flowers.

Beautiful as is the substance of this entire passage, so far from gaining, it loses by rhyme—loses, not in perspicuity, for Wordsworth like all his contemporaries (except Shelley) is mostly perspicuous, but in that metrical emphasis the quest of which is one of the impulses of all great poetry. The poet to whom the term "coleridgean defects, this famous ode of Wordsworth's is the finest irregular ode in the language; for, although Coleridge's "Ode to the Departing Year" excels it in Pindaric fire, it is below Wordsworth's ode in almost everything. Among the writers of English irregular odes, next to Wordsworth, stands Dryden. The second stanza of the "Ode for St Cecilia's Day" is great triumph.

Leaving the irregular and turning to the regular ode, it is natural to divide these into two classes: (1) those which are really Pindaric in so far as they consist of strophes, antistrophes and epodes, variously arranged; and (2) those which consist of a regular succession of regular stanzas. Perhaps all Pindaric odes tend to show that this form of art is in English a mistake. It is easy enough to write one stanza and call it a strophe, another in a different movement, and so in an irregular movement still and call it an epode. But in modern prosody, disconnected as it is from musical and from terpsichorean science, what are these?—No poet and no critic can say.

To the writer of the regular ode who wishes to make his metre match the music of the feelings he expresses, he should select a metre particularly fitted to the degree of passion which he wishes to express. What is needful is the true art of the poet, which is to make his metre match his passion.
are necessary parts—should catch, in short, that inevitability of structure upon which we have already touched. In order to justify a poet in writing a poem in three different kinds of movement, governed by no musical and no terpsichorean necessity, a necessity, to say so, should make itself felt; then the metrical wave moving in the strophe should be metrically answered by the counter-wave moving in the antistrophe, while the epode—which, as originally conceived by Stesichorus, was merely a separate movement to fill up a place—should have no antistrophe. It should clearly, in a language like ours, be a blended echo of these two. A mere metrical contrast such as some poets laboriously and laboriously failed to find. And if the reply to this criticism be that in Pindar hill and plain make itself felt; then the metrical scheme of Pindar is not appropriate to the circumstances in which that moment of sound is to be justified, for contrast is subordinate to the lost musical scheme of the musician. It has been contended, and is likely enough, that this musical scheme was simple—as simple, perhaps, as the scheme of a cathedral chant; but it is hardly to be considered in the case of a Chorephyllus, since the idea is that the moment of sound ceased to be chanted, the words strophe, antistrophe, and epode lost the musical value they had among the Greeks, and pretended to a complex metrical value: which their action and character then should or should not follow from this that odes should not be so arranged, but it does follow that the poet’s arrangement should justify itself by disclosing an entire metrical scheme in place of the musical scheme to which, indeed, it is made subordinated by the social demand even if the poet were a sufficiently skilled metrist to compass a scheme embracing a wave, an answering wave, and an echo gathering up the tones of each, i.e. the strophe, the antistrophe and the epode. If the ear were a reader, unaided by the musical emphasis which supported the rhythms of the old choral lyric, it is, it should seem, incapable of gathering up and remembering the sounds further than the phrase behind the phrase which is not the strophe but a return to the strophe. That is to say, an epode, as alternating in the body of the modern ode, is a mistake; a single epode at the end of a group of strophes and antistrophes (as in some of those of the modern ode) is a mistake. The general difficulty of the English ode is that of preventing, the apparent spontaneity of the impulse from being marred by the apparent artifice of the form; for, assuredly, no writer subsequent to Coleridge and to Keats would dream of writing an ode on the Horatian principles adopted by Warton, and even by Collins, in his beautiful “Ode to Evening.”

Of the second kind of regular odes, those consisting of a regular succession of couplets, the so-called odes of Sappho are, of course, so transparent that no other amatory lyrics can be compared with them. Never before these songs were sung and never since did the human soul, in the grip of a passion peculiar to herself, find its own point of view in directness, in lucidity, in that high impiore verbal economy which only nature herself can teach the artist, she has no equal, and none worthy to take the place of second, a true, a lifetime, to Burckhardt. With the modern poetry, there are some magnificent examples of this simple form of ode in English poetry—Spenser’s immortal “Epithalamion” leading the way in point of time, and probably also in point of excellence.

Pervour being absolutely essential, we think, to a great English ode, fluidity of metrical movement can never be dispensed with. The more bylerowy the metrical waves the better suited they are to the expression conveyed by the words, it is said. One may be ready to return to the suggestion by referring to Coleridge’s “Ode to France” (the finest ode in the English language, according to Shelley), and giving special attention to the first stanza—to the way in which the first metrical wave, if it is not fallen a full foot, is repeated at the end of the first quatrain, leaps up again on the double rhymes (which are expressly introduced for this effect), and goes bounding on, billow after billow, to the end of the stanza. Not that this fine thing is entirely free from the rule of the great vice of the English ode, rhetoric in excess of the situation. If we except Spenser and, in one instance, Collins, it can hardly be said that any English writer before Shelley and Keats produced odes independent of rhetoric entirely, however much he may have been free from the defects we have mentioned. “Ode to the West Wind” and Keats’s odes “To a Nightingale” and “On a Grecian Urn,” they are entirely free from rhetorical flavour. Notwithstanding that in the “Ode on a Grecian Urn” Keats, and not merely his arrangement of the parts, but in the second stanza of the “Ode to a Nightingale” varies from the rest by running on four rhyming-sounds instead of five, veering the ear at first by disappointed expectation, the two odes are, after Coleridge’s “France,” the finest regular odes perhaps in the English language.

With regard to the French ode, Malherbe was the first writer who brought it to perfection. Malherbe showed also more variety of mood than it is the fashion just now to credit him with. This may be especially noted in his “Ode to Louis XIII.” His disciple Racan is not of much account. There is certainly much vigour in that of Rousset, but it is not as good as that of Victor Hugo, and we realize what French poetry can achieve in this line; and contemporary poetry can hardly be examined here. We may say, however, that some of Hugo’s odes are truly magnificent. As a writer of words, and not of song—perhaps not even of a belated sort of song—he is perhaps the greatest of the poets of France. The Song.

The mere simplicity of grammatical structure which is foreign to many—magnificence—must be due to a verse over direct and simple speech which only true passion and feeling can give, and which “coming from the heart goes to the heart.” Without going so far as to say that no man is a poet who cannot write a good song, it may certainly be said that no man can write a good song who is not a good poet.

In modern times we have, of course, nothing in any way representing those choral dance-songs of the Greeks, which, originating in the primitive Cretan war-dances, became, in Pindar’s time, a magnificent blending of song and ballet. Nor is anything exactly representing the Greek short drinking songs of which Terpander is said to have been the inventor. That these scolia were written not only by poets like Alcaeus, Anacreon, Praxilla, Simonides, but also by Sappho and by Pindar, shows in what high esteem they were held by the Greeks. These songs seem to have been as brief as the stornelli of the Italian peasant. They were accompanied by the lyre, which was handed from singer to singer as the time for each scollon came round.

With regard to the stornelli, many critics seem to confound it with the rispetto, a verse figure of the most beautiful and delicate. The Italian rispetto consists of a stanza of inter-rhyming lines ranging from six to ten in number, but often not exceeding eight. The Tuscan and Umbrian stornello is much shorter, consisting, indeed, of a hemistich naming some natural object which suggests the motive of the little poem. The nearest approach to the Italian stornello appears to be, not the rispetto, but the Welsh twynfa.

Perhaps the mere difficulty of rhyming in English and the facility of rhyming in Italian must be taken into account when we inquire why there is nothing in Scotland—of course there could be nothing in England—answering to the nature-poetry of the Italian peasant. Most of the Italian rispetti and stornelli seem to have been improvised by Bincardi, and it is difficult to see how they are more than a ruse to the improvisations of the Italian peasant, the improvisations of the peasant. The poet discover who is the composer of a canzone, they will not sing it. The speciality of Italian peasant poetry is that the symbol which is mostly erotic is of the purest and most tender kind. A peasant girl will improvise a song as impassioned as “Come into the Garden, Maud,” and as free from unhomely tint.

With regard to English songs, the critic cannot but ask—Wherein lies the lost ring and charm of the Elizabethan song-writers? Since the Jacobean period at least, few have succeeded in the art of writing real songs as distinguished from mere book lyrics. Between songs to be sung and songs to be read there is in our time a difference as wide as that which exists between plays for the closet and plays for the boards.

Heartiness and melody—the two requisites of a song which can never be dispensed with—can rarely be compassed, it seems, by one and the same individual. In both these qualities the Elizabethan poets stand pre-eminent, though even with them the melody is not so singable as it might be made. Since their time heartiness has, perhaps, been a Scottish rather than an English endowment of the song-writer. It is difficult to imagine an Englishman writing a song like “Tullochgorum” or a song...
like "Maggie Lauder," where the heartiness and impulse of the poet's mood conquer all impediments of close vowels and rugged consonantal combinations. Of Scottish song-writers Burns is, of course, the head; for the songs of John Skinner, the heartiest song-writer that has appeared in Great Britain (not excluding Herrick), are too few in number to entitle him to be placed beside a poet so prolific in heartiness and melody as Burns. With regard to Campbell's heartiness, this is quite a different quality from the heartiness of Burns and Skinner, and is in quality English rather than Scottish, though, no doubt, it is of a fine and rare strain, especially in "The Battle of the Baltic." His songs illustrate an infirmity which even the Scottish song-writers share with the English—a defective sense of that true song-warble which we get in the stornelli and rispetto of the Italian peasants. A poet may have heartiness in plenty, but if he has that love of consonantal effects which Donne displays he will never write a first-rate song. Here, indeed, is the crowning difficulty of song-writing. An extreme simplicity of structure and of diction must be accompanied by an instinctive apprehension of the melodic capabilities of verbal sounds, and of what Samuel Lover, the Irish song-writer, called "singing" words, which is rare in this country, and seems to belong to the Celtic rather than to the Saxon ear. "The song-writer," says Lover, "must frame his song of open vowels with as few guttural or hissing sounds as possible, and he must be content sometimes to sacrifice grandeur and vigour to the necessity of selecting singing words and not reading words." And he exemplifies the distinction between singing words and reading words by a line from one of Shelley's songs—

"The fresh earth in new leaves drest,
  where nearly every word shuts up the mouth instead of opening it.
"But closeness of vowel sounds is by no means the only thing to be avoided in song-writing. A phrase may be absolutely unsinging, though the vowels be open enough, if it is loaded with consonants. The truth is that in song-writing it is quite as necessary to provide a balance of consonants like ours, to attend to the consonants as to the vowels; and perhaps the first thing to avoid in writing English songs is the frequent recurrence of the sibilant. But this applies to all the brief and quintessential forms of poetry, such as the sonnet, the elegy, &c.

As to the elegy—a form of poetic art which has more relation to the objects of the external world than the song, but less relation to these than the stornello—its scope seems to be wide indeed, as practiced by such various writers as Tyrtaeus, Theognis, Catullus, Tibullus, and our own Gray. It may almost be said that perfection of form is more necessary here and in the sonnet than in the song, inasmuch as the Metrical pretensions are more pronounced. Hence even such apparent minutiae as those we have hinted at above must not be neglected here.

We have quoted Dionysius of Halicarnassus in relation to the arrangement of words in poetry. His remarks on syllabists are equally deserving of attention. He goes so far as to say that "e is entirely disagreeable, and, when it often recurs, inexpressive. The bias seems to him to be more appropriate to the beast than to man. Hence certain writers, he says, often avoid it, and employ it with regret. Some, he tells us, have composed entire odes without it. But if sibilation is a defect, Greek odes, where the all-pervading effects of the sibilant are so potent, it is much more so in English poetry, where the consonants dominate, though it will be only specially noticeable in the brief and quintessential forms such as the song, the sonnet, the elegy. Many poets only attend to their syllabists when these clues of the rhythm. To write even the briefest song without a syllabist would be a tour de force; to write a good one would no doubt be next to impossible. It is singular that the only metricist who ever attempted to extend the English language into this "Citizen John" of President Thelwall, the friend of Lamb and Coleridge, and editor of the famous Champion newspaper, where many of Lamb's epigrams appeared. Thelwall gave much attention to metrical questions, and tried his hand at various metres. Though "Citizen John" laboured conscientiously, Captain Coluccio Salmacis and Nicolet de Nicolli befriended him, and in the year 1402 or 1403 he was received into the service of the Roman curia. His functions were those of a secretary; and, though he profited by benefices conferred on him in lieu of salary, he remained a layman to the end of his life. It is noticeable
that, while he held his office in the curia through that momentous period of fifty years which witnessed the Councils of Constance and of Basel, and the final restoration of the papacy under Nicholas V, his sympathies were never attracted to ecclesiastical affairs. Nothing marks the secular attitude of the Italians at an epoch which decided the future course of both Renaissance and Reformation more strongly than the mundane productivity of this apostolic secretary, heart and soul devoted to the resuscitation of classical studies amid conflicts of popes and antipopes, cardinals and councils, in all of which he bore an official part. Thus, when his duties called him to Constance in 1414, he employed his leisure in exploring the libraries of Swiss and Swabian convents. The treasures he brought to light at Reichenau, Weingarten, and above all St Gall, restored many lost masterpieces of Latin literature, and supplied students with the texts of authors whose works had hitherto been accessible only in mutilated copies. In one of his epistles he describes how he recovered Quintilian, part of Valerius Flaccus, and the commentaries of Asconius Pedianus at St Gall. MSS. of Lucretius, Columella, Silius Italicus, Manlius and Vitruvius were unearthed, copied by his hand, and communicated to the learned. Wherever Poggio went he carried on the same industry of research. At Langres he discovered Cicero’s Oration for Caecina, at Monte Cassino a MS. of Frontinus. He also could boast of having recovered Ammianus Marcellinus, Nonius Marcellus, Probus, Flavius Caper and Eutyches. If a codex could not be obtained by fair means, he was ready to use fraud, as when he bribed a monk to abstract a Livy and an Ammianus from the conven library of Hersfeld. Resolute in recognizing erudition as the chief concern of man, he sighed over the folly of popes and princes, who spent their time in wars and ecclesiastical disputes when they might have been more profitably employed in reviving the lost learning of antiquity. This point of view is eminently characteristic of the earlier Italian Renaissance. The men of that nation and of that epoch were bent on creating a new intellectual atmosphere for Europe by means of vital contact with antiquity. Poggio, like Aeneas Sylvius Piccolomini (Pius II.), was a great traveller, and wherever he went he brought enlightened powers of observation trained in liberal studies to bear upon the manners of the countries he visited. We owe to his pen curious remarks on English and Swiss customs, valuable notes on the remains of antique art in Rome, and a singularly striking portrait of Jerome of Prague as he appeared before the judges who condemned him to the stake. It is necessary to dwell at length upon Poggio’s devotion to the task of recovering the classics, and upon his disengagement from all but humanistic interests, because these were the most marked feature of his character. Continued and unflinching, he embraced the whole sphere of contemporary studies, and distinguished himself as an orator, a writer of rhetorical treatises, a panegyrist of the dead, a violent impugner of the living, a translator from the Greek, an epistolographer andgrave historian and a facetious compiler of fabliaux in Latin. On his moral essays it may suffice to notice the dissertations On Nobility, On Vicissitudes of Fortune, On the Misery of Human Life, On the Infidelity of Princes and On Marriage in Old Age. These compositions belonged to a species which, since Petrarch set the fashion, were very popular among Italian scholars. They have lost their value, except for the few matters of fact embedded in a mass of commonplace meditation, and for some occasionally brilliant illustrations. Poggio’s History of Florence, written in avowed imitation of Livy’s manner, requires separate mention, since it exemplifies by its defects the weakness of that merely stylistic treatment which deprived so much of Bruni’s, Carlo Aretino’s and Bembo’s work of historical weight. A somewhat different criticism must be passed on the Facetiae, a collection of humorous and indecent tales expressed in such Latinity as Poggio could command. This book is chiefly remarkable for its unsparing satires on the monastic orders and the secular clergy. It is also noticeable as illustrating the latinitizing tendency of an age which gave classic form to the lightest essays of the fancy. Poggio, it may be observed, was a fluent and copious writer in the Latin tongue, but not an elegant scholar. His knowledge of the ancient authors was wide, but his taste was not select, and his erudition was superficial. His translation of Xenophon’s Cyropædia into Latin cannot be praised for accuracy. Among contemporaries he passed for one of the most formidable polemical or gladiatorial rhetoricians; and a considerable section of his extant works are invectives. One of these, the Dialogue against Hypocrites, was aimed in a spirit of vindictive hatred at the vices of ecclesiastics; another, written at the request of Nicholas V., covered the anti-pope Felix with scurrilous abuse. But his most famous compositions in this vein are the personal invectives which he discharged against Filippo le Valla. All the resources of a copious and unexcelled Latin vocabulary were employed to degrade the objects of his satire; and every crime of which humanity is capable was ascribed to them without discrimination. In Filippo and Valla Poggio found his match; and Italy was amused for years with the spectacle of their indecent combats. To dwell upon such literary infamies would be below the dignity of the historian, were it not that these habits of the early Italian humanists imposed a fashion upon Europe which extended to the later age of Scaliger’s contentions with Scipioni and Milton’s with Salmasius. The greater part of Poggio’s long life was spent in attendance to his duties in the papal curia at Rome and elsewhere. But about the year 1452 he finally retired to Florence, where he was admitted to the burgershership, and on the death of Carlo Aretino in 1453 was appointed chancellor and historiographer to the republic. He had already built himself a villa in Valdarno, which he adorned with a collection of antique sculpture, coins and inscriptions. In 1455 he had married a girl of eighteen named Vaglia, of the famous Buondelmonte blood. His declining days were spent in the discharge of his honourable Florentine office and in the composition of his history. He died in 1459, and was buried in the church of Santa Croce. A statue by Donatello and a picture by Antonio del Pollajuolo remained to commemorate a citizen who chiefly for his services to humanistic literature deserved the notice of posterity.

Poggio’s works were printed at Basel in 1538, "ex aedibus Henrici Petri." Dr Shepherd’s Life of Poggio Bracciolini (1802) is a good authority on his biography. For his position in the history of the revival, see Voigt’s Wiederbelebung des classischen Alterthums, and Symonds’s Renaissance in Italy. (J. A. S.)

POGLIZZA (Serbo-Croatian, Poljica), a tract of mountainous land in Dalmatia, Austria; formerly the seat of an independent republic. The territories of Pogliza lay chiefly within the south-easterly curve made by the river Cetina before it enters the Adriatic at Omis (Omiš). This comprises also a part of the fertile strip of coast from Almissa to Stobrez, 10 m. W.N.W. The inhabitants lived in scattered villages, each ruled by its own council, and altogether ruled by the supreme count. These officers, with the three judges, were always of noble birth, though elected by the whole body of citizens. There were two orders of nobles; the higher, including about 20 families, claimed Hungarian descent; the lower, claiming kinship with the Bosnian aristocracy. Below these ranked the commoners and the serfs. At a very early date the warlike highlanders of Pogliza became the friends and allies of the Almanian corsairs, who were thus enabled to harass the seaborne trade of their neighbours without fear of a sudden attack by land. Almissa received a charter from Andrew II. of Hungary in 1507, and remained under the nominal protection of Hungary until 1444, when both Almissa and Pogliza accepted the suzerainty of Venice, while retaining their internal freedom. The population of Pogliza numbered 6566 in 1866. In the following year, however, the republic incurred the enmity of Napoleon by rendering aid to the Russians and Montenegrins in Dalmatia; and it was invaded by French troops, who plundered its villages, massacred its inhabitants, and finally deprived it of independence.

See the Annuario Dalmatico for 1885 (published at Zara); and A. Fortis, Travels into Dalmatia (London, 1778).
POINCARE—POINT PLEASANT

POINCARE, RAYMOND (1860—1912), French statesman, was born at Bar-le-Duc on the 20th of August 1860, the son of Nicolas Antoinin Hélène Poincare, a distinguished civil servant and member of the Académie des Sciences of the University of Paris, Raymond was called to the Paris bar, and was for some time law editor of the Voltaire. He had served for over a year in the department of agriculture when in 1887 he was elected deputy for the Meuse. He made a great reputation in the Chamber as an economist, and sat on the budget commissions of 1880-1881 and 1892. He was minister of education, fine arts and religion in the first cabinet (April-Nov. 1893) of Charles Dupuy, and minister of finance in the second and third (May 1894-Jan. 1895). In the succeeding Ribot cabinet Poincare became minister of public instruction. Although he was excluded from the Radical cabinet which followed, the reorganization scheme of duties proposed by the new ministry was based upon his proposals of the previous year. He became vice-president of the chamber in the autumn of 1895, and in spite of the bitter hostility of the Radicals retained his position in 1896 and 1897. In 1906 he returned to the ministry of finance in the short-lived Sarrien ministry. Poincare had retained his practice at the bar during his political career, and he published several volumes of essays on literary and political subjects.

His brother, Lucien Poincare (b. 1862), famous as a physicist, became inspector-general of public instruction in 1902. He is the author of La Physique moderne (1906) and L'Électricité (1907). Julien Henri Poincare (b. 1854), another distinguished physicist, belongs to another branch of the same family.

POINSETTIA. The Poinsettia pulcherrima of gardens (Euphorbia pulcherrima) of botanists, a native of Mexico and Central America, with its brilliant scarlet bracts, stands unrivalled amongst decorative plants. The white-bracted sort, var. alba, is not so effective, but the double-flowered, var. plenissima, in which the brilliant inflorescence is branched, is as brilliant as the type, and keeps long in flower. They are increased by cuttings in spring, which when taken off with a heel strike freely in brisk heat. They require good turfy loam, with an addition of one-sixth of leaf-mould and a little sand, and should be kept in a heat of from 55° to 70° at night, with a rise of 10° by day. To prevent their growing lanky, they should be kept with their heads almost touching the glass; and as the pots get filled with roots they must be shifted into others, 7 or 8 in. in diameter. About August they may be inoculated to a heat of 50° at night, and should be brought to bear air night and day whilst the weather is warm, or they may be placed out of doors for a month under a south wall in the full sun. This treatment matures and prepares them for flowering. In autumn they must be removed to a house where the temperature is 50° at night, and by the end of September some of them may be put in the stove, where they will come into flower, the remainder being placed under heat later for succession. When in bloom they may be kept at about 55° by night, and so placed will last longer than if kept in a higher temperature.

POINSET, LOUIS (1777-1859), French mathematician, was born at Paris on the 3rd of January 1777. In 1794 he became a scholar at the École Polytechnique, which he left in 1796 to act as a civil engineer. In 1804 he was appointed professor of mathematics at the Lycée, in 1809 professor of analysis and mechanics, and in 1816 examiner at the École Polytechnique. On the death of J. L. Lagrange, in 1813, Poinsot was elected to his place in the Académie des Sciences; and in 1845 he became a member of the superior council of public instruction. In 1846 he was made an officer of the Legion of Honour; and on the formation of the senate in 1852 he was chosen a member of that body. He died at Paris on the 4th of December 1859.

Poinset's earliest work was his Éléments de statique (1803; 9th edition, 1848), in which he introduces the idea of statical couples and investigates their properties. In the Théorie nouvelle de la rotation des corps (1834) he treats the motion of a rigid body geometrically, and shows that the most general motion of such a body can be represented at any instant by a rotation about an axis combined with a translation parallel to this axis, and that any motion of a body of which one point is fixed may be produced by the rolling of a cone fixed in the body on a cone fixed in space. Through his researches on the theory of rigid body had in every case been purely analytical, and so gave no aid to the formation of a mental picture of the body's motion; and the great value of this work lies in the fact that, as Poinsot himself says in the introduction, it enables us to represent to ourselves the motion of a rigid body as clearly as that of a moving point. In addition to publishing a number of works on geometrical and mechanical subjects, Poinsot also contributed a number of papers on pure and applied mathematics to Lionville's Journal and other scientific periodicals.

POINT PLEASANT, a town and the county-seat of Mason county, West Virginia, U.S.A., on the Ohio river, at the mouth of the Kanawha river, and about midway between Pittsburgh and Cincinnati. Pop. (1900) 1934; (1910) 2045. It is served directly by the Baltimore & Ohio and the Kanawha & Michigan (controlled by the Hocking Valley railways), and by the Hocking Valley railway on the opposite side of the Ohio river. The Kanawha river is navigable (by the use of locks and dams) for 90 m. above the town, and Point Pleasant is a re-shipping point for Kanawha coal. Coal and salt are mined in the vicinity, but the surrounding country is principally agricultural.

In 1774 the Battle of Point Pleasant, named after the place, in "Lord Dunmore's War," was fought here on the 20th of October 1774 between about 1100 Virginia militiamen, under General Andrew Lewis (c. 1720-1781), and about 1000 Shawnees and their allies, under their chief, Cornstalk (c. 1720-1777). Lewis had been ordered to meet Lord Dunmore here with a body of militiamen (recruited from Botetourt, West Augusta and Fincastle counties), but when he reached the mouth of the Kanawha, after marching 160 m. from Fort Union (now Lewisburg, W.Va.), Dunmore's force, which was to have gone over the Braddock trail to Fort Pitt, and thence down the Ohio river, had not arrived. Early on the morning of the 26th the Indians suddenly attacked, and the battle continued fiercely throughout the day. At night the Indians crossed the Ohio river, leaving behind many of their dead. The whites lost about 144 in killed and wounded, Colonel Charles Lewis (1733-1774), a brother of the commanding officer, being among the former. In December Lord Dunmore concluded a treaty with the Indians, by which they surrendered their claim to lands south of the Ohio and agreed not to molest whites travelling to the western country. The battle, which overawed the Indians, and the treaty, which was not seriously broken for three years, made possible the rapid settlement of the western country, especially of Kentucky, during the early years of the War of Independence. Four years before the battle the Virginia House of Burgesses had awarded to General Lewis, for his earlier services in the French and Indian War, 6876 acres of land, including the

1 General Lewis was born in Donegal, Ireland; served with Washington at Fort Necessity and at Braddock's defeat; was commissioner from Virginia to conclude the treaty with the Six Nations at Fort Stanwix (1768); was a member of the Virginia House of Burgesses for several years; served as a brigadier general in the French and Indian War; and was sent by Lord London to retire from Gwyn's Island, in Chesapeake Bay, where he had taken refuge.

2 Cornstalk and his son were killed within the fort at Point Pleasant in November 1777 by Virginian soldiers (contrary to the protests of their commanding officers), who thus avenged the death of a comrade. He was at the time warning the garrison of his inability to hold the Shawnees to the terms of the treaty of 1774. There is a granite monument (erected in 1899) over his grave in the yard of the courthouse.

3 Various American writers have asserted that Lord Dunmore incited the Indians to attack the frontier in order to divert the colonists from their pursuit of his time, and that he purposely refrained from effecting a junction with Lewis, so that Lewis might be defeated and Virginia thus be greatly crippled on the eve of the threatened war with the mother country; and the battle of 1774 has accordingly been referred to as the first battle of the War of Independence. The assertions with regard to Lord Dunmore, however, rest on circumstantial evidence alone, and have never been conclusively proved.
present site of Point Pleasant; the survey of this grant was made by George Washington. After the battle General Lewis sent a detachment to build a fort (called Fort Blair) here; in 1776 Fort Randolph (abandoned in 1779) was erected on the same site, and in 1785 (from which year the permanent settlement of the town may be dated) a third fort was built here. Daniel Boone lived here from 1788 until about 1799. In 1794 the village of Point Pleasant was platted; it was incorporated as a town in 1833. A granite monument (86 ft. high) commemorating the battle was unveiled on the 10th of October 1900.

**POISON.** An exact definition of the word "poison" (derived through Fr. from Lat. *poato, potonem*, a drink; i.e. a deadly draught) is by no means easy. There is no legal definition of what constitutes a poison, and the definitions usually proposed are apt to include either too much or too little. Generally, a poison may be defined to be a substance having an inherent deleterious property, rendering it capable of destroying life by whatever avenue it is taken into the system; or it is a substance which when introduced into the system, or applied externally, injures health or destroys life irrespective of mechanical means or direct thermal changes. In popular language a poison is a substance capable of destroying life when taken in small quantity; but a substance which destroys life by mechanical means as, e.g. powdered glass, is not, strictly speaking, a poison.

The subject of toxicology forms one of the most important branches of medical jurisprudence (q.v.). The medical jurist should be familiar with the nature and actions of poisons, the symptoms which they produce, the circumstances which modify their working, the pathological results of their action, and the methods of combating their effects.

**Action of Poisons.**—Poisons may act a twofold action. This may be either local, or remote, or both local and remote. The local action of a poison is usually one of corrosion, inflammation, or a direct effect upon the sensory or motor nerves. The remote actions of poisons are usually of a specific character, though some writers group the remote effects of poisons under two heads, and speak of the common and the specific remote effects of a poison. The local action of a poison of the corrosive class is usually so well marked and obvious that the fact of the administration of a poison of this class is generally unmistakable. The same may be said, in a less degree, of the irritant poisons, especially the mineral irritants; but here the symptoms sometimes times cloak those of natural disease as to render the recognition of the administration of poison a matter of difficulty. Hence an accurate acquaintance with the remote specific effects of the various poisons is indispensable to the medical jurist. The class of poisons which has been administered or taken will thus be suggested to his mind by the observation of the symptoms; and not unfrequently the specific poison taken will be suspected. It is almost universally admitted that absorption of a poison is necessary for the production of its specific remote effects, and the old notion that a poison may kill, by its action through the nervous system, without absorption, is abandoned.

**Modifying Circumstances.**—The ordinary action of a poison may be greatly modified by the largeness of the dose, by the state of aggregation, admixture, or of chemical combination of the poison, by the part or membrane to which it is applied, and by the condition of the patient. Thus, for example, opium may be a medicine or a poison, according to the dose in which it is given; and a dose of the drug which may be beneficial to an adult in certain states of the system may be fatal to a child, or to an adult when suffering from some forms of disease. All barium salts, again, are poisonous, except the quite insoluble sulphate. The simple cyanides, and many double cyanides, are highly poisonous; but yellow prussiate of potash, which is a double cyanide of iron and potassium, is almost without action upon the system. The part or tissue to which a poison is applied greatly affects the activity of a poison, owing to the varying rapidity with which absorption takes place through the cutaneous, mucous and serous surfaces, and by the other tissues of the body. Curare, an arrow poison, may be swallowed in considerable quantity without appreciable result, whilst a minute quantity of the same substance introduced into a wound is speedily fatal. Idiosyncrasy has an important bearing in toxicology. Pork, mutton, certain kinds of fish, more especially shell-fish so-called, and mushrooms have each produced all the symptoms of violent irritant poisoning, whilst other persons who have partaken of the same food at the same time have experienced no ill effects. Some persons are stated, on good authority, to be capable of taking with impunity such poisons as opium, corrosive sublimate, or arsenic, in enormous doses—and this irrespective of habit, which is known to have such an influence in modifying the effects of some poisons, notably the narcotics. A tolerance of poisons is sometimes engendered by disease, so that a poison may fail to produce its customary effect. Thus, opium is tolerated in large quantities in tetanus and in delirium tremens; and mercurial compounds may in some febrile affections fail to produce the usual constitutional effects of the metal. On the other hand, diseases which impede the elimination of a poison may intensify its effects.

The evidence that a poison has been administered is based upon the symptoms produced, on the appearances met with in the body after death, on the analysis of articles of food and drink, of excreta and ejecta, and of the organs of the body after death, and on physiological experiments made with substances extracted from the same articles. These physiological experiments are usually made upon animals, but in some cases, as for instance when aconite has to be searched for, the physiological experiments must be made also upon the human subject. The evidence obtained from one or more of these sources, as compared with the properties or effects, which are known poisons, will enable the medical jurist to form an opinion as to the administration or non-administration of a poison.

The symptoms exhibited by the patient during life rarely fail to afford some clue to the poison taken. Persons may, however, be found dead of whose history nothing can be learned. Here post mortem appearances, chemical analysis, and, it may be, physiological experiments, are all important for the elucidation of the nature of the case.

Poisoning may be acute or chronic. The general conditions which should arouse a suspicion of acute poisoning are the sudden onset of serious and increasingly alarming symptoms in a person apparently in good health, especially if there be pain in the region of the stomach. It may be the sudden appearance of the vital powers, a cadaveric aspect, and speedy death. In all such cases the aid of the analytical chemist must be called in to either confirm well-founded or to rebut ill-founded suspicions.

The mode of treatment to be adopted in the case of poisoned persons varies greatly according to the nature of the poison. The first indication, when the poison has been swallowed, is to evacuate the stomach; and this may usually be done by means of the stomach-pump when the poison is not of the corrosive class; or the stomach may be gently washed out by means of a funnel and flexible siphon-tube. In many cases emetics are valuable. Antidotes and counter-poisons may then be given. The former are such substances as chalk to neutralize the mineral acids and oxalic acid; the latter have a physiological counter-action, and are such as atropine, which is a counter-poison to morphia. These may usually be administered most effectively by hypodermic injection. The stomach may to a certain degree be protected from the injurious effects of irritants by the administration of mucilaginous drinks; alkaloïds may be rendered sparingly soluble by means of astringent substances containing tannin; and pain may be relieved by means of opium, unless contra-indicated by the nature of the poison. The effects of the convulsant poisons, such as strychnine, may be combated by means of the inhalation of chloroform.

The classification of poisons is a matter of difficulty. Various
attempts have been made to classify them scientifically, but with no signal success; and perhaps the best system is that which groups the various poisons according to the more obvious symptoms they produce. Our knowledge of the more intimate action of poisons is still too imperfect to admit of any useful classification according to the manner in which they specifically affect the vital organs. Poisons may in the manner indicated be classified as (1) Corrosives, (2) Irritants, (3) Neu-rotics, and (4) Gaseous Poisons.

1. Corrosives.

The typical member of this class is corrosive sublimate, the soluble chloride of mercury. In it are included also the concentrated alkali hydroxides, such as sodium and potash hydroxide; the metallic acids; the alkalis (potash, soda, and ammonia) and their carbonates; acid, alkaline, and corrosive salts of the metals (such as bisulphate of potash, alum, butter of antimony and nitrate of silver); and caustic soda.

The symptoms produced by the mineral acids and the alkalis are almost altogether referable to local action; but some corrosive poisons, such as carbolic acid, produce, besides a local action, remote and specific constitutional effects. The symptoms of corrosive poisoning are marked and unmistakable, except in infants. Immediately on swallowing the corrosive substance, an acid, caustic, or metallic burning sensation is experienced in the mouth, fauces, gullet, and stomach. The peristaltic movements of the stomach are increased in quantity and in rapidity, the whole belly; as a rule vomiting speedily follows. In the case of the mineral acids, and in oxalic acid poisoning, the vomit is so acid that if it falls upon a marble or concrete floor effervescence ensues, showing the evolution of carbonic acid. The ejected matters contain blood, and even fragments of the corroded walls of the alimentary canal. The belly becomes distended with gas, which has difficulty in passing. The mouth is found to be corrosed. Death usually occurs within the first hours; or, if the patient survives, he or she may perish miserably, months after the poison was taken, through starvation consequent upon the gradual contraction of the gullet, brought about by its corrosive and subsequent healing.

The treatment of corrosive poisoning consists in very gently emptying and washing out the stomach by means of a soft siphon-tube. The stomach-syrup cannot be used with safety in consequence of the weakening of the walls of the stomach by corrosive. Demulcents and opiate may be subsequently administered. After death from corrosive poisoning the walls of the stomach are found corrosed and perforated.

1. Corrosive Sublimate.—Here all the signs and symptoms of corrosive poisoning are produced in their severest form. A grain or two of this poison may prove fatal. Fortunately there is an efficient antidote in white of egg, the albumen of which, if administered at once, renders the salt insoluble. The eggs should be devoured of their yolks, beaten up with water, and given promptly, repeatedly, and within 15 or 30 minutes by emetics. Poisoning by corrosive sublimate may be followed by the specific toxic effects of mercury, such as salivation and tremor.

Workers in mercury, such as water-gilders, looking-glass makers, and electroplaters, and zinc workers, are exposed to the fumes from a peculiar form of shaking palsy, known as "the trembles," or mercurial tremor. This disease affects most frequently those who are exposed to mercurial fumes. The victim is affected with tremors when an endeavour is made to exert the muscles, so that he is unable, for instance, to convey a glass of water to the lips steadily, and when he walks he breaks into a dancing tr. The treatment consists in removal from the mercurial atmosphere, baths, fresh air, and administration of iron and other tonics.

2. Mineral Acids.—These are oil of vitriol or sulphuric acid, aqua fortis or nitric acid, and spirit of salt or hydrochloric (muriatic) acid. These, when taken in a concentrated form, produce well-marked symptoms of corrosive. When they are diluted, the symptoms are those of an irritant poison. Nitric acid stains the mouth and skin of a yellow colour. The treatment consists in the administration of the alkalis or other carbonates, chalk, whiting, or even uncoloured plaster scraped off the walls or ceiling, with the view of neutralizing the acid.

3. Oxalic acid is a vegetable acid. When taken in the state of corpuscles acts as a corrosive, but when diluted as an irritant. But it also exerts a specific effect by cardiac syncope not uncommonly within a few minutes. When a person after taking a crystalline substance, tasting strongly acid, dies within from five to 20 minutes, after the evacuation of the stomach, small pulse and failure of the heart's power, poisoning by oxalic acid is almost certain. The treatment consists in promptly administering an emetic, followed by chalk, whiting, or any sub- stantive sublimate corrosions of copper. When they are diluted, the symptoms are those of an irritant poison. The salt is valuable, for the alkaline oxalates are almost as poisonous as oxalic acid itself.

4. The Alkalis. Caustic potash and caustic soda produce symptoms resembling those of the mineral acids, except that purging is a usual accompaniment.

5. Carbolic acid when taken in the form of a concentrated liquid acts as a corrosive, causing whitening and shrinking of all the animal membranes with which it comes in contact. The patient, however, becomes speedily comatose, the poison acting profoundly on the nervous system. Our knowledge of the more intimate action of poisons is still too imperfect to admit of any useful classification according to the manner in which they specifically affect the vital organs. Poisons may in the manner indicated be classified as (1) Corrosives, (2) Irritants, (3) Neu-rotics, and (4) Gaseous Poisons.

6. Poisonous gases are of two classes—metallic poisons and vegetable and animal irritants, these latter being for convenience grouped under the term "Irritant." All the poisons except those of the latter group act purely as such, the irritant symptoms being usually accompanied by well-marked effects upon the nervous system. An irritant is a substance which may be introduced into the body by any one of the several ways, usually the alimentary canal, which may cause definite effects upon the nerves and muscles of the body. Other irritants are the moderately diluted acids, many metallic salts, such as those of antimony, lead, copper, iron, zinc; and the vegetable irritants, such as garlic, white wine, and certain vegetable poisons, such as those of castor oil, castor beans, and arsenic. The vegetable irritants are also included in the class of poisons which act as corrosives.

7. Vegetable Irritants.—These produce drastic purgative effects. Frequently the nature of the illness may be ascertained by the discovery of portions of the vegetable substance recognizable by the microscope—in the matters ejected by the patient.

1. Arsenic is a specific irritant poison. Almost all the compounds of this metal are poisonous. The term "arsenic" is, however, also applied to a large number of the compounds of arsenic, which are used in medicine, and which are known as arsenical poisons. There are the arsenious and the arsenic compounds of the various bases, the arsenates, the arsenates, and also the arsenious and the arsenic compounds of the vegetable kingdom. The common arsenical poisons are arsenious acid, arsenous acid, and arsenic acid.

Arsenic-eating, or the ability of some persons to take relatively large quantities of arsenic habitually, is a well-established fact. The cause of this singular immunity from the ordinary results of arsenic is unknown.

2. Lead.—The salts of lead, more especially the acetate (sugar of lead), the carbonate, and the nitrate, are family remedies. It is used occasionally death ensues, recovery, is the rule. Chalky yellow, or lead chromate, is a powerful irritant poison. All chromates are, indeed, irritant poisons. (See Lead Poisoning.)

3. Zinc salts and baryum salts, except the quite insoluble baryum sulphate, are irritant poisons; and baryum compounds act upon the central nervous system.

4. Chromates, e.g., bichromate of potash, are violent irritants. Chalky yellow, or lead chromate, has already been mentioned.

5. Phosphorus.—Of all the vegetable poisons— both the yellow or ordinary and the red or amorphous—the former only is poisonous. Rarely there is met with a chronic form of poisoning by phosphorus vapours. Its special characteristic is a peculiar necrosis or death of the bone structure of the lower jaw. Acute phosphorus poisoning is more common. Phosphorus is used for temporary emetics, and for the production of chemical poisons, as the basis of several venin destroyers. (See Phosphorus and Mattei.)

6. Vegetable Irritants.—These produce drastic purgative effects. Frequently the nature of the illness may be ascertained by the discovery of portions of the vegetable substance recognizable by the microscope—in the matters ejected by the patient.
POISON

8. Cantharides.—The administration of cantharides (g.v.) is followed by vomiting, purging, stranguary, or even entire inability to retain urine. The effects in severe cases are marked, and in long-acting cases the fumes of the fly may often be recognized. There is often great excitement of the sexual proclivities. The active principle of the fly, cantharidin, may be extracted from suspected matters by means of acetone. The distilled spirit contains about 10% of an active principle resembling aconite. The drug is very irritant to the eye, blisters the lip or any tender mucous surface to which it is applied. Demulcent remedies, with opiate enemata and injections, afford the best relief by way of treatment.

1. Prussic or Hydrocyanic Acid.—Hydrocyanic acid is one of the best known of all poisons. In a few minutes after the poison has been inhaled it is said to kill with lightning-like rapidity. It is met with in commerce only in a dilute state. In Great Britain two kinds of acid are commonly sold—the pharmacopoeial acid, containing 2% of carbonic anhydride and 98% of water; and a Swedish acid containing 4% of carbonic anhydride. Less than a teaspoonful of the 2% acid has caused death. Given in fatal doses, the symptoms of prussic-acid poisoning set in with great rapidity; and, in consequence, the readiness with which the poison is absorbed from the mucus and diffused through the circulation, the onset of symptoms is reckoned by seconds rather than by minutes. Occasionally the victim may be able to perform a few voluntary actions before alarming symptoms are developed. There is first a very brief stage of difficult breathing, and slow action of the heart, with a tendency for the organ to stop in the state of dilatation. With widely-dilated pupils of the eye, the patient is then thrown into a state of irregular movements. The rhythm of the respiratory movements is disturbed, and the countenance becomes of a bluish cast. The patient now sinks to the ground with complete loss of muscular power; and the third or apneic stage of action ensues, in which the patient takes deep, slow, regular respirations, loss of pulse, and paralysis of motion. Death is frequently preceded by muscular spasms. The fourouryant character of the illness, and the speedy death of the patient, coupled with the fact that the powder is nearly neutralized by the stomach, seem to leave no doubt as to the nature of the case.

The treatment consists in inhalation of fumes of strong ammonia, of warm and cold water alternately, friction of the limbs, and artificial respiration. The subcutaneous injection of atropine, which acts as a cardiac stimulant, may prove serviceable.

Other soluble cyanides, more especially cyanide of potassium, a salicylate, or a copper carbonate, are equally poisonous with hydrocyanic acid. (See PRUSSIC ACID.)

2. Opium.—In consequence of the extent to which opium, its preparations, and its active alkaloid morphine are used for the relief of pain, it is not surprising that, if of frequent occurrence, it is largely used by suicides; and children, being very susceptible to its influence, frequently die by misadventure after administration of an overdose of the drug. The ordinary preparations of opium are the drug itself, which is the insipped juice of the oriental poppy, and the tincture, commonly known as laudanum. Opium contains a variety of more or less active principles, the chief of which is the alkaloid morphine, which is present in good opium to the extent of about 1.5%. The active parts of the drug are actually psychologically inactive. Opium is largely used by Eastern nations for smoking, and there is great discrepancy of opinion as to the extent to which opium smoking is detrimental. Preparations of opium for medicinal purposes vary; and the opinion that opium smoking is demoralizing, degrading, and pernicious habit, and that its victims are sufferers both in body and mind from its use. (See OPUML AND MORPHINE.)

3. Strychnine and Strychnine-yielding Plants.—The alkaloids strychnine and brucine, as well as all the plants in which they are found, all act in the same manner, being highly poisonous, and causing death after spasms of a severe character. Many vermin killers contain strychnine as their active ingredient.

Strychnine, and all substances containing that alkaloid, produce their effects within a very few minutes—usually within ten or fifteen minutes. The most common symptom is convulsions that nearly always exhibit severe terror. There is an impression of impending calamity or death. Very speedily the head is jerked back, the limbs extended, the back arched (opisthotonis), so that the body may rest on the head and heels only. In a few moments these symptoms pass off, and there is complete relaxation of the spasm. The spasmodic condition speedily returns, and is brought about by the slightest touch or movement of the patient. Accessions and paroxysms of the tetanic state ensue rapidly till the patient succumbs, usually within half an hour of the administration of the poison. The best treatment is to put, and keep, the patient under the influence of chloroform till time, given, or the injection of the alkaloid, is said to have previously given a full dose of chloral hydrate. (See STRYCHNINE.)

4. Aconite Poisoning.—The ordinary blue rocket, wolfsbane or monkshood (Aconitum Napellus and A. Anthraez), and the Fleece-flower, or the Wild Purple Monarch, are perhaps the most deadly known poisons. One-sixteenth of a grain of aconite has proved fatal to a man. All the preparations of aconite produce a peculiar burning, tingling, and numbness of the parts to which they are applied. When given in large doses they produce violent vomiting, as a rule, more or less paralysis of motion and sensation, and great depression of the heart, accompanied by syncope. There is a dulness of the skin, often unalike till almost the last. The treatment consists in the hypodermic injection of digitalis, which is a counter-poison in its action upon the heart. The root of aconite has been eaten in mistake for asparagus, with fatal result.

5. Belladonna.—The belladonna or deadly nightshade, Atropa Belladonna, contains an alkaloid, atropine, which is largely used by occasion, and sometimes the pupils of the eyes are dilated. The bright scarlet berries of the plant have been eaten by children, and are often attracted by their tempting appearance. Belladonna produces dilatation of the pupils, rapid pulse, hot dry flushed skin, with an increase of the blood pressure. Unlike that of strychnine, the effects are of difficulty of swallowing, intense thirst, and gay, mirthful delirium. The treatment consists in evacuation of the poison by means of the stomach-pump, and the hypodermic injection of morphia as a counter-poison.

4. Gaseous Poisons.

The effects of these are varied—some of them acting as irritants, while others have a specific effect, apparently in consequence of their forming chemical compounds with the red pigment of the blood, and thus destroying its capability of acting as a carrier of oxygen.

1. Chlorine and bromine act as powerful irritants. They provoke spasm of the glottis when inhaled, and subsequently inhibit the respiration of the mucous membrane, which may prove fatal. Inhalation of diluted ammonia vapour is the best remedy.

2. Hydrochloric or muriatic acid gas and hydrofluoric or fluorac acid gas are irritating and destructive to life. The former is more powerful, and even children may be affected. In many processes of manufacture, and especially in the manufacture of carbonate of soda from common salt by Le Blanc's process, the gas is inhaled, causing a glazing of earthware, and in the manufacture of artificial manure.

3. Sulphurous Acid Gas.—The gas given off by burning sulphur is most suffocating and irritating. Its inhalation, even in a highly diluted state, may cause speedy death from spasmodic closure of the glottis.

4. Nitrous vapours, or gaseous oxides of nitrogen (except nitrous oxide), are given off from galvanic batteries excited by nitric acid; also from some copper electrolytes. When inhaled, they act as a dilute, little immediate irritation, but are exceedingly dangerous, setting up extensive and fatal inflammation of the lungs.

5. Ammoniac gas is highly irritant, but does not often prove fatal. (See NITRIC ACID.)

6. Carbon dioxide gas is heavier than atmospheric air, is totally irrespirable when pure, and is fatal when present in large quantities in respired air. It is given off from burning fuel, accumulates in pits and Wells as choke-damp, and constitutes the deadly afterdamp of coal-mines. It is also formed during alcoholic fermentation, and hence accumulates in partially filled vats in which fermented liquors are stored. When it is breathed in a concentrated state, it is almost instantaneous. Persons descending into mines with this gas sink within a very few minutes before they can be removed from the vitiated atmosphere. In these cases there is true asphyxia; but carbonic acid is also a narcotic gas. It is almost insensible when introduced to the lungs, but not long enough to produce fatal results, are affected with stertorous breathing, oppression, flushed face, prominent eyes, swollen tongue and feeble pulse. The proper treatment is removal from the foul atmosphere, alternate cold and tepid douches to the chest, friction of the limbs and trunk, and artificial respiration. When animation is restored the patient should be put to bed and kept quiet, but should be carefully watched in case of relapse.

7. Carbon monoxide gas is given off by burning charcoal and other forms of fuel, mixed with carbonic acid. The poisonous effects of carbonic fumes are perhaps due rather to the more poisonous carbonic oxide than to the less poisonous carbonic acid. An atmosphere of carbonic oxide is a far less poisonous atmosphere than one of carbonic acid, but not long enough to produce fatal results, are affected with stertorous breathing, oppression, flushed face, prominent eyes, swollen tongue and feeble pulse. The proper treatment is removal from the foul atmosphere, alternate cold and tepid douches to the chest, friction of the limbs and trunk, and artificial respiration.

When animation is restored the patient should be put to bed and kept quiet, but should be carefully watched in case of relapse.

8. Coal-gas acts as an asphyxiant and narcotic. The appearance of a blue film after death, especially on the fluid state of the blood—are similar to those observed after death from carbonic oxide gas, which is a constituent of coal-gas, and to which the chief effects of carbonic oxide may be attributed.

9. Sulphuretted hydrogen gas is highly poisonous by whatever channel it gains access to the body. In a concentrated form it produces almost instant death from asphyxia. Even in a diluted state it is powerful, and when inhaled, may pass into insensibility with lividity and feeble respiration. The skin is cold and clammy, or bathed in perspiration. The red blood corpuscles are disintegratet. The treatment consists in removal from the contaminated atmosphere, friction to the surface
of the body, warmth, and the administration of stimulants. The inhalation of chloroform has been recommended on chemical grounds; but it must be remembered that chloroform is itself poisonous.

11. Vapours of Hydrocarbons. —The volatile vapours of the natural hydrocarbons known as benzine, petroleum, &c., are poisonous when inhaled. Considerable injury may, if improperly administered, produce death by asphyxia, and perhaps otherwise. Obviouly, as a rule, medical assistance is at hand. The treatment consists in artificial respiration, and the use of galvanic current.

POISSON SIMÉON DENIS (1781—1840), French mathematician, was born at Pithiviers in the department of Loiret, on the 21st of June 1781. His father, Siméon Poisson, served as a common soldier in the Hanoverian wars; but, disgusted by the ill-treatment he received from his patriotic officers, he deserted. About the time of the birth of his son, Siméon Denis, he occupied a small administrative post at Pithiviers, and seems to have been at the head of the local government of the place during the revolutionary period. Poisson was first sent to an uncle, a surgeon at Fontainebleau, and began to take lessons in bleeding and blistering, but made little progress. Having given promise of mathematical talent he was sent to the École Centrale de Fontainebleau, and was fortunate in having a kind and sympathetic teacher, who, without knowing it, was to become his pupil. He was not long before this pupil was becoming his master, devoted himself to the study of higher mathematics in order to follow and appreciate him, and predicted his future fame by the punning quotation from La Fontaine:—

"Petit Poisson deviendra grand,
Pourvu que Dieu lui prévîe."  

In 1798 he entered the École Polytechnique at Paris as first in his year, and immediately began to attract the notice of the professors of the school, who left him free to follow the studies of his predilection. In 1800, less than two years after his entrance, he published two memoirs, one on É. Bezout’s method of elimination, the other on the number of integrals of an equation of finite differences. The latter of these memoirs was examined by S. F. Lacroix and A. M. Legendre, who recommended that it should be published in the Recueil des savants étrangers, an unparalleled honour for a youth of eighteen. This success at once procured for Poisson an entry into scientific circles. J. L. Lagrange, whose lectures on the theory of functions he attended at the École Polytechnique, early recognized his talent, and became his friend; while P. S. Laplace, in whose footsteps Poisson followed, regarded him almost as his son. The rest of his career, till his death on the 25th of April 1830, was almost entirely occupied in the composition and publication of his many works, and in discharging the duties of the numerous educational offices to which he was successively appointed. Immediately after finishing his course at the École Polytechnique he was appointed répétiteur there, an office which he had discharged as an amateur while still a pupil in the school; for it had been the custom of his comrades often to resort to his room after an unusually difficult lecture to hear him repeat and explain it. He was made professeur suppléant in 1802, and full professor in succession to J. Fourier in 1806. In 1808 he became astronomer to the Bureau des Longitudes; and when the Faculté des Sciences was instituted in 1809 he was appointed professeur de la mécanique rationnelle. He further became member of the Institute in 1812, examiner at the military school at St Cyr in 1815, leaving examiner at the École Polytechnique in 1816, councillor of the university in 1820, and geometer to the Bureau des Longitudes in succession to P. S. Laplace in 1827. His father, whose early experiences led him to hate aristocrats, bred him in the stern creed of the first republic. Throughout the empire Poisson faithfully adhered to the family principles, and refused to worship Napoleon. When the Bourbons were restored, his hatred against Napoleon led him to become a Legitimist—a conclusion which says more for the simplicity of his character than for the strength or logic of his political creed. He was faithful to the Bourbons during the Hundred Days; in fact, was with difficulty dissuaded from volunteering to fight in their cause. After the second restoration his fidelity was recognized by his elevation to the dignity of baron in 1825; but he never either took out his diploma or used the title. The revolution of July 1830 threatened him with the loss of all his honours; but this disgrace to the government of Louis Philippe was adroitly averted by F. Arago, who, while his "revocation" was being plotted by the council of ministers, procured him an invitation to dine at the Palais Royale, where he was openly and effusively received by the citizen king, who "remembered" him. After this, of course, his degradation was impossible, and seven years later he was made a peer of France, not for political reasons, but as a reward of his friendship for Arago.

As a teacher of mathematics Poisson is said to have been more than ordinarily successful, as might have been expected from his early promise as a répétiteur at the École Polytechnique. As a scientific worker his activity has rarely if ever been equaled. Notwithstanding his many official duties, he found time to publish more than three hundred works, several of them extensive treatises, and many of them memoirs dealing with the most abstruse branches of pure and applied mathematics. There are two remarks of his, or perhaps two versions of the same remark, that explain how he accomplished so much: one, "La recherche des causes de la richesse est pour moi une des grandes questions de la science"; and "Les mathématiques et à l’enseignement, &c.;" the other, "La vie c’est le travail." 

A list of Poisson’s works, drawn up by himself, is given at the end of Arago’s biography. A lengthened analysis of them would be out of place here, and all that is possible is a brief mention of the more important. There are few branches of mathematics to which he did not contribute something, but it was in the application of mathematics to physical subjects that his greatest services to science were performed. Perhaps the most original, and certainly the most permanent in their influence, were his memoirs on the theory of electricity and magnetism, which virtually created a new branch of mathematical physics. Next (perhaps in the opinion of some first) in importance stand the memoirs on celestial mechanics, in which he proved himself a worthy successor to P. S. Laplace. The most remarkable of these were those on the inequalities of the moons and the planets, "Sur la variation des constantes arbitraires dans les questions de mécanique," both published in the Journal de l’École Polytechnique (1800): "Sur la libration de la lune," in Comptes. rend. (1821), &c.; and "Sur la mouvement de la terre autour de son centre de gravité," in Mémo. d. l’acad. (1827), &c. In the first of these memoirs Poisson discusses the famous question of the stability of the planetary system, a question which had already been settled by Laplace, but which he had set aside after a degree of approximation for the disturbing forces. Poisson showed that the result could be extended to a second approximation, and thus made an important advance in the planetary theory. The memoir is considered by many as beginning the inauspicious period of inactivity, to compose in his old age one of the greatest of his memoirs, viz. that Sur la théorie des variations des éléments des planètes, et de la precession des méridiens, published in 1829. Important results of the memoirs on the precession of the equinoxes. So highly did he think of Poisson’s memoir that he made a copy of it with his own hand, which was found among his papers after his death. Poisson made important contributions to the theory of attraction. His well-known correction of Laplace’s partial differential equation for the potential was first published in the Bulletin de la société philomathique (1813). His two most important memoirs on the subject are Sur l’attraction des sphéroïdes (Comptes des temps, 1829), and "Sur l’attraction d’un ellipsoïde homogène" (Mém. d. l’acad., 1835). In concluding our selection from his physical memoirs we may mention his memoir on the theory of waves (Mém. d. l’acad., 1825).

In mathematics Poisson’s memoirs were his series of memoirs on definite integrals, and his discussion of Fourier’s series, which paved the way for the classical researches of L. Dirichlet and B. Kiemann on the same subject; these are to be found in the Journal de l’École Polytechnique from 1813 to 1824, and in the Mémo. de l’académie for 1823. In addition we may also mention his essay on the calculus of variations (Mém. d. l’acad., 1833), and his memoirs on the probability of the mean results of observations (Comptes des temps, 1835), &c. E. Arago has collected besides his many memoirs Poisson published a number of treatises, most of which were intended to form part of a great work on mathematical physics, which he did not live to complete. He had already completed his Traité de mécanique (2 vols. 8vo, 1831 and 1833), which was long a standard work; Théorie nouvelle de l’action capillaire (4to, 1831); Théorie mathématique de la chaleur (4to, 1835); Etudes sur les phénomènes physiques de l’air et des eaux (4to, 1835); Traité de la résistance des corps à la pression de l’air et de l’eau (4to, 1835); Etudes sur les lois de la propagations des sons et des ondes élastiques (4to, 1837); Etudes sur les lois de la propagation des sons et des ondes élastiques par les métaux et les cristaux (4to, 1837), all published at Paris.

See F. Arago, Biographie de Poisson, read before the Académie des Sciences on the 16th of December 1850.

1 This prediction is sometimes attributed to Laplace.
POISSY—POITIERS

POISSY, a town of northern France, in the department of Seine-et-Oise, 17 m. W.N.W. of Paris, on the railway from Paris to Rouen. Pop. (1906), 6,043. The church, supposed to have been built in the 14th century, and entirely restored under the direction of Viollet le Duc, is of special architectural interest, as affording one of the earliest and best examples of transition from the Romanesque to the Pointed style. The bridge of Poissy, a very ancient foundation, has been widened and modernized; of the mills which formerly bordered it one was known as Queen Blanche's. A statue of the painter J. L. E. Meissonier was erected in 1894, close to his house. Poissy supplied butchers' meat to Paris during six centuries, but in 1867 the market was removed to the metropolis. A handsome fountain stands in the old market-place. Distilling and the manufacture of chairs and flour-milling equipment are carried on and ragstone is quarried.

Poissy, the ancient Pinciacum, was the capital of the country of the Carnutes. In the time of Charlemagne it had a royal palace, where during the 9th century four national assemblies were held. Later it became a favourite residence of Blanche of Castille, and her son, afterwards St Louis, is supposed to have been born there. Philip the Fair gave the castle to the Dominicans, by whom it was completely transformed, and it was in the refectory of the abbey that the famous conference (see below) between the Roman Catholics and Protestants took place in 1561.

POISSY, COLLOQUIUM OF, a conference held in 1561 with the object of effecting a reconciliation between the Catholics and Protestants of France. It was initiated by Queen Catherine de' Medici, regent during the minority of her son Charles IX. In the policy of which it was the outcome she enjoyed the support of the Chancellor Miché de l'Hôpital and the lieutenant-general of the kingdom, Anthony of Navarre; while on the other hand the heads of the Catholic party had attempted to frustrate any form of negotiation. Theodore Beza from Geneva and Peter Martyr Vermigli from Zürich appeared at the colloquy; the German theologians to whom invitations had been despatched only arrived in Paris after the discussion was broken off. The conference was opened on the 9th of September in the refectory of the convent of Poissy, the king himself being present. The spokesman of the Reformed Church was Beza, who, in the first session, gave a lengthy exposition of its tenets, but excited such repugnance by his pronouncements on the Communion that he was interrupted by Cardinal Tournon. In the second session (Sept. 16) he was answered by the cardinal of Lorraine, who discharged his task with skill and moderation. On the motion, however, of Ippolito d'Este, the papal legate, exception was taken to the further conduct of the negotiations in full concave; and a committee of twenty-four representatives, twelve from each party, was appointed—ostensibly to facilitate a satisfactory decision. On the Catholic side, as was speedily demonstrated, there existed no sort of tendency to conciliation. On the contrary, the cardinal of Lorraine, by his question whether the Calvinists were prepared to sign the Confession of Augsburg, attempted to sow dissension between them and the Lutheran Protestants of Germany, on whose continued support they calculated. The Catholic delegates, moreover, discovered a powerful auxiliary when Lainez, the general of the Jesuit order, which had been admitted into France a short time previously, entered the debate; and the acrimony with which he opposed the Protestants was of material service in clarifying the situation. Still a further reduction was made in the number of members, and a small residuum consisting of five Catholics and five Protestants undertook to debate the first draft of the 14th clause on which the two churches disagreed with regard to the question of the Communion. Their difficult labours even seemed on the point of success when the assemblage of prelates refused assent, and the conference broke up on the 9th of October—a result which barred the way to a pacific understanding with the Huguenots.

See H. Küpfel, Le Colloque de Poissy (Paris, 1868); E. Lachenmann in Herzog-Hauck, Realencyklopädie f. protest. Theologie (3rd ed., 1904), xv. 497. (C. M.)

POITIERS, a town of western France, formerly the capital of Poitou, and now the chief town of the department of Vienne, 61 m. S.S.W. of Tours on the railway to Bordeaux. Pop. (1906), 291,529; Emmenab, 30,902. Poitiers is situated at the junction of the Boivre with the Clain (a tributary of the Loire by the Vienne), and occupies the slopes and summit of a plateau which rises 130 ft. above the level of the streams by which it is surrounded on three sides. The town is picturesque; and its streets are interesting for their remains of ancient architecture, especially of the Romanesque period, and the memories of great historical events. Blossac park, named after the intendant of the "generality" of Poitiers (1751-1786), and situated on the south side of the town, and the botanical garden on the north-east, are the two principal promenades. Till 1857 Poitiers contained the ruins of a Roman amphitheatre more extensive than that of Nîmes; remains of Roman baths, constructed in the 1st and demolished in the 3rd century, were laid bare in 1877; and in 1879 a burial-place and the tombs of a number of Christian martyrs were discovered on the heights to the south-east—the names of some of the Christians being preserved in paintings and inscriptions. Not far from these tombs is a huge dolmen (the "Pierre Levée"), 23 ft. long, 16 ft. broad and 6 or 7 ft. high, around which used to be held the great fair of St Luke.

The cathedral of St Peter, begun in 1162 by Henry II. of England and Eleanor of Guienne on the ruins of a Roman basilica, and well advanced by the end of the 12th century, is a building in the Romanesque and Early Gothic style, the latter predominating. It consists of three naves almost equal in height and width, both of which decrease towards the west, thus enhancing the perspective. Its length is 308 ft., and the keystone of the central vaulted roof is 80 ft. above the pavement. There is no apse, and the exterior generally has a heavy appearance. The principal front, the width of which is excessive in proportion to its height, has unfinished side-towers 105 and 110 ft. in height, begun in the 13th century. Most of the windows of the choir and the transepts preserve their stained glass of the 12th and 13th centuries; the end window, which is certainly the first in the order of time, contains the figures of Henry II. and Eleanor. The choir stalls, carved between 1255 and 1277, are among the oldest in France. The church of St Jean near the cathedral is the most ancient Christian monument in the country. Built as a baptistery in the first half of the 4th century, it was enlarged in the 7th century, since when it has suffered little structural alteration. It contains frescoes of the 12th century and a collection of tombs of the Merovingian period. The church of St Hilaire was erected at the close of the 4th century over the tomb of the celebrated bishop. At first an oratory, it was rebuilt on a larger scale by Clovis, and afterwards became, in the 10th, 11th and 12th centuries, a sumptuous collegiate church, of which the nave was flanked by triple aisles and surmounted by six cupolas. Great damage was done to it in the Wars of Religion and the French Revolution, and the façade was entirely rebuilt in the 19th century. The confessional or oratory under the choir contains the relics of St Hilaire and a Christian sarcophagus of the 4th century. The church of St Radegonde, a great resort of pilgrims, commemorates the consort of Clotaire (d. 587), and preserves in its crypt the tomb of Radegonde, who founded at Poitiers the abbey of the Holy Cross, and two others reputed to be those of St Agnes and St Disciola. The choir and tower above the entrance are of the 11th century, while the nave (late 12th century) is in the Angevin style. In a recess in the nave known as the Chapelle du Pas Dernier is a famous trefoil-arched altar of Christ, who appeared in a vision to St Radegonde. Notre-Dame-la Grande, which dates from the close of the 11th century, and represents a collegiate church of one or two hundred years older, has a sculptured Romanesque façade rivalled in richness only by that of St Pierre of Angoulême. The first stone of the church of Montierneuf (Monasterium Novum) was laid in 1077 by William VI., duke of Aquitaine and count of Poitiers, who is buried within its walls; and the choir (in the 13th century
modified by the erection of a "lantern" 1) was solemnly consecrated by Urban II. in 1096. Mutilated about 1640 and during the Revolution, the building was partly restored between 1850 and 1860. The tower of St Porchaire, a precious remnant of 11th-century architecture, was restored in the 19th century under the auspices of the well-known Société des antiquaires de l'Ouest.

Among the secular buildings the first place belongs to the law courts, formerly the palace of the dukes of Aquitaine and counts of Poitiers, and rebuilt between the 12th and the 15th century. The Salle des Pas Perdus forms a fine nave 160 ft. long by 56 ft. wide, with a vaulted wooden roof. The southern wall is the work of duke Jean de Berry (d. 1416), brother of Charles V.; above its three vast fireplaces are mullioned windows filled with stained glass. The Maubergeon tower attached to the palace by the same duke represented the feudal centre of all the lordships of the countship of Poitiers. The house known as the prébëtie or provost's mansion, built about 1500, has a fine façade flanked by turrets, and there are other houses of the 15th, 16th and 17th centuries. In the Hôtel de Ville, erected between 1869 and 1876, are museums of natural history and archeology. In the adjacent building occupies the chapel and the great hall of the old university, adjoining the old Hôtel de Ville; it is a valuable collection comprising Roman antiquities, Merovingian sculptures, medals, a fine Renaissance fireplace, &c. The building devoted to the faculties also contains the library. The municipal records are very rich in charters of Eleanor of Guienne, Philip Augustus, Alphonse of Poitiers, &c.

Poitiers is the seat of a bishop, a prefect, a court of appeal and a court of assizes, and centre of an educational division (académie), and has tribunals of first instance and of commerce, a board of trade arbitration, a chamber of commerce and a branch of the Bank of France. Its educational institutions comprise a university with faculties of law, science and letters, and a preparatory school of medicine and pharmacy, a school of theology, training colleges for both sexes, a lycée for boys and a school of fine art. Trade is in farm produce, wine, cattle, wool, honey, goose-quills and leather. The industries include the preparation of goose-skins, printing, tanning, and the manufacture of brushes, paint and candles.

Poitiers, called Limoum at the time of the Roman Conquest, afterwards took the name of its Gallic founders, the Pictones or Pictavi. Christianity was introduced in the 3rd century, and the first bishop of Poitiers, from 350 to 367, was St Hilarius. Fifty years later the city had fallen into the hands of the Arian Visigoths, and became one of the principal residences of their kings. Alaric II., one of their number, was defeated by Clovis at Vouillé, not far from Poitiers, in 507, and the town became a part of the Frankish dominion. This was the first occasion on which the peoples of northern and southern Gaul met in conflict in the neighbourhood of the town which was destined to see them so frequently join battle. By his victory in 732 over the Mahommedans at Moussais-la-Bataille in this region, Charles Martel proved the power of Christendom. Eleanor of Guienne frequently resided in the city, which she embellished and fortified, and in 1199 entrusted with communal rights. Alphonse of Poitiers, his latest and wealthiest, held in 1241 in the hands of the Arian Visigoths, and received the homage of his numerous vassals. After the battle of Poitiers in 1356 (see below), Poitou was recognized as an English possession by the treaty of Brétigny (1360); but by 1373 it was recovered by Bertrand Du Guesclin. It was at Poitiers that Charles VII. was proclaimed king (1432); and he removed thither the parlement and university of Paris, which remained in exile till the English withdrew from the capital in 1436. During this interval (1430) Joan of Arc was subjected to a formal inquest in the town. The university was founded in 1432. Calvin had numerous converts at Poitiers. Of the violent proceedings which attended the Wars of Religion the city had its share. In 1560 it was defended by Guillaume de Doillon, comte du Lude, against Gaspard de Coligny, who after an unsuccessful bombardment retired from the siege at the end of seven weeks.

Counts of Poitiers.—In the time of Charlemagne the countship of Poitiers, which was then a part of the kingdom of Aquitaine, was represented by a certain Abbon. Renoul (Ranulph), who was created count of Poitiers by the emperor Louis the Pious in 839, was the ancestor of a family which was distinguished in the 9th and 10th centuries for its attachment to the Carolingian dynasty. One of his successors, Ebles the Bastard (d. 933), took the title of duke of Aquitaine; and his descendants, who bore the hereditary name of William, retained the same title. William IV., Fiebrebrace, joined Hugh Capet, his brother-in-law, in 927. William V. the Great (903-1030) was a patron of letters, and received from the Italian lords the offer of the imperial crown after the death of the emperor Henry II. in 1024. William IX. (1028-1127) went on crusade in 1100, and had violent quarrels with the Papacy. His son William X. (1127-1137) sided with the anti-pope Anacletus against Innocent II. In accordance with the dying wishes of William X. his daughter Eleanor was married in 1137 to Louis, the son of Louis VI. of France. Sole heiress of her father, she brought her husband a large dowry, comprising Poitou, Saintonge, Aunis, Anjou, Angoumois, Poitou, Poitou and Berry. To Poitou, William VII. (1169-1181) succeeded William VIII. Louis, the son of William VII., was born in 1172. In 1214, when Charles VII. ascended the throne he finally united the countship of Poitiers to the Crown.

Battle of Poitiers.—This battle, fought on the 19th of September 1356 between the armies of King John of France and Edward the Black Prince, 1 was the second of the three great English victories of the Hundred Years' War. From Bordeaux the prince had led an army of his father's Guienne vassals, with which there was a force of English archers and men-at-arms, into central France and had amassed an enormous booty. King John, hitherto engaged against the army of John of Gaunt's duke of Lancaster, in Normandy, hurried south to intercept the raiding army and to bar its homeward road. The Black Prince, by forced marching, was able to slip past the French, but reaching Maupertuis, 7 m. south-east of Poitiers, with the king's army in chase, he found himself compelled to choose between fighting and abandoning his spoil. He chose the former course, in spite of the enemy's great superiority in numbers (16,000 to 6,500), and in order to give his trains time to draw off took up a defensive position on the 18th of September, with a slight hollow in front and a wood behind, between the Poitiers-Bordeaux main road and the River Maulus.2 John, instead of manoeuvring to envelop the English, allowed the Cardinal Talleyrand de Périgord to attempt to negotiate a peace. This proving vain, the French army attacked without any attempt at manoeuvre or reconnaissance, and on a front so narrow that the advantage of superior numbers was forfeited. Moreover, King John ordered all but the leading line to dismount and fall back on foot (tactics suggested by the success on the defensive of the dismounted English men-at-arms at Crecy and the Scots at Bannockburn), and thus condemned the best part of his army to a fatiguing advance on foot across difficult country in full armour.

The French arblasters, who might have crushed the relatively

1 The view adopted is that of Professor Oman, Art of War, Middle Ages, p. 631.
few English archers present, were mingled with the 300 picked mounted men in first line, but, as the latter charged, their advance masked the fire of the arbalisters in the first few seconds, besides leaping the choir (demolished, lines far in rear. Thus the first attack on the Black Prince (Poitiers) which greatly strengthened by trees and hedges in front of it, was promptly brought to a standstill by the arrows of the archers lining a hedge which overlooked the hollow in front; and the earl of Oxford hastily drawing out a body of archers beyond the defenders' left, into the low-lying ground of the Maussion valley, completed their rout by firing up the hollow into their flank. But it was not so easy to deal with the second line of disembodied men-at-arms, led by the dauphin, which was the next to arrive on the French side. The hedge indeed was held, and the assailants, unable to advance beyond the hollow, gave way, but to achieve this the prince had to use all but 400 of his men. Had the third body of the French advanced with equal spirit the battle would probably have ended there and then, but the duke of Orleans, who commanded it, was so demoralized by the retirement of the dauphin's division that he led his whole force off the field without striking a blow. Thereupon the king himself advanced furiously with the fourth and last line, and as it came on the situation of the English seemed so desperate that the prince was advised to retreat. But his determined courage was unshaken; seeing that this was the last attack he put his reserve into line, and rallying around this nucleus all men who could still fight, he prepared not only to repulse but to counter-attack the French. He despatched a small force under the Captal de Buch to ride round the flank of the enemy and to appear in their rear at the crisis of the fight. Though a medieval knight, he knew as well as Napoleon at Arcola that when the moral force of both sides has passed its culminating point even a materially insignificant threat serves to turn the balance. And so it fell out. When both lines were fighting hand-to-hand, the fifty horsemen of the Captal de Buch appeared in rear of the French. The front ranks fought on, but the rear of the French melted away rapidly, and at last only a group of the bravest, with King John and his son Philip, a boy of fourteen, in their midst, were left. This band continued their hopeless resistance for a time, but in the end they were killed or captured to a man. The rest of the French army, totally dispersed, was pursued by the victors until nightfall. Two thousand five hundred of the French, 2000 of them knights and men-at-arms, were killed, including the constable, one of the marshals, the standard-bearer and six other great lords. The prisoners included the king and his son Philip, the other marshal and 25 great lords, and 1933 knights and men-at-arms as well as 300 others.

POITOU, one of the old provinces of France, which also formed one of the great military governments of the kingdom, was bounded on the N. by Britanny, Anjou and Touraine; on the S. by Angoumois and Aunis; on the E. by Touraine, Berri and Marche; and on the W. by the ocean. It was divided into Lower Poitou, which corresponded to the modern departements of La Vendée, and Upper Poitou, now split into the departments of Deux-Sèvres and Vienne. The principal towns in Upper Poitou were Poitiers the capital, Mirebeau, Châtellerault, Richelieu, Loudun, Thouars, Mauléon, Parthenay, Niort, &c.; and in Lower Poitou Fontenay-le-Comté, Maillézeaus, Luçon and Roche-sur-Yon. Île d'Yeu or Île-Dieu and Noirmoutier belonged to the province. Ecclesiastically, Poitou was a diocese which was broken up in 1317 to form two new dioceses of Luçon and Maillézeaus; the seat of the latter was transferred in the 17th century to La Rochelle. For the administration of justice, Poitou was attached to the parlement of Paris. After 776 it formed part of the duchy of Poitou, known by the Latin name of Poitou (Pictavit, Pictavi) takes its name from the Pictores or Pictavi, a Gallic nation mentioned by Caesar, Strabo and Ptolemy, and described by Strabo as separated from the Namnetes on the north by the Loire. It formed part of the territory known as Aquitaine (q.v.).

