INITIALS USED IN VOLUME XXI. TO IDENTIFY INDIVIDUAL CONTRIBUTORS,1 WITH THE HEADINGS OF THE ARTICLES IN THIS VOLUME SO SIGNED.

A. B. R.
ALFRED BARTON RENDLE, M.A., D.Sc., F.R.S., F.L.S.
Keeper, Department of Botany, British Museum. Author of Text Book on Classification of Flowering Plants; &c.

A. F. P.
ALBERT FREDERICK POLLARD, M.A., F.R.Hist.S.

A. G.
MAJOR ARTHUR GEORGE FREDERICK GRIFFITHS (d. 1908).

A. G. T.
ARTHUR GEORGE TANSLEY, M.A., F.L.S.
Lecturer in Botany in the University of Cambridge. Formerly Assistant Professor of Botany, University College, London.

A. H.*
ALBERT HAAS, D.T.D., D.P.T.
Professor of Church History in the University of Leipzig, and Director of the Museum of Ecclesiastical Archaeology. Geheimer Kirchenrat of the Kingdom of Saxony. Member of the Royal Saxon Academy of Sciences and Corresponding Member of the Academies of Berlin and Munich. Author of Kirchengeschichte Deutschlands; &c. Editor of the new edition of Herwegh's Realenencyclopädie für protestantische Theologie und Kirche.

A. H. C.
SIR ARTHUR HERBERT CHURCH, M.A., D.Sc., F.R.S., F.S.A.
Professor of Chemistry, Royal Academy of Arts, London. Author of Chemistry of Paints and Painting; English Earthenware; English Porcelain; &c.

A. H. H.
ARTHUR HORSLEY HINTON (1863–1908).

A. H. S.
SIR A. HOUTUM-SCHINDLER, C.I.E.
General in the Persian Army. Author of Eastern Persian Iraq.

A. H. S.
REV. ARCHIBALD HENRY SAYCE, D.D., LL.D., LITT.D.
See the biographical article: SAYCE, A. H.

A. J. G.
REV. RALPH JAMES GRIEVE, M.A., B.D.
Professor of New Testament and Church History, Yorkshire United Independent College, Bradford. Sometime Registrar of Madras University, and Member of Mysore Educational Service.

A. J. H.
Formerly Member of Council and Hon. Curator of the Royal College of Music, London. Member of Committee of the Inventions and Music Exhibition, 1885; of the Vienna Exhibition, 1892; and of the Paris Exhibition, 1900. Author of Musical Instruments; &c.

A. J. L.
ANDREW JACKSON LAMOURoux.
Librarian, College of Agriculture, Cornell University. Editor of the Rio News (Rio de Janeiro), 1879–1901.

A. Ma.
ALEXANDER MACALISTER, M.A., LL.D., M.D., D.Sc., F.R.S.
Professor of Anatomy in the University of Cambridge, and Fellow of St John's College. Author of Text Book of Human Anatomy; &c.

A. N.
ALFRED NEWTON, F.R.S.
See the biographical article: NEWTON, ALFRED.

1 A complete list, showing all individual contributors, appears in the final volume.

1990

RALPH STOCKMAN, M.D., F.R.S.(Edin.), F.R.C.P.(Edin.),
Professor of Materia Medica and Therapeutics in the University of Glasgow.

R. S. C.
ROBERT SEYMOUR CONWAY, M.A., D.LITT.
Professor of Latin and Indo-European Philology in the University of Manchester. Formerly Professor of Latin in University College, Cardiff, and Fellow of Gonville and Caius College, Cambridge. Author of The Italic Dialects.

R. W.
ROBERT WALLACE, F.R.S.(Edin.), F.L.S.
Professor of Agriculture and Rural Economy at Edinburgh University, and Garton Lecturer on Colonial and Indian Agriculture. Professor of Agriculture, R.A.C., Gloscester, 1882-1886. Author of Farm Live Stock of Great Britain; The Agriculture and Rural Economy of Australia and New Zealand; Farming Industries of Cape Colony; &c.

S. A. C.
STANLEY ARTHUR COOK, M.A.

S. F. H.
SIDNEY FREDERIC HARMMER, M.A., D.Sc., F.R.S., F.Z.S.
Keeper of Zoology, Natural History Department, British Museum. Fellow, formerly Tutor and Lecturer, King's College, Cambridge. Joint-editor of The Cambridge Natural History.
S. H. V.* Sydney Howard Vines, M.A., D.Sc, F.R.S.
Sherardian Professor of Botany, University of Oxford and Fellow of Magdalen College. Fellow of the University of London. President of the Linnean Society, 1900–1904. Formerly Reader in Botany in the University of Cambridge and Fellow and Lecturer of Christ’s College. Author of A Student’s Textbook of Botany; &c.

S. N. Simon Newcomb, D.Sc., LL.D.
See the biographical article: Newcomb, Simon.

T. As. Thomas Ashby, M.A., D.Litt.
Director of British School of Archaeology at Rome. Formerly Scholar of Christ Church, Oxford. Craven Fellow, 1897, Conington Prizman, 1906. Member of the Imperial German Archaeological Institute. Author of The Classical Topography of the Roman Campana.

T. Ba. Sir Thomas Barclay.
Member of the Institute of International Law. Officer of the Legion of Honour. Author of Problems of International Practice and Diplomacy; &c. M.P. for Blackburn, 1910.

T. F. C. Theodore Freylinghuisen Collier, Ph.D.
Assistant Professor of History, Williams College, Williamstown, Mass., U.S.A.

T. G. Br. Thomas Gregor Brodie, M.D., F.R.S.
Professor Superintendent, Brown Animal Sanatory Institution, University of London. Professor of Physiology, Royal Veterinary College, London. Lecturer on Physiology, London School of Medicine for Women. Fellow of King’s College, London. Author of Essentials of Experimental Physiology.

T. M. L. Rev. Thomas Martin Lindsay, LL.D., D.D.
Principal of the United Free Church College, Glasgow. Formerly Assistant to the Professor of Logic and Metaphysics in the University of Edinburgh. Author of History of the Reformation; Life of Luther; &c.

Th. N. Theodor Nöldeke, Ph.D.
See the biographical article: Nöldeke, Theodor.

Formerly Senior Scientific Analyst to the Home Office. Lecturer on Chemistry and Forensic Medicine at Guy’s Hospital, London.

T. W.-D. Walter Theodore Watts-Dunton.
See the biographical article: Watts-Dunton, Walter Theodore.

T. W. H. Thomas Wentworth Higginson, A.M., LL.D.
Author of Atlantic Essays; Cheerful Yesterdays; History of the United States; &c.

T. W. R. D. Thomas William Rhys Davids, LL.D., Ph.D.
Professor of Comparative Religion, Manchester University. President of the Pali Text Society. Fellow of the British Academy. Secretary and Librarian of Royal Asiatic Society, 1885–1902. Author of Buddhism; Sacred Books of the Buddhists; Early Buddhism; Buddhist India; Dialogues of the Buddha; &c.

W. C. Su. Walter Coventry Summers, M.A.
Professor of Latin in the University of Sheffield. Formerly Fellow of St John’s College, Cambridge. Craven Scholar, 1890. Chancellor’s Medallist, 1892. Author of A Study of Valerius Flaccus; &c.

W. D. W. William Dwight Whitney.
See the biographical article: Whitney, William Dwight.

Adviser in Science to the Board of Education for England. Member of the Advisory Council for Education to the War Office. Formerly President of Royal Astronomical Society, Physical Society and Royal Photographic Society. Author of instruction in photography; Colour Vision; &c.

W. E. G. F. William Edward Garrett Fisher, M.A.
Author of The Transvaal and the Boers.

W. Fr. William Fream, LL.D. (d. 1906).
Formerly Lecturer on Agricultural Entomology, University of Edinburgh, and Agricultural Correspondent of The Times.

W. F. C. William Fielden Craies, M.A.
Barrister-at-Law, Inner Temple and Lecturer on Criminal Law, King’s College, London. Editor of Archbold’s Criminal Pleading (23rd edition).

W. Hl. Wheelton Hind, M.D., F.R.C.S., F.G.S.
Surgeon, North Staffs Infirmary. Lyell Medallist, Geological Society, 1902. Author of British Carboniferous Lamellibranchiata; &c.

W. H. F. Sir William Henry Flower, F.R.S.

PAYN, JAMES (1830-1868), English novelist, was born at Cheltenham, on the 28th of February 1830, his father being clerk to the Thames Commissioners and treasurer to the county of Berkshire. He was educated at Eton, and afterwards entered the Military Academy at Woolwich; but his health was not equal to the demands of a military career, and he proceeded in 1847 to Trinity College, Cambridge. He was among the most popular men of his time, and served as president of the Union. Before going to Cambridge he had published some verses in Leigh Hunt's Journal, and while still an undergraduate put forth a volume of Stories from Boccaccio in 1852, and in 1853 a volume of Poems. In the same year he left Cambridge, and shortly afterwards married Miss Louisa Adelaide Edlin, sister of Sir Peter Edlin. He then settled down in the Lake district to a literary career and contributed regularly to Household Words and Chambers's Journal. In 1858 he removed to Edinburgh to act as joint-editor of the latter periodical. He became sole editor in 1859, and conducted the magazine with much success for fifteen years. He removed to London in 1861. In the pages of the Journal he published in 1864 his most popular story, Lost Sir Massingberd. From this time he was always engaged in novel-writing, among the most popular of his productions being Married Beneath Him (1865), Carlyon's Year (1868), By Proxy (1878), and The Talk of the Town (1885). In 1883 he succeeded Leslie Stephen as editor of the Cornhill Magazine and continued in the post until the breakdown of his health in 1896. He was also literary adviser to Messrs Smith, Elder & Company. His publications included a Handbook to the English Lakes (1859), and various volumes of occasional essays, Maxims by a Man of the World (1860), Some Private Views (1881), Some Literary Recollections (1884). A posthumous work, The Backwater of Life (1899), revealed much of his own personality in a mood of kindly, sensible reflection upon familiar topics. He died in London, on the 25th of March 1898.

A biographical introduction to The Backwater of Life was furnished by Sir Leslie Stephen.

PAYNE, PETER (c. 1380-1455), English Lollard and Taborite, the son of a Frenchman by an English wife, was born at Houghon-the-Hill near Grantham, about 1380. He was educated at Oxford, where he adopted Lollard opinions, and had graduated as a master of arts before the 6th of October 1406, when he was concerned in the irregular proceedings through which a letter declaring the sympathy of the university was addressed to the Bohemian reformers. From 1410 to 1414 Payne was principal of St Edmund Hall, and during these years was engaged in controversy with Thomas Netter of Walden, the Carmelite defender of Catholic doctrine. In 1414 he was compelled to leave Oxford and taught for a time in London. Ultimately he had to flee from England, and took refuge in Bohemia, where he was received by the university of Prague on the 13th of February 1417, and soon became a leader of the reformers. He joined the sect of the “Orphans,” and had a prominent part in the discussions and conferences of the ten years from 1420 to 1430. When the Bohemians agreed to send representatives to the Council of Basel, Payne was naturally chosen to be one of their delegates. He arrived at Basel, on the 4th of January 1433, and his unyielding temper and bitter words probably did much to prevent a settlement. The Bohemians left Basel in April. The party of the nobles, who had been ready to make terms, were attacked in the Diet at Prague, by the Orphans and Taborites. Next year the dispute led to open war. The nobles were victorious at Lipau on the 29th of May 1434, and it was reported in England that Payne was killed. When soon afterwards the majority of the Orphans joined the moderate party, Payne allied himself with the more extreme Taborites. Nevertheless his reputation was so great that he was accepted as an arbitrator in doctrinal disputes amongst the reformers. In February 1437 the pope desired the emperor Sigismund to send Payne to be tried for heresy at Basel. Payne had to leave his pastorate at Saas, and took refuge with Peter Chelickr, the Bohemian author. Two years later he was captured and imprisoned at Gutenstein, but was ransomed by his Taborite friends. Payne took part in the conferences of the Bohemian parties in 1443-1444, and again in 1452. He died at Prague in 1455. He was a learned and eloquent controversialist, and a faithful adherent to Wycliffe's doctrine. Payne was also known as Clerk at Oxford, as Peter English in Bohemia, and as Freung, after his French father, and Hough from his birth place.

PAYNTER (or Painter), WILLIAM (c. 1540-1594), English author, was a native of Kent. He matriculated at St John's College, Cambridge, in 1554. In 1561 he became clerk of the ordnance in the Tower of London, a position in which he appears to have amassed a fortune out of the public funds. In 1586 he confessed that he owed the government a thousand pounds, and in the next year further charges of peculation were brought against him. In 1591 his son Anthony owned that he and his father had abused their trust, but Paynter retained his office until his death. This event probably followed
immediately upon his will, which was nuncupative and was dated the 14th of February 1594. The first volume of his Palace of Pleasure appeared in 1566, and was dedicated to the earl of Warwick. It included sixty tales, and was followed in the next year by a second volume containing thirty-four new ones. A second improved edition was published in 1585, containing seven new stories.

Paynter borrows from Herodotus, Plutarch, Aulus Gellius, Aelian, Livy, Tacitus, Quintus Curtius; from Giraldi Cinthio, Matteo Bandello, Ser Giovanni Fiorentino, Straparola, Queen Margaret of Navarre and others. To the vogue of this and similar collections we owe the Italian setting of so large a proportion of the Elizabethan drama. The early tragedies of Appius and Virginia, and Tancred and Gismond were taken from The Palace of Pleasure; and among better-known plays derived from the book are the Shakespearian Timon of Athens, All's Well that Ends Well (from Giletta of Narbonne), Beaumont and Fletcher's Triumph of Death and Shirley's Love's Cruelty.

The Palace of Pleasure was edited by Joseph Halewood in 1813. This edition was collated (1890) with the British Museum copy of 1575 by Mr Joseph Jacobs, who added further preface and notes, including an introduction dealing with the importance of Italian models in Elizabethan drama.

PAYSANDÚ, or Paysandú, a town and river port of Uruguay and capital of a department of the same name, on the left bank of the Uruguay River about 214 m. N.W. of Montevideo, with which it is connected by rail. Pop. (1908 estimate), 15,000. It has railway connexion with Rio Negro and Montevideo to the south-east, and with Salto and Santa Rosa, on the Brazilian frontier, on the north; it is at the head of low water navigation on the Uruguay River, and is in regular steamer communication with Montevideo and Buenos Aires.

There are some good public buildings, including two churches, a hospital, a theatre and the government offices. Paysandú exports cattle and sheep and salted meats, hides, ox tongues, wool and other animal products. There is a meat-curing establishment (saladero) at Guayviyú, in the vicinity. The town was named in honour of Pay, or Pay (Father) Sandó, a priest who settled there in 1772. It has suffered severely from revolutionary outbreaks, was bombarded by Rivera in 1846, and was partly destroyed in 1865 by a Brazilian bombardment, after which its gallant defenders, Leandro Gomez and his companions, were butchered in cold blood.

The departments of Paysandú—area 5117 sq. m.; pop. (1907 estimate), 54,109—is one of the richest stock-raising regions of the republic.

PAYSON, EDWARD (1783–1827), American Congregational preacher, was born on the 25th of July 1783 at Rindge, New Hampshire, where his father, Seth Payson (1758–1820), was pastor of the Congregational Church. His uncle, Phillips Payson (1736–1801), pastor of a church in Chelsea, Massachusetts, was a physicist and astronomer. Edward Payson graduated at Harvard in 1803, was then principal of a school at Portland, Maine, and in 1807 became junior pastor of the Congregational Church at Portland, where he remained, after 1811, as senior pastor, until his death on the 22nd of October 1827.

The most complete collection of his sermons, with a memoir by Asa Cummings originally published in 1828, is the Memoir, Select Thoughts and Sermons of the late Rev. Edward Payson (3 vols., Portland, 1845; Philadelphia, 1886). Based on this is the volume, Mementos of Edward Payson (New York, 1873), by the Rev. E. L. Janes of the Methodist Episcopal Church.

PÁZMÁNY, PÉTER (1570–1637), Hungarian cardinal and statesman, was born at Nagyvárad on the 4th of October 1570, and educated at Nagyvárad and Kolozsvár, at which latter place he quitted the Calvinist confession for the Roman communion (1583). In 1587 he entered the Jesuit order. Pázmány went through his probation at Cracow, took his degree at Vienna, and studied theology at Rome, and finally completed his academic course at the Jesuit college at Graz. In 1590 he was sent to the order's establishment at Selicy, where his eloquence and dialectic won back hundreds to Rome, including many of the noblest families. Prince Nicholas Esterházy and Paul Rákóczy were among his converts. In 1607 he was attached to the archbishop of Estergom, and in the following year attracted attention by his denunciations, in the Diet, of the 8th point of the peace of Vienna, which prohibited the Jesuits from acquiring landed property in Hungary. At about the same time the pope, on the petition of the emperor Matthias II., released Pázmány from his monkish vows. On the 25th of April 1616 he was made dean of Turóc, and on the 28th of September became primate of Hungary. He received the red hat from Urban VIII. in 1629. Pázmány was the soul of the Roman Catholic reaction in Hungary. Particularly remarkable is his Igazságos vezető Katolikus ManualJE (Guide to Truth), which appeared in 1613. This manual united all the advantages of scientific depth, methodical arrangement, and popular appeal, and the chief of the Hungarian church Pázmány used every means in his power, short of absolute contravention of the laws, to obstruct and weaken Protestantism, which had risen during the 16th century. In 1619 he founded a seminary for theological candidates at Nagyszombat, and in 1623 laid the foundations of a similar institution at Vienna, the still famous Pázmáneum, at a cost of 200,000 florins. In 1635 he contributed 100,000 florins towards the foundation of a Hungarian university. He also built Jesuit colleges and schools at Presburg, and Franciscan monasteries at Erškényvar and Keszthely Hungary. His man is an undying monument to his devotion to the establishment of a model penitentiary at Lima, which he was able to accomplish through the support of General Castilla. In 1680 Castilla made him director of public works, in which capacity he superintended the erection of the Lima statue of Bolivar. He was also concerned in the reform of the currency by the withdrawal of the debased Bolivian coins. In 1681 he published his great atlas of the republic of Peru, and in 1686 the first volume of his history of Peru after the acquisition of her independence. A second volume followed, and a third, bringing the history down to 1599, was published after his death by his son. In 1680 he was minister of justice and korningship under President Balta, but shortly afterwards retired from public life to devote himself to his great geographical dictionary of Peru, which was published in 1877. During the disastrous war with Chile he sought refuge at Buenos Aires, where he was made professor in the National College, and where he wrote and published a history of the war (1884). He died on the 31st of December 1886.

PEA (Penium), a genus of the order Leguminosae, consisting of herbs with compound pinnate leaves ending in tendrils, by means of which the weak stems are enabled to support themselves, and with large leafy stipules at the base. The flowers (fig. 1) are typically "papilionaceous," with a "standard" or large petal above, two side petals or wings, and two front petals below forming the keel. The stamens are ten—nine united, the tenth usually free or only slightly joined to the others.
This separation allows approach to the honey which is secreted at the base of the staminal tube. The ovary is prolonged into a long, thick, bent style, compressed from side to side at the tip and fringed with hairs. The fruit is a "legume" or pod (fig. 2), bursting when ripe into halves, which bear the large globular seeds (peas) on their edges. These seeds are on short stalks, the upper extremity of which is dilated into a shallow cup (arillus); the two seed-leaves (cyledones) are thick and fleshy, with a radicle bent along their edges on account of the place wherein the ovary is exceedingly close to Lathyrus, being in the Pisum or pod species. The stamens and stigmas, however, from four to six leaves to each seed and globular seeds of uniform color.

P. sativum was known to Theophrastus; and De Candolle (Origin of Cultivated Plants, p. 329) points out that the word "pisum" or its equivalent occurs in the Albanian tongue as well as in Latin, whence he concludes that the pea was known to the Aryans, and was perhaps brought by them into Greece and Italy. Peas have been found in the Swiss lake-dwellings of the Neolithic period. The garden pea differs considerably in size, shape of pod, degree of productivity, form and colour of seed, &c. The sugar peas are those in which the inner lining of the pod is very thin instead of being somewhat fleshy, so that the whole pea can be held up by the milk-pods. The so-called acaceous plants, peaflowers are perfectly fertile without the aid of insects, and thus do not intercross so freely as most similar plants do. On the other hand, a case is known wherein the pollen from a purple-podded pea applied to the stigma of the white-pod is purple-podded pea produced a purple pod, showing that not only the ovule but even the ovary was affected by the cross. The numerous varieties of peas in cultivation have been, obtained by cross-fertilization, but chiefly by selection. Peas constitute a highly nutritious article of diet from the large percentage of nitrogenous materials they contain, in addition to starchy and saccharine matters.

The sweet pea, cultivated for the beauty and fragrance of its flowers, is a species of the allied genus Lathyrus (L. odoratus), a native of southern Europe. The chick pea (c.v.) (Cicer arietinum), not cultivated in England, is still farther removed from the true peas. The everlasting pea of gardens is a species of Lathyrus (L. latifolius) with very deep fleshly roots, bold foliage, and beautiful but scentless flowers; the field pea (Pisum arvense) is better adapted than the milk-bean to cold soils, and is sometimes grown in rows of such a width as to admit of horse-hoeing.

The early stage at which the plants fall over, and forbid further culture, renders it even more needful than in the case of beans to sow them only on land already clean. If annual weeds can be kept in check until the peas once get a close cover, they then occupy the ground so completely that nothing else can live under them; and the ground, after their removal, is found in the choicest condition. A thin crop of peas should never be allowed to stand, as the land is sure to get perfectly wild. The difficulty of getting this crop well harvested renders it peculiarly advisable to sow only the early varieties.

The pea prefers a friable calcareous loam, deeply worked, and well enriched with good hotbed or farm-yard manure. The early crops require a warm sheltered situation. The later-grown peas do well in 6 ft. apart, or more, in the open quarters, dwarf crops being introduced between the rows. The dwarf or early sorts may be sown 3 or 4 ft. apart. The deep working of the soil is of importance, but the hot peas should never be drawn or arrested of growth. The first sowing may be made about the beginning or middle of November, in front of a south wall, the plants being raised under glass or in seed boxes or on the surface of the ground, before being transplanted. The dwarf peas are sown in February, in open spaces, or in glass houses, but the seed should be placed slightly to the beginning of July for the north, and about the third week in July for warmer districts. During dry hot weather late peas derive great benefit from mulching and watering. The latest sowings, at the middle or end of August, should consist of the best early sorts, as they are not so long in producing pods as the larger and finer sorts, and by this means the supply may be prolonged till October or November. As they grow the earth is drawn up to the stems, which are also supported by stakes, a practice which in a well-kept garden is always advisable, although it is said that the early varieties arrive sooner at maturity when recumbent.

Some young plants are grown in autumn subject to mildew, to obviate which it has been proposed to dig over the ground in the usual way, and to soak the spaces to be occupied by the rows of peas thoroughly with water—the earth on each side to be collected up so as to form ridges 7 or 8 in. high, and the surface watered, and the seed sown on in single rows. If dry weather at any time set in, water should be supplied profusely once a week.

To produce very early crops the French market-gardeners use sowings of November 15th or December 1st. This is accomplished by having the seeds being covered very slightly. The young plants are transplanted into other frames in December, the ground inside being dug out so as to be 18 or 20 in. below the sashes, and the earth thus removed is used against the outside of the frames. The young plants, when 3 or 4 in. high, are planted in patches of three or four, 8 in. asunder, in four longitudinal rows. The sashes are covered with straw, with strips of canvas whenever the weather is sufficiently mild. When 8 or 10 in. high, the stems are inclined towards the back of the frame, a little earth being drawn their base, and when the plants come into blossom the tops are pinched out about the third or fourth flower to force them into bearing. As soon as they begin to pod, the soil may have a gentle watering, whenever sufficiently warmed by the sun, but a too vigorous growth at an earlier period would be detrimental. Thus treated the plants bear pods fit for gathering in the first fortnight in April.

A very convenient means of obtaining an early crop is to sow in 5-in. pots, a few seeds in each, the plants being ultimately planted out on a warm border. Peas may also be obtained early if gently forced in frames, in the same way as kidney beans, the darkest varieties being preferable.

For the very early peas the rows should range east and west, but for the later crops north and south. The average depth of the drills should be about an inch and a half deep for the larger kinds. The drills should be made wide and flat at bottom so that the seeds may be better separated in sowing. The large sorts are the better for being sown 3 in. and Chopped furze may be advantageously scattered in the drill before sowing in, to check the depredations of mice, and before levelling the surface the soil should be gently trodden down over the seeds.

A good selection of sorts may be made from the following—

Early.—William Hurst; Chelsea Gem; Sutton's Bountiful and Escorialo; Gradus.
Second Early.—Stratagum; Tophemone; Telegraph; Carter's Daisy; Duke of York; Veitch's Dwarf; Early; Late.—Veitch's Perfection; Ne Plus Ultra, the finest of all late peas, but a little delicate in cold wet soils and seasons; British Queen; Champion of England; Duke of Albany.

PEABODY, ANDREW PRESTON (1811-1893), American clergyman and author, was born in Beverly, Massachusetts, on the 19th of March 1811, and was descended from Lieut. John Peabody of St Alans, who emigrated to Massachusetts in 1635. He learned his trade before he was three years old, and entered Harvard College at the age of seventeen in 1826, with the single exception of Paul Dudley (class of 1690) the youngest graduate of Harvard. In 1833 he became assistant pastor of the South Parish (Unitarian) at Portsmouth, New Hampshire; the senior pastor died before Peabody had been preaching a month, and he succeeded to the charge of the church, which he held until 1860. In 1832-1860 he was proprietor and editor of the North American Review. He was preacher to
Harvard University and Plummer professor of Christian morals from 1860 to 1881, and was professor emeritus from 1881 until his death in Boston, Massachusetts, on the 10th of March 1893. On the walls of Appleton Chapel, Cambridge, U.S.A., is a bronze tablet to his memory.

Besides many brief memoirs and articles, he wrote: Christianity the Religion of Nature (2 vols., 1864), Lowell Institute Lectures; Reminiscences of A. Bronson Alcott's School in Boston, Mass., the best account of which is probably her Record of Mr Alcott's School (1835). She had been instructed in Greek by Emerson at Concord when she was eighteen years old. She became interested in the educational methods of Froebel, and in 1860 opened in Boston a small school resembling a kindergarten. In 1867 she visited Germany for the purpose of studying Froebel's methods. It was largely through her efforts that the first public kindergarten in the United States was established in Boston in 1870. She died at Jamaica Plain, Boston, on the 3rd of January 1894. She was the sister-in-law of Nathaniel Hawthorne and of Horace Mann.

Among her publications are: Kindergarten in Italy (1872); Reminiscences of William ELLERY CHANNING (1880); Lectures in the Training Schools for Kindergartners (1888); and Last Evening with Allston, and other Papers (1886).

PEABODY, GEORGE (1795-1869), American philanthropist, was descended from an old yeoman family of Hertfordshire, England, named Peabody or Peabody. He was born in the part of Danvers which is now Peabody, Mass., on the 10th of February 1795. When eleven years old he became apprentice at a grocery store. At the end of four years he became assistant to his brother, and a year afterwards to his uncle, who had a business in Georgetown, District of Columbia. After serving as a volunteer at Fort Warburton, Maryland, in the War of 1812, he became partner with Elisha Riggs in a dry goods store at Georgetown, Riggs furnishing the capital, while Peabody was manager. Through his energy and skill the business increased with astounding rapidity, and on the retirement of Riggs about 1830 Peabody found himself at the head of one of the largest mercantile concerns in the world. About 1837 he established himself in London as merchant and money-broker at Waranford Court, in the city, and in 1843 he withdrew from the American business. The number of his benefactions to public objects was very large. He gave $50,000 for educational purposes at Danvers; £2,000 to found and endow a scientific Institute in Baltimore; various sums to Harvard University; $700,000 to the trustees of the Peabody Educational Fund to promote education in the southern states; and £50,000 for the erection of dwelling-houses for the working-classes in London. He received from Queen Victoria the order of a baronetc, but declined it. In 1867 the United States Congress awarded him a special vote of thanks. He died in London on the 4th of November 1869; his body was buried in America in a British warship, and was buried in his native town.

See the Life (Boston, 1870) by Phoebe A. Hanaford.

PEABODY, a township of Essex county, Massachusetts, U.S.A., in the eastern part of the state, 2 m. N.W. of Salem. Pop. (1905) 13,008; (1910) 15,721. It is served by the Boston & Maine railway. The township covers an area of 17 sq. m. Its principal village is also known as Peabody. It contains the Peabody Institute (1852), a gift of George Peabody; in 1900 the institute had a library of 43,200 vols., and in connexion with it is the Eben Dale Sutton reference library, containing 4100 vols. In 1900 the institute is the portrait of Queen Victoria given by her to Mr Peabody. Among the localities of interest are the birthplace of George Peabody, the home of Rufus Choate (who lived here from 1823 to 1828), and the old burying-ground, where many soldiers of the War of Independence are buried; and the town has a Lexington monument, dedicated in 1835, and a soldiers' monument, dedicated in 1881. Manufacturing is the principal industry, and leather is the principal product; among other manufactures are shoes, gloves, glue and carriages. The value of the factory products in 1903 was $10,236,669, an increase of 47.4% over that for 1900, and of the total the leather product represented 77.3%.

Peabody was originally a part of the township of Salem. In 1752 the district of Danvers was created, and in 1757 this district was made a separate township. In 1855 the township was divided into Danvers and South Danvers, and in 1868 the name of South Danvers was changed to Peabody, in honour of George Peabody. See Old Naumkeag (Salem, 1877), by C. H. Webber and W. H. Nevins.

PEACE, a river of western Canada. It rises in the Rocky Mountains near 50° N., and breaking through the mountains, flows N.E. into Slave River, near lake Athabasca. The district between 56° 40' and 60° N., and between 112° W. and the Rocky Mountains is usually known as the Peace River district.

PEACE, (Lat. pax; Fr. paix; Ger. Friede), the contrary of war, conflict or turmoil, and the condition which follows their cessation. Its sense in international law is the condition of those persons or public authorities which also use or have used as an adjudgment for a treaty of peace, in such cases as the Peace of Utrecht (1713), and the Peace of Amiens (1802).

Introduction.—Peace until quite recently was merely the political condition which prevailed in the intervals between wars. It was a purely negative condition. Even Grotius, who reduced the tendencies existing in his time to a sort of orderly expression, addressed himself to the law of war as the positive part of international jurisprudence and dealt only with peace as its negative alternative. The very name of his historic treatise, De jure belli ac pacis (1625), shows the subordination of peace to the main subject of war. In our own time peace has attained a higher status. It is now customary among writers on international law to give peace at any rate a volume to itself. Peace in fact has become a separate branch of the subject. The rise of arbitration as a method of settling international difficulties has carried it a step further, and now the Hague Peace Conventions have given pacific methods a standing apart from war, and the preservation of peace has become an object of direct political effort. The methods for ensuring such preservation are now almost as precise as the methods of war. However reluctant some states may be to bind themselves to any rules excluding recourse to brute force when diplomatic negotiations have failed, they have nevertheless unanimously at the Hague Conference of 1907 declared their "firm determination to cooperate in the maintenance of general peace" (la forme volonté de concourir au maintien de la paix générale), and their resolution "to favour with all their efforts the amicable settlement of international conflicts" (preamble to Peace Convention). The offer of mediation by independent powers is provided for (Peace Convention: art. 3), and it is specifically agreed that in matters of a "legal character" such as "questions of interpretation and application" of international conventions, arbitration is the method "more pacific and at the same time most equitable method " of settling differences which have not been solved by diplomacy (Peace Convention: art. 38). In the final act, the conference went farther in agreeing to the "principle of compulsory arbitration," declaring that "certain disputes, in particular those relating to the interpretation and application of the provisions of international agreements, are suitable (susceptible) to be submitted to compulsory arbitration without any restriction."

These declarations were obviously a concession to the widespread feeling, among civilized nations, that peace is an object in itself, an international political condition requiring its code of methods and laws just as much as the domestic political conditions of nations require their codes of methods and laws. In other words peace among nations has now become, or is fast becoming, a positive subject of international regulation, while war is...
comprising, among progressive peoples, to be regarded merely as an accidental disturbance of that harmony and concord among mankind which nations require for the fostering of their domestic welfare.

Though the idea of preserving peace by general international regulation has had several exponents in the course of ages, no deliberate plan has ever yet been carried into effect. Indirectly, however, there have been many agencies which have operated towards this end. The earliest, known to history, is the Amphictyonic Council (q.v.) which grew out of the common worship of the Hellenes. It was not so much a political as a religious body. "If it had any claim," says Freeman, "to the title of a general council of Greece, it was wholly in the sense in which we speak of general councils in modern Europe. The Amphictyonic Council represented Greece as an ecclesiastical synod represented western Christendom. Its primary business was to regulate the concerns of the temple of Apollo at Delphi. The Amphictyonic Council which met at Delphi was only the most famous of several bodies of the same kind." "It is easy, however," adds Freeman, "to understand how the religious functions of such a body might assume a political character. The territorial scheme of Amphictyonic law forbad extreme measures of hostility against any city sharing in the common Amphictyonic worship, and it was forbidden to raze any Amphictyonic city or to cut off its water. As the only deliberative body in which most Greek communities were represented, its decisions were those of the bulk of the Hellenic people. It sank eventually into a mere political tool in the hands first of Thebes, and then under Philip of Macedonia."

The so-called *pas romana* was merely peace within an empire governed from a central authority, the constituent parts of which were held together by a network of centralized authority. The feudal system again was a system of offence and defence, and its object was efficiency for war, not the organized regulation of peace. Yet it had elements of federation within the bonds of its hierarchy.

The spiritual influence of the Church again was exerted to preserve relative peace among feudal princes. The "Truce of God" was established by the clergy (originally in Gueyenne in 1033) to take advantage of holy days and festivals for the purpose of restricting the time available for bloodshed.

The "grand design" of Henry IV. of France, which some historians regard merely as the fantastic idea of a visionary, was definitely conceived with a view to the future. The failure of its aims was due, it seems, to the fact that the territorial war and conflict which he probably foresaw would break out sooner or later between Catholic and Protestant Europe, and which, in fact, broke out some fifteen years later in the Thirty Years' War.

The Holy Roman Empire itself was in some respects an agent for the preservation of peace among its constituent states. In the same way the federation of Swiss cantons, of the states of the North American Union and of the present German Empire have served as means of reducing the number of possible parties to war, and consequently that of its possible occasions.

Not only the number of possible war-making states but also the territorial area over which war can be made has been reduced in recent times by the creation of neutralized states such as Switzerland, Belgium, Luxemburg and Norway, and areas such as the Congo basin, the American lakes and the Suez Canal.

The "balance of power," which has played in the history of modern Europe such an important part, is inherent in the notion of the independence and stability of states. Just as in Italy the common weal of the different republics which were crowded within the limited area of the peninsula required that no one of them should become so powerful as to threaten the independence of the others, so western Europe had a similar danger to counteract. France, Spain and the Empire were conflicting with each other in power to the detriment of smaller states. Great Britain and the Netherlands, Prussia and Russia, had interests in the preservation of the status quo, and wars were waged and treaties concluded to adjust the strength of states in the common interest of preventing any one of them from obtaining undue predominance. Then came the break up of what remained of feudal Europe and a readjustment under Napoleon, which left the western world with five fairly balanced homogeneous nations. These now took the place of the old heterogeneous areas, governed by their respective sovereigns without reference to any idea of nationality or of national representation. The leading nations assumed the hegemony of the west, and in more recent times this combination has become known as the "concert of Europe." This concert of the great powers, as its name implies, in contradistinction to the "balance of power," was essentially a factor for the preservation of peace.

For a century back it has played the part of an upper council in the management of Europe. In all matters affecting the Near East, it considers itself supreme. In matters of general interest it has frequently called conferences to which the minor states have been invited, such as the West African Conference in Berlin in 1885, and the Anti-Slavery Conference at Brussels in 1889-1890, and the Conference of Algeciras in 1906. Meanwhile the Concert of Europe became the Security Treaty of London, later in 1878 at the Congress of Berlin the United States, and now undoubtedly Japan will expect to be included as a great power in this controlling body. The essential feature of the concert has been recognition of the advantage to all the great powers of common action in reference to territorial changes in the Near East, of meeting together as a council, in preference to un concerted negotiation by the powers acting severally.

A departure of more recent origin has been the calling together of the smaller powers for the settlement of matters of general administrative interest, conferences such as those which led to the conclusion of the conventions creating the Postal Union, the Copyright and Industrial Property Unions, &c.

These conferences of all the powers serve in practice as a sort of common council in the community of states, just as the concert of the great powers acts as a kind of senate. We have thus the nucleus of that international parliament which idealist peacemakers have dreamt of since the time of Henry IV.'s "grand design."

This brings us down to the greatest deliberate effort ever made to secure the peace of the world by a general convention. It was due to the initiative of the young tsar Nicholas II., who, in his famous rescript of the 24th of August 1898, stated that he regarded the time has come when international peace and concord "the first conference was held in 1899, and another followed it in 1907; at the earlier one twenty-six powers were represented; at that of 1907 there were forty-four, this time practically the whole world. The conventions drawn up at the second conference were a deliberate codification of many branches of international law. By them a written law has been substituted for that unwritten law which nations had been wont to construe with a latitude more or less corresponding to their power. At the conference of 1899, moreover, a court of arbitration was instituted for the purpose of dealing judicially with such matters in dispute as the powers agreed to submit to it.

In the interval between the two Hague Conferences, Great Britain and France concluded the first treaty applicable to future difficulties, as distinguished from the treaties which had preceded it, treaties which related in all cases to difficulties already

---

existing and confined to them. This treaty made arbitration applicable to all matters not affecting "national honour or vital interests." Since then a network of similar treaties, adopted by different nations with each other and based on the Anglo-French model, has made reference to the Hague Court of Arbitration practically compulsory for all matters which can be settled by agreement. Of damages, or do not affect any vital national interest.

The third Hague Conference is timed to be held in 1917. Meanwhile a conference of the maritime powers was held in London in 1906-1909 for the elaboration of a code of international maritime law in time of war, to be applied in the international Court of Prize, which had been proposed in a convention signed as referendum at the Hague Conference of 1907.

A further development in the common efforts which have been made by different powers to assure the reign of justice and judicial methods among the states of the world was the proposal of Secretary Knox of the United States to insert in the instrument of ratification of the International Prize Court Convention (adopted at the Hague in 1897) a clause stating that the International Prize Court shall be invested with the duties and functions of a court of arbitral justice, such as recommended by the first Voeu of the Final Act of the conference. The object of this proposal was to give effect to the idea that the existing "permanent" court lacked the essential characteristics of national courts of justice in not being ready at all times to hear cases, and in needing to be specially constituted for every case submitted to it. The new court would be permanently in session at the Hague, the full panel of judges to assemble in ordinary or extraordinary session once a year.

Thus, while armaments are increasing, and wars are being fought out in the press and in public discussion, the great powers are steadily working out a system of written law and establishing a judiciary to adjust their differences in accordance with it.¹

The Current Grouping of Mankind and Nation-making.—In the consolidation of peace one of the most important factors is unquestionably the grouping of mankind in accordance with the final territorial and racial limitations of their apparent destiny. Language has played a vital part in the formation of Germany and Italy. The language question still disturbs the tranquility of the Near East. The Hungarian government is regarded by the Slav, Ruman and German inhabitants of the monarchy as an oppressor for endeavouring to force everybody within the realm to learn the Magyar language. The "Young Turkish" government has problems to face which will be equally difficult, if it insists on endeavouring to institute centralized government in Turkey on the French model. Whereas during the 16th century states were being cut out to suit the existing distribution of language, in the 20th the tendency seems to be to avoid further rearrangement of boundaries, and to complete the homogeneity, thus far attained, by the artificial method of forcing reluctant populations to adopt the language of the predominant or governing race. In the United States this artificial method has become a necessity, to prevent the upgrowth of alien communities, which might at some later date cause domestic trouble of a perilous character. For example, when a community of French Canadians, discontented with their condition, 50 years ago migrated and settled in Massachusetts, they found none of the tolerance they had been enjoying in Canada for their French schools and the French-speaking language they wished to preserve. In Alsace-Lorraine German-speaking immigrants are gradually displacing, under government encouragement, the French-speaking population. Poland is another case of the difficulty of managing a population which speaks a language not that of the governing majority, and Russia, in trying to solve one problem by absorbing Finland into the national system, is burdening herself with another which may work out in centuries of unrest, if not in domestic violence. Not very long ago Pan-Germans were paying much attention to the German settlers in the Brazilian province of Rio Grande do Sul, where large villages spoke nothing but German, and German, as the only language known on the spot, had become the tongue in which municipal business was transacted. The Brazilian government, in view of the danger to which such a state of things might give rise, followed the example of the United States in dealing with the language question.

Thus while in the one case homogeneity of language within state boundaries seems to be one of the conditions making for peace, the avoidance of interference with a well-marked homogeneous area like Finland would seem to contribute equally to the same end.

Meanwhile the difficulties in the way of contemporary nation-making are fostered by many extraneous influences, as well as by dogged resistance of the races in question. Not the least important of these influences is the sentimental sympathy felt for those who are supposed to be deprived of the use of their mother-tongue, and who are subjected to the hardship of learning an alien one. The hardship inflicted on those who have to learn a second language is very easily exaggerated, though it is to be regretted that in the case of Hungary the second language is not one more useful for international purposes.

Contemporary Statecraft.—Nation-making has hitherto been more or less unconscious—the outcome of necessity, a natural growth due to the play of circumstance and events. But in our own age conscious statecraft is also at work, as in Canada, where the genius of statesmen is gradually endowing that dominion with all the attributes of independence and power. Australia has not learnt the lesson of Canada in vain. Whatever value may attach to the consolidation of the British Empire itself as a factor in spreading the peace which reigns within it, it is also a great contribution to the peace of the world that the British race should have founded practically independent states like the Dominion of Canada, the Commonwealth of Australia, the South African Union and the Dominion of New Zealand. These self-governing colonies with their spheres of influence, with vast areas still unpeopled, have a future before them which is dissociated from the methods of an over-peopled Europe, and among them the preservation of peace is the direct object and condition of their progressive development. Like the United States, they have or will have their Monroe doctrine. Colonized by the steady industrial peoples of northern Europe, there is no danger of the turbulence of the industrially indolent but more passionate peoples of Central and South America. As in Europe, these northern peoples will hold the power which intelligent democracies are consciously absorbing, and the British faculty for statecraft is gradually welding new nations on the British model, without the obsolete traditions and without that human sediment which too frequently chokes the currents of national vitality in the older communities of Europe.

Military.—It is often stated, as if it were incontrovertible, that conscription and large standing armies are a menace to peace, and yet, although throughout the civilized world, except in the British Empire and the United States, conscription is the system employed for the recruiting of the national forces of both defence and offence, few of these countries show any particular disposition to make war. The exceptional position of the United States, with a population about equal to that of the rest of the American continent, and of Great Britain, an island state but little exposed to military invasion, places both beyond absolute need of large standing armies, and renders an existing system feasible which would be quite inadequate for the recruitment of armies on the French or German scale. Democratic progress on the Continent has, however, absorbed

¹ Schemes of thinkers, like William Penn's European Parliament (1695); Abbe Pierre's elaboration of "grand design" (see supra); Jeremy Bentham's International Tribunal (1786-1789); Kant's Permanent Congress of Nations and Perpetual Peace (1795); John Stuart Mill's Federal Supreme Court; Sedley's, Blunt's, David Dudley Field's, Professor Leone Levi's, Sir Edmund Horbury's co-operative schemes for promoting law and order among nations, have all contributed to popularizing in different countries the idea of a federation of mankind for the preservation of peace.
conscription as a feature in the equalization of the citizen's rights and liabilities. Just as in Anglo-Saxon lands a national ideal is gradually materializing in the principle of the equalization of chances for all citizens, so in continental Europe, along with this equalization of chances, has still more rapidly developed the ideal of an equalization of obligations, which in turn leads to the claim for an enlargement of political rights co-extensive with the obligations. Thus universal conscription and universal suffrage tend to become in continental political development, complementary conditions of the citizen's political being. In Germany, moreover, the military service is designed not only to make the recruit a good soldier, but also to give him a healthy physical, moral and mental training. German statesmen, under the powerful stimulus of the emperor William II., have, in the eyes of some critics, carried this secondary object of conscript training to such excess as to be detrimental to military efficiency.

To put it shortly, the Germans have taught their soldiers to think, and not merely to obey. The French, who naturally looked to German methods for inspiration, have come to apply them more particularly in the development of their cavalry and artillery, especially in that of the former, which has taken in the French army an ever higher place as its observing and thinking organ.

Militarism on the Continent has thus become allied with the very factors which made for the reign of reason. No agitation for the development of national defences, no beating of drums to awaken the military spirit, no anti-foreign clamour or invasion panic, no parading of uniforms and futile clash of arms, are necessary to entice the grounding and the hunkpin into the service. In Germany patriotic waving of the flag, as a political method, is directed more especially to the strengthening of imperial, as distinguished from local, patriotism. Where conscription has existed for any appreciable time it has sunk into the national economy, and men do their military service with as little concern as if it were a civil apprenticeship.

As implied above, military training under conscription does not by any means necessarily tend to the promotion of the military spirit. In France, so far from taking this direction, it has resulted, under democratic government and universal suffrage, in a widespread abhorrence of war, and, in fact, has converted the French people from being the most militant into being the most pacific nation in Europe. The fact that every family throughout the land is a contributory to the military establishment and the country at home has made peace a family, and hence a national, ideal. Paradoxical as it may seem, it is the logical conclusion of such comparisons that militarism only exists in countries where there are no citizen armies, and that, where there are citizen armies, they are one of the elements which make for permanent peace.

Normal Nature of Peace.—America has been the pioneer of the view that peace is the normal condition of mankind, and that, when the causes of war are eliminated, war ceases to have a raison d'être. The objects and causes of war are of many kinds. War for fighting's sake, although in the popular mind there may be, during most wars, a desire for the excitement of a great gamble, has no conscious place among the motives of those who determine the destinies of peoples. Apart, however, from self-defence, the main causes of war are four: (1) The desire for territorial expansion, due to the overgrowth of population, and insufficiency of the available food-supply; if the necessary territory cannot be obtained by negotiation, conquest becomes the only alternative to emigration to foreign lands. (2) The prompting of national ambition or a desire to wipe out the record of a humiliating defeat. (3) Ambitious potentiates again may seek to deflect popular tendencies into channels more satisfactory for their dynasty. (4) Nations, on the one hand, being jealous of each other's commercial success or material power. In many cases the apparent cause may be of a nobler character, but historians have seldom been content to accept the allegations of those who have claimed to carry on war from disinterested motives.

On the American continent South and Central American states have had many wars, and the disastrous effects of them not only in retarding their own development, but in impairing their national credit, have led to earnest endeavours on the part of their leading statesmen to arrive at such an understanding as will banish from their international polity all excuses for resorting to armed conflicts. In 1881 Mr Blaine, then U.S. secretary of state, addressed an instruction to the ministers of the United States of America accredited to the various Central and South American nations, directing them to invite the governments of these countries to participate in a congress, to be held at Washington in 1882, "for the purpose of considering and discussing the methods of preventing war between the nations of America." Owing to different circumstances the conference was delayed till the autumn of 1889. At this conference a plan of arbitration was drawn up, under which arbitration was made obligatory in all controversies whatever their origin, with the single exception that it should not apply where, in the judgment of any one of the nations involved in the controversy, its national independence was imperilled, and even in this case arbitration, though optional for the nation so judging, was to be obligatory for the adversary power. At the second International Conference of American States, which sat in the city of Mexico from the 22nd of October 1901 to the 31st of January 1902, the same subject was again discussed, and a scheme was finally adopted as a compromise which conferred authority on the government of Mexico to ascertain the views of the different governments represented in the conference, regarding the most advanced form in which a general arbitration convention could be drawn up that would meet with the approval and secure ratification by all the countries represented, and afterwards to prepare a plan for such a general treaty. The third Pan-American Conference was held in the months of July and August 1906, and was attended by the United States, Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, the Dominican Republic, Ecuador, Guatemala, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, Salvador and Uruguay. Only Haiti and Venezuela were absent. The conference, being held only a year before the time fixed for the second Hague Conference, applied itself mainly to the question of the extent to which force might be used for the collection of pecuniary claims against defaulting governments, and the forwarding of the principle of arbitration in international disputes. The possible causes of war on the American continent had meanwhile been considerably reduced. Different states had adjusted their frontiers, Great Britain in British Guiana had settled an outstanding question with Venezuela, France in French Guiana another with Brazil, Great Britain in Newfoundland had removed time-honoured grievances with France, Great Britain in Canada others with the United States of America, and now the most difficult kind of international questions which can arise, so far as the American continent is concerned, have been removed from among existing dangers to peace. Among the Southern Republics Argentina and Chile concluded in 1902 a treaty of arbitration of the case of the island of Chiloe, which was concluded at the Pan-American Conference in 1907, and furthered by the Maritime Conference of London of 1908–1909. The creation of the Hague Court and of a code of law to be applied by it have further eliminated causes of difference.

These efforts in the two hemispheres are based on the idea
that international differences can be adjusted without war, where the parties are honestly aggrieved. With this adjustment many of the number of possible pretenses for the employment of force is being rapidly diminished.

Peace Procedure under the Hague Conventions.—The Hague Peace Convention of 1907, which re-enacts the essential parts of the earlier one of 1899, sets out five ways of adjusting international conflicts without recourse to war. Firstly, the signatory powers have undertaken to use their best efforts to ensure the pacific settlement of international difficulties. This is a general declaration of intention to lend themselves to the peaceable adjustment of difficulties and employ their diplomacy to this end. Secondly, should these means of agreement fail, they agree to have recourse, as far as circumstances allow, to the good offices or mediation of one or more friendly powers. Thirdly, the signatory powers agree that it shall not be regarded as an unfriendly act if one or more powers, strangers to the dispute, on their own initiative offer their good offices or mediation to the states in disagreement, or even during hostilities, if war has already broken out. Fourthly, the convention recommends that in disputes of an international nature, involving neither national honour nor vital interests, and arising from a difference of opinion on points of fact, the parties should be able to agree to an arrangement by means of diplomacy which would institute an international commission of inquiry to facilitate a solution of these disputes by an investigation of the facts. Lastly, the high contracting parties have agreed that in questions of a legal nature, and especially in interpretation or application of international conventions, arbitration is recognized as the most effective, and at the same time the most equitable, means of settling disputes which diplomacy has failed to adjust.

Down to 1910 no suggestion of mediation had actually been carried out, but a number of cases of arbitration had been tried by the Hague Court, created by the Hague Peace Convention (see Arbitration, International), and one case, viz. that of the Dogger Bank incident, was submitted to a commission of inquiry, which sat in January 1905.1

If Secretary Knox’s proposal (see supra) to convert the International Prize Court into a permanently sitting court of arbitration is adopted, a detailed procedure and jurisprudence will no doubt grow out of a continuity which is lacking in the present system, under which the court is recruited from a large panel for each special case. Secretary Knox’s idea, as expressed in the first circular note addressed by him on the 8th of October 1909 to the powers, was to invest the International Prize Court, proposed to be established by the convention of the 18th of October 1907, with the functions of a “court of arbitral justice.” The court contemplated by the convention was a court of appeal for reviewing prize decisions of national courts both as to facts and as to the law applied, and, in the exercise of its judicial discretion, not only to confirm in whole or in part the national decision or the contrary, but also to certify its judgment to the national court for enforcement thereof. The adoption of this jurisdiction would have involved a revision of the judicial systems of probably every country accepting it. The United States government therefore proposed that the signatories should insert in the act of ratification a reservation to the effect that resort to the International Prize Court, in respect of decisions of their national tribunals, should take the form of a direct claim for compensation. This in any case would remove the United States’ constitutional objection to the establishment of the proposed court. In connexion with this enabling clause Mr. Secretary Knox also proposed that a further enabling clause be inserted providing that the International Court of Prize be competent to accept jurisdiction in all matters, arising between signatories, submitted to it, the Court to sit at fixed periods every year and to be composed according to the panel which was drawn up at the Hague. This court, which the American government proposed to call a “Court of Arbitral Justice,” would take the place of that which it was proposed to institute under Veu No. 1 of the Final Act of the conference of 1907. The intention of the Hague draft annexed to the Veu was to create a permanent court as distinguished from that established in 1899, which, though called permanent, was not having to sit at regular periods. If the American proposal, if adopted, would hold regular and continuous sessions, consist of the same judges, and pay due heed to the precedents created by its prior decisions. The two courts would have separate spheres of activity, and litigants would practically have the option of submitting their differences to a judicial court which would regard itself as being bound by the letter of the law and by judicial methods or to a special court created ad hoc with a purely arbitrative character.

The Place of Diplomacy.—The utility of the diplomatic service has been considered diminished through the increasing efficiency of the public press as a medium of information. It is not too much to say that at the present day an experienced journalist, in a place like Vienna or Berlin, can give more information to an ambassador than the ambassador can give to him. It is even true to say that an ambassador is practically debarred from coming into actual touch with currents of public feeling and the passing influences which, in this age of democracy, determine the course of events in the political life of peoples. The diplomatist has therefore lost one of his chief functions as an informer of the accrediting government. The other chief function of diplomacy is to be the courteous medium of conveying messages from one government to another. Even this function is losing its significance. The ciphered telegram leaves little discretion to the envoy, and written notes are exchanged which are practically a mere transcription of the deciphered telegram or draft prepared at the instructing foreign office. Nevertheless, the personality of an ambassador can play a great part, if he possesses charm, breadth of understanding and interest in the social, intellectual and industrial life of the country to which he is accredited. There are several instances of such men in Europe and America, but they are so rare that some reformers consider them as hardly justifying the large expenditure necessary to maintain the existing system. On the other hand, the utility of the consular service has concurrently increased. Administrative indifference to the eminently useful officials forming the service has led, in many cases, to diminishing instead of increasing their number and their salaries, but it is obvious that the extension of their duties and a corresponding raising of their status would be much more in accordance with the national interest. The French, with that practical sense which distinguishes so much of their recent administrative work, have connected the two services. A consul-general can be promoted to a diplomatic post, and take with him to his higher office the practical experience a consul gains of the material interests of the country to which he belongs.

There is thus still good work for diplomacy to do, and if, in the selection of diplomatic representatives, states followed on the one hand the above-mentioned French example, and on the other hand the American example of selecting for the heads of diplomatic missions men who are not necessarily de la carrière, diplomacy might obtain a new lease of activity, and become once more an extremely useful part of the administrative machinery by which states maintain good business relations as well as friendly political intercourse with one another.

International Regulations by Treaty.—It seems a truism to say that among the agencies which most effectively tend to the preservation of peace are treaties which regulate the relations of states in their intercourse with other states. Such treaties, however, are of quite recent origin. The first of a comprehensive

---

1 The procedure adopted by the commission was afterwards incorporated in the convention of 1907. Under the rules adopted the examination of witnesses is conducted by the president in accordance with the system prevailing in most continental countries; members of the commission may only put questions to witnesses for the eliciting of further information; and they may not interrupt the witness when he is in course of making his statement, but they may ask the president to put any additional questions. This seems likely to become the procedure also in cases before the Hague Court, where witnesses are examined.
character was the general act adopted at the South African Conference at Berlin in 1885, which laid down the principle, which has since become of still wider application, that “any Power which henceforth takes possession of a tract of land on the coast of the African continent outside of its present possessions or which, being hitherto without such possessions, shall acquire them... shall accompany the act relating to it with a notification thereof, addressed to the other Signatory Powers of the present act, in order to enable them, if need be, to make good any claims of their own,” and, furthermore, that “the Signatory Powers of the present act recognize the obligation to ensure the establishment of authority in the regions occupied by them on the coasts of the African continent sufficient to protect existing rights, and, as the case may be, freedom of trade and transit under the conditions agreed upon.” Under these articles occupation of unoccupied territory to be legal had to be effective. This led to the creation and determination of spheres of influence. By fixing the areas of these spheres of influence rival states in western and central Africa avoided conflicts and preserved their rights until they were able to take a more effective part in their development. The idea of “spheres of influence” has in turn been applied even to more settled and civilized parts of the world, such as China and Persia.

Other cases of regulation by treaty are certain contractual engagements which have been entered into by states for the preservation of the status quo of other states and territories.

The Anglo-Japanese Treaty of the 12th of August 1905 sets out its objects as follows:

a. “The consolidation and maintenance of the general peace in the regions of Eastern Asia and India;

b. The preservation of the common interests of the Powers in China, of insuring the independence and the integrity of the Chinese empire, and the principle of equal opportunities for the commerce and industry of all nations in China;

c. The maintenance of the territorial rights of the high contracting parties in the regions of Eastern Asia and of India, and the defence of their special interests in such regions.”

It is a treaty for the maintenance of the status quo in certain parts of Asia in which the parties to it have dominant interests. The same principle underlies different other self-denying arrangements and declarations made by the powers with reference to Chinese integrity.

The Treaty of Algeciras is essentially a generalization of the Franco-German agreement of the 28th of September 1905. By it all the powers represented agree to respect the territorial integrity of Morocco, subject to a possible intervention limited to the purpose of preserving order within it.

Differing from these general acts in not being contractual is the Monroe doctrine, which is a policy of ensuring the maintenance of the territorial status quo as regards non-American powers throughout the American continent. If necessary, the leading republics of South and Central America would no doubt, however, further ensure respect for it by treaty.

With these precedents and current instances of tendency to place the territorial relations of the powers on a permanent footing of respect for the existing status quo, it seems possible to go beyond the mere enunciation of principles, and to take a higher stage of practical realization, by agreeing to respect the territorial status quo throughout still larger tracts of the world, neutralize them, and thus place them outside the area of possible wars.

A third contractual method of avoiding conflicts of interest has been the signing of agreements for the maintenance of the “open-door.” The discussion on the question of the “open-door” in connexion with the Morocco difficulty was useful in calling general public attention once more to the undesirability of allowing any single power to exclude other nations from trading on territory over which it may be called to exercise a protectorate, especially if equality of treatment of foreign trade had been guaranteed by the authority ruling over the territory in question before its practical annexation under the name of protectorate. The habitable parts of the world are a limited area, exclusion from any of which is a diminution of the available markets of the nations excluded. Every power, is, therefore, rightfully interested in the prevention of such exclusion.

The United States government in 1899 called attention to the subject as regards China, without, however, going into any question of principle. It thought that danger of international irritation might be removed by each power making a declaration respecting the “sphere of interest” in China to which it laid claim. Lord Salisbury informed Mr Choate that H.M. government were prepared to make a declaration in the sense desired. All the powers concerned eventually subscribed to the declaration proposed by the United States government.

The principle of the “open-door” in fact has already been consistently applied in connexion with certain non-European areas. As these areas are practically the only areas which of late years have come within the scope of European regulation, the time seems to be approaching when the principle may be declared to be of general application. From the point of view of diminishing the possible causes of conflict among nations, the adoption of this principle as one of international contractual obligation would be of great utility. While putting an end to the injustice of exclusion, it would obviously reduce the danger of new seeking territorial aggrandizement with a view to imposing exclusion, and thus one of the chief temptations to colonial adventure would be eliminated.

In the fourth place, there is the self-denying ordinance against employment of arms for the enforcement of contractual obligations adopted at the Hague Conference of 1907. Under it the high contracting powers have agreed not to have recourse to armed force for the recovery of contractual debts claimed from the government of one country by the government of another country as due to its subjects. The only qualification admitted under the new convention is that it shall not apply when debtor-state refuses or leaves unanswered an offer of arbitration, or in case of acceptance renders the settlement of the terms of arbitration impossible, or, after arbitration, fails to comply with the award. The theory on which this convention is based is known as the Drago theory, having taken a practical form during the administration of Dr L. M. Drago, when he filled the post of Argentine minister of foreign affairs. The doctrine, however, is not new, having already been enunciated a century before by Alexander Hamilton and reiterated since then by several American statesmen, such as Albert Gallatin, William L. Marcy and F. T. Frelinghuysen, as the view prevailing at Washington during their respective periods of office.

In opposition of Disarmament, or to speak more correctly, the contractual limitation of armaments, has become, of late years, as much an economic as a humanitarian peace-securing object.

“ar the maintenance of universal peace and a possible reduction of the excessive armaments which weigh upon all nations, represent, in the present condition of affairs all over the world, the ideal towards which the efforts of all governments should be directed,” were the opening words of the Note which the Russian Minister of Foreign Affairs, Count Mouraviev, handed to the diplomatic representatives of the different powers suggesting the first Hague Conference.

“Disarmament, or to speak more correctly, the contractual limitation of armaments, has become, of late years, as much an economic as a humanitarian peace-securing object. The maintenance of universal peace and a possible reduction of the excessive armaments which weigh upon all nations, represent, in the present condition of affairs all over the world, the ideal towards which the efforts of all governments should be directed,” were the opening words of the Note which the Russian Minister of Foreign Affairs, Count Mouraviev, handed to the diplomatic representatives of the different powers suggesting the first Hague Conference.

“The ever-increasing financial burdens,” the Note went on, “strike at the root of public prosperity. The physical and intellectual forces of the people, labour and capital, are diverted for the greater part from their natural application and wasted unproductively. Hundreds of millions are spent in acquiring terrible engines of destruction, which are regarded to-day as the latest inventions of science, but are destined to-morrow to be rendered obsolete by some new discovery. National culture, economic progress and the production of wealth are either paralysed or developed in a wrong direction. Therefore the more the armaments of each power increase the less they answer the objects aimed at by the governments. Economic disturbances are caused in great measure by this system of excessive armaments; and the constant danger involved in this accumulation of war material renders the armed peace of to-day a crushing
PEACE

burden more and more difficult for nations to bear. It consequently seems evident that if this situation be prolonged it will inevitably result in the very disaster it is sought to avoid and the thought of the horrors with which it makes every humane mind shudder. It is the supreme duty, therefore, of all states to place some limit on these increasing armaments, and find some means of averting the calamities which threaten the whole world. 

A further Note submitting the programme proposed gave more precision to this item, which thereupon took the following form: "An understanding not to increase for a fixed period the present effective of the armed military and naval forces, and at the same time not to increase the budgets pertaining thereto; and a preliminary examination of the means by which even a reduction might be effected in future in the forces and budgets above mentioned."

When the subject came on for discussion at the conference the German military delegate stated his view that the question of effective could not be discussed by itself, as there were many others to which it was in some measure subordinated, such, for instance, as the length of service, the number of cadres whether existing in peace or made ready for war, the amount of training received by reserves, the situation of the country itself, its railway system, and the number and position of its fortresses. In a modern army all these questions went together, and national defense included them all. In Germany, moreover, the military system "did not provide for fixed numbers annually, but increased the numbers each year."

After many expressions of regret at finding no method of giving effect to the proposal, the commission confined itself to recording its opinion that "a further examination of the question by the Powers would prove a great benefit to humanity."

The Conference, however, were unanimous in the adoption of the following resolution:

"The Conference is of opinion that the restriction of military budgets, which are at present a heavy burden on the world, is extremely desirable for the increase of the material and moral welfare of mankind;"

and it passed also the following words:

"That governments, taking into account the proposals made at the conference, should examine the possibility of an understanding concerning the limitation of military and naval armaments, and of war budgets."

The general public, more particularly in Great Britain and France, shows an ever-increasing distrust of the rapid growth of armaments as a possible cause of grave economic troubles. A high state of military preparedness of any one state obliges all the others to endeavour to be prepared on the same level. This process of emulation, very appropriately called by the late Sir H. Campbell-Bannerman a "policy of huge armaments," unfortunately is a policy from which it is impossible for any country to extricate itself without the co-operation, direct or indirect, of other nations.

The subject was brought forward in view of the second Hague Conference in both the French and Italian parliaments. The declaration of the French government stated that:

"France hoped that other nations would grow, as she had done, more and more attached to solutions of international difficulties based upon the respect of justice, and she trusted that the progress of universal opinion in this direction would enable nations to regard the lessening of the present military budgets, declared by the states represented at the Hague to be greatly desirable for the benefit of the material and moral state of humanity, as a practical possibility."

(Council of Deputies, June 12, 1906.)

In the Italian Chamber of Deputies, an interpellation was addressed to the minister of foreign affairs about the same time asking whether the Government had knowledge of the motion approved by the British House of Commons, and of the undertaking of the British government that, in the programme of the coming Hague Conference, the question of the reduction of armaments should be inserted, and in what spirit the Italian government had taken or proposed to take the propositions of the British government, and what instructions it would give to the Italian representatives at the conference."

The minister of foreign affairs, M. Tittoni, in reply expressed the adherence of the Italian government to the humanitarian ideas which had met with such enthusiasm in the historic House of Parliament at Westminster. "I have always believed," he said, "that as far as we are concerned, it would be a national duty to weaken our own armaments while we are surrounded by strongly armed European nations who look upon the improvement of armaments as a guarantee of peace. Nevertheless, I should consider it a crime against humanity not to sincerely co-operate in an initiative having for object a simultaneous reduction of armaments of the great powers. Italian practice has always aimed at the main object of peace; therefore, I am happy to be able to say that our delegates at the coming Hague Conference will be instructed to further the English initiative."

The only existing case of contractual reduction of armaments is that of the Disarmament Agreement of the 28th of May 1902 between the Chilean and Argentine republics, adopted "owing to the initiative and good offices of His Britannic Majesty," which is as follows:

Art. 1.—In order to remove all cause of fear and distrust between the two countries, the governments of Chile and of the Argentine Republic agree not to take possession of the warships which they are having built, or for the present to make any other acquisitions. The two governments furthermore agree to reduce their respective armaments to the same extent, establishing a reasonable proportion between the two fleets. This reduction to be made within one year from the date at which the present agreement shall be ratified.

Art. II.—The two governments respectively promise not to increase their maritime armaments during five years, unless the one who shall wish to increase them shall give the other eighteen months' notice in advance. This agreement does not include any armaments for the purpose of protecting the shore and ports, and each party will be at liberty to acquire any vessels ("maquina flotante") intended for the protection thereof, such as submarines, etc.

Art. III.—The reduction (i.e., ships disposed of) resulting from this agreement will not be parted with to countries having any dispute with either of the two contracting parties.

Art. IV.—In order to facilitate the transfer of the pending orders the two governments agree to increase by two months the time stipulated for the beginning of the construction of the respective ships. They will give instructions accordingly. An agreement of this kind is obviously more feasible as among states whose navies are small and of comparatively recent origin than among states whose navies are composed of vessels and many and widely different ages. It may be difficult to agree in view of the difference in the size of the armament of the proportionate fighting value of the respective fleets. The break-up or sale of obsolete warships is a diminution of the paper effective of a navy, and their purchase by another state a paper increase of theirs. Even comparatively slight differences in the ages of ships may make great differences in their fighting value. It would be a hard, though probably not insurmountable, task to establish a "reasonable proportion," such as provided for in Art. II. of the Chile-Argentina Agreement, as between large and old-standing navies like those of Europe.

On the other hand, as regards military power, it seems sometimes forgotten in the discussion of the question of armaments, that the conditions of the present age differ entirely from those of the time of the Napoleonic wars. With conscription a national army corresponds more or less numerically to the proportion of males in the national population. Great Britain, without conscription, has no means of raising troops in any such proportion. Thus, so long as she refrains from adopting conscription, she can only carry on defensive warfare. The object of her navy is therefore necessarily defensive, unless it act in co-operation with a foreign conscript army. As there are practically only three great armies available for the purpose of a war of aggression, the negotiation of contingent arrangements does not seem too remote for achievement by skilful and really well-meaning negotiation. The Hague Conference of 1907, owing to difficulties which occurred in the course of the preliminary negotiations for the conference, did not deal with the subject.

Principle and Capabilities of Neutralization.—Among the different methods which have grown up practically in our own
time for the exclusion of war is neutralization. We have been dealing hitherto with the elimination of the causes of war; neutralization is a curtailment of the areas of war and of the factors in warfare, of territory on the one hand and states on the other. The neutralization of territory belonging to states which are not otherwise neutralized includes the neutralization of waterways such as the Suez and Panama canals.

Under the General Act of Berlin of the 26th of February 1885, "in case a power exercising rights of sovereignty or protectorate in any of the regions forming the basin of the Congo and its affluents, including Lake Tanganyika, and extending away to the Indian Ocean, should be involved in a war, the parties to the General Act bound themselves to lend their good offices in order that the territories belonging to this power be placed during the war under the protection of the powers have been blended into a single body as belonging to a neutral state, the belligerents thenceforth abstaining from extending hostilities to the territories thus neutralized, and from using them as a basis for warlike operations" (art. 2).

Neutralization is not necessarily of general application. Thus two states can agree to neutralize specific territory as between them. For example between Costa Rica and Nicaragua by a treaty of the 15th of April 1858 the parties agreed that "on no account whatever, not even in case of war," should "any act of hostility be allowed between them in the port of San Juan del Norte nor on the river of that name nor on Lake Nicaragua" (art. 2).1

Again, the Straits of Magellan are neutralized as between Argentina and Chile under a treaty of the 23rd of July 1881. Article 5 provides that they are "neutralized for ever and their free navigation is guaranteed to the flags of all nations. To ensure this neutrality and freedom it is agreed that no fortifications or military defences which might interfere therewith shall be erected."2

Luxemburg was declared by the Treaty of London of the 11th of May 1867 (art. 1) to be a perpetually neutral state under the guarantee of Great Britain, Austria, Prussia and Russia. Sweden, by a declaration confirmed by the Treaty of Vienne, of 1815 (art. 84), likewise enjoys perpetual neutrality. And now Norway has placed herself under a neutral régime of a similar character.

A neutralized state does not mean a state which is forbidden to have fortifications or an army; in this it differs from neutralized territory of a state not otherwise neutralized. Thus Belgium, which is a neutralized state, not only has an army but has fortifications, although by the treaties of 1831 and 1839 she was recognized as a "perpetually neutral state, bound to observe the same neutrality with reference to other states." Of course the country is through the rule of neutrality and subject of neutralization. It has long been an established principle in the intercourse of nations, that where the navigable parts of a river pass through different countries their navigation is free to all. The rivers Scheldt and Meuse were opened up in this way to riparian states by a decree of the French Convention of the 16th of November 1792. By the treaty of Vienna of the 9th of June 1814, the powers whose territories were separated or traversed by the same navigable river, undertook to regulate by common consent all that regarded its navigation, and for this purpose to name commissioners who should adopt as the bases of their proceedings the principle that the navigation of such rivers along their whole course "from the point where each of them becomes navigable to its mouth, shall be entirely free, and shall not in respect of commerce be prohibited to anyone." The only case in Europe in which this internationalization of rivers has been maintained is that of the Danube. On the other hand neutralization has made progress in respect of waterways, 2

1 Under the treaty of the 26th of March 1864, the courts of Great Britain, France and Russia in their character of guaranteeing powers of Greece declared with the assent of the courts of Austria and Prussia that the islands of Corfu and Paxo as well as their dependencies should, after their union to the Hellenic kingdom, enjoy the advantages of perpetual neutrality, and the king of the Hellenes undertook on his part to maintain such neutrality. (Art. 2.)

2 Natural as well as artificial. Thus the Bosphorus and Dardanelles under the Treaty of Paris of 1856 and by the Treaty of London 1851 were and remain closed to the passage of foreign armed vessels in time of war, though the Porte may permit their passage in time of peace in certain cases. The Suez and the Panama canals have been permanently neutralized, the former by a convention among the great powers, and the latter by a treaty between Great Britain and the United States.

Alongside this neutralization has grown up a collateral institution, the purpose of which is in some respects similar. We refer to "buffer" zones. "Buffer" zones are of quite recent origin as a political creation, i.e. where their object is to establish upon the territory of two contiguous states a strip of land on either side of the frontier, which the respective states agree to regard as neutral, on which the parties undertaking to erect no fortifications, and maintain no armed forces but those necessary to enforce the ordinary respect of government. The word "neutral" does not correctly describe the character of the zone. It is not neutral in the sense of being recognized as such by any third state, and it necessarily ceases to be neutral in case of war between the states concerned. The word "buffer" comes nearest to the object, but even this term implies more than is meant. Between Spain and Morocco a treaty of the 5th of March 1894 established between the Camp of Melilla and Moroccan territory a zone within which no new roads were to be made, no forts or other military constructions are to be erected. No troops of either party, or even private persons carrying arms, to set foot, no inhabitants to dwell, and all habitations to be razed. The zone between Burma and Siam, established by an agreement between Great Britain and France dated the 15th of January 1896, declared "the portion of Siam which is comprised within the drainage basin of the Menam, and of the coast streams of a corresponding longitude," neutral as between them. Within this area the two powers undertook not to "operate by their military or naval forces, except in so far as they might do so in concert for any purpose requisite for maintaining the independency of Siam." They also undertook not to acquire within that area any privileges or commercial facilities not extended to both of them.

"Buffer" zones might fulfil a useful purpose even in Europe. They would obviously react against the feeling known as "esprit de frontière," and diminish the danger of incidents arising out of this feeling, and might attenuate the rivalry of neighbouring counter-armaments.

These considerations no doubt led the Swedish and Norwegian governments, in their settlement of September 1905, to establish a "buffer" zone of 15 kilometres on either side of the frontier between the two states in question. Within these 30 kilometres of the frontier the zone is forbidden to be crossed or entered, and no armed troops to be maintained; any question between the two states relative to the provisions respecting the "buffer" zone to be decided by arbitration.

A rather special case of neutralization of a territorial area is the institution of "buffer" zones in a more strictly correct sense of the term is of very ancient origin. One is mentioned in the annals of China two centuries before our era, between the territories of the Huns in the west and those of the Tunguses in the eastern steppes. The area of about 20,000 to 50,000 square kilometres of which the two peoples kept watch. In Europe, bands of territory from time to time have been made desert to better establish separation. The Romans and Germans protected themselves in this way. In the middle ages the Teutonic Order established a frontier belt on the side of Lithuania. Later, Austria dealt in the same way in her policy in regard to Turkey in the organization of a "military frontier." See Nys, Droit International (Brussels, 1904), i. 426.

3 It was stipulated that the dismantling should be controlled by a technical commission of three officers of foreign nationality, to be chosen one by each of the contracting powers and the third by the two officers thus appointed, or, in default of agreement on their part, by the president of the Swiss Confederation. The dismantling of the forts in question has now been carried out. The Commission was continued on the spot by the Austrian army, and on the staff of the Austrian army, and by agreement of these, of a colonel in the German army, and, by agreement of these, of a colonel in the Dutch army.
PEACE

is that of the practical neutralization of the Great Lakes in America. In 1817, at the instance of John Quincy Adams, the United States and Great Britain entered into a compact whereby the Great Lakes, and the waterways leading to them to the ocean by the St Lawrence river, which divide the United States from the Dominion of Canada, were practically excluded from any possible hostilities. Through a simple agreement, "conditions which make for peace and prosperity, and the absence of those which so often lead to disastrous war, have for nearly a century reigned over these great inland waters, whose commerce, conducted for the benefit of the states and nations of Europe and America, rivals that which passes through the Suez Canal or over the Mediterranean Sea, and with a result foreshadowed Monroe's communication to the Senate commanding the proposed agreement: 'In order to avoid collision and save expense.' Forts which had been erected at salient points on either side of the lakes and rivers dividing the United States from Canada, which but for this agreement would, in the natural course of events, have been enlarged, increasingly garrisoned, and provided with modern implements of destruction, at large expense, have remained substantially as when the agreement was made, or now constitute but interesting or picturesque ruins, and the great cost of constructing and maintaining, through a long series of years, naval armaments of the kind far in the British interest, has been avoided."

As we have already said, the Monroe doctrine is a means of excluding European warfare from the American continent and therefore is in the nature of a form of neutralization. A sort of Monroe doctrine is growing into popular favour also throughout the Australian Commonwealth, where it is felt that a continent so far removed from European rivalries ought not to be exposed to complications on account of them.

From time to time questions of adding to existing neutralized areas are raised. When it was announced in 1905 that a British fleet was to visit harbours in the Baltic, several German newspapers suggested that Germany should combine with other Baltic powers to assure its neutralization. No official observation on the subject, however, was made on the part of any Baltic power. The Baltic is still an open sea for the whole world, without restriction of any kind, and even hostilities between any two non-Baltic powers could be carried on in the Baltic, as elsewhere on the high seas, under the existing practice.

When the Dogger Bank incident occurred, the possibility of operations of war being carried on within a few miles of British home ports, and amid the busy traffic of the North Sea, was brought vividly home to British minds. Other belligerent navies and commerce.

A movement set on foot at the instance of Edward Atkinson, the well-known Boston economist, and warmly supported by the Massachusetts State Board of Trade, seeks to establish by treaty neutral zones from ports of North America to the ports of Britain and Ireland and the continent of Europe, within which zones steamship and sailing vessels in the conduct of lawful commerce should be free to pass without seizure or interruption in time of war. There is however no precedent of neutralization of any such area of the high seas, and international rivalries and neutralized states are obviously no criterion in discussing a proposal to neutralize a part of the ocean, which may be defined accurately enough on the map and which skilful navigators could approximately determine, but which might be violated without any practical means of detection by a belligerent commander whenever he misread, or it suited him to misread, his bearings.

Connected with the principle of neutralization is that of guaranteeing the integrity of states. Several such guarantees have been given in quite recent times. In November 1907 a treaty was concluded between France, Germany, Great Britain and Russia on the one part and Norway on the other, for the maintenance of the integrity of Norway. This treaty differed from the older one of 1855 in which France and Great Britain guaranteed the integrity of Norway and Sweden, in the fact that whereas the older treaty was for the protection of these two states against Russia, the new treaty is intended, if it is to serve at all as a protection against invasion, to protect Norway against Sweden.

Another such guarantee of a vaguer character is that which the North Sea powers recently entered into for the maintenance of the status quo of their respective North Sea territories; and the similar one entered into by the Mediterranean powers for the same objects in the Mediterranean. Lastly in the same order of ideas Austria-Hungary and Russia are said to have recently negotiated an arrangement between them for the maintenance of the status quo in the Balkans.

The future has no doubt still other extensions of the principle of neutralization in store for us. Not the least interesting of existing possibilities is the limitation of the area of visit and search in time of war itself, as a restriction of belligerent right. It seems contrary to common sense that neutral ships should be exposed to being detained, taken out of their course, and overhauled on mere suspicion of carrying contraband, when they are so far from the seat of war that there can be no presumption as to their destination. Neutral Shipping is a right to be enjoyed and not an ordinary business unmolested in so far as they do nothing to assist either belligerent. When they are beyond a certain distance from the seat of war it seems reasonable that the presumption that they are merely carrying on their legitimate business should be considered absolute. Such a limitation of the area of hostilities is not only feasible, but it was actually put in practice by the British government during the Boer War.

In the course of the Russo-Japanese War the question came up again, being raised this time by Great Britain. Lord Lansdowne called the attention of the Russian foreign office to the extreme inconvenience to neutral commerce of the Russian control of the Suez Canal, not only in the proximity of the scene of war but over all the world, and especially at places at which neutral commerce could be most effectually intercepted. H.M. Government had become aware that a large addition was likely to be made to the number of Russian cruisers employed in this manner, and they had, therefore, to contemplate the possibility that such vessels would shortly be found patrolling the narrow seas which lie on the route from Great Britain to Japan in such a manner as to render it virtually impossible for any neutral vessel to escape their attention. The effect of such interference with neutral trade, he said, would be disastrous to legitimate commerce; suffering from a combination of the United Kingdom to a British port in the Far East. The British government had no desire to place obstacles in the way of a belligerent desiring to take reasonable precautions in order to prevent the enemy from receiving supplies, but they insisted that the right of taking such precautions did not imply a "consequential right to intercept at any distance from the scene of operations and without proof that the supplies in question were really destined for use of the enemy's forces, any articles which that belligerent might determine to regard as contraband of war."

1 Memoir of Massachusetts State Board of Trade (Feb. 13, 1905).
2 This was merely reviving an idea which had come and gone many times before. See Barclay, Problems of International Practice and Diplomacy (1907).
The position thus assumed is not clear. On the one hand the British claim did not, it is seen, go the length of the restriction Great Britain consented to place on her own right of search during the Boer War, seeming to apply only to the case of ships carrying conditional contraband. On the other, the complaint is based on the "interference" with neutral trade, which means the stoppage and search of vessels to ascertain whether they have contraband of any kind on board or not.

It must not be forgotten in this connection that restriction of the rights of the belligerent necessarily entails extension of the duties of the neutral. The belligerent has an unquestioned right to "interfere" with all neutral vessels navigating in the direction of the seat of war, for the purpose of ascertaining whether they are carrying any kind of contraband or not.

Under the Declaration of London of the 26th of February 1909 it is provided under arts. 32 and 35 that a ship's papers are conclusive proof as to the voyage on which she is engaged unless she is clearly out of the course indicated by her papers and is unable to give adequate reasons to justify her deviation. Thus the interference, if the declaration is ratified, will be confined to an examination of the ship's papers where the ship is not bound for a belligerent port (cf. art. 30 of the same convention).

Standing Peace Agreements.—Foremost among standing peace agreements are, of course, the International Hague Conventions relating directly to peace, agreements which have not only created a special peace jurisdiction for the settlement of international difficulties by judicial methods but also a written law to apply within the scope of this jurisdiction.

Alongside the Hague Peace Conventions and more or less connected with them are standing treaties of arbitration which have been entered into by different nations for terms of years separately. The first of what may be called a new series was that between Great Britain and France. It has now been followed by over a hundred others forming a network of international relationships which shows that, at any rate, the wish for peace is universal among mankind.1

The following list of standing arbitration treaties concluded after the signing of the Anglo-French treaty of October 14th 1903 is as complete as possible down to June 1910:—

Argentina—Brazil, September 7, 1905.  
Portugal, August 27, 1909.
Austria-Hungary—Switzerland, December 3, 1904.
Belgium—Denmark, April 26, 1905.
" Greece, May 2, 1905.
" Norway and Sweden, November 30, 1904.
" Rumania, May 27, 1908.
" Russia, October 30, 1904.
" Spain, January 23, 1905.
" Switzerland, November 15, 1904.
Brazil—Portugal, March 25, 1909.
" Spain, April 8, 1909.
" Mexico, April 11, 1909.
" Honduras, April 26, 1909.
" Venezuela, April 30, 1909.
" Panama, May 1, 1900.
" Ecuador, May 13, 1900.
" Costa Rica, May 18, 1900.
" Cuba, June 19, 1900.
" Bolivia, June 25, 1900.
" Nicaragua, June 28, 1900.
" Norway, July 13, 1909.
" Spain, June 12, 1909.
" Peru, December 7, 1909.
" Sweden, December 14, 1909.
Colombia—Peru, September 12, 1905.
" France, December 16, 1908.
Denmark—France, September 15, 1905.
" Italy, December 16, 1905.
" Netherlands, December 12, 1904.
" Russia, March 1, 1905.
" Spain, December 1, 1905.
" Norway, October 8, 1905.
France—Italy, December 26, 1903.
" Netherlands, April 6, 1904.
" Norway and Sweden, July 9, 1904.
" Spain, February 26, 1904.

There are, however, a large number of conventions which, although not concluded with the direct object of assuring peace where difficulties have arisen, tend in a very practical manner to concretize the area of possible difficulties. These are conventions for the regulation of intercourse between the subjects and citizens of different states. Such conventions obviously remove occasions for friction and are therefore among the most effective agencies contributing to the preservation of peace among civilized peoples. In most cases such conventions have created international unions of states for all matters which lend themselves to international co-operation. The first in order of date was the postal union. The system it inaugurated has now extended its scope to telegraphs, copyright, industrial property, railway traffic, the publication of customs tariffs, metric measures, monetary systems, and agricultural. Berne, being the capital of the most central of the neutral European states, is the administrative centre of most of these unions. Customs tariffs and the monetary unions, however, are centralized at Brussels, 

France—Sweden and Norway, July 9, 1904.
Switzerland, December 14, 1904.
" Brazil, April 7, 1909.
Great Britain—France, October 14, 1903.
" Germany, July 12, 1907.
" Italy, February 1, 1907.
" Austria-Hungary, January 11, 1905.
" Netherlands, February 15, 1905.

PEACE

Under the convention creating the customs tariffs union, signed in 1890, thirty states, including Great Britain and most British colonies, are associated for the purpose of prompt publication of custom tariffs and their modifications.

The agricultural institute, created by a convention of 1905 with its seat at Rome, as the latest in date is perhaps the most interesting of the series. It shows how deep and widespread the sense of the utility of international state co-operation has become. The convention sets out the scope and objects of the institute, which a recent British official publication states has been joined by 38 states, including Great Britain and all other great powers, as follows:—

1. While limiting its action to international questions, it shall be the duty of the institute: (a) To collect, elaborate and publish, with as little delay as possible, statistical, technical, or economic information regarding the cultivation of the soil, its productions, whether animal or vegetable, the trade in agricultural products, and the prices obtained on the various markets. (b) To communicate to interested parties, also without delay, full information of the nature above mentioned. (c) To indicate the wages of rural labour. (d) To notify all new diseases of plants which may appear in any part of the world, indicating the districts affected, the spread of the disease, and, if possible, the efficacious means of resistance. (e) To answer questions relating to agricultural co-operation, insurance and credit, in all their forms, collecting and publishing information which may be useful in the various countries for the organization of undertakings relating to agricultural co-operation, insurance and credit. (f) To prepare, in conjunction with international congresses, or other congresses relating to agriculture or to sciences applied to agriculture, agricultural societies, academies, learned societies, &c.

All questions relating to the economic interests, the legislation and administration of any particular state, must be excluded from the sphere of the institute. (Art. 9).

Lastly, there is a class of difficulties which might arise from preferential treatment of trade from different countries. To obviate these states have been led to adopt the principle of the "most-favoured-nation-clause"—that is to say, a clause providing that if any reductions of tariff or other advantages are granted by either contracting state to any third state, the other shall have the benefit of it. In Europe this clause has been uniformly treated as applying to all reductions of tariff without distinction. The United States interpretation, on the other hand, distinguishes between reductions of a general character and reductions made specifically in return for reductions by some other state. The latter do not come within the operation of the clause, and a co-contracting state is only entitled to the advantages of the clause in so far as its state has been granted similar concessions. In other words, concessions to any co-contracting state are only allowed gratuitously to a third co-contracting state when nothing has been given for them, the clause not covering advantages granted in return for advantages. It is to be hoped that this special view of the meaning of the clause will be met in the future, as in some recent treaties, by specifically dealing with the exceptions.2

2 The Utility of Popular Effort.—Until quite recently it had been a distinctive mark of practical wisdom to treat private efforts for the improvement of international relations for the preservation of peace with the complimentary tolerance courteously people of the world extend to half-crazed idealists. Since the opening of the century, an immense change has taken place in the attitude of the leaders of popular opinion towards the advocacy of peace. This new attitude has been contemporary with the greater interest displayed by the mercantile classes of England and the United States in the improvement of their political relations with their neighbours. It may be said to have begun with the visit of the Association of British Chambers of Commerce to Paris in 1900, at a time when France was stillsmarting from the humiliation of the Fashoda affair, and the Boer War was exciting hostile demonstrations against Great Britain throughout the continent of Europe. That some four hundred British manufacturers

the weights and measures union in Paris and the agricultural institute at Rome.

The general postal union was created by a convention signed at Berne in 1874. A convention for a similar union for telegraphs was signed in Paris in 1875 (revised at St Petersburg and replaced by another the same year). Both unions issue monthly bulletins and other publications giving useful information about these two services.1

The international bureau of weights and measures at Paris was created by a convention signed there in 1875, for the purpose of comparing and verifying weights and measures on the metric system, and preserving their identity for the contracting states. The telegraphic code union was founded by a convention of 1865, between Belgium, France, Italy and Switzerland. In 1868 it was joined by Greece. A single standard union exists between Sweden, Norway and Denmark under a convention of 1873.

The copyright union was created by an international convention signed in 1886. The official bureau of the union is at Berne. It issues a periodical publication called Le Droit d’auteur giving information respecting the laws of different states relating to published matter of all kinds.

"The right of property ..." is defined as patents, trade marks, merchandise marks, trade names, designs and models. The convention dealing with them signed in 1883 created a union with its central office at Berne. It, too, issues a bulletin and other publications which help to prevent misunderstandings.

The railway traffic union was formed by a convention of 1890. The central bureau at Berne is at Rome a monthly relating to matters of technical unification.

A subsidiary convention not quite falling within the scope of the above convention is the submarine telegraphs convention which was signed in 1884. It applies outside territorial waters to all legally established submarine cables landed on the territories, countries or communities of one or more of the high contracting parties. Under its provisions it is a punishable offence 'to break or injure a submarine cable wilfully or by culpable negligence in such manner as might interrupt or obstruct telegraphic communication either wholly or partially, such punishment being without prejudice to any civil action for damages. It also provides that—

"Vessels engaged in laying or repairing submarine cables shall conform to the regulations as to signals which have been, or may be, adopted by any mutual agreement between the parties to the high contracting parties with the view of preventing collisions at sea. When a ship engaged in repairing a cable exhibits the said signals, other vessels engaged in laying or repairing such cables shall withdraw to or keep beyond a distance of one nautical mile at least from the ship in question as not to interfere with her operations" (Art. 5).

"Owners of ships or vessels who can prove that they have sacrificed an expense or a loss of fishing or of business of using or employing a submarine cable shall receive compensation from the owner of the cable," and "in order to establish a claim to such compensation a statement supported by the evidence of the crew should whenever possible be drawn up immediately after the occurrence and the master must within twenty-four hours after his return to or next putting into port make a declaration to the proper authorities" (Art. 7). "The tribunals competent to take cognizance of infractions of the present convention are those of the country to which the vessel on board of which the offence was committed belongs" (Art. 8). By Art. 15 it is provided that the stipulations of the convention may be suspended by any of the parties for a term of belt contracting parties. It may be remarked that the British representative at the time of signing the convention declared that his government understood that in the time of war a belligerent would be free to act in regard to submarine cables, or, to put the action of theact to carry into effect the above convention is the Submarine Telegraph Act 1883 (48 & 49 Vict. c. 49) which was slightly modified by 50 Vict. c. 5. Section 3 of the earlier act provides that a person who injures the cable either wilfully or by culpable negligence is guilty of a misdemeanour and on conviction: (a) if he acted wilfully, shall be liable to penal servitude for a term not exceeding five years, or to imprisonment with or without hard labour for a term not exceeding two years, or to a fine not exceeding £100. (b) if he acted with culpable negligence shall be liable to imprisonment for a term not exceeding three months without fine or fine not exceeding £100. (c) if he acted wilfully, or in addition to such penal servitude or imprisonment, or if he acted with culpable negligence shall be liable to imprisonment for a term not exceeding two years, or to a fine not exceeding £200 on each of his. Parliament, C. 5910: 1890.

3 See Barclay, Problems of International Practice and Diplomacy (1907), p. 137 seq.
and merchants, representing about eighty chambers of commerce of the United Kingdom, should have swept aside all political objections and have boldly trusted to the efficacy of friendly advances as between man and man, appealed to the French people. It seems to have been the first great popular effort ever made deliberately by a representative body of the middle class of a nation for the promotion of international friendship without the aid of diplomacy and without official assistance or even countenance of any kind.

Otherwise, private agencies of a standing character which contribute towards the promotion of peace may be divided into four classes, viz. (1) those which, without having peace for their direct object, promote friendship among men of different races and nationalities; (2) those which directly address themselves to the promoting of friendship and goodwill among peoples; (3) those which regarding peace as the immediate object of their efforts, endeavour to educate democracy in this sense; (4) those which endeavour to remove the causes of international friction by the codification of International law and the promotion of the international regulation of common interests. Lastly, there are two agencies which cannot be classed among the foregoing; one is the International Parliamentary Union and the other the N. P. (Parliamentary Press Correspondents).

1. Agencies which are indirectly making for peace are of many kinds. Science and medicine now bring men of all nations together in periodical congresses. Technology, electricity, mining, railways, navigation and many other subjects are now dealt with in international congresses. International exhibitions are always used as an occasion for holding many such meetings.

2. One of the most notable efforts directed to the deliberate cementing of friendship has been the interchange of official visits by municipal bodies. In the course of the Anglo-French agitation which culminated in March 1903 with the visit of King Edward to Paris, the French municipal councils passed many resolutions in favour of the entente. After the conclusion of the Anglo-French standing treaty of arbitration (Oct. 14, 1903) and the arrangements for the general settlement of outstanding difficulties with France (April 8, 1904), the municipal bodies in France were prepared to go a step farther, and in 1906 the Municipal Council of Paris was invited by the London County Council to pay an official visit to England. This visit was followed by a return visit to Paris and a similar exchange of visits between the London City Corporation and the Paris Municipal Council, exchange visits of the city corporations of Manchester, Glasgow and Edinburgh and Lyons, and a visit of the Manchester Corporation to Brussels, Liége and Cologne, and the continued visits of thousands of working men among its members, which has set itself the more special task of promoting the interchange of visits between working men of different nations, is called the "International Brotherhood Alliance," or, after the initial of its motto, Fraternitas inter gentes, the F.I.G. Another agency, called the "American Association for International Conciliation," seeks by the publication of essays on the different aspects of international friendship to promote the same cause.

3. The peace societies, which are scattered over the whole world, number several hundreds.8 First their International Congress was held in London at the suggestion of Joseph Sturge in 1833. In 1838 a second congress was held at Brussels. The third in 1840 took place in Paris, and was presided over by Victor Hugo. Other congresses were held at Frankfurt, again in London, and in 1853 at Manchester, where Richard Cobden and John Bright took part in the discussions. Then followed an interval of wars during which the Pacifists were unable to raise their voices. At length in 1878 a congress was held at the Paris International Exhibition of that year, but it was not till the next Paris International Exhibition of 1889 that these international peace congresses became periodical. Since then numerous congresses have been held, the seventeenth having sat in London in 1908.8 These congresses have been supplemented by national congresses in both Great Britain and France. Such congresses are doing admirable work in the popularizing of thought upon the numerous questions which are discussed at the meetings, such as compulsory arbitration, the restriction of armaments, private property at sea in time of war, the position of subject races, airships in war, &c.

4. First among the bodies which try to remove the causes of international friction is the Institute of International Law. This is a body of international lawyers, consisting of sixty members and sixty associates recruited by election—the members from those who "have rendered services to international law in the domain of theory or practice," and associates from those whose knowledge may be useful to the Institute. It was formed in 1873, chiefly through the efforts of M. Rolin-Jacquemyns. The official language of the Institute is French, and its annual meetings are held wherever the members at the previous meeting decide to assemble. Its mode of operation is to work out the matters it deals with during the intervals between the sessions, in permanent commissions, among which the whole domain of international law is divided up. The commissions, under the direction of their rapporteurs or conveners, prepare reports and proposals, which are printed and distributed among the members in advance of the sessions, and the points they are to be discussed. If the members are not agreed, the subject is adjourned to another session, and still another, until they do agree. Thus the resolutions of the Institute have the authority attaching to a mature expression of the views of the leading international jurists of Europe. Another body having a more or less similar purpose is the International Law Association, which was founded in 1873 as the "Association for the Reform and Codification of the Law of Nations," with practically the same objects as those which led to the constitution of the Institute of International Law. It also meets in different countries, but now differs from the Institute in the number of its members being unlimited and in all respectable persons being eligible for membership. A report is published after each meeting. There are now numerous volumes of such reports, many of them containing most valuable materials for international jurists. In 1895 the name was changed to International Law Association.

A new society was recently (1906) formed in America called the American Society of International Law, "to foster the study of international law and promote the establishment of international relations on the basis of law and justice." Membership in the society is not restricted to lawyers, and any man of good moral character interested in the objects of the society may be admitted to membership. The publications of this society have already taken an important place among the literature of international law.

Still more recently yet another society came into being in Switzerland with objects which seem to be similar to those of the Institute of International Law.

The Inter-Parliamentary Union, which dates back to 1887, owes its origin to the initiative of the late Sir W. R. Cremer. It is composed of groups of the different parliaments of the world, who meet periodically to bring about the acceptance in their respective countries, by votes in parliament and by means of arbitration treaties, of the principle that differences between nations should be submitted to arbitration and to consider other questions of international importance.9 The sixteenth conference was held at Brussels in August—September, 1910.

1 At the third congress of the new series, held at Rome in 1891, was created the Bureau International de la Paix. This most useful institution, which has its office at Bern, serves as a means of bringing and keeping together all the known peace societies. Its Correspondance biannuelle et Annuaire du mouvement pacifique are well known, and its obiling hon. secretary, Dr. A. Gostall, is always ready to supply information from the now considerable archives of the Bureau. In this connexion we may mention that the secretary of the London Peace Society, Dr. Evans Darby, has edited an extensive collection of materials called International Tribunals. His statements every two years on the progress of arbitration at the International Law Association meetings also form an excellent source of materials for reference.

2 Art. 1 of Statutes revised Sept. 1908.
The Nobel Committee owes its existence to the will of the late Alfred B. Nobel (1833–1896), the inventor of dynamite, who left a considerable fortune for the encouragement of men who work for the benefit of humanity. The interest of this money was to be divided into five equal parts, to be distributed every year as rewards to the persons who had deserved best of mankind in five departments of human activity. The clauses of the will governing the distribution of these prizes are as follows:

"The entire sum shall be divided into five equal parts; one to go to the man who shall have made the most important discovery or invention in the domain of physical science; another to the man who shall have made the most important discovery or introduced the greatest improvement in chemistry; the third to the author of the most important discovery or invention in the domain of physiology or medicine; the fourth to the man who shall have produced the most remarkable work of an idealistic nature; and, finally, the fifth to the man who shall have done the most or the best work for the fraternity of mankind, by the formation and propagation of peace congresses. The prizes shall be awarded as follows: For physical science and chemistry, by the Swedish Academy; for literature, by the Stockholm Academy, and for peace work, by a committee of five members elected by the Norwegian Storting."

Peace and War.—Peace is the ultimate object of all statecraft—peace in the development of the domestic activities of the nation administered, and peace in the relations of states with one another. For the purpose of ensuring peace an expensive diplomacy is maintained by all states and to procure for the treaties and decrees that are obtained to any state with one another. Even war has no other avowed purpose than that of placing specific international relations on a definite footing. Ultimate peace is uniformly proclaimed by every dictator at home, by every conqueror abroad, as the goal to which he is directing his efforts. And yet discontent voices are sometimes heard defending war as if it were an end in itself. Without going back to the well-known reply of Count Moltke to Professor Bluntschli respecting the Manual of Laws of War drawn up by the Institute of International Law in 1880, we need only quote that highly up-to-date philosopher, Nietzsche: "It is mere illusion and pure sentiment," he observes, "to expect much (even anything at all) from mankind if it forgets how to make war. As yet no means are known which call so much into action as a great war, that rough energy born of the camp, that deep impersonality born of hatred, that conscience born of murder and cold-bloodedness, that fervour born of effort in the annihilation of the enemy, that proud indifference to loss, to one's own existence, to that of one's fellows, to that earthquake-like soul-shaking which a people needs when it is losing its vitality."

It is pleasant to contrast this necrotic joy of one onlooker with the matter-for-the-moment reflections of another, the late W. E. H. Lecky. "War," he says "is not, and never can be a mere passionless discharge of a painful duty. It is in its essence, and it is a main condition of its success, to kindle into fierce exercise among great masses of men the destructive and combative passions—passions as fierce and as malevolent as that with which the bound hunts the fox to its death or the tiger springs upon its prey. Destruction is one of its chief ends. Deception is one of its chief means, and one of the great arts of skilful generalship is to deceive in order to destroy. Whatever other elements may mingle with the spirit of self-end, there at least is dignity with war, this at least is absence; and however reluctantly men may enter into war, however conscientiously they may endeavour to avoid it, they must know that when the scene of carnage has once opened, these things must be not only accepted and condoned, but stimulated, encouraged and applauded. It would be difficult to conceive a disposition more remote from the morals of ordinary life, not to speak of Christian ideals, than that with which the soldiers most animated with the fire and passion that lead to victory rush forward to bayonet the foe. . . . It is allowable to deceive an enemy by fabricated despatches purporting to come from his own side; by tampering with telegraphic messages; by spreading false intelligence in newspapers; by sending pretended spies and deserters to give him untrue reports of the numbers or movements of the troops; by employing false signals to lure him into ambushes. On the other hand, the flag and uniform of an enemy for purposes of deception there has been some controversy, but it is supported by high military authority. . . . Hardly any one will be so confident of the virtue of his rulers as to believe that every war which his country wages in every part of its dominions with uncivilized as well as civilized populations, is just and necessary, and it is certainly prima facie not in accordance with an ideal morality that men should bind themselves absolutely for life or for a term of years to kill without question, at the command of their superiors, those who have personally done them no wrong."

"Surely with all the existing activity in the removal of causes of war, in the reduction to precise expression of the rules of law governing the relations of states with one another, in the creation of international judicatures for the application of these rules, in the concluding of treaties specifically framed to facilitate the pacific settlement of difficulties diplomacy may have failed to adjust, in the promotion of democratic civilian armies with everything to lose by war, and all the other agencies which have been described above, the hope seems warranted that, in no distant future, life among nations will become still more closely assimilated to life among citizens of the same nation, with legislation, administration, reform all tending to the one great object of law, order and peace among men." (T. B.)

Peace, Breach of The—Theoretically all criminal offences cognizable by English law involve a breach of the king's peace, and all indictments whether for offences against the common law or by statute conclude "against the peace of our lord the king, his crown and dignity." Historically this phrase, now legally superfluous, represents the last trace of the process by which the royal courts assume jurisdiction over all offences, and gradually excluded the jurisdiction of the sheriff and of lords of manors and franchises, making crime a matter of national concern as distinguished from civil wrongs or infractions of the rights of local magnates, or of the rights of the tribal chiefs of the Teutonic conquerors of Britain. The peace of the king was sworn on his accession or full recognition, and the jurisdiction of his courts to punish all violations of that peace was gradually asserted. The completion of this process is marked by the institution of the office of justice of the peace.

In modern times the expression "breach of the peace" is usually limited to offences involving actual tumult, disturbances or disorder. As regards such offences, although they do not fall into the class of grave crimes described as felonies, officers of police and even private persons have larger powers and duties, as to immediate arrest without waiting for judicial warrant, than they possess as to other minor offences (see Arrest). Justices of the peace have under early statutes and the commission of the peace power to take sureties of the peace from persons who are threatening to commit a breach of the peace, and it is within the power of any court on conviction of any misdemeanour and of many felonies to require the offender to enter into a recognizance (q.v.) to keep the peace.

Peace Conferences, the official title of the two international conferences held at the Hague in 1899 and 1907. Both conferences were held at the request of Emperor Nicholas II. of Russia. The chief object of the first conference, as set out in the note of Count Mouraviev, the Russian minister of foreign affairs (Jan. 11, 1899), was to arrive at an "understanding not to increase for a fixed period the present effective of the armed military and naval forces, and at the same time not to increase the budgets pertaining thereto; and a preliminary examination of the means by which even a reduction might be effected in future in the forces and budgets above in accordance with the decisions taken by the congresses of Berlin and Portsmouth, the object being to ensure peace to all nations, and to make war unprofitable to any power."
mentioned." The conference, which was attended by representatives of 26 states, sat from the 18th of May to the 29th of July 1899.

When the subject of excessive armaments came up for discussion, the objections of the German military delegate led to its abandonment. Other very important matters, however, were dealt with, and three momentous conventions were adopted, viz.:

I. A convention for the pacific settlement of international disputes.
II. A convention relating to the laws and customs of war by land.
III. A convention for the adaptation to maritime warfare of the principles of the Geneva Convention of the 22nd of August 1864.

The following matters were also adopted:

a. Prohibition of the launching of projectiles and explosives from balloons or by other similar new methods.
b. Prohibition of the use of projectiles the only object of which is tooccasion injury to persons with, or upon, land, or to ships at sea.
c. Prohibition of the use of bullets which expand or flatten easily in the human body, such as bullets with a hard envelope, of which the envelope does not entirely cover the core, or is pierced with incisions.

The conference furthermore passed the following resolutions:

"The Conference is of opinion that the restriction of military budgets, which are at present a heavy burden on the world, is extremely desirable for the increase of the material and moral welfare of mankind."

"The Conference, taking into consideration the preliminary step prepared by the Federal Government for the revision of the Geneva Convention, expresses the wish that steps may be shortly taken for the assembling of a special conference, having for its object the revision of that Convention."

"The following proposals were adopted, but not unanimously:

1. The Conference expresses the wish that the question of the rights and duties of neutrals may be inserted in the programme of a conference in the near future.

2. The Conference expresses the wish that the questions with regard to rifles and naval guns, as considered by it, may be studied by the Governments with the object of coming to an agreement respecting the employment of new types and calibres.

3. The Conference expresses the wish that the Governments, taking into consideration the proposals made at the Conference, may examine the possibility of an agreement as to the limitation of armament by land and sea, and of war budgets.

4. The Conference expresses the wish that the proposals which contemplate the declaration of the inviolability of private property in naval warfare may be referred to a subsequent conference for consideration.

5. The Conference expresses the wish that the proposal to settle the question of the bombardment of ports, towns and villages by naval forces may be referred to a subsequent conference for consideration."

Great Britain signed and became a party to the three Conventions, but not to all the declarations, &c.

The Conference of 1907, which was attended by representatives of forty-four states, sat from the 15th of June to the 18th of October. It adhered to the principles and rule of the previous Conventions, and the armaments handed down from the Conference of 1899 this subject was waived, but still more important conventions than in 1899 were adopted on other matters. These were as follows:

I. Convention for the pacific settlement of international disputes.
II. Convention respecting the limitation of the employment of force for the recovery of contract debts.
III. Convention concerning the compensation of hostility.
IV. Conventions concerning the laws and customs of war on land.
V. Convention respecting the rights and duties of neutral powers and persons in war on land.
VI. Convention relative to the status of enemy merchant-ships at the outbreak of hostilities.

The conference was held at Geneva in June-July 1906. The revised Convention, composed of 33 articles, is dated July 6, 1906.

At the Conference the Russian government, further developing the proposal, submitted the following details:

1. Establishment of an international understanding for a term of five years, stipulating non-increase of the present figures of the peace effective of the troops kept up for home use.
2. Fixation, in case of this understanding being arrived at, and if possible, of the figures of the peace effective of all the powers excepting colonial troops.
3. Maintenance for a like term of five years of the amount of the military budgets at present in force.

"The Conference of 1899 was held at Geneva in June-July 1906. The revised Convention, composed of 33 articles, is dated July 6, 1906. This is an amended edition of that of 1899.

"The Conference of 1899 was held at Geneva in June-July 1906. The revised Convention, composed of 33 articles, is dated July 6, 1906. This is an amended edition of that of 1899.

Peach, William (1800-1886), British naturalist and geologist, was born on the 30th of September 1800 at Wansford in Northamptonshire; his father at the time was a saddler and harness-maker, and afterwards became an innkeeper farming about 80 acres of land. He received an elementary education at Wansford and at Fotheringham in Lincolnshire; and after several years of farm life, he entered the Revenue at Weybourn in Norfolk. Sea-weeds and other marine organisms now attracted his attention, and these he zealously collected. His duties during the next few years led him to remove successively to Sheringham, Hasboro (Happisburgh), Cromer and Cley, all in Norfolk. In the course of his rambles he met the Rev. James Layton, curate at Catfield, who lent him books and assisted in laying the foundations of accurate knowledge. About the year 1830 he was transferred to Charmouth in Dorset, thence to Beer, and Paignton in Devon, and to Gorran Haven near Mevagissey in Cornwall. Here he continued to pursue his zoological studies.
and supplied many specimens to G. Johnston, who was then preparing his History of the British Zeothele (1836). It was here too that he first received a fossil from the older rocks previously regarded as unfossiliferous—the discovery of which proved the presence of Bala Beds (Ordovician or Lower Silurian) in the neighbourhood of Gorran Haven. In 1841 he read a paper before the British Association at Plymouth "On the Fossil Organic Remains found on the south-east coast of Cornwall," and in 1843 he brought before the Royal Geological Society of Cornwall an account of his discovery of fish remains in the Devono-Silesian slates near Polperro. Peach transferred for a time to Powey; and in 1849 to Scotland, first to Peterhead and then to Wick (1853), where he made acquaintance with Robert Dick of Thurso. He collected the old red Sandstone fishes; and during a sojourn at Durness he first found fossils in the Cambrian limestone (1854). Peach retired from the government service in 1861, and died at Edinburgh on the 28th of February 1886.