For the history see the Mémoires of the Société des Antiquaires de l'Ouest (1835 sqq.) and the documents published by the Archives historiques du Poitou (1872 sqq.); also the Dictionnaire topographique de la France, by L. Réjot (1881).

POKEBERRY, POKEWEEDE (from the American-Indian pocan, applied to any plant yielding a red or yellow dye), a plant with a long, slender root and stem, which is frequently 9 feet in height, the leaves lanceolate and from three to five inches in length, and the flowers pink or crimson. It is used in the same way as the English pokeberry. It is a strong-smelling perennial herb, a native of North America, with ovate-lanceolate sharp-pointed leaves, racemes of small greenish-white flowers and flattish berries nearly 1 in. in diameter, which contain a crimson juice. The young asparagus-like shoots are sometimes used as a pot-herb, but the roots are poisonous. The plant is often cultivated in Europe, and has become naturalized in the Mediterranean region.

POKER, a game at cards. By most writers its origin has been ascribed to Il Frasso, an Italian game of the 15th century, from which the game of Primiera, called in Spain Primera, and La Prime in France, in which country it was elaborated into L'Ambigu or Le Mâle. In England the game was played under the name of Post and Pair, of which the modern Brag is only a variation. But Mr R. F. Foster proves that, though poker is probably a descendant of Primera, and perhaps of a much more ancient Persian game called As ros, it is not a development of the English Brag, but was introduced from France into the colony of Louisiana, the name being merely an English mispronunciation of Pogue, a game described as early as 1718 in the Académie universelle des jeux, and still played in Germany under the name Pochen. The earliest mention of the game in America is in G. B. Zieber's Exposée of the Arts and Mœurs of Gambling (1843), and it is probable that poker was generally played on the Mississippi steamboats as early as 1830, twenty cards being used, "full-deck poker" with 52 cards being invented later. "Draw-poker" was introduced about 1860.

Poker is played for money stakes, markers or "chips" of different value being used. These are either divided equally among the players, or, more usually, one player acts as banker and sells chips to the other players, redeeming them at the end of the game. There are several varieties of the game, but Draw Poker, played by from 2 to 6 or even 7 persons with a pack of 52 cards, is the most popular. The player who wins the cut for deal shuffles the pack, which is then cut by the player at his right. He then deals five cards, one by one, to each player. If a card is faced during the deal the player must accept it; if two are exposed a new deal must ensue. Before the deal is complete the player at the dealer's left, who is said to hold the age, and is called "the age," places (or puts up) on the table in front of him half the stake for which he wishes to play. This is called blind. The player at the age's left then looks at his hand and announces whether he will play. If his hand seems too weak he throws his cards away face-down and "dropping out" of the game. If he elects to play he puts up his ante, which is twice the amount of the blind. The other players, including the dealer, then either come in, i.e. elect to play, each putting up an equivalent or deeming their hands worthless, drop out. The age, who has the last say, may then himself drop out, forfeiting his half-stake already put up, or he may come in and make good his ante, i.e. put up his unpaid half of the blind. Each player in his turn has the privilege of increasing the stake to any amount not exceeding the limit, which is always agreed upon before the game begins. Thus, if the limit is £1, and the age has put up 6d. as his blind, any player may, when his turn comes to declare whether he will play, say, "I play and make it 10s. (or a sovereign) more to draw cards," at the same time placing the ante plus 10s. (or a sovereign) in the middle of the table. Thereupon all the other players, each in turn, must see the raise, i.e. pay in the additional sum, or drop out of the game, forfeiting what they have already paid into the pool. The "age" being the last to complete, is in the best position to raise, as a player who has already completed is less likely to sacrifice his stake and withdraw from the game. On the other hand each player

"Table stakes" means playing strictly for cash; "unlimited" explains itself, although even when this is the rule a certain high limit is pretty generally observed.
POKER

has the right, in his turn, after paying the extra stake called for, of raising it further on his own account, and this goes on until the players who have not dropped out have paid an equal sum into the pool and no one cares to raise further. Each player then throws away as many of his five cards as he chooses and receives from the dealer new ones in their place. In this supplementary deal no player may accept a faced card, but receives one in its place after all the other players have been served. The number of new cards taken by each one should be carefully noted by the other players, as it gives a valuable clue to the probable value of his hand. The following list shows the most common hands, beginning with the lowest.

1. One Pair (accompanied by five cards of different denominations). If two players each hold a pair, the higher wins; if similar pairs (e.g. a pair of kings each) then the next highest card wins.

2. Two Pairs.

3. Triplets or Threes of a Kind (e.g. three kings, accompanied by two other cards not forming a pair).

4. Straight, a sequence of five cards, not all of the same suit. Sometimes, but very rarely, these straights are not admitted. An ace may either begin or end a straight. For example: ace, king, queen, knave and 10 is the highest straight; 5, 4, 3, 2, and ace is the lowest. An ace cannot be in the middle. For example, 3, 2, ace, king, queen is not a straight.

5. Flush, five cards of the same suit, not in sequence. If two flushes are held, that containing the highest card wins; if the highest card is the same, then the next highest cards, &c.

6. Full, or Full House, meaning three cards of the same denomination together with a pair; e.g. three sixes and a pair of fours. If more than one player holds a full, the highest triplet wins.

7. Fours, or four cards of the same denomination; e.g. four queens, which beat four knaves and under.

8. Straight Flush, a sequence of five cards all of the same suit; e.g. knave, 10, 9, 8, 7, of hearts.

9. Royal Flush, the highest possible straight flush; e.g. ace, king, queen, knave and 10 of spades.

If no player holds at least one pair, then the hand containing the highest card wins.

Each player having received the new cards called for, the betting is opened by the player sitting at the age's left, should he consider his hand worth it; otherwise he throws down his cards and is out of the game, and the next player (whom we will call C) makes the first bet, which may be of any amount up to the limit, but is usually a small one, with a view to later developments. The next player, D, either drops out, trails, i.e. puts up the amount bet by C (also called seeing and calling), or raises C's bet; in other words puts in the amount bet by C plus as much more (within the limit) as he cares to risk. This raise on D's part means either that he thinks he holds a better hand than C, or that he is trying to frighten C out. The last manoeuvre illustrates the principle of the bluff, the most subtle art of the game. Of the two cards, P, C, with two small pairs in the hand, bets half a crown, and D, with a hand of no value whatever, covers, or sees C's bet and raises it to a sovereign, it is very likely that C will throw down his cards rather than risk a sovereign on his own by no means strong hand. In this case C has been bluffed by D, who, without even having to show his cards, wins the pool, although intrinsically his hand was far inferior to C's. The ability to bluff successfully depends upon self-command, keen observation, judgment and knowledge of character, so as to attempt the bluff when the bluffer is sure that there are no very strong hands out against him. Other wise he will surely be called in his turn, and, having nothing of value, will lose the pool, besides suffering the ignominy of throwing away money for nothing.

Two players with strong hands will often raise each other's bets repeatedly, until one of them calls the other, upon which the hands are shown and the stronger wins. The complete hands of the caller and the called must be shown. The common practice of throwing away unshown, for purposes of concealment, a losing hand that has called is illegal. No player who is not called is obliged to show his hand, so that the company is often in doubt whether or not the winner has bluffed. When two hands are of exactly equal value the pool is divided.

The game is often varied by a player going blind, i.e. raising the ante before the deal. Another variation is straddling the blind. This is done by the player sitting next the age, who puts up twice the amount of the blind with the words "I straddle." This has the effect of doubling the stake, as every player must then pay twice the amount of the straddle (instead of the blind) in order to play. The straddle may be straddled again in its turn if the aggregate amount does not pass the limit. The straddle does not carry with it the privilege of betting last, but merely raises the amount of the stake.

The regular Draw-Poker game is usually varied by occasional Jack-Pots, which are played once in so many deals, or when all have refused to play, or when the player deals who holds the jack, a marker placed in the pool with every jack-pot. In a jack-pot each player puts up an equal stake and receives a hand. The pot must then be opened by a player holding a hand of the value of a pair of knaves (jacks) or better. If no player holds so valuable a hand the deal passes and each player adds a small sum to the pot or pool. When the pot is opened the opener does so by putting up any sum he chooses, within the limit, and his companions must pay in the same amount or "drop." They also possess the right to raise the opener. The new cards called for are then dealt and the opener starts the betting, the play proceeding as in the regular game. If Progressive Jack-Pots are played, the minimum value of the opening hand is raised one degree every deal in which the pot is not opened. Thus the opening hand must in the first deal be at least a pair of knaves; but if the pot is not opened the minimum for the second deal is a pair of queens, for the third a pair of kings, &c. Jack-Pots were introduced about 1870.

Straight Poker, or Bluff, is played without drawing extra cards. It was the only variety of the game played, although 52 cards are now used instead of 20, as formerly. The first dealer is provided with a marker called a buck, and having, before dealing, put up the antes of all the players, passes the buck to the next dealer, who must in his turn ante for all when he deals. The rules for betting, raising, &c., are the same as at Draw-Poker. The hands of course, average smaller.

Stud-Poker is played like Draw-Poker, except that there is no draw and, in dealing, the first card only is dealt face down, the rest being exposed. Each player in turn looks at his turned card and makes his bet or raise. A common variation of Stud-Poker consists in stopping the deal after two cards, one face up and the other face down, have been dealt, and betting on those two cards. A third card is then dealt and betting again takes place, the process being repeated after the fourth and fifth cards have been dealt, the value of the different hands changing with each added card. A player failing to "stand" any raise must raise from the pot.

Whisky-Poker is also played without a draw. An extra hand, called the widow, is dealt to the table face down. The first bettor then examines his hand and has the option of taking up the widow and placing his own hand on the table face up in its place, or of passing and allowing the following players in turn the choice. After an exposed hand has been laid on the table in place of the widow the next player may either take up one card from the new widow replacing it with one from his own hand, or he may exchange his entire hand for the widow, or he may knock on the table. If he knocks every other player in turn may exchange one card or his whole hand, and the betting then begins, or there may be an agreement that the best hand wins from all the rest, or that the poorest hand pays a chip to the pool.

Technical Terms

Big Dog.—Ace high and nine low; not usually played. If played it beats a Little Dog.

Blaze.—Five court cards; not usually played. If played it beats any two pairs.

Blind.—Four cards of a flush or straight, the fifth card not filling.

Bone.—The smallest counter or chip.

Back.—A marker, to show when a jack-pot is to be played, viz. when it is the holder's deal.

Burst Card.—Card on the bottom of the pack turned up to prevent being seen.

Chips.—Counters.
Cold Feet.—Any excuse of a winner for leaving the game before the time agreed upon.

Deadwood.—The discard pile.

Deck.—Pack.

Falten.—Adding chips and a jack-pot after a failure to open.

Freeze Out.—A game in which a player having lost a certain agreed capital must stop playing.

Inside Straight.—Intermediate straight, e.g. 2, 3, 5, 6.

Killer.—Hand with no pair and no card above the nine; seldom played.

Kitty.—A fund, to pay for cards or refreshments, made by taking a chip from each jack-pot, or paid by a winner holding a valuable hand.

Little Dog.—Deuce low and seven high; not usually played.

Mistigris.—Poker with the joker added; the joker may be called any card the holder chooses.

Monkey Flush.—Three cards of a flush.

Natural Jacks.—Jack-pots played because there has been no ante in the previous deal.

Openers.—A hand on which a jack-pot may be opened.

Pat Hand.—A hand to which no card is drawn.

Pool.—The chips in the middle of the table.

Show.—Part of a pool to which a player is entitled who has bet as long as his capital lasted but is not able to stand further raises. If his hand is the best he wins whatever was in the pool at the time when he put it into it the last of his capital.

Sky.—Not having put up the jack-pot ante.

Splitting.—Having opened a jack-pot with one pair, and holding four other cards of one suit, to throw away one of the pair on the chance of making a flush.

Swede.—Chipping to a jack-pot after a failure to open.

Triplets.—Three of a kind.

Under the Gun.—The first player to bet.

Whangdoodle.—Compulsory round of jack-pots, usually agreed upon to follow a very large hand.

Widow.—An extra hand dealt to the table, as in Whiskey-Poker.

See Practical-Poker, by R. F. Foster (1904), the most authoritative work.

A very important attribute of a successful poker player is sound judgment in discarding, and this is principally based on the following mathematical table of approximate chances.

<table>
<thead>
<tr>
<th>Having in Hand</th>
<th>To make the Hand below</th>
<th>The Chance is</th>
</tr>

</table>

Of course these chances are somewhat improved by the fact that, in actual play, pairs and threes are, in a game of carefree shuffling, apt to lie together more or less.

POLA (Gr. Πόλα or Πόλω; Slovene, Polj), a seaport of Austria, in Istria, 86 m. S. of Trieste by rail. Pop. (1900), 45,052. It is the principal naval harbour and arsenal of the Austro-Hungarian monarchy, and is situated near the southern extremity of the peninsula of Istria. It lies at the head of the Bay of Pola, and possesses a safe and commodious harbour almost completely landlocked. An extensive system of fortifications, constructed on the hills, which enclose the harbour, defends its entrance, while it also possesses a good roadstead in the large channel of Fasana. This channel separates the mainland from the Brioni Islands, which dominate the entrance to extensive bays. The harbour has an area of 3-32 sq. m., and is divided into two basins by a chain of three small islands. The inner basin is divided by the large Olive Island into the naval harbour, lying to the south, and the commercial harbour, lying to the north. The Olive Island is connected with the coast by a chain-bridge, and is provided with wharfs and dry and floating docks. The town proper lies opposite the Olive Island, round the base of a hill formerly crowned by the Roman Capitol and now by a castle from the 17th century. Besides the castle the chief buildings are the cathedral, dating from the 15th century; the new garrison church, completed in 1858 in the Basilica style, with a fine marble façade; the Franciscan convent dating from the 14th century, and now used as a military magazine; the huge infantry barracks; and the town-hall, dating from the beginning of the 14th century. To the south-west, along the coast, extends the marine arsenal, a vast and well-planned establishment possessing all the requisites for the equipment of a large fleet. It contains an interesting naval museum, and is supplemented by the docks and wharves of the Scoglio Olivi. The artillery laboratory and the powder magazine are on the north bank of the harbour. Behind the arsenal lies the suburb of San Policarpo, almost exclusively occupied by the naval population and containing large naval barracks and hospitals. In the middle of it is a pleasant park, with a handsome monument to the emperor Maximilian of Mexico, who had been a rear-admiral in the Austrian navy. To the north, between San Policarpo and the town proper, rises the Monte Zaro, surmounted by an observatory and a statue of Admiral Tegetthoff. Pola has no manufactures outside of its naval stores, but its shipping trade is now considerable, the exports consisting of fish, timber and quartz sand used in making Venetian glass, and the imports of manufactured and colonial wares. To many people, however, the chief interest of Pola centres in its fine Roman ruins. The most notable of these is the amphitheatre built in A.D. 198-212, in honour of the emperors Septimius Severus and Caracalla, which is 70 ft. high, 400 ft. long and 330 ft. wide, and could accommodate 20,000 spectators. It is remarkable as the only Roman amphitheatre of which the outer walls have been preserved intact; the interior, however, is now completely bare—though the arrangements for the naumachiae, or naval contests, can still be traced. The oldest Roman relic is the fine triumphal arch of the forum in the Corinthisque style, erected soon after the battle of Actium; and of not much later date is the elegant and well-preserved temple of Augustus and Roma erected in the year 19 B.C. Among the other antiquities are three of the old town gates and a fragment of a temple of Diana.

The foundation of Pola is usually carried back to the mythic period, and ascribed to the Colchian pursuers of Jason and the Argonauts. In all probability it was a Thracian colony, but its verifiable history begins with its capture by the Romans in 178 B.C. It was afterwards held by Augustus on the espousal of the cause of Pompey, but was rebuilt on the intercession of his daughter Julia, and received (according to Pliny) the name of Pictas Julia. It became a Roman colony either
under the triumvir or under Octavian, and was mainly important as a harbour. It seems to have attained its greatest prosperity about the time of the emperor Septimius Severus (193–211 A.D.), when it was an important war harbour and contained 35,000 to 50,000 inhabitants. At a later period Pola became the capital of the margraves of Istria, and was captured by the Venetians in 1148. It was several times captured and plundered by the Genoese, and recaptured by the Venetians. In 1379 the Genoese, after defeating the Venetians in a great naval battle off the coast, took and destroyed Pola, which disappears from history for the next four hundred and fifty years. It remained under Venetian supremacy down to 1797, and has been permanently united with Austria since 1815. In 1848 a new era began for Pola in its being selected as the principal naval harbour of Austria.

See Th. Mommsen in Corp. inst. lat. v. 3 sqq. (Berlin, 1883); T. G. Jackson, Dalmatia, the Quarnero and Istria, vol. iii. (Oxford, 1887).

POLABS (Po=on, Laba=Elbe), the Slavs (q.v.) who dwelt upon the Elbe and eastwards to the Oder. Their chief tribes were the Vagri in Holstein, the Bodriči or Obotrite in Mecklenburg, the Ljutićí or Wilzit in western Pomerania, the Sprevane on the Spree and the Glomač or Daleminitsi in Saxony. Except the Lithuanians they were the last Europeans to be christianized; their chief sanctuary was at Areona on the Isle of Rügen. They were converted and conquered by the 12th century and systematically Germanized. By the 17th century Slavonic survived only in a tiny patch in the east of Hanover about Lichow, where a few words were still understood at the beginning of the 19th century. The population of the district still goes by the name of Wends (q.v.). The chief remains of the language are a patroterm, a few phrases and a short vocabulary written down by Pastor Chr. Henning (c. 1700), and the diary of J. Paruns Schultz (d. 1734). These were edited by A. Hilleferding (St. Petersburg, 1856), and a grammar was published there by A. Schleicher (1871). M. Porzezinski and Fr. Lorentz are the chief later authorities. Polabian agrees mostly with Polish and Kasube with its nasalized vowels and highly palatalized consonants. It had, however, long vowels and a free accent. The remains of it are most corrupt, having been written down when the language was full of Lower German by people who did not know Slavonic.

POLACCA, the Italian name for a three-masted merchant vessel, formerly common in the eastern waters of the Mediterranean. The masts were of one piece and the sails were square or lateen-shaped. The name appears in various forms in other languages, e.g. Fr. polaque or polacre, Sp. polaca, Du. polaak or Ger. Polack, and certainly means Polish, although there is no explanation to be found for any connexion between Poland and such a Mediterranean vessel.

POLAND (Polish Polska, Ger. Polen), (see Poland, Russian, below), a country of Europe which till the end of the 18th century was a kingdom extending (with Lithuania) over the basins of the Warta, Vistula, Dwina, Dnieper and upper Dnister, and had under its dominion, besides the Poles proper and the Baltic Slavs, the Lithuanians, the White Russians and the Little Russians or Ruthenians.

We possess no certain historical data relating to Poland till the end of the 10th century. It would seem, from a somewhat obscure passage in the chronicle compiled from older sources by Nestor, a monk of Kiev (d. c. 1115), that the progenitors of the Poles, originally established on the Danube, were driven from thence by the Romans to the still wilder wilderness of central Europe, settling finally among the vistic, visigothic, and impenetrable morasses of the banks of the upper waters of the Oder and the Vistula. Here the Lechici, as they called themselves (a name derived from the mythical patriarch, Lech), seemed to have lived for centuries, in loosely connected communities, the simple lives of huntsmen, herdsmen and tillers of the soil, till the pressure of rapacious neighbours compelled them to combine for mutual defence. Of this infant state, the so-called kingdom of the Piasts (from Plast its supposed founder), we know next to nothing. Its origin, its territory, its institutions are so many insoluble riddles. The earliest Polish chronicles, from Gallus in the early 12th century, and the book of Known Dates in the 14th, are of little help to us. The only facts of importance to be gleaned from them are that Prince Ziemovit, the great-grandfather of Mieszko (Mieszlaw) I. (992–1025), wrested from the vast but tottering Moravian Empire the province of Chrobacyja (extending from the Carpathians to the Bug), and that Christianity was first preached on the Vistula by Greek Orthodox missionary monks. Mieszko himself was converted by Jordan, the chaplain of his Bohemian consort, Dobrava or Bona, and when Jordan became the first bishop of Posen, the people seem to have followed the example of his prince. But the whole movement was apparently the outcome not of religious conviction, but of political necessity. The Slavonic peoples, whose territories then extended to the Elbe, and embraced the whole southern shore of the Baltic, were beginning to recoll before the vigorous impetus of the Germans in the West, who regarded their pagan neighbours in much the same way as the Spanish Conquistadores regarded the Aztecs and the Incas. To accept Christianity, at least formally, was therefore a prudential safeguard on the part of the Slavonians. This was thoroughly understood by Mieszko's son Boleslaus I. (992–1025), who went a considerable step farther than his father. Mieszko had been content to be received on almost any terms into the Christian community, Boleslaus aimed at securing the independence of the Polish Church as an additional guarantee of the independence of the Polish nation.

It was Boleslaus who made the church at Gnesen the capital of the Germans in the West, who regarded their pagan neighbours in much the same way as the Spanish Conquistadores regarded the Aztecs and the Incas. Subsequently he elevated Gnesen into the metropolitan see of Poland, with jurisdiction over the bishoprics of Cracow, Breslau and Kolberg, all three of these new sees, it is important to notice, being in territory conquered by Boleslaus; for hitherto both Cracow and Breslau had been Bohemian cities, while Kolberg was founded to curb the lately subjugated Pomeranians. Boleslaus was also the first Polish prince to bear the royal title, which seems to have been conferred upon him by Otto III. in 1000, though as Boleslaus crowned himself king a second time in 1025, it is evident that he regarded the validity of his first coronation as somewhat doubtful. He was primarily a warrior, whose reign, an almost uninterrupted warfare, resulted in the formation of a vast kingdom extending from the Baltic to the Carpathians, and from the Elbe to the Bug. But this imposing superstructure rested on the flimsiest of foundations. In less than twenty years after the death of its founder, it collapsed before a combined attack of all Poland's enemies, and simultaneously a terrible pagan reaction swept away the poor remnants of Christianity and civilization. For a time Poland proper became a smoking wilderness, and wild beasts made their lairs in the ruined fortified churches. Under Boleslaus II. (1058–1079) and Boleslaus III. (1102–1139) some of the lost provinces, notably Silesia and Pomerania, were recovered and Poland was at least able to maintain her independence against the Germans. Boleslaus III., moreover, with the aid of St Otto, bishop of Bamberg, succeeded in converting the heathen Pomeranians (1124–1128), and making head against paganism generally.

The last act of Boleslaus III. was to divide his territories among his sons, whereby Poland was partitioned into no fewer than four, and ultimately into as many as eight, principalities, many of which (Silesia and Greater Poland, for instance) in process of time split up into still smaller fractions all of them more or less bitterly hostile to each other. This partitional period, as Polish historians generally call it, lasted from 1138 to 1305, during which Poland lost all political significance, and became an easy prey to her neighbours. The duke of Little Poland, 1

1 Archdeacon of Gnesen 1357; vice-chancellor of Poland; d. c. 1387.
who generally styled himself duke of Poland, or *dux totius Poloniae*, claimed a sort of supremacy among these little states, a claim materially strengthened by the wealth and growing importance of his capital, Cracow, especially after little Poland had annexed the central principality of Sieradz (Sieradz). But Masovia to the north, and Great Poland to the north-west, refused to recognize the supremacy of Little Poland, while Silesia soon became completely germanized. It was at the beginning of this period too, between 1216 and 1224, that Pomerania, under an energetic native dynasty, freed herself from the Polish suzerainty. Nearly a generation later (1241) the Tatar hordes, under Batu, appeared for the first time on the confines of Poland. The Polish princes opposed a valiant but ineffectual resistance; the towns of Sandomir and Cracow were reduced to ashes, and all who were able fled to the mountains of Hungary or the forests of Moravia. Pursuing his way to Silesia, Batu overthrew the confederated Silesian princes at Liegnitz (April 9), and, after burning all the Silesian towns, invaded Hungary, where he routed King Bela IV. on the banks of the Sajo. But this marked the limit of his triumph. Exhausted and diminished by the stout and successful opposition of the Moravians at Olimütz, the Tatars vanished as suddenly as they had appeared, leaving a smoking wilderness behind them.

Batu's invasion had an important influence upon the social and political development of Poland. The only way of filling up the gaps in the population of the ravaged land was to invite foreign immigrants of a superior class, chapmen and handicraftsmen, not only given to peaceful pursuits and accustomed to law and order, but capable of building and defending strong cities. Such immigrants could naturally be obtained only from the civilized west, and on their own terms. Thus it came about that the middle class element was introduced into Polish society for the first time. Immediately dependent upon the prince, from whom they obtained their privileges, the most important of which were self-government and freedom from taxation, these traders soon became an important factor in the state, counterpoising, to some extent, the influence of the gentry, enriching the land by developing its resources, and promoting civilization by raising the standard of comfort.

Most of these German citizens in process of time were absorbed by the Poles and became devoted, heart and soul, to their adopted country; but these were not the only Germans with whom the young Polish state had now to deal. In the first year of the 13th century, the Knights of the Sword, one of the numerous orders of crusading military monks, had been founded in Livonia to “convert” the pagan Letts, and, in 1208, the still more powerful Teutonic order was invited by Duke Conrad of Masovia to settle in the district of Kulm (roughly corresponding to modern East Prussia) to protect his territories against the incursions of the savage Prussians, a race closely akin to the Lithuanians. Conrad has been loudly blamed by Polish historians for introducing this order and as it utilized their power, damaging elements into Poland. But the unfortunate prince had to choose between dependence and extermination, for his unaided resources were powerless against the persistent attacks of the unconquerable Prussians. The Teutonic Order, which had just been expelled from Hungary by Andrew II., “joyfully” accepted this new domicile, and its position in the north was definitely established by the compact of Kruutschwitz in 1230, whereby it obtained absolute possession of the maritime district between Pomerania and Courland, and southwards as far as Thorn. So far were the Poles from anticipating any danger from the Teutonic Order; that, from 1243 to 1255, they actually assisted it to overthrow the independent Pomeranian principality, the most formidable opponents of the Knights in the earlier years of their existence. A second Tatar raid in 1259, less dangerous, perhaps, but certainly more ruinous, than the first invasion—for the principalities of Little Poland and Sandomir were systematically ravaged for three months—still further depressed the land, and, at this very time, another enemy appeared in the east—the Lithuanians.

This interesting people, whose origin is to this day the most baffling of ethnographical puzzles, originally dwelt amidst the forests and marshes of the Upper Niemen. Thanks to the impenetrability of their fastnesses, they preserved their original savagery longer than any of their neighbours, and this savagery was coupled with a valour so tenacious and enterprising as to make them formidable to all who dwelt near them. The Russians fled at the sight of them, “like hares before hunters.” The Livs and Letts were as much the prey of the Lithuanians “as sheep are the prey of wolves.” The German chroniclers describe them as the most terrible of all the barbarians. The Lithuanians first emerge into the light of history at the time of the settlement of the Teutonic Order in the North. Rumours of the war of extermination conducted against their kinsmen, the wild Prussians, by the Knights, first woke the Lithuanians to a sense of their own danger, and induced them to abandon their loose communal system in favour of a monopolistic form of government, which concentrated the whole power of the state in a single hand. Fortunately, too, at this crisis of their history, the Lithuanians were blessed with an altogether exceptional series of great rulers, who showed themselves fully capable of taking care of themselves. There was, for instance, Mendovg (1240–1263), who submitted to baptism for purely political reasons, checked the Teutonic Knights by adroitly seeking the protection of the Holy See, and annexed the principality of Plock to his ever-widening grand duchy, which already included Black Russia, and formed a huge wedge extending southwards from Courland, thus separating Poland from Russia. A still greater prince was Gedymin (1315–1322) who did his utmost to civilize Lithuania by building towns, introducing foreigners, and tolerating all religions, though he himself remained a pagan for political reasons. Gedymin still further extended the limits of Lithuania by annexing Kiev, Chernigov and other old Russian principalities.

At the very time when Lithuania was thus becoming a compact, united, powerful state, Poland seemed literally to be dropping to pieces. Not even the exhortations of the popes could make her score of princes unite for mutual defence against the barbarians who everywhere frowned them. For, as it seemed highly probable that Poland would be completely germanized, like Silesia, or become a part of the new Bohemian Empire which Wenceslaus II. (crowned king of Poland in 1300) had inherited from his father, Ottakar II. From this fate she was saved by the valour of Wladislaus Lokietek, duke of Great Poland (1306–1333), who reunited Great and Little Poland, revived the royal dignity in 1320, and saved the kingdom from annihilation by his great victory over the Teutonic Knights at Plowce in 1332. The whole reign of Wladislaus I. was indeed an unceasing struggle against all the forces of anarchy and disintegration; but the fruits of his labours were richly reaped by his son Casimir III. the Great (1333–1370). Poland’s most successful effort to gain the modern sense of the word, who, by a most skilful system of matrimonial alliances, reintroduced isolated Poland into the European system, and gave the exhausted country an inestimably beneficial breathing space of thirty-seven years. A born ruler, Casimir introduced a whole series of administrative and economical reforms. He was the especial protector of the cities and the peasants, and, though averse from violent measures, punished aristocratic tyranny with an iron hand. Casimir’s few wars were waged entirely for profit, not glory. It is to him that Poland owed the important acquisition of the greater part of Red Russia, or Galicia, which enabled her to secure her fair share of the northern and eastern trade. In default of male issue, Casimir left the Polish throne to his nephew, Louis of Hungary, who ruled the country (1370–1382) through his mother, Queen Elizabeth, Wladislaus Lokietek’s daughter. Louis well deserved the epithet of “great” bestowed upon him by his contemporaries;
but Poland formed but a small portion of his vast domains, and Poland’s interests were subordinated to the larger demands of an imperial policy which embraced half Europe within its orbit.

On the death of Louis there ensued an interregnum of two years marked by fierce civil wars, instigated by duke Ziemowit of Masovia, the northernmost province of Poland, which continued to exist as an independent principality alongside of the kingdom of Poland. Ziemowit aimed to assert his claim to marry the infant princess Jadwiga of Hungary, who, as the daughter of Louis the Great and the grand-daughter of Wladislas Lokietek, had an equal right, by inheritance, to the thrones of Hungary and Poland. By an agreement with the queen mother of Hungary at Kassa in 1383, the Poles finally accepted Jadwiga as their queen, and, on the 18th of February 1386, greatly against her will, the young princess, already betrothed to William of Austria, was wedded to Jagiello, grand duke of Lithuania, who had been crowned king of Poland at Cracow, three days previously, under the name of Władysław II.

The union of Poland and Lithuania as separate states under one king had been brought about by their common fear of the Teutonic Order. Five years after the death of Gedymyn, Olgiert, the most capable of his seven sons, had been placed upon the throne of Lithuania by his devoted brother Kiejstut, and for the next two and-thirty years (1345-1377) the two princes still further extended the sway of Lithuania, principally at the expense of Muscovy and the Tatars. Kiejstut ruled the western portion of the land where the Teutonic Knights were a constant menace, while Olgiert drove the Tatar hordes out of the south-eastern steppes, and compelled them to seek a refuge in the Crimea. During Olgiert’s reign the southern boundaries of Lithuania touched the Black Sea, including the whole tract of land between the mouth of the Bug and the mouth of the Dnieper. Olgiert was succeeded by his son Jagiello as grand duke in 1377, while Kiejstut was left in possession of Samogitia, Troki and Grodno; but the Teutonic Order, alarmed at the growth of Lithuania, succeeded in estranging uncle and nephew, and Kiejstut was treacherously assassinated by Jagiello’s orders, at Krewo, on the 15th of August 1382. Three weeks later Jagiello was compelled to cede Samogitia, as far as the Dubisia, to the Knights, and, in the following year they set up against him Kiejstut’s son Witوت. The eyes of Jagiello were now opened to the fact that the machiavellian policy of the Knights aimed at subjugating Lithuania by dividing it. He at once made peace with his cousin; restored him his patrimony; and, to secure Lithuania against the future vengeance of the Knights, Jagiello made overtures to Poland for the hand of Jadwiga, and received the Polish crown along with it, as already mentioned.

Before proceeding to describe the Jagiellonic period of Polish history, it is necessary to cast a rapid glance at the social and political condition of the country in the preceding Piast period.

The paucity and taciturnity of our sources make it impossible to give anything like an adequate picture of Old Poland during the first four centuries of its existence. A great deal of ground is lost here and there of the political development of the country is the utmost that the most diligent scrutiny can glean from the scanty record of the early chronicles. External pressure, here as elsewhere, created a patriotic military caste, and the subsequent partitional period, when every little prince had his own separate court, still further established the growing influence of the szlachta, or gentry, who were not backward in claiming and obtaining special privileges in return for their services. The first authentic pacta conventa made between the Polish nobility and the Crown dates from the reign of Casimir (September 17, 1374), when Louis of Hungary agreed to exempt the szlachta from all taxation, except two Polish groschen per hide of land, and to compensate them for the expenses of all military service rendered beyond the confines of the realm. The clergy received their chief privileges much earlier. It was at the synod of Leczycy, nearly a century before the compact of Kassa, that the property of the Church was first safeguarded against the encroachments of the state. The beneficial influence of the Church of Poland in these early times was incalculable. To say nothing of the labours of the Cistercians as colonists, pioneers and church-builders, or of the missions of the Dominicans and Franciscans (the former of whom were introduced into Poland by Ivo, bishop of Cracow, the personal friend of Dominic), the Church was the one stable and unifying element in an age of centrifugal particularism. The frequent synods represented the whole of Poland, and kept alive, as nothing else could, the idea of national solidarity. The Holy See had also a considerable share in promoting the political development of the land. In the 13th century alone no fewer than forty-nine papal legates visited Poland, and thirty provincial synods were held by them to regulate church affairs and promote good government. Moreover the clergy, to their eternal honour, consistently protected the lower from the tyranny of the upper classes.

The growth of the towns was slower. During the heroic Bohemian period there had been a premature outcrop of civil life. As early as the mid-fourteenth century the towns of the Grand Duchy of Lithuania, and even those of the old Polish capital, and Gnesen, the metropolitan see, were of considerable importance, and played a leading part in public life. But in the ensuing anarcho period both cities were utterly ruined, and the centre of political gravity was transferred from Great Poland to Little Poland, where Cracow, singularly favoured by her position, soon became the capital of the monarchy, and one of the wealthiest cities in Europe. At the end of the 14th century we find all the great trade guilds established there, and the cloth manufactured at Cracow was eagerly sought after, from Prague to Great Novgorod. So wealthy did Cracow become at last that Casimir the Great felt it necessary to restrain the luxury of his citizens by summatory ordinances. Towards the end of the 14th century the Polish towns even attained some degree of political influence, and their delegates sat with the nobles and clergy in the king’s councils, a right formally conceded to them at Radom in March 1384. Even the peasants, who had suffered severely from the wholesale establishment of prisoners of war as serfs on the estates of the nobles, still preserved the rights of personal liberty and free transit from place to place, whence their name of Lasigi. The only portion of the community which had no privileges were the Jews, first introduced into Poland by Boleslaus the Pious, due to the obstinacy of the nobles, and their laws having been driven them northwards from the shores of the Adriatic. Casimir the Great extended their liberty of domicile over the whole kingdom (1334). From the first they were better treated in Poland than elsewhere, though frequently exposed to outbreaks of popular fanaticism.

The transformation of the pagan Lithuanian chieftain Jagiello into the catholic king of Poland, Wladislaus II., was an event of capital importance in the history of eastern Europe. Its immediate and inevitable consequence was the formal reception of the Lithuanian nations into the fold of the Church. What the Teutonic Order had accomplished in two centuries by terror and bloodshed, the progress for two centuries, was peacefully accomplished by Jagiello within a single generation, the Lithuanians, for the most part, willingly yielding to the arguments of a prince of their own blood, who promptly rewarded his converts with peculiar and exclusive privileges. The conversion of Lithuania menaced the very existence of the Teutonic Knights. Originally planted on the Baltic shore for the express purpose of christianizing their savage neighbours, these crusading monks had freely exploited the wealth and the volut of the West, ostensibly in the cause of religion, really for the purpose of founding a dominion of their own which, as time went on, lost more and more of its religious character, and was not little more than a military postern, extending from Pomorania to the Nienam, which deliberately excluded the Slavs from the sea and throve

1 Archbishops of Gnesen 1219-1220. Died at Modena 1229.
at their expense. The mere instinct of self-preservation had, at last, drawn the Poles and Lithuanians together against these ruthless and masterful intruders, and the coronation of Jagiello at Cracow on the 15th of February 1386, was both a warning and a challenge to the Knights. But if the Order had now become a superfluous anachronism, it had still to be disposed of, and the new kingdom of Lithuania, as Jagiello, as the rump of the grand duchy of Lithuania, and also of the Teutonic Order, still delivered, ere its end, the parting volley of the new in partibus, it had succeeded in establishing on the Baltic one of the strongest military organizations in Europe. In the art of war the Knights were immeasurably superior to all their neighbours. The pick of the feudal chivalry composed their ranks; with all Europe to draw upon, their resources seemed inexhaustible, and centuries of political experience made them as formidable in diplomacy as they were valiant in warfare. And indeed, for the next twenty years, the Teutonic Order more than held its own. Skillfully taking advantage of the jealousies of Poland and Lithuania, as they were accentuated by the personal antagonism of Jagiello and Witwot (q.v.), with the latter of whom the Knights more than once contracted profitable alliances, they even contrived (Treaty of Salia, 1378) to extend their territory by getting possession of the province of Samogitia, the original seat of the Lithuanians, where paganism still persisted, and where their inhuman cruelties finally excited the horror and indignation of Christian Europe. By this time, however, the prudent Jagiello had become convinced that Lithuania was too strong to be ruled by or from Poland, and yet not strong enough to stand alone, and by the compact of Vilna (January 18, 1401, confirmed by the compact of Radowo, March 10) he surrendered the whole grand duchy to the Teutonic Order on the condition that the two states should have a common policy, and that neither of them should elect a new prince without the consent of the other. The wisdom of this arrangement was made manifest in 1410, when Jagiello and Witwot combined their forces for the purpose of delivering Samogitia from the intolerable tyranny of the Knights. The issue was fought out on the field of Tannenberg, or Grünwald (July 15, 1410), when the Knights sustained a crushing defeat, which shook their political organization to its very foundations. A few weeks after the victory the towns of Thorn, Elbing, Braunsberg and Danzig submitted to the Polish king, and all the Prussian bishops voluntarily offered to render him homage, in order that he might be admitted to the manorial government of the Knights time to recover from the blow; the Polish levies proved unruly and incompetent; Witwot was suddenly recalled to Lithuania by a Tatar invasion, and thus it came about, that when peace was concluded at Thorn, on the 1st of February 1411, Samogitia (which was to revert to the Order on the death of Jagiello and Witwot), Dobrzyn, and a war indemnity of 70,000 marks payable in four instalments, were the best terms Poland could obtain from the Knights, whose territory practically remained intact. Jagiello’s signal for the attack at the battle of Grünwald, “Cracow and Vilna” (the respective capitals of Poland and Lithuania) had eloquently demonstrated the solidarity of the two states. This solidarity was still further strengthened by the Union of Horodlo (October 2, 1413) which enacted that henceforth Lithuania was to have the same order of dignitaries as Poland, as well as a council of state, or senate, similar to the Polish senate. The power of the grand-duce was also greatly increased. He was now declared to be the equal of the Polish king, and his successor could be elected only by the senates of Poland and Lithuania in conjunction. The Union of Horodlo also established absolute parity between the nobility of Poland and Lithuania, but the privileges of the latter were made conditional upon their profession of the Roman Catholic faith, experience having shown that the difference of religion in Lithuania menaced interference of politics, and a tendency Moscow-wards, the majority of the Lithuanian boyars being of the Greek Orthodox Confession.

During the remainder of the reign of Władysław II. the Teutonic Order gave Poland much trouble, but no serious anxiety. The trouble was due mainly to the repeated efforts of the Knights to evade the fulfilment of the obligations of the Treaty of Thorn. In these endeavours they were materially assisted by the emperor Sigismund, who was also king of Hungary. Sigismund’s main object was to procure a partition of Poland between Hungary, the empire and the Silesian princes, a scheme which foandered upon Sigismund’s imprudence and the reluctance of the Magyars to injure the Poles. More than once Władysław II. was even obliged to renew the war against the Knights, and, in 1422, he compelled them to renounce all claims upon Samogitia; but the long struggle, still undecided at his death, was fought mainly with diplomatic weapons at Rome, where the popes, generally speaking, listened rather to the victorious monarch who had added an ecclesiastical province to the Church than to the discomfited and turbulent Knights.

Had Władysław II. been as great a warrior as Witwot he might, perhaps, have subdued the Knights altogether. But by nature he was pre-eminently a diplomatist, and it must in fairness be admitted that his diplomacy in every direction was distinctly beneficial to Poland. He successfully thwarted all the schemes of the emperor Sigismund, by adroitly supporting the revolutionary party in Bohemia (q.v.). In return Husite mercenaries fought on the Polish side at Tannenburg, and Czech patriots repeatedly offered the crown of Bohemia to Władysław. The Polish king was always ready enough to support the Czechs against Sigismund; but the necessity of justifying his own orthodoxy (which the Knights were for ever impugning) at Rome and in the face of Europe prevented him from accepting the crown of St. Wenceslaus from the hands of heretics.

Władysław II. died at Lemberg in 1434, at the age of eighty-three. During his long reign of forty-nine years Poland had gradually risen to the rank of a great power, a result due in no small measure to the insight and sagacity of the first Jagiello, who sacrificed every other consideration to the vital necessity of welding the central Slavs into a compact and homogeneous state. The next ten years severely tested the stability of his great work, but it stood the test triumphantly. Neither a great war, nor age, nor the efforts of Sigismund to procure the revival of separatist tendencies in Lithuania, nor the outbreaks of aristocratic lawlessness in Poland, could do more than shake the superstructure of the imposing edifice. After the death at Varna, in 1444, of Jagiello’s eldest son and successor, Władysław III. (whose history belongs rather to Hungary than to Poland), another great statesman, in no wise inferior to Władysław II., completed and consolidated his work. This was Władysław’s second son, already grandduke of Lithuania, who ascended the Polish throne as Casimir IV, in 1447, thus reuniting Poland and Lithuania under one monarch.

Enormous were the difficulties of Casimir IV. He instinctively recognized not only the vital necessity of the maintenance of the union between the two states, but also the fact that the chief source of danger to the union lay in Lithuania, in those days a maelstrom of conflicting political currents. To begin with, Lithuania was a far less composite state than Poland. Two-thirds of the grandduchy consisted of old Russian lands inhabited by men who spoke the Ruthenian language and professed the Orthodox Greek religion, while in the north were the Lithuanians proper, semi-savage and semi-catholic, justly proud of their heroic forefathers of the house of Gedimin, and very sensitive of the pretensions of Poland to the provinces of Volhynia and Podolia, the fruits of Lithuanian valor. A Lithuanian himself, Casimir strenuously resisted the attempts of Poland to wrest these provinces from the grandduchy. Moreover, during the earlier years of his reign, he was obliged to reside for the most part in Lithuania, where his tranquilizing influence was needed. His supposed preference for Lithuania was the real cause of his unpopularity in Poland, where, to the very end of his reign, he was regarded
with suspicion, and where every effort was made to thwart his far-seeing and patriotic political combinations, which were beyond the comprehension of his self-seeking and narrow-minded contemporaries. This was notably the case as regards his dealings with the old enemy of his race, the Teutonic Order, whose destruction was the chief aim of his ambition.

The Teutonic Order had long since failed as a religious institution; it was now to show its inadequacy as a political organization. In the domain of the Knights the gentry, parochial clergy and townsfolk, who, beneath its protection, had attained to a high degree of wealth and civilization, for long remained without the slightest political influence, though they bore nearly the whole burden of taxation. In 1414, however, intimidated by the growing discontent, which frequently took the form of armed rebellion, the Knights consented to the establishment of a diet, which was re-formed on a more aristocratic basis in 1430. But the old abuses continuing to multiply, the Prussian towns and gentry at last took their affairs into their own hands, and formed a so-called Prussian League, which demanded an equal share in the government of the country. This league was supported, by whose benefit he had embarked upon the independence of the empire almost simultaneously in 1453, whereupon it placed itself beneath the protection of its nearest powerful neighbour, the king of Poland, who (March 6, 1454) issued a manifesto incorporating all the Prussian provinces with Poland, but, at the same time, granting them local autonomy and free trade.

But provinces are not conquered by manifestoes, and Casimir's acceptance of the homage of the Prussian League at once involved him in a war with the desperate Teutonic Knights, which lasted twelve years, but might easily have been concluded in a twelvemonth had he only been loyally supported by his own subjects, for whose benefit he had embarked upon this great enterprise. But instead of support, Casimir encountered obstinate obstruction at every point. No patriotic Pole, we imagine, can read the history of this miserable war without feeling heartily ashamed of his countrymen. The acquisition of the Prussian lands was vital to the existence of Poland. It meant the excision of an alien element which fed like a cancer on the body politic; it meant the recovery, at comparatively little cost, of the command of the principal rivers of Poland, the Vistula and the Niemen; it meant the obtaining of a seaport with the corollaries of sea-power and world-wide commerce. Yet, except in the border province of Great Poland, which was interested commercially, the whole enterprise was regarded with such indifference that the king, in the very crisis of the struggle, could only with the utmost difficulty obtain contributions for war expenses from the half-dozen local diets of Poland, which extorted from the helplessness of their distracted and impeneetrable sovereign fresh privileges for every subsidy they grudgingly granted. Moreover Casimir's difficulties were materially increased by the necessity of paying to Czech mercenaries, the pospolite ruszenie, or Polish militia, proving utterly useless at the very beginning of the war. Indeed, from first to last, the Polish gentry as a body took good care to pay and fight as little as possible, and Casimir depended for the most part upon the liberality of the Church and the Prussian towns, and the value of the Hussite infantry, 170,000 of whom, fighting on both sides, are said to have perished. Not till the victory of Puck (September 17, 1462), one of the very few pitched battles in a war of raids, skirmishes and sieges, did fortune incline decisively to the side of the Poles, who maintained and improved their advantage till absolute exhaustion compelled the Knights to accept the mediation of a papal legate, and the second peace of Thorn (October 14, 1466) concluded a struggle which had reduced the Prussian provinces to a wilderness.1 By the second peace of Thorn, Poland recovered the provinces of Pomerelia, Kulm and Michalow, with the bishopric of Ermeland, numerous cities and fortresses, including Marien-

18,000 of their 21,000 villages were destroyed. 1000 churches were razed to the ground, and the population was diminished by more than a quarter of a million. burg, Elbing, Danzig and Thorn. The territory of the Knights was now reduced to Prussia proper, embracing, roughly speaking, the district between the Baltic, the lower Vistula and the lower Niemen, with Königsberg as its capital. For this territory the grand-masters, within nine months of their election, were in future to render homage to the Polish king; but, on the other hand, the king undertook not to make war or engage in any important enterprise without the consent of the Prussian prince, and vice versa. Thus Prussia was now confederated with Poland, but she occupied a subordinate position as compared with Lithuania, inasmuch as the grand-master, though filling the first place in the royal council, was still a subject of the Polish crown. Thus the high hopes entertained by Casimir at the beginning of the war had not been realized. The final settlement with the Poles was of the nature of a compromise. Still the Knights had been driven beyond the Vistula, and Poland had secured a seaport; and it was due entirely to the infinite patience and tenacity of the king that even as much as this was won at last.

The whole foreign policy of Casimir IV. was more or less controlled by the Prussian question, and hence also his superior diplomacy triumphantly asserted itself. At the beginning of the war both the empire and the pope were against him, but he neutralized their hostility by alleging himself with George of Podpevbr, whom the Hussites had placed on the throne of Bohemia. On the death of George, Casimir's eldest son Wladislaus was elected king of Bohemia by the Utraquist party, despite the determined opposition of Matthias Corvinus, king of Hungary, whose ability and audacity henceforth made him Casimir's most dangerous rival. Sure of the support of the pope, Matthias (q.v.) deliberately set about traversing all the plans of Casimir. He encouraged the Teutonic Order to rebel against Poland; he entertained at his court anti-Polish embassies from Moscow; he encouraged the Tartars to ravage Lithuania; he thwarted Casimir's policy in Moldavia. The death of the brilliant adventurer at Vienna in 1490 came therefore as a distinct relief to Poland, and all danger from the side of Hungary was removed in 1490 when Casimir's son Wladislaus, already king of Bohemia, was elected king of Hungary also.

It was in the reign of Casimir IV. that Poland first came into direct collision with the Turks. The Republic was never, indeed, the " Buckler of Christendom." That glorious epithet belonged of right to Hungary, which had already borne the brunt of the struggle against the Ottoman power for more than a century. It is true that Wladislaus II. of Poland had fallen on the field of Varna, but it was as a Magyar king at the head of a Magyar army that the young monarch met his fate. Poland, indeed, was far less able to cope with the Turks than compact, wealthy Hungary, which throughout the 15th century was one of the most efficient military monarchies in Europe. The Jagiellons, as a rule, prudently avoided committing themselves to any political system which might irritate the still distant but much-dreaded Turk, but when their dominions extended so far southwards as to embrace Moldavia, the observance of a strict neutrality was found to be both difficult and impossible. Poland had established a sort of suzerainty over Moldavia as early as the end of the 14th century; but at best it was a loose and vague overlordship which the Hospodars repudiated whenever they were strong enough to do so. The Turks themselves were too much occupied elsewhere to pay much attention to the Danubian principalities till the middle of the 15th century. In 1478 Mahomet II. had indeed attempted their subjugation, with but indifferent success; but it was not till 1484 that the Ottomans became inconvenient neighbours to Poland. In that year a Turkish fleet captured the strongholds of Kilia and Akkerman, commanding respectively the mouths of the Danube and Dniester. This aggression seriously threatened the trade of Poland, and induced Casimir IV. to accede to a general league against the Ottomans. In 1485, after driving the Turks out of Moldavia, the Polish king, at the head of 20,000 men, proceeded to Kolomea on the
It was a fortunate thing for Poland that, during the first century of her ascension to the rank of a great power, political exigencies compelled her to appropriate almost more territory than her primitive and centrifugal government could properly assimilate; it was fortunate that throughout this period of expansion her destinies should, with one brief interval, have been controlled by a couple of superior statesmen, each of whom ruled for nearly fifty years. During the fourteen years (1492–1506) which separate the reigns of Casimir IV. and Sigismund I. she was not so lonely. The controlling hand of Casimir IV. was no sooner withdrawn than the unruly elements, ever present in the Republic, and ultimately the cause of its ruin, at once burst forth. The first symptom of this lawlessness was the separation of Poland and Lithuania, the Lithuanians proceeding to elect Alexander, Casimir’s fourth son, as their grand-duke, without even consulting the Polish senate, in flagrant violation of the union of Horodlo. The breach, happily, was of no very long duration. A disastrous war with Ivan III., the first Muscovite tsar, speedily convinced the Lithuanians that they were not strong enough to stand alone, and in 1499 they voluntarily renewed the union. Much more dangerous was the political revolution proceeding simultaneously in Poland, where John Albert, the third son of Casimir, had been elected king on the death of his father. The nature of this revolution will be considered in detail when we come to speak of the growth of the Polish constitution. Suffice it here to say that it was both anti-monarchical and anti-democratic, tending, as it did, to place all political authority in the hands of the szlachta, or gentry. The impetuous monarch submitted to the dictate of the diet in the hope of obtaining sufficient money to prosecute his ambitious designs. With his elder brother Wladislaus reigning over Bohemia and Hungary the credit of the Jagiellons in Europe had never been so great as it was now, and John Albert, bent upon military glory, eagerly placed himself at the head of what was to have been a great anti-Turkish league, but ultimately dwindled down to a raid upon Moldavia which ended in disaster.

The sole advantage which John Albert reaped from his championship of the Christian cause was the favour of the Curia, and the ascendency which that favour gave him over the Teutonic Knights, whose new grand-master, Albert of Saxony, was reluctantly compelled to render due homage to the Polish king. Under Alexander (g.v.), who succeeded his brother in 1501, matters went from bad to worse. Alexander’s election cemented, indeed, once for all, the union between Poland and Lithuania, inasmuch as, on the eve of it (Oct. 3, 1501) the senates of both countries agreed that, in future, the king of Poland should always be grand-duke of Lithuania; but this was the sole benefit which the Republic derived from the reign of Alexander, under whom the Polish government has been well described as a rudderless ship in a stormy sea, with nothing but the grace of God between it and destruction. In Lithuania the increasing pressure of the Muscovite was the chief danger. Till the accession of Ivan III. in 1462 Muscovy had been a negligible factor in Polish politics. During the earlier part of the 15th century the Lithuanian princes had successfully contested Muscovite influence even in Pskov and Great Novgorod. Many Russian historians even maintain that, but for the fact that Witowt had simultaneously to cope with the Teutonic Order and the Tatars, that energetic prince would certainly have extinguished struggling Muscovy altogether. But since the death of Witowt (1430) the military efficiency of Lithuania had sensibly declined; single-handed she was no longer a match for her ancient rival. This was owing partly to the evils of an oligarchic government; partly to the weakness resulting from the natural attraction of the Orthodox-Greek element in Lithuanian towards Muscovy, especially after the fall of Constantinople, but chiefly to the administrative superiority of the highly centralized Muscovite government. During the reign of Alexander, who was also tsar of Muscovy, the Lithuanian army in Lithuania, the Muscovites and Tatars ravaged the whole country at will, and were prevented from conquering it altogether only by their inability to capture the chief fortresses.

In Poland, meanwhile, something very like anarchy prevailed. Alexander had practically surrendered his authority to an incapable aristocracy, whose sole idea of ruling was systematically to oppress and humiliate the lower classes. In foreign affairs a policy of drift prevailed which encouraged all the enemies of the Republic to raise their heads, while the dependent states of Prussia in the north and Moldavia in the south made strenuous efforts to break away from Poland. Fortunately for the integrity of the Polish state the premature death of Alexander in 1506 brought upon the throne his capable brother Sigismund, the fifth son of Casimir IV., whose long reign of forty-two years was salutary, and would have been altogether recuperative, had his statesmanship only been loyally supported by his subjects. Eminently practical, Sigismund recognized that the first need of Poland was a standing army. The miserable collapse of the Polish chivalry during the Bukovinian campaign of 1497 had convinced everyone that the russsien pospolite was useless for serious military purposes, and that Poland, in order to hold her own, must in future follow the example of the West, and wage her warfare with trained mercenaries. But professional soldiers could not be hired without money, and the difficulty was to persuade the diet to lose its purse-strings. All that the gentry contributed at present was two pence (groschen) per hide of land, and this only for defensive service at home. If the king led the russsien pospolite abroad he was obliged to pay so much per pike out of his own pocket, notwithstanding the fact that the heavily mortgaged crown lands were practically valueless. At the diet of 1510 the chancellor and primate, Adam Laski, proposed an income-tax of 50% at once, and 5% for subsequent years, payable by both the lay and clerical estates. In view of the fact that Poland was the most defenceless country in Europe, with no natural boundaries, and constantly exposed to attacks from every quarter, it was not unreasonable to expect even this patriotic sacrifice from the privileged classes, who held at least two-thirds of the land by military tenure. Nevertheless, the diet refused to consider the scheme. In the following year a more modest proposal was made by the Crown in the shape of a capitation of six guldens, to be levied on every nobleman at the beginning of a campaign, for the hiring of mercenaries. This also was rejected. In 1512 the king came forward with a third scheme. He proposed to divide the country into five circles, corresponding to the five provinces, each of which was to undertake to defend the realm in turn should occasion arise. Moreover, every one who so desired it might pay a commutation in lieu of personal service, and the amount so realized was to be re-used to levy troops. To this the dietes, or local diets, of Great Poland, and Little Poland, agreed, but at the last moment the whole project foundered on the question who was the proper custodian of the new assessment rolls, and the king had to be content with the renewal of former subsidies, varying from twelve to fifteen groschen per hide of land for three years. Well might the disappointed monarch exclaim: “It is vain to labour for the welfare of those who do not care a jot about it themselves.” Matters improved somewhat in 1527, when the szlachta, by a special act, placed the mightiest magnates on the same level as the humblest squire as regards military service, and proposed at the same time a more general assessment for the purpose, the control of the money so realized to be placed in the hands of the king. In consequence of this law the great lords were compelled to put forces in the field proportioned to their enormous fortunes, and Sigismund was able in 1529 to raise 300 foot and 2000 horse from the province of Podolia alone. But though the treasury was thus temporarily replenished and the army increased, the gentry who had been so generous at
POLAND

The expense of their richer neighbours would hear of no additional burdens being laid on themselves, and the king only obtained what he wanted by sacrificing his principles to his necessities, and helping the zakońska to pull down the magnates. This fatal parsimony had the most serious political consequences, for it crippled the capacity of the state to defend itself in any emergency, and the more so, since he might, his needs were so urgent, his enemies so numerous, that, though generally successful in the end, he had always to be content with compromises, adjustments and semi-victories. Thus he was obliged, in 1525, to grant local autonomy to the province of Prusia instead of annexing it; he was unable to succour his unfortunate nephew, Louis of Hungary, against the Turkish peril; he was compelled to submit to the occupation of one Lithuanian province after the other by the Muscovites, and look on helplessly while myriads of Tatars penetrated to the very heart of his domains, wasting with fire and sword everything they could not carry away with them.

Again, it should have been the first duty of the Republic adequately to fortify the dzikie pola, or "savage steppe," as the vast plain was called which extended from Kiev to the Black Sea, and some feeble attempts to do so were at last made. Thus, in the reign of Alexander, the fugitive serfs whom tyranny or idleness had driven into this wilderness (they were subsequently known as Kazaki, or Cossacks, a Tatar word meaning freebooters) were formed into companies (c. 1504) and placed at the disposal of the frontier starostas, or lord marchers, of Kanjew, Kamenets, Czerekask on the Don and other places. But these measures proved inadequate, and in 1533 the lord marcher, Ostafii Dzaszkiewicz, the hero of Kanjew, which he had successfully defended against a countless host of Turks and Tatars, was consulted by the diet as to the best way of defending the Ukraine permanently against such inroads. The veteran expert advised the populating and fortifying of the islands of the Dnieper. Two thousand men would suffice, he said, and the Cossacks supplied excellent military material ready to hand. The diet unanimously approved of this simple and inexpensive plan; a special commission examined and approved of its details, and it was submitted to the next diet, which rejected it. So nothing at all was done officially, and the defence of the eastern Ukraine was left to providence. Oddly enough the selfish prudence of Sigismund III, as well as that of Queen Barbara, which was more accurately phrased as "the need of the moment," than the Polish state could do. Thus, to defend her immense possessions in Volynia and Podolia, she converted the castles of Bar and Krmieniec into first-class fortresses, and placed the former in the hands of her Silesian steward, who acquitted himself so manfully of his charge that "the Tatars fell away from the frontier all the days of Pan Prefcz," and a large population settled securely beneath the walls of Bar, henceforth known as "the bastion of Podolia." Nothing, perhaps, illustrates so forcibly the casual character of the Polish government in the most vital matters as this single incident.

The most important political event during the reign of Sigismund was the collapse of the ancient Hungarian monarchy at Mohacs in 1526. Poland, as the next neighbour of Hungary, was more seriously affected than any other European power by this catastrophe, but her politicians differed as to the best way of facing it. Immediately after the death of King Louis, who fell on the field of battle, the emperor Ferdinand and John Zapolya, voivode of Transylvania, competed for the vacant crown, and both were elected almost simultaneously. In Poland Zapolya’s was the popular cause, and he also found powerful support in the influential and highly gifted Laski family, as represented by the Polish chancellor and his nephews John and Hieronymus. Sigismund, on the other hand, favoured Ferdinand and Zamoyski. Though bound by family ties with both competitors, he regarded the decision from the purely political point of view. He argued that the best way to keep the Turk from Poland was for Austria to incorporate Hungary, in which case the Austrian dominion would be a strong and permanent barrier against a Mussulman invasion of Europe. History has  

1 Prefcz won no fewer than 70 engagements over the Tatars.

more than justified him, and the long duel which ensued between Ferdinand and Zapolya (see Hungary: History) enabled the Polish monarch to maintain to the end a cautious but observant neutrality. More than once, indeed, Sigismund was seriously compromised by the diplomatic vagaries of Hieronymus Laski, who coveted the service of Zapolya (since 1520 the protégé of the sultan), and greatly alarmed both the emperor and the pope by his disturbing philo-Turk proclivities. It was owing to Laski’s intrigues that the new hospodar of Moldavia, Petrylo, after doing homage to the Porte, intervened in the struggle as the foe of both Ferdinand and Sigismund, and besieged the Grand Hetman of the Crown, Jan Tarnowski, in Obertyn, where, however, the Moldavians (August 22, 1531) sustained a crushing defeat, and Petrylo was slain. Nevertheless, so anxious was Sigismund to avoid a collision with the Turks, that he forbade the victorious Tarnowski to cross the Moldavian frontier, and sent a letter of explanation to Constantinople. On the death of John Zapolya, the Austro-Polish alliance was still further cemented by the marriage of Sigismund’s son and heir, Sigismund Augustus, with the archduchess Elizabeth. In the reign of Sigismund was effected the incorporation of the duchy of Masovia with the Polish crown, after an independent existence of five hundred years. In 1526 the male line of the ancient dynasty became extinct, and on the 26th of August Sigismund received the homage of the Masovians at Warsaw, the capital of the duchy and ere long of the whole kingdom. Almost every acre of densely populated Masovia was in the hands of her sturdy, ultra-conservative squires, in point of culture far below their brethren in Great and Little Poland. The additional revenue gained by the Crown from Masovia was at first but 14,000 gulden per annum.

The four and twenty years of Sigismund II’s reign was a critical period of Polish history. Complications with the Turk were avoided by the adroit diplomacy of the king, while the superior discipline and efficiency of the Polish armies under the great Tarnowski (q.v.) and his pupils overawed the Tatars and extruded the Muscovites, neither of whom were so troublesome as they had been during the last reign. All the more disquieting was the internal condition of the country, due mainly to the invasion of Poland by the Reformers, and the coincidence of this invasion with an internal revolution of a constitutional kind. Both aimed at substituting the rule of the zakońska for the rule of the senate.

Hitherto the Republic had given the Holy See but little anxiety. Hussite influences, in the beginning of the 15th century, had been superficial and transitory. The Polish government had employed Hussite mercenaries, but rejected Hussite propagandists. The edict of Wielun (1424), remarkable as the first anti-heretical decree issued in Poland, crushed the new sect in its infancy. Lutheranism, moreover, was at first regarded with grave suspicion by the intensely patriotic Polish gentry, because of its German origin. Nevertheless, the extremely severe penal edicts issued during the reign of Sigismund I., though seldom applied, seem to point to the fact that heresy was spreading widely throughout the country. For a time, therefore, the Protestants had to be cautious in Poland proper, but they found a sure refuge in Prussia, where Lutheranism was already the established religion, and where the newly erected university of Königsberg became a seminary for Polish ministers and preachers.

While Lutheranism was thus threatening the Polish Church from the north, Calvinism had already invaded her from the west. Calvinism, indeed, rather recommended itself to the Poles as being of non-German origin, and Calvin actually dedicated his Commentary on the Mass to the young kradecni (or crown prince) Sigismund Augustus, from whom Protestantism, erroneously enough, expected much in the future. Meanwhile conversion to Calvinism, among the higher classes in Poland, became more and more frequent. We hear of crowned Calvinist conventicles in Little Poland from 1545 onwards, and Calvinism continued to spread throughout the kingdom during the latter
years of Sigismund I. Another sect, which ultimately found even more favor in Poland than the Calvinists, was that of the Bohemian Brethren. We first hear of them in Great Poland in 1548. A royal decree promptly banished them to Prussia, where they soon increased so rapidly as to be able to hold their own against the Lutherans. The death of the uncompromising Sigismund I. came as a great relief to the Protestants, who entertained high hopes of his son and successor. He was known to be familiar with the works of the leading reformers; he was surrounded by Protestant counsellors, and he was actually married to Barbara, daughter of Prince Nicholas Radziwill, “Black Radziwill,” the all-powerful chief of the Lithuanian Calvinists. It was not so generally known that Sigismund II. was by conviction a sincere though not a bigoted Catholic; and nobody suspected that beneath his diplomatic urbanity lay a patrician firmness and statesmanlike qualities of the first order. Moreover, they ignored the fact that the success of the Protestant propaganda was due rather to political than to religious causes. The Polish gentry’s jealousy of the clerical estate, whose privileges even exceeded their own, was at the bottom of the whole matter. Any opponent of the established clergy was the natural ally of the szlachta, and the scandalous state of the Church herself provided them with a most formidable weapon against her. It is not too much to say that the condition of the Catholic Church in Poland was almost as bad as it was in Scotland during the same period. The bishops were, for the most part, elegant triflers, as pliant as reeds, with no fixed principles and saturated with a false humanism. Some of them were notorious evil-livers. “Pint-pot” Latuski, bishop of Posen, had purchased his office for 12,000 ducats from Queen Bona; while another of her creatures, Peter, popularly known as the “wencher,” was appointed bishop of Przemysl with the promise of the reversion of the still richer see of Cracow. Moreover, despite her immense wealth (in the province of Little Poland alone she owned at this time 26 towns, 83 landed estates and 772 villages), the Church claimed exemption from all public burdens, from all political responsibilities, although her prelates continued to exercise an altogether disproportionate political influence. Education was shamefully neglected, the masses being left in almost heathen ignorance—and this, too, at a time when the upper classes were greedily appropriating the ripe fruits of the Renaissance and when, to use the words of a contemporary, there were “more Latinitas in Poland than there used to be in Latium.” The university of Cracow, the glory from the lowest depths in the vast Polish realm, was situated in the vicious circle of scholastic formulaires. The provincial schools, dependent upon so decrepit an alma mater, were suffered to decay. This criminal neglect of national education brought along with it its own punishment. The sons of the gentry, denied proper instruction at home, betook themselves to the nearest universities across the border, to Goldberg in Silesia, to Wittemberg, to Leipzig. Here they fell in with the adherents of the new faith, grave, earnest men who professed to reform the abuses which had grown up in the Church; and a sense of equity as much as a love of novelty moved them, on their return home, to propagate wholesome doctrines and clamber for the reformation of their own institutions. Fingone, the first Polish reformation, was at first carried on by their bishops, and excluded from all preference, took part with the szlachta against their own spiritual rulers and eagerly devoted and imparted to their flocks, in their own language, the contents of the religious tracts which reached them by divers ways from Goldberg and Königsberg. Nothing indeed did so much to popularize the new doctrines in Poland as this beneficial revival of the long-neglected vernacular by the reformers.

Such was the situation when Sigismund II. began his reign. The bishops at once made a high bid for the favour of the new king by consenting to the coronation of his Calvinist consort (Dec. 7, 1550) and the king five days later consented. In the capital, all the nobility had pledged his royal word to preserve intact the unity of the Church and to enforce the law of the land against heresy. Encouraged by this pleasing symptom of orthodoxy the bishops, instead of first attempting to put their own dilapidated house in order, at once proceeded to institute prosecutions for heresy against all and sundry. This at once led to an explosion, and at the diet of Piotrków, 1552, the szlachta accepted a proposition of the king, by way of compromise, that the jurisdiction of the clerical courts should be suspended for twelve months, on condition that the gentry continued to pay tithes as heretofore. Then began a religious interim, which was gradually prolonged for ten years, during which time Protestantism in Poland flourished exceedingly. Presently reformers of every shade of opinion, even those who were tolerated nowhere else, poured into Poland, which speedily became the battle-ground of all the sects of Europe. Soon the Protestants became numerous enough to form ecclesiastical districts of their own. The first Calvinist synod in Poland was held at Pinczow in 1550. The Bohemian Brethren evangelized Little Poland, but ultimately coalesced with the Calvinists at the synod of Kozminiec (August 1555). In the diet itself the Protestants were absolutely supreme, and invariably elected a Calvinist to be their marshal. At the diet of 1555 they boldly demanded a national synod, absolute toleration, and the equalization of all the sects except the Anti-trinitarians. But the king intervened and the existing interim was indefinitely prolonged. At the diet of Piotrków, 1558–1559, the onslaught of the szlachta on the clergy was fiercer than ever, and they even demanded the exclusion of the bishops from the senate. The king, however, perceiving a danger to the constitution in the violence of the szlachta, not only supported the bishops, but quashed a subsequent reiterated demand for a national synod. The diet of 1558–1559 indicates the high-water mark of Polish Protestantism. From this time forward it began to subside, very gradually but unmistakably. The chief cause of this subsidence was the division among the reformers themselves. From the chaos of creeds resulted a chaos of ideas on all imaginable subjects, politics included. The Anti-trinitarian proved to be the chief dissolvent, and from 1560 onwards the relations between the two principal Protestant sects, the Lutherans and the Calvinists, were fratricidal rather than fraternal. An auxiliary cause of the decline of Protestantism was the beginning of a Catholic reaction. The bulk of the population still held persistently, if languidly, to the faith of its fathers; the new bishops were holy and learned men, very unlike the creations of Queen Bona, and the Holy See gave to the slowly reviving zeal of both clergy and laity the very necessities that the state lacked. It was not, unfortunately, in those days of difficult inter-communication, not too far off, and it is indisputable that in the first instance it was the papal nuncios, men like Berard of Camerino and Giovanni Commendone, who reorganized the scattered and faint-hearted battalions of the Church militant in Poland and led them back to victory. At the diet of Piotrków in 1562, indeed, the king’s sore need of subsidies induced him, at the demand of the szlachta, to abolish altogether the jurisdiction of the ecclesiastical courts in cases of heresy; but, on the other hand, at the diet of 1564 he accepted from Commendone the Tridentine decrees and issued an edict banishing all foreign, and especially Anti-trinitarian, heretics from the land. At the diet of 1565 Sigismund went even further and decreed the suppression of the University of Cracow. From then on the religious party was at the height of its power. The Counter-Reformation in Poland.
POLAND

HIStory

welding together of her loosely connected component parts into a single state by the Union of Lublin.

In the middle of the 16th century, the ancient order of the Knights of the Sword, whose territory embraced Estonia, Livonia, Courland, Semgallen and the islands of Dagö and Ösel, was tottering to its fall. All the Baltic powers were more or less interested in the apportionment of this vast tract of land, whose geographical position made it not only the chief commercial link between east and west, but also the emporium whence the English, Dutch, Swedes, Danes and Germans obtained their corn, timber and most of the raw products of Lithuania and Muscovy. Matters were complicated by the curious political intricacies of this long-coveted domain, where the grand-master, the archbishop of Riga, and the estates of Livonia possessed concurrent and generally conflicting jurisdictions. Poland and Muscovy as the nearest neighbours of this moribund state, which had so long excluded them from the sea, were vitally concerned in its fate. After an anarchic period of suspense, lasting from 1546 to 1561, during which Sweden secured Estonia, while Ivan the Terrible fearlessly ravaged Livonia, in the hope of making it valueless to any other potentate, Sigismund II., to whom both the grand-master and the archbishop had appealed more than once for protection, at length intervened decisively. Both he and his chancellor, Piotr Myszkowski (d. 1591), were well aware of the importance of securing a coast-land which would enable Poland to become a naval power. But the diet, with almost incredible short-sightedness, refused to waste a penny on an undertaking which, they argued, concerned only Lithuania, and it was not as king of Poland, but as grand-duke of Lithuania, and with purely Lithuanian troops, that Sigismund, in 1561, occupied Livonia. At his camp before Riga the last grand-master, Gotthard von Ketteler, who had long been at the head of the Polish party in Livonia, and William of Brandenburg, archbishop of Riga, gladly placed themselves beneath his protection, and by a subsequent convention signed at Vilna (Nov. 28, 1561), Livonia was incorporated with Lithuania in much the same way as Prussia had been incorporated with Poland thirty-six years previously. Ketteler, who had adopted Lutheranism during a visit to Germany in 1553, now professed the Augsburg Confession, and became the first duke of a new Protestant duchy, which he was to hold as a fief of the Polish crown, with local autonomy and absolute freedom of worship. The southern provinces of the ancient territory of the Order, Courland and Semgallen, had first been ceded on the 24th of June 1559 to Lithuania on similar conditions, the matter being finally adjusted by the compact of March 1562.

The apathy of Poland in such a vital matter as the Livonian question must have convinced so statesmanlike a prince as Sigismund II. of the necessity of preventing any possibility of cleavage in the future between the two halves of his dominions whose absolute solidarity was essential to their existence as a great power. To this patriotic design he devoted the remainder of his life. A personal union, under one monarch, however close, had proved inadequate. A further step must be taken—the two independent countries must be transformed into a single state. The great obstacle in the way of this, the only true solution of the difficulty, was the opposition of the Lithuanian magnates, who feared to lose the absolute dominancy they possessed in the grand-duchy if they were merged in the szlachta of the kingdom. But, at the last moment, the dread of another Muscovite invasion made them more pliable and, at a Polish diet held at Warsaw from November 3 to June 1564, when the Lithuanians attended, the question of an absolute union was finally decided. When the magnates had decided, the king tactfully intervened and voluntarily relinquished his hereditary title to Lithuania, thus placing the two countries on a constitutional equality and preparing the way for fresh negotiations in the future. The death, in 1565, of Black Radziwill, the chief opponent of the union, still further weakened the Lithuanians, and the negotiations were reopened with more prospect of success at the diet which met at Lublin on the 10th of January 1569. But even now the Lithuanians were disposed towards a complete union, and finally they quitted the diet, leaving two commissioners behind to watch their interests. Then Sigismund recited his master stroke. Knowing the sensitiveness of the Lithuanians as regards Volynia and Podolia, he suddenly, of his own authority, formally incorporated both these provinces with the kingdom of Poland, whereupon, amidst great enthusiasm, the Volynian and Podolian deputies took their places on the same benches as their Polish brethren. The hands of the Lithuanians were forced. Even a complete union on equal terms was better than mutilated independence. Accordingly they returned to the diet, and the union was unanimously adopted on the 1st of July 1569. Henceforth the kingdom of Poland and the grand duchy of Lithuania were to constitute one inseparable and indivisible body politic, under one sovereign, elected in common, with one diet and one currency. All dependencies and colonies, including Prussia and Livonia, were to belong to Poland and Lithuania in common. The retention of the old duality of dignities was the one remissiveness of the original separation. No decision, however, could be come to as to the successor of the childless king, partly because of the multiplicity of candidates, partly because of Austrian intrigue, and this, the most momentous question of all, was still unsettled when Sigismund II. expired on the 6th of July 1572.