Biographical notice, with portrait, in S. Smiles’s Robert Dick, Baker, of Thurso, Geologist and Botanist (1878).

PEACH, the name of a fruit tree which is included by Bentham and Hooker (Genus Plantarum, i. 610) under the genus Prunus (Prunus persica); its resemblance to the plum is indeed obscure. Others have classed it with the almond as a distinct genus, Amygdalus, while others consider it sufficiently distinct to constitute a separate genus, Persica.

In general terms the peach may be said to be a medium-sized tree, with lanceolate, stipulate leaves, borne on long, slender, relatively unbranched shoots, and with the flowers arranged singly, or in groups of two or more, at intervals along the shoots of the previous year’s growth. The flowers have a hollow tube at the base bearing at its free edge five sepals, an equal number of petals, a central pistil, a staminal column, a corymbose, or spreading flower, and a great number of stamens. The pistil consists of a single carpel with its ovary, style, stigma and solitary ovule or twin ovules. The fruit is a drupe (fig. 1) having a thin outer skin (epicarp) enclosing the flesh of the peach (mesocarp), the inner layers of the carpel becoming woody to form the stone, while the stone expands into the pit or seed. This is exactly the structure of the plum or apricot, and differs from that of the almond, which is identical in the first instance, only in the circumstance that the fleshy part of the latter eventually becomes dry and leathery and cracks open along a line called the suture.

The nectarine is a variation from the peach, mainly characterized by the circumstance that, while the skin of the ripe fruit is downy in the peach, it is shining and destitute of hairs in the nectarine. That there is no essential difference between the two is, however, shown by the facts that the seeds of the peach will produce nectarines, and vice versa, and that it is not uncommon, though still exceptional, to see peaches and nectarines on the same branch, and fruits which combine in themselves the characteristics of both nectarines and peaches. The blossoms of the peach are formed the autumn previous to their expansion, and this fact, together with the peculiarities of their form and position, requires to be borne in mind by the gardener in his pruning and training operations. The only point of practical interest requiring mention here is the very singular fact attested by all peach-growers, that, while certain peaches are liable to the attacks of mildew, others are not. In the case of the peach this peculiarity is in some way connected with the presence of small glandular outgrowths on the stalk, or at the base of the leaf. Some peaches have globular, others reniform glands, others none at all, and these latter trees are much more subject to mildew than are those provided with glands.

The history of the peach, almond and nectarine is interesting and important as regards the question of the origin of species and the production and perpetuation of varieties. As to the origin of the peach two views are held, that of Alphonse de Candolle, who attributes all cultivated varieties to a distinct species, probably of Chinese origin, and which is adopted by many naturalists, but more especially by Darwin, who looks upon the peach as a modification of the almond.

In the first place, the peach as we now know it has been nowhere recorded in the wild state. As is well said in "there have been wild the probabilities are that the tree was an escape from cultivation. Atchison, however, in the Hazlardak Mkh train in Afghanistan a form with different-shaped fruit which is supposed to have spread being both flat and flat, and the surface of the fruit," he observes, "resembles that of the peach in texture and colour; and the nut is quite distinct from that of the wild almond. The whole shrub resembles more what one might regard as the wild form of the peach than that of the almond. It is admitted, however, by all competent botanists that the almond is wild in the hotter and drier parts of the Mediterranean and Levantine regions. Atchison also mentions the almond as wild in some parts of Afghanistan, where it is known to the natives as "hîdâm," the same word that they apply to the cultivated almond. The branches of the tree are carried by the priests in religious ceremonies. It is not known as a wild plant in China or Japan. As to the peach, of its origin as a variation from the peach there is abundant evidence, as has already been mentioned; it is only requisite to add the very important fact that the seeds of the nectarine, even when cultivated by itself, are propagated by its manner of forming, and generally produce nectarines, or, as gardeners say, "come true." Darwin brings together the records of several cases, not only of genetic changes between the peach and the almond, but intermediate forms between the peach and the almond. So far as we know, however, no case has yet been recorded of a peach or a nectarine producing an almond, or vice versa, although if all have had a common origin in such an event many more cases might be expected. The evidences cited by Darwin seems to indicate that the wild almond is the source of cultivated almonds, peaches and nectarines, and consequently that the peach was introduced from Asia Minor or Persia, whence it was given, according to the Persian and Arabic history, to Afghanistan of a form which reminded him of a wild peach lends additional force to this view.

On the other hand, Alphonse de Candolle, from phytological and other considerations, supposes the peach to be of Chinese origin. The peach has not, it is true, been found wild in China, but it has been cultivated there from time immemorial; it has entered into the culture of India, and as it has found its way into the country where, according to some, the peach is native; but Theophrastus, a hundred years later, does speak of it as a Persian fruit, and De Candolle suggests that it might have been introduced to Egypt by Alexander the Great, who invaded the country by the Caspian Sea. The discovery of the peach, cultivated for ages in China, might have been carried by the Chinese into Kashmir, Bokhara, and Persia between the periods of the Tartar and Greek emigration, and the Græco-Persian races established, its cultivation would readily extend westward, or, on the other hand, to Cassia to north-western India, where its cultivation is not ancient. While the peach has been cultivated in China for thousands of years, the almond does not grow wild in that country and its introduction is supposed not to go back farther than the Christian era.

On the whole, greater weight is due to the evidence from botanical science than to that derived from philology, particularly since the discovery both of the wild almond and of a form like a wild peach in Afghanistan. It may, however, well be that both peach and almond are derived from some pre-existing form of the genus Prunus, which branches over the whole geographical area mentioned; but this is a mere speculation, though indirect evidence in its support might be obtained from the nectarine, of which no more is known in Europe than we have, the history of which can be traced in our literature, and which, when seen, originates from the peach and reproduces itself by seed, thus offering the characteristics of a species in the act of developing itself.

The treatment in horticulture of the peach and nectarine is the same as that already stated. To perpetuate and multiply the choicer varieties, peaches and nectarines are budded upon plum or almond stocks. For dry situations almond stocks are preferable, but they are not long-lived, while for damp or clayey loams it is better to use certain kinds of plums. Double-working is sometimes beneficial; thus an almond budded on a plum stock may be budded with a tender peach, greatly to the advantage of the latter. The peach border should be composed of turfly mellow
loam, such as is suitable for the vine and the fig; this should be used in as rough a state as possible, or not broken small and fine. The bottom should slope towards the outer edge, where a drain should be cut, with an outlet, and on this sloping bottom should be laid a thickness of from 9 in. to 12 in. of rough materials, such as broken bricks or mortar rubbish, over which should be placed a layer of rough turf, with the grassy side downwards, and then the good loamy soil to form the surface, which should have a depth of about 2 ft. 6 in. The peach-tree is most productive when the roots are kept near the surface, and the borders, which should be from 8 ft. to 12 ft. wide, should not be cropped heavily with culinary vegetables, as deep trenching is very injurious. Sickly and unfruitful trees may often be revived by bringing up their roots within 5 or 6 in. of the surface. It is questionable whether it is not better, in cold soils and bleak situations, to abandon outdoor peach culture, and to cover the walls with a casing of glass, so that the trees may be under shelter during the unseasonal spring weather.

The fruit of the peach is produced on the ripened shoots of the preceding year. If these be too luxuriant, they yield nothing but leaves; and if too weak, they are incapable of developing flower buds. To furnish young shoots in sufficient abundance, and of requisite length, for the great object of training and pruning. Trees of slender-growing, twiggly habit naturally fall most readily into the fan form of training, and accordingly this has generally been adopted in the culture of peaches and nectarines (fig. 2). The young tree, in many cases, procured when it has been trained for two or three years in the nursery; but it is generally better to begin with a maiden plant—a plant of the first year after it has been budded. It is then in ordinary practice, in the second year, laid down its first set of lead, or main, branches, and in the third year its first secondary or sub-lateral branches. One of the principal objections to young trees, which are between the old wood and the blossoms e in fig. 4, except the lowest g, are carefully removed by rubbing them off with the finger. This never fails to produce a shoot d, the growth of which is favoured by destroying the useless spray e above the blossoms, and pinching off the points of those which are necessary to perfect the fruit. A replacing shoot is thus obtained, to which the whole is invariably shortened at the end of the year.

Seymour's form (fig. 5) approaches more nearly to the French method than any other practised in England; but the direct channel of the sap is not suppressed, and this results in the production of branches of unequal vigour, which is very undesirable.

For cold and late situations, Thomas Andrew Knight recommended the encouragement of spurs on the young wood, as such spurs, when close to the wall, generate the best organized and most vigorous blossoms, and generally ensure a crop of fruit. They may be produced, by taking care, during the summer pruning or disbudding, to preserve a number of the little shoots emitted by the yearly wood, only pinching off the minute succulent points. On the spurs thus formed blossom buds will be developed early in the following season. This practice is still adopted to cold situations. Peach trees require protection, especially at the period of blossoming, particularly in the north of England and in Scotland. Canvas or bunting screens are most effectual. By applying these early in the season, great benefit may be derived from retarding the blossom till the frosty nights of spring have passed. Wooden and glass copings are also very useful in warding off frosts. Care must be taken that the ground always has a sufficient supply of moisture and that the soil is moist wherever the roots run.

**Forcing.**—The pruning and training of the trees in the peach house do not differ materially from the methods practised out of doors. It may also be stated here that when occasion arises, peach trees well furnished with buds may be transplanted and forced immediately without risking the crop of fruit, a matter of some importance when, as sometimes happens, a tree may accidentally fail. In the forcing of peaches fire heat is commonly applied about December or January; but it may, where there is a demand, begin a month sooner. The trees must be got to start growth very
gradually, and at first the house should be merely kept closed at a temperature of about 45°, but the heat should gradually be raised to 50° and 55°, and 60° when the fruit is set, after which the house should be kept moist by sprinkling the walls and paths, or by placing water troughs on the return pipes, and the temperature should then range from 65° by day to 70° by night. After the fruit has set, the foliage should be refreshed and cleansed by the daily use of the syringe or garden engine. When the fruit has stoned—that is, as soon as the kernels have formed—the temperature should be raised to about 65° as a minimum, and 70°, with 75° by sun heat, as a maximum. Water must now be copiously supplied to the border, and air admitted in abundance, but cold draughts which favour the attack of mildew must be avoided. When the fruit begins to ripen, syringing must be discontinued till the crop is gathered, after which the syringe must be occasionally used. If the leaves should happen to shade the fruit, not only delay the ripening process but at any time after the stoming period, they should be gently turned aside, for in order that the fruit may acquire good colour and flavour, it should be freely exposed to light and air when ripening; it will bear the direct rays of the sun, even if they should rise to 100°, but nectarines are much more liable to damage than peaches. The trees often suffer from mildew, which is best prevented by keeping the borders of the peach house clear and sufficiently moist and the house well ventilated, and if it should appear the trees should be sprayed with 1 oz. potassium sulphide dissolved in 3 gallons of water. Care must be taken in using this fungicide not to wet the painted wood, as it is sure to become discoured.

Peaches and nectarines are frequently cultivated in well-drained pots, and are then usually trained as pyramids, and 2 ft. distance being allowed as standards, and the trees left to grow as firmly as possible, using turfy loam with which a little mortar rubble has been mixed. The trees are to be top-dressed from time to time with well-decayed manure and turfy loam, and considerable space must be left in the pots for this and the nectarine trees also.

The following are some of the best peaches and nectarines, arranged in the order of the times of their ripening:

**Peaches.**

- Early Beartice: ear. July
- Early Stowe: ear. July

**Nectarines.**

- Stanwick (under glass): m. Sept.

**Peacham, Henry** (c. 1576–1643), English writer, was the son of Henry Peacham, curate of North Mimmens, Hertfordshire, and author of a book on rhetoric called the *Garden of Rhetoric* (1577). The elder Peacham became in 1597 rector of Leveton, Lincolnshire. The son was educated at Trinity College, Cambridge, where he graduated B.A. in 1594–1595 and M.A. in 1595–1596. He was for some time a schoolmaster at Wymondham, Norfolk, but settled in London in 1617 to earn his living as tutor to young men preparing for the universities. His first book was *Graphice* (1606), a treatise on pen and water-colour drawing, which, as *The Gentleman's Exercise*, passed through three editions. The years 1613–1614 he spent abroad, part of the time as tutor to the three young sons of Thomas Howard (1585–1646), earl of Arundel, and partly on his own account. He travelled in Italy, France, Westphalia and the Netherlands. The table of Sir John Ogles, English governor of Utrecat, was, he says, a "little academy," where he met soldiers and scholars of all nationalities.

When he returned to London he was accused of libel on the king. Investigating papers had been discovered in the house of Edmond Peacham, rector of Hinton Saint George, who, on being charged with an attack on the king denied the authorship, stating that they were written by a namesake, "a divine, a scholar and a traveller." The change was, however, easily explained. Peacham had many friends in London, among them Thomas Dowland the musician, Inigo Jones, and Edward Wright the mathematician. In 1622 appeared Peacham's magnum opus, the *Compleat Gentleman*. Enlarged editions appeared in 1626 and 1627. The 1627 edition was reprinted in 1634, and a third, with additional notes on blazonry by Thomas Blount (1617–1679), appeared in 1661. The book is a text-book of manners and polite learning; it includes chapters on cosmography, geometry, poetry, music, antiquities, painting, the lives of the painters, the "art of limning (Peacham himself was a proficient engraver), and the military art, including the order of the main battle or pitched battle."

The book differs from the *Courtier* of Castiglione, which had been the guide of an earlier generation. Peacham was a Cavalier, even an ardent polemist in the royal cause, but the central point of his book is a more or less Puritan sentiment of duty. In his later years Peacham was reduced to extreme poverty, and is said to have written children's books at a penny each. His last book was published in 1642, and it may be concluded that he died soon afterwards.

His other works include: *Minerva Britannia* (1612), dedicated to Henrietta, Queen of Wales, *The Period of Mourning* (1613); in honour of the same prince; *Thalia's Banquet* (1620), a book of epigrams; *The Art of Living in London* (1642), and *The Worth of a Penny* (1641), &c. There is a nearly complete collection of Peacham's works in the Bodleian, Oxford, Harleian MS. 685, containing a translation by Peacham of James I.'s *Basilicon doron* into Latin verse, written in his own hand and ornamented with pen and ink drawings. *Compleat gentleman* was edited by G. S. Gordon in 1900 for the Clarendon Press; the *Art of Living* is reprinted in the *Harleian Misc. ix.; The Worth of a Penny* in E. Arber's *English Garner* (vol. vi. 1883).

**Peacham, Sir Barnes** (1810–1890), English judge, was born in 1810, the son of Lewis Peacham, a solicitor. After practising as a special pleader, he was called to the bar in 1836, and in 1844 obtained great reputation by pointing out the flaw which invalidated the conduct of Daniel O'Connell and his fellow deputies. In 1852 he went to India as legal member of the governor-general's council. He here displayed great activity as a law reformer, but sometimes manifested too little consideration for native susceptibilities. The legislative council was established soon after his arrival, and although no orator, he was so frequent a speaker that legislation enjoining councillors to deliver their speeches sitting was said to have been devised with the sole object of restraining him. As a member of Lord Dalhousie's council he supported the annexation of Oudh, and he stood by Lord Carnie all through the Mutiny. In 1850 he became chief justice of the Supreme Court. He retired from the bench in 1870, and in 1872 was placed upon the judicial committee of the privy council, where his Indian experience rendered him invaluable. He died on the 3rd of December 1890.

**Peacham, George** (1791–1838), English mathematician, was born at Thornton Hall, Denton, near Darlington, on the 9th of April 1791. He was educated at Richmond, Yorkshire, and entered Trinity College, Cambridge, in 1809. He was second wrangler in 1812 (Sir J. F. W. Herschel being senior), was elected fellow of his college in 1814, became assistant tutor in 1815 and full tutor in 1823. While still an undergraduate he formed a league with John Herschel and Charles Babbage, to conduct the famous struggle of "the differential dot-age," which ended in the introduction into Cambridge of the continental notation in the infinitesimal calculus to the exclusion of the fluxional notation of Sir Isaac Newton. This was an important reform, not so much on account of the mere change of notation (for mathematicians follow J. L. Lagrange in using both these notations), but because it signified the opening to the mathematicians of Cambridge of the vast storehouse of continental discoveries. The analytical society thus formed in 1813 published various memoirs, and translated S. F. Lacroix's *Differential Calculus* in 1816. Peacham powerfully aided the movement by publishing in 1830 *A Collection of Examples of the Application of the Differential and Integral Calculus*. In 1841 he published a pamphlet on the
PEACOCK, T. L.

Buckingham and the Liverpool salt interest, and made the subject of steam navigation to India peculiarly his own. He represented the company before the various parliamentary committees on this question; and in 1839 and 1840 superintended the construction of iron steamers, which not only made the voyage round the Cape successfully, but proved very useful in the Chinese War. His name is often coupled with that of Captain Marcus undertook the expedition of 1835, subsequently pronounced by its commander, General F. R. Chesney, to be models of sagacity. In 1836 he succeeded James Mill as chief examiner, and in 1856 he retired upon a pension. During his later years he contributed several papers to Fraser's Magazine, including reminiscences of Shelley, whose executor he was. He also wrote in the same magazine his last novel, Gryll Grange (1860), inferior to his earlier writings in humour and vigour, but still a surprising effort for a man of his age. He died on the 23rd of January 1866 at Lower Halliford, near Chertsey, where, so far as his London occupations would allow him, he had resided for more than forty years.

Peacock's position in English literature is unique. There was nothing like his type of novel before his time; though there might have been if it had occurred to Swift to invent a story as a vehicle for the dialogue of his Polite Conversation. Peacock speaks as well in his own person as through his puppets; and his pithy wit and sense, combined with remarkable grace and accuracy of natural description, alone for the primitive simplicity of plot and character. Of his seven fictions, Nightmare Abbey and Crochet Castle are perhaps on the whole the best, the former displaying the most vis comica of situation, the latter the fullest maturity of intellectual power and the most skilful grouping of the motley crowd of "perfectibilians, determinators, statu quo-ites, phrenologists, transcendentalists, political economists, theorists in all sciences, projectors in all arts, morbid visionaries, romantic enthusiasts, lovers of music, lovers of the picturesque and lovers of good dinners," who constitute the dramatic personae of the Peacockian novel. Maid Marian and The Misfortunes of Elpilin are hardly less entertaining. Both contain descriptive passages of extraordinary beauty. Melincourt is a comparative failure, the excellent idea of an orang-outang mimicking humanity being insufficient as the sole groundwork of a novel. Headlong Hall, though more than foreshadowing the author's subsequent excellence, is marred by a certain bookish awkwardness characterising his earlier work, but the title, Grange (1854), as the pedantry of an old-fashioned scholar, whose likes and dislikes have become inveterate and whose sceptical liberalism, always rather inspired by hatred of cant than enthusiasm for progress, has petrified into only too earnest conservatism. The book's quaint resolute paganism, however, is very refreshing in an age eaten up with introspection; it is the kindliest of Peacock's writings, and contains the most beautiful of his poems, "Years Ago," the reminiscence of an early attachment. In general the ballads and songs interspersed through his tales are models of exact and melodious diction, and instinct with true feeling. His more ambitious poems are worth little, except Rhododaphne, attractive as a story and perfect as a composition, but destitute of genuine poetical inspiration. His critical and miscellaneous writings are always interesting, especially the restorations of lost classical plays in the Horae dramaticae, but the only one of great mark is the witty and crushing exposure in the Westminster Review of Thomas Moore's ignorance of the manners and belief he has ventured to portray in his Epicurean. Peacock resented the misrepresentation of his favourite sect, the good and ill of whose tenets were fairly represented in his own person. Some-what sluggish and self-indulgent, incapable of enthusiasm or self-sacrifice, he yet possessed a deep undemonstrative kindness of nature; he could not bear to see anyone near him unhappy or uncomfortable; he was sympathetic to less than his genial humour, gained him the attachment of children, dependants, and friends. In official life he was upright and conscientious; his judgment was shrewd and robust. What Shelley justly termed "the lightness, strength and chastity" of his dictum secures him an honourable rank among those English writers whose claims to remembrance depend not only upon matter but upon style.
Peacock—Peale, C. W.

Peacock's works were collected, though not completely, and published in three volumes in 1875, at the expense of his friend and former protégé, Sir Henry Cole, with an excellent memoir by his granddaughter Mrs Clarke, and a critical essay by Lord Houghton. His prose works were collected by Richard Garnett in ten volumes (1891). Separate novels are included in "Macmillan's Illustrated Standard Novels," with introductions by Mr Sartibury. For an interesting personal notice, see A Post's Sketch Book, by R. W. Buchanan (1884).

PEACOCK (Lat. Pavo, O. Eng. Peave, Du. pauw, Ger. Pfau, Fr. Paon), the bird as well known from the splendid plumage of the male, as from the proverbial personification of pride. It is a native of the Indian peninsula and Ceylon, in some parts of which it is very abundant. Setting aside its importation to Palestine by Solomon (1 Kings x. 22; 2 Chron. ix. 21), its assignment in classical mythology as the favourite bird of Hera testifies to the early acquaintance the Greeks must have had with it; but, though it is mentioned by Aristophanes and other older writers, their knowledge of it was probably very slight until after the conquests of Alexander. Throughout all succeeding time, however, it has never very freely rendered itself to domestication, and, though in earlier days highly esteemed for the table,[1] it is no longer considered the delicacy it was once thought; the young of the wild birds are, however, esteemed in the East.

Japan or "black-shouldered" Peafowls.

As in most cases of domestic animals, pied or white varieties of the ordinary peacock, Pavo cristatus, are not infrequently to be seen, and they are valued as curiosities. Greater interest, however, attends what is known as the Japanese or Japan peacock, a form which has received the name of P. nigripennis, as though it were a distinct species. In this form the cock, besides other less conspicuous differences, has all the upper wing-coverts of a deep lustrous blue instead of being mottled with brown and white, while the hen is of a more or less grizzled-white. It "breeds true"; but occasionally a presumably pure stock of birds of the usual coloration throws out one or more having the Japan plumage. It is to be observed that the male has in the coloration of the parts mentioned no little resemblance to that of the second indubitatably good species, the P. muticus (or P. spicifer of some writers) of Burma and Java, though the character of the latter's crest—the feathers of which are barred along their whole length instead of at the tip only—and its golden-green neck and breast furnish a ready means of distinction.

Sir R. Heron was confident that the Japan breed had arisen in England within his memory,[2] and C. Darwin (Animals and Plants under Domestication, i. 290-292) was inclined to believe it only a variety; but its abrupt appearance, which rests on indisputable evidence, is most suggestive in the light that it may one day throw on the question of evolution as exhibited in the origin of "species." It should be stated that the Japan bird is not known to exist anywhere as a wild race, though apparently kept in Japan. The accompanying illustration is copied from a plate drawn by J. Wolf, given in D. G. Elliot's Monograph of the Phasianidae.

If the peacocks belong to the group Gallinae, from the normal members of which they do not materially differ in structure; and, though by some systematists they are raised to the rank of a family, Pavoidea, most of the works on birds are content to regard them as a sub-family of Phasianidae (PHEASANT q.v.). Akin to the genus Pavo is Poly-epictum, of which the males are armed with two or more spurs on each leg, and near them is generally placed the genus Argusianus, containing the argus-peacocks, remarkable for their wonderfully ocellated plumage, and the extraordinary length of the secondary quills of their wings, as well as of the tail-feathers. It must always be remembered that the so-called "tail" of the peacock is formed not by the rectrices or true tail-feathers, but by the singularly elongated covert feathers at the base of the tail-coverts.

PEAK, THE, a high table-land in the north of Derbyshire, England, included in the Pennine range of hills. The name, however, is extended, without definite limits, to cover the whole of the hilly district north of Buxton. The table-land reaches an elevation of 2088 ft. in Kinder Scout. The geological formation is millstone-grit, and the underlying beds are not domed, but cup-shaped, dipping inward from the flanks of the mass. The summit is a peaty moorland, through which masses of rock project at intervals. The name of this high plateau has from the 17th century been identified with "peak," the pointed or conical top of a mountain, but the very early references to the district and certain places in it show clearly, as the New English Dictionary points out, that this connexion is unwarranted. The name appears in the Old English Chronicle (924) as Pæacon, of the district governed from the castle of Peveril of the Peak (see DERBYSHIRE), and also in the name of the cavern under the hill at Castleton, Pæac's Arse. Pæac, it has been suggested, is the name of a local deity or demon, and possibly may be indentified with Puck. For the etymology of "peak," point, &c., and its variants or related words, pick and "pike," see Pike.

PEALE, CHARLES WILLSON (1741-1827), the American artist painter, celebrated especially for his portraits of Washington, was born in Queen Anne county, Maryland, on the 16th of April 1741. During his infancy the family removed to Chestertown, Kent county, Maryland, and after the death of his father (a country schoolmaster) in 1750 they removed to Annapolis. Here, at the age of 13, he was apprenticed to a saddler. About 1764 he began seriously to study art. He got some assistance from Gustavus Hesselius, a Swedish portrait painter then living near Annapolis, and from John Singleton Copley in Boston; and in 1767-1770 he studied under Benjamin West in London. In 1770 he opened a studio in Philadelphia, and met with immediate success. In 1772, at Mount Vernon, Peale painted a three-quarters-length study of Washington (the earliest known portrait of him), in the uniform of a colonel of Virginia militia. This canvas is now in the Lee Memorial Chapel of Washington and Lee University. He painted various other portraits of Washington; probably the best known in a full-length, which was made in 1778, and of which Peale made many copies. This portrait had been ordered by the Continental Congress, which, however, made no appropriation for it, and eventually it was bought for a private collection in Philadelphia. Peale painted two miniatures of Mrs Washington (1772 and 1777), and portraits of many of the famous men of the time, a number of which are in Independence Hall, Philadelphia. His portraits of Washington do not appeal so strongly to Americans as do those of Gilbert Stuart, but his admitted skill as a draughtsman gives to all of his work considerable historical value. Peale removed to

[1] Classical authors contain many allusions to its high appreciation at the most sumptuous banquets; and medieval bills of fare on state occasions nearly always include it. In the days of chivalry one of the most solemn oaths was taken "on the peacock," which seems to have been served up garnished with its gaudy plumage.

PEAR

Philadelphia in 1777, and served as a member of the committee of public safety; he aided in raising a militia company, became a lieutenant and afterwards a captain, and took part in the battles of Trenton, Princeton and Germantown. In 1779-1780 he was a member of the Pennsylvania Assembly, where he voted for the abolition of slavery—he freed his own slaves whom he had brought from Maryland. In 1801 he undertook, largely at his own expense, the excavation of the skeletons of two mastodons in Ulster and Orange counties, New York, and in 1802 he established at Philadelphia Peale's Museum. He was one of the founders, in 1805, of the Pennsylvania Academy of the Fine Arts at Philadelphia. At the age of eighty-one Peale painted a large canvas, "Christ Healing the Sick at Bethesda," and at eighty-three a full-length portrait of himself, now in the Academy of the Fine Arts. He died at his country home, near Germantown, Pennsylvania, on the 22nd of February 1826.

His brother, JAMES PEALE (1749-1831), also an artist, painted two portraits of Washington (one now the property of the New York Historical Society, and the other in Independence Hall, Philadelphia), besides landscapes and historical compositions.

PEALE, REMBRANDT (1778-1860), American artist, was born in Bucks county, Pennsylvania, on the 22nd of February 1778, the son of Charles Willson Peale (q.v.). He studied under his father, under Benjamin West in London (1802-1803), and in Paris in 1807 and 1809. As early as 1795 he had begun life a portrait of Washington. Of this he made many replicas, the latest in 1823, purchased by the United States government in 1832, and now in the Capitol of Washington. Peale was one of the first of American lithographers. He was an excellent draughtsman, but in colour his work cannot rank with his father's. In 1843 he devised for the Philadelphia public schools a system of teaching drawing and penmanship. His portraits include those of President Jefferson, Mrs Madison, Commodores Perry, Decatur, and Bainbridge, Houdon, the sculptor, General Armstrong, and an equestrian portrait of General Washington, now in Independence Hall, Philadelphia. His "Court of Death" (1820) is in the Detroit Art Gallery. In 1825 Peale succeeded John Trumbull as president of the American Academy of Fine Arts (founded in 1802 as the New York Academy of Fine Arts), and he was one of the original members of the National Academy of Design. He wrote several books, among them Notes on Italy (1831), Reminiscences of Art and Artists (1842). He died in Philadelphia on the 3rd of October 1860.

A brother, RAPHAELLE PEALE (1774-1825), was one of the earliest of American still-life painters; and another brother, TITIAN RAMSEY PEALE (1800-1882), made numerous drawings, some of them in water-colour, in illustration of animal life.

PEAR (Pyrus communis), a member of the natural order Rosaceae, belonging to the same genus as the apple (P. malus), which it resembles in floral structure. In both cases the so-called fruit is composed of the receptacle or upper end of the flower-stalk (the so-called calyx tube) greatly dilated, and enclosed within its cellular flesh the five cartilaginous carpels which constitute the "core" and are really the true fruit. From the upper rim of the receptacle are given off the five sepals, the five petals, and the very numerous stamens. The form of the pear and of the apple respectively, although usually characteristic enough, is not by itself sufficient to distinguish them, for there are pears which cannot by form alone be distinguished from apples, and apples which cannot by superficial appearance be recognised from pears. The main distinction is the occurrence in the fruit, or sometimes in the rind, of clusters of cells filled with hard woody deposit in the case of the pear, constituting the "grit," while in the apple no such formation of woody cells takes place. The appearance of the tree—the bark, the foliage, the flowers—is, however, usually quite characteristic in the two species. Cultivated pears, whose number is enormous, are without doubt derived from one or two wild species widely distributed throughout Europe and western Asia, and sometimes forming part of the natural vegetation of the forests. In England, where the pear is sometimes considered wild, there is always the doubt that it may not really be so, but the produce of some seed of a cultivated tree deposited by birds or otherwise, which has degenerated into the wild spine-bearing tree known as Pyrus communis.

The cultivation of the pear extends to the remotest antiquity. Traces of it have been found in the Swiss lake-dwellings; it is mentioned in the oldest Greek writings, and was cultivated by the Romans. The word "pear" or its equivalent occurs in all the Celtic languages, while in Slavonic and other dialects different appellations, but still referring to the same thing, are found—a diversity and multiplicity of nomenclature which led Alphonse de Candolle to infer a very ancient cultivation of the tree from the shores of the Caspian to those of the Atlantic. A certain race of pears, with white down on the under surface of their leaves, is supposed to have originated from P. nivalis, and their fruit is chiefly used in France in the manufacture of Perry (see CIDER). Other small-fruited pears, distinguished by their precocity and apple-like fruit, may be referred to P. cordata, a species found wild in western France, and in Devonshire and Cornwall.

Karl Koch considered that cultivated pears were the descendants of wild forms—P. communis nivalis, which has descended, P. clavatigrofia and P. sinensis. J. Decaisne, who made the subject one of critical study for a number of years, and not only investigated the wild forms, but carefully studied the peculiarities of numerous varieties which are cultivated in the Jardin des Plantes at Paris, refers all cultivated pears to one species, the individuals of which have in course of time diverged in various directions, so as to form now six races: (1) the Celtic, including P. cordata; (2) the Mediterranean, including P. communis; (3) the Pontic, including P. clavatigrofia; (4) the Indian, comprising P. Fasae; and (6) the Mongolic, represented by P. sinensis. With reference to the Celtic race, P. cordata, it is interesting to note its connexion with Arthurian legend and the Isle of Avalon or Isle of Apples. An island in Loch Awe has a Celtic legend containing the principal features of Arthurian story; but in this case the word is "berries" instead of "apples." Dr Phéné visited Armorica (Brittany) with a view of investigating these matters, and brought thence fruits of a small berry-like pear, which were identified with P. communis var. cordata of western France.

Cultivation.—The pear may be readily raised by sowing the pips of ordinary cultivated or of wildling kinds, these forming what are known as free or pear stocks, on which the choicier varieties are grafted for increase. For new varieties the flowers should be fertilized with a view to combine, in the seedlings which result from the union, the desirable qualities of the parents. The dwarf and pyramidal trees, more usually planted in gardens, are obtained by grafting on the quince stock, the Portugal quince being the best; but this stock, from its surface-rooting habit, is most suitable for soils of a cold damp nature. The pear-stock, having an inclination to send its roots down deeper into the soil, is the best for light dry soils, as the plants are not then so likely to suffer in dry seasons. Some of the finer pears do not unite readily with the quince, and in this case double working is resorted to; that is to say, a vigorous-growing pear is first grafted on the quince, and then the choicer pear is grafted on the pear introduced as its foster parent.

In selecting young pear trees for walls or espaliers, some persons prefer plants one year old from the graft, but trees two or three years trained are equally good. The trees should be planted immediately before or after the fall of the leaf. The wall trees require to be planted from 25 to 30 ft. apart when on free stocks, and from 15 to 20 ft. when dwarfed. Where the trees are trained as pyramids or columns they may stand 8 or 10 ft. apart, but standards in orchards should be allowed at least 30 ft., and dwarf bush trees half that distance.

In the formation of the trees the same plan may be adopted as in the case of the apple. For the pear orchard a warm situation is very desirable, with a soil deep, substantial, and thoroughly drained. Any good free loam is suitable, but a calcareous loam is the best. Pear trees worked on the quince should have the stock covered up to its junction with the graft. This is effected by raising up a small mound of rich compost around it, a contrivance which induces the graft to emit roots into the surface soil.
and also keeps the stock from becoming hard or bark-bound. The fruit of the pear is produced on spurs, which appear on shoots more than one year old. The mode most commonly adopted of training wall pear-trees is the horizontal. For the slender twiggy sorts the fan form is to be preferred, while for bearing growers the half fan or the horizontal is most suitable. In the late summer or early autumn, the tree is in full bloom, and the spores are distributed on the flowers. It is a matter of much regret that the cheery brown masses of spores on the spent bloom are not more noticeable to the sarcastic observer, who is disposed to be surprised at such a marvel of nature as the pear in full flower. The spores are washed about by the wind, and lodge on the leaves of the fruit, where they germinate and form young colonies of minute origin. In this stage the disease is not noticeable except to the begrudger of nature who fails to see the beauty in flowers or the utility of the fruit. The spores germinate on the leaves of the fruit and form colonies of young fungus, which feed on the leaf tissue and destroy it. This results in a brownish-red discoloration of the leaf. The ripe fruits of the pear become infected and develop a brownish-red discoloration on the surface. The infection spreads rapidly, and the leaves become leathery and discolored. The fruit becomes distorted and deformed, and the trees are eventually killed. The disease is most prevalent in the summer and early fall. Pruning and sanitation are the best ways to control the disease. The pruning of dead, diseased twigs and branches eliminates the disease spores. Sanitation includes the removal of diseased leaves and fruits, and the destruction of dead and fallen leaves and branches. The disease is not transmitted by seed, and therefore, the use of resistant varieties is the best way to control the disease.
which bear ex crescences, or are honeycombed by boring parasites, are those most likely to yield pearls.

The substance of a pearl is essentially the same as that which lines the interior of many shells and is known as "mother-of-pearl." Sir D. Brewster first showed that the iridescence of this substance was an optical phenomenon due to the interference of rays of light reflected from microscopic corrugations of the surface—an effect which may be imitated by artificial striations on a suitable medium. When the inner laminated portion of a nacreous shell is digested in acid the calcareous layers are dissolved away, leaving a very delicate membranous pellicle, which, as shown by Dr. Carpenter, may retain the iridescence as long as it is undisturbed, but which loses it when pressed or stretched.

It is obvious that if a pearl presents a perfectly spherical form it must have remained loose in the substance of the muscles or other soft tissues of the mollusc. Frequently, however, the pearl becomes connected to the interior of the shell, the point of attachment thus interfering with its symmetry. In this position it may receive successive nacreous deposits, which ultimately form a pearl of hemispherical shape, so that when cut from the shell it may be flat on one side and convex on the other, forming what jewelers know as a "perle bouton." In the course of growth the pearl may become involved in the general deposit of mother-of-pearl, and be ultimately buried in the substance of the shell.

It has thus happened that fine pearls have occasionally been unexpectedly brought to light in cutting up mother-of-pearl in the workshop.

When a pearl oyster is attacked by a boring parasite the mollusc protects itself by depositing nacreous matter at the point of invasion, thus forming a hollow body of irregular shape known as a "blister pearl." Hollow wartly pearls are sometimes termed in trade "coq de perle." Solid pearls of irregular form are often produced by deposition on rough objects, such as small fragments of wood, and these, and in fact all irregular-shaped pearls, are termed "perles baroques," or "barrok pearls." It appears that the Romans in the period of the Decline restricted the name unio to the globular pearl, and termed the baroque margaritum. It was fashionable in the 16th and 17th centuries to mount curiously shaped baroques in gold and enamel so as to form ornamental objects of grotesque character. A valuable collection of such mounted pearls by Dinglinger is preserved in the Green vaults at Dresden.

A pearl of the first water should possess, in jewelers' language, a perfect "skin" and a fine "orient"; that is to say, it must be of delicate texture, free from speck or flaw, and of clear almost translucent white colour, with a subdued iridescent sheen. It should also be perfectly spherical, or, if not, of a symmetrical pearl-shape. On removing the outer layer of a pearl the subjacent surface is generally dull, like a dead fish-eye, but it occasionally happens that a poor pearl encloses a "lively kernel," and may therefore be improved by careful peeling. The most perfect pearl in existence is said to be one, known as "La Pellegrina," in the museum of Zosima in Moscow; it is a perfectly globular Indian pearl of singular beauty, weighing 58 carats. The largest known pearl is one of irregular shape in the Beresford Hope collection at the Victoria and Albert Museum. This magnificent pearl weighs 3 oz., has a circumference of 4½ in., and is surmounted by an enamelled and jewelled gold crown, forming a pendant of great value.

Pearl Fisheries.—The ancients obtained their pearls chiefly from India and the Persian Gulf, but at the present time they are also procured from the Sulu seas, the coast of Australia, the shores of Central America and some of the South Pacific Islands. The ancient fisheries of Ceylon (Taprobane) are situated in the Gulf of Mannaar, the fishing-banks lying from 6 to 8 m. off the western shore, a little to the south of the island of Mannaar. The Timnevelly fishery is on the Madras side of the strait, near Tuticorin. These Indian fishing-pods are under the control of government inspectors, who regulate the fisheries. The oysters yield the best pearls at about four years of age. Fishing generally commences in the second week in March, and lasts for from four to six weeks, according to the season. The boats are grouped in fleets of from sixty to seventy, and start usually at midnight so as to reach the oyster-banks at sunrise. Each boat generally carries ten divers. On reaching the bank a signal-gun is fired, and diving commences. A stone weighing about 40 lb. is attached to the cord by which the diver is let down. The divers work in pairs, one man diving while the other watches the signal-cord, drawing up the sink-stone first, then hauling up the baskets of oysters, and finally raising the diver himself. On an average the divers remain under water from fifty to eighty seconds, though exceptional instances are cited of men remaining below for as long as six minutes. After resting for a minute or two at the surface, the diver descends again; and so on, until exhausted, when he comes on board and watches the rope, while his comrade relieves him as diver. The native divers naked, carrying only a girdle for the support of the basket in which he places the pearl oysters. In his sandals, he work the divers' drills, to knock off pearls without injuring the oysters. To arm himself against the attacks of the sharks and other fishes which infest the Indian waters he carries spikes of iron-wood; and the genuine Indian diver never descends without the incantations of shark-charmers, one of whom accompanies the boat while others remain on shore. As a rule the diver is a short-lived man.

The diving continues from sunrise to about noon, when a gun is fired. On the arrival of the fleet at shore the divers carry their oysters to a shed, where they are made up into four heaps, one of which is taken by the diver. The oysters are then sold by auction in lots of roo each. The pearls, after removal from the dead oysters, are "clipped" by passing through a number of small bone or colanders, known as "haksets," the holes in the successive vessels being smaller and smaller. Having been sized in this way, they are sorted as to colour, weighed and valued.

Since the days of the Macedonians pearl-fishing has been carried on in the Persian Gulf. It is said that the oyster-beds extend along the entire Arabian coast of the gulf, but the most important are on sandbanks off the islands of Bahrain. The chief centre of the trade is the port of Lingah. Most of the products of this fishery are known as "Bombay pearls," from the fact that many of the best are sold there. The shells usually present a dark colour on the edges, like that of "smoked pearl." The yellow-tinted pearls are sent chiefly to Bombay, while the whitest go to Bagdad. Very small pearls, much below a pea in size, are generally known as "seed-pears," and these are valued in India and China as constituents of certain electuaries, while occasionally they are calcined for chawan, or lime, used with betel as a masticatory. There is a small pearl-fishery near Karachi on the coast of Bombay.

From the time of the Ptolemies pearl-fishing has been prosecuted along the coast of the Red Sea, especially in the neighbourhood of Jiddah and Kosel. This fishery is now insignificant, but the Arabs still obtain from this district a quantity of mother-of-pearl shells, which are shipped from Alexandria, and come into the market as "Egyptians." Very fine pearls are obtained from the Sulu Archipelago, on the north-east of Borneo. The mother-of-pearl shells from the Sulu seas are characterized by a yellow colour on the border and back, which unfit them for many ornamental purposes. Pearl oysters are also abundant in the seas around the Aru Islands to the south-west of New Guinea. From Labuan a good many pearl-shells are occasionally sent to Singapore. They are also obtained from the neighbourhood of Timor, and from New Caledonia. The pearl oyster occurs throughout the Pacific, mostly in the clear water of the lagoons within the atolls, though fine shells are also found in deep water outside the coral reefs. The Polynesian divers do not employ sink-stones, and the women are said to be more skillful than the men. They anoint their bodies with oil before diving. Fine pearl-shells are obtained from Navigators' Islands, the Society Islands, the Low Archipelago or Paumotu Isles and the Gambier Islands. Many of the Gambier pearls present a bronzy tint. Pearl-fishing is actively prosecuted along the western coast of Central America, especially in the Gulf of California, and to a less extent around the Pearl Islands in the Bay of Panama.
PEARL

fishing-grounds are in water about 40 ft. deep, and the season lasts for four months. An ordinary fishing-party expects to obtain at least three to four tons of shells per day, and it is estimated that one shell in a thousand contains a pearl. The pearls are shipped in barrels from San Francisco and Panama. Some pearls of rare beauty have been obtained from the Bay of Mulege, near Los Coyotes, in the gulf of California; and in 1882 a pearl of 75 carats, the largest on record from this district, was found near La Paz in California. The coast of Guayaquil also yields pearls. Columbus found that pearl-fishing was carried on in his time in the Gulf of Mexico, and pearls are still obtained from the Caribbean Sea. In the West Indies the best pearls are obtained from St Thomas and from the island of Musco, off the coast of Venezuela. From Margarita Philip II. of Spain is said to have obtained in 1579 a famous pearl of 250 carats.

Of late years good pearls have been found in Shark's Bay, on the coast of Western Australia, especially in an inlet termed Useless Harbour. Mother-of-pearl shells are also fished at many other points along the western coast, between the 15th and 25th parallels of south latitude. An important pearl-fishery is also established in Torres Strait and on the coast of Queensland. The shells occur in water from four to six fathoms deep, and the divers are generally Malays and Papuans, though sometimes native Australians. On the west coast of British Columbia, the coast pearl-fishery was established by Julius Caesar to Venus Genetrix. As early as 1355 Scotch pearls are referred to in a statute of the goldsmiths of Paris; and in the reign of Charles II. the Scotch pearl trade was successfully attempted at the expense of part of the profits. But the Scotch pearl-fishery, after having declined for years, was revived in 1860 by a German named Moritz Unger, who visited Scotland and bought up all the pearls he could find in the hands of the manufacturers. It is estimated that in 1865 the produce of the season's fishing in the Scotch rivers was worth at least £12,000. This yield, however, was not maintained, and at the present time only a few pearls are obtained at irregular intervals by an occasional fisherman.

The principal rivers in Scotland which have yielded pearls are the Tay, the Tayport, the River Forth, the Clyde, the Dee, the Don, the Ythan, the Teith, the Forth and many other streams. In North Wales the Conway was at one time celebrated for its pearls; and it is related that Sir Richard Wynn, chamberlain to Henry VII., received from it one or two pearls, which is believed to occupy a place in the British crown. In Ireland the rivers of Donegal, Tyrone and Wexford have yielded pearls. It is said that Sir John Hawkins the circumnavigator had a patent for pearl-fishing in the Irt in Cumberland. Although the pearl-fisheries of Britain are now neglected, it is otherwise with those of Germany. The most important of these are in the forest-streams of Bavaria, between Ratisbon and Passau. The Saxony fisheries are chiefly confined to the basin of the White Elster, and those of Bohemia to the Horazdowitz district of Wotawa. For more than two centuries the Saxony fisheries have been carefully regulated by law. The season for pearl-fishing, as in the rest of Europe, where fishing is to be permitted. After a tract has been fished over, it is left to rest for ten or fifteen years. The fisher-people open the valves of the mussels with an iron instrument, and if they find no pearl they break the shell and discard the mussel.

River pearls are found in many parts of the United States, and have been systematically worked in the Little Miami river, Warren county, Ohio, and also on the Mississippi, especially about Muscatine. The season extends from June to October. Japan produces fresh-water pearls, found especially in the Anodonta japonica. But it is in China that the culture of the pearl-mussel is most extensively carried on. The conchologists also find pearls, and use a large quantity of mother-of-pearl for decorative purposes. More than twenty-two centuries before our era pearls are enumerated as a tribute or tax in China; and they are mentioned in the first case of the great emperor Han Wang, in a dictionary compiled earlier than 1000 B.C. A process for promoting the artificial formation of pearls in the Chinese river-mussels was discovered by Ye-jin-yang, a native of Houchow, in the 13th century; and this process is still extensively carried on near the city of Teh-tsing, where it forms the staple industry of several villages, and is said to give employment to about 5000 people. Large numbers of the mussels are collected in May and June, and the valves are broken in from time to time. After several months, in some cases two or three years, the mussels are removed, and the pearls which have formed on the mussels are cut from the shells, where the molluscs themselves were as food. The matrix is generally rolled from the pearl and the cavity filled with white wax, the aperture being neatly sealed up so as to render the appearance of the pearl as perfect as possible. Millions of such pearls are annually thus removed. These show the result of many years of work, which present the form of small seated images of Buddha. The figures are cast in very thin lead, or stamped in tin, and are inserted as previously described. Specimens of these Buddha pearls in the British Museum are referred to the species Dipsas plicata. It should be mentioned that Linnaeus, probably ignorant of what had long been practised in China, demonstrated the possibility of producing artificial pearls in the fresh-water mussels of Sweden.

The largest pearls are occasionally found in the great conch or button shell of the West Indies, Strombus gigas, L.; but these, though much prized, are not nacreous, and their tint is apt to fade. They are also produced on the channel shell, Turbinella scolymus, L. Yellowish and brown, or of little value, but yielding abundant conches and bad-coloured concretions are formed by the Placuna placenta.2 Black pearls, which are very highly valued, are obtained chiefly from larvae of oysters, and are found in the waters of Mexico. The common marine mussel Mytilus edulis also produces pearls, but, however, of little value.

According to the latest researches the cause of pearl-formation is in most cases, perhaps in all, the dead body of a minute parasite within the tissues of a mollusc, around which nacreous deposit is secreted. The parasite is a stage in the life history of a Trematoide in some cases, in others of a Cestode; that is to say of a form resembling the common liver-fluke of the sheep, or of a tapeworm. As long ago as 1652 Filippi of Turin showed that the species of Trematoide Dintomum duplicatum was the cause of a pearl formation in the fresh-water mussel Anodonta. Kuchenmeister subsequently investigated the question at Elster in Saxony and came to a different conclusion, namely that the central body of the pearl was a small specimen of a species of water mite which is a very common parasite of Anodonta. Filippi however states that the mite is only rarely found within a pearl, the Trematoide occurring in the great majority of cases. R. Dubois and Dr H. Lyster Jameson have made special investigations of the process in the common mussel Mytilus edulis. The latter states that the pearl is produced in a sac which is situated beneath the epidermis of the mantle and is lined by an epithelium. This epithelium is not developed from the outer epidermis but from the internal connective-tissue cells. This statement, if correct, is contrary to what would be expected, for calcareous matter is usually secreted by the external epidermis only. The sac or cyst is formed by the larva of a species of Trematoide belonging to the genus Leucothyridenervium, a species closely resembling and probably identical with L. somateria, which lives in the adult state in the eider duck. At Billiers, Morbihan, in France, the host of the adult Trematoide is another species of duck, namely the common Scoter, Oedemia nigro, which is notorious in the locality for its avidity for mussels. Trematoide are also known as the family Distomidae, to which the parasite under consideration belongs, usually have three hosts in each of which they pass different stages of the life history. In this case the first host at Billiers is a species of bivalve called Tapes decussatus, but at Piel in Lancashire there are no Tapes and the first stages of the parasite are found in the common cockle. The Trematoide enters the first host as a minute newly hatched embryo and

1 Strombus gigas, L., is a Gastropod belonging to the family Strombidae, of the order Pectinibrachia. Turbinella scolymus, L., is a Gasteropod belonging to the family Turbinellidae, of the order Pelecypoda.

2 Placuna placenta, L., belongs to the family Anomalidae; it is found on the shores of North Australia. Pinna squamosa, Gmelin, belongs to the Ostreaeae; it occurs in the Mediterranean. Both are Lamellibranchiata. 
PEARL, THE

Dr Jameson distinguishes in addition to the above thirty-two species of Margaritifera or Meleagrina; all these have rudimentary teeth on the hinge. The most important species is Meleagrina setacea, which is found along the coast of India, the lingesh shell of the Persian Gulf and the pearl oyster of the Red Sea. Since the opening of the Suez Canal the latter form has invaded the Mediterranean, specimens having been taken at Alexandria. In addition to the two species of Spondylus, Meleagrina cardita; or is the是一种 variety of Meleagrina vulgaris. Meleagrina radiata is the West Indian pearl oyster.

The greatest and most decided form of the white, precious metal is the Indian pearl. It is the most valuable species of mother-of-pearl.

PEARL, THE

The Middle-English poem known as Pearl, or The Pearl, is preserved in the unique manuscript Cotton Nero Ax at the British Museum; in this volume are contained also the poems Cleanness, Patience, and Sir Gawaine and the Green Knight. All the pieces are in the same handwriting, and from internal evidences of diction, style and parallel references, it is now generally accepted that the poems are all by the same author. The MS., which is quaintly illustrated, belongs to the end of the 14th or the beginning of the 15th century, and appears to be but little later than the date of composition; no line of Pearl or of the other poems is chaste too, it is a poem of two parts, the first for the loss of a girl-child, "who lived not upon earth two years"—the poet is evidently the child's father. In grief he visits the little grave, and there in a vision beholds his Pearl, now transfigured as a queen of heaven—she sees her beneath a "cystal rock," beyond a stream; the dreamer would fain cross over, but cannot. From the opposite bank Pearl, grown in wisdom as in stature, instructs him in lessons of faith and resignation, exults to him the mystery of her transfiguration, and leads him to a glimpse of the New Jerusalem. Suddenly the city is filled with glorious maidens, who in long procession glide towards the throne, all of them clad in white, pearl-bedecked robes as Pearl herself. And there he sees, too, "his little queen." A great love-longing possesses him to be by her. He must needs plunge...
into the stream that keeps him from her. In the very effort the dreamer awakes, to find himself resting upon the little mound where his Pearl had "strayed below"—"

"I roused me, and fell in great dismay,
And, sighing, to myself I said:
Now all be to that Prince's pleasure."

The poem consists of one hundred and one stanzas, each of twelve lines, with four accents, rhymed ab, ab, ab, ab, bc, bc; the versification combines rhyme with alliteration; trisyllabic effects add to the easy movement and lyrical charm of the lines. Five stanzas (in one case six), with the same refrain, constitute a section, of which accordingly there are twenty in all, the whole sequence being linked together by the device of making the first line of each stanza catch up the refrain of the previous verse, the last line of the poem re-echoing the first line. The author was not the creator of this form, nor was he the last to use it. The extant pieces in the metre are short religious poems, some of the later (e.g. God's Complaint, falsely attributed to Scottish authorship) revealing the influence of Pearl.

The dialect is West Midland, or rather North-West Midland, and the vocabulary is remarkable for the blending of native speech with Scandinavian and Romance elements, the latter partly Anglo-French, and partly learned French, due to the author's knowledge of French literature.

"While the main part of the poem," according to Gollancz, "is a paraphrase of the closing chapters of the Apocalypse and the parable of the Vineyard, the Remainant of the Rose is noteworthy, more particularly in the description of the wonderful land through which the dreamer wanders; and it can be traced throughout the poem, in the personification of Pearl as Reason, in the form of the colloquy, in the details of dress and ornament, in many a characteristic word, phrase and reference. 'The river from the throne,' in the Apocalypse, here meets 'the waters of the wells' devised by Sir Mirth for the Garden of the Rose. From these two sources, the Book of Revelation, with its almost Celtic glamour, and The Romaunt of the River, with its almost Oriental allegory, are derived much of the wealth and brilliancy of the poem. The poet's fancy revels in the richness of the heavenly and the earthly paradise, but his fancy is subordinated to his earnestness and intensity." The leading motifs of Pearl are to be found in the Gospel—
in the allegory of the merchant who sold all his to purchase one pearl of great price, and in the words, so fraught with solace for the child-bereft, "for of such is the Kingdom of Heaven."

Naturally arising from the theme, and from these motifs, some theological problems of the time are touched upon, or treated somewhat too elaborately perhaps, and an attempt has been made to demonstrate that Pearl is merely allegorical and theological, and not really poetical. Those who hold this view surely ignore or fail to recognize the subtle personal touches whereby the poem transcends all its theological interests, and makes its simple and direct appeal to the human heart. Herein, too, lies its abiding charm, over and above the poetical talent, the love of nature, colour and the picturesque, the technical skill, and the descriptive power, which in a high degree belonged to the unknown author.

Various theories have been advanced as to the authorship of Pearl and the other poems in the manuscripts. The claims of Huchown "of the Awle Ryale" have been vigorously (but unsuccessfully) advocated; the case in favour of Ralph Strode (Chaucer's "philosophical Strode")—the poet most attractive of all the theories—is still, unfortunately, "not proven." By piecing together the personal indications to be found in the poems an imaginary biography of the poet may be constructed. It may safely be inferred that he was born about 1350, somewhere in Lancashire, or a little to the north; that he delighted in open-air life, in woodcraft and sport; that his early life was passed amid the gay scenes that brightened existence in medieval hall and bower; that he availed himself of opportunities of study, theology and romance alike claiming him; that he wedded, and had a child named Margery or Marguerite—the Daisy, or the Pearl—at whose death his happiness dropped and life's joy ended.

Three of the four poems are closely linked and belong to one period of the poet's career. In Gawayne, probably the first of the series, the poet is still the minstrel rejoicing in the glamour of the Arthurian tale, but using it, in almost Spenserian spirit, to point a moral. In Pearl the minstrel has become the elegiac poet, harmonizing the old Teutonic form with the newer Romance rhyme. In Cleanness he has discarded all attractions of form, and writes, in direct alliterative metre, a stern homily on chastity. In Patience—a homiletic paraphrase of Jonah—he appears to be autobiographical, reminding himself, while teaching others, that "Poverty and Patience are need's playfellows." He had evidently fallen on evil days.

It is known that the composition after 1358 Boccaccio wrote his Latin elegy Golofrancis in memory of his young daughter Violante. A comparative study of the two poems is full of interest; the direct influence of the Latin on the English poem is not so clear as has been maintained. Pearl cannot be placed earlier than 1356; it is most probably later than Olympias.

Bibliography—

Texts and Translations: Early Alliterative Poems in the West Midland Dialect of the Fourteenth Century (edited by Richard Morris, Early English Text Society L. 1864; revised, 1869); G. Coulton, Sixteenth Century, edited, with a Modern Rendering, by Israel Gollancz (with frontpiece by Holman Hunt, and prefatory lines, sent to the editor by Tennyson); revised edition of the text, privately printed, 1896. The Authorized Version of the Apocrypha. Gollancz, 1885; Facsimile of MS. Cotton Nero A x, 1911–1918; The Pearl, (edited by C. G. Osgood; Boston, 1906). Translations by Gollancz (as above); G. G. Coulton (1906); Osgood (1907); Miss Mead (1908); Miss Hewitt (1908); part of the poem, by S. Weir Mitchell (1906). The Literary History: Tenbrink, History of English Literature (translated by H. M. Kennedy, 1886, i. 336–351); G. Phonology.—W. Fick. Zum mittelenglischen Gedicht von der Perle (Kiel, 1885).

PEARSALL—PEARSON, C. H.

PEARSALL, ROBERT LUCAS DE (1793–1866), English composer, was born on the 14th of March 1795, at Clifton. Educated for the bar, he practised till 1825, when he left England for Germany and studied composition under Panny of Mainz; with the exception of three comparatively short visits to England, during one of which he made the acquaintance of the English school of madrigals, he lived abroad, selling his family property of Willsbridge and settling in the castle of Wartensee, on the lake of Constance. He produced many works of lasting beauty, nearly all of them for voices in combination: from his part songs, such as "Oh, who will o'er the downs?" to his elaborate and scholarly madrigals, such as the admirable eight-part composition "Great God of Love" and "Lay a Garland," or the beautiful "Light of my Soul." His reception into the Roman Church in his later years may have suggested the composition of some beautiful sacred music, among other things a fine "Salve Regina." He wrote many valuable treaties on music, and edited a Roman Catholic hymn-book.

He died on the 5th of August 1856.

PEARSON, CHARLES HENRY (1830–1894), British historian and colonial statesman, was born in London on the 19th of September 1830. After receiving his early education at Rugby and King's College, London, he went up to Oxford, where he
was generally regarded as the most brilliant of an exceptionally able set, and in 1854 obtained a fellowship at Oriel College. His constitutional weakness and bad eyesight forced him to abandon medicine, which he had adopted as a career, and in 1855 he returned to King's College as lecturer in English language and literature, a post which he almost immediately quitted for the professorship of modern history. He made numerous journeys abroad, the most important being his visit to Russia in 1858, his account of which was published anonymously in 1859 under the title of Russia, by a Recent Traveller; an adventurous journey through Poland during the insurrection of 1863, of which he gave a sympathetic and much praised account in the Spectator; and a visit to the United States in 1868, where he gathered materials for his subsequent discussion of the negro problem in his National Life and Character. In the meantime, besides contributing regularly, first to the Saturday Review and then to the Spectator, and editing the National Review, he wrote the first volume of The Early and Middle Ages of England (1861). The work was bitterly attacked by Freeman, whose "extravagant Saxonism" Pearson had been unable to adopt. It appeared in 1868 in a revised form with the title of History of England during the Early and Middle Ages, accompanied by a second volume which met with general recognition. Still better was the reception of his admirable Maps of England in the First Thirteen Centuries (1870). But as the result of these labours he was threatened with total blindness; and, disappointed of receiving a professorship at Oxford, in 1871 he emigrated to Australia. Here he married and settled down to the life of a sheep-farmer; but finding his health and eyesight greatly improved, he came to Melbourne as lecturer on history at the university. Soon afterwards he became head master of the Presbyterian Ladies' College, and in this position practically organized the whole system of higher education for women in Victoria. On his election in 1878 to the Legislative Assembly he definitely adopted politics as his career. His views on the land question and secular education aroused the hitherto hostility of the rich squatters and the clergy; but his singular nobility of character, no less than his powers of mind, made him one of the most influential men in the Assembly. He was minister without portfolio in the Berry cabinet (1880–1881), and as minister of education in the coalition government of 1886 to 1890 he was able to pass into law many of the recommendations of his report. His reforms entirely remoulded state education in Victoria. In 1892 a fresh attack of illness decided him to return to England. Here he published in 1893 the best edition of his works, National Life and Character. It is an attempt to show that the white man can flourish only in the temperate zones, that the yellow and black races must increase out of all proportion to the white, and must in time crush out his civilization. He died in London on the 29th of May 1894.

A volume of his Reviews and Critical Essays was published in 1896, and was followed in 1900 by his autobiography, a work of great interest.

PEARSON, JOHN (1612–1686), English divine and scholar, was born at Great Snoring, Norfolk, on the 28th of February 1612. From Eton he passed to Queen's College, Cambridge, and was elected a scholar of King's in April 1632, and a fellow in 1634. On taking orders in 1639 he was collated to the Salisbury prebend of Nether-Avon. In 1640 he was appointed chaplain to the lord-keeper Finch, by whom he was presented to the living of Thornton in Suffolk. In the Civil War he acted as chaplain to George Goring's forces in the west. In 1654 he was made weekly preacher at St Clement's, Eastcheap, in London. With Peter Gunning he disputed against two Roman Catholics on the subject of schism, a one-sided account of which was printed in Paris by one of the Roman Catholic disputants, under the title Scisma Unmask't (1658). Pearson also argued against the Puritan party, and was much interested in Brian Walton's polyglot Bible. In 1659 he published in London his celebrated Exposition of the Creed, dedicated to his parishioners of St Clement's, Eastcheap, to whom the substance of the work had been preached several years before. In the same year he published the Golden Remains of the ever-memorable Mr John Hales of Eton, with an interesting memoir. Soon after the Restoration he was presented by Juxon, bishop of London, to the rectory of St Christopher-le-Stocks; and in 1660 he was created doctor of divinity at Cambridge, appointed a royal chaplain, prebendary of Ely, archdeacon of Surrey, and master of Jesus College, Cambridge. In 1661 he was appointed Lady Margaret professor of divinity; and on the first day of the ensuing year he was nominated one of the commissioners for the review of the liturgy in the conference held at the Savoy. There he won the esteem of his opponents and high praise from Richard Baxter. On the 14th of April 1662 he was made master of Trinity College, Cambridge. In 1667 he was admitted a fellow of the Royal Society. In 1672 he published at Cambridge Vindiciae epistolarius S. Ignatii, in 4to, in answer to Jean Daille. His defence of the authenticity of the letters of Ignatius has been confirmed by J. B. Lightfoot and other recent scholars. Upon the death of John Wilkins in 1672, Pearson was appointed to the bishopric of Chester. In 1682 his Annales episcopales were published at Oxford, with John Fell's edition of that father's works. He died at Chester on the 10th of July 1686. His last work, the Two Dissertations on the Succession and Times of the First Bishops of Rome, formed with the Annales Paulini the principal part of his Opera posthuma, edited by Henry Dodwell in 1688. See the memoir in Biographia Britannica, and another by Edward Churton, prefixed to the edition of Pearson's Minor Theological Works (2 vols., Oxford, 1844). Churton also edited almost the whole of the theological writings.

PEARSON, JOHN LOUGHBOROUGH (1817–1807), English architect, son of William Pearson, usher, of Durham, was born in Brussels on the 5th of July 1817. He was articled at the age of fourteen to Ignatius Bonomi, architect, of Durham, but soon removed to London, and worked under the elder Hardwicke. He revived and practised largely the art of vaulting, and acquired in it a proficiency unrivalled in his generation. He was, however, by no means a Gothic purist, and was also fond of Renaissance and thoroughly grounded in classical architecture. From the erection of his first church of Ellerker, in Yorkshire, in 1843, to that of St Peter's, Vauxhall, in 1864, his buildings are Geometrical in manner and exhibit a close adherence to precedent, but elegance of proportion and refinement of detail lift them out of the commonplace of mere imitation. Holy Trinity, Westminster (1843), and St Mary's, Dalton Holme (1858), are notable examples of this phase. St Peter's, Vauxhall (1864), which was designed as a mission church, was also the first of a series of buildings which brought Pearson to the fore among his contemporaries. In these he applied the Early English style to modern needs and modern economy with unreserved success. St Augustine's, Kilburn (1871), St John's, Red Lion Square, London (1874), St Alban's, Birmingham (1886), St Michael's, Croydon (1886), St John's, Norwood (1881), St Stephen's, Bournemouth (1889), and All Saints', Hove (1889), are characteristic examples of his mature work. He is best known by Truro Cathedral (1880), which has a special interest in its apt incorporation of the south aisle of the ancient church. Pearson's conservative spirit fitted him for the preparation of ancient edifices, and among cathedrals and other historical buildings par excellence care were Lincoln, Chichester, Peterborough, Bristol and Exeter Cathedrals, St George's Chapel, Windsor, Westminster Hall and Westminster Abbey, in the surveyorship of which last he succeeded Sir G. G. Scott. Except as to the porches, the work of Scott, he re-faced the north transept of Westminster Abbey, and also designed the vigorous organ cases. In his handling of ancient buildings he was repeatedly opposed by the ultra anti-restorers (as in the case of the west front of Peterborough Cathedral in 1856), but he generally proved the soundness of his judgment by his executed work. Pearson's practice was not confined to church building. Treberffydd House (1859), Quor Wood (1858), Lelchade Manor, an Elizabethan house (1753), Westwood House, Sydenham, in the French Renaissance style (1889), the Astor estate offices (1892) upon the Victoria
Great news was received in the parchment scrolls of the Royal Society in London. The commander, R. E. Peary, had succeeded in the final exploration of the North Pole. After years of planning, perseverance, and meticulous preparation, Peary, along with his loyal crew and the indigenous people, had reached their goal. This milestone was not only a triumph for Peary but also for the nation that invested in this endeavor. Peary, a man of vision and determination, was awarded the highest honor for his remarkable feat. The world celebrated his victory, and his name became synonymous with the North Pole. The newspapers were filled with advertisements for expeditions led by Peary, enticing adventurers and explorers alike to follow in his footsteps.

Peary, born on May 18, 1856, in Cresson, Pennsylvania, was a man of many talents. A lawyer by profession, he had an innate love for the sea and the vastness of the Arctic. His early expeditions were marked by his determination to reach the North Pole. He had been inspired by the stories of previous explorers and was driven by the desire to add to the body of knowledge about the Arctic.

The North Pole, a place of mystery and awe, had been the goal of many explorers. It was not just a geographical point but a symbol of human achievement. Peary, with his crew, including the brave Captain Matthew Henson, had overcome numerous challenges. They had faced the treacherous climatic conditions, the harsh terrain, and the lack of resources.

The expedition began in 1906, with Peary and his crew embarking on their final voyage. They had crossed the Bering Strait and reached the coast of Greenland. The journey to the North Pole was fraught with danger and uncertainty. Peary and his crew were well prepared, and their equipment was state-of-the-art. They had followed the route of their predecessors, and Peary was determined to be the first to reach the Pole.

After a long and arduous journey, Peary and his crew reached the Pole on April 6, 1909. The news of this historic achievement spread across the globe. The newspapers and magazines were filled with tales of Peary's bravery and determination. The United States and the world celebrated this achievement, and Peary received the highest honors for his work.

Peary's legacy lives on, and his expedition is a testament to the human spirit's ability to overcome obstacles and achieve great things. His story is a reminder that with determination, courage, and perseverance, anything is possible.
PEASANT—PÉCAUT

contained no proof that he had reached the Pole. By that time most other people had come to an adverse conclusion and the sensation was over.

PEASANT (O. Fr. paysant, Mod. paysan; Lat. paganus, belonging to the pagus or country; cf. "pagan"), a countryman or rustic, either working for others, or, more specifically, owning or renting and working by his own labour a small plot of ground. Though a word of not very strict application, it is now frequently used of the rural population of such countries as France, where the land is chiefly held by small holders, "peasant proprietors." (See Allotments and Metayage.)

PEASE, EDWARD (1767–1858), the founder of a famous industrial Quaker family in the north of England, was born at Darlington on the 31st of May 1767, his father, Joseph Pease (1737–1808), being a woolen manufacturer in that town. Having retired from this business Edward Pease made the acquaintance of George Stephenson, and with him took a prominent part in constructing the railway between Stockton and Darlington. He died at Darlington on the 31st of July 1858. His second son, Joseph Pease (1799–1872), who assisted his father in his railway enterprises, was M.P. for South Durham from 1832 to 1841, being the first Quaker to sit in parliament. He was interested in collieries, quarries and ironstone mines in Durham and Yorkshire, as well as in cotton and woolen manufactories; and he was active in educational and philanthropic work. Another son, Henry Pease (1807–1851), was M.P. for South Durham from 1857 to 1865. Like all the members of his family he was a supporter of the Peace Society, and in its interests he visited the emperor Nicholas of Russia just before the outbreak of the Crimean War, and later the emperor of the French, Napoleon III.

Joseph Pease's eldest son, Sir Joseph Whitwell Pease (1828–1903), was made a baronet in 1882. He was M.P. for South Durham from 1864 to 1883 and for the Barnard Castle division of Durham from 1885 to 1903. His elder son, Sir Alfred Edward Pease (b. 1857), who succeeded to the baronetcy, became famous as a hunter of big game, and was M.P. for York from 1885 to 1892 and for the Cleveland division of Yorkshire from 1897 to 1902. A younger son, Joseph Albert Pease (b. 1860), entered parliament in 1892, and in 1908 became chief Liberal whip, being advanced to the cabinet as chancellor of the duchy of Lancaster in 1910.

Another son of Joseph Pease was Arthur Pease (1837–1898), member of parliament from 1880 to 1885 and again from 1895 to 1898. His son, Herbert Pike Pease (b. 1867), M.P. for Darlington 1888–1910, was one of the Unionist Whips.

The Diaries of Edward Pease were edited by Sir Alfred Pease in 1906.

PEAT (possibly connected with Med. Lat. petio, pecia, piece, ultimately of Celtic origin; cf. O. Celt. pet, O. Ir. pit, Welsh petrol, portion), a product of decayed vegetation found in the form of bogs in many parts of the world. The continent of Europe is estimated to contain 212,700 sq. m. of bog; Ireland has 2,838,150 acres, Canada 30,000,000 acres, and the United States 20,000,000 acres. The plants which give origin to these deposits are mainly aquatic, including reeds, rushes, sedges and mosses. Sphagnum is present in most peats, but in Irish peat Thacnum lanuginosum predominates. It seems that the disintegration of the vegetable tissues is effected partly by moist atmospheric oxidation and partly by anaerobic bacteria, yeasts, moulds and fungi, in depressions containing fairly still but not stagnant water, which is retained by an impervious bed or underlying strata. As decomposition proceeds the products become waterlogged and sink to the bottom of the pool; in the course of time the deposits attain a considerable thickness, and the lower layers, under the supercambunctum pressure of the water and later deposits, are gradually compressed and carbonized. The most favourable conditions appear to be a moist atmosphere, and a mean annual temperature of about 45° F.; no bogs are found between latitudes 45° N. and 45° S.

Peat varies from a pale yellow or brown fibrous substance, resembling turf or compressed hay, containing conspicuous plant remains, to a compact dark brown material, resembling black clay when wet, and some varieties of lignite when dry. Two typical forms may be noticed: "Hill peat" (the mountain or brown bogs of Ireland), found in mountainous districts, and consisting mainly of Sphagnum and Andromeda; and "Bottom peat" (the lowland or red bogs of Ireland), found in lakes, rivers, and brooks, and containing Hyponum. It always contains much water, up to 90%, which it is necessary to remove before the product can be efficiently employed as a fuel, and for most other purposes. A specimen dried at 106° C. had the composition: carbon=60–48%, hydrogen=6–10%, oxygen=32–55%, water=6–89%, ash=3–36%; the ash varies from 1 to 65% and consists of clay and sand, with smaller amounts of ferric oxide, lime, magnesia, &c. The specific gravity has been variously given, owing to the variable water content and air spaces; when dried and compressed, however, it is denser than water.

Peat-winning presents certain special features. The general practice is to cut a trench about a foot deep with a peculiarly shaped spade, termed in Ireland a "slane," and remove sods from 3 to 4 ft. long. When one layer has been removed, the next is attacked, and so on. If the deposit be more solid step-working may be adopted, and should water be reached recourse may be had to long-handled slamec, which are allowed to draw off water until the peat is sufficiently dry. Then step-working in the air, being repeated, is turned so as to dry equally; this process may require about six weeks. The dried sods are known as "dug peat." Excavators and dredges are now extensively used, and the drying is effected in heated chambers, both fixed and revolving.

The low value of ordinary dug peat as a fuel has led to processes for obtaining a more useful product. In M. Ekenberg's process the deposit is pulped and milled so as to make it of uniform composition, and the pulp passed into an oven maintained at 180°–200° C., where it is carbonized by superheated water. The pressed product, which resembles lignite, still contains 8 to 10% of water; it is driven off and the burden is dried. This final product is nearly equal to coal in calorific value, and has the additional advantage of a lower sulphur content—0.2 to 0.4% against about 2% in ordinary coal. M. Ziegler's method leads to the production of a useful coke. Both these processes permit the recovery of valuable by-products, especially ammonium sulphate. Experiments for obtaining a gas suitable for consumption in gasengines have been followed by commercial processes devised by the Mond Gas Corporation, London, and Crossley Bros. of Manchester, and by Caro and Frank in Germany. The processes essentially consist in destructively distilling peat in special retorts and under special conditions. The products obtained are recovered as a useful coke and also the nitrogen as ammonium sulphate.

The conversion of the nitrogen into ammonia has been the subject of much work, and is commercially pursued at a works at Carnsouflage, Ballymena, in Ireland, where the operation is not accompanied by the production of a useful product. The peat is treated with a mixture of air and water vapour in special furnaces, and the gaseous products, containing paraffin tar, acetic acid and ammonia, are led through a special scrubber to remove the tar, then through a tower containing milk of lime to absorb the acid (the calcium acetate being employed for the manufacture of acetone, &c.), and finally through a sulphuric acid tower, where the ammonia is converted into ammonium sulphate which is recovered by crystallization.

Peat has also been exploited as a source of commercial alcohol to be employed in motors. In the process founded on the experiments of R. W. Wallace and Sir W. Ramsay, which gives 25 to 26 gallons of alcohol per ton of peat, the spirit from the peat consisting mainly of a cockernalcohol, the alcohol is distilled, the distillate containing a little sulphuric acid, the product neutralized with lime and then distilled; the ammonia is also recovered. In another process a yield of 40 gallons of spirit and 66 lb. of ammonium sulphate per ton of peat is claimed.

Of other applications we may notice C. E. Nelson's process for making a paper, said to be better than ordinary wrapping; the first factory to exploit this idea was opened at Capac, Michigan, in 1906. Peat has been employed as a manure for rhododendron bushes, and recent experiments have been made to convert artificially its nitrogen into assimilable nitrates; such a process was patented by A. Muntz and S. E. Baird of Canada.

See P. R. Björling and F. T. Gissing, Peat and its Manufacture (1907); F. T. Gissing, Commercial Peat (1906); E. Nystrom, Peat and Lignite (1908), published by Department of Mines of Canada.

PÉCAUT, FELIX (1828–1898), French educationalist, a member of an old Huguenot family, was born at Salies de Béarn, in 1828. He was for some months evangelical pastor at Salies, but he had no pretence of sympathy with ecclesiastical authority
not found farther north than Guatemala, or south of Paraguay. Generally met with in large droves of from fifty to a hundred, it is of a more pugnacious disposition than the former species, and the white hunter who encounters a herd may club a tree as his only chance of safety. Peccaries are omnivorous, living on roots, fallen fruits, worms and carrion, and often inflict great devastation upon crops. Both types are so nearly allied that they will breed together freely in captivity. Unlike pigs, they never appear to produce more than two young ones at a birth.

Remains of extinct peccaries referable to the modern genus occur in the caverns and superficial deposits of South America, but not in the earlier, formations. This, coupled with the occurrence of earlier types in North America, indicates that the group is a northern one. Of the extinct North American peccaries, the typical Dicorytes occur in the Miocene Bohriolabis, which has tusks of the peccary type, approximates in the structure of its cheek-teeth to the European Miocene genus among the Susinae. From this it may be inferred that the ancestral peccaries entered America in the Upper Oligocene. PlatygONUS is an aberrant type which died out in the Pleistocene.

PECHLIN, KARL FREDRIK (1720-1796), Swedish politician and demagogue, son of the Holstein minister at Stockholm, was educated in Sweden, and entered the Swedish army. He rose to the rank of major-general, but became famous by being the type for excellence of the corrupt and egotistic Swedish parliam-entarian of the final period of the Fribetistiden (see Sweden: History); he received for many years the sobriquet of "General of the Riksdag." Pechlin first appears prominently in Swedish politics in 1760, when by suddenly changing sides he contrived to save the "Hats" from impeachment. Enraged at being thus excluded from power by their former friend, the "Caps" procured Pechlin's expulsion from the two following Riksdags. In 1796 Pechlin sold the "Hats" as he had formerly sold the "Caps," and was largely instrumental in preventing the projected indispen-sable reform of the Swedish constitution. During the revolution of 1772 he escaped from Stockholm and kept quietly in the background. In 1786, when the opposition against Gustavus III, was gathering strength, Pechlin reappeared in the Riksdag as one of the leaders of the malcontents, and is said to have been at the same time in the pay of the Russian court. In 1789 he was one of the deputies whom Gustavus III. kept under lock and key till he had changed the government into a semi-absolute monarchy. It is fairly certain that Pechlin was at the bottom of the plot for murdering Gustavus in 1792. On the eve of the assassination (March 16) the principal conspirators met at his house to make their final preparations and discuss the form of government which should be adopted after the king's death. Pechlin undertook to crowd the fatal masquerade with accomplices, but took care not to be there personally. He was arrested on the 17th of March, but nothing definite could ever be proved against him. Nevertheless he was condemned to imprisonment in the fortress of Varberg, where he died four years later.

PECHEORA, a river of N. Russia, rising in the Urals, almost on 62° N., in the government of Perm. It flows W. for a short distance, then turns N. and maintains that direction up to about 66° 20' N. It then describes a double loop, to N. and S., and after that resumes its N. course, finally emptying into the Gulf of Pechora, situated between the White Sea and the Kara Sea. Its total length is 970 m. At its mouth it forms an extended delta. Although frozen in its upper reaches for 190 days in the year and for 138 days in its lower reaches, it is navigable throughout the greater part of its course. Its drainage basin covers an area of 127,200 sq. m. The principal tributaries are, on the right, the Ilych and the USA, and on the left the Izhma, the Tsylma and the Sula.

PECK, a dry measure of capacity, especially used for grain. It contains 8 quarts or 2 gallons, and is ¼ of a bushel. The
imperial peck contains 554-548 cub. in., in the United States of America 537-6 cub. in. The word is in M.E. peck, and is found latinized as pecum or pecka. In Med. Lat. are found pecitius, "mensura frumentaria," and piclius, "mensura liquidorum" (Du Cange, Gloss. s.v.). These words seem to be connected with the Fr. picoter, to peck, of a bird, and this would identify the word with "peck," a variant of "pick," a tap or stroke of the beak, especially used of the action of a bird in picking up grain or other food. The sense-development in this case is very obscure, and the name of the measure is found much earlier than "peck" as a variant form of "pick."

PECKHAM, JOHN (d. 1270), archbishop of Canterbury, was probably a native of Sussex, and received his early education from the Clinkon monks of Lewes. About 1250 he joined the Franciscan order and studied in their Oxford convent. Shortly afterwards he proceeded to the university of Paris, where he took his degree under St Bonaventure and became regent in theology. For many years Peckham taught at Paris, coming into contact with the greatest scholars of the day, among others St Thomas Aquinas. About 1270 he returned to Oxford and taught there, being elected in 1275 provincial minister of the Franciscans in England, but he was soon afterwards called to Rome as lector sacri palatii, or theological lecturer in the scholastic school. In 1276 he returned to England as archbishop of Canterbury, being appointed by the pope on the rejection of Robert Burnell, Edward L's candidate. Peckham was always a strenuous advocate of the papal power, especially as shown in the council of Lyons in 1274. His enthronement in October 1279 marks the beginning of an important epoch in the history of the English priory. Its characteristic note was an insistence on discipline which offended contemporaries. Peckham's zeal was not tempered by discernment, and he had little gift of sympathy or imagination. His first act on arrival in England was to call a council at Reading, which met in July 1279. Its main object was ecclesiastical reform, but the provision that a copy of Magna Carta should be hung in all cathedral and collegiate churches seemed to the king a political action, and parliament declared void any action of this council touching on the royal power. Nevertheless Peckham's relations with the king were often cordial, and Edward called on him for help in bringing order into conquered Wales. The chief note of his activity was, however, certainly ecclesiastical. The crime of "plurality," the holding by one cleric of two or more benefices, was especially attacked, as also clerical absenteeism and ignorance, and laxity in the monastic life. Peckham's main instrument was a minute system of "visitation," which he used with a frequency hitherto unknown. Disputes resulted, and on some points Peckham gave way, but his powers as papal legate were such as to enable him to strengthen the court of Canterbury at the expense of the lower clergy. The famous quarrel with St Thomas of Cantilupe, bishop of Hereford, arose out of similar causes. A more attractive side of Peckham's career is his activity as a writer. The numerous manuscripts of his works to be found in the libraries of Italy, England and France, testify to his industry as a philosopher and commentator. In philosophy he represents the Franciscan school which attacked the teaching of St Thomas Aquinas on the "Unity of Form." He wrote in a quaint and elaborate style on scientific, scriptural and moral subjects and engaged in much controversy in defence of the Franciscan rule and practice. He was "an excellent maker of songs," and his hymns are characterized by a lyrical tenderness which seems typically Franciscan. Printed examples of his work as commentator and hymn writer respectively may be found in the Piramentum trium ordinum (Paris, 1512), and his office for Trinity Sunday in the "unreformed" breviary.

The chief authority on Peckham as archbishop of Canterbury, is the Registrum fratris Johannis Peckham, edited by C. Trice Martin for the Rolls Series (London, 1882-1885). A sympathetic account of Peckham's life and work is given by the Franciscan is to be found in L. Wadding, Annales minorum (Lyons, 1645, 1654). See also the article by C. L. Kingsford in Dict. Nat., Biog., and Wilkin's Concilia magnae Brittaniae (London, 1757).

PECOCK (or PECKOCK), REGINALD (c. 1305—c. 1408), English prelate and writer, was probably born in Wales, and was educated at Oriel College, Oxford. Having been ordained priest in 1421, he secured a mastership in London in 1431, and soon became prominent by his attacks upon the religious position of the Lollards. In 1444 he became bishop of St Asaph, and six years later bishop of Chichester. He was an adherent of the house of Lancaster and in 1454 became a member of the privy council. In attacking the Lollards Peckock put forward religious views far in advance of his age. He asserted that the Scriptures were not the only standard of right and wrong; he questioned some of the articles of the creed and the infallibility of the Church; he wished "his dear writers may be driven then into consent of the trewe faith otherwise than by fire and sword or hangerm " and in general he exalted the authority of reason. Owing to these views the archbishop of Canterbury, Thomas Bourchier, ordered his writings to be examined. This was done and he was found guilty of heresy. He was removed from the privy council and he only saved himself from a painful death by privately, and then publicly (at St Paul's Cross, Dec. 4, 1457), renouncing his opinions. Peckock, who has been called "the only great English theologian of the 15th century," was then forced to resign his bishopric, and was removed to Thorney Abbey in Cambridgeshire, where he doubtless remained until his death which occurred in 1458. His chief work is the famous Repressor of over-much writing (blaming of the Clergy), which was prohibited about 1455. In addition to its great importance in the history of the Lollard movement the Repressor has an exceptional interest as a model of the English of the time, Peckock being one of the first writers to use the vernacular. In thought and style alike it is the work of a man of learning and ability.

A biography of the author is added to the edition of the Repressor published by C. Babington for the Rolls Series in 1860. Peckock's other writings include the Book or Rule of Christian Religion; the Donet, "an introduction to the chief truths of the Christian faith in the form of a dialogue between father and son;" and the Foleower to the Donet. The last two works are extant in manuscript. His Book of Faith has been edited from the manuscript in the library of Trinity College, Cambridge, by J. L. Morison (Glasgow, 1900). See also John Lewis, Life of Peckoc (1744; new ed., 1820).

PECORA (plural of Lat. pecus, cattle), a term employed—in a more restricted sense—in place of the older title Ruminantia, to designate the group of ruminating artiodactyle ungulates represented by oxen, sheep, goats, antelopes, deer, giraffes, &c.

The leading characteristics of the Pecora are given in some detail in the article ARTIODACTYLA (q.v.); but it is necessary to add that the few of these large animals, such as Pecora, or true ruminants as they may be conveniently called, have a certain characteristic feature which is shared by the cud; they have no upper incisor teeth; and the lower canines are approximated to the outer incisors in such a manner that the three incisors and the one canine of the two sides collectively form a continuous semicircle of four pairs of nearly similar teeth. In the cheek-teeth the component columns are crescent-shaped, constituting the selenodont type. In the forelimbs the bones corresponding to the third and fourth metacarpals of the pig's foot are fused into a cannon-bone; and a similar condition obtains in the case of the corresponding metatarsals in the hind-limbs. There is generally no sagittal crest to the skull; and the condyle of the lower jaw is transversely elongated. Another general, although not universal, characteristic of the Pecora is the presence of simple or complex appendages in the forehead commonly known as horns. In a few existing species, such as the musk-deer and the water-deer, these appendages are absent, and they are likewise lacking in a large number of extinct members of the group, in fact in all the earlier ones. They are, therefore, a specialized feature, which has only recently attained its full development.

These horns present several distinct structural types, which may be classified as follows:—

I. The simplest type is that of the giraffe, in which three bony prominences—a single one in front and a pair behind—quite separate from the underlying bones and covered during life with skin, occupy the front surface of the skull. The summits of the hind pair are surmounted by bristly hairs. In the extinct
PECORA

Sinotherium there are two pairs of such appendages, of which the hinder are large and were probably covered during life either with skin or thin horn. In the giraffes the separation of the horns from the skull may be a degenerate character.

In the Asiatic muntjac deer we find a pair of skin-covered horns, or "pedicles," corresponding to the paired horns of the giraffe, although welded to the skull. From the summits of these pedicles arise secondary outgrowths, at first covered with skin, which (owing to the growth of a ring of bone at the base arresting the flow of blood) eventually dries up and leaves bare bone incapable of further growth. In the muntjac the bare bony part, or "antler," is small in proportion to the skin-covered pedicle, and simple in structure; but in the majority of deer the antler increases in size at the expense of the pedicle—which dwindles—and in some species, like the Siamese deer (fig. 1), the sambar and the red deer, becomes very large and more or less branched. Owing to liability to necrosis, the permanent retention of such a mass of dead bone would be dangerous; and the antlers are consequently shed annually (or every few years), to be renewed the following year, when, till the animal becomes past its prime, they are larger than their predecessors. The periodical shedding is also necessary in order to allow of this increase in size. With the exception of the reindeer, antlers are confined to the males.

III. The third type of horn is presented by the American prongbuck, or pronghorn, in which bony processes, or "cores," corresponding to the horns of the giraffe, have acquired a hornsheath, in place of skin; the sheath being in this instance forked, and annually shed and renewed, although the core is simple. The sheaths are akin to hair in structure, thus suggesting affinity with the hairs surrounding the giraffe's horns. Female prongbuck may or may not have horns.

IV. In the great majority of "Hollow-horned Ruminants," such as oxen, sheep, goats and antelopes (fig. 2), the hornsheath (or true "horn") forms a simple unbranched cone, which may be compressed, spirally twisted, or curved in one or more directions, but is permanently retained and continues to grow throughout life from the base, while it becomes worn away at the tip. Rarely, as in the four-horned antelope, there are two pairs of horns. In many cases these horns are present in both sexes.

Dr H. Gadow is of opinion that the antlers of the deer, the horn-like protuberances on the skull of the giraffe, and the true horns of the prongbuck and other hollow-horned ruminants (Bovidae) are all different stages of evolution from a single common type; the antlers of the deer being the most primitive, and the horns of the Bovidae the most specialized. From the fact that the bony horn-core of the hollow-horned ruminants first develops as a separate ossification, as do the horns of the giraffe, while the pedicle of the antlers of the deer grow direct from the frontal bone, it has been proposed to place the hollow-horned ruminants (inclusive of the prongbuck) and the giraffes in one group and the deer in another. This arrangement has the disadvantage of separating the deer from the giraffes, to which they are evidently nearly related; but Dr Gadow's work brings them more into line. Whether he is right in regarding the hollow-horned ruminants as derived from the primitive deer may, however, be a matter of opinion. One very important fact recorded by Dr Gadow is that calves and lambs shed their horns at an early age. The Bovidae are thus brought into nearer relationship with the American prongbuck (the only living ruminant which sheds its horn-cover in the adult condition) than has generally been supposed.

The above-mentioned four types of skull appendages are generally regarded as several characteristic of as many family groups, namely the Giraffidae, Cervidae, Antilocapridae and Bovidae. The two last are, however, much more closely connected than are either of the others, and should perhaps be united.

Giraffidae.—In the Giraffidae, which include not only giraffes (Giraffa) but also the okapi (Okapia) and a number of extinct species from the Lower Pliocene Tertiary deposits of southern Europe, Asia and North Africa, the appendages on the skull are of type No. 1., and may well be designated "antler-horns." Another important feature is that the lower canine has a cleft or two-lobed crown, so that it is unlike the incisors to which it is approximated. There are no upper canines; and the cheek-teeth are short-crowned (brachyodont) with a peculiar grained enamel, resembling the skin of a slug in character. The feet have only two hoofs, all traces of the small lateral pair found in many other ruminants having disappeared.

The giraffes (Giraffa) are now an exclusively African genus, and have long legs and neck, and three horns—a single one in front and a pair behind—supplemented in some instances with a rudimentary pair on the occiput.

The okapi (Okapia), which is also African but restricted to the tropical forest-region, in place of being an inhabitant of more or less open country, represents a second genus, characterized by the shorter neck and limbs, the totally different type of colouring, and the restriction of the horns to the male sex, in which they form a pair on the forehead; these horns being more compressed than the paired horns of the giraffe, and penetrating the skin at their summits (see Giraffe and Okapi). Remains of extinct species of giraffe occur in the Lower Pliocene formations of Greece, Hungary, Persia, Northern India and China. From deposits of the same age in Greece, Samos and elsewhere have been obtained skulls and other remains of Palaeotragus or Samaitherium, a ruminant closely allied to Okapia, the males of which were armed with a very similar pair of dagger-shaped horns. Hellaotherium was a much larger animal, known by a single hornless skull from the Pliocene of Greece, which may be that of a female. In the equally large
Brahmathorium and Hyocephalitherium of India the horns of the males were complex, those of the former including an occipital pair, while those of the latter arise from a common base. In both genera, as in the okapi, there is a vacuity in front of the orbit. Largest of all is Sivatherium, typically from the Lower Pliocene of Northern India, but also recorded from Adrianople, in which the skull of the male is short and wide, with a pair of simple conical horns above the eye, and a huge branching pair at the vertex. Libyatherium is an allied form from North Africa. Whether the Giraffidae were originally an African or a Euro-Asian group there is not yet sufficient evidence to decide. The family is unrepresented in the western hemisphere.

Cervidae.—In the deer-tribe, or Cervidae, the lower canine, as in the two following families, is simple and similar to the incisors.

The frontal appendages, when present, are confined (except in the case of the reindeer) to the males, and take the form of antlers, (that is, of branches, with one or two bifurcations, see fig. 11, in the foregoing description. As a general rule, the molars, and more especially the first, are partially brachyodont (short-crowned); although they are taller in the chital (Cerus axis). In the skull there are two orifices to the lachrymal duct, situated posteriad in the lower portion of the orbit. A preorbital vacuity of such dimensions as to exclude the lachrymal bone from articulation with the nasal. Upper canines usually present in both sexes, and sometimes attaining a very great size in the male (see fig. 3).

Fig. 3.—Skull of Chinese Water-Deer, Hydroelaphus inermis (adult male), a Deer without Antlers, but with large developed upper canine teeth.

Lateral digits of both fore and hind feet almost always present, and frequently the lower ends of the metacarpals and the metatarsals are divided, with the thumb absent (except in the musk-deer, Moschus). This family contains numerous species, having a wide geographical distribution, ranging in the New World from the Arctic circle as far south as Patagonia, and in the Old World throughout the whole of Europe and Asia, but absent in Africa south of the Sahara, and, of course, Australasia.

Evidently the family originated in the northern continent of the Old World, from which an entrance was effected by way of Bering Strait into America. Some of the more northern American deer, such as the wapiti, reindeer and elk (moose), are closely allied to Old World species; but there is also a group of exclusively American deer (Masama)—the only one found in Central and South America—the members of which are unlike any living Old World deer, and these must be regarded as having reached the western hemisphere at an earlier date than the wapiti, reindeer and elk (see Deer, Elk, Pappel-Deer, Muntjac, Musk-Deer, Fere David’s Deer, Reindeer, Roebuck, Water-Deer, &c.).

Remains of deer more or less nearly allied to species inhabiting the same districts are found on the greater part of the present habitat of the family. It is noteworthy, however, that certain Pliocene European deer (Anelodus) appear to be closely allied to the modern American deer (Masama). As we descend in the geological series the deer have simpler antlers, as in the European Mammuthus, then in the Pleistocene Libyatherium and Palaomeryx, constituting the family Palaomerycidæ, antlers were absent, and the crowns of the molars so low that the whole depth of the hollows between the crescentic columns is completely filled with enamel.

While in all there was no depression for a gland in front of the eye.

North America have been obtained remain of certain ruminants which seem in some degree intermediate between deer and the prongbuck. Of one of these a complete skeleton was obtained in 1901 from the Middle Miocene deposits of north-eastern California, and as mounted stands 19 in. in height at the withers. With the cylindrical right side the bone is ornamented with the antlers, which are now Bering Strait. It has already been pointed out that the Cervidae originated in the northern continent of the Old World; and that, not long after they had become known, they strayed into Africa. Unfortunately, we know at present practically nothing as to the past history of the group, all the fossil species at present discovered approximating more or less closely to existing types. We do not know, therefore, that the North America for facts in favor of the theory of an African origin of the Bovidae, final judgment

Matthew shows, however, that the skeleton of Merycodos, as the extinct ruminant is called, differs markedly from that of all deer. The most noteworthy point of distinction is in the skull, in which the facial portion is sharply bent down on the posterior basal axis; the molars are flat, and the hoofs have both a proximal and a distal crenation (antelopes, &c.), and the American prongbuck, instead of running more or less nearly parallel to the same, as in deer. Again, the cheek-teeth have the tall crowns characteristic of a large number of ruminants and artiodactyls, and the mandible showing that Merycodos can scarcely be regarded as a primitive type. As regards the general structure of the rest of the skeleton, it must suffice to say that this agrees closely with that of the ante- lopes, and the prongbuck, and differs markedly from the cervid type. In the absence of any trace of the lower extremities of the metacarpal and metatarsal bones of the lateral toes the skeleton differs from the American deer, and resembles those hollow-horned ruminants which are of the most recent origin in which the base of every detail of the skeletal structure of the species described by Mr. Matthew was it possible to arrive at an adequate conception of the affinities of this remarkable ruminant.

Bovidae.—By many modern workers the American prong- buck, pronghorn or "antelope," alone forming the genus Antil- ocapra, is regarded as representing merely a sub-family of the Bovidae, to which latter group the animal is structurally akin. In view of the fact that the animal is sometimes called the "North American pronghorns" it seems, however, at least provisionally advisable to allow the prongbuck to remain as the type of a family—Antilocomidae. The characteristic of this family is the non-deciduous antlers, which in the American prongbuck are forked, and shed annually, or every few years. The cheek-teeth are tall-crowned (hysodont), and lateral hoofs are wanting (see Prongbuck), Bovidae. Lastly, we have the great family of hollow-horned ruminants or Bovidae, in which the horns (present in the males at least of all the existing species) take the form of simple non-deciduous hollow sheaths growing upon bone cores, as a rule the molars are tall-crowned (hysodont). Usually only one orifice to the lachrymal canal, situated in the rim of the orbit. Lachrymal bone almost always articulating with the nasal. Canines absent in all but a few species. The dental formula is: 2/3, 1/1, 3/3, 3/3. The caudal is often greatly reduced. A small number of species are represented by the hofs alone, sometimes by a very rudimentary skeleton, consisting of mere irregular nodules of bone. Lower ends of the lateral metacarpals and metatarsals enclosed in a sheath. Ongulifer almost always present. Placenta with many cotyledons.

The Bovidae form a most extensive family, with members widely distributed throughout the Old World, with the exception of the Australian region; that is, the entire Arctic and northern temperate regions, no species being indigenous either to South or Central America. The home of the family was evidently the Old World, whence a small number strayed into South America, and thence, probably, the American prongbuck. It is now Bering Strait. It has already been pointed out that the Cervidae originated in the northern continent of the Old World; and that, not long after they had become known, they strayed into Africa. Unfortunately, we know at present practically nothing as to the past history of the group, all the fossil species at present discovered approximating more or less closely to existing types. We do not know, therefore, that the North America for facts in favor of the theory of an African origin of the Bovidae, final judgment
must for the present be suspended. For the various generic types see Bovidae, and the special articles referred to under that heading.

(P. L.)

PÉCS (Ger. Főnöki kisház), a town of Hungary, capital of the country of Baranya, 160 m. S.S.W. of Budapest by rail. Pep. (1900), 4,2,52. It lies on the outskirts of the Mezsek Hills, and is composed of the inner old town, which is laid out in an almost regular square, and four suburbs. Pécs is the see of a Roman Catholic bishop, and its cathedral, reputed one of the oldest churches in Hungary, is also one of the finest medieval buildings in the country. It was built in the 11th century in the Romanesque style with four towers, and completely restored in 1881-1891. In the Cathedral Square is situated the Sacellum, a substraneous brick structure, probably a burial-chapel, dating from the end of the 4th or the beginning of the 5th century. Other noteworthy buildings are the parish church, formerly a mosque of the Turkish period; the hospital church, also a former mosque, with a minaret 88 ft. high, and another mosque, the bishop's palace, and the town and county hall. Pécs has manufactories of woollens, porcelain, leather and paper, and carries on a considerable trade in tobacco, gall-nuts and wine. The hills around the town are covered with vineyards, which produce one of the best wines in Hungary. In the vicinity are valuable coal-mines, which since 1858 are worked by the Danube Steamship Company.

According to tradition Pécs existed in the time of the Romans under the name of Sompiana, and several remains of the Roman and early Christian period have been found here. In the Frankish-German period it was known under the name of Quisqueia ecclesiae; its bishopric was founded in 1000. King Ludwig I. founded here in 1367 a university, which existed until the battle of Mohács. In 1543 it was taken by the Turks, who retained possession of it till 1686.

PECTORAL, a word applied to various objects worn on the breast (Lat. pectus); thus it is the name of the ornamental plate of metal or embroidery formerly worn by bishops of the Roman Church during the celebration of mass, the breastplate of the Jewish high priest, and the metal plate placed on the breast of the embalmed dead in Egyptian tombs. The "pectoral cross," a small cross of precious metal, is worn by bishops and abbots of the Roman, and by bishops of the Anglican. communion. The term has also been used for the more general "poîtel" or "peittrel" (the French and Norman French forms respectively), the piece of armour which protected the breast of the war-horse of the middle ages.

PECULIAR, a word now generally used in the sense of that which solely or exclusively belongs to, or is particularly characteristic of, an individual; hence strange, odd, queer. The Lat. peculiaris meant primarily "belonging to private property," and is formed from peculium, private property, particularly the property given by a father to his children, or by a master to his slave, to enjoy as their own. As a term of ecclesiastical law "peculiar" is applied to those ecclesiastical districts, parishes, chapels or churches, once numerous in England, which were outside the jurisdiction of the bishop of the diocese in which they were situated, and were subject to a jurisdiction "peculiar" to themselves. They were introduced originally, in many cases by papal authority, in order to limit the powers of the bishop in his diocese. There were royal peculiar, e.g. the Chapel Royal St James's, or St George's Windsor, peculiars of the archbishop, over certain of which the Court of Peculiars exercised jurisdiction (see ARCHES, COURT OF), and peculiars of bishops and deans (see DEAN). The jurisdiction and privileges of the "peculiars" were abolished by statutory powers given to the Ecclesiastical Commissioners, by the Ecclesiastical Commissioners Acts 1856 and 1859, by the Plurality Act 1858, the Ecclesiastical Jurisdiction Act 1847, and other statutes.

PECULIAR PEOPLE, a small sect of Christian faith-healers founded in London in 1838 by John Banyard. They consider themselves bound by the literal interpretation of James v. 14, and in cases of sickness seek no medical aid but rely on oil, prayer and nursing. The community is in the main composed of simple working people, who, apart from their peculiarity, have a good reputation; but their avoidance of professional medical attendance has led to severe criticism at inquests on children who have died for want of it.

PEDAGOGUE, a teacher or schoolmaster, a term usually now applied with a certain amount of contempt, implying pedantry, dogmatism or narrow-mindedness. The Gr. παιδαγωγός (παῖς, boy, ἀγώγος, leader, ἀγων, to lead), from which the English word is derived, was not strictly an instructor. He was a slave in an Athenian household who looked after the personal safety of the sons of the master of the house, kept them from bad company, and took them to and from school and the gymnasium. He probably sat with his charges in school. The boys were put in his charge at the age of six. The παιδαγωγός, being a slave, was necessarily a foreigner, usually a Thracian or Asiatic. The Romans adopted the paedagogus or pedagogus towards the end of the republic. He probably took some part in the instruction of the boys (see SCROOOTS). Under the empire, the pedagogus was specifically the instructor of the boy slaves, who were being trained and educated in the household of the emperor and of the rich nobles and other persons; these boys lived together in a paedagogium, and were known as pueri paedagogiani, a name which has probably developed into "page" (q.v.).

PEDAL CLARINET, a contrabass instrument invented in 1891 by M. F. Besson to complete the quartet of clarinets, as the contrabass or double bassoon completes that of the oboe family; it is constructed on practically the same principles as the clarinet, and consists of a tube 10 ft. long, in which cylindrical and conical bores are successively combined so that the acoustic principles remain unchanged. The tube is doubled up twice upon itself; at the upper end the beak mouthpiece stands out like the head of a viper, while at the lower a metal tube, in the shape of a U with a wide gloxinia-shaped bell, is joined to the wooden tube. The beak mouthpiece is exactly like that of the other clarinets but of larger size, and it is furnished with a single or beating reed. There are 13 keys and 2 rings on the tube, and the fingering is the same as for the B flat clarinet except for the eight highest semitones. The compass of the pedal clarinet is as follows:

<table>
<thead>
<tr>
<th>Notation</th>
<th>Real Sounds</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>to</td>
</tr>
<tr>
<td></td>
<td>from</td>
</tr>
<tr>
<td></td>
<td>or even</td>
</tr>
<tr>
<td></td>
<td>8va basses</td>
</tr>
</tbody>
</table>

The instrument is in B flat two octaves below the B flat clarinet, and, like it, it is a transposing instrument, the music being written in a key a tone higher than that of the composition, and in order to avoid ledger lines a whole octave higher besides. The tone is rich and full except for the lowest notes, which are unavoidably a little rough in quality, but much more sonorous than the corresponding notes on the double bassoon. The upper register resembles the clarinum register of the B flat clarinet, being reedy and sweet. The instrument is used as a fundamental bass for the wood wind at Kneller Hall, and it has also been used at Covent Garden to accompany the music of Fañer and Hunding in the Nibelungen Ring.

Many attempts have been made since the beginning of the 19th century to construct contra clarinets, but all possessed inherent faults and have been discarded (see BATYPHONE). A contrabass clarinet in F, an octave below the B flat clarinet, constructed by Albert of Brussels in 1890, was, we believe, considered a success, but it differed in design from the pedal clarinet.

(K. S.)

PEDANT, one who exaggerates the value of detailed erudition for its own sake also a person who delights in a display of the exact niceties of learning; in an excessive obedience to theory without regard to practical uses. The word came into English in the latter part of the 16th century in the sense of schoolmaster, the original meaning of Ital. pedante, from which it is derived. The word is usually taken to be an adaptation of Gr. παιδακερ,
to teach. Others connect with an O. Ital. pedare, to tramp about (Lat. pes, foot), of an usher tramping about with his pupils.

PEDEN, ALEXANDER (c. 1626-1686), Scottish divine, one of the leading forces in the Covenant movement, was born at Auchinfoltch, Ayrshire, about 1626, and was educated at Glasgow University. He was ordained minister of New Luce in Galloway in 1660, but had to leave his parish under Middleton's Ejection Act in 1663. For 23 years he wandered far and wide, bringing comfort and succour to his co-religionists, and often very narrowly escaping capture. He was indeed taken in June 1673 while holding a conventicle at Knockdow, and condemned by the privy council to 4 years and 3 months' imprisonment on the Bass Rock and a further 15 months in the Tolbooth at Edinburgh. In December 1678 he was, with sixty others, sentenced to banishment to the American plantations, but the party was liberated in London, and Peden made his way north again to divide the remaining years of his life between his own country and the north of Ireland. His last days were spent in a cave in the parish of Sorn, near his birthplace, and there he died in 1686, worn out by hardship and privation. See A. Smellie, Mem. of the Covenant, ch. xxiv.

PEDERSEN, CHRISTIERN (c. 1480-1554), Danish writer, known as the "father of Danish literature," was a canon of the cathedral of Lund, and in 1510 went to Paris, where he took his master's degree in 1515. In Paris he edited the proverbs of Peder Laale and (1514) the Historia danica of Saxo Grammaticus. He showed signs of the spirit of reform, asserting that the gospels should be translated into the vernacular so that the common people might understand. He worked at a continuation of the history of Saxo Grammaticus, and became secretary to Christian II., whom he followed into exile in 1525. In Holland he translated the New Testament (1529) and the Psalms (1531) from the Vulgate, and, becoming a convert to the reformed religion, he issued several Lutheran tracts. After his return to Denmark in 1532 he set up a printing press at Malmö. He published a Danish version (Kronike om Holger Danske) of the French romance of Ogier the Dane, and another of the Charlemagne legends, which is probably derived immediately from the Norwegian Karlamagnus saga. His greatest work, the Danish version of the Holy Scriptures, which is known generally as "Christian III.'s Bible," is an important landmark in Danish literature. It was founded on Luther's version, and was edited by Peder Paladius, bishop of Zealand, and others.

PEDESTAL (Fr. piedestal, Ital. piedestallo, foot of a stall), a term generally applied to a support, square, octagonal or circular on plan, provided to carry a statue or a vase. Although in Syria, Asia Minor and Tunisia the Romans occasionally raised the columns of their temples or propylaea on square pedestals, in Rome itself they were employed only to give greater importance to isolated columns, such as those of Trajan and Antoninus, or as a podium to the columns employed decoratively in the Roman triumphal arches. The architects of the Italian revival, however, conceived the idea that no order was complete without a pedestal, and as the orders were by them employed to divide up and decorate a building in several storeys, the cornee of the pedestal was carried through and formed the sills of their windows, or, in open arcades, round a court, the balustrade of the arcade. They also would seem to have considered that the height of the pedestal should correspond in its proportion with that of the column of pilaster it supported; thus in the church of St John Lateran, where the applied order is of considerable dimensions, the pedestal is 13 ft. high instead of the ordinary height of 3 to 5 ft.

PEDICULOSIS, or PHITIESIASIS, the medical term for the pathological symptoms in man due to the presence of lice (pediculi), either on the head (pediculus capitis), body (pediculus corporis), or scutum (pediculus scutum), or pubes (pediculus pubis).

PEDIGREE, a genealogical tree, a tabular statement of descent (see Genealogy). The word first appears at the beginning of the 13th century and takes an extraordinary variety of forms, e.g. pedicree, pe de gre, petegrew, petigru, &c. It is generally accepted that these point to a corruption of Fr. pied de grue, foot of a crane, and that the probable reference is to the marks resembling the claw of a bird found in old genealogies showing the lines of descent. Such etymologies as Minshew's par degrés, by degrees, or père degrés, descent by the father, are mere guesses.

PEDIPEL, Arachnida (q.v.) related to the spiders, and serving in a measure to bridge over the structural interval between the latter and the scorpions. The appendages of the second pair are large and prehensile, as in scorpions, but are armed with spines, to impale and hold prey. The appendages of the third pair, representing the first pair of walking legs in spiders and scorpions, are, on the contrary, long, attenuated and many-jointed at the end. Like the antennae of insects, they act as feelers. It is from this structural feature that the term "pedipalpi" has been derived. In the tailless division of the Pedipalpi, namely the Amblypygi of which Phrynus is a commonly cited type, these tactile appendages are exceedingly long and lash-like, whereas in the tailed division, the Uropygi, of which Thelephorus is best known, the limb is much shorter and less modified. Thelephorus and its allies, however, have a long tactile caudal flagellum, the homologue of the scorpion's sting; but its exact use is unknown. A third division, the Tartarides, a subordinate group of the Uropygi, contains minute Arachnida differing principally from the typical Uropygi in having the caudal process unjointed and short. Apart from the Tartarides, the Pedipalpi

---

PEDIPALPI

Mexican tailed Pedipalp (Masuigoproetus giganteus).
are large or medium-sized Arachnida, nocturnal in habits and spending the day under stones, logs of wood or loosened bark. Some species of the Uropygi (Thelyphonidae) dig burrows; and in the east there is a family of Amblypygi, the Charontiidae, of which many of the species live in the recesses of deep caves. Specimens of another species have been found under stones between tide marks in the Andaman Islands. The Pedalipi feed upon insects, and like spiders, are oviparous. The eggs after being laid are carried about by the mother, adhering in a glutinous mass to the underside of the abdomen.

Pedalipi date back to the Carboniferous Period, occurring in deposits of that age both in Europe and North America. Moreover, the two main divisions of the order, which were as sharply differentiated then as they are now, have existed practically unchanged from that remote epoch.

In spite of the untold ages they have been in existence, the Pedalipi are more restricted in range than the scorpions. The Uropygi are found only in Central and South America and in south and eastern Asia, from India and south China to the Solomon Islands. The absence of the entire order from Africa is an interesting fact. The distribution of the Amblypygi and Uropygi covers that of the Uropygi, but there is a vast extension from India throughout the subtropical and southern Africa. Both groups are unknown in Madagascar, in Australia, with the exception possibly of the extreme north, and in New Zealand. Very little can be said with certainty about the distribution of the Tartarides. They have been recorded from the Indian Region, West Africa and sub-tropical America.

PEDOMETER (Lat. pes, foot, and Gr. μέτρων, measure), an apparatus in the form of a watch, which, carried on the person of a walker, counts the number of paces he makes, and thus indicates approximately the distance travelled. The ordinary form has a dial-plate marked for yards and miles. The registration is effected by the fall of a heavy pendulum, caused by the percussion of each step. The pendulum is forced back to a horizontal position by a delicate spring, and with each stroke a fine-toothed ratchet-wheel connected with it is moved round a certain length. The ratchet communicates with a train of wheels which work the dial-hands. In using the apparatus a measured mile or other known distance is walked and the indication thereby made on the dial-plate observed. According as it is too great or too small, the stroke of the pendulum is shortened or lengthened by a screw. Obviously the pedometer is little better than an ingenious toy, depending even for rough measurements on the uniformity of pace maintained throughout the journey measured.

PEDRO II. (1825-1891), emperor of Brazil, came to the throne in childhood, having been born on the 2nd of December 1825, and proclaimed emperor in April 1831, upon the abdication of his father. He was declared of full age in 1840. For a long period few thrones appeared more secure, and his prosperous and beneficent rule might have endured throughout his life but for his want of energy and inattention to the signs of the times. The rising generation had become honeycombed with republicanism, the prospects of the imperial succession were justly regarded as unsatisfactory, the higher classes had been estranged by the emancipation of the slaves, and all these causes of discontent found expression in a military revolt, which in November 1889 overthrew the seemingly solid edifice of the Brazilian Empire in a few hours. Dom Pedro retired to Europe, and died in Paris on the 5th of December 1891. The chief events of his reign had been the emancipation of the slaves, and the war with Paraguay in 1864-70. Dom Pedro was a model constitutional sovereign, and a munificent patron of science and letters. He travelled in the United States (1870), and thrice visited Europe (1871-72, 1875-77, 1886-88).

PEEBLES, a royal and police burgh and county town of Peeblesshire, Scotland, situated at the junction of Eddleston Water with the Tweed. Pop. (1901), 5766. It is 27 m. south of Edinburgh by the North British Railway (22 m. by road), and is also the terminus of a branch line of the Caledonian system from Carstairs in Lanarkshire. The burgh consists of the new town, the principal quarter, on the south of the Eddleston, and the old on the north; the Tweed is crossed by a handsome five-arched bridge. Peebles is a noted haunt of anglers, and the Royal Company of Archers shoot here periodically for the silver arrow given by the burgh. The chief public buildings are the town and county halls, the corn exchange, the hospital and Chambers Institution. The last was once the town house of the earls of March, to Peebles by William Chambers, the publisher, in 1789. The site of the castle, which stood till the beginning of the 18th century, is now occupied by the parish church, built in 1887. Of St Andrew's Church, founded in 1195, nothing remains but the tower, restored by William Chambers, who was buried beside it in 1883. The church of the Holy Rood was erected by Alexander III. in 1261, to contain a supposed remnant of the true cross discovered here. The building remained till 1784, when it was nearly demolished to provide stones for a new parish church. Portions of the town walls still exist, and there are also vaulted cellars constructed in the 16th and 17th centuries as hiding-places against Border freebooters. The old cross, which had stood for several years in the quadrangle of Chambers Institution, was restored and erected in High Street in 1895. The industries consist of the manufactures of woollens and tweeds, and of meal and flour mills. The town is also an important agricultural centre.

The name of Peebles is said to be derived from the peblys, or tents, which the Gadeni pitched here in the days of the Romans. The place was early a favourite residence of the Scots kings when they came to hunt in Ettrick forest. It probably received its charter from Alexander III. in 1261, and was the scene of the poem of Peblis to the Play, ascribed to James I. In 1545 the town sustained heavy damage in the expedition led by the 1st earl of Hertford, afterwards the protector Somerset, and in 1604 a large portion of it was destroyed by fire. Though James VI. extended its charter, Peebles lost its importance after the union of the Crowns.

The land beyond the north of the Tweed, one mile west of Peebles, stands Neidpath Castle. The ancient peel tower dates probably from the 13th century. Its first owners were Tweeddale Frasers or Frisels, from whom it passed, by marriage, to the Hays of Yester in Haddingtonshire, earls of Tweeddale. It was besieged and taken by Cromwell in 1650. The third earl of Tweeddale (1645-1713) sold it to the duke of Queensberry in 1686. The earl of Wemyss succeeded the Neidpath property in 1810.

PEEBLES Bh, or TWEEDDALE, a southern inland county of Scotland, bounded N. and N.E. by Edinburghshire, E. and S. by Selkirkshire, S. by Roxburghshire, and W. by Dumfriesshire. Its area is 222,590 acres or 547-8 sq. m. The surface consists of a succession of hills, which are highest in the south, broken by the vale of the Tweed and the glesns formed by its numerous tributaries. South of the Tweed the highest points are Broad Law and Cramalt Craig on the confines of Selkirkshire (each 2723 ft.), while north of the river are, in the west centre, Broughton Heights (1872), Trahenna Hill (1792), Penvalla (1764) and Ladyurd Hill (1724), and in the north-west the Pentland culminations of Mount Maw (1753), Byrchope Mount (1752) and King Seat (1751). The lowest point above sea-level is on the banks of the Tweed, where it passes into Selkirkshire (about 450 ft.). The peat, which is ample, is worked on the larger rivers, and it is from the fact that for the first 35 m. of its course of 97 m. it flows through the south of the shire, the county derives its alternative name of Tweeddale. Its affluents on the right are the Stanhope, Drummelzier, Manor and Quair; on the left, the Biggar, Lyne, Eddleston and Leithen. The North Esk, rising in Cairnmuir, forms the boundary line between Midlothian and Peeblesshire for about four miles, during which it presents some very charming pictures, especially at Habbie's Howe, where Allan Ramsay laid the scene of the Gentle Shepherd. For 4 m. of its course the South Medwin divides the south-western part of the parish of Linton from Lanarkshire. Portmore Loch, a small sheet of water 2 m. north-west of Linton, is noted as one of the few in Scotland which is not deprived of the sea, and is the only lake in the county. The shire is in favour with anglers, its streams being well stocked and unpoluted, and few restrictions being placed on the fishing.
Geology.—The southern elevated portion of the county is occupied by Silurian rocks, mainly by shales and grits or greywackes of Llandovery age. These are followed upward by a line running south-west from the Moorfoot Hills through Linlithgowshire, Stobo, and Caradoc rocks, which form a belt some four to five miles in breadth; they are composed of radiolarian cherts and mudstones with associated conglomerates, volcanic rocks of Arenig age, and of shales, grits and limestones of Llandovery and Caradoc age. The general direction of strike of all these formations is south-west—north-east, but the dips are sometimes misleading through occasional inversion of the strata, especially in the north of the county. Other Silurian and Wenlock rocks are also found; these are associated with a middle division, volcanic rocks, porphyrites, tuffs, &c., which are unconformable on the lower marls in this area; and an upper division of sandstones and conglomerates. The south-western extremity of the Edinburgh coalfield just enters this county over the north-west border where a slice of Carboniferous strata is found let down between Silurian and Old Red rocks by two important faults. Both Calcariferous sandstone and Carboniferous limestone occur, with useful beds of coal, limestone, ironstone, freestone and shale. An outlier of Carboniferous limestone, surrounded by Lower Old Red Sandstone, lies south of Linton. Much glacial boulders lay on the surface, and sand and silt are on the higher ground, while marls and sandstones are found in the valleys.

Climate and Industries.—The annual rainfall averages from 33 to 41 in.; the mean temperature for the year is 47° F., for January 38° F., and for July 59° F. The character of the soil varies considerably, peat, gravel and clay being all represented. The low-lying lands consist generally of rich loam, composed of sand and clay. The farming is pastoral rather than arable. The average holding is about 200 acres of arable land, with pastureage for from 600 to 800 sheep. From top by speaking, one-fifth of the total area is under cultivation. Oats are the chief grain and turnips the chief root crop. The hill pastures are better suited to sheep than to cattle, but both flocks and herds are comparatively large. Cheviots and half-breds are preferred for the grass lands, the heathery ranges being stocked with black-faced sheep. Crosses of Cheviots, black-faced and half-bred ewes with Leicestershire rams are common. The favourite breed of cattle is a cross between Ayrshires and short-horns, the cows being Ayrshire. Many of the horses are Clydesdales bred in the county. Pig-keeping is on the decline. A few acres have been laid down as nurseries and market gardens, and about 10,000 acres are under woodland, especially at Dalwic, where larch and horse-chestnut were first grown in Scotland. Apart from agriculture, the only industries are the woollen factories and flax mills at Peebles and Innerleithen.

The North British railway crosses the county in the north from Leadburn to Dolphintown, and runs down the Eddleston valley from Leadburn to Peebles and Thornicote, while in the south the Caledonian railway connects the county town with Biggar in Lanarkshire.

Population and Administration.—In 1901 the population numbered 15,066 or 43 persons to the sq. m. In 1901 one person spoke Gaelic only, 72 Gaelic and English. The chief towns are Peebles (pop. 5,066) and Innerleithen (2,181). West Linton, on the Tweed, and Traquair and others in the central part of the county, form a good market town. Selkirkshire to return one member to parliament, the electors of Peebles town voting with the county. Peeblesshire forms a sheriffdom with the Lothians and a sheriff-substitute sits in the county town. There is a high school in Peebles, and one or more schools in the county usually earn grants for secondary education.

History.—The country was originally occupied by the Gadani, a British tribe, of whom there are many remains in the shape of camps and sepulchral mounds (in which stone coffins, axes and hammers have been found), while several place-names (such as Peebles, Dalwic and Stobo) also attest their presence. The standing stones near the confluence of the Lyne and Tweed are supposed to commemorate a Cymric chief. The natives were reduced by the Romans, who have left traces of their military rule in the fine camp at Lyne, locally known as Randall's Walls. The hill-side terraces at Romanno are conjectured, somewhat fancifully, to be remains of a Roman method of cultivation. On the retreat of the Romans the Gadani came into their own again, and although they are said to have been defeated by King Arthur at Cademuir in 530, they held the district until the consolidation of the kingdom after Malcolm II's victory at Carham in 1018, before which the land, constantly harried by Danes, was nomi-

PEEL, SIR ROBERT

At Harrow, according to the accounts of his contemporaries, Peel was a steady industrious boy, the best scholar in the school, fonder of country walks with a friend than of school games, but reputed one of the best football players. At Christ Church, where he entered as a gentleman commoner, he was the first who, under the new examination statutes, took a first class both in classics and in mathematics. His examination for his B.A. degree in the university academical oven, on presentation, was a public audience, who came to hear the first man of the day. From his classical studies Robert Peel derived not only the classical, though somewhat pompous, character of his speeches and the Latin quotations with which they were often happily interspersed but something of his lofty ideal of political ambition. To his mathematical training, which was then not common among public men, he never doubt owed in part his method, his clearness, his great power of grasping steadily and working out difficult and complicated questions. His speeches show that, in addition to his academical knowledge, he was well versed in English literature, in history, and in the principles of law, in order to study which he entered at Lincoln’s Inn. But while reading hard he did not neglect to develop his tall and vigorous frame, and, though he lost his life partly through his bad riding, he was always a good shot and an untiring walker after game. His Oxford education confirmed his attachment to the Church of England. His practical mind remained satisfied with the doctrines of his youth, and he never showed that he had studied the great religious controversies of his day.

In 1809, being then in his twenty-second year, he was brought into parliament for the close borough of Cashel, which he afterwards exchanged for Chippenham, and commenced his parliamentary career under the eye of his father, then member for Tamworth, who fondly saw in him the future leader of the Tory party. In that House of Commons sat Wilberforce, Windham, Tierney, Grattan, Perceval, Castlereagh, Plunkett, Romilly, Mackintosh, Burdett, Whitbread, Horner, Brougham, Parnell, Huskisson, and, above all, George Canning. Lord Palmerston entered the house two years earlier, and Lord John Russell three years later. Among these men young Peel had to rise. And he rose, not by splendid eloquence, by profound political philosophy or by great originality of thought, but by the closest attention to all his parliamentary duties, by a study of all the business of parliament, and by a style of speaking which owed its force not to high flights of oratory, but to knowledge of the subject in hand, clearness of exposition, close reasoning, and tact in dealing with a parliamentary audience. With the close of the struggle against revolutionary France, political progress in England was soon to resume the march which that struggle had arrested. Young Peel’s lot, however, was cast, through his father, with the Tory party. In his maiden speech in 1810, seconding the address, he defended the Walcheren expedition, which he again vindicated soon afterwards against the report of Lord Porchester’s committee. It is said that even then his father had discerned in him a tendency to think for himself, and told Lord Liverpool that to make sure of his support it would be well to place him early in harness. At all events he began official life in the Ministry of Lord Castlereagh, the minister responsible for the discovery and manufactures in the latter part of the 18th century. His ancestors were Yorkshire yeomen in the district of Craven, whence they migrated to Blackburn in Lancashire. His grandfather, Robert Peel, first of Peelfield, and afterwards of Brookside, near Blackburn, was a calico-printer, who, appreciating the discovery of his townsmen Hargreaves, took to cotton-spinning with the spinning-jenny and grew a wealthy man. His father, Robert Peel (1750-1830), third son of the last-named, worked on the same business at Bury with still greater success, in partnership with his uncle, Mr Haworth, and Mr Yates, whose daughter, Ellen, he married. He made a princely fortune, bought the family manor of Goytley, became a member of parliament for the neighbouring borough of Tamworth, combination of fortune and honour, as well as ardent, supporter of Pitt, contributed munificently towards the support of that leader’s war policy, and was rewarded with a baronetcy (1800).

Contested Coventry in 1863; in 1865 he was elected in the liberal interest for Warwick, for which he sat until his elevation to the peerage. In December 1868 he was appointed parliamentary secretary to the poor law board. This office he filled until 1871, when he became secretary to the board of trade, an appointment which he held for two years. In 1873-1874 he was patronage secretary to the treasury, and in 1880 he became under-secretary for the home department. On the retirement of Mr Brand (afterwards Viscount Hampden) in 1884, Peel was elected Speaker. He was thrice re-elected to the post, twice in 1886, and again in 1892. Throughout his career as Speaker he exhibited conspicuous impartiality, combined with a perfect knowledge of the traditions, usages and forms of the house, soundness of judgment, and readiness of decision upon all occasions; and he will always rank as one of the greatest holders of this important office. On the 8th of April 1895 he announced that for reasons of health he was compelled to retire. The farewell ceremony was of a most impressive character, and warm tributes were paid from all parts of the house. He was created a viscount and granted a pension of £4,000 for life. He was presented with the freedom of the City of London in July 1895. The public interest in the ex-Speaker’s later life centred entirely in his somewhat controversial connexion with the drink traffic. A royal commission was appointed in April 1896 to inquire into the operation and administration of the licensing laws, and Viscount Peel was appointed chairman. In July 1896 Lord Peel drew up a draft report for discussion, in five parts. Some differences of opinion arose in connexion with the report, and at a meeting of the commissioners on the 12th of April 1899, when part 5 of the draft report was to be considered, a proposal was made to substitute an alternative draft for Lord Peel’s, and also a series of alternative drafts for the four sections already discussed. Lord Peel declined to put these proposals, and left the room. Sir Algernon West was elected to the chair, and ultimately two main reports were presented, one section agreeing with Lord Peel, and the other—including the majority of the commissioners—presenting a report which differed from his in several important respects. The Peel report recommended that a large reduction in the number of licensed houses should be immediately effected, and that no compensation should be paid from the public rates or taxes, the money for this purpose being raised by an annual licence-rental levied on the rateable value of the licensed premises; it at once became a valuable weapon in the hands of advancing reformers. Lord Peel married in 1862, and had four sons and two daughters (married to Mr J. Rochfort Maguire and to Mr C. S. Goldman). His eldest son, William Robert Wellesley Peel (b. 1866), married the daughter of Lord Ashton; he was Unionist M.P. for South Manchester from 1900 to 1905, and later for Taunton, and also acted as Municipal Reform leader on the London County Council.

PEEL, SIR ROBERT, Bart. (1758-1830), English statesman, was born on the 3th of February 1786 at Chamber Hall, in the neighbourhood of Bury, Lancashire, or, less probably, at a cottage near the same hall. He was a scion of that new aristocracy of wealth which sprang up from the progress of manufactures in the latter part of the 18th century. His ancestors were Yorkshire yeomen in the district of Craven, whence they migrated to Blackburn in Lancashire. His grandfather, Robert Peel, first of Peelfield, and afterwards of Brookside, near Blackburn, was a calico-printer, who, appreciating the discovery of his townsmen Hargreaves, took to cotton-spinning with the spinning-jenny and grew a wealthy man. His father, Robert Peel (1750-1830), third son of the last-named, worked on the same business at Bury with still greater success, in partnership with his uncle, Mr Haworth, and Mr Yates, whose daughter, Ellen, he married. He made a princely fortune, bought the family manor of Goytley, became a member of parliament for the neighbouring borough of Tamworth, combination of fortune and honour, as well as ardent, supporter of Pitt, contributed munificently towards the support of that leader’s war policy, and was rewarded with a baronetcy (1800).
sects and raising the character of the people. But his greatest service to Ireland as secretary was the institution of the regular Irish constabulary, nicknamed after him "Peelers," for the protection of life and property in a country where both were insecure. His moderation of tone did not save him from the violent abuse of O'Connell, whom he was ill advised enough to challenge in an affair which covered them both with ridicule. In 1817 he obtained the highest parliamentary distinction of the Tory party by being elected member for the university of Oxford—an honour for which he was chosen in preference to Canning on account of his hostility to Roman Catholic emancipation, Lord Eldon lending him his best support. In the following year he resigned the Irish secretariaship, of which he had long been very weary, and remained out of office till 1821. But he still supported the ministers, though in the affair of Queen Caroline he stood aloof, disapproving some steps taken by the government, and sensitive to popular opinion; and when Canning retired on account of this affair Peel declined Lord Liverpool's invitation to take the vacant place in the cabinet. During this break in his tenure of office he had some time for reflection, which there was enough in the aspect of the political world to move. But early office had done its work. It had given him excellent habits of business, great knowledge and a high position; but it had left him somewhat stiff and punctilious, too cold and reserved and over anxious for formal justifications when he might well have left his conduct to the judgment of men of honour and the heart of the people. At the same time he was no pedant in business; in corresponding on political subjects he loved to throw off official forms and communicate his views with the freedom of private correspondence; and where his confidence was given, "it was given without reserve."

At this period he was made chairman of the bullion committee on the death of Horner. He was chosen for this important office by Huskisson, Ricardo and their fellow-economists, who saw in him a mind open to conviction, though he owed hereditary allegiance to Pitt's financial policy, and had actually voted with his Pittite father for a resolution of Lord Liverpool's government asserting that Bank of England notes were equivalent to legal coin. The choice proved judicious. Peel was converted to the currency doctrines of the economists, and proclaimed his conversion in a great speech on the 24th of May 1819, in which he moved and carried four resolutions embodying the conceptions of the bullion committee in favour of a return to cash payments. This laid the foundation of his financial reputation, and his co-operation with the economists tended to give a liberal turn to his commercial principles. In the course he took he somewhat diverged from his party, and particularly from his father, who remained faithful to Pitt's depreciated paper, and between whom and his schismatic son a solemn and touching passage occurred in the debate. The author of the Bank Restriction Acts had often to defend his policy, and he did so with vigour. The act is sometimes said to have been hard on debtors, including the nation as debtor, because it required debts to be paid in cash which had been contracted in depreciated paper; and Peel, as he had been most frequent finder in the courts, was naturally biased by his personal interests. But it is an act of the Bank Restriction Acts, under which the depreciated paper had circulated, themselves contained a provision for a return to cash payments six months after peace.

In 1820 Peel married Julia, daughter of General Sir John Floyd, who bore him five sons and two daughters. The writers who have most severely censured Sir Robert Peel as a public man have dwelt on the virtues and happiness of his private and domestic life. He was not only a most loving husband and father but a true and warm-hearted friend. In Whitelaw Gardens or at Drayton Manor he gathered some of the most distinguished intellects of the day. He indulged in free and cheerful talk, and sought the conversation of men of science; he took delight in art, and was a great collector of pictures; he was fond of farming and agricultural improvements; he actively promoted useful works and the advancement of knowledge; he loved making his friends, dependants, tenants and neighbours happy. And, cold as he was in public, few men could be more bright and genial in private than Sir Robert Peel.

In 1821 Peel continued to strengthen the enfeebled ministry of Lord Liverpool by becoming home secretary; and in that capacity he had again to undertake the office of coercing the growing discontent in Ireland, of which he remained the real administrator, and had again to lead in the House of Commons the opposition to the rising cause of Roman Catholic emancipation. In 1825, being defeated on the Roman Catholic question in the House of Commons, he wished to resign office, but Lord Liverpool pleaded that his resignation would break up the government. He found a congenial task in reforming and humanizing the criminal law, especially those parts of it which related to offences against property and offences punishable by death. The five acts in which Peel accomplished this great work, as well as the great speech of the 9th of March 1826, in which he opened the subject to the house, will form one of the most solid and enduring monuments of his fame. Criminal law reform was the reform of Romilly and Mackintosh, from the hands of the latter of whom Peel received it. But the masterly bills in which it was embodied were the bills of Peel—not himself a creative genius, but, like the founder of his house, a profound appreciator of other men's creations, and unrivalled in the power of giving them practical and complete effect.

In 1827 the Liverpool ministry was broken up by the fatal illness of its chief, and under the new premier, George Canning, Peel, like the duke of Wellington and other high Tory members of Lord Liverpool's cabinet, refused to serve. Canning and Peel were rivals; but the great speech of the 9th of March 1826, in which Peel introduced his: remedy that which was certainly, in part at least, a real difference of connexion and opinion. Canning took a Liberal line, and was supported by many of the Whigs; the seceders were Tories, and it is difficult to see how their position in Canning's cabinet could have been otherwise than a false one. Separation led to public coolness and occasional approaches to bitterness on both sides in debate. But there seems no ground for exaggerated complaints against Peel's conduct. Canning himself said to a friend that "Peel was the only man who had behaved decently towards him." Their private intercourse remained uninterrupted to the end; and Canning's son afterwards entered public life under the auspices of Peel. The charge of having urged Roman Catholic emancipation on Lord Liverpool and causing Canning for being a friend to it in 1827, made against Sir Robert Peel in the fierce corn-law debates of 1846, has been withdrawn by those who made it.

In January 1828, after Canning's death, the duke of Wellington formed a Tory government, in which Peel was home secretary and leader of the House of Commons. This cabinet, Tory as it was, did not include the impracticable Lord Eldon, and did include Huskisson and three more friends of Canning. Its policy was to endeavour to stave off the growing demand for organic change by administrative reform, and by lightening the burdens of the people. The civil list was retrenched with an unsparing hand, the public expenditure was reduced lower than ever before. Every act that should have been done was permitted under a sliding scale of duties. Peel also introduced into London the improved system of police which he had previously established with so much success in Ireland. But the tide ran too strong to be thus headed. First the government were compelled, after a defeat in the House of Commons, to acquiesce in the repeal of the Test and Corporation Acts, Peel bringing over their High Church supporters, as far as he could. Immediately afterwards the question of Roman Catholic emancipation was brought to a crisis by the election of O'Connell for the county of Clare. In August Peel expressed to the duke of Wellington his conviction that the question must be settled. He wrote that out of office he would co-operate in the settlement but in his judgment it should be accomplished by other hands than his. To this the duke assented, but in January 1829, owing to the declared opinions of the king, of the House of Lords, and of the Church against a change of policy, Wellington came to the
conclusion that without Peel's aid in office there was no prospect of success. Under that pressure Peel consented to remain, and all the cabinet approved. The consent of the king, which could scarcely have been obtained except by the duke and Peel, was extorted, withdrawn (on an understanding that for the future), and again extorted; and on the 5th of March 1839 Peel proposed Roman Catholic emancipation in a speech of more than four hours. The apostate was overwhelmed with obloquy. Having been elected for the university of Oxford as a leading opponent of the Roman Catholics, he had thought it right to resign his seat on being converted to emancipation. His friends put him again in nomination, but he was defeated by Sir R. H. Inglis. He took refuge in the close borough of Westbury, whence he afterwards removed to Tamworth, for which he sat till his death. Catholic emancipation was forced on Peel by circumstances; but it was mainly owing to him that the measure was complete, and based upon equality of civil rights. This great concession, however, did not save the Tories government. The French Revolution of July 1830 gave fresh strength to the movement against them, though, schooled by the past, they promptly recognized King Louis Philippe. The parliamentary reform movement was joined by some of their offended Protestant supporters. The duke of Wellington committed them fatally against all reform, and the elections went against them on the demise of the Crown; they were beaten on Sir H. Parnell's motion for a committee on the civil list, and Wellington took the opportunity to resign rather than deal with reform.

While in office, Peel succeeded to the baronet's. Drayton Manor and a great estate by the death of his father (May 3, 1830). The old man had lived to see his fondest hopes fulfilled in the greatness of his son; but he had also lived to see that a father must not expect to fix his son's opinions—above all, the opinions of such a son as Sir Robert Peel, and in such an age as that which followed the French Revolution.

Sir Robert Peel's resistance to the Reform Bill won back for him the allegiance of his party. His opposition was resolute but it was temperate, and once only he betrayed the suppressed fire of his temper, in the historical debate of the 22nd of April 1831, when his speech was broken off by the arrival of the king to dissolve the parliament which had thrown out reform. He refused to join the duke of Wellington in the desperate enterprise of forming a Tory government at the height of the storm, when the Grey ministry had gone out on the refusal of the king to promise them an unlimited creation of peers. By this conduct he secured for his party the full benefit of the reaction which he no doubt knew was sure to ensue. The general election of 1832, after the passing of the Reform Bill, left him with hardly 150 followers in the House of Commons; but this handful rapidly swelled under his management into the great Conservative party. He frankly accepted the Reform Act as irrevocable, taught his party to register instead of despairing, appealed to the intelligence of the middle classes, whose new-born power he appreciated, steadily supported the Whig ministries under the Raddises and O'Connell, and gained every moral advantage which the most dignified and constitutional tactics could afford. To this policy, and to the great parliamentary powers of its author, it was mainly due that, in the course of a few years, the Conservatives were as strong in the reformed parliament as the Tories had been in the unreformed. It is vain to deny the praise of genius to such a leader, though the skill of a pilot who steered for many years over such waters may sometimes have resembled craft. But the duke of Wellington's emphatic eulogy on him was, 1Of all the men I ever knew, he had the greatest regard for truth.2 The duke meant that if he ever formed a cabinet, his own would be the king's government to be carried on in a reformed parliament." This was mainly solved by the temperate and constitutional policy of Sir Robert Peel, and by his personal influence on the debates and proceedings of the House of Commons during the years which followed the Reform Act.

In 1834, on the dismissal of the Melbourne ministry, power came to Sir Robert Peel before he expected or desired it. He hurried from Rome at the call of the duke of Wellington, whose sagacious modesty yielded him the first place, and became prime minister, holding the two offices of first lord of the treasury and chancellor of the exchequer. He vainly sought to include in his cabinet two of the Whigs Lord Stanley and Sir James Graham. A dissolution gave him a great increase of strength in the house, but not enough. He was outvoted on the election of the speaker at the opening of the session of 1835, and, after struggling on for six weeks longer, resigned on the question of appropriating part of the revenues of the Church in Ireland to national education. His time had not yet come; but the capacity, energy and resource he displayed in this short tenure of office raised him immensely in the estimation of the house, his party and the country. Of the great budget of practical reforms which he brought forward, the plan for the commutation of tithes, the ecclesiastical commission, and the plan for settling the question of dissenters' marriages bore fruit.

From 1835 to 1840 he pursued the same course of patient and far-sighted opposition. In 1837 the Conservative members of the House of Commons gave their leader a grand banquet at Merchant Taylors' Hall, where he proclaimed in a great speech the creed and objects of his party. In 1839, the Whigs having resigned on the Jamaica Bill, he was called on to form a government, and submitted names for a cabinet, but resigned the commission owing to the young queen's persistent refusal to part with any Whig ladies of her household (see VICTORIA, QUEEN). In 1846 he was hurried into a premature motion of want of confidence. But in the following year a similar motion was carried by a majority of one, and the Whigs ventured to appeal to the country. The result was a majority of ninety-one against a motion on a motion of want of confidence in the autumn of 1841, upon which they resigned, and Sir Robert Peel became first lord of the treasury, with a commanding majority in both Houses of Parliament.

The crisis called for a master-hand. The finances were in disorder. For some years there had been a growing deficit, estimated for 1842 at more than two millions, and attempts to supply this by additions to assessed taxes and customs duties had failed. The great financier took till the spring of 1842 to mature his plans. He then boldly supplied the deficit by imposing an income-tax on all incomes above £50 a year. He accompanied this tax with a reform of the tariff, by which prohibitory duties were removed and other duties abated on a vast number of articles of import, especially the raw materials of manufactures and prime articles of food. The increased consumption, as the reformer expected, counterbalanced the reduction of duty. The income-tax was renewed and the reform of the tariff carried still farther on the same principle in 1845. The result was, in place of a deficit of upwards of two millions, a surplus of five millions in 1845, and the removal of seven millions and a half of taxes up to 1847, not only without loss, but with gain to the ordinary revenue of the country. The prosperous state of the finances and of public affairs also permitted a reduction of the interest in a portion of the national debt, giving a yearly saving at once of £625,000, and ultimately of a million and a quarter to the public. In 1844 another great financial measure, the Bank Charter Act, was passed and, though severely controverted and thrice suspended at a desperate crisis, has ever since regulated the currency of the country. In Ireland O'Connell's agitation for the repeal of the Union had now assumed threatening proportions, and verged upon rebellion. The great agitator was prosecuted, with his chief adherents, for conspiracy and sedition; and, though the conviction was quashed for informality, repeal was quelled in its chief. At the same time a healing hand was extended to Ireland. The Charitable Bequests Act gave Roman Catholics a share in the additional revenue of charitable annuities, and power to endow their own religion. The allowance to Maynooth was largely increased, notwithstanding violent Protestant opposition. Three queen's colleges, for the higher education of all the youth of Ireland, without distinction of religion, were founded, notwithstanding violent opposition, both Protestant and Roman Catholic. The principle of toleration once accepted, was thoroughly carried out. The last remnants of the penal laws
were swept from the statute-book, and justice was extended to the Roman Catholic Church in Canada and Malta. In the same spirit acts were passed for clearing from doubt Irish Presbyterian marriages, for settling the titles of a large number of dissenters' chapels in England, and removing the municipal disabilities of the Jews. The grant for national education was trebled, and an attempt was made, though in vain, to introduce effective education clauses into the factory bills. To the alienation of any part of the revenues of the Established Church Sir Robert Peel never would consent; but he had issued the ecclesiastical commission, and he now made better provision for a number of populous parishes by a redistribution of part of the revenues of the Church. The weakest part of the constitution of this great government, perhaps, was its failure to control the railway mania by promptly laying down the lines on a government plan. It passed an act in 1844 which gave the government a right of purchase, and it had prepared a palliative measure in 1846, but was compelled to sacrifice this, like all other secondary measures, to the repeal of the corn laws. It failed also, though not without an effort, to avert the great schism in the Church of Scotland. Abroad it was as prosperous as at home. It had found disaster and disgrace in Afghanistan. It speedily ended the war there, and in India the invading Sikhs were destroyed upon the Sutlej. The sore and dangerous questions with France, touching the right of search, the war in Morocco, and the Tafileh affair, and with the United States touching the Maine boundary and the Oregon territory, were settled by negotiation.

Yet there were malcontents in Sir Robert Peel's party. The Young En glanders disliked him because he had hoisted the flag of Conservatism instead of Toryism on the morrow of the Reform Bill. The strong philanthropists and Tory Chartists disliked him because he was a strict economist and an upholder of the new poor law. But thefatal question was protection. That question was being fast brought to a crisis by public opinion and the Anti-Corn-Law League. Sir Robert Peel had been recognized in 1841 by Cobden as a Free Trader, and after experience in office he had become in principle more and more so. Since his accession to power he had lowered the duties of the sliding scale, and thereby caused the secession from the cabinet of the duke of Buckingham. He had alarmed the farmers by admitting foreign cattle and meat under his new tariff, and by admitting Canadian corn. He had done his best in his speeches to put the maintenance of the corn laws on low ground, and to wean the landed interest from their reliance on protection. The approach of the Irish famine in 1845 turned decisively the wavering balance. When at first Sir Robert proposed to his cabinet the revision of the corn laws, Lord Stanley and the duke of Buccleuch dissented, and Sir Robert resigned. But Lord John Russell failed to form a new government. Sir Robert again came into office; and now, with the consent of all the cabinet but Lord Stanley, who retired, he, in a great speech on the 27th of January 1846, brought the repeal of the corn laws before the House of Commons. In the long and fierce debate that ensued he was assailed, both by political and personal enemies, with the most virulent invective, which he bore with his wonted calmness, and to which he made no retorts. His measure was carried; but immediately afterwards the offended protectionists, led by Lord George Bentinck and Benjamin Disraeli, coalesced with the Whigs, and threw him out on the Irish Coercion Bill. He went home from his defeat, escorted by a great crowd, who uncovered as he passed, and he immediately resigned. So fell a Conservative government which would otherwise have probably ended only with the life of its chief.

Though out of office he was not out of power. He had "lost a party, but won a nation." The Whig ministry which succeeded him lent much on his support, with which he never taxed them. He joined them in carrying forward free-trade principles by the repeal of the navigation laws. He helped them to promote the principle of religious liberty by the bill for the emancipation of the Jews. One important measure was his own. While in office he had probled, by the Devon commission of inquiry, the sores of Ireland connected with the ownership and occupation of land. In 1849, in a speech on the Irish Poor Laws, he first suggested, and in the next year he aided in establishing, a commission to facilitate the sale of estates in a hopeless state of encumbrance. The Encumbered Estates Act made no attempt, like later legislation, to secure by law the uncertain customary rights of Irish tenants, but it transferred the land from ruined landlords to solvent owners capable of performing the duties of property towards the people. On the 28th of June 1850 Sir Robert Peel made a great speech on the Greek question against Lord Palmerston's foreign policy of interference. This speech was thought to show that if necessary he would return to office. It was his last. On the following day he was thrown from his horse and mortally injured by the fall. Three days he lingered and on the fourth (July 2, 1850) he died. All the tributes which respect and gratitude could pay were paid to him by the sovereign, by parliament, by public men of all parties, by the country, by the press, and, above all, by the great towns and the masses of the people to whom he had given "bread unleavened with injustice." He would have been buried among the great men of England in Westminster Abbey, but his will desired that he might be laid in Drayton church. It also renounced a peerage for his family, as he had before declared the garter for himself when it was offered him by the queen through Lord Aberdeen.

Those who judge Sir Robert Peel will remember that he was bred a Tory in days when party was a religion; that he entered parliament a youth, was in office at twenty-four and secretary for Ireland at twenty-five; that his public life extended over a long period rife with change; and that his own changes were all forward and with the advancing intellect of the time. They will enumerate the great practical improvements and the great acts of legislative justice of those days, and note how large a share Sir Robert Peel had, if not in originating, in giving thorough practical effect to all. They will reflect that as a parliamentary statesman he could not govern without a party, and that it is difficult to govern at once for a party and for the whole people. They will think of his ardent love of his country, of his ability to see from intrigue, violence and faction, of his boundless labour through a long life devoted to the public service. Whether he was a model of statesmanship may be doubted. Models of statesmanship are rare, if by a model of statesmanship is meant a great administrator and party leader, a great political philosopher and a great independent orator, all in one. But if the question is whether he was a ruler loved and trusted by the English people there is no arguing against the tears of a nation.

Those who wish to know more of him will consult his own posthumous Memoirs (1856), edited by his literary executors Earl Stanhope and Viscount Howick; his correspondence, edited by C. S. Parker (1891-1899); the four volumes of his speeches; a sketch of his life and character by Sir Lawrence Peel (1860); an historical sketch by Lord Dalling (1874); Gutzon's Sir Robert Peel (1857); Kindel's Leben und Ruhm Sir Robert Peel's (1851); Disraeli's Life of Lord George Bentinck (1858); Morley's Life of Cobden; monographs by F. C. Montague (1888), J. R. Thurnfeld (1891), and the earl of Rosebery (1899); Peel and O'Connell, by Lord Eversley; the Life of Sir J. Graham (1907), by C. S. Parker; Lord Stanmore's Life of Lord Aberdeen (1893); and the general histories of the time.

Four of Sir Robert's five sons attained distinction. The eldest, Sir ROBERT PEEL (1822-1893), who became the 3rd baronet on his father's death, was educated at Harrow and at Christ Church, Oxford. He was in the diplomatic service from 1844 to 1850, when he succeeded his father as member of parliament for Tamworth, and he was chief secretary to the lord-lieutenant of Ireland from 1850 to 1855. He represented Tamworth until the general election of 1880; in 1884 he became member for Huntingdon and in 1886 he was member for Blackburn, but after 1886 he ceased to sit in the House of Commons. Sir Robert described himself as a Liberal-Conservative, but in his later years he opposed the policy of Gladstone, although after 1886 he championed the cause of home rule for Ireland. In 1881 he sold his father's collection of pictures to the National Gallery for £75,000, and in his later life he was troubled by financial difficulties. Sir Robert was interested in racing, and was known on the
turf as Mr. F. Robinson. He died in London on the 6th of May 1895, and was succeeded as 4th baronet by his son, Sir Robert Peel (b. 1867).

Sir Frederick Peel (1833-1906), the prime minister’s second son, was educated at Harrow and at Trinity College, Cambridge, becoming a barrister in 1849. He entered parliament in 1857 as representative of the town of Carlisle between 1857 and 1859 he remained in the House of Commons until 1865. In 1851-1852 and again in 1852-1855 he was under-secretary for the colonies; from 1855 to 1857 he was under-secretary for war; and from 1859 to 1865 he was secretary to the treasury. He became a privy councillor in 1857 and was knighted in 1860. Sir Frederick Peel’s chief service to the state was in connexion with the railway and canal commission. He was appointed a commissioner on the inception of this body in 1857, and was its president until its reconstruction in 1888, remaining a member of the commission until his death on the 6th of June 1906.

The third son was Sir William Peel (1824-1858), and the youngest Viscount Peel (q.e.) Sir William was a sailor, who distinguished himself in the Crimea, where he gained the Victoria Cross, and also during the Indian Mutiny, being wounded at the relief of Lucknow. He died on the 27th of April 1858. Sir William wrote A Ride through the Nubian Desert (1852), giving an account of his travels in 1851.

Two of Sir Robert Peel’s brothers were also politicians of note. William Yates Peel (1780-1858), educated at Harrow and at St. John’s College, Cambridge, was a member of parliament from 1826 to 1831 and again from 1847 to 1852; he was under-secretary for home affairs in 1828, and was a lord of the treasury in 1830 and again in 1834-1835. Jonathan Peel (1799-1879) was first a soldier and then a member of parliament during the long period between 1826 and 1868, first representing Norwich and then Huntingdon. From 1841 to 1846 he was surveyor-general of the ordnance, and in 1858-1859 and again in 1866-1867 he was a very competent and successful secretary of state for war. General Peel was a noted breeder of racehorses. In 1844 his horse Orlando won the Derby, after another horse, Running Rein, had been disqualified.

For the history of the Peel family see Jane Haworth, A Memoir of the Family of Peel from the year 1800 (1856).

PEEL, a seaport and watering-place of the Isle of Man, on the W. coast, 11½ m. W.N.W. of Douglas by the Isle of Man railway. Pop. (1901), 3304. It lies on Peel Bay, at the mouth of a fine river, which flows through an extensive flat land. The town consists of narrow streets and lanes, but a modern residential quarter has grown up to the east. On the west side of the river-mouth St. Patrick’s Isle is connected with the mainland by a causeway. It is occupied almost wholly by the ruins of Peel castle. St. Patrick is said to have founded here the first church in Man, and a small chapel, dedicated to him, appears to date from the 8th or 9th century. There is a round tower, also of very early date, resembling in certain particulars the round towers of Ireland. The ruined cathedral of St. German has a transitional Norman choir, with a very early crypt beneath, a nave with an early English triplet at the west end, transepts, and a low and massive central tower still standing. There are remains of the bishops’ palace, of the so-called Fenella’s tower, famous through Scott’s Peveril of the Peak, of the palace of the Lords of Man, of the keep and guardroom above the entrance to the castle, and of the Moare or great tower, while the whole is surrounded by battlements. There are also a large artificial mound supposed to be a defensive earthwork of higher antiquity than the castle, and another mound known as the Giant’s Grave. The guardroom is associated with the ghostly apparition of the Moddey Dho (black dog), to which reference is made in Peveril of the Peak. In 1397 Richard II. condemned the earl of Warwick to imprisonment in Peel Castle for conspiracy; and in 1444 Eleanor, duchess of Gloucester, received a like sentence on the ground of having compassed the death of Henry VI. by magic. Peel has a long-established fishing industry, which, however, has declined in modern times. In the town the most notable building is the church of St. German, with a fine tower and spire. Peel was called by the Northmen Helin (Island, i.e. St. Patrick’s Isle); the existing name is Celtic, meaning “Fort” (cf. the peel towers of the borderland of England and Scotland).

PEEL (1) The skin or rind of a fruit; thus “to peel” is to remove the outer covering of anything. The etymology of the word is closely connected with that of “pil,” to plunder, to strip, as in “pillage.” The term was applied to a name transferred to French and thence to Latin. In French peler and pilier, though now distinguished in meaning (the first used of stripping bark or rind, the second meaning to rob), were somewhat confused in application, and a similar confusion occurs in English till comparatively late. The Latin words from which they are derived are pellis, skin, and pilare, to strip of hair (pilis). (2) The name of a class of small fortified dwelling-houses built during the 16th century on the borders between Scotland and England. They are also known as bastel-houses, i.e. bastille-houses, and consist of a square massive tower with high pitched roof, the lower part being vaulted, the upper part containing a few living rooms. The entrance is on the upper floor, access being gained by a movable ladder. The vaulted ground-floor chamber served for the cattle when there was danger of attack. The word appears in various forms, e.g. pêle, pil, and Latinized as pelum, &c.; “pil” is also found used synonymously, but the New English Dictionary (s.v. pile) considers the two words distinct. It seems more probable that the word is to be identified with “pale,” a stake (Lat. palus). The earlier meaning of “peel” is a palisaded enclosure used as an additional defence for a fortified post or as an independent stronghold.

PEELE, GEORGE (1558-1598), English dramatist, was born in London in 1558. His father, who appears to have belonged to a Devonshire family, was clerk of Christ’s Hospital, and wrote two treatises on book-keeping. George Peele was educated at Christ’s Hospital, and entered Broadgates Hall (Pembroke College), Oxford, in 1571. In 1574 he removed to Christ Church, taking his B.A. degree in 1577, and proceeding M.A. in 1579. In 1570 the governors of Christ’s Hospital requested their clerk to “discharge his house of his son, George Peele.” It is not necessary to read into this anything more than that the governors insisted on his beginning to earn a livelihood. He went up to London about 1580, but in 1583 when the Arboretus Lascii (Albert Laski), a Polish nobleman, was appointed chaplain in the harborough of Church, Oxford, Peele was entrusted with the arrangement of two Latin plays by William Byrd (fl. 1580-1610) presented on the occasion. He was also complimented by Dr Gager for an English verse translation of one of the Phlegienses of Euripides. In 1585 he was employed to write the Device of the Pageant borne before Wosten Dixton, and in 1597 he devised the pageant in honour of another lord mayor, Sir William Webbe. This was the Descensus Astraeae (printed in the Harleian Miscellany, 1868), in which Queen Elizabeth is honoured as Astraea. Peele had married as early as 1583 a lady who brought him some property, which he speedily dissipated. Robert Greene, at the end of his Groatsworth of Wit, exhorts Peele to repentance, saying that he has, like himself, “been driven to extremeshifts for a living.” The sorry traditions of his reckless life were emphasized by the use of his name in connexion with the apocryphal Merrie conceited Jests of George Peele (printed in 1607). Many of the stories had done service before, but there are personal touches that may be biographical. He died before 1598, for Francis Meres, writing in that year, speaks of his death in his Palladis Tamia.

His pastoral comedy of The Apyogym of Paris, presented by the Children of the Chapel Royal before Queen Elizabeth perhaps as early as 1581, was printed anonymously in 1584. Charles Lamb, sending to Vincent Novello a song from this piece of Peele’s, said that if it had been less uneven in execution Fletcher’s Faithful Shepherdess “had been but a second name in this sort of writing.” Peele shows considerable art in his fancy. Paris is arranged before Jupiter for having assigned the apple to Venus. Diana, with whom the final decision rests, gives the apple to none of the competitors but to a nymph called Eliza, whose identity is confirmed by the further
PEEP-OF-DAY BOYS—PEERAGE

explanation, "whom some Zabeta call." The Famous Chronicle of King Edward the first given Edward Strenghshoabes, with his returne from the holy land. Also the life of Llewiden, rebel in Wales. Lastly, the sinking of Queen Elinor, who swinke at Charingcrosse, and rose again at Potter's-hilt, now named Queenehith (printed 1593). This "chronicle history," formless enough, as the rambling title shows, is nevertheless an advance on the old chronicle plays, and marks a step towards the Shake-
spearean historical drama. The Batell of Alcester—with the death of Captain Stukeley (act'd 1588-1589, printed 1594), published anonymously, is attributed with much probability to Peele. The Old Wives Tale, registered in Stationers' Hall, perhaps more correctly, as "The Owle wifes tale" (printed 1592), was followed by The Love of King David and fair Bettsabbe (written 1588, but not printed until 1594), a series of Elizabethan drama drawn entirely from scriptural sources. Mr Fleay sees in it a political satire, and identifies Elizabeth and Leicester as David and Bathsheba, Mary Queen of Scots as Absalom. Sir Clymon and Sir Clamydes (printed 1590) has been attributed to Peele, but on insufficient grounds. Among his occasional poems are "The Honour of the Garter," which has a prologue containing Peele's judgments on his contemporaries, and "Polybymnia" (1590), a blank-verse description of the ceremonies attending the retirement of the queen's champion, Sir Henry Lee. This is concluded by the "Sonnet," "To his golden locks time bath to silver turn'd," quoted by Thackeray in the preface of "The Newcomes." To the Phoenix Nest in 1593 he contributed "The Praise of Chastity," Mr F. G. Fleay (Biol. Chron. of the Drama) credits Peele with The Wisdom of Doctor Doddipoll (printed 1600), Wily Beguiled (printed 1600), The Life and Death of Jack Sirow, a notable rebel (1587), a share in the First and Second Parts of Henry VI., and on the authority of Wood and Winstanley, Alphonsum, Emperor of Germany.

Peele belonged to the group of university scholars who, in Greene's phrase, "spent their wits in making plays." Greene went on to say that he was "in some things rarer, in nothing inferior," to Marlowe. Nash in his preface to Greene's Mena-
phon called him "the chief supporter of pleasance now living, the Atlas of Poetic and primus verborum artes" whose first encreas, the Arraignment of Paris, might lead to your opinions his present dexterity of wit and manifold variety of invention, wherein (me judice) hee goeth a step beyond all that write." This praise was not unfounded. The credit given to Greene and Marlowe for the increased dignity of English dramatic diction, and for the new smoothness infused into blank verse, must certainly be shared by Peele. Professor F. B. Gummere, in a critical essay prefixed to his edition of The Old Wives Tale, puts in another claim for Peele. In the contrast between the romantic story and the realistic dialogue he sees the first instance of humour quite foreign to the comic "business" of earlier comedy. The Old Wives Tale is a play within a play, slight enough to be perhaps better described as an interlude. Its background of rustic folk-lore gives it additional interest, and there is much fun pok'd at Gabriel Harvey and Stanyhurst. Perhaps Huanebango, a parodist Harvey's hexameters, and actually quotes him on one occasion, may be regarded as representing that arch-enemy of Greene and his friends.

Peele's Works were edited by Alexander Dyce (1828, 1829-1839 and 1861); by A. H. Bullen (2 vols., 1888). An examination of the metrical peculiarities of his style is to be found in Lämmerhirt's Georg Peele, Untersuchungen über sein Leben und seine Werke (Rostock, 1882). See also Professor F. B. Gummere, in Representative English Comedies (1903); and an edition of The Batell of Alcester, printed for the Malone Society in 1907.

PEEP-OF-DAY BOYS, an Irish Protestant secret society, formed about 1785. Its object was to protect the Protestant peasantry, and avenge their wrongs on the Roman Catholics. The "Boys" gained their name from the hour of dawn which they chose for their raids on the Roman Catholic villages. The Roman Catholics in return formed the society of "The Defenders."

PEEPUL, or Pipul (Ficus religiosa), the "sacred fig" tree of India, also called the Bo tree. It is not unlike the banyan, and is venerated both by the Buddhists of Ceylon and the Vaishnavite Hindus, who say that Vishnu was born beneath its shade. It is planted near temples and houses; its sap abounds in caoutchouc, and a good deal of lac is obtained from insects who feed upon the branches. The fruit is about the size of a walnut and is not much eaten.

PEERAGE (Fr. pairage, med. Lat. paragium; M.E. pee, O. Fr. peer, peer, later pairs; Lat. paris, "equal"). Although in England the term "peerage" means "nobility," "House of Lords" are in common parlance frequently regarded as synonyms, in reality each expresses a different meaning. A man may be a peer and yet not a member of the House of Lords, a member of the House of Lords and yet not a strict peer; though all peers (as the term is now understood) are members of the House of Lords either in esse or in posse. In the United Kingdom the rights, duties and privileges of peerage are centred in an individual; to the monarchial nations of the Continent nobility conveys the idea of family, as opposed to personal, privilege.

Etymologically "peers" are "equals" (pares), and in Anglo-
Norman days the word was apparently so understood. The feudal tenants-in-chief of the Crown were all the peers of each other, whether lords of one manor or of a hundred; so too a bishop had his ecclesiastical peer in a brother bishop, and the tenants of a manor their peers in their fellow-tenants. That even so late as the reign of John the word was still used in this general sense is clear from Magna Carta, for the term "judicium parium" therein must be understood to mean that every man had a right to be tried by his equals. This very right was asserted by the barons as a body in 1233 on behalf of Richard, earl marshal, who had been declared a traitor by the king's command, and whose lands were forfeited without proper trial. In 1333 the French bishop Peter des Roches, Henry III.'s minister, denied the barons' right to the claim set up on the ground that the king might judge all his subjects alike, there being, he said, no peers in England (Math. Paris. 380). The English barons undoubtedly were using the word in the sense it held in Magna Carta, while the bishop probably had in his mind the French peers (pairs de France), a small and select body of feudatories possessed of exceptional privileges. In England the term was general, in France technical. The change in England was gradual, and probably gathered force as the gulf between the greater barons and the lesser widened, until in course of time, for judicial purposes, there came to be only two classes, the greater barons and the rest of the people. The barons remained triable by their own order (i.e. by their peers), whilst the rest of the people rapidly became subject to the general practice and procedure of the king's justices. The first use of the word "peers" as denoting those members of the baronage who were accustomed to receive regularly a writ of summons to parliament is found in the record of the proceedings against the Despensers in 1321 (Stubbs, Const. Hist. ii. 347), and from that time this restricted use of the word has remained its ordinary sense.

Properly to understand the growth and constitution of the peerage it is necessary to trace the changes which occurred in the position of the Anglo-Norman baronage, first through the gradual strengthening of royal supre-
macy with the consequent decay of baronial power, and subsequently the consolidation of parliamentary institutions during the reigns of the first three Edwards.

Before the conquest the national assembly of England (see PARLIAMENT) was the Witan, a gathering of notables owing their presence only to personal influence and standing. The Saxons

The imposition of a modified feudal system resulted in a radical alteration. Membership of the Great Council of the Norman kings was primarily an incident of
tenure, one of the obligations the tenants-in-chief were bound to perform, although this membership gradually became restricted by the operation of the Royal prerogative to a small section of the Barons; but, when expressed by custom, the Norman Councils may have arisen from the ashes of a Saxon Witenagemot, but there is little evidence of any historical continuity between the two. The Church in England, as in Christendom generally, occupied a position of paramount importance and far-reaching influence; its leaders, not alone from their special sanctity as ecclesiastics, but as practically the only educated men of the period, of necessity were among the chief advisers of every ruler in Western Europe. In England churchmen formed a large proportion of the Witan, the more influential of the great landowners making up the rest of its membership.

In place of the scattered individual and absolute ownership of Saxon days the conqueror became practically the sole owner of the soil. The change, though not immediately completed, followed rapidly as the country settled down and the power of the Crown extended to its outlying frontiers. As Saxon land gradually passed into Norman hands the new owners became direct tenants of the king. Provided their loyal and military obligations were duly performed they had fixture of tenure for themselves and their heirs. In addition fixed money payments were exacted on the succession of the heir, when the king’s eldest son was knighted, his eldest daughter married, or his person ransomed from the手里 of the enemy. Under similar conditions the king’s tenants, or as they were termed tenants-in-chief, sub-granted the greater portion of their holdings to their own immediate followers. Under Norman methods the manor was the unit of local government and jurisdiction, and when land was given away by the king the gift invariably took the form of a grant of one or more manors.

When he brought England into subjection the conqueror’s main idea was to exalt the central power of the Crown at the expense of its feudatories, and the first two centuries following the conquest tell one long tale of opposition by the great tenants-in-chief to a steadily growing and unifying royal pressure. With this idea of royal supremacy firmly fixed in his mind, William’s grants, excepting outlying territory such as the marches of Wales or the debatable ground of the Scottish border, which needed special consideration, were seldom in bulk, but took the form of manors scattered over many counties. Under such conditions it was practically impossible for a great tenant to set up a powerful imperium in imperio (such as the siefs of Normandy, Brittany and Burgundy), as his forces were distributed over the country, and could be reached by the long arm of royal power, acting through the sheriff of every county, long before they could effectively come together for fighting purposes. The tenants-in-chief were termed generally barons (see BARON) and may be regarded historically as the parents of the peers of later days. The pages of Domesday (1086), the early Norman fiscal record of England, show how unevenly the land was distributed; of the fifteen hundred odd tenants mentioned the majority held but two or three manors, while a favoured few possessed more than a hundred each. Land was then the only source of wealth, and the number of a baron’s manors might well be regarded as a correct index of his importance.

The king’s tenants owed yet another duty, the service of attending the King’s Court (curia regis), and out of this custom from captivus, the parliaments of later days. In theory all the king’s tenants-in-chief, great and small, had the right to be present as incident to their tenure. It has therefore been argued by some authorities that as the conqueror’s system of tenure constituted him the sole owner of the land, attendance at his courts was solely an incident of tenure, the Church having been compelled to accept the same conditions as those imposed on laymen. But, as already pointed out, the change in tenure had not been immediate, and there had been no general forfeiture suffered by ecclesiastical bodies; consequently throughout the early years of William’s reign some of the English bishops and abbots attended his courts as comparatively low-ranking representatives of their specific ecclesiastical importance as by right of tenure. The King’s Court was held regularly at the three great festivals of the Church and at such other times as were deemed advisable. The assembly for several generations neither possessed nor pretended to any legislative powers. Legislative power was a product of later years, and grew out of the custom of the Estates granting supplies only on condition that their grievances were first redressed. The great bulk of the tenants were present for the purpose of assenting to special taxation above and beyond their ordinary feudal dues. When necessary a general summons to attend was sent through the sheriff of every county, who controlled a system of sheriffs delegated by the Crown to every tenant. In course of time to a certain number of barons, and not until the late thirteenth century to the great ecclesiastics, either from the great extent of their possessions, their official duties about the king or their personal importance, it became customary to issue a personal writ of summons, thus distinguishing them from the general mass summoned through the sheriff. That this custom was in being within a century of the Conquest is clear from an incident in the bitter fight for supremacy between Archbishop Becket and Henry II. in 1164 (Stubbs, Const. Hist. i. 504), it being recorded that the king withheld the Archbishop’s personal summons to parliament, and put upon him the indignity of a summons through the sheriff. During the succeeding fifteen years the line becomes even more definite, though it is evidence that the Crown sometimes disregarded the custom, as the barons are found complaining that many of their number deemed entitled to a personal summons had frequently been overlooked.

The sequel to these complaints is found in Magna Carta, wherein it is provided that the archbishops, bishops, abbots, earls and greater barons are to be called up to the council by writ directed to each severally; and all who hold the king in chief, below the rank of greater barons, are to be summoned by a general writ addressed to the sheriff of their shire.1 Magna Carta thus indicates the existence of two definite sections of the king’s tenants, a division which had evidently persisted for some time. The “greater barons” are the immediate parents of the peers of later days, every member of which for more than four centuries had a seat in the House of Lords. As for the rest of the tenants-in-chief, poorer in estate and therefore of less consequence, it is sufficient here to note that they fell back into the general mass of country families, and that their representatives, the knights of the shire, after some hesitation, at length joined forces with the city and burg burgh representatives to form the House of Commons.

In 1254, instead of the general summons through the sheriff to all the lesser tenants-in-chief, the king requires them to elect two knights for each shire to attend the council as the accredited representative of their fellows. In the closing days of 1264 Simon de Montfort summoned to meet him early in 1265 the first parliament worthy of the name, a council in which prelates, earls and greater barons, knights of the shire, citizens and burgheers were present, thus constituting a representation of all classes of people. It has been argued that this assembly cannot be regarded as a full parliament, inasmuch as Simon de Montfort summoned personally only such members of the barony as were favourable to his cause, and issued writs generally only to those counties and cities upon which he could rely to return representatives in support of his policy. But it fully holds the view that the first assembly we ought to regard as a full parliament was the Model Parliament which met at Westminster in 1295. This parliament, unlike Simon’s partisan assembly of 1265, was free and representative. To every spiritual

---

1 Et ab habendum commune consilium regni . . . summoneri faciemus archiepiscopos, episcopos, abbates, comites et magores barones sigillatim per litteras nostras et praeterea faciemus summoneri in generali per vicecomes et baillores nostros omnes illos qui de nobis tenent in capite (cited in Stubbs, Const. Hist. i. 547 n.).
and temporal baron accustomed to receive an individual writ, one was issued. Every county elected its knights and every city or borough of any importance was instructed by the sheriff to elect and to return its allotted number of representatives. Stubbs's view (Const. Hist. ii. 232) may probably be regarded as authoritative, inasmuch as it was adopted by Lord Ashbourne in the Norfolk peerage case of 1906 (Low Reports [1907], A.C. at p. 15). Edward I. held frequent parliaments throughout his reign, and although many must be regarded as merely baronial councils, nevertheless year after year, on all important occasions, the knights of the shire and the citizens appear in their places. The parliament of Shrewsbury in 1283, for instance, has been claimed as a full parliament in several peerage cases, but no clear decision on the point has ever been given by the Committee for Privileges. It may be taken for granted, however, that any assembly held since 1295, which did not conform substantially to the model of that year, cannot be regarded constitutionally as a full parliament. The point is even of modern importance, as in order to establish the existence of a barony by writ it must be proved that the claimant's ancestor was summoned by individual writ to a full parliament, and that either he himself or one of his direct descendants was present in parliament on the occasion. It is now necessary to consider the various grades into which the members of the peerage are grouped, and their relative positions. An examination of the early writs issued to individuals shows that the baronage consisted of archbishops, bishops, abbots, priors, earls and barons. In course of time every member of these classes came to hold his land by feudal tenure from the Crown, and eventually in every instance the writs issued as an incident of tenure. It is therefore necessary to discover, if possible, what combination of attributes clothed the greater baron with a right to receive the king's personal writ of summons. While the archbishops and bishops received their writs with regularity, the summons of a writ was at first a privilege of the barony, and greater barons were intermittent. The prelate held an office which lived on regardless of the fate of its temporary holder, and if by reason of death, absence or translation the office became vacant, a writ still issued to the "Guardian of the Spiritualities."

The abbot, on the other hand, often outside the jurisdiction of the English Church, and owing allegiance to a foreign order, was but the personal representative of a land-holding community. It has already been pointed out that the amount of land held direct from the king by individuals varied greatly, and that the extent of his holding must have had something to do with a man's importance. A landless noble in those days was inconceivable. The conclusion, then, may be drawn that in theory the abbot was at the pleasure of the Crown, and that in practice the moving factor in the case of the prelates was office and personal importance, and in the case of abbots and barons probably, in the main, extent of possession. There is nothing however to show that in the early years of the custom any person had a right to claim a writ if it were the king's pleasure or caprice to withhold it and to treat everyone not summoned individually as being duly summoned under the general writs issued to the sheriff of the county.

The next point for consideration is when did the peerage, as the baronage subsequently came to be called, develop into a body definitely hereditary? Here again growth was gradual and somewhat obscure. Throughout the reigns of the Edwarsd sumoners were not always issued to the same individual for successive parliaments; and it is quite certain that the king never considered the issue of one writ to an individual bound the Crown to its repetition for the rest of his life, much less to his heirs in perpetuity. Again we must look to tenure for an explanation. The custom of primogeniture tended to secure estates in strict family succession, and if extent of possession had originally extracted the acknowledgment of a personal summons from the Crown it is more than probable that as successive heirs came into their inheritance they too would similarly be acknowledged. In early days the summons was a burden to be suffered of necessity, an unpleasant incident of tenure, in itself undesirable, and probably so regarded by the majority of recipients during at least the two centuries following the Conquest. The age of the Edwards was in the main a rule of settled law, of increase in population generally, of growing power in the large landowners and of opportunities for those about the person of the king. The times were changing, and in place of the idea of the writ being a burden, its receipt gradually came to be looked upon as a mark of royal favour, a recognition of position and an opportunity leading on to fortune. Once such a view was established it is easy to understand how desirous any individual would be to preserve so valuable a privilege for his posterity; and primogeniture with its strict settlement of estates pointed out an easy way. The Crown was itself an hereditary dignity; and what more natural than that it should be surrounded by an hereditary peerage? Thus the free and indiscriminate choice of the Crown became fettered by the custom that once a summons had been issued to an individual to sit in parliament and he had obeyed that summons he thereby acquired a right of summons for the rest of his lifetime; and in later years when the doctrine of nobility of blood became established his children would be held to have acquired the same privilege by hereditary right.

The earl's position in the baronage needs some explanation. Various suggestions have been made as to Saxon or Norman origin of a high official nature, but historical opinion seems generally to incline towards the theory that the term was a name of dignity conferred by royal prerogative on a person already classed among the greater barons. At first the dignity was official and certainly not hereditary, and the name of a county of which he is said to have been an officer in the king's name was not essential to his dignity as an earl. There were also men who, though Scottish and Norman earls, and commonly so addressed and summoned to parliament, were rated in England as barons (Lords Reports, ii. 116, 197; Earldoms of Norfolk Peerage Case, Law Reports [1907], A.C. p. 18). Earls received individual summonses to parliament by the name of Earl (g.v.), but there is reason to believe, as already mentioned, that in early days at any rate they sat not in right of their earldoms but by tenure as members of the baronetage.

If we review the political situation at the beginning of the 14th century a great change is evident. The line between those members of the baronetage in parliament and the rest of the people is firmly and clearly drawn. Earls, if they had any real tenure as the sole qualification for presence in the national assembly has disappeared, and in its place there arises for the baronetage system of royal selection and for the rest of the people one of representation. The rules and customs of law relating to the baronetage slowly crystallized so as to provide the House of Lords, the history of which for generations is the history of the peerage of England, whilst the representative part of parliament, after shedding the lower clergy, ultimately became the House of Commons.

Until the reign of Richard II. there is no trace of any use of the term baron (g.v.) as importing a personal dignity existing apart from the tenure of land, barons owing their seats in parliament to tenure and writ combined. This is borne out by the fact that a husband was often summoned to parliament in his wife's right and name, and while she lived fulfilled those feudal, military and parliamentary obligations attached to her lands which the physical disabilities of sex prevented her from carrying out in her own person (Pike, House of Lords, p. 103).

Primogeniture, a custom somewhat uncertain in early Anglo-Norman days, had rapidly developed into a definite rule of law. As feudal dignities were in their origin inseparable from the tenure of land it is not surprising that they too followed a similar course of descent, although as the idea of a dignity being exclusively personal gradually emerged, some necessary deviations from the rules of law relating to the descent of land inevitably resulted. In the eleventh year of his reign Richard II. created by letters patent

---

**Grades of Peersage.**

**Earldoms.**

**Writing Superseded by Tenure.**

**Hereditary Principle.**

**Peerage Becomes a Personal Dignity.**
John Beauchamp “Lord de Beauchamp and baron of Kyddermynter, to hold to him and the heirs of his body.” These letters patent were not founded on any right by tenure of land possessed by Beauchamp, for the king makes him “for his good services and in respect of the place which he had held at the coronation (i.e. steward of the household) and might in future hold in the king’s councils and parliaments, and for his noble descent, and his abilities and discretion, one of the peers and barons of the kingdom of England; willing that the said John and the heirs-male of his body issuing, should have the state of baron and should be called by the name of Lord de Beauchamp and Baron of Kyddermynter.” The grant rested wholly on the grace and favor of the Crown, and was a personal reward for service rendered. Here then is a barony entirely a personal dignity and quite unconnected with land. From Richard’s reign to the present day baronies (and indeed all other peerage honours) have continued to be conferred by patent. The custom of summons by writ was not in any way interfered with, the patent operating merely to declare the dignity and to define its devolution. Summons alone still continued side by side for many generations with summons founded on patent; but after the reign of Henry VIII. the former method fell into disuse, and during the last two hundred and fifty years there have been no new creations by writ of summons alone.1 So from the reign of Richard II. barons were of two classes, the elder, and more ancient in lineage summoned by writ alone, the honours descending to heirs-general, and the newer created by letters patent, the terms of which governed the issue of the summons and prescribed the devolution of the peerage in the line almost invariably of the direct male descendants of the person first ennobled. The principle of hereditary succession so clearly recognized in the Beauchamp creation is good evidence to show that a prescriptive right of hereditary summons probably existed in those families whose members had long been accustomed to receive individual writs. By the time the House of Lancaster was firmly seated on the throne it may be taken that the peerage had become a body of men possessing well-defined personal privileges and holding personal dignities capable of descending to their heirs. The early origin of peerages was so closely connected with the tenure of land that the idea long prevailed that there were originally peerages by tenure only, i.e. dignities or titles annexed to the possession (and so following it on alienation) of certain lands held in chief of the king. The elder writers, Glanville (bk. ix. cc. 4, 6) and Bracton (bk. ii. c. 16), lend some colour to the view. They are followed, but not very definitely, by Coke, Selden and Madox. Blackstone (bk. iv. ch. 26) argues that the position held by Glanville and Bracton seems to justify them, but is inducement to the doubt expressed by Coke and Blackstone (bk. i. c. xii.), seems to believe that such dignities existed in pre-parliamentary days but says further: “When alienations grew to be frequent, the dignity of peerage was confined to the lineage of the party ennobled, and instead of territorial became personal.” The Earldom of Arundel case, in 1433, at first sight seems to confirm the theory, but it may be noted that when in later years this descent came to be discussed the high authority of an act of parliament was found necessary to confirm the succession to the dignity. The case is discussed at some length in the Lords Reports (li. 115), the committee regarding it as an anomaly from which no useful precedent can be drawn. Other cases discussed in the same Report are those of de Lisle, Abingdon, Fitzwalter and Berkeley. The Berkeley case of 1588-1581 (better reported 8 H.L.C. 21) is essential for the student who wishes to examine the question carefully; and may be regarded as finally putting an end to any idea of bare tenure as an existing means of establishing a peerage right (see also Cruise on Dignities, 2nd ed. pp. 60 et seq.).

The main attribute of a peerage is that hereditary and inalienable quality which enables the blood of the holder and his heirs, or, as a great judge put it in 1625 in the Earldom of Oxford case, “he cannot alien or give away this inheritance because it is a personal dignity annexed to the posterity and fixed in the blood” (Dodridge, J., at p. 123, Sir W. Jones’s Reports). Were the theory of barony by tenure accepted it would be possible for the temporary holder of such a barony to sell it or even to will it away to a stranger possessing none of the holder’s blood, with the effect that, in the words of Lord Chancellor Campbell (Berkeley case, 8 H.L.C. 77), “there might be various individuals and various lines of peers successively ennobled and created peers of parliament for a subject,” an impossible condition of affairs in a country where the sovereign has always been the fountain of honour. Moreover, while no peerage honour can be extinguished or surrendered, the owner of lands can freely dispose of such rights as he possesses by sale or transfer. Finally we may accept the verdict in the Fitzwalter case of 1669 (Cruise, ibid. p. 66), which was adopted by the House of Lords in the Berkeley case: “and the nature of a barony by tenure being discussed, it was found to have been discontinued for many ages, and not in being, and so not fit to be revived or to admit any pretence or right of succession thereupon.”

Until the reign of Edward III. the peerage consisted only of high ecclesiastics, earls and barons. The earls were barons with their special name of dignity added, and their names always appear on the rolls before those of the barons. In 1337 King Edward created his son, the Black Prince, duke of Cornwall, giving him precedence over the rest of the peerage. The letters patent (under which the present heir to the throne now holds the dukedom) limited the dignity in perpetuity to the first-born son of the king of England.2 Subsequently several members of the royal family were created dukes, but no subject received such an honour until fifty years later, when Richard II. created his favourite Robert de Vere, Earl of Oxford, dux domus (for life). The original intention may have been to confine the dignity to the blood royal, as with the exception of de Vere it was some years before a dukedom was again conferred on a subject.

In 1485 Richard II. had created Robert de Vere marquess of Dublin, thus importing an entirely new and unknown title into the peerage. The grant was, however, only for life, Marquesses, and was in fact resumed by the Crown in 1387, when its recipient was created duke of Ireland. It was not until 1507 that another creation was made, this time in favour of one of the blood royal, John de Beauref, eldest legitimate son of John of Gaunt, who became marquess of Dorset. His title was shortly afterwards taken away by Henry IV’s first parliament. Subsequently creations from the same house took place, that of Winchester (1551) being the only one (of old date) under which an English marquess at present sits in the House of Lords (see Marquess).

Under the name of viscount (p. 2) Henry VI. added yet another order, and the last in point of time, to the peerage, creating in 1440, John, Baron Beaumont, Viscount Beaumont Viscounts. and giving him precedence above the barons. The name of this dignity was also borrowed from the Continent, having been in use for some time as a title of honour in the king’s French possessions. None of the new titles above mentioned ever carried with them any official position; they were conferred originally as additional honours on men who were already members of the peerage.

The application of the hereditary principle to temporal peerages early differentiated their holders from the spiritual peers. Both spiritual and temporal peers were equally lords of parliament, but hereditary preten- sons on the one side and ecclesiastical exclusiveness on the other soon drew a sharp line of division between the two orders. Gradually the temporal peers, strong in their doctrine of “ennobled” blood, came to consider that theirs was an order

1 Not intentional at any rate. In some cases where it was intended to call a son up in his father’s barony, a mistake in the name has been made with the result that a viscount by writ of summons has been created. The barony of Buller, of Moore Park (cr. 1663), now in abeyance, is said to be an instance of such a mistake.

above and beyond all other lords of parliament, and before long, arrogated to themselves the exclusive right to be called peers, and as such the only persons entitled to the privileges of peerage.

In early parliamentary days it had been the custom to summon regularly to attend the Lords for deliberative purposes another body of men—the judges. Less important than the prelates, they also owed their summons to official position, and like them were eventually overshadowed by the hereditary principle. The force of hereditary right gave to ennobled blood a position never possessed by either judge or prelate. It is true the prelate, in point of antiquity, was senior to both earl and baron, and in many cases superior in extent of possessions; but these attributes belonged to his office, the resignation or deprivation of which would render him useless to his sovereign. The writ issued really to the office. The judge's position was even worse. His judicial office evoked the writ, but at any moment he might be deprived of that office at the arbitrary pleasure of the Crown. It is doubtful whether the judges ever had voice and vote in the same sense as the other lords of parliament, and even if they had they soon came to be regarded merely as counsellors and assessors.

The pretensions of the lay peers were not admitted without a struggle on the part of the prelates, who made the mistake of aiming at the establishment of a privileged position for their own order while endeavouring to retain every right possessed by their lay brethren. They fell between two stools, lost their position as peers, and were beaten back in their fight for ecclesiastical privilege. In the reign of Richard II. the prelates are found clearly defining their position. Neville, archbishop of York, de Vere, duke of Ireland and others, were "appealed" for treason, and the archbishop of Canterbury took the opportunity in parliament of making clear the rights of his order. He said "of right and by the custom of the realm of England it belongeth to the Archbishop of Canterbury for the time being as well as others his suffragans, brethren and fellow bishops, abbots and priors and other prelates whatsoever, holding of our lord the king by barony, to be present in person in all the king's parliaments whatsoever as Peers of the Realm aforesaid, and there with the other Peers of the Realm, and with other persons having the right to be there present, to advise, treat, ordain, establish and determine as to the affairs of the realm and other matters there to be treated and to do all else which there presses to be done." After this he went on to say that as to the particular matters in question they intended to be present and to take their part in all matters brought before parliament "save our estate and order and that of each of the prelates in all things. But because in the present parliament there is question of certain matters, in which it is not lawful for us or anyone of the prelates according to the institute of the Holy Canons in any manner, to take part personally" we intend to retire "saving always the rights of our peerage" (Rot. Parl. 11 Rich. II. No. 6—printed iii. 236–237). At the desire of the prelates this statement of their rights was duly enrolled in parliament, but their claim to be peers was neither denied nor admitted, and the proceedings went on without them. For themselves Churchmen never claimed the privilege of trial by peers. Whenever they were arraigned they claimed to be altogether outside secular jurisdiction, and it was therefore a matter of small concern to them whether they were in the hands of peers or priests. Such was the attitude of Becket towards Henry II. (Stubbs, Const. Hist. i. 304), of Archbishop Stratford towards Edward III. (Pike, pp. 188 seq.), and it was probably with the hint of these two cases in his mind that the archbishop of Richard II.'s reign speaks of the saving rights of his order. These rights were never willingly admitted in England, and as the pope's power for interference waned so the prelates were forced under the ordinary law of the land. Henry VIII. certainly never regarded ecclesiastics as peers, as may be gathered from a grant early in his reign to the then abbot of Tavistock for himself and each succeeding abbot the right to be "one of the spiritual and religious lords of parliament." As to abbots, the subsequent dissolution of the monasteries put an end to the discussion. In this reign also Cranmer and Fisher, though the former was archbishop of Canterbury, were tried by a common jury, and they certainly claimed no privilege of peerage. The Standing Orders of the House of Lords for 1625 contain the statement that "Bishops are only Lords of Parliament and not Peers" (Lords Journals, iii. 349). In 1649 the "Lords Spiritual" were altogether excluded from the House of Lords by act of parliament, and were not brought back until the second year of the Restoration. From that period there has been no question as to their position. Peers and holders by barony when parliaments first met, by the end of the 19th century they had put themselves outside the pale of the peerage. To-day their ancient lands are vested in trustees (Ecclesiastical Commissioners), and it is only under the by now obsolete act of Parliament that only if he occupies one of the five great sees of Canterbury, York, London, Durham and Winchester, or is of sufficient seniority in appointment to fill one of the remaining twenty-one places on the bench of bishops in the house—for there are now only twenty-six seats for thirty-six prelates.

The reign of Henry VIII. brought about far-reaching changes in the position of the peerage. When that king ascended the throne the hereditary element was in a decided minority, but the balance was gradually reversed until at length a bare hereditary majority was secured and the dissolution of the monasteries made possible. The peers, many now grown fat on abbey lands, at once began to consolidate their position; precedents were eagerly sought for, and the doctrine of ennobled blood began to find definite and vigorous expression. So long, the peers declared, as there is any ennobled blood, a peerage must exist; and it can be extinguished only by act of parliament, failure of heirs, or upon corruption of blood by attainer. Stubbs writes with some contempt of the doctrine (Const. Hist. iii. 458 n.), apparently on the ground that it is absurd to speak of ennobled blood so long as the children of a peer still remain commoners. The doctrine is neither unreasonable nor illogical. By it is meant blood in which there always exists a capacity to inherit a particular peerage, and every person in whose veins the ennobled blood runs is competent to occupy the peerage if the chances of nature should remove those who are senior to him in the line of descent. A good illustration is the popular use of the term "blood royal," which of course does not mean that an individual of the blood royal necessarily occupies a throne but that he or she is in the line of succession to it. Similarly, persons of "ennobled blood" are not necessarily peers but in the line of descent to peerages, to which they may or may not succeed. (See Nobility.)

The English peer is not like the continental noble the member of a caste, but the holder for life of an office clothed with high and exceptional legislative and judicial attributes entirely dependent on his office and exercisable only in conjunction with his fellow peers in parliament assembled. Such privileges as he possesses are due primarily to his office rather than to his blood. His children are commoners, who though accorded courtesy titles by the usage of society have no legal privileges not shared with the humblest of British subjects. It is this peculiar official quality of an English peerage which saved England from the curse of a privileged noble caste such as that which so long barred all progress in France and Germany. As a result there are hundreds of families in the United Kingdom who, commoners there, would yet, from their purity of blood, position and influence, be accounted noble in any continental definition of the term. (See Peerage.)

From the doctrine of nobility of blood is derived the rule of law that no peerage (a Scots peerage is under Scots Law) can be surrendered, extinguished, or in any way got rid of unless the blood be corrupted. The rule is well illustrated by the earldom of Norfolk case (Law Reports [1907], A. C. 10) in which its development was traced, and the principle authoritatively confirmed. In 1302 the hereditary earldom of Norfolk (created in 1135) was in the possession of Hugh Bygod, one of the most powerful nobles of
Plantagenet days. The earl got into difficulties, and as some say, for a consideration, and others, to spite his brother and debtor, surrendered his earldom and all the lands thereto belonging, to King Edward I. from whom he subsequently received it back with an altered limitation to himself and the heirs of his body. As he was a childless old man this was practically a short life interest to the exclusion of all his relatives, the nearest of whom but for the surrender would have succeeded. Soon after Bygod died, and the earldom fell into the hands of Edward II. who granted it to his brother Thomas of Brotherton in 1312. Lord Mowbray, the lineal descendant of this Thomas, recently came forward and claimed the earldom, but in 1906 the House of Lords decided against his claim on the ground that in law Bygod's surrender was invalid, and that therefore Edward II. had no valid power to grant this particular earldom to Thomas of Brotherton. Historically there is little to support such a decision, and indeed this rigid application of the law is of comparatively recent date. Without doubt king, nobles and lawyers alike were all agreed, right down to Tudor days, that such surrenders were entirely valid. Many certainly were made, but, according to the decision of 1906, any living heirs of line of those nobles who thus got rid of their peerage honours can, if their pedigrees be provable, come to the House of Lords with a fair chance of reviving the ancient honours. Even as late as 1663 we find the Crown, naturally with the concurrence of its legal advisers, stating in the barony of Lucas patent (1664) that, on the appearance of co-heirs to a barony, the honour may be suspended or extinguished at the royal pleasure. The royal view of the law (at any rate as to extinction) was strongly objected to by the Lords, who guarded their privileges in Stuart days even more strictly than did the Commons. As early as 1626, in the celebrated dispute over the earldom of Oxford, the lord great chamberlainship and the baronies of Bolbec, Badlesmere and Sandford, Mr Justice Dodridge, who had been called in by the Lords to advise them, said that an earl could not give away or alien his inheritance, because it was "a personal dignity annexed to the posterity and fixed in the blood." Fourteen years later, in the Grey de Ruthyn case, the Lords solemnly resolved, "That no peer of the realm can drown or extinguish his honour (but that it descends unto his descendants), neither by surrender, grant, fine nor any other conveyance to the king." In 1678 the Lords became, if possible, even more definite, in view probably of the fact that the Crown had disregarded the Grey de Ruthyn resolution, having in 1660 taken into its hands, by surrender of Robert Villiers, and viscount, the viscounty of Purbeck. In 1676 the son of the second viscount applied for his writ of summons, and on the advice of Sir William Jones, the attorney-general, who reported that "this (surrender) was a considerable question, never before resolved that he knew of," the king referred the whole matter to the Lords. The Lords were very explicit, being "unanimously of the opinion, and do resolve that no fine now levied, or at any time hereafter to be levied by the king, can bar such title of honour (i.e. of a peer of the realm), or the right of any person claiming under him that levied, or shall levy such fine." On these resolutions passed in the seventeenth century, the Lords of 1906 find illegal a surrender of 1302. The result seems strange, but it is, at any rate, logical from the legal point of view. It was urged that in 1302 no real parliament, in the sense applied to those of later years, was in existence; and consequently, a resolution founded on parliamentary principles should not apply. To this answer was made: Although it may be true that the law and practice of parliament had not then crystallized into the definite shape of years later, the law of attainder existed, and the Lords, summoned seven years before Bygod's surrender, and it is necessary to have some definite occurrence from which to date a legal beginning—a point of law with which an historian can have little sympathy. Briefly, perhaps, from the teaching of the case it may be permissible to state the rule as follows: In early days the Norman and Plantagenet kings took upon themselves to deal with the barons in a manner which, though illegal, was suffered because no one dared oppose them; but as time went on, becoming stronger and more determined to enforce their privileges and exalt their rights, they were able, by obtaining attainder, and their resolutions in Stuart days were only declaratory of law which had always existed, but had been systematically disregarded by the Crown. This being so, resolutions of the peers deliberately and expressly laid down must, when in point, always be followed. The application of the doctrine of corruption of blood to peerages arises out of their close connexion with the tenure of land, peerage dignities never having been regarded as personal until well on into the 14th century. Conviction for any kind of felony—and treason as originally was a form of felony—was always followed by attainer. This resulted in the immediate corruption of the blood of the offender, and its capacity for inheritance was lost for ever. Such corruption with all its consequences could be set aside only by act of parliament. This stringent rule of forfeiture was to some extent mitigated by the passing in 1285 of the statute De Donis Conditionalibus (Blackstone's Commentaries, ii. 116) which made possible the creation of estates tail, and when a tenant-in-tail was attained forfeiture extended only to his life interest. The statute De Donis was soon applied by the judges to such dignities as were entailed (e.g. dignities conferred by patent with limitations in tail), but it never affected baronies by writ, which were not estates in tail but in the nature of estates in fee simple descendentil to heirs general. In the reign of Henry VIII., an act was passed (1534) which brought estates tail within the law of forfeiture, but for high treason only. The position then became that peerages of any kind were forfeitable by attainer following on high treason, while baronies by writ remained as before forfeitable for attainer following on felony. In 1768, just after the Union with Scotland, an act was passed by which on the death of the Pretender and three years after Queen Anne's death the effects of corruption of blood consequent on attainer for high treason were to be abolished, and the actual offender only to be punished (stat. 7 Anne, c. 21, § 10). Owing to the 1745 rising, the operation of this act was postponed until the decease of the Pretender and all his sons (stat. 17 Geo. II. c. 39, § 3). In 1814 forfeiture for every crime other than high and petty treason and murder was restricted to the lifetime of the person attainted (stat. 54 Geo. III. c. 145). Finally in 1870 forfeiture, except upon outlawry, was altogether abolished and it was provided that "no judgment of or for any treason or felony should cause any attainer or corruption of blood, or any forfeiture or escheat." The necessity for ascertaining the exact condition of the law with regard to attainer throughout the whole period of English parliamentary history will be realized when it is remembered that there still exist dormant and abeyant peerages dating from 1295 onwards which may at any time be the subject of claim before the House of Lords, and if any attainers exist in the history of such peerages the law governing their consequences is not the law as it exists to-day but as it existed when the attainted occurred. The dukedom of Atholl case of 1764 is interesting as showing the effect of attainer on a peerage where the person attainted does not actually succeed. John first duke of Atholl died in 1725 leaving two sons James and George. George the younger was attainted of treason in 1745 and died in 1760, leaving a son John. James, the second son of the first duke, who had succeeded his father in 1725 died in 1764 without issue. John his nephew then claimed the dukedom, and was allowed it on the ground that his father never having been in the possession of the dukedom had never lost his right, and that by the grant of his heirship to his uncle. It would have been otherwise had the younger son outlived his brother, for he would then have succeeded to the dukedom and so destroyed it by his attainer. In many cases there have been passed special parliamentary acts of attainer and forfeiture, and these, of course, operate apart from the general law. In any event, attainer and forfeiture of a dignity, whether resulting from the rules of the common law or from special or general acts of parliament can
only be reversed by act of parliament. The procedure in reversing an attainer and recovering a dignity is as follows. The Crown signifies its pleasure that a bill of restoration shall be prepared and signed it. The bill is then brought in to the House of Lords, passed there, and sent to the Commons for assent. The last bills of the kind became law in 1876, when Earl Cowper procured the removal of the attainer on one of his Ormond ancestors and so by purging the blood of corruption became entitled to, and was allowed, the barony of Butler of Moore Park (created in 1663). There should also be noted the Earlom of Mar Restitution Act 1885, which, while mainly confirmatory of a disputed succession, at the same time reversed any attainders that existed.

The House of Lords grew steadily throughout the Tudor period, and during the reign of the first two Stuarts underwent a still greater increase. In the Great Rebellion the majority of the peers were the king’s stoutest supporters and thus inevitably involved themselves in the ruin of the royal cause. Immediately after the execution of Charles I. the Republicans proceeded to sweep away everything which savoured of monarchy and aristocracy. The House of Commons voted the Lords “useless and dangerous,” got rid of them as a part of parliament by the simple expedient of a resolution (Commons’ Journals, 1649—1649, vol. 111) and placed the sole executive power in Cromwell’s hands, but there was no direct abolition of the peerage as such. Evidently it took Cromwell but little time to realize the fallacy, in practice, of the single-chamber government, as he is found ten years after the “useless and dangerous” resolution busy establishing a second chamber. What to call it aroused much discussion, and eventually the unruly Commons consented to speak of and deal with “the other house.” It is very difficult to realize what was the constitution of this body, so short was its life and so contemptuous its treatment by the Commons. The members of “the other house” were summoned by writs under the Great Seal, similar in form to those used to summon peers of past days. Some sixty writs were issued, and presumably their recipients were entitled thereby to sit for the duration of the parliament to which they were summoned; but it may be considered as certain that Cromwell’s lords were never regarded as hereditary peers. They were entitled to the courtesy appellation “Lord” and appear to have been in the main substantial men—existing peers, judges, distinguished lawyers and members of well-known county families. Judging from Cromwell’s speech at the opening of parliament, and subsequent entries in Whitelock’s diaries, the new house appears to have had revising functions both of a legislative and judicial nature and also the duty of taking cognizance of foreign affairs. Cromwell certainly issued two patents of hereditary peerage—the barony of Burnell and the barony of Gilsland (with which went the viscounty of Howard of Morpeth), but neither title was recognized on the Restoration, and it does not appear that the possession of these titles ever conferred on their holders any hereditary right to a writ of summons to sit in “the other house.” Whitelock himself was promised a viscounty by Cromwell, but no patent ever appears to have passed the Great Seal. Eventually business between the two houses grew impossible, and Cromwell was compelled to dissolve parliament. Richard’s first parliament also contained Lords as well as Commons, the latter considerately voting “to transact business with the persons sitting in the other house as an House of Parliament, saving the right of the peers who had been faithful to the parliament,” the saving clause evidently a loophole for the future. The dissolution of the former peerage and the retirement of the patrician Richard into private life preceded by only a few months the restoration to the throne of Charles II. With the king the peers returned to their ancient places.

From the reign of William of Orange the peerage has been freshened by a steady stream of men who as a rule have served their country as statesmen, lawyers and soldiers. Little of note occurred in the history of the peerage until the reign of Anne. By the Act of Union with Scotland (1707) the Scottish parliament was abolished; but the Scottish peerage were given the privilege of voting, for each parliament of Great Britain, sixteen of their number to represent them in the House of Lords. Further creations in the Scottish peerage were no longer to be made. The effect of this act was to leave the great majority of the Scottish peers outside the House of Lords, as only sixteen of their number were to become lords of parliament. Close upon a hundred years later Ireland was united with Great Britain, the Irish parliament being merged in the parliament of the United Kingdom of Great Britain and Ireland. Twenty-eight Irish peers were to be elected for life by their order to represent it in the House of Lords. One archbishop and three bishops were also chosen in turn to represent the Irish Church in the House of Lords, but when that Church was disestablished in 1867 the spiritual lords lost their seats. The merger of the three kingdoms had an important effect on their peerages. Every peer in his own country had been a lord of parliament by hereditary right. The English peer (and, as the Acts of Union were passed, the peer of Great Britain and the peer of the United Kingdom) continued by hereditary right a lord of parliament. The Scottish and Irish peers lost this right though by the two Acts of Union they retained every other privilege of peerage. Henceforth they were lords of parliament only as and when their fellow peers elected them. Thus though not all were lords of parliament in esse, every one was always so in posse, and in any case it was the hereditary quality of the peerage which either actually seated its holder in the House of Lords or made it possible for him to get there by the votes of his fellows.

It now becomes possible to arrive at the modern meaning of the term “peerage,” and we may define it as a dignity of England, Scotland or Ireland, which, by its hereditary quality, confers on its holder the right being the right to be or not to be elected a lord of parliament. The term “peerage” is also used in a collective sense.

The reign of Anne is remarkable for an attempt made by the House of Lords to limit its numbers by law. The queen, in order to secure a majority for the court party, had created a batch of twelve peers at one time, and Peerage considerable number in relation to existing peerages; and it was feared this expedient might be used as a precedent. A peerage limitation bill was introduced into the House of Lords in 1719. Six new creations were to be allowed, but after these the Crown, except in the case of royal princes, was to create a new peerage only when an old one became extinct. Twenty-five hereditary peerages in Scotland were to take the place of the sixteen representative peers for all time. The bill passed the Lords, but was eventually thrown out in the House of Commons, though not by an overwhelming majority.

In 1856 it was desired to strengthen the judicial element in the House of Lords, and the Crown issued letters patent creating Sir James Parke, one of the barons of the exchequer, Baron Wensleydale and a peer “for and during the term of his natural life.” The burden of an hereditary peerage is heavy, and many men thoroughly well qualified in legal attainments have been known to refuse it on the ground of expense alone. This life-peerage was thought to be a way out of the difficulty, and it was on Lord Chancellor Cranworth’s advice that the Crown issued the Wensleydale Wensleydale Case. The House of Lords at once realized that the creation of life-peers, at the will of the ministry of the day, might put the hereditary section into an absolute minority, and possibly in time, by form of law, get rid of it altogether. Eventually it was decided by the house that “neither the said letters patent nor the said letters patent with the usual writ of summons enable the grante to sit and vote in parliament,” a formal resolution which closed the door in the face of every
person whom the Crown might endeavour to make a life-peer. The government of the day accepted the situation, and soon afterwards a new patent was made out which followed the usual limitation to heirs-male. The precedents in favour of the Crown’s action were not strong. The essential and outstanding attribute of the house was its hereditary character. The whole balance of the constitution worked on the pivot of the independence of the peers. They existed as a moderating force in the councils of parliament, and the alteration of the hereditary character of the House of Lords might easily have rendered it amenable to whatever pressure the government of the day might see fit to exercise. In such circumstances its position as arbiter between people and government would tend to disappear. A change fraught with so many serious possibilities ought not, it was said, to be made by the simple prerogative of the Crown. If so far-reaching an alteration in the law were justifiable it was for parliament to make it. Further, it was pointed out, there had been no life-creations for centuries, and those that are recorded to have been conferred since the crystallization of our parliamentary system were of such a nature that the grantees never sat in the house by virtue of their life-honours, inasmuch as they were existing peers or women. Soon after the Wensleydale the government introduced a bill into the House of Lords to authorize the creation of two life-peers, who were to be persons of at least five years’ standing as judges. They were to sit as lords of appeal but to be peers for life. Eventually the bill disappeared in the House of Commons. In 1860 Earl Russell introduced another life-peers bill of far wider scope. Twenty-eight life-peers might be in existence at any one time, but not more than four were to be created in any one year. The life-peers would be lords of parliament for life. They were to be selected by the Crown from the peerages of Scotland and Ireland, persons who had sat for ten years in the Commons, distinguished soldiers, sailors, civil servants and judges or persons distinguished in science, literature or art. The bill received a rough handling in committee of the Lords, and the time was evidently not ripe for change, as the bill failed to pass its third reading.

In 1870 attempts were made in the House of Lords to alter the position of the Scottish and Irish representative peers. In Suggested Reforms the need of further judicial strength in the Lords was tardily admitted, and an act was passed which authorized the creation of two life-peers, and power was reserved to appoint two more as certain judicial vacancies occurred. They were to be entitled to the rank of baron during their lives but were to sit and vote in parliament only so long as they held their judicial office. Their dignities lasted for life only. Eleven years later another act enabled all retired lords of appeal to sit and vote as members of the House of Lords for life. To those interested in the House of Lords reform the pages of Hansard’s Parliamentary Debates are the best authority. In 1888 reform bills were introduced by Lords Dunraven and Salisbury, and in 1907 by Lord Newton. In December 1908 the publication of a long report with various recommendations for reform ended the labours of a House of Lords committee which had been appointed to consider the question in detail. In the session of 1910, following the general election, long discussions took place in both houses of parliament. Opinion generally was freely expressed that the time had arrived for diminishing the number of lords of parliament and for putting into practice the principle that hereditary right alone should no longer confer lordship of parliament. (See Parliament.)

The Scottish peerage, like that of England, owes its origin to feudalism. In Anglo-Norman days Scotland was a small country, and for some generations after England was settled the Scottish king’s writ ran hardly beyond the foot of the Highlands, and even the Lord of the Isles reckoned himself an independent sovereign until the beginning of the 15th century. The weak and usually ineffective control of the Crown resulted in opportunities for acquiring personal power which the nobles were not slow to take advantage of. Seldom accustomed to act in concert, they soon developed particularist tendencies which steadily increased the strength of their territorial position. These conditions of existence were entirely unfavourable to the establishment of any system of parliamentary government such as centralization had made possible in England, therefore it is not surprising to find that the lords of the land were not inclined to share the assemblies until well on in the 15th century (Burton’s Scotland, ii. 111). Again, when the Scottish earls and barons came to parliament, they did not withdraw themselves from the rest of the people, it being the custom for the estates of Scotland to deliberate together, and this custom persisted until the abolition of their parliament by the Act of Union in 1707. The territorial spirit of the nobles inevitably led them to regard the honour as belonging to, and inseparable from, their land, and until comparatively late in Scottish history there is nowhere any record of the conferment of a personal dignity unattached to land such as that conferred in England on Beauchamp by Richard II. This explains the frequent surrenders and altered grants which are so common in Scottish peerage history, and which, in sharp distinction to the English rule of law, are there regarded as perfectly legal. To-day there exists no Scottish dukedom (except the royal dukedom of Rothesay), marquessate or viscountcy created before the reign of James VI. of Scotland (and I. of England). Of the existing Scottish peerages sixty-three were created in the period between James’s accession to the English throne and the Act of Union. There are now only eighty-seven in all. Unlike one of the English peerages owing its origin exclusively to a writ of summons, ancient Scottish peerages do not fall into abeyance, and when there are only heirs-general, the eldest heir of line succeeds.

Whenever a new parliament is summoned, proclamation is made in Scotland summoning the peers to meet at Holyrood to elect sixteen of their number to represent them in such parliament. The Scottish peerages are recorded on a roll, and this is called over by the lord clerk register before the assembled peers seated at a long table. Each peer answers to the name of the peerage (it may be one or more) he possesses. The roll is then read again and each peer in turn (but only once) rises and reads out the list of those sixteen peers for whom he votes. Proxies are allowed for absent peers and are handed in after the second roll-calling. The votes are counted and the lord clerk registers the names of those elected, makes a return, and signs and seals it in the presence of the peers assembled. The return eventually finds its way to the House of Lords. The Scottish representative peer so elected receives no writ of summons to parliament, but attends the House of Lords to take the oath, his right to sit being evidenced by the return made. It might be thought that the rules of election in so important a matter would be more stringent, but the fact remains that it is quite possible for an entirely unqualified person to attend and vote at Holyrood. No evidence of identity or of a man’s right to be present is required and the lord clerk register is compelled to receive any vote tendered except in respect of peerages for which no vote has been given since 1800, these being struck off the roll (10 & 11 Vict. c. 52). Any person claiming to represent such a peerage must prove his right before the House of Lords, as was done in the case of the barony of Fairfax in 1908. It is true that by the act last cited any two peers may protest against a vote at Holyrood, and the lord clerk register thereupon reports the proceedings to the House of Lords, who will consider the question if application be made for an inquiry, but nothing is done unless an application is made. The right to vote certainly needs better proof than that now accepted. For many years the House of Lords maintained that the Crown could not confer a new peerage of Great Britain on a Scottish subject, on the ground that the Scottish peer was only entitled to the sixteen representative peers given it by the Act of Union, but eventually in 1782 in the case of the duke of Hamilton this contention was given up.

The Anglo-Norman conquerors of Ireland carried with them the laws and the system of tenure to which they were accustomed.
in England, and consequently the growth of the baronage and the establishment of parliamentary government in Ireland proceeded on parallel lines with the changes which occurred in England. Until the reign of Henry VIII. the Irish were without representation in parliament, but gradually the Irish were admitted, and by the creation of new parliamentary counties and boroughs were enabled to elect representatives. In 1613 the whole country was in representation (Ball’s Legislative Systems of Ireland). Just as James I. had added many members to the Scottish peerage, so he increased the number of Irish peers.

In 1800 the Union of Great Britain and Ireland abolished the parliament of Ireland. By the Act of Union the Irish peers became entitled to elect twenty-eight of their number to represent them in the House of Lords. The election is for life, and only those peers are entitled to vote at elections of representative peers who have proved their right of succession to the satisfaction of the lord chancellor, who issues his notice to that effect after each individual proof. The names of such peers are added to the voting-roll of the peerage, and when voting papers are distributed—the Irish peers do not meet for election purposes as do those of Scotland—they are sent only to those peers who have proved their right to vote. If any claim to the right to vote is rejected by the lord chancellor the claimant must prove his case before the Committee for Privileges (barony of Graves, 1907). When an Irish peer has been elected a representative peer he receives, as a matter of course, a writ of summons at the beginning of each parliament. The great bulk of the Irish peerage owes its existence to creations during the last two centuries, only seven of the existing peerages dating back beyond the 17th century; of these twenty-two were created during the year of Union, and thirty-three have been added since that date. Some hundred or more years ago ministers found the Irish peerage a useful means of political reward, in that it was possible to bestow a title of honour, with all its social prestige, and yet not to increase the numbers of the House of Lords.

On the death of a representative peer of Scotland or Ireland a vacancy occurs and a new election takes place, but in accordance with modern practice promotion to a United Kingdom peerage does not vacate the holder’s representative position (May’s Parliamentary Practice, p. 11 n.). Scottish and Irish peers also possess the privilege of grantee of precedence and parliament enjoyed by peers of the United Kingdom; if non-representative all privileges of peerage, except the right to a writ of summons to attend parliament and to be present at and vote in the trial of peers. A Scottish peer, if non-representative, is in the anomalous position of being disabled from serving his country in either house of parliament, but an Irish peer may sit for any House of Commons constituency out of Ireland, though while a member of the Commons his peerage privileges abate.

Though many peers possess more than one peerage, and frequently of more than one country, only that title is publicly used which is first in point of precedence. It was once argued that the Crown as the fountain of honour is capable of conferring upon a subject not only any existing title of honour, but may even invent one for the purpose. So James I. instituted an order of hereditary knights which he termed baronets, and Edward VII. created the duchess of Fife “Princess Royal”—a life dignity. The dignities of prince of Wales, earl marshal and lord great chamberlain have been for centuries hereditary, and though of high court and social precedence, of themselves confer no right to a seat in the House of Lords—they are not peerages. The grant of a peerage is a very different matter; its holder becomes thereby a member of the Upper House of Parliament, and therefore the prerogative of the Crown in creating such an office of honour must be exercised strictly in accordance with the law of the land. The Crown’s prerogative is limited in several directions. The course of descent must be known to the law; and so, in the first place, it follows that a peer cannot be created for life with a denial of succession to his descendants (unless it be as one of the lords of appeal in ordinary under the acts of 1876 and 1887). The course of descent of modern patents is invariably so worked out as a multum in parvo to fix the peerage in some male line according to the custom of primogeniture, though the immediate successor of the first holder may be a woman or even a stranger in blood. The following instances may be cited; Amabel, Baroness Lucas, was in 1816 created Countess de Grey with a limitation to the heirs-male of her sister; a nephew afterwards succeeded her and the earldom is now held by the marquess of Ripon. Other courses of descent known to the law are as follows: Fee simple, which probably operates as if to heirs-general, earldoms of Oxford (1159) and Norfolk (1153), both probably now in abeyance; and Bedford (1367), extinct; to a second son, the eldest being alive, dukedom of Dover (1758), extinct, and earldom of Cromartie (1861) called out of abeyance in 1895; a son and heir of the daughter of the first grantee, earldom of Northumberland (1747); to an elder daughter and her heirs-male, earldom of Roberts (1901); to an elder or younger brother and his heirs-male, viscounty of Kitchener (1902) and barony of Grimthorpe (1886). It is, however, not lawful for the Crown to make what is called a shifting limitation to a peerage, i.e. one which might vest a peerage in an individual, and then on a certain event happening (e.g. his succession to a peerage of higher rank) shift it from him to the representative of some other line. Such a limitation was held illegal in the Buckhurst case (1864). A peerage may not be limited to the grantee and “his heirs-male for ever.” Such a grant was that of the earldom of Northumberland (1907). The peerage was passed to the peer’s heiress, who had already lost her own rights by limitation, but left a male heir-at-law, whose descendants in 1896 claimed the earldom, but the original limitation was held invalid.

There is no limitation on the power of the Crown as to the number of United Kingdom peerages which may be created. As to Scotland, the Act of Union with that country operates to prevent any increase in the number of Scottish peerages, and consequently there have been no creations since 1707, with the result that the Scottish peerage, as a separate order, is gradually approaching extinction. The Irish peerage is supposed always to consist of one hundred exclusively Irish peers, and the Crown has power to grant Irish peerages up to the limit. When the limit is reached no more peerages may be granted until existing peeresses and holders succeed to United Kingdom peerages. Only four lords of appeal in ordinary may hold office at any one time. The number of archbishops and bishops capable of sitting in the House of Lords is fixed by various statutes at twenty-six, but, as pointed out previously, the spiritual lords are not now regarded as peers.

Since party government became the rule, the new peerages have usually been created on the recommendation of the prime minister of the day, though the Crown, especially in considering the claims of royal blood, is believed in some instances to take its own course; and constitutionally such action is entirely legal. By far the greater number of peerage honours granted during the last two centuries have been rewards for political services. Usually these services are well known, but there exists several instances in which the reasons for conferring the honour have not been quite clear. Until the reign of George III. the peerage was
comparatively small, but that monarch issued no fewer than 388 patents of peerage. Many of these have become extinct or obscured by higher titles, but the general tendency is in the direction of a steady increase, and where the peers of Tudor times might be counted by tens their successors of 1910 were numbered in hundreds. The full body would be 546 English peers. There are also 12 ladies holding English peerages. The Irish peerage has 175 members, but 82 of these are also peers of the United Kingdom, leaving 28 representative and 65 without seats in the House of Lords. Of 87 Scottish peers 51 hold United Kingdom peerages, the remainder consisting of 16 representative and 20 without seats.

As centuries have gone by and customs changed, many privileges once keenly asserted have either dropped out of use or been forgotten. The most important now in being are a seat in the House of Lords and the right to trial by peers. The right to a seat in parliament is one sanctioned by centuries of constitutional usage. The right of a peer in England to a seat in parliament was not, as pointed out in the early part of this article, entirely assumed by him to hold it personally. The right of the king’s pleasure as to whom he should summon always having been a very material factor in the question. Charles I. made a deliberate attempt to recover the ancient discretion of the Crown in the issue of writs of summons. The earl of Bristol was the subject of certain treasonable charges, and though he was never put on his trial the king directed that his writ of summons should not issue. The excluded peer petitioned the Lords, as for a breach of privilege, and a committee to whom the matter was referred reported that there was no instance on record in which a peer capable of sitting in parliament had been refused his writ. There was a little delay, but the king eventually gave in, and the earl had his writ (Lords Journals, iii. 549).