The Jagiellonic period (1386-1572) is the history of the consolidation and fusion into one homogeneous, political whole of numerous national elements, more or less akin ethnologically, but differing immensely in language, religion and, above all, in degrees of civilization. Out of the ancient Piast kingdom, mutilated by the loss of Silesia and the Baltic shore, arose a republic consisting at first of various loosely connected entities, naturally centrifugal, but temporarily drawn together by the urgent need of combination against a superior foe, who threatened them separately with extinction. Beneath the guidance of a dynasty of princes which, curiously enough, was supplied by the least civilized portion of this congeries of nationalities, the nascent republic gradually grew into a power which subjected its former oppressors and, viewed externally, seemed to bear upon it the promise of empire. It is dangerous to prophesy, but all the facts and circumstances before us point irresistibly to the conclusion that had the Jagiellonic dynasty but endured this promise of empire might well have been realized. The extraordinary thing about the Jagiellions was the equable possession of their genius. Not only were five of the seven great statesmen, but they were statesmen of the same stamp. We are disturbed by no such sharp contrasts as are to be found among the Plantagenets, the Vasas and the Bourbons. The Jagiellios were all of the same mould and pattern, but the mould was a strong one and the pattern was good. Their predominant and constant characteristic is a sober sagacity which instinctively judges aright and imperturbably realizes its inspirations. The Jagiellios were rarely brilliant, but they were always perspicacious. Above all, they alone seem to have had the gift of guiding the most difficult of nations properly. Two centuries of Jagiellonic rule made Poland great despite her grave external difficulties. Had that dynasty been prolonged for another century, there is every reason to suppose that it would also have dealt satisfactorily with Poland's still more dangerous internal difficulties, and arrested the development of that anarchical constitution which was the ruling factor in the ruin of the Republic.

Simultaneously with the transformation into a great power of a number of petty principalities which composed ancient Poland, another and equally momentous political transformation was proceeding within the country itself.

The origin of the Polish constitution is to be sought in the wiece or councils of the Polish princes, during the partitional period (c. 1270-1370). The privileges conferred upon the magnates of which these councils were composed, especially upon the magnates of Little Poland, who brought the Jagiellios to
the throne, directed their policy, and grew rich upon their liberality, revolted the less favoured szlachta, or gentry, who, towards the end of the 14th century, combined for mutual defence in their sejmiki, or local diets, of which originally there were five, in Great Poland, one in Little Poland and one in Posen-Kalisz. 1 In these sejmiki in the cities of the few great towns were also represented. The Polish towns, not being part of the Teutonic state, retained all their privileges, including freedom from tolls and municipal government, from the Crown in return for important services, such as wading off the Tatars, while the cities of German origin were protected by the Magdeburg law. Casimir the Great even tried to make municipal government as democratic as possible by enacting that one half of the town council of Cracow should be elected from the civic patriciate, but the other half from the commonalty. Louis the Great placed the burgesses on a level with the gentry by granting to the town council of Cracow jurisdiction over all the serfs in the extra-rural estates of the citizens. From this time forth deputies from the cities were summoned to the sejmiki on all important occasions, such, for instance, as the ratification of treaties, a right formally conceded to them by the sejmik of Radom in 1384. Thus at this period Poland was a confederation of half a dozen semi-independent states. The first general assembly of which we have certain notice is the szead walny which was summoned to Koszyce in November 1404, to relieve the financial embarrassments of Wladislaus, and granted him an extraordinary subsidy of twenty groats per head of land to enable him to purchase Dobrzyn from the Teutonic Knights. Such subsidies were generally the price for the confirmation of ancient or the concession of new privileges. Thus at the diet of Brzécki Kujawski, in 1425, the szlachta obtained its first babaes corpus actum in recognition for acknowledging the right of the infant krolewicz Wladislaus to his father's throne. The great opportunity of the szlachta was, of course, the election of a new king, especially the election of a minor, an event always accompanied and succeeded by disorders. Thus at the election in the infant Wladislaus III., his guardians promised in his name to confirm all the privileges granted by his father. If, on retaining his majority, the king refused to ratify these promises, his subjects were ipso facto absolved from their obedience. This is the first existence of the mischievous principle de prestanda obedientia, subsequently evolved by the szlachta. It is the principle, too, that we meet with the first rokosz, or insurrection of the szlachta for the election of a king by the deputies. The extraordinary difficulties of Casimir IV. were freely exploited by the szlachta, who granted that ever impecunious monarch as little as possible, but got full value for every penny they grudgingly gave. Thus by the Articles of Cerekwica presented to him by the sejmik or diet of Great Poland in 1454 on the outbreak of the Teutonic War, he conceded the principle that no war should in future be begun without the consent of the local diets. A few months later he was obliged to grant the Privileges of Nieszawa, which confirmed and extended the operation of the Articles of Cerekwica. The sejmik had thus added to their original privilege of self-taxation the right to declare war and control the national purse. 2 This was a serious political retrogression. A strongly centralized government had ever been Poland's greatest need, and Casimir the Great had striven successfully against all centrifugal tendencies. And now, eighty-four years after his death, Poland was once more split up into half a dozen loosely federated states in the hands of country gentlemen too ignorant and prejudiced to look beyond the boundaries of their own provinces. The only way of saving the Republic from disintegration was to concentrate all its political factors into a sejm-walny or general diet. But to this the magnates and the szlachta were equally opposed, the former because they feared the rivalry of a national assembly, the latter because they were of more importance in their local diets than they could possibly hope to be in a general diet. The first sejm to legislate for the whole of Poland was the diet of Piotrkow (1493), summoned by John Albert to grant him subsidies; but the mandates of its deputies were limited to twelve months, and its decrees were to have force for only three years. John Albert's second diet (1496), after granting subsidies the burden of which fell entirely on the towns and peasantry, passed a series of statutes benefiting the szlachta. The article of a statute passed in 1496 permitted the szlachta henceforth to export and import goods duty free, to the great detriment of the towns and the treasury. Another statute prohibited the burgesses from holding landed property and enjoying the privileges attaching thereto. A third statute disqualified plebeians from being elected to canonicry or bishoprics. A fourth endeavoured to bind the peasantry more closely to the soil by forbidding emigration. The condition of the serfs was subsequently (1520) still further deteriorated by the introduction of socage. In a word, this diet disturbed the equilibrium of the state by enfeebling and degrading the middle classes. Nevertheless, so long as the Jagiello dynasty lasted, the political rights of the nobility were jealously protected by the Crown against the usurpations of the nobility. Deputies from the towns took part in the election of John Albert (1492), and the burgesses of Cracow, the most enlightened economists in the kingdom, supplied Sigismund I. with his most capable counsellors during the first twenty years of his reign (1506-1526). Again and again the nobility attempted to exclude the deputies of Cracow from the diet, in spite of a severe edict issued by Sigismund I. in 1509, threatening to prosecute for treason all persons who dared to infringe the liberties of the citizens. During Sigismund's reign, moreover, the Crown recovered many of the prerogatives of which it had been deprived during the reign of his feeble predecessor, Alexander, who, to say nothing of the curtailments of the prerogative, had been forced to accept the statute nihil novi (1505) which gave the sejm and the senate an equal voice with the Crown in all executive matters. In the latter years of Sigismund I. (1530-1548) the political influence of the szlachta grew rapidly at the expense of the executive, and the gentry in diet assembled in curtailing the functions of all the great officers of state. During the reign of Sigismund II. (1548-1572) they diverted their attention to the abuses of the Church and considerably reduced both her wealth and her privileges. In this respect both the Crown and the country were with them, so that their interference if violent, was on the whole distinctly beneficial. The childless Sigismund II. died suddenly without leaving any regulations as to the election of his successor. Fortunately for Poland the political horizon was absolutely unclouded. The Turks, still reeling from the shock of Lepanto, could with difficulty hold their own against the united forces of the pope, Spain and Venice; while Ivan the Terrible, had just concluded a truce with Poland. Domestic affairs, on the other hand, were in an almost anarchical condition. The Union of Lublin, barely three years old, was anything but consolidated, and in Lithuania it continued to be extremely unpopular. In Poland proper the szlachta were fiercely opposed to the magnates; and the Protestants seemed bent upon still further undermining the Crown. Worst of all, there existed no recognized authority in the land to curb and control its jarring centrifugal political elements. It was nearly two hundred years since the Republic had suffered from an interregnum, and the precedents of 1382 were obsolete. The prince, on hearing of the demise of the Crown, at once invited all the senators of Great Poland to a conference at Lowicz, but passed over the szlachta altogether. In an instant the whole Republic was seething like a caldron, and a rival assembly was simultaneously summoned to Cracow by Jan Jerle, the head of the Protestant party. Civil war was happily averted at the last moment, and a national convention, composed of the magnates and deputies from the country, assembled at Warsaw, in April 1573, for the purpose of electing a new king. Five candidates for the throne were already in the field. Lithu-

1 The Red Russian sejmik was of later origin, c. 1433.  
2 In view of the frequency of the Tatar inroads, the control of the militia was retransferred to the Crown in 1501.
the Catholic magnates were for an Austrian archduke, while the strongly anti-German szlachta were inclined to accept almost any candidate but a German, so long as he came with a gift in his hand and was not a Muscovite. In these circumstances it was an easy task for the adroit and energetic French ambassador, Jean de Montluc (d. 1579), brother of the famous marshal, and bishop of Valence, to procure the election of the French candidate, Henry, duke of Anjou. Well provided with funds, he speedily bought over many of the leading magnates, and his popularity reached its height when he strenuously advocated the adoption of the mode of election by the gentry en masse (which the szlachta proposed to revive), as opposed to the usual and more orderly "secret election" by a congress of senators and deputies, sitting with closed doors. The religious difficulty, meanwhile, had been adjusted to the satisfaction of all parties by the compact of Warsaw (Jan. 28, 1573), which granted absolute religious liberty to all non-Catholic denominations (dissidentes de religione, as they now began to be called) without exception, thus exhibiting a far more liberal intention than the Germans had manifested in the religious peace of Augsburg eighteen years before. Finally, early in April 1573, the election diet assembled at Warsaw, and on the 18th of May, in the midst of intrigue, corruption, violence and confusion, Henry of Valois was elected king of Poland.

The election had, however, been preceded by a correctura jurum, or reform of the constitution, which resulted in the Henry of Valois, king, Poland from a famous "Henrian Articles" which converted Poland, a limited monarchy into a republic 1573-1574, with an elective chief magistrate. Henceforward the king was to have no voice in the choice of his successor. He was not to use the word haeres, not being an hereditary sovereign. He was to marry a wife selected for him by the senate. He was not to seek for a divorce nor give occasion for it. He was to be neutral in all religious matters. He was not to lead the militia across the border except with the consent of the szlachta, and then only for three months at a time. Every year the senate was to appoint sixteen of its number to be in constant attendance upon the king in rota of four, which sedecimviri were to supervise all his actions. Should the king fail to observe any one of these articles, the nation was ipso facto absolved from its allegiance. This constitutional reform was severely criticized by contemporary political experts. Some strongly condemn the clause justifying renunciation of allegiance, as tending to treason and anarchy. Others defended it against the anomalous and helpless position of the so-called king, who, if he could do no harm, was certainly powerless for good. But such Cassandras prophesied to heathen ears. The Republic had deliberately cast itself upon the downward grade which was to lead to ruin.

The reign of Henry of Valois lasted thirteen months. The tidings of the death of his brother Charles IX., which reached him on the 14th of June 1574, determined him to exchange a thorny for what he hoped would be a flowery throne, and at midnight on the 18th of June he literally fled from Poland, pursued to the frontier by his indignant and bewildered subjects. Eighteen months later (Dec. 14, 1575), mainly through the influence of Stephen Báthory, prince of Transylvania, was elected king of Poland by the szlachta in opposition to the emperor Maximilian, who had been elected two days previously by the senate, after disturbances which would have rent any other state but Poland to pieces.

The glorious career of Stephen Báthory (1575-1586) is dealt with elsewhere (see Stephen, King of Poland). His example demonstrates the superiority of genius and valour over the most difficult circumstances. But his reign was too brief to be permanently beneficial.

The Vasa period of Polish history which began with the election of Sigismund, son of John III., king of Sweden, was the period of most hopes and lost chances. The collapse of the Muscovite tirannia in the east and the submergence of the German Empire in the west by the Thirty Years' War, presented Poland with an unprecedented oppor-

uinity of consolidating, once for all, her hard-won position as the dominating power of central Europe. Everywhere circumstances were favourable to her, and in Zółkiewski, Chodkiewicz and Koniecpolski she possessed three of the greatest captains of that or any other age. With all the means at her disposal cheerfully placed in the hands of such valiant and capable ministers, it would have been no difficult task for the Republic to have wrested the best part of the Baltic littoral from the Scandinavian powers, and driven the distracted Muscovites beyond the Volga. Permanent greatness and secular security were within her reach at the commencement of the Vasa period; but was it, then, that at the end of that period, only fifty years later, Poland had already sunk irredeemably into much the same position as Turkey occupies now, the position of a moribund state, existing on sufferance simply because none was yet quite prepared to administer the coup de grâce? There is only one answer; the principal cause of this complete and irretrievable collapse is to be sought for in the folly, egotism and selfishness of the Polish gentry, whose insane delusions of all discipline, including even the salutary discipline of regular government, converted Poland into something very like a primitive tribal community at the very time when her European statesman, including the more enlightened of the Poles themselves, clearly recognized that the political future belonged to the strongly centralized monarchies, which were everywhere rising on the ruins of feudalism. Of course there were other contributory causes. The tenacity with which Sigismund III. clung to his hereditary rights to the Swedish Crown involved Poland in a quite unnecessary series of wars with Charles IX. and Gustavus Adolphus, when her forces were sorely needed elsewhere. The adhesion of the same monarch to the League of the Catholic Reaction certainly added to the difficulties of Polish diplomacy, and still further divided the already distracted diet, besides alienating from the court the powerful and popular chancellor Zamorsky. Yet Sigismund III. was a far more clear-
while the king and the senate were powerless, every great noble or lord-marcher was free to do what he chose in his own domains, so long as he flattered his "little brothers," the szlachta. Incredibly as it may seem, the expedition to place the false Demetrius on the Muscovite throne was a private speculation of a few Lithuanian magnates, and similar enterprises on the part of other irresponsible noblemen on the Danube or Dniester borders had kept Poland without a king for nearly two years, and the whole province of Littau had been reduced whole provinces to ashes. Every attempt to improve matters, by reforming the impossible constitution, stranded on the opposition of the gentry. Take, for instance, the typical and highly instructive case of Zebrydowski's rebellion. Nicholas Zebrydowski, a follower of the chancellors Zamoyski, was one of the wealthiest and most respectable magnates in Poland. As palatine of Cracow he held one of the highest and most lucrative dignities in the state, and was equally famous for his valour, piety and liberality. Disappointed in his hope of obtaining the great seal on the death of Zamoyski, he at once conceived that the whole of the nobility had been insulted in his person, and proceeded to make all government impossible for the next three years. On the 7th of March 1606 Sigismund summoned a diet for the express purpose of introducing the principle of decision by majority in the diet, whereupon Zebrydowski summoned a counter-diet to Stetszyn in Little Poland, whose first act was to open negotiations with the prince of Transylvania, Stephen Bocskay, with the view of hiring mercenaries from him for further operations. At a subsequent conference, held at Lublin in June, Zebrydowski was reinforced by another great nobleman, Stanislaw Stadnicki, called the Devil, who "had more crimes on his conscience than hairs on his head," and was in the habit of cropping the ears and noses of small squires and chaining his serfs to the walls of his underground dungeons for months at a time. This champion of freedom was very eloquent as to the wrongs of the szlachta, and proposed that the assembly should proceed in a body to Warsaw and there formally renounce their allegiance. The upshot of his oratory was the summoning of a rokosz, or national insurrection, to Sandomir, which was speedily joined by the majority of the szlachta all over the country, who openly proclaimed their intention of dethroning the king and chastising the senate, and sent Stadnicki to Transylvania to obtain the armed assistance of Stephen Bocskay. Only the clergy, naturally conservative, still clung to the king, and Sigismund III., who was no coward, at once proceeded to Cracow to overthrow the rokoszanie, or insurrectionists, by his proximity, and take the necessary measures for his own protection. By the advice of his senators he summoned a szaad, or armed convention, to Wiślica openly to oppose the insurrection of Sandomir, which szaad was to be the first step towards the formation of a general confederation for the defence of the throne. Civil war seemed inevitable, when the szlachta of Red Russia and Sieradz suddenly rallied to the king, who at once ordered his army to advance, and after defeating the insurrectionists at Janowice (in October), granted them a full pardon, on the sole condition that they should refrain from all such acts of rebellion in future. Despite their promises, Zebrydowski and his colleagues a few months later were again in arms. In the beginning of 1607 they summoned another rokosz to Jendrzejow, at the very time when the diet was assembling at Warsaw. The diet authorized the king to issue a proclamation dissolving the rokosz, and the rokosz retorted with a manifesto in which an insurrection was declared to be as much superior to a parliament as a general council was to a pope. In a second manifesto published at Jeziorna, on the 24th of June, the insurrectionists again renounced their allegiance to the king. Oddly enough, the diet before dissolving had, apparently in order to meet the rokosz half-way, issued the famous edict De non praetendis obedience, whereby, in case of future malpractices by the king and his subsequent neglect of at least two of the three principal liberties, he was to be formally deposed by the next succeeding diet. But even this was not enough for the insurrectionists. It was not the contingent but the actual deposition of the king that they demanded, and they had their candidate for the throne ready in the person of Gabriel Bethlen, the new prince of Transylvania. But the limits of even Polish complacency had at last been reached, and Żółkiewski and Chodkiewicz were sent against the rebels, whom they routed at Oransk near Guzow, after a desperate encounter, on the 6th of July 1607. But, though driven from the field, the agitation simmered all over Poland for nearly two years longer, and was only terminated, in 1609, by a general amnesty which excluded every prospect of constitutional reform. Władysław IV., whose succeeded his father in 1632, was the most popular monarch who ever sat on the Polish throne. The szlachta, who had had a "King Log" in Sigismund, were determined that Władysław should be a "King Bee who will give us nothing but honey."—1632-1648. In other words they hoped to wheedle him out of even more than they had wrested from his predecessor. Władysław submitted to everything. He promised never to declare war or levy troops without the consent of the sejm, undertook to fill all vacancies within a certain time, and released the szlachta from the payment of income-tax, their one remaining fiscal obligation. This boundless complacency was due to policy, not weakness. The second Polish Vasa was a man of genius, fully conscious of his powers, and determined to use them for the benefit of his country. The events of the last reign had demonstrated the incompetence of the Poles to govern themselves. Any amelioration of the existing anarchy must be extra-parliamentary and proceed from the throne. But a reforming monarch was inconceivable unless he possessed the confidence of the nation, and such confidence, Władysław naturally argued, could only be won by striking and undeniable public services. On these principles he acted with brilliant results. Within three years of his accession he compelled the Muscovites (Treaty of Polyankov, May 28, 1634) to retrocede Smolensk and the eastern provinces lost by Sigismund II., overawed the Porte by a military demonstration in October of the same year, and, by the Truce of Stumdorf (Sept. 12, 1635), recovered the Prussian provinces and the Baltic seaboard from Sweden. But these achievements excited not the gratitude but the suspicion of the szlachta. They were shrewd enough to guess that the royal triumph might prejudice their influence, and for the next five years they deliberately thwarted the enlightened and far-reaching projects of the king for creating a navy and introducing the revenue which should be raised from the estates, by a system of tolls levied on the trade of the Baltic ports (see WŁADYSŁAW IV.), even going so far as to refuse for nine years to refund the expenses of the Muscovite War, which he had defrayed out of his privy purse. From sheer weariness and disgust the king refrained from any intervention in public affairs for nearly ten years, looking on indifferently while the ever shorter and stormier diets wrangled perpetually over questions of preferment and the best way of dealing with the extreme dissenters, to the utter neglect of public business. But towards the end of his reign the energy of Władysław revived, and he began to occupy himself with another scheme for regenerating his country, in its own despite, by means of the Cossacks. First, however, it is necessary to describe briefly the origin and previous history of these romantic free-booters who during the second half of the 17th century were the determining factor of Polish and Muscovite politics. At the beginning of the 16th century the illimitable steppe of south-eastern Europe, extending from the Dnieper to the Urals, had no settled population. Hunters and fishermen frequented its innumerable rivers, returning home laden with rich store of fish and pelts, while runaway serfs occasionally settled in small communities beneath the shelter of the fortresses built, from time to time, to guard the southern frontiers of Poland and Muscovy. Obliged, for fear of the Tatars, to go about with arms in their hands, these settlers gradually grew strong enough to raid their raiders, selling the booty thus acquired to the merchants of Muscovy and Poland. Moreover, the Turks and Tatars being the natural enemies of Christendom, a war of extermination
against them was regarded by the Cossacks as a sacred duty. Curiously enough, these champions of orthodoxy borrowed the name, which has stuck to them ever since, from their "dog-headed" adversaries. The rank and file of the Tatar soldiery were known as Kazaki, or Cossacks, a word meaning "freebooters," and this term came to be applied indiscriminately to all the free dwellers in the Ukraine, or border-lands. As time went on the Cossacks multiplied exceedingly. Their daring grew with their numbers, and at last they came to be a constant annoyance to all their neighbours, both Christian and Mussulman, frequently involving Poland in dangerous and unprofitable wars with the Ottoman Empire. Indeed, it is not too much to say that, until the days of Sobieski, the Cossacks were invariably the chief cause of the breaches between the Porte and the Republic. We have seen how carefully the Jagiellods avoided participating in any of the crusades directed by the Holy See against the arch-enemies of the Cross. So successful was their prudential abstention that no regular war occurred between Turkey and Poland during the two centuries of their sway. The first actual collisions, the Cecora campaign of 1620 and the Khotin War of 1621 (for John Albert's Moldavian raid does not count), were due to the depredations of the Cossacks upon the dominions of the sultan by land and sea, and in all subsequent treaties between the two powers the most essential clause was always that which bound the Republic to keep its freebooters in order.

But in the meantime the Cossacks themselves had become a semi-independent community. The origin of the Cossack state is still somewhat obscure, but the germs of it are visible as early as the beginning of the 16th century. The union of Lublin, which led to the polarization of Lithuania, was the immediate occasion of a considerable exodus to the lowlands of the Dnieper of those serfs who desired to escape from the taxes of the Polish government and the tyranny of the Polish landlords. Stephen Báthory presently converted the pick of them into six registered regiments of 1000 each for the defence of the border. Ultimately the island of Horta, just below the falls of the Dnieper, was fixed upon as their headquarters; and on the numerous islands of that broad river there gradually arose the famous Cossack community known as the Zaporozhskaya Svyet, or Settlement behind the Falls, whence the Dnieperian Cossacks were known, generally, as Zaporozhians, or Backfaltsmen. The Cossack kosh, or commonwealth, had the privilege of electing its heiman, or chief, and his chief officers, the starshins. The heiman, after the death of the kosh, the insignia of his office, viz. the bulavo, or baton, the bunchuk, or horse-tail standard, and his official seal; but he was responsible for his actions to the kosh alone, and an inquiry into his conduct was held at the expiration of his term of office in the obshchaya shkoda, or general assembly. In time of peace his power was little more than that of the responsible minister of a constitutional republic; but in time of warfare he was a dictator, and disobedience to his orders in the field was punishable by death.

The Cossacks were supposed to be left alone as much as possible by the Polish government, so long as they faithfully fulfilled their chief obligation of guarding the froniers of the Republic from Tatar raids. But the relations between a community of freebooters, mostly composed of fugitive serfs and refugees, and a government of small squires who regarded the Cossacks as a mere rabble were bound to be difficult at the best of times, and political and religious differences presently supervened. The Cossacks, mostly of Lithuanian origin, belonged to the Orthodox religion, so far as they belonged to any religion at all, and the Jagiellods had been very careful to safeguard the religious liberties of their Lithuanian subjects, especially as the Poles themselves were indifferent on the subject. But, at the beginning of the 17th century, when the current of the Catholic renaissance was very strong, and the Jesuits, after subduing the Protestant Church in Lithuania, a more intolerant spirit began to prevail. The old Calvinist nobility of Lithuania were speedily reconverted; a Uniate Church in connection with Rome was established; Greek Orthodox congregations, if not generally persecuted, were at least depressed and straitened; and the Cossacks began to hate the Pans, or Polish lords, not merely as tyrants, but as heretics. Yet all these obstacles to a good understanding might, perhaps, have been surmounted if only the Polish diet had treated the Cossacks with common fairness and common sense. In 1619 the Polish government was obliged to prohibit absolutely the piratical raids of the Cossacks in the Black Sea, where they habitually destroyed Turkish property to the value of millions. At the same time, by the compact of Rastawica, the sejm undertook to allow the Cossacks, partly as wages, partly as compensation, 40,000 (raised by the compact of Kurukow to 60,000) gulden and 170 wagons of cloth per annum. These terms were never kept, despite the earnest remonstrances of the king, and the complaints of the aggrieved borderers. Parsimony prevailed, as usual, over prudence, and when the Cossacks showed unmistakable signs of restiveness, the Poles irritated them still further by ordering the construction of the strong fortress of Kidak at the confluence of the Dnieper and the Samara, to overawe the Zaporozhian community. This further act of repression led to two terrible Cossack risings, in 1652 and 1656, put down only with the utmost difficulty, wherein the diet of 1638 deprived the Cossacks of all their ancient privileges, abolished the elective hetmanship, and substituted for it a commission of Polish noblemen with absolute power, so that the Cossacks might well declare that those who hated them were lords over them.

Such was the condition of affairs in the Ukraine when Wladislaus IV. proposed to make the Cossacks the pivot of his foreign policy and his domestic reforms. His far-reaching plans were based upon two facts, the absolute devotion of the Zaporozhians to himself personally, and the knowledge, secretly conveyed to him by Stanislaus Koniecpolski (q.v.), that the whole of the Ukraine was in a ferment. He proposed to provoke the Tatars to a rupture by repudiating the humiliating tribute with which the Republic had so long and so vainly endeavoured to buy off their incessant raids. In case of such rupture he meant, at the head of 100,000 Cossacks, to fall upon the Crimea itself, the seat of their power, and exterminate the Khanate. He calculated would bring about a retaliatory invasion of Poland by the Tatars, which, if once begun, taking the field against them also with all the forces of the Republic would, he would be able to impose the will of a victorious king upon a discredited diet, and reform the constitution on an English or Swedish model. Events seemed at first to favour this audacious speculation. Almost simultaneously a civil war broke out in the Crimea and the Porte declared war against the Venetian republic, with which Wladislaus at once concluded an offensive and defensive alliance (1645). He then bade the Cossacks prepare their boats for a raid upon the Turkish galleys, and secured the co-operation of the tsar in the Crimean expedition by a special treaty. Unfortunately, Venice, for her own petty's sake, refused to remove the publication of the Venetian-Turkish alliance; the Porte, perhaps conscious of the course of Polish affairs, remained strictly neutral despite the most outrageous provocations; and Wladislaus, bound by his crown oath not to undertake an offensive war, found himself at the mercy of the diet which, full of consternation and rage, assembled at Warsaw on the 2nd of May 1647. It is needless to say that the Venetian alliance was repudiated and the royal power still further reduced. A year later Wladislaus died at his hunting-box at Merecz, at the very moment when the long-impending tempest which he himself had conjured up burst over-whelming fury over the territories of the Republic.

One of the most important events of the great rebellion which shook the Polish state to its foundations was the Cossack Bohdan Khmiejniki (q.v.), who had been initiated in all the plans of Wladislaus IV. and, with good reason, feared to be the first victim of the Polish magnates when the king's designs were

---

transferred his allegiance to the tsar, and the same year the tsar's armies invaded Poland, still bleeding from the all but mortal wounds inflicted on her by the Cossacks. The war thus begun, and known in Russian history as the Thirty Years' War, far exceeded even the Thirty Years' War in grossness and brutality. It resembled nothing so much as a hideous scramble of ravening beasts and obscene foulies for the dismembered limbs of a headless carcasse, for such did Poland seem to all the world before the war was half over. In the summer of 1655, moreover, while the Republic was still reeling beneath the shock of the Muscovite invasion, Charles X. of Sweden, on the flimsiest of pretext, forced a war upon reluctant and inoffensive Poland, simply to gratify his greed of martial glory, and in the year before the war was out his forces had occupied the capital, the coronation city and the best half of the land. King John Casimir, betrayed and abandoned by his own subjects, fled to Silesia, and profiting by the cataclysm which, for the moment, had swept the Polish state out of existence, the Muscovites, unopposed, quickly appropriated nearly everything which was not already occupied by the Swedes. At this crisis Poland owed her salvation to two events—the formation of a general league against Sweden, brought about by the appeasement of Vienna and an almost simultaneous popular outburst of religious enthusiasm on the part of the Polish people. The first of these events, to be dated from the alliance between the emperor Leopold and John Casimir, on the 27th of May 1657, led to a truce with the tsar and the welcome diversion of all the Muscovite forces against Swedish Livonia. The second event, which began with the heroic and successful defence of the monastery of Czernstochowa by Prior Kordecki against the Swedes, resulted in the return of the Polish king from exile, the formation of a national army under Stephen Czarniecki and the recovery of almost all the lost provinces from the Swedes, who were driven back headlong to the sea, where with difficulty they held their own. On the sudden death of Charles X. (Feb. 13, 1660), Poland gladly seized the opportunity of adjusting all her outstanding differences with Sweden. By the peace of Oliva (May 3, 1660), made under French mediation, John Casimir ceded Livonia, and renounced all claim to the Swedish crown. The war with Muscovy was then prosecuted with renewed energy and extraordinary success. In the autumn of 1661 the Russian commanders were routed at Zeromsk, and nearly all the eastern provinces were recovered. In 1665 a peace was signed at Andrussovo, and the prospect for Poland seemed most brilliant; but at the very moment when she needed all her armed strength to sustain her diplomacy, the rebellion of one of her leading magnates, Prince Lubomirsky, involved her in a dangerous civil war, compelled her to reopen negotiations with the Muscovites, at Andrussovo, under far more unfavourable conditions, and after protracted negotiations practically to accept the Muscovite terms. By the truce of Andrussowo (Feb. 11, 1667) Poland received back the Truce from Muscovy, Vitelsk, Polotsk and Polish Livonia, of Andrussow, but ceded in perpetuity Smolensk, Syeversk, Cherni, gov and the whole of the eastern bank of the Dnieper, including the towns of Pereyaslav, Chornograd, Polotsk and Ezym. The Cossacks of the Dnieper were henceforth to be under the joint dominion of the tsar and the king of Poland. Kiev, the religious metropolis of western Russia, was to remain in the hands of Muscovy for two years.

The "truce" of Andrussowo proved to be one of the most permanent peace in history, and Kiev, though only pledged for two years, was never again to be separated from the Orthodox Slavonic state to which it rightly belonged. But for the terrible and persistent ill-luck of Poland it is doubtful whether the "truce" of Andrussowo would ever have been signed. The year in which it concluded was to be the last open struggle between the two powers in the face of Russia; over Poland was steadily to increase, without any struggle at all, the Republic being already stricken with that creeping paralysis which ultimately left her a prey to her neighbours. Muskovy
had done with Poland as an adversary, and had no longer any reason to fear her ancient enemy.

Poland had, in fact, emerged from the cataclysm of 1656-1667 a moribund state, though her not unskilful diplomacy had enabled her for a time to save appearances. Her territorial losses, though considerable, were, in the circumstances, not excessive, and she was still a considerable power in the opinion of Europe. But a fatal change had come over the country during the age of the Vasa. We have already seen how the ambition of the oligarchs and the lawlessness of the szlachta had reduced the executive to impotence, and rendered anything like rational government impossible. But these demoralizing and enervating influences had been suspended by the religious revival due to the Catholic reaction and the Jesuit propaganda, a revival which reached its height towards the end of the 16th century. This, the whole, salutary and edifying movement permeated public life, and produced a series of great captains who cheerfully sacrificed themselves for their country, and would have been saints if they had not been heroes. But this extraordinary religious revival had wellnigh spent itself by the middle of the 17th century. Its last manifestation was the successful defence of the monastery of Czestochowa by Pior Kordecki against the finest troops in Europe, its last representative was Stephen Czarniecki, who brought the fugitive John Casimir back from exile and reinstated him on his tottering throne. The succeeding age was an age of unmitigated egoism, in which the old ideals were abandoned and the old examples were forgotten. It synchronized with, and was partly determined by, the new political system which was spreading all over Europe, the system of dynastic diplomatic competition and the unscrupulous employment of unlimited secret service funds. This system, which dates from Richelieu and culminated in the reign of Louis XIV., was based on the secular rivalry of the houses of Bourbon and Habsburg, and presently divided all Europe into two hostile camps. Louis XIV. is said to have expended 50,000,000 livres a year for bribing purposes, the court of Vienna was scarcely less liberal, and very soon nearly all the monarchs of the Continent and their ministers were in the pay of one or other of the antagonists. Poland was no exception to the general rule. Her magnates, having already got all they could out of their own country, looked eagerly abroad for fresh El Dorados. Before long most of them had become the hirelings of France or Austria, and the value demanded for their wages was, not infrequently, the betrayal of their own country. To do them justice, the szlachta at first were not only free from the taint of official corruption, but endeavoured to fight against it. Thus, at the election diet of 1669, one of the deputies, Pieniaszek, moved that a new and higher law should be enacted by the general confederation, to the effect that every senator and deputy should solemnly swear not to take bribes, while another szlacz proposed that the ambassadors of foreign Powers should be excluded permanently from the Polish elective assemblies. But the flighty and ignorant szlachta not only were incapable of any sustained political action, but they themselves unconsciously played into the hands of the enemies of their country by making the so-called liberum veto an integral part of the Polish constitution. The liberal veto was based on the assumption of the absolute political equality of every Polish gentleman, with the inevitable corollary that every measure introduced into the Polish diet must be adopted unanimously. Consequently, if any single deputy believed that a measure already approved of by the rest of the house might be injurious to his constituency, he had the right to rise and exclaim nie powinnoam, "I disapprove," when the measure in question fell at once to the ground. Subsequently this vicious principle was extended still further. A deputy, by interposing his individual veto, could at any time dissolve the diet, when all measures previously passed had to be re-submitted to the consideration of the following diet. The liberum veto seems to have been originally devised to cut short interminable debates in times of acute crisis, but it was generally used either by highly placed criminals, anxious to avoid an inquiry into their misdeeds, or by malcontents, desirous of embarrassing the executive. The origin of the liberum veto is obscure, but it was first employed by the deputy Wladislaus Siiciński, who dissolved the diet of 1652 by means of it, and before the end of the 17th century it was used so frequently and recklessly that all business was frequently brought to a standstill. In later days it became the chief instrument of foreign ambassadors for dissolving inconvenient diets, as a deputy could always be bribed to exercise his veto for a handsome consideration.

The Polish crown first became an object of universal competition in 1573, when Henry of Valois was elected. In 1575, and again in 1597, it was put up for public auction when the Polish Báthory and the Swede Sigismund respectively gained the prize. But at all three elections, though money and intrigue were freely employed, they were not the determining factors of the contest. The Polish gentry were still the upees as well as the stake-holders; the best candidates generally won the day; and the defeated competitors were driven out of the country by force of arms if they did not take their discomfiture, after a fair fight, like sportmen. But with the election of Michael Wisniewski in 1669 a new era began. In this case a native Pole was freely elected by the unanimous vote of his countrymen. Yet a few years later he was overthrown by the other of the whole series of conspiracies for the purpose of dethroning his lawful sovereign, and openly placed himself beneath the protection of Louis XIV. of France, just as the rebels of the 18th century placed themselves under the protection of Catherine II. of Russia. And this rebel was none other than John Sobieski, at a later day the heroic deliverer of Vienna! If heroes could so debase themselves, can we wonder if men who were not heroes lent themselves to every sort of villainy? We have come, in fact, to the age of utter shamelessness, when disappointed place-hunters openly invoked foreign aid against their own country. Sobieski himself, as John III. (he succeeded Michael in 1674), was to pay the penalty of his past lawlessness, to the uttermost farthing. Despite his brilliant military achievements (see JOHN III., KING OF POLAND), his reign of twenty-two years was a failure. His victories over the Turks were fruitless so far as Poland was concerned. His belated attempts to reform the constitution only led to conspiracies against his life and crown, in which the French faction, which he had been the first to encourage, took an active part. In his later years Lithuania was in a state of chronic revolt, while Poland was bankrupt both morally and materially. He died a broken-hearted man, prophesying the inevitable ruin of a nation which he himself had done so much to demoralize. The policy of Sobieski was to make Poland sink lower than she had sunk already. Yet an era was now to follow, compared with which even the age of Sobieski seemed to be an age of gold. This was the; Saxon period which, with occasional violent interruptions, was to drag on for nearly seventy years. By the time it was over Poland was irretrievably doomed. It only remained to be seen how that doom would be accomplished. On the death of John III. no fewer than eighteen candidates for the vacant Polish throne presented themselves. Austria supported James Sobieski, the eldest son of the late king, France Francis Louis Prince of Conti (1663-1704), but the successful competitor was Frederick Augustus, elector of Saxony, who cheerfully renounced Lutheranism for the coveted crown, and won the day because he happened to arrive last of all, with fresh funds, when the agents of his rivals had spent all their money. He was crowned, as Augustus II., on the 15th of September 1707, and his first act was to expel from the country the prince of Conti, the elect of a respectable minority, directed by the cardinal primate Michal Radziejowski (1645-1705), whom Augustus II. subsequently bought over for 75,000 thalers.

1Thus the Sapiehas, who had been living on rapine for years, dissolved the diet of 1688 by means of the veto of one of their hirelings, for fear of an investigation into their conduct.
POLAND

Good luck attended the opening years of the new reign. In 1699 the long Turkish War, which had been going on ever since 1583, was concluded by the peace of Karlowitz, whereby Podolia, the Ukraine and the fortress of Kamien Podolskiy were retroceded to the Republic by the Ottoman Porte. Immediately afterwards Augustus was persuaded by the plausible Livonian exile, Johan Reinhold Patkul, to form a nefarious league with Frederick of Denmark and Peter of Russia, for the purpose of despoiling the youthful king of Sweden, Charles XII. (see SWEDEN: HISTORY). This he did as elector of Saxony, but it was the unfortunate Polish republic which paid for the hazardous speculation of its newly elected king.

Throughout the Great Northern War (see SWEDEN: HISTORY), war was to some extent a regular event. For eighteen years of the twenty years (1700-1719), all the belligerents treated Poland as if she had no political existence. Swedes, Saxons and Russians not only lived upon the country, but plundered it systematically. The diet was the humble servant of the conqueror of the moment, and the leading magnates chose their own sides without the slightest regard for the interests of their country, the Lithuanians for the most part supporting Charles XII., while the Poles divided their allegiance between him and Augustus and Stanislaus Leszczyński, whom Charles placed upon the throne in 1704 and kept there till 1709. At the end of the war Poland was ruined materially as well as politically. Augustus attempted to indemnify himself for his failure to obtain Livonia, his covenanted share of the Swedish plunder, by offering Frederick William of Prussia Courland, Polish Prussia and even part of Great Poland, provided that he were allowed a free hand in the disposal of the rest of the country. When Prussia declined this tempting offer for fear of Russia, Augustus went a step farther and actually suggested that "the four eagles" should divide the banquet between them. He died, however (Feb. 1, 1733) before he could give effect to this shameless design.

On the death of Augustus II., Stanislaus Leszczyński, who had, in the meantime, become the father-in-law of Louis XV., attempted to regain his throne with the aid of a small French army corps and 4,000,000 livres from Versailles. Some of the best men in Poland, including the Czartoryscy, were also in his favour, and on the 26th of August 1733 he was elected king for the second time. But there were many malcontents, principally among the Lithuanians, who solicited the intervention of Russia in favour of the elector of Saxony, son of the late king, and in October 1733 a Russian army appeared before Warsaw and compelled a phantom diet (it consisted of but 15 senators and 530 of the szlachta) to proclaim Augustus III. From the end of 1733 till the 30th of June 1734 Stanislaus and his partisans were besieged by the Russians in Danzig, their last refuge, and with the surrender of that fortress the cause of Stanislaus was lost. He retired once more to his little court in Lorraine, with the title of king, leaving Augustus III. in possession of the kingdom.

Augustus III. was disqualified by constitutional indolence from taking any active part in affairs. He left everything to his omnipotent minister, Count Heinrich Brühl, and Brühl entrusted the government of Poland to the Czartoryscy, who had intimate relations of long standing with the court of Dresden.

The Czartoryscy, who were to dominate Polish politics for the next half-century, came of an ancient Ruthenian stock which had intermarried with the Jagiellons at an early date, and had always been remarkable for their civic virtues and political sagacity. They had powerfully contributed to the adoption of the Union of Lublin; were subsequently received into the Roman Catholic Church; and dated the beginning of their influence in Poland proper from the time (1674) when Florian Czartoryski became primate there. Florian's nephews, Fryderyk Michal and Augustus, were now the principal representatives of "the Family," as their opponents sarcastically called them. The former, through the influence of Augustus's minister and favourite Brühl, had become, in his twenty-eighth year, vice-

1 The fourth eagle was the White Eagle, i.e. Poland.

chancellor and subsequently grand chancellor of Lithuania, was always the political head of the family. His brother and Augustus, after fighting with great distinction against the Turks both by land and sea (Prince Eugene decorated him with a sword of honour for his valour at the siege of Belgrade), had returned home to marry Sophia Sieniawska, whose fabulous dowry won for her husband the sobriquet of "the Family Crousus." Their sister Constantia had already married Stanislaus Poniatowski, the father of the future king. Thus wealth, position, court influence and ability combined gave the Czartoryscy a commanding position in Poland, and, to their honour be it said, they had determined from the first to save the Republic, whose impending ruin in existing circumstances they clearly foresaw, by a national constitutional reconstruction which was to include the abolition of the liberum veto and the formation of a standing army.

Unfortunately the other great families of Poland were obstinately opposed to any reform or, as they called it, any "violation" of the existing constitution. The Potocky, whose possessions in south Poland and the Ukraine covered thousands of square miles, the Radziwiłłowies, who were omnipotent in Lithuania and included half a dozen millionaires 4 amongst them, the Lubomirscy and their fellows, hated the Czartoryscy because they were too eminent, and successfully obstructed all their well-meant efforts. The castles of these great lords were the foci of the social and political life of their respective provinces. Here they lived like little princes, surrounded by thousands of retainers, whom they kept for show alone, making no attempt to organize and discipline this excellent military material for the defence of their defenceless country. Here congregated hundreds of the younger szlachta, fresh from their school benches, whence they brought nothing but a smattering of Latin and a determination to make their way by absolute subservience to their "elder brethren," the ępons. These were the men who, a little later, at the bidding of their ę benefactors, 5 dissolved one inconvenient diet after another; for it is a significant fact that during the reign of the two Augustuses every diet was dissolved in this way by the hirings of some great lord or, still worse, of some foreign potentate. In a word constitutional government had practically ceased, and Poland had become an arena in which contesting clans strove together for the mastery.

It was against this primitive state of things that the Czartoryscy struggled, and struggled in vain. First they attempted to abolish the liberum veto with the assistance of the Saxon court where they were supreme, but fear of foreign complications and the opposition of the Potocky prevented anything being done. Then they broke with their old friend Brühl and turned to Russia. Their chief intermediary was their nephew Stanislaus Poniatowski, whom they sent, as Saxon minister, to the Russian court in the suite of the English minister Hanbury Williams, in 1755. The handsome and insinuating Poniatowski speedily won the susceptible heart of the grand-duchess Catherine, but he won nothing else and returned to Poland in 1759 somewhat discredited. Disappointed in their hopes of Russia, the Czartoryscy next attempted to form a confederation for the deposition of Augustus III., but while the strife of factions was still at its height the absentee monarch put an end to the struggle by expiring, conveniently, on the 5th of October 1763.

The interregnum occurring on the death of Augustus III. belittled at a time when all the European powers, exhausted by the Seven Years' War, earnestly desired peace. The position of Poland was, consequently, much more advantageous than it had been on every other similar occasion, and if only the contending factions had been able to agree and unite, the final catastrophe might, perhaps, even now, have been averted. The Czartoryscy, of all men, were bound by their principles and professions to set their fellow citizens an example of fraternal concord. Yet they rejected with scorn and derision the pacific overtures of their political opponents, the Potocky, the Radziwiłłowies, and the Braniscy, Prince Michał openly declaring that of two tyrannies he preferred the tyranny of the Muscovite to the

4 Michał Kazimierz Radziwiłł alone was worth thirty millions.

5 History
tyranny of his equals. He had in fact already summoned a Russian army corps to assist him to reform his country, which suffered from its own haughtiness and the unwooed complacency of the rival magnates.

The simplicity of the Czartoryscy was even more mischievous than their haughtiness. When the most enlightened statesmen of the Republic could seriously believe in the benevolent intentions of Russia the end was not far off. Their naïve expectations were very speedily disappointed. Catherine II. and Frederick II. had already determined (Treaty of St Petersburg, April 22, 1764) that the existing state of things in Poland must be maintained, and as early as the 18th of October 1762 Catherine had recommended the election of Stanislaus Poniatiowski as “the individual most convenient for our common interests.” The personal question did not interest Frederick: so long as Poland was kept in an anarchical condition he cared not who was called king. Moreover, the opponents of the Czartoryscy made no serious attempt to oppose the entry of the Russian troops.

At least 40,000 men were necessary for the purpose, and these could have been obtained for 200,000 ducats; but a congress of magnates, whose collective fortunes amounted to hundreds of millions, having decided that it was impossible to raise this sum, there was nothing for it but to fight a few skirmishes and then take refuge abroad. The Czartoryscy now fancied themselves the masters of the situation. They at once proceeded to pass through the convocation diet a whole series of salutary measures. Four special commissions were appointed to super-intend the administration of justice, the police and the finances. The extravagant powers of the grand hetmans and the grand marshals were reduced. All financial and economical questions before the diet were henceforth to be decided by a majority of votes. Shortly afterwards Stanislaus Poniatiowski was elected king (Sept. 7, 1764) and crowned (Nov. 25). But at the beginning of 1766 Prince Nicholas Repnin was sent as Russian minister to Warsaw with instructions which can only be described as a carefully elaborated plan for destroying the Republic. The first weapon employed was the dissident question. At that time the population of Poland was, in round numbers, 11,500,000, of whom about 1,000,000 were dissenters or dissenters. Half of these were the Protestants of the towns of Polish Prussia and Great Poland, the other half was composed of the Orthodox population of Lithuania. The dissenters had no political rights, and their religious liberties had been also unjustly restricted; but two-thirds of them being agricultural labourers, and most of the rest artisans or petty tradesmen, they had no desire to enter public life, and were so ignorant and illiterate that their new protectors, on a closer acquaintance, became heartily ashamed of them. Yet it was for these persons that Repnin, in the name of the empress, now demanded absolute equality, political and religious, with the gentlemen of Poland. He was well aware that an aristocratic and Catholic assembly like the sejm would never concede so preposterous a demand. He also calculated that the demand itself would make the szlachta suspicious of all reform, including the Czartoryscy reforms, especially as both the king and his uncles were generally unpopular, as being innovators under foreign influence. His calculations were correct. The sejm of 1766 not only rejected the dissident bill, but repelled all the Czartoryscy reforms and insisted on the retention of the Liberum veto as the foundation of the national liberties. The discredit into which Stanislaus had now fallen encouraged the Saxon party, led by Gabriel Podolski (1719-1777), to form a combination for the purpose of dethroning Poniatowski. The other magnates would never consent to such a measure; but he secretly employed the plot for his own purposes, with signal success. Early in 1767 the malcontents, fortified by the adhesion of the leading Catherine II., political refugees, formed a conferation at Radom, whose first act was to send a deputation to St Petersburg, petitioning Catherine to guarantee the liberties of the Republic, and allow the form of the Polish constitution to be settled by the Russian ambassador at Warsaw. With this carte blanche in his pocket, Repnin proceeded to treat the diet as if it were already the slave of the Russian empress. But despite threats, wholesale corruption and the presence of Russian troops outside and even inside the iwa, or chamber of deputies, the patriots, headed by four bishops, Wocław Hieronim Sierakowski (1690-1784) of Lemberg, Feliks Pawel Turski of Chelm (1729-1800), Kajetan Ignacy Soltyn of Cracow (1715-1788), and Józef Jedrzej Zaluski of Kiev (1702-1774), offered a determined resistance to Repnin's demands. Only when brute force in its extremest form had been ruthlessly employed, only when three senators and some deputies had been arrested in full session by Russian grenadiers and sent as prisoners to Kaluga, did the opposition collapse. The Liberum veto and all the other ancient abuses were now declared unalterable parts of the Polish constitution, which was placed under the guarantee of Russia. All the edicts against the dissidents were, at the same time, repealed.

This shameful surrender led to a Catholic patriotic uprising, known as the Confederation of Bar, which was formed on the 29th of February 1768, at Bar in the Ukraine, by a handful of small squires. It never had a chance of permanent success, though, feebly fed by French subsidies and French volunteers, it lingered on for four years, till finally suppressed in 1772. But, insignificant itself, it was the cause of great events. Some of the Bar confederates, scattered by the Russian regulars, fled over the Turkish border, pursued by their victors. The Turks, already alarmed at the progress of the Russians and Poles in the Orient, overawed by that time French ambassador at Constantinople, at once declared war against Russia. Seriously disturbed at the prospect of Russian aggrandizement, the idea occurred, almost simultaneously, to the courts of Berlin and Vienna that the best mode of preserving the equilibrium of Europe was for all three powers to readjust their territories at the expense of Poland. The idea of a partition of Poland was nothing new, but the vastness of the country, and the absence of sufficiently powerful and united enemies, had hitherto saved the Republic from spoliation. But now that Poland lay utterly helpless and surrounded by the three great military monarchies of Europe, nothing could save her. In February 1770 Frederick sent Count Rochus Friedrich Lynar (1708-1783) to St Petersburg to sound the empress as to the expediency of a partition, in August Joseph II. solicited an interview with Frederick, and in the course of the summer the two monarchs met, first at Neisse in Silesia and again at Neustadt in Moravia. Nothing definite as to Poland seems to have been arranged, but Prince Kaunitz, the Austrian chancellor, was now encouraged to take the first step by occupying, in 1770, the county of Zip, which had been hypothecated by Hungary to Poland in 1442 and never redeemed. This act decided the other confederates. In June 1770 Frederick surrounded those of the Polish provinces he coveted with a military cordon, ostensibly to keep out the cattle plague. Catherine's consent had been previously obtained by a special mission of Prince Henry of Prussia to the Russian capital.

The first treaty of partition was signed at St Petersburg between Prussia and Russia on the 6-17th of February 1772; the second treaty, which admitted Austria also to a share of the spoil, on the 5-16th of August the same year. It is unnecessary to recapitulate the unheard-of atrocities by which the consent of the sejm to this act of brigandage was at last extorted (Aug. 18, 1773). Russia obtained the palatinates of Vitebsk, Polotsk Maslawa: 1566 sq. m. of territory, with a population of 550,000 and an annual revenue of 930,000 Polish gulden. Austria got the part of Galicia, minus Cracow: 1710 sq. m., with a population of 86,000 and an annual revenue of 1,430,000 gulden. Prussia received the maritime palatinate minus Danzig, the palatinate of Kulm minus Thorn, Great Poland as far as the Nitza, and the palatinates of Marienburg and Ermeland: 629 sq. m. with a population of 378,000, and an annual revenue of 534,000 thalers. In fine, Poland lost about one-fifth of her population and one-fourth of her territory.
In return for these enormous concessions the partitioning powers presented the Poles with a constitution superior to anything they had ever been able to devise for themselves. The most mischievous of the ancient abuses, the elective monarchy and the liberum veto, were of course retained. Poland was to be dependent on her despotters, but they evidently meant to make her a serviceable dependant. The government was henceforth to be in the hands of a rada miestojaca, or permanent council of thirty-six members, eighteen senators and eighteen deputies, elected biennially by the sejm in secret ballot, subdivided into the five departments of foreign affairs, police, war, justice and the exchequer, whose principal members and assistants, as well as all other public functionaries, were to have fixed salaries. The royal prerogative was still further reduced. The king was indeed the president of the permanent council, but he could not summon the diet without its consent, and in all cases of preferment was bound to select one out of three of the council's nominees. The annual budget was fixed at 30,000,000 Polish gulden,\(^1\) out of which a regular army of 30,000\(^2\) men was to be maintained. Sentiment apart, the constitution of 1773 was of distinct benefit to Poland. It made for internal stability, order and economy, and enabled her to develop and husband her resources, and devote herself uninterruptedly to the new burning question of national education. For the shock of the first partition was so far salutary that it awoke the public conscience to a sense of the national inferiority; stimulated the younger generation to extraordinary patriotic efforts; and thus went far to produce the native reformers who were to do such wonders during the great quadrennial diet.

It was the second Turkish War of Catherine II. which gave patriotic Poland her last opportunity of re-establishing her independence. The death of Frederick the Great (Aug. 17, 1786) completely deranged the balance of power in Europe. The long-standing accord between Prussia and Russia came to an end, and while the latter drew nearer to Austria, the former began to look to the Western powers. In August 1787 Russia and Austria provoked the Porte to declare war against them both, and two months later a defensive alliance was concluded between Prussia, England and Holland, as a counterpoise to the alarming preponderance of Russia. In June 1788 Gustavus III. of Sweden also attacked Russia, with 50,000 men, while in the south the Turks held the Muscovites at bay beneath the walls of Ochakov, and drove back the Austrian invaders into Transylvania. Prussia, emboldened by Russia's difficulties, now went so far as to invite Poland also to forsake the Russian alliance, and placed an armed force of 40,000 at her disposal. It was under the exceptional circumstances that the "four years' diet" assembled (Oct. 6, 1788). Its leaders, Stanislaw Malachowski, Hugo Kollontaj and Ignaty Potocki, were men of character and capacity, and its measures were correspondingly vigorous. Within a few months of its assembling it had abolished the permanent council; enlarged the royal prerogative; raised the army to 65,000 men; established direct communications with the Western powers; rejected an alliance which Russia, alarmed at the rapid progress of events, had hastened to offer; declared its own session permanent; and finally settled down to the crucial task of reforming the constitution on modern lines. But the difficulties of the patriots were commensurate with their energies, and though the new constitution was drafted so early as December 1789, it was not till May 1791 that it could safely be presented to the diet. Meanwhile Poland endeavoured to strengthen her position by an advantageous alliance with Prussia. Frederick William II. stipulated, at first, that Poland should surrender Danzig and Thorn, and Pitt himself endeavoured to persuade the Polish minister Michal Kleophas Oginski (1765-1853) that the protection of Prussia was worth the sacrifice. But the Poles proving obstinate, and Austria simultaneously displaying a disquieting interest in the welfare of the Republic, Prussia, on the 20th of March 1791, concluded an alliance with Poland which engaged the two powers to guarantee each other's possessions and render mutual assistance in case either were attacked.

But external aid was useless so long as Poland was hampered by her anarchical constitution. Hitherto the proceedings of the diet had not been encouraging. The most indispensable reforms had been frantically opposed, the debate on the reorganization of the army had alone lasted six months. It was only by an audacious surprise that Kollontaj and his associates contrived to carry through the new constitution. Taking advantage of the Easter recess, when most of the malcontents were out of town, they suddenly, on the 3rd of May, brought the whole question before the diet and demanded urgency for it. Before the opposition could remonstrate, the marshal of the diet produced the latest foreign despitches, which unanimously predicted another partition, whereupon, at the solemn adjuration of Ignaty Potocki, King Stanislaus exhorted the deputies to accept the new constitution as the last means of saving their country, and himself set the example by swearing to defend it.

The revolution of the 3rd of May 1792 converted Poland into a hereditary 3 limited monarchy, with ministerial responsibility and duennial parliaments. The liberum veto and all the intricate and obstructive machinery of the anomalous old system were for ever abolished. All invidious class distinctions were done away with. The franchise was extended to the towns. Serfdom was mitigated, preparatorily to its entire abolition; absolute religious toleration was established, and every citizen declared equal before the law. Frederick William II. officially congratulated Stanislaus on the success of "the happy revolution which has at last given Poland a wise and regular government," and declared it should henceforth be his "chief care to maintain and confirm the ties which unite us." Coben, the Austrian minister at St Peterburg, writing to his court immediately after the reception of the tidings at the Russian capital, describes the empress as full of consternation at the idea that Poland under an hereditary dynasty might once more become a considerable power. But Catherine, still in difficulties, was obliged to watch in silence the collapse of her party in Poland, and submit to the double humiliation of recalling her ambassador and withdrawing her army from the country. Even when the peace of Jassy (Jan. 9, 1792) finally freed her from the Turk, she waited patiently for the Polish malcontents to afford her a pretext and an opportunity for direct and decisive interference. She had not long to wait. On the 3rd of May 1792, the Diet of Warsaw, the crisis with Austria having delayed its proceedings, met in extraordinary session, and forthwith nominated Ignaty Potocki, Felix Branicki, three of the chief dignitaries of Poland, hastened to St Petersburg, and there entered into a secret convention with the empress, whereby she undertook to restore the old constitution by force of arms, but at the same time promised to respect the territorial integrity of the Republic. On the 14th of May 1792 the conspirators formed a confederation, consisting, in the first instance, of only ten other persons, at the little town of Targowica in the Ukraine, protesting against the constitution of the 3rd of May as tyrannous and revolutionary, and at the same time the new Russian minister at Warsaw presented a formal declaration of war to the king and the diet. The diet then met the crisis with dignity and firmness. The army was at once despatched to the frontier; the male population was called to arms, and Ignaty Potocki was sent to Berlin to claim the assistance stipulated by the treaty of the 10th of March 1791. The king of Prussia, in direct violation of all his oaths and promises, declined to defend a constitution which had never had his "concurrence." Thus Poland was left entirely to her own resources. The little Polish army of 46,000 men, under Prince Joseph Poniatowski and Tadeusz Kosciusko, did all that was possible under the circumstances. For more than three months they kept back the invader, and, after winning three pitched battles, retired in perfect order on the capital (see Poniatowski, and

---

\(^1\) 1 Pol. gulden = 5 silber groschen.
\(^2\) At the very next diet, 1776, the Poles themselves reduced the army to 18,000 men.
Kościuszko). But the king, and even Kollontaj, despairing of success, now acceded to the confederation; hostilities were suspended; the indignant officers threw up their commissions; the king ordered all disbands, but the Polish patriots continued to distribute the reforms abroad; and the constitution of the 3rd of May was abolished by the Targowianics as "a dangerous novelty."

The Russians then poured into eastern Poland; the Prussians, at the beginning of 1793, alarmed lest Catherine should appropriate the whole Republic, occupied Great Poland; and a diminutive, debased and helpless army met at Grodno in order, in the midst of a Russian army corps," to come to an amicable understanding" with the partitioning powers. After every conceivable means of intimidation had been unscrupulously applied for twelve weeks, the second treaty of partition was signed at three o'clock on the morning of the 23rd of September 1793. By this pactum subjectionis, as the Polish patriots called it, Russia got all the eastern provinces of Poland, extending from Livonia to Moldavia, comprising a quarter of a million of square miles, while Prussia got Dobrzyn, Kujavia and the greater part of Great Poland, with Thorn and Danzig. Poland was now reduced to one-third of her original dimensions, with a population of about three and a half millions.

The focus of Polish nationality was now transferred from Warsaw, where the Targowianics and their Russian patrons reigned supreme, to Leipzig, whither the Polish patriots, Kościuszko, Kollontaj and Ignacy Potocki among the number, assembled from 16 quarters. From the first they meditated a national rising, but their ignorance, enthusiasm and simplicity led them to commit blunder after blunder. The first of such blunders was Kościuszko's mission to Paris, in January 1794. He was full of the idea of a league of republics against the league of sovereigns; but he was unaware that the Jacobins themselves were already considering the best mode of detaching Prussia, Poland's worst enemy, from the anti-French coalition. With a hypocrisy worthy of the diplomacy of the tyrants, the committee of public safety declared that it could not support an insurrection engineered by aristocrats, and Kościuszko returned to Leipzig empty-handed. The next blunder of the Polish refugees was to allow themselves to be drawn into a premature rising by certain Polish officers in Poland who, to prevent the incorporation of their regiments in the Russian army, openly revolted and led their troops from Warsaw to Cracow. Kościuszko himself condemned their madness; but, when the Russian troops began to concentrate, his feelings grew too strong for him, and early in April he himself appeared at Cracow. In an instant the mutiny became a revolution. The details of the heroic but useless struggle will be found elsewhere (see K. Kościuszko, Kollontaj, Potocki, Ignacy, Dombrowski). Throughout April the Polish arms were almost universally successful. The Russians were defeated in more than one pitched battle; three-quarters of the ancient territory was recovered, and Warsaw and Vilna, the capitals of Poland and Lithuania respectively, were liberated. Kościuszko was appointed dictator, and a supreme council was established to assist him.

The first serious reverse, at Szczekociny (June 5), was more than made up for by the successful defence of Warsaw against the Russians and Prussians (July 9 to Sept. 6); but in the meantime the ineradicable lawlessness of the Poles had asserted itself, as usual, and violent and ceaseless dissensions, both in the supreme council and in the army, neutralized the superhuman efforts of the unfortunate but still undaunted dictator. The death-blow to that movement was the disaster of Maciejowice (Oct. 10), and it expired amidst the carnage of Praga (Oct. 29), though the last Polish army corps did not capitulate till the 18th of November. Yet all the glory of the bitter struggle was with the vanquished, and if the Poles, to the last, had shown themselves children in the science of government, they had at least died on the field of battle like men. The greed of the three partitioning powers very nearly led to a rupture between Austria and Prussia; but the tact and statesmanship of the empress of Russia finally adjusted all difficulties. On the 24th of October 1795 Prussia acceded to the Austro-Russian partition compact of the 3rd of January, and the distribution of the conquered provinces was finally regulated on the 10th of October 1796.

By the third treaty of partition Austria had to be content with Western Galicia and Southern Masovia; Prussia took Podlachia, and the rest of Masovia, with Warsaw; and Russia all the rest.

The immediate result of the third partition was an immense emigration of the more high-spirited Poles who, during the next ten years, fought the battles of the French Republic and of Napoleon all over Europe, but principally against their own enemies, the partitioning powers. They were known as the Polish legionaries, and were commanded by the best Polish generals, e.g. Joseph Poniatowski and Dombrowski. Only Kościuszko stood aloof. Even when, after the peace of Tilsit, the independent grand-duchy of Warsaw was constructed out of the central provinces of Prussian Poland, his distrust of Napoleon proved to be invincible. He was amply justified by the course of events. Napoleon's anxiety to conciliate Russia effectively prevented him from making Poland large and strong enough to be self-supporting. The grand-duchy of Warsaw originally consisted of about 1850 sq. m., to which Western Galicia and Cracow, about 900 sq. m. more, were added in 1809. The grand-duchy was, from first to last, a mere recruiting-ground for the French emperor. Its army was limited, on paper, to 30,000 men; but in January 1812 65,000, and in November the same year 70,000 recruits were drawn from it. The constitution of the little state was dictated by Napoleon, and, subject to the exigencies of war, was on the French model. Equality before the law, absolute religious toleration and local autonomy, were its salient features. The king of Saxony, as grand-duke, took the initiative in all legislative matters; but the administration was practically controlled by the French. (R.N.B.)

The Congress Kingdom, 1813-1863.—The Grand Duchy of Warsaw perished with the Grand Army in the retreat from Moscow in 1812. The Polish troops had taken a prominent part in the invasion of Russia, and their share in the plundering of Smolensk and of Moscow had intensified the racial hatred felt for them by the Russians. Those of them who survived or escaped the disasters of the retreat fled before the tsar's army and followed the fortunes of Napoleon in 1813 and 1814. The Russians occupied Warsaw on the 18th of February 1813 and overran the grand duchy, which thus came into their possession by conquest. Some of the Poles continued to hope that Alexander would remember his old favour for them, and would restore their kingdom under his own rule. Nor was the tsar unwilling to encourage their delusion. He himself cherished the desire to re-establish the kingdom for his own advantage. As early as the 13th of January 1813 he wrote to assure his former favourite and confidant, Prince Adam Czartoryski, that, "Whatever the Poles do now to aid in my success, will at the same time serve to forward the realization of their hopes." But the schemes of Alexander could be carried out only with the co-operation of other powers. They refused to consent to the annexation of Saxony by Prussia, and other territorial arrangements which would have enabled him to unite all Poland in his own hand. By the final act of the Congress of Vienna, signed on the 9th of June 1815, Poland was divided between Prussia, Austria and Russia, with one trifling exception—Cracow with its population of 61,000 was erected into a republic embedded in Galicia. Posen and Gnesen, with a population of 810,000, were left to Prussia. Austria remained in possession of Galicia with its 1,500,000 inhabitants. Lithuania and the Ruthenian Palatinate, the spoil of former partitions, continued to be incorporated with Russia. The remnant was constituted as the so-called Congress Kingdom under the emperor of Russia as king (tsar) of Poland. It had been stipulated by the Final Act that the Poles under foreign rule should be endowed with institutions to preserve their national existence.
according to such forms of political existence as the governments to which they belong shall think fit to allow them.

Alexander, who had a sentimental regard for freedom, so long as it was obedient to himself, had promised the Poles a constitution in April 1825 in a letter written to Zabłocki, his minister of state. This promise was publicly proclaimed on the 25th of May, and was reaffirmed in the Zamość or palace at Warsaw and the cathedral of St John on the 20th of June. The constitution thus promised was duly drafted, and was signed on the 30th of November. It contained 165 articles divided under seven heads. The kingdom of Poland was declared to be united to Russia, in the person of the tsar, as a separate political entity. The kingdom was the Congress Kingdom, for the vague promises of an extension to the east which Alexander had made to the Poles were never fulfilled. Lithuania and the Ruthenian Palatinates continued to be incorporated with Russia as the Western Provinces and were divided from the Congress Kingdom by a customs barrier until the reign of Nicholas I.

The kingdom of Poland thus defined was to have at its head a lieutenant of the emperor (namiestnik), who must be a member of the Imperial house or a Pole. The first holder of the office, General Zajonczek (1752-1826), was a veteran who had served Napoleon. Roman Catholicism was recognized as the religion of the state, but other religions were tolerated. Liberty of the Press was promised subject to the passing of a law to restrain its abuses. Individual liberty, the use of the Polish language in the law courts, and the exclusive employment of Poles in the civil government were secured by the constitution. The machinery of government was framed of a council of state, at which the Imperial government was represented by a commissioner plenipotentiary, and a diet divided into a senate composed of the princes of the blood, the palatines and councillors named for life, and a house of nuntii elected for seven years, 77 chosen by the "dietines" of the nobles, and 51 by the commons. The diet was to meet every other year for a session of thirty days, and was to be renewed by thirds every two years. Poland retained its flag, and a national army based on that which had been raised by and had fought for Napoleon. The command of the army was given to the emperor's brother Constantine, a man of somewhat erratic character, who did much to offend the Poles by violence, but also a good deal to please them by his marriage with Johanna Grutzinska, a Polish lady afterwards created Princess Lowicz, for whose sake he renounced his right to the throne of Russia.

The diet met three times during the reign of Alexander, in 1818, in 1820, and in 1825, and was on all three occasions opened by the tsar, who was compelled to address his subjects in French. He did not speak, and would not learn, their language. It is highly doubtful whether, with the best efforts on both sides, a constitutional government could have been worked by a Russian autocrat, and an assembly of men who inherited the memories and characters of the Poles. In fact the tsar and the diet soon quarrelled. The Poles would not abdicate the jury to please the tsar, nor conform as he wished them to do to the Russian law of divorce. Opposition soon arose, and as Alexander could not understand a freedom which differed from himself, and would not condescend to the use of corruption, by which the ancient Polish diets had been managed, he was driven to use force. The third session of the diet—13th of May to 13th of June 1825—was a mere formality. All publicity was suppressed, and one whole district was disfranchised because it persisted in electing candidates who were disapproved of at court. On this conclusion, the Poles were led to the failure of constitutional government. They would agitate by means of the so-called National Masonry, or National Patriotic Society as it was afterwards called, for the restoration of the full kingdom of Poland. The nobles who dominated the diet did nothing to remove the most crying evil of the country—the miserable state of the peasants, who had been freed from personal serfdom by Napoleon in 1807, but were being steadily driven from their holdings by the landlords. In spite of the general prosperity of the country due to peace, and the execution of public works mostly at the expense of Russia, the state of the agricultural class grew, if anything, worse.

Yet a breach occurred during the reign of Alexander, nor for five years did relations with Russia improve. The Decembrist movement in Russia had little or no echo in Poland. On the death of Zajonczek in 1826, the grand duke Constantine became Imperial lieutenant, and his administration, though erratic, was not unfavourable to displays of Polish nationality. The Polish army had no share in the Turkish War of 1829, largely, it is said, at the request of Constantine, who loved parades and thought that war was the ruin of soldiers. No attempt was made to profit by the embarrassments of the Russians in their war with Turkey. A plot to murder Nicholas at his coronation on the 24th of May 1829 was not carried out, and when he held the fourth diet on the 30th of May 1830, the Poles made an ostentatious show of their nationality which Nicholas was provoked to describe as possibly patriotic but certainly not civil. Nevertheless, he respected the settlement of 1815. In the meantime the Patriotic Society had divided into a White or Moderate party and a Red or Extreme party, which was subdivided into the Academics or Republicans and the Military or Terrorists. The latter were very busy and were supported by the Roman Catholic Church, which did little for the Russian Poles and nothing for the Austrian Poles, but was active in harassing the schismatical government of Russia.

The outbreak of the French Revolution in 1830 and the revolt of Belgium produced a great effect in Poland. The spread of a belief, partly justified by the language of Nicholas, that the Polish army would be used to coerce the Belgians, caused great irritation. At last, on the 20th of November 1830, a military revolt took place in Warsaw accompanied by the murder of the minister of war, Hauke, himself a Pole, and other loyal officers. The extraordinary weakness of the grand duke allowed the rising to gather strength. He evacuated Warsaw and finally left the country, dying at Vitebsk on the 27th of June 1831 (see Constantine Pavlovich). The war lasted from January till September 1831. The fact that the Poles possessed a well-drilled army of 23,800 foot, 6800 horse and 108 guns, which they were able to recruit to a total strength of 80,821 men with 138 guns, gave solidity to the rising. The Russians, who had endeavoured to overawe Europe by the report of their immense military power, had the utmost difficulty in putting 114,000 men into the field, yet in less than a year, under the leadership of Diebitsch, and then of Paskevich, they mastered the Poles. On the political and administrative side the struggle of the Poles was weakened by the faults which had been the ruin of their kingdom—factiousness, corruption, and inefficiency. The factiousness pressed to the point of anarchy, want of discipline, intrigue and violence, as shown by the abominable massacre which took place in Warsaw when the defeat of the army was known. The Poles had begun by protesting that they only wished to defend their rights against the tsar, but they soon proceeded to proclaim his deposition. Their appeal to the powers of Europe for protection was inevitably disregarded.

When the Congress Kingdom had been reconquered it was immediately reduced to the position of a Russian province. No remnant of Poland's separate political existence remained save the minute republic of Cracow. Unable to acquiesce sincerely in its insignificance and even unable to enforce its neutrality, Cracow was a centre of disturbance, and, after Russia, Prussia, and Austria had been occupied by Austria by the 6th of November 1848, as a consequence of the troubles, more agrarian than political, which convulsed Galicia. The administration established by Nicholas I. in Russian Poland was harsh and aimed avowedly at destroying the nationality, and even the language of Poland. The Polish universities of Warsaw and Vilna were suppressed, and the students compelled to go to St Petersburg and Kiev. Polish
recruits were distributed in Russian regiments, and the use of the Russian language was enforced as far as possible in the civil administration and in the law courts. The customs barrier between Lithuania and the former Congress Kingdom was removed, in the hope that the influence of Russia would spread more easily over Poland. A very hostile policy was adopted against the Roman Catholic Church. But though these measures cowed the Poles, they failed to achieve their main purpose. Polish national sentiment was not destroyed, but intensified. It even spread to Lithuania. The failure of Nicholas was in good part due to mistaken measures of what he hoped would be conciliation. He supported Polish students at Russian universities on condition that they then spent a number of years in the public service. It was the hope of the emperor that they would thus become united in interest with the Russians. But these Polish officials made use of their positions to aid their countrymen, and were grasping and corrupt with patriotic intentions. The Poles in Russia, whether at the universities or in the public service, formed an element which refused to assimilate with the Russians. In Poland itself the tsar left much of the current civil administration in the hands of the nobles, who, though nominally under their peasants was hardly diminished and was misused as of old. The Polish exiles who fled Europe after 1830 intrigued from abroad, and maintained a constant agitation. The stern government of Nicholas was, however, so effective that Poland remained quiescent during the Crimean War, in which many Polish soldiers fought in the Russian army. The Russian government felt safe enough to reduce the garrison of Poland largely. It was not till 1863, eight years after the death of the tsar, that the last attempt of the Poles to achieve independence by arms was made. The rising of 1863 may without injustice be said not to be due to the more humane policy of the tsar. Alexander II. Exiles were allowed to return to Poland, the Church was, though prostrated, the weight of the Russian administration was lightened, police rules as to passports were relaxed, and the Poles were allowed to form an agricultural society and to meet for a common purpose for the first time after many years. Poland in short shared in the new era of milder rule which began in Russia. In April 1856 Alexander II. was crowned king in the Roman Catholic cathedral of Warsaw, and addressed a flattering speech to his Polish subjects in French, for he too could not speak their language. His warning, "No nonsense, gentlemen" (Point de rôvères, Messieurs), was taken in very ill part, and it was perhaps naturally, but beyond question most unhappily, the truth that this was a professional man's inarticulateness. The Poles were urged to return to Poland and to produce a strong Russian reaction against his liberal policy. As the Poles could no longer dispose of an army, they were unable to assail Russia as openly as in 1830. They had recourse to the so-called "unarmed agitation," which was in effect a policy of constant provocation designed to bring on measures of repression to be represented to Europe as examples of Russian brutality. They began in 1856 at the funeral of the widow of General Sophinski, killed in 1830, and on the 27th of February 1861 they led to the so-called Warsaw massacres, when the troops fired on a crowd which refused to disperse. The history of the agitation which culminated in the disorderly riots is told by an advocate, secret agent, and in the end of shear terrorism by a secret society, which organized political assassination. The weakness of the Russian governor, General Gorchakov, in 1861 was a repetition of the feebleness of the Grand Duke Constantine in 1830. He allowed the Poles who organized the demonstration of the 27th of February to form a kind of provisional government. Alongside of such want of firmness as this were, however, to be found such measures of ill-timed repression as the order given in 1860 to the agricultural society not to discuss the question of the settlement of the peasants on the land. Concession and repression were employed alternately. The Poles, encouraged by the one and exasperated by the other, finally broke into the partial revolt of 1863-1864. It was a struggle of ill-armed partisans, who were never even numerous, against regular troops, and was marked by no real battle. The suppression of the rising was followed by a return to the hard methods of Nicholas. The Polish nobles, gentry and Church—the educated classes generally—were crushed. It must, however, be noted that one class of the measures taken to punish the old governing part of the population of Poland has been very favourable to the majority. The peasants were freed in Lithuania, and in Poland proper the nobles were done to death. Their position as a class has been benefited by their comparative prosperity, and by the incurable hatred they continue to feel for the classes which were once their oppressors. The national history of Poland closes with the rising of 1863.

(D. H.)