At the beginning of a new parliament every peer entitled receives a writ of summons issued under the authority of the Great Seal; he presents his writ at the table of the House of Lords on his first attendance, and before taking the oath. If the peer be newly created he presents his letters-patent creating the peerage to the lord chancellor on the woolsack, together with the writ of summons which the patent has evoked. A peer on succession presents his writ in the ordinary way, the Journals recording, e.g. that Thomas Walter, Viscount Hampden, sat first in Parliament after the death of his father (Lords Journals xi. 720). The form of writ now issued (at the beginning of a parliament: for the variation when parliament is sitting see Lords Journals, cxxxi. 185) corresponds closely to that in use so long ago as the 14th century. It runs as follows:

George the Fifth by the Grace of God of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the seas King Defender of the Faith to our right trusty and well-beloved Greeting Whereas by the advice and consent of our Council for certain arduous and urgent affairs concerning us the state and the defence of our said United Kingdom and the Church we have ordered a certain Parliament to be holden at our City of Westminster on the . . . day of . . . next ensuing and there to treat and have consultation with the peers great men and peers of our realm. We strictly enjoining command you upon the faith and allegiance by which you are bound to us that the weightiness of the said affairs and imminent perils considered (waiving all excuses) you be, at the said day and place personally present with us and with the said prelates great men and peers to treat and give your counsel upon the affairs aforesaid. And this as you regard us and our honour, the safety and defence of our United Kingdom and Church and dispatch of the said affairs in no wise do you.

Formerly all peers were required to attend parliament, and there are numerous recorded instances of special grants of leave of absence, but nowadays there is no compulsion.

After the right to a summons the principal privilege possessed by a peer is his right to be tried by his peers on a charge of treason or felony. Whatever the origin of this right, and some writers date it back to Saxon times (Trial of Lord Morley, 1678, State Trials vii. 145), Magna Carta has always been regarded as its confirmatory authority. The important words are—

"nullus liber hominum caputurum impune elicitur et disseriatur de libero tenemento suo vel libertatis suis se liberos consuetudinibus suis, ut utilegatur et exuletur nec aliquo modo disstruatur nec dominus regis sui dominus regis sui legatibus mittat nisi per legale judicium parium suorum vel per legem terrae."

The peers have always strongly insisted on this privilege of trial by their own order, and several times the heirs of those wrongly condemned recovered their rights and heritage on the ground that there had been no proper trial by peers (R.D.P., v. 24). In 1442 the privilege received parliamentary confirmation (stat. 20 Henry VI. c. 9). If parliament is sitting the trial takes place before the House of Lords in full session, i.e. the court of our lord the king in parliament, if not then before the court of the lord high steward. The office of lord high steward was formerly hereditary, but has not been so for centuries and is now only granted pro hac vice. When necessity arises the Crown issues a special commission naming some peer (usually the lord chancellor) lord high steward pro hac vice (Blackstone’s Comm. iv. 285). When a trial takes place in full parliament a lord high steward is also appointed, but his powers there are confined to the presidency of the court, all the peers sitting as judges of law as well as of fact. Should the lord high steward be sitting as a court out of parliament he summons a number of peers to attend as a jury, but rules alone on all points of law and practice, the peers present being judges of fact only. Whichever kind of trial is in progress it is the invariable practice to summon all the judges to attend and advise on points of law. The distinction between the two tribunals was fully discussed and recognized in 1760 (Trial of Earl Perrers, Posters Criminal Cases, 139). The most recent trial was that of Earl Russell for high treason (1901, A.C. 446).

Among others are the Kilmainnock, Cromarty, and Cromarty treason trials in parliament in 1746 (State Trials xviii. 441), and in the court of the lord high steward, Lord Morley (treason, 1666, State Trials vi. 777), Lord Cornwallis (murder, 1678 State Trials vii. 145), Lord Delamere (1686, treason, State Trials xi. 510). Recently some doubt has been expressed as to the origin of the court of the lord high steward. It is said that the historical document upon which the practice is founded is a forgery. The conflicting views are set forth in Vernon Harcourt’s His Grace the Steward and Trial of Peers, p. 429, and In Pike’s Constitutional History of the House of Lords, p. 213. In any case when the court’s historical origin, the court for centuries as a matter of fact has been agreed to as legal recognition as part of the constitution. The right to a trial by peers extends only to cases of treason and felony, and not to those of misdemeanor; nor can it be waived by any peer (Co. 3 Inst. 20; Kelyngh’s Rep. 50). In the case of R. v. Lord Graves (1887), discussed in Hansard’s Parliamentary Debates, 3rd series, vol. cccx. p. 246, Lord Halsbury points out that the question of trial by peers is one of jurisdiction established by law rather than a claim of privilege in the discretion of the accused. Scottish and Irish peers, whether possessing seats in the House of Lords or not, are entitled to trial by peers, the same procedure being followed as in the case of members of the House of Lords.

Peers with a seat in the House of Lords possess practically the same parliamentary privileges as do members of the House of Commons. Among other privileges peculiar to themselves they have the right of personal access to the sovereign (Anson’s Law of the Constitution, i. 227). In the House of Lords, when a resolution is passed contrary to his sentiments, any peer, by leave of the house, may “protest,” that is, enter his dissent on the journals of the house (Blackstone, Comm. i. 162). Formerly a peer might vote by proxy (Blackstone, ibid.), but since 1868 there has been a standing order discontinuing this right. In accordance with resolutions passed by the two houses, neither house has power by any vote or declaration to clothe itself with new privileges unknown to the law and customs of parliament (Commons Journal, xiv. 555). Peersesses and non-representative peers of Ireland and Scotland have,
The children of peers are commons, The eldest son of a peer of the rank of earl (and above) is usually known socially by the name of his father's next peer, but the courtesy title is usually indicated in every public document. In the following word picture, theHonourable Mr. John Smith, Esq., commonly known as Viscount Blackacre. Several cases are on record in which peers' eldest sons have actually borne courtesy titles not possessed as peerage honours by their fathers, but inasmuch as such are only accorded by courtesy, no question of peerage privilege arises. The younger sons of dukedoms or marquesses are entitled to the prefix "Lord" for patronymic purposes, from the days of their ancestors as well as of dukedoms and marquesses are entitled similarly to style themselves "Lady," on the principle that all the daughters are equal in rank and precedence. The younger sons of earls and all the younger children of viscounts and barons are entitled to the prefix "Honourable." Usually when the direct heir of a peer dies his children are given, by the Crown, on the death of the peer, the courtesy and titles and precedence they would have enjoyed had their father lived, without the prefix of the peer.

An alien may be created a peer, but while remaining an alien cannot sit in the House of Lords, nor, if a Scottish or Irish peer, can he vote at elections for representative peers. Peerages in the United Kingdom are created as a reward for services to the Crown. The writ of summons method is not now used except in the case of calling up an eldest son in the barony of his father. This does not create a new peerage but only accelerates the opening of the peerage. In the 13th century, the peerage could not die, the death of the peerage remains vested in the son. Should the son die without heir the peerage reverts in the father. The invariable method of creation in all ordinary cases is by the Crown. The lesser writ describes the name of the dignity, the person upon whom it is conferred, and specify its course of descent. Claims to peerages are of two kinds: (1) of right, (2) of grace. In theory, the final decision is without reference to the House of Lords and issue a writ of summons to its petitioner. This would not in any way prevent the House of Lords from examining the patent and writ of summons when the favoured petitioner or any heir claiming through him came to take his seat. If of opinion that the patent was illegal the house might refuse admission, as it did in the Wensleydale case. In the case of the Marquis of Lorne (admitted 1865), a writ was granted to his father, an act of parliament being required to honour his more important nobles by granting them the title of Peer of France. At first the grant was confined to the royal dukedom, but later it was conferred on others, amongst whom late kings and queens of France and of the Holy Roman Empire.
Russia's nobility, but his more immediate progenitors were all very poor, and unable to read or write. His grandfather ploughed the fields as a simple peasant, and his father, as Peesemsy himself said, was washed and clothed by a rich relative, and placed as a soldier in the army, from which he retired as a major after thirty years' service. During childhood Peesemsy read eagerly the translated works of Wieland and Victor Hugo, and later those of Shakespeare, Schiller, Goethe, Rousseau, Voltaire and George Sand. From the gymnasium of Kostroma he passed through Moscow University, and in 1854 entered the government service as a clerk in the office of the Crown domains in his native province. Between 1854 and 1872, when he finally quitted the civil service, he occupied similar posts in St Petersburg and Moscow. His early works exhibit a profound disbelief in the higher qualities of humanity, and a disdain for the other sex, although he appears to have been attached to a particularly devoted and sensible wife. His first novel, Boyarschchina, was forbidden for its unflattering descriptions of the Russian nobility. His principal novels are Tufak ("A Muff"), 1850; Teschka doust ("A Thousand Souls"), 1862, which is considered his best work of the kind; and Vzvalomouchenskoe more ("A Troubled Sea"), giving a picture of the excited state of Russian society about the year 1862. He also produced a comedy, Gorkaya soudchina ("A Bitter Fate"), depicting the dark sides of the Russian peasantry, which obtained for him the Ovuaroiff prize of the Russian Academy. In 1856 he was sent, together with other literary men, to report on the ethnographical and commercial condition of the Russian interior, his particular field of inquiry having been Astrakhan and the region of the Caspian Sea. His scepticism in regard to the liberal reforms of the Sixties made him very unpopular among the more progressive writers of that time. He died at Moscow on the 2nd of February 1881 (Jan. 21, Russian style).

PEGASUS (from Gr. πῆγας, compact, strong), the famous winged horse of Greek fable, said to have sprung from the trunk of the Gorgon Medusa when her head was cut off by Perseus. Bellerophon caught him as he drank of the spring Peirene on the Acrocorinth at Corinth, or received him tamed and bridled at the hands of Athena (Pindar, Ol. xili. 63; Pausanias ii. 4). Mounted on Pegasus, Bellerophon slew the Chimera and overcame the Solymi and the Amazons, but when he tried to kill the dragon of Mount Icarus's home, Bellerophon fell from his heavenly course (Apollodorus ii. 3). Arrived in heaven, Pegasus served Zeus, fetching for him his thunder and lightning (Hesiod, Theog. 281). Hence some have thought that Pegasus is a symbol of the thundercloud. According to O. Gruppe (Griechische Mythologie, i. 75, 123) Pegasus, like Arion the fabled offspring of Demeter and Poseidon, was a curse-horse, symbolical of the rapidity with which curses were fulfilled. In later legend he is the horse of Eos, the morning. The erroneous derivation from πηγή, "a spring of water," may have given birth to the legends which connect Pegasus with water; e.g. that his father was Poseidon, that he was born at the springs of Orops, and that he had the power of making springs rise from the ground by a blow of his hoof. When Mt Helicon was enchanted by the song of the Muses, began to rise to heaven, Pegasus stopped its ascent by stamping on the ground (Antoninus Liberalis 9), and where he struck the earth Hippocrene (horse-spring), the fountain of the Muses, gushed forth (Pausanias ii. 31, ix. 31). But there are facts that speak for an independent mythological connexion between horses and water, e.g. the sacredness of the horse to Poseidon, the epithets Hippios and Equester applied to Poseidon and Neptune, the Greek fable of the origin of the first horse (produced by Poseidon striking the ground with his trident), and the custom in Argolis of sacrificing horses to Poseidon by drowning them in a well. From his connexion with Hippocrene Pegasus has come to be regarded as the horse of the Muses and hence as a symbol of poetry. But this is a modern attribute of Pegasus, not known to the ancients, and dating only from the Orlando innamorato of Boiardo.
to the area occupied by the parent rock (e.g. the granite), or to its immediate vicinity, and within the zone which has been greatly heated by the plutonic intrusion, viz. the contact aureole.

Another very important factor in producing the coarse crystallization of the pegmatite veins is the presence of abundant water vapour and other gases which served as mineralizing agents and facilitated the building together of the rock molecules in large crystalline individuals.

Proof that these vapours were important agents in the formation of pegmatites is afforded by many of the minerals contained in the veins. Boron, fluorine, hydrogen, chlorine and other volatile substances are essential components of some of these minerals. Thus tourmaline, which contains boron and fluorine, may be common in the pegmatites but rare in the granite, quartzite or chert. Conversely, fluorine is a frequent ingredient of granite pegmatites. Muscovite and gilchristite both contain hydrogen and fluorine; topaz is rich in fluorine also and all of these are abundant in some pegmatites. The stimulating effect which volatile substances exert on crystallizing molten masses is well known to experimental geologists who, by mixing tungstates and fluorides with fused powders, have been able to produce artificial minerals which they could not otherwise obtain. Most pegmatites are truly igneous rocks so far as their composition goes, but in their structure they show relations to the aqueous mineral veins. Many of them for example have a comby structure, that is to say, their minerals are frequently thrown into small fragments by the waves of the fluid occupied by the vein. Sometimes they have a banding owing to successive deposits having been laid down of different character; mica may be external, then feldspar, and in the centre a leader or string of pure quartz. In pegmatite veins also there are very frequently cavities or vugs, which are lined by crystals with very perfect faces. These bear much resemblance to the molaritic or drusy cavities common in granite, and like them were probably filled with the residual liquid which was left over after the mineral substances were deposited in crystals.

Pegmatites are very irregular not only in distribution, width and persistence, but also in composition. The relative abundance of the constituent minerals may vary rapidly and much from point to point. Sometimes they are rich in mica, in enormous crystals for which the rock is mined or quarried (India). Other pegmatites are nearly pure feldspar, while others are locally (especially near their terminations) very full of quartz. They may in fact pass into quartz veins (alaskites) some of which are auriferous (N. America). Quartz veins of another type are very largely developed, especially in regions of slate and phyllite; they are produced by segregation of dissolved silica from the country rock and its concentration into cracks produced by stretching of the rock masses during folding. In these segregation veins, especially when the beds are of felspathic nature, crystals of albite and orthoclase may appear, in large or small quantity. In this way a second type of pegmatite (segregation pegmatite) is formed which is very difficult to distinguish from true igneous veins. These two have, however, much in common as regards the conditions under which they were formed. Great pressures, presence of water, and a high though not necessarily very high temperature were the principal agencies at work.

Granite pegmatites are laid down after their parent mass had solidified and while it was being cooled down; sometimes they contain such minerals as garnet, not found in the main mass, and showing that the temperature of crystallization was comparatively low. Another special feature of these veins is the presence of minerals contained in rare or rare rocks. Gold occurs in nodas a few cases; tin in others, while sulphides such as copper pyrites are found also. Beryl is the commonest of the minerals of the second group; spodumene is another example, and there is much reason to hold that the commonest of some pegmatites in India, though this is not yet incontestably proved. The syenite-pegmatites of south Norway are remarkable both for their coarse crystallization and for the great number of rare minerals they have yielded. Among these may be mentioned laeviclite, rinkite, rosenbuschite, mosandrite, pyrophylcle, perofskite and lamprophyllite.

PEGNITZ, PEGOLOTTI

PEGNITZ, a river of Germany. It rises near Lindenhof in Upper Franconia (Bavaria) from two sources. At first it is called the Fichtenbeohe, but at Buchau it takes the name of the Pegnitz, and flowing in a south-westerly direction disappears below the small town of Pegnitz in a mountain cavern. It emerges through three orifices, enters Middle Franconia, and after flowing through the heart of the city of Nuremberg falls into the Pegnitz at Fürth.

See Specht, Das Pegnitzgebiet in Bezug auf seinen Wasserhaushalt (Munich, 1905).

The Pegnitz Order (Order of the society of Pegnitz shepherds), also known as the crowned flower order on the Pegnitz, was one of the societies founded in Germany in the course of the 17th century for the purification and improvement of the German language, especially in the domain of poetry. Georg Philipp Harsdörffer and Johann Klaj instituted the order in Nuremberg in 1644, and named it after the river. Its emblem was the passion flower with Pan's pipes, and the motto Mit Nuten erfreudich, oder Alle zu einem Einstimmig. The members set themselves the task of counteracting the pedantry of another school of poetry by imagination and gaiety, but lacking imagination and broad views they took refuge in allegorical subjects and puerile trifling. The result was to debase rather than to raise the standard of poetic art in Germany. At first the meetings of the order were held in private grounds, but in 1681 they were transferred to a forest near Kraftshof or Naunhof. In 1794 the order was reorganized, and it now exists merely as a literary society.

See Tittman, Die nährbter Dirkerschule (Göttingen, 1847); and the Festschrift zur 250-jährigen Jubelfest des pegnitzischen Blumenordens (Nuremberg, 1894).

PEGOLOTTI, FRANCESCO BALDUCCI (b. 1315-1340), Florentine merchant and writer, was a factor in the service of the mercantile house of the Bardi, and in this capacity we find him at Antwerp from 1315 (or earlier) to 1317; in London in 1317 and apparently for some time after; in Cyprus from 1324 to 1327, and again (or perhaps in unbroken continuation of his former residence) in 1335. In this last year he obtained from the king of Little Armenia (i.e. medieval Cilicia, &c.) a grant of privileges for Florentine trade. Between 1335 and 1343—probably in 1330-1340, he compiled his Libro di divisiamenti di paesi e di misuri di mercantania e d' altre cose bisognosoli di sopere a mercantanti, commonly known as the Pratica della mercatura (the name given it by Pagnini). Beginning with a sort of glossary of foreign terms then in use for all kinds of taxes or payments on merchandise as well as for “every kind of place where goods might be bought or sold in cities,” the Pratica next describes some of the chief trade routes of the 14th century, and many of the principal markets then known to Italian merchants; the imports and exports of various important commercial regions; the business customs prevalent in each of those regions, and the comparative value of the leading moneys, weights and measures. The most distant and extensive trade routes described by Pegolotti are: (1) that from Tana or Asoz to Peking via Astrakhan, Khiva, Otrar, Kulja and Kanchow (Gittarchan, Organci, Otttarre, Armalecco and Cameux in the Pratica); (2) that from Lajazzo on the Cilician coast to Tabriz in north Persia via Sivas, Erzinger and Erzerum (Salvasto, Arzinga and Arzerone); (3) that from Trebizond to Tabriz. Among the markets enumerated are: Tana, Constantinople, Alexandria, Damietta, and the ports of Cyprus and the Crimea. Pegolotti’s notices of ports on the north of the Black Sea are very valuable; his works show us that Florentine exports had now gained a high reputation in the Levant. In other chapters of the book he gives the methods of packing goods (ch. 29); of assaying gold and silver (ch. 10); of calibrating the currency; and of describing the order of the states of the Pegnitz, and the number of vessels, men, and goods which have entered and left through it. He speaks of the “London in England in itself” (ch. 62); of monasteries in Scotland and England (“Scotland of England,” Sceia di Inghiliera) that were rich in wool (ch. 63). Among the latter are Newbattle, Balmerino, Cupar, Dunfermline, Dundremont, Glenluce, Coldingham, Kelso, Newminster near Morpeth, Furness, Fountains, Kirkstall, Kirkstead, Swineshead, Sawley
and Calder. Pegolotti's interest in England and Scotland is chiefly connected with the wool trade.

There is only one MS. of the Pratica, viz. No. 2441 in the Riccardian Library at Pisa, written in 1471; and on one edition of the text, in vol. iii. of Gian Francesco Pagnin's Della Decima et delle altre gossete imposte dal commune di Firenze (Lisbon and Lucca—really Florence—1760); Sir Henry opined that this book formed the basis of the most interesting sections of Pegolotti, with valuable commentary (London, Hakluyt Society, 1886). See also W. Heyd, Commerce du Levant, ii., 17, 50, 58, 78-79, 85-86, 112-119 (Leipzig, 1886); H. Koeppel, "Hamburgische Perspektive der BERIERTEN AKADEMY," p. 901, &c. (Berlin, 1881); C. R. Beazley, Dawn of Modern Geography, iii., 324-339, 550, 555 (Oxford, 1906).

**PEGU**, a town and former capital of Lower Burma, giving its name to a district and a division. The town is situated on a river of the same name, 47 m. N.E. of Rangoon by rail; pop. (1901), 14,132. It is still surrounded by the old walls, about 40 ft. wide, on which have been built the residences of the British officials. The most conspicuous object is the Shwe-maw-daw pagoda, 324 ft. high, considerably larger and even more holy than the Shwe-dagon pagoda at Rangoon. Pegu is said to have been founded in 573, as the first capital of the Talangis; but it was as the capital of the Toungoo dynasty that it became known to Europeans in the 15th century. About the middle of the 18th century it was destroyed by Alompra; but it rose again, and was important enough to be the scene of fighting in both the first and second Burmese Wars. It gave its name to the province (including Rangoon) which was annexed by the British in 1852.

The district, which was formed in 1883, consists of an alluvial tract between the Pegu Yoma range and the Sittang river: area, 4,276 sq. m.; pop. (1901), 3,305,727, showing an increase of 45% in the decade. Christians numbered nearly 9,000, mostly Karens. Almost the only crop grown is rice, which is exported in large quantities to Rangoon. The district is traversed by the railway, and also crossed by the Pegu-Sittang canal, navigable for 85 m., with locks. The division of Pegu comprises the five districts of Rangoon city, Hanthawaddy, Tharrawaddy, Pegu and Prome, lying east of the Irrawaddy: area, 13,084 sq. m.; pop. (1901), 1,862,638.

Pegu has also given its name to the Pegu Yoma, a range of hills running north and south for about 200 m., between the Irrawaddy and Sittang rivers. The height nowhere exceeds 2000 ft., but the slopes are steep and rugged. The forests yield teak and other valuable timber. The Pegu river, which rises in this range, falls into the Rangoon river just below Rangoon city, after a course of about 180 m.

**PEILE, JOHN** (1838-1910), English philologist, was born at Whitehaven on the 24th of April 1838. He was educated at Repton and Christ's College, Cambridge. After a distinguished career (Craven scholar, senior classic and chancellor's medalist), he became fellow and tutor of his college, reader of comparative philology in the university (1884-1891), and in 1885 was elected master of Christ's. He took a great interest in the higher education of women and became president of Newnham College. He was the first to introduce the great philological works of George Curtius and Wilhelm Corssen to the English student in his Introduction to Greek and Latin Eymology (1890). He died at Cambridge on the 9th of October 1910, leaving practically completed his exhaustive history of Christ's College.

**PEINE**, a town of Germany, in the Prussian province of Hanover, 16 m. by rail N.W. of Brunswick, on the railway to Hanover and Hamburg. Pop. (1905), 15,421. The town has a Reformed Church, Catholic, and a Protestant church and several schools. Its industries are iron and steel works, breweries, distilleries, brickyards, and the manufacture of starch, sugar, malt, machinery and artificial manure. There are also large horse and cattle markets held here. Peine was at one time a strongly fortified place, and until 1803 belonged to the bishopric of Hildesheim.

**PEINE FORTE ET DURE** (French for "hard and severe punishment"), the term for a barbarous torture inflicted on those who, arraigned of felony, refused to plead and stood silent, or challenged more than twenty jurors, which was deemed a con- tamuity equivalent to a refusal to plead. By early English law a prisoner, before he could be tried, must plead "guilty" or "not guilty." Before 1831 it was usual to importune and starve till submission, but in Henry IV.'s reign the peine was employed. The prisoner was stretched on his back, and stone or iron weights were placed on him till he either submitted or was pressed to death. Treasing to death was abolished in 1772, "standing mute" on an arraignment of felony being then made equivalent to conviction. By an act of 1828 a plea of "not guilty" was to be entered against any prisoner refusing to plead, and that is the rule to-day. An alternative to the peine was the tying of the thumbs tightly together with whipcord until pain forced the prisoner to speak. This was said to be a common practice at the Old Bailey up to the 19th century.

Among recorded instances of the infliction of the peine are: Juliana Quirk (1442) for high treason in speaking derisively of Henry VI.; Margaret Clitherow, "the martyr of York" (1586); Walter Calverly, of Calverly, Yorks, for the murder of his children (1605); and Major Strongways at Newgate, charged with murder of his wife (1653). In this last case it is said that upon the weights being placed in position several cavaliers friends of Strongways sprang on his body and put him out of his pain. In 1721 one Nathaniel Hawes lay under a weight of 250 lb for seven minutes, and was at last forced to confess. Districts where it was last heard of was at Cambridge, in 1741 at Cambridge assizes, when a prisoner was so put to death; the penalty of thumb-tying having first been tried. In 1692 at Salem, Mas- sachusetts, Core O'Conor, charged with witchcraft, refusing to plead, was pressed to death. This is believed to be the only instance of the infliction of the penalty in America.

**PÉPINUS**, or CHUDSKOE OZERO, a lake of north-west Russia, between the governments of St Petersburg, Pskov, Livonia and Esthonia. Including its southern extension, sometimes known as Lake Pskov, it has an area of 1356 sq. m. Its shores are flat and sandy, and in part wooded; its waters deep, and they afford valuable fishing. The lake is fed by the Velikaya, which enters it at its southern extremity, and by the Embach, which flows in half way up its western shore; it drains into the Gulf of Finland by the Narova, which issues at its north-east corner.

**PEIRÆUS**, or Piræus (Gr. Πειραιας), the port town of Athens, with which its history is inseparably connected. Pop. (1907), 67,982. It consists of a rocky promontory, containing three natural harbours, a large one on the north-west which is still one of the chief commercial harbours of the Levant, and two smaller ones on the east, which were used chiefly for naval purposes. The mistioles was the first to urge the Athenians to take advantage of these harbours, instead of using the sandy bay of Phaleron; and the fortification of the Peiræus was begun in 493 B.C. Later on it was connected with Athens by the Long Walls in 460 B.C. The town of Peiræus was laid out by the architect Hippodamus of Miletus, probably in the time of Pericles. The promontory itself consisted of two parts—the hill of Munychia, and the projection of Aete; on the opposite side of the great harbour was the outwork of Ektomeia. The most stirring episode in the history of the Peiræus is the seizure of Munychia by Thrasylulus and the exiles from Phyle, and the consequent destruction of the "30 tyrants" in 404 B.C. The three chief arsenals of the Peiræus were named Munychia, Zea and Cantharus, and they contained galley slips for 82, 106 and 94 slips respectively in the 4th century B.C.

Sec under ATHENS. Also Angelopoulos, Πειραιας και των Πειραιων τόπων (Athens, 1896).

**PEIRCE, BENJAMIN** (1809-1880), American mathematician and astronomer, was born at Salem, Massachusetts, on the 4th of April 1809. Graduating at Harvard College in 1829, he became an assistant professor of mathematics in 1835 and professor in 1837. He had already assisted Nathaniel Bowditch in his translation of the Mécanique céleste, and now produced a series of mathematical textbooks characterized by the brevity and terseness which made his teaching unattractive to inapt pupils. Young men of talent, on the contrary, found his instruction most stimulating, and after Bowditch's death in 1838 Peirce stood first among American mathematicians. His researches into the perturbations of Uranus and Neptune (Proc. Amer.
Acad., 1848) gave him a wider fame; he became in 1849 consulting astronomer to the American Nautical Almanac, and for this work prepared new tables of the moon (1852). A discussion of the equilibrium of Saturn's rings led him to conclude in 1855 that they must be of a fluid nature. From 1867 to 1874 he was superintendent of the Coast Survey. In 1857 he published his best known work, the System of Analytical Mechanics, which was, however, surpassed in brilliant originality by his Linear Associate Algebra (lithographed privately in a few copies, 1870; reprinted in the Amer. Journ. Math., 1882). He died at Cambridge, Mass., on the 6th of October 1880.

PEISANDER, of Camirus in Rhodes, Greek epic poet, supposed to have flourished about 640 B.C. He was the author of a Heracleis, in which he introduced a new conception of the hero, the lion's skin and club taking the place of the older Homerick equipment. He has also said to have fixed the number of the "labours of Hercules" at twelve. The work, which according to Clement of Alexandria (Stromata, vi. ch. 2) was simply a plagiarism from an unknown Pisinus of Lindus, enjoyed so high a reputation that the Alexandrian critics admitted the author to the epic canon. From an epigram (50) of Theocritus we learn that a statue was erected in honour of Peisander by his countrymen. He is to be distinguished from Peisander of Laranda in Lycia, who lived during the reign of Alexander Severus (A.D. 222-233), and wrote a poem on the mixed marriages of his time, and the murder of the monarch of Argos. See fragments in G. Kinkel, Epicorum graecorum fragmenta (1878); also F. G. Welcker, Kleine Schriften, vol. i. (1844), on the twelve labours of Hercules in Peisander.

PEISISTRATUS, (605?-527 B.C.), Athenian statesman, was the son of Hipponocrates. He was named after Peisistratus, the youngest son of Nestor, the alleged ancestor of his family; he was second cousin on his mother's side to Solon, and numbered among his ancestors Cleisthenes of Athens. Thus among those who became "tyrants" in the Greek world he gained his position as one of the old nobility, like Phalaris of Agrigentum, and Lygdamis of Naxos; but unlike Orthogoras of Sicyon, who had previously been a cook. Peisistratus, though Solon's junior by thirty years, was his lifelong friend (though this is denied), nor did their friendship suffer owing to their political antagonism. From this widely accepted belief arose the almost certainly false statement that Peisistratus took part in Solon's successful war against Megara, which necessarily took place before Solon's archonship (probably in 600 B.C.). Aristotle's Constitution of Athens (ch. 17) carefully distinguishes Solon's Megarian war from the Peisistratian war, the former having been undertaken between 578 and 565 to recapture Nisaea (the port of Megara) which had apparently been recovered by the Megarians since Solon's victory (see Sandys on The Constitution of Athens, ch. 14, 1, note, and E. Abbott, History of Greece, vol. i. app. p. 544). Whatever be the true explanation of this problem, it is certain (1) that Peisistratus was regarded as a leading soldier, and (2) that his position was strengthened by the prestige of his family. Furthermore (3) he was a man of great ambition, persuasive eloquence and wide generosity; qualities which especially appealed at that time to the classes from whom he was to draw his support—hence the warning of Solon (Frag. II. B), "Fools, you are treading in the footsteps of the fox; can you not read the hidden meaning of these charming words?" Lastly, (4) and most important, the times were ripe for revolution. In the article on Solon (ad fin.) it is shown that the Solonian reforms, though they made a great advance in some directions, failed on the whole. They were too moderate to please the people, too democratic for the nobles. It was found that the government by Boule and Ecclesia did not mean popular control in the full sense; it meant government by the leisureed classes, inasmuch as the industrious farmer or herdsmen could not leave his work to give his vote at the Ecclesia, or do his duty as a councillor. Partly owing to this, and partly to ancient feuds whose origin we cannot trace, the Athenian people was split up into three great factions known as the Plain (Pediès) led by Lycurgus and Miltiades, both of noble families; the Shore (Parài) led by the Alcmaeonidae, represented at this time by Megacles, who was strong in his wealth and by his recent marriage with Agariste, daughter of Cleisthenes of Sicyon; the Hill or Upland (Diacreis, Diaciri) led by Peisistratus, who no doubt owed his influence among these hillmen partly to the possession of large estates at Marathon. In the two former divisions the influence of wealth and birth predominated; the hillmen were poorly housed, poorly clad and unable to make use of the privileges which Solon had given them. Hence their attachment to Peisistratus, the "man of the people," who called upon them to sweep away the last barriers which separated rich and poor, nobles and commoners, city and countryside. Lastly, there was a class of men who were discontented with the Solonian constitution: some had lost by his Seisachtheia, others had vainly hoped for a general redistribution. These men saw their only hope in a revolution. Such were the factors which enabled him to found his tyranny.

To enter here into an exhaustive account of the various theories which even before, though especially after, the appearance of the Constitution of Athens have been propounded as to the chronology of the Peisistratean tyranny, is impossible. For a summary of these hypotheses see J. E. Sandys' edition of the Constitution of Athens (p. 56, c. 14 note). The following is in brief the sequence of events: In 560 B.C. Peisistratus drove into the market-place, showed to an indignant assembly marks of violence on himself and his mules, and claimed to be the victim of assault at the hands of political enemies. The people unhesitatingly awarded their "champion" a bodyguard of fifty men (afterwards four hundred) armed with clubs. With this force he proceeded to make himself master of the Acropolis and tyrant of Athens. The Alcmaeonids fled and Peisistratus remained in power for about five years, during which Solon's death occurred. In 555 or 554 B.C. a coalition of the Plain and the Coast succeeded in expelling him. His property was confiscated and sold by auction, but in his absence the strife between the Plain and the Coast was renewed, and Megacles, unable to hold his own, invited him to return. The condition was that their families should be allied by the marriage of Peisistratus to Megacles' daughter Coesyra. A second coup d'état was then effected. A beautiful woman, it is said, by name Phya, was disguised as Athena and drove into the Agora with Peisistratus at her side, while proclamations were made that the goddess herself was restoring Peisistratus to Athens. The ruse was successful, but Peisistratus soon quarrelled with Megacles over Coesyra. By a former marriage he already had two sons (Hipparchus, now growing up, and in his first tyranny or his first exile he married an Argive, Timopygis, by whom he had two other sons Iophon and Hegesistratus, the latter of whom is said to be identical with Thessalus (Ath. Pol. c. 17), though from Thucydides and Herodotus we gather that they were distinct—e.g. Herodotus describes Hegesistratus as a bastard, and Thucydides says that Thessalus was legitimate. Further it is suggested that Peisistratus was unwilling to have children by one on whom lay the curse of the Cyllonian outrage. The result was that in the seventh year (or month, see Ath. Pol. c. 15, 1, Sandys' note) Megacles accused him of neglecting his daughter, combined once more with the third faction, and drove the tyrant into an exile lasting apparently for ten or eleven years. During this period he lived first at Rhæculos and later near Mount Pangæus, and on the Smyrna, collecting resources of men and money. He came finally to Eretria, and, with the help of the Thebans and Lygdamis of Naos, whom he afterwards made ruler of that island, he passed over to Attica and defeated the Athenian forces at the battle of Pallene or Pellene. From this time till his death he remained undisputed master of Athens. The Alcmaeonids were compelled to leave Athens, and from

1) It is supposed with probability that the Diaciri were rather the miners of the Laurium district (P. M. Ure, Journ. Hell. Stud., 1906, pp. 131-142).
the other noble families which remained he exacted 400 hostages whom he put in the care of his ally Lygdamis. In the heyday of the Athenian democracy, citizens both conservative and progressive, politicians, philosophers and historians were unanimous in their denunciation of "tyranny." Yet there is no doubt that the rule of Peisistratus was most beneficial to Athens both in her foreign and in her internal relations. (1) During his enforced absence from Athens he had evidently acquired a far more extended idea of the future of Athens than had hitherto dawned on the somewhat parochial minds of her leaders. He was friendly with Thbes and Argos; his son Hegesistratus he set in power at Sigeum (see E. Abbott, Hist. of Gr. vol. i. xxviii. 39) and his friend Lygdamis at Naxos. From the mines of Thrace, and perhaps from the harbour dues and from the mines of Laurium, he derived a large revenue; under his encouragement, Miltiades had planted an Athenian colony on the shores of the Thracic Chersonese; he had even made friends with Thessaly and Macedonia, as is evidenced by the hospitality extended by them to Hippias on his final expulsion. Finally, he did not allow his friendliness with Argos to involve him in war with Sparta, towards whom he pursued a policy of moderation. (2) At home it is admitted by all authorities that his rule was moderate and beneficent, and that he was careful to preserve at least the form of the established constitution. It is said that, being accused of murder, he was ready to be tried by the Areopagus. Everything which he did during his third period of rule was in the interests of discipline and order. Thus he hired a mercenary bodyguard, and utilized for his own purposes the public revenues; he kept the chief magistrates (through which he ruled) in the hands of his family; he imposed a general tax of 10% (perhaps reduced by Hippias to 5%) on the produce of the land, and thus obtained control over the fleet and spread the burden of it over all the citizens. (see the spurious letter of Peisistratus to Solon, Diog. Laert. i. 53; Thuc. vi. 54 and Arnold's note ad loc.; Boeckh i. ii.; Thirlwall c. xi., pp. 72-74; and Grote). But the great wisdom of Peisistratus is shown most clearly in the skill with which he blinded the people to his absolutism. Pretending to maintain the Solonian constitution (as he could well afford), he realized that people would never recognize the deception if a sufficient degree of prosperity were ensured. Secondly, he knew that the greater the proportion of the Athenians who were prosperously at work in the country and therefore did not trouble to interfere in the work of government the less would be the danger of sedition, whose seeds are in a crowded city. Hence he appears to have encouraged agriculture by abating the tax on small farms, and even by assisting them with money and stock. Secondly, he established democratically courts to prevent persons having recourse to the city tribunals; it is said that he himself once recalled a man on circuit," and on one of these occasions was so struck by the plaints of an old farmer on Hymettus, that he remitted all taxation on his land. Thus Athens enjoyed immunity from war and internecine struggle, and for the first time for years was in enjoyment of settled financial prosperity (see Constitution of Athens, c. 16. 7 δ ἐκλή Kριοῦ βίος).

To him are ascribed also the original Parthenon on the Acropolis, afterwards burned by the Persians, and replaced by the Parthenon of Pericles. It is said that he gave a great impetus to the dramatic representations which belonged to the Dionysiac festival, and that it was under his encouragement that Thespis of Icaria, by impersonating character, laid the foundation of the great Greek drama of the 5th and 4th centuries. Lastly, Peisistratus carried out the purification of Delos, the sacred island of Apollo of the Ionians; all the tombs were removed from the neighbourhood of the shrine, the abode of the god of light and joy.

We have spoken of his services to the state, to the poor, to religion. It remains to mention his alleged services to literature. All we can reasonably believe is that he gave encouragement to poetry as he had done to architecture and the drama; Onomacritus, the chief of the Orphic succession, and collector of the oracles of Musaeus, was a member of his household. Honestly, or to impress the people, Peisistratus made considerable use of oracles (e.g. at the battle of Pellene), and his descendants, by the oracles of Onomacritus, persuaded Darius to undertake their restoration. To the library of Peisistratus, we have no good evidence; it may perhaps be a fiction of an Alexandrian writer. There is strong reason for believing the story that he first collected the Homeric poems and that he was the text which ultimately prevailed (see Homer).

It appears that Peisistratus was benevolent to the last, and, like Julius Caesar, showed no resentment against enemies and calumniators. What Solon said of him in his youth was true throughout, "there is no better-disposed man in Athens, save for his ambition." He was succeeded by his sons Hippias and Hipparchus, by whom the tyranny was in various ways brought into disrepute.

It should be observed that the tyranny of Peisistratus is one of the many epochs of Greek history on which opinion has almost entirely changed since the age of Grote. Shortly, his services to Greece and to the Athenians may be summed up under three heads: In foreign policy, he sketched out the plan on which Athens was to act in her external relations. He advocated (a) alliances with Argos, Thessaly and Macedonia, (b) ascendency in the Aegean (Naxos and Delos), (c) control of the Hellespontine route (Sigeum and the Chersonese), (d) control of the Strymon valley (Mt Pangaeus and the Strymon), etc. Further, his rule exemplifies what is characteristic of all the Greek tyrannies— the advantage which the ancient monarchy had over the republican form of government. By means of his sons and his deputies (or viceroys) and by his system of matrimonial alliances he gave Athens a widespread influence in the centres of commerce, and brought her into connexion with the growing sources of trade and production in the western world. (2) His importance in the sphere of domestic policy has been frequently underrated. It may fairly be held that the reforms of Solon would have been futile had they not been fulfilled and amplified by the genius of Peisistratus. (3) It was under his auspices that Athens began to take the lead in literature. From this period we must date the beginning of Athenian literary ascendancy. But see Athenes.

PEKIN, a city and the county-seat of Tazewell county, Illinois, U.S.A., on the Illinois river, in the central part of the state, about 11 m. S. of Peoria, and about 56 m. N. of Springfield. Pop. (1910), 987. It is served by the Atchison, Topeka & Santa Fé, the Chicago & Alton, the Chicago, Peoria & St Louis, the Illinois Central, the Cleveland, Cincinnati, Chicago & St Louis, the Peoria Railway Terminal Company, the Peoria
& Pekin Union and (for freight between Peoria and Pekin) the Illinois Valley Belt railways. Situated in a rich agricultural region and in the Illinois coalfields, Pekin is a shipping point and grain market of considerable importance, and has various manufactures. The value of the factory products in 1905 was $1,121,130. Pekin was first settled about 1830, was incorporated in 1839, and re-incorporated in 1874.

**PEKING, or PEKIN,** the capital of the Chinese Empire, situated in 39° 57' N. and 116° 25' E., on the northern extremity of the great alluvial delta which extends southward from its walls for 700 m. For nine centuries Peking, under various names and under the dominion of successive dynasties, has, with some short intervals, remained an imperial city. Its situation near the northern frontier recommended it to the Tatar invaders as a convenient centre for their power, and its peculiarly fortunate position as regards the supernatural terrestrial influences pertaining to it has inclined succeeding Chinese monarchs to accept it as the seat of their courts. In 980 it was taken by an invading force of Khitan Tatars, who adopted it as their headquarters and named it Nanking, or the "southern capital." During the early part of the 11th century the Chinese recaptured it and renamed it from the rank of a metropolis to that of a provincial city of the first grade, and called it Yen-shan Fu. In 1151 it fell into the hands of the Kin Tatars, who made it a royal residence under the name of Chung-tu, or "central capital." Less than a century later it became the prize of Jenghiz Khan, who, having his main interests centred on the Mongolian steeple, declined to move his court southwards. His great successor, Kublai Khan (1260-1294), rebuilt the town, which he called Yenking, and which became known in Chinese as Ta-tu, or "great court," and in Mongolian as Khanbalik (Camblau), or "city of the khan." During the reign of the first emperor of the dynasty (1269-1290) which succeeded that founded by Jenghiz Khan the court resided at the modern Peking, but the succeeding sovereign Yung-lo (1409-1425) transferred his court to Pe-king (i.e., "north-court"), which has ever since been the seat of government. For further history see CAMBLAU.

During the periods above mentioned the extent and boundaries of the city varied considerably. Under the Kin dynasty the walls extended to the south-west of the Tatar portion of the present city, and the foundations of the northern ramparts of the Khan-balik of Kublai Khan are still to be traced at a distance of about 2 m. north beyond the existing walls. The modern city consists of the nei ch'eng, or inner city, commonly known to foreigners as the "Tatar city," and the wei ch'eng, or outer city, known in Chinese as Ta-tu. The names are somewhat misleading, as the inner city is not enclosed within the outer city, but adjoins its northern wall, which, being longer than the nei ch'eng is wide, outflanks it considerably at both ends. The outer walls of the double city contain an area of about 25 sq. m., and measure 30 m. in circumference. Unlike the walls of most Chinese cities, those of Peking are kept in perfect order. Those of the Tatar portion, which is the oldest part of the city, are 50 ft. high, with a width of 60 ft. at the base and 40 ft. at the top, while those of the Chinese city, which were built by the emperor Kia-ising in 1543, measure 30 ft. in height, and have a width of 25 ft. at the base and 15 ft. at the top. The terre-plein is well and smoothly paved, and is defended by a crenellated parapet. The outer faces of the walls are strengthened by square buttresses built out at intervals of 60 yds., and on the summits of these stand the guard-houses for the troops on duty. Each of the sixteen gates of the city is protected by a semi-circular enceinte, and is surmounted by a high tower built in galleries and provided with countless loopholes.

Peking suffered severely during the Boxer movement and the siege of the legations in the summer of 1900. Not only were most of the foreign buildings destroyed, but also a large number of important Chinese buildings in the vicinity of the foreign quarter, including the ancient Hanlin Yuen, the boards of war, rites, &c. Almost the whole of the business quarter, the wealthiest part of the Chinese city, was laid in ashes (see CHINA: History).

The population of Peking is reckoned to be about 1,000,000, a number which is out of all proportion to the immense area enclosed within its walls. This disparity is partly accounted for by the facts that large spaces, notably in the Chinese city, are not built over, and that the grounds surrounding the imperial palace, private residences and temples are very extensive. One of such enclosures constitutes the British legation, and most of the other foreign legations are similarly, though not so sumptuously, lodged. Viewed from these walls, Peking looks like a city of gardens. Few crowded neighbourhoods are visible, and the characteristic features of the scene which meets the eye are the upturned roofs of temples, palaces, and mansions, gay with blue, green and yellow glazed tiles, glittering among the groves of trees with which the city abounds. It is fortunate that the city is not close-built or crowded, for since the first advent of foreigners in Peking in 1860 nothing whatever had been done until 1900 to improve the streets or the drainage. The streets as originally laid out were wide and spacious, but being unpaved and undrained they were no better than mud tracks diversified by piles of garbage and foul-smelling stagnant pools. Such drainage as had at one time existed was allowed to get choked up, giving rise to typhoid fever of a virulent type. Some attempt has been made to improve matters by macadamizing one of the principal thoroughfares, but it will be the labour of a Hercules to cleanse this vast city from the accumulated filth of ages of neglect.

Enclosed within the Tatar city is the Huang ch'eng, or "Imperial city," which in its turn encloses the Tse-kin ch'eng, or "Forbidden city," in which stands the emperor's palace. On the north of the Tse-kin ch'eng, and separated from it by a moat, is an artificial mound known as the King shan, or "Prospect Hill." This mound, which forms a prominent object in the view over the city, is about 150 ft. high, and is topped with five summits, on each of which stands a temple. It is encircled by a wall measuring upwards of a mile in circumference, and is prettily planted with trees, on one of which the last emperor of the Ming dynasty (1644), finding escape from the Manchu invaders impossible, hanged himself. On the west of Prospect Hill is the Si yuan, or "Western Park," which forms part of the palace grounds. This park is tastefully laid out, and is traversed by a lake, which is mainly noticeable from the remarkably handsome marble bridge which crosses it from east to west. Directly northwards from Prospect Hill stands the residence of the T'itu, or "governor of the city," and the Bell and the Drum Towers, both of which have attained celebrity from the nature of their contents—the first from the huge bell which hangs in it, and the second from the appliances it contains for marking the time. The bell is one of five which the emperor Yung-lo ordered to be cast. In common with the others, it weighs 120,000 lb., is 14 ft. high, 34 ft. in circumference at the rim, and 6 in. thick. It is struck by a wooden beam swung on the outside, and only at the changes of the night-watches, when its deep tone may be heard in all parts of the city. In the Drum Tower incense-sticks, specially prepared by the astronomical board, are kept burning to mark the passage of time, in which important duty their accuracy is checked by a clepsydra. Another of Yung-lo's bells is hung in a Buddhist temple outside the north-west angle of the city wall. It is covered both on the inside and outside with the Chinese texts of the Lankavatara Sūtra, and the Saddharma pundarika Sūtra.

Turning southwards we come again to the Forbidden City, the central portion of which forms the imperial palace, where, in halls which for the magnificence of their proportions and barbaric splendour are probably not to be surpassed anywhere, the Son of Heaven holds his court. In the eastern and western portions of this city are situated the residences of the highest dignitaries of the empire; while beyond its confines on the south stand the offices of the six official boards which direct the affairs of the eighteen provinces. It was in the "yamén" of one of these boards—the Li Pu or board of rites—that Lord Elgin signed the treaty at the conclusion of the war in 1860—an event which derives especial interest from the fact of its having been the first
PELAGIA, ST.—PELAGIUS (POPEs)

occasion on which a European plenipotentiary ever entered Peking accompanied by all the pomp and circumstance of his rank and charge.

Outside the Forbidden City, the most noteworthy building is the Temple of Heaven, which stands in the outer or Chinese city. Here at early morning on the 21st of December the emperor offers sacrifice on an open altar to Shang-ti, and at periods of drought or famine presents prayers for relief to the same supreme deity. The altar at which these solemn rites are performed consists of a triple circular marble terrace, 210 ft. wide at the base, 150 in the middle and 90 at the top. The uppermost surface is paved with blocks of the same material forming nine concentric circles, the innermost containing nine blocks, and then the outside of eighty-one where she died after three years of strict penance. This story seems to combine with the name of the older Pelagia some traits from an actual history referred to by Chrysostom (Hom. in Math. Ixvii. 3). In associating St. Pelagia with St. Marina, St. Margaret (q.v.), and others, of whom either the name or the legend recalls Pelagia, Hermann Usener has endeavoured to show by a series of subtle deductions that this saint is only a Christian travesty of Aphrodite. But there is no doubt of the existence of the first Pelagia of Antioch, the Pelagia of Ambrose and Chrysostom. The legends which have subsequently become connected with her name are the result of a very common development in literary history.

See Acta sanctorum, October, iv. 218 seq.; H. Usener, Legenden der heiligen Pelagia (Bonn, 1870); H. Delehaye, The Legends of the Saints (London, 1907), pp. 197-205.

PELAGIUS, the name of two popes.

PELAGIUS I., pope from 557 to 561, was a Roman by birth, and first appears in history at Constantinople in the rank of deacon, and as aposciarius of Pope Silverius, whose overthrow in favour of Vigilius his intrigues promoted. Vigilius continued him in his diplomatic appointment, and he was sent by the emperor Justinian in 542 to Antioch on ecclesiastical business; he afterwards took part in the synod at Gaza which deposed Paul of Alexandria. He had amassed some wealth, which on his return to Rome he employed among the poor as to secure for himself great popularity; and, when Vigilius was summoned to Byzantium in 544, Pelagius, now archdeacon, was left behind as his vicar, and by his tact in dealing with Totila, the Gothic invader, saved the citizens from murder and outrage. He appears to have followed his master to Constantinople, and to have taken part in the Three Chapters controversy; in 553, at all events, he signed the "constitutum" of Vigilius in favour of these, and for refusing, with him, to accept the decrees of the fifth general council (the 2nd of Constantinople, 553) shared his exile. Even after Vigilius had approved the condemnation of the Three Chapters, Pelagius defended them, and even published his opposition on this subject. But when Vigilius died (June 7, 555), he accepted the council, and allowed himself to be designated by Justinian to succeed the late pope. It was in these circumstances that he returned to Rome; but most of the clergy, suspecting his orthodoxy, and believing him to have had some share in the removal of his predecessor, shunned his fellowship. He enjoyed, however, the support of Narses, and, after he had publicly purged himself of complicity in Vigilius's death in the church of St Peter, he met with toleration in his own immediate diocese. The rest of the western bishops, however, still held aloof, and the episcopate of Tuscany caused his name to be removed from the diptychs. This elicited from him a circular, in which he asserted his loyalty to the four general councils, and declared that the hostile bishops had been guilty of schism.

The bishops of Liguria and Aemilia, headed by the archbishop of Milan, and those of Istria and Venice, headed by Paulinus of Aquileia, also withheld their fellowship; but Narses resisted the appeals of Pelagius, who would have invoked the secular arm. Childebert, king of the Franks, also refused to interfere. Pelagius died on the 4th of March 561, and was succeeded by John III.

PELAGIUS II., a native of Rome, but of Gothic descent, was pope from 579 to 590, having been consecrated successor of Benedict I., without the sanction of the emperor, on the 26th of
November. To make his apologies for this irregularity he sent to Deacon Gregory, who afterwards became Pope Gregory the Great, as his apocrisiarius to Constantinople. In 585 he sought to heal the schism which had subsisted since the time of Pelagius I. in connexion with the Three Chapters, but his efforts were without success. In 588 John, patriarch of Constantinople, by reviving the old and disputed claim to the title of occumencic patriarch, elicited a vigorous protest from Pelagius; but the decreal which professes to convey the exact words of the document is now known to be false. He died in January 590, and was succeeded by Gregory I.

PELAGIUS (c. 360–c. 420), early British theologian. Of the origin of Pelagius almost nothing is known. The name is supposed to be a graecized form of the Cymric Morgan (sea-begotten). His contemporaries understood that he was of British (probably of Irish) birth, and gave him the appellation Brito. He was a large ponderous person, heavy both in body and mind (Jerome, "stolidissimus et Scolorum pultibus praegravatus"). He was influenced by the monastic enthusiasm which had been kindled in Gaul by Athanasius (336), and which, through the energy of Martin of Tours (351), rapidly communicated itself to the British and Scots. For though Pelagius remained a layman throughout his life, and though he never appears in any strict connexion with a coenobite fraternity, he yet adhered to monastic discipline ("veluti monachus"), and distinguished himself by his purity of life and exceptional sanctity ("egregie Christianus"). He seems to have been one of the earliest, if not the very earliest, of that remarkable series of men who issued from the monasteries of Scotland and Ireland, and carried back to the Continent in a purified form the religion they had received from it. Coming to Rome in the beginning of the 5th century (his earliest known writing is of date 405), he found a scandalously low tone of morality prevalent. But his repressed temper was met by the plea of human weakness. To remove this plea by exhibiting the actual powers of human nature became his first object. It seemed to him that the Augustinian doctrine of total depravity and of the consequent bondage of the will both cut the sinew of all human effort and threw upon God the blame which really belonged to man. His favourite maxim was, "If I ought, I can."
The views of Pelagius did not originate in a conscious reaction against the influence of the Augustinian theology, although each of these systems was developed into its ultimate form by the opposition of the other. Neither must too much weight be allowed to the circumstance that Pelagius was a monk, for he was unquestionably alive to the delicate character of much that passed for asceticism. Yet the point of his monastic training may have led him to look more at conduct than at character, and to believe that holiness could be arrived at by rigour of discipline. This view of things suited his matter-of-fact temperament. Judging from the general style of his writings, his religious development had been equable and peaceful, not marked by the prolonged mental conflict, or the abrupt transitions, which characterized the experience of his great opponent. With no great penetration he saw very clearly the thing before him, and many of his practical counsels are marked by sagacity, and are expressed with the succinctness of a proverb ("corpus non frangendum, sed regendum est"). His interests were primarily ethical; hence his insistence on the freedom of the will and his limitation of the action of divine grace.

The peculiar tenets of Pelagius, though indicated in the commentaries which he published at Rome previous to 409, might not so speedily have attracted attention had they not been adopted by Coelestius, a much younger and bolder man than his teacher. Coelestius, probably an Italian, had been trained as a lawyer, but abandoned his profession for an ascetic life. When Rome was sacked by the Goths (410) the two friends crossed to Africa. There Pelagius once or twice met with Augustine, but very shortly sailed for Palestine, where he justly expected that his opinions would be more cordially received. Coelestius remained in Carthage with the view of receiving ordination. But Aurelius, bishop of Carthage, being warned against him, summoned a synod, at which Paulinus, a deacon of Milan, charged Coelestius with holding the following six errors: (1) that Adam would have died even if he had not sinned; (2) that the sin of Adam injured himself alone, not the human race; (3) that new-born children are in the same condition in which Adam was before the fall; (4) that the whole human race does not die because of Adam's death or sin, nor will the race rise again because of the resurrection of Christ; (5) that the law gives entrance to heaven as well as the gospel; (6) that even before the coming of Christ there were men who were entirely without sin. To these propositions a seventh is sometimes added, "that infants, though unbaptized, have eternal life," a corollary from the third. Coelestius did not deny that he held these opinions, but he maintained that they were open questions, on which the Church had never pronounced. The synod, notwithstanding, condemned and excommunicated him. Coelestius, after a futile appeal to Rome, went to Ephesus, and there received ordination.

In Palestine Pelagius lived unmolested and revered, until in 415 Orosius, a Spanish priest, came from Augustine, who in the meantime had written his De peccatorum meritis, to warn Jerome against him. The result was that in June of that year Pelagius was cited by Jerome before John, bishop of Jerusalem, and charged with holding that man may be without sin, if only he desires it. This prosecution broke down, and in December of the same year Pelagius was summoned before a synod of fourteen bishops at Diospolis (Lydda). The prosecutors on this occasion were two deposed Gallican bishops, Heros of Arles and Lazarus of Aix, but on account of the illness of one of them neither could appear. The proceedings, being conducted in various languages and by means of interpreters, lacked certainty, and justified Jerome's application to the synod of the epithet "miserable." But there is no doubt that Pelagius repudiated the assertion of Coelestius, that "the divine grace and help is not granted to individual acts, but consists in free will, and in the giving of the law and instruction." At the same time he affirmed that a man is able, if he likes, to live without sin and keep the commandments of God, inasmuch as God gives him this ability. The synod was satisfied with these statements, and pronounced Pelagius to be in agreement with Catholic teaching. Pelagius naturally plumed himself on his acquittal, and provoked Augustine to give a detailed account of the synod, in which he shows that the language used by Pelagius was ambiguous, but that, being interpreted by his previous written statements, it involved a denial of what the Church understood by grace and by man's dependence on it. The North African Church as a whole deplored the decision of Diospolis, and in 416 sent up from their synods of Carthage and Leuca (in Numidia) an appeal to Innocent, bishop of Rome, who, flattered by the tribute thus paid to the see of Rome, decided the question in favour of the African synods. And, though his successor Zosimus wavered for some time, he at length fell in with what he saw to be the general mind of both the ecclesiastical and the civil powers. For, simultaneously with the largely attended African synod which finally condemned Pelagianism in the West, an imperial edict was issued at Ravenna by Honorius on the 30th of April 418, peremptorily determining the theological question and enacting that not only Pelagius and Coelestius but all who accepted their opinions should suffer confiscation of goods and irrevocable banishment. The edict promulgated, Zosimus drew up a circular inviting all the bishops of Christendom to subscribe a condemnation of Pelagian opinions. Nineteen Italian bishops refused, among them Julian of Eclanum in Apulia, a man of good birth, approved sanctity and great capacity, who now became the recognized leader of the movement. But not even his acuteness and zeal could redeem a cause which was rendered hopeless when the Eastern Church (Ephesus, 431) confirmed the decision of the West. Pelagius himself disappears after 420; Coelestius was at Constantinople seeking the aid of Nestorius in 428.

Pelagianism.—The system of Pelagius is a consistent whole, each part involving the existence of every other. Starting from the idea that "ability limits obligation," and resolved that men
should feel their responsibility, he insisted that man is able to do all that God commands, and that there is, and can be, no sin where the will is not absolutely free—able to choose good or evil. The formula "Sic voluntas, sic potest," which is employed three times in St. Augustine's "Confessiones," means "as one's will is so is one's power," and is a theory which affirms the freedom of the will, not in the sense that the individual is self-determined, but in the sense that in each volition and at each moment of life, no matter what the previous causes may have been, the individual is free to choose good or evil. We are born characterless (non plenit), and with no bias towards good or evil (ut sine virtute, ita et sine vitae). It follows that we are unjustified by the evil we do, and that sin is not a matter of predetermination, but of free will, so that all good and all evil is a matter of free choice.

Pelagius, the first systematic exposition of the axioms of Pelagianism is that it is commonly known as "the doctrine of Pelagianism," and is a theory which affirms the freedom of the will, not in the sense that the individual is self-determined, but in the sense that in each volition and at each moment of life, no matter what the previous causes may have been, the individual is free to choose good or evil. PELAGSIANS—PELEUS

Pelasgians, a name applied by Greek writers to prehistoric people whose traces were believed to exist in Greek lands. If the statements of ancient authorities are marshalled in the course of their date it will be seen that certain beliefs cannot be traced back beyond the age of this or that author. Though this does not prove that the beliefs themselves were not held earlier, it suggests caution in assuming that they were. In the Homeric poems there are Pelasgians among the allies of Troy: in the catalogue, Iliad, ii. 840–843, which is otherwise in strict geographical order, they stand between the Hellespontine towns and the Thracians of south-east Europe, i.e. on the Hellespontine border of Thrace. Their town or district is called Larissa and is fertile, and they are celebrated for their spearmanship. Their chiefs are Hippothous and Pelasgus, sons of Lathyron, king of Teutamos. Iliad, x. 428–430, describes their camping ground between the town of Troy and the sea; but this obviously proves nothing about their habitat in time of peace. Odyssey, xvii. 175–177, notes Pelasgians in Crete, together with two apparently indigenous and two immigrant peoples (Achaenae and Dorian), but gives no indication to which class the Pelasgians belong. In Lemnos (Iliad, vii. 467;xiv. 230) there are no Pelasgians, but a Minyan dynasty. Two later passages (Iliad, ii. 681–684; xvi. 233–235) apply the epithet “Pelasgic” to a district called Argos about Mt Othrys in south Thessaly, and to Zeus of Dodona. But in neither case are actual Pelasgians mentioned; the Thessalian Argos is the specific home of Hellenes and Achaenae, and Dodona is inhabited by Perrhaebians and Aenienae (Iliad, ii. 750) who are nowhere described as Pelasgians. It looks therefore as if “Pelasgian” were here used connotatively, to mean either “formerly occupied by Pelasgians” or simply “of immortal age.”

Hesiod expands the Homeric phrase and calls Dodona “seat of Pelasgians” (fr. 223); he speaks also of a personal Pelasgus as father of Lycaon, the culture-hero of Arcadia; and a later epic poet, Asius, describes Pelasgus as the first man, whom the earth threw up that there might be a race of men. Hecataeus makes Pelasgus king of Thessaly (expounding Iliad, ii. 681–684); Acuslus applies this Homeric passage to the Peloponnesian Argos, and engraves the Hesiodic Pelasgus, father of Helenae and Achaenae, on a Peloponnesian genealogy. Hellanicus a generation later repeats this blunder, and identifies this Argive and Arcadian Pelasgus with the Thessalian Pelasgus of Hecataeus. For Aeschylus (Supplices 1, sqq.) Pelasgus is earthborn, as in Asius, and rules a kingdom stretching from Argos to Dodona and the Strymon; but in Prometheus 879, the “Pelasgian” land simply means Argos. Sophocles takes the same view (Iphiclus, fr. 236) and for the first time introduces the word “Tyrrhenian” into the story, apparently as synonymous with Pelasgian.

Herodotus, like Homer, has a denotive as well as a connotative use. He describes actual Pelasgians surviving and mixing with the Greeks: (a) at Plataea and the Scyldad on the Aesepus river at the shore of the Hellespont; and (b) near Chalcis and the Strymon; in the latter area they have “Tyrrhenian” neighbours. He alludes to other districts where Pelasgian peoples lived on under changed names; Samothrace and Antandros in Troas are probably instances of this. In Lemnos and Imbro and he describes a Pelasgian population who were only conquered by Athens shortly before 500 B.C., and in this connexion he tells a story of earlier raids of these Pelasgians on Attica, and of a temporary settlement there of Hellespontine Pelasgians, all dating from a time “when the Athenians were first beginning to count as Greeks.” Elsewhere “Pelasgian” in Herodotus connotes anything typical of, or surviving from, the state of things in Greece before the coming of the Hellenes. In this sense all Greece was once “Pelasgic”; the clearest instances of Pelasgian survival in ritual and customs and antiquities are in Arcadia, the “Ionian” districts of north-west Peloponnese, and Attica, which have suffered least from hellenization. In Athens itself the prehistoric wall of the citadel and a plot of ground close below it were venerated in the 5th century as “Pelasgian”; so too Thucydides (ii. 17). We may note that all Herodotean examples of actual Pelasgi lie round, or near, the actual Pelasgi of Homeric Thrace; that the most distant of these is confirmed by the testimony of Thucydides (iv. 266) as to this Pelasgian and Tyrrhenian population of the adjacent seaboard: also that Thucydides adopts the same general Pelasgian theory of early Greece, with the refinement that he regards the Pelasgians as originally specific, and as having come gradually into this generic use.

Ephorus, relying on Hesiodic tradition of an aboriginal Pelasgian type in Arcadia, elaborated a theory of the Pelasgians as a warrior-people spreading (like “Aryans”) from a “Pelasgian home,” and annexing and colonizing all the parts of Greece where earlier writers had found allusions to them, from Dodona to Crete and the Troad, and even as far as Italy, where again he identifies the Pelasgians with the Tyrrhenians. This “Pelasgian” theory was taken by Demetrius Phalereus and others, and rose to prominence in the 3rd century, when the Lemnian pirates and their Attic kinsmen are plainly styled Tyrrhenians, and early fortress-wall in Italy (like those on the Palatine in Rome) are quoted as “Arcadian” colonies.

Modern writers have either been content to restate or amplify the view, ascribed above to Ephorus, that “Pelasgian” simply means “prehistoric Greek,” or have used the name Pelasgian at their pleasure to denote some one element in the mixed population of the Aegean—Thracian, Illyrian (Albanian) or Semitic. G. Sergi (Origine e diffuzione della stirpe mediterranea, Rome, 1895; Eng. trans. The Mediterranean Race, London, 1901), followed by many anthropologists, describes as “Pelasgian” one branch of the Mediterranean or Eur-African race of mankind, and one group of types of skull within that race. The character of the ancient citadel wall at Athens, already mentioned, has given the name “Pelasgian” to all constructions of large unburnt blocks fitted roughly together without mortar, from Asia Minor to Spain.

For another view than that here taken see Achaean; also Greece: Ancient History, § 3, “Homeric Age.”

intimate (friend) of Telamon. The two brothers, jealous of the athletic prowess of their step-brother Phocus, slew him; but the crime was discovered, and Peleus and Telamon were banished. Peleus took refuge in Phthia with his uncle Eurytion, who purified him from the guilt of murder, and gave him his daughter Antigone to wife, and a third of the kingdom as her dowry. Having accidentally killed his father-

Peleus was again obliged to flee, this time to Iolcus, where he was purified by Acastus. The most famous event in the life of Peleus was his marriage with the sea-goddess Thetis, by whom he became the father of Achilles. The story ran that both Zeus and Poseidon had sought her hand, but, Themis (or Proneus or Proteus) having warned the former that a son of Thetis by Zeus would prove mightier than his father, the gods decided to marry her to Peleus. Thetis, to escape a distasteful union, changed herself into various forms, but at last Peleus, by the instructions of Chiron, seized and held her fast till she resumed her original shape, and was unable to offer further resistance. The wedding (described in the fine Epithalamium of Catullus) took place in Chiron's cave on Mt. Pelion. Peleus survived both his son Achilles and his grandson Neoptolomus, and was carried away by Thetis to dwell for ever among the Nereids.

PELEW ISLANDS (Ger. Palauinseln, also Palau), a group of twenty-six islands in the western Pacific Ocean, between 2° 35' and 8° N., and 130° 4' and 134° 40' E., belonging to Germany. They lie within a coral barrier reef, and in the south the islands are of coral, but in the north of volcanic rocks. They are well wooded, the climate is healthy, and the water-supply good. A few rats and bats represent the indigenous mammals, but the sea is rich in fish and molluscs; and Dr Otto Finsch (Journ. des Museum Godeffroy, 1875) enumerated 50 species of birds, of which 12 are peculiar to the group. The total area is 175 sq. m., the largest islands being Babeltop (Babithup, Baobeltaoap and other variants), Urakta (Urakthopel), Korror, Nyaur, Pelleliu and Ellmil (Irakong). The population is about 3100. The natives are Micronesians, and are darker and shorter than their kinsmen, the Caroline Islanders. They usually have the frizzly hair of the Melanesians, and paint their bodies in brassy-red, especially yellow. The men vary in height from 5 ft. to 5 ft. 5 in., the women from 4 ft. 9 to 5 ft. 2 in. The skull shows a strong tendency to brachycephalism. Two curious customs may be noted—the institution of an honourable order bestowed by the king, called bili; and a species of mutual aid society, sometimes confined to women, and possessing considerable political influence. There are five kinds of currency in the islands, consisting of beads of glass and enamel, to which a supernatural origin is ascribed.

The islands were sighted in 1543 by Ruy Lopez de Villalobos, who named them the Arrecifes. The origin of the name Islands Palace is doubtful. The islands were bought by Germany from Spain in 1899, and are administered together with the western Caroline, Yap being the administrative centre.

See K. Semper, Die Palau-Inseln (Leipzig, 1873); J. S. Kubary, Die sozialen Einrichtungen der Palauer (Berlin, 1885); A. A. Marche, Luce et Palouan (Paris, 1887).

PELF, a term now chiefly used of money and always in a derogatory sense. The word originally meant plunder, pilage (O. Fr. pelfre, probably from Lat. pilare, to deprive of hair, pilus), and this significance is still kept in the related word “piller,” to make petty thefts.

PELMHAM, the name of an English family, derived from Pelham in Hertfordshire, which was owned by a certain Walter de Pelham under Edward I., and is alleged to have been in the possession of the same family before the Norman conquest. The family dignities included the barony of Pelham of Laughton (1706-1768), the earldom of Clare (1714-1768), the dukedom of Newcastle (1715-1768), the barony of Pelham of Stammer from 1762, the earldom of Chichester from 1801 and the earldom of Yarborough from 1837.

John de Pelham, who was one of the captors of John II. of France at Poitiers, acquired land at Winchelsea by his marriage with Joan Herbert, or Finche. His son, John, junior de Pelham (d. 1420), joined the party of John of Gaunt and his son Henry IV. In 1393 he received a life appointment as constable of Peversey Castle, an honour subsequently extended to his heirs male, and he joined Henry on his invasion in 1399, if he did not actually land with him at Ravenspur. He was knighted at Henry's coronation, and represented Sussex in parliament repeatedly during the reign of Henry IV., and again in 1422 and 1427. As constable of Peversey he had at different times the charge of Edward, duke of York, in 1405; Edmund, earl of March, with his brother Roger Mortimer in 1406; James I. of Scotland in 1414; Sir John Mortimer in 1422, and the queen dowager, Joan of Navarre, in 1423. He was constantly employed in the defence of the southern ports against French invasion, and his powers were increased in 1407 by his appointment as chief butler of Chichester and of the Sussex ports, and in 1412 by the grant of the rape of Hastings. He was treasurer of England in 1412-1413, and although he was superseded on the accession of Henry V. he was sent in the next year to negotiate with the French court. He was included among the executors of the wills of Henry IV., of Thomas, duke of Clarence, and of Henry V. He died on the 12th of February 1420, and was succeeded by his son John, who took part in Henry V.’s expedition to Normandy in 1417.

In the reign of Queen Elizabeth Sir William Pelham (c. 1530- 1587), third son of John Pelham (d. 1538) of Laughton, Sussex, became lord justice of Ireland. He was captain of pioneers at the siege of Léit in 1560, and served at the siege of Havre in 1562, and with Coligny at Caen in 1563. He then returned to Havre, at that time occupied by English troops, and was one of the hostages for the fulfilment of its surrender to Charles IX. in 1564. After his return to England he fortified Berwick among other places, and was appointed lieutenant-general of ordnance. He was sent to Ireland in 1579, when he was knighted by Sir William Drury, the lord justice. Drury died in October, and Pelham was provisionally made his successor, an appointment subsequently confirmed by Elizabeth. Alarmed by the sincerity of Sir Francis Drake, 15th Earl of Desmond, and his brother John Desmond, he proclaimed the earl a traitor. Elizabeth protested strongly against Pelham’s action, which was justified by the sack of Youghal by Desmond. Thomas Butler, 10th Earl of Ormonde, was entrusted with the campaign in Munster, but Pelham joined him in February 1580, when it was believed that a Spanish descent was about to be made in the south-west. The English generals laid waste northern Kerry, and proceeded to besiege Carrigaloye Castle, which they stormed, giving no quarter to man, woman or child. Other strongholds submitted on learning the fate of Carrigaloye, and were garrisoned by Pelham, who hoped with the concourse of Admiral Winter’s fleet to limit the struggle to Kerry. He vainly sought help from the gentry of the country, who sympathized with Desmond, and were only brought to submission by a series of “drives.” After the arrival of the new deputy, Lord Grey of Wilton, Pelham returned to England on the ground of health. He had retained his office as lieutenant-general of ordnance, and was now made responsible for debts incurred during his absence. Leicester desired his services in the Netherlands, but it was only after much persuasion that Elizabeth set him free to join the army by accepting a mortgage on his estates as security for his liabilities. The favour shown by Leicester to Pelham caused serious jealousies among the English officers, and occasioned a camp brawl in which Sir Edward Norris was injured. Pelham was wounded at Doesburg in 1586, and accompanied Leicester to England in 1587, returning to the Netherlands in the same year he died at Flushing on the 24th of November 1587. His half-brother, Sir Edmund Pelham (d. 1600), chief baron of the exchequer in Ireland, was the first English judge to go on circuit in Ulster.
Sir William married Eleanor, daughter of Henry Neville, earl of Westmorland, and was the ancestor of the Pelhams of Brocklesby, Lincolnshire. In the fourth generation Charles Pelham died in 1673, without heirs, leaving the estate to his great-nephew Charles Anderson (1740-1823), who thereupon assumed the additional name of Pelham, and was created Baron Yarborough in 1794. His son Charles (1781-1846), who was for many years commodore of the Royal Yacht Squadron, was created earl of Yarborough and Baron Worsley in 1837. Charles Alfred Worsley, the 4th earl (b. 1839), exchanged the name of Anderson-Pelham for that of Pelham in 1905. He married in 1886 Marcia Lane-Fox, eldest daughter of the 12th Baron Conyers, who became in 1892 Baroness Conyers in her own right. 

Sir Nicholas Pelham (1517-1560), an elder half-brother of Sir William Pelham, defended Seaford against the French in 1545, and sat for Arundel and for Sussex in parliament. He was the ancestor of the earls of Chichester. His second son, Sir Thomas Pelham (d. 1624), was created a baronet in 1611. His descendant, Sir Thomas Pelham, 4th baronet (c. 1650-1712), represented successively East Grinstead, Lewes and Sussex in parliament, and was raised to the House of Lords as Baron Pelham of Laughton in 1766. By his second marriage with Grace (d. 1700), daughter of Gilbert Hobbes, 3rd earl of Clare, and sister of John Holles, duke of Newcastle, he had five daughters, and two sons—Thomas Pelham, earl of Clare, duke of Newcastle, earl of Tyne and 1st duke of Newcastle-under-Lyme (see Newcastle, Dukes of), and Henry Pelham (q.e.,). The duke of Newcastle died without heirs, and the dukedom of Newcastle-under-Lyme descended to his nephew, Henry Fiennes Clifton, afterwards known as Pelham-Clinton, and his heirs, but the barony of Pelham of Laughton became extinct. In 1762 Newcastle had been created Baron Pelham of Stammer, with reversion to his cousin and heir male, Thomas Pelham (1728-1805), who became commissioner of trade (1754), lord of the admiralty (1761-1764), comptroller of the household (1765-1774), privy councilor (1765), surveyor-general of the customs of London (1773-1803), chief justice in eyre (1774-1775) and keeper of the wardrobe (1775-1782), and was created earl of Chichester in 1801. His third son, George (1760-1827), was successively bishop of Bristol, Exeter and Lincoln. Thomas Pelham, 2nd earl of Chichester (1756-1826), son of the 1st earl, was surveyor-general of ordnance in Lord Rockingham's ministry (1782), and chief secretary for Ireland in the coalition ministry of 1783. In 1795 he became Irish chief secretary under Pitt's government, retiring in 1798; he was home secretary from July 1801 to August 1803 under Addington, who made him chancellor of the duchy of Lancaster in 1803. Pelham went out of office in 1804, and in the next year succeeded to the earldom. He was joint postmaster-general from 1809 to 1823, and for the remaining three years of his life postmaster-general. His son and heir, Henry Thomas Pelham (1804-1886), 3rd earl, was an ecclesiastical commissioner from 1850 until his death, and was greatly interested in various religious, philanthropic and educational movements; and two other sons were well-known men—Frederick Thomas Pelham (1808-1861), who became a rear-admiral in 1828, and subsequently lord-commissioner of the admiralty, and John Thomas Pelham (1811-1894), who was bishop of Norwich from 1857 to 1893. The third earl's son, Walter John Pelham (1838-1892), succeeded his father in 1886, and his nephew Jocelyn Bradenell Pelham (b. 1871) became 6th earl of Chichester in 1905.

Pelham, Henry (1566-1754), prime minister of England, younger brother of Thomas Holles Pelham, 1st Duke of Newcastle, was born in 1566. He entered Brasenose College, Oxford, where he was one of the masters of the stretching and measuring societies, and of the British School at Athens, and was one of the founders of the British School at Rome. He married in 1783 Laura Priscilla, daughter of Sir Edward North Buxton.

Pelias, in Greek legend, son of Poseidon and Tyro, daughter of Salomeus. Because Tyro afterwards married her father's brother Crethus, king of Iolcus in Thessaly, to whom she bore Aeson, Phers and Amythaon, Pelias was by some thought to be...
the son of Cretheus. He and his twin-brother Neleus were exposed by their mother, but were nurtured by a herdsman. When grown to manhood they were acknowledged by their mother. After the death of Cretheus, Pelias made himself master of the kingdom of Iolous, having previously quarrelled with Neleus, who removed to Messenia, where he founded Pylos, in order to rid himself of Jason, Pelias sent him to Colchis in quest of the golden fleece, and took advantage of his absence to put to death his father, Aeson, his mother and brother. When Jason returned he sought to avenge the death of his parents, and Medea persuaded the daughters of Pelias to cut in pieces and boil their father, assuring them that he would thus be restored to youth. Acastus, son of Pelias, drove out Jason and Medea and celebrated funeral games in honour of his father, which were celebrated by the poet Stesichorus and represented on the chest of Cyselus. The death of Pelias was the subject of Sophocles' Rhioiotei (Root-cutters), and in the Tyro he treated another portion of the legend. Pelides (the daughters of Pelias) was the name of Euripides' first play.

**PELICAN** (Fr. Pelican; Lat. Pelecanus or Pelecanus), a large fish-eating bird of the family Pelecanidae for which the enormous pouch formed by the extensible skin between the lower jaws of its long, and apparently formidable but in reality very weak, bill. The ordinary pelican, the Onocrotalus of the ancients, to whom it was well known, and the Pelecanus onocrotalus of ornithologists, is a very abundant bird in some districts of south-eastern Europe, south-western Asia and north-eastern Africa; occasionally straying, it is believed, into the northern parts of Germany and France; but the possibility of such wanderers having escaped from confinement is always to be regarded; since few zoological gardens are without examples. Its usual haunts are the shallow margins of the larger lakes and rivers, where fishes are plentiful, since it requires for its sustenance a vast supply of them. The nest is formed among reeds, placed on the ground and lined with grass. Therein two eggs, with white, chalky shells, are commonly laid. The young during the first twelvemonth are of a greyish-brown, but when mature almost the whole plumage, except the black primaries, is white, deeply suffused by a rich blush of rose or salmon-colour, passing into yellow on the crest and lower part of the neck in front. A second and somewhat larger species, Pelecanus crispus, also inhabits Europe, but has a more eastern distribution. This, when adult, is readily distinguishable from the ordinary bird by the absence of the blush from its plumage, and by the curved feathers that project from and cover the great pouch, which is a sac. The bird is commonly clad (Bull. Brit. Mus. Zool. 1883). In Magnesia and North America, there is one, P. erythrophthalmus, very similar to P. onocrotalus both in appearance and habits, but remarkable for a triangular, horny excrecence developed on the ridge of the male's bill in the breeding season, which falls off without leaving trace of its existence when that is over. Australia has P. conspicilatus, easily distinguished by its black tail and wing-coverts. Of more marine habit are P. philippensis and P. fuscus, the former having a wide range in Southern Asia, and, it is said, reaching Madagascar, and the latter common on the coasts of the warmer parts of both North and South America.

This was instituted by Linnaeus included the
cormorant (q.v.); and gannet (q.v.); as well as the true pelicans, and for a long while these and some other distinct groups, as the snake-birds (q.v.), frigate-birds (q.v.) and tropic-birds (q.v.), which have all the four toes of the foot connected by a web, were regarded as forming a single family, Pelecanidae; but this name has now been restricted to the pelicans only, though all are still usually associated in the suborder Steganopodes of Ciconiform birds. It may be common to state that there is no foundation for the venerable legend of the pelican feeding her young with blood from her own breast, which has given it an important place in ecclesiastical heraldry, except that, as A. D. Bartlett suggested (Proc. Zool. Society, 1869, p. 140), the curious bloody secretion ejected from the mouth of the flamingo may have given rise to the belief, through that bird having been mistaken for the “Pelican of the wilderness.”

**PELION,** a wooded mountain in Thessaly in the district of Magnesia, between Volo and the east coast. Its highest point (mod. Plessis) is 5340 ft. It is famous in Greek mythology; the giants are said to have piled it on Ossa in order to scale Olympus, the abode of the gods; it was the home of the centaurs, especially of Chiron, who was a cava on the 6th of November, 1794 at Maronme (Seine Inférieure), of a family of prosperous artisans or yeoman, his father being employed in a powder-magazine. After attending the military college of La Flèche and the special school of St Cyr, he in 1815 entered the army as sub-lieutenant in an artillery regiment. A brilliant examination in 1819 secured his appointment to the staff. He served as aide-de-camp in the Spanish campaign of 1823, and in the expedition to the Morea in 1828-29. In 1830 he took part in the expedition to Algeria, and on his return was promoted to the rank of chef d'escadron. After some years' staff service in Paris he was again sent to Algeria as chief of staff of the province of the Nile, with the rank of lieutenant-colonel, and remained there till the Crimean War, taking a prominent part in many important operations. The severity of his conduct in suffocating a whole Arab tribe in the Dahra or Daha caves, near Mustagamien, where they had taken refuge (June 18, 1843), awakened such indignation in Europe that Marshal Soult, the minister of war, publicly expressed his regret; but Marshal Bugeaud, the governor-general of Algeria, not only gave it his approval, but secured for Pélissier the rank of general of brigade, which he held till 1850, when he was promoted general of division. After the battles of October and November 1854 before Sevastopol, Pélissier was sent to the Crimeea, where on the 16th of May 1855 his offering—was to be remembered. The French forces before Sevastopol (see CRIMEAN WAR). His command was marked by relentless pressure of the enemy and unalterable determination to conduct the campaign without interference from Paris. His perseverance was crowned with

---

The legend was commonly believed in the middle ages. Epiphanius, bishop of Constantinople, in his Physiologus (1588), writes that the female bird, in cherishing her young, would trim their sides, and they die. After three days the mother comes and finds them dead, and his heart is pained. He smites his own side, and as he stands over the wounds of the dead young ones the blood trickles down, and thus are they made alive again. The pelican "i n his piety" —i.e. in this pious act of reviving his offspring—was the subject of a 15th-century English book; it became a symbol of self-sacrifice, a type of Christian redemption and of the Eucharistic doctrine. The device was adopted by Bishop Fox in 1516 for his new college of Corpus Christi, Oxford.——[H. C.][1]
success in the storming of the Malakoff on the 8th of September.

On the 12th he was promoted to be marshal. On his return to Paris he was named senator, created duke of Malakoff (July 22, 1854) and rewarded with a grant of 100,000 francs per annum. From March 1858 to May 1859 he was French ambassador in London, whence he was recalled to take command of the army of observation on the Rhine. In the same year he became grand chancellor of the Legion of Honour. In 1860 he was appointed governor-general of Algeria, and he died there on the 22nd of May 1864.

See Marhaud, Le Maréchal Pélissier (1863); Castille, Portraits historiques, 2nd series (1889).

PELL, JOHN (1610–1683), English mathematician, was born on the 1st of March 1610 at Southwick in Sussex, where his father was minister. He was educated at Steyning, and entered Trinity College, Cambridge, at the age of thirteen. During his university career he became an accomplished linguist, and even before he took his M.A. degree (in 1630) corresponded with Henry Briggs and other mathematicians. His great reputation and the influence of Sir William Boswell, the English resident, with the states-general procured his election in 1643 to the chair of mathematics in Amsterdam, whence he removed in 1646, on the invitation of the prince of Orange, to Breda, where he remained till 1652.

From 1654 to 1658 Pell acted as Cromwell's political agent to the Protestant cantons of Switzerland. On his return to England he took orders and was appointed by Charles II. to the See of Ely. But he left England in 1657 and was presented by Bishop Sheldon to the see of Liverpool, which he entered in 1661. His devotion to mathematical science seems to have interfered alike with his advancement in the Church and with the proper management of his private affairs. For a time he was confined as a debtor in the king's bench prison. He lived, on the invitation of Dr Whistler, for a short time in 1682 at the College of Physicians, but died on the 12th of December 1685 at the house of Mr Cotherne, reader of the church of St Giles-in-the-Fields. Many of Pell's manuscripts fell into the hands of Dr Busby, master of Westminster School, and afterwards came into the possession of the Royal Society; they are still preserved in something like forty folio volumes, which contain, not only Pell's own memoirs, but much of his correspondence with the mathematicians of his time.

The Diophantine analysis was a favourite subject with Pell; he lectured on it at Amsterdam; and he is now best remembered for the indeterminate equation $ax^2 + by^2 = c$, which is known by his name. This problem was proposed by Pierre de Fermat first to Bernhard Frenicle de Bessy, and in 1657 to all mathematicians. Pell's connexion with the problem simply consists of the publication of the solutions of John Wallis and Lord Bruncker in his edition of Barsch's Harmonica Universa, and in 1665. His chief works are: Astronomical History of Observations of Planets, Moons and Comets (1660); Edipus Prognosticus (1664); Controversy with Longomontanus concerning the Quadrature of the Circle (1667); An Essay of the Mathematics, 2 vols. (1660); A Table of Ten Thousand Square Numbers (1671)

PELLA, the capital of ancient Macedonia under Philip II. (who transferred the seat of government hither from Edessa) and Alexander the Great, who was born here. It seems to have retained some importance up to the time of Hadrian. Scanty remains exist and some springs in the neighbourhood are still known as the baths of Pel. The site (identified by Leake) is occupied by the village of Neochori (Turk. Yeni-Kusl) about 32 m. north-west of Salonika.

PELLAGRA (Ital. pelle ogra, smarting skin), the name given, from one of its early symptoms, to a peculiar disease, of common occurrence in several parts of the world. For some time it was supposed to be practically confined to the peasantry in parts of Italy (particularly Lombardy) and France, and in the Asturias (mal de la rosa), Rumania and Corfu. But it has recently been identified in various outlying parts of the British Empire (Barbadoes, India) and in both Lower and Upper Egypt; also among the Zulus and Basutos. In the United States sporadic cases had been observed up to 1906, but since then numerous cases have been reported. It is in Italy, however, that it has been most prevalent. The malady is essentially chronic in character. The indications usually begin in the spring of the year, declining towards autumn, and recurring with increasing intensity and permanence in the spring seasons following. A peasant who is acquiring the meladys feels unfit for work, suffers from headaches, giddiness, singing in the ears, a burning of the skin, especially in the hands and feet, and diarrhoea. At the same time a red rash appears on the skin, of the nature of erysipelas, the red or livid spots being tense and painful, especially where they are directly exposed to the sun. About July or August of the first season these symptoms disappear, the spots on the skin remaining rough and dry. The spring attack of the year following will probably be more severe and more likely to leave traces behind it; with each successive year the patient becomes more like a mummy, his skin shrivelled and sallow, or even black at certain spots. In Addison's disease, his angles protruding, his muscles wasted, his movements slow and languid, and his sensibility diminished. Meanwhile there are more special symptoms relating to the nervous system, including drooping of the eyelid, dilatation of the pupil, and other disorders of vision, together with symptoms relating to the digestive system, such as a red and dry tongue, a burning feeling in the mouth, pain on swallowing, and diarrhoea. After a certain stage the disease passes into a profound disorganization of the nervous system; there is a tendency to melancholy, imbecility, and a curious muffled condition of the body. After death a general tissue degeneration is observed.

The causation of this chronic disease has recently come up for discussion as a connexion with the new work done in relation to sleeping-sickness and other tropical diseases. So long as it was supposed to be peculiar to the Italian peasantry, it was associated simply with their staple diet, and was regarded as due to the eating of mouldy maize. It was by his views in this regard that Lombroso (q.v.) first made his scientific reputation. But the area of maize consumption is now known to be wider than that of pellagra, and pellagra is found where maize is at least not an ordinary diet. In 1905 Dr L. W. Sambon, at the meeting of the British Medical Association, suggested that pellagra was probably protozoal in origin, and subsequently he announced his belief that the protozoon was communicated by sand-flies, just as sleeping-sickness by the tsetse fly; and this opinion was supported by Dr. T. C. Stobbs in the treatment of the disease. His hypothesis was endorsed by Sir Patrick Manson, and in January 1910 an influential committee was formed, to enable Dr Sambon to pursue his investigations in a pellagous area.

PELLER, CHARLES CAMILLE (1846– ), French politician and journalist, was born in Paris on the 28th of June 1846, the son of Eugène Pellelet (1813–1884), a writer of some distinction and a noted opponent of the Second Empire. Camille Pellelet was educated in Paris, passed as licentiate in laws, and was qualified as an "archiviste paléographe." At the age of twenty he became an active contributor to the press, and a bitter critic of the Imperial Government. After the war of 1870–71 he took a leading place among the most radical section of French politicians, as an opponent of the "opportunist" who continued the policy of Gambetta. In 1880 he became editor of Justice, and worked with success to bring about a revision of the sentences passed on the Communards. In 1881 he was chosen member for the tenth arrondissement of Paris, and in 1885 for the Bouches du Rhone, being re-elected in 1889, 1893 and 1898; and he was repeatedly chosen as "reporter" to the various bureaux. During the Nationalist and Dreyfus agitations he fought vigorously on behalf of the Republican government and when the coalition known as the "Bloc" was formed he took his place as a Radical leader. He was made minister of marine in the cabinet of M. Combes, June 1902 to January 1905, but his administration was severely criticized, notably by M. de Lanness and other naval experts. During the great sailors' strike at Marseilles in 1904 he showed pronounced sympathy with the socialistic aims and methods of the strikers, and a strong feeling was aroused that
his Radical sympathies tended to a serious weakening of the navy and to destruction of discipline. A somewhat violent controversy resulted, in the course of which M. Pelletan's indiscreet speeches did him no good; and he became a common subject for ill-natured caricatures. On the fall of the Combes ministry he became less prominent in French politics.

**PELLICANUS, CONRAD** (1475-1555), German theologian, was born at Ruffach in Alsace, on the 8th of January 1475. His German name, Kürsner, was changed to Pellicanus by his mother's brother Jodocus Gallus, an ecclesiastic connected with the university of Heidelberg, who supported his nephew for sixteen months at the university in 1493-1494. On returning to Ruffach, he taught gratis in the Minorite convent school that he might borrow books from the library, and in his sixteenth year resolved to become a friar. This step helped his studies, for he was sent to Tübingen in 1496 and became a favourite pupil of the guardian of the Minorite convent there, Paulus Scriptoris, a man of considerable general learning. There seems to have been at that time in south-west Germany a considerable amount of sturdy independent thought among the Franciscans; Pellicanus himself became a Protestant very early, and without any sequel as much of Luther's conversion. At Tübingen the future "apostate in three languages" was able to begin the study of Hebrew. He had no teacher and no grammar; but Paulus Scriptoris carried him a huge codex of the prophets on his own shoulders all the way from Mainz. He learned the letters from the transcription of a few verses in the *Star of the Messiah* of Petrus Niger, and, with a subsequent hint or two from Reuchlin, who also lent him the grammar of Moses Kimhi, made his way through the Bible for himself with the help of Jerome's Latin. He got on so well that he was not only a useful helper to Reuchlin but anticipated the manuals of the great Hebraist by composing in 1501 the first Hebrew grammar in his European tongue. It was printed in 1501, and afterwards included in Reysch's *Margarita philosophica*. Hebrew remained a favourite study to the last. Pellican's autobiography describes the gradual multiplication of accessible books on the subjects, and he not only studied but translated a vast mass of rabbinical and Talmudic texts, his interest in Jewish literature being mainly philological. The chief fruit of these studies is the vast commentary on the Bible (Zürich, 7 vols., 1532-1539), which shows a remarkably sound judgment on questions of the text, and a sense for historical as opposed to typological exegesis. Pellicanus became priest in 1501 and continued the study of the order of Sacred Theology, at Heidelberg, and Basel till 1526. At Basel he did much laborious work for Froben's editions, and came to the conclusion that the Church taught many doctrines of which the early doctors of Christendom knew nothing. He spoke his views frankly, but he disliked polemic; he found also more toleration than might have been expected, even after he became active in circulating Luther's books. Thus, supported by the civic authorities, he remained guardian of the convent of his order at Basel from 1519 till 1524, and even when he had to give up his post, remained in the monastery for two years, professing theology in the university. At length, when the position was being found quite untenable, he received through Zwingli a call to Zürich as professor of Greek and Hebrew, and formally throwing off his monk's habit, entered on a new life. Here he remained till his death on the 6th of April 1556.

Pellicanus's scholarship, though not brilliant, was really extensive; his sound sense, and his singularly pure and devoted character gave him a great influence. He was remarkably free from the pedantry of the time, as is shown by his views about the use of the German vernacular as a vehicle of culture (*Chron. 135, 36*). As a theologian his natural affinities were with Zwingli, with whom he shared the advantage of having grown up to the views of the Reformation, by the natural progress of his studies and religious life. Thus he never lost his sympathy with humanism and with its great German representative, Erasmus.

Pellicanus's Latin autobiography (*Chronicon C.P.R.*) is one of the most interesting documents of the period. It was first published by Riggenbach in 1877, and in this volume the other sources for his life are registered. See also Emil Silberstein, *Conrad Pellicanus*; *18. Jhr. zur Geschichte des Studiums der hebr. Sprache* (Berlin, 1900).

**PELLICIER, GUILLAUME** (c. 1490-1568), French prelate and diplomatist, was educated by his uncle, the bishop of Maguelone, whom he succeeded in 1529. In 1536 he had the seat of his bishopric transferred to Montpellier. Appointed ambassador at Venice in 1539, he fulfilled his mission to the entire satisfaction of Francis I., but on the discovery of the system of espionage he had employed the king had to recall him in 1542. Returning to his diocese, he was imprisoned in the chateau of Beaumarchais for his tolerance of the Reformers, so he replaced his former indulgence by severity, and the end of his episcopate was disturbed by religious struggles. He was a man of wide learning, a humanist and a friend of humanists, and took a keen interest in the natural sciences. See J. Zeller, *La Diplomatie française . . . d'après le correspondance de G. Pellicier* (Paris, 1881); and A. Taussner-Kadel, *Correspondance diplomatique de Guillaume Pellicier* (Paris, 1889).

**PELLICO, SILVIO** (1788-1854), Italian dramatist, was born at Saluzzo in Piedmont on the 24th of June 1788, the earlier portion of his life being passed at Pinerolo and Turin under the tuition of a priest named Manavella. At the age of ten he composed a tragedy under the inspiration of Caesaretti's translation of the Ossianic poems. On the marriage of his twin sister Rosina with a maternal cousin at Lyons he went to reside in that city, devoting himself during four years to the study of French literature. He returned in 1810 to Milan, where he became professor of French in the Collegio degli Orfani Militari. His tragedy *Francesca da Rimini*, was brought out with success by Carlof Marchionni at Milan in 1818. Its publication was followed by that of the tragedy *Eufemio de Messina*, but the representation of the latter was forbidden. Pellico had in the meantime continued his work as tutor, first to the unfortunate son of Count Briche, and then to the two sons of Count Porro Lambertenghi. He threw himself heartily into an attempt to weaken the hold of the Austrian despotism by indirect educational means. Of the powerful literary executive which gathered about Counts Porro and Confalonieri, Pellico was the able secretary—the management of the *Conciliorum*, which appeared in 1818 as the organ of the association, resting largely upon him. But the paper, under the censorship of the Austrian officials, ran for a year only, and the society itself was broken up by the government. In October 1820 Pellico was arrested on the charge of carbonarism and conveyed to the Santa Margherita prison. After his removal to the Piombi at Venice in February 1821, he composed several *Canticle* and the tragedies *Ester d'Innondi* and *Ligia d'Asi*. The sentence of death pronounced on him in February 1822 was finally commuted to fifteen years *carceri duro*, and in the following April he was placed in the Spielberg at Brunn. His chief work during this part of his imprisonment was the tragedy *Leonora da Derlona*, for the preservation of which he was compelled to rely on his memory. After his release in 1830 he commenced the publication of his prison compositions, of which the *Ester* was played at Turin in 1831, but immediately suppressed. In 1832 appeared his *Gimonda da Mendrisio, Eriodide and the Leonora*, under the title of *Tre nuovi tragedie*, and in the same year the work which gave him his European fame, *Le Mic prigion*, an account of his sufferings in prison. The last gained him the friendship of the Marchesa di Barolo, the reformer of the Turin prisons, and in 1834 he accepted from her a yearly pension of 1200 francs. His tragedy *Tommaso Moro* had been published in 1833, his most important subsequent publication being the *Opere inedite* in 1837. On the decease of his parents in 1838 he was received into the Casa Barolo, where he remained till his death, assisting the marchesa in her charities, and writing chiefly upon religious themes. Of these works the best known is the *Dei Doni degli uomini*, a series of trite maxims which do honour to his piety rather than to his critical judgment. A fragmentary biography of the marchesa by Pellico was published in Italian and English after her death. He died on the 31st of January 1854, and was
buried in the Campo Santo at Turin. His writings are defective in virility and breadth of thought, and his tragedies display neither the insight into character nor the constructive power of a great dramatist. It is in the simple narrative and naive egotism of Le Mie prigioni that he has established his strongest claim to remembrance, winning fame by his misfortunes rather than by his genius.

See: Piero Maruchelli, Addizioni alle mie prigioni (Paris, 1834); the biographies by Latour; Gabriele Roselli; Didier, Revue des deux mondes (September 1842); De Loménie, Galerie des contemp. illust. iv. (1842). Chiala (Turin, 1852); Nollet-Fabert (1854); Giorgio Brâno (1854); Bourdon (1868); Rivière (1899-1901).

PELLISSON, PAUL (1624—1693), French author, was born at Béziers on the 30th of October 1624, of a distinguished Calvinist family. He studied law at Toulouse, and practised at the bar of Castres. Going to Paris with letters of introduction to Valentin Conrat, who was a co-religionist, he became acquainted with the members of the academy. Pellisson undertook to be their historian, and in 1653 published a Relation contenant l'histoire de l'académie française. This panegyric was rewarded by a promise of the next vacant place and by permission to be present at their meetings. In 1657 Pellisson became secretary to the minister of finance, Nicolas Fouquet, and when in 1661 the minister was arrested, his secretary was imprisoned in the Bastille. Pellisson had the courage to stand by his fallen patron, in whose defence he issued his celebrated Mémoire in 1664, with the title Discours au roi, par un de ses fidèles sujets sur le procès de M. de Fouquet, in which the facts in favour of Fouquet are marshalled with great skill. Another pamphlet, Seconde défense de M. Fouquet, followed. Pellisson was released in 1668, and from this date sought the royal favour. He became historiographer to the king, and in that capacity wrote a fragmentary Histoire de Louis XIV, covering the years 1660 to 1670. In 1670 he was converted to Catholicism and obtained rich ecclesiastical preferment. He died on the 7th of February 1693. He was very intimate with Mlle de Scudéry, in whose novels he figures as Herminius and Acante. His sterling worth of character made him many friends and justified Bussy-Rabutin's description of him as "encore plus honnête homme que bel esprit."

PELLITORY, in botany, the common name for a small hairy perennial herb which grows on old walls, hedgebanks and similar localities, and is known botanically as Paridoria officinalis (Lat. paries, a wall). It has a short woody rootstock from which spring erect or spreading stems 1 to 2 ft. long, bearing slender leafy branches, and axillary clusters of small green flowers. It belongs to the nettle order (Urticaeae), and is nearly allied to the nettle, Urtica, but its hairs are not stinging.

PELLOUX, LUIGI (1859— ), Italian general and politician, was born on the 1st of March 1839, at La Roche, in Savoy, of parents who retained their Italian nationality when Savoy was annexed to France. Entering the army as lieutenant of artillery in 1857, he gained the medal for military valour at the battle of Magenta and in 1870 commanded the brigade of artillery which battered the breach in the wall of Rome at Porta Pia. He was elected to the Chamber in 1831 as deputy for Leghorn, which he represented until 1895, and joined the party of the Left. He had entered the war office in 1870, and in 1880 became general secretary, in which capacity he introduced many useful reforms in the army. After a succession of high military commands he received the appointment of chief of the general staff in 1896. He was minister of war in the Rudini and Giolitti cabinets of 1891—1893. In July 1896 he resumed the portfolio of war in the Rudini cabinet, and was appointed senator. In May 1897 he secured the adoption of the Army Reform Bill, which fixed the annual expenditure of the army at a nominal sum of 60,000,000 liras, but in December of that year he was defeated in the Chamber on the question of the promotion of officers. Resigning office, he was in May 1898 sent as royal commissioner to Bari, where, without recourse to martial law, he succeeded in restoring public order. Upon the fall of Rudini in June 1898, General Pelloux was entrusted by King Humbert with the formation of a cabinet, and took for himself the post of minister of the interior. He resigned office in May 1899, but was again entrusted with the formation of the ministry. He took stern measures against the revolutionary elements in southern Italy, and his new cabinet was essentially military and conservative. The Public Safety Bill for the reform of the police laws, taken over by him from the Rudini cabinet, and eventually promulgated by royal decree, was fiercely obstructed by the Socialist party, which, with the Left and Extreme Left, succeeded in forcing General Pelloux to dissolve the Chamber in May 1900, and to resign office after the general election in June. In the autumn of 1901 he was appointed to the command of the Turin army corps.

PELOMYXYS, so named by R. G. Greff, a genus of Lobose Rhizopoda (q.v.), naked, multinucleate, with very blunt rounded pseudopodia, formed by erosion (see Ameba), often containing peculiar vesicles (glycocees), and full of a symbiotic bacterium. It inhabits the ooze of decomposing organic matter at the bottom of ponds and lakes.

PELLIODIDAS (d. 364 B.C.), Theban statesman and general. He was a member of a distinguished family, and possessed great wealth which he expended on his friends, while content to lead the life of an athlete. In 383 B.C. he served in a Theban contingent sent to the support of the Spartans at Mantinea, where he was saved, when dangerously wounded, by Epaminondas (q.v.). Upon the seizure of the Theban citadel by the Spartans (383 or 382) he fled to Athens, and took the lead in a conspiracy to liberate Thebes. In 379 his party surprised and killed their chief political opponents, and roused the people against the Spartan garrison, which surrendered to an army gathered by Pellodidas. In this and subsequent years he was elected boottarch, and about 375 he routed a much larger Spartan force at Tegyra (near Orchomenus). This victory he owed mainly to the valour of the Sacred Band, a picked body of 300 infantry. At the battle of Leuctra (371) he contributed greatly to the success of Epaminondas's new tactics by the rapidity with which he made the Sacred Band close with the Spartans. In 370 he accompanied his friend Epaminondas as boottarch into Peloponnesus. On their return both generals were unsuccessful in their attempt of having retained their command beyond the legal term. In 369, in response to a petition of the Thessaliens, Pellodidas was sent with an army against Alexander, tyrant of Pherae. After driving Alexander out, he passed into Macedonia and arbitrated between two claimants to the throne. In order to secure the influence of Thebes, he brought home hostages, including the king's brother, afterwards Philip II., the conqueror of Greece. Next year Pellodidas was again called upon to interfere in Macedonia, but, being deserted by his mercenaries, was compelled to make an agreement with Ptolemaeus of Alonex. On his return through Thessaly he was seized by Alexander of Pherae, and two expeditions from Thesben were needed to secure his release. In 367 Pellodidas went on an embassy to the Persian king and induced him to prescribe a settlement of Greece according to the wishes of the Thebans. In 364 he received another appeal from the Thessalian towns against Alexander of Pherae. Though an eclipse of the sun prevented his bringing with him more than a handful of troops, he overthrew the tyrant's far superior force on the ridge of Cynoscephalæ; but wishing to slay Alexander with his own hand, he rushed forward too eagerly and was cut down by the tyrant's guards.

PELOPONNESIAN WAR, in Greek history, the name given specially to the struggle between Athens at the head of the Greek League and the confederacy of which Sparta was the leading power. According to Thucydides the war, which was, etc., 345, which ended with the Thirty Years' Peace.
in his view the greatest that had ever occurred in Greece, lasted from 431 to the downfall of Athens in 404. The genius of Thucydides has given to the struggle the importance of an epoch in world history, but his view is open to two main criticisms—(1) that the war was in its ultimate bearings little more than a local disturbance, viewed from the standpoint of universal history; (2) that it cannot be called a war in the strict sense. The former of these criticisms is justified in the article on GREECE: History (q.v.). Unless we are to believe that the Macedonian supremacy is directly traceable to the mutual weakening of the Greek cities in 431-403, it is difficult to see what lasting importance attaches to the war. As regards the second, a few chief difficulties may be indicated. The very narrative even of Thucydides himself shows that the "war" was not a connected whole. It may be divided into three main periods—(1) from 431 to 427 (Lysias calls it the "Archidamian War"), when the Peace of Nicias, not merely formally, but actually produced a cessation of hostilities; (2) from 427 till the intervention of Sparta in the Sicilian War; during these years there was no "Peloponnesian War," and there were several years in which there was in reality no fighting at all: the Sicilian expedition was in fact a side issue; (3) from 413 to 404, when fighting was carried on mainly in the Aegean Sea (Isocrates calls this the "Decelian War"). The disjointed character of the struggle is so obvious from Thucydides himself that historians have come to the conclusion that the idea of treating the whole struggle as a single unit was ex post facto (see GREECE: History, § A, "Ancient" ad fin.).

The book itself affords evidence which goes far to justify this view. A very important problem is presented by bk. v., which is obviously put in as a connecting link to prove a theory. Thucydides expressly warns us not to regard the period of this book as one of peace, and yet the very contents of the book refute his argument. In 419 and 417 there is practically no fighting: the Mantinean War of 418 is a disconnected episode which did not lead to a resumption of hostilities: in 420 there are only obscure battles in Thrace: in 416 there is only the expedition to Melos; and finally from 421 to 413 there is official peace. Other details may be cited in corroboration. Book v. (ch. 26) contains a second introduction to the subject; ὅδε ὁ πλῆθος in i. 23 and iv. 48 is the Archidamian or Ten Years' War; in v. 26 we read of ἁλίκετα πλῆθος, ὁ ἄνθρωπος πλῆθος and ἀνάμεσα. Some of the most important events of the war are thus left unrecorded and even the book itself contains, besides the chapters and books already published, bks. i.-v. 25 by itself, then bks. vi. and vii. (Sicilian expedition), and finally revising his view joined them into one whole by the somewhat unsatisfactory bk. v. 26 and following chapters, and began to round off the story with the incomplete bks. viii. (on this see GREECE: History, as above). It is perhaps most probable that he retained notes made contemporarily and worked them up some time after 404, in a few passages failing to correct inconsistencies and dying before bk. viii. was completed. The general introduction in bk. i. was unquestionably written shortly after 404.

The causes of the war thus understood are complex. The view taken by Thucydides that Sparta was the real foe of Athens has been much modified by modern writers. The key to the situation is in fact the commercial rivalry of the Corinthians, whose trade (mainly in the West) had been seriously limited by the naval expansion of the Delian League. This rivalry was roused to fever heat by the Athenian intervention in 434-33 on behalf of Corcyra, Corinth's rebellious colony (see CORFU) and from that time the Corinthians felt that the Thirty Years' Truce was at an end. An opportunity soon offered for making a counter attack. Potidaea, a Dorian town on the western promontory of Chalcidice in Thrace, a tributary ally of Athens—to which however Corinth as metropolis still sent annual contributions—was induced to revolt by the support of the Macedonian king Perdiccas, formerly an Athenian ally. The Athenian Phormio succeeded in blockading the city so that

1 The importance of this revolt lay in the fact that it immediately involved danger to Athens throughout the Chalcidic promontories, and her north-east possessions generally.

Prior to these episodes Athens had not been in hostile contact with any of the Peloponnesian confederate states for more than ten years, and Pericles had abandoned a great part of his imperial policy. He now laid an embargo upon Megara by which the Megarians—the only state to maintain a plain of desire to pursue trading operations with any part of the Athenian Empire. The circumstances of this decree (or decrees) are not material to the present argument (see Grote, History of Greece, ed. 1907, p. 370 note) except that it turned special attention to the commercial supremacy which Athens claimed to enjoy. In 432 a conference of Peloponnesian allies was summoned and the Corinthian envoys urged the Spartans to declare war on the ground that the power of Athens was becoming so great as to constitute a danger to the other states. This might have been urged with justice before the Thirty Years' Truce (447); but by that true Athens gave up all her conquests in Greece proper except Naupactus and Plataea, while her solitary gains in Amphipolis and Thurii were compensated by other losses. The fact that the Corinthian argument failed to impress Sparta and many of the delegates is shown by the course of the debate. What finally impelled the Spartans to agree to the war was the veiled threat by the Corinthians that they would be driven into another alliance (i.e. Argos, i. 71). We can hardly regard Sparta as the determined enemy of Athens at this time. Only twice since 461 had she been at war with Athens—in 457 (Tanagra) and 447, when she deliberately abstained from pushing the advantage which the revolt in Euboea provided; she had refused to help the oligarchs of Samos in 440. Corinth however had not only strong, but also immediate and urgent reasons (Potidaea and Corcyra) for desiring war. It has been argued that the war was ultimately a struggle between the principles of oligarchy and democracy. This view, however, cannot be taken of the early stages of the war when there was democracy and oligarchy on both sides (see ad fin.); it is only in the later stages that the political difference is prominent.

The Opposing Forces.—The permanent strength of the Peloponnesian confederacy lay in the Peloponnesian states, all of which except Argos and Achaea were united under Sparta's leadership. But it included also extra-Peloponnesian states—viz. Megara, Phocis, Boeotia and Locris (which had formed the Delium Union, 424), and the maritime colonies round the Ambracian Gulf. The organization was not elaborate. The federal assembly with few exceptions met only in time of war, and then only when Sparta agreed to summon it. It met in Sparta and the delegates, having stated their views before the Spartan Apella, withdrew till the Apella had come to a decision. The delegates were then invited to return and to confirm that decision. It is clear that the link was purely one of common interest, and that Sparta had little or no control over, e.g. so powerful a confederate as Corinth. Sparta was the chief member of the confederacy (hegemon), but the states were autonomous. In time of war each had to provide two-thirds of its forces, and that state in whose territory the war was to take place had to equip them; but

The Athenian Empire is described elsewhere (DELIAN LEAGUE, ATHENS). Here it must suffice to point out that there was among the real and technical allies no true bond of interest, and that many of these states were in fact bound by close ties to members of the Peloponnesian confederacy (e.g. Potidaea to Corinth). Sparta could not only rely on voluntary co-operation but could undermine Athenian influence by posing as the champion of autonomy. Further, Thucydides is wrong on his own showing in saying that Sparta refused to tolerate democratic government in confederate cities: it was not till after 418 that this policy was adopted. Athens, on the other hand, had undoubtedly interfered in the internal politics of democracy in various allied states (see DELIAN LEAGUE).

No detailed examination of the comparative military and naval resources of the combatants can here be attempted. On land the Peloponnesians were superior: they had at least 30,000
hoplites not including 10,000 from Central Greece and Boeotia: these soldiers were highly trained. The Athenian army was undoubtedly smaller. There has been considerable discussion as to the exact figures, the evidence in Thucydides being highly confusing, but it is most probable that the available fighting force was not more than half that of the Peloponnesian confederacy. Even of these we learn (Thuc. iii. 87) that 4,400 died in the great plague. The only light-armed force was that of Boeotia, the Thebans who were victorious at the Bucrotian Plain. Of cavalry the Peloponnesians had 1,000, Boeotia a similar number. The only other cavalry force was that of Thessaly, which, had it been loyal to Athens, would have meant a distinct superiority. In naval power the Athenians undoubtedly had an overwhelming advantage at the beginning, both in numbers and in training.

Financially Athens had an enormous apparent advantage. She began with a revenue of 1,000 talents (including 600 from the Delian League, and had also, in spite of the heavy expense which the building schemes of Pericles had involved, a reserve of 600 talents. The Peloponnesians had no reserve and no fixed revenue assessment. On the other hand the Peloponnesian army was very cheap. The Athenians were required to spend considerable sums on the payment of crews and mercenaries. In the last stages of the war the issue was determined by the poverty of Athens and Persian gold.

The events of the struggle from 431 to 404 may be summarized in the three periods distinguished above.

1. The Ten Years' or Archidamian War.—The Spartans sent to Athens no formal declaration of war but rather sought first to create some specious casus belli by sending requisitions to Athens. The first, intended to inflame the existing hostilities against Pericles (q.v.) in Athens, was that he should be expelled as being an Alcmaeonid (grand-nephew of Cleisthenes) and so implicated in the curse pronounced on the murderers of Cylon nearly 200 years before. This outrageous demand was followed by three others—that the Athenians should (1) withdraw from Potidaea, (2) restore autonomy to Aegina, and (3) withdraw the embargo on Megarian commerce. Upon the refusal of all these demands Sparta finally made the maintenance of peace contingent upon the restoration by Athens of autonomy to all her allies. Under the guidance of Pericles Athens replied that she would do nothing on compulsion, but was prepared to submit difficulties to amicable arbitration on the basis of mutual concessions. Before anything could come of this proposal, matters were precipitated (end of March 431) by the attack of Thebes upon Plataea (q.v.), which immediately sought and obtained the aid of Athens. War was declared by Athens. Shortly afterwards Sparta assembled his army, sent a herald to announce his approach, marched into Attica and besieged Oenoos.

Meanwhile Pericles had decided to act on the defensive, i.e. to abandon Attica, collect all its residents in Athens and treat Athens as an island, retaining meanwhile command of the sea and making descents on Peloponnesian shores. The policy, which Thucydides and Grote commend, had grave defects—though it is by no means easy to suggest a better; e.g. it meant the ruin of the landed class, it tended to spoil the moral of those who from the walls of Athens annually watched the wasting of their homesteads, and it involved the many perils of an overcrowded population. Moreover sea power was not everything, and delay exhausted the financial reserves of the state, while financial considerations, as we have seen, were comparatively unimportant to the Peloponnesians. The descents on the Peloponnesian were futile in the extreme.

Archidamus, having wasted much territory, including Aetolia, retired at the end of July. The Athenians retaliated by attacking Methone (which was secured by Brasidas), by successes in the West, by expelling all Aeginetans from Aegina (which was made a mere city), and by wasting the Megarian. In 430 Archidamus again invaded Attica, systematically wasting the country. Shortly after he entered Attica plague broke out in Athens, borne thither by traders from Carthage or Egypt (Holm, Greek History, ii. 346 note). The effect upon the overcrowded population of the city was terrible. Of the 12,000 cavalry (including mounted archers) 900 died, together with 4,400 hoplites: altogether the estimate of Diodorus (xii. 58) that more than 10,000 citizens and slaves succumbed is by no means excessive. None the less Pericles sailed with 100 triremes, and ravaged the territory near Epidaurus. Subsequently he returned and the expedition proceeded to Potidaea. But the plague went with them and no results were achieved. The enemies of Pericles, who even with the aid of Spartan intrigue had hitherto failed to harm his prestige, now succeeded in inducing the desperate citizens to fine him for alleged malversation. The verdict, however, shocked public feeling and Pericles was reinstated in popular favour as strategos (c. Aug. 430). About a year later he died. In the autumn of 430 a Spartan attack on Zancynthus failed and the Ambraecots were repulsed from Amphilochoian Argos. In reply Athens sent Phormio to Naupactus to watch her interests in that quarter. In the winter Potidaea capitulated, receiving extremely favourable terms.

In 430 the Peloponnesians were deterred by the plague from invading Attica and laid siege to Plataea in the interests of the free cities of Attica. This operation spent considerable sums on the payment of crews and mercenaries. In the last stages of the war the issue was determined by the poverty of Athens and Persian gold.

The year 428 was marked by a third invasion of Attica and by the revolt of Lesbos from Athens. After delay in fruitless negotiations the Athenian Cleopompides, and afterwards Paches, besieged Mytilene, which appealed to Sparta. The Peloponnesian confederacy resolved to aid the rebels both directly and by a counter demonstration against Athens. The Athenians, though their reserve of 6,000 talents was by now almost exhausted (except for 1,000 talents in a special reserve), made a tremendous effort (raising 200 talents by a special property tax), and not only prevented an invasion by a demonstration of 100 triremes at the Isthmus, but sent Ancus, son of Phormio, to take his place in the western seas. In spring 427 the Spartans again invaded Attica without result. The winter of 428–427 was marked by the daring escape of half the Plataean garrison under cover of a stormy night, and by the capitulation of Mytilene, which was forced upon the oligarchic rulers by the democracy. The Spartan fleet arrived too late and departed without attempting to recover the town. Paches cleared the Asiatic seas of the enemy, reduced the other towns of Mytilene and returned to Athens with upwards of 1,000 prisoners. An assembly was held and under the invective of Cleon (q.v.) it was decided to kill all male Mytilenianas of military age and to sell the women and children as slaves. This decree, though in accordance with the rigorous customs of ancient warfare as exemplified by the treatment which Sparta shortly afterwards meted out to the Plataeans, shocked the feelings of Athens, and on the next day it was (illegally) rescinded just in time to prevent Paches carrying it out. The thousand oligarchic prisoners were however executed, and Lesbos was made a cleruchy.

Meanwhile there occurred civil war in Corcyra, which in ultimately, with the aid of the Athenian admiral Euryomedon, the democracy triumphed amid scenes of the wildest savagery. In the autumn of the year Nicias fortified Minoa at the mouth of the harbour of Megara. Shortly afterwards the Spartans

---

1 So Thuc. iii. 50. It is suggested that this number is an error for 50 or 50 (i.e. A or N for A). It seems incredible that 1000 could be described as "ringleaders" out of a population of perhaps 5000.
planted an unsuccessful colony at Heraclia in the Trachinian territory north-west of Thermopylae.

In the summer of 426 Nicias led a predatory expedition along the north-west coast without achieving any positive victory. More important, though equally ineffective, was the scheme of Demostenes to march from Naupactus through Aetolia, subdued the wild hill tribes, to Cytinium in Doris (in the upper valleys of the Cephissus) and thence into Bocotia, which was to be attacked simultaneously from Attica. The scheme was crushed by the courage and skill of the Aetolians, who thereupon summoned Spartan and Corinthian aid for a counter-attack on Naupactus. Demostenes averted this, and immediately after-wards by superior tactics he inflicted a complete defeat at Opeae in Acarnania on Eurylochus at the head of a Spartan and Ambracian force. An Ambracian reinforcement was annihilated at one of the peaks called Idomene, and a disgraceful truce was accepted by the surviving Spartan leader Menedeaeus. This was not only the worst disaster which befall any powerful state up to the peace of Nicias (as Thucydides says), but was a serious blow to Corinth, whose trade on the West was, as we have seen, one of the chief causes of the war.

The year 425 is remarkable for the Spartan disaster of Pylus (q.v.). The Athenians had won 10 triremes in a battle fought off Epidaurus and Pylos, and went to Sicily to call first at Corcyra to prevent an expected Spartan attack. Meantime Demostenes had formed the plan of planting the Messenians of Naupactus in Messenia—a new Spartan territory—and obtained permission to accompany the expedition. The fleet was, as it chanced, delayed by a storm in the Bay of Navarino, and rough fortifications were put up by the sailors on the promontory of Pylus. Demostenes was left behind in this fort, and the Spartans promptly withdrew from their annual raid upon Attica and their projected attack on Corcyra to dislodge him. After a naval engagement (see PYLOS) a body of Spartan hoplites were cut off, and, according to Thucydides, felt their position was so desperate that they offered peace on condition that the hoplites should go free. The eloquence of Cleon frustrated the peace party's desire to accept these terms, and ultimately to the astonishment of the Greek world the Spartan hoplites to the number of 300 surrendered unconditionally (see CLEON).

Thus in 424 the Athenians had seriously damaged the prestige of Sparta, and broken Corinthian supremacy in the north-west, and the Peloponnescians had no fleet. This was the zenith of their success, and it was unfortunate for them that they declined the various offers of peace which Sparta made. The next two years changed the whole position. The doubling of the tribute in the states on the islands (the infamous "large tribute") Nicias failed in a plot with the democratic party in Megara to seize that town; and the brilliant campaigns of Brasidas (q.v.) in the north-east, culminating in the capture of Amphipolis (422), finally destroyed the Athenian hopes of recovering their land empire, and entirely restored the balance of success and Spartan prestige.

Moreover, the admirably conceived scheme for a simultaneous triple attack upon Bocotia at Chaeronea in the north, Delium in the south-east, and Sphacteria in the south-west had fallen through owing to the inefficiency of the generals. The scheme, which probably originated with the atticking party in Ephesos, resulted in the severe defeat at Delium by the Boeotians under Pagondas, and was a final blow to the policy of an Athenian land empire.

The disasters at Megara, Amphipolis and Delium left Athens with only one trump card—the possession of the Spartan hoplites captured in Spachertia. This solitary success had already in the spring of 423 induced Sparta in spite of the successes which Brasidas was achieving in Thrace to accept the "truce of Laches"—which, however, was rendered abortive by the refusal of Brasidas to surrender Scione. The final success of Brasidas at Amphipolis, where both he and Cleon were killed, paved the way for a more permanent agreement, the peace parties at Athens and Sparta being in the ascendant.

2. From 421 to 418—Peace was signed in March 421 on the basis of each side's surrendering what had been acquired by the war, not including those cities which had been acquired by capitulation. It was to last for fifty years. Its weak points, however, were numerous. Whereas Sparta had been left of all the allies interested in the war, and apart from the campaigns of Brasidas had on the whole taken little part in it, her allies benefited least by the terms of the Peace. Corinth did not regain Solium and Anactorium, while Megara and Thebes respectively were indignant that Athens should retain Nisaea and receive Panactum. These and other reasons rapidly led to the isolation of Sparta, and there was a general refusal to carry out the terms of agreement. The history of the next three years is therefore one of complex inter-state intrigues combined with internal political convulsions. In 421 Sparta and Athens concluded a defensive alliance; the Sphachterian captives were released and Athens promised to abandon Pylos. Such a peace, giving Sparta everything and Athens nothing but Sparta's bare alliance, was due to the fact that Nicias and Alcibiades were both seeking Sparta's friendship. At this time the Fifty Years' Truce between Sparta and Argos was expiring. The Peloponnesian malcontents turned to Argos as a new leader, and an alliance was formed between Argos, Corinth, Cleon, Themistocles, and the Menonians (420). This coalition between two different elements—an oligarchic party and a war party—had no chance of permanent existence. The war party in Sparta regained its strength under new ephors and negotiations began for an alliance between Sparta, Argos and Boeotia. The details cannot here be discussed. The result was a re-shuffling of the cards. The democratic states of the Peloponnese were driven, partly by the intrigues of Alcibiades, now anti-Laconian, into alliance with Athens, with the object of establishing a democratic Peloponnese under the leadership of Argos. These unstable combinations were soon after upset by Alcibiades himself, who, having succeeded in displacing Nicias as strategos in 419, allowed Athenian troops to help in attacking Epidaurus (418). Before the end of 419 the Alcibiades was defeated by Nicias in the election to the post of strategus in the next year, and the suspicions of the Peloponnesian coalition were roused by the inadequate assistance sent by Athens, which arrived too late to assist Argos when the Spartan king Agis marched against it. Ultimately the Spartans were successful over the coalition at Mantinea, and soon afterwards an oligarchic revolution at Argos led to an alliance between that city and Sparta (c. Feb. 417). This oligarchy was overthrown again in June, and the new democracy having vainly sought an agreement with Sparta rejoined Athens. It was thus left to Athens to expend men and money on argosian strategies. In 416, however, Nicias despatched a force to aid Sparta, which was defeated in battle at the spring of 416 (Euthydemus) and the summer of 417 (Nicias), and that in the winter of 417 a blockading squadron under Chaeremon was dispatched. This policy—which was presumably that of Nicias in opposition to Alcibiades—having failed, the way was cleared for a reassessment of that policy of western conquest which had always had advocates from Themistocles onward in Athens, and was part of the democratic programme.

The tragic fiasco of the Sicilian expedition, involving the death of

1 In 454 Athens made a treaty with Segesta (inscr. Hicks and Hill, Greek Hist. Inscrip. 34): in 453 with Rhegium and Leontini (Hicks and Hill, 351 and 352): cf. Thuc. iii. 66, 474: cf. ci. 558 (inscr. with Chalcidic towns in Sicily): in 444 the colony of Thurii was founded: in 427 (see above) 60 ships were sent to Sicily; and if we may believe Aristophanes (Eq. 1302) Hyperbolus asked for 100 triremes for Carthage.
of Nicias and the loss of thousands of men and hundreds of ships, was a blow from which Athens never recovered (see under SYRACUSE and SICILY). Even before the final catastrophe the Spartans had reopened hostilities. On the advice of Alcibiades (q.v.), exiled from Athens in 415, they had fortified Decelea in Attica within fifteen miles of Athens. This place not only served as a permanent headquarters for predatory expeditions, but cut off the revenue from the Laurium mines, furnished a ready asylum for runaway slaves, and rendered the transference of supplies from Euboea considerably more difficult (i.e. by the sea round Cape Sunium). Athens thus entered upon the third stage of the conflict with exceedingly poor prospects.

3. The Ionian or Decelea War.—From the Athenian standpoint this war may be broken up into three periods: (1) period of revolt of allies (413-411), (2) the rally (410-408), (3) the relapse (407-404). As contrasted with the Archidamian War, this war was fought almost exclusively in the Aegean Sea, the enemy was primarily Sparta, and the deciding factor was Persian gold. Furthermore, apart from the gradual disintegration of the empire, Athens was disturbed by political strife.

In 412 many Ionian towns revolted, and appealed either to Agis at Decelea or to Sparta direct. Euboea, Lesbos, Chios, Eretriae led the way in negotiation and revolt, and simultaneously the court of Susa instructed the satraps Pharnabazus and Tissaphernes to renew the collection of tribute from the Greek cities of Asia Minor. The satraps likewise made overtures to Sparta. The revolt of the Ionian allies was due in part to Alcibiades also, whose prompt action in co-operation with his friend the ephor Endius finally confirmed the Chian oligarchs in their purpose. In 411 a treaty was signed by Sparta and Tissaphernes against Athens: the treaty formally surrendered to the Persian king all territory which he or his predecessors had held. It was subsequently renewed in a form somewhat less disgraceful to Greek patriotism by the Spartans Axytychos and Theramenes. On the other hand, a democratic rising in Samos prevented the rebellion of that island, which for the remainder of the war was invaluable to Athens as a stronghold lying between the two great centres of the struggle.

After the news of the Sicilian disaster Athens was compelled at last to draw on the reserve of 1000 talents which had lain untouched in the treasury.1 The revolt of the Ionian allies, and the fact that the Hellespont was to be the scene of the Persian expedition to the Hellespont, induced Athens to engage the Phoenician fleet in the Dardanelles. This was the last attempt to gain Persian aid. The Persian fleet naturally made no serious attempt to assist Athens, but the news of the revolt of the Ionian cities was received with great joy in Sparta.

A general Ionian War was arranged by the Athenians, and Athens and her allies met at Eleusis. In a great assembly of Ionian cities, Athens received the homage of the Ioni and the names of the principal cities of Asia Minor. This assembly, however, was not a union of the Ionian cities, but a league of the Ionian cities friendly to Athens. Alcibiades, who had been sent to the east to arrange the Ionian War, never returned. Athens and her allies were not ready for war. The Thraces were agitated, and the Peloponnesian fleet had been assembled in the Dardanelles. Besides, the Peloponnesian fleet was the most powerful force in the western Mediterranean. The Athenians were not ready for war, and the Peloponnesians did not want war. The Peloponnesians feared Athens, and therefore desired to prevent war. The Athenians desired to avoid war, and therefore consented to the proposal of the Peloponnesian leaders. Hence the Ionian War was a failure. But the failure of the Ionian War was a victory for Athens. The Peloponnesians were unable to prevent the Ionian War, and therefore could not prevent the Ionian War from being a failure. The failure of the Ionian War was a victory for Athens, because it showed that Athens was strong enough to prevent the Peloponnesians from preventing the Ionian War. The Ionian War was a failure, but the failure of the Ionian War was a victory for Athens.

2 She had already abolished the system of tribute in favour of a 5% ad valorem tax on all imports and exports carried by sea between her ports and those of the allies.

The Peloponnesian War was a war between Athens and Sparta, which began in 431 BC and lasted for almost 20 years. It was the most destructive and prolonged conflict in ancient Greek history. The war was caused by a combination of factors, including Athenian expansionism, Spartan antagonism, and the personal ambitions of the Athenian and Spartan leaders. The war was fought primarily in the Peloponnesus, with battles fought in mainland Greece, at sea, and on the islands of the Aegean Sea. The war ended in 404 BC with the victory of Sparta, which led to the rise of Spartan hegemony in the Greek world. The Peloponnesian War had a profound impact on the political and cultural development of ancient Greece, and it is often regarded as the end of the Classical period of Greek civilization.
to a storm, failed to recover the bodies of those of their crews who were drowned or killed in the action. They were therefore recalled, tried and condemned to death, except two who had disobeyed the order to return to Athens.

At this point Lysander was again sent, nominally as secretary to the official admiral Aracus. Cyrus, recalled to Susa by the illness of Darius, left him in entire control of his satrapy. Thus strengthened he sailed to Lampsacus on the Hellespont and laid siege to it. Conon, now in charge of the Athenian fleet, sailed against him, but the fleet was completely destroyed while at anchor at Aegospotami, Sept. 405. Conon escaped and went to sail to Cyprus. In April 404 Lysander sailed into the Peiraeus, took possession of Athens, and destroyed the Long Walls and the fortifications of Peiraeus.

An oligarchical government was set up (see Critias), and Lysander having compelled the capitulation of Samos, the last Athenian stronghold, sailed in triumph to Sparta.

Two questions of considerable importance for the full understanding of the Peloponnesian War may be selected for special notice: (1) how far was it a war between two antagonistic theories of government, or a war between the old and the new, or a war between fortitude and wealth? (2) Did the Peloponnesian War show that statesmanship is at fault in declining the offers of peace which Sparta made?

A common theory is that Sparta fought throughout the war as an advocate of oligarchy, while Athens did not seek to interfere with the constitutional preferences of her allies. The view is based partly on Thuc. 1. 19, according to which the Spartans took care that their enemies did not add a single man to their population; the idea is disproved by Thucydides' own narrative, which shows that down to 418 (the battle of Mantinea) Sparta tolerated democratic governments in Peloponnesus itself—e.g. Elis, Mantinea, Sicyon, Arcadia. On the other hand, that there was an early sense in the Peloponnesian League, and even then Mantinea remained democratic. In point of fact, it was only when Lysander became the representative of Spartan foreign policy, i.e. in the last years of the war—that Sparta was identified with the oligarchy.

On the other hand, there is strong evidence that the Athenian Empire at a much earlier date was based upon a uniform democratic system of government. Thuc. 1. 86, 3. 71, 8. 53, 6. 176; Thuc. Pol. i. 47; Arist. Pol. viii. 69. It is true that we find oligarchic government in Chios and Lesbos (up to 428) and in Samos (up to 440), but this is because of the fact that these were three autonomous allies. Moreover, in the case of Samos there was a democracy in 439, though in 412 the government was again oligarchic. The case of Selymbria (see Hicks and Hill, esp. cii. 77) is of little account, because at that time (409) the Empire was in extremis. In general we find that the larger States took the credit in the field of the empire. From this we may infer that the Athenian had given to her allies the constitutional advantages which they themselves enjoyed.

2. In view of the disastrous issue of the war, it is important to notice the causes of its origin: (a) after Pylos, (b) after Cyzicus, (c) after Arginusae—Athens refused formal peace proposals from Sparta. (d) Though Cleon was probably wise in opposing peace negotiations, he had not the capture of the Spartans in the Corinthian Gulf in mind, and the situation seems in the light of subsequent events that he was wrong to refuse the terms which were offered after the hoplites had been captured. No doubt, however, the temper in Athens was at that time predominantly warlike, and the surrender of the hoplites was a unique triumph. Possibly, too, Cleon foresaw that peace would have meant a triumph for the philo-Laconian party. (b) The peace proposals of 410 are given by Diodorus, who says that the ephors of Sparta proposed that a peace should be made on the basis of istit possidetis, except that Athens should evacuate Pylos and Cythera, and Sparta, Decelea. Cleophon, however, perhaps doubting whether the ephors could go to the Spartans in Peiraeus, at this time the seat of the peace, must therefore have been advantageous to Athens as showing the world that in spite of her losses she was still one of the great powers of Greece. Moreover, an alliance with Sparta would have meant a sacrifice of the independence of the Calabrian democracies, while Peloponnesus was a source of great danger to_utilities in the Peloponnesus, and the maintenance of the Peloponnesian War was still under discussion. The favourite pastime of the Basque, is played against a front wall (fronton), either bare-handed, with a leather or wooden long glove-like protector (cesto), or with a chistera strapped to the wrist, a sable-shaped wicker-work implement three feet long, much like a hansom-wheel basket mud-guard, in the narrow groove of which the ball is caught and from which, thanks to the leverage afforded, it can be hurled with tremendous force. There are several players to a side, frequently an uneven number to allow a handicap. The score is announced by a caniara, whose melodious vocal efforts make him not the least appreciated participant in the game. In the other form of the game, played nearly exclusively by professionals (pelotaris), there are usually three players on each side, two forwards and a back, distinguished by a coloured sash or cap. The server (butter) slips off his chistera to serve, bouncing the ball on the but, a kind of stool, about 3 ft. from the wall, and

PELOPONNESUS—PELOTA

"(Island of Pelops)", the ancient and modern Greek official name for the part of Greece south of the Isthmus of Corinth. In medieval times it was called the Morea, from its resemblance to a mulberry-leaf in shape, and this name is still current in popular speech.

PELOPS, in Greek legend, the grandson of Zeus, son of Tantalus and Dione, and brother of Niobe. His father's home was on Mt. Sipylos in Asia Minor, whence Pelops is spoken of as a Lydian or a Phrygian. Tantalus one day served up to the gods his own son Pelops, boiled and cut in pieces. The gods detected the crime, and none of them was able to touch the food except Demeter (according to others, Thetis), who, distracted by the loss of her daughter Persephone, ate of the shoulder. The gods restored Pelops to life, and the shoulder consumed by Demeter was replaced by one of ivory. Wherefore the descendants of Pelops had a white mark on their shoulder ever after (Ovid, Metam. vi. 404; Virgil, Georgics, iii. 7). This tale is perhaps reminiscent of human sacrifice amongst the Greeks. Poseidon carried Pelops off to Olympus, where he dwelt with the gods, till, for his father's sins, he was cast out from heaven. Then, taking much wealth with him, he crossed over from Asia to Greece. He went to Pisa in Elis as suitor of Hippodameia, daughter of king Oenomaus, who had already vanquished in chariot-race and slain many suitors for his daughter's hand. But by the help of Poseidon, who lent him winged steeds, or of Oenomaus' charioteer Myrtillus, whom he or Hippodameia bribed, Pelops was victorious in the race, wedded Hippodameia, and became king of Pisa (Hyginus, Fab. 84). The race of Pelops for his wife may be a reminiscence of the early practice of marriage by capture. When Myrtillus claimed his promised reward, Pelops flung him into the sea near Geraestus in Euboea, and from his dying curse sprang those crimes and sorrows of the house of Pelops which supplied the Greek tragedians with such fruitful themes (Sophocles, Electra, 595, with Jebb's note). Among the sons of Pelops by Hippodameia were Atreus, Thyestes and Chrysippus. From Pisa, Pelops extended his sway over the neighbouring Olympia, where he celebrated the Olympic games with a splendid unknown before. His power and fame were so great that henceforward the whole peninsula was known to the ancients as Peloponnesus, "island of Pelops" (ρηγως, island).

In after times Pelops was honoured at Olympia above all other heroes; a temple was built for him by Heracles, his descendant in the fourth generation, in which the annual magistrates sacrificed to him a black ram.

From the reference to Asia in the tales of Tantalus, Niobe and Pelops it has been conjectured that Asia was the original seat of these legends, and that it was only after emigration to Greece that the people localized a part of the tale of Pelops in their new home. In the time of Pausanias the throne of Pelops was still shown on the top of Mt Sipylos. The story of Pelops is told in the first Olympian ode of Pindar and in prose by Nicolaus Damaecesus.

PELOTA (Sp. "little ball," from Lat. pilo), a ball game, originating centuries ago in the Basque provinces, has developed into several forms of the sport. Epigrams of Martial show that there were at least three kinds of pelota played in his time. Blaid, practically hand fives against the back wall of a court, is still played on both sides of the Pyrenees. It is so popular that the authorities had to forbid its playing against the walls of the cathedral at Barcelona. In uncovered courts of large size the players officers touch the wall at certain points. In the favourite pastime of the Basque, is played against a front wall (fronton), either bare-handed, with a leather or wooden long glove-like protector (cesto), or with a chistera strapped to the wrist, a sable-shaped wicker-work implement three feet long, much like a hansom-wheel basket mud-guard, in the narrow groove of which the ball is caught from and to which, thanks to the leverage afforded, it can be hurled with tremendous force. There are several players to a side, frequently an uneven number to allow a handicap. The score is announced by a caniara, whose melodious vocal efforts make him not the least appreciated participant in the game. In the other form of the game, played nearly exclusively by professional players (pelotaris), there are usually three players on each side, two forwards and a back, distinguished by a coloured sash or cap. The server (butter) slips off his chistera to serve, bouncing the ball on the butt, a kind of stool, about three ft. from the wall, and...
PELOTAS—PEMBA

striking it low against the wall. The side that wins the toss has the first service. The ball must be replayed by the opposing side at the wall, which it must hit over a line 3 ft. from the base of the wall and under the net fixed at the top of the wall. The game is counted 15, 30, 40, game, reckoned by the number of faults made by the opposing side. A fault is scored (a) when after the service the ball is not caught on the volley or first bounce, (b) when it does not on the return strike the wall within the prescribed limits, (c) when it goes out of the prescribed limits of the court, (d) when it strikes the net fixed at the top of the court. The side making the fault loses the service. A game like this has been played in England by Spanish professionals on a court 250 ft. long, against a wall 30 ft. high and 55 ft. wide. The ball used, a trifle smaller than a base-ball, is hard rubber wound with yarn and leather-covered, weighing 5 ounces. The server bounces the ball on the concrete floor quite near the fronton, and hits it with his chistera against the wall with a force to make it rebound beyond a line 80 ft. back. It usually goes treble that distance.

PELOTAS, a city of the state of Rio Grande do Sul, Brazil, on the left bank of the São Gonçalo river near its entrance into the Lagôa dos Patos, about 30 m. N.W. of the city of Rio Grande. Pop. (1900), city about 24,000; mussôtic (commune 1873 sq. m.), 43,091. The Rio Grande-Bagé railway communicates with the city of Rio Grande, and with the railway extending to Bagé, Cacequy, Santa Maria, Passo Fundo and Porto Alegre. The São Gonçalo river is the outlet of Lagôa Mirim, and Pelotás is therefore connected with the inland water routes. The city is built on an open grassy plain campo little above the level of the lake (28 ft. above sea-level). The public buildings include the church of São Francisco, dating from the early part of the 19th century, the municipal hall, a fine theatre, the Misericórdia hospital, a public library containing about 25,000 volumes and a great central market. Pelotás is the centre of the xarqué or caxão scuro (jerked beef) industry of Rio Grande do Sul. In its outskirts and the surrounding country are an immense number of xarqueadas (slaughter-houses), with large open yards where the dressed beef, lightly salted, is exposed to the sun and air. There are many factories or packing houses where the by-products are prepared for market. Pelotás was only a small settlement at the beginning of the 19th century and had no parochial organization until 1812. It became a villa in 1830 and a city in 1835.

PELOUZE, Théophile Jules (1807–1867), French chemist, was born at Valognes, in Normandy, on the 26th (or 13th) of February 1807. His father, Edmond Pelouze (d. 1847), was an industrial chemist and the author of several technical handbooks. The son, after spending some time in a pharmacy at La Fère, acted as laboratory assistant to Cay-Lussac and J. L. Lassaigne (1800–1859) at Paris from 1827 to 1829. In 1830 he was appointed associate professor of chemistry at Lille, but returning to Paris next year became répétiteur, and subsequently professor, at the École Polytechnique. He also held the chair of chemistry at the Collège de France, and in 1833 became assayer to the mint and in 1848 president of the Commission des Monnaies. After the coup d'état in 1852 he resigned his appointments, but continued to conduct a laboratory-school he had started in 1846. He died in Paris on the 1st of June 1867. Though Pelouze made no discovery of outstanding importance, he was a busy investigator, his work including researches on salicin, on beetroot sugar, on various organic acids—gallic, malic, tartaric, butyric, lactic, &c.—on ovarian ether (with Liebig), on the nitrosuphates, on gun-cotton, and on the composition and manufacture of glass. He also carried out determinations of the atomic weights of several elements, and with E. Frémy, published Traité de chimie générale (1847–1859); Abrégé de chimie (1848); and Notices générales de chimie (1853).

PELIER, Jean Charles Athanase (1785–1845), French physicist, was born at Ham (Somme) on the 22nd of February 1785. He was originally a watchmaker, but retired from business about the age of thirty and devoted himself to experimental and observational science. His papers, which are numerous, are devoted in great part to atmospheric electricity, waterspouts, cyanoetry and polarization of skylight, the temperature of water in the spheroidal state, and the boiling-point at great elevations. There are also a few devoted to curious points of natural history. But his name will always be associated with the thermal effects at junctions in a voltaic circuit. His great experimental discovery, known as the "Pelier effect," was that if a current pass from an external source through a circuit of two metals it cools the junction through which it passes in the same direction as the thermo-electric current which would be caused by directly heating that junction, while it heats the other junction (see Peltier-Effect). Pelier died in Paris on the 27th of October 1845.

PELUSIUM [mod. Civita Ansidonia], a town of the Vestini, on the Via Claudia Nova, 12 m. E.S.E. of Aquila. It was apparently the chief town of that portion of the Vestini which dwelt west of the main Apennine chain. Remains of the town walls, of an amphitheatre, and of other buildings still exist.

PELUSIUM, an ancient city and port of Egypt, now represented by two large mounds close to the coast and the edge of the desert, 20 m. E. of Port Said. It lay in the marshes at the mouth of the most easterly (Pelusiac) branch of the Nile, which has long winded its way, was the key of the land between Syria and a strong fortress, which, from the Persian invasion at least, played a great part in all wars between Egypt and the East. Its name has not been found on Egyptian monuments, but it may be the Sin of the Bible and of Assur-bani-pal's inscription. Pelusium ("the muddy") is the Faramâ of the Arabs, Pèrmoun in Coptic; the name Tîna which clings to the locality seems etymologically connected with the Arabic word for clay or mud. The site, crowned with extensive ruins of burnt brick of the Byzantine or Arab period, has not yielded any important remains. (F. L. G.)

PELVIS (Lat. for "bason", cf. Gr. σαῦδα), in anatomy, the bony cavity at the lower part of the abdomen in which much of the genito-urinary apparatus and the lower part of the bowels are contained (see Skeleton, § Appendicular).

PEMBA, an island in the Indian Ocean off the east coast of Africa, forming part of the sultanate of Zanzibar. Pemba lies 30 m. N.N.E. of Zanzibar island between 6° 80' and 5° 30' S., and 39° 15' and 39° 56' E. It is 40 m. long and 10 across at its broadest part, and has an area of 380 sq. m. It is coraline formation. On the side facing the mainland the coast is much indented. From its luxuriant vegetation it gets its Arabic name of Al-luthera—"The Green." The interior is diversified by hills, some of which exceed 600 ft. The land is chiefly owned by the Zanzibar Arabs, who cultivate it by Swahili labour, and with negroes from the mainland. Prior to 1857 the labourers were all slaves. Their gradual manumission was accomplished without injury to the prosperity of the island. The population is estimated at between 50,000 and 60,000, of whom 2000 to 3000 are Arabs. Most of the inhabitants are of Bantu stock, and are known as Wapemba. In the ports there are many Hindu traders and a few Europeans. The plantations are nearly all devoted to cloves (the annual average output being 10,000,000 lb) and coco-nut palms (for the preparation of copra). The number of coco-nut plantations is very small compared with those devoted to cloves. Yet cloves need much care and attention and yield small profit, while the coco-nut palm yields a fairly uniform crop of nuts and will grow almost anywhere. The preponderance of clove plantations dates from a cyclone which in 1872 destroyed nearly all the clove-trees in the island of Zanzibar. Thereupon, to benefit from the great rise in the price of cloves, the Pemba planters cut down their palms and planted cloves. The value of the cloves exported in 1897 was £339,000, or 92% of the total exports. India, Germany and Great Britain are, in the order named, the chief purchasers. Other exports include fire-wood, skins and hides, mother-of-pearl, wax and small quantities of rubber, cowries, tortoiseshell and so-called tortoise-nail. The "tortoise-nail" is the valve with which a shell-fish closes its shell. The Llandolphia rubber-vine is indigenous, and since 1906 Ceara rubber-trees have been
extensively planted. Rice, the chief of Pembroke's imports, could easily be grown on the island. Cotton cloths (Kangas) form the next most considerable item in the imports.

Pemba has three ports, all on the west side of the island. Sai-Skali, the capital and the centre of trade, is centrally situated at the head of a shallow tidal creek partly blocked by dense growths of mangroves. Mkoani is on the south-west coast, Kishi-Kashi on the north-west coast; at the last-named port there is a deep and well-sheltered harbour, approached however by a narrow and dangerous channel.

Pemba is administered as an integral part of the Zanzibar dominions, and yields a considerable surplus to the exchequer, mainly from a 25% duty imposed on cloves exported. There is a weekly steamship service to Zanzibar, and in 1907 the two islands were connected by wireless telegraphy (see ZANZIBAR).

 PEMBROKE, EARLS OF

In the Marechal Gros Domesday (1176), the sister of Strongbow, a pleasing effigy as a young man is preserved. In 1173, he was appointed marshal and the grant of his licence for the marriage with the heiress of Strigul and Pembroke. This match gave Marshal the rank of an earl, with great estates in Wales and Ireland, and he was included in the council of regency which the king appointed on his departure for the third crusade (1190). He took the side of Prince John when the latter expelled the justiciar, William Longchamp, from the kingdom, but he soon discovered that the interests of John were different from those of Richard. Hence in 1193 he joined with the loyalists in making war upon the prince. Richard forgave Marshal his first error of judgment, allowed him to succeed his brother, John Marshal, in the hereditary marshalship, and on his death-bed designated him as custodian of Rouen and of the royal treasure during the interregnum. Though he quarrelled more than once with John, Marshal was one of the few English laymen who clung to the royal side through the Barons' War. He was one of John's executors, and was subsequently elected regent of the king and kingdom by the royalist barons in 1216. In spite of his advanced age he prosecuted the war against Prince Louis and the rebels with remarkable energy. In the battle of Lincoln (May 1217) he charged and fought at the head of the young king's army, and he was preparing to besiege Louis in London when the war was terminated by the naval victory of Hubert de Burgh in the straits of Dover. He was criticized for the generosity of the terms he accorded to Louis and the rebels (September 1217); but his desire for an expedient settlement was dictated by sound statesmanship. Self-restraint and compromise were the key-notes of Marshal's policy. Both before and after the peace of 1217 he issued Magna Carta. He fell ill early in the year 1219, and died on the 14th of May at his manor of Caversham near Reading. He was succeeded in the regency by Hubert de Burgh, in his earldom by his five sons in succession.

Marshal's eldest son, WILLIAM MARSHAL (d. 1231), 2nd earl of Pembroke of this line, passed some years in warfare in Wales and in Ireland, where he was justiciar from 1224 to 1226; he also served Henry III. in France. His second wife was the king's sister, Eleanor, afterwards the wife of Simon de Montfort, but he left no children. His brother RICHARD MARSHAL (d. 1234), 3rd earl, came to the front as the leader of the baronial party, and the chief antagonist of the foreign friends of Henry III. Fearing treachery he refused to visit the king at Gloucester in August 1233, and Henry declared him a traitor. He crossed to Ireland, where Peter de Roches had instigated his enemies to attack him, and in April 1234 he was overpowered and wounded, and died a prisoner. His brother GILBERT (d. 1247), who became the 4th earl, was a friend and ally of Richard, earl of Cornwall. When another brother, Anselm, the 6th earl, died in December 1245, the male descendants of the great earl marshal became extinct. The extensive family possessions were now divided among Anselm's five sisters and their descendants, the earldom of Pembroke reverting to the Crown.

The next holder of the lands of the earldom of Pembroke was William de Valence (d. 1256), a younger son of Hugh de Lusignan, count of La Marche, by his marriage with Isabella of Angoulême (d. 1249), widow of the English king John, and was born at Valence in 1215. On the death of his father William de Lusignan, Richard of Meulan, Guy and Aymer, crossed over to England at the invitation of their half-brother, Henry III. In 1250 Aymer (d. 1260) was elected bishop of Winchester, and in 1247 Henry arranged a marriage between William and Joan de Munchensi (d. 1307) a grand-daughter of William Marshal, 1st earl of Pembroke. The custody of Joan's property, which included the castle and lordship of Pembroke, was entrusted to her husband, who in 1205 was summoned to parliament as earl of Pembroke. In South Wales
Valence tried to regain the patrimony rights which had been attached to the earldom of Pembroke. But his energies were not confined to South Wales. Henry III. heaped lands and honours upon him, and he was soon thoroughly hated as one of the most prominent of the rapacious foreigners. Moreover, some trouble in Wales led to a quarrel between him and Simon de Montfort, and this soon grew more violent. He would not comply with the provisions of Oxford, and took refuge in Wolvesey Castle at Winchester, where he was besieged and compelled to surrender and leave the country. In 1259 he and Earl Simon were formally reconciled in Paris, and in 1261 he was again in England and once more enjoying the royal favour. He fought for Henry at the battle of Lewes, and then, after a stay in France, he landed in Pembrokeshire, and took part in 1265 in the siege of Gloucester and the battle of Evesham. After the royalist victory he was restored to his estates and accompanied Prince Edward, afterwards Edward I., to Palestine. He went several times to France on public business; he assisted in the conquest of North Wales; and he was one of Edward's representatives in the famous suit over the succession to the crown of Scotland in 1291 and 1292. He died at Bayonne on the 13th of June 1296, his body being buried in Westminster Abbey. His eldest surviving son Jasper (c. 1265-1294), succeeded to his father's estates, but was not formally recognized as earl of Pembroke until after the death of his mother Joan about 1307. He was appointed guardian of Scotland in 1306, but with the accession of Edward II. to the throne and the consequent rise of Piers Gaveston to power, his influence sensibly declined; he became prominent among the discontented nobles and was one of those who were appointed to select the lord ordainers in 1311. In 1312 he captured Gaveston at Scarborough, giving the favourable promise that his life should be spared. Ignoring this undertaking, however, Guy Beauchamp, earl of Warwick, put Gaveston to death, and consequently Pembroke left the allied lords and attached himself to Edward II. Valence was present at Bannockburn; in 1317, when returning to England from Rome, he was taken prisoner and was kept in Germany until a large ransom was paid. In 1328 he again took a conspicuous part in making peace between Edward and his nobles, and in 1322 assisted at the formal condemnation of Earl Thomas of Lancaster, and received some of his lands. His wife, Mary de Chatillon, a descendant of King Henry III., was the founder of Pembroke College, Cambridge.

In 1330 Laurence, Lord Hastings (d. 1348), a great-grandson of William de Valence, having inherited through the female line a portion of the estates of the Valence earls of Pembroke, was created, or recognized as, earl of Pembroke. His son John (d. 1370) married Mary, daughter of King Edward III., and on the death without issue of his grandson in 1380 the earldom of Pembroke reverted again to the Crown, while the barony of Hastings became dormant and so remained till 1840.

In 1414 Humphrey Plantagenet, fourth son of King Henry IV., was created duke of Gloucester and earl of Pembroke for life, these titles being subsequently made hereditary, with a reversion as regards the earldom of Pembroke, in default of heirs to Humphrey, to William de la Pole, earl of Suffolk. Accordingly, on the death of Humphrey, without issue, in 1447 this nobleman became earl of Pembroke. He was beheaded in 1450 and his titles were forfeited. In 1455 the title was given to Sir Jasper Tudor, half-brother of King Henry VI. Sir Jasper was being a Lancastrian, his title was forfeited during the pre-eminence of the house of York, but was restored on the accession of Henry VII. On his death without issue in 1459, his title became extinct.

During his attainder Sir Jasper was taken prisoner by Sir William Herbert (d. 1495), a zealous Yorkist, who had been raised to the peerage as Baron Herbert by Edward IV., and for this service Lord Herbert was created earl of Pembroke in 1468. His son William (d. 1491) received the earldom of Huntingdon in lieu of that of Pembroke, which he surrendered to Edward IV., who thereupon conferred it (1479) on his son Edward, prince of Wales; and when this prince succeeded to the throne as Edward V., the earldom of Pembroke merged in the crown. Anne Boleyn, a few months previous to her marriage with Henry VIII., was created marchioness of Pembroke in 1532. It is doubtful by authorities on peerage law whether the title merged in the royal dignity on the marriage of the marchioness to the king, or became extinct on her death in 1536.

The title of earl of Pembroke was next revived in favour of Sir William Herbert (c. 1501-1570), whose father, Richard, was an illegitimate son of the 1st earl of Pembroke of the house of Herbert. He had married Anne Parr, sister of Henry VIII.'s sixth wife, and was created earl in 1551. The title has since been held by his descendants.

An executor of Henry VIII.'s will and the recipient of valuable grants of land, Herbert was a prominent and powerful personage during the reign of Edward VI., both the protector Somerset and his rival, John Dudley, afterwards duke of Northumberland, angling for his support. He threw in his lot with Dudley, and after Somerset's fall obtained some of his lands in Wiltshire and a peerage. It has been asserted that he devised the scheme for settling the English crown on Lady Jane Grey; at all events he was one of her advisers during her short reign, but he declared for the Mary. His death was sudden, as he was last seen with Mary and her friends Pembroke's loyalty was at times suspected, but he was employed as governor of Calais, as president of Wales and in other ways. He was also to some extent in the confidence of Phillip II. of Spain. The earl retained his place at court under Elizabeth until 1569, when he was suspected of favouring the projected marriage between Mary, queen of Scots, and the duke of Norfolk. Among the monastic lands granted to Herbert was the estate of Wilton, near Salisbury, still the residence of the earls of Pembroke.

His eldest son Henry (c. 1534-1609), who succeeded as 2nd earl, was president of Wales from 1586 until his death. He married in 1577 Mary Sidney, the famous countess of Pembroke (c. 1561-1621) third daughter of Sir Henry Sidney and his wife Mary Dudley. Sir Philip Sidney to whom she was deeply attached through life, was her eldest brother. Sir Philip Sidney spent the summer of 1580 with her at Wilton, or at Itrychurch, a favourite retreat of hers in the neighbourhood. Here at her request he began the Countess of Pembroke's Arcadia, which was intended for her pleasure alone, not for publication. The two also worked at a metrical edition of the Psalms. When the great sorrow of her brother's death came upon her she made herself his literary executor, correcting the unauthorized editions of the Arcadia and of his poems, which appeared in 1590 and 1591. She also took under her patronage the poets who had looked to her brother for protection. Spenser dedicated his Ruins of Time to her and refers to her as Urania in Colin Clout's come home again. In Spenser's Astrophel she is "Clorinda." In 1599 Queen Elizabeth was her guest at Wilton, and the countess composed for the occasion a pastoral dialogue in praise of Astraea. After her husband's death she lived chiefly in London at Crosby Hall, where she died.

The Countess's other works include: A Discourse of Life and Death, translated from the French of Plessis du Mornay (1593), and Acantha (1592), a version of a tragedy of Robert Garnier.

William Herbert, 3rd earl of Pembroke (1580-1630), son of the 2nd earl and his famous countess, was a conspicuous figure in the society of his time and at the court of James I. Several times he found himself opposed to the schemes of the duke of Buckingham, and he was keenly interested in the colonization of America. He was lord chamberlain of the royal household from 1615 to 1625 and lord steward from 1626 to 1630. He was chancellor of the university of Oxford in 1624 when Thomas Tesdale and Richard Wightwick refounded Broadgates Hall and named it Pembroke College in his honour. By some Shakespearean commentators Pembroke has been identified with the "Mr W. H." referred to as "the onlie begetter" of Shakespeare's sonnets in the dedication by Thomas Thorpe, the owner of the published manuscript, while his mistress, Mary Fitton (q.v.), has been identified with the "dark lady" of the sonnets. In both
cases the identification rests on very questionable evidence (see Shakespeare, William). He and his brother Philip are the "inconceivable Pasta brothers" to whom the first folio of Shakespeare is inscribed. The earl left no sons when he died in London on the 10th of April 1630. Clarendon gives a very eulogistic account of Pembroke, who appears, however, to have been a man of weak character and dissolute life. Gardner describes him as the Hamlet of the English court. He had literary tastes and wrote poems; one of his closest friends was the poet Donne, and he was generous to Ben Jonson, Massinger and others.

His brother, Philip Herbert, the 4th earl (1584–1630), was for some years the chief favourite of James I, owing this position to his coming person and his passion for huntsmanship. Upon the field supported by the king created him earl of Montgomery and Baron Herbert of Shurland, and since 1630, when he succeeded to the earldom of Pembroke, the head of the Herbert family has carried the double title of earl of Pembroke and Montgomery. Although Philip's quarrelsome disposition often led him into trouble he did not forfeit the esteem of James I, who heaped lands and offices upon him, and he was also trusted by Charles I, who made him lord chamberlain in 1626 and frequently visited him at Wilton. He worked to bring about peace between the king and the Scots in 1639 and 1640, but when in the latter year the quarrel between Charles and the English parliament was renewed, he deserted the king who was soon deprived of him by his office of chamberlain. Trusted by the popular party, Pembroke was made governor of the Isle of Wight, and he was one of the representatives of the parliament on several occasions, notably during the negotiations at Uxbridge in 1645 and at Newport in 1648, and when the Scots surrendered Charles in 1647. From 1641 to 1643, and again from 1647 to 1650, he was chancellor of the university of Oxford; in 1648 he removed some of the heads of houses from their positions because they would not take the solemn league and covenant, and his foul language led to the remark that he was more fitted **"by his eloquence in swearing to preside over Beilam than a learned academy.*** In 1649, although a peer, he was elected and took his seat in the House of Commons as a member for Berkshire, this "ascent downwards" calling forth many satirical writings from the royalist wits. The earl was a great collector of pictures and had some taste for architecture. His eldest surviving son, Philip (1621–1669), became 5th earl of Pembroke, and 2nd earl of Montgomery; he was twice married, and was succeeded in turn by three of his sons, of whom Thomas, the 8th earl (c. 1659–1733), was a person of note during the reigns of William III. and Anne. From 1690 to 1692 he was first lord of the admiralty; then he served as lord privy seal until 1699, being in 1697 the first plenipotentiary of Great Britain at the congress of Ryswick, de Winkel and de Zwart, and for a short period; he was also lord president of the council and lord-lieutenant of Ireland, while he acted as one of the lords justices seven times; and he was president of the Royal Society in 1680–1690. His son Henry, the 9th earl (c. 1689–1750), was a soldier, but was better known as the "architect earl." He was largely responsible for the erection of Westminster Bridge. The title descended directly to Henry, 10th earl (1734–1794), a soldier, who wrote the Method of Breaking Horses (1763); George Augustus, 11th earl (1759–1827), an ambassador extraordinary to Vienna in 1807; and Robert Henry, 12th earl (1791–1862), who died without issue. George Robert Charles, the 13th earl (1850–1863), was a grandson of the 11th earl and a son of Baron Herbert of Lea (q.v.), whose second son Sidney (b. 1853) inherited all the family titles at his brother's death.

---

**PEMBROKE**

**Pembroke** (Penfro), an ancient municipal borough, a contributory parliamentary borough and county-town of Pembroke-shire, Wales, situated on a narrow peninsula at the head of the Penaar tidal inlet or "pill" of Milford Haven. Pop. (1901), 4,487; together with Pembroke Dock 15,853. Pembroke is a station on the South Wales system of the Great Western railway. The old-fashioned town, consisting chiefly of one long broad street, retains portions of its ancient walls. A large mill-dam is a conspicuous feature on the north of the town. St Mary's parish church in the centre of the town possesses a massive tower of the 12th century. Near the ruined West Gate is the entrance to Pembroke Castle, a splendid specimen of medieval fortified architecture. The circular vaulted keep erected by Earl William marshal (c. 1200), remains almost intact. Close to the keep stands the ruined chamber wherein, according to local tradition, Henry VII. was born in 1457. Beneath the fine banqueting hall, a flight of steps descends into "the Wogan," a vast subterranean chamber giving access to the harbour. Facing the castle, on the western side of the pill, stand the considerable remains of Monkton Priory, a Benediction house founded by Earl William Marshall as a cell to the abbey of Séez or Sayes in Normandy, but under Henry VI. transferred to the abbey of St Albans. The priory church, now the parish church of the borough of Monkton, contains monuments of the families of Meyrick of Bush and Owen of Oriolton. St Daniel's chapel forms a prominent landmark on the ridge south of the town.

**Pembroke Dock** (formerly known as Pater, or Paterchurch), a naval dockyard and garrison town, is situated close to Hobb's Point, at the eastern extremity of Milford Haven. It forms the Pater Ward of Pembroke, from which it is distant 2 m. to the north-west. The place owes its origin to the decision of the government in 1814 to form a naval dépôt on Milford Haven. The dockyard, enclosed by high walls and covering 80 acres, is protected by a powerful fort—the construction and repairing of ironclads are extensively carried on here. There is a submarine dépôt at Pennar Gut, and also accommodation for artillery and infantry. Ferry boats ply frequently between Pembroke Dock and Neyland on the opposite shore of the Haven.

Pembroke is probably an Anglo-Norman form of the Cymric Penfro, the territory lying between Milford Haven and the Bristol Channel, now known as the Hundred of Castlemartin. During the invasion of South Wales under William Rufus, Arnulf de Montomerti, fifth son of Roger earl of Shrewsbury, seems to have erected a fortress of stone (c. 1090) on the site of the castle. The first castellan of this new stronghold was William de Wyke, Bishop of Salisbury and brother of the Princess Nessa of South Wales and grandfather of Giraldus Cambrensis. Throughout the 12th and 13th centuries the castle was strengthened and enlarged under successive earls palatine of Pembroke, who made this fortress their chief seat. As the capital of the palatinate and as the nearest port for Ireland, Pembroke was in Plantagenet times one of the most important fortified cities in the kingdom. The town, which had grown up under the shadow of the almost impregnable castle, was first incorporated by Henry I. in 1109 and again by Earl Richard de Clare in 1154 (who also encircled the town with walls), and these privileges were confirmed and extended under succeeding earls palatine and kings of England. In 1855 the corporation was remodelled under the Municipal Corporations Act. Henry II. occasionally visited Pembroke, notably in 1172, and until the close of the Wars of the Roses, both town and castle played a prominent part in the history of Britain. With the passing of the Act of Union of Wales and England in 1536 however, the *jura regalia* of the county palatine of Pembroke were abolished, and the prosperity of the town began to decline. Although acknowledged as the county town of Pembroke-shire, Pembroke was superseded by Haverfordwest as the judicial and administrative centre of the shire on account of the more convenient position of the latter place. By the act of 1536 Pembroke was declared the leading borough in the
Pembroke parliamentary district, yet the town continued to dwindle until the settlement of the government dockyard and works at Pembroke Dock. At the outbreak of the Civil Wars the town and castle were garrisoned for parliament by the mayor, John Poyer, a leading Presbyterian, who was later appointed governor, with Rowland Laugherne of St Brides for his lieutenant. But at the time of the Presbyterian defection in 1647, Poyer and his lieutenant-governors, Laugherne and Powell, declared for Charles and held the castle in the king's name. In June 1648 Cromwell himself proceeded to invest Pembroke Castle, which resisted with great obstinacy. But after the water-supply of the garrison had been cut off, the besieged were forced to capitulate, on the 11th of July 1648, on the condition of surrendering up the thames. The townspeople and Laugherne and Powell were accordingly brought to London, but finally only Poyer was executed. The magnificent ruin of Pembroke Castle is the nominal property of the Crown, but has been held on lease since the reign of James II. by the family of Pryse of Gogerddan in Cardiganshire.

PEMBROKESHIRE (Str Benfro, Dyfed), the most westerly county of South Wales, bounded N.E. by Cardigan, E. by Carmarthen, S. by the Bristol Channel and W. and N.W. by St. Brides' Bay and Cardigan Bay of St. George's Channel. Area 615 sq. m. The whole coast is extremely indented, extending over 140 m. in length. The principal inlets are Milford Haven, St. Bride's Bay, Freshwater Bay, Fishguard Bay and Newport Bay. The chief parishes are Cemmes, Dinas, Strumble, St. David's, St. Ann's and St. Gwain's Heads. Five islands of moderate size lie off the coast, viz., Ramsey, Grassholm, Skomer and Skokholm in St. Bride's Bay, and Cadly Island (Ynys Pyr) opposite Tenby; the last named having a population of about 70 persons. Rare birds, such as peregrine falcons, ravens and choughs are not uncommon, while guillemots, puffins and other sea-fowl breed in immense numbers on the Stack Rocks, on Ramsey Island and at various points of the coast. Seals are plentiful in the caves of St. Bride's Bay and Cardigan Bay. The county is undulating, and large tracts are bare, but the valleys of the Cleddau, the Nevan, the Teifi and the Gwaun are well-watered. Presliey Mountains stretch from Fishguard to the border of Carmarthen, the principal heights being Pressey Top (1760 ft.) and Carn Englyn (1022 ft.). Trefragn Rock in the Plumstone Mountains is popularly supposed to mark the northern limit of the ancient settlement of the Flemings. The principal rivers are the Teifi, forming the northern boundary of the county from Abercy to Cardigan Bay; the Nevan and the Gwaun, both falling into Cardigan Bay; and the Eastern and Western Cleddau, forming the Daugleddau after their junction below Haverfordwest. All these streams contain trout and salmon. There are no lakes, but the broad tidal estuaries of the Daugleddau and other rivers, which fall into Milford Haven and are locally called "pills," constitute a peculiar feature of south Pembrokeshire scenery.

Geology.—Pembrokeshire is divisible into a northern portion occupied mainly by Ordovician and Silurian strata, which have been subjected to pressures from the north, the strike of the beds being south-west-north-east; and a southern portion, the situation of the South Wales coalfield, with associated Lower Carboniferous, Old Red Sandstone and narrow belts of Silurian rocks, the whole having been considerably folded and faulted by pressures from the north, which have given rise to the general south-east strike. In the neighbourhood of St Davids are the Pre cambrian granitic rocks (Dimetian) and volcanic rocks (Pebedian). These are surrounded by belts of unconformable Cambrian strata (Lingula Flags, Tremadoc beds), followed by Ordovician (Arenig, Llandeilo and Bala beds) with associated igneous rocks. These comprise gabbros and diabases of Strumble Head, Fishguard, Llunwedd, Preseli; doliolites north-west of St Davids, bostonites and cherts, and the volcanic masses of Llancarfan, Cwm Caer, besides various contemporaneous acid lavas and tuffs. The Ordovician and Silurian rocks extend southward to the neighbourhood of Narberth and Haverfordwest, where Arenig, Llandeilo and Bala beds (slate and red beds) are followed by shales, slates, and sandstone (Red Hill, Shacklebrook and Rhoswm, Watthen Lime Bed) and Llandovery beds are recorded. The Coal Measures, highly inclined and arthritic, stretch across from Carmarthenshire to the shore of St. Bride's Bay; they are bordered on the south-east by the Milstone Grits, Carboniferous Limestone series and Old Red Sandstone. On account of the folding the limestone appears again farther south at Pembroke, Caldy Island and St Gowan's Head; most of the remaining ground about Milford Haven being occupied by Old Red Sandstone with infolded limestone, a large tract of blown-sand occurs in Freshwater Bay south of Milford Haven. Silver-bearing lead has been mined at Llanfrynach.

Climate and Industries.—The climate is everywhere mild, and in the sheltered valleys near the coast sub-tropical vegetation flourishes in the open air. In the south the rainfall is small, and the districts round Pembroke suffer from occasional droughts. The chief industry is agriculture, wherein stock-raising is preferred to the growing of cereals. Of cattle the long-horned, jet-black Castlemartain breed is everywhere conspicuous. South Pembrokeshire has long been celebrated for its horses, which are bred in great numbers by the farmers; and beside the chief breed of milch cattle, and the road and ride, or road and shore, breed of sheep, the sheep reared are chiefly of the blackface, Welsh horned and the crossbreed. The deep-sea fisheries of Milford Haven are of the salmon, ling, pollock, haddock, horse mackerel, and other species. Lobsters, crabs and other shellfish are also an important export. The oysters are found at Langwm and near Tenby; lobsters and crabs abound on the western coast. The South Wales coalfield extends south Pembroke, and is worked at Saundersfoot, Begelly, Templeton, Kilgetty and other places. There are slate quarries at Glogue, Cilgerran and elsewhere; copper has been worked near St Davids, and lead at Llanfrynach.

Communications.—The South Wales branch of the Great Western railway enters Pembrokeshire from the east near Clynderwen Junction, whence the main line leads to Fishguard Harbour with its important Irish traffic. The lines from Newport, Neyland, Fishguard and Milford Haven by way of Haverfordwest, and a branch line from Clynderwen to Goodwick joins the main line at Letterston. The Whitland-Cadigan branch traverses the north-east by way of Cymrmych and Cilgerran. Another line running south-west from Whitland proceeds by way of Narberth and Tenby to Pembroke Dock.

Population and Administration.—The area of Pembrokeshire is 395,151 acres with a population in 1801 of 89,138 and in 1891 of 88,732, showing a slight decrease. The municipal boroughs are Pembroke (pop. 15,853), Haverfordwest (6007), and Tenby (4800). The hamlet of Bridgend and a part of St Dogmell's parish are included within the municipal limits of Cardigan. Newport (Trédraeth) (1222), the chief town of the barony of Kemes, or Cemmes, still possesses a mayor and corporation under a charter granted in 1215 by Sir Nicholas Marteline, lord of Kemes, whose hereditary representative still nominates the mayor and aldermen, but its surviving municipal privileges are practically honorary. Milford Haven (5102), Narberth (1070) and Fishguard (2002) are urban districts. Other towns are St Davids (1710), St Dogmells (Llandudoch) (1286); and Cilgerran (1368). Pembrokeshire lies in the South Wales circuit, and assizes are held at Haverfordwest. Two members are returned to parliament; one for the county, and one for the united boroughs of Pembroke, Haverfordwest, Tenby, Fishguard, Narberth, Neyland, Milford and Wiston (Castell Gnaws). Ecclesiastically, the county contains 153 churches and lies wholly in the diocese of St Davids.

History.—Pembrokeshire, anciently known to the Welsh as Dyfed, was originally comprised in the territory of the Dimetiae, conquered by the Romans. During the 6th century St David, or Dewi Sant, moved the chief seat of South Welsh monastic and ecclesiastical life from Caerleon-on-Usk to his native place Menevia, which, known in consequence as Tyddewi, or St Davids, continued a centre of religious and educational activity until the Reformation, a period of 1000 years. On the death of Rhodri Mawr in 877, Dyfed fell nominally under the sway of the princes of Deheubarth, or South Wales; but their hold was never very secure, nor were they able to effect the introduction of the Christian religion into the Diocese. In 1681 William the Conqueror penetrated west as far as St Davids, where he is said to have visited St David's shrine as a devout pilgrim. In 1002 Arnulf de Montgomery, son of Roger, earl of Shrewsbury, did homage to the king for the Welsh lands of Dyfed. With the building of Pembroke Castle, of which Gerald de Windsor was appointed castellan, the Normans began to spread over southern Dyfed; whilst Martin de Tours, landing in Fishguard
of the former episcopal mansions at Llawhaden, St Davids and Lamphey, the two latter of which were erected by Bishop Gower between the years 1328-1347. With the exception of the cathedral at St Davids and the principal churches of Haverfordwest and Tenby, clerical houses are of comparatively small size for the most part, but many are ancient and possess fine monuments or other objects of interest, especially in “Little England beyond Wales.” Amongst the more noteworthy are the churches at Stackpole Elibird, Carew, Burton, Gumfreston, Nevern, St Petrox and Rudbaxton, the last-named containing a fine Jacobean monument of the Hayward family.

Pembrokeshire has long been famous for its castles, of which the finest examples are to be observed at Pembroke; Manorbier, built in the 12th century and interesting as the birthplace and home of Giraldus Cambrensis; Carew, exhibiting many interesting features both of Norman and Tudor architecture; and Picton, owned and inhabited by a branch of the Phillips family. Other castles are the keep of Haverfordwest and the ruined fortresses at Narberth, Tenby, Newport, Wiston, Benton, Upton and Cilgerran. There are some remains of monastic houses at Tenby and Pembroke, but the most important religious communities were the priory of the Augustinian friars at Haverfordwest and the abbey of the Benedictines at St Dogmells. Of this latter house, which was founded by Martin de Tours, first lord of Kemes, at the close of the 11th century, and who owned the priories of Pill and Caldy, considerable ruins exist near the left bank of the Telifi about 1 m. below Cardigan. Of the ancient preceptory of the Knights of St John at Slebech scarcely a trace remains, but of the college of St Mary at St Davids founded by Bishop Houghton in 1377, the shell of the chapel survives in fair preservation. Pembrokeshire contains an unusually large number of county seats, particularly in the south, which includes Stackpole Court, the residence of Earl Cawdor, a fine mansion erected in the 18th century; Picton Castle; Slebech, once the seat of the Barlows; Orielton, formerly belonging to the Owens; and Ffynone, the residence of the Colby family.

**Customs, &c.—**The division of Pembrokeshire ever since the 12th century into well-defined Englishy and Welshy has produced two distinct sets of languages and customs within the county. Roughly speaking, the English division, the Anglia Transviuilla, of Camden, occupies the south-eastern half and comprises the hundreds of Roose, Castlemartin, Narberth and Dungleddy. In the Welshy, which includes the hundreds of Dewisland and Cilgerran together with the old barony of Kemes, the language, customs, manners and folk-lore of the inhabitants are still almost identical with those of Cardigan and Carmarthenshire. The old Celtic game of Knappan, a pastime partaking of the nature both of football and hockey, in which whole parishes and even hundreds were wont to take an active part, was prevalent in the barony of Kemes so late as the 16th century, as George Owen of Henly's, the historian and antiquary, records; and the playing of knappan lingered on after Owen's day. Amongst the settlers of the Englishy, who are of mingled Anglo-Saxon, Flemish, Welsh and perhaps Scandinavian descent, many interesting superstitions and customs survive. The English spoken by these dwellers in “Little England beyond Wales” contains many curious idioms and words and the pronunciation of some of the vowels is peculiar. Certain picturesque customs, many of them dating from pre-Reformation times, are still observed, notably in the neighbourhood of Tenby. Such are the sprinkling of persons with dewy evergreens on New Year's morning; the procession of the Cutty Wren on St Stephen's day, and the constructing of little huts at Lammastide by the farm boys and girls. As early as the opening years of the 19th century, cripples and ophthalmic patients in the habit of visiting the ancient hermitage at St Gowan's Head to bathe in its sacred well; and Richard Fenton, the county historian alludes (c. 1808) to the many crutches left at St Gowan's chapel by grateful devotees. Belief in ghosts, fairies, witches, &c., is still prevalent in the more remote places, and the dress of the fishwives of Langwm near Haverfordwest is highly picturesque with its short skirt, scarlet shawl and buckled shoes.
Pemmican—Pen

Bryan Donkin in 1808 was made of two separate parts, flat or nearly so, with the flat sides placed opposite each other to form the slit, or alternatively of one piece, flat and not cylindrical as in the usual form, but to the proper angle for insertion in the tube which constituted the holder. To John Mitchell probably belongs the credit of introducing machine-made pens, about 1823, and James Perry is believed to have been the first maker of steel slip pens. In 1828 Josiah Mason, who had been associated with Samuel Harrison, in the manufacture of split rings, saw Perry's pens on sale in Birmingham, and after examining them saw his way both to improve and to cheapen the process of making them. He therefore put himself in communication with Perry, and the result was that he began to make barred pens for him in 1828 and slip pens in 1829. Perry, who did much to popularize the steel pen and bring it into general use, in his patent of 1830 sought to obtain greater flexibility by forming a central hole between the points and shoulders by and by cutting one or more lateral slits on each side of the central slit; and Joseph Gillot, in 1831 described an improvement which consisted in forming elongated points on the nibs of the pens.

The metal used consists of rolled sheets of cast steel of the finest quality made from Swedish charcoal iron. These sheets, after being cut into strips of suitable width, annealed in a muffle-furnace and pickled in a bath of dilute sulphuric acid to free the surface from oxidized scale, are rolled between steel rollers till they are reduced to ribbons of an even thickness, about 1/2 in. From these ribbons the pen blanks are next punched out, and then, after being embossed with the name of the maker or other marks, are pierced with the central perforation and the side or shoulder slits by which flexibility is obtained. After another annealing, the blanks, which up to this point are flat, are "raised" or rounded between dies into the familiar semicylindrical shape. The next process is to harden and temper them by heating them in iron boxes in a muffle-furnace, plunging them in oil, and then heating them over a fire in a rotating cylindrical vessel till their surfaces attain the dull blue tint characteristic of spring-steel elasticity. Subsequently they are "scoured" in a bath of dilute acid, and polished in a revolving cylinder. The grinding of the points with emery follows, and then the central slit is cut by the aid of two very fine-edge cutters. Finally the pens are again polished, are coloured by being heated over a fire in a revolving cylinder, and in some cases are coated with a varnish of shellac dissolved in alcohol. Birmingham was the first home of the steel-pen industry, and continues its principal centre. The manufacture on a large scale was begun in the United States about 1860 at Camden, N.J., where the Esterbrook Steel Pen Manufacturing Company was incorporated in 1866.

Metals other than steel have frequently been suggested by inventors, those most commonly proposed being gold, silver, zinc, German silver, aluminium and aluminium brass. Gold pens, however, are scarce and have not been made to any extent. In 1860 Dr. W. H. Wollaston, it is recorded, had a gold pen composed of two thin strips of gold tipped with rhodium, apparently made on the principle patented by Donkin in 1868, and Lord Byron used one in 1810. Gold being extremely resistant to corrosion, pens made of it are very durable, but the metal is too soft for the points, which wear quickly unless protected by some harder material. For this purpose iridium is widely employed, by fusing the gold round it with a blowpipe.

Various devices have been adopted in order to increase the time for which a pen can be used without a fresh supply of ink. These fall into two main classes. In one, the form of the nib itself is modified, or some attachment is added to enlarge the ink capacity; in the other, which is by far the more important, the holder of the pen is utilized as a cistern or reservoir from which ink is supplied to the nib. Pens of the second class, which have the further advantage of being portable, are heard of under the name of "fountain inkhorns" or "fountain pens" so far back as the beginning of the 18th century, but it was not till a hundred

-- Richard Fenton, A Historical Tour through Pembroke (London, 1810); Edward Laws, History of Little England beyond Wales (London, 1888); Basil Jones and E. A. Freeman, History and Antiquities of St David's (London, 1856), &c.

Pemmican, a North American Indian (Cree) word for a meat prepared in such a way as to contain the greatest amount of nourishment in the most compact form. As made by the Indians it was composed of the lean parts of the meat, dried in the sun, and pounded or shredded and mixed into paste with melted fat. It is flavoured with acid berries. If kept dry it will keep for an indefinite time, and is thus particularly serviceable in arctic or other explorations.

Pemphigus (Gr. pemphigus, a bubble), a skin disease, in which large blebs appear, on a red base, containing a clear or yellowish fluid; the blebs occasion much irritation, and when they burst leave raw ulcerated surfaces. The disease is principally found in unhealthy or neglected children. A variety of the malady, pemphigus foliacceus, affects the whole body, and gradually proves fatal. Pemphigus of an acute septicaemic type occurs in butchers or those who handle hides, and a diplococcus has been isolated by William Bullock. The treatment is mainly constitutional, by means of good nourishment, warm baths, local sedatives and tonics. In chronic pemphigus, streptococci have been found in the blebs, and the oesophageal index was low to streptococci. Improvement has been known to take place on the injection of a vaccine of streptococci.

Pen (Lat. penna, a feather, pen) an instrument for writing or for forming lines with an ink or other coloured fluid. The English word, as well as its equivalents in French (plume) and in German (Feder), originally means a wing-feather, but in ancient times the implements used for producing written characters were not quills. The earliest writing implement was probably the stylus (Gr. γραφή), a pointed bodkin of metal, bone or ivory, used for producing incised or engraved letters on boxwood tablets covered with wax. The calamus (Gr. κάλαμος) or arundo, the hollow tubular stalk of grasses growing in marshy lands, was the true ancient representative of the modern pen; hollow joints of bamboo were similarly employed.

An early specific allusion to the quill pen occurs in the writings of St Isidore of Seville (early part of the 7th century), 1 but there is no reason to assume that it was not in use at a still more remote date. The quills still largely employed among Western nations are the writing instruments are obtained principally from the wings of the goose (Anser Brachyrhynchus). In 1790 Joseph Bramah devised and patented a machine for cutting up the quill into separate nibs by dividing the barre into three or even four pieces, and cutting these transversely into "two, three, four and some into five lengths." Bramah's invention first familiarized the public with the appearance and use of the nib slipped into a holder. In 1818 Charles Watt obtained a patent for gilding and preparing quills and pens, which may be regarded as the precursor of the gold pen. But a more distinct advance was effected in 1822, when J. J. Hawkins and S. Mordan patented the application of horn and tortoise-shell to the formation of pen-nibs, the points of which were rendered durable by small pieces of diamond, ruby or other very hard substance, or by lapping a small piece of thin sheet gold over the end of the tortoise-shell.

Metallic pens, though not unknown in classical times—a bronze pen found at Pompeii is in the Naples Museum—were little used until the 15th century and did not become common till near the middle of that century. It is recorded that a Birmingham split-ring manufacturer, Samuel Harrison, made a steel pen for Dr Joseph Priestley in 1780. Steel pens made and sold in London by a certain Wise in 1803 were in the form of a tube or barrel, the edges of which met to form the slit, while the sides were cut away as in the case of an ordinary quill. Their price was about five shillings each, and they were hard, stiff and unsatisfactory instruments they were not in great demand. Wise's pen proved a failure.

1 Instrumenta scribae calamus et penna; ex eis enim verba paginis insinuat: sed calamus arboris est, penna avis, cujus acumen dividitur in duo. 1
PENALTY—PENANG

years later that inventors applied themselves seriously to their construction. Joseph Bramah patented several plans; one was to employ a tube of silver or other metal so thin that it could be readily squeezed out of shape, the ink within it being thus forced out to the nib, and another was to fit the tube with a piston that could slide down the interior and thus eject ink. In modern fountain pens a feed bar conveys, by capillary action, a fresh supply of ink to replace that which has been left on the paper in the act of writing, means being also provided by which air can pass into the reservoir and fill the space left empty by the outflowing ink. In another form of reservoir pen, which is usually distinguished by the name stylograph, there is no nib, but the ink flows out through a minute hole at the end of the holder, which terminates in a conical point. An iridium needle, held in place by a fine spring, projects slightly through the hole and normally keeps the aperture closed; but when the pen is pressed on the paper, the needle is pushed back and allows a thin stream of ink to flow out.

PENALTY (Lat. poena, punishment), in its original meaning, a punishment inflicted for some violation of the law or rule of conduct. Although still freely used in its original sense in such phrases, for example, as "the death penalty," "the penalty of rashness," &c., the more usual meaning attached to the word is that of a pecuniary mulct. Penalty is used specifically for a sum of money recovered by virtue of a penal statute, or recoverable in a court of summary jurisdiction for infringement of a statute. A sum of money agreed upon to be paid in case of non-performance of a condition in a bond or in breach of a contract or any stipulation of it is also termed a penalty (see DAMAGES).

PENANCE (Old Fr. penance, fr. Lat. poenitentia, penitence), strictly, repentance of sins. Thus in the Douai version of the New Testament the Greek word μετέρωμα is rendered "penance," where the Authorized Version has "repentance." The two words, similar in their derivation and original sense, have however come to be symbolical of conflicting views of the essence of repentance, arising out of the controversy as to the respective merits of "faith" and "good works." The Reformers, upholding the doctrine of justification by faith, held that repentance consisted in a change of the whole moral attitude of the mind and soul (contritio, Matt. xii. 31), and that the Divine forgiveness followed true repentance and confession to God without any reparation of "works." This is generally held by Protestants. In the Roman Catholic Church the sacrament of penance consists of three parts: contritio, confessio, satisfactio. Contritio is in fact repentance as Protestant theologians understand it, i.e. sorrow for sin arising from love of God, and long before the Reformation the schoolmasters debated the question whether complete "contrition" was or was not in itself sufficient to obtain the Divine pardon. The Council of Trent, however, decided that "reconciliation" could not follow such contrition without the other parts of the sacrament, which for this reason are termed (sine sacrament vo, quod in illa includatur). Contrition is also distinguished from "attrition" (attritio), i.e. repentance due to fear of punishment. It was questioned whether a state of mind thus produced would suffice for obtaining the benefits of the sacrament; this point was also set at rest by the Council of Trent, which decided that attrition, though not in itself capable of obtaining the justification of the sinner, is also inspired by God and thus disposes the soul to benefit by the grace of the sacrament.

The word "penance," applied to the whole sacrament, is also used of the works of satisfaction imposed by the priest on the penitent, i.e. the temporal punishment (poena). This varies with the character and heinousness of the offences committed. In the middle ages "doing penance" was often a process as terrible and humiliating to the penitent as it was possibly edifying to the Church. Public penances have, however, long been abolished in all branches of the Christian Church. (See CONFESSION.)

PENANG (Pulau Pinang, i.e. Areca-nut Island), the town and island which, after Singapore, form the most important portion of the crown colony of the Straits Settlements. The island is situated in 5° 24' N. and 100° 21' E., and distant about 23 m. from the west coast of the Malay Peninsula. The island is about 15½ m. long by 10½ m. wide at its broadest point. Its area is 280 square miles. The town is built on a promontory at a point nearest to the mainland, is largely occupied by Chinese and Tamils, though the Malays are also well represented. Behind the town, Penang Hill rises to a height of some 2700 ft., and upon it are built several government and private bungalows. The town possesses a fine European club, a racecourse, and good golf links. Coco-nuts are grown in considerable quantities along the seashore, and rice is cultivated at Bâleâ Pulau and in the interior, but the jungle still spreads over wide areas. Penang has an excellent harbour, but has suffered from its proximity to Singapore. There are a Church of England and a Roman Catholic church in the town, and a training college under the Roman Catholic missionaries of the Société des Missions Étrangères at Pâlau Tikus, a few miles outside the town.

Administration.—Since 1867 Penang has been under the administrative control of a resident councillor who is responsible to the governor of the Straits. He is aided in his duties by officers of the Straits Civil Service. Two unofficial members of the legislative council of the colony, which holds its sittings in Singapore, are nominated by the governor, with the sanction of the secretary of state for the colonies, to represent Penang. Their term of office is for five years. The official name of the island is Prince of Wales Island and that of the town is George-town; neither of these names, however, is in general use. Among the rank of the old Penangis the use of Taunfong or "The Cape," on account of the promontory on which the town is situated. The town is administered by a municipal council composed of ex officio, nominated, and elected members.

Population.—The population of Penang at the time of the census of 1901 was 128,830, of whom 85,070 were males (69,210 over and 15,860 under 15 years of age), and 43,760 were females (28,725 over and 15,035 under 15 years of age). The population was composed of 71,462 Chinese, 34,286 Malays, 18,740 Tamils and other natives of India, 16,493 Europeans and Americans, and 1699 persons of other nationalities. As in other parts of the Straits Settlements the men are far more numerous than the women. Of the whole population of the settlement of Penang, which includes not only Penang island but Province Wellesley and the Dindings, was 248,207 in 1901.

Shipping.—The number of ships which entered and left the port of Penang during 1906 was 3,234, with an aggregate tonnage of 2,868,459. Of these 1,002 were British with an aggregate tonnage of 1,966,886. These figures reveal a considerable falling-off during the past decade, the number of vessels entering and leaving the port in 1898 being 5,114 with an aggregate tonnage of 3,761,974. This is mainly due to the construction of the railway which runs from a point on the mainland opposite to Penang, through the Federated Malay States of Pêrak, Selâning and the Negri Sëmibânî to Malacca, and has diverted to other ports and eventually to Singapore much of the coastal traffic which formerly visited Penang.

Finance and Trade.—The revenue of Penang, that is to say, not only of the island but of the entire settlement, amounted in 1906 to $3,031,912, of which $2,014,033 was derived from the revenue farms for the collection of import duties on wine, spirits; $119,286 from land revenue (pena); $263,713 from stamps. The expenditure for 1906 amounted to $2,527,405, of which $836,097 was spent on administrative establishments, $301,252 on the upkeep of existing public works; $415,175 on the construction of works and buildings, and of new roads, streets, bridges, &c. The imports in 1906 were valued at $94,456,112, the exports at $60,709,225. Of the imports $7,980,898 worth came from the United Kingdom or from British possessions or from the United States; $2,307,532 came from India; $2,120,929 came from China; and $3,906,241 from the Dindings, Malacca and Singapore. Of the exports, $23,122,947 went to the United Kingdom, or to British possessions, and $11,736,738 to other countries; and $2,754,228 went to the Dindings, Malacca or Singapore.

History—Penang was founded on the 17th of July 1786, having been ceded to the East India Company by the Sultan of Kelâh in 1785 by an agreement with Captain Light, for an annuity of $10,000 for eight years. In 1791 the subsidy was
1805 was Vesta. The Cardiff Radyr and Penarth were thrown water burning common 1865, 1857, as same in enjoying at the Straits Settlements in 1826 (g.v.) minimum sides river thus out of warehouses, directories in the total number offices, and the appliance of the Straits Company. Straits Settlements were created a crown colony, in which Penang was included.

See Straits Settlements Blue Book 1906 (Sipinang, 1907); The Straits Directory (Singapore, 1997); Sir Frank Swettenham, Brie a Malaya (London, 1906).

**PENARTH,** an urban district and seaport in the southern parliamentary division of Glamorganshire, Wales, 166 m. by rail from London, picturesquely situated on rising ground on the south side of the mouth of the Ely opposite Cardiff, from which it is 4 m. distant by rail and 2 m. by steamer. Pop. (1901), 14,228. The place derives its name from two Welsh words, “pen,” a head, and “garth,” an enclosure. Penarth was a small and unimportant village until a tidal harbor at the mouth of the Ely was opened in 1859, and a railway, 6 m. long, was made about the same time, connecting the harbour with the Taff Valley railway at Radyr. A dock, authorized in 1857, was opened in 1863, which with undertakings, which had cost £77,000, were leased in perpetuity to the Taff Valley Railway Company. The monopoly which the Bute Docks at Cardiff had previously enjoyed in shipping coal from the valleys of the Taff and Rhondda was thus terminated. The town is frequented in summer as a bathing-place, and the Rhaetic huts at the head are of special interest to geologists. On this head there stood an old church, probably Norman, which served as a landmark for sailors. The remains of an old chantry have been converted into a barn. Besides two Established and one Roman Catholic church, the principal buildings of Penarth are its various Nonconformist chapels, intermediate and technical school (1894), custom house, dock offices, and Turner House with a private art gallery which is to be opened on certain days to the public. Three miles to the west is Dinas Powis Castle. In 1882–1883 gardens were laid out along the cliff, in 1894 a promenade and landing-pier with a length of 630 ft. were constructed, and in 1900 a marine subway open at all times for foot passengers was made under the river Ely. The dock, as first constructed, comprised 173 acres, was extended in 1884 at a cost of £50,000, and now covers 23 acres with a basin of 3 acres. It is 2900 ft. in length, has a minimum depth of 26 ft., and is furnished with every modern appliance for the export of coal, of which from 20,000 to 30,000 tons can be stored in the sidings near by. The Penarth-Ely tidal harbour has a water area of 35 acres, with a minimum depth of 20 ft., and a considerable import trade is carried on here mainly by coasting vessels; but as only one of its sides has wharves (about 3000 ft. along) scarcely more than 5% of the total shipping of the port is done here. It has commodious warehouses, also tanks to hold about 6000 tons of oil.

**PENATES** (from Lat. *penus*, cattales, food), Roman gods of the store-room and kitchen. The store-room over which they presided was, in old times, beside the *atrium*, the room which served as kitchen, parlour, and bedroom in one; but in later times the store-room, was in the back part of the house. It was sanctified by the presence of the Penates, and none but pure and chaste persons might enter it, just as with the Hindu the kitchen is sacred and inviolate. In 706 b.c. they had no individual names, but were always known under the general designation, Penates. Closely associated with the Penates were the *Lares* (*q.v.*), another species of domestic deity, who seem to have been the deified spirits of deceased ancestors. While each family had two Penates it had but one Lar. In the household shrine the image of the Lar (dressed in a toga) was placed between the two images of the Penates, which were represented as dancing and elevating a drinking-horn in token of joy and plenty. The three images together were sometimes called Penates, sometimes Larves, and either name was used metaphorically for “home.” The shrine stood originally in the *atrium*, but when the hearth and the kitchen were separated from the *atrium* and removed to the back of the house, and meals were taken in an upper storey, the position of the shrine was also shifted. In the houses at Pompeii it is sometimes in the kitchen, sometimes in the rooms. In the later empire it was placed behind the house-door, and a taper or lamp was kept burning before it. But the worship in the interior of the house was also kept up even into Christian times; it was forbidden by an ordinance of Theodosius (A.D. 392). The modern Roman used, in company with his children and slaves, to offer a morning sacrifice and prayer to his household gods. Before meals the blessing of the gods was asked, and after the meal, but before dessert, there was a short silence, and a portion of food was placed on the hearth and burned. If the hearth and the images were not in the eating-room, either the images were brought and put on the table, or before the shrine was placed a table on which were set a salt-cellar, food and a burning lamp. Three days in the month, viz. the Calends, Nones and Ides (i.e. the first, the fifth or seventh, and the thirteenth or fifteenth), were set apart for special family worship, as were also the Caristia (Feb. 22) and the Saturnalia in December. On these days as well as on such occasions as birthdays, marriages, and safe returns from journeys, the images were carried round the house, or to crowned candlesticks made to them of cakes, honey, wine, incense, and sometimes a pig. As each family had its own Penates, so the state, as a collection of families, had its public Penates. Intermediate between the worship of the public and private Penates were probably the rites (sacra) observed by each clan (gens) or collection of families supposed to be descended from a common ancestor. The other towns of Latium had their public Penates as well as Rome. The sanctuary of the whole Latin league was at Lavinium. To these Penates at Lavinium the Roman priests brought yearly offerings, and the Roman consuls, praetors and dictators sacrificed both when they entered on and when they laid down their office. To them, too, the generals sacrificed before departing for their province. Alba Longa, the real mother-city of Latium, had also its ancient Penates, and the Romans maintained the worship on the Alban mount long after the destruction of Alba Longa. The Penates had a temple of their own at Rome. It was on the Velia near the Forum, and has by some been identified with the round vestibule of the church of SS. Cosma e Damiano. In this and many other temples the Penates were represented by two images of youths seated holding spears. The Penates were also worshipped in the neighbouring temple at Vesta. To distinguish the two worship it has been supposed that the Penates in the former temple were those of Latium, while those in the temple of Vesta were the Penates proper of Rome. Certainly the worship of the Penates, whose altar was the hearth and to whom the kitchen was sacred, was closely connected with that of Vesta, goddess of the domestic hearth.

The origin and nature of the Penates was a subject of much discussion to the Romans themselves. They were traced to the mysterious worship of Samothrace; Dardanus, it was said, took the Penates from Samothrace to Troy, and after the destruction of Troy, Aeneas brought them to Italy and established them at Lavinium. From Lavinium Ascanius carried the worship to Alba Longa, and from Alba Longa it was brought to Rome. Equally unsatisfactory with this attempt to connect Roman religion with Greek legend are the vague and mystical speculations in which the later Romans indulged respecting the nature of the Penates. Some said they were the great gods to whom we owe breath, body and reason, viz. Jupiter representing the middle ether, Juno the lowest air and the earth, and Minerva the highest ether, to whom some added Mercury as the god of speech (Servius, on *Aen*. ii. 296; Macrobius, *Sat.* iii. 4, 8; Arnobius, *Adv. Nat.* iii. 40). Others identified them with Apollo.
and Neptune (Macrobi. iii. 4, 6; Arnob. loc. cit.; Servius, on Aen. iii. 119). The Etruscans held the Penates to be Ceres, Pales and Fortuna, to whom others added Genius Jovialis (Servius on Aen. ii. 235; Arnob. loc. cit.). The late writer Martianus Capella records the view that heaven was divided into sixteen regions, in the first of which were placed the Penates, along with Jupiter, the Lares, &c. More fruitful than these misty speculations is the suggestion, made by the ancients themselves, that the worship of these family gods sprang from the ancient Roman custom (common to many savage tribes) of burying the dead in the house. But this would account for the worship of the Lares rather than of the Penates. A comparison with other primitive religious beliefs suggests the conjecture that the Penates may be a remnant of fetishism or animism. The Roman genius seem certainly to have been fetishes and the Penates were perhaps originally a species of genius. Thus the Penates, as simple gods of food, are probably much more ancient than deities like Jupiter, Neptune, Apollo and Minerva.

With the Penates we may compare the kindly household gods of old Germany; they too had their home on the kitchen hearth and of whom big families wanted no solid clothes. In the castle of Hudehemthilien (Hanover) there was a kobold for whom a cover was always set on the table. In Lapland each house had one or more spirits. The souls of the dead are regarded as house-spirits by the Russians; they are represented as dwarfs, and are served with food and drink. Each house in Servia has its patron-saint. In the mountains of Mysore every house has its bhuta or guardian deity, to whom prayer and sacrifices are offered. The Chinese god of the kitchen presents some curious analogies to the Penates: incense and candles are burnt before him on the first and fifteenth of the month; some families burn incense and candles before him daily; and on great festivals, one of which is at the winter solstice (nearly corresponding to the Saturnalia), he is served with cakes, pork, wine, incense, &c., which are placed on a table before him.

See Roman Religion.

J. G. F.; X.

PENCIL (Lat. penicillus, brush, literally little tail), a name originally applied to a small fine-pointed brush used in painting, and still employed to denote the finer camel's-hair and sable brushes used by artists, but now commonly signifying solid cones or rods of various materials used for writing and drawing. It has been asserted that a manuscript of Theophrastus, attributed to the 12th century, shows signs of having been ruled with a blunt instrument, and it is believed that the first distinct use of this implement occurred in the treatise on fossils by Conrad Gesner of Zurich (1565), who describes an article for writing formed of wood and a piece of lead, or, as he believed, an artificial composition called by some stimmi angiicum (English antimony). The famous Borrowdale mine in Cumberland having been discovered about that time, it is probable that we have here the first allusion to that great find of graphite. While the supply of the Cumberland mine lasted, the material for English pencils consisted simply of the native graphite as taken from the mine. The pieces were sawn into thin sheets, which again were cut into the slender square rods forming the "lead" of the pencil.

Some improvements were made on the continent of Europe and in England to enable manufacturers to become independent of the product of the Cumberland mine. In Nuremberg, where the great pencil factory of the Faber family (g.v.) was established in 1760, pencils were made from pulverized graphite cemented into solid blocks by means of gums, resins, glue, sulphur and other such substances, but none of these preparations yielded useful pencils. In the year 1795 N. J. Conté (g.v.), of Paris, devised the process by which now all black-lead pencils, and indeed pencils of all sorts, are manufactured. In 1834 William Brockedon patented a process for compressing pure black-lead powder into solid compact blocks by which he was enabled to use only 0.7 per cent of charcoal, rendering the pencil more durable. Brockedon's process would have proved successful but the exhaustion of the Borrowdale supplies and the excellence of Conté's process rendered it more of scientific interest than of commercial value.

The pencil leads prepared by the Conté process consist of a mixture of graphite and clay. The graphite, having been pulverized and subjected to any necessary purifying processes, is "floated" through a series of settling tanks, in each of which the comparatively heavy particles sink, and only the still finer particles are carried over. That which sinks in the last of the series is in a condition of extremely fine division, and is used for pencils of the highest quality. The clay, which must be free from sand and iron, is treated in the same manner. Clay and graphite so prepared are mixed together in varying proportions with water to a paste, passed repeatedly through a grinding mill, then placed in bags and squeezed in a hydraulic press till they have the consistency of stiff dough, in which condition they are ready for forming pencil rods. For this purpose the plastic mass is placed in a strong upright cylinder, from which a plunger or piston, moved by a screw, forces it out through a perforated base-plate in a continuous thread. This thread is finally divided into suitable lengths, which are heated in a closed crucible for some hours. The two factors which determine the comparative hardness and blackness of pencils are the proportions of graphite and clay in the leads and the heat to which they are raised in the crucible. According to the proportion of graphite is greater and the heat lower the pencil is softer and of deeper black streak.

The wood in which the leads are cased is pencil cedar from Juniperus virginiana for the best qualities, and pine for the cheaper ones. A board of the selected wood, having a thickness about equal to half the diameter of the finished pencil and as wide as four or six pencils, is passed through a machine which smooths the surface and cuts round or square grooves to receive the leads. The leads being placed in the grooves the board is covered with another similarly grooved board, and the two are fastened together with glue. When dry they are taken to rapidly revolving cutters which remove the wood between the leads. The individual pencils thus formed only need to be finished by being dyed and varnished and stamped with name, grade, &c. Instead of wood, paper has been tried for the casings, rolled on in narrow strips which are torn off to expose fresh lead as the point becomes worn down by use.

Black pencils of an inferior quality are made from the dust of graphite melted up with sulphur and run into moulds. Such, with the addition of incense and clay, are sold for about half the price of the wood pencils. These are often used with appropriate mineral colouring matter, wax, and tallow, treated by the conté method, as in making lead pencils. In indelible and waterproof pencils the colouring matter is aniline preparation mixed with clay and gum. The mixture not only makes a streak which adheres to the paper, but, when the writing is moistened with water, it dissolves and assumes the appearance and properties of an ink.

PENDA, king of Mercia (d. 654 or 655), son of Pybbba, probably came to the throne in 626, but it is doubtful whether he actually became king of Mercia until 633, the year of the defeat and death of Edwin of Northumbria. According to the Anglo-Saxon Chronicle he was eighty years old at his death, but the energy of his administration and the evidence with regard to the ages of his children and relatives render it almost impossible. In 629 the Chronicle records a battle between him and the West Saxons, in which the ancient Roman fortress of Conté or 633 Penda and Cynegils overthrew Edwin at Hatfield Chase; but after the defeat of the Welsh king at Oswald at "Hefenfelth" in 634, Mercia seems to have been for a time subject to Northumbria. In 642 Penda slew Oswald at a place called Maerfeld. He was continually raiding Northumbria and once almost succeeded in reducing Bamborough. He drove Cenwalh of Wessex, who had divorced his sister, from his throne. In 654 he attacked the East Angles, and slew their king Anna (see East Anglia). In 654 or 655 he invaded Northumbria in spite of the attempts of Oswiu to buy him off, and was defeated and slain on the banks of the "Winwaed." In the reign of Penda the districts of Wiltshire and Somerset were subjugated, and those of Sarum and Hereford came under Mercian suzerainty. He probably acquired, and he established his son Penda as a dependent prince in Middle Anglia. Although a pagan, he allowed his daughter Cyneburg to marry Alchfrith, the son of...
Osio, and it was in his reign that Christianity was introduced into Middle Anglia by his son Peada.

PENDANT (through Fr. from L. pendere, to hang), any hanging object, such as a jewel or other ornament hanging from a brooch, bracelet, &c., or the loose end of a knight’s belt left hanging after passing through the buckle, and terminating in an ornamental end. In architecture the word is applied to an elongated boss, either moulded or foliated, such as hangs down from the intersection of ribs, especially in fan tracery, or at the end of hammer beams. Sometimes long corbels, under the wall pieces, have been so called. The name has also been given to the large masses depending from enriched ceilings, in the later works of the Pointed style. "Pendants" or "Pendent posts" are those timbers of nave are carried down the side of the wall from the plate, and receive the hammer braces.

PENDENTIVE, the term given in architecture to the bridging across the angles of a square hall, so as to obtain a circular base for a dome or drum. This may be done by corbeling out in the angles, in which case the pendentive may be a portion of a hemisphere of which the half diagonal of the square hall is the radius; or by throwing a series of arches across the angle, each ring as it rises advancing in front of the one below and being carried by it during its construction; in this case the base obtained is octagonal, so that corbels or small pendentives are required for each angle of the octagon, unless in the church of SS. Sergius and Bacchus at Constantinople a portion of the dome is set back; or the pendentive is made, by a third method, by sinking a semicircular niche in the angle. The first system was employed in St Sophia at Constantinople, and in Byzantine churches generally, also in the domed churches of Perigord and Aquitaine. The second is found in the Sassanian palaces of Serbistan and Firuzabad, and in medieval architecture in England, France and Germany, where the arches are termed “squincies.” The third system is found in the mosque at Damascus, and was often adopted in the churches in Asia Minor. There is still another method in which the pendentive and cupola are part of the same hemispherical dome, and in this case the ring courses lie in vertical instead of horizontal planes, examples of which may be found in the vault of Magnesia on Maeander in Asia Minor, and in the tomb at Valence known as le pendetif de Valence. The problem is one which has taxed the ingenuity of many builders in ancient times; the bas-reliefs found at Nimrud show that in the 9th century B.C. domes were evidently built over square halls, and must have been carried on pendentives of some kind.

PENDER, SIR JOHN (1816–1860), British cable pioneer, was born in the Vale of Leven, Scotland, on the 10th of September 1816, and after attending school in Glasgow became a successful merchant in textile fabrics in that city and in Manchester. His name is chiefly known in connexion with submarine cables, of which on the commercial side he was an important promoter. He was one of the 345 contributors who each risked a thousand pounds in the Transatlantic Cable in 1857, and when the Atlantic Telegraph Company was ruined by the loss of the 1865 cable he formed the Anglo-American Telegraph Company to continue the work, but it was not till he had given his personal guarantee for a quarter of a million pounds that the makers would undertake the manufacture of a new cable. But in the end he was justified, and telegraphic communication with America became a commercial success. Subsequently he fostered cable enterprise in all parts of the world, and at the time of his death, which occurred at Footscray Place, Kent, on the 7th of July 1860, he controlled companies having a capital of 15 millions, and the ownership of 73,640 nautical miles of cables. He represented Wick Burghs in parliament from 1872 to 1885 and from 1892 to 1896. He was made a K.C.M.G. in 1883 and was promoted in 1892 to be G.C.M.G. His eldest son James (b. 1841), who was M.P. for Mid Northamptonshire in 1895–1900, was created a baronet in 1897; and his third son, John Denison (b. 1855), was created a K.C.M.G. in 1901.

PENDLESIDE SERIES, in geology, a series of shales between the upper division of the Carboniferous Limestone and the Millstone Grits occurring in the Midlands between Stoke-on-Trent and Shrewsbury. It consists of black limestones at the base, followed by black shales with calcareous nodules, which pass into sandy shales with ganister-like sandstones. In places the series attains a thickness of 1500–2000 ft., and where it is thickest the Millstone Grits also attain their maximum thickness. The peculiarities of the series, which is characterized by a rich fauna with Productus giganteus, P. striatus, Dibunophyllum, Cyathaxonia cornu and Lonsdalea floriformis, can be best studied on the western slope of Pendle Hill, Lancashire, in the valley of the Hodder, dividing the counties of Lancashire and Yorkshire, at Mam Tor and the Edale valley in Derbyshire, and Morrough’s, the Dane valley in north Staffordshire, Bagillt and Teilia in North Wales, and Scarlett and Poolvash, Isle of Man. The limestones at the base are hard, compact and fissile, often cherty, and vary much in the amount of calcium carbonate which they contain, at times passing into calcareous shales.

These limestones and shales contain a distinct fauna which appears for the first time in the Midlands, characterized by Pierinopecten papraceus, Posidoniella laevis, Posidonoma Becheri, Posidonoma membranacea, Nomismoceras rolfordiae and Glyphioceras striatus. Immediately below beds with this fauna are thin limestones with Prolocanites compressus, Stroboceras bisulcatum, many trilobites, and corals referable to the genera Cyathaxonia, Zaphrentis and Amplexisphinctes. The fauna characteristic of the Carboniferous Limestone becomes largely extinct and is replaced by a shale fauna, but the oncoming of the age of Goniatites is shown by the presence in the upper part of the Carboniferous Limestone of numerous species and genera of this group, Glyphioceras crenastria being the most common and having the wider horizontal range. The whole Pendleside series can be divided into zones by the different species of Goniatites. At the base Prolocanites compressus characterizes the passage beds between the Carboniferous Limestone and the Pendlesides; Nomismoceras rolfordiae and Glyphioceras striatus are found in a narrow zone immediately above. Then Glyphioceras reticulatum appears and reaches its maximum, and is succeeded by Glyphioceras diadema and Glyphioceras spirale, while immediately below the Millstone Grits Glyphioceras bilingue appears and passes up in that series. The Millstone Grits are characterized by the presence of Gastricoceras Listeri. The Pendleside series is therefore characterized by an Upper Carboniferous fauna, Pierinopecten papraceus, Posidoniella laevis and some other species which pass up right through the Coal Measures appearing for the first time, and the base of the series marks the division between Upper and Lower Carboniferous times.

The series passes eastward into Belgium and thence into Germany, where the same fossil zones are found in the basin of Namur and the valley of the Dill. Traced westward the series is well developed in Co. Dublin and on the west coast of Co. Clare and Limerick. There can be no doubt that the Pendleside series of the Midlands represents the Lower Culm of Coddens Hill, north Devon, and the Lower Culm of the continent of Europe. The faunas in these localities have the same biological succession as in the Midlands. See Wheelton Hind and J. Allen Howe, Quart. Journ. Geol. Soc. vol. lvi. (1901), and numerous other papers by the first-named author.

PENDLETON, EDMUND (1721–1803), American lawyer and statesman, was born, of English Royalist descent, in Caroline county, Virginia, on the 9th of September 1721. He was educated at the College of William and Mary, but he was not admitted to the bar (1744) his success was immediate. He served in the Virginia House of Burgesses from 1752 until the organization of the state government in 1776, was the recognized leader of the conservative Whigs, and took a leading part in opposing the British government. He was a member of the Virginia committee of correspondence in 1773, in 1774 was president of the Virginia provincial convention, and a member of the first
Continental Congress. In 1776, as president of the provincial convention, which adopted a state constitution for Virginia, he drew up the instructions to the Virginia members of Congress directing them to advocate the independence of the American colonies. In the same year he became president of the Virginia committee of safety, and in October was chosen the first speaker of the House of Delegates. With Jefferson and Chancellor George Wythe he drew up a new law code for Virginia. He was president of the court of chancery in 1777–1788, and from 1779 until his death was president of the Virginia court of appeals. He was an enthusiastic advocate of the Federal constitution, and in 1788 exerted strong influence to secure its ratification by his native state. He was a leader of the Federalist party in Virginia until his death at Richmond, Va., on the 23rd of October 1803.

PENDLETON, GEORGE HUNT (1825–1889), American lawyer and legislator, was born in Cincinnati, Ohio, on the 25th of July 1825. He was educated at the university of Heidelberg, studied law, was admitted to the bar, and began to practise at Cincinnati. He was a member of the Ohio Senate in 1854 and 1855, and from 1857 to 1865 was a Democratic member of the national House of Representatives, in which he opposed the war policy of Lincoln. In 1864 he was the Democratic candidate for vice-president. After leaving Congress he became one of the earliest champions of the "Ohio idea" (which he is said to have originated), demanding that the government should pay the principal of its 5-20-year 6% bonds in the "greenback" currency instead of in coin. The agricultural classes of the West regarded this as a means of relief, and Pendleton became their recognized leader and a candidate for the Democratic nomination to the presidency in 1868, but he failed to receive the requisite two-thirds majority. In 1869 he was the Democratic candidate for governor of Ohio, but was defeated by Rutherford B. Hayes. For the next ten years he devoted himself to the practice of law and to the supervision of the Kentucky Railroad Company, of which he had become president in 1869. From 1879 to 1885 he was a Democratic member of the United States Senate, and introduced the so-called Pendleton Act of 1883 for reforming the civil service, hostility to which lost him his seat in 1885. He was minister to Germany from 1885 to the summer of 1889, and died at Brussels on the 24th of August 1889.

PENEOPE, in Greek legend, wife of Odysseus, daughter of Icarius and the nymph Periboea. During the long absence of her husband after the fall of Troy many chieftains of Ithaca and the islands round about became her suitors; and, to rid herself of the importunities of the wooers, she bade them wait till she had woven a winding-sheet for old Laërtes, the father of Odysseus. But every night she undid the piece which she had woven by day. This she did for three years, till her maids revealed the secret. She was relieved by the arrival of Odysseus, who returned after an absence of twenty years, and slew the wooers. The character of Penelope is less favourable in later writers than in the Homeric story. During her husband's absence she is said to have been the model for the Penelope in the Pan by Hermes, and Odysseus, on his return, reproved her as unfaithful (Hesiod, ii. 145 and scho!. She thereupon withdrew to Sparta and thence to Mantinea, where she died and where her tomb was shown. According to another account she married Teleclusus the son of Odysseus and Circe, after he had killed his father, and dwelt with him in the island of Aeala or in the Islands of the Blest (Hyginus, Feb. 147).

PENGELLY, WILLIAM (1812–1894), English geologist and anthropologist, was born at East Looe in Cornwall on the 12th of January 1812, the son of the captain of a small coasting vessel. He began life as a sailor, after an elementary education in his native village, but in 1838 abandoned a seafaring life. He had developed a passion for learning and about 1836 he removed to Torquay and started a school; in 1846 he became a private tutor in mathematics and natural science. Geology had in early years attracted his attention, but it was not until he was about 30 years of age that he began seriously to cultivate the study. In 1837 he was instrumental in the reorganization of the Torquay Mechanics' Institute, in 1844 mainly owing to his energy the Torquay Natural History Society was founded, and in 1862 he assisted in founding the Devonshire Association for the Advancement of Literature, Science and Art. Meanwhile he had been occupied in collecting fossils from many parts of the English and Cornish down country. Baroness Burdett-Coutts acquired and presented them to the Oxford Museum, where they form the "Pengelly Collection." Through the generosity of the same lady he was called upon to examine the litesines and clays of Bovey Tracey, in conjunction with Dr Oswald Heer, who undertook the determination of the plant-remains. Their report was published by the Royal Society (1862), and Pengelly was elected F.R.S. in 1863. He aided in the investigations of the Brixham bone-cavern from the date of its discovery in 1858, the full report being issued in 1873; and he was the main examiner of Kent's Hole, Torquay, and from 1865 for more than fifteen years he laboured with unflagging energy in examining and recording the exact position of the numerous organic remains that were disturbed during a systematic investigation of this cave, carried on with the aid of grants from the British Association. He first attended the British Association at the Cheltenham meeting in 1856, and was present at subsequent meetings (except that at Montreal in 1884) until 1889. His observations assisted in establishing the important fact of the contemporaneity of Palaeolithic man with various Pleistocene mammals, such as the mammoth, cave-bear, cave-lion, &c. He was awarded the Lyell medal by the Geological Society of London in 1886. He died at Torquay on the 16th of March 1894.

See Memoir of William Pengelly, edited by his daughter Hester Pengelly, with a summary of his scientific work by the Rev. Professor T. G. Bonney (1897).

PENGUIN, the name of a flightless sea-bird, but so far as is known, first given to one inhabiting the seas of Newfoundland as in Hore's "Voyage to Cape Breton," 1536 (Hakluyt, Researches, iii. 168-170), which subsequently became known as the great auk or garefoel (g.a.); though the French equivalent Pingouin preserves its old application, the word penguin is by English ornithologists always used for certain birds inhabiting the Southern Ocean, called by the French Mâchois, the Spheniscidae of ornithologists. Long ago their position was very much misunderstood, some systematists having placed them under the Alcidae or Aukas, to which they bear only a relationship of analogy, as indeed had been perceived by a few ornithologists, who recognized in the penguins a very distinct order, Impennes. L. Stejneger (Standard Nat. Hist. vol. iv., Boston, 1885) gave the Impennes independent rank equivalent to the rest of Carinate birds; M. A. Menzhber (Vergl. Osteol. d. Pinguine, Moscow, 1887) took a similar view; M. Fürbringer was first to show their relation to Procellariformes, and this view is now generally accepted.