BIBLIOGRAPHY.—The best general history of Poland is still Józef Szujski's monumental History of Poland according to the latest investigations (4 vols., Pol., Lemberg, 1865-1886), a work which has all the authority of careful criticism and easy scholarship. It adopts, with Finkel's, the contemporary general history is August Sokolowski's Illustrated History of Poland (Pol., Vienna, 1896-1900). The best independent German history of Poland is, on the whole, Roepell (Richard) and Caro's (Jakob) Geschichte Polens (Hamburg and Göttinga, 1840-1880). The best and most entertaining book by an Englishman is G. H. Leeb's History of Poland from the 9th to the 20th century (2 vols., London, 1872, &c.), and the Historical Dissertations (Pol., 1874, &c.), all three collections published, under the most careful editorship, by the University of Cracow. To the same order belong Ludwik Finkel's Geschichte der polnischen Revolution von 1846 bis 1848 (Pol., Lemberg, 1866), and Schiemann's Die Geschichte Polens in den Jahren 1848-1863 (2 vols., Leipzig, 1892-1902), the result of which a French translation was published at Paris, in 1861. Proceeding to the earlier history of Poland, Lelewel's Poland in the Middle Ages (4 vols., Posen, 1848-1851) is still a standard work, though the greatest authority on Polish antiquities is probably Breslaus u. Seechef (Paris, 1844). The most successful of the present French writers on Polish history is an arbitrary thing. His Historical Sketches of the Eleventh Century (Pol., Cracow, 1904) is a very notable work. Karol Szajnocha's great monograph, justly described as "a pearl of historical literature," Jadwiga i Jagiello (4 vols., Lemberg, 1861), the result of the political theory of the period, and Kiszewski's The Reign of Stephen Batory (Pol., Cracow, 1887). Of the books relating to the Polish Vassas the most notable is Sza- jnoch's Two Years of our History, 1656-1658 (Lemberg, 1865), which deals exhaustively with the little-known but remarkable attempt (the last practical attempt of its kind) of Ladislaus IV. to abolish the incurably vicious Polish constitution. Another firstclass work, relating to the same period and dealing specifically with the part of Poland which then belonged to the Austrian empire, is Pierling's The War and Peace of the War of Chocim (Pol., Lemberg, 1893). For works relating to the Sobieskian, Saxon and Partitional periods of Polish history, the reader is referred to the bibliographical notices appended to the above work. We may perhaps add that the most important book is the book by Szymon Askenazy (Cracow, 1882-1886). The extremely valuable Prince Repnin in Poland by Aleksander Kruschar (Warsaw, 1890), one of the most thorough of contemporary and historical works relating to the Partitional period. Perhaps the best of all is Walery Jan Kalinka's great work in four volumes, Der vierjährige polnische Reichstag (Berlin, 1896-1898). Kalinka is, however, far too severe upon the patriots and much too indulgent towards
King Stanislaus. Albert Sorel's *La Question d'Orient au XVIII*: stelle (Paris, 1889) is lucid and accurate, but somewhat superficial. Wolfgang Michael's *Englands Stellung zur ersten Teilung Polens* (Hamburg, 1890) is of especial interest to Englishmen. Maryan Dubielewicz's *Polonier Polen* (Cracow, 1897) shows what self-sacrificing devotion the gentry and people supported Kościuszko's rising. For more complete bibliography see Jozef Korzeniowski's *Catalogus actuum et documentarum res gestas Poloniae illustrium* (Cracow, 1889). There is also a special bibliography of Polish *History* (Pol., Lemberg, 1891). For the period 1815-1863 see also N. A. Day, *The Russian Government in Poland* (London, 1867); Theodor Schiemann, *Russland unter Kaiser Nikolaus I.*, vol. 1 (Berlin, 1904).

**POLISH LITERATURE**

The Polish language belongs to the western branch of the Slavonic tongues, and exhibits the closest affinities with the Czech or Bohemian and Lusatian Wendish. Unlike the people of other Slavonic countries, the Poles are comparatively poor in popular and legendary poetry, but such compositions undoubtedly existed in early times, as may be seen by the writings of their chroniclers; thus Gallus translated into Latin a poem written on Boleslaus the Brave, and a few old Polish songs are included in Wojciecki's *Library of Ancient Writers*. A great deal of the early literature written in Poland is in Latin. The earliest specimen of the Polish language is the so-called Psalter of Queen Margaret, discovered in 1826 at the convent of St Florian. The date of the manuscript appears to be the middle of the 14th century, and probably in its present form it is only a copy of a much older text; there is also a translation of the 5th Psalm belonging to the 11th century.1 The ancient Polish hymn of war song, *Pisan Boga Rodosca*, was an address to the Virgin, sung by the Poles when about to fight. The oldest manuscript of this production is dated 1408, and is preserved at Cracow. By a legend which subsequently grew up the composition of it was assigned to St Adalbert. John Lodzia, bishop of Posen from 1335 to 1346, composed several religious songs in Latin.

The next monument of Polish literature to which we come is the Bible of Queen Sophia or Bible of Szczuczyn. It is imperfect, and only contains the early books, viz., the Pentateuch, Joshua, Ruth and Kings; there are, however, fragments of three others. It is said to have been written for Sophia, the fourth wife of Jagiello, about the year 1455. It has been edited with great care by Malecki. Five religious songs in Polish dating from the 15th century have been preserved; they are ascribed to Andrew Słopuchowski, prior of the monastery of the Holy Cross on Lysa Góra. There is also the fragment of a hymn in praise of Wycliffe. To these fragments may be added the prayer-book of a certain Wacław, a sermon on marriage, and some Polish glosses. These are all the existing memorials of the Polish language before the 16th century.

Perhaps a few words should be said concerning the writers in Latin. Martin Gallus lived in Poland between 1110 and 1135. From his name he has been supposed by some to have been a Frenchman or Walloon, and we must remember that Poland swarmed at that time with foreign ecclesiastics. Lelewel, the Polish historian, considers that it is merely a translation into Latin of some such name as *Kura*, signifying "a fowl." Others suppose him to have been an Italian, or a monk from the convent of St Gall in Switzerland. He has plenty of legends to tell us, and writes altogether in a poetical style, so that his prose seems to fall into rhythm unconsciously. His quotations from the classics, Sallust, Lucan and others, show the extent of his reading. Gallus was followed by Matthew Chelewa and Vincent Kadliuk, two bishops of Cracow, and Boguslaw of Boguchwal, bishop of Lutsk. The use of Kadliuk's is more ornate in diction than that of Boguslaw, and for a long time enjoyed great popularity. He was born in 1160, educated at the university of Paris, and died in Poland in 1223 as a Cisterian monk. His Latin, like that of Gallus, is far from classical, but he writes with spirit and throws a good deal of light upon

1. The Psalter is called after Margaret, the first wife of King Louis, who died in 1349, by a mere conjecture. Caro thinks it more probable that the book belonged to Mary, his daughter.

the events of his time. The education of the country was wholly in the hands of the ecclesiastics, many of whom were foreigners. We may thus explain the great prevalence of the Latin language. Such a system would of course stifle all national outgrowth, and accordingly we have among the Poles none of those early monuments of the language which other countries boast. For instance, there are no bilint or legendary poems, such as are found among the Russians, although many passages in the ancient chroniclers from their poetical composition seem to be borrowed from old songs or legends, and the first verses of some of these compositions have been preserved. Mention may here be made of other chroniclers such as Martin the Pole (Polonus), who died in 1279 or 1280, and Jan of Czarnecki, who died in 1386; the latter was the historian and panegyrist of the Great Polish monarch of the reign of Casimir III. (1333-1370) must be associated the statutes of Wisława. Jadwiga, the wife of Jagiello, was mainly instrumental in creating the university of Cracow, which received a charter in 1364, but did not come into effective existence till its reconstitution in 1400. In this institution for many years all the great men of Poland were trained—among others Gregory of Sanok, Dlugosz and Copernicus. Casimir the Great may be said to have laid the foundation of this university. Having obtained the consent of Pope Urban V., he established at Cracow a *studium generale* on the model of the university of Bologna. It consisted of three faculties—Roman law, medicine and philosophy. But the aristocratic youth still preferred frequenting the universities of Prague, Padua, Paris, and accordingly the newly founded *studium* languished. Jadwiga, however, obtained from Boniface IX. permission to create a new chair, that of theology; and the university of Cracow was remodelled, having been reorganized on the same basis as that of Paris. Another university was founded later at Vilna by Batory, and one at Zamość by the chancellor Zamowski. There were also good schools in various places, such as the Collegium Lubranzksiego of Posen and the school of St Mary at Cracow. In the year 1479 a press was set up in the latter city, where Günther Zainer printed the first book. The first press from which books in the Polish language appeared was that of Hieronymus Wietor, a Silesian, who commenced publishing in 1515. A few fragments printed in Polish had appeared before this, as the Lord's Prayer in the statutes of the bishops of Breslau in 1475, the story of Pope Urban in Latin, German and Polish in 1505, &c.; but the first complete work in the Polish language appeared from the press of this printer at Cracow in 1521, under the title, *Speeches of the Wise King Solomon*. The translation was executed by Jan Koszycki, as the printer informs us in the preface, and the work is dedicated to Anna Wojnicka, the wife of a castellan. In 1522, a Polish translation of Ecclesiastes appeared from that press, and before the conclusion of that year *The Life of Christ*, with woodcuts, translated into Polish by Baltasar Opec. Many other presses were soon established. Printers of repute at Cracow, during the sixteenth and beginning of the 17th century, were Sybeneicher and Piotrowski.

Little as yet had been produced in Polish, as the chroniclers still adhered to Latin; and here mention must be made of Jan Długosz, who called himself Longinus. He was bishop of Lemberg, the capital of Galicia, and has left us a very valuable history which has merits of style and shows considerable research. So anxious was Długosz to make his work as perfect as he could that he learned Russian so as to be able to read the *Chronicle of Nestor*. The best part of his book is that which treats of the period between 1386 and 1480. About 1500 was written an interesting little work entitled "Memoirs of a Polish Janissary" (*Pamietniki tanczara polaka*). Although written in the Polish language, it was probably, the production of a Serb, Michael Constantovich of Ostrovitsa. He was taken prisoner by the Turks in 1425 and served ten years among the Janissaries, after which he escaped into Hungary. About this time also flourished Nicholas Copernicus, a native of Thorn, one of the few Poles who have made themselves known beyond the limits of their country.

The Poles call the period between 1548 and 1606 their golden
age. Poland was the great land of eastern Europe, and owing to the universal toleration encouraged by the government, Protestantism was widely spread. Many of the chief nobility were Calvinists, and the Socini came to reside in the country. All this, however, was to pass away under the great Jesuit reaction. At Rakow in Poland was published the catechism of the Socini, a document that was reprinted and had many editions in Poland in 1564, and soon succeeded in getting the schools of the country into their hands. Besides extirpating the various sects of Protestants, they also busied themselves with destroying the Greek Church in Lithuania. Latin poetry was cultivated with great success by Clement Janicki (1516-1543), but the earliest poet of repute who wrote in Polish is Rej of Naglowice (1503-1560). After a somewhat idle youth he betook himself to poetry. He was a Protestant, and among other religious works translated the Psalms. His best work was *Zwierciadło albo żywot poszczańegó chłopika* (The Mirror or Life of an Honourable Man)—a somewhat tedious didactic piece. He was also the author of a kind of play—a mystery we may term it, and productions of this sort seem to have been common in Poland from a very early time—entitled *Life of Joseph in Egypt*. This piece is interesting merely from an antiquarian point of view; there is but little poetry in it. It teems with anachronisms; thus we have mention of the mass and organs, and also of a German servant. Lucas Goinicki (1527-1603) wrote many historical works, and *Dworzanie polski*, an imitation of the Cortegiano of Castiglione.

Jan Kochanowski (1530-1584), called the prince of Polish poets, came of a poetical family, having a brother, a cousin, and a nephew who all enriched the literature of their country with some productions. Kochanowski studied for some time at the university of Padua, and also resided in Paris, where he made the acquaintance of Ronsard. Returning to Poland, he became in 1564 secretary to Sigismond Augustus. He has left *The Game of Chess*, an imitation of *Vida*, and *Properce albo hold; pruski* (The Standard or Investiture of Prussia), where he describes the fealty done by Albert of Brandenburg to Sigismond Augustus. He also executed a translation of the Psalms. He wrote a play—a piece of one act, with twelve scenes—*The Despatch of the Greek Ambassadors*. It is written in rhymeless five-foot iambics, and is altogether a product of the Renaissance, not of the productions of the Gothic period. The rhyme is employed in the choruses only. It was acted on the marriage of the chancellor Jan Zamoyski with Christine Radziwiłł, in the presence of King Stephen and his wife, at Ujazdowo near Warsaw in 1578. The poet's most popular work, however, is his *Troyen* or *Lamentations*, written on the death of his daughter Ursula. These beautiful elegies have been justly praised by Mickiewicz; they are enough to raise Kochanowski far above the level of a merely artificial poet. Besides poems in Polish, he also wrote some in Latin. It will be observed that we get this double-sided authorship in many Polish writers. They composed for an exclusive and learned circle, certainly not for the Jew, the German trader of the town, or an illiterate peasant. It may be said with truth of Kochanowski that, although the form of his poetry is classical and imitated from classical writers, the matter is Polish, and there is much national feeling in what he has left us. Mention must also be made of his epigrams, which he styled *Trifles* (Frassé); they are full of spirit and genius. Stanisław Grochowski (1554-1612) was a priest; but his poetry is of little merit, although he was celebrated in his time as a writer of panegyrics. His satire *Babie Kolo* (The Women's Circle) gave offence on account of its personalities. A priest of the Catholic church in the time of Sigismund III. was Casimir Szymonowicz, whose *Wlodze Wlosznogome* and *Farewell to his Native Country* deserves mention. Szymonowicz, who died young in 1581, deserve notice as having introduced the sonnet to the Poles. This species of poetry was afterward to be carried to great perfection by Mickiewicz and Gaszynski.

Szymonowicz (1554-1624) was a writer of good pastorals. Although they are imitated from classical writers, he has introduced many scenes of national life, which he describes with much vigour. Among the best are "The Lovers," *Rej's Adventures on the Seven Sacraments* (Kolac), Mickiewicz is very loud in his praise, and considers him one of the best followers of Theocritus. The condition, however, of the Polish peasants was too miserable to admit of their being easily made subjects for bucolic poetry. There is an artificial air about the idylls of Szymonowicz which makes one feel too keenly that they are productions of the Renaissance; one of their best features is the humane spirit towards the miserable peasantry which they everywhere display. Another excellent writer of pastorals was Zimorowicz, a native of Lemberg, who died at the early age of twenty-five. Some of his short lyrics are very elegant, and remind us of Herrick and Carew—e. g. that beginning "*Ukochana Lancelot! Ciebie nie pozostaw o tolo.*" Another writer of pastorals, but not of equal merit, was Jan Gawinski, a native of Cracow. Some good Latin poetry was written by Casimir Sarbiwski, better known in the west of Europe as Sarbiwius (d. 1640). He was considered to have approached Horace more nearly than any other modern poet, and a gold medal was given him by Pope Urban VIII. Martin Kroker (1512-1589) wrote a history of Poland in thirty books, and another volume, giving a description of the country and its institutions—both in Latin. The history is written in an easy style and is a work of great merit. A poet of some importance was Sebastian Fabian Klonowicz (1545-1602), who latinized his name into Acernus, Klan being the Polish for maple, and wrote in both Latin and Polish, and through his inclination to reform drew down on himself the anger of the clergy. Sometimes he is descriptive, as in his Polish poem entitled *Flis* ("The Boatman"), in which he gives a detailed account of the scenery on the banks of the Vistula. There is some poetry in this composition, but it alternates with very prosaic details. In another piece, *Ryzaolonia*, in Latin, he describes the beauties of Galicia. Occasionally he is didactic, as in Worek Judassaw (The Bag of Judas) and *Vittoria deorum*, where, under the allegory of the gods of Olympus, he represents the struggles of parties in Poland, not so much the Seven Sacraments, and especially his sermons preached before the diet, in which he lashed the Poles for their want of patriotism and prophesied the downfall of the country. Mecherzynski, in his "History of Eloquence in Poland" (Historia wymowy w Polsce), especially praises his two funeral sermons on the burial of Anna Jagielonka, widow of Stephen Batory, and Anna of Austria, first wife of Sigismund III. Besides the Latin histories of Wapowski and Gwagnin (Guagnini, of Italian origin), we have the first historical work in Polish by Martin Bielski, a Protestant, viz. Kronika polska, which was afterwards continued by his son. The author was born in 1495 on his father's estate, Biela, and was educated like so many other of his fellow-countrymen at the university of Cracow. He lived to the age of eighty; but, however great were the merits of his Chronicle, it was long considered a suspicious book on account of the leanings of the author to Calvinism. After his death his work was continued by

1 His collected works were printed in 1584; there were many times reprinted, the best edition being that of Warsaw (4 vols., 1884). His life was written by Przyborowski (Posen, 1857).
his son Joachim (1540–1596). There is also a Chronicle by Bartholomew Papprocki. In 1582 was also published the Chronicle of Stryjekowski, full of curious learning, and still of great use to the student of history. Five years later appeared the Annales Poloniae of Sarnicki. The last three works are in Latin.

A few words may be said here about the spread of Protestantism in Poland, which is so intimately mixed up with the development of the national language. The doctrines of Hus had entered the country in very early times, and we find Polish recensions of Bohemian hymns; even the hymn to the Virgin previously mentioned is supposed to have a Czech background. These bishops were quite unprepared to conform to the doctrines of the Roman church. Thus we find that Bishop Andrew of Braun seized five Hussite priests and caused them to be burnt in the market of Pozen in 1430. A hundred years afterwards a certain Katharina Malcher, on account of her Utraquist opinions, was condemned by Gamrat, the bishop of Cracow, to be burnt, which sentence was accordingly carried out in the ragmarket at Cracow. As early as 1530 Lutheran hymns were sung in the Polish language at Thorn. In Königsberg, John Seklucyan, a personal friend of Luther, published a collection of Christian Songs. He was born in Great Poland, and was at first a Roman Catholic priest in Pozen, but afterwards embraced the Protestant faith and was invited by Duke Albert as a preacher to Königsberg, where he died in 1578. He executed the first translation of the New Testament in 1551. Four years afterwards appeared a complete Polish Bible published by Scharffenberg at Cracow. In 1553 appeared at Brzesk the Protestant translation of the whole Bible made by a committee of learned men and divines, and published at the expense of Nicholas Radziwiłł, a very rich Polish magnate who had embraced the Protestant doctrines. This book is now of great rarity because his son Christopher, having been induced to become a Roman Catholic by the Jesuit Skarga, caused all copies of his father’s Bible which he could find to be burnt. One, however, is to be seen in the Bodleian Library, and another in the library of Christ Church at Oxford.

A Socinian Bible was issued by Simon Budny in 1570 at Nieszowiez, as he professed to find many faults in the version issued under the patronage of Radziwiłł; in 1597 appeared the Roman Catholic version of the Jesuit Wujek; and in 1632 the so-called Danzig Bible, which is in use among Protestants and is still the most frequently reprinted.

Up to this time Polish literature, although frequently rhetorical and too much tainted with classical influences, had still exhibited signs of genius. But now, owing to the sudden influx of Jesuits, and to the suppression of the macaronic period supervised, which lasted from 1666 to 1764, and was a time of great degradation for the language and literature. The former was now mixed with Latin and classical expressions; much of the literature consists of fulsome panegyric, verses written on the marriages and funerals of nobles, with conceits and fantastic ideas, devoid of all art, drawn from their coats of arms. The poets of this period are, as may be imagined, in most cases mere rhymerysts; there are, however, a few whose names are worth recapitulating, such as Wacaw Potocki (c. 1622–c. 1660), now known to have been the author of the Wójna Chocimska, or "War of Khotin," the same campaign which afterwards formed the subject of the epic of Krasluk. At first the author was supposed to have been Andrew Lipski, but the real poet was traced by the historian Szajnocha. The epic, which remained in manuscript till 1839, is a genuine representation of Polish life; no picture so faithful appeared till the Pan Tadeusz of Mickiewicz. Moreover, Potocki had the good taste to avoid the macaronic style so much in vogue; his language is pure and vigorous. He does not hesitate to introduce occasionally satirical remarks on the luxury of the times, which he compares, to its disadvantage, with the simplicity of the old Polish life. There is also another poem attributed to Potocki called the New Mercury. In one passage he censures King Michael for ceding Podolia to the Turks. Samuel Twardowski (1600–1660) was the most prolific poet of the period of the Vasas. His most important poem is Władysława IV., King of Poland, in which he sings in a very bombastic strain the various expeditions of the Polish monarch. A bitter satirist appeared in the person of Christopher Opalski (1600–1656). His works were published under the title of Juvenalis redivivus; and, although boasting but little poetical merit, give us very curious pictures of the times. Hieronymus Vespasian Kolczowski (1635–1696) was a soldier-poet, who went through the campaigns against the Swedes and Cosacks; he has left several books of lyrics full of vivacity, a Christian epic of the Polish psalmody. Another poet was Andrew Moraczewski (born about 1620; died about the commencement of the 18th century), an astute courtier, who was finance minister (podchorąży) under John Casimir, and was a devoted adherent of the French party at court, in consequence of which, in the reign of Sobieski, he was compelled to leave his native country and settle in France. His poems are elegant and free from the conceits and pedantry of the earlier writers. In fact, he introduced into Poland the easy French manner of such writers as Voiture. He translated the Cid of Corneille, and wrote a poem on the subject of Psyche, based upon the well-known Greek myth. Elegy in the macaronic period made a bolder effort; there it had been written in the Polish language in the golden age; it was now again to take a Latin form, as in the Chronica Gestarum in Europa singulinarum of the ecclesiastic Paul Piasecki (1580–1649), who is an authority for the reigns of Sigismund III. and Władysław IV., and Rudwski, who describes events from the accession of John Casimir to the peace of Oliva (1568–1660); and as valuable materials for history may be mentioned the five huge volumes of Andrew Chrysostom Zaluski (1711), bishop of Warma. This work is entitled Epistolae historico-familiares. It would be impossible to recapitulate here the great quantity of material in the shape of memoirs which has come down, but it will suffice to mention the Memoirs of James Sobieski, the father of the celebrated John, given to Orchoswic, the tutor of his sons. This has been twice printed in comparatively recent times (Instrukcja Jakoba Sobieskiego kosztelana Krakowskiego dana panu Orchoswiemu se strony synowy, Vilna, 1840). The old gentleman in his aristocratic imperiousness frequently reminds us of the amusing directions given by Sir John Wynne to his chaplain, quoted in Pennant’s Tour in Wales.

A History of the Lithuanians in Latin was published by the Jesuit Koalowicz; the first volume appeared at Danzig in 1650. A valuable work on the condition of Poland was written by Stanislaus Leszczynski, who was twice chosen king, entitled Glos zwołany wobec ubóstwiejącej (A Free Voice Guaranteeing Freedom), where he tells the Poles some homely and perhaps disagreeable truths illustrating the maxim Summa libertas etiam perire volentibus.

A notable man was Joseph Andrew Zaluski, bishop of Kiev, a Pole who had become thoroughly Frenchified—so much so, that he preached in French to the fashionable congregations of Warsaw. He collected a splendid library of about 300,000 volumes and 15,000 manuscripts, which he bequeathed to the Polish nation; but it was afterwards carried off to St. Petersburg, where it formed the foundation of the imperial public library. According to Nitschmann in his Geschichte der polnischen
Litteratur—a work which has been of service in the preparation of this article—the books were transported to Russia very care-
lessly, and many of them injured by the way. It was especially
rich in works relating to Polish history. Konarski edited in six
volumes a valuable work entitled Volumina Jegum, containing
a complete collection of Polish laws from the time of the statute
of Wilsica. He did much good also in founding throughout
the country schools for the education of the sons of the upper
classes, but as yet nothing had been done for popular educa-
tion properly so-called. About the close of this period we have
some valuable writers on Polish history, which now began to
be studied critically, such as Hartknoch in his All- und Neues
Preussen (1684), a work in which are preserved interesting
specimens of the Polish language, and Lengnich (1680-
1774), author of the valuable Jus publicum regni Polonicus,
which appeared in 1742.

We now come to the reign of the last Polish king, Stan-
islaus Poniatowski, and the few quiet years before the final
division of the country, during which the French taste was all-
powerful. This is the second great period of the development
of Polish literature, which has known nothing of medieval
romanticism. The literature of the first or Renaissance period
gives us some good poets, who although occasionally imitators
are not without national feeling, and a goodly array of chron-
iclers, most of whom made use of Latin. In the second or French
period we get verse-makers rather than poets, who long to
Frenchmen, and sigh over the barbarism of their country;
but the study of history in a critical spirit is beginning under
the influence of Naruszewicz, Albertran and others. In
the third period, that of modern romanticism, we get true na-	ionalismin, but it is too often the literature of exile and despair.
Here may be mentioned, although living a little time before
the reign of Stanislaus, a Polish poetess, Elizabeth Druzbacka
(1605-1676), whose writings show a feeling for nature at a time
when verse-making of the most artificial type was prevalent
throughout the country. The portrait prefixed to the Leipzig
collection of her works is a striking one, representing a hand-
some, intellectual-looking woman, dressed in the garb of some
religious order. Her Life of David in verse appears tedious,
but many of the descriptions in the Seasons are elegant.
Unfortunately she introduces latinitism, so that her Polish is
by no means pure. A national theatre was founded at Warsaw
in 1705 under the influence of the court, but it was not till
long afterwards that anything really national connected with
the drama appeared in Poland. Thomas Kajetan Węgrzyn
(1755-1787), who was chamberlain to the king, enjoyed a con-
siderable reputation among his countrymen for his satirical
writing. He was a kind of Polish Churchill, and his Eng-
lish parallel died young. His life also appears to have been
as irregular as Churchill's. In consequence of an attack on
the empress of Russia, he was compelled to leave Poland, and
accordingly made a tour in Italy, France, America, and Eng-
land, dying at Marseilles at the early age of thirty-three.
His poetry shows the influence of the French taste, then prevalent
throughout Europe. In times of great national disasters he
deserves to be remembered as a true patriot; but the spirit
of his poetry is altogether unwholesome. It is the wailing cry
of a moribund nation. The great laureate of the court of
Stanislaus was Trembecki (1727-1812), whose sympathies
were too much with the Russian invaders of his country. He
was little more than a fluent poetaster, and is now almost for-
gotten. One of his most celebrated pieces was Zofiiwka,
written on the country seat of Felix Potocki, a Polish magnate,
for this was the age of descriptive as well as didactic poetry.
Perhaps the English gave the hint in such productions as
"Cooper's Hill." The old age of Trembecki appears to have been
ignoble and neglected; he had indeed "fallen upon evil days
and evil tongues"; and when he died at an advanced age all
the gay courtiers of whom he had been the parasite were either
dead or had submitted to the Muscovite yoke. He comes before
us as a belated epicurean, whose airy trifles cannot be warbled
in an atmosphere surcharged with tempests and gunpowder.

The end of the 18th century was not the period for a court
poet in Poland.

The most conspicuous poet, however, of the time was Ignatius
Krasicki, bishop of Warmia (1735-1801). He was the friend of
Frederick the Great and a prominent member of the
king's literary club at Sans Souci. Krasicki wrote an epic on the war of Khotin—the same as had furnished
the subject of the poem of Potocki, of which Krasicki in all
probability had never heard, and also that of the Dalmatian
Gundulich. Krasicki's poem is at best but a dull affair, in
fact a pale copy of a poor original, the Henriade of Voltaire.
His mock heroes are, to say the least, amusing, and among these
may be mentioned Myssel; where he describes how King Popiel,
with his poems, "According to the legend, was written by
Monemachius" is in six cantos, and is a satire upon the monks.
The bishop was also the writer of some pretty good comedies.
In fact most styles of composition were attempted by him—of
course satires and fables among the number. He presents him-
self to us much more like a transplanted French abbe than a
Pole. In the year 1801 he travelled to Berlin, and died there
after a short illness. Among his other works the bishop pub-
lished in 1781-1782, in two volumes, a kind of encyclopaedia
of belles lettres entitled Zdob Wiedomosci. His estimates of
various great poets are not very accurate. Of course he finds
Shakespeare "a very incorrect author, although he is willing
to allow him considerable praise for his vigour." F. Narus-
wicz (1783-1861) published some excellent Fables (1800) in
the manner of Krasicki, and in 1851 an epic entitled My Grandfather's
Farm. Adam Naruszewicz (1733-1796) was bishop and poet.
The existence of so many ecclesiastical writers was a natural
feature in Polish literature; they formed the only really cul-
tured class in the community, which consisted besides of a
haughty ignorant nobility living among their serfs, and (at a
vast distance) those serfs themselves, in a brutalized condition.

Burghers there were, properly speaking, none, for most of the
citizens in the large towns were foreigners governed by the
Jewish rabbis. Naruszewicz has not the happy vivacity
of Krasicki; he attempts all kinds of poetry, especially satire
and fable. He is at best but a mediocre poet; but he has suc-
cceeded better as a historian, and especially to be praised is his
"History of the Polish Nation" (Historia narodu polskiego),
which, however, he was not able to carry further than the year
1836. He also wrote an account of the Polish general Chod-
kiewicz, and translated Tacitus and Horace. Interesting
memoirs have been published by Kilinski, a Warsaw shoemaker,
and Kosmin, state referendary, who lived about this time
and saw much of the War of Independence and other political
affairs. Among the smaller poets of this period may be men-
tioned Karpiński (1741-1828), a writer of sentimental elegies
in the style then so very much in fashion, and Franciszek
Dyonizy Kniaźnin (1750-1807), who nourished his muse on
classical themes and wrote several plays. He was the court
poet of Prince Adam Czartoryski at Pulawy, and furnished
odes in commemoration of all the important events which
occurred in the household. He lost his reason on the down-
fall of Poland, and died after eleven years' insanity in 1807.
Julian Ursyn Niemcewicz (1758-1841) was one of the most
popular of Polish poets at the commencement of the present
century (see NIEIMCEWICZ). His most popular work is the
"Collection of Historical Songs" (Spiewy historyczne), where
he treats of the chief heroes of Polish history. Besides these
he wrote one or two good plays, and a novel in letters, on
the story of two Jewish lovers. John Paul Woroniecki (1757-
1820), born in Volhynia, and at the close of his life bishop of
Warsaw and primate of Poland, was a very eloquent divinity, and
has been called the modern Skarga. A valuable worker in the
field of Slavonic philology was Linde, the author of an excellent
Polish dictionary in six volumes. For a long time the culti-
vation of Polish philology was in a low state, owing to the preva-
ence of Latin in the 17th century and French in the 18th.
No Polish grammar worthy of the name appeared till that of
Kopczyński at the close of the 18th century, but the reproach
People of Pinsk, and collections have even appeared of those of the Kashoubes, a remnant of the Poles living near Danzig. Mickiewicz had had a predecessor, but of far less talent, Casimir Pułaski (1722–1779), who was also born in the Polish legion, and has left a small collection of poems, the most important being the idyl Wiesław, in which the manners of the peasants of the district of Cracow are faithfully portrayed. The second great poet of the romantic school who appeared in Poland after Mickiewicz was Julius Słowacki (1809–1849), born at Krzemieniec. In 1831 he left his native country and chose Paris as his residence, where he died. His writings are full of the fire of youth, and show great beauty and elegance of expression. We can trace in them the influence of Byron and Victor Hugo. He is justly considered one of the greatest of the modern poets of Poland. His most celebrated pieces are Hugo; Mnich ("The Monk"); Lambro, a Greek comedy, quite in the style of Byron; Anhelli, a very Dantesque poem expressing under the form of an allegory the sufferings of Poland; Krol duch ("The Spirit King"), another mysterious and allegorical poem; Wadaw, on the same subject as the Marya of Malczewski, to be afterwards noticed; Beniowski, a long poem in ottava rima on this strange adventurer, something in the style of Byron's humorous poems; Kordyan, of the same school as the English poet's Manfred; Lilja Wenda, a poem dealing with the early period of Slavonic history. The life of Słowacki has been published by Professor Anton Malczek in two volumes. Mickiewicz and Słowacki were both more or less mystics, but even more we may assign this characteristic to Sigismund Krasinski, who was born in 1812 at Paris, and died there in 1859. It would be impossible to analyse here his extraordinary poem Nieboska komedja ("The Undivine Comedy"), Irydion, and others. In them Poland, veiled under different allegories, is always the central figure. They are powerful poems written with great vigour of language, but enveloped in clouds of mysticism. The life of Krasinski was embittered by the fact that he was the son of General Vincent Krasinski, who had become unpopular among the Poles by his adherence to the Russian government; the son wrote anonymously in consequence, and was therefore called "The Unknown Poet." Among his latest productions are his "Psalms of the Future" (Psalmy przyszłosć), which were attacked by the democratic party as a defence of aristocratic views which had already ruined Poland. His friend Słowacki answered them in some taunting verses, and this led to a quarrel between the poets. One of the most striking pieces of Krasinski has the title "Resurrecturis." The sorrows of his country and his own physical sufferings have communicated a melancholy tone to the writings of Krasinski, which read like a dirge, or as if the poet stood always by an open grave—and the grave is that of Poland. He must be considered as, next to Mickiewicz, the greatest poet of the country. Other poets of the romantic school of considerable merit were Gorecki, Witwicki, Odyniec, and Gaszynski; the last-named wrote many exquisite sonnets, which ought alone to embellish his name. Witwicki (1800–1847) was born a professor at Krzemieniec. He was a writer of ballads and poems dealing with rural life, which enjoyed great popularity among his countrymen and had the good fortune to be set to music by Chopin. The works of Lelewel have separate mention (see LELEWEL); but here may be specified the labours of Narbutt, Dzieje starej ery odrodzenia ilewskiego ("Early History of the Lithuanian People"), published at Vilna in nine volumes, and the valuable Monumenta Poloniae historice, edited at Lemberg by Bielowski, of which several volumes have appeared, containing reprints of most of the Chronicle and other documents. A further development of romanticism was the so-called Ukraine school of poets, such as Malczewski, Goszczynski, and Zaleski. Anton Malczewski (1793–1826) wrote one poem, Marya, a Ukrainian tale which passed unnoticed at the time of its publication, but after its author's death became very popular. Malczewski was one of Napoleon's officers; he led a wandering life and was intimated with Byron at Venice; he is said to have suggested to
the latter the story of Mazeppa. *Marya* is a narrative in verse in the manner of Byron. It is written with much feeling and elegance, and in a most harmonious metre. The chief poem is Severin Goszczyński (1802-1836) is *Zamek Kanionów* ("The Tower of Kanionów"). The most interesting poem of Bogdan Zaleski is his *Spirits of the Past* ("Duchy dawnych") (1822), which attracted a great deal of attention at the time of its appearance. Schmitt got mixed up with some of the political questions of the day — he was a native of Galicia and therefore a subject of the Austrian administration, and whatever disturbances were produced at that period was commuted in imprisonment in Spielberg, whence he was released by the revolution of 1848. In 1863 he took part in the Polish rebellion, and was compelled to fly to Paris, where he only returned 87th. His most famous work is *The Earliest Times to the year 1763 (1854), History of Poland in the 18th and 19th Centuries (1866), and History of Poland from the time of the Partitions (1868), which he carried down to the year 1852. In opposition to the opinion of many historians, his contemporaries, that Poland fell through the nobility and the diets, Schmitt held (as did Lewelek) that the country was brought to ruin by the kings, who comprehensively interfered with the life of the nation. After the pernicious influence of the Jesuits, Adalbert Kętrzyński, who succeeded Bielow in 1877 in his post of director of the Ossoliński Institute at Lemberg, is the author of some valuable monographs on Polish History. Although he has been a member of the Polish Academy of Letters, Bielow, who has treated of the period of the Jagellons; and Szaraniewicz, professor at the University of Lemberg, has written on the early history of Galicia. Thaddeus Wojciechowski has published a clever work on Poland and its literature, which is a valuable and interesting history. He has also written a monograph on the universal history of Lemberg, has published many historical essays of considerable value, and separate works by him have appeared in the *Gazeta*, Polish Swedish, Danish and Spanish languages. The "Sketch of the History of Poland" by Michael Bobrzyński, born in 1840 in Cracow (professor of Polish and German law), is a very spirited work, and has given rise to a great deal of discussion. It has been translated into many languages, and has spread the views of its schools to those of the school of Lelewel. Vincent Zakrzewski, professor of history at Cracow, has written some works which have attracted considerable attention, such as *On the Origin and Growth of Jewish Literature* (1873). Most of them are in Polish, and one, which he describes the condition of the country during the period between that king's departure from Poland and the election of Stephen Batory. Smolka has published a history entitled *Mieszko the Elder and his Age*. Władysław Wislocki has prepared a catalogue of manuscripts in the Jagiellon Library at Cracow. Dr Joseph Casimir Płański, besides editing the Biblioteka warszawska, a very valuable literary journal which stands at the head of all works of the kind in Poland, has also published a pamphlet on the *liberum veto*, which puts that institution in a new light. Felix Jezierski, the previous editor of the above-mentioned journal, has published a translation of parts of Homer, and is also the author of an excellent version of the *Iliad*. The history of Polish literature has not been neglected. We first have the early history of Felix Bentkowski (1781-1852), followed by that of Michael Wasiński (1794-1856), which, however, only extends to the 17th century, and is at best but a quarry of materials for subsequent writers, the style being very heavy. A "History of Eloquence" ("Historya wernywo to Polsce") was published by Władysław Wislocki, but this work, however, only extends to the 17th century, and is at best but a quarry of materials for subsequent writers, the style being very heavy. A History of Eloquence" ("Historya wernywo to Polsce") was published by Władysław Wislocki, but this work, however, only extends to the 17th century, and is at best but a quarry of materials for subsequent writers, the style being very heavy. Felix Jezierski, the previous editor of the above-mentioned journal, has published a translation of parts of Homer, and is also the author of an excellent version of the *Iliad*. The history of Polish literature has not been neglected. We first have the early history of Felix Bentkowski (1781-1852), followed by that of Michael Wasiński (1794-1856), which, however, only extends to the 17th century, and is at best but a quarry of materials for subsequent writers, the style being very heavy. A History of Eloquence" ("Historya wernywo to Polsce") was published by Władysław Wislocki, but this work, however, only extends to the 17th century, and is at best but a quarry of materials for subsequent writers, the style being very heavy.
deserve mention. August Cieszkowski has written on philosophical and economic subjects. Moritz Straszewski, professor of philosophy at the University of Cracow, has also published some remarkable works.

Mention has already been made of the poetess Elizabeth Drzbacka. Female writers are not very common among Slavonic nations. Perhaps the most celebrated Polish authoress was Klementina Hofmann, whose melody, born in Warsaw in 1798. She married Karl Borromaus Hofmann, and accompanied her husband, in 1831, to Passy near Paris, where she died in 1845. Her fame rests upon the popular poetry of Poland. Of the poetesses of later times there are many of some eminence. Zofia Nowakowska (1854-1905), Maria Stanisławska, translator of Scott’s ‘Lord of the Isles’, and Jadwiga Łuszczewska may be mentioned.

Among remarkable merit is Adam Asnyk (1838-1897). In his poetry we seem to trace the steps between romanticism and the modern realistic school, such as we see in the Russian poet Nekrasov. In some of the flights of his muse he reminds us of Słowacki, in the melody of his verse of Śoleński. Besides showing talent as a poet, he has also written some good plays, as ‘The Jew’ (Zid), ‘Campa di Rienzi’, and ‘Kieżuty’. Other poets worthy of mention are Zagórski, Czebrowski, and Maria Konopnicka, who has published two volumes of poems that have been very favourably noticed. Mention must also be made of Balucki (1837-1901), author of novels and comedies, and Narzynski (1839-1872), who was educated in France, but spent part of his short life in Cracow, author of some popular tales.

The four centres of Polish literature, which, in spite of the attempts which have been made to denationalize the country, is fading, are Cracow, Poznań, Lemberg, and Warsaw. A cheap edition of the leading Polish classics, well adapted for dissemination among the people, has been published, under the title of Biblioteka Polska, at Cracow. Not only are the professors of Cracow University some of the most eminent living Polish, but it has been chosen as a place of residence by many Polish literary men. The academy of sciences, founded in 1872, celebrated the bicentenary of the raising of the siege of Vienna by Sobieski by publishing the valuable Acta Academiae Cracoviensis, regis Poloniae. Some good Polish works have been issued at Poznań. At Lemberg, the capital of Austrian Galicia, there is an active Polish press. Here appeared the Monumenta Polonicæ Historica of Bielowski, previously mentioned; but Polish in this province has to struggle with the Red-Russian or Ruthenian language or dialect which for all practical purposes is the same as the southern or Little Russian. At Warsaw, since the last insurrection, the Press has become entirely national, and its productions are published in Russian; but Polish works of merit still issue from the press—among others the leading Polish literary journal, Biblioteka warszawska.

Perhaps the most modern popular writer in Poland is Eliza Orzeszkowa, of whose novels a complete ‘Jubilee’ edition has appeared. Many of her tales—as, for instance, Argonauci (‘The Argonauts’)—have appeared in the Tygodnik, or weekly illustrated journal of Warsaw. Meta Ekonomiczna has enjoyed great popularity.

The object of this tale is to bridge over the gulf between the Jew and Christian in Poland. Adolf Dyganski writes clever village tales of the ‘kail yard’ school, as it has been sometimes termed in England. Gerhard Bielinski has written Twelve Years in the Land of the Jokuts, a contribution to the literature of folk-lore and ethnology such as only a real artist could produce. Among the last writers, mention may be made of Wyspianski, Kisielewski, Reynmont, and Jeszenski. The latter’s novel, the Mieszy of a poor peasant, and his plays, and the novel has been published in the Press—among others the leading Polish literary journal, Biblioteka warszawska.

Poland, Russian, a territory consisting of ten governments which formerly constituted the kingdom of Poland (see above), but now are officially described as the “governments on the

XXI. 30
group of small lakes is situated in the basin of the Warta (north part of Kalisz), the largest being Gopło, 18 m. long and 100 ft. deep.

Climate.—With the exception of the Lysa Góra hilly tracts (besides the southern Carpathians), which lie within the isotherms of 41° and 42°, Poland is situated between the isotherms of 42° and 46°. The isothermes and isotherems (i.e. lines of equal mean summer and winter temperature respectively) crossing one another at right angles, and the former running east-north-east, the latter forming the isothermes of 64° and 61°, and the isotherems of 35° and 39°. The prevailing winds are westerly, with north-north-east and south winds in autumn and winter, and east winds in spring. There is an increase from the south-west to the south-east of 21-7 to 25-6 in. of rainfall in central Poland, and the quantity increases slowly towards the south on account of the proximity of the Carpathians, where it is 30-3 in. Owing to this difference in the snow-show in Poland is not very thick, and spring sets in early. Still, frosts of 4° to 20° fall in Poland, and the rivers are generally icebound for two and a half to three months—the Warta being under ice for 70 to 80 days, the Vistula at Warsaw for 83 days (exceptionally even for 116, and the Memel for 100 (exceptionally for 140). The following averages will serve to illustrate the climate of Poland:

Flora.—The flora of Poland is more akin to that of Germany than to that of Russia, several middle European species finding their home in this country, and the limits in the north of Lithuania. Coniferous forests, consisting mostly of pine (Pinus sylvestris) and birch, cover large tracts in Mazovia in the north, extend across the Baltic lake-ridge southwards as far as the confines of the Volhynia and the Narew, and join in the south-east the Polisia of the Priep. The pine covers the Lysa Góra hills and the hills in the extreme south-west. The larch, which three centuries ago covered large tracts, has almost entirely disappeared. Pine and fir are still only remembered, as also Taxus baccata. Picea obovata is cultivated.

Deciduous trees, the common beech is the most typical; it extends from the Carpathians to 52° N. and reaches three degrees farther north in small groups or isolated specimens; the confidence of the Bug and the Narew may be regarded as its eastern limit. The white beech (Fagnum betulacum), the aspen, and elms (Ulmus carpinifolius, U. europa) are found likewise everywhere. The lime (Tilia cordata) grows only in the east (Memel, Priep, Livonia); it is the most popular tree with the Poles, as the birch with the Russians; judgment of old was pronounced under its shade, and all the folklore of it. The oak is of its native soil, and is not so abundant, though not so much as in Lithuania—grows in forests only on the most fertile land, but it is of common occurrence in conjunction with the beech, elm, &c. The maples (Acer platanoides and A. pseudoplatanus) are rather common. Oak, maple, and ash grow near the banks of the rivers and canals, and the Alnus incana is common. The willow and orchard trees—apple, pear, plum and cherry—are cultivated everywhere.

Fauna.—The fauna of Poland belongs to the middle European zoological group; within the historical period it has lost such species as formerly gave it a subarctic character. The reindeer now occurs only as a fossil; the sable, mentioned in the annals, has migrated eastwards; the wild horse, described as intermediate between the horse and the ass—probably similar to the Equus przewalskii of central Asia—is reputed to have been met with in the 15th century in the basin of the Warta, and two centuries later in the forests of Lithuania. The wild boar, bison and elk have migrated to the Lithuanian forests. The lynx and beaver have disappeared. The brown bear continues to haunt the forests of the south, but is becoming rarer; the wolf, the wild bear, and the fox are most common throughout the great plain, as also the hare and several species of Arvicola. The mammals in Poland, however, do not exceed fifty species. The avifauna, which does not differ much from that of the former, is not less numerous, especially between the isotherms of 64° and 61° and the isotherems of 35° and 39°. The prevailing winds are westerly, with north-north-east and south winds in autumn and winter, and east winds in spring. There is an increase from the south-west to the south-east of 21-7 to 25-6 in. of rainfall in central Poland, and the quantity increases slowly towards the south on account of the proximity of the Carpathians, where it is 30-3 in. The non-domiciled population numbered about 12,000,000, and by 1904 the total was estimated to have increased to 12,000,000, the rate of increase from 1890 to 1904 having been 40-6. Poland, with 193 (domiciled) inhabitants or 213 inhabitants in all to the square mile in 1897, and 240 to the square mile in 1904, has a denser population than any other region in the Russian empire, the next to it being the governments of Moscow, with 186 inhabitants to the square mile, Podolia with 186, and Kiev with 181. The drift towards the rural parts of the Russian empire began in 1890, when the urban population amounted to only 18% of the whole, whereas in 1904 it reached 24% as compared with 16% for the establishment of the empire as a whole. Of the towns of Poland 32 have a population exceeding 10,000, the largest being Warsaw the capital, with 635,208 inhabitants, and the second being Lublin with 315,570 in 1900; Czestochowa, with 45,130 in 1897 and 53,990 in 1900; and Lublin, with 50,152 in 1897. According to nationalities, the population was made up as follows in 1897: 6,755,503 Poles, equal to 82.6% of the whole; 599,827 Russians (6%); 631,684 Russians (6%); 391,440 Germans (4%); 310,836 Lithuanians and Letts (5%); with a few thousands each of Tatars, Bohemians, Rumanians, and Esthonians, and a few Gypsies and Hungarians.

During prehistoric times the basin of the Vistula seems to have been inhabited by a dolichocephalic race, different from the brachycephalic Poles of the present day; but from the days of the Polish Commonwealth (1569-1795) no Polish people, with the exception of the Kashubians and the Kashubian language, have been found excepting those who have been naturalized and integrated with the Polish nation. The Kashubians, with the exception of those who have emigrated to America and Canada, have assimilated to the Polish language and are considered as Polish citizens. In the years 1915-1919, a number of Kashubians migrated to America and Canada.

The most important cities in Poland are Warsaw, the capital, which has a population of about 600,000, Poland, Krakow, and Warsaw. The city of Warsaw is the capital of Poland and the seat of the government. It is situated on the Vistula River, which flows through the city, and is connected by rail and river with other cities in Poland and other parts of Europe. The city is famous for its beautiful architecture and historic buildings, including the Royal Castle, the University, and the Royal Opera House. Warsaw is also the center of the Polish government and the seat of various universities and museums. The city is a major cultural, educational, and economic hub of Poland, and is known for its rich history and cultural heritage. Warsaw has a population of about 1.7 million people, making it one of the largest cities in Poland and Europe. The city is also known for its vibrant nightlife, with a wide range of restaurants, bars, and nightclubs. Warsaw is a major tourist destination and is a popular destination for both domestic and international visitors.
greatest progress being the textile. Whereas in 1864 the annual production of all factories in Poland was valued at not more than 5,000,000 crowns, the census of 1875, when 23,000 works were numbered, showed that the output was estimated at even less; but in 1905 the value of the industrial production reached 53 millions sterling. The principal industrial centres are Lodz (textiles), Warsaw (sugar, leather and miscellaneous) and Radom (mining). The sugar factories and refineries, situated chiefly in the governments of Warsaw, Lublin and Plock, turn out approximately one million tons of sugar in the year, the Polish sugar industry being exceeded only by that of France. The production of cotton is the product of the mills at Lodz and Lask, both in Piotrkow, though woollen cloth, silk and linen are also produced. Tanning is centred in Warsaw and Radom; Polish (i.e. Warsaw) boots and shoes have a great reputation throughout the Russian Empire. The branches of manufacturing industry, besides those already named, are flour-mills, jute, hosier, lace, paper, cement, hats, haberdashery, matches, tins, glass, soap, candles, tinfoil, steel, bricks, iron, distilleries, breweries, potteries, vinegar, chocolate, varnish, furniture, clothing and brickworks. The cottage industries, such as pottery and basket-making, formerly of considerable importance, are gradually being replaced by the factory system of working.

Southern Poland possesses abundant minerals, especially in the Kielce mountains and the region adjacent to Prussian Silesia. The Devonian sandstones contain malachite ores near Kielce, and copper has been worked here since the 18th century, though the mines were now neglected. The brown iron ores of Kielce contain no less than 46% of iron. The zinc ores of the Olkus district, more than 50 ft. thick, contain 14 to 15% sometimes 25% of zinc. The tin ores of Olkus are still worked, but not extensively, probably as early as the 16th century. Brown iron ores, appearing in the neighbourhood of Bendzin as lenticular masses 55 ft. thick, and containing 50% iron, accompanied by ore containing 18% of copper and 32% of iron are plentiful also in the "Keuper formation." Sulphur is wrought in the district of Płockow; the deposits, which contain 25% of sulphur, reach a thickness of 7 to 10 ft. Coal occurs in south-west Poland over an area of 200 sq. m., in the region of Bendzin and Olkus. Brown coal, or lignite, which appears in the Olkus district in beds 3 to 7 ft. thick, has been worked out. The output of coal is 4,000,000 to 5,000,000 tons in the year, the number of mines reported being 2,600. The yield of lignite is less than 100,000 tons annually; of zinc, 10,000 to 12,000 tons; of copper and lead small. The production of iron and steel increased from 13,000 tons in 1862 to about 500,000 tons in 1905. Of other mineral products, chalk, exported from Lublin, a few quantities of marble and many of building stones, are worthy of notice. Mineral waters are used medicinally at Ciechołnek in Plock and Naleczów in Sandomierz.

Communications.—The railways of Poland have an aggregate length of 1,300 m. A line of great importance, connecting Vienna with St Petersburg, crosses the country from south-west to north-east, passing through the mineral district and through Warsaw, and sending a short branch to Lodz. Another important line, connecting Danzig with Odessa, crosses Poland from north-west to south-east. A branch line, parallel to this last, connects Skierne- witz with Grabowo and Elbing; this is the line which radiates from the fortresses of Warsaw and Ivangorod with Brest-Litovsk, via Siedlce and Lukow. The line from Berlin to St Petersburg traverses the north of Suwalk for 54 m. between Eydikunen and Kowno. The inland trade of Poland is merged in that of Russia, under which heading it is treated. With the extension of the railways the fairs have lost much of their importance, but their aggregate yearly returns are still estimated at £3,000,000. The principal fairs are held at Warsaw (wool, hemp, bales), Leczyca in Kalisz, Skarzyslow in Radom, Ciechanowice in Lomza, and Lowicz in Warsaw.

Administration.—The entire administration of Poland is under the governor-general residing at Warsaw. He is at the same time the commander in chief of the military forces of the "Warsaw military district." Justice is administered by the gminas, or by the "judices of the peace (nominated by government);" the sędzia, or "court, " of the justices of the peace; the district tribunals (assizes) in each government; and the Warsaw courts of appeal and cassation. Poland has no separate budget since 1867; its income and expenditure are included in those of the empire.

After the insurrection of 1863 all towns with less than 2000 inhabitants were deprived of their municipal rights, and were included, under the designation of psedas, in the gminas. Viewed with suspicion by the Russian government, the Polish towns are ruled by no self-government like the villages. The elective municipal council enjoy only the rights, including that of maintaining their own police, although in reality they were under the rule of the nobility, were practically abolished, and Russian officials were nominated in their place and entrusted with all their rights. The municipal councils were, however, maintained to carry out the orders of the military chiefs. The new municipal law of 1870, first introduced at Warsaw, reduced the functions of the municipal council almost to nothing. The burgomaster is entirely dependent upon the police and the chief of the district, and has to discharge all sorts of functions (bailiff, policeman, &c.) which have nothing to do with municipal affairs. In all official communications the municipal council is not mentioned as obligatory, and a gradual elimination of Poles from the administration has been going on.

Defence.—Poland contains the first line of defence of the Russian empire on its western frontier. The marshy lowlands, covered with forests on the western bank of the Vistula, are a natural defence against an army advancing from the west, and they are strengthened by the nature of the roads. The remainder of the country contains many large forts, and the principal of these are large, and effectively manned. There is a fort with Novogoevejus, formerly Modlin, in the north, at the mouth of the Bug, and Ivangorod, formerly Demblin, in the south, at the south of the Wart. Novogoevejus is a strongly fortified camp which requires a garrison of 12,000 men and may shelter an army of 50,000 men. The town of Sierock, at the confluence of the Bug and the Narew, is fortified to protect the rear of Novogoevejus. The Vistula line of fortresses labour, however, under the great disadvantage of being easily turned from the rear by a force from East Prussia or Galicia. Brest-Litovsk, at the western issue from the marshes of the Priepet, the towns of Dubno, Lutsk and Bobruisk, are of the same importance.

Religion and Education.—The prevalent religion is the Roman Catholic, to which over 75% of the total population belong. Protestants (mostly Lutherans) amount to 6%, while about 5% are members of the Greek, or Ruthenian, Church. The Church of Warsaw, by 1863, measures were taken to reduce the numbers of the Roman Catholic clergy in Poland. One diocese (Podlasie) was abolished, and a new one established at Kielce, while several bishops were transferred from the country. Poland is now divided into four dioceses—Warsaw, Sandomierz, Lublin and Plock.

The educational institutions of Poland are represented by a university of Warsaw, with 1500 students. Teaching has been carried on in Russian schools. There are excellent technical schools, an institute of agriculture and forestry at Nowa-Alexandria, and several seminaries for teachers. At Warsaw there is a good observatory, and the Jewish children are mostly sent to the Jewish schools, but there are also a few German schools. Although there has been a decided increase in the number of both the primary and the secondary schools, nevertheless the school accommodation has in neither the towns nor the villages risen to two per 1000 of the population. The proportion of primary schools has in fact been steadily decreasing, and the applications for admission to the secondary schools and colleges are on the average twice as great as the places available. The situation is far from favouring Poland in the general level of education, for whereas those able to read and write in 1867 amounted in Poland to 30-5% of the population (only 9-3% in 1862), in Russia it was 19-8%.

POLARITY (Lat. polaris, polus, pole), having two poles or parts at which certain properties are the opposite to one another, as in a magnet the ends of which have opposite magnetic characters. The act of producing polarity is termed polarization. For electrolytic polarization see Battery and Electrolysis, and for optical see Polarization of Light below.

Polarization of Light. A stream of light coming directly from a natural source has no relation to space except that concerned in its direction of propagation, round which its properties are alike on all sides. That this is not a necessary characteristic of light was discovered by Christian Huygens, who showed that, whereas a stream of sunlight in traversing a rhomb of sapphire or the quartz remains the same, but the two streams of equal brightness, each of these emergent streams is divided by a second rhomb into two portions having a relative intensity dependent upon the position with respect to one another of the principal planes of the faces of entry into the rhomb— the planes through the axes of the crystals perpendicular to the refracting surfaces. In certain cases, indeed, one portion vanishes entirely: thus the stream ordinarily refracted in the first rhomb gives an ordinary or an extraordinary stream alone in the second, according as the principal planes are parallel or perpendicular, the reverse being the case with the extraordinary stream of the first rhomb. In intermediate cases the intensities of the two beams are proportional to the squares of the cosines of the angles that the principal plane of the second rhomb makes with the positions in which they have the greatest intensity.
POLARIZATION OF LIGHT

On the other hand, if the emergent streams overlap and the common part be examined, it is found to have all the properties of common light. To this phenomenon E. T. Malus gave the name of polarization, as he attributed it, on the emission theory of light, to a kind of polarity of the light-corpuscles. This term has been retained and the ordinary stream is said to be plane polarized in the principal plane of the face of entry into the body, and the extraordinary stream to be plane polarized in the perpendicular plane.

The phenomenon of polarization observed by Huygens remained an isolated fact for over a century, until Malus in 1808 discovered that polarization can be produced independently of double refraction, and must consequently be something closely connected with the nature of light itself. Examining the light reflected from the windows of the Luxembourg palace with a doubly refracting prism, he was led to infer (though more refined experiments have shown that this is not strictly the case) that light reflected at a certain angle, called the polarizing angle, from the surface of transparent substances has the same properties with respect to the plane of incidence as those of the ordinary stream in Iceland spar with respect to the principal plane of the crystal. Thus in accordance with the definition, it is polarized in the plane of incidence. Further, if polarized light fall at the polarizing angle on a reflecting surface, the intensity of the reflected stream depends upon the azimuth of the plane of incidence, being proportional to the square of the cosine of the angle between this plane and the plane of the polarization.

At angles other than the polarizing angle common light gives a reflected stream that behaves as a mixture of common light with light polarized in the plane of incidence, and is accordingly said to be partially polarized in that plane. The refracted light, whatever be the angle of incidence, is found to be partially polarized in a plane perpendicular to the plane of incidence, and D. F. J. Arago showed that at all angles of incidence the reflected and refracted streams contain equal quantities of polarized light. The polarizing angle varies from one transparent substance to another, and Sir David Brewster in 1815 enunciated the law that the tangent of the polarizing angle is equal to the refractive index of the substance. It follows then that if a stream of light be incident at the polarizing angle on a pile of parallel transparent plates of the same nature, each surface in turn will be met by the light at the polarizing angle and will give rise to a reflected portion polarized in the plane of incidence. Hence the total reflected light polarized in this plane and will of necessity have a greater intensity than that produced by a single surface. The polarization of the light transmitted by the pile is never complete, but tends to become more nearly so as the number of the plates is increased and at the same time the angle of incidence for which the polarization is a maximum approaches indefinitely the polarizing angle (Sir G. G. Stokes, Math. and Phys. Papers, iv. 145).

In order to isolate a polarized pencil of rays with a rhomb of Iceland spar, it is necessary to have a crystal of such a thickness that the emergent streams are separated, so that one may be stopped by a screen. There are, however, certain crystals that by the thickness given to the crystal show a thickness greater than that is attributed to the vector that is more or less completely polarized. The polarization action of such crystals is due to the unequal absorption that they exert on polarized streams. Thus a plate of tourmaline of from 1 mm. to 2 mm. in thickness with its faces perpendicular to the optic axis is nearly opaque to light falling normally upon it, and a plate of this thickness parallel to the axis permits of the passage of a single stream polarized in a plane perpendicular to the principal section. Such a plate acts in the same way on polarized light, stopping it or allowing it to pass, according as the plane of polarization is parallel or perpendicular to the principal section. Certain artificial salts, e.g. isodo-sulphate of quinine, have this property.

From the above instances we see that an instrumental appliance that polarizes a beam of light may be used as a means of detecting and examining polarization. This latter process is termed 'analysis', and an instrument is called a polarizer or an analyser according as it is used for the first or the second of these purposes.

In addition to the above facts of polarization mention may be made of the partial polarization, in a plane perpendicular to that of emission, of the light emitted in an oblique direction from a white-hot solid, and of the polarization produced by diffraction. Experiments with gratings have been instituted by Sir G. Gabriel Stokes, C. H. A. Holtmann, F. Eisenlohr and others, with the view of determining the direction of the vibrations in polarized light (side infra), but the results have not been consistent, and H. Fizeau and G. H. Quincke have shown that they depend upon the size and form of the apertures and upon the state of the surface on which they are traced. The polarization of the light reflected from a glass grating has also been investigated by I. Fröhlich, while L. G. Gouy has studied the more simple case of diffraction at a straight edge. The polarization of the light scattered by small particles has been examined by G. Govi, J. Tyndall, L. Soret and A. Lallemand, and in the case of ultra-microscopic particles by H. Siedentopf and R. Zsigmondy (Drude Ann. 1903, xil); an interesting case of this phenomenon is the polarization of the light from the sky—a subject that has been treated theoretically by Lord Rayleigh in an important series of papers (See SKY, COLOUR OF, and Rayleigh, Scientific Works, i, 87, 104, 518, iv. 397).

An important addition to the knowledge of polarization was made in 1816 by Augustin J. Fresnel and D. F. J. Arago, who summed up the results of a searching series of experiments in the following laws of the interference of polarized light:

1 Under the same conditions in which two streams of common light interfere, two streams polarized at right angles are without mutual influence.
2 Two streams polarized in parallel planes give the same phenomena of interference as common light.
3 Two streams polarized at right angles and coming from a stream of common light can be brought to the same plane of polarization without thereby acquiring the faculty of interfering.
4 Two streams polarized at right angles and coming from a stream of polarized light interfere as common light, when brought to the same plane of polarization.

In calculating the conditions of interference in the last case, it is necessary to add a half wave-length to the actual difference of path of the streams, unless the primitive and final planes of polarization lie in the same angle between the two perpendicular planes.

The lateral characteristics of a polarized stream lead at once to the conclusion that the stream may be represented by a vector, and since this vector must indicate the direction in which the light travels as well as the plane of polarization, it is natural to infer that it is transverse to the direction of propagation. That this is actually the case is proved by experiments on the interference of polarized light, from which it may be deduced that the polarization-vector of a train of plane waves of plane polarized light executes rectilinear vibrations in the plane of the waves. By symmetry the polarization-vector must be either parallel or perpendicular to the plane of polarization: which of these directions is assumed depends upon the character of the stream. In fact, whatever theory of light be adopted, there are two vectors to be considered, that are at right angles to one another and connected by purely geometrical relations.

The general expressions for the rectangular components of a vector transverse to the direction of propagation in the case of waves of length \( \lambda \) travelling with speed \( v \) are:

\[ u = a \cos (T - \alpha), \quad v = b \cos (T - \beta) \]

where \( T = \pi \rho (t - \tau) / \lambda \).

The path of the extremity of the vector is then in general an ellipse, traversed in a right-handed direction to an observer receiving the light when \( \rho \) is between 0 and \( \pi \) and in a left-handed direction if this angle be between \( \pi \) and \( 2\pi \), or between 0 and \( -\pi \).

In conformity with the form of the path, the light is said to be elliptically polarized, right- or left-handedly as the case may be, and the axes of the elliptic path are determined by the planes of
maximum and minimum polarization of the light. In the particular case in which \(a = b\) and \(a - \beta = \pm (2n + 1) \pi/2\), the vibrations are circular and the light is said to be circularly polarized.

These different types of polarization may be obtained from a plane polarized stream by passing it through a quarter-wave plate, i.e. a crystalline plate of such a thickness that it introduces a relative retardation of a quarter of a wave between the component streams within it. Such plates are generally made of mica or selenium, and the normal to the plane of polarization of the most retarded stream is called "the axis of the plate." If this axis be parallel or perpendicular to the primitive plane of polarization, the emergent beam remains plane polarized; it is circularly polarized if the axis be at 45° to the plane of polarization, and in other cases it is elliptically polarized with the axes of the elliptic path parallel and perpendicular to the axis of the plate. Conversely a quarter-wave plate may be employed for reducing a circularly or elliptically polarized stream to a state of plane polarization.

Two streams are said to be oppositely polarized when the one is so far as regards to its polarization, what the other becomes when it is turned through an azimuth of 90° and has its character reversed as regards right and left hand. An analytical investigation of the conditions of interference of polarized streams of the most general type leads to the result that there will be no interference only when the two streams are oppositely polarized, and that when the polarizations are identical the interference will be perfect, the fluctuations of intensity being the greatest that the difference of intensity of the streams admits (Sir G. G. Stokes, Math. and Phys. Papers, iii. 233).

It remains to consider the constitution of common unpolarized light. Since a beam of common light can be resolved into plane parallel streams and these two streams give a stream with properties indistinguishable from those of common light, whatever their relative retardation may be, it is natural to assume that an analytical representation of common light can be obtained in which no longitudinal vector occurs. On the other hand a stream of strictly monochromatic light with a polarization-vector that is entirely transversal must be (in general elliptically) polarized. Consequentit it follows that common light cannot be absolutely monochromatic. The conditions that are necessary in order that a stream of light may behave as natural light may have been investigated by Sir G. Gabriel Stokes (loc. cit.) and by E. Verdet (Oeuvres, i. 281), and it may be shown that two polarized streams of a definite character are analytically equivalent to common light provided that they are of equal intensity and oppositely polarized and that there is no common phase relation between the corresponding monochromatic constituents. Further a stream of light of the most general character is equivalent to the admixture of common and polarized light, the polarization being elliptical, circular or plane.

We see then that there are seven possible types of light: common light, polarized light and partially polarized light; the polarization in the two latter cases being elliptical, circular or plane. Common light, light of which the fine lines of the polarization are known, is a circularly polarized light all have the characteristic of giving two streams of equal intensity on passing through a thorn of Iceland spar, however it may be turned. They may, however, be distinguished by the fact that on previous transmission through a quarter-wave plate this property is retained in the case of common light, while with the two other types the relative intensity of the streams depends upon the orientation of the rhomb, and with circularly polarized light one stream may be made to vanish. Plane polarized light gives in general two streams of unequal intensity when examined with a rhomb, and for certain positions of the crystal there is only one emergent stream. Plane polarized, partially elliptically polarized and partially plane polarized light give with Iceland spar two streams of, in general, unequal intensity, neither of which can be made to vanish. They may be differentiated by first passing the light through a quarter-wave plate with its axis parallel or perpendicular to the plane of maximum polarization: for elliptically polarized light thereby becomes plane polarized and one of the streams is extinguished on rotating the rhomb; but with the other two kinds of light this is not the case, and the light is partially plane or partially elliptically polarized according as the plane of maximum polarization remains the same or is changed.

Colours of Crystalline Plates.—It was known to E. T. Malus that the transmission of a doubly refracting crystal could be reversed and an analyser regulated for extinction has the effect of partially restoring the light, and he used this property to discover double refraction in crystals in which the separation of the two refracted light was too small to be detected. J. Arago in 1811 found that in the case of white light and with moderately thin plates the transmitted light is no longer white but coloured, a variation of brightness but not of tint being produced when the polarizer and analyser being crossed are rotated together, with the rotation of the analyser alone produces a change of colour, which passes through white into the complementary tint. This phenomenon was subjected to a detailed investigation by Jean Baptiste Biot during the years 1812 to 1814, and from the results of his experiments Thomas Young, with his brilliant acumen, was led to infer that the colours were to be attributed to interference between the component streams of the plate. This explanation is incomplete, as it leaves out of account the action of the polarizer and analyser, and it was with the purpose of removing this defect that Fresnel and Arago undertook the investigations in which they have. The explanation given above and thus supplied what was wanting in Young’s explanation. In Biot’s earlier experiments the beam of light employed was nearly parallel; the phenomena of rings and brushes that are seen with a conical pencil of light were discovered by Sir David Brewster in the case of uniaxal crystals in 1815 and in that of biaxal crystals in 1819.

Let \(\alpha, \beta, \gamma\) be the angles that the primitive and final planes of polarization make with the plane of incidence in the two streams of light, the angles between the plate with a fixed plane, and let \(\alpha\) be the relative retardation of phase of the two streams on emergence from the plate for light of period \(n\). On entry into the crystal the original polarized stream is resolved into components represented by

\[
a \cos(\alpha - \phi) \cos T, a \sin(\alpha - \phi) \sin T, a \cos(\beta - \phi) \cos T, a \sin(\beta - \phi) \sin T
\]

and on emergence we may take as the expression of the waves

\[
a \cos(\alpha - \phi) \cos T, a \sin(\alpha - \phi) \cos T, a \cos(\beta - \phi) \cos T, a \sin(\beta - \phi) \cos T
\]

Finally after traversing the analyser the sum of the two resolved components is

\[
a \cos(\phi - \phi) \cos(\beta - \phi) \cos T + a \sin(\phi - \phi) \sin(\beta - \phi) \cos T,
\]

of which the intensity is

\[
a^2 \sin^2(\phi - \phi) + a^2 \cos^2(\beta - \phi) - 2 \cos(\phi - \phi) \sin(\beta - \phi) \sin T.
\]

When the primitive light is white, this expression must be summed for the different monochromatic constituents. In strictness the angle \(\phi\) should be the angle of incidence of the two streams upon the crystal, and \(\phi\) is relatively to the double refraction, the product sin \((\phi - \phi) \sin(\beta - \phi)\) has sensibly the same value for all terms of the summation, and we may write

\[
a^2 \sin^2(\phi - \phi) + 2 \cos(\phi - \phi) \sin(\beta - \phi) \sin T
\]

This formula contains the whole theory of the colours of crystalline plates in polarized light. Since the first term represents a stream of white light, the plate will appear uncoloured whenever the plane of polarization of either stream transmitted by it coincides with either the primitive or final plane of polarization. In intermediate cases the field is coloured, and the tint changes to its complementary as the plate passes through one of these eight positions, since the second term in the above expression then changes sign. If, however, the primitive angle is increased, and the final angle diminished, the field exhibits only one colour during a complete revolution of the plate.

The crystalline plate shows no colour when it is very thin, and also when its thickness exceeds a moderate amount. In the former case the retardation of phase of mean period the intensity is nearly the same for all colours; in the latter case it alters so rapidly that for a small change in the period the intensity passes from a maximum or a minimum, and consequently so many constituents of the light there are so close to one another in frequency, that the light presents to the eye the appearance of being white. The true character of the light in this case may be revealed thereby, and it will be seen that the plate appears traversed by dark bands corresponding to the constituents that are weakened or annulled. The phenomenon of colour may, however, be obtained with thick plates by superposing two of them in a suitably orientated manner, a condition which arises when the plane of polarization of the light is subjected to an active torsion according as the planes of polarization of the quicker waves within them are parallel or crossed. In this way a delicate test for slight traces of double refraction is obtained. When the retardation of phase for light of mean period is \(\pi\) or a small multiple of it a crystalline plate placed between a crossed polarizer and analyzer...
Polarization of Light

exhibits in white light a distinctive greyish violet colour, known as a "naïf". It is often directed to the observer, and is most noticeable on a white or red, when the retardation is very slightly increased or diminished. If then the sensitive plate be cut in half and the two parts be placed side by side after the one has been turned through 90° in its own plane, the tint of this half will be considerably changed, and the sight will be lowered when the compound plate is associated with a second doubly refracting plate.

When light from an extended source is made to converge upon the sensitive plate, and the latter is in both directions of radiation, it is obtained. The exact calculation of the intensity in this case is very complicated, and the resulting expression is too unwieldy to be of any use. But, by approximation the formula for the case of a parallel beam may be applied, and the light is circularly or ordinary polarized, and therefore being regarded as functions of the angle and plane of incidence and consequently as variables. In monochromatic light, then, the intensity of the light is characterized by a system of hyperbolae of the form of the curves of constant retardation \( r = \text{const.} \); the lines of like \( \rho = \text{const.} \); the curves of constant intensity \( I = \text{const.} \). When \( r = 2\pi \) and also when \( \rho = 0 \) or \( \pm \frac{\pi}{2} \) or \( \pm \frac{3\pi}{2} \), that is, perpendicular to the principal axes, the planes in parallel and perpendicular to the planes of primitive and final polarization, the intensity (called the fundamental intensity) is the same as when the plate is removed. These conditions define two curves of constant intensity and passes through the optic axes of constant retardation and the principal lines of like polarization, these latter lines dividing the field into regions in which the intensity is alternately greater and less than the fundamental intensity. When the retardation is made up of two dark bands, each consisting of the retardation of the two wave plates put together, the same hyperbolae coincide, and the intensity at all points in the former case is greater than in the latter when the plate is removed, but this is the same as the introduction of the plate. The determination of the curves of constant retardation depends upon expressing the retardation in terms of the optical constants of the crystal, the angle of incidence and the azimuth of the plane of incidence. A. Böttcher has shown that a useful picture of the form of these curves may be obtained by taking sections, parallel to the plate, of a surface that he calls the "isochromatic surface," and that is the locus of points on the crystal at which the retardation of two wave planes passing simultaneously through a given point and travelling in the same direction has an assigned value. But as this surface is obtained by assuming that the interfering streams follow the same route in the crystal, and that the retardation occurs in the plate itself, it is not easy to make accurate numerical calculations. To the same degree of accuracy as that employed in obtaining the expression for the intensity, the expression for the retardation is obtained. The section, parallel to the plate, of a cone, whose generating lines are the directions of propagation of waves that have their planes of polarization parallel and perpendicular to a given plane: the cone is in general of several degree and passes through the optic axes of the crystal. We must limit ourselves in this article to indicating the chief features of the phenomenon in the more important cases. (Reference should be made to the article Crystallography for illustrations of the phenomena.)

With an uniaxial plate perpendicular to the optic axis, the curves of constant retardation are concentric circles and the lines of like polarization are the bisectors of the 45° angles that make with the optic axis. The retardation is produced thus with polarizer and analyser separated for extinction, the pattern consists of a series of bright and dark circles interrupted by a black cross with its arms parallel to the planes of polarization and analysis. In the case of a biaxial plate, each axis is in a separate direction, and between the optic axes, the curves of constant retardation are approximately Cassin’s oval, and the lines of like polarization are equilateral hyperbola’s running through the points corresponding to the optic axes. With a crossed polarizer and analyser the rings are interrupted by a dark hyperbolic brush that cuts the plane of the optic axes rather than being a rectangular cross with its arms parallel and perpendicular to the plane, and the colors of the plane coincides with the plane of primitive or final polarization—the normal position. When light is used in which the employed quarter rings are obtained, provided the relative retardation of the interfering streams is not too great. The isochromatic lines, unless the dispersion is excessive, follow in the main the course of the curves of constant retardation, and are in the direction of like polarization. The polarizer and analyser dark brushes, that in certain cases are fringed with colour. This state of things may, however, be considerably departed from if the axes of optical symmetry of the crystal are different. L. Pockels has shown how by careful measurements of the optic axes in biaxial crystals (see Refraction, § Double) may be conveniently made with a plate perpendicular to the acute bisectrix placed in the diagonal position for 45° passing through the centre of the crystal. When the rings are coloured symmetrically with respect to two perpendicular lines the acute bisectrix and the plane of the axes are the same for all frequencies, and the colour for which the separation of the acute angles is greatest, is on the same side of the oval as the summit of the hyperbolic brushes.

Crossed, inclined and horizontal dispersion are characterized respectively by a distribution of colour that is symmetrical with respect to the centre alone, the plane of the optic axes, and the perpendicular plane.

The phenomenon of interference produced by crystalline plates is highly noticeable. It may be lightly modelled by analysis or polarized and analysed by the interposition of a quarter-wave between the crystal and the polarizer or analyser. Thus in the two cases described above the brushes disappear and the rings are continuous and elliptical. In the third, and in the cases of the biaxial plates, the most important case, on account of its practical application to determining the sign of a crystal, is that in which the light is plane polarized and circularly or analytically reversed. Let us suppose the plate to be composed of two parts, one crossing which the rings are discontinuous, expansion or contraction occurring as the plate is rotated, the second the quarter-wave plate, according as the crystal is positive or negative.

With a biaxial plate perpendicular to the optic axis in the crystal, and passing through the analyser, the light, however, and the rings are expanded or contracted on its concave side, with a positive plate, according as the plane of the optic axes is parallel or perpendicular to the axis of the quarter-wave plate, the reverse being the case with a negative plate. With a combination of plates in plane-polarized and plane-analysed light the interference pattern with monochromatic light is generally very complicated, the dark curves when polarizer and analyser are crossed, the light curves otherwise. The phenomenon is a general one when, however, the field is very small, or when the primitive light is white so that interference is only visible for small retardations. The problem becomes in many cases of far less complexity, when the crystal is biaxial. For a biaxial plate, an interference pattern known as Savart’s plate. This consists of two plates of an uniaxial crystal of equal thickness, cut at the same inclination of about 45° to the optic axis and spaced with their principal planes at right angles. The interference pattern produced by this combination is, when the field is small, a system of parallel straight lines bisecting the angle between the principal planes of its constituents. When these are in their maximum visibility when the plane of analysis is at 45° to these planes, and vanish when the plane of polarization is parallel to either of the principal planes.

The phenomena of chromatic polarization afford a ready means of determining the optical form of a body. Thus, in the case of a biaxial crystal, the light, if originally white, is found to be colourless and to be extinguished when the polarizer and analyser are crossed. When, however, a plate of quartz is used in this experiment, the light is bluish and in the last cut off by the analyser. The yellow, however, is extinguished and the blue persists, indicating that the crystal under examination is biaxial. The interference pattern is then a series of rings separated by a neutral line, the double refraction being positive on the dilated and negative on the compressed side. Again, a system of rings, similar to those of an uniaxial plate perpendicular to the axis may be observed, with the difference that the blue is extinguished and the red heat from its surface to its axes by immersion in heated oil, and glass that has been raised to a red heat and then cooled rapidly at its edges gives a polarized light. The white light is extinguished at the point of a regular form dependent upon the shape of the contour.

Rotary Polarization.—In general a stream of plane-polarized light undergoes no change in traversing a plate of uniaxial crystal in which the length of its axis is equal to the length of the wave of light, if originally white, is found to be colourless and to be extinguished when the polarizer and analyser are crossed. When, however, a plate of quartz is used in this experiment, the light is bluish and in the last cut off by the analyser. The yellow, however, is extinguished and the blue persists, indicating that the crystal under examination is biaxial. The interference pattern is then a series of rings separated by a neutral line, the double refraction being positive on the dilated and negative on the compressed side. Again, a system of rings, similar to those of an uniaxial plate perpendicular to the axis may be observed, with the difference that the blue is extinguished and the red heat from its surface to its axes by immersion in heated oil, and glass that has been raised to a red heat and then cooled rapidly at its edges gives a polarized light. The white light is extinguished at the point of a regular form dependent upon the shape of the contour.

A similar rotary property is possessed by other uniaxial crystals, such as tourmaline and the thiosulphates of potassium, lead, and calomel, and of crystals which have their optical axes in common with the principal planes of a crystal. C. Dufet (Journ. de phys., 1894 [4], iii. 757) have shown by a few biaxial crystals, such as sugar and Rochelle salt, the rotation produced by a given thickness being in general different, and in some cases of opposite sign. In the two cases of sodium, nitrate, and chloride, as sodium chloride and bromate, and also some liquids and even vapours, rotate the plane of polarization of the light that they traverse, whatever may be the direction of the stream.

In crystals the rotary property appears to be sometimes inherent
in the crystalline arrangement of the molecules, as it is lost on fusion or solution, and in several cases belongs to enantiomorphous crystals, the left-handed forms being one lefthanded and the right-handed and the other left-handed optically as well as crystallographically, this being necessarily the case if the property be retained when the crystal is fused or dissolved. In organic bodies the rotary property, as has been shown by the researches of J. A. Le Bel, E. H. van't Hoff and others, is established, corresponds to the presence of one or more asymmetric atoms of carbon—that is, atoms directly united to elements or radicals all different from one another—and in every case there exists an invariable plane of polarization, for the rotation is always in the opposite direction. Absence of rotary power when asymmetric carbon atoms are present, may be caused by an internal compensation within the compound, as in the case of orientating and meso- tactic acids, or may be due to the fact that the compound is an equimolecular mixture of left- and right-hand varieties, this being the case with racemic acid that was broken by Louis Pasteur into left- and right-hand forms in 1848.

Substances that by reason of the structure or arrangement of their molecules rotate the plane of polarization are said to be structurally active, and the rotation produced by unit length is called their rotary power. If unit mass of a solution contains m grammes of an active substance and if \( \beta \) be the density and \( \alpha \) be the rotary power of the solution, the specific rotary power is defined by \( \beta \alpha \), and the molecular rotary power is obtained from this by multiplying by the molecular weight of the particular compound. To express the quantity \( \alpha \) it is not absolutely constant, and in many cases varies with the concentration of the solution and with the nature of the solvent. A mixture of two active substances, or even of an active and an inactive substance, in one solution sometimes produces anomalous effects.

Fresnel showed that rotary polarization could be explained kinematically by supposing that a plane light ray entering an active medium into two oppositely circularly polarized streams propagated with different speeds, the rotation being right- or left-handed according as the ray in the right- or left-handed stream采取了 different directions.

The polarization-vector of the primitive stream being \( \xi = a \cos n t \), the first circularly polarized stream after traversing a distance \( s \) in the medium may be represented by \( \xi = a \cos n (t + k_1 s) \), and the second by \( \xi = a \cos n (t + k_2 s) \), where \( k_1 \) and \( k_2 \) are the wave-differences of the wave-length of the circular components of the same frequency.

If other streams have different speeds, Fresnel argued that it would be possible to separate them by oblique refraction, and though the divergence is small, since the difference of their refractive indices in the case of quartz is only about 0.0007, he supposes that it is possible in a single thickness of a hundredth of an inch of the ordinary kind of quartz to resolve a plane-polarized stream into two distinct circularly polarized streams. A similar arrangement of two prisms was suggested by F. B. Leiden (Am. J. Math., 1855, 7, 326), but this was not successful, and the only method of resolution in large amounts of liquid in the laboratory at present known is afforded by Michael Faraday's discovery of the rotary polarization connected with a magnetic field. There is, however, a marked difference between this magnetic rotation and that of a structurally active substance. If, for example, a crystal of quartz is placed in a known magnetic field, the direction of the wave rotation, the so-called Magnetic axis, is altered. The wave rotates, and the plane of polarization of the wave is realigned in magnetic field. This was supplied by Fresnel, who, starting from a mechanical hypothesis, showed by ingenious but not strictly dynamical reasoning that if the incident wave stream have unit amplitude, that of the reflected stream will be

\[
\sin (i - r) / \sin (i + r) + \tan (i - r) / \tan (i + r)
\]

according to the incident light is polarized in or perpendicularly to the plane of incidence \( \alpha \), being the angles of incidence and refraction connected by the formula \( \sin \alpha = \sin \beta \). The intensity of the reflected light, measured by the square of the amplitude, is \( |(\alpha - \beta)/(\alpha + \beta)|^2 \) in both cases; but whereas in the former the intensity increases uniformly with \( \alpha \) to the value unity for \( \alpha = 90^\circ \), in the latter the intensity decreases from unity until it attains the value zero when \( i + r = 90^\circ \), or tan \( i = 1 - \alpha ^{\circ} \) the polarizing angle of Brewster—and then increases until it becomes unity at grazing incidence. If the incident light be polarized in a plane, then the beam is resolved into two that are polarized in the principal azimuths, and these will be reflected in accordance with the above laws. Hence if \( \beta \) be the angle between the plane of incidence and that in which the reflected light is polarized

\[
\tan \beta = \tan \alpha (\cos (i + r) / \cos (i - r) - \tan (i - r) / \tan (i + r))
\]

The expression for the intensity of the refracted light may be obtained from those relating to the reflected light by the principle of energy. In order to do this in the case of different media, it is convenient to suppose that the refracted stream emerges into a medium similar to the first by a transition so gradual that no light is lost by reflection. The intensities of the incident, reflected and refracted streams are then measured in the same way, and we have merely to express that
Polarization of Light

The square of the amplitude of the incident vibrations is equal to the sum of the squares of the amplitudes of the reflected and refracted vibrations.

Fresnel obtained his formulae by assuming that the optical difference of medium is due to a change in the effective density of the ether, that is, to a change in the incoherence principle of the theory of double refraction—and was led to the result that the vibrations are perpendicular to the plane of polarization. Franz Neumann (Wied. Ann., 1890, xi, 203) has shown that the propagation of the vibrations is determined by a function of $v - v_0$, where $v_0$ is the velocity of the disturbance in the medium; and that the velocity of the disturbance is equal to the velocity of light in media of different dispersions, in the case of waves for which the refraction and polarization are inconsistent.

The above optical constants (refractive index and coefficient of extinction) of the medium may be obtained from observations of the principal incidence and the elliptic polarization then produced. A detailed investigation of these constants has been made by Drude (Wied. Ann., 1890, xxxiv. 504), who has found the remarkable result that copper, gold, magnesium, and silver yellow, and that their refraction points have been completely confirmed by observations with metallic prisms of small refracting angle. He further showed that except in the cases of copper, lead and gold the dispersion is abnormal—the index of the extraordinary extraordinary is less than that of the ordinary—because the coefficient of extinction for light of a given period, the more copious will be the reflection of that constituent of a mixed pencil. It is possible to employ one pencil of light of wave-length, and in this wave-length of light 0.661 mm. have been isolated by five successive reflections from the surface of sylvite.

The study of polarization.—The best method of obtaining a strong beam of polarized light is to isolate one of the streams into which a beam of common light is resolved by double refraction. This is effected in polarizing prisms of the earlier type, devised by A. M. de Rochon, H. H. de Sénarmont and W. H. Wollaston, by blocking off one of the two streams of light which are obtained by combining two equal crystalline prisms cut differently with respect to the optic axis—an arrangement that achronimates more or less completely the pencil that is allowed to pass. In a second case, one of the two streams of light is resolved by reflection. Theoretically the best construction for prisms of this class is the following: a rectangular block of Iceland spar, of length about four times the width and having its end and two of its side faces parallel to the optic axis, is cut in half by a plane parallel to the optic axis and making an angle of about 14° with the sides; the two halves are then reunited with a cement whose refractive index is close to that of silver spar. The ordinarily refracted side of one of the prisms is used as nearly as possible equal to the latter. Thus constructed, the prism produces no lateral shift of the transmitted pencil; a conical pencil, incident directly, has nearly constant polarization over its entire extent. The position of the ordinary axis of a parallel pencil, incident not quite normally, is a minimum.

In a Nicol's prism it is the extraordinary stream that passes; in a prism suggested by E. Sang and sometimes called a Bertrand's prism, it is the ordinary stream which is isolated. A thin crystalline plate between two glass prisms turned in opposite directions by a cement of the same refractive index as the glass. This refractive index should be equal to the greatest index of the two prisms, the beam of light passing between the plate the mean angle of optical dispersion should be parallel to its faces and in the normal section of the prisms, while with an uniaxal plate the optic axis should be in a plane perpendicular to this normal section. These prisms have the advantage of a sharp economy, the ordinary axis of one of the ordinary Nicol's prism, but a difficulty seems to be experienced in finding a suitable permanent cement.

An accurate determination of the type of polarization analysers that act by extinction are not of much practical use, and a different device has to be employed. Savart's analyser consists of a Savart's plate (see above) connected to a Nicol's prism, the faces of which make an angle of 45° with the principal planes of the plate: the plane of polarization is determined by turning the analyser until the bands, ordinarily seen, disappear, in which case it is parallel to one of the principal planes of the plate. The analyser can distinguish slight differences in the intensities of two streams seen in juxtaposition, when the illumination is not too bright. The field is divided into two parts that for most positions of the analyser are considered as approximately equal in intensity by the analyser until both halves are equal. These instruments are very sensitive, but care must be taken to avoid errors caused by changes in the relative intensities of parts of the source of light— a precaution that is sometimes overlooked in furnishing polarimeters with these analysers. In J. H. Jellet's and M. A. Cornu's analysers
POLAR REGIONS

formed for the one from two parts of a rainbow, the other from the disturbance of a Nicol’s prism—the two halves of the field are analysed in slightly different planes; but these, though they have certain advantages, are now seldom employed, partly on account of a difficulty in their construction and partly because the Nicol’s prism, more usual half-sphere analyser is available for light of only one frequency, as it depends upon the action of a half-wave plate, in traversing which the plane of polarization is turned through 90°. To the same end an analyser was first put but on the opposite side: half the field is covered with the plate, to which is attached a Nicol’s prism with its principal section inclined at a small angle to that of the plate. The eye must be focused on the edge of the plate, and the two halves of the field will only be equally dark when the principal plane of the plate is parallel to the primitive plane of polarization. Another plan, due to J. H. Poynting, is before analysis to impress unequal rotations upon the ray before passage through the crystal, by means of an active medium, or by oblique transmission through glass plates.

Elliptically polarized light is investigated by the reduction of the primitive plane of plane polarization, and a determination of the resulting plane of polarization. One method consists in finding directly the elliptic constants of the vibration by means of a quarter-wave plate and an analyser; but the more usual plan is to measure the half-wave plate in the retardant components of the stream by a Babinet’s compensator. The plate is made of two equal wedges of quartz, that can be moved over one another so as to vary the phase difference between the two rays, and is placed parallel to the optic axis, in which the first wedge is perpendicular and in the second is parallel to the refracting edge. It is clear that direct transmission through the plate at a point where the thicknesses of the two wedges are d and d + Δd results in the rotation of the plane of polarization by an amount of (μd − μd) (Δd/d) between streams polarized in planes parallel and perpendicular to the edges of the prisms, μd and μd, being the ordinary and the extraordinary refractive indices; and it is hence possible by an adjustment of the thickness to reduce elliptically polarized to plane polarization at an assigned point marked off by two parallel lines. A subsequent determination of the plane of polarization gives the ratio of the amplitudes of the vibrations in the component streams.

For the observation and measurement of rings in crystals polariscopes are constructed on the following principle. Light from an extended source passes after polarization through two converging, between which the plate is placed, and is then received in an eyepiece furnished with an analyser. Measurements are required to the plate must have a motion round an axis on the principal section inclined at a small angle to the field, and a second, perpendicular to the first, normal to its faces: the polarizer and analyser must also be capable of adjustment. All the rays through a given point in the first principal focal plane of the anterior system of lenses traverse the plate between the parallel beam and the second focal plane of the posterior system, each in its passage being divided into two by the plate having a given relative retardation. It is on this latter plane that the eyepiece must be focussed, and an adjustment of its magnification controls the size of the systems of lenses depend upon the object for which the polariscope is intended, and are given for some of the principal types of instruments in Th. Liesbich’s Physikalische Kristallographie.

Optically active crystals are subjected to polarizer to polarized waves, where there are three principal forms. In Wilh. Pistorobstometer, light from a soda flame, rendered parallel by a lens, is polarized by a Nicol’s prism, and then passing through the object into the which the ordinary is to be made to disappear in such a way by turning the analyzer by means of a rack and pinion worked by an arm from the observer’s end of the instrument. The polarizing prism consists of a cut goods, to which has been added a piece of glass, with a fixed vernier determines the positions of the analyzer, for which the bands disappear at the assigned point of the field. Laurent’s Polarimeter is a half-sphere instrument. Sod’s, an observer’s eye views a plate in succession a lens, a Nicol’s prism, and a glass plate half covered with a half-wave plate of quartz, that is cut parallel to the optic axis and has its principal section inclined at a small angle to the plane of polarization. When the retardation of the half-wave plate is adjusted so as to have a common diameter and having such a thickness that each rotates the plate of polarization of mean yellow light through the same multiple of 90°. If then a stream of polarized white light traverse the biquartz, it is possible by an analyser to cut off the mean yellow light from each half of the field, and the whole will then have the sensitive tint; but a small change in the plane of analysis will give the one half a red and the other half a blue tone. A rotation of the plane of polarization is not, however, obtainable by means of an active medium, or by oblique transmission through glass plates.

POLAR REGIONS, a general term for the regions about the North or South Pole, otherwise called the Arctic or Antarctic regions. The ancients had no actual knowledge of History of the Polar Regions. They had probably heard rumours of the light summer nights and the dark winter days for the North and South Poles. The best description of the Laestrygons having the short nights and the Cimmerians living in perpetual darkness by astronomical speculations the Greeks had come to the conclusion that north of the Arctic Circle there must be midnight sun at midsummer and no sun at midwinter. The general view was that the Polar regions, north and south, belonged to the uninhabitable frozen zones; while according to a less scientific notion there was a happy region north of the wind (Boreas), where the sun was always shining and the Hyperboreans led a peaceful life. The first traveller of history who probably approached the Arctic Circle and reached the land of the midnight sun was Pytheas of Magnesia (C. 330 B.C.), from whom the name Pytheas comes. It is the same land that called Thule, where there was hardly any night at midnight. It is possible that Iceland and the Faeroes were inhabited by a small Celtic population before the Irish monks

BIBLIOGRAPHY—A bibliography of the subjects treated in this article may be found in the summary chapters of the corresponding chapters of E. Verdet’s Leçons d’optique physique (1869); this work has been brought to a later date in the German translation by Karl Exner (Breslau, 1887); references to later work will be found in C. H. Walker’s The Analytical Theory of Light (1904). In addition to the above the reader may consult for the general subject of polarization the following treatises: Th. Preston (3rd, ed. by C. J. Joly), Electromagnetism, Light, and Heat (1903); A. de Sèze, Analytical Treatise of Optics (1904); R. W. Wood, Physical Optics (1905); E. Mascart, Travaux d’optique (1889); and for the phenomena exhibited by crystals F. Pockels, Lehrbuch der Kristalloptik (1906); Th. Liesbich, Physikalische Kristallographie (1911).

POLAR REGIONS, a general term for the regions about the North or South Pole, otherwise called the Arctic or Antarctic regions. The ancients had no actual knowledge of History of the Polar Regions. They had probably heard rumours of the light summer nights and the dark winter days. The best description of the Laestrygons having the short nights and the Cimmerians living in perpetual darkness by astronomical speculations the Greeks had come to the conclusion that north of the Arctic Circle there must be midnight sun at midsummer and no sun at midwinter. The general view was that the Polar regions, north and south, belonged to the uninhabitable frozen zones; while according to a less scientific notion there was a happy region north of the wind (Boreas), where the sun was always shining and the Hyperboreans led a peaceful life. The first traveller of history who probably approached the Arctic Circle and reached the land of the midnight sun was Pytheas of Magnesia (C. 330 B.C.), from whom the name Pytheas comes. It is the same land that called Thule, where there was hardly any night at midnight. It is possible that Iceland and the Faeroes were inhabited by a small Celtic population before the Irish monks

We hear of no other voyages towards the Arctic regions before the Irish monk Dicuil, writing about a.d. 825, mentions the discovery by Irish monks of a group of small islands (the Irish write De Sylva, and a translation of their name calls Thule, where there was hardly any night at midnight. It is possible that Iceland and the Faeroes were inhabited by a small Celtic population before the Irish monks

Glaclers...
came thither. The fact that Irish monks lived in Iceland before the Norsemen settled there in the end of the 9th century is verified by the Icelandic sagas.

In his translation of Orosius, King Alfred inserts the interesting story of the first known really Arctic voyage, told him by the Norwegian Ottar (Alfred calls him Oththere), who about 870 rounded the North Cape, sailed eastwards along the Murman coast and discovered the White Sea, where he reached the south coast of the Kola Peninsula and the boundary of the land of the Biarmians (Bearoons). Ottar told King Alfred that “he chiefly went thither, in addition to the seeing of the country, on account of the walruses.”

After Ottar’s time the king of Norway took possession of all land as far east as the White Sea and the land of the Biarmians, and the native “Finns” had to pay him tribute. Many voyages, mostly of hostile nature but also for trade purposes, were undertaken from Norway to the White Sea, and even kings went as far. It is told of King Eric, called Bloodaxe, who died as king of York in England, that he made such a voyage, and fought with the Biarmians, about 920, and about 905 his son Harold Graafeld defeated the Biarmians and killed many people in a great battle near the river Dvina, where Archangel was built later.

After having settled in Iceland in the end of the 9th century, the Norsemen soon discovered Greenland and settled there. The first who is reported to have seen the coast of Greenland was a Norwegian, Gunnbjörn Ulfsson, who on his way to Iceland was storm-driven westwards. He came to some islands, afterwards called Gunnhjörnsker, and saw a coast, but, without exploring the new land, he had evidently continued his way till he reached Iceland. The real discoverer and explorer of Greenland was the Norwegian, Eric the Red, who, with his father had settled in Iceland. As he and his men had been declared outlaws for having killed several people they had to leave Iceland for three years, and he went westward to find the land which Gunnbjörn was reported to have seen. He explored the west coast of Greenland for three years, probably about 982-985. He then returned to Iceland, and founded the following year a colony in Greenland (g.n.). Many colonists followed, and two Norse settlements were formed, viz. the Eystrabyggd (i.e. eastern settlement) on the south-eastern part of the Greenland west coast, between Cape Farewell and about 61° N. lat., where Eric the Red had his house, Brattalid, at the Eiriksfjord; and the Vestabyggd (i.e. western settlement) in the region of the present Godthaab district, between 63° and 66° N. lat. The Norse settlers carried on their seal and whale-hunting still farther north along the west coast beyond the Arctic circle, and probably in the region of Disco Bay. A rune stone was found in a calm near Godthaab Island in 1749, north of Upernavik, showing that Norsemen had been there.

The stone probably dates from the 14th century. About 1267 an expedition was sent northwards along the west coast and may possibly have reached some distance north of Upernavik.

The last known communication between the Norse settlements in Greenland and Norway was in 1410, when some Icelanders returned, who four years previously had been storm-driven to Greenland. After that time we possess no reliable information about the fate of these settlements. When Greenland was rediscovered in the 16th century no descendants of the Norse settlers were found. The probability is that having gradually been cut off from all communications with Europe, the remaining settlers who had not returned to the motherland were obliged to adopt the Eskimo mode of life, which in those surroundings was far superior to the European, and by intermarriage they would then soon be absorbed amongst the more numerous natives. There is evidence to show that an expedition was probably sent from Denmark or Norway to Greenland in the latter part of the 15th century (perhaps about 1470) under Pining and Pothorsh (by Purchas called "Punns and Pothorse"); and perhaps with Johan Scolvus as pilot. It is probable that this expedition had intercourse with the natives of Greenland, and possibly even reached Labrador, but it is unknown whether any remains of the Norse settlements were found on the Greenland west coast.

It is reported by Adam of Bremen (about 1070) that the Norwegian king Harold Haardraade (in the 11th century) made an expedition into the Arctic Sea (probably northwards) in order to examine how far it extended, but we know nothing more about this voyage.

The Icelandic annals report that a land called Snaulandi was discovered in 1194. The name means the cold side or coast. The land was, according to the sagas, situated four days’ sailing from north-eastern Iceland northwards in the Hafsbotn (i.e. the northern termination of the land). There can be no doubt that this land was Spitsbergen. The Norsemen carried on seal, walrus and whale hunting, and it is believed on good ground that they extended their hunting expeditions eastwards as far as Novaya Zemlya and northwards to Spitsbergen.

On his way to Greenland from Norway in the year 1000 Leif Ericsson found America, probably Nova Scotia, which he called Wineland the Good. A few years later Thorfinn Karlsefni sailed from Greenland with three ships to make a settlement in the land discovered by Leif. They first came to Labrador, which they called Heligoland, then to Newfoundland, which was called Markland (i.e. woodland), and then to Cape Breton and Nova Scotia (Vinland; Wineland). After three years they had to give up the undertaking on account of hostilities with the natives, probably Red Indians, and they returned to Greenland about 1006. We know of no later expedition of the Norsemen that reached Greenland; it is stated that Eric Upfri, the first bishop of Greenland, went in 1121 to seek Vinland, but it is not related whether he ever reached it, and the probability is that he never returned.

The Icelandic annals state that in 1347 a small Greenland ship which had sailed to Markland (Newfoundland) was afterwards storm-driven to Iceland with seventeen men. This is the last known voyage made by the Norsemen of Greenland which with certainty reached land in America.

The discoveries of the old Norsemen extended over the northern seas from Novaya Zemlya in the east to Labrador, Newfoundland and Nova Scotia in the west; they had visited all Arctic lands in these regions, and had explored the White Sea, the Barents Sea, the Spitsbergen and Greenland Sea, Davis Strait, and even some part of Baffin Bay. They were the first navigators in history who willingly left the coasts and sailed across the open ocean, and they crossed the Atlantic between Norway and America, thereby being the real discoverers of this ocean, as well as the pioneers in oceanic navigation. They were ahead of all modern navigators by centuries, and it is hardly an accident that the undertakings of England towards the west started from Bristol, where many Norwegians had settled, and which from the beginning of the 15th century had much trade with Iceland.

John Cabot, sent out by the merchants of Bristol, rediscovered the American continent in 1497. He came to Cape Breton and Nova Scotia, probably the same land where Leif Ericsson had landed 500 years before. John Cabot started on a new expedition towards the west in 1498, but no more is known of this expedition, not even whether Cabot returned or not. There is no reliable evidence to prove that John Cabot or his son Sebastian ever discovered Labrador, as has been generally believed.

The Portuguese Gaspar Corte-Real rediscovered Greenland in 1500. He sailed along its east coast without being able to land on account of the ice. Whether he visited the west coast is uncertain. In 1501 he made a new expedition when he also rediscovered Newfoundland. One of his ships returned home to Lisbon, but he himself and his ship disappeared. His brother went in search of him the following year, but was heard of no more.

Cabeot's and Corte-Real's discoveries were followed by the development of the Newfoundland and Labrador fisheries,
and a whole fleet of English, Portuguese, Basque and Breton fishermen was soon met with in these waters, and they probably still along the Hudson coast onward, as far as Hudson Strait, without having left any report of their discoveries.

It is believed, on good grounds, that expeditions (combined English-Portuguese) were sent out to the newly discovered regions from Bristol in 1501 and 1502. It is unknown what their discoveries were, but they may possibly have sailed along the coast of Labrador.

It is possible that John Cabot’s son, Sebastian Cabot, made an Arctic expedition in 1558-1559, in search of a short passage to China towards the north-west, and later, in 1521, King Henry VIII. made an attempt to persuade the merchants of London to support him in sending out an expedition, under Sebastian Cabot, to the north-western countries. It is uncertain whether it ever started, but it is certain that it achieved nothing of importance.

John Rut sailed from Plymouth in 1557, in order to seek a passage to China through the Arctic seas towards the north-west, following the suggestion of Robert Thorne of Bristol. He met ice in 55° N. lat. and returned to Newfoundland. Several other expeditions were sent out from various countries towards the north-west and west during this period, but no discoveries of importance are known to have been made in the Arctic regions.

There are rumours that the Portuguese, as early as 1484, under King John II., had sent out an expedition towards Novaya Zemlya in search of a north-east passage to India. The Genovese Paolo Centurione probably proposed to King Henry VIII. of England, in 1525, to make an expedition to search for such a passage to India north of Russia, and there is evidence to show that there had been much talk about an undertaking of this kind in England and at the English court during the following period, as it was hoped that a new market might be found for English merchandise, especially cloth. But it led to nothing until 1553, when Sebastian Cabot was one of the chief promoters. Three ships and 112 men under Sir Hugh Willoughby sailed from Ratcliffe on the 10th (20th) May 1553. Richard Chancellor commanded one of the ships, which was separated from the two others in a gale off northern Norway on the 3rd (13th) August. Willoughby, after having sighted land in various places, probably Kolguev Island, where they landed, the coast near the Pechora river and Kanin Nos, came on the 14th (24th) September to a good harbour on the northern coast of the Kola Peninsula. His one ship being leaky, Willoughby resolved to winter there, but he and all his men perished. Chancellor, after his separation from the two other ships, rounded the North Cape, to which he or his sailing-master, Stephen Borough, gave this name. He reached Vardhous, and after having waited there in vain for Willoughby, he followed the route of the Norsemen to the White Sea and reached the bay of St. Nicholas, with a monastery of this name, near the mouth of the Dvina river, where Archangel was built later. Chancellor undertook a journey to Moscow, made arrangements for commercial intercourse with Russia, and returned next year with his ship, which was, however, plundered by the Flemings, but he reached London safely with a letter from the tsar. In spite of the disaster of Willoughby and his men this expedition became of fundamental importance for the development of English trade. Chancellor’s success and his so-called discovery of the passage to the White Sea, which was well known to the Norwegian traders in that region, proved to people in England the practical utility of these regions. It led to a charter being granted to the Association of Merchant Adventurers, also called the Muscovy or Russia Company, and gave a fresh impulse to Arctic discovery. Chancellor undertook a new expedition to the White Sea and Moscow in 1555; on his way home in the following year he was wrecked on the coast of Scotland and perished.

In 1556 Stephen Borough (Burrough), who had served with Chancellor, was sent out by the Muscovy Company in a small pinnace called the “Search-thrift,” in order to try to reach the river Ob, of which rumours had been heard. Novaya Zemlya, Yalich Island, and the Kara Strait leading into the Kara Sea were found by Chancellor, who kept a careful journal of his voyage. In 1580 the company fitted out two vessels under Arthur Pet and Charles Jackman, with orders to sail eastwards of north of Russia and Asia to the lands of the emperor of Cathay (China). They penetrated through the Kara Strait into the Kara Sea; they possibly saw the west coast of Yalmal, but met with much ice and were compelled to return. The two ships were separated on the way home, Pet reached London on December 26th in safety; Jackman wintered with his ship in Norway and sailed thence in February, but was never heard of again.

About 1574 the Portuguese probably made an attempt to find the north-west passage under Vasqueanes Corte-Real. They reached “a great entrance,” which may have possibly been Hudson Strait, and they “passed above twenty leagues” into it, “without all impediment of ice,” “but their victualls failing them . . . they returned backe agayne with joy.”

After the expeditions in search of the north-west passage achieved the success of opening up a profitable trade with Russia, via the White Sea, new life was inspired in the undertakings of England on the sea, at the same time the power of the Hanseatic merchants, called the Easterlings, was much reduced. It was therefore only natural that the plan of seeking a north-west passage to China and India should again come to the front in England, and it was much discussed. It was Sir Martin Frobisher who opened that long series of expeditions all of which for three hundred years were sent from England in search of the north-west passage until the last expedition, which actually accomplished it, sailed from Norway. “Being persuaded of a new and neerer passage to Cataya” (China) towards the north-west, Frobisher “determined and resolved wyth himself, to go make full proffe thereof . . . or else never to returne againe, knowing this to be the onely thing of the worlde that was left yet undone, whereby a notable mind might be made famous and fortunate.” After having attempted in vain for fifteen years to find support for his enterprise, he at last obtained assistance from Ambrose Dudley, earl of Warwick, and through him the interest of Queen Elizabeth was also secured. The Muscovy Company was now obliged to give a licence for the voyage in 1574, and the necessary money was found by London merchants. Aided especially by Michael Lok, an influential merchant and diligent student of geography, Frobisher sailed, on the 7th (17th) of June 1576, from Deptford with two small vessels of 20 and 25 tons, called the “Gabriel” and “Michael,” and a small pinnace of 10 tons; the crews amounted to 35 men all told. On the 8th (18th) of July they lost sight of the pinaca, which was seen no more. On the 11th (21st) of July they sighted a high, rugged land, but could not approach it for ice. This was the east coast of Greenland, but, misled by his charts, Frobisher assumed it to be the fictitious Frisland, which was the fabrication of a Venetian, Niccolo Zeno, who in 1558 published a spurious narrative and map (which he pretended to have found) as the work of an ancestor and his brother in the 14th century. The Zeno map was chiefly fabricated on the basis of a map by the Swede Olaus Magnus of 1537 and the map by the Dane Claudius Clavus of the 15th century. It was accepted at the time as a work of high authority, and its fictitious names and islands continued to appear on subsequent maps for at least a century, and have puzzled both geographers at home and explorers in the field. These islands had also been introduced on the charts of Mercator of 1569 and of Ortlev of 1570, and Frobisher probably followed these. Evidently frightened by the sight of the great quantities of ice off the Greenland coast, one ship, the “Michael,” left him secretly, “and returned home wyth greate reporte that he was cast away.” The gallant Frobisher continued his voyage towards the north-west in the “Gabriel” alone, although his mast was sprung, his topmast blown overboard, and his “mizen-mast” had had to be cut away in a gale. On the 29th of July (Aug. 8) he sighted high
land which he called Queen Elizabeth's Foreland. This was the southern part of Baffin Land (Resolution Island) in about 62° N. lat. He was stopped by ice, but nearly two weeks later he reached the coast and entered an inlet which he considered to be the strait of the north-west passage, and he gave it his own name (it is now Frobisher Bay on Baffin Land). The land was called "Meta Incognita." Frobisher was not well prepared for going much farther, and after his boat with five men had disappeared he returned home, where, unfortunately, some "gold-finders" in London took it into their heads that a piece of dark heavy stone brought back contained gold ore. This caused great excitement; it was now considered much more important to collect this precious ore than to find the north-west passage, and much larger expeditions were sent out in the two following years. As many as fifteen vessels formed the third expedition of 1578, and it was the intention to form a colony with a hundred men in the gold land, but this scheme was given up. Frobisher came into Hudson Strait, which was at first thought to be Frobisher Strait and therefore called Mistaken Strait. There was an open sea without any land or ice towards the west, and Frobisher was certain that he could sail through to the "Mare del Sur" (Pacific Ocean) and "Kathaya," but his first goal was the "gold mines," and the vessels returned home with full loads of the ore. One of them, a buss (small ship) of Bridgewater, called the "Emmanuel," reported that on her voyage home she had first sighted Frisiland on the 8th (18th) of September, but four days later she had sighted another land in the Atlantic and sailed along it till the following day; they reckoned its southern end to be in about 57°30' N. lat. This land soon found its place on maps and charts south-west of Iceland under the name of Buss Island, and as it was never seen again it was after 1745 called "the sunken land of Buss." The explanation is that, misled by the maps, Frobisher assumed Greenland to be Frisland of the Zeno map and Baffin Land was afterwards assumed to be the east coast of Greenland. When the buss on her way home sighted Greenland in about 62° N., she therefore thought it to be Frisiland, but when she four days later again sighted land near Cape Farewell and her dead reckoning probably had carried her about two degrees too far south, she naturally considered this to be a new land, which puzzled geographers and navigators for centuries. Owing to a similar mistake, not by Frobisher, but by later cartographers and especially by Davis, it was afterwards assumed that Frobisher Strait (and also Mistaken Strait) was not in Baffin Land but on the east coast of Greenland, where they remained on the maps till the 18th century.

John Davis, who made the next attempt to discover a north-west passage, was one of the most scientific seamen of that age. He made three voyages in three successive years aided and fitted out by William Sanderson and other merchants. Sailing from Dartmouth on the 7th (17th) of June 1585, with two ships, he sighted on the 20th (30th) of July "the most deformed, rocky and mountainous land, that ever we saw." He named it the Land of Desolation, although he understood that he had rediscovered "the shore which in ancient time was called Groenland." It was its east coast. He visited the west coast, where Frobisher had also mistaken it for Frisiland. Davis anchored in a place called Gilbert's Sound in 64°00' (near the present Danish settlement of Godthaab) and had much intercourse with the Esquimaux. He then, crossing the strait which bears his name, traced a portion of its western shore southwards from about 65°40' N. lat. and came into Cumberland Sound, which he thought to be the strait of the north-west passage, but returned home on account of contrary winds. In the second voyage (with four ships) Davis traced the western shore of Davis Strait still farther southwards, and sailed along the coast of Labrador. In the third voyage (with three ships) in 1587 he advanced far up his own strait along the west coast of Greenland in a small leaky pinnace, "Ellin," and reached a lofty granite island in 72°41' N. lat., which he named Hope Sound. He met with ice in the sea west of this place, but reported that there was not "any yce towards the north, but a great sea, free, large, very salt and blew, and of an unsearchable depth." By contrary winds, however, he was prevented from sailing in that direction. He sailed into Cumberland Sound, but now found that there was no passage. He also passed on his way southwards the entrance to Frobisher Strait, which he named Lumley Inlet, and Hudson Strait, without understanding the importance of the latter. When Davis came to Labrador, where his two larger ships were to have waited for him, they had sailed to England. The little "Ellin" now struck a broken rock and sprung a leak, which was repaired, and he crossed the Atlantic in this small leaky craft. He still believed in the existence of a passage through Davis Strait, but could find no support for another Arctic voyage. Davis was not the first to discover this strait; it was well-known to the Norsemen. Gaspar Corte-Real had possibly also been there, and Frobisher had during his voyages crossed its southern part every year. The result of Davis's discoveries are shown on the Molynex globe, which is now in the library of the Middle Temple; they are also shown on the "New Map" in Hakluyt's Principal Navigations (1598-1600). When Davis was trying to reconcile his discoveries to the previous ones, especially those of Frobisher, he made fatal mistakes as mentioned above. As early as 1565, by the intervention of a certain Philip Winterkönig, an exile from Vardøhus in Norway, Dutch merchants formed a settlement in Kola, and in 1578 two Dutch ships anchored in the mouth of the river Dvina, and a Dutch settlement was established where Archangel was built a few years later. The leading man in these undertakings was Olivier Brunel, who is thus the founder of the White Sea trade of the Dutch; he was also their first Arctic navigator. He had travelled both overland and along the coast to Siberia and reached the river Ob; he had also visited Kasin Shar on Novaya Zemlya. He propounded plans for the discovery of the north-east passage to China, and in 1581 he went from Russia to Antwerp to prepare an expedition. He probably started with one ship in 1582, on the first Arctic expedition which left the Netherlands. Little is known of its fate except that it ended unsuccessfully with the wreck of the ship in the shallow Pechora Bay, possibly after a vain attempt to penetrate through the Yugor Strait into the Kara Sea. In 1583 we find Olivier Brunel in Bergen trying to organize a Norwegian undertaking, evidently towards the north-east, but it is uncertain whether it led to anything.

The English, however, started to see the importance of a northern route to China and India, especially as the routes through the southern seas were jealously guarded by the Spaniards and Portuguese, and after 1584 all trade with Portugal, where the Dutch got Indian goods, was forbidden. By Brunel's efforts their attention had been directed towards the north-east passage, but it was not until 1594 that a new expedition was sent out, one of the promoters being Peter Plancius, the learned cosmographer of Amsterdam. Four ships sailed from Havszunden on the 5th (15th) of June 1594. Two of these ships from Amsterdam were under the command of Willem Barents, who sighted Novaya Zemlya, north of Matroos Strait, and sailed on to the New Land, which he named home on the 11th (21st) of August from that date until the 1st (17th) of Barents continued perseveringly to seek a way through the ice-floes, and discovered the whole western coast as far as the Great Ice Cape, the latitude of which he, with his admirable accuracy, determined to be 77° N. Having reached the Orange Islands at the north-west extremity, he decided to return. The two other ships under the command of Cornelis Nay had discovered the Yugged Strait, through which they sailed into the Kara Sea on the 1st (11th) of August. They reached the west coast of Yamal; being sure that they had passed the mouth of the river Ob, and seeing the sea open, they thought they had found a fresh passage to Japan, and returned home on the 11th (21st) of August. A new expedition was made the following year, 1595, with seven ships under the command of Cornelis Nay, as admiral, and Willem Barents as
Polar Regions

Chief pilot, but it merely made several unsuccessful attempts to enter the Kara Sea through the Yugor Strait. The third expedition was more spectacular. Two vessels sailed from Amsterdam on the 10th (20th) of March 1596, under the command of Jacob van Heemskerk and Corneliozoon Rijp, and Barents accompanied Heemskerck as pilot, and Gerrit de Veer, the historian of the voyage, was on board as mate. The masses of ice in the straits leading to the Sea of Kara, and the impenetrable nature of the pack near Novaya Zemlya, had suggested the advisability of avoiding the land and, by keeping a northerly course, of seeking a passage in the open sea. They sailed northwards, and on the 9th (19th) of June discovered Bear Island. Continuing on the same course they sighted a mountainous snow-covered land in about 85° N. lat., soon afterwards being stopped by the polar pack ice. This important discovery was named Spitsbergen, and was believed to be a part of Greenland. Arriving at Bear Island again on the 1st of July, Rijp parted company, while Heemskerck and Barents proceeded eastward, intending to pass round the northern extreme of Novaya Zemlya. On the 20th of August (Sept. 5) they reached Ice Haven, after rounding the northern extremity of the land. Here they wintered in a house built out of driftwood and planks from the 'tween decks and the deck-house of the vessel. In the spring they made their way in boats to the Lapland coast; but Barents died during the voyage. This was the first time that an arctic winter was successfully faced. The voyages of Barents stand in the first rank among the polar enterprises of the 16th century. They led to flourishing whale and seal fisheries which long enriched the Netherlands.

The English enterprises were continued by the Muscovy Company, and by associations of patriotic merchants of London; and even the East India Company sent an expedition under Captain Waymouth in 1602 to seek for a passage by the opening seen by Davis, but it had no success.

The best servant of the Muscovy Company in the work of polar discovery was Henry Hudson. His first voyage was undertaken in 1607, when he discovered the most northern known point of the east coast of Greenland in 73° N, named "Hold with Hope," and examined the ice between Greenland and Spitsbergen, probably reaching Hakluyt's Headland in 79° 50' N. On his way home he discovered the island now called Jan Mayen, which he named "Hudson's Tutches." In his second expedition, during the season of 1608, Hudson examined the edge of the ice between Spitsbergen and Novaya Zemlya. In his third voyage he was employed by the Dutch East India Company; he again approached Novaya Zemlya, but was compelled to return westwards, and he explored the coasts of North America, discovering the Hudson river.

In 1610 he entered Hudson Strait, and discovered the great bay which bears and immortalizes his name. He was obliged to winter there, undergoing no small hardships. On his way home his crew mutinied and set him, his little son and some sick men adrift in a boat, and the explorer perished in the seas he had opened up.

The voyages of Hudson led immediately to the Spitsbergen whale fishery. From 1609 to 1612 Jonas Poole made four voyages for the prosecution of this lucrative business, and he was followed by Fotherby, Baffin, Joseph, and Edge. These hold seamen, while in the pursuit of whales, added considerably to the knowledge of the archipelago of islands known under the name of Spitsbergen, and in 1617 Captain Edge discovered an island to the eastward, which he named Wyche's Land.

About the same time the kings of Denmark began to send expeditions for the rediscovery of the lost Greenland colony. In 1605 Christian IV, sent out three ships, under the Englishmen Cunningham and Hall and a Dane named Lindencov, which reached the western coast of Greenland and had much intercourse with the Eskimo. Other expeditions followed in 1606-1607.

Meanwhile, the merchant adventurers of London continued to push forward the western discovery. Sir Thomas Button, in command of two ships, the "Resolution" and "Discovery," sailed from England in May 1612. He entered Hudson Bay, crossed the western shore, and wintered at the mouth of a river in 57° 10' N. This was named Nelson river after the master of the ship, who died and was buried there. Next year Button explored the shore of Southampton Island as far as 65° N., and returned home in the autumn of 1613.

An expedition under Captain Gibbons despatched in 1614 to Hudson Bay was a failure; but in 1615 Robert Bylot as pilot and William Baffin as pilot and navigator in the "Discovery" examined the coasts of Hudson Strait and to the north of Hudson Bay, and Baffin, who was the equal of Davis as a scientific seaman, made many valuable observations. In 1616 Bylot and Baffin again set out in the "Discovery." Sailing up Davis Strait they passed that navigator's farthest point at Sanderson's Hope, and sailed round the great channel with smaller channels leading from it which has been known ever since as Baffin Bay. Baffin named the most northern opening Smith Sound, after the first governor of the East India Company, and the munificent promoter of the voyage, Sir Thomas Smith. Lancaster Sound and Jones Sound were named after other promoters and friends of the voyage. The fame of Baffin mainly rests upon the discovery of a great channel extending north from Davis Strait; but it was unjustly dimmed for many years, owing to the omission of Purchas to publish the navigator's tabulated journal and map in his great collection of voyages. It was two hundred years before a new expedition sailed north through Baffin Bay. It may be mentioned, as an illustration of the value of these early voyages to modern science, that Professor Hansteen of Christiania made use of Baffin's magnetic observations in the compilation of his series of magnetic maps. In 1619 Denmark sent out an expedition, under the command of Jens Munk, in search of the north-west passage, with two ships and 64 men. They reached the west coast of Hudson Bay, where they wintered near Churchill river, but all died with the exception of one man, a boy, and Munk himself, who managed to sail home in the smallest ship.

In 1631 two expeditions were despatched, one by the merchants of London, the other by those of Bristol. In the London ship "Charles," Luke Fox explored the western side of Hudson Bay as far as the place called "Sir Thomas Roe's Welcome." In August he encountered Captain James and the Bristol ship "Maria" in the middle of Hudson Bay, and went north until he reached "North-west Fox his farthest," in 66° 47' N. He then returned home and wrote an entertaining narrative. Captain James had to winter off Charlton Island, in James Bay, the southern extreme of Hudson Bay, and did not return until October 1632. Another English voyager, Captain Wood, attempted, without success, to discover a north-east passage in 1676 through the sea round the North Pole, but was wrecked on the coast of Novaya Zemlya.

The 16th and 17th centuries were periods of discovery and daring enterprise. Hudson Strait and Bay, Davis Strait and Baffin Bay, the icy seas from Greenland to Spitsbergen and from Spitsbergen to Novaya Zemlya had all been explored; but much more was not discovered than had been well known to the Norsemen five or six centuries earlier. The following century was rather a period of reaping the results of former efforts than of discovery. It saw the settlement of the Hudson Bay Territory and of Greenland, and the development of the whale and seal fisheries.

The Hudson's Bay Company was incorporated in 1670, and Prince Rupert sent out Zachariah Gillan, who wintered at Rupert Harbour. At first very slow progress was made. A voyage undertaken by Mr. Knight, nearly 80 years old, who had been appointed governor of the factory at Nelson river, was unfortunate, as his two ships were lost and the crews perished. This was in 1719. In 1722 John Scroggs was sent from Churchill river in the missing ships, but merely entered Sir Thomas Roe's Welcome and returned. His reports were believed to offer decisive proofs of the existence.
of a passage into the Pacific; and a naval expedition was de-
spatched under the command of Captain Christopher Middleton,
consisting of the "Discovery" pink and the "Furn-
ace" bomb. Wintering in Churchill river, Middle-
town started in July 1742 and discovered Wager river and Repulse
Bay. In 1746 Captain W. Moor made another voyage in the
same direction, and explored the Wager Inlet.

Moor.

Later in the century the Hudson's Bay Company's

servants made some important land journeys to discover the
shores of the American polar ocean. From 1769 to 1772 Samuel
Hearne descended the Coppermine River to the polar sea; and in
1789 Alexander Mackenzie discovered the mouth of the
Mackenzie river. (For the establishment of the modern Danish
settlements in Greenland, see GREENLAND.)

The countrymen of Barents vied with the countrymen of
Hudson in the perilous calling which annually brought fleets
of ships to the Spitsbergen seas during the 17th and
18th centuries. The Dutch had their large summer
station for boiling down blubber at Smeerenberg,
near the northern extreme of the west coast of Spitsbergen.
Captain Vlamingh, in 1664, advanced as far round the northern
end of Novaya Zemlya as the winter quarters of Barents. In
1700 Captain Martens, a nobleman, sailed by Witsen who had sailed
north in the longitude of Novaya Zemlya and to have been
an extent of 40 m. of broken land, but Theunis Ys, one of the
most experienced Dutch navigators, believed that no vessel
had ever been north of the 82nd parallel. In 1671 Frederick
Martens, a German surgeon, visited Spitsbergen, and
wrote the best account of its physical features and
natural history that existed previous to the time of Scoresby.
In 1707 Captain Cornelis Gillies went far to the eastward
along the northern shores of Spitsbergen, and saw land to the east in 80° N., which has since been known as Gillies Land. The
Dutch geographical knowledge of Spitsbergen was embodied
in the famous chart of the Van Keulens (father and son), 1700-
1728. The Dutch whale fishery continued to flourish until the
French Revolution, and formed a splendid nursery for training
the seamen of the Netherlands. From 1700 to 1775 the whaling
fleet numbered 100 ships and upwards. In 1719 the Dutch
opened a whale fishery in Davis Strait, and continued to frequent
the west coast of Greenland for upwards of sixty years from that
time.

The most flourishing period of the British fishery in the
Spitsbergen and Greenland seas was from 1732 to 1820. Bounties
of 40s. per ton were granted by act of parliament; and in 1776 as many as 225 sail of whalers were
employed. In order to encourage discovery £5,000
was offered in 1776 to the first ship that should sail beyond the
89th parallel (16 Geo. III. c. 6). Among the numerous daring
and able whaling captains, William Scoresby takes the first rank, alike as a successful whaler and a
scientific observer. His admirable Account of the Arctic Regions
is still a textbook for all students of the subject. In 1806 he
succeeded in advancing his ship "Resolution" as far north as
83° 12' 42". In 1822 he forced his way through the ice which
encumbers the approach to land on the east coast of Greenland,
and surveyed that coast from 75° down to 69° N., a distance of
400 m. Scoresby combined the closest attention to his
business with much valuable scientific work and did not insignifi-
cantly amount of exploration.

The Russians, after the acquisition of Siberia, succeeded in
gradually exploring the whole of the northern shores of that vast
region. In 1648 a Cossack named Simon Dezhneff
is said to have equipped a boat expedition in the river Kolyma, passed through the strait since named after Bering, and reached the Gulf of Anadyr. In 1738 a voyage was
made by two Russian officers from Archangel to the mouths of the
Ob and the Yenisei. Efforts were then made to effect a
passage from the Yenisei to the Lena. In 1735 Lieut.
T. Chalyushkin got as far as 77° 40' N. near the cape which
bears his name; and in 1743 he rounded that most
northern point of Siberia in sledges, in 77° 41' N. Captain
Vitus Bering, a Dane, was appointed by Peter the Great to
command an expedition in 1725. Two vessels were built at
Okhotsk, and in July 1728 Bering ascertained the
existence of a strait between Asia and America.

Bering.

In 1740 Bering was again employed. He sailed from Okhotsk
in a vessel called the "St Paul," with G. W. Steller on board as
naturalist. Their object was to discover the American side
of the strait, and they sighted the magnificent peak named
Bering Mt St Elias. The Aleutian Islands were also explored,
but the ship was wrecked on an island named after the ill-fat-
deserved of discovery, and scurvy broke out amongst his crew. Bering himself died there on the 9th of December 1741.

Hedenström.

These islands were more fully explored by an officer named
Hedenström in 1809, and seekers for fossil ivory annually resorted

of. From 1773 onwards to the end of the 19th century the objects
of polar exploration were mainly the acquisition of knowledge
in various branches of science. It was on these grounds that
Daines Barrington and the Royal Society induced the British
government to undertake arctic exploration once more. The
result was that two vessels, the "Racehorse" and "Carcass"
bombs, were commissioned, under the command of
Captain J. C. Phipps. The expedition sailed from the
Nore on the 2nd of June 1773, and was stopped by the ice to the
north of Hakuyt Headland, the north-western point of Spits-
bergen. Phipps reached the Seven Islands and discovered Walden
Island; but beyond this point progress was impossible. When
he attained their highest latitude in 86° 48' N., north of the
central part of the Spitsbergen group, the ice at the edge of the
pack was 24 ft. thick. Captain Phipps returned to England
in September 1773. Five years afterwards James
Cook. Cook received instructions to proceed northerly from Kamchatka and search for a north-east or north-west
passage from the Pacific to the Atlantic. In accordance with
these orders Captain Cook, during his third voyage, reached
Cape Prince of Wales, the western extremity of America, on
the 9th of August 1778. His ships, the "Resolution" and "Discovery", arrived at the edge of the ice, after passing Bering
Strait, in 70° 41' N. On the 17th of August the farthest
point seen on the American side was named Icy Cape. On the
Asian side Cook's survey extended to Cape North. In
the following year Captain Clerke, who had succeeded to the
command, made another voyage, but his ship was beset in the
ice, and so much damaged that further attempts were
abandoned.

The wars following the French Revolution put an end to voyages
to discovery till, after the peace of 1815, north polar research
found a powerful and indefatigable advocate in Sir
John Barrow. Through his influence a measure for
promoting polar discovery became law in 1818 (38 Geo. III.
c. 20), by which a reward of £20,000 was offered for making the
first west passage, and of £5000 for reaching 86° N., while
the commissioners of longitude were empowered to award pro-
portionate sums to those who might achieve certain portions of
such discoveries. In 1817 the icy seas were reported by Captain
Scoresby and others to be remarkably open, and this circumstance
enabled Barrow to obtain sanction for the despatch of two
expeditions, each consisting of two whalers—one to attempt
discoveries by way of Spitsbergen and the other by Baffin
Bay. The vessels for the Spitsbergen route, the "Dorothea" and
"Treat", were commanded by Captain David Buchan and
Lieut. John Franklin, and sailed in April 1818. Driven
into the pack by the prevailing south-westerly winds, both
vessels were severely crippled, and had to return to England.
The other expedition, consisting of the "Isabella" and
"Alexander", commanded by Captain John Ross and Lieut.
Barrow.
Edward Parry, followed in the wake of Baffin's voyage of 1616. Ross sailed from England in April 1818. The chief merit of his voyage was that it vindicated Baffin's accuracy as a discoverer. For practical results, that of Baffin was a disappointment, for he found a lucrative fishery in the "North Water" of Baffin Bay, which continued to be frequented by a fleet of whalers every year. Captain Ross thought that the inlets reported by Baffin were merely bays, while the opinion of his second in command was that a wide opening to the westward existed through the Lancaster Sound of Baffin.

Parry was selected to command a new expedition in the following year. His two vessels, the "Hecla" and "Griper," under the command of Captain Parry, sailed from the Nore of Ireland on the 8th of May, and arrived at the ice on the 19th of May 1821, and again put into the ice for the winter. During the winter they were stranded on the north shore of Melville Island. Parry's scientific arrangements during the winter were judicious, and the scientific results of his expedition were valuable. The vessels returned in October 1820; and a fresh expedition in the "Fury" and "Hecla," again under the command of Captain Parry, sailed from the Nore on the 8th of May 1821, and put into the ice for the winter of the newly discovered archipelago in 66° 11' N. Still persevering, Parry passed his second winter among the Eskimo at Igloolik in 69° 20' N., and discovered a channel leading westward from the head of Hudson Bay, which he named Fury and Hecla Strait. The expedition returned in the autumn of 1823. Meantime Parry's friend Franklin had been employed in attempts to reach by land the northern shores of America, hitherto only touched at two points by Hearne and Mackenzie. Franklin went out in 1819, with Dr John Richardson, George Back and Robert Hood. They landed at York factory, and proceeded to the Great Slave Lake. In August of the following year they started for the Coppermine river, and, embarking on it, reached its mouth on the 18th of July 1821. From that point 550 m. of coast-line were explored, the extreme point being called Cape Turnagein. Great sufferings, from starvation and cold, had to be endured during the return journey; but eventually Franklin, Richardson and Back arrived safely at Fort Chippewyan.

It was thought desirable that an attempt should be made to connect the Cape Turnagein of Franklin with the discoveries made by Parry during his second voyage; but the first attempt, under Captain Lyon in the "Griper," was unsuccessful. In 1824 three combined attempts were organized. While Parry again entered by Lancaster Sound and pushed down a great opening he had seen to the south, named Prince Regent Inlet, Captain Beechey was to enter Bering Strait, and Franklin was to make a second journey by land to the shores of Arctic America. Parry was unfortunate, but Beechey entered Bering Strait in the "Blossom" in August 1826, and extended our knowledge as far as Point Barrow in 71° 23' 30" N. lat. Franklin, in 1825-1826, descended the Mackenzie river to its mouth, and explored the coast for 374 m. to the westward; while Dr Richardson discovered the shore between the mouths of the Mackenzie and Coppermine, and sighted land to the northward, named by him Wollaston Land, the dividing channel being called Union and Dolphin Strait. They returned in the autumn of 1826.

Work was also being done in the Spitsbergen and Barents Seas. From 1821 to 1824 the Russian Captain Litke was surveying the west coast of Novaya Zemlya as far as Cape Nassau, and examining the ice of the adjacent sea. In May 1823 the "Griper" sailed, under the command of Captain Clavering, to convey Captain Sabine to the polar regions in order to make pendulum observations. Clavering pushed through the ice in 75° 30' N., and succeeded in reaching the east coast of Greenland, where observations were taken on Pendulum Island. He charted the coast-line from 76° 20' to 74° 45' N.

In Parry's attempt to reach the pole from the northern coast of Spitsbergen by means of sledge-boats (see PARRY), the highest latitude reached was 82° 45' N., and the attempt was persevered in until it was found that the ice as a whole was drifting to the south more rapidly than it was possible to travel over it to the north.

In 1830 the Danes undertook an interesting piece of exploration on the east coast of Greenland. Captain Graah of the Danish navy rounded Cape Farewell in boats, with four Europeans and twelve Eskimo. He advanced as far as 65° 18' N. on the east coast, where he was stopped by an insurmountable barrier of ice. He wintered in 65° 22' N., and returned to the settlements on the west side of Greenland in 1830.

In the year 1829 Captain John Ross, with his nephew James Clark Ross, having been furnished with funds by a wealthy distiller named Felix Booth, undertook a private expedition of discovery in a small vessel called the "Victory." Ross proceeded down Prince Regent Inlet to the Gulf of Boothia, and wintered on the eastern side of a land named by him Boothia Felix. In the course of exploring excursions during the summer months James Ross crossed the land and discovered the position of the north magnetic pole on the western side of it, on the 1st of June 1831. He also discovered a land to the westward of Boothia which he named King William Land, and the northern shore of which he examined. The most northern point was called Cape Felix, and thence the coast trended south-west to Victory Point. The Rosses could not get their little vessel out of its winter quarters. They passed three winters there, and then fell back on the shores of Fury Beach, where they passed their fourth winter, 1832-1833. Eventually they were picked up by a whaler in Barrow Strait, and brought home. Great anxiety was naturally felt at their prolonged absence, and in 1835 Sir George Back, with Dr Richard King as a companion, set out by land in search of the missing explorers. Wintering at the Great Slave Lake, they left Fort Reliance on the 7th of June 1834, and descended the Great Fish river for 530 m. The mouth was reached in 65° 11' N., and then the want of supplies obliged them to return. In 1836 Sir George Back was sent, at the suggestion of the Royal Geographical Society, to proceed to Repulse Bay in his ship, the "Terror," and then to cross an assumed isthmus and examine the coastline thence to the mouth of the Great Fish river; but the ship was obliged to winter in the drifting pack, and was brought home in a sinking condition.

The tracing of the polar shores of America was completed by the Hudson's Bay Company's servants. In June 1837 Thomas Simpson and P. W. Dease left Chippewyan, reached the mouth of the Mackenzie, and connected that position with Point Barrow, which had been discovered by the "Blossom" in 1826. In 1839 Simpson passed Cape Turnagein of Franklin, tracing the coast eastward so as to connect with Back's work at the mouth of the Great Fish river. He landed at Montreal Island in the mouth of that river, and then advanced eastward as far as Castor and Pollux river, his farthest eastern point. On his return he travelled along the north side of the channel, the southern shore of the King William Island discovered by James Ross. The southwestern point of this island was named Cape Herschel, and there Simpson built a calum on the 26th of August 1839. Little remained to do in order to complete the delineation of the northern shores of the American continent, and this task was entrusted to Dr John Rae, a Hudson's Bay factor, in 1846. He went in boats to Repulse Bay, where he wintered in a stone hut near on the Arctic Circle; and there he and his six Orkney men maintained themselves on the deer they shot. During the spring of 1847 Dr Rae explored on foot the shores of a great gulf having 700 m. of coast-line. He thus connected the work of Parry, at the mouth of Fury and Hecla.
Strait, with the work of Ross on the coast of Boothia, proving that Boothia was part of the American continent. While British explorers were thus working hard to solve some of the geographical problems relating to Arctic America, the Russians were similarly engaged in Siberia. In 1821 Lieut. F. F. Anjou made a complete survey of the New Siberia Islands, and came to the conclusion that it was not possible to advance far from them in a northerly direction, owing to the thinness of the ice and to open water existing within 20 or 30 m. Baron Wrangel prosecuted similar investigations from the mouth of the Kolyma between 1820 and 1823. He made four journeys with dog sledges, exploring the coast between Cape Chelagakoi and the Kolyma, and attempted to make the passage to some distance from the land, but he was always stopped by thin ice. In 1843 Middendorf was sent to explore the region which terminates in Cape Chelyuskin. He reached Taimyr Bay in the height of the short summer, whence he saw open water and no ice blink in any direction. The whole arctic shore of Siberia had now been explored and delineated, but no vessel had yet rounded the extreme northern point.

The success of Sir James Ross’s Antarctic expedition and the completion of the northern coast-line of America by the Hudson’s Bay Company’s servants gave rise in 1845 to a fresh attempt to make the passage from Lancaster Sound to Bering Strait. The story of the unhappy expedition of Sir John Franklin, in the “ Erebus ” and “ Terror, ” is told under Franklin; but some geographical details may be given here. The heavy polar ice flows south-east between Melville and Baring Islands, down M’Clintock Channel, and impinges on the north-west coast of King William Land. It was this branch from the “ palaeocryostatic ” sea which finally stopped the progress of Franklin’s expedition. On leaving the winter quarters at Beechy Island in 1846 Franklin found a channel leading south, along the western shore of the land of North Somerset discovered by Parry in 1819. If he could reach the channel on the American coast, he knew that he would be able to make his way along it to Bering Strait. This channel, now called Peel Sound, pointed directly to the south. He sailed down it towards King William Island, with land on both sides. But directly the southern point of the western land was passed and no longer shielded the channel, the great ice stream from Melville Island, pressing on King William Island, was encountered and found impassable. Progress might have been made by rounding the eastern side of King William Island, but its insularity was then unknown.

It was not until 1846 that anxiety began to be felt about the Franklin expedition. In the spring of that year Sir James Ross opened the route that had been discovered by M’Clintock. Ross wintered at Leopold Harbour, near the north-east point of North Devon. In the spring he made a long sledging journey with Lieut. Leopold M’Clintock along the northern and western coasts of North Somerset, but found nothing.

On the return of the Ross expedition without any tidings, the country became tolerably alarmed. An extensive plan of search was organized—the “ Enterprise ” and “ Investigator ”—under Col. Collinson and M’Clure following the line of the “ Enterprise ”. The “ Investigator ” wintered at Leopold Harbour, near the north-west point of North Devon. In the spring he made a long sledging journey with Lieut. Leopold M’Clintock along the northern and western coasts of North Somerset, but found nothing.

Meanwhile M’Clure in the “ Investigator ” had passed the winter of 1845-1851 at the Princess Royal Islands, only 30 m. from Barrow Strait. In October M’Clure ascended a hill whence he could see the frozen surface of Barrow Strait, which was navigated by Parry in 1819-1820. Thus, like the survivors of Franklin’s crew when they reached Cape Herschel, M’Clure discovered a north-west passage. It was impossible to reach it, for the stream of heavily packed ice which stopped Franklin off King William Land lay athwart their northerly course; so, as soon as he was free in 1851, M’Clure turned southwards, round the southern extremity of Banks Land, and commenced to force a passage to the northward between the western shore of that land and the enormous fields of ice which pressed upon it. The cliffs rose like walls on one side, while on the other the stupendous ice of the “ palaeocryostatic ” sea rose from the water to a level with the “ Investigator’s ” lower yards. After many hairbreadth escapes M’Clure took refuge in a bay on the northern shore of Banks Land, which he named the Bay of
God's Mercy. Here the “Investigator” remained, never to move again. After the winter of 1851-1852 M'Clure had made a journey across the ice to Melville Island, and left a record of his own fieldwork. All attempts to recall him were unfortunately obtained, but a third winter had to be faced. In the spring of 1853 M'Clure was preparing to abandon the ship with all hands, and attempt, like Franklin's crews, to reach the American coast; but succour arrived in time.

The Hudson's Bay Company continued the search for Franklin. In 1848 Sir John Richardson and Dr Rae examined the American coast from the mouth of the Mackenzie to that of the Coppermine. In 1849 and 1850 Rae continued the search; and by a long sledging journey in the spring of 1851, and a boat voyage in the summer, he examined the shores of Wollaston and Victoria Lands, which were afterwards explored by Captain Collison in the “Enterprise.”

In 1852 the British government resolved to despatch another expedition by Lancaster Sound. Austin's four vessels were recommissioned, and the “North Star” was sent out as a depot ship to Beechy Island. Sir Edward Belcher commanded the “Assistance,” with the “Pioneer” under Sherard Osborn as steam tender. He went up Wellington Channel to Northumberland Bay, where he wintered, passing a second winter lower down in Wellington Channel, and then abandoning his ships and coming home in 1854. But Sherard Osborn and Com. G. H. Richards did good work. They made sledging journeys to Melville Island, and thus discovered the northern side of the Parry group. Captain Kellett received command of the “Resolute,” with M'Clintock in the steam tender “Intrepid.” Among Kellett's officers were the best of Austin's sledging-travelers, M'Clintock, Mecham, and Vesey Hamilton, so that good work was sure to be done. George S. Naes, leader of the future expedition of 1874-1875, was also on board the “Resolute.” Kellett pressed onwards to the westward and passed the winter of 1852-1853 at Melville Island. During the autumn Mecham discovered M'Clintock's record, and the position of the “Investigator” was thus ascertained. Lieut. Pim made his way to this point early in the following spring, and the officers and crew of the “Investigator” led by M'Clintock, arrived safely on board the “Resolute” on the 17th of June 1853. They reached England in the following year, having not only discovered but traversed a north-west passage, though not in the same ship and partly by travelling over ice. For this great feat M'Clintock received the honour of knighthood, and a reward of £10,000 was granted to himself, the other officers, and the crew, by a vote of the House of Commons.

The travelling parties of Kellett's expedition, led by M'Clintock, Mecham and Vesey Hamilton, completed the discovery of the northern and western sides of Melville Island, and the whole outline of the large island of Prince Patrick, further west. M'Clintock was away from the ship with his sledge party for one hundred and five days, and travelled over 1378 m. Mecham was away ninety-four days, and travelled over 1163 m. Sherard Osborn, in 1853, was away ninety-seven days, and travelled over 935 m. The “Resolute” was obliged to winter in the pack in 1853-1854, and in the spring of 1854 Mecham made a remarkable journey in the hope of obtaining news of Captain Collison at the Princess Royal Islands. Leaving the ship on the 3rd of April he was absent seventy days, out of which there were sixty-one and a half days of travelling. The distance gone was 1336 statute miles. The average rate of the homeward journey was 243 m. a day, the average time of travelling each day nine hours twenty-five minutes.

Pears was detailed for another winter, Sir Edward Belcher ordered all the ships to be abandoned in the ice, the officers and crews being taken home in the “North Star,” and in the “Phoenix” and “Talbot,” which had come out from England to communicate. They reached home in October 1854. In 1852 Captain Edward A. Inglefield, R.N., had made a voyage up Baffin Bay in the “Isabel” as far as the entrance of Smith Sound. In 1853 and 1854 he came out in the “Phoenix” to communicate with the “North Star” at Beechy Island.

The drift of the “Resolute” was a remarkable proof of the direction of the current out of Barrow Strait. She was abandoned on the 10th of September 1854, and sank with all on board. In 1854 he set out on a journey which occupied fifty-six days in April and May. He succeeded in connecting the discoveries of Simpson with those of James Ross, and thus established the fact that King William Land was an island. Rae also brought home the first tidings and relics of Franklin's expedition gathered from the Eskimo, which decided the Admiralty to award him the £10,000 offered for definite news of Franklin's fate. Lady Franklin, however, sent out the “Fox” under the command of M'Clintock (see Franklin). M'Clintock prosecuted an exhaustive search over part of the west coast of Boothia, the whole of the shores of King William Island, the mouth of the Great Fish river and Montreal Island, and Allen Young completed the discovery of the southern side of Prince of Wales Island.

The catastrophe of Sir John Franklin's expedition led to 7000 m. of coast-line being discovered, and to a vast extent of unknown country being explored, securing very considerable additions to geographical knowledge.

The American nation was first led to take an interest in Polar research through a noble and generous sympathy for Franklin and his companions. Mr Grinnell of New York gave practical expression to this feeling. In 1850 he equipped two vessels, the “Advance” and “Rescue,” to aid in the search, commanded by Lieuts. de Haven and Griffith, and accompanied by Dr E. K. Kane. They reached Beechy Island on the 27th of August 1850, and assisted in the examination of Franklin's winter quarters, but returned without wintering. In 1853 Dr Kane, in the little brig “Advance,” of 120 tons, undertook to lead an American expedition up Smith Sound, the most northern outlet from Baffin Bay. The “Advance” reached Smith Sound on the 7th of August 1853, but was stopped by ice in 75° 45' N. only 17 m. from the entrance. Kane described the coast as consisting of precipitous cliffs 800 to 1200 ft. high, and at their base there was a belt of ice about 18 ft. thick, resting on the beach. Dr Kane adopted the Danish name of “ice-foot” (is foed) for this permanent frozen ledge. He named the place of his winter quarters Van Rensselaer Harbour. In the spring some interesting work was done. A great glacier was discovered with a sea face 45 m. long and named the Humboldt glacier. Dr Kane's steward, Morton, crossed the foot of this glacier with a team of dogs, and reached a point of land beyond named Cape Constitution. But sickness and want of means prevented much from being done by travelling parties. Scurvy attacked the whole party during the second winter, although the Eskimo supplied them with fresh meat and were true friends in need. On the 17th of May 1855 Dr Kane abandoned the brig, and reached the Danish settlement of Upernivik on the 5th of August. Lieut. Hartstene, who was sent out to search for Kane, reached the Van Rensselaer Harbour after he had gone, but took the returning crew on board on his return voyage.

On the roth of July 1860 Dr L. L. Hayes, who had served with Kane, sailed from Boston for Smith Sound, in the schooner "United States," of 130 tons and a crew of fifteen men. His object was to follow up the line of research opened by Dr Kane. He wintered at Port Foulke, in 78° 17' N., but achieved nothing of importance, and his narrative is not to be depended on.
Charles Hall (q.v.), in his first journey (1860–1862), discovered remains of a stone house which Sir Martin Frobisher built on the Greenland coast in 1578. In his second expedition (1864–1866) Hall reached the line of the retreat of the Franklin survivors, at Todd’s Island and Peffer River, on the south coast of King William Island. He heard the story of the retreat and of the wreck of one of the ships from the Eskimo; he was told that seven bodies were buried at Todd Island; and he brought home some bones which are believed to be those of Lieut. Le Vescomte of the “Erebuse.” Finally, in 1871 he took the “Polaris” for 250 m. up the channel which leads northwards from Smith Sound. The various parts of this long channel are called Smith Sound, Kane Basin, Charles Channel and Robeson Channel. The “Polaris” was beset in 83° 14’ N. from July 25th to August 14th. The animals in the storehouses were in Thank God Harbour, 8° 48’ N., and here Hall died.

The Spitsbergen seas were explored during last century by Norwegian fishermen as well as by Swedish and German expeditions and by British yachtsmen. In 1827 the Norwegian geologist Keilhau made an expedition to Bear Island and Spitsbergen which was the first purely scientific Arctic expedition. The Norwegian Spitsbergen fishery dates from 1829, but it was only in the latter part of the century that Professor Mein of Christiania carefully collected information from the captains who had taken part in the work when at its height. In 1863 Captain Carlsen circumnavigated the Spitsbergen group for the first time in a brig called the “Jan Møyen.” In 1864 Captain Tobiesen sailed round North-East Land. In 1872 Captains Altmann and Nils Johnsen visited Wiche’s Land, which was discovered by Captain Edge in 1617. In that year there were twenty-three sailing vessels from Tromsø, twenty-four from Hammerfest, and one from vardø engaged in the Arctic sealing trade, averaging from 35 to 40 tons, and carrying a dozen men. Exploration went on slowly, in the course of the sealing and fishing voyages, the records of which are not very full. In 1869 Carlsen crossed the Kara Sea and reached the mouth of the Ob. In 1870 there were about sixty Norwegian vessels in the Barents Sea, and Captain Johannesen circumnavigated Novaya Zemlya. In 1873 Captain Tobiesen was unfortunately obliged to winter on the Novaya Zemlya coast, owing to the loss of his schooner, and both he and his young son died in the spring. Two years previously Captain Carlsen had succeeded in reaching the winter quarters of Barents, the first visitor since 1597, an interval of two hundred and seventy-four years. He landed on the 9th of September 1871, and found the house still standing and full of interesting relics, which are now in the naval museum at the Hague.

Between 1858 and 1872 the Swedes sent seven expeditions to Spitsbergen and two to Greenland, marking a new scientific era in Arctic exploration, of which Keilhau had been the pioneer. All returned with valuable scientific results. That of 1864 under A. E. Nordenskiöld and Duner made observations at 80 different places on the Spitsbergen shores, and fixed the heights of numerous mountains. In 1868, in an iron steamer, the “Sophia,” the Swedes attained a latitude of 81° 42’ N. on the meridian of 12° E., during the month of September. In 1872 an expedition, consisting of the “Polhem” steamer and brig “Gladen,” commanded by Professor Nordenskiöld and Lieut. Palander, wintered in Møself Bay on the northern shore of Spitsbergen. In the spring an important sledding journey of sixty days’ duration was made over North-East Land. The expedition was in some distress as regards supplies owing to two vessels, which were to have returned, having been forced to winter. But in the summer of 1873 they were visited by Mr Leigh Smith, in his yacht “Diana,” who supplied them with fresh provisions.