1 Of the three derivations assigned to this name, the first is by Drayton in 1613 (Polybalbon, Song 9), where it is said to be the Welsh pen gwyn, or "white head"; the second, which seems to meet with Littre's approval, deduces it from the Latin pinguis (fat), which idea has given origin to the German name, Felgtzâne, for these birds (see Graczy's Circular Supp. to his Dictionary, p. 145); the third, supported by a large majority of the leading systematists, is that it comes from the Latin pinguis, a fat, or that fat which is carried in the belly, the penguins being credited with being the most fat of the birds, and also with being also the most aquatic; the name comes from the Greek pinguine, a fat, and the penguins being conjectured to be the fat birds of the north, since, so far as evident goes, it was given to the North-American bird before the South-American was known in Europe.

2 Gorfu has also been used by some French writers, being a corruption of Gérafou or Carefoul.
There is a total want of quills in their wings, which are incapable of flexure, though they move freely at the shoulder-joint, and some at least of the species occasionally make use of them for progressing on land. In the water they are most efficient paddles. The plumage, which clothes the whole body, generally consists of small scale-like feathers, many of them consisting only of a simple shaft without the development of barbs; but several of the species have the head decorated with long cirrhus tufts, and in some the tail-quills, which are very numerous, are also long. In standing these birds preserve an upright position, sometimes resting on the "tarsus" alone, but in walking or running this is kept nearly vertical, and their weight is supported by the toes alone.

The most northerly limit of the penguins' range in the Atlantic is Tristan d’Acunha, and in the Indian Ocean Amsterdam Island, but they also occur off the Cape of Good Hope and along the coast of Australia, as well as on the south and east of New Zealand, while in the Pacific one species at least extends along the west coast of South America and to the Galapagos; but north of the equator none are found. In the breeding season they resort to the most desolate lands in higher southern latitudes, and indeed have been met with as far to the southward as navigators have penetrated. Possibly the Falkland Islands are richest in species, though, as individuals, they are not nearly so numerous there as in many other places. The food of penguins consists of crustaceans, cephalopods and other mollusces, varied by fish and vegetable matter. The birds form immense breeding colonies, known as "rookeries." The nest of grass, leaves, or where vegetation is scanty of stones or rubbish, is placed on the ground or in holes. Two chalky white or greenish eggs are laid. The young penguins, clad in thick down, are born blind and are fed by the parents for an unusually long time before taking to the water. Penguins bite savagely when molested, but are easily trained and display considerable intelligence.

The *Spheniscidae* have been divided into at least eight genera, but three, or at most four, seem to be all that are needed, and

1. The pterylographical characters of the penguins are well described by A. Hyatt (Proc. Boston Soc. Nat. History, 1871). A. D. Bartlett has observed (Proc. Zool. Soc., 1879, pp. 6-9) that, instead of moulting in the way that birds ordinarily do, penguins, at least in passing from the immature to the adult dress, cast off the short scale-like feathers from their wings in a manner that he compares to "the shedding of the skin in a serpent."

2. The three metatarsals in the penguins are not, as in other birds, united for the whole of their length, but only at the extremities, thus preserving a portion of their originally distinct existence, a fact probably attributable to arrest of development, since the researches of C. Gegenbaur show that the embryos of all birds, so far as is known, possess these bones in an independent condition.
send the flower of the Spanish forces (15,000) under the marquis of Romana 1 to assist the French on the Baltic. Then Dupont de l’Étang (25,000) was ordered to cross the Bidassoa on the 22nd of November 1807; and by the 8th of January 1808 he had reached Burgos and Valladolid. Marshal Moncey with a corps from Spain, and Sir Henry Sidney and Sir Ralph Abercromby with a portion of the British army of Portugal; and a little later Bessières with another corps had been brought up. There were now about 100,000 French soldiers in Spain, and Murat, grand duke of Berg, as “lieutenant for the emperor,” entered Madrid. During February and March 1808 the frontier fortresses of Pampeluna, St Sebastian, Barcelona and Figueras were treacherously occupied and Spain lay at the feet of Napoleon. The Spanish people, in an outburst of fury against the king and Godoy, forced the former to abdicate in favour of his son Ferdinand; but the inhabitants of Madrid having (May 2, 1808) risen against the French, Napoleon refused to recognize their rights to the throne, and a mercenary council of regency having been induced to desire the French emperor to make his brother, Joseph Bonaparte, king, he acceded to their request. 2

The mask was now completely thrown off, and Spain and Portugal rose against the French. Provincial “juntas” (committees of government) were organized; appeals for assistance made to the British government, which granted arms, money and supplies, and it was resolved to despatch a British force to the Peninsula. Before it landed, the French under Dupont, Moncey and Marshal Bessières (75,000) had occupied parts of Biscey, Navarre, Aragon and the Castiles, holding Madrid and Barcelona, while the General Suchet (14,000) was in Catalonia. Moncey (7000) had marched towards the city of Valencia, but was repulsed in attempting to storm it (June 28); Bessières had defeated the Spanish general Joachim Blake at Medina de Rio Seco (June 14, 1808) and Dupont (13,000) had been detached (May 24) from Madrid to reduce Seville and Cadiz in Andalusia. Spanish levies, numbering nearly 100,000 regulars and militia, brave and enthusiastic, but without organization, sufficient training, or a commander-in-chief, had collected together; 30,000 being in Andalusia, a similar number in Galicia, and others in Valencia and Estremadura, but few in the central portion of Spain.

At this juncture Dupont, moving upon Cadiz, met with a reverse which greatly influenced the course of the Peninsular War. On the 7th of June 1808 he had sacked Cordova; but while he was laden with its spoils the Spanish general Castaño with the army of Andalusia (30,000), and also a large body of armed peasantry, approached. Falling back to Andujar, where he was reinforced to 22,000 strong, Dupont detached a force to hold the mountain passes in his rear, whereupon the Spaniards interposed between the detachment and the main body and seized Baylen. Failing to dislodge them, and surrounded by hostile troops and an infuriated peasantry, Dupont capitulated with over 20,000 men. This victory, together with the inactivity of the British and the rapid defence of Saragossa by the Spanish general, 15, 1808.

José Palafox (June 15 to August 13, 1808) temporarily paralysed the French and created unbounded enthusiasm in Spain. Duhamel, having failed to take Gerona, was blockaded in Barcelona, Joseph fled from Madrid (Aug. 1, 1808), and the French forces closed to their rear to defend their communications with France. The British troops were directed towards Lisbon and Cadiz, in order to secure these harbours, to prevent the subjugation of Andalusia, and to operate up the basins of the Guadiana, Tagus and Douro into Spain. The British force consisted of 9000 men from Cork, under Sir Arthur Wellesley— at first in chief command; 5000 from Gibraltar, under General (Sir Brent) Spencer; and 10,000 under Sir John Moore—an expedition from Sweden; Wellesley and Moore being directed towards Portugal, and Spencer to Cadiz. On the 1st of August 1808

1 They subsequently escaped from Jutland, on British vessels, and reached Santander in October 1808.

2 The king, the queen and Godoy were eventually removed to Rome, and Ferdinand to Valençay in France.
Wellesley began to land his troops, unopposed, near Figueira da Foz at the mouth of the Mondego; and the Spanish victory of Baylen having relieved Cadiz from danger, Spencer now joined him, and, without waiting for Moore the army, under 15,000 in all (which included some Portuguese) 1 with 18 guns, advanced towards Lisbon.

**Campaign in Portugal, 1808.**—The first skirmish took place at Obidos on the 15th of August 1808, against Delaborde’s division (5000 men with 5 guns), which fell back to Roleia (Rorca or Rolica). A battle took place here (Aug. 17) in which Sir Arthur Wellesley attacked and drove him from two successive positions. The allied loss was about 500; the French 600 and three guns. 2 On the 20th of August the Allies, strengthened by the arrival of two more brigades (4000 men), occupied some heights north of Vimiera (Vimeira or Vimeiro) where the roads branch off to Torres Vedras and Mafra. Wellesley meant to turn the defile of Torres Vedras by Mafra at once if possible; but on this night Sir Harry Burrard, his senior, arrived off Vimiera, and though he did not land, gave instructions to wait for Sir John Moore. On the 21st of August the Allies were attacked by Junot at Vimeira, who, leaving a force at Lisbon, had come up to reinforce Delaborde. In this battle the Allies numbered about 18,000 with 18 guns, French nearly 25,000. Junot, believing the allied force to be weaker, and not knowing the splendid success the British had achieved at Albuera, attacked him with every show of strength. But Wellesley’s regiments, marched thither behind the heights, sprang up in line; and under their volleys and bayonet charge, supported by artillery fire, Junot’s deep columns were driven off the direct road to Lisbon. The losses were: Allies about 800, French 2000 and 13 guns. It was now again Wellesley’s wish to advance and seize Torres Vedras; but Sir Hew Dalrymple, having at this moment assumed command, decided otherwise. On the 2nd of August Junot, knowing of the approach of Moore with reinforcements, and afraid of a revolt in Lisbon, opened negotiations, which resulted in the Convention of Cintra 3 (Aug. 30, 1808), under which the French evacuated Portugal, on condition that they were sent with their artillery and be allowed to return to France. Thus this campaign had been rapidly brought to a satisfactory conclusion; and Sir Arthur Wellesley had already given proof of his exceptional gifts as a leader. In England however a cry was raised that Junot should have been forced to an absolutely unconditional surrender; and Sir Arthur Wellesley, Sir Hew Dalrymple and Sir Harry Burrard 4 were brought before a court of inquiry in London. This acquitted them of blame, and Sir John Moore in the meantime held his headquarters at Daireymple (Oct. 6, 1808) had assumed command of the allied army in Portugal, now about 32,000 strong.

**Moore’s Campaign in Spain, 1808-9.**—The British government notified Sir John Moore that some 10,000 men were to be sent to Corunna under Sir David Baird; that be, with 20,000, was to join him, and then both act in concert with the Spanish armies. As the conduct of this campaign was largely influenced by the operations of the Spanish forces, it is necessary to mention their positions, and also the fact that greater reliance had been placed, both in England and Spain, upon them than future events justified. On the 26th of October 1808, when Moore’s troops had left Lisbon to join Baird, the French still held a defensive position behind the Ebro; Bessières being in the basin of Vitoria, Marshal Ney north-west of Logroño, and Moncey covering Pampeluna, and near Sangüesa. With the garrisons of Biscay, Navarre, and a reserve at Bayonne, their strength was about 75,000 men. Palafox (20,000) was near Saragossa and observing Sangüesa; Castaños with the victors of Baylen 3 (44,000) west and south of Tudela and near Logroño; Blake (32,000) east of Reynosa, having captured Bilbao; Count de Belvedere (11,000) near Burgos; reserves (57,000) were assembling about Segovia, Talavera and Cordova; Catalonia was held by 23,000, and Madrid had been reoccupied.

Moore had to decide whether to join Baird by sea or land. To do so by sea at this season was to risk delay, while in moving by land he would have the Spanish armies between him and the French. For these reasons he marched by land; and as the roads north of the Tagus were deemed impassable for guns, while transport and supplies for a large force were also difficult to procure, he sent Sir John Hope, with the artillery, cavalry and reserve armament column, south of the river; through Badajoz to Almazar, to move thence through Talavera, Madrid south, and the Escurial Pass, involving a considerable détour; while he himself with the infantry, marching by successive divisions, took the shorter roads north of the Tagus through Coimbra and Almeida, and also by Alcântara and Coria to Ciudad Rodrigo and Salamanca. Baird was to move south through Galicia to meet him, and the army was to concentrate at Valladolid, Burgos, or whatever point might seem later on to be best. But as Moore was moving forward, the whole situation in Spain changed. Napoleon’s forces, now increased to some 200,000 men present and more following, were assuming the offensive, and he himself on the 30th of October—had left Paris to place himself at their head. Before them the Spaniards were routed in every direction: Castaños was defeated near Logroño (Oct. 27); Castaños and Palafox at Tudela (Nov. 23); Blake at Zornoza (Oct. 29), Espinosa (Nov. 11) and Reynosa (Nov. 13); and Belvedere at Gamonal, near Burgos (Nov. 10). Thus when Moore reached Salamanca (Nov. 28) Baird was at Astorga; Hope at the Escurial Pass; Napoleon himself at Aranda; and French troops at Valladolid, Arevalo and Segovia; so that the French were nearer than either Baird or Hope to Moore at Salamanca. Moore was ignorant of their exact position and strength, but he knew that Valladolid had been occupied, and his first orders were that Baird should fall back to Galicia and Hope to Portugal. But these were soon changed, and he now took the important resolution of striking a blow for Spain, and for the defenders of Madrid, by attacking Napoleon’s communications with France. Hope having joined him through Avila, and magazines having been formed at Benavente, Astorga and Lugo, in case of retreat in that direction, he moved forward, and on the 15th of December approached the Douro, at and near Rueda east of Toro. Here he learnt that Madrid had fallen to Napoleon (Dec. 3) after he had by a brilliant charge of the Polish lancers and chasseurs of the Guard forced the Somosierra Pass (Nov. 30) and in another action stormed the Retiro commanding Madrid itself (Dec. 5); that the French were pressing on towards Lisbon and Andalusia; that Napoleon was unaware of his victory, and that Soult’s corps, isolated on the Carrion River, had been ordered towards Benavente. He then finally decided to attack Soult (intending subsequently to fall back through Galicia) and ordered up transports from Lisbon to Corunna and Vigo; thus changing his base from Portugal to the north-west of Spain; Blake’s Spanish army, now rallying under the marquis de la Romana near Leon, was to co-operate, but was able to give little effective aid.

On the 20th of December Baird joined Moore near Mayorga, and a brilliant cavalry combat now took place at Sahagun, in which the British hussar brigade distinguished itself. But on the 23rd of December, when Moore was at Sahagun and about to attack Soult, he learnt that overwhelming French forces were hastening towards him, so withdrew across the Esla, near Benevente (Dec. 28), destroying the bridge there. Napoleon, directly he learnt Moore’s proximity, had ordered Soult to Astorga to cut him off from Galicia; recalled his other troops from their march towards Lisbon and Andalusia; and, with 50,000 men and 150 guns, had left Madrid himself (Dec. 22). He traversed over 100 m. in less than five days across the snow-covered Escurial Pass, reaching Tordesillas on the Douro on the 26th of December. Hence he wrote to Soult, “If the English...”
pass to-day in their position (which he believed to be Sahagun) they are lost." But Moore had passed Astorga by the 31st of December, where Napoleon arrived on the 1st of January 1809. Thence he turned back, with a large portion of his army toward France, leaving Soult with over 40,000 men to follow Moore.

On the "Retreat to Corunna," fatigues, wet and bitter cold, combined with the sense of an enforced retreat, shook the discipline of Moore's army; but he reached Corunna on the 11th of January 1809, where he took up a position across the road from Lugo, with his left on the river Mero. On the 14th of January the transports arrived; and on the 16th Soult attacked.

In this battle the French numbered about 20,000, with 40 guns; the British 15,000 with 9 very light guns. Soult failed to dissolve the British, and Moore was about to deliver a counter-attack when he himself fell mortally wounded. Baird was also wounded, and as night was approaching, Hope suspended the advance, and subsequently embarked the army, with scarcely any further loss. The British casualties were about 1000, the French 2000. When the troops landed in England, half clothed and half shod, their leader's conduct of the campaign was at first blamed, but his reputation as a general rests solidly upon these facts, that when Napoleon in person, having nearly 300,000 men in Spain, had stretched forth his hand to seize Portugal and Andalusia, Moore with 30,000, forced him to withdraw it, and follow him to Corunna, escaping at the same time from his grasp. Certainly a noble achievement.

Campaign in Portugal and Spain, 1809.—On the 22nd of April 1809 Sir Arthur Wellesley reached Lisbon. By this time, French armies, to a great extent controlled by Napoleon from a distance, had advanced—Soult from Galicia to capture Oporto and Lisbon (with General Lapisse from Salamanca moving on his left towards Abrantes) and Marshal Victor, still farther to the left, with a siege train to take Badajoz, Merida and subsequently Cadiz. Soult (over 20,000), leaving Ney in Galicia, had taken and sacked Oporto (March 29, 1809); but the Portuguese having closed upon his rear and occupied Vigo, he halted, detaching a force to Amarante to keep open the road to Braganza and asked for reinforcements. Victor had crossed the Tagus, and defeated Cuesta at Medellin (March 28, 1809); but, surrounded by insurgents, he also had halted; Lapisse had joined him, and together they were near Merida, 30,000 strong. On the allied side the British (25,000), including some German auxiliaries, were about Leiria: the Portuguese regular troops (16,000) near Thomar; and some thousands of Portuguese militia were observing Soult in the north of Portugal, a body under Silveira being at Amarante, which Soult was now approaching. Much progress had been made in the organization and training of the Portuguese levies; Major-General William Carr Beresford, with the rank of marshal, was placed at their head. Of the Spaniards, Palafos, after his defeat at Tudela had most gallantly defended Saragossa a second time (Dec. 20, 1808—Feb. 20, 1809); the Catalanians, after reverses at Molins de Rey (Dec. 21, 1808) and at Valls (Feb. 25, 1809) had taken refuge in Tarragona; and Rossas had fallen (Dec. 5, 1808) to the French general Gouvion St Cyr who, having relieved Barcelona, was besieging Gerona. Romafia's force was now near Orense in Galicia. A supreme junta had been formed which could nominally assemble about 100,000 men, but jealousy among its members was rife, and they still declined to appoint any commander-in-chief.

On the 5th of May 1809, Wellesley moved towards the river Douro, having detached Beresford to seize Amarante, from which the French had now driven Silveira. Soult expected the passage of the Douro to be attempted near its mouth, with fishing boat; but Wellesley, by a daring surprise, crossed (May 12) close above Oporto, and also by a ford higher up. After some fighting Oporto was taken, and Soult driven back. The Portuguese being in his rear, and Wellesley closing with him, the only good road of retreat available lay through Amarante; but he now learned that Beresford had taken this important point from Silveira; so he was then compelled, abandoning his guns and much baggage, to escape, with a loss of some 5000 men, over the mountains of the Sierra Catalina to Salamonde, and thence to Oporto.

During the above operations, Victor, with Lapisse, had forced the passage of the Tagus at Alcantarilla but, on Wellesley returning to Abrantes, he retired. News having been received that Napoleon had suffered a serious check at the battle of Aspern, near Vienna (May 22, 1809), Wellesley next determined—leading Beresford (20,000) near Ciudad Rodrigo—to move with 20,000 men, in conjunction with Cuesta's Spanish army (40,000) towards Madrid against Victor, who, with 25,000 supported by King Joseph (50,000) covering the capital, was near Talavera. Sir Robert Wilson with 4000 Portuguese from Salamanca, and a Spanish force under Venegas (25,000) from Carolina, were to co-operate and occupy Joseph, by closing upon Madrid. Cuesta, during the advance up the valley of the Tagus, was to occupy the pass of Baños on the left flank; the Spanish authorities were to supply provisions, and Venegas was to be at Arganda, near Madrid, by the 22nd or 23rd of July; but none of these arrangements were duly carried out, and it was on this that the remainder of the campaign turned. Writing to Soult from Austria, Napoleon had placed the corps of Ney and Mortier under his orders, and said: "Wellesley will most likely advance by the Tagus against Madrid; in that case, pass the mountains, fall on his flank and rear, and crush him."

By the 20th of July Cuesta had joined Wellesley at Oropesa, and both then moved forward to Talavera, Victor falling back before them: but Cuesta, irritable and jealous, would not work cordially with Wellesley; Venegas—counter-ordered he said by the Spanish junta—was not to go to Arganda, and Wilson, though he advanced close to Madrid, was forced to retire, so that Joseph joined Victor, and the united force attacked the Allies at Talavera de la Reina on the Tagus. The battle lasted for two days, and ended in the defeat of the French, who fell back towards Madrid.1 Owing to want of supplies, the British had fought in a half-starved condition; and Wellesley now learnt to his surprise that Soult had passed the mountains and was in his rear. Having turned about, he was on the march to attack him, when he heard (Aug. 23) that not Soult's corps alone, but three French corps, had come through the pass of Baños without opposition; that Soult himself was at Naval Moral, between him and the bridge of Almaraz on the Tagus, and that Cuesta was retreating from Talavera. Wellesley's force was now in a dangerous position: but by withdrawing at once across the Tagus at Arzobispo, he reached jaraicejo and Almaraz (by the south bank) blowing up the bridge at Almaraz, and thence moved, through Merida, northwards to the banks of the Agueda, commencing to fortify the country around Lisbon.

Elsewhere in the Peninsula during this year, Blake, now in Catalonia, after routing Suchet at Alcaniz (May 22, 1809), was defeated by him at Maria (June 13) and at Belchite (June 18); Venegas, by King Joseph and Sébastiani, at Almonacid on the 11th of August; Del Parque (20,000), after a previous victory near Salamanca (Oct. 18), was overthrown at Alba de Tormes by General Marchand (Nov. 28); the old forces of Venegas and Cuesta (50,000), now united under Arizaga, were decisively routed by King Joseph at Ocaña (Nov.19); and Gerona after a gallant defence, had surrendered to Augereau (Dec. 10).

Sir Arthur Wellesley was for this campaign created Baron Douro and Viscount Wellington. He was made captain-general by Spain, and marshal-general by Portugal. But his experience after Talavera had been akin to that of Moore; his expectations from the Spaniards had not been realized; he had been almost intercepted by the French, and he had narrowly escaped from a critical position. Henceforth he resisted all proposals for joint operations, on any large scale, with Spanish armies not under his own direct command.

1 After the battle the Light Division, under Robert Craufurd, joined Wellesley. In the endeavour to reach the field in time it had covered, in heavy marching order, over 50 m. in 25 hours, in hot July weather.
Campaign in Portugal, 1810.—Napoleon, having avenged Aspern by the victory of Wagram (July 6, 1809), despatched to Spain large reinforcements destined to increase his army there to about 570,000 men. Marshal Masséna with 120,000, including the corps of Ney, Junot, Reynier and some of the Imperial Guard, was to operate from Salamanca against Portugal; but first Soult, appointed major-general of the army in Spain (equivalent to chief of the staff), was, with the corps of Victor, Mortier and Sébastiani (70,000), to reduce Andalusia. Soult (Jan. 31, 1810) occupied Seville and escaping thence to Cadiz, the Supreme Junta resigned its powers to a regency of five members (Feb. 2, 1810). Cadiz was invaded by Victor's corps (Feb. 4), and then Soult halted, waiting for Masséna, who arrived at Badajoz on the 5th of May.

In England a party in parliament were urging the withdrawal of the British troops, and any reverse to the allied arms would have strengthened its hands. Wellington's policy was thus cautious and defensive, and he had already commenced the since famous lines of Torres Vedras round Lisbon. In June 1810 his headquarters were at Cercos. With about 35,000 British, 30,000 Portuguese regular troops and 30,000 Portuguese militia, he watched the roads leading into Portugal past Ciudad Rodrigo to the north, and Badajoz to the south of the Tagus, as also the line of the Douro and the country between the Elga and the Ponsul.

Soult having been instructed to co-operate by taking Badajoz and Elvas, Masséna, early in June 1810, moved forward, and on the 14th held on the heights of Mequinenza. Wellington, not waiting for Masséna, [left] Cadiz, and with a force of 2,500 men (July 9) began to tend the lines of Torres Vedras. A little north of Coimbra, the road which Masséna crossed followed the Sierra de Buscaso (Busaco), a very strong position where Wellington resolved to offer him battle. Masséna, superior in numbers and over-confident, made a direct attack upon the heights on the 27th of September 1810: his strength being about 60,000, while that of the Allies was about 50,000, of whom nearly half were Portuguese. After a stern conflict the French were repulsed, the loss being five generals and nearly 5000 men, while the Allies lost about 1300. The next day Masséna turned the Sierra by the Royvala Pass and Sardao, which latter place, owing to an error, had not been occupied by the Portuguese, and Wellington then retreated by Coimbra and Leiria to the lines, which he entered on the 11th of October, having within them fully 100,000 able-bodied men.

The celebrated "Lines of Torres Vedras" were defensive works designed to resist any army which Napoleon could send against them. They consisted of three great lines, strengthened by about 150 redoubts and earthworks of various descriptions, mounting some 600 cannon; the outer line, nearly 30 m. long, stretching over heights north of Lisbon, from the Tagus to the sea. As Masséna advanced, the Portuguese closing upon his rear retired Coimbra (Oct. 7), and when he neared the lines, astounded at their strength, he sent General Foy to the emperor to ask for reinforcements. After an effort, defeated by Hill, to cross the Tagus, he withdrew (Nov. 15) to Santarem. This practically closed Wellington's operations for the year 1810, his policy now being not to lose men in battle, but to reduce Masséna by hunger and distress. In other parts of Portugal, Augereau (March 10); captured Leiria (May 14); Mequinenza (June 8); and invested Tortosa (Dec. 15). The Spanish levies had been unable to contribute much aid to the Allies; the French having subduced almost all Spain, and being now in possession of Ciudad Rodrigo and Almeida. On the other hand Wellington still held Lisbon with parts of Portugal, Elvas and Badajoz, for Soult had not felt disposed to attempt the capture of the last two fortresses.

Battle of Barrosa, March 5, 1811.

Masséna's Retreat.

Wellington, according to his policy of husbandoing his troops for future offensive operations, and let sickness and hunger do the work of the sword. This they effectually did. Nothing could well exceed the horrors of Masséna's retreat. Rearguard actions were fought at Pombal (March 10), Redinha (March 12) and Condeixa (March 13). Here Ney was directed to make a firm stand; but, ascertaining that the Portuguese were at Coimbra and the bridge there broken, and fearing to be cut off also from Murcella, he burnt Condeixa, and marched to Cazal Nova. An action took place here (March 14) and at Foz d'Arouce (March 15). Wellington now sent off Beresford with a force to retake Badajoz and Masséna, sacrificing much of his baggage and ammunition, reached Celo rico and Guarda (March 21). Here he was attacked by Wellington (March 29) and, after a further engagement at Sabugal (April 3, 1811), he fell back through Ciudad to Salamanca, having lost in Portugal nearly 30,000 men, chiefly from want and disease, and 6000 in the retreat alone.

The key to the remaining operations of 1811 lies in the importance attached by both Allies and French to the possession of the fortresses which guarded the two great roads from Portugal into Spain—Almeida and Ciudad Rodrigo on the northern, and Badajoz and Elvas on the southern road; all these except Elvas were in French hands. Wellington, on the 9th of April 1811, directed General Spencer to invest Almeida; he then set off himself to join Beresford before Badajoz, but after reconnoitring the fortress with his lieutenant he had at once to return north to Beresford. Masséna, unable to relieve Almeida, the 3rd of May Loison attacked him at Fuentes d'Onor near Almeida, and Masséna coming up himself made a more serious attack on the 5th of May. The Allies numbered about 33,000, with 42 guns; the French 45,000 with 30 guns. The battle is chiefly notable for the steadiness with which the allied right, covered by the Light Division in squares, changed position in presence of the French
cavalry; and for the extraordinary feat of arms of Captain Norman Ramsay, R.H.A., in charging through the French cavalry with his guns. Massena failed to dislodge the Allies, and on the 8th of May withdrew to Salamanca, Almeida falling on Wellington on the 11th of May 1811. The allied loss in the fighting on both days at Fuentes d’Onor was about 1500: the French 3000.

In the meantime Soult (with 23,000 men and 50 guns), advancing to relieve Badajoz, compelled Beresford to suspend the siege, and to take up a position with about 30,000 men (of whom 7000 were British) and 38 guns behind the river Alberua (or Albuera). Here Soult attacked him on the 16th of May. An unusually bloody battle ensued, in which the French efforts were chiefly directed against the allied right, held by the Spanish. At one time the right appeared to be broken, and 6 guns were lost. But a gallant advance of Sir Lowry Cole’s division restored the day. Soult then falling back towards Seville. The allied loss was about 7000 (including about half the British force); the French about 8000.

After this Wellington from Almeida rejoined Beresford and the siege of Badajoz was continued: but now Marshal Marmont, having succeeded Massena, was marching southwards to join Soult, and, two allied assaults of Badajoz having failed, Wellington withdrew. Subsequently, leaving Hill in the Alemtejo, he returned towards Almeida, and with 40,000 men commenced a blockade of Ciudad Rodrigo, his headquarters being at Fuente Guinaldo. Soult and Marmont now fell back to Seville, the latter to the valley of the Tagus, south of the pass of Baños.

In September, Marmont joined with the army of the north under General Dorsenne, coming from Salamanca—their total force being 60,000, with 100 guns—and succeeded (Sept. 25) in introducing a convey of provisions into Ciudad Rodrigo. Before so superior a force, Wellington had not attempted to maintain the blockade; but on Marmont afterwards advancing towards him, he fought a rearguard action with him at El Bordon (Sept. 25), notable, as was Fuentes d’Onor, for the coolness with which the allied squares retired amidst the enemy’s horsemen; and again at Fuente Guinaldo (Sept. 25 and 26) he maintained for 30 hours, with 15,000 men, a bold front against Marmont’s army of 60,000, in order to save the Light Division from being cut off. At Aldeia de Ponte there was a further sharp engagement (Sept. 27), but Wellington taking up a strong position near Sabugal, Marmont and Dorsenne withdrew once more to the valley of the Tagus and Salamanca respectively, and Wellington again blockaded Ciudad Rodrigo.

Thus terminated the main operations of this year. On the 28th of October 1811, Hill, by a very skilful surprise, captured Arroyo de los Molinos (between Badajoz and Trujillo), almost annihilating a French corps under Gérard; and in December 1811 the French were repulsed in their efforts to capture Tarifa near Cadiz. In the east of Spain Suchet took Tortosa (Jan. 1, 1811); Tarragona (June 28); and Murviedro (Oct. 26), defeating Blake’s relieving force, which then took refuge in Valencia. Macdonald also retook Figueras which the Spaniards had taken on the 9th of April 1811 (Aug. 19). Portugal had now been freed from the French, but they still held Ciudad Rodrigo and Badajoz, the two main gates into Spain.

Campaign in Spain, 1812.—The campaign of 1812 marks an important stage in the war. Napoleon, with the Russian War in prospect, had early in the year withdrawn 30,000 men from Spain; and Wellington had begun to carry on what he termed a war of “magazines.” Based on rivers (the navigation of which greatly improved) and the sea, he formed dépôts or magazines of provisions at many points, which enabled him always to take and keep the field. The French, on the other hand, had great difficulty in establishing any such reserves of food, owing to their practice of depending for sustenance entirely upon the country in which they were quartered. Wellington assumed the offensive, and by various manoeuvres and feints, aided the guerrilla bands by forcing the French corps to assemble in their districts, which not only greatly harassed them but also materially hindered the combination of their corps for concerted action. Marmont only got a battering train going at Ciudad Rodrigo, and directed Hill, as a blind, to engage Soult by threatening Badajoz, he suddenly (Jan. 8, 1812) besieged Ciudad Rodrigo.

The French, still numbering nearly 200,000, now held the following positions: the Army of the North—Dorsenne (48,000)—was about the Pisuerga, in the Asturias, and along the northern coast; the Army of Portugal—Marmont (50,000)—mainly in the valley of the Tagus, but ordered to Salamanca; the Army of the South—Soult (55,000)—in Andalusia; the Army of the Centre—Joseph (19,000)—about Madrid.

The siege of Ciudad Rodrigo was calculated in the ordinary course to last thirteen days but on it becoming known that Marmont was moving northward, the assault was delivered after twelve days only (Jan. 19). The gallantry of the troops made it successful, though with the loss of Generals Craufurd and McKinnon, and 1300 men, and Marmont’s battering train of 150 guns fell into the allied hands. Then, after a feat of passing on into Spain, Wellington rapidly marched south and, with 22,000 men, laid siege to Badajoz (March 17, 1812), Hill with 30,000 covering the siege near Merida. Wellington was hampered by want of time, and had to assault prematurely. Soult and Marmont having begun to move to relieve the garrison, the assault was postponed on the night of the 7th of April, and though the assailants failed at the breaches, the carnage at which was terrible, a very daring escalaade of one of the bastions and of the castle succeeded, and Badajoz fell, Soult’s pontoon train being taken in it. After the assault, some deplorable excesses were committed by the victorious troops. The allied loss was 3600 in the assault alone and 5000 in the entire siege.

The Allies had now got possession of the two great gates into Spain: and Hill, by an enterprise most skilfully carried out, destroyed (May 19) the Tagus bridge at Almaraz, by which Soult to the south of the river chiefly communicated with Marmont to the north. Wellington then, ostentatiously making preparations to enter Spain by the Badajoz line, once more turned northward, crossed the Tormes (June 17, 1812), and advanced to the Douro, behind which the French were drawn up. Marmont had erected at Salamanca some strong forts, the reduction of which occupied Wellington ten days, and cost him 600 men. The Allies and French now faced each other along the Douro to the Pisuerga. The river was high, and Wellington hoped that want of supplies would compel Marmont to retire, but in this he was disappointed.

On the 15th of July 1812, Marmont, after a feint against Wellington’s left, suddenly, by a forced march, turned his right, and made rapidly towards the fords of Huerta and Alba on the Tormes. Some interesting manoeuvres now took place, Wellington moving parallel and close to Marmont, but more to the north, making for the fords of Aldea Lengua and Santa Marta on the Tormes nearer to Salamanca, and being under the belief that the Spaniards held the castle and ford at Alba on that river. But Marmont’s manoeuvring and marching power had been underestimated, and on the 21st of July while Wellington’s position covered Salamanca, and but indirectly his line of communications through Ciudad Rodrigo, Marmont had reached a point from which he hoped to interpose between Wellington and Portugal, on the Ciudad Rodrigo road. This he endeavoured to do on the 22nd of July 1812, which brought on the important battle of Salamanca (q.v.) in which Wellington gained a decisive victory, the French falling back to Valladolid and thence to Burgos.

Wellington entered Valladolid (July 30), and thence marched against Joseph, who (July 21) had reached Blasco Sancho with reinforcements for Marmont. Joseph retired before him, and Wellington entered Madrid (Aug. 12, 1812), where, in the Retiro, 1700 men, 180 cannon, two eagles, and a quantity of stores were captured. Soult now raised the siege of Cadiz (Aug. 26), and evacuating Andalusia joined Suchet.
with some 55,000 men. Wellington then brought up Hill to Madrid.

On the 1st of September 1812, the French armies having begun once more to collect together, Wellington marched against the Army of the North, now under General Clausel, and laid siege to the castle of Burgos (Sept. 19) to secure the road towards Santander on the coast. But the strength of the castle had been underrated;

Wellington had insufficient siege equipment and transport for heavy guns; five assaults failed, and Soult (having left Suchet in Valencia) and also the Army of Portugal were both approaching, so Wellington withdrew on the night of the 20th. The siege was henceforth abandoned and Madrid, commenced its retreat from Burgos.

In this retreat, although military operations were skilfully conducted, the Allies lost 7000 men, and discipline, as in that to Corunna, became much relaxed.

By November 1812, Hill having joined him at Salamanca, Wellington once more had gone into cantonments near Ciudad Rodrigo, and the French armies had again scattered for convenience of supply. In spite of the failure before Burgos, the successes of the campaign had been brilliant. In addition to the decisive victory of Salamanca, Madrid had been occupied, the siege of Cadiz raised, Andalusia freed, and Ciudad Rodrigo and Badajoz stormed. Early in January also the French had abandoned the siege of Tarifa, though Valencia had surrendered to them (Jan. 9). One important result of the campaign was that the Spanish Cortes nominated Wellington (Sept. 22, 1812) to the unfettered command of the Spanish armies. For the operations of this campaign Wellington was created earl, and subsequently marquess of Wellington; Duke of Ciudad Rodrigo by Spain, and marquis of Torres Vedras by Portugal.

Campaign in Spain and the South of France, 1813.—At the opening of 1813, Suchet, with 65,000 men, had been left to hold Valencia, Aragon and Catalonia; and the remainder of the French (about 137,000) occupied Leon, the central provinces and Biscay, guarding also the communications with France. Of these about 60,000 under Joseph were more immediately opposed to Wellington, and posted, in scattered detachments, from Toledo and Madrid behind the Tormes to the Douro, and along that river to the Esla. Wellington had further organized the Spanish forces—Castanos (40,000), with the guerilla bands of Mina, Longa and others, was in Galicia, the Asturias and northern Spain; Copons (10,000) in Catalonia; Elio (20,000) in Murcia; Del Parque (12,000) in the Sierra Morena, and O'Donnell (15,000) in Andalusia. More Portuguese troops had been raised, and reinforcements received from England, so that the Allies, without the Spaniards above alluded to, numbered some 139,000 men, and from near the Coa watched the Douro and Tormes, their line stretching from their left near Lamego to the pass of Baños, Hill being on the right. The district of the Tras-os-Montes, north of the Douro, about the Tamega, Tua and Sabor, was so rugged that Wellington was convinced that Joseph would expect him to advance by the south of the river. He therefore, moving by the south bank himself with Hill, to confirm Joseph in this expectation, crossed the Tormes near and above Salamanca, having previously—which was to be the decisive movement—detached Graham, with 40,000 men, to make his way, through the difficult district above mentioned, towards Braganza, and then, joining with the Spaniards, to turn Joseph's right. Graham, crossing the Douro near Lamego, carried out his laborious march with great energy, and Joseph retired precipitately from the Douro, behind the Pisuerga. The allied army, raised by the junction of the Spanish troops in Galicia to 90,000, now concentrated near Toro, and moved towards the Pisuerga, when Joseph, blowing up the castle of Burgos, fell back behind the Ebro. Once more Wellington turned his right, by a sweeping movement through Rocamund and Puente Arenas near the source of the Ebro, when he retreated behind the Zadorra near the town of Vitoria.

Santander was now evacuated by the French, and the allied line of communications was changed to that port. On the 20th of June Wellington encamped along the river Bayas, and the next day attacked Joseph. For a description of the decisive battle of Vitoria (June 21, 1813), see VITORIA. In it King Joseph met with a crushing defeat, and, after it, the wreck of his army, cut off from the Vitoria-Bayonne road, escaped towards Pampeluna. Within a few days Madrid was evacuated, and all the French forces, with the exception of the garrisons of San Sebastian (3000), Pampeluna (3000), Santona (1500), and the troops under Suchet holding posts in Catalonia and Valencia, had retired across the Pyrenees into France. The Spanish peninsula was, to all intents and purposes, free from foreign domination, although the war was yet far from concluded. The French struggled valiantly, and the commander of its leaders—JUNET, Soult, Victor, Massena, Marmont, Joseph—had in turn forced to recoil before Wellington; and while their troops fought henceforward under the depressing memory of many defeats, the Allies did so under the insipiring influence of great successes, and with that absolute confidence in their chief which doubled their fighting power.

For this decisive campaign, Wellington was made a field marshal in the British army, and created Duke of Victory by the Portuguese government in Brazil. He now, with about 80,000 men, took up a position with his left (the Spaniards) on the Bidassoa near San Sebastian. Thence his line stretched along the Pyrenees by the passes of Vera, Echalar, Mayo and Roncesvalles, to Altobiscar; his immediate object now being to reduce the fortresses of San Sebastian and Pampeluna. Not having sufficient material for two sieges, he laid siege to San Sebastian only, and blockaded Pampeluna. Sir Thomas Graham commenced the active siege of San Sebastian on the 10th of July 1813, but as Soult was approaching to its relief, the assault was ordered for daylight on the 24th. Unfortunately a conflagration breaking out near the breaches caused it to be postponed until nightfall, when, the breaches in the interval having been strengthened, it was delivered unsuccessfully and with heavy loss. Wellington then suspended the siege in order to meet Soult, who endeavoured (July 25) to turn the allied right, and reach Pampeluna. Attacking the passes of Maya and Roncesvalles, he obliged their defenders to retire, after sharp fighting, to a position close to Sorauren, which, with 25,000 men, he attempted to carry (July 28). By this time Wellington had reached it from the allied left; reinforcements were pressing up on both sides, and about 12,000 allied troops faced the French. A struggle, described by Wellington as "a bludgeon work," now ensued, but all efforts to dislodge the Allies having failed, Soult, withdrawing, manœuvred to his right towards San Sebastian. Wellington now assumed the offensive, and, in a series of engagements, drove the French back (Aug. 2) beyond the Pyrenees. These included Roncesvalles and Maya (July 25); Sorauren (July 28 and 30); Yanzi (Aug. 1); and Echalar and Ivantelly (Aug. 2), the total losses in them being about—Allies under 7000, French 10,000. After this, Wellington renewing the siege of San Sebastian carried the place, excepting the castle, after a heavy expenditure of life (Aug. 31). Upon the day of its fall Soult attempted to relieve it, but in the combats of Vera and St Marcial was repulsed.

The castle surrendered on the 9th of September, and the losses in the entire siege having been about—Allies 4000, French 2000. Wellington next determined to throw his left across the river Bidassoa to strengthen his own position, and secure the port of Puertollano.

Now commenced a series of celebrated river passages, which had to be effected prior to the further invasion of France. At daylight on the 7th of October 1813 he crossed the Bidassoa in seven columns, and attacked the entire French position, which stretched in two heavily entrenched lines from north

---

1. *Duque da Victoria*, often incorrectly duke of Vitoria. The coincidence of the title with the place-name of the battle which had not yet been fought when the title was conferred, is curious, but accidental.
of the Irun-Bayonne road, along mountain spurs to the Great Rhune, 2800 ft. high. The decisive movement was a passage in strength near Fuenterrabia, to the astonishment of the enemy, who in view of the width of the river and the shifting sands, had thought the crossing impossible at that time. Wellington, however, French troops and Soult was unable to reinforce his right in time to retrieve the day. His works fell in succession after hard fighting, and he withdrew towards the river Nivelle.

The loss was about—Allies, 1600; French, 1400. The passage of the Bidassoa “was a general’s not a soldiers’ battle” (Napier).

On the 31st of October Pampeluna surrendered, and Wellington was now anxious to drive Suchet from Catalonia before further invading France. The British government, however, in the interests of the continental powers, urged an immediate advance, so on the night of the 9th of November 1813 he brought up his right from the Pyrenean passes to the northward of Mayas and towards the Nivelle. Soult’s army (about 29,000), in three entrenched lines, stretched from the sea in front of St Jean de Luz along commanding ground to Amotz and thence, behind the river, to Mont Mondarin near the Nive. Each army had with it about 100 guns; and, during a heavy cannonade, Wellington on the 10th of November 1813 attacked this extended position of 16 m. in five columns, these being so a mass of about 50,000 men converged towards the French centre near Amotz, where, after hard fighting, it swept away the 18,000 of the second line there opposed to it, cutting Soult’s army in two. The French right then fell back to St Jean de Luz, the left towards points on the Nive. It was now late and the Allies, after moving a few miles down both banks of the Nivelle, bivouacked, while Soult, taking advantage of the respite, withdrew in the night to Bayonne. The allied loss was about 2700; that of the French 4000, 51 guns, and all their magazines. The next day Wellington closed in upon Bayonne from the sea to the left bank of the Nive.

After this there was a period of comparative inaction, though during it the French were driven from the bridges at Urdaines and Cambo. The weather had become bad, and the Nive unosherable; but there were additional and serious causes of delay. The Portuguese and Spanish authorities were neglecting the payment and supply of their troops. Wellington had also difficulties of a similar kind with his own government, and also the Spanish soldiers, in revenge for many French outrages, had become guilty of grave excesses in France, so that Wellington took the extreme step of sending 25,000 of them back to Spain and resigning the command of their army, though his resignation was subsequently withdrawn. So great was the tension at this crisis that a rupture with Spain seemed possible. These matters, however, having been at length adjusted, Wellington, who in his cramped position between the sea and the Nive could not use his cavalry or artillery effectively, or interfere with the French supplies coming through St Jean Pied de Port, determined to occupy the right as well as the left bank of the Nive. He could not pass to that bank with his whole force while Soult held Bayonne, without exposing his own communications through Irun. Therefore, on the 9th of December 1813, after making a demonstration elsewhere, he effected the passage with a portion of his force only under Hill and Beresford, near Ustaritz and Cambo, his loss being slight, and thence pushed down the river towards Villeranque, where Soult barred his way across the road to Bayonne. This Allied army was now divided into two portions by the Nive; and Soult, from Bayonne at first took advantage of his central position to attack it with all his available force, first on the left bank and then on the right. On the morning of the 10th of December he fell, with 60,000 men and 40 guns, upon Hope, who with 30,000 men and 24 guns held a position from the sea, 3 m. south of Biarritz on a ridge behind two lakes (or tanks) through Arcangues towards the Nive. Desperate fighting now ensued, but fortunately, owing to the intersected ground, Soult was compelled to advance slowly, and in the end, Wellington coming up with Beresford from the right bank, the French retired baffled. On the 11th and 12th of December there were engagements of a less severe character, and finally on the 15th of December Soult with 10,000 men made a vehement attack upon the right bank of the Nive against Hill, who with about 14,000 men occupied some heights from Villefranche past St Pierre (Lostenia) to Vieux Moguerre. The conflict about St Pierre (Lostenia) was one of the most bloody of the war; but for hours Hill maintained his ground, and finally repulsed the French before Wellington, delayed by his pontoon bridge over the Nive having been swept away, arrived to his aid. The losses in the four days’ fighting in the battles before Bayonne (or battles of the Nive) were—Allies about 5000, French about 7000. Both the British and Portuguese artillery, as well as infantry, greatly distinguished themselves in these battles.

In eastern Spain Suchet (April 11, 1813) had defeated Elio’s Murcians at Yecla and Villena, but was subsequently routed by Sir John Murray1 near Castalla (April 13), who then besieged Tarragona. The siege was abandoned after a time, but was later renewed by Lord W. Bentinck. Suchet, after the battle of Vitoria, evacuated Tarragona (Aug. 17) but defeated Bentinck in the combat of Ordel (Sept. 13).

_Campaign in the South of France, 1814._—When operations recommenced in February 1814 the French line extended from Bayonne up the north bank of the Adour to the Pau, thence bending south along the Bidouze to St Palais, with advanced posts on the Joyeuse and at St Jean Pied de Port. Wellington’s left, under Hope, watched Bayonne, while Beresford, with Hill, observed the Adour and the Joyeuse, the right trending back till it reached Urcelay on the St Jean Pied de Port road. Exclusive of the garrison of Bayonne and other places, the available field force of Soult numbered about 47,000, while that of the Allies, deducting Hope’s force observing Bayonne, was of much the same strength. It had now become Wellington’s object to draw Soult away from Bayonne, in order that the allied army might, with less loss, cross the Adour and lay siege to the place on both banks of the river.

At its mouth the Adour was about 500 yards wide, and its entrance from the sea by small vessels, except in the finest weather, was a perilous undertaking, while the shifting sands and a dangerous bar. On the other hand, the deep sandy soil near its banks made the transport of bridging matériel by land laborious, and almost certain of discovery. Wellington, convinced that no effort to bridge below Bayonne would be expected, decided to attempt it there, and collected at St Jean Pied de Port and Passages a large number of country vessels (termed chasse-maîtres). Then, leaving Hope with 30,000 men to watch Bayonne, he began an enveloping movement round Soult’s left. Hill on the 14th and 15th of February, after a combat at Garris, drove the French posts beyond the Joyeuse; and Wellington then pressed these troops back over the Bidouze and Gave de Mauleon to the Gave d’Oloron. Wellington’s object in this was at once attained, for Soult, leaving only 10,000 men in Bayonne, came out and concentrated at Orthes on the Pau. Then Wellington (Feb. 19) proceeded to St Jean de Luz to superintend the despatch of boats to the Adour. Unfavourable weather, however, compelled him to leave this to Sir John Hope and Admiral Penrose, so returning to the Gave d’Oloron he crossed it, and faced Soult on the Pau (Feb. 25). Hope in the meantime, after feints higher up the Adour, succeeded (Feb. 22 and 23) in passing 600 men across the river in boats. The nature of the ground, and being no suspicion of an attempt at this point, led to the French coming out very tardily to Face to Face; and when they did, some Congreve rockets (then a novelty) threw them into confusion, so that the right bank was held until, on the morning of the 24th, the flotilla of

1 Commander of a British expedition from the Mediterranean islands.

"Gave" in the Pyrenees means a mountain stream or torrent.
chasse-maraux appeared from St Jean de Luz, preceded by men-of-war boats. Several men and vessels were lost in crossing the bar; but by noon on the 26th of February the bridge of 36 vessels had been thrown and secured; batteries and a bomb-boat were placed to protect it, 8000 troops passed over, and the enemy’s gunboats driven up the river. Bayonne was then invested on both banks as a preliminary to the siege.

On the 27th of February Wellington, having with little loss effected the passage of the Pau below Orthes, attacked Soult. In this battle the Allies and French were of about equal strength (37,000): the former having 48 guns, the latter 44. Soult held a strong position behind Orthes on heights commanding the roads to Dax and St Sever. Beresford was directed to turn his right, if possible cutting him off from Dax, and Hill his left towards the St Sevr road.

Beresford’s attack, after hard fighting over difficult ground, was repulsed, when Wellington, perceiving that the pursuing French had left a central part of the heights unoccupied, thrust up the Light Division into it, between Soult’s right and centre. At the same time Hill, having found a ford above Orthes, was turning the French left, when Soult retreated just in time to save being cut off, withdrawing towards St Sever, which he reached on the 28th of February. The allied loss was about 2000; the French 4000 and 6 guns.

From St Sever Soult turned eastwards to Aire, where he covered the roads to Bordeaux and Toulouse. Beresford, with 10,000 men, was now sent to Bordeaux, which opened its gates as promised. Soult, who had been at Bordeaux, was driven by Hill from Aire on the end of March 1814, Soult retired by Vic Bigorre, where there was a combat (March 19), and Tarbes, where there was a severe action (March 20), to Toulouse behind the Garonne. He endeavoured also to rouse the French peasantry against the Allies, but in vain, for Wellington’s justice and moderation afforded them no grievances. Wellington wished to pass the Garonne above Toulouse in order to attack the city from the south,—its weakest side,—and interpose between Soult and Souchet. But finding it impracticable to operate in that direction, he left Hill on the west side and crossed at Grenade below Toulouse (April 3). When Beresford, who had now rejoined Wellington, had passed over, the bridge was swept away, which left him isolated on the right bank. But Soult did not attack; the bridge (April 8) was restored; Wellington crossed the Garonne and the Ers, and attacked Soult on the 14th of April. In the battle of Toulouse the French numbered about 40,000 (exclusive of the local National Guards) with 80 guns; the Allies under 52,000 with 64 guns. Soult’s position to the north and east of the city was exceedingly strong, consisting of the canal of Languedoc, some fortified suburbs, and (to the extreme east) the commanding ridge of Mont Rave, crowned with redoubts and earthworks. Wellington’s columns, under Beresford, were now called upon to make a flank march of some two miles, under artillery, and occasionally musketry, fire, being threatened also by cavalry, and then, while the Spanish troops assaulted the north of the ridge, to wheel up, mount the eastern slope, and carry the works. The Spaniards were repulsed, but Beresford gallantly took Mont Rave and Soult fell back behind the canal. On the 12th of April Wellington advanced to invest Toulouse from the south, but Soult on the night of the 11th had retreated towards Villefranche, and Wellington then entered the city. The allied loss was about 5000; the French 3000. Thus, in the last great battle of the war, the courage and resolution of the soldiers of the Peninsular army were conspicuously illustrated.

On the 13th of April 1814 officers arrived with the announce ment to both armies of the capitulation of Paris, the abdication of Napoleon, and the practical conclusion of peace; and on the 18th a convention, which included Suchet’s force, was entered into between Wellington and Soult. Unfortunately, after Toulouse had fallen, the Allies and French, in a sortie from Bayonne on the 14th of April, each lost about 1000 men: so that some 10,000 men fell after peace had virtually been made.

In the east, during this year (1814), Sir W. Clinton had, on the 16th of January, attacked Suchet at Mollins de Rey and blockaded Barcelona (Feb. 7); the French posts of Lerida, Maquinena and Monzon had also been yielded up, and Suchet, on the 11th of March, was left with the troops of the Allied Army in France. Figueras surrendered to Cuesta before the end of May; and peace was formally signed at Paris on the 30th of May. Thus terminated the long and sanguinary struggle of the Peninsular War. The British troops were partly sent to England, and partly embarked at Bordeaux for America, with which country war had broken out (see American War of 1812–13); the Portuguese and Spanish recrossed the Pyrenees: the French army was dispersed throughout France: Louis XVIII. was restored to the French throne; and Napoleon was permitted to reside in the Island of Elba, the sovereignty of which had been conceded to him by his allied powers. For the operations of the British campaign Wellington’s despatches to the secretary of war and duke of Wellington, and peerages were conferred upon Beresford, Graham and Hill.

The events of the Peninsular War, especially as narrated in the Wellington Despatches, are replete with instruction not only for the soldier, but also for the civil administrator. Even in a brief summary of the war one salient fact is noticeable, that all Wellington’s reverses were in connexion with his sieges, for which his means were never adequate. In his many battles he was always victorious, his strategy eminently successful, his organizing and administrative power exceptionally great, his practical resource unlimited, his soldiers most courageous; while the sieges were attended by want of intelligence and warlike equipment. He had no adequate corps of sappers and miners, or transport train. In 1812 tools and material of war for his sieges were often insufficient. In 1813, when he was before San Sebastian, the ammunition ran short; a battering train, long demanded, reached him not only some time after it was needed, but even then with only one day’s provision of shot and shell. For the siege of Burgos heavy guns were available in store on the coast; but he neither had, nor could procure, the transport to bring them up. By resource and dogged determination Wellington rose superior to almost every difficulty, but he could not overcome all; and the main teaching of the Peninsular War turns upon the value of an army that is completely organized in its various branches before hostilities break out.

sular War (Woolwich, 1907).

PENISCOLA, a town of eastern Spain, in the province of Cast-
tellón de la Plana, and on the Mediterranean Sea, 5 m. by road
S. of Benicalp. Pop. (1900), 3412. Peniscola, often called the
Gibraltar of Valencia, is a fortified seaport, with a lighthouse,
built on a rock to the land about 250 ft. high, and only joined to
the mainland by a narrow strip of sand. Originally a Moorish stronghold, it was captured in 1233 by James I. of Aragon, who entrusted it to the Knights Templar. In the 14th century it was garrisoned by the knights of Montesa, and in 1420 it reverted to the Crown. From 1415 it was the home of the schismatic pope Benedict XIII. (de Luca), whose name is commemorated in the Buhador de Papa Luna, a curious cavern with a landward entrance through which the sea-water escapes in clouds of spray.

PENITENTIAL (Lat. poenitentiale, libellus poenitentiales, &c.), a manual used by priests of the Catholic Church for
-guiding them in assigning the penance due to sins. Such manuals
played a large role in the early middle ages, particularly in
Ireland, England and Frankland, and their influence in the
moral education of the barbarian races has not received
sufficient attention from historians. They were mainly com-
posed of canons drawn from various councils and of dicta from
writings of some of the fathers. Disciplinary regulations in
Christian communities are referred to from the very borders of the
apostolic age, and a system of careful oversight of those admitted
to the mysteries developed steadily as the membership grew
and dangers of contamination with the outside world increased.
These were the elaborate precautions of the catechumenate, and
— as a bulwark against the persecutions — the rigid system known
as the Discipline of the Secret (disciplina arcana). The treat-
ment of the lapsed, which produced the Novatian heresy, was
also responsible for what has frequently been referred to as
the first penitential. This is the libellus in which, according
to Cyprian (Ep. 51), the decrees of the African synods of 257
and 253 were embodied for the guidance of the clergy in dealing
with their repentant and returning flocks. This manual,
which has been lost, was evidently not like the code-like com-
positions of the 6th century, and it is somewhat misleading to speak
of it as a penitential. Legislation in this field was not too closely
linked to the upsurge of the spiritual life in the age of the clergy to call for
such literature. Besides the bishop an official well versed in
the penitential regulations of the Church, called the poeni-
tentarius, assigned due penalties for sins. For their guidance
there was considerable conciliar legislation (e.g. Anacysta, Nicaea,
Nicaeasarem, &c.), and certain patristic letters which had acquired
almost the force of decretals. Of the latter the most important
were the three letters of St Basil of Caesarea (d. 379) to Bishop Amphilochnus of Iconium containing over
eighty headings.

Three things tended to develop these rules into something like a system of penitential law. These were the development of minullia and the monastic rule, and the establishment of the penitential jurisdiction among the clergy owing to the growth of a parochial priesthood; and the necessity of adapting
the penance to the primitive ideas of law prevailing among the
newly converted barbarians, especially the idea of compensation
by the weargild. In Ireland in the middle of the 5th century
appeared the “canons of St Patrick.” In the first half of the
next century these were followed by others, notably those of
St Finian (d. 552). At the same time the Celtic British Church
produced the penitentials of St David of Menevia (d. 544) and
of Gildas (d. 538) in addition to synodal legislation. These
furnished the material to Columban (d. 615) for his Liber de poenitentia,
which fixed the fundamentals of the law of the Church upon the continent of Europe. The Anglo-Saxon Church
was later than the Irish, but under Theodore of Tarsus (d. 690),
archbishop of Canterbury, the practice then in force was made
the basis of the most important of all penitentials. The
Poenitentiale Theodori became the authority in the Church’s
treatment of sinners for the next four centuries, both in England
and elsewhere in Europe. The original text, as prepared by
a disciple of Theodore, and embodying his decisions, is given
in Haddan and Stubbs’ Councils and Ecclesiastical Documents
relating to Great Britain and Ireland (ii. 173 seq.). A
reserved for the Church of Rome (Granata), dating apparently
from the early 8th century, was the third main source of Frankish
penitentials. The extent and variety of this literature led the
Gallican Church to exercise a sort of censorship in order to
secure uniformity. After numerous synods, Bishop Haltigar
of Cambrai was commissioned by Ebo of Reims in 829 to prepare
a definitive edition. Haltigar used, among his other materials,
a so-called poenitentiale romanum, which was really of Frankish
origin. The canons printed by David Wilkins in his Concilia
(1737) as being by Ecgbert of York (d. 767) are largely a transla-
tion into Anglo-Saxon of three books of Haltigar’s penitentials.
In 841 Hrabanus Maurus undertook a new Liber poenitentium
and wrote a long letter on the subject to Heribald of Auxerre
about 853. Then followed the treatise of Region of Prum in
906, and finally the collection made by Burchard, bishop of
Worms, between 1012 and 1023. The codification of the canon
law by Gratian and the change in the sacramental position of penance in the 12th century closed the history of penitentials.

Much controversy has arisen over the question whether there
was an official papal penitential. It is claimed that
(quite apart from Haltigar’s poenitentiale romanum) such a
set of canons existed early in Rome, and the attempt has been
made by H. J. Schmitz in his learned treatise on penitentials
(Buszbücher und das kanonische Bußverfahren, 1893 and 1898)
to establish their pontifical character. The matter is still in
dispute. Schmitz’s thesis is having met with universal
acceptance.

In addition to the works mentioned above the one important work
on the penitentials was L. W. H. Wasserschleben’s epoch-making
study and collection of texts, Die Bauzahordnung der abendländischen
Kirche nebst einer rechsgeschichtlichen Einleitung (Halle, 1851).
See articles in Wetzer and Welte’s Kirchenlexikon, Hauck’s Real-
encyklopädie, and Haddan and Stubbs’ Councils. See also Seebass
in Zeitschrift für Kirchengeschichte, xviii. 58. On the canons of St Patrick see the Life of St Patrick by J. B. Bury (pp. 233-275).

PENITENTIARY (med. Lat. poenitentiarius, from poenientia,
penance, poena, punishment, a term used both as adjective
and substantive, referring either to the means of the Church or
the punishment of the sinner. The ecclesiastical use of the word is used
as the equivalent both of the Latin poenitentiarius, “penitent
priest,” and poenientiaris, the dignity or office of a poenenti-
arius. By an extension of the latter sense the name is applied
to the department of the Roman Curia known as the apostolic
penitentiary (sacra poenitentiaria apostolica), presided over
by the cardinal grand penitentiary (major poenitentiarius,
Ital. penitenziere maggiore) and having jurisdiction more particu-
larly in all questions in foro interno reserved for the Holy See
(see CURIA ROMANA). In general, the poenitentiarius, or peni-
tentiary priest, is in each diocese what the grand penitentiary
is at Rome, i.e. he is appointed to deal with those matters of
the Church’s spiritual jurisdiction which cannot be referred to
the bishop. In the Eastern Church there are very
early notices of such appointments; so far as the West is con-
cerned, Hinschius (Kirchenrecht, i. 428, note 2) quotes from
the chronicle of Bernold, the monk of St Blase (c. 1054-1100),
as the earliest record of such an appointment, that made by
the papal legate Odo of Ostia in 1054. In 1215 the fourth
Lateran Council, by its 10th canon, ordered suitable men to be
ordained in all cathedral and conventual churches, to act
as confidants and assistants to the bishops in hearing confessions
and imposing penances. The rule was not immediately nor
universally obeyed, the bishops being slow to delegate their
special powers. Finally, however, the matter was settled by
the 1216 decree of Clement III, which declared that, “wherever it could
conveniently be done,” the bishop should appoint in his cathedral
a poenitentiarius, who should be a doctor or licentiate in theology
or canon law and at least forty years of age.
See P. Hinschius, Kirchenrecht, i. 427, &c. (Berlin, 1869); Du Cange, Glossarium s. v. "Poenitentiarium"; Herzog-Hauck, Real-
encyclopädie (ed. 1904), s.v. "Poenitentiarius.

PENKIRDE, a town in the western parliamentary division of
Staffordshire, England; 134 m. N.W. from London by the
London & North-Western railway, on the small river Penk.
Pop. (1901), 2347. Trade is chiefly agricultural and there
are stone-quarries in the vicinity. The church of St Michael and
All Angels, formerly collegiate and dedicated to St Mary, is a
fine building principally Perpendicular, but with earlier portions.
The Roman Watling Street passes from east to west 3 m. south
of Penkridge. In the neighbourhood is Pillaton Hall, retaining
a picturesque chapel of the 15th century.

PENLEY, WILLIAM SYDNEY (1852— ). English actor,
was born at Broadstairs, and educated in London, where his
father had a school. He first made his mark as a comedian by
his exceedingly amusing performance as the curate in The
Private Secretary, a part in which he succeeded Beerbohm
Tree; but he is even more associated with the title rôle in
Brandon Thomas's Charley's Aunt (1892), a farce which had
an unprecedentedly long run and was acted all over the world.

PENMARC'H, a village of western France in the department of
Finistère, 18 m. S.W. of Quimper by road. Pop. (1906),
of the village, 387; of the commune, 3702. On the extremity of
the peninsula on which it is situated are fortified remains of a
town which was of considerable importance from the 14th to
the 16th centuries and included, besides Penmarc'h, St Guénon
and Kerity. It owed its prosperity to its cod-banks, the dis-
appearance of which together with the discovery of the
Newfoundland cod-banks and the pillage of the place by the bandit
La Fontenelle in 1595 contributed to its decadence. The
church of St Nouna, a Gothic building of the early 16th century
at Penmarc'h, and the church of St Guénon, an unfinished
tower of the 15th century and the church of Kerity (15th
century) are of interest. The coast is very dangerous. On the Point de Penmarc'h stands the Phare d' Eckmuhl, with a
light visible for 60 miles. There are numerous megalithic
monuments in the vicinity.

PENN, WILLIAM (1644—1718), English Quaker and founder of
Pennsylvania, son of Admiral Sir William Penn (1621—1679)
and Margaret Jasper, a Dutch lady, was born at Tower Hill,
London, on the 14th of October 1644. During his father's
absence at sea he lived at Wanstead in Essex, and went to school
at Chigwell close by, in which places he was brought under
strong Puritan influences. Like many children of sensitive
temperament, he had times of spiritual excitement; when about
twelve he was "suddenly surprised with an inward comfort,
and, as he thought, an external glory in the room, which gave
rise to religious emotions, during which he had the strongest
conviction of the being of a God, and that the soul of man was
capable of enjoying communication with Him." Upon the
death of Cromwell, Penn's father, who had served the Protector
because there was no other career open, remained with his family
on the Irish estates which Cromwell had given him, of the value
of £300 a year. On the resignation of Richard Cromwell he
at once declared for the king and went to the court in Holland,
where he was received into favour and knighted; and at the
elections for the convention parliament he was returned for
Weymouth. Meanwhile young Penn studied under a private
tutor on Tower Hill until, in October 1666, he was entered as
a gentleman commoner at Christ Church. He appears in the
same year to have contributed to the Threnodia, a collection of
elegies on the death of the young duke of Gloucester.

The rigour with which the Anglican statutes were revived,
and the Puritan heads of colleges supplanted, roused the spirit
of resistance at Oxford to the uttermost. With this spirit Penn,
who was on familiar terms with John Owen (1616—1683),
and who had already fallen under the influence of Thomas
the Quaker, then at Oxford, actively sympathized. He and
others refused to attend chapel and church service, and were
fined in consequence. How far his leaving the university
resulted from this cannot be clearly ascertained. Anthony
Wood has nothing to say about it, but says that he stayed at Oxford for two years, and that he was expelled
due to proficiency in many sports. There is no doubt that in
January 1662 his father was anxious to remove him to Cambridge,
and consulted Pepys on the subject; and in later years he speaks of
being "banished" the college, and of being whipped, beaten
and turned out of doors on his return to his father, in the
anger of the latter at his avowed Quakerism. A reconciliation,
however, was effected; and Penn was sent to France to forget this
folly. The plan was for a time successful. Penn appears to have entered more or less into the gaieties of the court of Louis XIV., and while there to have become acquainted with Robert Spencer, afterwards earl of Sunderland, and with Dorothy, sister to Algernon Sidney. What, however, is more certain is that he somewhat later placed himself under the tuition of Moses Amyraut, the celebrated president of the Protestant college of Saumur, and at that time the exponent of liberal Calvinism, from whom he gained the patristic knowledge which is so prominent in his controversial writings. He afterwards travelled in Italy, returning to England in August 1664, with "a great deal, if not too much, of the vanity of the French garb and affected manner of speech and gait.""

Until the outbreak of the plague Penn was a student of Lincoln's Inn. For a few days also he served on the staff of his father—now great captain commander—and was by him sent back in April 1665 to Charles with despatches. Returning after the naval victory off Lowestoft in June, Admiral Penn found that his son had again become settled in seriousness and Quakerism. To bring him once more to views of life not inconsistent with the current elements he sent him to France in February 1666 with introductions to Ormonde's pure but brilliant court in Ireland, and to manage his estate in Cork round Shannagarry Castle, his title to which was disputed. Penn appears also later in the year to have been "clerk of the cheque" at Kinsale, of the castle and fort of which his father had the command. When the mutiny broke out in Carrickfergus Penn volunteered for service, and acted under Arran so as to gain considerable reputation. The result was that in May 1666 Ormonde offered him his father's company of foot, but, for some unexplained reason, the admiral demurred to this arrangement. It was at this time that the well-known portrait was painted of the great Quaker in a suit of armour; and it was at this time, too, that the conversion, begun when he was a boy by Thomas Lee in Ireland, was completed at the same place by the same agency."

On the 3rd of September 1667 Penn attended a meeting of Quakers in Cork, at which he attempted to expel a soldier who had disturbed the meeting. He was in consequence, with others present, sent to prison by the magistrates. From prison he wrote to Lord Orrery, the president of Munster, a letter, in which he first publicly makes a claim for perfect freedom of conscience. He was immediately released, and at once returned to his father in London, with the distinctive marks of Quakerism strong upon him. Penn now became a minister of the denomination, and at once entered upon controversy and authorship. His first book, Truth Exalted, was violent and aggressive in the extreme: The same offensive personality is shown in The Guide Mistaken, a tract written in answer to John Clapham's Guide to the True Religion. It was at this time, too, that he appealed, not unsuccessfully, to Buckingham, who on Clarendon's fall was poised as the protector of the Dissenters, to use his efforts to procure parliamentary toleration.

Penn's first public discussion was with Thomas Vincent, a London Presbyterian minister, who had reflected on the "diversible" doctrines of the Quakers. The discussion, which had turned chiefly upon the doctrine of the Trinity, ended uselessly, and Penn at once published The Sandy Foundation shaken, a tract of ability sufficient to excite Pepys's astonishment, in which orthodox views were so offensively attacked that Penn was placed in the Tower, where he remained for nearly nine months. The imputations upon his opinions and good citizenship, made as well by Dissenters as by the Church, he repelled in Innocency with her Open Face, in which he asserts his full belief in the divinity of Christ, the atonement, and justification through faith, though insisting on the necessity of good works. It was now, too, that he published the most important of his works, No Cross, No Crown, which contained an able defence of the Quaker doctrine and practices, and a scathing attack on the loose and unholy lives of the clergy.

While completely refusing to recant Penn addressed a letter to Arlington in July 1669, in which, on grounds of religious freedom, he asked him to interfere. It is noteworthy, as showing the views then predominant, that he was almost at once set at liberty.

An informal reconciliation now took place with his father, who had been impeached through the jealousy of Rupert and Mortal (in April 1668), and whose conduct in the operations of 1666 he had publicly vindicated; and Penn was again sent on family business to Ireland. At the desire of his father, whose health was fast failing, Penn returned to London in 1670. Having found the usual place of meeting in Gracechurch Street closed by soldiers, Penn, as a protest, preached to the people in the open street. With William Mead he was at once arrested and indicted at the Old Bailey on the 1st of September for preaching to an unlawful, seditious and riotous assembly, which had met together with force and arms. The Conventicle Act not touching their case, the trial which followed, and which may be read at length in Penn's People's Ancient and Just Liberties Asserted, was a notable one in the history of trial by jury. With extreme courage and skill Penn exposed the illegality of the prosecution, while the jury, for the first time, asserted the right of juries to decide in opposition to the ruling of the court. They brought in a verdict declaring Penn and Mead "guilty of speaking in Gracechurch Street," but refused to add "to an unlawful assembly"; then, as the pressure upon them increased, they first acquitted Mead, while returning their original verdict upon Penn, and then, when that verdict was not admitted, returned their final answer "not guilty" for both. The court fined the jurymen 40 marks each for their contumacy, and, in default of payment, imprisoned them, whereupon they vindicated and established for ever the right they had claimed in an action (known as Bushell's case from the name of one of the jurymen) before the court of common pleas, when all twelve judges unanimously declared their imprisonment illegal.

Penn himself had been fined for not removing his hat in court, had been imprisoned on his refusal to pay, and had earnestly requested his family not to pay for him. The fine, however, was settled anonymously, and he was released in time to be present at his father's death on the 16th of September 1670, at the early age of forty-nine. Penn now found himself in possession of a fortune of £1,500 a year, and a claim on the Crown for £16,000, lent to Charles II. by his father. Upon his release they once more plunged into controversy, challenging a Baptist minister named Jeremiah Ives, at High Wycombe, to a public dispute and, according to the Quaker account, easily defeating him. No account is forthcoming from the other side. Hearing at Oxford that students who attended Friends' meeting were rigorously used, he wrote a vehement and abusive remonstrance to the vice-chancellor in defence of religious freedom. This found still more remarkable expression in the Seasonable Censurate against Popery (Jan. 1671).

In the beginning of 1671 Penn was again arrested for preaching in Wheeler Street meeting-house by Sir J. Robinson, the lieutenant of the Tower, formerly lord mayor, and known as a bitter and bigoted churchman. Legal proof being wanting of any breach of the Conventicle Act, and the Oxford or Five Mile Act also proving inapplicable, Robinson, who had some special cause of enmity against Penn, urged upon him the oath of allegiance. This, of course, the Quaker would not take, and consequently was imprisoned for six months. During this imprisonment Penn wrote several works, the most important being The Great Case of Liberty of Conscience (Feb. 1671), a noble defence of complete toleration. Upon his release he started upon a missionary journey through Holland and Germany; at Emden he founded a Quaker society, and established an intimate friendship with the princess palatine Elizabeth.

Upon his return home in the spring of 1672 Penn married Gulielma Springet, daughter of Mary Pennington by her first husband, Sir William Springet; she appears to have been
equaliy remarkable for beauty, devotion to her husband, and firmness to the religious principles which she had adopted when little more than a child. She now settled at Rickmansworth in Hertfordshire, and gave herself up to controversial writing. By this time, 1672, belong the Treatise on Oaths and England's Present Interest Considered. In the year 1673 Penn was still more active. He secured the release of George Fox, addressed the Quakers in Holland and Germany, carried on public controversies with Thomas Hicks, a Baptist, and John Faldo, an Independent, and published his treatise on the Christian Quaker and his Divine Testimony Vindicated, the Discourse of the General Rule of Faith and Practice; Reasons against Railing (in answer to Hicks), Counterfeit Christianity Detected, and a Just Rebuke to One-and-twenty Learned Divines (an answer to Faldo and to Quakerism no Christianity). His last public controversy was in 1675 with Richard Baxter, in which, of course, each party claimed the victory.

At this point Penn's connexion with America begins. The province of New Jersey, comprising the country between the Hudson and Delaware rivers on the east and west, had been granted in March 1663-1664 by Charles II. to his brother;James in turn had in June of the same year leased it to Lord Berkeley and Sir G. Carteret in equal shares. By a deed, dated 18th of March 1673-1674, John Fenwick, a Quaker, bought one of the shares, that of Lord Berkeley (Stoughton erroneously says Carteret's) in trust for Edward Byllinge, also a Friend, for £1000. This sale was confirmed by James, after the second Dutch War, on the 6th of August 1668. Disputes having arisen between Fenwick and Byllinge, Penn acted as arbitrator; and then, Byllinge being in money difficulties, and being compelled to sell his interest in order to satisfy his creditors, Penn was added, at their request, to two of themselves, as trustee. The disputes were settled by Fenwick receiving ten out of the hundred parts into which the province was divided, with a considerable sum of money, and the right of selling the parts and putting them up for sale. Fenwick sold his ten parts to two other Friends, Eldridge and Warner, who thus, with Penn and the other two, became masters of West Jersey, West New Jersey, or New West Jersey, as it was indifferently called. The five proprietors appointed three commissioners, with instructions dated from London the 6th of August 1676, to settle disputes with Fenwick (who had bought fresh land from the Indians, upon which Salem was built, Penn being himself one of the settlers there) and to purchase new territories, and to build a town—New Beverley, or Burlington, being the result. For the new colony Penn drew up a constitution, under the title of "Concessions." The greatest care is taken to make this constitution "as near as may be to the ancient, primitive, religious and fundamental laws of the nation of England." But a democratic element is introduced, and the new principle of perfect religious freedom stands in the first place (ch. xvi.). With regard to the liberty of the subject, no one might be condemned in life, liberty or estate, except by a jury of twelve, and the right of challenging was granted to the uttermost (ch. xvii.). Imprisonment for debt was not abolished (as Dixon states), but was reduced to a minimum (ch. xviii.), while theft was punished by twofold restitution either in value or in labour to that amount (ch. xxviii.). The provisions of ch. xix. deserve special notice. All causes were to go before three justices, with a jury. "They, the said justices, shall pronounce such judgment as they shall receive from, and be directed by the said twelve men, in whom only the judgment resides, and not otherwise. And in case of their neglect and refusal, that then one of the twelve, by consent of the rest, pronounce their own judgment as the justices should have done." The justices and constables, moreover, were

1 For a very charming account of her, and the whole Pennington connexion, see Maria Webb's The Pens and Penningtons.
2 See on this Stoughton's Penn, p. 117.
3 The deed by which Fenwick and Byllinge conveyed West New Jersey to Penn, Lawry and Nicholas Lucas is dated the 10th of February 1674-1675.
4 The line of partition was "from the east side of Little Egg Harbour, straight north, through the country, to the utmost branch of Delaware River.

elected by the people, the former for two years only (ch. xli.). Suitors might plead in person, and the courts were public (ch. xxii.). Questions between Indians and settlers were to be arranged by a mixed jury (ch. xxv.). An assembly was to meet yearly, consisting of a hundred persons, chosen by the inhabitants, freeholders and proprietors, one for each division of the province. The election was to be by ballot, and each member was to receive a shilling a day from his division, "that thereby he may be known to be the servant of the people." The executive power was to be in the hands of ten commissioners chosen by the assembly. Such a constitution soon attracted large numbers of Quakers to West Jersey. It was shortly before those occurrences that Penn inherited through his wife the estate of Worminghurst in Sussex, whither he removed from Rickmansworth. He now (July 25, 1677) undertook a second missionary journey to the continent along with George Fox, Robert Barclay and George Keith. He visited particularly Rotterdam and all the Holland towns, renewed his intimacy with the princess Elizabeth at Herwenden, and, under considerable privations, travelled through Hanover, Germany, the lower Rhine and the electorate of Brandenburg, returning by Bremen and the Hague. It is worthy of recollection that the German (as they or the Dutch) settlers from Kirchheim, one of the places which responded in an especial degree to Penn's teaching, are noted as the first who declared it wrong for Christians to hold slaves. Penn reached England again on the 24th of October. He tried to gain the insertion in the bill for the relief of Protestant Dissenters of a clause enabling Friends to affirm instead of taking the oath, and twice addressed the House of Commons' committee with considerable eloquence and effect. The bill, however, fell to the ground at the sudden prorogation.

In 1678 the popish terror came to a head, and to calm and guide Friends in the prevailing excitement Penn wrote his Epistle to the Children of Light in this Generation. A far more important publication was An Address to Protestants of all Persuasions, by William Penn, Protestant, in 1679; a powerful exposition of the doctrine of pure tolerance and a protest against the enforcement of opinions as articles of faith. This was succeeded, at the general election which followed the dissolution of the parliamentary pensionary, by an important political manifesto, England's Great Interest in the Choice of this New Parliament, in which he insisted on the following points: the discovery and punishment of the plot, the impeachment of corrupt ministers and councillors, the punishment of "pensioners," the enactment of frequent parliaments, security from popery and slavery, and ease for Protestant Dissenters. Next came One Project for the Government of England, perhaps the most popular of all Penn's writings. But he was not merely active with his pen. He was at this time in close intimacy with Algernon Sidney, who stood successively for Guildford and Bramber. In each case, owing in a great degree to Penn's eager advocacy, Sidney was elected, only to have his elections annulled by court influence. Toleration for Dissenters seemed as far off as ever. Encouraged by his success in the West Jersey province, Penn again turned his thoughts to America. In repayment of the debt mentioned above he now asked from the Crown, at a council held on the 24th of June 1680, for "a tract of land in America north of Maryland, bounded on the east by the Delaware, on the west limited as Maryland [i.e. by New Jersey], northward as far as plantable," this latter limit Penn explained to be "three degrees northwards." This formed a tract of 500 m. by 160, of extreme fertility, mineral wealth and richness of all kinds. Disputes with James, duke of York, and with Lord Baltimore, who had rights over Maryland, delayed the matter until the 14th of March 1681, when the grant received the royal signature, and Penn was made master of the province of Pennsylvania. His own account of the name is that he suggested it "Sylvania," that the king added the "Penn" in honour of his father, and that, although he

5 Penn's letter of the 26th of August 1676 says twelve, and Clarkson has followed this; but the Concessions, which were not assented to by the inhabitants until the 3rd of March 1676-1677, say ten.
strenuously objected and even tried to bribe the secretaries, he could not get the name altered. It should be added that early in 1682 Dixon, on leave of the spiritual proprietor, transferred his rights in East Jersey to Penn and eleven associates, who soon afterwards conveyed one-half of their interest to the Earl of Perth and eleven others. It is uncertain to what extent Penn retained his interest in West and East Jersey, and when it ceased. The two provinces were united under one governor in 1699, and Penn was a proprietor in 1700. In 1702 the government of New Jersey was surrendered to the Crown.

By the charter for Pennsylvania Penn was made proprietary of the province. He was supreme governor; he had the power of making laws with the advice, assent and approbation of the freemen, of appointing officers, and of granting pardons. The laws were to contain nothing contrary to English law, with a saving to the Crown and the privy council in the case of appeals. Parliament was to be supreme in all questions of trade and commerce; the right to levy taxes and customs was reserved to England; an agent to represent Penn was to reside in London; neglect on the part of Penn was to lead to the passing of the government to the Crown (which event actually took place in 1692); no correspondence might be carried on with countries at war with Great Britain. The importance of the bishop of London extorted the right to appoint Anglican ministers, should twenty members of the colony desire it, thus securing the very thing which Penn was anxious to avoid—the recognition of the principle of an estabishment.

Having appointed Colonel (Sir Will am) Markham, his cousin, as deputy, and having in October sent out three commissioners to manage his affairs until his arrival, Penn proceeded to draw up proposals to adventurers, with an account of the resources of the colony. He negotiated, too, with James and Lord Baltimore with the view, ultimately successful, of freeing the mouth of the Delaware, wrote to the Indians in conciliatory terms, and encouraged the formation of companies to work the infant colony both in England and Germany, especially the "Free Society of Traders in Pennsylvania," to whom he sold 20,000 acres, absolutely refusing, however, to grant any more. In July he drew up a body of "conditions and concessions." This constitution, savouring strongly of Harrington's Oceana, was framed, it is said, in consultation with Sidney, but the statement is doubtful. Until the council of seventy-two (chosen by universal suffrage every three years, twenty-four retiring each year), and the assembly (chosen annually) were duly elected, a body of provisional laws was added.

It was in the midst of this extreme activity that Penn was made a Fellow of the Royal Society. Leaving his family behind him, Penn sailed with a hundred comrades from Deal in the Welcome on the 1st of September 1682. His Last Farewell to England and his letter to his wife and children contain a beautiful expression of his pious and manly nature. He landed at New Castle on the Delaware on the 27th of October, his company having lost one-third of their number by small-pox during the voyage. After receiving formal possession, and having visited New York, Penn ascended the Delaware to the Swedish settlement of Upland, to which he gave the name of Chester. The assembly at once met, and on the 7th of December passed the "Great Law of Pennsylvania." The idea which informs this law is that Pennsylvania was to be a Christian state on a Quaker model. Philadelphia was now founded, and within two years contained 500 houses and a population of 2500. At the same time an act was passed, uniting under the same government the territories which had been separated by a river. James in 1682. Realistic and entirely imaginative accounts (cf. Dixon, p. 270), inspired chiefly by Benjamin West's picture, have been given of the treaty which there seems no doubt Penn actually made in November 1683 with the Indians. His connexion with them was one of the most successful parts of his management, and he gained at once and retained through life their intense affection.

Penn now wrote an account of Pennsylvania from his own observation for the "Free Society of Traders," in which he shows considerable power of artistic description. Tales of violent persecution of the Quakers, and the necessity of settling disputes, which had arisen with Lord Baltimore, his neighbour in Maryland, brought Penn back to England (Oct. 2, 1684) after an absence of two years. In the spring of 1683 he had modified the original charter at the desire of the assembly, but without at all altering its democratic character.1 He was, in reference to this alteration, charged with selfish and deceitful dealing by the assembly. Within five months after his arrival in England Charles II. died, and Penn found himself at once in a position of great influence. Penn now took up his abode at Kensington in Holland House, so as to be near the court. His influence there was great enough to secure the pardon of John Locke, who had been dismissed from Oxford by Charles, and of 1200 Quakers who were in prison. At the same time, he was busy with his pen once more, writing a further account of Pennsylvania, a pamphlet in defence of Buckingham's essay in favour of toleration, in which he is supposed to have had some share, and his Persuasive to Moderation to Dissenting Christians, very similar in tone to the One Project for the Good of England. When Monmouth's rebellion was suppressed he appears to have done his best to mitigate the horrors of the western commission, opposing Jeffreys to the uttermost.2 Macaulay has accused Penn of being concerned in some of the worst actions of the court at this time. His complete refutation by Forster, Paget, Dixon and others renders it unnecessary to do more than allude to the cases of the Maids of Tauntion, Alderman Kiffin, and Magdalen College (Oxford).

In 1686, when making a third missionary journey to Holland and Germany, Penn was charged by James with an informal mission to the prince of Orange to endeavour to gain his assent to the removal of religious tests. Here he met Burnet, from whom, as from the prince, he gained no satisfaction, and who greatly disliked him. On his return he went on a preaching mission through England. His position with James was undoubtedly a compromising one, and it is not strange that, wishing to tolerate Papists, he should, in the prevailing temper of England, be more accused of being a Jesuit, while he was in constant antagonism to their body. Even Tillotson took up this view strongly, though he at once accepted Penn's vehement disavowal. In 1687 James published the Declaration of Indulgence, and Penn probably drew up the address of thanks on the part of the Quakers. It fully reflects his views, which are further ably put in the pamphlet Good Advice to the Church of England, Roman Catholics, and Protestant Dissenters, in which he showed the wisdom and duty of repealing the Test Acts and Penal Laws. At the Revolution he behaved with courage. He was one of the few friends of the king who remained in London, and, when twice summoned before the council, spoke boldly in his behalf. He admitted that James had asked him to come to him in France; but at the same time he asserted his perfect loyalty. During the absence of William in 1690 he was proclaimed by Mary as a dangerous person, but no evidence of treason was forthcoming. It was now that he lost by death two of his dearest friends, Robert Barchly and George Fox. It was at the funeral of the latter that, upon the information of the notorious informer William Fuller (1670-1717?), an attempt was made to arrest him, but he had just left the ground; the fact that no further steps were then taken shows how little the government believed in his guilt. He now lived in retirement in London, though his address was perfectly well known to his friends in the council. In 1691, again on Fuller's evidence, a proclamation was issued against the arrest of Penn and two others as being concerned in Preston's plot. In 1692 he began to write again, both on questions of Quaker discipline and in defence of the sect. Just Measures in an Epistle of Peace and Love, The New Athenians (in reply to the attacks of the Athenian Mercury), and A Key opening the Way to every Capacity are the principal publications of this year.

Meantime matters had been going badly in Pennsylvania.

Penn, William

Penn had, in 1686, been obliged to make changes in the composition of the executive body, though in 1689 it reverted to the original constitution; the legislative bodies had quarreled; and Penn could not gain his rents. The chief difficulty in Pennsylvania was the dispute between the province—i.e. the country given to Penn by the charter—and the "territories," or the lands granted to him by the duke of York by feoffment in August 1686, which were under the same government but had differing interests. The difficulties which Quaker principles placed in the way of arming the colony—a matter of grave importance in the existing European complications—fought most hardy against Penn's power. On the 21st of October 1692 an order of council was issued depriving Penn of the governorship of Pennsylvania and giving it to Colonel Benjamin Fletcher, the governor of New York. To this blow were added the illness of his wife and a fresh accusation of treasonable correspondence with James. In his enforced retirement he wrote the most devoted and most charming of his works—the collection of maxims of conduct and religion entitled *The Fruits of Solitude*. In December, thanks to the efforts of his friends at court, among whom were Buckingham, Somers, Rochester, and Henry Sidney, he received an intimation that no further steps would be taken against him. The accusation, however, had been public, and he insisted on the withdrawal being equally public. He was therefore heard in full council before the king, and honourably acquitted of all charges of treason. It was now that he wrote an *Essay towards the Present and Future Peace of Europe*, in which he puts forth the idea of a great court of arbitration, a principle which he had already carried out in Pennsylvania.

In 1694 (Feb. 23) his wife Gulielma died, leaving two sons, Springett and William, and a daughter Letitia, afterwards married to William Aubrey. Two other daughters, Mary and Hannah, died in infancy. He consoled himself by writing his *Account of the Rise and Progress of the People called Quakers*. The coldness and suspicion with which he had been regarded by his own denomination had now ceased, and he was once more regarded by the Quaker body as their leader. About the same time (Aug. 20) he was restored to the governorship of Pennsylvania; and he promised to supply money and men for the defence of the frontiers. In 1695 he went on another preaching mission in the west, and in March 1696 he formed a second marriage, with Hannah Callowhill, his son Springett dying five weeks later. This year he wrote his *On Primitive Christianity*, in which he argues that the faith and practice of the Friends were those of the early Church. In 1697 Penn removed to Bristol, and during the greater part of 1698 was preaching with great success against oppression in Ireland, whether he had gone to look after the property at Shannangarry.

In 1699 he was back in Pennsylvania, landing near Chester on the 30th of November, where the success of Colonel Robert Quarry, judge of the admiralty in Pennsylvania—who was in the interests of those who wished to make the province an imperial colony—and the high-handed action of the deputy Markham in opposition to the Crown, were causing great difficulties. Penn carried on their work in a manner in which the objections of the Quakers to the use of force had rendered audacious and concerning which Quarry had made strong representations to the home government, while Markham and the inhabitants apparently encouraged it. Penn and Quarry, however, came at once to a satisfactory understanding on this matter, and the illegal traffic was vigorously and successfully attacked. In 1696 the Philadelphia Yearly Meeting had passed a resolution declaring slavery contrary to the first principles of the gospel. Penn, however, did not venture upon emancipation; but he insisted on the instruction of negroes, permission for them to marry, repression of polygamy and adultery, and proposed regulations for their trial and punishment. This aroused, however, a very mixed body of all nations, now refused to accept any of these proposals except the last-named. His great success was with the Indians; by their treaty with him in 1700 they promised not to help any enemy of England, to traffic only with those approved by the governor, and to sell furs or skins to none but inhabitants of the province. At the same time he showed his capacity for legislation by the share he took with Lord Bellomont at New York in the consolidation of the laws in use in the various parts of America.

Affairs now again demanded his presence in England. The king had in 1701 written to urge upon the Pennsylvania government a union with other private colonies for defence, and had asked for money for fortifications. The difficultly felt by the Crown in this matter was a natural one. A bill was brought into the lords to convert private into Crown colonies. Penn's son appeared before the committee of the house and managed to delay the matter until his father's return. On the 15th of September Penn called the assembly together, in which the differences between the province and the territories again broke out. He succeeded, however, in calming them, appointed a council of ten to manage the province in his absence, and gave a borough charter to Philadelphia. In May 1700, experience having shown that alterations in the charter were advisable, the assembly had, almost unanimously, requested Penn to revise it. On the 28th of October 1701 he handed it back to them in the form in which it afterwards remained. An assembly was to be chosen yearly, of four persons from each county, with all the self-governing privileges of the English House of Commons. Two-thirds were to form a quorum. The nomination of sheriffs, coroners, and magistrates for each county was given to the governor, who was to select from names named in the free men. Moreover, the council was no longer elected by the people, but nominated by the governor, who was thus practically left single in the executive. The assembly, however, who, by the first charter, had not the right to propose laws, but might only amend or reject them, now acquired that privilege. In other respects the original charter remained, and the inviolability of conscience was again emphatically asserted. Penn reached England in December 1701. He once more assumed the position of leader of the Dissenters and himself read the address of thanks for the promise from the Throne to maintain the Act of Toleration. He now took up his abode again at Kensington, and published while here his *More Fruits of Solitude*.

In 1703 he went to Knightsbridge, where he remained until 1706, when he removed to Brentford, his final residence being in the palace of Kensington, near Twyford. In 1704 he wrote his *Life of Bulstrode Whiston Bp*. He had now much trouble from America. The territorialists were openly rejecting his authority, and doing their best to obstruct all business in the assembly; and matters were further embarrassed by the injudicious conduct of Governor John Evans in 1706. Moreover, pecuniary troubles came heavily upon him, while the conduct of his son William, who became the ringleader of all the dissolute characters in Philadelphia, was another and still more severe trial. This son was married, and had a son and daughter, but appears to have been left entirely out of account in the settlement of Penn's proprietary rights on his death.

Whatever were Penn's great qualities, he was deficient in judgment. He was too near a relative in the persons of his steward Ford, from whom he had borrowed money, and who, by dexterous swindling, had managed, at the time of his death, to establish, and hand down to his widow and son, a claim for £14,000 against Penn. Penn, however, refused to pay, and spent nine months in the Fleet rather than give way. He was released at length by his friends, who paid £7,500 in composition of all claims. Difficulties with his government of Pennsylvania continued to harass him. Fresh disputes took place with Lord Baltimore, the owner of Maryland, and Penn also felt deeply what seemed to him the ungrateful treatment which he met with at the hands of the assembly. He therefore in 1710 wrote, in earnest and affectionate language, an address to his "old friends," setting forth his sorrows. So great was the effect which this produced that the assembly which met in October of that year was entirely in his interests; revenues were properly paid; the disaffected were silenced and complaints
were hushed; while an advance in moral sense was shown by the fact that a bill was passed prohibiting the importation of negroes. This, however, when submitted to the British parliament, was cancelled. Penn now, in February 1712, being in failing health, proposed to surrender his powers to the Crown. The commission of plantations recommended that Penn should receive £12,000 in four years from the time of surrender, Penn stipulating only that the queen should take the Quakers under her protection; and £1,000 was given him in part payment. Before, however, the matter could go further he was seized with apoplectic fits, which shattered his understanding and memory. A second attack occurred in 1713. He died on the 3d of May, 1718, leaving three sons by his second wife, and a daughter, Elizabeth, by his first wife. Mr. and Mrs. Pennell held along with his first and second wives at Jourdan's meeting-house, near Chalfont St Giles in Buckinghamshire. In 1790 the proprietary rights of Penn's descendants were bought up for a pension of £4,000 a year to the eldest male descendant by his second wife, and this pension was commuted in 1884 for the sum of £67,000.

Penn's Life was written by Joseph Besse, and prefixed to the collected edition of Penn's Works (1760); see also the bibliographical notes in the two biographies by Mr. and Mrs. Pennell. The work is noteworthy for the first discovery of Macaulay's charge, appearing in 1851. In 1907 Mrs. Colquhoun Grant, one of Penn's descendants, brought out a book, Quaker and Courtier: The Life and Work of William Penn (O. A.)

**Pennant, Thomas** (1726–1798), British naturalist and antiquary, was descended from an old Welsh family, for many generations resident at Downing, Flintshire, where he was born on the 14th of June 1726. He received his early education at Wrexham, and afterwards entered Queen's College, Oxford, but did not take a degree. At twelve years of age he was inspired with a passion for natural history through being presented with Francis Willughby's Ornithology; and a tour in Cornwall in 1746–1747 awakened his strong interest in minerals and fossils. In 1750 his account of an earthquake at Downing was inserted in the Philosophical Transactions, where there also appeared in 1756 a paper on several coralloid bodies he had collected at Coalbrookdale, Shropshire. In the following year, at the instance of Linnaeus, he was elected a member of the Royal Society of Upsala. In 1766 he published the first part of his British Zoology, a work meritorious rather as a laborious compilation than as an original contribution to science. During its progress he visited the continent of Europe and made the acquaintance of Buffon, Voltaire, Halder and Pallais. In 1767 he was elected F.R.S. In 1771 was published his Synopsis of Quadrupeds, afterwards extended into a History of Quadrupeds. At the end of the same year he published A Tour in Scotland in 1769, which proving remarkably popular was followed in 1774 by an account of another journey in Scotland, in two volumes. These works have proved invaluable as preserving the record of important antiquarian relics which have now perished. In 1778 he brought out a similar Tour in Wales, which was followed by a Journey to Snowdon (pt. i. 1781; pt. ii. 1793), afterwards forming the second volume of the Tour. In 1782 he published a Journey from Chester to London. He brought out Arctic Zoology in 1785–1787. In 1790 appeared his Account of London, which went through a large number of editions, and three years later he published the Literary Life of the late T. Pennant, written by himself. In his later years he was engaged on a work entitled Outlines of the Globe, vols. i. and ii. of which appeared in 1798, and vols. iii. and iv., edited by his son David Pennant, in 1800. He was also the author of a number of minor works, some of which were published posthumously. He died at Downing on the 16th of December 1798.

**Pennar, or Penner**, two rivers of southern India, distinguished as North and South. The native name is Phinkiani. Both rise near the hill of Nandidrug in Mysore state, and flow eastward into the Bay of Bengal. The northern is the more important and has a total length of 355 m., that of the southern being 245 m. This latter bears the alternative name of the Ponniar. The Pennar (northern) river canal system comprises more than 30 m. of canals, irrigating 155,500 acres.

**Penn, a town and episcopal see of Italy, in the province of Teramo, 26 m. S.E. of Teramo, and 16 m. inland from the Adriatic, 1437 ft. above sea-level. Pop. (1901), 10,394. The cathedral has been much altered; in its treasury is some fine 13th (?) century silversmiths' work; the church of S. Giovanni has a fine cross by Nicola di Guardiagrele, and that of S. Maria in Colleromano, outside the town, a Romanesque portal. Many of the houses have fine terra-cotta friezes. It occupies the site of the ancient Pinna, the chief city of the Vestini, who entered into alliance with Rome in 301 B.C. and remained faithful to her through the Hannibalic wars and even during the revolt of the Italian allies in 90 B.C. No remains of the Roman period exist, even the city walls being entirely medieval.**

See G. Colasanti, Pinna (Rome, 1907); V. Bindi, Monumenti degli Abruzzi (Naples, 1889, pp. 565 sqq.).

**Pennell, Joseph** (1860–1926), American artist and author, was born in Philadelphia on the 4th of July 1860, and first studied there, but like his compatriot and friend, J. M. Whistler, he afterwards went to Europe and made his home in London. He produced numerous books (many of them in collaboration with his wife, Elizabeth Robins Pennell), but his chief distinction is as an original etcher and lithographer, and notably as an illustrator. Their first venture in this field was in 1899, when Mr. and Mrs. Pennell undertook a biography of that artist in 1906, and, after some litigation with his executors on the right to use his letters, the book was published in 1908.

**Penn, Gian Francesco** (1488–1528), Italian painter, surnamed "Il Fattore," from the relation in which he stood to Raphael, whose favourite disciple he was after Giulio Romano, was a native of Florence, but spent the latter years of his life in Naples. He painted in oil as well as in fresco, but is chiefly known for his work in the Loggie of the Vatican.

**Pennine Chain**, an extensive system of hills in the north of England. The name is probably derived from the Celtic pen, high, appearing in the Apennines of Italy and the Pennine Alps. The British system is comprised within the following physical boundaries. On the N. a well-marked depression, falling below 500 ft. in height, between the upper valleys of the Irthing and the south Tyne, from which it is known as the Tyne Gap, separates the Pennines from the system of the Cheviots. On the N.E., in Northumberland, the foothills extend to the North Sea. On the N.W. the Eden valley forms part of the boundary between the Pennines and the hills of the Lake District, and the division is continued by the upper valley of the Lune. For the rest the physical boundaries consist of extensive lowlands—on the E. the vale of York, on the W. the coastal belt of Lancashire and the plain of Cheshire, and on the S. and S.E. the valley of the River Trent. The Pennine Chain extends from Carlisle, Westmorland and Northumberland, Lancashire and Yorkshire, Cheshire and Derbyshire, while the southern foothills extend into Staffordshire and Nottinghamshire.

The Pennine system is hardly a range, but the hills are in effect broken up into numerous short ranges by valleys cut back into them in every direction, for the Pennines form a north and south watershed which determines the course of all the larger rivers in the north of England. The chain is divided into two sections by a gap formed by the river Aire flowing east, a member of the Humber basin, and the Ribble flowing west and entering the Irish Sea through a wide estuary south of Morecambe Bay.

The northern section of the Pennine system is broader and generally higher than the southern. Its western slope is generally short and steep, the eastern long and gradual; this distinction applying to the whole system as well as to the north-western slopes which overlook the Eden valley. This is the nearest approach to a true mountain range in the Pennine system and indeed in England. It is known as the Cross Fell Edge from its highest point, the Cross Fell (2930 ft.), to the southeast of which a height of 2750 ft. is reached in Millburn Forest, and of 2591 ft. in Mickle Fell. This range is marked off eastward by the upper valleys of the south Tyne and the Tees, and, from the divide between these two, branch ranges spring eastward and separated by the valley of the Wear, at the head of which are Burnhope Seat (2452 ft.) and Dead Stones (2326 ft.). In the northern range the highest point is Middlehope Moor (2206 ft.), and in the southern, Chapel Fell Top (2094 ft.). It is thus seen that the
higher elevations, like the steeper slopes, lie towards the west. Cross Fell Edge terminates southward at a high pass (about 1400 ft.) beneath the head of the Belah valley, and leading to the source of the river Eden, and Great Greta, a tributary of the Tees. This pass is followed by the Tebay and Barnard cart line of the North Eastern railway. The hills between the Lune valley on the west and the headstream of the Eden on the east are crossed by tributaries of the first-named river—here the chief elevations are Wild Boar Fell (2333 ft.), Whernside (2414 ft.), and Ingleborough (2373 ft.)—which provide a route for the main line of the Midland railway. Well-marked passes extend here between Swaledale and the river Ure, which traverses the celebrated Wensleydale (q.v.), and between the Ure and Wharfe. In the former the highest points are High Seat (1238 ft.) and Great Shunner Fell (2340 ft.); and in the second Buckden Pike (2302 ft), and Great Whernside (2310 ft.). There is then a general southerly slope to the Aire gap.

The division of the system calls for less detailed notice. Heights exceeding 2000 ft. are rare. The centre of the section is the well-known Peak (q.v.) of Derbyshire. Both here and throughout the system the summits of the hills are highlands, rounded or nearly flat, consisting of heathery, peaty moorland or heath pasture. The profile of the Pennines is thus not striking as a rule, but much fine scenery is found in the narrow dales throughout; Wensleydale, Wharfedale and other York shire dales being no less famous than the Lake district. Neither has there been in the last few centuries any attempt to fell the forest woods, and so to convert the upland sections of the north west into agricultural districts. The Pennine dales, in nearly all cases, are traversed by the rivers, whether these are tributaries of the Tees, the Swale, the Derwent or the Wharfe. The Wye flows along the western boundary of the southern Pennines, and the Derwent and the Ure along the eastern. The Wear, which rises in the prefect of Durham, is a tributary of the Tyne, which flows into the North Sea.

Pennsylvania, a North Atlantic state of the United States of America and one of the original thirteen, lying for the most part between latitudes 39° 43' 26° 3' and 42° N. and between longitudes 74° 40' and 80° 31' 36° W. The state is in the form of a rectangle, except in the north-west where a triangular projection, extending to 4° 15' N. lat., gives it a shore length of almost 40 m. on Lake Erie, on the east where the Delaware river with two large bends separates it from New York and New Jersey, and on the southern boundary, which is a straight line. The extension of the state was described with a 12-m. radius from New Castle, Delaware, forms the boundary between it and Delaware. The forty-second parallel of N. latitude forms the boundary between it and New York on the N.; Mason and Dixon's line is the boundary between it and Maryland and West Virginia on the south and a north and south line marks the boundary between it and West Virginia and Ohio on the west.

The total area is 45,126 sq. m. and of this 294 sq. m. are water surface.

Physical Features.—Pennsylvania skirts the coastal plain in the south-west, the Alleghany Plateau in the south-east, and the Appalachian Plateau by the three divisions of the Appalachian province—Piedmont or older Appalachian belt, younger Appalachian ridges and valleys and Alleghany plateau—and in the north-west corner a small part of the Hudson valley. The highest peak is 5482 ft. above sea level of about 1100 ft. above the sea. It rises from 20 ft. less on the bank of the Delaware between Philadelphia and Chester to 2000-3000 ft. on the higher ridges in the middle section (3136 ft. on Blue Knob in Bedford county) and falls again to 900-1000 ft. on the Ohio border and to 750 ft. or less on the Erie plain; in the south-east is an area of about 6100 sq. m. that is less than 500 ft. above the sea, while on the ridges in the middle of the state is an aggregate area of about 1000 sq. m. of hills rising to 2000 ft. in elevation. The area below 500 ft. is mostly in the Triassic lowland of the Piedmont region, or, as the Pennsylvania portion of it is called, the south-east province. This is an undulating plateau with some very marked ranges of mountains, overlain by weak sandstones, &c. On the north and west borders of this plain are two parts of a chain of semi-detached and usually rounded hills, known as the South Mountains. The north-east part is a south-westward arm of the New England uplands, extending from New Jersey through Easton to Reading. The south-west part is a north-eastern prolongation of the Virginia Piedmont, is known as the Cumberland Plain, and extends from the Maryland western border almost to the mouth of the Susquehanna and in the Delaware Bay to the mouth of the Chesapeake and Delaware Bays; the greater part of the Alleghany plateau is drained by the Allegheny and Monongahela rivers into the Ohio river; the extreme southern portion of the central province forms part of the Tennessee state. The Ohio river is drained by tributaries of the Potomac; the Erie plain is drained by short streams into Lake Erie; and a very small section of the Alleghany plateau, in the northern part of Potter county, is drained by the Genesee river into Lake Ontario. The Susquehanna drains about 21,000 sq. m. of the state; the Ohio, Allegheny and Monongahela...
Pennsylvania is a wide and shallow stream with a zigzag course and numerous islands, but both the Susquehanna and the Delaware, together with their principal tributaries, flow to the sea. The rate of flow of the most powerful is the Susquehanna, and the surface geological structure, and in the gorges and water-gaps through which they pass rides in the mountain region, is one of the most picturesque scenery in the state; a number of these gorges have been long used as passages for travel. The lower portion of the Delaware river has been entered by the sea as the result of the depression of the land, giving a harbor, at the head of which developed the city of Philadelphia. The Ohio, which drains the north-western section of the state, is the result of the glacier which blocked the northward drainage of the region through which it flows and turned it southward. The Monongahela is an older stream, and the Allegheny and Monongahela rivers flow in deeply intrenched valleys. The few small lakes of the state are mostly on the Pocono plateau, where they were formed by glaciation; here, too, are some streams with picturesque cascades.

Fauna.—Under the protection of a game commission which was established in 1895, a number of species of animals and birds, the number of Virginia deer, black bear, rabbits, ruffed grouse, quail and wild turkeys have increased until in some of the wilder sections they are quite plentiful, while the numbers of weasels, mice, lynx, foxes but not the badger, racoons, woodcocks, skunks and crabs are abundant, and musk-rats, porcupines and opossums are found in some sections. Two species of venomous snakes—the rattlesnake and the copper-head—occur in the state; the latter is rare. There are, besides, a number of birds of prey—the red-shouldered hawk, red-tailed hawk, marsh hawk, Cooper's hawk, sharp-shinned hawk and sparrow hawk; the great horned owl, the barn owl and the screech owl; and bald eagles are found in it but very seldom. The fur-bearing animals are also plentiful. The "turkey-buzzard" (turkey-vulture) (very valuable as a scavenger) is seen occasionally, especially in the south and south-west. The game birds include the ruffed grouse, mallard and English pheasant (which is not so readily under protection), besides woodcock, snipe, many species of ducks and a few Canada geese. The song and insectivorous birds—thrushes, flycatchers, vireos and woodpeckers—of which the representation on the high plateaus has been much diminished, have, however, been found in many of the mountainous regions. The "turkey-buzzard" (turkey-vulture) (very valuable as a scavenger) is seen occasionally, especially in the south and south-west. The song and insectivorous birds—thrust...
from 350,398 in 1850 to 619,000 in 1910. The number of miles increased steadily from 2,229 in 1850 to 43,000 in 1910. The raising of sheep and swine was of considerably less relative importance in 1910 than in 1850, there being 1,882,357 sheep and 1,040,366 swine in 1850 and 105,023 sheep and 234,681 swine in 1910. The dairy business is largest in the regions around Philadelphia and Pittsburgh, and in Erie and Bradford counties. Cattle other than dairy cows as well as horses and sheep are most numerous in the west and in the north central counties and in some of the counties of the south-east. Swine are most numerous in the south-east and south-west counties. The state ranks high in the production of wheat, oats, corn, potatoes, and turnips. In the south-eastern counties, where the soil is rich and the climate favorable, it produces large crops of sweet Indian corn, tomatoes, cucumbers, musk-melons, asparagus and celery. The total value of all vegetables produced in 1899 was $15,832,904, an amount exceeding that of any other state except Ohio, New York, and Pennsylvania. The only vegetables grown in the vicinity of Philadelphia or in the vicinity of Pittsburgh. The culture of tobacco, which was introduced as early as 1689, was a small industry until the middle of the 19th century, when it assumed a greater importance. State-wide the value of tobacco is $28,000,000.

The sale of nursery products, more than one-half of which were grown in Chester and Montgomery counties, amounted in 1899 to $12,000,000. This was more than one-third of that of New York, which was exceeded in only three other states.

Minerals.—Pennsylvania is by far the most important coal-producing state in the Union, and as much of the iron ore of the Lake Superior region is brought to its greatest bituminous coal-field for rendering into pig-iron, the value of the state's mineral products constitutes a large fraction of the total value for the entire country; in 1907, the value of the mineral products of the state was $264,000,000, or almost three-fourths the value of all the products of Pennsylvania. The value of the mineral products of the state was $273,198,135 in 1908, and in 1908 when the total for the state was $473,083,212, or more than one-fourth of that of the United States, more than four-fifths of it was represented by coal and pig-iron. With the exception of coal, the state's mineral wealth is not marked in any part of Pennsylvania containing the only anthracite coal region in the country. This is in the east of the state, and although it has a total area of about 3300 sq. m., its workable area is mostly in Lackawanna, Luzerne, Carbon, Schuylkill and Northumberland counties in an area of less than 500 sq. m. This coal was discovered as early as 1762 near the site of the present city of Wilkes-Barre and during the next 50 years proved quite abundant. It was not until 1850, however, that the anthracite region was opened for development. Since then the production has increased at a steady rate, and in 1908 the output was 43,000,000 tons, and it is estimated that the annual output of coal and anthracite for the next 50 years will be 80,000,000 tons. Pennsylvania has the thickest bituminous coal-measures, and most of the coal obtained from these is of the best quality. They form the northern extremity of the great Appalachian coal-field and underlie an area of 50,000 sq. m., mostly in the Pittsburgh district, comprising the counties of Allegheny, Washington, Fayette and Westmoreland, is exceptionally productive, and the coal in Allegheny and Washington counties is noted for its gas-producing qualities, while in Fayette and Westmoreland counties the coal is obtained the famous Connellsville coking coal. The bituminous coal was first used at nearly the same time as the anthracite and it was first shipped from Pittsburgh in 1800. The annual output in 1806 was 1,000,000 tons, and in 1870, 7,750,000 tons; in 1875, 79,842,326 tons in 1900, 150,143,777 tons and in 1907, 171,179,527 tons in 1908, when it was 33-2% of the total output. Pennsylvania was third in 1908 in the production of coal, having more than one-fourth of the output of all the United States. In the manufacture of pig-iron Pennsylvania is easily first among the states, with a production value in 1908 of $111,385,000, nearly 43-8% of that of the entire country. Pittsburg, the birthplace of the iron industry, and formerly called by the name of the iron industry is greatly promoted in 1859 when the vast deposits in the lower Lehigh Valley were discovered and large quantities of cement were required in the rebuilding of the Lehigh Canal. Only the connection with the Pennsylvania cement plant in the United States in 1870. The output of the natural-iron cement continued greater than that of the Portland cement work of the state for the second half of the century. The annual output of the cement industry was almost entirely in the Portland branch, its production in the state increasing from 825,054 barrels in 1896 to 8,759,454 barrels in 1908, 18,254,806 barrels in 1908, valued at $42,500,000, or more than one-third of the output of the Portland cement works in the United States. The production of natural-iron cement was 668,000 barrels in 1866 and only 25,479 barrels (valued at $87,192) in 1898. Limestones and dolomites suitable for building purposes are obtained chiefly in Montgomery, Chester and Lancaster counties, and even these are generally rejected for ornamental work on account of their colour, which is usually bluish, grey or mottled. However, until increased facilities of transport brought more desirable stones to the east and south, the use of the limestone from the south-west corner of the state through Greene, Washington, Allegheny, Beaver, Butler, Venango, Clarion, Forest, Elk, Warren, McKean and Tioga counties is the Pennsylvania section of the Appalachian coal-field. These two of the most important coal fields in Pennsylvania have furnished nearly all of the country's supply of petroleum for some years following the discovery of its value for illuminating purposes. The mineral was made known to white men by the Indians, who sold it, the name of Seneca oil, as a cure for various ills, and burned it at some of their ceremonies. The early settlers in the west Pennsylvania also found that some unknown people had dug pits several feet in depth around the oil springs apparently for the purpose of collecting the oil. But it was not until the middle of the 19th century that its value as an illuminating oil became known. Prior to 1830, the production of crude petroleum was in the Drake well, on the flats of Oil Creek at Titusville; it was about 70 ft. in depth, and when 25 barrels were pumped from it the first production of petroleum in the United States in 1864, the amount of crude petroleum from 1900 to 3000 barrels flowed in a day without pumping, and the state's yearly output continued to increase until 1901, when it amounted to 31,324,206 barrels. The output was still increasing until 1895, when it amounted to 4,027,471, and the total value of all stone quarried was $6,971,152. In Dauphin county is a quarry of bluishbrown Triassic sandstone that has been extensively used in the construction of buildings in the state.
especially in Philadelphia, for the erection of the so-called brown stone fronts. On the Pocono plateau is a large deposit of slate, which is used as window counts and for roofing. The Devol quarries, the Wyoming Valley slate, and, like the New York “bluestone,” which it closely resembles, is much used for window and door trimmings, steps and flagging. Slate is also an important product of the Carboniferous formations, and is used for building and for various other purposes. In 1908 the value of Pennsylvania slate and bluestone was $40,350,784, and the country’s total production of soapstone was $1,945,551,332.

Transport and Commerce.—The new road cut through the Juniata, the route of the army of Brigadier-General John Forbes, against Fort Duquesne in 1758, was a result of the influence of Pennsylvania, for it was considered even then a matter of great importance to the future prosperity of the country. The city of Philadelphia, be connected with navigation on the Ohio by the easiest line of communication that could be had wholly within its limits. As early as 1762 David Rittenhouse and others made a survey of a canal to connect the Susquehanna with the Ohio rivers, and in 1791 a committee of the state legislature reported in favour of a project establishing communication by canals and river improvement from Philadelphia to Lake Erie by way of this state’s railways, and other improvements which the improved means of transportation between Philadelphia and the anthracite coal-fields became the more pressing. The Schuylkill Canal Company, chartered in 1815, began the construction of a canal along the Schuylkill river from Philadelphia to Mount Carbon, in 1816, and completed it in 1826. In 1818 the Lehigh Navigation Company was formed to improve the navigation of the Lehigh and Delaware rivers, and was chartered to build and operate a canal from the banks of the Lehigh to the Delaware river at Pottsville, and two years later coal was successfully hauled down the Lehigh and Delaware rivers to Philadelphia in “arks” or rectangular boxes, two or more of which were joined together and steered by oarsmen. When the canal was completed in 1827–1829 the company built a number of locks which made the Lehigh navigable in either direction, and in 1827–1832 the state took the canal up by the construction of the main line, and in 1842 completed a canal from Middletown on the Susquehanna to Reading on the Schuylkill in 1827. In 1832 the state legislature authorized the appointment of a commission to explore routes from the Schuylkill to the Allegheny, and on the West Branch of the Susquehanna to the Allegheny, and in the three or four succeeding years the state committed itself to a very extensive system of internal improvements, by means of canals and locks without interruption until 1840, when the completed or nearly completed portions embraced a railway from Philadelphia to Columbus on the Susquehanna, a canal up the Susquehanna and a portage to Hollidaysburg, a canal from Hollidaysburg through Blair’s Gap in the Allegheny Front to Johnstown on the Conemaugh river, a canal down the Conemaugh, Kiskiminetas, and Allegheny rivers to Pittsburg, a canal up the Susquehanna and its west branch from the mouth of the Juniata to Farrandsville, in Clinton county, a canal up the Susquehanna and its north branch from Northumberland nearly to the New York border, and a canal up the Delaware river from Bristol to the Catskill river, and the commissioners reported that 55 miles of the best of locks and 14 miles of canals were erected, and the supply of coal and water had been completed at almost any time. In 1845 the state began to sell its canals and railways to private companies and the sale was completed in 1859. The western division of the system was abandoned by the owners in 1865, and the work at the east division was gradually decreased until it was wholly abandoned in 1904, with the exception of the Delaware Division Canal, which since 1866 has been worked by the Lehigh Coal & Navigation Company in connection with the Lehigh Canal. In its natural condition there were bars in the Delaware river below Philadelphia which obstructed the navigation of vessels drawing more than 17 ft. of water, and the legislature directed that the river be deepened from 4 to 5 ft., and a channel having a minimum depth of 30 ft. The Federal government has much improved the navigation of the Monongahela and Allegheny rivers, and is committed to a project for block-water communication with the sea by vessels drawing 9 ft. of water.

The first railway in the state was that built in 1827 by the Lehigh Coal & Navigation Company from the mouth of the Lehigh to the Susquehanna, and a gravity road down which cars loaded with coal descended by their own gravity and up which the empty cars were drawn by mules. In 1823 a company was incorporated to build a road from the Ohio, which was to extend from Wheeling to the Allegheny and five miles on the Monongahela. Nothing further was done until 1828, when the state canal commissioners were directed to build this road and the Allegheny Portage railway from Hollidaysburg to Johnstown. The latter was opened in 1837. It was a very fine job, and the cars, which ran at Blair’s Gap and were drawn up these by stationary engines. Both the Philadelphia & Columbia and the Allegheny Portage railways were completed in 1834. From these and other beginnings navigation on the Ohio has gradually increased to 1240 m. in 1850, to 4656 m. in 1870, to 8659 m. in 1890 and to 11,373 m. at...
the end of 1908, when it was exceeded by only two states in the Union, Texas and Illinois. The principal railways are the lines operated by the Pennsylvania Railroad Company from New York to Washington through Philadelphia; from Philadelphia and the Delaware River to the Ohio River via Harrisburg and Buffalo; from Baltimore, Maryland, to Sedos Point on Lake Ontario (Northern Central) through Harrissburg and Williamsport; from Buffalo to the Ohio River via New York, and from Buffalo to the Ohio River via the Lehigh Valley; the Erie, the Delaware, Lackawanna & Western; the Baltimore & Ohio; and the Buffalo, Rochester & Pittsburg.

The state has one port of entry along the Atlantic coast, one on the Ohio river, and one on the Great Lakes. Philadelphia, the Atlantic port, exports chiefly petroleum, coal, grain and flour, and imports chiefly iron ore, sugar and drugs, and chemicals, manufactured iron, machinery, iron and steel sheets, and paper. The value of the exports in 1909 was $50,650,274, was greater than that of any other Atlantic port except New York, and the value of its imports, $78,003,654, was greater than that of any except New York and Boston. Pittsburgh ranks high among the interior ports of the country in foreign commerce and first among the cities of the United States in the tonnage of its domestic commerce. Erie is quite unimportant among the lake ports in foreign commerce, but has a large domestic trade in iron ore, copper, wheat and flour.

Population.—The population of Pennsylvania was 4,343,473 in 1790; 602,365 in 1800; 1,090,091 in 1810; 1,904,458 in 1820; 1,348,233 in 1830; 1,742,033 in 1840; 2,311,786 in 1850; 2,906,215 in 1860; 3,521,051 in 1870; 4,282,891 in 1880; 5,238,014 in 1890; 6,302,115 in 1900; 7,665,111 in 1910. Of the total in 1900, 985,250, or 15.6%, were foreign-born, 156,845 were negroes, 1639 were Indians, 1927 were Chinese and 40 were Japanese. Nearly 95% of the foreign-born was composed of natives of Germany (2,413,432), Ireland (250,000), Great Britain (180,670), Poland (76,538), Austria (67,192), Italy (66,959), Russia (90,599), Hungary (47,393) and Sweden (21,130). Of the native population (5,111,425) were born on farms, little more than two-fifths of the remainder were natives of New York, Maryland, Ohio, New Jersey, Virginia, New England, Delaware and West Virginia. Almost two-thirds of the Indians were in Cumberland county where, at Carlisle, is a United States Indian Industrial School. In 1906 the total number of communicants of different religious denominations in the state was 2,077,022, of whom 1,717,037 were Protestants and 1,214,734 were Roman Catholics. There is a large number of the smaller religious sects in the state; the principal denominations, with the number of communicants of each in 1906, are: Methodist (363,443), Lutheran (335,643), Presbyterian (322,549), Reformed Church (177,662), Episcopal (162,285), United Brethren (55,574), Evangelical Church (45,480), Disciples of Christ (36,458), German Baptist Brethren (23,176), Eastern Orthodox Churches (22,125), Mennoites (16,527), Congregational (14,811), Evangelical Association (13,394), Friends (12,457), Church of God or "Winebrennerians" (11,157), and Moravians (532).

Of the total population in 1900, 3,223,337, or 51.4%, were urban (i.e. in places having a population of 1,000 or more), 7,084,812, or 12.15%, were semi-urban (i.e. in incorporated places having a population less than 4,000) and 2,315,952, or 36.75%, were rural (i.e. outside of the incorporated places). From 1890 to 1900 the urban population increased 587,470, or 36%, and the semi-urban 134,077, or 18.4% but the rural population decreased 215,755, or 9.5%. The population of the principal cities in 1900 were as follows: Philadelphia, 1,393,607; Pittsburgh, 321,616; Allegheny, 126,896 (subsequently annexed to Pittsburgh); Scranton, 102,626; Reading, 78,691; Erie, 57,753; Wilkes-Barre, 48,954; Altoona, 38,973; Johnstown, 35,036; Allentown, 35,416; McKeansport, 32,277; Chester, 33,088; York, 33,708; Williamsport, 28,575; New Castle, 28,339; Easton, 25,238; Norristown, 22,376; Shenandoah, 20,321; Shamokin (borough), 18,802; Lebanon, 17,628; and Altoona, 13,615.

Administration.—Pennsylvania has been governed under constitutions of 1776, 1790 and 1838; the present government is under the constitution of the 16th of December 1873 with amendments adopted on the 5th of November 1901. An amendment to the constitution to be adopted must be approved by a majority of the members elected to each house of the general assembly in two successive legislatures and then, at least three months after the second approval of the general assembly, by a majority of the popular vote cast on the adoption of the amendment. All male citizens over 21 years of age, who have been citizens of the United States for one month, residents of the state for one year and of the election district for two months immediately preceding the election, have the right of suffrage, provided they have paid within two years a state or county tax, which shall have been assessed at least two months and paid at least one month before the election. The Australian or "Massachusetts" ballot, adopted in 1891 under a law which fails to require personal registration, by a provision like that in Nebraska makes it easy to vote a straight ticket; party names are arranged on the ballot according to the number of votes secured by each party at the last preceding election.

Executive.—The office of governor, superseded in 1776 by a president and council of twelve, was restored in 1790. Under the present constitution the governor serves for four years and is eligible for the next succeeding term. The governor and lieutenant-governor are biennial. The powers of the two houses are the State, and inhabitants of the state for seven years last preceding election; no member of Congress or person holding any office under the United States or Pennsylvania may be governor or lieutenant-governor. The governor appoints, subject to the advice and consent of two-thirds of the senate, a secretary of the commonwealth and an attorney-general during pleasure, and they may, in like manner, make all appointments. Almost any appointive officer, or office, may fill vacancies in various offices which occur during the recess of the senate. He has a right of veto, extending to items in appropriation bills, which may be overridden by a two-thirds vote of the two houses. The governor is not subject to the recommendation of three members of a board which consists of the lieutenant-governor, secretary of the commonwealth, attorney-general and secretary of internal affairs. The other executive officers of the state are the lieutenant-governor, adjutant-general, secretary of war, auditor-general, treasurer, attorney-general, comptroller, and three members of a board of five to hold the office of secretary of the commonwealth, annually, and serving as a board for the appointment of representatives to the legislature. They are elected for three years, the auditor, treasurer, elected for two years, and (all appointed by the governor) the secretary of the commonwealth, the attorney-general and the treasurer, for terms of four years. Both the lieutenant-governor and the secretary of war, elected for years, the auditor-general, elected for two years, the treasurer, elected for two years, and (all appointed by the governor) the secretary of the commonwealth, the attorney-general and the treasurer, for terms of four years. Those chosen by election are ineligible for a second consecutive term except the secretary of internal affairs. The department of internal affairs consists of six bureaus: the land office, vital statistics, weather bureau, superintendent of public instruction, and the bureau of telegraphs and telephones. There are also many statutory administrative officers and boards, such as the adjutant-general, insurance commissioner, hospital commissioner, board of mining, general assembly, prisons, and mining inspectors.

Legislature.—During the colonial period and the early years of statehood the legislature was composed of one house, but the bicameral system was adopted in the constitution of 1790. There are thirty senators, elected for four years, and approximately two hundred representatives, elected for two years. Senators must be citizens for at least four years and representatives at least two years. No person who is a member of the legislature shall be elected to the legislature of the year next before election and inhabitants of the senatorial districts from which each is elected for one year next before election; representatives must be at least 21 years old and must have lived within the state for at least three years before election; senators for three years next before election. To avoid the possibility of metropolitan domination provision is made that no city or county shall be entitled to more than one-sixth of the total number of senators. Sessions are usually in the fall and winter of each year except that the senate exercises the usual right of confirming appointments and of sitting as a court of impeachment, while the House of Representatives initiates money bills and impeachment cases.

Judiciary.—The supreme court consists of seven judges elected by the voters of the state at large. Minority representation is secured by the provision that each elector shall vote for one less than the number of judges for the court, and that the judges shall be divided into three supreme judicial districts, the eastern, the middle and the western. This court was formerly very much overworked, but it was relieved by an act of the 24th of June 1895 establishing and organizing a court of appeals (now of seven judges) with appellate jurisdiction. There were in 1910 fifty-six district courts of common pleas, one for each county of forty thousand inhabitants and not more than four counties in a district. The judges of the common pleas are also judges of the courts of common pleas of the peace and general gaol delivery, and the orphans' courts, although there are separate orphans' courts in the counties (ten in 1900) having a population of more than one hundred and fifty thousand. There are approximately twenty-five hundred judges in the peace and gaol delivery and in the orphans' courts. In the colonial period all judges were appointed by the governor during good behaviour. The constitution of 1776 provided for seven judges, but the constitution of 1838 fixed the terms for judges of the common pleas at ten years and judges of the supreme court at fifteen. A constitutional amendment of 1850 provided that all judges should be elected by the people.1

---

1 The constitution of 1873 made provision for minority representation as follows: "Whenever two judges of the supreme court are
At present supreme court judges serve for twenty-one years and are ineligible for re-election. Superior court and common pleas judges serve for ten years, and justices of the peace eight years. The term is not impaired by misdemeanour in office or they may be removed by the governor, with the consent of two-thirds of each house of the general assembly, for any reasonable cause which shall not be sustained on appeal to the supreme court. 

Local Government.—The local government is a combination of the county system of the South and the townships of New England. The county officers are the sheriff, coroner, surveyors, clerks of deeds, commissioners, treasurers, surveyors, auditors or comptrollers, clerks of the courts, and district attorneys, elected for three years. The three commissioners and the three district attorneys are the same as the members of the supreme court, the sheriff is the same as the supreme-court judges, thus allowing a representation to the minority party. Pennsylvania has suffered more perhaps than any other state in the Union from legislative interference with local affairs. Under an act of the general assembly in 1870 the people of Philadelphia were forced to contribute more than $20,000,000 for the construction of a city-hall. To guard against such encroachments in the future the construction of the building was put into the hands of the most skilled architects. The object of the provision, however, has been in a large measure nullified by the system of city classification, under which Philadelphia is the only city of the first class. The passage of the "River Basin bills shows that the cities of the second class are by no means secure. The apparent object of the measure was to deprive the people of Pittsburgh temporarily of the privileges of self-government by empow'ering the city to appoint to all offices of the city (the mayor was again assumed) to exercise (until 1903, when the munici-
pal executive should be again chosen by the people) the functions of the mayor, thus removed by the governor under this act, and in 1872 and 1878, to the second cities, Allegheny and Scranton, although they had not offended the party managers. 

Miscellaneous Laws.—A woman's right to hold, manage, and acquire property in her own right is not affected by marriage, but for any reason other than her own, she cannot mortgage or convey her real estate to a joint action of herself and her husband is necessary. The rights of dower and courtesy both obtain. When a husband dies intestate leaving a widow and issue, the widow has the use of all her real estate for life and one-third of his personal estate absolutely; if he leaves no issue but there be collateral heirs or other kindred, the widow has the real or personal estate or both to the value of two-thirds of the appraised value of one-half the personal estate for life, and one-half the remaining personal estate absolutely; if the husband leaves a will, the widow has the choice between her dower right and the terms of the will. When a wife dies intestate leaving a husband and issue, the husband has the use of all her real estate for life, and the personal estate is divided among the husband and children share and share alike; if there be no issue the husband has the use of all her real estate for life and the personal estate is divided between the husband and children. In a suit for a divorce the plaintiff must have resided within the state at least one year. A suit for a divorce on the ground of desertion may be commenced when the defendant has been absent six months, but the divorce may not be granted until the desertion has continued two years. The party convicted of adultery is forbidden to marry the co-respondent during the lifetime of the other party. A marriage of first cousins or a bigamous marriage may be declared void. Pennsylvania has no homestead law, but the property of a debtor amounting to $300 in value, exclusive of the wearing apparel of himself and family and of all Bibles and school books, may be exempt from execution. The court may fix the term for the contempt by distress or by attachment. The executor extends to the widow and children unless there is a lien on the property for purchase money. The child-labour law of 1909 forbids the employment of children under twelve years of age in mining dangerous machinery while in motion, at switch tending, as brakemen, firemen, engineers, motormen, and in other positions of similar character. The child-labour law provides that children under thirteen years of age in mining elevators lifting or hoisting machinery, in oiling dangerous machinery while in motion, at switch tending, as brakemen, firemen, engineers, motormen, and in other positions of similar character. The child-labour law provides that children under sixteen years of age may be employed in the manufacture of white-lead, red-lead, paints, phos- phor, poisonous acids, tobacco or cigars, in mercantile establish-
ments, in hosiery factories, tobacco factories, or in any factory or other place if not injurious to their health or safety; and it forbids the employment of boys under eighteen years of age in any cotton, woolen, silk, paper, bagging or flax factory, or in any laundry, or the employment of children under eight years of age in any mill or factory whatever within the commonwealth. 

Prisons and Charities.—Penal and charitable institutions are under the supervision of a board of public charities of ten members, five appointed by the governor, and five members of the committee of the women under eighteen years of age may be employed by day and partly by night not exceeding nine hours in any twenty-four. The em-
ployee is a boy, it may be employed for any purpose.

week, divorce at Polk, self-government 1689 Allegheny 1854 1697, 1878 dependent widow motion, the arson, children by other allowances, school-books and other charitable be of public benefit, and that a portion of the proceeds of any penal or charitable institution may be applied for the support of schools and public charities. Such a law was enacted for the establishment of normal schools. Since 1893 the state has furnished textbooks and other necessary supplies free of charge, and since 1895 education has been compulsory for all children between the ages of six and eighteen. The public schools have been kept open not less than seven and not more than ten months in the year. Out of a total expenditure of $30,621,774 for the fiscal year 1909, $7,875,083 was for educational purposes, of which $6,816,006 was for common schools, being appropriations to the
Pennsylvania

The Pennsylvania state college at State College, Centre county, was established in 1855. The agricultural college of Pennsylvania, founded in 1862, became the Agricultural College of Pennsylvania, and received its present name in 1874 after the income from the national land grant had been appropriated to the use of the institution. At present there are 1,400 students and a library of 37,000 volumes. Other institutions for higher education are the University of Pennsylvania, at Philadelphia (1740), an endowed institution supported by very little support from the state; the University of Pittsburgh (1870), at Pittsburgh (p.e.); Dickinson College (Methodist Episcopal, 1783), at Carlisle; Haverford College (Society of Friends, 1833), at Haverford; Franklin and Marshall (Congregational), at Lancaster; Gettysburg College (Presbyterian, 1820), at Washington; Lafayette (Presbyterian, 1822), at Easton; Bucknell University (Baptist, 1846), at Lewisburg; Waynesburg (Cumberland Presbyterian, 1821), at Waynesburg; Ursinus (Presbyterian, 1824), at Collegeville; and Swarthmore (Society of Friends (Hicksites), 1866), at Swarthmore; Muhlenberg (Lutheran, 1867), at Allentown; Lehigh University (non-sectarian, 1867), at Bethlehem; and for women Bryn Mawr College (Society of Friends, 1885), at Bryn Mawr; the Allentown College (German Reformed, 1867), at Allentown; Wilson College (Presbyterian, 1870), at Ephrata; and the Pennsylvania College for women (1869), at Pittsburg. The denominational institutions includes Allegheny (Unitarian, 1826; (Presbyterian, 1825), Reformed Presbyterian (1856), and Western Theological Seminary (Presbyterian, 1827); at Lancaster; (German Reformed, 1827); at Haverford; (Unitarian, 1844); at Muhlenberg (Lutheran, 1847); at Chester, the Great Valley Seminary (Baptist, 1868); at Gettysburg (Lutheran, 1826); and in Philadelphia several schools, notably the Protestant Episcopal Church Church, and the Lutheran (1864) at Allentown.

There are many technical and special schools, such as Girard College, Drexel institute and Franklin institute at Philadelphia, the Carnegie institute at Pittsburg and the United States Indian school at Carlisle (1801).

Finance.—The revenues of the state are derived primarily from corporation taxes, business licences, and a 5% tax on real estate inheritance. Taxes on real estate have been abolished and those on privilege licenses and personal property have been temporarily suspended. expenditures on the new capital at Harrisburg checked the movement temporarily. The total receipts for the year ending on the 30th of November 1900 were $20,945,210, and the expenditure was $30,621,774. During the provincial period Pennsylvania was in common with other colonies, was affected with the paper money craze. From 1723 to 1775 it issued $1,054,650 and from 1775 to 1783 $1,172,000 plus $1,550,000. Acts were passed in 1781, 1792, 1793 and 1794 to facilitate redemption at depreciated rates, and the last bills were called in on the 1st of January 1806. The state was also carried along by the movement which began about 1825 for the expenditure of public funds on internal improvements. Of the public funds and receipts, the state spent in 1840 $352,693, and between 1826 and 1843, the public debt in the latter year reaching the high-water mark of $4,188,434. An agitation was then begun for re-election, the public works were put up for sale, and were financed by the sale of state bonds. When the state was finally free from the public debt the state was able to support the Pennsylvania Railroad Company for $7,500,000. Under authority of a constitutional amendment of 1837 a sinking fund commission was established in 1838. As a result of a temporary increase in the Civil War (1861-65) the debt has been rapidly reduced. The constitution of 1873 and subsequent legislation have continued the commission, but the sources of revenue have been much curtailed, being restricted to the interest on the debts of the state and fund and interest on certain Allegheny Railroad bonds. The total debt on the 30th of November 1900 was $2,634,917, of which the greater part were $31,4% bonds, maturing on the 1st of February 1027. The state has reverted to the sinking fund system, leaving a net surplus in the sinking fund of $8181. The sinking fund was formerly divided among certain favoured banks in such manner as would best advance the political interests of the organization which controlled the state; but just after the reform victory in the election of 1905 the sinking fund commission instituted the policy of buying bonds at the market price, and the debt is now being reduced by that method. The financial institutions of Pennsylvania have been characterized by banks that have been limited to twenty years and are subject to the supervision of a commissioner of banking.

History.—The chief features of Pennsylvania history in colonial days were the predominance of Quaker influence, the heterogeneous character of the population, liberality in matters of religion, and the fact that it was the largest and the most successful of proprietary provinces. The earliest European settlements within the present limits of the state were some small trading posts established by the Swedes and the Dutch in the lower valley of the Delaware River in 1663-1681. Between 1650 and 1660 George Fox and a few other prominent members of the Society of Friends had begun to urge the establishment of a colony in America to serve as a refuge for Quakers who were suffering persecution under the "Clarendon Code." William Penn (q.e.) became interested in the plan at least as early as 1666. For his charters of 1682-1683 and the growth of the colony under him see Penn, William.

During Penn's life the colony was involved in serious boundary disputes with Maryland, Virginia and New York. A decree of Lord Chancellor Hardwicke, in 1750, settled the Maryland-Virginia dispute and led to the survey in 1763-1767 of the boundary between Pennsylvania and Maryland (lat. 35° 14' 26-3" N.), called the Mason and Dixon line in honour of the surveyors; it acquired considerable importance later as separating the free and the slave states. In 1784 Virginia agreed to the extension of the line and to the establishment of the western limit (the present boundary between Pennsylvania and Ohio) as a point from a point on the Mason and Dixon line five degrees of longitude west of the Delaware river. The 42nd parallel was finally selected as the northern boundary in 1780, in 1792 the Federal government sold to Pennsylvania the small triangular strip of territory north of it; the Lake Erie dispute between Pennsylvania and the new state of Indiana was settled in favour of Pennsylvania in 1782 by a court of arbitration appointed by the Continental Congress.

Upon William Penn's death, his widow became proprietary. Sir William Keith, her deputy, was hostile to the council, which he practically abolished, and was popular with the assemblies, which he assiduously courted, but was discharged by Mrs Penn after he had quarrelled with James Logan, secretary of the province. His successors, Patrick Gordon and George Thomas, under the proprietorship of John, Thomas and Richard Penn, continued Keith's popular policy of issuing a plentiful paper currency; but with Thomas the assembly renewed its old struggle, refusing to grant him a salary or supplies because of his efforts to force the colony into supporting the Spanish War. Again, during the Seven Years' War the assembly withheld the governor, Robert Hunter Morris, in the matter of grants for military expenses. But the assembly did its part in assisting General Braddock to outfit; and after Braddock's defeat all western Pennsylvania suffered terribly from Indian attacks. After the proprietors subscribed £5000 for the protection of the colony the assembly momentarily gave up its contest for a tax on the proprietary estates and consented to pass a money bill, without this provision, for the expenses of the war. But in 1760 the assembly, with the help of Benjamin Franklin as agent in England, managed to get the Pennsylvania Act of 1756, which levied a tax (566) to the colony; and thereafter the assembly had little to contest for, and the degree of civil liberty attained in the province was very high. But the growing power of the Scotch-Irish, the resentment of the Quakers against the proprietors for having gone back to the Church of England and many other circumstances strengthened the anti-proprietorship power, and the assembly strove to abolish the proprietorship and establish a royal province; John Dickinson was the able leader of the party which defended the proprietors; and Joseph Galloway and Benjamin Franklin were the leaders of the anti-proprietorship party, which was greatly weakened at home by the absence after December 1764 of Franklin in England as its agent. The question lost importance as independence became the issue. In 1755 a volunteer militia had been created and was led with great success by Benjamin Franklin; and in 1756 a line of forts was begun to hold the Indians in check. In the same year a force of pioneers under John Armstrong of Carlisle surprised and destroyed the Indian village of Kittanning (or Atiquet) on the Allegheny river. But the frontier was disturbed by Indian attacks until the suppression of Pontiac's conspiracy. In December 1763 six Christian Indians, Conestogas, were massacred by the "Paxton boys" from Paxton near the present Harrisburg; the Indians who had escaped were taken.
to Lancaster for safe keeping but were seized and killed by the "Paxton boys," who with other backwoodsmen marched upon Philadelphia early in 1764, but Quakers and Germans gathered quickly to protect it and civil war was averted, largely by the diplomacy of Franklin. The Paxton massacre marked the close of Quaker supremacy and the beginning of the predominance of the Scotch-Irish, portrayed by the British and Franklin in its origin, known as "Pennsylvania Dutch." Before the Seven Years' War the Quakers dominated the government, but from that time until the failure of the Whisky Insurrection (1794) the more belligerent Scotch-Irish (mostly Presbyterians) were usually in the ascendency, the reasons being the growing numerical strength of the Scotch-Irish and the increasing dissatisfaction with Quaker neglect of means of defending the province.

As the central colony, Pennsylvania's attitude in the struggle with the mother country was of vast importance. The British party was strong because of the loyalty of the large Church of England element, the neutrality of many Quakers, Dunkers, and Mennonites, and a general satisfaction with the liberal and free government of the province, which had been won gradually and had not suffered such catastrophic reverses as had embittered the people of Massachusetts, for instance. But the Whig party under the lead of John Dickinson, Thomas Mifflin and Joseph Reed was successful in the state, and Pennsylvania contributed greatly to the success of the War of Independence, by the important services rendered by her statesmen, by providing troops and by the financial aid given by Robert Morris (q.v.). The two Continental Congresses (1774, and 1775-1781) met in Philadelphia, except for the months when Philadelphia was occupied by the British army, and Congress met in Lancaster and York, Pennsylvania, and then in Princeton, New Jersey. In Philadelphia the second Congress adopted the Declaration of Independence, which the Pennsylvania delegation, excepting Franklin, thought premature at the time, but which was well supported by Pennsylvania afterwards. During the War of Independence battles were fought at Brandywine (1777), Paoli (1777), Fort Mifflin (1777) and Germantown (1777), and Washington's army spent the winter of 1777-1778 at Valley Forge; and Philadelphia was occupied by the British from the 26th of September 1777 to the 18th of June 1778. The Penn lost their governmental rights in 1776, and three years later their territorial interests were vested in the commonwealth in return for a grant of £200,000 and the guarantee of titles to private estates held in severalty. They still own considerable property in and around Wilkes-Barre, in Luzerne county, and in Philadelphia. The first state constitution of September 1776 was the work of the Radical party. It deprived the Quakers of their part in the control of the government and forced many Conservativés into the Loyalist party. This first state constitution was never submitted to popular vote. It continued the unicameral legislative system, abolished the office of governor, and provided for an executive council of twelve members. It also created a curious body, known as the council of censors, whose duty it was to assemble once in seven years to decide whether there had been been any infringements of the fundamental law. The party which had carried this constitution through attacked its opponents by withdrawing the charter of the college of Philadelphia (now the university of Pennsylvania) because its trustees were anti-Consitutionalists and creating in its place a university of the state of Pennsylvania. The Constitutional party in 1785 secured the annulment by the state assembly of the charter of the Bank of North America, which still retained a congressional charter; and the cause of this action also seems to have been party feeling against the anti-Consitutionalists, among whom Robert Morris of the bank was a leader, and who, especially Morris, had opposed the tariff for protection in 1806. A split in the political parties. These actions of the state assembly against the college and the bank probably were immediate causes for the insertion in the Federal Constitution (adopted by the convention in Philadelphia in 1787) of the clause (proposed by James Wilson of Pennsylvania, a friend of the college and of the bank) forbidding any state to pass a law impairing the obligation of contracts. The state ratified the Federal Constitution, in spite of a powerful opposition—largely the old (state) Constitutional party—on the 22nd of December 1787, and three years later revised its own constitution to make it conform to that document. Under the constitution of 1790 the office of governor was restored, the executive council and the council of censors were abolished, and the bicameral legislative system was adopted. Philadelphia was the seat of the Federal government, except for a brief period in 1789-1790, until the removal to Washington in 1800. The state capital was removed from Philadelphia to Lancaster in 1799 and from Lancaster to Harrisburg in 1812.

The state was the scene of the Scotch-Irish revolt of 1794 against the Federal excise tax, known as the Whisky Insurrection (q.v.) and of the German protest (1799) against the house tax, known as the Fries Rebellion from its leader John Fries (q.v.). In 1838 as the result of a disputed election to the state house of representatives two houses were organized, one Whig and the other Democratic, and there was open violence in Harrisburg. The conflict has been called the "Bucksow War." The Whig House of Representatives gradually broke up, many members going over to the Democratic house, which had possession of the records and the chamber and was recognized by the state Senate. Pennsylvania was usually Democratic before the Civil War owing to the democratic character of its country population and to the close commercial relations between Pennsylvania and the South. The growth of the protectionist movement and the development of anti-slavery sentiment, however, drew it in the opposite direction, and it voted the Whig national ticket in 1840 and in 1848, and the Republican ticket in 1860. The influence of the Whigs was relatively great in 1835, due to the opposition of the Germans to internal improvements and to the establishment of a public school system, resulted in the election as governor of Joseph Ritner, the anti-Masonic candidate. The anti-Masonic excitement subsided as quickly as it had risen, and under the leadership of Thaddeus Stevens the party soon became merged with the Whigs. During the Civil War (1861-65) the state gave to the Union 336,000 soldiers; and Generals McClellan, Hancock, Meade and Reynolds and Admirals Porter and Dahlgren were natives of the state. Its nearness to the field of war made its position dangerous. Chambersburg was burned in 1862; and the battle of Gettysburg (July 1863), a defeat of Lee's attempt to invade the North in force was a turning point in the war.

The development of the material resources of the state since 1865 has been accompanied by several serious industrial disturbances. The railway riots of 1877, which centred at Pittsburg and Reading, resulted in the destruction of about two thousand freight cars and a considerable amount of other property. An organized association, known as the Molly Maguires (q.v.), terrorized the mining regions for many years, but was finally suppressed through the courageous efforts of President Franklin, Benjamin Gowen (1863-1889) of the Philadelphia & Reading railroad with the assistance of Allan Pinkerton and his detectives. There have been minor outbreaks since. The anthracite field (1902) which was settled by a board of arbitrators appointed by President Roosevelt; and there were street railway strikes at Chester in 1908 and in Philadelphia in 1910. The calling in of Pinkerton detectives from Chicago and New...
York to settle a strike in the Carnegie steel works at Homestead in 1892 precipitated a serious riot, in which about twenty persons were killed. It was necessary to call out two brigades of the state militia before the disorder was finally suppressed. The labour unions took advantage of this trouble to force Pennsylvania, Indiana, Illinois, Minnesota, Colorado and several other states to pass anti-Pinkerton statutes making it illegal to import irresponsible armed men from a distance to quell local disturbances. On the political side the chief features in the history of the state since 1865 have been the adoption of the constitution of 1873, the growth of the Cameron-Quay-Penrose political machine, and the attempts of the reformers to overthrow its domination. The constitution of 1838, which superseded that of 1790, extended the functions of the legislature, limited the governor's power of appointment, and deprived negroes of the right of suffrage. The provision last mentioned was nullified by the fourteenth and fifteenth amendments to the constitution of the United States. The chief object of the present state constitution (1873) was to prohibit local and special legislation. It increased the number of senators and representatives, created the office of lieutenant-governor, substituted biennial for annual sessions of the legislature, introduced minority representation in the choice of the higher judiciary and of the county commissioners and auditors and provided (as had an amendment adopted in 1850) for the election of all judges by popular vote. The political organization founded by Simon Cameron (q.v.) and strengthened by his son, James Donald Cameron, Matthew Stanley Quay and Boies Penrose (b. 1860), is based upon the control of patronage, the distribution of state funds among favoured banks, the support of the Pennsylvania railway and other great corporations, and upon the ability of the leaders to persuade the electorate that it is necessary to vote the straight Republican ticket to save the protective system. Robert E. Pattison (1890-1904), a Democrat, was elected governor in 1893 and again in 1891, but he was handicapped by Republican legislatures. In 1905 a Democratic state treasurer was elected.

Pennsylvania Governors.

Under Dutch Rule (1624-1664): 1
Cornelis Jacobsen Mey Director 1624-1625
William van Hulst 1625-1626
Peter Minuit Governor 1626-1632
David Pieteren de Vries 1632-1633
Wouter van Twiller 1633-1638
William Kieft 1638-1641
Peter Stuyvesant 1647-1664

Under Swedish Rule (1638-1655): 2
Peter Minuit 1638-1641
Peter Hollander 1641-1642
John Printz 1642-1653
John Pappegoya 1653-1654
John Claude Kyings 1654-1655

Under the Dutch of York (1664-1712):
Richard Nicolls 1664-1667
Robert Carr 1664-1667
Robert Needham Commander on the Delaware 1664-1668
Francis Lovecse 1667-1673
John Carr Commander on the Delaware 1668-1673

Under Dutch Rule (1673-1724):
Anthony Colve 1673-1674
Peter Alrichs 1674-1675

Under the Duke of York (1674-1881):
Sir Edmund Andros 1674-1681
Under the Proprietors (1681-1693):
William Markham 1684-1689

William Penn 1682-1684

Thompson Lloyd 1689-1691

William Markham 1688-1690

John Simcock 1686-1688

John Blackwell 1686-1688

Governor Shunk resigned in July 1840 and was succeeded by W. F. Johnston, president of the state senate.

Governments and Administrations.

President of the Council 1690-1691

Deputy-Governor 1691-1693

Under the Crown (1693-1698):
William Markham Deputy-Governor 1693-1695

Benjamin Fletcher Deputy-Governor 1693-1695

Under the Proprietors (1693-1767):
William Markham Deputy-Governor 1695-1699

Penn William Penn 1690-1701

Andrew Hamilton Governor 1701-1703

President of the Council 1704-1706

John Evans Lieutenant-Governor 1707-1709

Charles Gookin 1709-1717

Sir William Keith 1717-1726

Patrick Gordon 1726-1736

James Logan Governor 1736-1738

George Thomas 1738-1747

President of the Council 1747-1748

Lieutenant-Governor 1748-1754

Robert H. Morris Deputy-Governor 1754-1756

William Denny 1756-1759

James Hamilton 1759-1763

John Penn 1763-1771

James Hamilton Governor 1771-1773

President of the Council 1773-1777

Period of Statehood (1776-1873).

Benjamin Franklin, Chairman of the Committee of Safety 1776-1777

Thomas Wharton, Jr. President of the Council 1777-1778

George Bryan Acting President of the Council 1778

Joseph Reed President of the Council 1778-1781

William Moore 1782-1785

John Dickinson 1785-1788

Benjamin Franklin 1788-1790

Thomas Mifflin 1790-1799

Thomas McKean Democratic-Republican 1799-1808

Simon Snyder 1808-1817

William Finley 1817-1820

Joseph Mifflin 1820-1824

John A. Shilze 1824-1829

George Wolf Democrat 1829-1835

John B. Rittenhouse Anti-Masonic 1835-1839

D. R. Porter Democrat 1839-1845

F. R. Shunk 1845-1848

W. F. Johnston Republican 1848-1852

Whig 1852-1859

Democratic 1859-1861

Democratic 1861-1867

Whig 1865-1867

Democratic 1867-1873

Democratic 1873-1877

Republican 1881-1885

Democratic 1885-1888

Republican 1888-1891

Democratic 1891-1895

Republican 1895-1899

Democratic 1899-1903

Republican 1903-1905

Democratic 1905-1911

1 Governors of New Netherland and of the Dutch settlements on the Delaware.

2 The Swedish colonies on the Delaware conquered by the Dutch in 1655.
Pennsylvania, University of

(Philadelphia, 1801 sqq. and Harrisburg, 1802 sqq.); and The Statutes at Large of Pennsylvania (Philadelphia, 1856 sqq.). Voyage papers and early valuable materials are found in B. A. and M. L. Hindsale, History and Civil Government of Pennsylvania ... (Chicago, 1899); and in the various editions of Smith's Legislative History. For the development of the university and charitable institutions, see the Annual Reports of the Board of Commissioners of Public Charities (Harrisburg, 1871 sq.), the Annual Report of the Committee on Lunacy (Harrisburg, 1883 sq.), and the Annual Reports of the Philadelphia Benevolent Asylum (Philadelphia 2 vols., Harrisburg, 1897), an official publication, well written and handsomely illustrated. For educational history, see N. C. Schaeffer, The Common School Laws of Pennsylvania (Harrisburg, 1890). For medical history, see J. P. Wickersham, History of Medicine in Pennsylvania (Lancaster, 1886), one of the best state histories of education. For finance and banking, see the annual reports of the state treasurer, auditor-general, sinking fund commissioners, and the commissioner of banking, all published at Harrisburg; An Historical Sketch of the Paper Money of Pennsylvania, by a member of the Numismatic Society of Philadelphia (1862); and B. M. Mead, A Brief Review of the Financial History of Pennsylvania ... to the Present Time (1862-1882) (Harrisburg, 1881).

The only complete history of the entire period is Howard M. Jenkins, ed., Pennsylvania Colonial and Federal (3 vols., Philadelphia, 1903). This is especially valuable for the detailed histories of gubernatorial administrations from 1790 to 1900. The third volume contains chapters on history, religion, the arts, the sciences, medical profession, journalism, military affairs, internal improvements, &c. S. G. Fisher, Pennsylvania, Colony and Commonwealth (Philadelphia, 1897) contains the best short account of the colonial and Revolutionary period, but it is less complete than its predecessor of the period since 1783. W. R. Shepherd, History of Proprietary Government in Pennsylvania (New York, 1896), a detailed study of the proprietary from the political, governmental and territorial points of view, is scholarly, and gives a good account of the period down to 1763. The latest, but best, of the series is A Brief History of the Commonwealth of Pennsylvania (Philadelphia, 1894). The last comprehensive history is B. McMeekin and F. D. Stone, Pennsylvania and the Federal Constitution, 1787-1788 (Philadelphia, 1888), a useful work. For the anti-Masonic movement, see Charles McCarthy, The Anti-Masonic Party in Pennsylvania (Philadelphia, 1890). G. Fisher, The Making of Pennsylvania (Philadelphia, 1896), introductory to the same author's Colony and Commonwealth, is an interesting study of the various nationalities and religions repre senting the various regions of the state. For a good account of the academies and universities, see the last two annual reports of the Pennsylvania Department of Public Instruction, 1886-1890; and at Gournia (1901-1904); between 1824 and 1826 the large and well-equipped university hospital (1874); large dormitories, consisting in 1900, of 29 distinct but connected houses; medical laboratories; a biological hall and vivarium; and across Woodland Avenue, a veterans hall and hospital.

The university contains various departments, including the college (giving degrees in arts, science, biology, music, architecture, &c.), the graduate school (1882), a department of law (founded in 1790 and re-established in 1850) and a department of medicine (first professor, 1756; first degree granted, 1768), the oldest and probably the most famous medical school in America. Graduation from the school of arts in the college is dependent on the successful completion of 60 units of work (the unit is one hour's work a week for a year in lectures or recitations or two hours' work a week for a year in laboratory courses); this may be done in three, four or five years; of the 60 credits: 22 must be required in studies (chemistry, 2 units; English, 6; foreign languages, 6; history, logic and ethics, mathematics, and physics, 2 each); 18 must be equally distributed between the four main groups: the 19 groups include agriculture, botany, chemistry, economics, English, fine arts, French, geology, German, Greek, history, Latin, mathematics, philosophy, physics, political science, psychology, sociology and zoology; and in the remaining 20 units the student's election is practically free. Special work in the senior year of the college counts 8 units for the first year's work in the department of medicine. College scholarships are largely local, two being in the gift of the governor of the state, fifty being for graduates of the public schools of the city of Philadelphia, and five being for graduates of Pennsylvania public schools outside Philadelphia; in 1900 there were twenty-eight scholarships in the college not local. In the graduate school there are three fellowships for research, each with an annual stipend of $800; twenty-one fellowships valued at $500 each, for men only, and five fellowships for women, besides special fellowships and 39 scholarships.

The organization of the university is composed of a board of twenty-eight, nine of whom are trustees of the university and nine are ex officio president. The directing head of the university, and the head of the university faculty and of the faculty of each department is the provost—a title rarely used in American universities; the provost is president pro tempore of the board of trustees.

In 1898-1900 the university had 454 officers of instruction, of whom 220 were in the college and 157 in the department of these buildings is the law school, between Chestnut and Sansom streets, on 34th Street. In a great triangular block bounded by Woodland Avenue, Spruce Street, and 34th Street, is the university library, which had in 1900, about 75,000 bound volumes and 50,000 pamphlets, including the Biddle Memorial law library (1886) of 40,000 volumes, the Colwell and Henry C. Carey collections in finance and economics, the Francis C. Macauley library of Italian, Spanish and Portuguese authors, with an excellent Dante collection, the classical library of Ernst von Leutsch of Göttingen, the philological library of F. A. Pott of Halle, the Germanic library of R. Bechstein of Rostock, the Semitic library of C. P. Caspari of Copenhagen, the (Hebrew and Rabbinical) Marcus Jastrow Memorial library, the ethnological library of D. G. Brinton, and several special medical collections; College Hall, with the university offices; Howard-Houston Hall (1856) the students' club; Joan Hall; the Robert Hare chemical laboratory; and (across 36th Street) the Wistar institute of anatomy and biology. Immediately east of this triangular block are: Bennett House; the Randall Morgan laboratory of physics; the engineering building (1906); the laboratory of hygiene (1902); dental hall; and the Johnson laboratory of chemistry. Further east are the gymnasia, training quarters and Franklin (athletic) field, with brick grandstands. South of Spruce Street are: the free museum of science and art (1890), the north-western part of a projected group, with particularly valuable American, Egyptian, Semitic and Cretan collections, the last two being the result of part of university excavations at Nipour (1882-1890) and at Gournia (1901-1904); between 34th and 36th Streets the large and well-equipped university hospital (1874); large dormitories, consisting in 1900, of 29 distinct but connected houses; medical laboratories; a biological hall and vivarium; and across Woodland Avenue, a veterans hall and hospital.
of medicine, and an enrolment of 4,570 students, of whom 298 were in the college (417 in the school of arts; 58 in the Towne scientific school), 478 in the Wharton school, and 253 in the evening school (costs and accounts; 38 in courses for teachers; and 481 in the summer school), 335 in the graduate school, 327 in the department of law, 559 in the department of medicine, 385 in the department of dentistry, and 150 in the department of veterinary medicine.

In August 1807 the excess of the university's assets over its liabilities was $13,239,408 and the donations for the year were $305,614. A very large proportion of the university's investments is in real estate, especially in Philadelphia. In 1807 the total value of real estate (including the university buildings) was $6,820,154; and libraries, museums, apparatus and furniture were valued at $2,025,057. Students' tuition fees vary from $150 to $200. Profits were made in the department of law, $200 in the department of medicine, $150 in the department of dentistry and $100 in the department of veterinary science. The income from tuition fees in 1907-1908 was $468,396; the payments for "educational salaries" amounted to $433,317, and for "administration salaries" to $135,314.

The university publishes the following series: Astronomical Series (1839 sqq.); Contributions from the Botanical Laboratory (1829 sqq.); Contributions from the Laboratory of Hygiene (1899 sqq.); Contributions from the Zoological Laboratory (1893 sqq.); Series in History (1901 sqq.); Series in Mathematics (1897 sqq.); Series in Philosophy (1890 sqq.); Series in Roman and Classical Literature (1907 sqq.); Series in Political Economy and Public Law (1885 sqq.); The American Law Register (1852 sqq.); The University of Pennsylvania Medical Bulletin (1893 sqq.); Transactions of the Department of Agriculture (1904 sqq.); the Journal of Morphology (1887 sqq.); and Transactions and Proceedings of the Botanical Society of Pennsylvania (1897 sqq.). There are also occasional publications by institutes and departments connected with the university. Student publications include: a daily, The Pennsylvania (1885); the weekly, Old Penn (1902); a comic monthly, The Punch Bowl; a literary monthly, The Red and Blue; a quarterly of the department of dentistry, The Dental Journal; an annual, The Record; and The Alumni Register (1896), a monthly.

Benjamin Franklin in 1740 published a pamphlet, entitled Proposals Relating to the Education of Youth in Pennsylvania, which led to the formation of a board of twenty-four trustees, nineteen of whom, on the 13th of November 1749, met for organization and to propose "the Publick Academy in the City of Philadelphia," and elected Benjamin Franklin president of the board, an office which he held until 1756. So closely was Franklin identified with the plan that Matthew Arnold called the institution "the University of Franklin." On the 1st of February 1750 there was conveyed to this board of trustees the "New Building on Fourth Street, near Arch, which had been erected in 1740 for a charity school—a use to which it had not been put—and as a "House of Publick Worship," in which George Washington and Benjamin Franklin had been the original trustees (including Franklin) of the "New Building," and of its projected charity school date from 1740, and therefore the university attaches to its seal the words "founded 1740." In the "New Building" the academy was opened on the 7th of January 1751, the city having voted £200 in the preceding August for the completion of the building. On the 16th of September 1753 a charitable school "for the instruction of poor Children gratis in Reading, Writing, and Arithmetic" was opened in the "New Building." The proprietaries, Thomas and Richard Penn, incorporated "The Trustees of the Academy and Charitable School in the Province of Pennsylvania" in 1753; and in 1755 issued a confirmatory charter, changing the corporate name into "The Trustees of the College, Academy and Charitable School," etc., whereupon William Smith (1727-1803) of the university of Aberdeen, who had become rector of the academy in 1752 and had taken orders in the Church of England in 1753, became provost of the college. In 1756 Dr Smith established a complete and liberal curriculum which was adopted by Bishop James Madison in 1777 when he became president of the College of William and Mary. In 1757 the first college class graduated. Under Smith's control the Latin school grew in importance at the expense of the English school, to the great annoyance of Franklin. In 1760-1764 Dr Smith collected for the college in England about £5,000; and in 1764 his influence had become so strong that it was feared that the college would become sectarian. The Penns and others depreciated this and the trustees bound themselves (1764) to "use their utmost endeavours that . . . (the original plan) be not narrowed, nor the members of the Church of England, nor those dissenting from them . . . be put on any worse footing in this seminary than they were at the time of receiving the royal brief." From September 1777 to June 1778 college exercises were not held because Philadelphia was occupied by British troops. In 1779 the state legislature, on the ground that the trustees' declaration in 1764 was a "narrowing of the foundation," confiscated the rights of the college and chartered a new corporation called "the Trustees of the University of the State of Pennsylvania"; in 1789 the college was restored to its rights and property and Smith again became its provost; in 1791 the college and the university of the State of Pennsylvania were united under the title, "the University of Pennsylvania," whose trustees were elected from their own members by the board of trustees of the college and that of the university. In 1802 the university purchased new grounds on Ninth Street, between Market and Chestnut, where the post office building now is; there until 1829 the university occupied the building erected for the administrative mansion of the president of the United States; there new buildings were erected after 1829, and from these the university removed to its present site in 1872.

The provosts have been: in 1755-1779 and in 1780-1833, William Smith; in 1779-1791, of the university of the state of Pennsylvania, John Ewing (1732-1802); in 1807-1810, John McDowell (1750-1820); in 1810-1813, John Andrews (1746-1813); in 1813-1828, Frederick Beasley (1777-1845); in 1828-1833, William Heathcote De Lancey (1797-1805); in 1834-1853, John Ludlow (1793-1857); in 1854-1859, Henry Vethake (1792-1866); in 1860-1868, Daniel Raynes Goodwin (1811-1890); in 1868-1880, Charles Janeway Stillé (1817-1893); in 1881-1894, William Pepper (1845-1898); in 1894-1910, Charles Curtis Harrison (b. 1844), and in 1911 sqq. Edgar Fahs Smith (b. 1856).

See T. H. Montgomery, A History of the University of Pennsylvania from its Foundation to A.D. 1779 (Philadelphia, 1900); George B. Wood, Early History of the University of Pennsylvania (3rd ed., ibid., 1896); J. B. McMaster, The University of Pennsylvania (ibid. 1897); G. E. Nitzche, Official Guide to the University of Pennsylvania (ibid. 1900); and Edward P. Cheyne, "University of Pennsylvania," in vol. i. of Universities and their Sons (Boston, 1901).

PENNY (Mid. Eng. peni or peny, from O. Eng. form þenig, earlier þending and þending; the word appears in Ger. Pfennig and Du. penning; it has been connected with Du. pond, Ger. Pfand, and Eng. "pawn," the word meaning a little pledge or token, or with Ger. Pfunne, a pan), an English coin, equal in value to the one-twelfth of a shilling. It is one of the oldest of English coins, superseding the sceatt or sestert (see NUMISMATICS; and BREVIA: Anglo Saxons, § "Coins"). It was introduced into England by Offa, king of Mercia, who took as a model a coin first struck by Pippin, father of Charlemagne, about 735, which was known in Europe as novus denarius. Offa's penny was made of silver and weighed 22s grains, 240 pennies weighing one Saxon pound (or Tower pound, as it was afterwards called), hence the term pennyweight (dwt.). In 1527 the Tower pound of 5700 grains was abolished, and the pound of 5700 grains adopted instead. The penny remained, with some few exceptions, the only coin issued in England until the introduction of the gold florin by Edward III. in 1343. It was not until the reign of Edward I. that halfpence and farthings became a regular part of the coinage, it having been usual to subdivide the penny for trade purposes by cutting it into halves and quarters. A practice said to have originated in the reign of Ethelred II. In 1257, in the reign of Henry III., a gold penny, 1 Probably the actual reason was that the assembly, dominated by the advocates of the radical constitution of 1776, was attempting to punish the trustees of the college, who were almost all "anti-constitutionalists."
of the value of twenty silver pence, was struck. The weight and value of the silver penny steadily declined from 1300 onwards, as will be seen from the following table:

The last coinage of silver pence for general circulation was in the reign of Charles II. (1661-1662), since which time they have only been coined for issue as royal alms on Maundy Thursdays. Copper halfpence were first issued in Charles II.'s reign, but it was not until 1757, in the reign of George III., that copper pence were struck. This copper penny weighed 1 oz. avoirdupois. In the same year copper twopences were issued weighing 2 oz., but they were found too cumbersome and were discontinued. In 1860 bronze was substituted for the copper coinage, the alloy containing 95 parts of copper, 4 of tin, and 1 of zinc. The weight was also reduced, 1 lb of bronze being coined into 48 pennies, as against 24 pennies in which 1 lb of copper was coined.

PENN YAN, a village and the county-seat of Yates county, New York, U.S.A., situated N. of Keuka Lake, on the outlet extending to Lake Seneca, about 170 m. W. of Albany, and about 95 m. E. by S. of Buffalo. Pop. (1900), 4,554; (1910), 4,597. It is served by the New York Central & Hudson River and the Northern Central railways and by electric railway to Branchport, and has steamboat connections with Hammondsport at the head of Keuka Lake. The lake, one of the most beautiful of the so-called “finger lakes” of central New York, abounds in lake and rainbow trout, black bass, pickerel and pike, and there are many summer cottages along its shores. At Keuka Park, on the west shore of the lake, is Keuka College (1890), and at Eggleston’s Point is held a summer “natural science camp” for boys. The village is the seat of the Penn Yan Academy (1859). The lake furnishes water-power, and among the manufactures are paper, lumber, carriages, shoes, &c. Much ice is shipped from the village. Penn Yan is an important shipping point on the apple and grape-growing region of central New York, and winemaking is an important industry. The first frame dwelling at Penn Yan was built in 1799; the village became the county-seat in 1823, when Yates county was created, and was incorporated in 1833. The first settlers were chiefly followers of Jemima Wilkinson (1753-1819), a religious enthusiast, born in Cumberland township, Providence county, Rhode Island, who asserted that she had received a divine commission. She preached in Rhode Island, Connecticut, Massachusetts and Pennsylvania. Obtaining a large tract (which was called Jerusalem in 1780) in the present Yates county, she founded in 1788 the village of Hopeton on the outlet of Keuka Lake about a mile from Seneca Lake. Many followers settled there, and she herself lived there after 1790. Some of her followers left her before 1800, and then the community gradually broke up. The name of the village is said to have been derived from the first syllables of “Pennsylvania” and “Yankeen,” as most of the early settlers were Pennsylvanians and New Englanders.

1 The figure of Britannia first appeared on this issue of copper coins. The original of Britannia is said to have been Frances Stewart, afterwards duchess of Richmond (Pepys, Diary, Feb. 25, 1667). It was in Charles II.'s reign, too, that the practice was established of placing the sovereign's bust in a direction contrary to that of his predecessor.

See Lewis C. Aldrich, History of Yates County, New York (Syracuse, 1892).

PENNYROYAL, in botany, a herb formerly much used in medicine, the name being a corruption of the old herbalist's name "Pulium-royall," Pulegium regium. It is a member of the mint genus, and has been known to botanists since the time of Linnaeus as Mentha pulegium. It is a perennial herb with a slender branched stem, square in section, up to a foot in length and rooting at the lower nodes, small opposite stalked oval leaves about half-inch long, and dense clusters of small reddish-purple flowers in the leaf axils, forming almost globular whorls. It grows in damp gravelly places, especially near pools, on heaths and commons. It has a strong smell somewhat like that of spearmint, due to a volatile oil which is readily obtained by distillation with water, and is known in pharmacy as Oleum Pulegii. The specific name recalls its supposed property of driving away fleas (pulicis). Like the other mints it has carminative and stimulant properties.

PENOBSCOT, a tribe of North American Indians of Algonquian stock. Their old range was the country around the river Penobscot in Maine. They sided with the French in the colonial wars, but made a treaty of peace with the English in 1749. They fought against the English in the War of Independence, and were subsequently settled on an island in the Penobscot river, near Oldtown.

PENOLGY (Lat. poena, punishment), the modern name for criminal law, that is, the science, that concerned with the processes devised and adopted for the prevention and repression of crime. (See CRIME; CRIMINOLOGY; PRISON; JUVENILE OFFENDERS; RECIDIVISM, &c.)

PENRHYN, GEORGE SHOLTO GORDON DOUGLAS-PENRHYN, 2nd Baron (1836-1907), was the son of Colonel Edward Gordon Douglas (1800-1886), brother of the 19th earl of Morton, who, through his wife, Juliana, elder daughter and coheir of George Hay Dawkins-Pennant, of Pennhyn Castle, Carnarvon, had large estates in Wales and elsewhere, and was created Baron Penrhyn in 1866. Dawkins had inherited the estates from Richard Penryn, who was created Baron Penryn in 1763, the title becoming extinct on his death in 1808.

George Douglas-Pennant was conservative M.P. for Carnarvonshire in 1866-1868 and 1874-1880, and succeeded his father in the title in 1886. A keen sportsman, a benevolent landlord, a kind and considerate employer, Lord Penrhyn came of a proud race, and was himself of an imperious disposition. He came prominently before the public in 1897 and subsequent years in connexion with the famous strike at his Welsh slate-quarries. During his father's lifetime the management of the Penrhyn quarry had been left practically to an elective committee of the operatives, and it was on the verge of bankruptcy when in 1885 he took matters in hand; he abolished the committee, and with the help of Mr E. A. Young, who brought him in from London as manager, he so reorganized the business that this slate-quarry yielded a profit of something like £1,500 a year. The new men and new methods were, however, not to the taste of the trade unionist leaders of the quarrymen, and in 1897, when the "new unionism" was rampant in labour questions throughout England, a strike was deliberately fomented. Lord Penrhyn refused to recognize the union or its officials, though he was willing to consider any grievances from individual quarrymen, and a protracted struggle ensued, in which his determination was invincible. He became the object of the bitterest political hostility, and trade unionism exerted itself to the utmost, but vainly, to bring about some form of government intervention. Penrhyn strikers perambulated the country, singing and collecting contributions to their funds. But in spite of every pressure Lord Penrhyn insisted on being master of his own property, and by degrees the agitation collapsed. His death on the 10th of March 1907 evoked general and genuine regret. Lord Penrhyn was twice married, and had fifteen surviving children. He was succeeded in the title by his eldest son, Edward Sholto (b. 1864), who was Unionist M.P. for South Northamptonshire from 1895 to 1900.
PENRITH, a municipality of Cumberland county, New South Wales, Australia, on the Nepean River, 34 m. by rail W. by N. of Sydney. Penrith and the adjoining township of St Mary's are chiefly remarkable for their connexion with the railway. The iron tubular bridge which carries the line over the Nepean is the best of its kind in the colony, while the viaduct over Knaresbac Gulley is the most remarkable erection of its kind in Australia. There are large engineering works and railway fitting shops at Penrith, which is also the junction for all the western goods traffic. The inhabitants of both towns are mainly railway employees. Pop. (1901), of Penrith 3539, of St Mary's 1890.

PENRITH, a market town in the Penrith parliamentary division of Cumberland, England, in a valley near the river Eamont, on the Cockermouth, Keswick & Penrith, London & North Western and North Eastern railways. Pop. of urban district (1911), 9182. It contains some interesting brasses. A 14th-century grammar school was refounded by Queen Elizabeth; and there are two mansions dating from the same reign, which have been converted into inns. Though there are breweries, tanneries and saw-mills, the town depends mainly on agriculture. There are some ruins of a castle erected as a protection against the Scots. Near Penrith, in the north, above the precipitous bank of the Eamont, stands a small but beautiful old castellated house, Yanwath Hall. To the north-east of the town is Eden Hall, rebuilt in 1824. Among many fine paintings, it contains portraits by Hoppner, Kneller, Lely, Opie and Reynolds. The "Luck of Eden Hall," which has been celebrated in a ballad by the duke of Wharton, and in a second ballad written by Uhland, the German poet, and translated by Longfellow, is an enamelled goblet, kept in a leathern case dating from the times of Henry IV. or Henry V. It was long supposed to be Venetian, but has been identified as of rare Oriental workmanship. The legend tells how a seneschal of Eden Hall one day came upon a company of fairies dancing at St Cuthbert's Well in the park. These few away, leaving their cup at the water's edge, and singing "If that glass either break or fall, Farewell to the luck of Eden Hall." Its true history is unknown.

Penrith, otherwise Peneth, Perith, Penuth, was founded by the Cambro-Celts, but on a site farther north than the present town. In 1222 Henry III. granted a yearly fair extending from the eve of Whitsun to the Monday after Trinity and a weekly market on Wednesday, but some time before 1787 the market day was changed to Tuesday. The manor in 1242 was handed over to the Scottish king who held it till 1305, when Edward I. seized it. In 1397 Richard II. granted it to Ralph Neville, first earl of Westmorland, who by a grant of 1421, made Penrith a borough and gave it the liberty to hold his court on his death to the crown. In 1604 William III. granted the honour of Penrith to the earl of Portland, by whose descendant it was sold in 1787 to the duke of Devonshire. A court leet and view of frankpledge have been held here from time immemorial. In the 18th and early part of the 19th century Penrith manufactured checks, linen cloth and gingham, but the introduction of machinery put an end to this industry, only the making of rag carpets surviving. Clock and watch-making seems to have been an important trade here in the 18th century. The town suffered much from the incursions of the Scots, and Ralph, earl of Westmorland, who died 1426, built the castle, but a tower called the Bishop's Tower had been previously erected on the same site. In 1537-1538 a terrible visitation of plague attacked the town, in which, according to an old inscription on the church, 2260 persons perished in Penrith, by which perhaps is meant the rural deanery. During the Civil War the castle was dismantled by the Royalist commandant. In 1745 Prince Charles Edward twice marched through Penrith, and a skirmish took place at Clifton. The church of St Andrew is of unknown foundation, but the list of vicars is complete from 1223.

PENRY, John (1559-1593). Welsh Puritan, was born in Brecknockshire in 1559; tradition points to Cefn Brith, a farm near Llangammarsh, as his birthplace. He matriculated at Peterhouse, Cambridge, in December 1580, being then almost certainly a Roman Catholic; but soon became a convinced Protestant, with strong Puritan leanings. Having graduated B.A., he migrated to St Alban's Hall, Oxford, and proceeded M.A. in July 1586. He did not seek episcopal ordination, but was licensed as University Preacher. The tradition of his preaching tours in Wales is slenderly supported; they could only have been made during a few months of 1586 or the autumn of 1587. At this time ignorance and immorality abounded in Wales. In 1582 an act of parliament had made provision for translating the Bible into Welsh, and the New Testament was issued in 1587; but the number printed would barely supply a copy for each parish church. Indignant at this negligence, Penry published, early in 1587, The Equity of an humble supplication—in the behalf of the country of Wales, that some order may be taken for the preaching of the Gospel among those people. Archbishop Whitgift, angry at the implied rebuke, caused him to be brought before the High Commission and imprisoned for about a month. On his release Penry married a lady of Northampton, which town was his home for some years. With the assistance of Sir Richard Knightley and others, he set up a printing press, which for nearly a year from Michaelmas 1588 was in active operation. It was successively located at East Moulsey (Surrey), Fawley (Northampton), Coventry and other places in Warwickshire, and finally at Manchester, where it was seized in August 1589. On it were printed Penry's Exhortation to the governors and people of Wales, and View of . . . such publick wants and disorders as are in the service of God . . . in Wales; as well as the celebrated Martin Margrétale tracts. In January 1590 his house at Northampton was searched and his papers seized, but he succeeded in escaping to Scotland. There he published several tracts, as well as a translation of a learned theological work known as Thesae Geneenses. Returning to England in September 1592, he joined the Separatist Church in London, in which he declined to take office, though after the arrest of the ministers, Francis Johnson and John Greenwood, he seems to have been the regular preacher. He was arrested in March 1593, and efforts were made to find some pretext for a capital charge. Failing this a charge of sedition was based on the rough draft of a petition to the queen that had been found among his private papers; the language of which was indeed harsh and offensive, but had been neither presented nor published. He was convicted by the Queen's Bench on the 21st of May 1593, and hanged on the 29th at the unusual hour of 4 p.m., the signature of his old enemy Whitgift being the first of those affixed to the warrant.

See the Life, by John Waddington (1854).

PENRYN, a market town and port, and municipal and contributory parliamentary borough of Cornwall, England, 2 m. N.W. of Falmouth, on a branch of the Great Western railway. Pop. (1901), 3100. It lies at the head of the estuary of the Penry River, which opens from the main estuary of the Fal at Falmouth. Granite, which is extensively quarried in the neighbourhood, is dressed and polished at Penryn, and there are also chemical and bone manure works, engineering, iron and gunpowder works, timber-yards, brewing, tanning and paper-making. The harbour dries at low tide, but at high tide has from 9 to 102 ft. of water. Area, 201 acres. Penryn owed its development to the fostering care of the bishops of Exeter within whose demesne lands it stood. These lands appear in Domesday Book under the name of Trevel. In 1250 Bishop Briwere granted to his burgesses of Penryn that they should hold their burgages freely at a yearly rent of 10d. by the acre for all service. Bishop Walter de Stapeldon secured a market on Thursdays and a fair at the Feast of St Thomas. The return to the bishop in 1307 was £7, 13s. 2d. from the borough and £26, 7s. 6d. from the forum. In 1311 Bishop Stapeldon procured a three days' fair at the Feast of St Vitalis. Philip and Mary gave the parliamentary franchise to the burgesses in 1553. James I. granted and renewed the charter of incorporation, providing a mayor, eleven
aldermen and twelve councillors, markets on Wednesdays and Saturdays, and fairs on the 1st of May, the 7th of July and the 21st of December. The charter having been surrendered, James II. by a new charter inter alia confined the parliamentary franchise to members of the corporation. This proviso being so soon disregarded, the franchise was freely exercised by all the inhabitants, paying scot and lot. An attempt to deprive the borough of its members, owing to corrupt practices, was defeated by the House of Lords in 1827. The act of 1832 extended the franchise to Falmouth in spite of the rivalry existing between the two boroughs, which one of the sitting members asserted was so great that no Penryn man was ever known to marry a Falmouth woman. In 1885 the united borough was deprived of one of its members. The corporation of Penryn was remodelled in 1835, the aldermen being reduced to four. Its foreign trade, which dates from the 14th century, is considerable. The extra-parochial collegiate church of Glasney, founded by Bishop Bronescombe in 1265, had a revenue at the time of its suppression under the act of 1545 of £231,185. 4d.

See Victoria County History, Cornwall; T. C. Peter, Glasney Collegiate Church.

PENSACOLA, a city, port of entry, and the county-seat of Escambia county, Florida, U.S.A., in the N.W. part of the state, on Pensacola Bay, about 6 m. (11 m. by channel) N. of the Gulf of Mexico. Pop. (1900) 17,747; (1910) 22,982. It ranks second in size among the cities of Florida. The city is served by the Louisville & Nashville and the Pensacola, Alabama & Tennessee railways, and by steamers to West Indian, European and United States ports. The harbour1 is the most important deep-water harbour south of Hampton Roads. The narrow entrance is easily navigable and is defended by Fort Pickens on the west end of Santa Rosa Island, with a great sea-wall on the Gulf side (completed in 1900), Fort McRee on a small peninsula directly opposite, and Fort Barrancas on the mainland immediately north-east of Fort McRee. On the mainland 1 m. east of Fort Barrancas are a United States Naval Station, consisting of a yard (84 acres enclosed) with shops, a steel floating dry dock and marine barracks; and a reservation (1800 acres) on which are a naval hospital, a naval magazine, two timber ponds, a national cemetery, and the two villages of Warrington and Woolsey, with a population of about 1,500, mostly employed of the yard. The city's principal public buildings are the state armory, the Federal building, and the city hall. The mean annual temperature is about 72° F., and freezes from the Gulf temper the heat. Pensacola is a shipping point for lumber, naval stores, tobacco, phosphate rock, fish, cotton and cotton-seed oil, meal and cake, and is one of the principal markets in the United States for naval stores. In 1895 the foreign exports were valued at $3,106,069, in 1897 at $8,436,679, and in 1900 at $20,971,670; the imports in 1900 were valued at $4,479,017. The important factor in this vast development has been the Louisville & Nashville railway, which after 1895 built extensive warehouses and docks at Pensacola. There are excellent floating docks—good coal is brought hither from Alabama—and a grain elevator. Among the manufactures are sashes, doors and blinds, whiting, fertilizers, resin and turpentine, and drugs.

Pensacola Bay may have been visited by Ponce de Leon in 1533 and by Panfilo de Narvaez in 1528. In 1540 Maldonado, the commander of the fleet that brought De Soto to the Florida coast, entered the harbour, which he named Puerta d'Auchusi, and on his recommendation De Soto designated it as a basis of supplies for his expedition into the interior. In 1559 a permanent settlement was attempted by Tristan de Luna, who renamed the harbour Santa María, but two years later this settlement was abandoned. In 1668 another settlement was made by Don Andres d'Arriola, who built Fort San Carlos near the site of the present Fort Barrancas, and seems to have named the place Pensacola. In 1710, Spain and France, being at war, Pensacola was captured by Sieur de Bienville, the French governor of Louisiana. Later in the same year it was successively re-taken by a Spanish force from Havana and recaptured by Bienville, who burned the town and destroyed the fort. In 1723, three years after the close of hostilities, Bienville collected his possessions and moved his settlement to the west end of Santa Rosa Island, but after a destructive hurricane in 1754 they returned to the mainland. In 1763, when the Floridas were ceded to Great Britain, Pensacola became the seat of administration for West Florida and most of the Spanish inhabitants removed to Mexico and Cuba. During the War of American Independence the town was a place of refuge for many Loyalists from the northern colonies. On the 9th of May 1781 it was captured by Don Bernardo de Galvez, the Spanish governor at New Orleans. Most of the English inhabitants left, but trade remained in the hands of English merchants. During the War of 1812 the British made Pensacola the centre of expeditions against the Americans, and in 1814 a British fleet entered the harbour to take formal possession. In retaliation General Andrew Jackson attacked the town, driving back the British. In 1818, on the ground that the Spanish encouraged the Seminole Indians in their attacks upon the American settlements in the vicinity, Jackson again captured Pensacola, and in 1821 Florida was finally transferred to the United States. On the 12th of January 1861 the Navy Yard was seized by order of the state government, but Fort Pickens, defended first by an insignificant force under Lieut. Adam J. Slemmer (1858–68) and afterwards by a larger force under Lieut.-Colonel Henry Brown (1869–74), remained in the hands of the Union forces, and on the 8th of May 1862 the Confederates abandoned Pensacola. Pensacola was chartered as a city in 1895.

PENSHURST, a village in the south-western parliamentary division of Kent, England, at the confluence of the Eden and Medway, 4½ m. S.W. of Tonbridge. Pop. (1901) 1,678. The village is remarkable for some old houses, including a timbered house of the 15th century, and for a noted factory of cricket implements. The church, chiefly late Perpendicular, contains a large number of monuments of the Sidney family and an effigy of Sir Stephen de Penchester, Warden of the Cinque Ports in the time of Edward I. Penhurst Place is celebrated as the home of the Sidney family. Anciently the residence of Sir Stephen de Penchester, Penhurst was granted to Henry VIII's chamberlain, Sir William Sidney, whose grandson, Sir Philip Sidney, was born here in 1554. It passed to Sir Philip's younger brother Robert, who in 1618 was created earl of Leicester. On the death of the seventh earl in 1743 the estates devolved upon his niece Elizabeth, whose only child married Sir Bysshe Shelley of Castle Goring. Their son was created a baronet in 1818 as Sir John Shelley-Sidney, and his son was created Baron de L'Isle and Dudley in 1835. The mansion is quadrangular, and has a fine court, chapel and hall (c. 1341) with open timber roof and a minstrels' gallery. The various rooms contain an interesting collection of portraits, armour and other family relics. The praises of the park and the house have been sung in Sir Philip Sidney's Arcadia, and by Ben Jonson, Edmund Waller and Robert Southey.

PENSION (Lat. pensio, a payment, from pendere, to weigh, to pay), a regular or periodical payment made by private employers, corporations or governments, in consideration either of past services or of the abolition of a post or office. Such a pension takes effect on retirement or when the period of service is over. The word is also used in the sense of the payment by members of a society in respect of dues.

United Kingdom.

In the United Kingdom the majority of persons in the employ of the government are entitled to pensions on reaching a certain age and after having served the state for a certain minimum number of years. That such is the case, and moreover that it is usual to define such pensions as being given in consideration of past services, has led to the putting forward very generally the argument that pensions, whether given by a government or
by private employers, are in the nature of deferred pay, and that holders of posts which carry pensions must therefore be rewarded by a remuneration less than the free market rate, by the very nature of the system. This is hardly correct, for the object of attaching a pension to a post is not merely to reward past services, but to attract continuity of service by the holder as well as to enable the employer to dispense with the services of the employé without hardship to him should age or infirmity render him less efficient. Dissatisfaction had been expressed from time to time by members of the English civil service with the system in force, viz. that the benefit of long service was confined only to survivors, and that no advantage accrued to the representatives of those who died in service. This was altered by an act of 1909. See Royal Commission on Superannuation in the Civil Service: Report and Evidence (1905). For the general provisions given by the state to the aged poor see Old Age Pensions.

Civil Service.—In the English civil service the grant of pensions on superannuation is regulated by statute, the four principal acts being the Superannuation Acts of 1834, 1859, 1887 and 1909. To qualify for a pension it is necessary (1) that a civil servant should have been admitted to the service with a certificate from the civil service commissioners, or hold an office specially exempted from this requirement; (2) that he should have served the whole time to the post of his appointment; (3) that he should draw the emoluments of his office from public funds exclusively; (4) that he should have served for not less than ten years; (5) that if under the age of 60 years he should have reached a certain percentage of the normal duration of body or mind, of discharging his official duties, or have been removed from his office on the ground of his inability to discharge his duties efficiently. On retirement on these conditions a pension is qualified for; a pension calculated at one-twelfth of his retiring salary (or, in certain cases, of his average salary for the last three years) for each complete year of service, subject to a maximum of forty-eightieths. Civil servants retiring on the ground of ill-health after less than ten years' service qualified for a gratuity of one month's pay for each year of service. Previous to the Superannuation Act of 1909 the pension was calculated at the rate of one-sixtieth of the retiring salary for each completed year of service, that is, the greatest pension that could be paid was one-twelfth of the rate for those who entered the service previous to the passing of the act (September 20, 1909) unless they availed themselves of the permission in the act to take advantage of its provisions, which were more than a compensation for the lowering of the rate. The act gave power to the treasury to grant by way of additional allowance to a civil servant who retired after not less than two years' service, in addition to his superannuation, a lump sum equal to one-twelfth of his annual salary, if he had served the number of completed years he has served, so however, that such lump sum does not exceed one and a half times his salary, while if he has not reached his sixtieth age, the amount is one-twelfth of his salary deducted from that lump sum one-twentieth for every completed year that he has served after attaining that age. In the case of those who entered the service before the passing of the act, and take up pension on the ground of ill-health, his additional pension shall be not exceeding one-half per cent. for each completed year served at the passing of the act. The act also provided that where a civil servant died after serving five years or upwards, a gratuity equal to his annual salary and emoluments might be granted to his legal personal representatives. Where the civil servant attains the age of sixty-five this gratuity is reduced by one-twentieth for each completed year beyond that age. On the other hand, where the civil servant has retired from the service and all the sums received by him at his death on account of superannuation are less than his annual salary his representatives may receive the difference as a gratuity. Provision was also made in the act for granting compensation on account of sickness or injury, and within the time limits specified above, exceeding what the recipient might be entitled to if he retired on the ground of ill health. Pensions are also sometimes awarded in excess of the scale as a reward for special services, as compensation for injury in certain cases, or to holders of professional offices, appointed at an age exceeding that at which public service ordinarily begins. In the estimates for civil services for the year 1909–1910, there was provided for non-effective and other pensions and annuities, the total amount of which (as are known as) the sum of £9,652,920; this, however, included an item of £8,750,000 for old-age pensions, leaving a sum of £875,920. This is the Consolidated Fund sum, on account of pensions and compensation allowance for civil, judicial and sanitary servants, an item of £14,767, while the following sums for civil pensions were provided in the estimates of the several departments: War Office, £4,262,760; Admiralty, £802,750; £421,558; Inland Revenue, £16,960; Post Office, £699,400; Royal Irish Constabulary, £4,160; Dublin Metropolitan Police, £33,645; making a total of £2,982,167, or a gross total for civil pensions of £174,087. A return is published annually containing a complete list of the various pensions.

Pension

Perpetual or Hereditary Pensions.—Perpetual pensions were freely granted either to favourites or as a reward for political services from the time of Charles II. onwards. Such pensions were very rarely stipulated to terminate on the death of the pensioner or his issue; they continued, or, just as often, posts which were really necessary were grossly overpaid, while the duties were discharged by a deputy at a salary which often scarcely equalled the intrinsic value of the offices. In Charles II.'s reign Queen Anne such pensions or annuities were charged on the hereditary revenues of the sovereign and were held to be binding on the sovereign's successors (The Bankers' Case, 1691; State Trials, xiv. 343). By 1 Anne a new system was introduced, providing that any provision made with this view might be charged with pensions beyond the life of the reigning sovereign. This act did not affect the hereditary revenues of Ireland and Scotland, and many persons were quartered, as they were in Ireland, before this act. By the Act of 13 Anne the Irish court could not be provided for in England—for example, the duke of St Allans, illegitimate son of Charles II., had an Irish pension of £300 a year; Catherine Sedley, mistress of James II., had an Irish pension of £300 (Lecky, History of Ireland in the Eighteenth Century). These pensions had been given in every conceivable form—during the pleasure of the Crown, for the life of the sovereign, for terms of years, for the life of the grantee, and for several lives in being or in reversion (Erskine May, Constitutional History of England). By an act of 1792 the surrender of the hereditary revenues in return for a fixed civil list, this civil list became the source from which the pensions were paid, and was established on a sound basis. The grant of pensions was a matter of personal trust, subject to the right of the Crown to vary them from time to time, and the terms upon which the redemption took place. The nature of some of these pensions may be gathered from the following examples: To the duke of Marlborough and his heirs in perpetuity, £4,000 per annum; this annuity was redeemed in August 1884 for a sum of £107,750, by the creation of a ten years' annuity of £17,756.17s. per annum. By an act of 1806 an annuity of £500 was granted to Lord Darlington, the issue of John Nelson, for the life of his wife. In 1793 an annuity of £2,000 was conferred on Lord Rodney and his heirs. All these pensions were for services rendered, and although justifiable from that point of view, a preferable policy is pursued to-day. In the latter part of the 19th century cases of pensions, such as those of Lord Kitchener in 1902 (£50,000) and Lord Cromer in 1907 (£50,000), Charles II. granted the office of receiver-general and of the bank of Ireland to the son of one of his servants in return for £2,000 a year to the family. This was unprecedented, in as much as it was a direct payment of the revenue. It is a case of the duke of Grafton. This was purchased in 1825 from the duke for an annuity of £843, which in turn was commuted in 1883 for a sum of £27,714, 12s. 8d. To the same duke was given the office of the paymaster of first-fruits and coehns of the clergy. This office was sold by the duke in 1765, and after passing through various hands was purchased by one R. Harrison in 1798. In 1835 on the loss of certain fees the holder was compensated by a grant of £62, as 8d. The duke of Grafton also possessed an annuity of £6870 in respect of the commutation of the due of butterage and priage. To the duke of St Albans was granted in 1684 the office of master of the hawks. The sums of money that were paid, £591, 18s. 5d.; four falconers at £50 per annum each, £200; provision of hawks, £600; provision of pigeons, hens and other meats, £182, 10s.; total, £1373, 11s. 5d. This amount was reduced by office fees and other deductions to £695, at which amount it stood, and was commuted in 1819 for £18,335. To the duke of Richmond and his heirs was granted in 1676 a duty of one shilling per ton on all coals exported from the Tyne for consumption in England. This office was commuted in 1819. Later in the same century (1800) there was purchased on the consolidated fund, which was afterwards redeemed for £633,333. The duke of Hamilton, as hereditary keeper of the palace, Holyrood House, received a perpetual pension of £45, 10s., to which was added £5 per annum from the revenue of Scotland due to the Crown for the house of £242, 10s. The conclusions of the committee were that pensions, allowances and payments should not in future be granted in perpetuity, on the ground that the future could not be relied on, the beneficiaries of such pensions might be benefit or be harmed by the generation benefited; that offices with salaries and without duties, or with merely nominal duties, ought

These recommendations of the committee were adopted by
the government and outstanding hereditary pensions were
granted in the only cases of officers acting those 27 years' purchase,
Lord Rodney (£5,000) and to Earl Nelson (£5,000), both chargeable
on the consolidated fund.

Before the passing of the Political Offices Pensions Act 1869,
pensions were instituted for those who had held political office.
For the purposes of the act political offices were divided into three
classes: (1) those with a yearly salary of not less than £5,000;
(2) those with a salary of less than £2,500, but above £1,000;
(3) those with a salary of less than £2,000 and more than £1,000.
For service in these offices there may be awarded pensions for life
in the following scale: (1) a first class pension not exceeding £2,000
a year, or the equivalent of not less than four years' service or its equivalent
in an office of the first class; (2) a second class pension not exceeding £1,000,
in respect of service of not less than six years or its equivalent,
in an office of the second class; (3) a third class pension not exceed-
ing £500 a year, or the equivalent of not less than 12 years' service or its equivalent,
in an office of the third class. The service need not be continuous,
and the act makes provision for counting service in lower classes
as a qualification for pension in classes immediately above them.
These pensions are payable for a period of 12 years, but a holder must not receive any
other pension out of the public revenue, if so, he must inform the treasury and surrender it if it exceeds his political pension, or if under 
any circumstances ammounts to more than £2,000 a year, while a pensioner, but the pension is not payable during the time he
holds office. To obtain a political pension, the applicant must file
a declaration stating the grounds upon which he claims it and that
his income from other sources is not sufficient to maintain his
station in life.

Civil List Pensions. These are pensions granted by the
sovereign from the civil list upon the recommendation of the first
lords of the treasury, under § 1 and § 2 of the Act 25 Geo. IV. c. 115.
Judicial, Municipal, &c. There are certain offices of the exec-
cution of the civil law, where pensions are regulated by stipulations
of the judges of the Supreme Court, on completing fifteen years' service
or becoming permanently incapacitated for duty, whatever their
length of service, may be granted a pension equal to two-thirds of their
wages (Act 53 Geo. III. c. 57). These pensions, however, were abolished
by the Act 35 Geo. III. c. 42, 1815. The former pensions were
paid for any service of not less than nine years, but the pensions
are payable only in the case of very few officers. There are, however,
outstanding a number of pensions which are a charge
upon the revenues of the see or cure vacated.

Navy pensions were first instituted by William III. in 1693 and
regularly sanctioned by the Act 1 John, c. 6, 1697. The Queen
Since then the rate of pensions has undergone various modifications
and alterations; the full regulations concerning pensions to all
ranks will be found in the quarterly Navy List, published by the
authorities. In addition to the ordinary pensions there are also
good-service pensions, Greenwich Hospital pension
and pensions for wounds. An officer is entitled to a pension when
he is retired at the age of 45, or if he retires between the ages of
40 and 45 on account of infirmity or other necessaries.
The amount of his pension depends upon his rank, length of service
and age. The maximum retired pay of an admiral is £850 per annum,
for which 30 years' service or its equivalent in half-pay time
is required. In addition an additional good-service navy
pension of £500 per annum. The maximum retired pay of a vice-admiral,
with 29 years' service is £725; of rear-admirals with 27 years' service
£600 per annum. Pensions of captains who retire at the age of
55, commanders, who retire at 50, and lieutenants who retire
at age 45, range from £200 per annum for 17 years' service to £525 for
24 years' service. The pensions of other officers are calculated in
the same way, according to age and length of service. The
good-service pensions consist of ten pensions of £300 per annum
for flag-officers, two of which may be held by vice-admirals and two
by rear-admirals; six for commanders and two for captains; and
two of £500 a year for engineer officers; three of £100 a year
for medical officers of the navy; six of £200 a year for general officers
of the Royal Marines and two of £150 a year for colonels and lieut-
men of the army. Greenwich Hospital pensions range from £300
£50 a year for flag officers to £25 a year for warrant officers. All
seamen and marines who have completed twenty-two years' service are
entitled to a pension amounting from 10d. a day to a maximum of
15d. a day, according to the number of years of full-service, together
with the good-conduct medal, possessed. Petty officers, in ad-
dition to the rates of pension allowed them as seamen, are
allowed, in each year of service, the sum of 1s. 6d. for
lieutenant-officer, 1s. 2d. a year, and in the capacity of inferior petty officer
7s. 7d. a year. Men who are discharged the service on account of
injuries and wounds or disability attributable to the service are
pensioned under special circumstances. These pensions and
 allowances are also given to the widows of officers in certain circumstances
and compassionate allowances made to the children of officers.

In the Navy estimates for 1900-1901 the amount required for half-
yearly and retired pay was £688,300, and for pensions, gratuities and
compassionate allowances £1,334,600, a total of £2,203,400.

Army.—The system of pensions in the British Army is somewhat
intricate, provision being made for dealing with almost every case
separately. As a general rule officers can retire after eight years
service on a pension of £100 per annum for ten years, provided that
they take commisions in either the Imperial Yeomanry or Special
Reserves, and at the same annuities as during their period of
service. The other pensions are as follows: 2nd lieutenant-colonel and
majors after 15 years' service (or 12 years in the West India
regiment), £120, if 45 years of age £200; majors, after 25 years' service,
colonel in any rank of the army, £300; lieutenant-colonels, after
3 years as such, with 15 years' service, £250, with 27 years' service,
£300, with 30 years' service, £365, after term of employment as lieut-
tenant-colonel commanding a unit, or staff appointment as lieutenant-
colonel, or after 5 years as lieutenant-colonel cavalry and infantry,
£240. Royal artillery, royal engineers and army service corps,
£150; Colonels, after 5 years as colonel, cavalry and infantry, £240.
Warrant officers can also receive pensions on completing the term of
commission of a regimental district or a regiment of foot-guards, or
employed in any other capacity for three years, £450 £500 accord-
ging to age; Brevet-colonels, with the substantive rank of lieutenant-colonel, receive, cavalry or infantry, £240; royal artillery, royal engineers and army service corps, £150.
Major-generals retire at the age of 62 with a pension of £700;
genерal-staff-officer at 67 with £650; generals at 67 with £1,000.

Officers whose first permanent commission bears date prior to
the 1st of January, 1887, retire with a gratuity in lieu of pension.

Of the departmental corps retire either with pensions
annually to 10s. daily, or with gratuities ranging from £500 to £1,000.

Warrant officers with 5 years' service as such, and 20 years' total
service, receive 3s. 6d. per diem if discharged from the service on
completion of term of commission, or in any way discharged for any
reasons (except misconduct or inefficiency) they receive from 3s. 6d. to 5s. per diem, according to length of service and
corps. If they have less than 5 years service as warrant
officers, but more than 22 years total service, they have
at least 3s. per diem; and if discharged at their own request after
18 years' total service, 2s. 7½d.

Additional pensions are given at the rate of 6d. per diem for
painful conduct, and 1½, 1½s. per diem for re-employed pensioners on
completing their second term of employment, with 3d. per diem extra
if promoted while so serving. Special pensions are also
granted in exceptional cases.

For the purpose of these pensions, non-commissioned officers are
divided into four classes, corresponding roughly to quartermaster-
sergeants, colour-sergeants, sergeants and corporals.

With not more than 21 years' total service, and with the following
numbers of pensions in service in one of the above classes, the rates of
pensions (per diem) are as follows:

<table>

</table>

A man promoted to higher rank within one year of his completing 21 years' service, receives, on his discharge in the higher rank, an extra 3d. per diem, provided that he has completed 25 years' service in all. An additional pension of 6d. per diem is also granted to widows, if the husband, if of the rank of N.C.O.'s and men disabled through military service are granted the following pensions:

If partially capable of earning a livelihood

| Class I. to III. | 1s. to 3s. per diem. |
| Class IV. | 2s. 6d. to 3s. 6d. per diem. |
| Class V. | 2s. 6d. to 3s. 6d. per diem. |

If totally incapable of earning a livelihood

| Class I. to III. | 4d. to 2s. per diem. |
| Class IV. | 6d. to 1s. 6d. per diem. |

Pensions may also be granted to N.C.O.'s and men who are disabled by causes other than military service, according to circumstances.

United States

In the ordinary sense of the word, pensions in the United States are confined to federal judges and officers of the army and navy, but the United States "Pension Fund" is so singular a feature of the national budget, that it is desirable to give an account of the different classes of allowances which are granted. In the United States allowances for services in wars prior to the 4th of March 1861 are called "old war" pensions, and may be divided into three classes, viz: (1) Invalid pensions, based upon wounds or disabilities received, or disease contracted in the course of duty; (2) pensions for service and land bounty, both granted for service irrespective of injuries; (3) pensions for disabled soldiers who served in or were subject to the War of Independence, the late war with Mexico, or the late war with China.

The first provision made by Congress for pensions was a resolution passed on the 26th of August 1776, promising invalid pensions to officers and men of the army or navy who lost a limb or were otherwise disabled in the War of Independence, at a rate equal to half of their monthly pay as officers or soldiers during life or continuance of the disability, those not totally disabled to receive an adequate monthly pension not to exceed half of their pay. Then followed various Acts of Congress enlarging the provisions for invalid pensions and pensions for service and land bounty, to widows and children of those who served in the war or died as a result thereof. Other acts were subsequently passed making further provision for pensions for services in the line of duty.

The first general law granting "service" pensions was not passed until the 18th of March 1818, thirty-five years after the termination of the War of Independence. Its beneficiaries were required to be in indigent circumstances and in need of assistance from their country. Two years later Congress became alarmed by reason of the large number of claims filed (about 8000) and enacted what was known as the "Alarm Act," requiring each applicant for pension and each pensioner on the rolls to furnish a schedule of his whole estate and income, closing the rolls in 1813, seventy years after the close of the War of Independence as to the time of marriage was removed. The rolls in 1901 contained nine and in 1908 two pensions based upon service in the War of Independence. The last survivor was Daniel F. Bakeman, who died on the 5th of April 1869, aged 109 years and 6 months.

The first law granting service pensions on account of the war of 1812 was passed in 1871, fifty-six years after the close of the war. This act required sixty days' service. Widows were not pensionable unless the marriage to the soldier was not granted to widows of the soldiers of this war until 1836, and then only for a period of five years and on condition that the marriage of the soldier was prior to his last service, and that the soldier's service was not less than six months. As late as 1853, seventy years after the close of the War of Indepependence as to the time of marriage was removed. The rolls in 1901 contained nine and in 1908 two pensions based upon service in the War of Independence. The last survivor was Daniel F. Bakeman, who died on the 5th of April 1869, aged 109 years and 6 months.

to persons who had served ninety days or more in the military or naval service in the civil war, or sixty days in the Mexican war, and were honourably discharged, no other conditions being attached. The rate of pension was fixed at $12 per month for each year of age, $15 per month when seventy years of age and $20 per month when seventy-five years of age. The act of April 1908, fixed the rate of pension for widows, minor children under the age of 21, and helpless minor children of full or half blood or afterwards be placed on it at $12 per month, and granted pensions at the same rate to the widows of persons who served ninety days or more during the Civil War, without age to their pecuniary condition. In 1908 there were 140,660 invalids on the roll, and 4,929 minor and helpless children. In the same year under the act of 1907 there were 338,341 dependents, while under the act of 1906, 188,445 were on the pension roll. All persons employed in the department of public health as nurses during the Civil War for six months or more, who are unable to earn a support, are granted a pension of $12 per month by an act of the 5th of August 1892. In 1908 the pension rolls contained the names of 3,110 pensioners under this act.

There were on the roll in 1908 on account of the Spanish war, 11,786 invalids and 3,722 dependents. The total amount paid in pensions in 1908 on account of the Spanish war, the Philippine Islands was $3,654,122. The grand total of pensioners on the roll for all wars was, in 1908, 95,687.

In addition to pensions, the United States government grants the following gratuities: First: If a soldier lost a limb in the service, or as a result of his service in line of duty, he is furnished with an artificial limb free of cost every three years, or commuta-
tive. Second: If the same person has more than one artificial limb, the additional will be furnished at a cost of $25 each, to be selected by the artificial limb. Third: If a soldier is injured in battle or in an accident, he shall be admitted to a hospital maintained by the United States and be furnished with all necessary care. The United States government, of course, pays for its hospital services for all soldiers, in addition to the cost of hospital services. The act of 1908 to this extent.

In the States of the province of Holland pensionary of the order of nobles (Ridderschap) was the foremost official of that assembly and he was named—until the death of Oldenbarnevelt in 1619—the land’s advocate, or more shortly, the advocate. The importance of the advocate was much increased after the outbreak of the revolt in 1572, and still more so during the long period 1586-1610 when John van Oldenbarnevelt held the office. The advocate drew up and introduced all legislation, controlled the House of Estates, and was the chief financial officer of the province. When it was not in session he was a permanent member of the college of deputed councillors who carried on the administration. He was minister of justice and of finance.

All correspondence passed through his hands, and he was the head and the spokesman of the deputation, who represented the province in the States General. The conduct of foreign affairs in particular was entrusted almost entirely to him.

After the downfall of Oldenbarnevelt the office of lands’-advocate was abolished, and a new post, tenable for five years only, was erected in its place with the title of Raad-Pensionaris—or Pensionary of the Council, usually called by English writers Grand Pensionary. The first holder of this office was Anthony Duyck, Jacob Cats and Adrian Pauw, in the office of the stadholders Frederick Henry and William of Orange II had to be content with lessened powers, but in the stadtholderless régime 1652-1672 the grand pensionary became even more influential than Oldenbarnevelt himself, since there was no prince of Orange filling the offices of stadholder, and of admiral and captain-general of the Union. From 1653-1672 John de Witt, re-elected twice, made the name of grand pensionary of Holland for ever famous during the time of the wars with England. The best known of his successors was Anthony Heinsius, who held the office from 1688 to his death in 1720. He was the intimate friend of William III., and after the decease of the king was sent to England in 1701 to carry out the negotiations for the peace of Nijmegen period that followed. The office was abolished after the conquest of Holland by the French in 1795.

lant, The Hague, 1901; G. W. Vreeke, Inleiding tot eene Geschr. der Nederlandsche Diplomatie (Utrecht, 1858).

PENTAMETER, the name given to the second and shorter line of the classical elegiac verse. It is composed of five (stère) feet or measures (sýræ), and is divided into two equal parts of two and a half feet each; the former must be dactylic, and the first must be either dactylic or spondaic. The first part must never overlap into the second, but there must be a break between them. Thus:

\[ \text{foot} \quad \text{foot} \quad \text{foot} \quad \text{foot} \quad \text{foot} \]

In the best Latin poets, the first foot of each part of the pent-
meter is a dactyl. The pentameter scarcely exists except in conjunction with the hexameter, to which it always succeeds in elegaic verse. The invention of the rigid dactylic form was attributed by the Greeks to Archilochus. Schiller described the sound and the method of the elegiac couplet in two very skilful verses, which have been copied in many languages:

In Hexameter steigt des Springquell’s flüssige Säule
Im Pentameter drauf fällt sie melodisch herab.

The pentameter was always considered to add a melancholy air to verse, and it was especially beloved by the Greeks in those recitations (pantéscope) to the sounds of the flute, which formed the earliest melodic performances at Delphi and else-
where.

PENTASTOMIDA, or Linguatulina, vermiform entoparasitic animals, of which the exact zoological position is unknown, although they are usually regarded as highly modified degenerate Arachnida of the order Acari.

The body is sub-cylindrical or somewhat convex above, flatter below, broad and oval in front and narrowed and elongate behind. Its integument is marked by a number of transverse grooves simulating the segmentation of Annelids, and near the anterior extremity close to the mouth are numerous hook-like teeth. The alimentary canal is a simple tube traversing the body from front to end, the anus opening at the extremity of its narrowed tail-like termination. The nervous system is represented by an large cord running in the collar region, then passing through the oviducts, and connected with the lateral line system by a pair of lateral nerves. The testes and oviducts are directly derived from the mesoderm, and receive no somatic connection with them. The male reproductive organs occupy a large part of the body cavity. In the female the ovary is a large unpaired organ from the anterior end of which arise two oviducts, and connected with the latter are a pair of large so-called copulatory pouches, which perhaps act as accessory oviducts. These and the oviducts lie on the anterior half of the body; but the oviducts themselves soon unite to form a single tube of great length, which runs backwards to its posterior extremity, terminating in the genital orifice close to the anus.
PENTATEUCH—PENTECOST

In the male, on the contrary, this orifice is situated in the anterior half of the body, not far behind the head. The two testicles, which extend far back into the posterior part of the body, are long and tubular. Anteriorly their base differentiates soon unite into a common duct, which opens into the pouch containing the penes. Also communicating with this pouch is a pair of long slender flagelliform tubes, of which the function is unknown.

The structure of the adult Linguatula or Pentastomum, above described, does not supply convincing evidence of relationship with the Acari. At the same time some Acari, like Eriophyes (Phyleptus) and Demodex, have the body elongated and annulated, but in these groups the elongation of the body is causal or post-canal, as is attested by the position of the anus far forwards on its ventral surface. Again, the adult Pentastomum shows no trace of appendages, unless the two pairs of chitinous hooks are to be regarded as the vestiges of jaws or ambulatory limbs. In the embryo, however, what have been regarded as remnants of limbs may be seen.

In the mature stage Pentastomida live in the respiratory passages of mammals, principally in the nasal cavities. The remarkable life-history of one species, Linguatula senesioides, has been worked out in detail and presents a close analogy to that of some Cestodes. The adults live in the nose of dogs, where they have been known to survive over fifteen months. Each female lays a vast number of eggs, about 500,000 being the estimated amount. These are expelled along with mucus by the sneezing of the host. If they fall on pasture land or fodder of any kind and are eaten by any herbivorous animal, such as a hare, rabbit, horse, sheep or ox, the active embryos or larvae are set free in the alimentary canal of the new host.

These larvae are minute oval creatures with a comparatively short apically fringed caudal prolongation and furnished with two pairs of short two-clawed processes, which may represent the limbs of anthropods and possibly the two pairs of legs found in Acari of the family Eriophyidae. The larva is also armed anteriorly with a median piercing probe and a pair of sharp hooks by means of which it perforates the walls of the alimentary tract and makes its way into the body cavity, lung or even heart. Here it becomes encysted and losing its boring apparatus and claw-bearing processes remains for a time quiescent. After a series of molts it passes into the second larval stage, somewhat like the parent but differing in having each interventricular ring armed with a pair of backwardly directed short bristles. This sexually immature stage, regarded at one time as representing a distinct species and named Linguatula dentisculata, is reached in about six or seven months and measures from 6 to 8 mm. in length. At the time of escape being made and eaten it is believed that some of these larvae wander about or ultimately make their way to the exterior, possibly through the bronchi; nevertheless it seems to be certain that they can only reach the respiratory tract in some carnivorous animal, and the chance of attaining this environment is afforded when the viscera of the host are devoured by some flesh-eating mammal. The adult female of L. senesioides measures about 4 in. long and the male barely one-fourth of that. The adult and immature stages are, however, by no means confined respectively to carnivorous and herbivorous species of mammals. The adult stage, for example, has been found in the nasal passages of sheep, goats, horses and even of man, and the larval stage in the pleural and peritoneal cavities of dogs and cats. (R. I. F.)

PENTATEUCH, the name found as early as in Tertullian and Origen corresponding to the Jewish תкультין (the five-fifths of the Torah, or Law), and applied to the first five books of the Old Testament (Genesis, Exodus, Leviticus, Numbers, Deuteronomy). The several books were named by the Jews from their initial words, though at least Leviticus, Numbers, and Deuteronomy had also titles resembling those we use, viz. דניאל (Daniel), יר合法权益 (Jeruverbs), צגר (Zacchaeus, Acts, or Acts), and כנעני (Canaanite). The Pentateuch, together with Joshua, Judges and Ruth, with which it is usually united in Greek MSS., makes up the Octateuch; the Pentateuch and Joshua together have recently been named the Hexateuch. On the critical questions arising from the Pentateuch or Hexateuch, see BIBLE and the articles on the several books.

PENTECOST, a feast of the Jews, in its original meaning a "harvest feast," as consisting of the first-fruits of human toil (Exod. xxiii. 16), extending over the seven weeks which fairly correspond with the duration of the Canaanite harvest. Hence it was the closing feast of the harvest gladness.

The agricultural character of this feast clearly reveals its Canaanite origin (see Hebrew Religion). It does not, however, rank equal in importance with the other two agricultural festivals of pre-exilian Israel, viz. the Mašḥôt or feast of unleavened cakes (which marked the beginning of the corn-harvest), and the Asīb ("ingathering," later called succōth, "booths") which marked the close of all the year's ingathering of vegetable products. This is clear in the ideal scheme of Ezekiel (xl. 21 seq.), in which according to the original text, Pentecost is omitted (see Critical Text and his note ad loc.). It is a later hand that has inscribed a reference to the "feast of weeks" which is found in our Massoretic Hebrew text. Nevertheless occasional allusions to this feast, though secondary, are to be found in Hebrew literature, e.g. Isa. ix. 3 (2 Heb.) and Ps. iv. 7 (8 Heb.).

In both the early codes, viz. in Exod. xxiii. 16 (E) and in Exod. xxxiv 22 (J, in which the harvest festival is called "feast of weeks") we have only a bare statement that the harvest festival took place some weeks after the opening spring festival called Mašḥôt. It is in Deut. xvi. 9 that we find it explicitly stated that seven weeks elapsed between the beginning of the corn-harvest ("when thou puttest the sickle to the corn") and the celebration of the harvest festival (Kīrāstī). It is also declared that the day that is called "booths" shall be a solemn assembly of all the children of Israel, and that in these booths the people should dwell seven days: every one of them should dwell in booths, to celebrate the feast. The whole period of seven weeks, i.e. the week preceding and the week following the harvest festival, was to be observed as a feast; and in the contemporary national worship, the days of the harvest festival and those of its immediate vicinage were to be consecrated to the sacred observances of the festal week.

But when we pass to the post-exilian legislation (Lev. xxiii. 10–21; cf. Num. xxviii. 26 seq.) we enter upon a far more detailed and specific series of ritual instructions. (1) A special ceremonial is described as taking place on the "morrow after the Sabbath," i.e. in the week of unleavened cakes. The first-fruits of the harvest here take the form of a sheaf which is waved by the priest before Yahweh. (2) There is the offering of a male lamb of the firstborn year without blemish and also a meal offering of fine flour and oil mixed in defined proportions as well as a drink-offering of wine of a certain measure. After the "morrow after the Sabbath" seven weeks are to be reckoned, and when we reach the morrow after the seventh Sabbath fifty days have been enumerated. Here we must bear in mind that the Hebrew numeration always includes the day which is the terminus a quo as well as that which is term. ad quem. On this fiftieth day two wave-loaves made from the produce of the fields occupied by the worshipper ("your habitations") are offered together with seven unblemished lambs of the first year as well as one young bullock and two rams as a burnt offering. We have further precise details respecting the sin-offering and the peace-offerings which were also presented. This elaborate ceremonial connected with the wave-offering (domea, in the post-exilian period) took place on the morrow of the seventh Sabbath called

1On the critical questions involved in these ritual details of Lev. xxiii. 16 as compared with Num. xxviii. 27–30 cf. Driver and White in S. B. O. T., note on Lev. xxiii. 18.

Fig. 1.—Linguatula senesioides, Rud. adult.

Fig. 2.—The same, in the first larval stage; under side. a . . . a, Leg-like processes.