Dr A. Petermann of Gotha urged his countrymen to take their share in the work of polar discovery, and at his own risk he fitted out a small vessel called the “Germania,” which sailed from Bergen in May 1868, under the command of Captain Koldeway. His cruise extended to Hinlopen Strait in Spitsbergen, but was merely tentative; and in 1870 Baron von Heuglin with Count Zeil explored the Star Fjord in a Norwegian schooner, and also examined Walter Fjord. In Spitsbergen, the northern part of which a regular expedition was organized under the command of Captain Koldeway, provisioned for two years. It consisted of the “Germania,” a screw steamer of 140 tons, and the brig “Hansa,” commanded by Captain Hegemann. Lieut. Julius Payer, the future explorer of Franz Josef Land, gained his first Arctic experience on board the “Germania.” The expedition sailed from Bremen on the 15th of June 1869, its destination being the east coast of Greenland. But in latitude 70° 46’ N. the “Hansa” got separated from her consort and crushed in the ice. The crew built a house of patent fuel on the floe, and in this strange abode they passed their Christmas. In two months the current carried the “Germania” 120 miles to the north, and the “Hansa” met a vessel and was tugged out of the ice-raft, and finally, on the 14th of June 1870, they arrived safely at the Moravian mission station of Friedriksfjalk, to the west of Cape Farewell. Fairer fortune attended the “Germania.” She sailed up the east coast of Greenland as far as 75° 30’ N., and eventually wintered at the Pendulum Islands of Clavering in 74° 30’ N. In March 1870 a travelling party set out under Koldeway and Payer, and reached a distance of 100 m. from the ship to the northward, when want of provisions compelled them to return. A grim cape, named after Prince Bismarck, marked the northern limit of their discoveries. As soon as the vessel was free, a deep branching fjord, named after Franz Josef Fjord, was discovered in 73° 15’ N. stretching for a long distance into the interior of Greenland. The expedition returned to Bremen on the 11th of September 1870. Lieut. Payer was resolved to continue in the path of polar discovery. He and the naval officer Weyprecht chartered a Norwegian schooner called the “Isbjörn,” and examined the edge of the ice between Spitsbergen and Novaya Zemlya, in the summer of 1871. Their observations led them to select the route by the north end of Novaya Zemlya with a view to making the north-east passage. It was to be an Austro-Hungarian expedition, and the idea was seized with enthusiasm by the whole monarchy. Weyprecht was to command the ship, while Julius Payer conducted the sledge parties. The steamer “Tegethoff,” of 300 tons, was fitted out in the Elbe, and left Tromsø on the 14th of July 1872. The season was severe, and the vessel was closely beset near Cape Nassau, at the northern end of Novaya Zemlya, in the end of August. The summer of 1873 found her still a close prisoner drifting, not with a current, but chiefly in the direction of the prevailing wind. At length, on the 31st of August, a mountainous country was sighted about 14 m. to the north. In October the vessel was drifted within 3 m. of an island lying off the main mass of land. Payer landed on it, and found the latitude to be 79° 54’ N. It was named after Count Wilczek, one of the warmest friends of the expedition. Here the second winter was passed. Bears were numerous and sixty-seven were killed, their meat proving to be an efficient preventive of scurvy. In March 1874 Payer made a preliminary sledge journey in intense cold (thermometer at −58° F.). On the 24th of March he started for a more prolonged journey of thirty days. Payer believed that the newly discovered country equalled Spitsbergen in extent, and described it as consisting of two or more large masses—Wilczek Land to the east, Zichy Land to the west, intersected by numerous fjords and skirted by a large number of islands. A wide channel, named Austria Sound, was supposed to separate the two main masses of land, and extend to 82° N. The whole country was named Franz Josef Land. Payer’s large land-masses have by later discoveries been broken up into groups of islands and much of the land he thought he saw towards the east was found by Nansen not to exist. Payer returned to the “Tegethoff” on the 24th of April; and a third journey was undertaken to explore a large island named after M’Clintock. It then became necessary to abandon the ship and attempt a retreat in boats. This perilous voyage was commenced on the 20th of May. Three boats stored with provisions were placed on sledges. It was not until the 14th of August that they reached
the edge of the pack in 77° 46′ N., and launched the boats. Eventually they were picked up by a Russian schooner and arrived at Vardø on the 3rd of September 1874.

One of the most interesting events connected with the physical geography of the polar regions is the actual condition of the vast elevated interior of Greenland, which is one enormous glacier. In 1867 Mr Edward Wydymper planned an expedition to solve the question, and went to Greenland, accompanied by Dr Robert Brown; but their progress was stopped, after going a short distance over the ice, by the breaking down of the dog-sledges. The expedition brought home geologic and natural history collections of value. Dr H. Rink, for many years royal inspector of South Greenland and the most distinguished authority on all GREENLANDIC questions, also visited the inland. An important inland journey was undertaken by Professor A. E. Nordenskild in 1870, accompanied by Dr Berggren, professor of botany at Lund. The difficulty of traversing the inland ice of Greenland is caused by the vast ice-cap being in constant motion, advancing slowly towards the sea. This movement gives rise to huge crevasses which bar the traveller’s way. The chasms occur chiefly where the movement of the ice is most rapid, near the ice streams which reach the sea and discharge icebergs. Nordenskild therefore chose for a starting-point the northern arm of a deep inlet called Aukelitsvikfjord, which is 60 m. south of the discharging glacier at Jakobshavn and 240 north of that at Godthaab. He commenced his inland journey on the 10th of July. The party consisted of himself, Dr Berggren, and two Greenlanders; and they advanced 30 m. over the glaciers to a height of 2200 ft. above the sea.

The gallant enterprises of other countries rekindled the zeal of Great Britain for Arctic discovery; and in 1874 the prime minister announced that an expedition would be despatched in the following year. Two powerful steamers, the “Alert” and “Discovery,” were selected for the service, and Captain George S. Nares was recalled from the “Challenger” expedition to act as leader. Commander Albert H. Markham, who had made a cruise up Baffin Bay and Barrow Strait in a whaler during the previous year, Lieut. Pelham Aldrich, an accomplished surveyor, and Captain Henry Wemyss Feilden, R.A., asnaturalist, were also in the “Alert.” The “Discovery” was commanded by Captain Henry F. Stephenson, with Lieut. Lewis A. Beaumont as first lieutenant. The expedition left Portsmouth on the 29th of May 1875, and entered Smith Sound in the last days of July. After much difficulty with drifting ice Lady Franklin Bay was reached in 81° 44′ N., where the “Discovery” was established in winter quarters. The “Alert” pressed onwards, and reached the edge of the heavy ice named by Nares the palaeocystic sea, the ice-foes being from 80 to 100 ft. in thickness. Leaving Robeson Channel, the vessel made progress between the land and the grounded ice pieces, and passed the winter off the open coast and facing the great polar pack, in 82° 27′ N. Autumn travelling parties were despatched in September and October to lay out dépôts; and during the winter a complete scheme was matured for the examination of as much of the unknown area as possible, by the combined efforts of sledding parties from the two ships, in the ensuing spring. The parties started on the 3rd of April 1876. Captain Markham with Lieut. Farr advanced, in the face of great difficulties, over the polar pack to the latitude of 83° 20′ N. Lieut. Aldrich explored the coast-line to the westward, facing the frozen polar ocean, for a distance of 220 m. Lieut. Beaumont made discoveries of great interest along the northern coast of Greenland. The parties were attacked by scurvy, which increased the difficulty and hardships of the work a hundredfold. The expedition returned to England in October 1876. The “Alert” reached a higher latitude and wintered farther north than any ship had ever done before. The results of the expedition were the discovery of 300 m. of new coast line, the examination of part of the frozen polar ocean, a series of meteorological, magnetic and tidal observations at two points farther north than any such observations had ever been taken before, and large geological and natural history collections.

In the same year 1875 Sir Allen Young undertook a voyage in the steam yacht “Pandora” to attempt to force his way down Peel Sound to the magnetic pole, and if possible to make the north-west passage by rounding the eastern shore of King William Island. The “Pandora” entered Peel Sound on the 20th of August 1875, and proceeded down it much farther than any vessel had gone since it was passed by Franklin’s two ships in 1846. Sir Allen reached a latitude of 72° 14′ N., and sighted Cape Bird, at the northern side of the western entrance of Bellot Strait. But here ice barred his progress, and he was obliged to retrace his track, returning to England on the 16th of October 1875. In the following year Sir Allen Young made another voyage in the “Pandora” to the entrance of Smith Sound.

Lieut. Koolemans Beyen, a young Dutch officer, who had shared Young’s two polar voyages, on his return successfully endeavoured to interest his countrymen in polar discovery. It was wisely determined that the first expeditions of Holland should be summer reconnaissances on a small scale. A sailing schooner of 70 tons was built at Amsterdam, and named the “Willem Barents.” In her first cruise she was commanded by Lieut. A. de Bruync, with Koolemans Beyen as second, and she sailed from Holland on the 6th of May 1876. Her instructions were to examine the ice in the Barents and Spitzbergen seas, take deep-sea soundings, and make natural history collections. She was on the spot to erect memorials to early Dutch polar worthies at certain designated points. These instructions were ably and zealously carried out. Beyen died in the following year, but the work he initiated was carried on, the “Willem Barents” continuing to make annual polar cruises for many years.

In 1879 Sir Henry Gore-Booth and Captain A. H. Markham, R.N., in the Norwegian schooner “Ishörn” sailed along the west coast of Novaya Zemlya to its most northern point, passed through the Matockin Shahr to the east coast, and examined the ice in the direction of Franz Josef Land as far as 78° 24′ N., bringing home collections in various branches of natural history, and making useful observations on the drift and nature of the ice in the Barents and Kara Seas.

In 1880 Mr B. Leigh Smith, who had previously made three voyages to Spitsbergen, reached Franz Josef Land in the polar steam yacht “Eira.” It was observed that, while the Greenland icebergs are generally angular and peaked, those of Franz Josef Land are flat on the top, like the Antarctic bergs. The “Eira” sailed along the south side of Franz Josef Land to the westward and discovered 110 m. of coast-line of a new island named Alexandra Land, until the coast trended north-west. A landing was effected at several points, and valuable collections were made in natural history. In the following year the same explorer left Peterhead on the 14th of July; Franz Josef Land was sighted on the 23rd of July, and the “Eira” reached a point farther west than had been possible in her previous voyage. But in August the ship was caught in the ice, was nipped, and sank. A hut was built on shore in which Mr Leigh Smith and his crew passed the winter of 1881–1882, their health being well maintained, thanks to the exertions of Dr W. H. Neale. On the 21st of June 1882 they started in four boats to reach some vessels on the Novaya Zemlya coast. It was a most laborious and perilous voyage. They were first seen and welcomed by the “Willem Barents,” on the 1st of August, and soon afterwards were taken on board the “Hope,” a whaler which had come out to search for them under the command of Sir Allen Young.

Professor A. E. Nordenskild, when he projected the achievement of the north-east passage, was a veteran polar explorer, for he had been in six previous expeditions to Greenland and Spitsbergen. In 1875 he turned his attention to the possibility of navigating the seas along the northern coast of Siberia. Captain Joseph Wiggins of Sunderland was a pioneer of this route.
and his voyages in 1874, 1875 and 1876 led the way for a trade between the ports of Europe and the mouth of the Yenisei River.

In June 1875 Professor Nordenskiöld sailed from Tromsö in the Norwegian vessel, the “Proven,” reached the Yenisei by way of the Kara Sea, and discovered an excellent harbour on the eastern side of its mouth, which was named Port Dickson, in honour of Baron Oscar Dickson of Gothenburg, the munificent supporter of the Swedish expeditions. It has been suggested that the success of this voyage was due to the unusual state of the ice in 1875; Nordenskiöld undertook a voyage in the following year in the “Ymer,” which was equally successful. By a minute study of the history of former attempts, and a careful consideration of all the results of the previous expeditions, he convinced himself that the achievement of the north-east passage was feasible.

The king of Sweden, Baron Oscar Dickson, and M. Sibirakoff, a wealthy Siberian proprietor, supplied the funds, and the steamer “Vega” was purchased. Nordenskiöld was leader of the expedition, Lieut. Palander was appointed commander of the ship, and there was an efficient staff of officers and naturalists, including Lieut. Hovgaard of the Danish and Lieut. Bove of the Italian navy. A small steamer called the “Lena” was to keep company with the “Vega” as far as the mouth of the Lena, and they sailed from Gothenburg on the 4th of July 1878. On the morning of the 10th of August they left Port Dickson, and on the 10th they reached the most northern part of Siberia, Cape Chelyuskin, in 77° 41’ N. On leaving the extreme northern point of Asia a south-easterly course was steered, the sea being free from ice and very shallow. This absence of ice is to some extent due to the mass of warm water discharged by the great Siberian rivers during the summer. On the 27th of August the mouth of the river Lena was passed, and the “Vega” parted company with the little “Lena,” continuing her course eastward. Professor Nordenskiöld very nearly made the north-east passage in one season; but towards the end of September the “Vega” was frozen in off the shore of a low plain in 67° 7' N. and 175° 20’ W. near the settlements of the Chukchis. During the voyage very large and important natural history collections were made, and the interesting aboriginal tribe among whom the winter was passed was studied with great care. The interior was also explored for some distance. On the 18th of July 1879, after having been imprisoned by the ice for 294 days, the “Vega” again proceeded on her voyage and passed Bering Strait on the 20th. Sir Hugh Willoughby made his disastrous attempt in 1553. After a lapse of 326 years of intermittent effort, the north-east passage had at length been accomplished without the loss of a single life and without damage to the vessel. The “Vega” and her crew had reached the Lena on 1879.

In 1879 an enterprise was undertaken in the United States, with the object of throwing further light on the sad history of the retreat of the officers and men of Sir John Franklin’s expedition, by examining the west coast of King William Island in the summer, when the snow is off the ground. The party consisted of Lieut. Schwatka of the United States army and three others. Wintering near the entrance of Chesterfield Inlet in Hudson Bay, they set out overland for the estuary of the Great Fish river, assisted by Eskimo and dogs, on the 1st of April 1879. They took only one month’s provisions, their main reliance being upon the game afforded by the region to be traversed. The party obtained, during the journeys out and home, no less than 522 reindeer. After collecting various stories from the Eskimo at Montreal Island and at an inlet west of Cape Richardson, Schwatka crossed over to Cape Herschel on King William Land in June. He examined the western shore of the island with the greatest care for relics of Sir John Franklin’s parties, as far as Cape Felix, the northern extremity. The return journey was commenced in November by ascending the Great Fish river for some distance and then marching over the intervening region to Hudson Bay. The cold of the winter months in that country is intense, the thermometer falling as low as —70° F., so that the return journey was most remarkable, and reflects the highest credit on Lieut. Schwatka and his companions. As regards the search little was left to be done after McClintock, but some graves were found as well as a medal belonging to Lieut. Irving of H.M.S. “ Terror,” and some bones believed to be his, which were brought home and interred at Edinburgh.

Mr Gordon Bennett, the proprietor of the New York Herald, having resolved to despatch an expedition of discovery at his own expense by way of Bering Strait, the “Pandora” was purchased from Sir Allen Young, and rechristened the “Jeanette.” Lieut. de Long of the United States navy was appointed to command, and it was made a national undertaking by special act of Congress, the vessel being placed under martial law and officered from the navy. The “Jeanette” sailed from San Francisco on the 8th of July 1879, and was bound towards Wrangel Land on the 3rd of September. This land had been seen by Captain Kellett, in H.M.S. “Herald” on the 11th of August 1879, but no one had landed on it, and it was shown on the charts by a long dotted line. The “Jeanette” was provisioned for three years, but as no tidings had been received of her by 1881, two steamers were sent up Bering Strait in search. One of these, the “Rodgers,” under Lieut. Berry, anchored in a good harbour on the south coast of Wrangel Land, in 70° 57’ N., on the 26th of August 1881. The land was examined by the officers of the “Rodgers” and found to be an island about 70 m. long by 28, with a ridge of hills traversing it east and west, the 71st parallel running along its southern shore. Lieut. Berry then proceeded to examine the ice to the northward, and attained a higher latitude by 27 m. than had ever been reached before on the Bering Strait meridian—namely, 73° 44’ N. No news was obtained of the “Jeanette,” but soon afterwards melancholy tidings arrived from Siberia. After having been beset in heavy pack ice for twenty-two months, the “Jeanette” was crushed and sunk on the 13th of June 1881, in 77° 15’ N lat. and 155’ E. long. The officers and men dragged their boats over the ice to an island which was named Bennett Island, where they landed on the 29th of July. They reached one of the New Siberia Islands on the 10th of September, and on the 12th they set out for the mouth of the Lena. But in the same evening the three boats were separated in a gale of wind. A boat’s crew with Mr Melville, the engineer, reached the Lena delta and searching for the other parties found the ship’s books on the 14th of November, and resuming the search at the earliest possible moment in spring, Melville discovered the dead bodies of De Long and two of his crew on the 23rd of March 1882. They had perished from exhaustion and want of food. Three survivors of De Long’s party had succeeded in making their way to a small Eskimo village; but they lost the third. The crew was lost. The “Rodgers” was at the same time a hazardous journey homewards through north-east Siberia.

The Norwegian geologist Professor Amund Henrik Land made an expedition to Greenland in 1875 and discovered the marvellously rapid movements of the Greenland glaciers.

The Danes have been very active in prosecuting discoveries and scientific investigations in Greenland, since the journey of Nordenskiöld in 1870. Lieut. Jensen made a gallant attempt to penetrate the inland ice in 1878, collecting important observations, and Dr Steenstrup, with Lieut. Hammer, closely investigated the formation of ice masses at Omenak and Jacobshavn. In 1883 an expedition under Lieuts. Holm and Gade began to explore the east coast of Greenland. In the summer of 1879 Captain Mourier, of the Danish man-of-war “Ingolf,” sighted the coast from the 6th to the 20th of July, and was enabled to observe and delineate it from 68° 10’ N. to 65° 55’ N., this being the gap left between the discoveries of Scoresby in 1822 and those of Graah in 1829. Nansen sighted part of the same coast in 1882. Lieut. Hovgaard of the Danish navy, who accompanied Nordenskiöld in his discovery of the north-east passage, planned an expedition to ascertain if land existed to the north of
POLAR REGIONS

Cape Chelyuskin. He fitted out a small steamer called the "Dympna" and sailed from Copenhagen in July 1882, but was unfortunately beset and obliged to winter in the Kara Sea. In 1883 Baron A. E. Nordskjöld undertook another journey over the inland ice of Greenland. Starting from Auleitisvikfjord on the 4th of July, his party penetrated 84 m. eastward, and to an altitude of 5000 ft. The Laplanders who were of the party were sent farther on snow-shoes, travelling over a desert of snow to a height of 7000 ft. Useful results in physical geography and biology were obtained.

On the 18th of September 1875 Lieut. Weyprecht, one of the discoverers of Franz Josef Land, read a paper before a large meeting of German naturalists at Graz on the scientific results to be obtained from polar research and the best means of securing them. He urged the importance of establishing a number of stations within or near the Arctic Circle, and also a ring of stations as near as possible to the Antarctic Circle, in order to record complete series of synchronous meteorological and magnetic observations. Lieut. Weyprecht did not live to see his suggestions carried into execution, but they bore fruit in due time. The various nations of Europe were represented at an international polar conference held at Hamburg in 1879 under the presidency of Dr Georg Neumayer, and at another at Berne in 1880; and it was decided that each nation should establish one or more stations where synchronous observations should be taken for a year from August 1882. This fine project was matured and successfully carried into execution. The stations arranged for in the North Polar region were at the following localities:

The whole scheme was successfully accomplished with the exception of the part assigned to the Dutch at Port Dickson. They named their "wintering station" "Batavia" but were obliged to winter there. The "Varna" was lost, and the crew took refuge on board Lient. Hvogaard's vessel, which was also forced to winter in the pack during 1882-1883. The scientific observations were kept up on both vessels during the time they were drifting with the ice.

The American stations commenced work in 1882 and one of these furnished a rare example of heroic devotion to duty in face of difficulties due to the fault of those who should have brought relief at the appointed time. Lieut. A. W. Greely's party consisted of two other lieutenants, twenty sergeants and privates of the United States army, and Dr Pavy, an enthusiastic explorer who had been educated in France and had passed the previous winter among the Eskimo of Greenland. On the 11th of August 1881 the steamer "Proteus" conveyed Lient. Greely and his party to Lady Franklin Bay during an exceptionally favourable season; a house was built at the "Discovery's" winter quarters, and they were left with two years' provisions. The regular series of observations was at once commenced, and two winters were passed without accident. Travelling parties were also sent out in the summer, dogs having been obtained at Disco. Lient. Lockwood with twelve men and eleven sledges made a journey along the north coast of Greenland and reached Lockwood Island in 8°24' N. and 42°45' W., the highest land he reached at that time. From this island at a height of 2600 ft. on a clear day an unbroken expanse of ice was seen stretching to the northward, the view extending far beyond the 84th parallel. A promontory of the north coast of Greenland seen to the north-east in 83°35' N. was named Cape Washington. Vegetation was found at the extreme position and animal life was represented by foxes, hares, lemmings and ptarmigan. The party returned to Fort Conger on the 1st of June 1882 after an absence of 59 days. Greely made two journeys westward into the interior of Grinnell Land following up the northern branch of Chandler Fjord to a great sheet of frozen fresh water, Hazen Lake, with an area of about 500 square miles. Beyond this, 13°16' E. from Conger, he climbed Mt Arthur, 4500 ft., the highest summit of Grinnell Land, and saw distant mountains beyond a fjord to the southwest. In the spring of 1883 Lockwood made still more extensive journeys, crossing Grinnell Land to Greedy Fjord, which entered the western sea. The central depression of Grinnell Land abounded in musk oxen and was free from ice, though the higher land to north and south lay under permanent ice-caps. Important as these geographical discoveries were, the main object of the expedition was the series of scientific observations at the headquarters, and these were carried out during the whole period with the most scrupulous exactness. As neither the relief ship which was to have been dispatched in 1882, nor that in 1883, sent the expected relief to the station at Fort Conger, Lient. Greely started from Lady Franklin Bay with his men in a steam launch and three boats on the 9th of August, expecting to find a vessel in Smith Sound. The boats were beset and had to be abandoned, the party reaching the shore across the ice with great difficulty, carrying their supplies of food, now rapidly diminishing. On the 21st of October 1883 they were obliged to encamp at Cape Sabine, on the western shore of Smith Sound, and build a hut for wintering. A few dépâts were found, which had been left by Sir George Nares and Lient. Beebe, but all supplies were exhausted before the spring. Then came a time of indescribable misery and acute suffering. The party proceeded insubordinate and the sternest measures were required to maintain military discipline. When the sun returned in 1884 the poor fellows began to die of actual starvation; but it was not until the 22nd of June 1884 that the relieving steamer "Thetis" and "Bear" reached Cape Sabine. Lient. Greely and six suffering companions were found just alive, but with all their scientific records, their instruments in order and the great collections of specimens intact. The failure of the relief expeditions to overcome difficulties which were child's play to what Greely and his companions had come through only enhances the splendid courage and determination of the heroic survivors.

Norwegian: Lieut. P. Nansen, March 1883-1885. After a long expedition in the Eskimo Fjords, Lient. G. A. Holm explored the east coast of Greenland from Cape Farewell northwards in Eskimo boats between 1883 and 1885, and at Angmagssalik they encountered a tribe of Eskimo who had never seen white men before. Lient. Ryder and Lient. T. V. Garde continued the exploration of East Greenland, and Ryder explored the great Scoresby Fjord. Captain Holm established a missionary and meteorological station at Angmagssalik Fjord in 1894, from which the Danish government take charge of the Eskimo of that region. In 1892-1893 an expedition sent out by the Berlin Geographical Society under Dr Erich von Drygalski studied the ice formations on the west of Greenland.

In July 1886 Lient. Robert E. Peary, civil engineer, U.S. Navy, accompanied by the Dane Christian Maigaard, made a journey on the inland ice of Greenland eastward from Disco Bay in about 69°30' N. They reached a height of 7500 ft., when according to Peary's observations they were 100 m. from the coast, and then returned. Dr Fridtjof Nansen with Otto Sverdrup and five other companions, after overcoming great difficulties in penetrating the ice-floes, succeeded in landing on the east coast of Greenland in August 1886 in 64°25' N. and reached a height of 8920 ft. on the inland ice, which was crossed on ski to the west coast. The interior was found to be a nearly flat plateau of snow resembling a frozen ocean, and at the high altitude of more than 8000 ft. the cold was intense. From this point they occupied themselves for more than two weeks, and the party not having dogs had themselves to haul all their gear on sledges. As they approached the western edge of the ice their progress was checked by dangerous crevasses; but on the 26th of September they succeeded in reaching the west coast at the head of the Ameralik Fjord in 64°12' N., having
traversed 260 m. of glacier. Nansen discovered that in that latitude the inland ice of Greenland has the form of a huge shield rising rather rapidly but regularly from the east coast to nearly 3000 ft., but even in the middle the ice-masses were falling again regularly toward the western side, completely enveloping the land. An important principle acted on for the first time in Arctic travel on this journey was that of starting from the less accessible side and pushing straight through with no possibility of turning back, and thus with no necessity for forming a base or traversing the same route twice.

Peary spent the winter of 1891–1892 at Inglefield Gulf on the north-west coast of Greenland, Mrs Peary, Dr F. A. Cook, Eivind Astrup and a coloured servant Matthew Henson being in his party, and a large number of the Etah Eskimo in the vicinity. In April 1892 he set out for a journey across the inland ice to the north-eastward in the hope of reaching the east coast and also the northern extremity of the land. After getting well up on the ice-covered plateau a supporting party returned to winter quarters, while Peary and Astrup, with two companions and sixteen dogs, entered on the serious part of their work. The highest part of the inland ice was found to be about 5700 ft., and as usual after the first part of the descent, towards the north-east in this case, the surface was broken by numerous dangerous crevasses, progress amongst which was very slow. Great hardships were experienced from cold, insufficiency of food and the wearing out of sledges and clothes, but on the 4th of July, having left the ice and got on bare land in 81° 37' N., where musk oxen and other game were found and flowers growing, Peary was rewarded by a glimpse of the sea to the north-eastward, and named it from the date Independence Bay. He also traced a channel to the north beyond which lay a new land largely free from snow, no doubt the southern part of the island along the north of which Markham and Lockwood had travelled to their farthest north. The return journey to Inglefield Gulf was a wonderful feat of endurance, which was completed on the 4th of August; the total distance marched on the whole journey out and home was 1300 m. Peary returned to northern Greenland in 1893, having spent the whole time between the two expeditions in writing and lecturing in order to raise funds, for he travelled at his own charges. He landed on the shore of Inglefield Gulf on the 3rd of August and wintered there with a party of thirteen, including Mrs Peary, and there their daughter was born. Astrup was taken ill after starting on the great journey in March 1894, which was to have extended the explorations of the previous year, and had to return; others were severely frost-bitten, disease broke out amongst the dogs, and a month after the start Peary was only 130 m. from his base and had to return. Peary with two of his party, Hugh J. Lee and Matthew Henson, remained at Inglefield Gulf for another winter, and on the 1st of April 1895, with deer and walrus meat in place of pemmican, the supply of which had been lost, set out for Independence Bay. They reached the ice-free land when their food was exhausted and fortunately fell in with a herd of musk oxen, the meat from which made it possible to get back to Inglefield Gulf, though without adding anything material to the results of 1892. The experience of ice-travel and of Eskimo nature gained in the four years' almost continuous residence in northern Greenland were however destined to bear rich fruit.

Dr Nansen, after making an exhaustive study of the winds and drifts of the Arctic Sea, and influenced largely by the occurrence of driftwood on the shores past which the ice-laden waters flowed southward between Greenland and Spitsbergen, satisfied himself that there was a general drift across the polar basin and perhaps across the Pole. He planned his voyage to take advantage of this drift on the principle which guided his crossing of Greenland, that of entering at the least accessible point and not turning back, thus having no line of retreat and making a relief expedition impossible. He planned a ship, the "Fram," which was immensely strong, to resist crushing, and of such a section that if nipped in the ice the opposing ice-masses would pass under her and lift her on to the surface. The plan of the expedition was based on scientific reasoning, but the methods were totally at variance with those of previous explorers. Otto Sverdrup, who had been one of Nansen's party in crossing Greenland, was captain of the expedition, which included the crews of six vessels constituting a company of thirteen living together on terms of social equality. Nansen paid the greatest possible attention to the provisions, and all the arrangements for the health and happiness of those on board were carefully thought out. The clothing of the expedition was as original in design as the ship; instead of having furs, thick woollen underclothing was adopted, with a light wind-proof material for the outer dress. The "Fram" left Christiania in the summer of 1893 and made her way through the Kara Sea and along the north coast of Asia until on the 20th of September she was run into the ice in 77° 30' N., off the New Siberia Islands, and the great drift commenced. As anticipated, she rose to the pressure of the ice and was borne on an even keel high above the water for the whole duration of the drift. The movement of the ice was irregular, and on the 7th of November the "Fram" was back at her starting-point, but on the whole the movement was north-westward until the 15th of November 1895, when the highest latitude of the ship was attained, 83° 55' N. in 60° 31' E., the meridian of the east of Novaya Zemlya; then it was westward and finally southward until the ice was broken by blasting round the ship in June in 83° N. lat.; and after being aloof, though unable to make much progress until the middle of July, the "Fram" broke out of the ice off the north coast of Spitsbergen on the 13th of August 1896. No ship before or since has reached so high a latitude.

In all her drift the "Fram" came in sight of no new land, but the soundings made through the ice proved that the Arctic Sea was of great depth, increasing towards the Pole, the greatest depth exceeding 2000 fathoms. The great mass of water filling the polar basin was comparatively warm, indicating free circulation with the Atlantic. It was established that the ice formed off the coast of Asia drifted across the polar basin in a period of from three to five years, and the hypothesis on the truth of which Nansen risked his success was abundantly verified by facts. The ship's company all returned in perfect health. After the second winter on the "Fram" at a time when the northward movement of the drift seemed to be checked, Nansen, accompanied by Lieut. Hjalmar Johansen, left the ship in order to explore the regions towards the Pole by travelling on ski with dog sledges carrying kayaks. It was obviously hopeless to attempt to find the drifting ship on their return, and Nansen intended to make for Spitsbergen in the hope of meeting one of the tourist steamers there. A more daring plan was never formed, and it was justified by success. Leaving the ship on the 14th of March 1895 in 83° N. 102° E., they made a fairly rapid march northward, reaching a latitude of 86° 5' N. on the 8th of April, the nearest approach to the Pole so far achieved. Turning south-westwards they travelled with much difficulty, sometimes on the ice, sometimes in kayaks in the open lanes of water, incurring great danger from the attacks of bears and walrus, but at length reaching a group of new islands east of Franz Josef Land. They travelled westward through this archipelago until the 28th of August, when they built a small stone hut roofed with their light silk tent, in which they passed the winter on a land since called Frederick Jackson Island. There they lived like Eskimo on bear and walrus meat cooked over a blubber lamp. The journey southward was resumed in the spring of 1896, and on the 15th of June they met Mr F. G. Jackson, in whose relief ship, the "Windward," they returned to Norway. Nansen and Johansen reached Tromsö on the 15th of August 1896.

Mr Frederick George Jackson planned an exploring expedition...
to attain a high latitude by the Franz Josef Land route and was supported financially by Mr A. C. Harnswort (Lord Northcliffe). He was accompanied by Lieut. Albert Armitage, R.N.R., as second in command and six scientific men, including Dr Reginald Koettlitz; Dr W. S. Bruce also was one of the number in the second year. The Jackson-Harmsworth expedition sailed in 1894, and was landed at Cape Flota, where log houses were built. In the spring of 1895 Jackson made a journey northward to 81° 10' N., the highest latitude reached, and added considerably to our knowledge of the archipelago by discovering a channel between groups of islands west of the Austrian Sound of Payer. He made numerous other journeys by land and in boats, and surveyed a considerable portion of the islands on which he landed, the most interesting being that of 1897, to the western portion of the group. The geological collections were of some value and the specimens secured indicated that Franz Josef Land and Spitsbergen were parts of an extensive land existing in Tertiary times. The expedition returned in 1897.

In 1897 and subsequent years a party led by Sir Martin Conway explored the interior of Spitsbergen. Dr A. G. Nathorst, the Swedish geologist, explored the eastern coast and off-lying islands, and made important observations on North-East Land, circumnavigating the Spitsbergen archipelago in 1898. In 1899 Nathorst visited the north-east coast of Greenland in search of Andrée's balloon expedition, and here he mapped Franz Josef Fjord and discovered the great King Oscar Fjord in waters that had never been navigated before.

In subsequent years valuable surveys and scientific observations were made by the Prince of Monaco in his yacht "Princesse Alice," by Dr W. S. Bruce, notably on Prince Charles Forland, and by others. Franz Josef Land was visited by the American explorer W. Wellman in 1898 and 1900, and his companion E. Baldwin in the former year made the discovery of several islands in the east of the archipelago. A wealthy American, W. Zeigler, also sent out expeditions to Franz Josef Land in 1901 and between 1903 and 1905, in the course of which A. Fiala reached the high latitude of 82° 4' N. in the "America," but the ship was afterwards lost in Tepiltz Bay. These expeditions added little to our knowledge of polar geography, but some useful meteorological, magnetic and tidal observations were made.

The Italian expedition under the command of H.R.H. Prince Luigi d'Albenigo, the Duke of Abruzzi, was the most successful of all those which have attempted to reach high latitudes by way of Franz Josef Land. Embarking in the summer of 1899 on the "Stella Polare" (formerly the Norwegian whaler "Jason") which had landed Nansen on the east coast of Greenland in 1888) the expedition put into Tepiltz Bay in Rudolf Land, where they wintered and there the ship was seriously damaged by the ice. In the spring of 1900 a determined effort was made to reach the North Pole by sledging over the sea-ice. The duke of the Abruzzi having been disabled by frost-bite, the leadership of the northern party devolved upon Captain Umberto Cagni of the Italian navy, who started on the 15th of March 1900 with ten men (Alpine guides and Italian sailors) and nearly a hundred dogs. His plan was to sledge northward over the sea-ice, sending back two parties as the diminishing stores allowed the advance party to take on the whole of the supplies destined to support them on their way to the Pole and back. Before losing sight of Rudolf Island three men forming the first party started to return, but they never reached winter quarters and all must have perished. The second party went back from latitude 83° 10' N., and reached their base in safety. Cagni pushed on with three companions, determined if he could not reach the Pole at least to outdistance his predecessor Nansen, and on the 25th of April 1900 he succeeded in reaching 89° 54'. On 25th May 1900, having made it necessary to turn at this point, and although he had reached it in 45 days it took Cagni 60 days to return. The advance of summer loosened the ice-floes, and the westward component of the drift of the pack became a more and more serious danger, threatening to carry the party past Franz Josef Land without sighting it. Fortunately Cape Mill, a headland of characteristic outline, was sighted just in time, and with this as a guide the party succeeded in reaching Tepiltz Bay, having eaten the last of their dogs and been reduced to great extremities. At the farthest north no land was visible, the rough sea-ice extending to the horizon on every side.

As early as 1895 a scheme for an exploring expedition in a balloon was put forward seriously, and in 1897 the Swedish aeronaut S. A. Andrée carried it out. He had brought a balloon to Danes Island, in the north of Spitsbergen, the previous year, but the weather was unpropitious and the ascent had to be postponed. On the 11th of July 1897 he started in a new and larger balloon with about five tons of supplies and two companions. It was hoped that the balloon could be steered to some extent by the use of heavy guide ropes dragging over the ice, and Andrée had already made successful flights in this way. Rising at 2.30 p.m. the balloon was out of sight of Danes Island in an hour. At 10 p.m. Andrée threw out a buoy containing a message which was recovered, and this stated that the balloon was in 82° N. 25° E., moving towards the north-east at an altitude of 800 ft. above a rugged ice-field. This was the last news received, and although scarcely a year has passed without some rumour of the balloon having been found in Siberia or North America, nothing further has ever been ascertained.

In 1899 Admiral Makaroff of the Russian navy arranged for the trial trip of the great ice-breaker "Yermak," which he designed, to take the form of an expedition into the sea-ice off Spitsbergen. Though no high latitude was attained on this occasion he formed the opinion that a vessel of sufficient size and power could force a passage even to the Pole. The Russian-Japanese War put an end to the polar projects of this gifted man of science.

Captain Otto Sverdrup, who had been Nansen's companion on his two polar expeditions, planned an Arctic voyage for the circumnavigation of Greenland, and the "Fram" was altered and refitted to suit her for the work. Starting in 1899, he was obliged to abandon the attempt to get northward through Smith Sound, and making his way westward into Jones Sound he spent three years in exploring and mapping the portion of the Arctic archipelago which lay to the north of the field of labour of the Franklin search expeditions. Ellesmere and Grinnell Islands were shown to be part of one large land mass, called King Oscar Land, which is separated by a narrow channel, Eureka Sound, from an extensive island named Axel Heiberg Land. Two of his party (Isachsen and Hassel) discovered and explored two islands west of Heiberg Land, and Dr Scheie made most valuable observations on the geology of the whole of the district examined. Sverdrup's journeys cleared up a great deal of uncertainty regarding the geography of the least known portion of the Arctic archipelago, and leave little more to be done in that quarter. He brought the "Fram" safely back to Norway in 1903.

Many American whalers working in the sea reached through Bering Strait, believe that land of considerable extent lies farther west than the Arctic archipelago, north of the mouth of the Mackenzie River, but neither the English traveller A. H. Harrison in 1905, nor the Dane Einar Mikkelsen in 1907, was able to find any trace of it, though the latter sailed over the sea ice as far as 72° N., where in 150° W. he got a sounding of 330 fathoms with no bottom. This depth makes it somewhat improbable that land exists in that quarter.

Russian surveyors and explorers continued to map portions of the Siberian coast, and in 1886 Dr Bunge and Baron Toll visited the New Siberia Islands and made known the remarkable remains of mammoths which exist there in great numbers. In 1893 Baron Toll made an important geological expedition to the islands, discovering many well-preserved remains of mammoths and other extinct mammals and finding evidence that in the mammoth period trees grew at least as far as 74° N. Indefatigable in the pursuit of his studies, Toll set out once more in 1901 on board the
“Zarya,” hoping to reach Sannikoff Island, the most northern and still unvisited portion of the New Siberia group. In August 1902 he reached Barents Island with the astronomer Heiberg and two Eskimos. He found the island to be a plateau about 190 ft. in elevation, and remained there until November studying the geological features. Nothing more was heard of the expedition, and a relief expedition in 1904, under Lieuts. Brunsneff and Kolchak, failed to find any trace of the explorers beyond a record left on Barents Island, which gave a summary of their movements up to the time of leaving the island.

In 1901 Captain Roald Amundsen, a Norwegian, who had been on the “Beltica” in her Antarctic voyage, planned an expedition to the area of the north magnetic pole visited by Sir James Ross in 1831, in order to re-locate it, and as a secondary object he had in view the accomplishment of the North-West Passage by water for the first time. M’Clure not having carried his ship through from sea to sea. A small Norwegian sealing sloop, the “Gjöa,” the cabin of which measured only 9 ft. by 6, was fitted with a petroleum motor engine of 30 h.p. for use in calm weather and strengthened to withstand ice-pressure. She left Christiania on the 17th of June 1903 with a total company of six men, second in command being Lieut. Godfred Hansen of the Danish navy. She passed through Lancaster Sound and worked her way down the west side of Boothia Felix in August, and took up winter quarters in Gjöa Harbour at the head of Petersen Bay in King William Land. Here the little vessel remained for the remainder of the winter, as observations of the aurora borealis were carried out, and sledging excursions were made to the magnetic pole and along the coasts of Victoria Land, which was charted up to 72° N. In August 1905 the “Gjöa” proceeded westward along the American coast but was frozen in off King Point for a third winter. On the 11th of July 1906 she got free, and after much difficulty with the ice reached Bering Strait on the 30th of August and entered the Pacific, the first ship to pass from ocean to ocean north of Patagonia.

Danish explorers have continued to concentrate their attention on the problems of Greenland, and especially the geography of the east coast. Lieut. G. D. Amdrup, in a series of expeditions between 1898 and 1900, charted the coast-line as far north as 79° 15’ N, and made important scientific observations and collections. From time to time whalers reached the east Greenland coast at points in high latitudes. The duke of Orleans in the “Belgica,” under the command of Captain Gerlache, made an important voyage in 1905, in the course of which he cruised along the coast of Germany Land between 76° and 78° N., and fixed the general outline of the land up to that latitude. This expedition did a large amount of scientific work, especially in oceanography. The stream of sea-ice which presses outwards from the polar basin every summer bears close against the east coast of Greenland, and exploration by sea has always proved exceedingly difficult and precarious, success depending very much on the occurrence of chance leads amongst the ice. Taking advantage of all previous experience, the most important of the Danish expeditions was planned by L. Mylius-Erichsen in 1905, the expense being partly raised by private subscriptions and partly provided by the Danish government. He sailed in the “Danmark” in June 1906 and found winter quarters in Danmarkhavn, 75° 43’ N., where the ship remained for two years, while systematic magnetic and meteorological observations were kept up at the base and the main work of exploring to the northward was carried on by sledge. From existent maps it was believed that there was up to 620 m. of coast separated the winter quarters from the northern point of Greenland, but when the sledge expedition went out in 1907 the coast was found to curve much farther to the eastward than had been anticipated, and the outward journey extended to 800 m. Having left the winter quarters on the 28th of March 1907, Mylius-Erichsen, with Captain Koch, Hagen, an educated Eskimo, Brönlund and two others, reached North-East Greenland, the eastern extremity of Greenland (84° 20’ N., 11° 15’ W.). Here they divided; Koch with Berthelsen and the Eskimo Tobias went north-westward to explore the east coast of Peary Land, and succeeded in reaching the most northerly extremity of the land beyond Cape Bridgman in 85° 30’ N. From this great journey he returned in safety to winter quarters, arriving on the 24th of June. Meanwhile Mylius-Erichsen, with Hagen and the Eskimo Brönlund, followed the coast westward into what was believed to be the Independence Bay seen from a distance by Peary; this turned out to be a deep inlet now named Danmark Fjord. Keeping to the coast, they entered the great channel separating the mainland of Greenland from Peary Land, and surveyed Hagen Fjord on the southern shore and Brönlund Fjord on the northern shore of the strait. They had pushed on to Cape Glacier in 84° 3 N. and 35° W. by the 14th of June 1907, within sight of Navy Cliff, which had been Peary’s farthest coming from the west side, and here the softness of the snow kept them all summer. When they could travel no more, they tried to waste adrift on a floe in the effort to cross Danmark Fjord. Here the sun left them, while they were without food, almost worn out and more than 500 m. from the ship. It was impossible to attempt the long journey round the coast, and the only chance of safety, and that a very slender one, was to make a way southward over the inland ice and cut off the eastern horn of Greenland which the expedition had discovered. Under the most terrible difficulties, with only four starved dogs, and their equipment going to pieces, they accomplished the feat of marching 160 m. in 26 days, and reached the east coast again in 79° N. That same way; Mylius-Erichsen himself struggled on until he nearly reached the provisions left on Lambert Island on the northern journey; but he too perished, and only Brönlund reached the supplies. He was frost-bitten and unable to proceed further, and after recording the tragedy of the return journey in his diary, he died also alone in the Arctic night. His body and the records of the great journey were discovered in the following year by Koch, who started on a relief expedition as soon as travelling became possible. The results of this expedition are a splendid monument to the courage and devotion of the leader and his followers. The channel between Spitsbergen and Greenland was shown by their efforts to be far narrower than had previously been supposed, and the outline of Greenland itself was fixed for the first time, and that by an extremely accurate survey.

There only remains one further episode to bring the history of polar exploration up to 1910, but that is the crowning event of four hundred years of unceasing effort, the attainment of the Pole itself; and it was accomplished by the undaunted perseverance of one man who would never accept defeat. After the return of the Jackson-Harmsworth expedition, Lord Northcliffe presented the “Windward” to Lieut. Peary, who resumed in 1898 his systematic explorations of the Smith Sound region in the north of Ellesmere Island. He was not restrained by the precedents of earlier travellers and made some long sledge journeys in the winter of 1898-1899, having his feet badly frost-bitten and losing eight toes. Even this crippling did not stop his work. He wintered amongst the Etah Eskimo in 1899-1900 and next spring made a successful journey to the most northerly land north of Greenland in 83° 35’ where the land had an abundant flora and fauna, and he pushed north over the sea-ice for twenty miles farther, reaching 83° 54’ N. Peary wintered again at Fort Conger in 1900-1901, and for the Fourth year in succession he went through the Arctic winter, 1901-1902, at Payer Harbour. In the spring of 1902 he made a great journey to Cape Hecla in the north of Grant Land and thence northward over the frozen sea to 84° 15’ N. in 70° W. Frequent open leads of water and the moving of the ice-floes made further advance impossible, and after an unparalleled sojourn in the farthest north, Peary returned to the United States. The Peary Arctic Club of New York, formed to support this indomitable explorer, provided funds for a new expedition and a ship differing in some respects from those hitherto employed and named the “Roosevelt.” In her he proceeded in the summer of 1905 through Smith Sound and the northern channels to Cape Sheridan on the north coast of Grant Land,
Polar Regions

Captain Robert Bartlett being in command of the ship. From this point he advanced by sledge to Cape Heceta, whence he made a more strenuous attempt to reach the North Pole. Organizing his large following of trained Eskimos, whose confidence in him had been won by many years of friendship, and his few white companions in separate parties, each complete in itself and well furnished with dogs and food, he set off at the end of February 1906. A very broad lead of open water was encountered in 84° 38' N. and as the party did not carry kayaks much time was lost in getting across. The floes had a marked eastward drift and it was difficult to make progress northward; however, Peary struggled on by forced marches to 85° 6' N., which he reached on the 21st of April 1906, the most northerly point he so far attained. His return journey was the most dangerous in his experience; many leads had to be crossed, sometimes on ice so thin that it bent beneath the weight of the explorers, provisions were exhausted and the men were reduced to eating their dogs before they made land at Cape Neumayer in the north of Greenland, where game was found, and whence the return to the ship was comparatively easy.

Returning to America, Peary prepared for a last attempt. The "Roosevelt" was overhauled and various defects made good, but not in time for the summer of 1907. Peary's Journey to the North Pole. Leaving New York in July 1908 the "Roosevelt," again under the command of R. Bartlett, brought the party, with the Eskimo who were picked up on the way, to Cape Sheridan by the 5th of September. During the winter all supplies were transported to Cape Columbia, farther west on the coast of Grant Land. Here there were ready to start in the first light of the Arctic day seven explorers, 17 picked Eskimos and 133 of the best dogs in Greenland with 19 sledges. As the outcome of all Peary's experience the expedition was arranged to consist of a lightly equipped advance party to select the route and make the trail by clearing a way through rough ice, and a main party composed of units of four men each with sledges containing all their requirements marching one day behind the pioneer party. From this unit parties were to return southward at intervals with the empty sledges, leaving the diminished main party to push on fully provisioned. The "big lead" which marks the edge of the continental shelf in 83° N. was crossed after some delay and here the sun appeared for the first time on the 5th of March 1909. Dr MacMillan with three Eskimos and three sledges returned along the outward trail after the 7th of March from 84° 26' N. A sounding at this point showed the depth of the sea to be 825 fathoms. After five more marches G. Borup turned back in 85° 23' with three Eskimos and three sledges, the best Eskimo and dogs remaining with the main party. From this point the advance was regular; the pioneer party started from the snow-houses they had built and slept in when the main party arrived, and while the latter slept the pioneers marched, selected a camp, built new snow-houses, and slept till the main party came up. At 86° 28' N. Prof. R. G. Marvin turned back, as usual with the three worst Eskimo and the worst dogs. His party reached the ship, but he himself was drowned in recrossing the "big lead," the only casualty of the expedition. At 88° N. Bartlett turned back on the 1st of April in accordance with the system with two Eskimos, one sledge and 18 dogs. Up to this point Peary had saved himself as much as possible, leaving the path-finding and the observations to his very competent colleagues; but now he put forth all his strength for the arduous 140 m. which separated him from the Pole. He was accompanied by Henson and four Eskimos. The ice improved as he went on and it was possible to do 25 m. in a day march of 10 hours, and on one occasion 31 m. in 24 hours. On the 6th of April an observation gave 89° 57' N., and here a camp was made and observations taken throughout 24 hours to fix the position, as well as excursions a few miles farther on and a few miles to right and left so as to be sure of actually reaching the Pole. No land was to be seen, and a sounding through the ice gave a depth of 1500 fathoms with no bottom. The American flag was hoisted; the goal of all the ages of exploration had been reached.

The return journey was quick and easy. The tracks kept open by the passage of the various return parties were distinct enough to follow, the snow-houses stood ready for sheltering at the end of each march, and a northerly gale kept the ice pressed well together and the leads closed. On the 23rd of April Cape Columbia was reached and soon after the party was safe on board the "Roosevelt." Success was due to the accumulated experience of twenty-three years' constant Arctic work, and to the thorough acquaintance with the Eskimo and their dogs, which enabled the best work to be got out of them.

Dr F. A. Cook spent two years in the Arctic regions, 1907-1909, and claimed to have reached the Pole by sledge alone with two Eskimos a year before Peary. He submitted the evidence for this achievement to the university of Copen- hagen, which failed to find it satisfactory, and Dr Cook did not appear to challenge this decision.

Physiography of the Arctic Region

Geology.—Although much remains to be done in the exploration of the North Polar area, the main features of the physical geography of the region have been determined beyond any reasonable doubt. Within the Arctic Circle the northern portions of Europe, Asia, America and Greenland surround a central area of deep sea, the southern margin of which forms a broad continental shelf bearing many islands. The ring of land and shallow sea is broken only by the broad channel between Greenland and Europe through which Atlantic water gains an entrance into the Arctic Sea. The physical conditions of this sea, which covers the greater part of the Arctic regions, are dealt with later in detail; but there is less to be said regarding the land.

In a climate which taxes human powers to the utmost to carry on the simplest route-surveys in the course of an exploring expedition, and in the presence of a snow covering which is permanent on all high ground and only disappears for a short time in summer, even on the shores and islands, it is obvious that any knowledge of the geology must be difficult to obtain. On the earlier Arctic expeditions enthusiastic collectors brought together quantities of specimens, many of which it was found impossible to bring home, and they have been found abandoned by later travellers. As Arctic exploration was usually carried out on the sea or over the sea-ice even those expeditions in which experienced geologists took part furnished few opportunities for making investigations. The result is that the geology of the Arctic lands has to be inferred from observations made at isolated points where the fortune of the ice stopped the ship, or where on land journeys a favourable exposure was found. Almost every geological formation is known to be represented, from the Archæan to the Quaternary, and there is a general resemblance in the known geological features of most of the great Arctic islands. The fundamental rock in all appears to be Archæan gneiss. In the extreme north-east Carboniferous strata have recently been discovered similar to the Carboniferous rocks of Spitsbergen. The Jurassic rocks farther south are in places capped by Cretaceous beds, and closely resemble the Jurassic rocks of Spitsbergen, Franz Josef Land and the northern parts of Norway and Russia. Cretaceous and Tertiary rocks are found on the west coast of Greenland covered over by great flows of basalt, probably of Tertiary age, at Disco Island, Nugssuaq Peninsula and various points farther north. The only mineral of economic value found in Greenland is cryolite, which is mined at Ivigtut in the south-west. Native iron occurs in considerable masses in several places, some of it undoubtedly of telluric origin, though some is probably of volcanic origin.

The second "Fram" expedition confirmed and extended the geological observations of the Franklin search expeditions on the American Arctic archipelago, and showed the presence above the Archæan rocks of Cambrian, Silurian and Devonian strata, the Silurian being represented by a widespread brown limestone abounding in fossils. Carboniferous limestones also occur and less extensive beds of quartz sandstones, schists and limestones containing ammonites and other Mesozoic fossils. Tertiary

rocks including beds of lignite and plant fossils of Miocene age also occur, and they are interstratified and overspread with basaltic and other eruptive rocks as in Greenland. In Grant Land Tertiary coal occurs in Lady Franklin Bay (61° 45' N.), the most northerly deposit of fossil fuel known. Arctic Canada consists of Archaean and Palaeozoic rocks worn down into plateaux or plains and bearing marks of glacial action, the absence of which is the most remarkable feature of the tundra region of Siberia. The Siberian coast is superficially formed to a large extent of frozen soil and gravel sometimes interbedded with clear ice, and in this soil the frozen bodies of mammoths and other Quaternary animals have been found preserved in a fresh condition by the low temperature. The absence of a glacial period in northern Siberia is probably indirectly due to the very low temperature which prevailed there, preventing the access of water vapour from without and so stopping the supply required to produce sufficient precipitation to form glaciers or ice-caps. On the New Siberia Islands Silurian and Tertiary rocks have been recognized, the latter with abundant deposits of fossil wood.

The geological evidence is complete as to the existence of a genial climate in Tertiary times as far north as the present land extends, and of a climate less severe than that of to-day in the Quaternary period. The existence of raised sea margins in many Arctic lands and especially in the American Arctic archipelago bears evidence to a recent elevation of the land, or a withdrawal of the sea, which has been influential in forming some of the most prominent features of the present configuration. It is noteworthy that no great mountain range runs into the Arctic region. The Rocky Mountains on the west and the Urals range on the east drop to insignificant elevations before reaching the Arctic Circle. The plateau of Greenland forms the loftiest mass of Arctic land, but the thickness of the ice cap is unknown. The one active volcano within the Arctic Circle is on the little island of Jan Mayen.

The Arctic Climate.—As the water of the Arctic Sea is free from ice around the margin only for a few months in summer, and is covered at all times over its great expanse with thick ice in slow uneasy motion, there is less contrast in climate between land and sea, especially in winter, than in other parts of the world. The climate of the polar area may be described as the most characteristic of all the natural features, and observations of temperature and pressure are more numerous and systematic than any other scientific observations. The Russian meteorological system includes Siberia, and long series of observations exist from stations up to and within the Arctic Circle. The Canadian Meteorological Service has secured like observations for the extreme north of North America, though the records are more fragmentary and of shorter duration. Norway and Iceland also yield many records on the margin of the Arctic Circle. The international cirum-polar stations maintained during 1882 connected the Siberian, Norwegian and Canadian land stations with the more fragmentary work of the various polar expeditions which have wintered from time to time in high latitudes. The most valuable records and practically the only data available for the climate north of 84° are those of the first expedition of the "Fram" in her three years' drift across the polar basin. Later expeditions beyond the 84th parallel were merely dashes of a few weeks' duration, the records from which, however accurate, are of an altogether different order of importance. The data collected by the "Fram" were discussed in great detail by Professor H. Mohn in 1894, and that eminent authority combined them with all that had been known previously, and all that was ascertained by later explorers up to the return of Captain Sverdrup from the second "Fram" expedition, so as to give the completest account ever attempted of the climate of the North Polar regions, and on this we rely mainly for the following summary.

Temperature.—From Professor Mohn's maps of the isotherms north of 60° N. it is evident that the temperature reduced to sea-level is lowest in the winter months within an area stretching across the pole from the interior of Greenland to the middle of Siberia, the long axis of this very cold area being in the meridian of 40° W. and 140° E. For every month from October to April the mean temperature of this cold area is below 0° F., and in the two coldest months there are three very cold areas or poles of cold with temperatures below -40° arranged along the axis. These are the interior of Greenland, an area around the North Pole and the centre of Northern Siberia. Professor Mohn is satisfied that these three poles of cold are separated by somewhat warmer belts, as observations on the north coast of Greenland show a temperature higher both than the temperature of the interior reduced to sea-level and the temperature on the frozen sea further north. As summer advances the temperature rises to the freezing point most rapidly in North America, the mean temperature for June, July, and August on the American coast and the Arctic archipelago being above the freezing point.

The interior of Greenland is believed to be below the normal temperature for the latitude in all months and so is the region between Bering Strait and the Pole; the Norwegian-Sea, and the region north of it as far as the Pole, has a temperature above the normal for the latitude in all months; while the temperature

1 It must be remembered that for cartographical purposes temperature is reduced to its value at sea-level, allowing for a change of 1° F. in altitude. This in Arctic temperatures makes the snowcap of Greenland at the height of 9000 ft. is 30° F. lower at all seasons than is shown on an isothermal map, and that of Verkhoyans (500 ft.) is only 1°F. lower than is charted.
in the northern continents is below the normal in winter and above the normal in summer.

The "Fram" observations showed that while the ordinary diurnal range of temperature prevailed for the months when the sun was above the horizon during some part of the day, there was also a diurnal range in the winter months when the sun did not appear, the minimum then occurring about 2 p.m. and the maximum about 1 a.m., the "day" being colder than the "night." Except in July and August the temperature was always found to be lower with the weaker winds and higher with the stronger winds irrespective of direction. Extraordinarily rapid variations of temperature have been observed in the winter months, on one occasion in February 1896 (north of 84 ° N.) the thermometer rising within 24 hours from -45.4 ° to +22.3 ° F., a rise of 67.7 °.

Cloud and Precipitation.—The amount of cloud in the far north is greater in the daytime than at night, the summer months being cloudy, the winter very clear, and the amount is greater with the stronger winds and less with the weaker winds. Precipitation is most frequent in the summer months, the "Fram" results showing an average of 20 days per month from May to September; while from October to April the average was only 1.1 days per month. Rain was only observed in the months from May to September; but snow occurs in every month and is most frequent in May and June, least frequent in November and December, which are the months of minimum precipitation. It has never been possible to make satisfactory measurements of the amount of precipitation in the Arctic regions on account of the drifting of snow with high wind. Fogs occur most frequently in July and August (20 or 16 days per month); they are practically unknown between November and April.

Pressure.—The "Fram" observations enabled Professor Mohn to revise and extend the isobaric maps of Dr Buchan, the correctness of which was strikingly confirmed. The Atlantic and Pacific low pressure areas are found at all seasons on the margin of the Arctic area, the position shifting a little in longitude from month to month. The two low pressures are separated in the winter months by a ridge of high pressure (exceeding 30-00 in.) stretching from the Canadian to the Siberian side between the North Pole and Bering Strait; this ridge has been termed by Professor Supan "the Arctic wind divide..." In April the high pressure over Asia gives way and an intense low pressure area takes its place during the summer, uniting in August with the less intense low-pressure area which develops later over Canada, and reducing the Arctic high pressure area to an irregular belt extending from North Greenland to Franz Josef Land on the Atlantic side of the Pole. The general pressure over the polar area is much higher in winter than in summer and the gradients are steeper also in the cold weather, giving rise to stronger winds. The isobaric conditions indicate light variable winds in summer along the route of the "Fram" from the New Siberia Islands to the north of Spitsbergen, and in winter south-easterly or easterly winds of greater force; this is in accord with the observations made during the drift. Professor Mohn believes that the maximum pressure at the North Pole takes place in April, when it is about 30-08 in.; and the minimum pressure from June to September, when it is about 29-88 in., the annual range of monthly mean pressure being thus only 0-20 in., so that the Pole may be said to be a region of permanently high atmospheric pressure. Cyclonic depressions crossed the region of the "Fram's" track with considerable frequency, 73 being experienced in the three years, the frequency being greatest in winter but the wind velocity in cyclones greatest in summer; the most considerable movement was from west to east. The average velocity of the cyclonic winds encountered by the "Fram" was only about 20 m. per hour, the highest 40 m. per hour, the portion of the Arctic Sea she crossed being much less stormy than the coasts of the Arctic lands, where winds have been recorded of far greater severity, e.g. 45 m. per hour in Spitsbergen in 1882, 53 m. per hour in Teplitz Bay, Franz Josef Land, in 1900, 62 m. per hour on the Siberian coast in the "Vega" in 1879, and as much as 90 m. per hour at Karmakul in Novaya Zemlya in 1883. There seems little doubt that the interior of the polar area is a fair weather zone as compared with its margins, where the contrast of the seasons is more marked.

Flora.—The land flora of the Arctic regions, although necessarily confined to the lower levels which are free from snow for some time every year, and greatly reduced in luxuriance and number of species as compared with the flora of the temperate zone, is still in its own way both rich and varied, and it extends to the most northerly land known. In some of the fjords of western Greenland and also of Ellesmere Land almost on the 80th parallel the prevailing colour of the landscape in summer is due to vegetation and not to rock. The plants which occur on the margin of the Arctic Sea and in the polar islands represent the hardier species of the North European, Asiatic and American flora, the total number of species amounting to probably about a thousand phanerogams and a still larger number of cryptogams. The habit of all is lowly, but some grasses grow to a height of 1 ft. 6 in., and the mosses, of which the Eukimo make their lamp-wicks, frequently form cushions more than a foot in depth. Trees are absent north of 73 ° N., which is the extreme point reached in Siberia, or they are dwarfed to the height of shrubs as in southern Greenland, or farther north to that of the prevailing herbage. The flowers of many Arctic species of phanerogams have an intensely brilliant colour. The plains and lower slopes of the plateaux of Ellesmere Land and Heberg Land and the plain of Peary Land north of Greenland are sufficiently clothed with vegetation to support large numbers of rodents and ruminants, the plants occurring not as occasional curiosities, but as the normal summer covering of the ground, playing their full part in the economy of nature. The cold of winter is not sufficient to put a stop to plant life even at the pole of cold in northern Siberia; and there is no reason to doubt that if there were islands close to the North Pole they would bear vegetation.

Fauna.—Animal life is comparatively abundant in the waters of the Arctic Sea, though the whalebone whale, Balena mysticetus, has become almost extinct by reason of the energy with which its pursuit has been carried on. The white whale and narwhal still abound in the open waters as far north as ships can go. The walrus and several species of seal prey on the marine life, and the polar bear, the king of Arctic beasts, probably roams the whole surface of the frozen seas in pursuit of seals and the larger fish. The other Arctic carnivora include the Arctic fox and wolf, the latter attacking all the land mammals except the polar bear and old musk-oxen. The wild reindeer is still found in all the circum-polar lands except Franz Josef Land; but its range does not extend so far to the north as that of the typical ruminant of the polar lands, the musk-ox (Ovis moschatus), which now abounds only in Peary Land, north Greenland and in the American Arctic Archipelago, though it was formerly circum-polar in its distribution. The Arctic hare is almost equally characteristic and more abundant, and the lemming probably more common still. The ermine and other valuable fur-bearing animals also occur. The animals are either permanently white like the polar bear, or change their coats with the season, being brown in summer and white in winter like the hares and lemmings. The birds of the Arctic regions are all migrants, retreating southward in winter but nesting in incredible numbers on the Arctic coast-lands, and in summer probably finding their way as individuals to every part. They are mainly sea-birds, though the snow bunting, the Arctic owl and other land birds are amongst the summer visitors. It iscustomary to divide the vegetation of Greenland and of many of the large islands are totally devoid of life of every kind on account of their unchanging covering of snow and the intensely rigorous climate due to their great altitude.

Arctic People.—The conditions of life in the continental parts of the Arctic regions are extremely severe as regards temperature in the winter, but it has been found possible for civilized people to live permanently both in the extreme north of North
Polar Regions

America and in the north of Siberia. In the north of Norway where the winter is mild on account of the warm south-westerner winds from the open Atlantic, organized communities dwell within the Arctic Circle in free communication with the south by telegraph, telephone, steamer, and in some cases by rail also, all the year round. The climate on the coast of Norway is scarcely less favourable in the north than in the south except for the absence of light in winter when the sun never rises, and the absence of darkness in summer when the sun never sets. If there were natural products of sufficient value permanent settlements might arise in any part of the Arctic regions where there is land free from snow in summer; but as a rule the Arctic land is poor in mineral wealth and the pursuit of whales and seals requires only a summer visit. The original people of the farthest north of Europe are now represented by the Lapps, who lead a migratory life, depending mainly on fishing and on their herds of reindeer. Farther east their place is taken by the Samoyedes who live along the coast of the Kara Sea and the Yalmial Peninsula; they have also a small settlement in Novaya Zemlya. The Samoyedes, like the Lapps, live on the produce of the sea in summer and on their herds of reindeer, moving rapidly over the frozen country in winter by means of reindeer sledge. The Samoyedes of Lena-Josef Land, which has never had native inhabitants. Along the coast of Siberia there is no continuous population, except in the land of the Chukchis in the extreme east between the Kolyma river and Bering Strait; but small settlements of many tribes of pagan hyperboreans occur here and there. North American Indian tribes wander far to the north of the Arctic Circle in Canada and Alaska, keeping their hereditary enemies the Eskimo to the coast and islands. The Eskimo of the American coast are intermingling not only with the American whalers but also with the Polynesians who come north as part of the crew of the whalers, and the pure race is tending to disappear. The traces of Eskimo encampments in the Polar archipelago, where no Eskimo now live, may mark a former wider range of hunting grounds, or a greater extension of the population. The Greenland Eskimo are the most typical and the best known of their race. A few hundred live on the east coast, where they were formerly much more numerous. The greatest part of the west coast Eskimo are now civilized members of the Danish colonies, and it is stated that whereas in 1855 only about 30% of the population were half-breeds, the blending of the Eskimo and Europeans is now so complete that no full-blooded Eskimo remain in Danish Greenland. The tribe of Eskimo living to the north of Melville Bay, the only one of which the people of the coast tribes of Denmark-Greenland were first described by Sir John Ross, who called them Arctic Highlanders. They have been fully studied by Commander Peary, who succeeded in utilizing them in his great series of journeys, and to their aid he attributes the success of his method of Arctic travelling.

The Arctic Sea.

According to its geographical position, the Arctic Sea might be described as the sea situated north of the Arctic Circle; but according to its natural configuration, it is better defined as the gulf-like northern termination of the long and relatively narrow Atlantic arm of the ocean which extends north between Europe and America on one side and America and Asia on the other. By this situation as the northern end of a long arm of the ocean its physical conditions are to a very great extent determined. This Arctic gulf is bounded by the northern coasts of Europe, Siberia, North America, the American Arctic archipelago, Greenland and Iceland. Its entrance is the opening between Europe and Labrador divided by Iceland, Greenland and the American Arctic islands; and its natural southern boundary would be the subarctic ridge extending from Scotland and the Shetland Islands through the Faeroe Islands and Iceland to Greenland, and continuing on the other side of Greenland across Davis Strait to Baffin Land. This ridge separates the depression of the Arctic Sea, filled with cold water at the bottom, from the deep depression of the North Atlantic. The Arctic Sea communicates with the Pacific Ocean through Bering Strait, which is, however, only 40 m. broad and 27 fathoms deep. The area of the Arctic Sea may be estimated to be about 3,600,000 sq. m., of which nearly two-thirds (or 2,300,000 sq. m.) is continuously covered by floating ice.

The Arctic Sea may be divided into the following parts: (1) The North Polar Basin (including the Siberian Sea), bounded by the northern coasts of Siberia (from Bering Strait to the western Taimyr Peninsula), Franz Josef Land, Spitsbergen, Greenland, Grinnell Land, Axel Heiberg Land, King-ner Land, the Farry Islands and Alaska; (2) the Kara Sea, between Novaya Zemlya and the Siberian coast, south of a line from the north point of the former to Lonely Island (Ensomsheiden) and Norden-sköld Island; (3) the Barents and Murman Sea, bounded by Novaya Zemlya, Franz Josef Land, Spitsbergen, Bear Island and the northern coasts of Norway and Russia; (4) the Norwegian Sea, between Norway, Spitsbergen, Jan Mayen, Iceland and the Faeroes; (5) the Greenland Sea, between Spitsbergen, Jan Mayen, Iceland and Greenland; (6) Baffin Bay and Davis Strait, between Greenland, Ellesmere Land, North Devon and Baffin Land.

Depths.—The Arctic Sea forms an extended depression separating the two largest continental masses of the world—the European-Asianic (Eurasia) and America. Along its centre this depression is deep, but around its margin, on both sides, it is unusually shallow—a shallow submarine plateau or drowned plain extending northward from both continents, forming the largest known continental shelf. North of Europe this shelf may be considered as reaching Spitsbergen and Franz Josef Land, extending over more than 10 degrees of latitude, although there is a somewhat deeper depression in between. North of Spitsbergen it reaches beyond 81° N., and north of Franz Josef Land probably somewhat north of 82° N. North of Siberia the shelf is 330 m. broad, or more, with depths of 50 to 80 fathoms, or less. In longitude 13° E. it reaches nearly 75° N., where the bottom suddenly sinks to form a deep sea with depths of 2000 fathoms or more. Farther east it probably has a similar northward extension. North of America and Greenland the shelf extends to about latitude 84° N. This shelf, or drowned plain, evidently marks an old extension of the continents, and its northern edge must be considered as the real margin of their masses, the coasts of which have probably been overflowed by the sea at some comparatively recent geological period. On this submarine plateau the Arctic lands are situated between Spitsbergen (with seven Islands to the north, Bear Island and Heninger Island to the south), Franz Josef Land, Novaya Zemlya, Lonely Island, the New Siberia Islands, Wrangel Island, the American Arctic archipelago. The depth of the shelf is, especially north of Siberia, very uniform, and usually not more than 50 to 80 fathoms. North of Europe it is intersected by a submarine fjord-like depression, or broad channel, extending eastward from the Norwegian Sea. Between Norway and Bear Island this depression is about 240 fathoms deep, and between Novaya Zemlya and Franz Josef Land 100 to 150 fathoms deep. It gives off several submerged fjords or channels towards the south-east into the shallow Murman Sea, e.g. one channel, more than 100 fathoms deep, along the Murman coast towards the entrance of the White Sea; another narrow channel, in parts 160 fathoms deep, along the south-west coast of Novaya Zemlya through Kara Strait. It also extends into the Kara Sea, rounding the north point of Novaya Zemlya and forming a narrow channel along its eastern coast. On the American side similar but much narrower submarine depressions, which may be called submarine fjords, extend from Baffin Bay into the continental shelf, northward through Smith Sound, Kane Basin and Kennedy Channel, and westward through Lancaster Sound. The greatest depths in the Arctic Sea have been found in the North Polar Basin, where depths of 2100 fathoms, in about 81° N. and 130° E., have been measured with certainty. In longitude 13° E., north of Franz Josef Land, depths of 160 fathoms along the “Fram,” from about 70° N. and 138° E. to near Spitsbergen. In 84° 1/2 N. and about 78° E. the depth is 2020 fathoms,
and in 83° N. and 13° E. it is 1860 fathoms. The northern and eastern extension of this deep basin is not known. Commander Peary reports a depth of 1500 fathoms with no bottom at 5 sea miles from the Pole (about 80° 55′ N.) where he tried to obtain a sounding. It was formerly believed that still greater depths existed west of Spitsbergen, in the so-called Swedish deep, where 2600 fathoms had been sounded, but the NARTHOL expedition in 1808 found no greater depths there than about 1700 fathoms. The Norwegian Sea, farther south, is 2000 fathoms deep midway between Iceland and Norway, in about 68° N. This so-called Norwegian deep is, as before stated, separated from the North Atlantic Basin by the Wyllie-Thomson ridge and the Faeroe-Iceland ridge. Farther north there is a low transverse ridge extending eastwards from Jan Mayen, in about 72° N., which is about 1300 fathoms deep. North of this the sea is again deeper—1085 fathoms in 75° N. From the north-west corner of Spitsbergen a submarine ridge extends in a north-western direction, with depths of about 430 fathoms in 81° N. and about 4° E. How far this ridge extends is unknown, but there is a probability that it reaches Greenland, and thus separates the Swedish and the Norwegian deep from the deep depression of the North Polar Basin. Baffin Bay forms, probably, a relatively deep basin of about 1000 or 1300 fathoms, which is separated from the West Atlantic Basin by the shallow submarine ridge from Greenland to Baffin Land in about 65° or 66° N.

The deposit composing the bottom of the Arctic Sea contains in its northern part, in the North Polar Basin, extremely little matter of organic origin. It is formed mainly of mineral material, sandy clay of very fine grain, to an extent which is hardly found in any other part of the ocean with similar depths. It contains only from 1 to 4% of carbonate of lime. Farther south, in the sea between Spitsbergen and Greenland, the amount of carbonate of lime gradually increases owing to the shells of foraminifera (especially biloculinae); west of Spitsbergen the proportion rises to about 20 or even 30%, while in the direction of Greenland it is considerably lower.

The vertical and horizontal distribution of temperature and salinity (i.e. density); secondly, by the influence of the winds, especially on the ice-covered surface. The currents in this sea may to some extent be considered as convection currents, caused by the cooling of the water near the surface, which becomes heavier, sinks, and must be replaced on the surface by warmer water coming from the south, which is also influenced by the prevailing winds. On account of the rotation of the earth the northward-running water on the surface, as well as the sinking water, will be driven in a north-easterly or easterly direction, and thus forced into a southward-flowing stratum along the bottom, as well as the rising water, is driven south-west or westward. This very simple circulation, however, is to a great extent complicated on the one hand by the irregular configuration of the sea-bottom, especially the transverse submarine ridges—e.g. the Spitsbergen ridge, the Jan Mayen ridge, and the Scotland-Faeroe-Iceland ridge; and on the other hand by the circumstance that the upper water strata of the sea are comparatively light in spite of their low temperature. These strata, about 100 or 120 fathoms thick, are diluted by the addition of fresh water from the North European, Siberian, Canadian and Alaskan rivers, as well as by precipitation, while at the same time the evaporation from the surface of the mostly ice-covered sea is insignificant. The light surface strata will have a tendency to spread over the heavier water farther south, and thus the polar surface currents running southward along the east coasts of Greenland, Baffin Land and Labrador are formed, owing their westerly course to the rotation of the earth. These currents are certainly to a great extent helped and increased by the prevailing winds of the region. The winds get a firm hold on the rough surface of the floating ice, which, with its deep hummocks and ridges, gets a good grip of the water, transferring the movement of the surface immediately down to at least 5 or 10 fathoms.

The chief currents running into the Arctic Sea are the following:—
1. The Gulf Stream, or Atlantic drift, passing north-eastward over the Scotland-Faeroe-Iceland ridge, along the west coast of Norway, north of one archipelago, between the Victoria Cape and the Barents Sea, and another branch running northward along the margin of the shelf between Norway, Bear Island and Spitsbergen, passing as a very narrow current along the west coast of the latter, over the Barents ridge and its north-west corner, and into the North Polar Basin, where it flows gradually northward and eastward (on account of the rotation of the earth) below the cold but lighter layer, 100 fathoms thick, of polar water, and fills the North Polar Basin below 100 or 120 fathoms to the bottom with Atlantic water.
2. The Irminger Current, running north along the west coast of Iceland. One part of it passes southward between Iceland and Jan Mayen into the Greenland Current in Denmark Strait, following the Greenland Polar Current, whilst another smaller part runs northward, eastward and south-eastward to the north and east of Iceland.
3. The Atlantic current running northward along the west coast of Greenland, passes the ridge across Davis Strait, and flows into Baffin Bay, forming its deeper strata below the polar water in a similar way to the Gulf Stream in the North Polar Basin. There is a possibility that some slight portion of this current even reaches the latter along the bottom of the deep channel through Smith Sound.
4. A small current running northward into the North Polar Basin through Bering Strait.

The Arctic Sea receives also a contribution of fresh water from the rivers of northern Europe, Siberia and America, as well as from the glaciers of Greenland and the precipitation over the whole area of the sea itself.

The chief currents running out of the Arctic Sea are: (1) The Greenland Polar Current, running southward along the east coast of Greenland, and directed towards both the east Greenland branch, (a) the east Greenland branch, passing south through Denmark Strait and rounding Cape Farewell; (b) the east Iceland branch, running south-eastward between Iceland and Jan Mayen, towards the Faeroes. It seems as if only a small portion of this current actually passes the Faero-Iceland ridge and reaches the Atlantic Ocean. The greater part is partly mixed with the water of the Gulf Stream and is turned by the latter in a north-easterly direction, forming the kind of eddy observed in the north-eastern corner of the Norwegian Sea. (2) The Labrador Polar Current, formed by the water running south through Smith Sound, Lancaster Sound and Jones Sound, as well as water from Baffin Bay, and also from the east Greenland current rounding Cape Farewell and crossing Davis Strait. (3) Along the south-east coast of Spitsbergen a polar current also passes in a south-westerly or westerly direction past South Cape, where it meets the Gulf Stream. (4) A small current probably also runs out along the western end of Bering Strait.

Temperature and Salinity.—While the temperature is comparatively uniform, with small variations, the difference in salinity between the upper and lower strata is greater than in most other parts of the ocean. In the North Polar Basin the vertical distribution of temperature as well as salinity is very much the same in all places examined. Near the surface, from 0 down to 100 fathoms, the water is below the freezing point of fresh water by about 0° 5 (salinity 0·2%). From 100 fathoms to about 30 fathoms, which is about 1·5° C. At a depth of about 25 fathoms—and is much diluted with fresh water (see above), the salinity gradually increasing downward from about 25 or 30 per mille near the surface to nearly 35 per mille in 100 fathoms. Below 100 fathoms the temperature as well as the salinity gradually increases, until they approach their maximum in about 160 or 200 fathoms, where the temperature varies between 32° 5 (0·3° C), north of the New Siberia Islands, and about 33° 8 (1° C) north of Franz Josef Land; and the salinity is about 35·1 per mille. From this depth the temperature gradually sinks downward; 32° 6 (0·5° C) is found at about 490 fathoms in the western part of the basin—e.g. between about 84° N. 15° E. and 85° N. 58° E., while it is found in about 400 fathoms farther east—e.g. in 81° 3 N. and 123° E. In depths between 1400 and 1600 fathoms the temperature has a second minimum between 30° 6 (0·8° C) and 30° 4 (0·0° C), below which depth the temperature again rises slowly, a few tenths of a degree towards the bottom. In all depths below 200 fathoms the salinity of the water remains very much the same, about 35·1 per mille, with very slight variations. This comparatively warm and saline water evidently originates from the branch of the Gulf Stream passing north across the submarine ridge from north-west Spitsbergen. The vertical distribution of temperature and salinity is very much the same,
summer and winter, throughout the North Polar Basin, except near the surface, which in summer is covered by a layer of fresh water arising from the melting of the snow-covered surface of the floe-ice. This fresh-water layer may attain a thickness of 5 or 6 ft. between the floes. North of the Siberian coast the sea is, during summer, covered with a layer of warm water from the Siberian rivers, and the temperature of the surface may rise to several degrees above freezing-point.

In the Norwegian and Greenland Seas there are greater variations of temperature. Below a certain limit, which in the northern part (on the eastern side) is about 350 fathoms deep, and in the southern part between 330 and 400 fathoms deep, the ice-crested northern basin of this sea is filled with water which has an unusually uniform salinity of about 34-92 per mille, and the temperature of which is below zero centigrade, gradually sinking downward from the above-mentioned limit, where it is 32° (30° C.); and down to 29-8° (1-1° C.) or 29-6° (1-3° C.) near the bottom in 1400 or 1600 fathoms. This cold underlying water of such a remarkably uniform and comparatively low salinity is formed chiefly in a small area between Jan Mayen and Spitsbergen, by the formation of ice and cooling down of the Atlantic surface water by radiation of heat during the winter. In this manner the surface water becomes heavier than the underlying water and gradually sinks to the bottom. This water seems to be distinctly different from the hitherto known water filling the deep of the North Polar Basin, as it has a lower salinity and lower temperature; the known bottom temperature of the North Polar Basin being between 30-7° (o° 7° C.) and 30-4° (o° 4° C.), and the salinity about 35-1 per mille. This fact seems to indicate that there can be no direct communication between the deep depression of the North Polar Basin and the Norwegian-Greenland Sea, which are probably separated by a submarine ridge running from the north-west corner of Spitsbergen to Greenland.

The above-mentioned layer of uniform cold water of the Norwegian-Greenland Sea is, along its eastern side, covered by the warm and saline Gulf Stream flowing northward along the west coast of Norway, Bear Island and Spitsbergen, and forming the upper strata of the sea about 300 to 500 fathoms deep. The maximum temperature of this water is on the surface about 40° (38° C.) to 50° (30° C.) west of northern Norway, and about 35° (3° C.) to 39° (4° C.) west of Spitsbergen. The salinity is generally between 35-0 and 35-3 per mille.

Along the western side of this sea, towards the east coast of Greenland, the underlying cold water is covered by the less saline water of the polar current, which in the upper strata of the sea, from the surface down to about 100 fathoms, has very much the same temperature and salinity as in the upper cold and less saline strata of the North Polar Basin. Near the east coast of Greenland, a layer of comparatively warm and saline water, with a temperature of 32-7° (4° C.) and a salinity of 35-2 per mille, has been found (by the Ryder expedition in 1891) below the cold and lighter polar water in a depth of 70 to 90 fathoms. This warmer undercurrent is a continuation of the warm Spitsbergen current sending off a branch westward from Spitsbergen, and thus forming a great vortex movement in the Spitsbergen-Greenland Sea similar to the one mentioned farther south in the Norwegian Sea.

In Barents Sea the temperature and salinity are highest in the western part near Norway or between Norway and Bear Island, where the eastern branch of the Gulf Stream enters and where in summer the salinity generally is between 34-8 and 35 per mille from the surface down to the bottom, and the surface temperature generally is about 41° or 43° (5° C. or 6° C.), and the bottom temperature is above zero centigrade. The eastern part of Barents Sea is filled with water of a little lower salinity, the deeper strata of which are very cold, with temperature even as low as 28-0° (1-7° C.), but often with salinity above 35-0 per mille. This cold and saline water is formed during the formation of ice on the sea-surface. The bottom temperature is everywhere in the eastern part below zero centigrade and generally below —1°C.

The Kara Sea is covered near the surface with a layer of cold water much diluted by the fresh water from the Siberian rivers, especially the Ob and the Yenisei. The salinity varies between 29 and 34 per mille; near the mouth of the rivers it is naturally much lower.

The vertical distribution of temperature and salinity in Baffin Bay seems to be very similar to that of the North Polar Basin, with a cold but less saline upper stratum of water—with a minimum temperature of about 28-9° (1-7° C.)—and a warmer and more saline deeper stratum from 100 to 200 fathoms downwards, with a maximum temperature of 33-6° (0-9° C.) in about 200 fathoms, and the temperature slowly decreasing towards the bottom.

Arctic Ice—As before mentioned, at least two-thirds of the Arctic Sea is constantly covered by drifting ice. This ice is mostly formed on the surface of the sea itself by freezing, the so-called floe-ice or sea-ice. A small part is also river-ice, formed on the rivers, especially those of Siberia, and carried into the sea during the spring or summer. Another comparatively small part of the ice originates from the glaciers of the Arctic lands. These pieces of glacier-ice or icebergs are, as a rule, easily distinguished from the floe-ice by their size and structure. They occur almost exclusively in the seas round Greenland, where they originate from the glaciers descending into the sea from the inland ice of Greenland. Some small icebergs are also formed in Franz Josef Land, Spitsbergen, and the Zemlya, Grinnell Land, and, but they are comparatively insignificant, and are not as a rule carried far from the coasts. Sea-ice or floe-ice is formed during the autumn, winter and spring, especially in the North Polar Basin, but also in the Kara Sea, the greater part of Barents Sea, the northernmost part of the Norwegian Sea (near Bear Island and towards Jan Mayen), Greenland Sea and Baffin Bay. The floe-ice does not, as a rule, grow thicker than 7 or 8 ft. in one year, but when it floats in the water for some years it may attain a thickness of 16 ft. or more directly by freezing. By the constant upheaval from pressure much greater thicknesses are attained in the piled-up hummocks and ridges which may be 20 to 30 ft. high above the water when floating. During the summer the floe-ice decreases again by melting partly on the surface owing to the direct radiation of heat from the sun, partly on the under side owing to the higher temperature of the water in which it floats. The first kind of melting is that which prevails in the North Polar Basin, which the second occurs in more southern latitudes. The floe-ice is constantly more or less in movement, carried by winds and currents. The changing wind, and also to a great extent the changing tidal current, causes diverging movements in the ice by breaking it into larger or smaller floes. When the floes separate, lanes and channels are formed; when they meet, ice-pressures arise, and the floes are piled up to form hummocks or ridges, and thus the uneven polar ice arises. In the North Polar Basin the floe-ice is slowly carried by the prevailing winds and the currents in an average direction from Bering Strait and the New Siberia Islands, north of Franz Josef Land and Spitsbergen, near the North Pole, towards the Greenland Sea and southward along the east coast of Greenland. Such a drift of an ice-floe from the sea north of Bering Strait to the east coast of Greenland probably takes, as a rule, four or five years, and the floes found in this part of the sea are not, therefore, generally older. What the drift of the ice is on the American side of the North Polar Basin is still little known. But there it is probably more or less blocked up in its southward movement by the islands of the American Arctic archipelago, and the ice-floes may thus grow very old and thick. Commander Peary found a strong easterly movement of the floes in the region north of Grant Land in 1907. The southwest distribution of the drifting floe-ice (the pack ice) in Barents Sea, Norwegian-Greenland Sea and Davis Strait may differ much from one year to another, and these variations are evidently due to more or less periodical variations in the currents and also in the directions of the prevailing winds. In most places the ice has its most southerly distribution during the late winter and spring, while the late summer and autumn (end of August and September) is the most open season.
Biological Conditions.—The development of organic life is comparatively poor in those parts of the Arctic Sea which are continuously covered by ice. This is, amongst other things, proved by the bottom deposits, which contain exceptionally little carbonate of lime of organic origin. The reason is evidently that the thick ice prevents to a great extent the development of plant life on the surface of the sea by absorbing the light; and as the plant life forms the base for the development of animal life, this has also very unfavourable conditions. The result is that—e.g., in the interior of the North Polar Basin—there is exceptionally little plant life in the sea under the ice-covering, and the animal life both near the surface and in deeper strata is very poor in individuals. Whilst it is comparatively rich in species. Near the outskirts of the Arctic Sea, where the sea-ice is only present during the greater part of the year, the pelagic plant life as well as animal life is unusually rich, and, especially during the early summer, there is often here such a development of plantkton (i.e., pelagic life) on the surface as is hardly found in any other part of the ocean. It seems as if the polar water is specially favourable for the development of pelagic plant life, which makes the flora, and consequently also the fauna, flourish as soon as the ice-covering disappears and the surface water is exposed to the full sunlight of the long Arctic day. At the same time the temperature of the water rises, and thus the conditions for the chemical change of better and nutritive assimilation are much improved.

The Arctic Shelf, on the North Polar Basin, is thus considered as a lung or reservoir in the circulation of the ocean where the water produces very little life, and thus, as it were, gets rest to time and accumulate those substances necessary for organic life, which are everywhere present only in quite minimal quantities. It is also a remarkable fact of interest in this connexion that the greatest fisheries of the world seem to be limited to places where waters from the Arctic Ocean and from more southern seas meet—e.g., Newfoundland, Iceland, Lofoten and Finmarken in Norway.

The mammalian life is also exceptionally rich in individuals along the outskirts of the Arctic Sea. We meet in those waters, especially along the margin of the drifting ice, enormous quantities of seals of various kinds, as well as whales, which live on the plankton and the fishes in the water. A similar development of mammalian life is not met with anywhere else in the ocean, except perhaps in the Antarctic Ocean and Bering Sea, where, however, similar conditions are present. In the interior of the Arctic Sea or the North Polar Basin mammalian life is very poor, and consists mostly of some straggling polar bears which probably occasionally wander everywhere over the whole expanse of ice; some seals, especially Phoca foetida, which has been seen as far north as between 84° and 85° N.; and a few whales, especially the narwhal, which has been seen in about 85° N.

The bird life is also exceptionally rich on the outskirts of the Arctic Sea, and the coasts of most Arctic lands are every summer inhabited by millions of sea-birds, forming great colonies almost on every rock. These birds are also dependent for their living on the rich plankton of the surface of the sea. In the interior of the Arctic Sea the bird life is very poor, but straggling seabirds may probably be met with occasionally everywhere, during summer-time, over the whole North Polar Basin.

1487 by Bartholomew Diaz first brought explorers within touch of the Antarctic cold, and proved that the ocean separated Africa from any Antarctic land that might exist. The passage of Magellan's Strait in 1520 showed that America and Asia also were separated from the Antarctic continent, which was then believed to extend from Tierra del Fuego southward. The doubling of Cape Horn by Drake in 1578 proved that the Tierra del Fuego archipelago was of small extent and that any continent ever died a harder death. It is not to the purpose here to describe in detail how Schouten and Le Maire rediscovered the southern extremity of Tierra del Fuego and named Cape Horn in 1615, how Quiros in 1606 took possession for the king of Spain of all the lands he had discovered in Australia del Espiritu Santo (the New Hebrides) and those he would discover "even to the Pole," or how Tasman in 1642 showed that New Holland (Australia) was separated by sea from any continuous southern continent.

Limit of Pack Ice

West 150° Longitude

1 Chatham Is. 1

Voyagers round the Horn frequently met with contrary winds and were driven southward into snowy skies and ice-encumbered seas; but so far as can be ascertained none of them before 1770 reached the Antarctic circle, or knew it, if they did. The story of the discovery of land in 64° S. by Dirk Gerrits on board the "Blijde Boodschap" in 1599 has recently been shown to be the result of the mistake of a commentator, Kasper Barlaeus, in 1622. Much controversy has arisen as to whether South Georgia was sighted in 1675 by La Roche, but the point is of no importance in the development of the history of exploration. It may
safely be said that all the navigators who fell in with the southern ice up to 1750 did so by being driven off their course and not of set purpose. An exception may perhaps be made in favour of Halley's voyage in H.M.S. "Paramour" for magnetic investigations in the South Latitude, when he met the ice in 58° S. In January 1770 he found that latitude was his farther south. A determined effort on the part of the French naval officer Pierre Bouvet to discover the South Land described by a half legendary sieur de Gonneville resulted only in the discovery of Bouvet Island in 54° 10' S., and in the navigation of 48 degrees of longitude of ice-cumbered sea nearly in 55° S. in 1739. In 1771 Yves Joseph Kerguelen sailed from France with instructions to proceed south from Mauritius in search of "a very large continent." He lighted upon a land in 50° S. which he called South France, and believed to be the central mass of the southern continent. He was sent out again to complete the exploration of the new land, and found it to be only an inhospitable island which he re-named in disgust the Isle of Desolation, but in which posternity has recognized his courageous efforts by naming it Kerguelen Land. The obsession of the undiscovered continent culminated in the brain of Alexander Dalrymple, the brilliant and erratic hydrographer who was nominated by the Royal Society to command the Transit of Venus expedition to Tahiti in 1769, a post he coveted for its astronomical interest than for the opportunity it would afford him of confirming the truthfulness of his favourite explorer Quiros. The command of the expedition was given by the admiralty to Captain James Cook, whose geographical results were criticized by Dalrymple with a force and persistency which probably had some weight in deciding the admiralty to send Cook out again with explicit instructions to solve the problem of the southern continent.

Sailing in 1772 with the "Resolution," a vessel of 462 tons under his own command and the "Adventure" of 336 tons under Captain Tobias Furneaux, Cook first searched in vain for Bouvet Island, then sailed for 20 degrees of longitude to the westward in latitude 58° S., and then 30° eastward for the most part south of 60° S. a higher southern latitude than had ever been voluntarily entered before by any vessel. On the 17th of January 1773 the Antarctic Circle was crossed for the first time in history and the two ships reached 67° 15' S. in 30° 35' E., where their course was stopped by ice. There Cook turned northward to look for South France, of the discovery of which he had received news at Cape Town, but from the rough determinism of his longitude by Kerguelen, Cook reached the assigned latitude 10° too far east and did not see it. He turned south again and was stopped by ice in 61° 52' S. and 95° E. and continued eastward nearly on the parallel of 60° S. to 147° E. where on March 16th the approaching winter drove him northward for rest to New Zealand and the tropical islands of the Pacific. In November 1773 Cook left New Zealand, having parted company with Furneaux and reached 66° 16' and in 177° W., whence he sailed eastward keeping as far south as the floating ice allowed. The Antarctic Circle was crossed on the 20th of December and Cook remained south of it for three days, being compelled after reaching 67° 31' S. to stand north again in 135° W. A long detour to 47° 50' S. served to show that there was no land connexion between New Zealand and Tierra del Fuego, and turning south again Cook crossed the Antarctic Circle for the third time in 190° 30' W., and four days later his progress was blocked by ice in 71° 10' S., 106° 54' W. This point, reached on the 30th of January 1774, was the farthest south attained in the 18th century. With a great detour to the east almost to the coast of South America, the expedition regained Tahiti for refreshment. In November 1774 Cook started from New Zealand and crossed the South Pacific without sighting land between 53° and 59° S. to Tierra del Fuego, then passing Cape Horn on the 29th of December he discovered the Isle of Georgia and Sandwich Land, the only ice-land he had seen, and crossed the South Atlantic to the Cape of Good Hope between 55° and 60° S., thereby wiping out Dalrymple's continent from all the oceans and laying open the way for future Antarctic exploration by exploding the myth of a habitable southern continent. Cook's most southerly discovery of land lay on the temperate side of the 60th parallel, and he convinced himself that if land lay farther south it was practically inaccessible and of no economic value.

On the 16th of December Captain James Cook set out on voyages to South Georgia both from England and America, but no clear accounts of the southern limits of their voyages before the year 1810 can now be obtained. In February of that year William Smith of the brig "Williams" trading between Monte Video and Valparaiso, rounding the Horn with a wide sweep to the south, saw land in 62° 40' S. Repeating the voyage in October he saw the land distinctly, and named it South Shetland. The "Williams" was chartered by the British naval commander on the Pacific station, and in 1820 Edward Bransfield, master R.N., surveyed the group and went as far as 64° 30' among the islands. Meanwhile American sealers from Stonington, Connecticut, had begun operations on the newly discovered land, and one of these, Nathaniel B. Palmer, discovered the mountainous archipelago still farther south which now bears his name. In 1831-1832 George Powell, apparently a British sealer, discovered and surveyed the South Orkney Islands which, though typical Antarctic lands, lie outside the Antarctic region.

A voyage only second in importance to that of Cook was planned in Russia and sent out by the emperor Alexander I. under the command of Fabian von Bellinghausen in the "Vostok," with Lieut. Lazareff in the "Mirrina" in company, both vessels being about 500 tons. The object of the expedition was to supplement that of Cook by circumnavigating the Antarctic area, taking care to keep as far south as possible in those longitudes where Cook had made his northward detours. Bellinghausen entered on his exploring work by sighting South Georgia at the end of December 1819, discovered the Traverse Islands, sighted the Sandwich group and met a solid ice-pack in 60° S., to get round which he made a wide detour, sailing east to the south of Cook's track, and getting south of the 60th parallel in 8° W. On the 26th of January he crossed the Antarctic Circle in 8° W. and by February 1st had reached 69° 25' in 1° 17' W., a latitude which has never been surpassed on that meridian. Being stopped by ice, Bellinghausen turned northward and then continued to the east well to the south of Cook's track, getting south again as the ice permitted and reaching 69° 6' S. in 18° E. On this occasion he was able to sail for three degrees of longitude within the circle before being forced north of it by a succession of heavy gales. He still kept eastward south of 65° S. and crossed the circle once more in 41° E., where the number of birds seen suggested the proximity of land, and in fact Enderby Land was not very far off, though out of sight. A storm of unexampledd violence drove the ships northward, but they still held to the east south of 66° S. as far as 87° E., having followed the edge of the ice through those meridians south of Kerguelen Land where Cook had made a great detour to the north. Bellinghausen now made for Sydney to rest and refit, arriving there on the 29th of March 1820, after 131 days under sail from his land port. At Sydney Bellinghausen heard of the discovery of the South Shetlands, and leaving early in November reached the sixtieth parallel a month later in longitude 143° W., and sailing eastward kept south of that parallel through 145 degrees of longitude during sixty-five days, never out of sight of the ice, keeping close along the pack edge through the great gap left by Cook south of New Zealand. He managed to cross the circle three times more, in 164° 30' W., in 120° W. and in 92° 10' W., where he reached 69° 52' S., the culminating point of his voyage. As the cruise was supplementary to Cook's, no attempt was made to get south of the meridian where that great navigator made his highest latitude. On the 22nd of January 1821, the day after reaching his highest latitude, Bellinghausen sighted the first land ever seen within the Antarctic Circle, the little island named after Peter I. A week later another and larger land, named after Alexander I., was seen at a distance of 40 m. and sketches made of its bold outline in which the black rock stood out in contrast to the snow.
Bellingshausen then made for the South Shetlands, where he met the American sealers, and thence returned to Russia. The voyage was a worthy pendant to that of Cook; it was carried out with a faithful devotion to instructions and consummate seamanship, and as a result it left only half the periphery of the Antarctic Circle within which land could possibly project beyond the Frigid Zone.

The next episode in the history of Antarctic exploration was the voyage of James Weddell, a retired master R.N., in 1823.

Weddell was in command of the "Jane," a brig of 160 tons, with the cutter "Beaufort" of 65 tons in company, and after cruising among the South Orkneys during January he started for the south on exploration, and as he was well equipped with chronometers his positions may be taken as of a far higher degree of accuracy than those of ordinary sealers. On the 2oth of February he reached the highest latitude yet attained, 74° 15' S. in 34° 17' W., having seen much ice but no impenetrable pack, and at the farthest point the sea was clear and open, but the lateness of the season and the length of the return voyage decided him to go no farther. Weddell made interesting collections of Antarctic animals, including the type specimen of the seal which bears his name, and the book in which he describes his voyage testifies to the keenness of his observations and the soundness of his reasoning. The sea which he penetrated so far to the south he named after the reigning king, George IV., but it is now known as Weddell Sea.

In 1829 Captain Henry Foster, R.N., in H.M.S. "Chanticleer" spent some months in the South Shetlands carrying on pendulum and gravity observations at the most southerly harbour that could be found, and though he did not go south of 65°50' S. the careful observations which were made threw much light on the physical conditions of the Antarctic regions.

The firm of Enderby Brothers of London took a conspicuous part in the exploration of the Antarctic seas during the first four decades of the 19th century. They encouraged the masters of the whaling and sealing craft which they sent to the southern seas to take every opportunity that offered for exploration and to fix the position of any land seen with the greatest possible accuracy. The voyage of the Enderby's brig "Tula," under the command of John Bischoe, R.N., with the cutter "Lively" in company, is worthy to rank with Cook's and Bellingshausen's expeditions, for it repeated and advanced upon their achievements with a mere fraction of their resources. Enderby's discovery of the Terra Nova, which, apparently, had escaped the notice of Bellingshausen's discoveries, was a keen explorer and a man given to thinking over and reasoning upon all that he saw, and in many of his conclusions he was far in advance of his time. At the beginning of January 1831 Bischoe, who had been hunting vainly for seals on the Sandwich group, started on a voyage easterly to look for new islands, and in trying to get south of 60° S. he had to coast the impenetrable ice-pack as far as 10° W., and continuing he got within the Antarctic Circle in 1° E. on a track parallel to that of Bellingshausen but farther east. Contrary winds delayed the little vessels, no seal-bearing lands were to be found, but in spite of difficulties, constant danger from fogs and icebergs, and disappointed crews he held on, and on the 28th of January he made the Terra Nova, south of Cook's track, and, except at one or two points, to the south of Bellingshausen's also. Though his highest latitude was only 69° S. in 10° 43' E., on the 28th of January, he remained south of the Antarctic Circle, or within a few miles of it, for another month, when, in longitude 49° 18' E., he was rewarded by the discovery of land. But just as he was entering on a clear lead of water running straight for a promontory which he named Cape Ann, a terrific storm descended on the vessels, damaged them seriously and drove them helpless before it with the driving ice. A fortnight's struggle with the wind and ice brought Cape Ann into sight again on the 16th of March, but as it was now to be conquered, the sea was beginning to freeze and half the crew were helpless with the effects of exposure, so Bischoe was compelled to give up the fight and reluctantly let the land—now known as Enderby Land—drop out of sight astern. With only three men able to stand, Bischoe brought the "Tula" into Hobart Town, Tasmania, and the "Lively," with only the master, one man, and a wounded boy alive, just escaped shipwreck in Port Phillip Bay. After recruiting their health and completing their crews the two captains put to sea again and spent some time in sealing on the shores of New Zealand and neighbouring islands. They started south once more, and crossed 65° S. in 131° W. on the 28th of January 1832. Bischoe kept between 66° S. and the Antarctic Circle, north of Bellingshausen's route, for he dared not risk the lives of his second crew, but he got south to 67° S. in 79° W. and here, on the 14th of February, he again sighted land, which, in ignorance of Bellingshausen's discoveries in the same region, he believed was the most southerly land yet known. He named it Adelaide Land after the queen. A few days later he passed a row of low ice-covered islands—the Bischoe Islands—running from W.S.W. to E.N.E. Beyond these islands lay the mountains of an extensive land of which Bischoe took possession in the name of King William IV., and to which the name of Graham Land was subsequently given. Bischoe returned home after an arduous two months' sealing in the South Shetlands, and the splendid results of his relentless determination as an explorer won for him the gold medals of the young Geographical Societies of London and Paris.

In 1833 another of Enderby's captains named Kemp reported the discovery of land in 66° S. and 62° E. about 160° east of Enderby Land. The last of the great voyages of exploration due to Enderby Brothers was the cruise of the "Eliza Scott" under the command of John Balleny, with the cutter "Sabrina" in company. This voyage is interesting because it was the first attempted in high latitudes from east to west, and all those made in the opposite direction had suffered much from the buffetting of head winds. Balleny left Campbell Island south of New Zealand on the 17th of January 1838 and crossed the Antarctic Circle in 178° E. on the 20th. Heavy pack ice stopped him in 66° S., a higher latitude than that previously been reached in that region. On the 28th of February, after the little vessels had been working north-westward along the edge of the pack ice for more than a week, land was seen and found to be a group of mountainous islands—the Balleny Islands—one of which rose to a height of 12,000 ft., and another was an active volcano. Captain Freeman of the "Sabrina" made a momentary landing on one of the islands and was nearly drowned in the attempt, but secured a few specimens. Balleny named them after the rocks to be volcanic. The vessels held on their way westward between latitudes 63° and 65° S., far south of any earlier voyager, and land, or an appearance of land, to which the name of the "Sabrina" was given, was reported in 121° E. In 103° 40' E. an iceberg was passed with a rock embedded in the ice, clear proof of land existing to the southward. A few days later the "Sabrina" was lost in a gale, but Balleny returned in safety.

About 1835 the importance of obtaining magnetic observations in the far south, and the scientific interest of the study of the south polar regions led to plans being put forward for expeditions in the United States, France, and Great Britain. The Frenchman Jules Dumont D'Urville, equipped in the frigates "Astrolabe" and "Zélée" under Jules Dumont D'Urville for ethnographical research in the Pacific Islands, was instructed to make an attempt to surpass Weddell's latitude in the South Atlantic Ocean, and this D'Urville tried to do with conspicuous ill-success, for he never reached the Antarctic Circle though he spent the first two months of 1835 round the edge of the ice-pack south of the South Shetlands and the South Orkneys. Some portions of the land south of the South Shetlands were charted and named Joliville Island and Louis Philippe Land; but the addition to knowledge was not great. Two years later, after fulfilling the main purpose of his expedition by exploring the coast of New Zealand, D'Urville resolved for the glory of France to attempt to reach the Magnetic Pole, towards which he was aware that a British and an American expedition were directing their course. He left Hobart Town on the 1st of January 1840, and on the 20th he crossed the 66th parallel in 140° E. and discovered land 3000
Polar Regions

964

or 4000 ft. high, which he named Adélie Land and took possession of by landing on a rocky islet off the icebound coast. Ten days later in 64°30'S. D'Urville cruised westward along a high ice-barrier, which he believed to be connected with land, from longitude 131° E. and he named it the Clarie Coast. A few days later he left the Antarctic regions for the Pacific.

As early as 1836 the United States Congress had authorized an American Exploring Expedition in the programme of which Antarctic exploration had a leading place. Lieut. Charles Wilkes was appointed to command the expedition of five vessels in August 1838, and his instructions, dated in that month, required him amongst other things to follow Weddell's route as far as possible, (2) to visit the most southerly point reached by Cook in the Antarctic, and (3) to make an "attempt to penetrate within the Antarctic region, south of Van Diemen's Land, and as far west as longitude 45° E., or to Enderby Land." The ships were in bad repair and ill-adapted for navigation in the ice, and many of the officers were not devoted to their chief; but in spite of great difficulties Wilkes fulfilled his programme. In following Weddell's route Wilkes in March 1839 fared no better than D'Urville in the previous year, but the "Flying Fish" of 60 tons under Lieutenant Walker reached 70° S. in 105° W., thus nearly reaching Cook's position of 1774. The third item of the Antarctic programme was made the subject of the most strenuous endeavour. Wilkes sailed from Sydney in the "Vincennes" on the 26th of December 1838, accompanied by the "Peacock" under Lieut. William L. Hudson, the "Porpoise" under Lieut. Cadwaladar Ringgold, and the "Flying Fish" under Lieut. Pinkney. They went south to the west of the Balleny Islands, which they did not see, and cruised westward along the ice-barrier or as near it as the ice-pack allowed towards Enderby Land nearly on the Antarctic Circle. The weather was bad with fogs, snowstorms and frequent gales, and although land was reported (by each of the vessels) at several points along the route, it was rarely seen distinctly and the charting of the coast was not attempted. In some cases, unfortunately controversies have arisen at intervals during sixty years as to the reality of Wilkes's discoveries of land, and as to the justice of the claim he made to the discovery of the Antarctic continent. Some of the land claimed at the eastern end of his route has been shown by later expeditions not to exist; but there can be no doubt that Wilkes saw land along the line where Adélie Land, Kemp Land and Enderby Land are known to exist, even if the positions he assigns are not quite accurate. No one, however, could establish a claim to the discovery of a continent from sighting a discontinuous chain of high land along its coast, without making a landing. It seems no more than due to a gallant and much-persecuted officer, who did his best in most difficult circumstances, to leave the name of Wilkes Land on the map of the region he explored.

Unlike the other two expeditions, that equipped by the British government in 1839 was intended solely for Antarctic exploration and primarily for magnetic surveys in the southern polar seas. There were two ships, the "Erebus" of 370 tons, and the "Terror" of 340, stoutly built craft especially strengthened for navigation in the ice. Captain James Clark Ross, R.N., was in command of the "Erebus" and of the expedition; Commander Francis Rawdon Moira Crozier of the "Terror." A young surgeon, Joseph Dalton Hooker, joined the Royal Navy in order to go on the expedition, and he lived to take a keen interest in every subsequent Antarctic expedition down to that of Captain Scott in 1910. Ross had intended to make straight for the meridian of the Magnetic Pole, but, finding that D'Urville and Wilkes had already entered on those seas he determined to try to make a high latitude farther east, and leaving Hobart Town on the 12th of November 1840 he crossed the Antarctic Circle on the 1st of January 1841 and entered the pack ice on the 5th in 174° E. Instead of proving an impenetrable obstacle, the pack let the two ships work through in five days, and they emerged into open sea. Sailing towards the Magnetic Pole they found a chain of great mountains rising from a coast which ran due south from a prominent cape (Cape Adare) in 71° S. The continent was taken formal possession of for Queen Victoria by landing on Possession Island, the mainland being inaccessible, and the ships continued southward in sight of the coast of Victoria Land, where the loftiest mountain was named Mt Melbourne after the Prime Minister, until the twin volcanoes named Erebus and Terror were sighted in 78° S. on the 28th of January. From Cape Crozier, at the base of the mountains, a line of lofty cliffs of ice ran eastwards, the great ice-barrier, unlike any object in nature ever seen before, rising perpendicularly from the water to the height of 200 or 300 ft. and continuing unbroken for 250 m. Along the barrier the highest latitude of 78° 3' S. was attained and the farthest point to the east was 157° W., whereas Ross turned to look for a winter harbour in Victoria Land. Being desirous to winter near the South Magnetic Pole, Ross did not explore McMurdo Bay between Mt Erebus and the north-running coast, where, as we now know, a harbour could have been found, and as he could not reach the land elsewhere on account of ice extending out from it for 15 or 16 m., after sighting the Balleny Islands at a great distance, on the 2nd of March the ships returned to Hobart. This was the most remarkable Antarctic voyage for striking discoveries ever made.

In November 1841 the "Erebus" and "Terror" returned to Antarctic waters, steering south-east from 'New Zealand and entering the ice-pack in about 60° S. and 146° W., the idea being to approach the great barrier from the eastward, but by the end of the year they had just struggled as far as the Antarctic Circle and they, together with the pack, were several times driven far to the northward by heavy gales in which the ships were at the mercy of the floating ice. During a storm of terrible severity on the 18th of January the rudders of both ships were smashed, and not until the 1st of February did they break out of the pack in 67° 20' S., 150° W. The barrier was sighted on the 22nd and the ships reached 78° 10' S. in 161° 27' W., the highest latitude attained for 60 years. To the eastward the Antarctic waters, steering south-east from 'New Zealand, had a more Phillipenous height, but although Ross believed it to be land, he would only treat it officially as "an appearance of land," leaving the confirmation of its discovery as King Edward Land to the next century. No more work was done in this quarter; the "Erebus" and "Terror" turned the edge of the pack to the northward and on getting into clear water sailed eastward to Cape Horn, meeting the greatest danger of the whole cruise by colliding with each other at night while passing between two icebergs in a gale.

After wintering in the Falkland Islands and making good the damage received, Ross made his third and last attack on the southern ice, and for six weeks he cruised amongst the pack along the margin of the ice, and along the Ross Island and Lusapho Islands and in the Neumayer Channel to reach the Antarctic Circle. Failing in this attempt he turned to follow Weddell's route and skirted the pack eastward in 56° S., crossing Weddell's track on the 14th of February 1843, more than a degree farther south than D'Urville in his attempt four years before, but on the edge of an equally impenetrable pack. Coasting it eastward to 12° W. the "Erebus" and "Terror" at last rounded the pack and found the way open to the south, crossing the circle on the 1st of March. Four days later the pack was met with again and the ships were forced into it for 27 miles to latitude 71° 30' S. In 14° 51' W., nineteen degrees east of Weddell's farthest south. No sign of land was seen, a deep-sea sounding showed 4000 fathoms with no bottom, and although this was a mistake, for the real depth was later proved by Dr Bruce to be only 2600 fathoms, it showed at least that there was no land in the immediate neighbourhood.

This was Ross's last piece of Antarctic work, but the magnetic observations of his expedition were continued by Lieut. T. E. L. Moore, R.N., in the hired barque "Pagoda," which left Simon's Bay in January 1845 and proceeded south-east, crossing the Antarctic Circle in 30° 45' E. and reaching a farthest south of 67° 30', nine degrees farther east. An attempt to reach Enderby Land was frustrated by the weather, and Moore continued his
vessel was the Victoria 30', which, under Captain Enderby’s short leadership, was the first steamer to cross the Antarctic Circle. She was the 'S. Challenger,' the first steamer to navigate a high latitude in the Southern Hemisphere, under Captain Tassell of the Crown.

The "Challenger" sailed from Melbourne in September 1859, having on board Carstens Egeberg Borchgrevink, a young Norwegian resident in Australia, who, being determined to take part in a voyage to the south pole, was the first person to set foot on the Antarctic continent.

The "Challenger" visited Antarctic waters, a German whaler, the "Grönländ", under Captain Dallmann, visited the western coast of the Antarctic land south of Tierra del Fuego, and modified the chart in several particulars. The chief discovery was a channel, named Bismarck Strait, in 65° S., which seemed to run between Palmer Land and Graham Land.

When the International Circumpolar observations were set on foot in 1882, two scientific stations were maintained for a year in the southern hemisphere in order to obtain data for comparison with the observations at twelve stations round the North Pole. One of these was occupied by French observers in Tierra del Fuego in 55° S., the other by German observers at Royal Bay on South Georgia in 54° 30′ S. The meteorological observations were of considerable importance.

In 1882 a four steamers of the Dundee whaling fleet— the "Balena," "Active," "Diana," and "Polar Star"— went out to test Ross's statement that the "right whale" inhabited Antarctic waters. The surgeons of two of the vessels— the "Balena" Dr W. S. Bruce, on the "Active" Dr C. W. Donald — were selected for their scientific tastes, and equipped with all requisite instruments for observations and collecting. The result of the experiment was disappointing. No whales were obtained, and the ships devoted their attention to sealing on the east of Joinville Island and Louis Philippe Land, not going farther south than 65° S. (Geographical Journal, 1896, vii. 502-521, 625-643).

A Norwegian sealing, the "Jason," Captain Larsen, also visited those seas in the same season, but the captain landed and collected fossils at several points north of 65° S. In 1883-1884 the "Jason," accompanied by two other Norwegian vessels, the "Hertha" and the "Castor," returned to the Antarctic and entered the ice-laden waters in November at the very beginning of summer. Captain Larsen in the "Jason" made his way as far south as 68° 10′ in 66° W. on the eastern side of Graham Land, but several miles from the coast, which was bordered by a high ice-barrier. The land beyond this barrier was named Foyin Land, after a famous Norwegian whaler owner. Returning northwards, two small islands, Lindenberg and Christensen, were discovered and found to be active volcanoes. Meanwhile the "Hertha," Captain Evensen, had reached the South Shetland Islands on the 1st of November 1883, and worked her way southward along the west side of Palmer Land and past the Biscoe Islands, reaching the Antarctic Circle on the 9th of November without meeting ice. This was the first time the Antarctic Circle had been crossed since the "Challenger" did so twenty years before. Captain Larsen and the "Jason" crew made a most successful voyage, and passing over from ice-fogs they reached their farthest south, 66° 10′ S. in 76° 12′ W. (Mitteilungen der Geographischen Gesellschaft, Hamburg, 1892, pp. 245-304).

In 1894 the well-known Norwegian whaler, Swede Foyin, sent out one of his vessels, the "Antarctic," Captain Christensen, to try his luck off the coast of Victoria Land. The "Antarctic" sailed from Melbourne in September vink, 1894, having on board Carstens Egeberg Borchgrevink, a young Norwegian resident in Australia, who, being determined to take part in a voyage he could join in no other way, shipped as an ordinary seaman. He made notes of the voyage, and published an account of it in his return to Europe (Report of Sixth International Geographical Congress, London, 1895, pp. 169-175).

The "Antarctic" entered the pack in 65° 45′ S, 171° 30′ E, on the 8th of December 1894. The Balleny Islands were sighted on the 14th of December, and Cape Adare on Victoria Land two days later. On the 22nd of January 1895 the farthest point was reached at Coulman Island in 74° S; the sea was then easily navigable to the south. On the 23rd of January a small party, including the captain and Mr Borchgrevink, landed on the mainland near Cape Adare, the first people to set foot on the Antarctic continent.

Efforts had been made from time to time, by Professor von Neumayer in Germany and by Sir John Murray and others in Great Britain, to induce learned societies to inaugurate a new era of scientific Antarctic research. "Belgica," under Government or at least under national auspices. In 1895 Sir Clements Markham, as president of the Royal Geographical Society and of the International Geographical Congress, also took the matter up, and interest in the Antarctic regions began to be aroused in every civilized country. Captain Adrien de Gerlache organized and led a Belgian expedition, for which he raised the funds with difficulty. M. Georges Lecomte, captain of the "Belgica," and Lieut. Danco, magnetic observer, were Belgians; Mr Roald Amundsen, the mate, a Norwegian; M. Arctowski, the geologist and physicist, a Pole; M. Racovita, the biologist, a Rumanian; and Dr F. A. Cook, the surgeon, an American. On the 14th of January 1898, already long past midsummer, the "Belgica," left Staten Island for Antarctic waters. She sighted the South Shetlands on the 21st and proceeded to Hughes Gulf, from which a channel, Gerlache Strait, was explored leading southeastward between continuous land, named Danco Land, on the east (the northern extension of Graham Land), and Palmer Land on the west. Palmer Land was found to be a group of large islands. On the 12th of February the "Belgica" re-entered the open sea to the west at Cape Tuxen in 65° 15′ S. Much fog was experienced, but on the 16th Alexander Land was sighted in the distance. Continuing on a westerly course, the "Belgica" made every effort to enter the pack, which was successfully accomplished after a heavy storm on the 28th. By taking advantage of the leads, the expedition advanced to 71° 30′ S. in 85° 15′ W. by the 2nd of March, but the ship was blocked next day by the growth of young ice soldering the pack into one continuous mass. For more than a year further independent movement was impossible; but the ship drifted with the ice between the limits of 80° 30′ W. and 102° 10′ W., and of 65° 40′ and 71° 35′ S., which was the highest latitude attained (May 31, 1899). The sun did not rise for seventy days, and all on board suffered severely from depression of spirits and disorders of the circulation, which Dr Cook attributed to the darkness and to improper food. Lieut. Danco died during the period of darkness. On the 13th of March 1899, when a second winter in the ice began to seem probable, the "Belgica" was released in 69° 50′ S. and 102° 16′ W. The geographical results of this expedition were insignificant so far as the discovery of land or penetration to a high latitude is concerned. The ship passed several times to the south and west of Peter I. Island, proving that the land seen by Bellinghausen at that
point is of very limited extent. During the drift in the ice the soundings were usually between 200 and 300 fathoms, which, compared with the depths of the sea bottom, is indeed a very small depth. It would be necessary to have a ship of considerable breadth, probably connected with land in the south. The scientific collections were of unique value and have been worked up and the results published at the expense of the Belgian government.

The Hamburg-America Company's steamer "Valdivia," charted by the German Government for a scientific voyage under the leadership of Professor Carl Chun of Leipzig, with Dr Gerhard Schott as oceanographer, left Cape Town on the 13th of November 1885, and on the 25th was fortunate in rediscovering Bouvet Island (53° 26' S, 3° 24' E.), which had been searched for in vain by Cook, Ross, Moore and many other sailors. Steering south, the "Valdivia," although an unprotected steel vessel, followed the edge of the pack from 8° E. to 68° E., reaching 64° 15' S. in 54° 20' E. on the 16th of December. At this point a depth of 2541 fathoms was found, so that if Enderby Land occupies its assigned position, 102 nautical miles farther south, the sub-oceanic slope must be of quite unusual steepness. The rocks dredged up contained specimens of gneiss, granite and schist, and one great block of red sandstone weighing 5 cwt. was secured, confirming the theory of the continental nature of the land to the south.

On his return to England in 1895 Mr Borchgrevink made strenuous efforts to organize an Antarctic expedition under his own leadership, and in August 1898 he left the Thames on the "Southern Cross" in charge of a private expedition equipped by Sir George Newnes. His scientific staff included Lieut. Colbeck, R.N.R.; Mr Louis Bernacchi, a trained mineral observer, and Mr N. Hanson, biologist. About fifty dogs were taken out, the intention being to land at Cape Adare and advance towards the magnetic, and perhaps also towards the geographical pole by sledge. The "Southern Cross" sighted one of the Balleny Islands on the 14th of January 1899, and after in vain attempting to get south about the meridian of 164° E., the ship forced her way eastward and emerged from the pack (after having been beset for forty-eight days) in 70° S., 174° E. She reached Cape Adare, and anchored in Robertson Bay on the 17th of February. The land party, consisting of ten men, was established in a house built on the strip of beach at the base of the steep ascent to the mountains, and the ship left on the 2nd of March. Mr Borchgrevink found it impossible to make any land journey of importance and the party spent the first year ever passed by man on Antarctic land in making natural history collections and keeping up meteorological and magnetic observations. The "Southern Cross" returned to Cape Adare on the 28th of January 1900, and after taking the winter party on board—diminished by the death of Mr Hanson—set out for the south on the 2nd of February. Landings were made on several islands, on the mainland at the base of Mt Melbourne, and on the 10th of February at the base of Mt Terror near Cape Crozier. From this point the ship steamed eastward along the great ice-barrier to a point in 164° 10' W., where an inlet in the ice was found and the ship reached her highest latitude, 78° 34' S., on the 17th of February. The edge of the ice was found to be about 30 m. farther south than it had been when Ross visited it in 1842. Mr Borchgrevink was able to land on the ice with sledges and dogs, and advanced southward about 16 m., reaching 78° 50' S. He discovered that plant life existed in the shape of mosses and lichens in some of the rocky islands, a fact not previously known.

In the autumn of 1901 three well-equipped expeditions left Europe for Antarctic exploration. The British National Antarctic expedition was organized by the relief committee of the Royal Society and the Royal Geographical Society, and equipped under the superintendence of Sir Clements Markham. Most of the cost was borne by the government, the rest mainly by Mr L. W. Longstaff, who provided £30,000, the Royal Geographical Society, and Mr A. C. Harmsworth (afterwards Lord Northcliffe).

A strong wooden ship of about 700 tons register (1700 tons displacement) was built at Dundee, and named the "Discovery." She was made entirely non-magnetic amidships, so that magnetic observations might be carried on without interference. In October the expedition sailed under the command of Commander R. F. Scott, R.N., with Lieut. Albert Armitage, R.N.R., as second in command, Lieuts. Royds and Barne, R.N., Lieut. Shackleton, R.N.R., and Engineer-Lieut. Skelton, R.N. The crew of forty men were almost entirely sailors of the Royal Navy. The scientific staff included Dr Koettlitz, who had shared with Mr Armitage in the Jackson-Harmsworth arctic expedition; Mr Louis Bernacchi, who had wintered with Mr Borchgrevink at Cape Adare; Dr E. A. Wilson, Mr Hodgson, biologist, and Mr Ferrar, geologist. The "Discovery" sailed from New Zealand on the 24th of December 1901, met the pack ice on the Antarctic circle and was through into the open sea in 175° E. on the 8th of January 1902. She made a straight run to Cape Crozier and cruised along the great ice barrier, confirming Borchgrevink's discovery that it lay 30 m. farther south than in 1842, and at the eastern end of the barrier Scott discovered and named King Edward Land where Ross had recorded an "appearance" only. The sea in the neighbourhood had shoaled to less than 100 fathoms and the ice-barrier in places was so low that the "Discovery" was able to lie alongside as at a quay. A captive balloon ascent was made from the barrier but nothing was seen to the south. Returning to McMurdo Bay the "Discovery" found that Mt Erebus and Terror were on an island, the "bay" being really a sound. The ship was secured in winter quarters in 77° 49' S. 166° E., and a hut erected on shore. From this base land-exploration in the Antarctic was initiated, and the history of exploration entered on a new phase. Although some symptoms of scurvy appeared during the winter they were checked by change of diet, and with the beginning of spring sledge journeys with dogs were commenced and a quantity of provisions was laid down in depots to assist the great journey which Scott had planned to the south. On the 2nd of November 1902 Captain Scott, with Lieut. E. H. Shackleton and Dr E. A. Wilson, set out with dog-sledges travelling south over the surface of the barrier in sight of a range of new mountains running parallel to their track on the west. The conditions of travelling were unlike those in the Arctic region, the weather being more inclement and the summer temperature much lower than in similar latitudes in the north. There were no bears to menace the safety of the travellers, and no wolves or foxes to plunder the depots; but on the other hand there was no game of any sort to be met with, and all food for men and dogs had to be carried on the sledges. The surface of the ice was often rough and much crevassed, especially near the western land, snow blizzards frequently occurred making travelling impossible and the heavy sledges had at first to be brought forward by relays, making it necessary to march three miles for every mile of south- ing made. The dogs also weakened and had to be killed one by one to feed the rest. On the 3oth of December they were in 85° 17' S. and Scott determined to try to reach the mountains to the west; but on approaching the land he found the ice so much crevassed and disturbed that the attempt had to be given up. Great peaks in 83° S. were named Mt Markham (15,100 ft.) and Mt Longstaff (9700 ft.) after the chief promoters of the expedition. The outward journey of 380 m. had taken 59 days, and was a splendid achievement, for the conditions to be encountered were totally unknown, and new methods had to be devised as the necessity arose, yet no previous polar explorer had ever advanced so far beyond his predecessor as Scott did. The return journey occupied 34 days and the ship was reached on the 3rd of February 1903, but Shackleton had had to abandon "Morning" on the 3rd of March, Lieut. Mulock, R.N., taking his place on the "Discovery." During the absence of the commander in the great southern journey Armitage and Skelton had found a way to ascend by a glacier in 78° S. to the summit of the vast snow-covered plateau beyond the granite summits of the western mountains. They reached a distance of 130 m. from the ship and an elevation of 9000 ft. Many shorter journeys were made; Ferrar studied the geology of the
mountains and Hodgson was indefatigable in collecting marine fauna, while Bernacchi kept up the physical and meteorological observations. The second winter was lightened by the use of acetylene gas for the first time, and the dark months were passed in better spirits and better health than in the case of any previous polar wintering. In the spring of 1903-1904 Scott undertook a great journey on the western plateau, starting on the 26th of October without dogs. By the 30th of November he had reached a point on the featureless plateau of dead-level snow, 3097 ft. due west from the ship, the position being 77° 59' S., 146° 33' E. and 9000 ft. above sea-level. The ship was reached again on the 25th of December, and on the 4th of January the "Morning" arrived accompanied by a larger vessel, the "Terra Nova," sent out by the Admiralty with orders to Captain Scott to abandon the "Discovery" and return at once. Fortunately, although all the stores and collections had been transferred to the relief ships, the "Discovery" broke out of the ice on the 16th of February 1904 and Captain Scott had the satisfaction of bringing her home in perfect order. The relief ships had provided so little coal that a most promising voyage to the westward of the Balleny Islands had to be abandoned in 135° E.; but it showed that the land charted by Wilkes east of that meridian did not exist in the latitude assigned.

Simultaneously with the "Discovery" expedition and in full co-operation with it as regards simultaneous meteorological and Drygalski; magnetic observations, the German government, "Gauss," equipped an expedition in the "Gauss" which was specially built for the occasion. The expedition was under the charge of Professor Erich von Drygalski and the scientific staff included Professor Vanhöffen as naturalist, Dr Emil Philippi as geologist and Dr Friedrich Biddingmaier as meteorologist and magnetician. The ship was under the command of Captain Hans Rüser of the Hamburg-American line. A supplementary expedition set up a station for simultaneous observations on Kerguelen Land. The "Gauss" crossed the parallel of 60° S. in 92° E. early in February 1902 and got within 60 m. of the charted position of Wilkes' Termination Land, where a depth of 1730 fathoms was found with no sign of land. The pack made it necessary to turn south-westward and land was seen to the eastward on February 1902 on the Antarctic Circle in the direction of Termination Land. Soon afterwards the "Gauss" was beset and spent the winter in the ice. Land of considerable extent was seen to the south and was named Kaiser Wilhelm II. Land; the most conspicuous feature on it was a hill of bare black rock with an elevation of about 1000 ft., which was called the Gaussberg, and was situated in 67° S., 96° E. This was the only bare land seen, and its neighbourhood was thoroughly investigated by the Gaussberg party, but no distant journey was undertaken. In February 1903 the "Gauss" was freed from the ice; but although Drygalski struggled for two months to thread the maze of floes to the eastward and south he could gain no higher latitude and was able to force his way only to 80° E. before seeking the open sea. The scientific observations and collections were most extensive and of great value.

Two private expeditions organized by men of science were in the Antarctic region simultaneously with the British and Nordenskiöld. German national expeditions, and the Thule- Stockfors. The Swedish party in the "Antarctic," with Captain C. A. Larsen in command of the ship, and the South Shetlands in January 1902, afterwards exploring on the east side of Joinville Island and Louis Philippe Land, and wintering on shore on Snow Hill Island in 64° 25' S. From this point a long journey on ski over the flat sea ice bordering King Oscar Land was made to the south, but the Antarctic Circle was not reached. Meanwhile the "Antarctic" had succeeded in penetrating the pack in the Weddell Sea almost to the circle in 55° W., where D'Urville and Ross had failed to get so far south. A second winter was spent at the base on Snow Hill Island, and, the ship having been lost in the ice on her way to take them off, the party was rescued by a brilliant dash of the Argentine gunboat "Uruguay," under Captain Irizar, before the relief ship sent from Sweden arrived.

Meanwhile Dr W. S. Bruce, largely aided financially by Mr James Coats and Captain Andrew Coats, equipped a Scottish expedition in the "Scotia," with Captain Thomas Robertson in command of the ship, and a scientific staff including Mr R. C. Mavor as meteorologist, Mr R. N. Rudmose Brown as naturalist, and Dr J. H. H. Pirie as geologist. The principal object of the expedition was the exploration of the Weddell Sea. The "Scotia" sighted the Orkneys on the 3rd of February 1903, and after a short struggle with the pack she found an open sea at 70° 25' S., where she was beset on the 22nd in 18° W., and whence she returned by a more westerly course, re-crossing the Antarctic Circle in 40° W. This important voyage midway between the tracks of Weddell and Ross, who alone of all who tried had reached 70° S. in this region, practically demonstrated the navigability of Weddell Sea in favourable conditions, and the oceanographical observations made were the most valuable yet carried out in the Antarctic region. The following year, starting from the Sandwich group, Bruce crossed the Antarctic Circle about 25° W., and was able to make a straight run south to 74° 1' S., where the "Scotia" was stopped by the ice in 159 fathoms of water, the sea having shoaled rapidly from a great depth. From the 3rd of March to the 13th the "Scotia" remained in shallow water, catching occasional glimpses of a great ice wall with snow-covered heights beyond it, along a line of 150 m., and dredging quantities of continental rocks. On this evidence the name Coats Land was given to the land within the barrier. The "Scotia" crossed the Antarctic Circle northward in 17° W., having in the two years explored a totally unknown sea for a distance of thirty degrees of longitude. A meteorological station was established by Mr Mossman on Laurie Island, in the South Orkneys (61° S.) in March 1903, and kept up by him for two years, when it was taken over by the Argentine government, and it now has the distinction of being the most southerly station at which continuous observations have ever been taken for over five years.

In January 1904 Dr Jean B. Charcot, a man of science and an accomplished yachtman, led the French archipelago for the Antarctic in the "Français," in command of a French exploring expedition equipped at his own instance. He cruised through the islands of the Palmer Archipelago, and wintered in a cove of Wandel Island 65° 5' S. near the southern entrance of Gerlache Strait. On the 22nd of December 1904 the "Français" was free, and continued to cruise southward along the coast of Graham Land, to the south of which, on the 15th of January, when nearly in latitude 67°, a new coast appeared, mountainous and stretching to the south-west, but Charcot could not determine whether it was joined to Graham Land or to Alexander Land. While approaching the land the "Français" struck a rock, and was so much damaged that further exploration was impossible, and after naming the new discovery Loubet Land, the expedition returned. Charcot organized a second expedition in 1908 on board the "Pourquoi Pas?" and, leaving Punta Arenas in December, returned to the Fildorschipelago, and during January 1909 made a detailed examination of the coast to the southward, finding that Loubet Land was practically continuous on, the north with Graham Land and on the south with Alexander Land, which was approached within a mile at one point. Adelaide Island, reported by Bischoff as 8 m. long, was found to be a large island 70 m. in length, consisting of a series of summits rising out of an icefield. The Bischoff Islands were found to be much more numerous than was formerly supposed. The expedition wintered at Petermann Island in 65° 10' S., and attempts were made to reach the interior of Graham Land, though with little success. After ceasing from the whalers' dépôt at Deception
Island, the "Pourquoi Pas?" sailed on the 6th of January 1910 to the south-west, and reached 70° S. on the 11th, whence views of Alexander Land were obtained from a new position, and a new land discovered farther to the south-west. The highest latitude reached was about 75° 30' S., and Captain was able to look upon it as certain that the parallel crossing the region of the "Belgica's" drift, passing close to Peter I Island across the meridian of Cook's highest latitude, where the ice seemed to promise an easy way south if coal had permitted, and on to 128° W. through an absolutely unknown sea, from which point a direct course was made for Punta Arenas. Frequent soundings and dredgings were made, and Dr Charcot satisfied himself from all the appearances that along the 20 degrees of longitude west of Gerlache's farthest, and more than half-way from Graham Land to King Edward Land, land was probably not far distant to the south.

After his return invalided from the "Discovery," Lieut. Shackleton planned a fresh expedition, which he equipped at his own expense, aided by his personal friends, and he started in the small whaler "Nimrod" from Lyttelton, New Zealand, on the 1st of January 1908, being towed by a steamer to the Antarctic Circle, in order to save coal. The plan was to land a shore party on King Edward Land and return to take them off in the following year, but although a strenuous effort was made to reach the land the floe ice was too heavy, and it would have been madness to establish winter-quarters on the barrier, the coast-line of which had altered greatly since 1902, and was obviously liable to break off in great ice-islands. On the 26th of January the "Nimrod" began to return from the extreme east of the barrier, and the landing of stores commenced on the 3rd of February at Cape Royds, at the base of Mt Erebus, 20 m. north of the "Discovery's" winter-quarters. The shore party included the leader and fifteen companions, amongst them Professor T. W. Edgeworth David, of Sydney University; Lieut. James Boyd Adams, R.N.R.; Sir Philip Breckhurst, Bart.; Mr James Murray, biologist; Mr Raymond E. Priestley, geologist; Dr Alistair Forbes Mackay; Dr Eric Marshall; Mr Douglas Mawson, geologist; and Ernest Joyce and Frank Wild of the Royal Navy, who had taken part in the "Discovery" expedition. No casualty occurred during the whole duration of the expedition, special care having been taken to supply the best provisions, including fresh bread baked daily and dried milk in unlimited quantity, while abundant artificial light was secured by the use of acetylene gas. A motor-car was taken in the hope that it might be used on the barrier surface, but this was found impracticable, although it did good work in laying dépôts on the sea-ice. Another and more successful experiment in traction was the use of Manchurian ponies. Eight of these extraordinarily hardy creatures were taken south in the "Nimrod," but four died in the first month after landing. The others did good service. Nine dogs were also taken, but the experience on the "Discovery" expedition did not lead to much dependence being placed on them. The "Nimrod" left for the north on the 22nd of February and the scientific staff at once began the observations and collections which were kept up to the end. The discovery of a considerable fresh-water fauna and of a poor but characteristic flora was one of the most unexpected results. Apart from many minor excursions and surveys, the expedition performed three journeys of the first importance, each of them surpassing any previous land work in the Antarctic regions. Before winter set in, Professor David, with five companions, made the ascent of Mt Erebus, starting from the winter quarters on the 5th of March, and gaining the summit at an altitude of 13,300 ft. on the 10th; this was found to be the edge of an active crater, the abyss within being 900 ft. deep, though rarely visible on account of the steam and vapours which rose in a huge cloud 1000 ft. above the summit.

The second achievement was the attainment of the South Magnetic Pole by Professor David, with Mr Douglas Mawson and Dr Mackay. They left winter-quarters on the 6th of October 1908, dragging two sledges over the sea-ice. Proceeding along the coast they were able to supplement their provisions and fuel by seal-meat and blubber, and on the 1st of December they reached the Drygalski ice barrier in 75° S., which proved very disturbed ice cross; leaving this so Long ago on the 19th, they proceeded to ascend the plateau with one sledger. Exposure and great risks from the crevasses into which they were constantly falling. On reaching the summit of the plateau travelling became easier, and on the 16th of January 1909 the magnetic dip was 90°, and the position of the magnetic pole was determined as 78° 25' S., 155° 16' E., at an altitude of 7260 ft. and 260 m. from the dépôt of provisions left at the Drygalski glacier. The return journey to this point was accomplished by forced marches on the 3rd of February, and next day the party was picked up by the "Nimrod," which was scouting for them along the coast.

The third and greatest achievement of this remarkable expedition was Shackleton's great southern journey. Dépôts had been laid out in advance on the barrier ice, and the main southern party, consisting of Messrs Shackleton, Adams, Marshall and Wild, started from winter-quarters on the 29th of October 1908, with the four ponies and four 11-f. sledges; a supporting party of five men accompanied the main division for ten days. In order to avoid the disturbed and crevassed ice near the great south-running mountain range, Shackleton kept about 40 m. farther to the east than Scott had done. The ponies enabled rapid progress to be made, but after passing the 81st parallel on the 21st of November, one pony broke down and had to be shot, the meat being left in a dépôt for the return journey. In spite of cold weather and frequent high winds, progress was made at the rate of 15 m. per day, and on the 26th of November the farthest south of the "Discovery" expedition was passed, and Mts Markham and Longstaff were in full view. New mountains continued to appear beyond these, and the range changed its southerly to a south-easterly trend, so that the path to the Pole led through the mountains. On the 28th a second pony became used up and was shot, and a dépôt was formed with provisions and stores for the return in 83° 38' S., and progress was resumed with two sledges. The surface of the barrier ice formed great undulations of gentle slope. On the 1st of December a third pony had to be shot, in 83° 16' S., and horseflesh became the principal article of diet; the remaining pony hauled one sledge, the four men took the other. On the 4th of December the party left the barrier, passing over a zone of much disturbed ice, and commenced the ascent of a great glacier (the Beardmore glacier) which descended from the mountains between magnificent granite cliffs 2000 ft. high. On the 7th, when tiring amongst a maze of crevasses on the glacier, 2000 ft. above sea-level, the last pony fell into a crevasse and was lost, though the loaded sledge was saved; the pony was to have been shot that night as it could not work on the disturbed ice; but its loss meant so much less food, and as far as can be judged this alone made it impossible for the party to reach the Pole. For the next few days of laborious advance one or other of the party was continually falling into a crevasse, but the sledge harness saved them, and no serious harm resulted. After climbing upwards for 100 m. on the glacier, a dépôt was made at a height of 6000 ft. of everything that could possibly be left behind, including all the warm clothing, for it was found possible with Jaegers and wind-proof Burberrys to meet any weather in which exertion was possible. By Christmas Day the plateau surface was fairly reached at a level of 9500 ft., in latitude 83° 55' S., and there was no more difficulty to overcome. The ground had been so empty of snow that the effort of going on over a nearly level surface with insufficient food in a very low temperature, intensified by frequent blizzards. Rations were reduced in the hope of being able to push on to the Pole. Three days later the last crevasse was passed and the surface, now 12,200 ft. above sea-level, grew smoother, allowing 15 m. a day to be done with fair weather. At 4 a.m. on the 9th of January 1909 the four explorers left their sledge and
racing, half walking, half running, they reached 88° 25' S. in 162° E. at 9 a.m., the height above sea being 17,600 ft. The utmost had been done, though more food would have enabled the group to travel 97 geographical miles to the South Pole to be accomplished. The camp was reached again at 3 p.m. The return journey of over 700 m. to the ship was one long nightmare of toil and suffering, but the length of the marches was unsurpassed in polar travel. Once and again all food was exhausted the day before the dépôt, on which the only hope of life depended, was picked up in the waste of snow. Snow-blindness and dysentery made life almost undurable; but, despite it all, the ship was reached on the 1st of March, and the geological specimens from the southernmost mountains, which prevented the sledges of the exhausted men being lightened as they went on, were safely secured. Never in the history of polar exploration had any traveller outdistanced his predecessor by so vast a step towards either Pole.

During the return journey of the "Nimrod" Shackleton was able to do a little piece of exploration to the south of the Balleny Islands, tracing the coast of the mainland for 50 m. to the south-west beyond Cape North, thus indicating that the Antarctic continent has not a straight coastline running from Cape Adare to Wilkes Land. The British government contributed £20,000 to the expenses of the expedition in recognition of the great results obtained, and the king conferred a knighthood on the explorer, the first given for Antarctic work since the time of Sir James Clark Ross.

Captain R. F. Scott left England in the summer of 1910 with a new expedition in the "Terra Nova," promoted by his Experiments of 1910-1911. With a carefully selected crew and a highly competent scientific staff. He intended to arrange for two parties, one leaving King Edward Land, the other McMurdo Sound, to converge on the South Pole. A German expedition under Liut. Wilhem Filchner was announced to leave early in 1911 with the hope of exploring inland from a base in the western part of Weddell Sea, and Dr W. S. Bruce has announced, for the same year an expedition to the eastern part of Weddell Sea mainly for oceanographical exploration. It appears that the greatest extension of knowledge would now be obtained by a resolute attempt to cruise round the south polar area from east to west in the highest latitude which can be reached. This has never been attempted, and a modern Biscoe with steam power could not fail to make important discoveries on a westward circumnavigation.

Physiography of Antarctic Region.—In contrast to the Arctic region, the Antarctic is essentially a land area. It is almost certain that the South Pole lies on a great plateau, part of a land that must be larger and loftier than Greenland, and may probably be as large as Australia. This land area may be composed of two main masses, or of one continent and a great archipelago, but it can no longer be doubted that the whole is of continental character as regards its rocks, and that it is permanently massed into one surface with ice and snow, which in some parts at least unites lands separated by hundreds of miles of sea. But all round the land-mass there is a ring of deep ocean cutting off the Antarctic region from all other land of the earth and setting it apart as a region by itself, more unlike the rest of the world than any continent or island. The expedition of the "Scotia" showed the great depth of the Weddell Sea area, and the attention paid to soundings on other expeditions—notably that of the "Belgica"—has defined the beginning of a continental shelf which cannot be doubted slopes up to land not yet sighted. In the Arctic region large areas within the Polar Circle belong to climatically temperate Europe, and to habitable lands of Asia and America; but in the Antarctic region extensive lands—Graham Land, Louis Philippe Land, Joinville Island and the Palmer archipelago outside the Polar Circle—partake of the typically polar character of the higher latitudes, and even the islands on the warmer side of the sixtieth parallel are of a sub-Antarctic nature, akin rather to lands of the frigid than to those of the temperate zone.

Geology.—Definite information as to the geology of Antarctic land is available from three areas—Graham Land and the archipelago to the north of it, Kaiser Wilhelm Land and Victoria Land. In the Graham Land region there seems to be a fundamental rock closely resembling the Archaean. Palaeozoic rocks have not been discovered so far in this region, although a graptolite fossil, probably of Ordovician age, shows that they occur in the South Orkneys. Mesozoic rocks have been found in various parts of the archipelago, a very rich Jurassic fossil flora of ferns, conifers and cycads having been studied by Nordenskjöld, some of the genera found being represented also in the rocks of South America, South Africa, India and Australia. Cretaceous ammonites have also been found, and Tertiary fossils, both of land and of marine forms, bring the geological record down probably to Miocene times, the flora including of the southern extinct of New Zealand. Raised beaches show an emergence of the land in Quaternary times, and there is evidence of a recent glacial period when the inland ice on Graham Land was a thousand feet higher than it is now. The most prominent features of the scenery are due to eruptive rocks, which have been identified as belonging to the eruptive system of the Andes, suggesting a geologically recent connection between South America and the Antarctic lands. Volcanic activity is not yet extinct in the region.

As regards Kaiser Wilhelm Land, the Gaussberg is a volcanic cone mainly composed of leucite-basalt, but its slopes are strewn with terraces presumably transported from the south by glaciers. The mountains, which include gneiss, mica-schist and quartzite, apparently Archaean. Much more is known as to the geology of Victoria Land, and the results are well summarized by Professor David and Mr Priestley of Sir Ernest Shackleton's expedition, whom we follow. From Cape North (71° S.) to 86° S. a grand mountain range runs south curving to south-eastward, where it vanishes into the unknown; it is built up of gneiss and granite, and of horizontal beds of sandstone and limestone capped with eruptive rock, the peaks rising to heights of 8000, 10,000 and even 15,000 feet, the total length of the range so far as known being at least 1100 miles. This range rises abruptly from the sea, or from the ice of the Great Barrier, and forms a slightly higher edge to a vast snow plateau which has been traversed for several hundred miles in various directions, and may for aught we know extend farther for a thousand miles or more. The accumulated snows of this plateau discharge by the hugest glaciers in the world down the valleys between the mountains. About 78° S. a group of volcanic islands, of which Ross Island, with the active Mt Erebus is the largest, rise from the sea in front of the range, and at the northern extremity the volcanic peaks of the Balleny Islands match them in height. The composition of the volcanic rocks is similar to that of the volcanic rocks of the south of Europe, and they are formed of andesitic lavas and quartzitic rocks. The oldest rocks of Victoria Land are apparently banded gneiss and gneissic granite, which may be taken as Archaean. Older Palæozoic rocks are represented by greenish grey slates from the sides of the Beardmore glacier and by radiolarian cherts; but the most widespread of the sedimentary rocks occurring in vast beds in the mountain faces is that named by Ferrar the Beacon sandstones, which in the far south Shackleton found to be banded with seams of shale and coal amongst which a fossil occurred which has been identified as confitiferous wood and suggests that the place of the formation is Lower Carboniferous or perhaps Upper Devonian. No Mesozoic strata have been discovered, but deposits of peat derived from fungi and moss are now being accumulated in the fresh-water lakes of Ross Island, and raised beaches show a recent change of level. The coast-line appears to be of the Atlantic, not the Pacific type, and may owe its position and trend to a great fault, or series of faults, in the line of which the range of volcanoes, Mt Melbourne, Mt Erebus, and Mt Discovery, stand. Boulders of gneiss, quartzite and sandstone have been dredged at so many points between the Balleny Islands and the Weddell Sea that there can be no doubt of the existence of similar continental land along the whole of that side, at least within the Antarctic Circle.
Polar Regions

Antarctic Ice Conditions.—It is difficult to decide whether the ice of the polar regions should be dealt with as a geological formation or a meteorological phenomenon; but in the Antarctic the ice is so characteristic a feature that it may well be considered by itself. So far as can be judged, the total annual precipitation in the Antarctic region is very slight, probably not more than the equivalent of 10 in. of snow, and perhaps less. It was formerly supposed that the immense accumulation of snow near the South Pole produced an ice-cap several miles in thickness which, creeping outward all round, terminated in the sea in vast ice-cliffs, such as those of Ross’s Great Barrier, whence the huge flat-topped ice-islands broke off and floated away. Evidence, both in the Graham Land and in the Victoria Land areas, points to a former much greater extent of the ice-cap. Thus Shackleton found that the summit of Mt Hope, in 83° 30’ S., which stands 2000 feet above the ice of the surrounding glaciers, was strown with erratics which must have been transported by ice from the higher mountains to the south and west. In McMurdo Sound, as in Graham Land, evidence was found that the surface of the ice-sheet was once at least a thousand feet above its present level. These facts appear to indicate a period of greater snowfall in the geologically recent past—i.e. a period of more genial climate allowing the air to carry more water vapour to the southern mountains. Whatever may have been the case in the past the Antarctic glaciers are now greatly shrunked and many of them no longer reach the sea. Others project into the sea a tongue of hard ice, which in the case of the Drygalski glacier tongue is 30 m. long, and affords probably for a considerable distance. Some of these glacier tongues of smaller size appear now to be cut off at their shoreward end from the parent glacier. At one time the Victoria Land glacier tongues may have been confluent, forming a great ice barrier along the coast similar to the small ice-barriers which clothe the lower slopes of some of the islands in Gerlache Strait. The Great Ice Barrier is in many ways different from these. Captain Scott showed that it was afloat for at least 400 m. of its extent from west to east. Sir Ernest Shackleton followed it for 400 m. from north to south, finding its surface in part thrown into long gentle undulations, but with no evidence of the surface being otherwise than level on the average. The all-but-forgotten experiments and cogitations of Biscone convinced that shrewd observer that all Antarctic icebergs were sea-ice thickened with snow “accumulated with time.” The recent expeditions seem to confirm this view to a great extent in the case of the Barrier, which, so far as the scientific men on the “Nimrod” could see, was formed everywhere of compressed neve, not of true glacier ice. Instances have been seen of tabular bergs floating with half their bulk above water, showing that they are of very much less density than solid ice. The thrust of the glaciers which descend from the western mountains upon the Barrier, throws it into sharp crenaxed folds near the point of contact, the disturbance extending 20 m. from the tip of the Beardmore glacier, and the seaward creep of the whole surface of the Barrier is possibly due to this impulse; the rate of movement at the eastern side of the Barrier was found to be at the rate of 500 yds. per annum for the seven years between Scott’s and Shackleton’s expeditions.

Pack ice composed of broken-up sea-ice and fragments of icebergs appears to form a floating breakwater round the Antarctic area. It is penetrated by powerful steamers with ease or with difficulty according to the action of the wind which loosens the pack when it drives it towards the open sea, and closes it up when it drives it against a coast or a barrier of fast ice. At every point but one around the circumpolar area the pack, being light or dense, appears to extend up to the southern permanent ice or land, though, as in the Weddell Sea, the pack seems at times to be driven bodily away. The exceptional region is the opening of the Ross Sea east of Cape Adare, where a comparatively narrow band of pack ice has always been penetrated by the resolute advance even of sailing ships and led to an extensive open sea to the south. No doubt the set of the ocean currents accounts for this, but how they act is still obscure. The great flat-topped ice-islands which in some years drift out from the Antarctic area in great numbers are usually met with in all parts of the Southern Ocean south of 50° S., and worn-down icebergs have been sighted in the Atlantic even as far north as 26° 30’ S. The greater frequency of icebergs in the Southern Ocean in some years is attributed to earthquakes in the Antarctic breaking off masses of the floating edge of the Barrier.

Antarctic Climate.—Although a vast mass of observations has recently been accumulated, it is not yet possible to treat of the climate of the South Polar region in the same broad way as in the case of the North Polar region. The following table shows the mean temperatures of each month and of the year at all the stations at which the Antarctic winter has been passed. The result is to show that while the winter is on the whole less severe at high latitudes than at equal latitudes in the north, the summer is very much colder, and has little relation to latitude. Even in the South Orkneys, in latitude 60°, in the three warmest months the air scarcely rises above the freezing point as an average, while in Shetland (60° N.) the temperature of the three summer months averages 54° F. But on the other hand, the warmest month of the year even in 77° S. has had a mean temperature as high as 36°. A study of the figures quoted in the accompanying table shows that until longer records
become available it is impossible to speak definitely as to the normal distribution of monthly temperature throughout the year, for even at the same station in consecutive years the months vary greatly. Thus at Snow Hill (65° S.) the mean temperature of August 1903 was 13·5° higher than that of August 1902, though June had been 7° colder, and at the "Discovery's" winter-quarters July 1903 was 13° colder than July 1902 though June was 2° warmer, August having exactly the same mean temperature in each year. The mean temperature of the year is evidently higher in the position of the "Belgica's" drift than in Victoria Land at the same latitude; but it is noticeable that on the west side of Graham Land, where Charcot wintered, the average mean temperature was considerably higher than that of the average of his two winterings) 15° higher than on the east side, where Nordenskjöld wintered in nearly the same latitude. The observations, however, were not synchronous; and it may not be right to compare them. We may perhaps say that along the whole of the known Antarctic coast the temperature in the two midsummer months is within a degree or two of 32° F., and varies little from place to place or from year to year; but in the winter months the temperature is lower as the latitude increases and is subject to great variations from place to place and from year to year. It seems quite possible that at no place in the Antarctic region the mean temperature of January or of July, and the mean temperature of February and August, were ever within 5°F. of each other. The mean temperature of June, however, was nearly of the same value throughout the whole of the region.

The absolute lowest temperature recorded in the Antarctic region was -66·8° on a column of air 80 ft. high at the station "Belgica," on the 15th of September 1903; the lowest temperature at the winter-quarters was -58·5° on the 28th of September 1903. On Sir Ernest Shackleton's expedition the lowest temperature was -57·2°, but no other expedition met temperatures lower than -45·6° on the "Belgica," -43·1° at Cape Adare, and -41·4° on the "Gauss." Sudden rises of temperature during storms are common in the Antarctic region, from whichever quarter the wind blows.

During the ascent of Mt Erebus the temperature was found to fall as the height increased from 0° F. at sea-level to -24° at 5000 ft.; it remained stationary at 8600 ft., fell to -18° at 11,500 ft. and then increased again to -14° at the summit. The maximum temperature was 36° below zero (lower than the coldest temperature at the South Pole) at the summit. The air was exceedingly dry. It is possible to walk barefoot in the air, and there was no snow, although the temperature was -30°F. The wind was strong and it varied from the south-west to the north-east.

The intensity of the blizzards is worthy of remark, for the velocity of the wind often reached 40 or even 60 m. an hour, and they were usually accompanied by a rapid rise of temperature. The observations of sunshine made at the "Discovery's" winter-quarters yielded many records of continuous sunshine extending throughout 24 consecutive hours, and in the summer months about 50% of the possible sunshine was often recorded, the maximum being 490 hours, or 66% of the total possible for December 1903. Thus, although the sun was above the horizon only for 24 1/2 days, it shone sufficiently to yield more than 1725 hours of bright sunshine for the year, an amount exceeded in few parts of England, where the sun may shine on 365 days. The intensity of solar radiation in the clear weather of the Antarctic makes it feel exceedingly hot even when the air temperature is far below the freezing point. There is a great difference between the clear skies of the poles and the extremely foggy fogs which shroud the coast near the Antarctic Circle and render navigation and surveying exceedingly difficult. Heavy snowstorms are frequent on the coast, but inland during the snow blizzards it is impossible to say whether the whirling snow-dust is falling from the air or being swept from the ground. Professor David is inclined to believe that the surface of the snow-plains is being lowered more by the action of the wind sweeping the snow out to sea than it is raised by precipitation, the total amount of which appears to be very small.

**Plants and Fauna.** Recent expeditions have discovered that, despite the low temperature of the summer, in which no month has a mean temperature appreciably above the freezing point, there are on the exposed Antarctic land patches of ground with a sparse growth of cryptogamic vegetation consisting of mosses, lichens, fungi and fresh-water algae. The richest vegetation discovered on the " Nimrod" expedition consisted of sheets of a lichen or fungus growth, covering the bottom of the fresh-water lakes near Cape Royds, and visible through the clear ice throughout the many months when the water is frozen. No flowering plants occur within the Antarctic Circle or in the immediately adjacent lands.

The marine fauna is very rich and abundant. All the expeditions obtained many new species, and the resemblance which occurs between many of the forms and these which inhabit...
the Arctic seas has given rise to the hypothesis that certain
species have been able to pass from one frigid zone to the other.
It is argued on the other hand that all the forms which resemble
each other in the two polar areas are cosmopolitan, and occur
also in the intermediate seas; but the so-called "problem of
bipolarity" is still unsettled. Bird life on sea and land is fairly
abundant, the most common forms being the skua gull, snow
petrels, and the various species of penguins. The penguins are
specially adapted for an aquatic life, and depend for their food
entirely on marine animals. The largest species, the emperor
penguin, inhabits the most southerly coast known on the edge
of the Great Barrier, and there it breeds at mid-winter, very
likely in December and January; and indeed it is probable that
this apparently impossible feat practicable. The social organiza-
tion and habits of the various species of penguins have been care-
fully studied, and show that these birds have arrived at a stage
of what might almost be called civilization worthy of the most
intelligent beings native to their continent. The only mam-
mal life in the Antarctic is marine, in the form of various
species of whales, but not the "right whale," and a few
species of seals which live through the winter by keeping open
blow-holes in the sea-ice. There is no trace of any land animal
except a few species of minute wingless insects of a degenerate
4-th or 5-th order; and the nearest implement of the human type
is the tardigrada, or "water bears" and rotifers showing a remark-
able power of resistance to low temperature, being thawed out
alive after being frozen solid for months and perhaps for years.

Antarctic Expedition 1907-1909. Reports on the Scientific
Inquiries (several vols., London, v.d.).

POLDER, the Dutch name for a piece of low-lying, marshy
land reclaimed from the sea or other water by drainage and
diking (see HOLAND).

POLE (FAMILY). The family of the Poles, ears and dukes of
Suffolk, which, but for Richard III's defeat at Bosworth, might
have given the next king to England, had its origin in a house
of merchants at Kingston-upon-Hull. It has been said that
these Poles were the first English peers whose fortunes had been
founded upon riches gained in trade; but the Berkeleys, de-
cendants of Robert Fitz Harding, the rich burgheers of Gloucester,
POLE

... been sent home sick after the siege. He returned with the ‘viage’ of 1417, leading thirty men-at-arms and ninety archers. Henry V. made him admiral of Normandy, and until the crowning of Henry VI. in Paris in 1431 he served in France without, by his own account, coming home or seeing England. He held the chief command before Salisbury after the sad event had fallen to a cannon-shot from the city, but was forced to surrender to Joan of Arc at Jargeau, where his brother Alexander was killed, another brother, John, being taken prisoner with the earl. A fourth brother, Thomas, a clerk, became hostage to Dunois until the vast ransom of the earl was paid down. After which Suffolk turned to English politics. Like his grandfather, he found a king’s uncle, another Gloucester, the chief of his enemies. Defeating Gloucester’s project of an Armagnac match, Suffolk arranged for the young king’s marriage with Margaret of Anjou, and brought home the bride to Portsmouth in 1445. In the year before he had been created marquess of Suffolk, being the fourth Englishman to take the style of marquess. His party and the queen’s were on the point of overthrowing their opponent, Gloucester, when the ‘good duke’ died suddenly in the hands of those who had arrested him. This death, followed by that of Cardinal Beaufort, left the field to Suffolk. In 1448, as Duke of Suffolk, he was created Earl of Pembroke.

Duke Humphrey’s death. His honours were capped in 1448 with a dukedom of Suffolk, he being then admiral of England, governor of Calais, constable of Dover, and warden of the Cinque Ports. But it seemed that long service in the foreign wars had not purged the offence of the name of Pole. All the old enmity which had driven his grandfather into exile was gathering against Suffolk. His peace policy had cost the cession of Maine and Anjou, while the blunders of his ally, Somerset, as lieutenant in France, lost Normandy to England. Early in 1450 the Commons, in spite of Suffolk’s appeal to his years of loyal service, accused him of treason and he was sent to the Tower. A long indictment was reinforced by new accusations, and the king could do no more for his minister than set him free under a sentence of five years’ banishment. He sailed from Ipswich on the May Day of 1450, but before he could enter the port of Calais he was cut off by a royal ship, the ‘Nicholas,’ whose master had him put overboard into the cockpit, where his head was hacked off by an Irish knave’s rusty sword. His body, cast headless upon Dover beach, was carried by the king’s orders to the Poles’ vault in Wingfield church, where his effigy may still be seen. Who sent out the ‘Nicholas,’ and by whose orders Suffolk died, are questions which remain unanswered. He was the third husband of Suffolk, claiming still fresh whom he married to the widow of Thomas, Earl of Salisbury, slain before Orleans. She was the daughter and heiress of Thomas Chaucer, of Ewelme, and, although direct evidence is wanting, the granddaughter, without doubt, of Geoffrey Chaucer, the poet. She lies at Ewelme, under a magnificent tomb.

John Pole (1442-1491), only son of the murdered duke, should have succeeded to the dukedom, his father having died unattainted. But the honours were apparently regarded as forfeited, and the dukedom was formally restored to the boy in 1453, the cardinal of Pembroke being allowed to laye. Although three generations of warrior lords lay between him and the Hull warehouses, the origin of his house was still fresh in men’s memories. JohnPaston, writing in 1465, could tell every name in the duke’s pedigree back to “William Pool of Hull,” whom he had been “first a merchant and after a knight,” and “what the father of the said William was” John Paston knew “right well.” The duke’s father was an upstart for the crowd, whose ballads pelted him with the name of “Jac Napes,” suggested by his familiar badge of the ape’s clog and chain. Nevertheless a wife of royal blood was found for the young duke, King Edward IV’s own sister Elizabeth. The marriage confirmed him a partisan of the White Rose. The son of Margaret’s faithfull minister rode against her man at the second battle of St Albans. Before he was of age he was steward of England at his brother-in-law’s crowning, and at Queen Elizabeth’s crowning he bore her sceptre. Having held many offices under Edward IV. he was ready to bear a sceptre at Richard’s coronation, and, after Bosworth, to swear fealty to the Tudor dynasty and to bear another sceptre for another Queen Elizabeth. He died in 1491, having safely kept his lands, his dukedom, and his head through perilous years.

But each advance in rank had brought danger and misfortune to the Poles. Before the death of the second duke they had begun to pay the price of their matching with the royal house. In the next generation their name was blotted out. John Pole, eldest son of Duke John and the Lady Elizabeth, had been created Earl of Lincoln by his uncle, Edward IV. Before he followed Richard to Bosworth, the young man had been chosen as heir to the throne, Clarence’s son Warwick being put aside. He survived King Richard and Henry VII. spared him. But he egged on Sisneld’s plot, joined the rebels in Ireland, and was killed at Stoke in 1487, leaving no issue by his wife, the daughter of the earl of Arundel. Edmund, his younger brother, (c. 1472-1513) should have succeeded in 1491 as duke of Suffolk, but on coming of age he agreed to submit himself to his title. Suffolk was then a making grudgingly, without restoring any portion of the estates forfeited by his uncle. In 1499 he suddenly left the kingdom, but was persuaded to return. But the death of the imprisoned earl of Warwick may have suggested to him that Henry’s court was a dangerous place for those of the blood of York, and in 1501 he found his way to the emperor Maximilian in Tirol with a scheme for the invasion of England. Although the kaiser at first promised him men for the adventure, nothing came of his promises. Maximilian, persuaded by a gift of English money, bound himself not to succour English rebels. Suffolk, who had reassumed the ducal style, was attainted in 1504, and in the same year was seized by the duke of Guelders. From the duke’s hands the prisoner was taken by Philip, king of Castile, who surrendered him to England on a promise that his life should be spared. But in 1513, when Richard, his brother, was in arms in the French service, Edmund Pole was taken from his prison in the Tower to the block.

Richard Pole, who in 1501 escaped from England with Edmund, had been received by the king of Hungary, and afterwards by Louis of France, who assigned him a pension. Commanding German Lanzknechts in the French service, he was the friend and companion in arms of the chevalier Bayard. At the death of his brother Edmund, he took the title of the dukedom, and in 1514, as Duke of Suffolk, he was confirmed in his possession of all his father’s titles. He defeated the French in the battle of the Spurs, and was created Archbishops of York. In 1524 Louis gave him the leading of 12,000 riotous German mercenaries to essay the conquest of England. The treaty of peace stayed the adventure, but Louis refused to surrender Richard, and allowed him to depart for the imperial city of Metz. Francis I. continued the payment of his allowance, and gave him employment. In 1522 the anonymous writer of a journal describes the coming to Paris of “Richard de la Poule, soydisant duc de Suffert et la Blanche Rose.” In 1525 the White Rose was killed by the French king’s side at Pavia. With him died the last descendant in the male line of William Pole, the Hull merchant.

One of the stories of the family of history, another family of the name of Pole, having no kinship with the house of Suffolk, owed, like the Suffolks, their advancement and their fall to a match with a princess of the royal house. Sir Richard Pole, a Buckinghamshire knight, was the son of Geoffrey Pole, a squire whose wife, Edith St John, was sister of the half-blood to the mother of Henry VII. About 1490 or 1491 he married the Lady Margaret, daughter of George, duke of Clarence. He died in 1505, and in 1513 King Henry VIII. created the widow countess of Salisbury, as some amends for the judicial murder of her brother, the Earl of Warwick. Four years later, the barony of Montague was revived for her eldest son Henry. Until the king’s marriage with Anne Boleyn, the countess of Salisbury was about the court as governess of her godchild, the Lady Mary. When her son, the famous Cardinal Pole, published his treatise,
De unitate ecclesiastica, the whole family fell under the displeasure of the king, who resolved to make an end of them. The Lord Montague was the first victim, beheaded in 1539 on a charge of treasonable conversations, evidently concocted by him but never brought to his knowledge, and one of an unhappy brother, Sir Geoffrey Pole. In 1541 the aged countess, attainted with her son Montague, met her death at the barbarous hands of an unskilful headman. Sir Geoffrey Pole, seeing that his house was doomed, fled the country, and joined the cardinal in exile. He returned with him at Mary's accession, both dying in 1558. His sons Arthur and Edmund, taken in 1562 as plotters against Queen Elizabeth, were committed to the Tower of London, where they died after eight years of imprisonment.

POLE, REGINALD (1500-1558), English cardinal and archbishop of Canterbury, born at Stourton Castle, Staffordshire, was the third son of Sir Richard Pole, Knight of the Garter, and Margaret, countess of Salisbury, a daughter of George, duke of Clarence, and therefore niece of Edward IV. He was intended for the church from his youth; and when seven years old was sent for five years to the grammar school which Colet had founded near the monastery of Sheen. Here he had Linacre and William Latimer as teachers. In his thirteenth year he went to Magdalen College, Oxford, and two years after took his degree in arts. In 1517 Henry VIII. appointed his young kinsman to a prebend in Salisbury, and soon afterwards to the deaneries of Wimborne and Exeter. He was a friend of Sir Thomas More, who says that Pole was as learned as he was noble and as virtuous as he was learned. In 1519, at the king's expense, he went to Padua, the Athens of Europe, according to Erasmus; and there, where Colet and Cuthbert Tunstall had also been educated, the nobleman of England as he was called, came into contact with the choicest minds of the later Italian Renaissance, and formed the friendship that influenced his life.

In 1525 he went to Rome for the Jubilee, and two years after returned to England and was initiated by Thomas Cromwell into the mysteries of statesmanship, that master telling him that the main point consisted in discovering and following the will of princes, who are not bound by the ordinary code of honour. When the divorce question arose, Pole, like many other excellent men, seems at first to have been in its favour. He probably took the same view that Wolsey had, viz., that the dispensation of Julius II. was insufficient, as of two existing diriment impediments only one had been dispensed. When however the king raised the theological argument which ended in disaster, Pole could not accept it; and, after the failure of Campegio's mission, when the king asked him for his opinion, he excused himself on the score of inexperience, but went by Henry's order to Paris (1530) to obtain the judgment of the Sorbonne, making the condition that another should be joined with him to do the necessary business. At this time, he says, the more he saw into the case the less he knew how to act as he was desired. On his return to England he spoke strongly against the project to the king, who seems to have dealt gently with him in the hope of using him for his own ends. He offered him the see of Winchester and, as he hesitated, by the death of his father, which was a stormy interview at York Place; but Pole succeeded in mollifying his rage so far that Henry told him to put into writing his reasons against the divorce. This was done, and, recognizing the difficulties of the situation, the king gave him leave to travel abroad, and allowed him still to retain his revenues as dean of Exeter. In 1535, which saw by the deaths of Bishop Fisher and Sir Thomas More a change in Henry's policy, Pole received orders to send a formal opinion on the royal supremacy, and the king promised to find him suitable employment in England, even if the opinion were an adverse one. The parting of the ways had come, Pole's reply, which took place in August, and was afterwards published with additions under the title Pro unitate ecclesiastica, was sent to England (May 25, 1539) and was meant for the king's eye alone. It contained a vigorous and severe attack upon the royal policy, and did not shrink from warning Henry with temporal punishment at the hands of the emperor and the king of France if he did not repent of his cruelties and return to the Church. He was again summoned to return to England to explain himself, but declined until he could do so with honour and safety; but he was on the point of going at all risks, when he heard from his mother and brother that the whole family would suffer if he remained obstinate. Pole III. who had prepared a bull of excommunication and deposition against Henry, summoned Pole to Rome in October, and two months after created him cardinal. In January 1537 he received a sharp letter of rebuke from the king's council, together with the suggestion that the differences might be discussed with royal deputies either in France or Flanders, provided that Pole would attend without being commissioned by any one. He replied that he was willing and had the pope's leave to meet any deputies anywhere. Pole III. in the early spring of that year named him legate a latere to Charles V. and Francis I., for the purpose of securing their assistances in enforcing the bull by helping a projected rising in England against Henry's tyranny. The mission failed as the mutual jealousy of the sovereigns did not allow either to begin operations. Moreover, the fear of Henry was sufficient to make the French king refuse to allow one who was attained by act of parliament to remain in the kingdom; so Pole passed over to Flanders, to wait for the possible arrival of any royal deputies. The proposed conference never took place, and in August 1537 the cardinal returned to Rome. There he was appointed to the famous commission which Pole III. established for considering the reforms necessary for the church and Roman curia. The report Consilium delectiorum cardinalium is, in its plain-spoken directness, one of the most noteworthy documents of the history of the period. Towards the end of 1539, after Henry had destroyed the abrite of St Thomas Becket, another attempt was made to launch the bull of deposition, and Pole again was sent to urge Charles V. to assist. Once more his efforts were in vain, and he retired to his friend Sadoletto at Carpentras. As Pole had escaped Henry's power the royal vengeance now fell on his mother, who was executed as a traitor on the 27th of May 1541. When the news came to the cardinal he said to his secretary Beccatelli that he had received good tidings: "Hitherto I have thought myself indebted to the divine goodness for having received my birth from one of the most noble and virtuous women in England; but henceforward my obligation will be much greater, as I understand I am now the son of a martyr. We have one patron more added to those we already have in heaven"; and returning to his oratory Pole found peace in his sorrow.

On the 21st of August 1541 the cardinal was appointed legate at Viterbo, and for a few years passed a happy and congenial life amid the friends that gathered round him. Here he came into close relations with Vittoria Colonna, Contarini, Sadoletto, Bembo, Morone, Marco Antonio, Flamiano, and other scholars and leaders of thought; and many of the questions raised by the Reformation in Germany were eagerly discussed in the circle of Viterbo. The burning question of the day, the French war, by the Cardinal. The "dolce ilirico," the famous Trattato utilissimo del beneficio di Gesù Cristo crocifisso circa i cristiani, which was the composition of a Sicilian Benedictine and had been touched up by the great latinist Flamiano, just appeared at Mantua in 1542 under the auspices of Morone, and had a wide circulation (over 40,000 copies of the second edition, Venice 1543, were sold). Containing extracts from the Hundred and Ten Divine Considerations of Juan Valdes (q.v.),
The project of the queen's marriage was also an obstacle. A marriage between her and Pole, who was then only a deacon, was proposed by some, but this did not at all meet the views of the emperor, who therefore hindered him the more from setting out for England. The marriage with Philip, of which Pole did not approve, having taken place (July 25, 1544), and Rome yielding on the practical difficulties of the lay holders of Church lands, a parliament favourable to the proposed reunion now assembled, and Pole was allowed to return to England as cardinal. On his landing he was informed that the attainer had been reversed; and he received the royal patent authorizing his performance of the legatine duties within the realm. Arriving at Whitehall, where he was received with joy by Mary and Philip on the 30th of November, he proceeded to parliament and there appeared to be no obstacle to his return. Hereafter, however, Parliament increased the demands respecting ecclesiastical property.

He entered wisely on his work of reformation, for which he was well prepared. One of the most important matters he had to deal with was to rectify the canonical position of those who had been ordained or consecrated since the breach with Rome. Acting according to the instructions he had received from Rome, where the matter had been fully gone into, he made an investigation, and divided the clergy ordained after that period into two classes; one consisting of those ordained in schism, indeed, but according to the old Catholic rite, and the other of those who had been ordained under the new rite drawn up by Oxford. He also condemned the clergy ordained in Roman form, and by Papal act, and prevented by law of parliament 1st of April 1550.

The first class, after submission, were absolved from their irregularity, and, receiving penance, were reinstated; the second class were simply regarded as laymen and dismissed without penance or absolution. At his first conviction he exhorted the bishops to use gentleness rather than rigour in their dealings with heretics; and Pole, in himself, was true to his principle. He was not responsible for the cruel persecution by which the reign was disfigured.

On the 4th of November 1555 Pole opened, in the chapel royal at Westminster, a legatine synod, consisting of the united convocations of the two provinces, and for the purpose of laying the foundations of wise and solid reforms in the Reformation Anglice which he brought out in 1556, based on his Legatine Constitutions of 1555, he ordered that every cathedral church should have its seminary, and the very words he used on this subject seem to have been copied by the Council of Trent in the twenty-third session (1563).

He also ordered that the Catechism of Caraffa, who, like him, was to suffer from the Inquisition for this very book, should be translated into English for the use of the laity. On Cranmer's deprivation, Pole became archbishop of Canterbury; and, having been ordained priest two days before, he was consecrated on the 22nd of March 1556, the day after Cranmer suffered at Oxford; Pole's name the demand respecting ecclesiastical property.

The accession of Mary opens the third period of his life. On the 5th of August 1555 he was appointed legate to the new queen and began his negotiations. But many difficulties were put in the way of return. He was still under attainder; and the temple of England was not yet ripe for the presence of a cardinal.

1 See, however, Herzog-Hauck, Realencyclopädie (ed. 3) § "Pole," where it is said that "only his procrastination, and then his death saved him from appearing before the Inquisition." Within the institution of the Inquisition his name continued to be regarded as an obstacle; and Pole's vanquished, the Cranmer supremacy is preserved by the mass of evidence accumulated against him in the Compendium inquisitorum (c. archivio della società di storia patria, Rome, 1880), p. 283, &c. — (Ed.)
and so Pole remained in England. Broken down as much by the blow as by ill-health the cardinal died at Lambeth on the 17th of November 1538, twelve hours after Mary's death and under the unspeakable disgrace of the papacy in defence of which he had lost his life. He was buried at Canterbury near the spot where the shrine of St. Thomas Becket once stood.

The chief sources for Pole's biography are his life written in Italian by his biographer Beccaria, which was translated into the Latin by Andrew Duddith as Vita Pole cardinalis (Venice, 1656), and his letters (Epistolae Reginaldi Poli) edited by Girolamo Quirini and published in 5 volumes (Brescia, 1744-1757), a new edition of which appeared at Rome in 1769 from the Archives of the Sacred Congregation of Rites. See also the State Papers (foreign and domestic) of Henry VIII, Edward VI, and Mary; the Spanish and Venetian State Papers, Bernardo Theiner's Acta genuina S.S. Oecumenici (Rome, 1784); and the processi del santo ufficio di Roma da Paolo III. a Paolo IV. (Società romana di storia patria, Archivio, ii. 261 seq.); T. Phillipps's History of the Life of R. Pole (Oxford, 1764-1767); Athanasius Zimmermann, S.J., Kardinal Pole sein Leben und seine Schriften (Regensburg, 1893); Martin Hallei, Life of Reginald Pole (1910); and F. G. Lee, Reginald Pole (E. T.).

POLE, RICHARD DE LA (d. 1529), pretender to the English crown, was the fifth son of John de la Pole (1442-1491), 2nd duke of Suffolk, and Elizabeth, second daughter of Richard, duke of York and sister of Edward IV. His eldest brother John de la Pole, earl of Lincoln (c. 1446-1457), is said to have been named heir to the throne by his uncle Richard III., who gave him a pension and the reversion of the estates of Lady Margaret Beaufort. On the accession of Henry VII., however, Lincoln lost the oath of allegiance, but in 1487 he joined the rebellion of Lambert Simnel, and was killed at the battle of Stoke. The second brother Edmund (c. 1472-1513), succeeded his father while still in his minority. His estates suffered under the attainder of his brother, and he was compelled to pay large sums to Henry VII. for the recovery of part of the forfeited lands, and also to exchange his title of duke for that of earl. In 1501 he sought the German King Maximilian in Tirol, and received from him a promise of substantial assistance in case of an attempt on the English crown. In consequence of these treasonable proceedings Henry seized his brother William de la Pole, with four other Yorkist noblemen. Two of them, Sir James Tyrell and Sir John Wyndham, were executed, William de la Pole was imprisoned and Suffolk outlawed. Then in July 1502 Henry concluded a treaty with Maximilian by which the king bound himself not to countenance English rebels. Presently Suffolk fell into the hands of Philip, king of Castile, who imprisoned him at Namur, and in 1506 surrendered him to Henry VII. on condition that his life was spared. He remained a prisoner until 1513, when he was beheaded at the time his brother Richard took up arms with the French king. Richard de la Pole joined Edmund abroad in 1504, and remained at Aix as surety for his elder brother's debts. The creditors threatened to surrender him to Henry VII., but, more fortunately than his brother, he found a safe refuge at Buda with King Ladislas VI. of Hungary. He was excepted from the general pardon proclaimed at the accession of Henry VIII., and when Louis XII. went to war with England in 1512 he recognized Pole's pretensions to the English crown, and gave him a command in the French army. In 1513, after the execution of Edmund, he assumed the title of earl of Suffolk. In 1514 he was given 12,000 German mercenaries ostensibly for the defence of Brittany, but really for an invasion of England. These he led to St. Malo, but the conclusion of peace with England prevented their embarkation. Pole was required to leave France, and he established himself at Metz, in Lorraine, and built a splendid palace at La Haute Pierre near Metz. At Canterbury he had numerous interviews with Francis I., and in 1515 he was permitted, in concert with John Stewart, duke of Albany, the Scottish regent, to arrange an invasion of England, which was never carried out. He was with Francis I. at Pavia and was killed on the field on the 24th of February 1525.

POLE, WILLIAM (1841-1900), English engineer, was born at Birmingham on the 22nd of April 1841. He was a man of many accomplishments. Having spent his earlier years in various engineering occupations in England, he went out to India in 1844 as professor of engineering at Elphinstone College, Bombay, where he had to first organize the course of instruction for native students, but his health obliged him to return to England in 1848. For the next ten years he worked in London under James Simpson and J. M. Rendel, and the high reputation he achieved as a scientific engineer gained his appointment in 1859 to the chair of civil engineering in University College, London. He added a considerable amount of official work from the government. He served on the committees which considered the application of armour to ships and fortifications (1864), and the comparative advantages of Whitworth and Armstrong guns (1863-1865). He was secretary to the Royal Commission on Railways (1865-1867), the duke of Richmond's Commission on London Water (1867-1869), also taking part in the subsequent proceedings for establishing a constant supply, the Royal Commission on the Disposal of London Sewage (1882-1884), and the departmental committee on the science museums at South Kensington in 1885. In 1877 he was employed by the War Office to report on the Martini-Henry rifle, and in the same year was appointed consulting engineer in London to the Japanese government, a position through which he exercised considerable influence on the development of the Japanese railway system. He was elected a fellow of the Royal Society in 1861, in recognition of some investigations on colour-blindness. Music was also one of his chief interests. At the age of twenty-two he was appointed organist of St Mark's, North Audley Street, in open competition, the next selected candidate being Dr E. J. Hopkins (1818-1901), who subsequently was for fifty years organist of the Temple Church. He took the degree of Bachelor of Music at Oxford in 1866, proceeding to his doctor's degree in 1867, and in 1879 published his Philosophy of Music. He was largely concerned in the institution of musical degrees by the University of London in 1877, and for many years acted as one of the examiners. His mathematical tastes found congenial occupation in the study of whist, and as an exponent of the scientific principles of that game he was even earlier in the field than "Cavendish." His literary work included treatises on the steam-engine and on iron construction, biographical studies of famous engineers, including Robert Stephenson and I. K. Brunel, Sir William Fairbairn and Sir W. Siemens, several books on musical subjects and on whist, and many papers for reviews and scientific periodicals. He died on the 30th of December 1900. His son, William Pole (1852- ), became known as an actor and writer under the stage-name of William Pole, more especially for his studies in Shakespearean drama and his work in connection with the Elizabethan Stage Society.

POLE (t) (O. Eng. pöl, cf. Ger. Pfahl, Du. puel, from Lat. palus, stake), a tapering cylindrical post or stake of some considerable length, used as a support in scaffolding, for telegraph or telephone wires, hops, &c., and as a means for taking jumps (see POLE-VAULTING), and also as a single shaft for a vehicle driven by two horses. As a measure of length a "pole," also called "rod" or "perch," is equal to 53 yds. (160 ft.), as a measure of area it is equal to 30 sq. yds. (2) (Lat. palus, adapted from Gr. πῶλος, pivot, axis), one or other of the extremities of the axis of the earth; the "celestial pole" is one of the points in the heavens to which the earth's axis points, in the northern hemisphere the Polar Star, or Ursa Minor, better known as the Polar-star or Poles (see URSA MAJOR). For the regions lying about the north and south poles of the earth see POLAR REGIONS.

In mathematics the word pole has several meanings. In spherical trigonometry the "pole" of a circle on a sphere is the point where the diameter of the sphere perpendicular to the plane of the circle intersects the sphere. In crystallography (q.v.) the "pole" of a face is the intersection of a line perpendicular to the face with
the sphere of projection. The term is also applied to a point from which lines radiate, as, for instance, the origin in a system of polar co-ordinates, or the common point of a pencil of rays. In the geometry of conic sections the "pole" of a line, termed the "polar" of the point, is the intersection of the tangents (either real or imaginary) at the points where the line meets the conic (see GEOMETRY: § Projective). The "magnetic poles" of the earth are the points on the earth's surface where the dipping needle is vertical (see TERRESTRIAL MAGNETISM); and the "poles" of a magnet are the points of the magnet where the magnetic intensity is greatest. In electricity, the term is applied to the elements of a galvanic battery (q.v.), or to the terminals of a frictional electrical machine.

POLECAT, the common name given to any member of the Musteline genus *Mustela* (see Carnivora). The polecat forms a small group confined to the northern hemisphere, of which the best known and most widely distributed is the common polecat of Europe (*P. fœtidus* or *P. putorius*). This animal, at least so far as its disposition, size and proportions are concerned, is well known in its domesticated condition as the ferret, which is but a tamed albino variety of the true polecat. The colour of the latter, however, instead of the familiar yellowish-white of the ferret, is of a dark brown tint above and black below, the face being variegated with dark brown and white markings. Its skull is rough, strongly ridged, and altogether of a far more powerful type than those of the stoats, weasels or martens; the skull of the female is very much smaller and lighter than that of the male. The fur is long, coarse, and of comparatively small value, and changes its colour very little, if at all, at the different seasons of the year.

POLECAT—POLE-VULTING 977

The polecat ranges over the greater part of Europe, reaching northwards into southern Sweden and in Russia to the region of the White Sea. It does not occur in the extreme south, but is common everywhere throughout central Europe. In the Alps it ranges far above the tree-line during the summer, but retreats in winter to lower ground. It is confined to the northern counties of England and Scotland, where it is becoming very rare, owing to persecutions from game-keepers, and in Ireland it appears to be extinct. In fine weather it lives either in the open air, in holes, fox-earths, rabbit-warrens, under rocks or in wood-stacks; while in winter it seeks the protection of deserted buildings, barns or stables. During the day it sleeps in its hidding place, waking forth at night to plunder dovecots and hen-houses. It climbs but little, and shows far less activity than the marten. It feeds ordinarily on small mammals, such as rabbits, hamsters, rats and mice, on such birds as it can catch, especially poulter-y and pigeons, and also on snakes, lizards, frogs, fish and eggs. Its prey is devoured only in its lair; but, even though it can carry away but a single victim, it commonly kills everything that comes in its way, often destroying all the inhabitants of a hen-house in order to gratify its passion for slaughter. The pairing time is towards the end of the winter, and the young, from three to eight in number, are born in April or May, after a period of gestation of about two months. The young, if taken early, may be easily trained, like ferrets, for rabbit-catching. The polecat is very tenacious of life and will beat many severe wounds before succumbing; it is also said to receive with impunity the bite of the adder. Its field screech has become proverbial. To this it is indebted for its generic name *Putorius* (derived, as are also the low Lat. *putarius*, Fr. *pouiois*, and Ital. *puzzola*, from *puto*), as well as the designation founcart (i.e. foul marten) and its other English names, fitchet, fitchew. Attempts to account for the first syllable of the word polecat rest entirely on conjecture.

The Siberian polecat (*Putorius cœrsmanni*) is very like the European in size, colour and proportions, but with head and back both nearly or quite white, and skull more heavily built and sharply constricted behind the orbits, at least in fully adult individuals. It inhabits the greater part of south-western Siberia, extending from Tibet into the steppes of south-eastern Russia.

The black-footed or American polecat (*Putorius nigripes*) is a native of the central plateau of the United States, and extends southwards into Texas. It is often called the prairie-dog hunter, as it is nearly always found in the warrens of that animal. The fur is cream-yellow, the legs are brown, and the feet and tail-tip black.

The mottled polecat (*Putorius surmaticus*), a species occurring in southern Russia and south-western Asia, and extending from Poland to Afghanistan, differs from other polecats both by its smaller size and its remarkable coloration, the whole of the upper-parts being marbled with large irregular reddish spots on a white ground, while the under-side, limbs and tail are deep shining black. Its habits appear to be much like those of the common polecat.

(R. L. *)

POLENTA, DA, the name of a castle in Romagna, from which came the noble and ancient Italian family of Da Polenta. The founder of the house is said to have been Guido, surnamed l’Antico or the Elder, who wielded great authority in Ravenna in the 13th century. His grandson Guido Novello upheld the power of the house and was also capitanio del popolo at Bologna; he was overthrown in 1322 and died the following year. His chief claim to renown lies in the fact that in 1321 he gave hospitality to the poet Dante, who immortalized the tragic history of Guido’s daughter Francesca, unhappily married to Malatesta, lord of Rimini, in an episode of the *Inferno*. Guido’s kinsman Ostasio I. was lord of Cervia and Ravenna from 1322 to 1329, and, after being recognized as a vassal of the Holy See, again became independent and went over to the house of Este, whom he served faithfully in their struggles with the Church until his death in 1346. His son Bernardino, who succeeded him as lord of Ravenna in 1346, was deposed in 1347 by his brothers, Obizzo and Lamberto III., but was reinstated a few months later and ruled until his death in 1350; he was famous for his prodigality and cruelty. His son Guido III. ruled more mildly and died in 1390. Then followed Ostasio II. (d. 1396), Obizzo (d. 1431), Pietro (d. 1404), Aldobrandino (d. 1406), all sons of Guido III. Ostasio III. (or V.), son of Obizzo, was at first allied with the Venetians; later he went over to the Milanese, and, although he again joined the Venetians, the latter never forgave his intrigue with their enemies, and in 1441 they deprived him of his dominions. He died in a monastery in 1447.

POLE-VULTING, the art of springing over an obstacle with the aid of a pole or staff. It is probable that an exercise of the kind was a feature of Greek gymnastics, but with this exception there is no record of its ancient practice as a sport. As a practical means of passing over such natural obstacles as canals and brooks it has been made use of in many parts of the world, for instance in the marshy provinces along the North Sea and the great level of the fens of Cambridgeshire, Huntingdonshire, Lincolnshire and Norfolk. The artificial draining of these marshes brought into existence a network of open drains or canals intersecting each other at right angles. In order to cross these dryshod, and at the same time avoid tedious round-about journeys over the bridges, a stack of jumping poles was
kept at every house, which were commonly used for vaulting over the canals.

As a sport, pole-vaulting made its appearance in Germany in the first part of the 19th century, when it was added to the gymnastic exercises of the Turnverein by Johann C. F. Guts-Muths and Frederick L. Jahn. In Great Britain it was first commonly practised at the Caledonian games. It is now an event in the athletic championships of nearly all nations. Although strength and good physical condition are essential to efficiency in pole-vaulting, skill is a much more important element. Broad-jumping with the pole, though the original form of the sport, has never found its way into organized athletics, the high jump being the only form recognized. The object is to clear a bar or lathe supported upon two uprights without knocking it down. The pole, of hickory or some other tough wood, is from 13 to 15 ft. long and 1½ in. thick at the middle, tapering to 1¼ in. at the ends, the lower of which is truncated to prevent sinking into the earth and shed with a single spike to avoid slipping. A hole in which to place the end of the pole is often dug beneath the bar. In holding the pole the height of the cross-bar is first ascertained, and the right hand placed, with an undergrip, about 6 in. above this point, the left hand, with an over-grip, being from 14 to 30 in. below the right. The vaulter then runs towards the bar at full speed, plants the spiked end of the pole in the ground about 18 in. in front of the bar and springs into the air, grasping the pole firmly as he rises. As he nears the bar he throws his legs forward, and, pushing with shoulders and arms, clears it, letting the pole fall backwards. In Great Britain the vaulter is allowed to climb the pole when it is at the perpendicular. Tom Ray, of Ulverston in Lancashire, who was champion of the world in 1887, was able to gain several feet in this manner. In the United States climbing is not allowed. Among the best British vaulters, using the climbing privilege, have been Tom Ray, E. L. Stones, R. Watson and R. D. Dickinson; Dickinson having cleared 11 ft. 9 in. at Kidderminster in 1891. The record pole-vault is 12 ft. 6½ in., made by W. Drye of Yale in 1907.

**POLICE** (Fr. *police*, government, civil administration, a police force, Gr. πολιτεία, constitution, condition of a state, πόλις, city, state), a term used of the enforcement of law and order in a state or community, of the department concerned with that part of the civil administration, and of the body or force which has to carry it into execution. The word was adopted in English in the 18th century and was disliked as a symbol of foreign oppression. The first official use appears, according to the *New English Dictionary*, in the appointment of "Commissioners of Police" for Scotland in 1714. A police system has been devised for the purpose of preventing evils and providing benefits. In its first meaning it protects and defends society from the dissidents, those who decline to be bound by the general standard of conduct accepted by the larger number of the law-abiding, and in this sense it is chiefly concerned with the prevention and pursuit of crime. It has a second and more extensive meaning as applied to the regulation of public order and enforcing good government.

**United Kingdom.**—The establishment of a systematic police force was of slow growth in England, and came into effect long after its creation abroad. A French king, Charles V., is said to have been the first to invent a police, "to increase the happiness and security of his people." It developed into an engine of horrible oppression, and as such was repugnant to the feelings of a free people. Yet as far back as the 13th century a statute, known as that of "Watch and Ward," was passed in chaste exercise of Edward I. (1285), aimed at the maintenance of peace in the city of London. Two centuries later (1585) an act was passed for the better government of the city and borough of Westminster, and this act was re-enacted with extended powers in 1737 and soon succeeded by another (1777) with wider and stricter provisions. The state of London at that date, and indeed of the whole country at large, was deplorable. Crime was rampant, highwaymen terrorized the roads, footpads infested the streets, burglaries were of constant occurrence, river thieves on the Thames committed depredations wholesale. The watchmen appointed by parishes were useless, inadequate, indifferent and, intrustworthy, acting often as accessories in aiding andabetting crime. Year after year the shortcomings and defects were emphasized and some better means of protection were constantly advocated. At the commencement of the 19th century it was computed that there was one criminal to every twenty-two of the population. The efforts made at repression were pitifully unequal. In the district of Kensington, covering 15 sq. m., the protection afforded was dependent on three constables and three head-boroughs. In the parish of Tottenham nineteen attempts at burglary were made in six weeks, and sixteen were entirely successful. In Spitalfields gangs of thieves stood at the street door and openly rifled all who came in. In other parishes there was no police whatever, no defence, no protection afforded to the community but the voluntary exertions of individuals and "the honesty of the thieves." In those days victims of robberies constantly compounded with felonies and paid blackmail to thieves, promising not to prosecute on the restitution of a portion of the stolen property.

The crying need for reform and the introduction of a proper police was admitted by the government in 1829, when Sir Robert Peel laid the foundation of a better system. Much opposition was offered to the scheme, which was denounced as an insidious attempt to enslave the people by arbitrary and tyrannical methods. The police to be employed, it was advocated, as the instruments of a new standing army, advocated members of a new standing army, under the centralized authority, riding roughshod over the peaceable citizens. But the guardians of order, under the judicious guidance of such sensible chiefs as Colonel Rowan and Sir Henry Maine, soon lived down the hostility first exhibited, and although one serious and lamentable collision occurred between the mob and the police in 1833, it was agreed two years later that the unfavourable impression at one time existing against the new police was rapidly diminishing, and that it had fully answered the purpose for which it was formed. Crime had already diminished; it was calculated that the annual losses inflicted on the public by the depredations of the dangerous classes had appreciably fallen and a larger number of convictions had been secured.

The formation of the metropolitan police was in due course followed by the extension of the principle to the provinces. Borough constabulary forces were established by the Municipal Corporation Act (1835), which entrusted their administration to the mayor and a watch committee, and this act was revised in 1822, when the general powers of this authority were defined. Acts of 1839 and 1840 permitted the formation by the justices of a paid county police. Action in this case was optional, but after an interval of fifteen years the Police Act of 1856 made the rule compulsory, it being found that an efficient police force throughout England and Wales was necessary for the more effective prevention and detection of crime, the suppression of vagrancy and the maintenance of good order. Local acts had already endowed Scotland with a police system, and in 1857, and again in 1862, counties were formed into police districts, and the police of towns and populous places was generally regulated. Ireland has two police forces; the Dublin metropolitan police originated in 1808, and in 1829 the provisions of Sir Robert Peel's act for London were embodied in the Police Law for Ireland.

The extent to which the metropolitan police has developed will best be realized by contrasting its numbers on first creation and the nature of the duties and functions that then appertained to it. The first act (the Metropolitan Police Act) of 1829 extended the police to the metropolis, exclusive of the city of London, and constituted a police area having a radius of 12 m. from Charing Cross. Two justices of the peace were appointed, presently named commissioners of the police, to act as the secretaries of the department of the secretary of state for the home department. The first police office was located in Whitehall in Scotland Yard, from which it was removed in the autumn of 1890 to the new and imposing edifice on the Embankment, in which all branches are centred, known as New Scotland Yard. The first constables
Policing

The state employs police solely in the interests of the public welfare. No sort of espionage is attempted, no effort made to penetrate privacy; no claim to pry into the secret actions of law-abiding persons or would be tolerated; the agents of authority must not seek information by underhand or unworthy means. In other countries the police system has worked more arbitrarily; it has been used to check free speech, to interfere with the right of public meetings, and to condemn the expression of opinion hostile or to critical of the ruling powers. An all-powerful police, minutely organized, has in some foreign states grown into a terrible engine of oppression and made daily life nearly intolerable. In England the people are free to walk the streets, to gather in open spaces, to express themselves freely, to make petitions, to often forcibly express, of mob orators, provided always that no obstruction is caused or that no disorder or breach of the peace is threatened.

The strength of the metropolitan police in 1806 was 18,167, comprising 32 superintendents, 572 inspectors, 2,378 constables and 15,185 constables. At the head is a commissioner, appointed by the home secretary, an assistant by four assistant commissioners, one of whom was appointed under the Police Act 1809, in accordance with the recommendation of the Royal Commission on the Metropolitan Police 1806; his duty especially being to deal with the various local police laws of the various counties; the metropolitan police are divided into 21 divisions, to which letters of the alphabet are assigned for purposes of distinction. There is in addition the Thames division, divided mostly from sailors, charged with the prevention of crime on the river Thames. To the metropolitan police also are assigned the control and guardianship of the various naval dockyards and arsenals.

The city of London has under its own distinct police organization under a commissioner and assistant commissioners, the functions extend over an area of 673 statute acres containing two courts of justice, those of the Guildhall and Mansion House, where the police are divided into two divisions, and the area is comparatively small, the rateable value being enormous. The force comprises 2 superintendents, 48 inspectors, 86 sergeants and 645 constables; also some 60 constables on private service duties.

The total police force of England and Wales in 1809 was 30,376 almost equally divided between counties and boroughs; that of Scotland numbered 5,375. In Ireland the Royal Irish Constabulary are semi-military force, numbering over 10,000; they police the whole of Ireland, except the city of Dublin, which is under the Dublin metropolitan police, a particularly fine body.

The functions of the modern English police is that especially devoted to criminal investigation or the detection of crime. The detective, is the chief director of the old "Bow street runners" or "Robin Hood detective," so shielded in his work of the old-fashioned police offices and despatched by the sitting magistrates to follow up any very serious crime in the interests of the public or at the urgent request of private persons. The "detective" has, as a rule, no excess of authority, but is introduced by Sir Robert Peel came into force in 1829, and at first no part of the new force was especially attributed to the detection of crime. They were much missed, but fifteen years elapsed before Sir James Graham (then home secretary) decided to allow a few constables in plain clothes for that purpose as a tentative measure. The first "detectives" appointed numbered only a dozen or there abouts, and they were the magistrates. Altogether six constables were shortly added as "auxiliaries," but the number was gradually enlarged as the manifest uses of the system became more and more obvious.

In the British India is divided into police districts, the general arrangements of the system of the regular police, which dates from the disappearance of the East India Company, resembling in most respects those of the English police, but differing in the smallness of the districts and the training of the police. The police is not trained to the use of firearms and drilled, and may be called upon to perform military duties. The superior officers are nearly all Europeans and many of them are military officers. The rest are trained as "auxiliary constables," and the ordinary police in the police was not dealt with by the criminal code which came into force in 1883, but the code is full of provisions tending to make the force efficient. By that code as well as by the former code of the police is required to function under the control of the commander-in-chief of the army in England; they take evidence for their own information and guidance in the investigation of cases and are clothed with the power to compel the attendance of witnesses and question; the residence of any officer of the metropolitan police force, and other circumstances, make the police more powerful and relatively far more powerful in India than in England (Stephen). The difficulties in the way of ascertaining the truth and investigating false statements and
suppressed cases are very great. As regards the royal police of India every village headman and each of the watchmen required by the code to communicate to the nearest magistrate or the officer in charge of the nearest police station, whichever is nearest, any information respecting offences, is covered by the officers of the system. To this officer, which has numerous duties over and above those of the prevention and detection of crime, greatly aids a government so paternal as that of India in keeping touch with the widely extended masses of the population.

France.—It is a matter of history that under Louis XIV., who created the police of Paris, and in succeeding times, the most popular and unjustifiable use made of police as a secret instrument of the State. The police act itself was dangerous, but the dangers were revealed under the imperial Napoleonic system. The Directory, by an act of the Directory in 1796, was in 1818 suppressed as an independent office, and in 1852 it was united with the ministry of the interior. The regulations for its generation, which are, other ordinances, are in substance as if "in" mafekeurs, falls naturally and broadly into two grand divisions, the administrative and the active, the police "in the office" and the police "out of doors." The first attends to the clerical business, voluminous and incessant. An army of clerks in the numerous bureaus, hundreds of patient government employed, the ronds de cuit, as they are contemptuously called, because they sit for choice on round leather cushions, are engrossed in papers and filled with reports for hours on end, day after day. The active army of police out of doors, which constitutes the second half of the whole machine, is divided into two classes: that in uniform and that in plain clothes. Every writer to travel to Paris is met by the plain-clothes policeman, in his short frock-coat or cape, smart képi cocked on one side of his head, and with a sword by his side. The first is known by the title of agent, sergent de la paix, and is a very useful public servant. He is almost invariably an old soldier, a sergent who has left the army with a first-class character, honesty and sobriety being indispensable qualifications. These uniformed police are not all employed in the streets and arrondissements, but there is a large reserve composed of the six central brigades, as they are called, a very smart body of old soldiers, well drilled, well dressed and fully equipped; armed, moreover, with the rifles which they carry in their hands as sentries at the doors or entrance of the prefecture. In Paris, the men of these six central brigades are nicknamed "vaisseaux" (vessels), because they carry on their collars the badge of the golden shield of Paris—an ancient ship—while the sergeants in the towns, districts wear only numbers, their own individual number, and that of the quarter in which they serve. These vaisseaux claim to be the elite of the force; they are in daily contact with the Gares de la Cité, the Pratique of the Pratique, which contains the Garde des Sceaux, the mixed force of policemen, constables and army constables, as sentries at the doors or entrance of the prefecture. The men of these central brigades are on call when required to reinforce the out-of-door police at special times.

Central Police.—Central police controls public carriages, the other the Halles, the great central market by which Paris is provided with a large part of its food. Every cab-stand is under the charge of its own policeman, who knows the men, their arrival and departure, and marks their generation. The central police officers of the central brigades superintend the street traffic.

So much for the police in uniform. That in plain clothes, en bourgeois, as the French call it, is not so numerous, but fills a higher, or at least a more confidential mission. Its members are styled inspectors, not agents, and their functions fall under four principal heads. There is, first of all, the service of the Sûreté—in France, and the police secret of the rest of Europe—employed entirely in the pursuit and capture of criminals; next comes the police, now amalgamated with the Sûreté, that watches over the moral and political safety of the empire under the existing laws of France; then there is the brigade de gendarmerie, the police charged with the supervision of all lodging-houses, from the commonest 'sleep-sellers' shop, as it is called, to the grandest hotels; there is the brigade de la paix, or the peace business, whose business it is to act as the eyes and ears of the prefecture.

The pay of the gardienns de la paix is from 1,400 to 1,700 francs; brigadiers get 2,000 francs; sous-brigadiers 1,800 francs; officers de paix 6,000 francs. The proportion of police to inhabitants is one in 352.

Germany.—Taking the Berlin force as illustrative of the police system in the German Empire, police duties are as various as in France, but many of the political and detective duties relating to the press, societies, clubs and public and social amusements. Police duties are carried out under the direction of the royal police presidency, the executive police force comprising a police chancellery, with, besides commissions of criminal investigations, captains, lieutenants, acting-lieutenants, sergeant-majors and a large number of commissioned and serving officers.

It is computed that the proportion of population to police in Berlin is between 350 and 400 to each officer. The pay of the police is principally provided from fiscal sources and varies in an ascending scale from 115 francs to 5,150 marks and lodging allowances for the lowest class of constable.

Austria.—Taking Vienna in the same way as illustrative of the Austrian police, it is to be observed that there are three branches: (1) the police of the admiinistration and the safeguard of the life and security of the subjects by force of law; (2) that of the general police function; (3) that of the criminal police, or the office of public safety, the central inquiry office and the record or Evidenzbureau. The government police branch comprises three departments: the government police, the combined office, and various sections which includes the following departments: the office for public safety, the central inquiry office and the record or Evidenzbureau. The government police branch comprises three departments: the government police, the combined office, and various sections which includes the following departments: the office for public safety, the central inquiry office and the record or Evidenzbureau. Belgium.—In Belgian municipalities the burgomasters are the heads of the force, which is under their control. The administrator of public safety is, however, specially under the minister of justice, who sees that the laws and regulations affecting the police are properly carried out, and he can call on all public functionaries to assist. The department of police is specially charged with the administration of the law in regard to aliens, and this law is applied to persons stirring up sedition. The duty of control over the horse and foot police is generally to maintain internal order and aertain compliance with the law. In Brussels as elsewhere the burgomaster is the head, but for executive purposes there is a chief commissary (subject, however, to the orders of the burgomaster), with assistant commissaries, and in the larger cities commissaries of divisions and other officers and central and other bureaus, with a body of agents (police constables) in each.

There are two main classes of police functions recognized by law, the administrative and the judicial; the former engaged in the daily maintenance of peace and order and so preventing offences, the latter in the investigation of crime and tracing offenders; but the duties are necessarily performed to a great extent by the same persons. The procedure of the police in case of a petty offense, however, limited to the same classes of officers, and they perform the same duties as in Paris—the law in practice there being expressly adopted in Brussels.

In Paris, Switzerland, which is sometimes classed with Belgium as among the least-policed states of Europe, the laws of the cantons vary. In some respects they are stricter than in Belgium or even in France. There a permis de séjour is sometimes required where permission was not before necessary.

Russia was till lately the most police-ridden country in the world; not even in France in the worst days of the monarchy were the people so completely in the hands of the government. To the Russian reaching functions of the police, the power assumed in matters momentous and quite insignificant, we may quote from the list of circulars issued by the minister of the interior to the governors of Russian provinces: "It was necessary that all police measures were directed to regulate religious instruction in secular schools, to prevent horse-stealing, to control subscriptions collected for the holy places in Palestine, to regulate the advertisements of medicines and chemicals, to examine the quality of quinine soap and overlook the cosmetics and other toilet articles—such as soap, starch, brillantine, tooth-brushes and insect-powder—provided by chemists. They were to issue regulations for the proper construction of houses and villages, to exercise an active censorship over published price-lists and printed notes of invitation and visiting cards, as well as seals and rubber stamps. All private meetings and public gatherings, with the expressions of opinion and the class of subjects discussed, were to be controlled by the police.

The political or state police was the invention of Nicholas I. Alexander I. had copied a model of a ministry of the interior, but it was Nicholas who devised the second branch, which he designed for his own protection and the security of the state. After the insurrection of 1865, he created a special bulwark for his defence, and decided that the police should be divided under the "Third Section," the emperor's own chancery, and while it lasted, was the most dread police in the empire. It was practi
cally supreme in the state, a ministry independent of all other ministries and placed quite above them and respected by the tsar himself.

United States.—The organization of police forces in the United States differs more or less in the different states of the Union. As a rule the force is under the control of the mayor, and by law there are numerous exceptions. In Boston, for instance, the three commissioners at the head of the force are appointed by the governor of Massachusetts. The force in New York City, alike from the standpoint of numbers and of the size and character
POLICE COURTS—POLISH SUCCESSION WAR

of the city, is the most important in the United States. It included in 1910 a commissioner appointed by the mayor and exercising a wide range of authority; four deputy commissioners; a chief inspector; nine assistant inspectors and chiefs; and all orders are issued; he is assisted by 18 inspectors, who are in charge of different sections of the city, and who carry out the orders of the chief; 67 captains, each of whom is in direct charge of 250 men and later ranks of ordinary soldiers or patrolmen, as they are often called from the character of their duties. There is a separate branch, the detective bureau, composed of picked men, charged with the investigation and, still more, the prevention of the acts in the city. The total number of patrology was 8562. Appointments are for life, with pensions in case of disability and after a given number of years of service.

LITERATURE.—Patrick Colquhoun, Treatise on the Police of the Metropolis (1797); H. L. de l'Epinay sous le règne de Louis XIV. (1866); Maxime Du Camp, Paris, ses orgues, ses fonctions et sa vie (1869-1875); Dr Norman Chevers, Indian Medical Jurisprudence (Calcutta, 1870); A. T. Crawford, Reminiscences of an Indian Police Officer (1894); C. R. W. Hervey, Records of Indian Crime (1742-1784); Arthur Griffiths, Mysteries of Police and Crime (1903); Captain W. L. Melville Lee, A History of Police in England (Methuen, 1901); Sidney and Beatrice Webb, English Local Government (Longmans, 1906-1908); article "Police," in The New Encyclopædia Britannica; and Anon., Police, in the English Historical Review (October 1895); W. F. Maitland, Justice and Police (Macmillan, 1883); L. F. Fuld, Police Administration (New York, 1910).

POLICE COURTS, courts of summary jurisdiction, held in London and certain large towns of the United Kingdom by specially appointed and salaried magistrates. They were originally called "public offices" (Middlesex Justices Act 1792), but after the establishment of the police force, in 1829, they came to be called "police courts." These changes have been the result of the question of their nature. They are so described in a report of a select committee which inquired into the system in 1837 and 1838; in the same report the magistrates who presided in the courts were first described as "police magistrates." Police offices were first officially described by their modern title in the Metropolitan Police Courts Act 1839. In 1839 there were nine police courts; since 1792 there had been three magistrates to each court, and the act of 1839 retained twenty-seven as the maximum number at any time (s. 2). In 1833 unsalaried justices ceased to sit in the police courts along with the paid magistrates. The Metropolitan Police Courts Act 1840 gave power to the police commissioners to judge in police courts, to vest the police with new and increased powers by an act called the Police Act 1842, and to establish police courts wherever necessary, the artificial limit of twenty-seven magistrates being at the same time preserved. Additional courts have from time to time been established by orders in council, and in 1910 there were in London fourteen courts with twenty-five magistrates. Their divisions are regulated by orders in council of 1903 and 1905; the nine original courts are Bow Street, Westminster, Marylebone, Marlborough Street, Worship Street, Clerkenwell, Thames, Tower Bridge and Lambeth.

The courts are held every day from 10 a.m. to 5 p.m. except on Sunday, Christmas Day, Good Friday or any day appointed for a public fast or thanksgiving or bank holiday. The Greenfield and Woolwich court, which comprises one division, is held at Greenwich in the morning and at Woolwich in the afternoon. The chief magistrate (sitting at Bow Street) receives a salary of £1800 a year, and the other magistrates £1500 each. The magistrates are appointed by the Crown; they must be members of the bar, barid for seven years or stipendiary magistrates for some place in England or Wales. One police magistrate has the special power of acting in the absence of the justices, which may be done at special or petty sessions of all the justices acting in the division or at quarter sessions. He can alone do justice in a police court on any act which any justice may do, and is, for all purposes, regarded as a justice of the peace. When a police court is created, the mayor of the town appoints salaried magistrates was followed for certain towns in the provinces by particular acts, and in 1863 the Stipendiary Magistrates Act gave power to towns and boroughs of 25,000 inhabitants and upwards to obtain a stipendiary magistrate.

POLIGNAC, an ancient French family, which had its seat in the Cevennes near Puy-en-Velay (Haute Loire). Its authentic pedigree can be traced to the 9th century, but in 1412 the male line became extinct. The heiress married Guillaume, sire de Chalelon (not to be confused with the barons of Chaléon in Vivarais), who assumed the name and arms of Polignac. The first member of the family who was of any historical importance was Cardinal Melchior de Polignac (1661-1742), a younger son of Armand XVI., marquis de Polignac, who at an early age achieved distinction as a diplomatist. In 1695 he was sent as ambassador to Poland, where he contrived to bring about the election of the prince of Conti as successor to John Sobieski (1697). The subsequent failure of this intrigue led to his temporary disgrace, but in 1702 he was restored to favour, and in 1712 he was sent as the plenipotentiary of Louis XIV. to the Congress of Utrecht, during the reign of the republic, he became involved in the cellareau plot, and was exiled to Flanders for three years. From 1725 to 1732 he acted for France at the Vatican. In 1726 he received the archbishopric of Auch, and he died at Paris in 1742. He left unfinished a metaphysical refutation of Lucretius which was published after his death by the abbé de Rothelin (Anti-Lucretius, 1745), and had considerable vogue in its day. Count Jules de Polignac (d. 1817), grand-nephew of the preceding, was created duke by Louis XVI. in 1780, and in 1792 was made postmaster-general. His position and influence at court were largely due to his wife, Gabrielle de Polastre, the beautiful friend of Marie Antoinette; the duke and duchess filled the unoccupied throne and, when the unfortunate queen was first to "emigrate" in 1789. The duchess died shortly after the queen, but her husband, who had received an estate from Catherine II. in the Ukraine, survived till 1817. Of their three sons the second, Prince Jules de Polignac (1780-1845), played a conspicuous part in the clerical and ultra-royalist reaction after the Revolution. Under the empire he was implicated in the conspiracy of Cadoual and Ficheguy (1804), and was imprisoned till 1813. After the restoration of the Bourbons he held various offices, received from the pope his title of "prince" in 1820, and in 1823 was made ambassador to the English court. On the 8th of August 1829 he was called by Charles X. to the ministry of foreign affairs, and in the following November he became president of the council. His appointment was taken as symbolic of the king's intention to overthrow the constitution, and Polignac, with the other ministers, was held responsible for the policy which culminated in the issue of the Four Ordinances which were the immediate cause of the revolution of July 1830. On the outbreak of this he fled for his life, but, after wandering for some time among the wilds of Normandy, was arrested at Granville. His trial before the chamber of peers resulted in his condemnation to perpetual imprisonment (at Ham), but he benefited by the amnesty of 1836, when the sentences was commuted to ten years, and after his release he wrote Considérations politiques (1835). He afterwards spent some years in England, but finally was permitted to re-enter France on condition that he did not take up his abode in Paris. He died at St Germain on the 29th of March 1847.
August the Strong when Charles's projects collapsed. The claims of Stanislaus were supported by France, Spain and Sardinia, those of the Saxon prince by Russia and the empire, the local quarrel being made the pretext for the settlement of minor outstanding claims of the great powers amongst themselves. The war was therefore a typical 18th century "war with a limited object," in which no one but the cabinets and the professional armies were concerned. It was fought on two theatres, the Rhine and Italy. The Rhine campaigns were entirely unimportant, and are remembered only for the last appearance in the field of Prince Eugène and Marshal Berwick—the latter was killed at the siege of Philippsburg—and the baptism of fire of the young crown prince of Prussia, afterwards Frederick the Great. In Italy, however, there were three hard-fought—though indecisive—battles, Parma (June 29, 1734), Luzzara (Sept. 19, 1734) and Bitonto (May 25, 1735), the first and last won by the Austrians, the second by the French and their allies. In Poland itself, Stanislaus, elected king in September 1733, was soon expelled by a Russian army and was afterwards besieged in Danzig by the Russians and Saxons (Feb.–June 1733).

POLIZIANO (1454–1494). Angelo Ambrogini, known in literary annals as Angelo Poliziano or Politzianus from his birth-place, was born at Arezzo the 9th August 1454. He was the son of the Madre, a jurist of good family and distinguished ability, was murdered by political antagonists for adopting the cause of Piero de' Medici in Montepulciano; and this circumstance gave his eldest son, Angelo, a claim on the family of Medici. At the age of ten the boy came to prosecute his studies at Florence, where he learned Latin under Cristoforo Landino, and Greek under Argyropulos and Andronicus Kallistos. From Marzillo Ficino he imbibed the rudiments of philosophy. The precocity of his genius for scholarship and poetry was early manifested. At thirteen years of age he began to circulate Latin letters; at seventeen he sent forth essays in Greek versification; at eighteen he published an edition of Catullus. In 1470 he won for himself the title of Homerius juvenis by translating four books of the Iliad into Latin hexameters. Lorenzo de' Medici, who was then the autocrat of Florence and the chief patron of learning in Italy, took Poliziano into his household, made him the tutor of his children, and secured him a distinguished post in the university of Florence. Before he reached the age of thirty, Poliziano expounded the humanities with almost unexampled lustre even for that epoch of brilliant professors. Among his pupils could be numbered the chief students of Europe, the men who were destined to carry to their homes the spolia opima of Italian culture. Not to mention Italian scholars, his pupils were Lorenzo de' Medici himself, the future Pope Leo X, the humanist Reuchlin, the English Grocyn and Linacre, the Portuguese Tessler.

Poliziano had few advantages of person to recommend him. He was ungainly in form, with eyes that squinted, and a nose of disproportionate length. Yet his voice was rich and capable of fine modulation; his eloquence, ease of utterance and copious stream of erudition were incomparable. It was the method of professors at that period to read the Greek and Latin authors with their class, dictating philological and critical notes, emending corrupt passages in the received texts, offering elucidations of the matter, and pouring forth stores of acquired knowledge regarding the laws, manners, religious and philosophical opinions of the ancients. Poliziano covered nearly the whole ground of classical literature during the years of his professorship, and published the notes of his courses upon Ovid, Suetonius, Statius, the younger Pliny, Quintilian, and the writers of Augustan histories. He also undertook a recension of the text of the Pandects of Justinian, which formed the subject of one of his courses; and this recension, though it does not rank high in the scale of juristic erudition, gave an impulse to the scholarly criticism of the Roman code. At the same time he was busy as a translator from the Greek. His versions of Epicurus, Herodotus, Hippocrates, Galen, Pliny's Erudita and Plato's Charmides delighted contemporaries by a certain limpid fluency of Latin style and grace of manner which distinguished him also as an original writer. Of these learned labours the most universally acceptable to the public at that time were a series of discursive essays on philology and criticism, first published in 1489 under the title of Miscellanea. They had an immediate, a lasting and a wide renown, encouraging the scholars of the next century and a half to throw their occasional discoveries in the field of scholarship into a form at once so attractive and so instructive. Poliziano was not, however, contented with these simply professorial and scholastic compositions. Nature had endowed him with literary and poetic gifts of the highest order. These he devoted to the composition of Latin and Greek verses, which count among the best of those produced by men of modern times in rivalry with ancient authors. The Manto, in which he pronounced a panegyric of Virgil; the Ambra, which contains a beautiful idyllic sketch of Tuscan landscape, and a studied eulogy of Homer; the Rusticus, which celebrated the pleasures of country life in no frigid or scholastic spirit; and the Nutricula, which was intended to serve as a general introduction to the study of ancient and modern poetry—these are the masterpieces of Poliziano in Latin verse, displaying an authenticity of inspiration, a sincerity of feeling, and a command of metrical resources which mark them out as original productions of poetic genius rather than rudely professorial lucubrations. Exception may be taken to their appearance in modern copies with the work of the Augustan or even of the Silver age. But what renders them always noteworthy to the student of modern humanistic literature is that they are in no sense imitative or conventional, but that they convey the genuine thoughts and emotions of a born poet in Latin diction and in metre moulded to suit the characteristics of the singer's temperament.

Poliziano was great as a scholar, as a professor, as a critic, and as a Latin poet at an age when the classics were still studied with the passion of assimilative curiosity, and not with the scientific industry of a later period. He was the representative hero of that age of scholarship in which students drew their ideal of life from antiquity and fondly dreamed that they might so restore the past as to compete with the classics in production and bequeath a golden age of resuscitated paganism to the modern world. Yet he was even greater as an Italian poet. Between Boccaccio and Ariosto, no single poet in the mother tongue of Italy deserves so high a place as Poliziano. What he might have achieved in this department of literature had he lived at a period less preoccupied with humanistic studies, and had he found a congenial sphere for his activity, can only be guessed. As it is, we must reckon him as decidedly the foremost and indubitably the most highly gifted among the Italian poets who were contented with the demand for a reasonably good version of the vulgar literature. Lorenzo in the nobler line, and Poliziano was more a follower in his path than an initiator. Yet what Poliziano produced, impelled by a courtly wish to satisfy his patron's whim, proves his own immeasurable superiority as an artist. His principal Italian works are the stanzas called La Giostra, written upon Giuliano de' Medici's victory in a tournament; the Orfeo, a lyrical drama performed at Mantua with musical accompaniment; and a collection of fugitive pieces, reproducing various forms of Tuscan popular poetry. La Giostra had no plan, and remained imperfect; but it demonstrated the capacities of the octave stanza for rich, harmonious and sonorous metrical effect. The Orfeo is a slight piece of work, thrown off at a heat, yet abounding in unpremeditated lyrical beauties, and containing in itself the germ both of the pastoral play and of the opera. The Tuscan songs are distinguished by a "rosy fluency," an exquisite charm of half romantic, half humorous abandonment to fancy, which mark them out as improvisations of genius. It may be added that in all these departments of Italian composition Poliziano showed how the taste and learning of a classical scholar could be engrafted on the stock of the vernacular, and how the highest perfection of artistic form might be attained in Italian without a sacrifice of native spontaneity and natural flow of language.

It is difficult to combine in one view the several aspects presented to us by this many-sided man of literary genius. At
a period when humanism took the lead in forming Italian character and giving tone to European culture, he climbed with facility to the height of achievement in all the branches of scholarship which were then most seriously prized—in varied knowledge of ancient authors, in critical capacity, in rhetorical and poetical exuberance. This was enough at that epoch to direct the attention of all the learned men of Europe on Poliziano. At the same time, almost against his own inclination, certainly with very little enthusiasm on his part, he lent himself so successfully to Lorenzo de' Medici's scheme for resuscitating the decayed literature of Tuscany, that his slightest Italian effusions exercised a potent influence on the immediate future. He appears before us as the dictator of Italian culture in a double capacity—as the man who most perfectly expressed the Italian conception of humanism, and brought erudition into accord with the pursuit of noble and harmonious form, and also as the man whose vernacular compositions were more significant than any others of the great revolution in favour of Italian poetry which culminated in Ariosto. Beyond the sphere of pure scholarship and pure literature Poliziano did not venture. He was present, indeed, at the attack made by the Pazzi conspirators on the persons of Lorenzo and Giuliano de' Medici, and wrote an interesting story of the affair. But the most part of his life was engaged in a curious document on the death of Lorenzo de' Medici to the students of Florentine history. But he was not, like many other humanists of his age, concerned in public affairs of state or diplomacy, and he held no office except that of professor at Florence. His private life was also uneventful. He passed it as a house-friend and dependant of the Medici, as the idol of the learned world, and as a simple man of letters for whom (with truly Tuscan devotion to the Saturnian country) rural pleasures were always acceptable. He was never married; and his morals incurred suspicion, to which his own Greek verses lend a certain amount of plausible colouring. In character Poliziano was dialectical, interested in the internal intercourse of his country, which he displayed. He died, half broken-hearted by the loss of his friend and patron Lorenzo de' Medici, on the 24th of September 1494, just before the wave of foreign invasion which was gathering in France swept over Italy.

For the life and works of Polizian, see F. O. Mencken (Leipzig, 1736), a vast repertory of accumulated erudition; Jac. Mähly, Angelus Polizianus (Leipzig, 1864); Carducci's edition of the Italian prose works and Latin and Greek poems (Florence, Barber, 1867); the Opera omnia (Bazel, 1854); Greswell's English Life of Polizian (1865); Roscoe's Lorenzo de' Medici (10th ed., 1866); and Roscoe's Renaissance in Italy, and translations from Poliziano's Italian poems in Symonds' Sketches and Studies in Italy, which include the Orfeo.

POLK, JAMES KNOX (1795-1849), eleventh president of the United States, was born in Mecklenburg county, North Carolina, on the 2nd of November 1795. In 1806 he crossed the mountains with his parents and settled in what is now Maury county, Tennessee. He graduated from the University of North Carolina in 1818, studied law in the office of Felix Grundy (1777-1840) at Nashville in 1819-1820, was admitted to the bar in 1820, and began to practise in Columbia, the county-seat of Maury county. After two years of service (1823-1825) in the state House of Representatives, he represented the sixth Tennessee district in the National House of Representatives from 1825 to 1839. In the party conflicts which succeeded the presidential election of 1824 he sided with the Jackson-Van Buren faction, and soon became recognized as leader of the Democratic forces. He was speaker from 1835 until 1839, when he retired from Congress to become governor of Tennessee. His administration (1839-1841) was successful, but he was unable to overcome the popular Whig movement of that period, and was defeated in 1841 and again in 1843. When the Democratic national convention met in Baltimore in 1844 he was mentioned as a possible candidate for the vice-presidency, but was suddenly brought forward as a "dark horse" and selected to lead the ticket. Finding it impossible under the two-thirds rule to nominate their candidate, the followers of Van Buren brought forward Polk, who was popular in the South, in order to defeat Lewis Cass and James Buchanan. George Bancroft, the historian, has asserted that this suggestion came originally from him, and Gideon J. Pillow, Polk's intimate friend, did much to bring about the nomination.

The unequivocal stand of Polk and his party in favour of the immediate annexation of Texas and the adoption of a vigorous policy in Oregon contrasted favourably with the timid vacillations of Henry Clay and the Whigs. Polk was elected, receiving 170 electoral votes to 105 for his opponent Clay. In forming his cabinet he secured the services of James Buchanan of Pennsylvania, as secretary of state, Robert J. Walker of Mississippi, as secretary of the treasury, William J. Marcy of New York, as secretary of war, and George Bancroft, then of Massachusetts, as secretary of the navy.1 There is no doubt that each of these men, and Bancroft in particular, influenced the policy of the administration, yet the historian James Schouler, who has made a careful study of the Polk papers, is doubtless correct in saying that the president himself was "the framer of the public policy which he carried into so successful execution, and that instead of being led (as many might have imagined) by the more famous statesmen of his administration and party who surrounded him, he in reality led and shaped his own executive course." Bancroft's opinion is that Polk was "prudent, far-sighted, bold, exceeding any Democrat of his day in his undeviatingly correct exposition of Democratic principles."

The four chief events of President Polk's administration were the final establishment of the independent treasury system, the reduction of the tariff by the Walker Bill of 1846, the adjustment of the Oregon boundary dispute with Great Britain by the treaty concluded on the 15th of June 1846, and the war with Mexico and the consequent acquisition of territory in the south-west and west. The first three of these were recommended in his first annual message, and he privately announced to Bancroft his determination to seize California. The independent treasury plan originated during Van Buren's administration as a Democratic measure; it had been repealed by the Whigs in 1841, and was now re-enacted. Protectionists contend that the tariff legislation of 1846 was in direct violation of a pledge given to the Democrats of Pennsylvania in a letter written by Polk during the campaign to John K. Kane of Philadelphia. Briefly summarized, this letter approves of a tariff for revenue with incidental protection, whereas the annual message of the 2nd of December 1845 criticizes the whole theory of protection and urges the adoption of a revenue tariff just sufficient to meet the needs of the government conducted on an economical basis. It is difficult to determine whether this was always his idea of incidental protection, or whether his views were changed after 1844 through the influence of Walker and the example set by Sir Robert Peel in Great Britain, or whether he was simply "playing politics" to secure the protectionist vote in Pennsylvania.

The one overshadowing issue of the time, however, was territorial expansion. Polk was an ardent expansionist, but the old idea that his policy was determined entirely by a desire to advance the interests of slavery is no longer accepted. As a matter of fact, he was personally in favour of insuring upon 54° 40' as the boundary in Oregon, and threw upon Congress the responsibility for accepting 49' as the boundary, and he approved the acquisition of California, Utah and New Mexico, territory from which slavery was excluded by geographical and climatic conditions. Furthermore a study of his manuscript diary now shows that he opposed the efforts of Walker and Buchanan in the Cabinet, and of Daniel S. Dickinson (1800-1866) of New York and Edward A. Hannegan (d. 1859) of Indiana, in the Senate, to retain the whole of Mexico, territory in which slavery might have thrived. At the close of his term (March 4, 1849) Polk retired to his home in Nashville, Tennessee, where he died on the 15th of the following June.

1 Bancroft served until September 1846, when he was appointed minister to England. He was succeeded as secretary of the navy by John J. Mason, who had previously held the office of attorney-general.
POLK, L.—POLKA

See John S. Jenkins, James Knox Polk (Auburn and Buffalo, 1850), and L. B. Chase, History of the Polk Administration (New York, 1850), both of which contain some documentary material, but are not discriminating in their method of treatment. George Bancroft contributed a good short sketch to J. G. Wilson’s Presidents of the United States (New York, 2nd ed., 1894). He made copies of the Polk manuscripts and was working upon a detailed biography at the time of his death in 1891. These copies, now deposited in the Lenox Library, New York City, contain a diary in 24 typewritten volumes, besides some correspondence and other private papers. They have been used by James Schouler in his Historical Briefs (New York, 1896), and by E. G. Bourne in an article entitled “The Proposed Absorption of Mexico in 1847–1848,” published in the Annual Report of the American Historical Association for 1899, i. 157–169 (Washington, 1900). Bourne discusses the part which Polk took in preventing the complete absorption of Mexico. See also the Diary of James K. Polk . . . . 1845 to 1849 (Chicago, 4 vols., 1910), edited by M. M. Quaife.

(W. R. S.*)

POLK, LEONIDAS (1806–1864), American soldier, was born at Raleigh, North Carolina, on the 10th of April 1806, and was a cousin of James Knox Polk, president of the United States. He was educated at West Point, but afterwards studied theology and took orders in the Protestant Episcopal Church in 1831. In 1838 he became missionary bishop of the South-West, Arkansas, Indian Territory, Louisiana, Alabama and Mississippi, and in 1841 he was consecrated bishop of Louisiana. His work in the Church was largely of an educational kind, and he played a prominent part in movements for the establishment of higher educational institutions in the South. At the outbreak of the Civil War in 1861 he resigned his bishopric and, like many other clergymen and ministers of religion, entered the army which was raised to defend the Confederacy. His rank in the hierarchy and the universal respect in which he was held in the South, rather than his early military education, caused him to be appointed to the important rank of major-general. He fortified the post of Columbus, Kentucky, the foremost line of defence on the Mississippi, against which Brigadier-General U. S. Grant directed the offensive reconnaissance of Belmont in the autumn. In the following spring, the first line of defence having fallen, Polk commanded a corps at Shiloh in the field army commanded by Albert Sidney Johnston and Beauregard. In October 1862 he was promoted lieutenant-general, and thereupon he commanded one of the three corps of the army of Tennessee under Bragg and afterwards was in charge of the Department of Alabama, Mississippi and East Louisiana. He was killed in the fighting in front of Marietta, while reconnoitring near Pine Mountain, Georgia, on the 14th of June 1864.

See Life, by his son W. M. Polk, (1893).

POLKA (either from the Czech pulka, half, with an allusion to the short steps characteristic of the dance, or from the Polish Polka, feminine of Polak, a Pole), a lively dance of Bohemian origin, danced to music written in \( \frac{3}{4} \) time. (See DANCE.)