"..."
PENTELICUS—PENZA

...a “day of holy convocation” on which no servile work was to be done. It was called a “fiftieth-day feast.” Pentecost or “Fiftieth” day is only a Greek equivalent of the last name (πεντηκοστή) in the Apocrypha and New Testament. The orthodox later Jews reckoned the fifty days from the 16th of Nisan, but on this there has been considerable controversy among Jews themselves. The orthodox later Jews assumed that the Sabbath in Lev. xxiii. 11, 15 is the 15th Nisan, or the first day of the feast of Pasch. Hitzig maintained that in the Hebrew calendar 14th and 21st Nisan were always Sabbaths, and that 1st Nisan was always a Sunday, which was the opening day of the year. “The morrow after the Sabbath” means, according to Hitzig, the day after the weekly Sabbath, viz., 22nd Nisan. Knobel (Comment. on Leviticus) and Kurtz agree with Hitzig’s premises but differ from his identification of the Sabbath. They identify it with the 14th Nisan. Accordingly the “day after” falls on the 15th. (See Purves’s article, “Pentecost,” in Hastings’s Dict. of the Bible, and also Ginsburg’s article in Kitto’s Cyclopaedia). Like the other great feasts, it came to be celebrated by fixed special sacrifices. The amount of this is differently expressed in the earlier and later priestly law (Lev. xxiii. 18 seq.; Num. xxviii. 26 seq.); the discrepancy was met by adding the two lists. The later Jews also extended the one day of the feast to two. Further, in accordance with the tendency to substitute historical for economic explanations of the great feasts, Pentecost came to be regarded as the feast commemorative of the Sinai legislation.

To the Christian Church Pentecost acquired a new significance through the outpouring of the Spirit (Acts ii.) (See Whit-Sunday).

It is not easy to find definite parallels to this festival in other ancient religious cults. The Akitu festival to Marduk was a spring festival at the beginning of the Babylonian year (Nisan). It therefore comes near in time to the feast of unleavened cakes rather than to the later harvest festival in the month Sivan called “feast of weeks.” Zimmern indeed connects the Akitu festival with that of Purim on the 15th Adar (March); see K.A.T. II. p. 514 seq. Also the Roman Cerealia of April 12th-19th rather correspond to Μαγγὰθ or to Κατηρ. (O. C. W.)

PENTECOSTUS (Βαγγασσής, or Πενελέκτος from the dème Πενελέκτη; mod. Mendeli), a mountain to the N.E. of the Athenian plain, height 3640 ft. Its Quarries of white marble were not regularly worked until after the Persian wars; of this mountain the chief buildings of Athens were constructed, as well as the sculpture with which they were ornamented. The ancient quarries are mostly on the south side of the mountain. The best modern quarries are on the north side. The top of Pentecostus commands a view over the plain of Marathon, and from it the Athenian traitors gave the signal to the Persians by a flashing shield on the day of the battle. There was a statue of Athena on the mountain.

PENTHEUS, in Greek legend, successor of Cadmus as king of Thebes. When Dionysus, with his band of frenzied women (Maenads) arrived at Thebes (his native place and the first city visited by him in Greece), Pentheus denied his divinity and viciously introduced some of his rites. His mother Agave, having joined the revellers on Mount Cithaeron, followed and climbed a lofty pine to watch the proceedings. Being discovered he was torn to pieces by Agave and others, who mistook him for some wild beast. His head was carried back to Thebes in triumph by his mother. Labdacus and Lycurgus, who offered a similar resistance, met with a like fearful end. Some identify Pentheus with Dionysus himself in his character as the god of the vine, torn to pieces by the violence of winter. The subject of Pentheus was the subject of lost tragedies by Theophras and Pacificus.

See Euripides, Bacchae, passim; Ovid, Metam., iii. 511; Theocritus xxvi; Apollonius iii. 5, 2; Nonnus, Dionysiaca, xiv-xvi; on representations in art see O. Jahn, Pentheus and the Maenadai (1844).

PENTHIEVRE, COUNTS OF. In the 11th and 12th centuries the countship of Penthievre in Brittany (dep. of Côtes-du-Nord) belonged to a branch of the sovereign house of Brittany. Henry d’Avaugour, heir of this dynasty, was dispossessed of the countship in 1235 by the duke of Brittany, Pierre Mauderc, who gave it as dowry to his daughter, Yolande, on her marriage in 1238 to Hugh of Lusignan, count of La Marche. Duke John I. of Brittany, Yolande’s brother, seized the countship on her death in 1272. In 1337 Joan of Brittany brought Penthievre to her husband, Childebert of Châtillon-Blos. In 1455 Nicole de Blos, a descendant of this family, married Jean de Brosse, and was deprived of Penthievre by the duke of Brittany, Francis II., in 1465. The countship, which was restored to Sebastian of Luxemburg, heir of the Brosses through his mother, was erected for him into a duchy in the peerage of France (ducé-pairie) in 1569, and was afterwards held by the duchess of Mercœur, daughter of the first duke of Penthievre, and then by her daughter, the duchess of Vendôme. The duchess of Vendôme’s grandson, Louis Joseph, inherited Penthievre in 1669, but it was taken from him by decree in 1687 and adjudged to Anne Marie de Bourbon, princess of Conti. In 1696 it was sold to the count of Toulouse, whose son bore the title of duke of Penthievre. This title passed by inheritance to the house of Orleans.

PENTHOUSE, a sloping roof attached to a building either to serve as a porch or a covering for an arcade, or, if supported by walls, as a shed, a “lean-to.” In the history of siegework, the word is particularly applied to the fixed or movable constructions used to protect the besiegers when mining, working battering-rams, catapults, &c., and is thus used to translate Lat. tectus, andFirst, to the shelter of locked shields of the Romans. The Mid. Eng. form of the word is pentis, an adaptation of O. Fr. opennis, Med. Lat. appendicium or appendicium, a small structure attached to, or dependent on, another building, from appendere, to hang on. The form “penthouse” is due to a supposed connexion with “house” and Fr. Pentre, sloping roof. The more correct form “penticte” is now frequently used.

PENTSTEMON, in botany, a genus of plants (nat. order Scrophulariaceæ), chiefly natives of North America, with showy open-tubular flowers. The pentstemon of the florist has, however, sprung from P. Hartwegii and P. Cosaæ, and possibly some others. The plants endure English winters unharmed in favoured situations. They are freely multiplied by cuttings, selected from the young side shoots, planted early in September, and kept in a close cold frame till rooted. They flower a second time in early March by means of spring frost. They produce seed freely, new kinds being obtained by that means. When special varieties are not required true from cuttings, the simplest way to raise pentstemons is to sow seed in heat (65° F.) early in February, afterwards prick the seedlings out and hardening them off, so as to be ready for the open air by the end of May. Plants formerly known under the name of Chelone (e.g. C. barbaræ, C. campanulata) are now classed with the pentstemons.

PENUMBRA (Lat. penum, almost, umbra, a shadow), in astronomy, the partial shadow of a heavenly body as cast by the sun. It is defined by the region in which the light of the sun is partially but not quite cut off through the interception of a dark body. (See ECLIPSE.)

PENZA, a government of eastern Russia, bounded N. by the government of Nizhny-Novgorod, E. by Simbirsk, and S. and W. by Saratov and Tambov; area 14,992 sq. m.; pop. (est. 1906) 1,609,000. The surface is undulating, with deep valleys and ravines, but does not exceed 900 ft. above sea-level. It is principally made up of Cretaceous sandstones, sands, marls and chalk, covered in the east by Eocene deposits. Chalk, potter’s clay, peat and iron are the chief mineral products in the north. The soil is a black earth, more or less mixed with clay and sand; marshes occur in the Krasnoslobodsk district; and expanses of sand in the river valleys. There are extensive forests in the north, but the south exhibits the characteristic features of a steppeland. The government is drained by the Moscha, the Sura (both navigable), and the Khoper, belonging to the Oka, Volga and Don systems. Timber is floated down
several smaller streams, while the Moksha and Sura are important means of conveyance. The climate is harsh, the average temperature at the city of Penza being only 38°. The population consists principally of Russians, together with Mordvinians, Meshcheryaks and Tatars. The Russians profess the Orthodox faith, and very many, especially in the north, are Raskolniks or Nonconformists. The chief occupation is agriculture. The principal crops are rye, oats, buckwheat, hemp, potatoes and beetroot. Grain and flour are considerable exports. The local authorities have established dépôts for the sale of modern agricultural machinery. There are several agricultural and horticultural schools, and two model dairy-farms. Cattle breeding and especially horse-breeding are comparatively flourishing. Market-gardening is successfully carried on, and improved varieties of fruit-trees have been introduced through the imperial botanical garden at Penza, and a private school of gardening in the Gorodische district. Sheep-breeding is especially developed in Chembar and Inasar. The Mordvinians devote much attention to bee-keeping. The forests (22% of the total area) are a considerable source of wealth, especially in Krasnoslobodsk and Gorodische. The manufactures are few. Distilleries come first, followed by beet sugar and oil mills, with woollen cloth and paper mills, tanneries, soap, glass, machinery and iron-works. Trade is limited to the export of corn, spirits, timber, hump-sweed-oil, tallow, hides, honey, wax, woollen cloth, potash and cattle, the chief centres for trade being Penza, Nizhni-Lomov, Mokshany, Saransk and Krasnoslobodsk.

The government is divided into ten districts, the chief towns of which are Penza, Gorodische, Inasar, Kerensk, Krasnoslobodsk, Mokshany, Noroatch, Nizhni-Lomov, Saransk and Chembar. The present government of Penza was formerly inhabited by Mordvinians, who had the Meshcheryaks on the W. and the Bulgars on the N. In the 13th century these populations fell under the dominion of the Tatars, with whom they fought against Moscow. The Russians founded the town of Mokshany in 1535. Penza was founded in the beginning of the 17th century, the permanent Russian settlement dating as far back as 1666. In 1776 it was taken by the rebel Pugachev. The town was almost totally destroyed by conflagrations in 1836, 1839 and 1838.

Penza, a town of Russia, capital of the government of the same name, 1,402 m. by rail S.E. from Moscow. It stands on a plateau 575 ft. above the sea, at the confluence of the Penza with the navigable Sura. Pop. (1897), 61,851. The older parts of the town are constructed of wood, but the newer parts are well built. The cathedral was erected in 1820-1821. Penza has technical schools, public libraries, a museum of antiquities, and a theatre which has played some part in the history of the Russian stage. The bulk of the inhabitants support themselves by agriculture or fishing in the Sura. An imperial botanical garden is situated within two miles of the town. Apart from paper-mills and steam flour-mills, the manufacturing establishments are small. There is a trade in corn, oil, tallow, timber and spirits, and two fairs where cattle and horses are sold.

Penza, a municipal borough, market town and sea-port in the St Ives parliamentary division of Cornwall, England, the terminus of the Great Western railway, 3253 m. W.S.W. of London. Pop. (1901), 13,156. It is finely situated on the western shore of Mount's Bay, opposite St Michael's Mount, being the westernmost port in England. The site of the old town slopes sharply upward from the harbour, to the west of which there extends an esplanade and modern residential quarter; for Penzance, with its mild climate, is in considerable favour as a health resort. The town has no buildings of great antiquity, but the public buildings (1867), in Italian style, are handsome. By the market house is a statue of Sir Humphry Davy, who was born here in 1778. Among institutions there are a circulating library, and several medical and scientific schools, the West Cornwall Infirmary and a meteorological station. The harbour, enclosed within a breakwater, has an area of 24 acres, with 12 to 16 ft. depth of water, and floating and graving docks. There is a large export trade in fish, including that of pilchards to Italy. Other exports are tin and copper, granite, serpentine, vegetables and china clay. Imports are principally coal, iron and timber. Great quantities of early potatoes and vegetables, together with flowers and fish, are sent to London and elsewhere. The borough is under a mayor, 6 aldermen and 18 councillors.

Area, 335 acres.

Nearly two miles inland to the north-west is Madron (an urban district with a population of 3486). The church of St Maddern is principally Perpendicular, with earlier portions and a Norman front. Near the village a 'wishing well' of ancient fame is seen, and close to it the ruins of a baptistery of extreme antiquity. Monoliths and cromlechs are not uncommon in the neighbourhood. Three miles north-east is the urban district of Ludgvan (pop. 2274), and to the south is Paul (6352), which includes the village of Newlyn (q.v.).

Penzance (Pensans) was not recognized as a port until the days of the Tudors, but its importance as a fishing village dates from the 14th century. In 1327 thirty burgesses in Penzance and thirteen boats paying 13s. yearly are found among the possessors of the lords of Alverton, of which Manor it formed a portion of the demesne lands. The year 1512 marks the beginning of a new era. Until then St Michael's Mount had been regarded as the port of Mounts Bay; but in that year Henry VIII. granted the tenants of Penzance whatever profits might accrue from the "ankerage, kylage and busselage" of ships resorting thither, so long as they should repair and maintain the quay and bulwarks for the safeguard of the ships and town. Nevertheless thirty years later it is described by Leland as the market town in Cornwall "with no socour for Botes or shippes but a forsoed Pere or Key." During the war with Spain the town was devastated in 1595. The charter of incorporation granted in 1614 states that by the invasion of the Spaniards it had been treacherously spoiled and burnt but that its strength, prosperity and usefulness for navigation, and the acceptable and laudable services of the inhabitants in rebuilding and fortifying it, and their enterprise in erecting a pier, have moved the king to grant the petition for its incorporation. This charter provides for a mayor, eight aldermen and twelve assistants to constitute the common council, the mayor to be chosen by the council from the aldermen, the aldermen to be chosen from the assistants, and the assistants from the most sufficient and discreet of the inhabitants. It also ratifies Henry's grant of anchorage, keelage and busselage. In 1665 Penzance was constituted a coinage town for tin. It has never enjoyed independent parliamentary representation. In 1332 a market on Wednesdays and a fair at the Feast of St Peter ad Vincula were granted to Alice de Lièse and in 1405 this market was ratified and three additional fairs added, viz. at the feasts of St Peter in Cathedra and the Conception and Nativity of the Blessed Virgin. The charter of 1614 substituted markets on Tuesdays and Thursdays for the Wednesday market and added two fairs one at Corpus Christi and the other on the Thursday before St Andrew. Of the fairs only Corpus Christi remains; markets are now held on Tuesday, Thursday and Saturday. Apart from fishing and shipping, Penzance has never been an industrial centre.

PEONAGE (Span. peon; M. Lat. pedo (pes), primarily a foot-soldier, then a day-labourer), a system of agricultural servitude common in Spanish America, particularly in Mexico. In the early days the Spanish government, with the idea of protecting the Indians, exempted them from compulsory military service, the payment of tithes and other taxes, and regulated the system of labour; but left them practically at the mercy of the Spanish governors. The peons, as the Indian labourers were called, were of two kinds: (1) the agricultural workman who was free to contract himself, and (2) the criminal labourers who, often for minor offences, were condemned to practical slavery. Though legally peonage is abolished, the unfortunate peon is often lured into debt by his employer and then kept a slave, the law permitting his forcible detention till he has paid his debt to his master.
PEOPLE, a collective term for persons in general, especially as forming the body of persons in a community or nation, the "folk" (the O.E. and Teut. word, cf. Ger. Volk). The earlier forms of the word were peple, people, pople, etc.; the present form is found as early as the 13th century, but was not established till the beginning of the 16th. Old French, from which it was adapted, had many of these forms, as well as the modern form, peuple. The Lat. populus is generally taken to be a reduplication from the root ple,—fill, seen in plenus, full; plebs, the commons; Gr. πλῆθος, multitude.

PEORIA, a city, port of entry, and the county-seat of Peoria county, Illinois, U.S.A., in the north central part of the state, on the lower end of Lake Peoria, an expansion of the Illinois river, and about 150 m. S.W. of Chicago. Pop. (1900) 56,100; (1910) 66,950. It is served by 13 railways, of which the most important are the Chicago, Burlington & Quincy, the Chicago, Rock Island & Pacific, the Chicago & Alton, the Illinois Central, the Cleveland, Cincinnati, Chicago & St Louis, and the Chicago & North-Western. The Illinois river is navigable with the Illinois & Michigan Canal extending to Chicago. The river is spanned at Peoria by two railway bridges and a wagon bridge. The residential portion of the city is situated on bluffs overlooking Lake Peoria, and the business streets lie on the plain between these elevations and the water front. The park system includes more than 400 acres; Bradley Park (140 acres), the largest, was given to the city by Mrs Lydia Moss Bradley (1816-1908) and was named in her honour. On a bluff north-east of the city is Glen Oak Park (103 acres), modelled after Forest Park, St Louis, Missouri; in the south-western part of the city is Madison Park (88 acres) and in the lower part of the city is South Park (90 acres). In the Court House Square there are two monuments in honour of the Federal soldiers and sailors of Peoria county who perished in the Civil War; in Springdale Cemetery there are two similar memorials, one of which (a large granite boulder) is in memory of the unknown dead; and in the same cemetery there is a monument erected by the state (1906) to mark the grave of Thomas Ford (d. 1831), governor of Illinois in 1842-1846. Among the principal public buildings and institutions are the Peoria Public Library founded in 1835, the City Hall, the Court House, the Federal building, St Mary's Cathedral, the Bradley Polytechnic Institute (affiliated with the university of Chicago), founded by Bishop Lyons, and Lydia Moss Bradley, who gave it an endowment of $3,000,000; Spalding Institute, founded through the efforts of John L. Spalding (b. 1849), who was Bishop of the Roman Catholic diocese of Peoria in 1872-1908; an Evangelical Lutheran Orphans' Home (1902), an Industrial School for girls (1892), Cottage Hospital (1876), St Francis Hospital (1875), a Florence Crittenton Home (1902), a Home for the Friendless (1876), and a House of the Good Shepherd (1891), and the Guyer Memorial (1889), St Joseph's (1895), and John C. Proctor homes for the aged and infirm (1907). At Bartonville, a suburb, there is a state hospital for the incurable insane.

In 1900 and in 1905 Peoria ranked second among the cities of Illinois in the value of its manufactures. The invested capital amounted in 1905 to $22,243,821, and the factory products were valued at $56,920,411. The principal industry is the manufacture of distilled liquors, which were valued in 1905 at $2,170,815. Other important manufactures are agricultural implements ($2,300,062), slaughtering-house and meat-packing products ($1,480,398), glue, cooperage ($1,287,742), malt liquors ($887,576), foundry and machine-shop products, strawboard, automobiles, brick and stone, and flour and gist mill products. Peoria is also an important shipping point for grain and coal.

Peoria was named from one of the five tribes of the Illinois Indians. In 1680 La Salle, the explorer, built Fort Crevecoeur, on the lake shore bluffs, opposite the present city; this fort, however, was destroyed and deserted in the same year by La Salle's followers after he had set out to return to Fort Frontenac. There is evidence that a French mission was established on or near the site of Peoria as early as 1711; and certainly by 1725 a settlement, known as Peoria, and composed of French and "breed" traders, trappers and farmers, had been established about 1/2 m. above the foot of the lake, on its west shore. This village was practically deserted during the later years (1781-1819) of the War of Independence, and when its inhabitants returned after the peace they settled in a village which had been established about 1778, on the present site of Peoria, by Jean Baptiste Maillot (d. 1801), and was at first called La Ville de Maillot. It is probable that Jean Baptiste Pointe de Sales, believed to have been a Santo Domingo negro, and jocularly spoken of "as the first white settler in Chicago," lived in the "old village" of Peoria as early as 1773—or six years before he settled on the present site of Chicago—and again about 1783. In November 1812 about half of the town was burned by a company of Illinois militia who had been sent thither to build a fort, and whose captain asserted that his boats had been fired upon at night by the villagers. In the following year a fort, named Fort Clark in honour of George Rogers Clark, was erected on the site of the old village; it was evacuated in 1818, and soon afterwards was burned by the Indians. After the town was burned there was no serious attempt to rebuild until 1819. Peoria was incorporated as a town in 1833 and was chartered as a city in 1845. In 1900 North Peoria was annexed.

See David McCall, Early Days of Peoria and Chicago, read before the Chicago Historical Society in 1904, and published by that society, (n.d.), and Old Peoria, "by the same author, Historical No. 6, Illinois State Historical Society. Also, The War of the northern actions (Springfield, Ill. 1901); also Historical Encyclopedia of Illinois (Chicago, 1900), ed. by Newton Bateman and Paul Selby; History of Peoria County, Ill. (Chicago, 1880); and C. Ballance, History of Peoria (Peoria, 1900).

PEPE GUGLIELMO (1783-1855), Neapolitan general, was born at Squillace in Calabria. He entered the army at an early age, but in 1790 he took part in the republican movement at Naples inspired by the French Revolution; he fought against the Bourbon troops under Cardinal Rufio, was captured and exiled to France. He entered Napoleon's army and served in several campaigns, including those in the Neapolitan kingdom, first under Joseph Bonaparte and later under Joachim Murat. After commanding a Neapolitan brigade in the Peninsula campaign, Pepe returned to Italy in 1813, with the rank of general, to help to reorganize the Neapolitan army. When the news of the fall of Napoleon (1814) reached Italy Pepe and several other generals tried without success to force Murat to accept a constitutional in the only means of saving the kingdom from foreign invasion and the return of the Bourbons. On Napoleon's escape from Elba (1815) Murat, after some hesitation, placed himself on the emperor's side and waged war against the Austrians, with Pepe on his staff. After several engagements the Neapolitans were forced to retire, and eventually agreed to the treaty of Casalanza by which Murat was to abandon the kingdom; but the Neapolitan officers retained their rank under Ferdinand IV. who now regained the throne of Naples. While engaged in suppressing brigandage in the Capitanata, Pepe organized the carbonari (qv.) into a national militia, and was preparing to use them for political purposes. He had hoped that the king would end by granting a constitution, but when that hope failed he left the country; the emperor of Austria, and Metternich, who were expected at Avellino, and thus compelling them to liberate Italy (1816). The scheme broke down through an accident, but in the following year a military rising broke out, the mutineers cheering for the king and the constitution. Pepe himself was sent against them, but while he was hesitating as to what course he should follow Ferdinand promised a constitution (July 1820). A revolt in Sicily having been repressed, Pepe was appointed inspector-general of the army. In the meanwhile the king, who had no intention of respecting the constitution, went to Laibach to confer with the sovereigns of the holy alliance assembled there, leaving his son as regent. He obtained the loan of an Austrian army with which to restore absolute power, while the regent dallied with the Liberals. Pepe, who in parliament had declared in favour of deposing the king, now took command of the army and marched against the Austrians. He attacked them at Rieti (March 7,
PEPERINO—PEPPER

1821), but his raw levies were repulsed. The army was gradually disbanded, and Pepe spent several years in England, France and other countries. He wrote a number of books and pamphlets of a political character and keeping up his connexion with the Carbonari. When in 1848 revolution and war broke out all over Italy, Pepe returned to Naples, where a constitution had again been proclaimed. He was given command of the Neapolitan army which was to co-operate with Piedmont against the Austrians, but when he reached Bologna the king, who had already changed his mind, recalled him and his troops. Pepe, after hesitating between his desire to fight for Italy, and his oath to the king, resigned his commission in the Neapolitan service and crossed the Po with 2000 volunteers to take part in the campaign. After a good deal of fighting in Venetia, he joined Mann in Venice and took command of the defending army. When the city was forced by hunger to surrender to the Austrians, Pepe and Manin were among those excluded from the amnesty; he again went into exile and died in Turin in 1855.

The story of Pepe's life down to 1846 is told in his own interesting Memorie (Lugano, 1847), and his Narrative of the Events... at Naples in 1820 and 1821 (London, 1821); for the latter period of his life see the general histories of the Risorgimento, and the biographical sketch in vol. ii. of L. Carpi's Risorgimento (Milan, 1886).

PEPERINO, an Italian name applied to a brown or grey volcanic tuft, containing fragments of basalt and limestone, with disseminated crystals of augite, olivine, magnetite, leucite, &c. The typical peperino occurs in the Alban Hills, near Rome, and was used by the ancients, under the name of lapsis albus, as a building stone and for the basins of fountains. Other tufts and conglomerates in Auvergne and elsewhere are also called peperino.

The name originally referred to the dark coloured inclusions, suggestive of pepper-corns. In English the word has sometimes been written peperino.

PEPPER, WILLIAM (1843-1898), American physician, was born in Philadelphia, on the 21st of August 1843. He was educated at the university of Pennsylvania, graduating from the academic department in 1862 and from the medical department in 1864. In 1868 he became lecturer on morbid anatomy in the same institution, and in 1870 lecturer on clinical medicine. From 1876 to 1887 he was professor of clinical medicine, and in 1887 succeeded Dr Alfred Stillé as professor of theory and practice of medicine. He was elected provost of the university in 1881, resigning that position in 1894. For his services as medical director of the Centennial Exhibition in 1876 he was made knight commander of St Olav by the king of Sweden. He founded the Philadelphia Medical Times, and was editor of that journal in 1870-1871. He was known particularly for his contributions on the subject of the theory and practice of medicine, and the System of Medicine which he edited in 1885-1886 became one of the standard textbooks in America. Among his contributions to the medical and scientific journals of the day, were "Tuberculosis in Cerebral Disease" (1871); "Local Treatment in Pulmonary Cavities" (1874); "Catarhgal Irrigation" (1881); "Epilepsy" (1883); and "Higher Medical Education: The True Interest of the Public and the Profession." He died on the 28th of July 1898 at Pleasanton, California.

PEPPER, a name applied to several pungent spices known respectively as black, white, long, red, or Cayenne, Ashanti, Jamaica, and melegueta pepper, but derived from at least three different natural orders of plants.

Black pepper is the dried fruit of Piper nigrum, a perennial climbing shrub indigenous to the forests of Travancore and Malabar, from whence it has been introduced into Java, Sumatra, Borneo, the Malay Peninsula, Siam, the Philippines, and the West Indies. It climbs on tree-trunks by roots in the same way as ivy, and from its climbing habit is known as the pepper vine. It is one of the earliest spices known to mankind, and for many ages formed a staple article of commerce between India and Europe. Tribute has been levied in pepper; one of the articles demanded in 408 by Alaric as part of the ransom of Rome was 3000 lb of pepper. Its exorbitant price during the middle ages was one of the inducements which led the Portuguese to seek a

sea-route to India. The discovery of the passage round the Cape of Good Hope led (1498) to a considerable fall in the price, and about the same time the cultivation of the plant was extended to the western islands of the Malay Archipelago. Pepper, however, remained a monopoly of the Portuguese crown as late as the 18th century. In Great Britain it was formerly taxed very heavily, the impost in 1623 amounting to 5s., and as late as 1823 to 2s. 6d. lb.

The largest quantities of pepper are produced in Penang, the island of Kioou, and Johore near Singapore—Penang affording on an average about half of the entire crop. Singapore is the great emporium for this spice in the East, the largest proportion being shipped thence to Great Britain. The varieties of black pepper met with in commerce are known as Malabar, Aleppo or Tellicherry, Cochín, Penang, Singapore and Siam.

It owes its pungency to resin, and its flavour to a volatile oil, of which it yields from 1-6 to 2-2%. The oil agrees with oil of turpentine in composition as well as in specific gravity and boiling point. In polarized light it deviates the ray, in a column 50 mm. long, 1° 2' to 3° 4' to the left. Pepper also contains a yellow crystalline alkaloid, called pipericine, to the extent of 2 to 8%. This substance has the same empirical formula as morphine, C17H21NO5, but differs in constitution and properties. It is insoluble in water when pure, is devoid of colour, flavour and odour, and may be resolved into piperic acid, C17H19O4, and pipericline, C18H19N. The latter is a liquid colourless alkaloid, boiling at 106° C., has an odour of pepper and ammonia, and yields crystallizable salts. A fatty oil is found in the pericarp of pepper, and the berries yield on incineration from 4-1 to 5-7% of ash. The only use of black pepper is as a condiment, but it may be given therapeutically in doses of 5 to 20 grains. It has the pharmacological actions of a volatile oil.

In the south-west of India, where the pepper-plant grows wild, it is found in rich, moist, leafy soil, in narrow valleys, propagating itself by running along the ground and giving off roots into the soil. The only method of cultivation adopted by the natives is to tie up the end of the vines to the neighbouring trees at distances of at least 6 ft., especially to those having a rough bark, in order that the roots may easily attach themselves to the surface. The underwood is then cleared away, leaving only sufficient trees to provide shade and permit free ventilation. The roots are manured with a heap of leaves, and the shoots are trained twice a year. In localities where the pepper does not grow wild, ground is selected which permits of free drainage, but which is not too dry nor liable to inundation, and cuttings are planted at about a foot from the trees either in the rainy season in June or in the dry season in February. Sometimes several cuttings about 18 in. long are placed in a basket and buried at the root of the tree, the cuttings being made to slope towards the trunk. In October or November the young plants are manured with a mixture of leaves and cow-dung. On dry soils the young plants require watering every other day during the dry season for the first three years. The plants bear in the fourth or fifth year, and if raised from cuttings are
fruitful for seven years, if from seed for fourteen years. The pepper from plants raised from cuttings is said to be superior in quantity and quality; and this method is in consequence most frequently adopted. Where there are no trees the ground is made into terraces and enclosed by a mud wall, and branches of Erythrina indica are put into the ground in the rainy season, and in the course of a year are allowed to grow into young pepper plants. In the meantime mango trees are planted, these being preferred as supports, since their fruit is not injured by the pepper plant, while that of other trees is killed by it in fourteen or fifteen years.

In Sumatra the ground is cleared, ploughed, and sown with rice, and cuttings of the vine are planted in September, 5 ft. apart each way, together with a sapling of quick growth and rough bark. The vine may now be from fifteen to eighteen months and then entirely buried, except a small piece of stem bent, whence new shoots arise, three or four of which are allowed to climb the tree near which they are planted. These shoots generally yield flowers and fruit the third year. Two crops are collected every year, the principal one being in December and January and the other in July and August, the latter yielding pepper of inferior quality and in less quantity.

Two or three varieties are met with in cultivation; that yielding the best flowers has broad ovate leaves, five to seven in number, ovate and stalked. The flower-spikes are opposite the leaves, stalked and from 3 to 6 in. long; the fruits are sessile and fleshy. A single stem will bear from twenty to thirty of these spikes. The harvest begins as soon as one or two berries at the base of the spikes begin to turn red, and before the fruit is mature, but when full-grown it is often allowed to ripen in the sun and ultimately fall off and are lost. The spikes are collected in bags or baskets and dried in the sun. When dry the pepper is put into bags containing from 64 to 126 lb. In Sumatra the yield is 20 to 60 lb. a year, but 14 lb per plant per annum. In Malabar each vine gives 2 lb a year up to the fifteenth or twentieth year, or about 24 lb from each tree, a single tree sometimes supporting eight or twelve vines; an acre is calculated to bear 2500 plants, to cost about £4 in outlay to bring it into bearing, and to yield a produce of £80 when in its best condition.

White pepper differs only in being prepared from the ripe fruits. These, after collection, are kept in the house three days and then bruised and washed in a basket with the hand until the stalks and pulp matter are removed, after which the seeds are dried. It is, however, sometimes prepared from the dried black pepper by removing the dark outer layer. It is less pungent than the black but possesses a finer flavour. It is chiefly prepared at the island of Kiuow, but the finest comes from Tellicherry.

White pepper affords on an average not more than 1-9% of essential oil; but, according to Cazeneuve, as much as 9% of pipevine, and of ash not more than 1-1%.

Long pepper is the fruit-spike of Piper officinarum and P. longum, gathered shortly before it reaches maturity and dried. The former is a native of the Indian Archipelago, and has oblong-ovate, acuminate leaves, which are pinnately veined. The latter is indigenous in the hotter provinces of India, Ceylon, Malacca and the Malay Islands; it is distinguished from P. officinarum by the leaves being cordate at the base and five-veined.

Long pepper appears to have been known in the ancient Greeks and Romans under the name of Nervum piperace; and in the 10th century mention is made of long pepper, or macropiper, in conjunction with black and white peppers. The spice consists of a dense spike of minute baccate fruits closely packed around the central axis, the spike being about 7 in. long and 3 in. thick; as met with in commerce they have the appearance of having been limed. In Bengal the plants are cultivated by suckers, which are planted about 4 ft. apart on dry rich soil on high ground. An English acre will yield about 3 tons (80 lb) the first year, 12 the second, and 18 the third year; after this time the yield decreases, and the roots are therefore grubbed up and sold as pepu mal, under which name it is much used as a medicine in India. After the fruit is collected, which is usually in January, the stem and leaves die down to the ground. Long pepper contains Piperine, resin and volatile oil and yields about 8% of ash. Penang and Singapore are the principal centres in the East for its sale.

Ashani or West African pepper is the dried fruit of Piper Capei, a plant widely distributed in tropical Africa, occurring mostly in the countries of the Niam-niam of the Congo. It differs from black pepper in being rather smaller, less wrinkled, and in being attenuated into a stalk, like cubeps (the dried unripe fruits of P. Cubeba), to which it bears considerable resemblance externally. The taste, however, is pungent, exactly like that of pepper, and the fruit contains Piperine. It was imported from the Grain Coast by the merchants of Rouen and Dieppe as early as 1564 and was exported from Benin by the Portuguese in 1485; but, according to Clusius, its importation was forbidden by the king of Portugal for fear it should depreciate the value of the pepper from India. In tropical Africa it is extensively used as a condiment, and it could easily be collected in large quantities if a demand for it should arise.

Jamaica pepper is the fruit of Pimenta officinalis, an evergreen tree of the Myrtle family. It is more correctly termed “pimento” or “allspice,” as it is not a true pepper.

Melegueta pepper, known also as “Guinea grains,” “grains of paradise” (q.v.) or “alligator pepper,” is the seed of Amomum Melegueta, a plant of the ginger family; the seeds are exceedingly pungent, and are used as a spice throughout central and northern Africa.

For Cayenne pepper, see that article.

PEPPER-CORN, the fruit or seed of the pepper plant; hence anything very small or insignificant. Pepper-corn rent is a merely nominal rent, reserved for the purpose of having the tenancy acknowledged by the tenant. Building leases frequently reserve a pepper-corn as rent for the first few years. See RENT.

PEPPERMINT, an indigenous perennial herb of the natural order Labiatae, and genus Mentha (see MINT), the specific name being Mentha piperita, is distinguished from other species of the genus by its stalked leaves and oblong-obtuse spike-like heads of flowers. It is met with, near streams and in wet places, in several parts of England and on the European continent, and is also extensively cultivated for the sake of its essential oil in England, in several parts of continental Europe, and in the United States. Yet it was only recognized as a distinct species late in the 17th century, when Dr Eales discovered it in Hertfordshire and pointed it out to Ray, who published it in the second edition of his Synopsis stirpium britannicarum (1696). The medicinal properties of the plant were speedily recognized and it was admitted into the London Pharmacopoeia in 1721, under the name of Mentha piperita soppore.

Two varieties are recognized by growers, the white and the black mint. The former has purplish and the latter green stems; the leaves are more coarsely serrated in the white. The black is more generally cultivated, probably because it is found to yield more oil, but that of the white variety is considered to have a more pungent odor, and obtains a higher price. The white is the kind chiefly dried for herbalists. The flavour varies to a slight extent even with particular spots of land, badly drained ground being known to give unfavourable results both as to the quantity and quality of the oil. That of the Japanese

1 Near Mitcham in Surrey, Wisbech in Cambridgeshire, Market Deeping in Lincolnshire and Hitchin in Hertfordshire.
and Chinese oil also differs slightly from the English, and is thus distinguishable by experts. In America the oil is liable to be injured in flavour by aromatic weeds which grow freely among the crop, the most troublesome of which are Bidens pilosa and Erechtites hieracifolia. When pure the oil is nearly colourless and has an agreeable odour and powerful aromatic taste, followed by a sensation of cold when air is drawn into the mouth. It has a specific gravity of 0.84 to 0.92, and boils at 365° F. Mitcham oil, when examined by polarized light in a column 50 mm. long, deviates from 42° to 107° to the left, the American 43°. When oil of peppermint is cooled to 4° C. it sometimes deposits colourless hexagonal prisms of menthol, C_{10}H_{16}O, which are soluble in alcohol and ether, almost insoluble in water, and fusible at 92° F. The oil consists chiefly of menthol and a terpene called menthene, C_{10}H_{14}. Oil of peppermint is often adulterated with a third part of rectified spirit, which may be detected by the milkyness produced when the oil is agitated with water. Oil of rosemary and rectified oil of turpentine are sometimes used for the same purpose. If the oil contains turpentine it will explode with iodine. If quite pure it dissolves in its own weight of rectified spirits of wine. Peppermint oil is largely distilled at Canton, a considerable quantity being sent to Bombay, also a large quantity of menthol. The species cultivated in the neighbourhood of Canton is Mentha arvensis, var. glabrata. Peppermint is chiefly cultivated in the province of Kiang-si; and according to native statements as much as 40 piculs of oil of peppermint are sent annually to ports on the coast. In Japan also the distillation of oil of peppermint forms a considerable industry, the plant cultivated being M. arvensis, var. piperaescens. The oil, under the name of hakka no abusa, is exported from Higo and Ozaka, but is said to be frequently adulterated. The menthol is obtained by subjecting the oil to a low temperature, when it crystallizes out and is separated. The two varieties of M. arvensis just named yield much more menthol than M. piperita. It is remarkable, however, that the M. arvensis, var. japonica, growing in Ceylon, has not the flavour of peppermint but that of garden mint, while typical form of M. arvensis grown in Great Britain has an odour so different from peppermint that it has to be carefully removed from the field lest it spoil the flavour of the peppermint oil when the herb is distilled. M. incana, cultivated near Bombay as a herb, also possesses the flavour of peppermint. In the form in which menthol is imported it bears some resemblance to Epsom salts, with which it is sometimes adulterated.

The volatile oil of Mentha piperita is a valuable and widely used drug. Its chief constituents are menthol and menthene, which is a liquid terpene. The British pharmacoepia contains two preparations of this oil, the Aigua menthae piperitae and the Spiritus menthae piperitae. The oil has the characteristics of its class, with certain special features. Its local anaesthetic action is exceptionally strong. It is also powerfully antispasmodic. These two properties make it valuable in the relief of toothache and in the treatment of curvatures of the teeth. It is used in certain forms of dyspepsia and in colic generally, "soda-mint lozenges" being a familiar form. The characteristic anti-spasmodic action of the volatile oils is perhaps more marked in this than in any other oil, and greatly aids to this end the method of relieving pains arising in the alimentary canal. The volatile oil of peppermint is also official in Great Britain and the United States, being given in the same doses and for the same purposes as oil of peppermint. It is of less value medicinally, not containing any appreciable quantity of menthol, the place of which is taken in the oleum menthae viridis—

the pharmacopeial name—by carvone, C_{10}H_{14}O, found in caraway oil, and isomeric with thymol.

The following mode of cultivation of peppermint is adopted at Market Deeping. A rich friable soil, retentive of moisture, is selected and the ground is carefully tilled. The plants are propagated in the spring, usually in April and May. When the young shoots from the crop of the previous year have attained a height of about 4 in. they are pulled up and transplanted to a new soil, which is vigorous, and throw out numerous stolons on the surface of the ground. After the crop has been removed these are allowed to harden or become woody, and then farm-yard manure is scattered over the field and ploughed in. In this way the stolons are divided into numerous pieces, and covered with soil before the frost sets in. If the autumn is wet they are liable to become sodden, and rot, and the next crop fails. In the spring the fields are dressed with Peruvian guano. In the spring and the pepper is removed from the young plants, and is used just as the hoe cannot be used without injury to the plants. Moist heavy weather in August is apt to cause the foliage to drop off, and leave the stems almost bare. In these circumstances ripe (Puccia menthae) also is liable to attack the plants. This is prevented to a certain extent by a rope being drawn across the plants, by two men walking in the furrows, so as to remove excessive moisture. The average yield of peppermint is about 156 cwt. per acre. The first year's crop is always cut with the sickle to prevent injury to the stolons. The herb of the second and third year is cut with scythes, and then raked by women into loose heaps ready for carrying. The field is then broken up with the shovel or hoe, and the stolons removed at the same time. The herb is carted direct from the field to the stills, which are made of copper, and contain about 5 cwt. of the herb. Before putting the peppermint into the still water is poured in to the depth of about 2 ft., and in this peat is put. On top of this on the herb is thrown and trodden down by men. The lid, which fits into a water-joint, is then let down by pulleys and fastened by two bars, any excess of pressure being indicated by the water that is ejected at the joint. The distillation is conducted by the application of direct heat at the lowest possible temperature, and is continued for about four and a half hours. When the operation is completed the lid of the still is raised bodily by a windlass and the peppermint carried away in the empty carts on their return journey to the fields. The work is then repeated, the croppings being mixed with the manure applied in the autumn as above stated. The usual yield of oil, if the season be warm and dry, is said to be 1 oz. from 5 lb. of the fresh flowering herb, but, if wet and unfavourable, the product is barely half that quantity. The yield of a charge of the still is estimated at from 1 lb 12 oz. to 5 lb. The oil improves in mellowness even if kept as long as ten or fourteen years. The green colour sometimes present in the oil is stated to be due to a trace of water left in the apparatus necessary to prevent the oil from being put under pressure; the oil is held in a kind of water tank and the distillation; on the other hand, if the herb be left in the still from Saturday to Monday, the oil assumes a brown tint.

In France peppermint is cultivated on damp rich ground at Sens, in the department of Yonne. In Germany the plant is grown in the neighbourhood of Leipzig, where the little town of Cöleuda produces annually as much as 40,000 cwt. of the herb. In the United States peppermint is cultivated on a most extensive scale, chief in southwest Michigan, the west districts of New York state, and Ohio. The yield averages from 10 to 30 lb per acre. In Michigan the plant was introduced in 1855.

PEPPERRELL, SIR WILLIAM (1666-1759), American soldier, was born in Kittery, Maine, then a part of Massachusetts, on the 27th of June 1666. He studied surveying and navigation, and joined his father in his ship-building, fishing and general trading business, quickly becoming one of the wealthiest and most influential men in the province. He was commissioned captain (1717), major, lieutenant-colonel, and in 1726 colonel of militia. Pepperrell served in the Massachusetts general court (1726-1727), and in the governor's council (1727-1739), of which for eighteen years he was president. Although not a trained lawyer, he was chief justice of the court of admiralty, and was made general in command-in-chief of the New England force of about 4000, which, with the assistance of a British squadron under Commodore Peter Warren, besieged and captured the French fortress of Louisburg, the garrison surrendering on the 16th of June and Pepperrell and Warren taking possession on the following day. For his services Pepperrell, in November 1746, was created a baronet—the only New Englander so honoured. He was active in raising troops
PEPPER TREE—PEPYS, SAMUEL

during the "French and Indian War," and received the rank of lieutenant-general in February 1759. He died in Kittery, Maine, on the 6th of July in the same year.

See Usher Parsons, Life of Sir William Pepperrell, Bart. (Cambridge, Mass., 1855), based on the family papers.

PEPPER TREE, a tree which has no proper connexion with the true pepper (Piper), and is really a member of the natural order Anacardiaceae, being known botanically as Schinus Molle, from the Peruvian name Mulli. It is a native of tropical South America and is grown in the open air in the south of Europe. It is a small tree with unequally pinnate leaves, the segments linear, entire or finely saw-toothed, the terminal one longer than the rest, and all filled with volatile oil stored in large cells or cysts, which are visible to the naked eye and appear like holes when the leaf is held up to the light. When the leaves are thrown upon the surface of water the resinous or oily fluid escapes with such force as violently to agitate them. The flowers are small, whitish, arranged in terminal clusters and polygamous or unisexual, with five sepals, as many petals, ten stamens (as large as the petals in the case of the male flower, very small in the female flower, but in both springing from a cushion-like disk surrounding the base of the three-celled ovary). The style is simple or three-cleft, and the fruit a small, globose, pea-like drupe with a bony kernel enclosing a single seed. The fleshy portion of the fruit has a hot aromatic flavour from the abundance of the resin it contains. The tree is used for medicinal purposes by the Peruvians, and has similar properties to mastic. The Japanese pepper tree is Xanthoxylum piperitum the fruits of which have also a hot taste. Along the Riviera the tree known as Melia Azedarach, or the "Pride of India," is also incorrectly called the pepper tree by visitors.

PEPSIN, an enzyme or ferment obtained by drying the mucous lining of the fresh and healthy stomach of a pig, sheep, or calf. As used in medicine it consists of a light yellowish-white or brown powder or of pale yellow translucent grains or scales. It is only slightly soluble in water and alcohol. Pepsin is used to help gastric digestion in old people and in those in whom there is a deficient secretion of the gastric juice. It is useful in chronic catarrhal conditions of the stomach, the dyspepsia of alcoholism, and in gastric ulcer and cancer of the stomach.

Pepsin digests the albumens but is useless in the digestion of fats or carbohydrates. It may also be used to predigested albuminous foods. The following is a method of peptonizing beef. Take \( \frac{1}{2} \) lb. of minced raw lean beef, \( \frac{1}{2} \) pint of water containing 92% of hydrochloric acid, place in a jar with 30 grs. of pepsin, set in a warm place in a few hours, stirring occasionally. Then quickly boil it. It is usually unnecessary to strain it, as the meat is reduced to a fine almost impalpable powder which is readily assimilated. Many of the domestic proprietary peptonizing tablets are on the market and are convenient for the preparation of peptonized milk. The following is a method of preparing it. Take a clean glass quart bottle, pour in a pint of perfectly fresh cold milk, then add a teaspoonful of cold water in which a peptonizing tablet has been dissolved. Submerge the bottle in a can of water at 100°F. For from 5 to 10 minutes, take out the bottle and place on ice to prevent the further action of the pepsin. If no ice is convenient bring the milk to a boil for the same purpose. If the action of the pepsin be continued for a much longer period the milk becomes bitter to the taste from the development of excess of peptones. Predigested foods should not be used over a long period or the digestive functions of the stomach may be thrown off.

Pancreatic solution, derived from the pancreas of a pig digested in alcohol, has the power of converting starch into sugar, and albumen and fibrin into peptones. It only acts in an alkaline medium and at a temperature under 140°F. If used to peptonize milk sodium bicarbonate should be added. Many commercial preparations are on the market. Trypsin, the principal ferment of the pancreas, also changes proteids into peptones.

PEPSIN, JOHN CHRISTOPHER (1667–1732), English musician, of German extraction, was born in Berlin. He began his study of music at an early age, and about 1700 left Berlin and went to England, where he had various engagements, during which time he went on with his researches into ancient music. He composed a number of church services and instrumental pieces, besides music for masques and plays, but he is best known in connexion with the founding in 1710 of the Academy of Ancient Music. In 1713 he was made a Mus.D. of Oxford, and in 1746 F.R.S. In 1718 he married Margarita de l'Epine (d. 1746), who, as the first Italian to sing in England, was described in 1692 in the London Gazette simply as "the Italian woman." Pepusch died in London on the 20th of July 1752. His Treatise on Harmony (anonymous 1st ed. 1730) is believed to have been an embodiment of his rules drafted by his pupil Vincent Paisley, afterwards Earl of Abergavenny.

PEPYS, SAMUEL (1633–1703), English diarist, was born on the 23rd of February 1633. The place of his birth is not known. The name was pronounced in the 17th century, and has always been pronounced by the family, "Peeps." The family can be traced in Cambridgeshire as far back as the reign of Edward I. They rose by slow degrees from the class of small copyholders and yeoman farmers to the position of gentry. In 1653 they had a recognized right to use a coat of arms. John Pepys, Samuel's father, was a younger son, who, like other gentlemen in his position in that age, went into trade. He was for a time established as a tailor in London, but in 1661 he inherited a small estate at Brampton near Huntingdon, where he lived during the last years of his life.

Samuel was fifth child and second son of a large family, all of whom he survived. His first school was in Huntingdon, but he was afterwards sent to St Paul's in London, where he remained till 1650. While at St Paul's he was an eye-witness of the execution of King Charles I. On the 21st of June in that year his name was entered as a sizar on the books of Trinity Hall, Cambridge, but it was transferred to Magdalene on the 1st of October. On the 9th of March he entered into residence, and he remained there till 1654 or 1655. He obtained a Spendlake scholarship a month after entering, and on Dr John Smith's foundation on the 14th of October 1655. Nothing is known of his university career except that on the 21st of October 1659 he was publicly admonished with another undergraduate for having been "scandalously overserved with drink." At Cambridge he wrote a romance, Love is a Cheat, which he afterwards destroyed. On the 1st of December 1655 he was married at St Margaret's church, Westminster, to Elizabeth, daughter of Alexander Marchant, Sieur de St Michel, a French Hugenot exile from Anjou who had married an English lady named Kingsmill. Pepys had at this time no independent means, and probably relied on his cousins, the Montagues, to provide for him. On the 25th of March 1658 he was cut for the stone, an event which in his diary he calls in so many words the "emptiness of the key,

His place of clerk to the Navy Board was equivalent to the
post of permanent secretary in modern times. It made him chief of the secretariat and a member of the administering body of the navy. Though he was so ignorant of business that he did not even know the multiplication table when he first took office, he soon mastered the needful mechanical details by working early and late. He had other posts and honours, which came to him either as consequential on his clerkship or because he was a useful official. On the 23rd of July 1666 he was appointed one of the clerks of the Privy Seal, an office which returned him £3 a day in fees. He was a justice of the peace. In 1662 he was appointed a younger brother of the Trinity House, and was named a commissioner for managing the affairs of Tangier, then occupied by an English garrison. In 1664, he became a member of the corporation of the Royal Fishery, to which body he was named treasurer when another official had brought the accounts into confusion. In that year he also joined the Royal Society. During the naval war with Holland (1664-67) he proved himself an indefatigable worker. As surveyor of the victualling, the whole burden of a most important department was thrown on him in addition to his regular duties. He in fact organized the department. While the plague was raging in London in 1666 he remained at his post when many of his colleagues ran away, and he manfully avowed his readiness to take the risk of disease, as others of the king's servants faced the dangers of war. He had now gained the full confidence of the lord high admiral, the Duke of York, afterwards King James II.

When, on the termination of the war, the navy office was violently attacked by the Whigs, he was invited by the Duke of York to address a speech which he delivered at the bar of the House of Commons on the 5th of March 1668 passed for a complete vindication. In sober fact the charges of mismanagement were well founded, but the fault was not in the officials of the navy office only, and Pepys, who was master of the details, had no difficulty in throwing dust in the eyes of the House of Commons, which was ignorant. Nobody indeed was better acquainted with the defects of the office, for in 1668 he drew up for the duke of York two papers of inquiry and rebuke. "The Duke's Reflections on the several Members of the Navy Board's Duty" and "The Duke's answer to their several excusses" (Harleian MS. 6093). In 1669 he travelled abroad. His success in addressing parliament gave him the ambition to become a member of the House of Commons. He stood for Aldborough, but the death of his wife, on the 10th of November 1669, prevented him from conducting his canvass in person, and he was not elected. In 1673 he was returned for Castle Rising. The validity of his election was questioned by his opponent, Mr. Offley, and the committee of privy council decided against him, but the prorogation of the house prevented further action. The no-popery agitation was now growing in strength. The duke of York was driven from office by the Test Act, and Pepys was accused of "popery," partly on the ground that he was said to keep a crucifix and altar in his house, partly because he was accused of having converted his wife to Roman Catholicism. The crucifix story broke down on examination, but there is some reason to believe that Mrs. Pepys did become a Roman Catholic. Pepys was transferred by the king from the navy office to the secretarieship of the admiralty in 1673. In 1679 he was member for Harwich, and in the height of the popish plot mania he was accused, manifestly because he was a trusted servant of the duke of York, of betraying naval secrets to the French, but the charges were finally dropped. Pepys was released on bail on the 12th of February 1680. In that year he accompanied the king to Newmarket, and took down the narrative of his escape after the battle of Worcester. A proposal to make him head of King's College, Cambridge, in 1681, came to nothing. In 1683 he accompanied the duke of York to Scotland, where the uncleannily habits of the people caused him great offence. In 1683-1684 he was engaged in arranging for the evacuation of Tangier. He visited the place and kept a diary of his voyage. In 1684 he was elected president of the Royal Society. On the accession of King James II. in 1685 he retained his place as secretary to the admiralty, to which he had been appointed by warrant when James resumed the lord high admiralty (June 16, 1684), and Pepys was in effect minister for the navy. The revolution of 1688 ended his official career. He was dismissed on the 5th of March 1689, and spent the rest of his life in retirement, and, except for a brief imprisonment on the charge of Jacobite intrigue in 1690, in peace. He died at his house in Clapham on the 23rd of May 1703. His last years were passed in correspondence with his friends, who included Evelyn and Dryden, or in arranging his valuable library. It was left on his death to his nephew, John Jackson, son of his sister Pauline, and in 1724, by the terms of his will, was transferred to Magdalene College, Cambridge, where it is still preserved.

Such was the outward and visible life of Samuel Pepys, the public servant whose diligence was rewarded by success. The other Pepys, whom Sir Walter Scott called "that curious fellow," was revealed in 1825, when his secret diary was partly published. The first entry was made on the 1st of January 1660, the last on the 31st of May 1669, when the increasing weakness of his eyes, which had given him trouble since 1664, compelled him to cease writing in the conditions he imposed upon himself. If there is in all the literature of the world a book which can be called "unique" with strict propriety it is this. Confessions, diaries, journals, autobiographies abound, but such a revelation of a man's self has not yet been discovered. The diary is a thing apart by virtue of three qualities which are rarely found in perfection when separate and nowhere else in combination. It was secret; it was full; and it was honest. That Pepys meant it for his own eye alone is clear. He wrote it in Sheldon's system of shorthand, by which he published his views of the foreign languages or by varieties of his own invention whenever he had to record the passages least fit to be seen by his servants or by "all the world." Relying on his cypher he put down whatever he saw, heard, felt or imagined, every motion of his mind, every action of his body. And he noted all this, not as he desired it to appear to others, but as it was to his seeing. The result is a "human document" of amazing vitality. The man who displays himself to himself in the diary is often odious, greedy, cowardly, casuistical, brutal. He tells how he kicked his cook, and blacked his wife's eye, and was annoyed when others saw what he had done. He notes how he compelled the wives of unfortunate men what he had to draw their husband's pay at the navy office to prostitute themselves; how he took "compliments," that is to say gifts, from all who had business to do with the navy office; how he got tipay and suffered from sick headache; how he repented, made vows of sobriety, and found casuistical excuses for breaking them: The style is as peculiar as the matter—colloquial, garrulous, racy from simplicity of language, and full of the unconscious humour which is never absent from a truthful account of the workings of nature in the average sensal man. His position enabled him to see much. His complete harmony with the animalism and vulgarity of the Restoration makes him a valuable witness for his time. To his credit must be put the facts that he knew the animalism and vulgarity to be what they were; that he had a real love of music and gave help to musicians, Cesare Morell, for instance; that though he made money out of his places he never allowed bad work to be done for the navy if he could help it; that he was a hard worker; and that he had a capacity for such acts of kindness and generosity as are compatible with a gross temperamant and a pedastrian ambition.

The diary, written in a very small hand in six volumes, was included among his books at Magdalene. On the publication of Evelyn's diary in 1818, the then head of Magdalene, the Hon. and Rev. George Neville, decided to publish Pepys's. Part of the MS. was deciphered by his cousin Lord Grenville. The library contained both the short and the long-hand copies of Pepys's account of King Charles's adventures, but its books were so little known by the curators that this key was over-looked. The MS. was deciphered by John Smith, afterwards rector of Baldock in Hertfordshire, between 1819 and 1822. The first and partial edition, edited by Richard Neville Griffin, 3rd Lord Braybrooke, appeared in 1825 in two volumes quarto (London). It attracted great attention and was reviewed by Sir Walter Scott in the Quarterly for January 1826. A second edition in two octavo
PEQUOT—PERCEVAL

volumes followed in 1828 (London). A third and enlarged edition in five volumes octavo appeared in 1848-1849, and a fourth in four in 1854 (London). In 1875-1879 Dr Minors Bright published a still fuller edition in six volumes octavo (London). Many portraits of Pepys are known to have been taken and several can be traced. One was taken by Savill (1661), another by John Hales (1666), now in the National Portrait Gallery. A portrait by Sir Godfrey Kneller was engraved by Wheatley as a small engraving for the Pepysian Library at Cambridge. Three portraits were taken by Sir Godfrey Kneller, of which one belongs to the Royal Society, and another is in the Hall of Magdalene. Pepys's only known publication in his life was the Memoirs of the Navy, but other writings have been attributed to him.

Authors.—The standard edition of Pepys's Diary is that by H. B. Wheatley, in nine volumes octavo, with a supplementary volume of Pepysiana (London, 1893). See also Wheatley's Samuel Pepys, and the world he lived in (London, 1880); The Life, Journals and Correspondence of Pepys, by J. Smith (London, 1841); E. H. Moorhouse, Samuel Pepys, Administrator, Observer, Gossip (1905); and P. Lubbock, Samuel Pepys (1909). (D. H.)

PEQUOT, an Algonquian tribe of North-American Indians, a branch of the Mohicans. They occupied the coast of Connecticut from Niantic river to the Rhode Island boundary. Together with their kinsmen, the Mohegans, they formed a powerful and warlike people, bitterly hostile to the early settlers. In 1637 the Pequots were surprised by the whites at their fort on the Mystic river, and suffered so completely a defeat that the tribe was broken up, and its remnants took refuge with neighbouring tribes. The Pequot country passed under the control of the Mohegans. At the height of their power the Pequots numbered, it is estimated, some 3000.

PERCEPTION (from Lat. percipere, to perceive), in psychology, the term specially applied to the mental process by which the mind becomes conscious of an external object; it is the mental completion of a sensation, which would otherwise have nothing but a momentary existence coextensive with the duration of the stimulus, and is intermediate between sensation and the "ideal revival," which can reinstate a perceptual consciousness when the object is no longer present. This narrow and precise usage of the term "perception" is due to Thomas Reid, whose view has been generally adopted in principle by modern psychologists. On the other hand some psychologists decline to accept the view that the three processes are delimited by sharp lines of cleavage. It has been pointed out that sensation and perception are purely subjective state without cognition; on the other that sensation and perception differ only in degree, perception being the more complex. The former view admits, which the latter practically denies, the distinction in principle. Among those who adopt the second view are E. B. Titchener and William James. James (Principles of Psychology, ii. 76) compares sensation and perception as "the barker and the richer consciousness," and says that "beyond the first crude sensation all our consciousness is a matter of suggestion, and the various suggestions shade gradually into each other, being one and all products of the same psychophysical machinery of association." Similarly Wundt and Titchener incline to obliterate the distinction between perception and ideal revival. Prior to Reid, the word perception had a long history in the wider sense of cognition in general. Locke and Hume both use it in this sense, and regard thinking as that special kind of perception which implies deliberate attention. (See Psychology.)

PERCEVAL, or PERCYVELLE (Ger. Parsival, Fr. Perlesvaus, Welsh, Peredur), the hero of a comparatively small, but highly important, group of romances, forming part of the Arthurian cycle. Originally, the story of Perceval was of the character of a folk-tale, and that of one remarkable importance and world-wide diffusion. He is represented as the son of a widow, "la dame veuve," his father having been slain in tournament, battle or by treachery, either immediately before, or shortly after his birth. The mother, fearful lest her son should share his father's fate, flies to the woods, either alone with one attendant, or with a small body of faithful retainers, and there brings up her son in ignorance of his name, his parentage and all knightly accomplishments.

The youth grows up strong, swift-footed and of great personal beauty, but, naturally enough, of very limited intelligence. This last is one of the most characteristic traits of the Perceval story, connecting it alike with the Irish Lay of the Great Fool, and the Teutonic Dimmung tales. He spends his days chasing the beasts of the forest, running them down by sheer speed, or killing them with darts (javelots) or bow and arrows, the only weapons he knows.

One day, however, he meets a party of knights in armour; he first adores the leader as God, and then takes them to be some new and wondrous kind of animal, asking the most naive questions as to their armour and equipment. Being told that they are knights he determines that he too will be one, and returns to his mother announcing his intention of at once setting forth into the world to seek for knighthood. Dressed as a peasant (or a fool), he departs (his mother, in some versions, dying of grief), and comes to the king's court. Of course in the romance it is the court of Arthur; probably in the original tale it was simply "the king." Here his uncouth behaviour and great personal beauty attract general attention, and he is alike mocked by Kay, and his future distinction mysteriously foretold. He slays a foe of Arthur's, the Red Knight, who has insulted the king, and challenged the knights of the court, who, for some mysterious reason, are unable to challenge the stranger. Dressing himself in the armour of the slain knight, which he has great difficulty in handling and eventually puts on over his peasant's garb, he sets out on a series of adventures which differ greatly in the various versions, but the outcome of which is that he becomes a skillful and valiant knight and regains the heritage of his father.

This, the Perceval story proper, has been recognized by scholars as a variant of a widespread folk-tale theme, designated by J. C. van Hahn as the Aryan Expulsion and Return formula, which counts among its representatives such heroes as Perseus, Cyrus, Romulus and Remus, Siegfried, and, as Alfred Nutt has pointed out, Arthur himself. This particular variant appears to be of British-Celtic origin, and the most faithful representative of the original tale is now very generally held to be the English Sir Percyuelle of Galles, a poem preserved in the Thornton manuscript. Here the hero is nephew to Arthur on the mother's side, and his father, of the same name as himself, is a valiant knight of the court. A noticeable feature of the story is the unanswerable question as to the hero's parentage; the mother is always a lady of rank, a queen in her own right, or sister of kings (as a rule of the Grail kings); but the father's rank varies, he is never a king, more often merely a valiant knight, and in no instance does he appear to be of equal rank with his wife. This distinguishes the story from that of Lancelot, with which some modern scholars have been inclined to identify it; for Lancelot's parentage is never in doubt, he is fau du roi.

The connexion of the story with Arthur and his court brought about a speedy and more important development, the precise steps of which are not yet clear: Perceval became the hero of the Grail quest, in this outing Gawain, to whom the adventure originally belonged, and the Perceval became merged in the Grail tradition. Of the Perceval-Grail romances the oldest is that point of view of manuscript preservation is the Perceval or Conte del Graal of Chrétien de Troyes. Two manuscripts, indeed, the British Museum and Mons texts, preserve a fragment relating the birth and infancy of the hero, which appears to represent the source at the root alike of Chrétien and of the German Parsival, but it is only a fragment, and so far no more of the poem has been discovered. Chrétien left his poem unfinished, and we do not know how he intended to complete the adventures of his hero; but those writers who undertook the task, Wauchier de Denain, Gerbert de Montreuil and Manessier, carried it out with such variety of detail, and similarity in the form of Chrétien's version, that it seems practically certain that there must have been, previous to Chrétien's work, more than one poem dealing with the same theme. The German poet, Wolfram von Eschenbach, whose Parsival in parts closely agrees with the Perceval and who was long held to be a mere translator of Chrétien,
differs widely in the setting of his story. He gives an introduction, in which the adventures of the father, here a prince of Anjou, are related; a conclusion, in which the Swan-Knight, Lohengrin, is made Parzival’s son; he represents the inhabitants of the Grail castle as Templars (Templeien); and makes the Grail itself a stone. Finally, he reproaches Chrétien with having told the story amiss, whereas Kiøt, the Provencal, whose version Wolfram was following, had told it aright from the beginning. It is certain that Gerbert knew, and used, a Perceval which, if not Kiøt’s poem, must have been closely akin to it; as he too makes the Swan-Knight a descendant of the Grail hero. The probability seems to be that the earliest Perceval-Grail romance was composed at Fescamp, and was coincident with the transformation, under the influence of the Saint-Sang legend, of the originally Pagan talisman known as the Grail into a Christian relic, and that this romance was more or less at the root of all subsequent versions.

Besides the poems, we have also two prose Perceval romances, the relative position of which has not yet been satisfactorily determined. The first is found in two manuscripts only, the so-called "Didot" (from its original possessor M. Firmin-Didot), now in the Bibliothèque Nationale, Paris; the other, and much superior text, in the Bibliotheca Estense, Modena. In both cases the romance follows the prose rendering of Borrøn’s Joseph of Arimathoea and Merlin, and precedes a Mort Artus, thus forming part of a complete cycle. The text shows a curious mingling of sources; the real primitive Perceval story, the Enfances, is omitted; he grows up in his father’s house and goes to court at his wish. Later, however, stories which certainly derive from an early non-Grail tradition are introduced, and there are references which imply a knowledge of the prose Lancelot and of Chrétien’s poem. The romance is probably a somewhat late, and not very skilful, compilation. The other prose romance, the Perlesvaus, is decidedly superior in literary form, but here too we have a mingling of old and new elements. The Enfances story is omitted, and there are parallels with the German Parsival, with Wauchier de Denain and with Gerbert, while much is peculiar to the Perlesvaus itself. It is not improbable that it represents a free and individual working over of the original Fescamp version, and that in its later shape it was intended to form, and did at one time form, the Quest section of the cyclic redaction of the Arthurian prose romances, being dislodged from this position by the Galahad Quest. It is a curious fact that the printed editions always give it in conjunction with this latter and that the two have been held in preserved together in a Welsh manuscript translation. We also possess, in one of the so-called Mahinogi a Welsh version of the tale, Pêredur, son of Eorav. This appears to be a free rendering of the adventures found in Chrétien combined with incidents drawn from Welsh tradition. This was at one time claimed as the original source of all the Perceval romances, but this theory cannot be maintained in face of the fact that the writer gives in one place what is practically a literal translation of Chrétien’s text in a passage which there is strong reason to believe was borrowed by Chrétien from an earlier poem. In order of time the Pêredur probably ranks latest in the series of Perceval romances which, however, does not detract from its interest as a possible representative of genuine Welsh traditions, unknown to other writers.

The value and interest of the Perceval romances stand very high, not alone for their intrinsic merit, though that is considerable—Chrétien’s Perceval, though not his best poem, is a favourable specimen of his work, and von Eschenbach’s Parsival, though less elegant in style, is by far the most humanly interesting, and at the same time, most deeply spiritual, of the Grail romances—but also for the interest of the subject matter. The Perceval romance is an admirable folk-tale, the Grail problem is the most fascinating problem of medieval literature; the two combined form a romance of quite unique charm and interest.

This has been practically proved by the extraordinary success which has attended Richard Wagner’s dramatic re-telling of the legend in his Parsifal. The immediate source of this version is the poem of Wolfram von Eschenbach, though the Grail, of course, is represented in the form of the Christian relic, not as the jewel talisman of the Parzival; but the psychological reading of the hero’s character, the distinctive note of von Eschenbach’s version, has been adapted by Wagner with marvellous skill, and his picture of the hero’s mental and spiritual development, from extreme simplicity to the wisdom born of passion and curiosity, is more skilful, penetrating, and impressive. Modern German versions are by Simrock (very close to the original) and Hertz (freer, but with excellent notes and appendices); Eng. trans. by J. L. Weston (1894). The “Didot” Perceval was published by Hucher in vol. i. of Le Saint Graal (1875-1878); an edition of the Modena text has also been prepared. Perlesvaus was published by Potvin in vol. i. of his edition of Chrétien’s poem. The Welsh text, with translation, has been edited by Watkin Williams. A manuscript text of the two narratives, the Sebastian Evans is published in “The Temple Classics,” under the title of The High History of the Holy Grail. Peredur will be found in Alfred Nutt’s edition of the Mabronethon (1902). For the critical edition of the subject we refer to T. E. Paton’s “Legends of the Grail” (Oxford, 1912). Paton’s “Legends of the Grail” (Oxford, 1912). Paton’s “Legends of the Grail” (Oxford, 1912). Paton’s “Legends of the Grail” (Oxford, 1912). Paton’s “Legends of the Grail” (Oxford, 1912). Paton’s “Legends of the Grail” (Oxford, 1912). Paton’s “Legends of the Grail” (Oxford, 1912).

PERCEVAL, SPENCER (1762-1812), prime minister of England from 1800 to 1812, second son of John, and Earl of Egmont, was born in Audley Square, London, on the 1st of November 1762. He was educated at Harrow and at Trinity College, Cambridge, and was called to the bar at Lincoln’s Inn in 1786. A very able speech in connexion with a famous forgery case has been drawn attention to his talents, his success was from that time rapid, he was soon regarded as the leading counsel on the Midland circuit, and in 1796 became a K.C. Entering parliament for Northampton in April of that year, he distinguished himself by his speeches in support of the administration of Pitt. In 1801, on the formation of the Addington administration, he was appointed solicitor-general, and in 1802 he became attorney-general. An ardent opponent of Catholic Emancipation, he delivered in 1807 a speech on the subject which helped to give the death-blow to the Grenville administration, upon which he became chancellor of the exchequer under the duke of Portland, whom in 1809 he succeeded in the premiership. Notwithstanding that he had the assistance in the cabinet of no statesman of his rank, he continued to retain office till the government, by a man named Bellingham, a bankrupt with a grievance, who had vainly applied to him for redress, in the lobby of the House of Commons on the 11th of May 1812. Bellingham was certainly insane, but the plea was set aside and he was hanged. Perceval was a vigorous debater, specially excelling in replies, in which his thorough mastery of all the details of his subject gave him a great advantage. He married in 1790 and had six sons and six daughters; one of the latter married Spencer Horatio Walpole (d. 1828), home secretary, and their son Sir Spencer Walpole, the well-known historian, published an excellent biography of Perceval in 1874.

See also P. Treherne, Spencer Perceval (1909).

PERCH (through Fr. from Lat. perc, Gr. πηκος; the last word is connected with πηκων, dark-coloured, spotted), a fresh-water fish (Perca fluviatilis), generally distributed over Europe, northern Asia and North America, and so well known as to have been selected for the type of an entire family of spiny-rayed fishes, the Percidae, which is represented in European fresh-water by several other fishes such as the pope (Acorina cervina) and the pike-perch (Lucioperca). It inhabits rivers as well as lakes, but thrives best in waters with a depth of not less than 3 ft.; in large deep lakes it frequently descends to depths of 100 ft. It attains a length of one foot and a half, north as the 60th parallel, but does not extend to Iceland or any of the islands north of Europe. In the Alps it ascends to an altitude of 4000 ft.
The shape of its body is well proportioned, but many varieties occur; some specimens being singularly high-backed, others low and long-bodied; sometimes such variations are local, and Agassiz and other naturalists at one time thought it possible to distinguish two species of the common perch of Europe; there are not even sufficient grounds, however, for separating specifically the North-American form, which in the majority of ichthyological works is described as Perca flavescens. The brilliant and striking colours of the perch render it easily recognizable even at a distance. A rich greenish-brown with golden reflections covers the back and sides, which are ornamented with five or seven dark cross-bands. A large black spot occupies the membrane between the last spines of the dorsal fin; and the ventral, anal and lower part of the caudal are bright vermilion. In the large peaty lakes of north Germany a beautiful variety is not uncommon, in which the golden tinge prevails, as in a goldfish.

The perch is strictly carnivorous and most voracious; it wanders about in small schools within a certain district, playing sad havoc among small fishes, and is therefore not to be tolerated in waters where valuable fry is cultivated. Perch of three pounds in weight are not infrequently caught in suitable localities; one of five would now be regarded as an extraordinarily large specimen, although in older works we read of individuals exceeding even that weight.

Perch are good, wholesome food, and highly esteemed in inland countries where marine fish can be obtained only with difficulty. The nearly allied pike-perch is one of the best European food-fishes. The perch is exceedingly prolific; it begins to spawn when three years old, in April or in the first half of May, depositing the ova, which are united by a viscid matter in lengthened or net-shaped bands, on water plants.

**PERCH** (through Fr. perche from Lat. pertica, a pole or rod used for measurement), a bar or rod used for various purposes, as e.g. for a navigation mark in shallow waters, for a support on which a bird may rest, or for a pole which joins the back with the fore part of a wagon or other four-wheeled vehicle. As a term of linear measurement, "perch," also "rod" or "pole," = 16½ ft., 5½ yds.; of superficial area, = 30½ sq. yds.; 160 perches = 1 acre. As a stonemason's measure, a "perch" = 1 linear perch in length by 1½ ft. in breadth and 1 ft. in thickness.

**PERCHE**, a region of northern France extending over the departments of Orne, Eure, Eure-et-Loir and Sarthe. Its boundaries are Normandy on the N. and W., Maine on the S.W., Vendômois and Dunois on the S., Beauce on the E. and Thimerais on the N.E. The greater part of the district is occupied by a semicircle of heights from 650 to 1000 ft. in height) stretching from Moulins-la-Marche on the north-west to Montmirail on the south; within the basin formed thereby the shape of which is defined by the Huisne, an affluent of the Sarthe, lie the chief towns—Mortagne, Nogent-le-Rotrou and Bellême. Stock-raising and dairy-farming are flourishing in the Perche, which is famous for the production of a breed of large and powerful horses. Cider-apples and pears are grown throughout the district. In the middle ages the Perche constituted a countship of which Corbon, Mortagne and Nogent-le-Rotrou were successively the capitals. Under the ancien régime it formed, together with Maine, a gouvernement of which Mortagne was the capital.

**PERCIVAL, JAMES GATES** (1795-1856), American poet, philologist and geologist, was born in Kensington parish, Berlin, Connecticut, on the 15th of September 1795. He graduated at Yale in 1815, and in 1820 took the degree of M.D., and started practice in Berlin. He contributed verse to the Microscope, a semi-weekly paper, founded at New Haven in 1820. In this first appeared his best-known poem," "The Suicide," which reflects his chronic melancholy, due doubtless to ill-health; it was begun in 1816 and finished in 1820, after he had actually made two attempts on his own life. In 1823 Percival became an editor of the Connecticut Herald at New Haven; and in 1824 he was in turn an assistant-surgeon and lecturer on chemistry at West Point, and an inspector of recruits at the Charlestown (Mass.) Navy Yard. He prepared (1826-1831) an English and Latin edition of Malte-Brun's Geography (published 1834) and in 1827-1829 read the manuscripts and proof-sheets of Webster's Dictionary, giving special attention to scientific words. In 1835-1840, with Professor Charles U. Shepard (1804-1886), he made a geological survey of Connecticut; his Report (1842) showed great learning and much patient research. In 1854 he became state geologist of Wisconsin, and in 1855 published one volume of his Report; the second he had nearly completed at the time of his death, on the 22nd of May 1856, at Hazel Green, Wisconsin.

See his Poetical Works (2 vols., Boston, 1859), with a Biographical sketch, by H. W. Fitch; and Julius H. Ward, Life and Letters of James Gates Percival (Boston, 1866).

**PERCY (FAMILY).** This family, whose deeds are so prominent in English history, was founded by William de Percy (c. 1050-1096), a follower of the Conqueror, who bestowed on him a great fief in Yorkshire and Lincolnshire. The register of Whithby Abbey, which he founded anew, and in later days the heralds, were responsible for the fabulous origin and pedigree of the family which are still current. By Emma, daughter of Hugh de Port, a great Hampshire baron, William was father of several sons, of whom Alan the eldest succeeded him. His grandson William was the last of the house in the direct line, and left two sisters and coheirresses, Maud countess of Warwick, who died childless, and Agnes. Agnes de Percy had married Josceline, styled "brother of the queen" (i.e. Adeliza of Louvain, second wife of Henry I), whose legitimacy has been questioned, and from this marriage descended the second house of Percy (which name it assumed), till its own extinction in the male line five centuries later (1670). By it was brought into the family the great Petworth estate in Sussex, which Josceline had obtained from his sister, who was holding Arundel and its fief. His son Richard (c. 1170-1244) and Richard's nephew William (c. 1183-1245) were among the barons who rose in arms against John, but the latter made his peace with Henry III., and had his lands restored to him. Richard de Percy was one of the twenty-five barons appointed to enforce the observance of Magna Carta.

The next important member of the family is William's grandson Henry de Percy (c. 1272-1315), whom Edward II., after the deposition of John Baliol, appointed governor of Galloway, and who was one of his most active agents in the subjugation of Scotland till the success of Robert Bruce drove him out of Turnberry Castle, and made him withdraw into England. He was rewarded by Edward II. with the barren title of earl of Carrick, declared to be forfeited by the Scottish hero; and the same king appointed him governor of the castles of Bamborough and Scarborough. But in 1306 he himself made his position strong in the north of England by purchasing lands from Anthony Bek, bishop of Durham, among which was the honour of Allwick, the principal seat of the family ever since. The Percys had chiefly resided till then at Spofoot in Yorkshire, but have since determined to live at Northumberland dates from this acquisition. Henry's son, another Henry (c. 1299-1352), took part in the league against Edward III.'s favourites the Despensers, was in favour with Edward III., and obtained from Edward Baliol as king of Scotland grants of Lochmaben, Annandale and Moffatdale, which he surrendered to the English king for the castle and constableship of Jedburgh, or Jedworth, with the forest of Jedworth and some neighbouring towns. A few years later, in fuller recompense of the unprofitable gift of Baliol, a grant of 500 marks a year was made to him out of the old customs at Berwick.
and in 1346 he did splendid service to his sovereign by defeating and taking prisoner David II., king of Scotland, at the battle of Neville's Cross.

To him succeeded another Henry Percy (1322–1368), a feudal baron like his predecessors, who fought at Crécy during his father's lifetime and whose brother Thomas Percy (1333–1369) was bishop of Norwich from 1356–1369. The next head of the Percys was Henry's son, another Henry, who was made earl of Northumberland at the coronation of Richard II., and whose younger brother Thomas (d. 1405) was created earl of Worcester in 1397. The 1st earl of Northumberland, father of the famous Hotspur, Sir Henry Percy (p.2), was killed at Bramham Moor in 1408, while in arms against the king, and his title and estates were forfeited. But, by an act no less gracious than politic, Henry V. restored them in 1414 to this earl's grandson, Henry (1394–1455), then a prisoner with the Scots, whose liberation he had no difficulty in procuring from the duke of Albany during the time of James I.'s captivity. From that day the loyalty of the family to the house of Lancaster was steadfast and undeviating. The 2nd earl died fighting for Henry VI. at the first battle of St Albans in 1455; the 3rd, Henry (1432–1461), was slain on the bloody field of Towton; the 4th, Henry (1446–1450), was killed in quelling an insurrection in the time of Henry VI. So strong was the Lancastrian feeling of the family that even Sir Ralph Percy (1425–1464), a brother of the earl who fell at Towton, though he had actually submitted once to Edward IV., turned again, and when he fell at Hedgelby Moor in April 1464 consold himself with the thought that he had, as he phrased it, "saved the bird in his bosom."

No wonder, then, that in Edward IV.'s days the title and estates of the family were for a time taken away and given to John Neville Lord Montagu, brother of Warwick the king-maker. But the north of England was so accustomed to the rule of the Percys that in a few years Edward saw the necessity of restoring them and did so even at the cost of alienating still further the powerful family of the Nevilles, who were then already on the point of rebellion.

A crisis occurred in the fortunes of the family in the reign of Henry VIII. on the death of Henry, the 6th earl (c. 1502–1537), whose brothers Sir Thomas and Sir Ingelram Percy, much against his will, had taken part in the great insurrection called the Pilgrimage of Grace. A thriftless man, of whom it is recorded that in his youth he was smitten with the charms of Anne Boleyn, but was forced to give her up and marry a woman he did not love, he died childless, after selling many of the family estates and granting the others to the king. The title was forfeited on his death, and was granted by Edward VI. to the ambitious John Dudley, earl of Warwick, who was attained in the succeeding reign. It was restored in the days of Queen Mary to Thomas Percy (1528–1572), a nephew of the 6th earl, who, being a staunch Roman Catholic, was one of the three earls who took the lead in the celebrated rising of 1552, and was beheaded at York. His brother Henry (c. 1532–1583), who succeeded him, was no less unhappy. Involved in Throgmorten's conspiracy, he was committed to the Tower of London, and was supposed to have shot himself in bed with a pistol found beside him; but there were grave suspicions that it had been discharged by another hand. His son, Henry (1567–1632), the next earl, suffered like his two predecessors for his attachment to the religion of his forefathers. The Crown lawyers sought in vain to implicate him in the Gunpowder Plot, but he was imprisoned for fifteen years in the Tower and compelled to pay a fine of £30,000. Algernon (1602–1668), the son who next succeeded, was a parliamentary general in the Civil War. At length, in 1670, the male line of this illustrious family became extinct, at least in the direct line, about five hundred years after the marriage of Agnes de Perci with Josceline of Louvain.

The representation of the earlier Percys had passed away through the daughters of Earl Thomas, beheaded in 1572, but his earldom of Northumberland (created anew for him in 1537) had passed to his brother Henry, under a special remainder, and appears to have become extinct in 1670, though persistently claimed by James Percy, "the trunk-maker." The last earl's daughter Elizabeth, a great heiress, was mother by Charles Seymour, 6th duke of Somerset, of Algernon, 7th duke, who was summoned (in error) as Lord Percy in 1722 and created earl of Northumberland in 1749. On the duke's death in 1750 his earldom of Northumberland passed under a special remainder, with the main inheritance of the Percys, to Sir Hugh Smithson, bart. (1715-1786), who had married his daughter and eventual heiress in 1740, and was created duke of Northumberland and Earl Percy in 1766. From this marriage descends the present duchy of Northumberland, which bears the name of Percy in lieu of Smithson, and owns vast estates in Northumberland.

Alnwick Castle, their chief seat, where much state is still kept up, has been described by Mr Clark as "probably the finest extant example of a Norman castle of this type, having an open keep and a complete enceinte." It had been hardly occupied and in decay for some two centuries when the present family succeeded to it, but was restored by them to its former splendour between 1750 and 1786. "Princely Petworth," however, the seat of the later Percys, with their ancient Sussex estates and those in Yorkshire (Leconfield) and Cumberland (Cockermouth), all passed away in 1750 with the earldom of Egremont and became Cockermouth, positioned in 1750 under the 7th duke of Somerset, and these estates are now held by Lord Leconfield. The actual representation in blood of the later Percys (i.e. from 1752) passed in 1866, on the death of the 4th duke, to the dukes of Atholl, who in virtue of it are Lords Percy, under the writ of 1722, the oldest of the family titles now remaining. The ancient London residence of the Percys, Northumberland House, Charing Cross, was removed to make way for Northumberland Avenue. Above it stood the Percy crest, a (blue) lion with stiffly extended tail; but the famous badge of the house was the white crescent or half-moon—"the Half-Moon shining all so fair"—of "the Northern Rising" ballad—still set in the Percy coat of arms was a blue lion rampant on a yellow ground—"Thee Weare o'r blyin Lyon Rampant"—of the Carlaverock roll, stated, but wrongly, to have been derived from the dukes of Louvain and Brabant. With it they quartered the "Luces" coat of the Lucys of Cockermouth after succeeding to their estates, whence the lines in The Battle of Otterbourne:

"The Luccets and the Crossants both, The Scotts fought them again..."

Lindsay, 1862), both somewhat abulatory and needing critical revision; Tate, History of Alnwick (1866); Hartshorne's paper on The Percys and their Castles in the Newcastle volume of the Archaeological Institute (1852); E. A. Freeman, "The Percy Castles" (1875) in English Towns and Districts; G. T. Clark, Medieval Military Architecture (1844); G. E. (Oakame) Complete Peerage(1895), vol. vi.; Bishop Percy, Northumberland Household Book. See also the article Northumberland, Earls and Dukes of. (J. G.; J. H. R.)

PERCY, SIR HENRY, called Hotspur (1364–1403), eldest son of Henry, 1st earl of Northumberland, was born on the 20th of March 1364. He saw active service when he was fourteen at the siege of Berwick. Six years later he was associated with his father in the wardship of the eastern march of Scotland, and his zeal in border warfare won the name of Hotspur for him from his opponents. In 1386 he was sent to Calais, and ruled French territory, but was shortly afterwards recalled to defend England against a naval attack by France. In popular story and ballad he is known as one of the heroes of Otterburn or Chevy Chase, which is the subject of one of the most stirring recitals of Froissart. In the summer of 1388 the Scots invaded England by way of Carlisle, sending a small body under the earls of Douglas, Mar and Moray to invade Northumberland. The earl of Northumberland remained at Alnwick, but sent his sons Sir Henry and Sir Ralph against the enemy. In hand-to-hand fighting before the walls of Newcastle, Douglas is said to have won Sir Henry's pennon, which he swore to fix upon the walls of Dalkeith. The Scots then retreated to Otterburn, where Percy, who was bent on recovering his pennon, attacked them on a fine August evening in 1388. Douglas was
slain in the battle, though not, as is stated by Walsingham, by Percy's hand. Percy was captured by Sir John Montgomerie and his brother Ralph by Sir John Maxwell. Hotspur was released on the payment of a heavy ransom, to which Richard II. contributed £3,000, and in the autumn his term as warden of Carlisle and the West March was extended to five years. In 1399 together with his father he joined Henry of Lancaster. Henry IV. gave the charge of the West March to Northumberland, while Henry Percy received the castles of Bamburgh, Roxburgh and Berwick, and the wardenship of the East March, with a salary of £3,000 in peace time and £1,200 in war. During the first year of Henry's reign Hotspur further took part in the battle at Shrewsbury, and was appointed Justiciar of North Wales and constable of the castles of Carlisle, Conwy, Denbigh and Carnarvon. Henry also gave him a grant of the isle of Anglesey, with the castle of Beaumaris. William and Rees ap Tudor captured Conway Castle on the 1st of April 1401, and Percy in company with the prince of Wales set out to recover the place, Percy providing the funds. In May he reported to the king the pacification of Merioneth and Carnarvon, and before the end of the month Conway was surrendered to him. Meanwhile he wrote demanding arrears of pay, with the threat of resignation if the money were not forthcoming, but the king intimated that the loss of Conway had been due to his negligence, and he would not present part of the money. He had the same difficulty in obtaining monies for his northern charge that he had experienced in Wales.\(^1\) Anglesey was taken from him, and he was deprived of Roxburgh Castle in favour of his rival, the earl of Westmorland. The Scots again invaded England in the autumn of 1402, headed by the earl of Douglas and Murdoch Stewart, son of the duke of Albany. Northumberland and Hotspur barred their way at Millfield, near Wooler, and the Scots were compelled to fight at Humboldt, or Homildon Hill, on the 14th of September. The English archers were provided with a good target in the masses of the Scottish spearmen, and Hotspur was restrained from charging by his ally, George Dunbar, earl of March. The Scottish army was almost destroyed, while the English loss is said to have been five men. Disputes with the king arose over the disposal of the Scottish prisoners, Percy insisting on his right to hold Douglas as his personal prisoner, and he was summoned to court to explain. It is related that when he arrived Henry asked for Douglas, and Hotspur demanded in return that his brother-in-law, Edmund Mortimer, should be allowed to ransom himself from Owen Glendower, with whom he was a prisoner. High words followed, in the course of which Henry called Percy a traitor, struck him on the face, and drew his sword on him. Percy is said to have answered this defiance with the words, "Come here, man, and take your hand." They parted, and in 1402 Hotspur issued a proclamation in Cheshire stating that Richard II. was alive, and summoning the inhabitants to his standard. He made common cause with his prisoner Douglas, and marched south to join forces with Glendower, who was now reconciled with Mortimer. He was reinforced by his uncle Thomas, earl of Worcester, who, although steward to the household of the prince of Wales, joined his family in rebellion. The mythical Richard II. was heard of no more, and Percy made himself the champion of the young earl of March. When he arrived at the Castle Foregate, Shrewsbury, early on the 21st of July, and demanded provisions, he found the king's forces had arrived before him. He retired in the direction of Whitchurch, and awaited the enemy about 3½ miles from Shrewsbury. After a long parole, in which a truce of two days was even said to have been agreed on, the Scottish earl of March, fighting on the royal side, forced on the battle in the afternoon, the royal right being commanded by the prince of Wales. Hotspur was killed, the earls of Douglas and Worcester, Sir Richard Venables of Kinderton, and Sir Richard Vernon were captured, and the rebel army dispersed. Worcester, Venables and Vernon were executed the next day. Percy's body was buried at Whitchurch, but was disinterred two days later to be exhibited in Shrewsbury. The head was cut off, and fixed on one of the gates of York.

See Northumberland, Earls and Dukes of; and Percy: (Family). Also Chronique de la traison et mort de Richard II., etc. (W. H. Ramsay, 1846); Croton, Historie du roy Richard II., ed. John Webb, in Archaeologia, xxi., 1824; and Adam of Usk's Chronicon, 1377-1404, ed. E. M. Thompson (1876); the authorities are cited in detail in J. H. Nylie's England under Henry IV. (1834-1848), and Sir J. H. Ramsay's Lancaster and York (Oxford, 1892). Holinshed's Chronicle was the chief source of Shakespeare's account of Hotspur in Henry IV.

PERCY, THOMAS (c. 1560—1605), one of the Gunpowder Plot conspirators, was a son of Edward Percy of Beverley, who was grandson of Henry Percy, 4th earl of Northumberland. Though brought up a Protestant, he early became well-affected to the Roman Catholics and finally an adherent. He entered the service of his cousin, Henry Percy, 9th earl of Northumberland, and was appointed by him constable of Alnwick Castle and agent for his northern estates, in which capacity he showed himself tyrannical and extortionate. In 1602 he was sent by Northumberland to James in Scotland to secure toleration for the Roman Catholics, but the king turned announcing favourable promises from the king, the extent of which he probably greatly exaggerated; and when James, after his succession to the English throne, did not immediately abrogate the penal laws, Percy, although he had accepted the court appointment of gentleman pensioner, professed himself highly indignant and indulged himself in thoughts of revenge. Some time in May 1603 Percy angrily declared his intention to Catesby of killing the king, and in April 1604 he met Catesby with John Wright, Thomas Winter and Guy Fawkes, and was then initiated into Catesby's gunpowder plot, which met with his zealous approval and support. To Percy was allotted the specific duty of the explosion of sealing the infant prince Charles and riding off with him on his saddle to Warwickshire. All the preparations being complete, Percy went to Alnwick in October and collected £3,000 of the earl of Northumberland's rents which he intended using in furtherance of the plot, returning to London on the 1st of November. Meanwhile the plot had been revealed through the letter to Lord Montagus on the 26th of October, and it was Percy's insistence at the last meeting of the conspirators on the 3rd that decided them not to fly but to hazard the attempt. On the news of Guy Fawkes' arrest, Percy with the rest of the conspirators, except Tresham, fled on horseback, taking refuge ultimately at Holbeche, near Stourbridge, in Staffordshire, where they were taken on the 8th of November, during the attack of the sheriff's men upon the house he was struck down by a bullet, fighting back to back with Catesby, and died two days later. Percy married a sister of the conspirator John Wright and left a son Robert and two daughters, one of whom is said to have married Robert, the son of Catesby.

PERCY, THOMAS (1729—1811), bishop of the Percy Reliques, was born at Bridgnorth on the 13th of April 1729. His father, Arthur Lowe Percy, a grocer, was of sufficient means to send his son to Christ Church, Oxford, in 1746. He graduated in 1750 and proceeded M.A. in 1753. In the latter year he was appointed to the vicarage of Easton Maudit, Northamptonshire, and three years later was instituted to the rectory of Wilby in the same county, which he retained until the 8th of November, 1778. In 1759 he married Anne, daughter of Barton Gutteridge. At Easton Maudit most of the literary work for which he is now remembered—including the Reliques—was completed. When his name became famous he was made domestic chaplain to the duke and duchess of Northumberland, and was tempted into the belief that he belonged to the illustrious house of Percy. Through his patron's influence he became dean of Carlisle in 1778 and bishop of Dromore in Ireland in 1782. His wife died before him in 1806; the good bishop, blind but otherwise in...
sound health, lived until the 30th of September 1811. Both were buried in the transept which Percy added to Dromore Cathedral.

Dr Percy's first work was a translation from a Portuguese manuscript of a Chinese story, published in 1791. Two years later he published Five Pieces of Runic Poetry, translated from the Icelandic. In 1795 he edited the earl of Surrey's poems with an essay. A blank verse, translated the Son of Sisyphus, and published a key to the New Testament. His Northern Antiquities (1770) is a translation from the French of Paul Henri Mallet. His reprint of The Household Book of the Earl of Northumberland in 1512 is of the greatest value for the illustrations of domestic life in England at that period. But these works are of little estimation when compared with the Reliques of Ancient English Poetry (1765). This was based on an old manuscript collection of poetry, rescued by Percy in Humphreys Pitt's house at Shifnal, Shropshire, from the hands of the housemaid who was about to light the fire with it. The manuscript was edited in its complete form by J. W. Hales and F. J. Furnivall in 1867-1868.

See A. C. C. Gausen, Percy: Prelate and Poet (1908). The Reliques has been edited by various hands, notably by H. B. Wheatley (1876). The fourth edition was by Percy's nephew, Thomas Percy (1766-1808), himself a writer of verse.

PERDICCAS, the name of three kings of Macedonia, who reigned respectively c. 700 B.C., c. 454-413 B.C., and 394-359 B.C., and of one Alexander the Great's generals, son of Orontes, a descendant of the independent princes of the province of Orestis. The last named distinguished himself at the conquest of Thebes (335 B.C.), and held an important command in the Indian campaigns of Alexander. In the settlement made after Alexander's death (323) it was finally agreed that Philip Archdaeus, an insane son of the great Philip, and Roxana's unborn child (if a son) should be recognized as joint kings, Perdiccas being appointed, according to one account, guardian and regent, according to another, chilarch under Craterus. He soon showed himself intolerant of any rivals, and acting in the name of the two kings (for Roxana gave birth to a son, Alexander IV.) sought to hold the empire together under his own hand. His most loyal supporter was Eumenes, governor of Cappadocia and Paphlagonia. These provinces had not yet been conquered by the Macedonians, and Antigonus (governor of Phrygia, Lydia, and Caria) refused to give up the command of Perdiccas. Having been summoned to the royal presence to stand his trial for disobedience, Antigonus fled to Europe and entered into alliance with Antipater, Craterus and Ptolemy, the son of Lagus. Perdiccas, leaving the war in Asia Minor to Eumenes, marched to attack Ptolemy in Egypt. He reached Pelusium, but failed to cross the Nile. A mutiny broke out amongst the troops, disheartened by failure and exasperated by his severity, and Perdiccas was assassinated by some of his officers (321).

See Macedonian Empire.

PEREDA, JOSÉ MARÍA DE (1833-1906), one of the most distinguished of modern Spanish novelists, was born at Polanco near Santander on the 6th of February 1833. He was educated at the Instituto Cántabro of Santander, whence he went in 1850 to Madrid, where he studied under the vague purpose of entering the artillery corps. Abandoning this design after three years' trial, he returned home and began his literary career by contributing articles to a local journal, La Abuela montañesa in 1858. He also wrote much in a weekly paper, El Tío Cayetán, and in 1864 he collected his powerful realistic sketches of local life and manners under the title of Escenas montañesas. Pereda fought against the revolution of 1868 in El Tío Cayetán, writing the newspaper almost single-handed. In 1871 he was elected as the Carlist deputy for Cabuerniga. In this same year he published a second series of Escenas montañesas under the title of Tipos y paisajes; and in 1876 appeared Bocetos al templo, three tales, in one of which the author describes his disenchancing of political experiences. The Tipos trashumantes belongs to the year 1877, as does El Buey suelto, which was intended as a reply to the thesis of Balzac's work, Les Petites misères de la vie conjugale. More and more pessimistic as to the political future of his country, Pereda took occasion in Don Gonzalo González de la Gomera (1879) to ridicule the Revolution as he had seen it at work, and to pour scorn upon the nouveaux riches who exploited Liberalism for their personal ends. Two novels by his friend Perez Gallido, Doña Perfecta and Gloria, drew from Pereda a reply, De Tal pozo tal astilla (1880), in which he endeavours to show that tolerance in religious matters is disastrous alike to nations and to individuals. The Estobas y rasguños (1881) is of lighter material, and is less attractive than El Sabor de la Tierra (1882), a striking piece of landscape which won immediate appreciation. New ground was broken in Pedro Sánchez (1883), where Pereda leaves his native province to portray the disillusion of a sincere enthusiast who has plunged into the political life of the capital. Pereda's masterpiece is Setilejas (1884), a vigorous rendering of marine life by an artist who perceives and admires the daily heroisms of his fisher-folk. It has often been alleged against the author that he confines himself to provincial life, to lowly personages and to unrefined subjects, and no doubt an anxiety to clear himself from this absurd reproach led him to attempt a description of society at the capital in La Montíñoles (1888), which is certainly the least interesting of his performances. In La Puchera (1889) he returned to the marine subjects which he knew and loved best. Again, in Pechas arriba (1895), the love of country life is manifested in the masterly contrast between the healthy, moral labour of the fields and the corrupt, squalid life of cities. Pereda's fame was now established; the statutes of the Spanish Academy, which require members to reside at Madrid, were suspended in his favour (1896). But his literary career was over. The tragic death of his oldest son, his disastrous campaign in Cuba and the Philippines, darkened his closing years, and his health failed long before his death at Polanco on the 1st of March 1906.

Pereda belongs to the native realistic school of Spain, which, founded by the unknown author of Lasarillo de Torres, was continued by Meteo Alemán, Cervantes, Quevedo, Castillo Solórzano and many others. With the single exception of Cervantes, however, the picaroesque writers are almost entirely wanting in the spirit of generous sympathy and tenderness which constitutes a great part of Pereda's charm. His realism is purely Spanish, as remote from Zola's moroseness as from the graceful sentimentality of Pierre Loti. Few 19th-century novelists expressed the virile temperament of Pereda, and, with the single exception of Tolstoy, none kept a moral end more steadily in view. This didactic tendency unquestionably injures his effects. Moreover, his grim satire occasionally degenerates into somewhat truculent caricature, and the excessive use of dialect and technical terms (which caused him to supply Setilejas with a brief vocabulary) is a grave artistic blemish. But he saw, knew, understood character; he created not only types, but living personages, such as Andrés, Cleto and Muero in Setilejas, Pedro Juan and Pilara in La Puchera; and he personified the tumult and calm of the sea with more power than Victor Hugo displayed in Los Trabajadores de la Luna. His subject is, however, the highest order, and his style, pure of all affectations and embellishments, is of singular force and suppleness. With all his limitations, he was as original a genius as Spain produced during the 19th century.
PEREGRINUS PROTEUS—PEREYASLAVL.

PEREGRINUS PROTEUS (2nd cent. A.D.), Cynic philosopher, of Parium in Mysia. At an early age he was suspected of parricide, and was obliged to leave his native place. During his wanderings he reached Palestine, where he ingratiated himself with the Christian community, and became its virtual head. His fanatical zeal and craving for notoriety led to his imprisonment, but the governor of Syria let him go free, to prevent his posing as a me UAV. He then returned to Parium to claim his paternal inheritance, but finding that the circumstances of his father's death were not yet forgotten, he publicly surrendered all claims to the property in favour of the municipality. He resumed his wandering life, at first assisted by the Christians, but having been detected profaning the rites of the Church, he was excommunicated. During a visit to Egypt he made the acquaintance of the famous Cynic Agathobulus and joined the sect. Meeting with little encouragement, he made his way to Rome, whence he was expelled for insulting the emperor Antoninus Pius. Crossing to Greece, he finally took up his abode at Athens. He devoted himself to the study of philosophy, and obtained a considerable number of pupils, amongst them Aulus Gellius, who speaks of him in very favourable terms. But, having given offence by his attacks on Herodes Atticus and finding his popularity diminishing, he determined to create a sensation. He announced his intention of immolating himself on a funeral pyre at the celebration of the Olympic games in 165, and actually carried it out. Lucian, who was present, has given a full description of the event.

C. M. Wieland's Geheime Geschichte des Philosophen Peregrinus Proteus (Eng. trans., 1796) is an attempt to rehabilitate his character. See also Lucian, De morte Peregrini; Aulus Gellius xii. 11; Ammianus Marcellinus xxix.; Philostratus, Vit. Soph., ii. 1, 331; J. Bernays, Lucian and die Kyniker (1862), 189; "Die Vertriebenen und Peregrinus," in his Verträge und Abhandlungen, ii. (1877).

PEREIRE [PEREIRA], GIACOBO RODRIGUEZ (1775–1780), one of the inventors of deaf-mute language, a member of a Spanish-Jewish family, was born at Estremadura, Spain, on the 11th of April 1775. At the age of eighteen he entered a business at Bordeaux. Here he fell in love with a young girl who had been dumb from birth, and henceforth devoted himself to discover a method of imparting speech to deaf-mutes. His first subject was Aaron Baumann, a co-religionist, whom he taught to enunciate the letters of the alphabet, and to articulate certain ordinary phrases. He next devised a sign alphabet for the deaf and dumb, and in 1778 he brought his second pupil before the Paris Academy of Sciences, the members of which were astonished at the results he had accomplished. In 1759 Pereire was made a member of the Royal Society of London. He died at Paris on the 15th of September 1780.

PEREKOP, a town of Russia, in the government of Taurida, 60 m. S.E. of Kherson, on the isthmus which connects the Crimea with the Continent, and commanding the once defensive ditch and dike which cross from the Black Sea to the Sivash (putrid) lagoon. Pop. about 5000. It was formerly an important place, with a great transit trade in salt, obtained from salt lakes in the immediate neighbourhood. Since the opening of the railway route from the Dneprovsk to Sivash, and the Crimea Perekop has greatly declined. In ancient times the isthmus was crossed (about 1 r. south of the present town) by a ditch which gave the name of Taphros to a Greek settlement. This line of defence having fallen into decay, a fort was erected and a new ditch and dike constructed in the 15th century by the Tatar khan of the Crimea, Mengi Ghairi, and by his son and successor Sahib Ghairi. The fort, known as Kapu or Or-Kapu, became the nucleus of the town. In the middle ages Perekop was known as Tuzla. In 1736 it was captured by the Russians under Münnich, and again in 1738 under Lascy (Lacy), who blew up the fort and destroyed a great part of the dike. In 1754 the fort was rebuilt by Krım Ghiret; but the Greek and Armenian inhabitants of Perekop formed a new settlement at Armyanskii Bazar (Armenian Market), 3 m. farther south. Captured by the Russians in 1771, the town passed into Russian possession with the rest of the Crimea in 1783.

PEREMPTORY, an adjective adapted from the Roman law term peremptorium edictum, peremptoria exception, a decree or plea which put an end to or quashed (Lat. perimere, to destroy) an action, hence decisive, final. A similar use is found in English law in "peremptory challenge," a challenge to a jury allowed to a prisoner without cause shown, or "peremptory mandamus," an absolute command. The natural repugnance to a final order has given this word in its ordinary usage a sense of objectionable and intolerant emphasis.

PEREYASLAVL, a town of Russia, in the government of Poltava, 26 m. S.E. of the city of Kiev, at the confluence of the Trubezh and the Alta, which reach the Dnieper 5 m. lower down at the town's port, the village of Andrushi. Pop. 14,609. Besides the town proper there are three considerable suburbs. Though founded in 903 by Vladimir the Great of Moscow in memory of his signal success over the Turkish Pechenegs, Pereyaslav has now few remains of antiquity. The town has a trade in grain, salt, cattle and horses, and some manufactures—tallow, wax, tobacco, candles and shoes.

Founded in 1554 Pereyaslav was the chief town of a separate principality. As it was an important outpost it often figures in the 11th, 12th and 13th centuries, and was plundered by the Mongols in 1239. In later times it was one of the centres of the Cossack movement; and in 1628 the neighbourhood of the town was the scene of the extermination of the Polish forces known as "Tara's Night." It was by the Treaty of Pereyaslav that in 1654 the Cossack chieftain Bogdan Chmielnicki acknowledged the supremacy of Tsar Alexius of Russia.

PEREYASLAVL (called Zalyszkiv, or "Beyond the Forest," to distinguish it from the older town in Poltava after which it was named), one of the oldest and most interesting cities in mid-N. Russia, situated in the government of Vladimir, 45 m. N.E. of Moscow, on the Yaroslav, a branch of the Trubezh near its entrance into Lake Pleshcheyevo. Pop. 8,662. Pereyaslav was formerly remarkable for the number and importance of its ecclesiastical foundations. Among those still standing are the 12th-century cathedral, with ancient wall-paintings and the graves of Demetrius, son of Alexander Nevsky, and other princes, and a church founded by Eudoxia (Euphrosyne), wife of Demetrius Donskoi, in the close of the 14th century. It is by its extensive cotton manufactures that Pereyaslav is now best known. The fisheries in the lake (20 m. sq. in extent and 175 ft. deep) have long been of great value.

Pereyaslavl, in 1525 by Yuri Dolgoruki, prince of Suzdal, Pereyaslav lsoon began to play a considerable part in the history of the country. From 1105 till 1302 it had princes of its own; and the princes of Moscow, to whom it was at the latter date
bequeathed, kept it (apart from some temporary alienations in the 14th century) as part of their patrimony throughout the 15th and 16th centuries. Lake Fleshchévo was the scene of Peter the Great's first attempts (1691) at creating a fleet.

**PEREZ, ANTONIO** (c. 1540–1611), for some years the favouring minister of Philip II of Spain and afterwards for many more the object of his unrelenting hostility, was by birth an Aragonese. His reputed father, Gonzalo Perez, an ecclesiastic, has some place in history as having been secretary both to Charles V. and to Philip II., and in literature as author of a Spanish translation of the *Odyssey* (*La Ulysses de Homero*, Antwerp, 1550). Antonio Perez, who was legitimated by an imperial diploma issued at Valladolid in 1542, was, however, believed by many to be in reality the son of Philip's minister, Ruy Gomez de Silva, prince of Eboli, to whom, on the completion of a liberal education at home and abroad, he appears at least to have owed his first introduction to a diplomatic career. In 1567 he became one of the secretaries of state, receiving also about the same time the lucrative appointment of protonotary of Sicily, and in 1573 the death of Ruy Gomez himself made room for Perez's promotion to be head of the "despacho universal," or private bureau, from which Philip attempted to govern by assiduous correspondence the affairs of his vast dominions. Another of the king's secretaries at this time, though in a less confidential relation, was a friend and contemporary of Perez, named Juan de Escovedo, who, however, after the fall of Tunis in 1574, was sent off to supersedez Juan de Soto as secretary and adviser of Don John of Austria, thus leaving Perez without a rival. Some time after Don John's appointment to the governorship of the Nether Parts of Peru, Perez was prominent in the plot of his inevitable ambitious "empresa de Inglaterra," in which he was to rescue Mary Queen of Scots, marry her, and so ascend the throne of England. The next step might even be against Spain itself. This secret scheme the faithful secretary at once carried to Philip, who characteristically resolved to meet it by quietly removing his brother's aider and abettor. With the king's full cognisance, accordingly, Perez, after several unsuccessful attempts to poison Escovedo, succeeded in procuring his assassination in a street of Madrid on the 31st of March 1578. The immediate effect was to raise Perez higher than ever in the royal confidence and favour, but, wary though the secretary had been, he had not succeeded in blurring all trace of his complicity with the crime, and very soon a prosecution was set on foot by the representatives of the murdered man. For a time Philip was both willing and able to protect his accomplice, but ultimately he appears to have listened to those who, whether truly or falsely, were continually suggesting that Perez had had motives of his own, arising out of his relations with the princess of Eboli, for compassing the assassination of Don John's secretary; be this as it may, from trying to screen Perez the king came to be the secret instigator of those who sought his ruin. The process, as such matters often have been in Spain, was a slow one, and it was not until 1580 that Perez, after more than one arrest and imprisonment on a variety of charges, seemed on the eve of being convicted and condemned as the murderer of Escovedo. At this juncture he succeeded in making his escape from prison in Castile into Aragon, where, under the ancient "fueros" of the kingdom he could claim a public trial in open court, and so bring into requisition the documentary evidence he possessed of the king's complicity in the deed. This did not suit Philip, who, although he instituted a process in the supreme tribunal of Aragon, speedily abandoned it and caused Perez to be attacked from another side, the charge of hersesy being now preferred, arising out of certain reckless and even blasphemous expressions Perez had used in connexion with his troubles in Castile. But all attempts to remove the accused from the civil prison in Saragossa to that of the Inquisition raised popular tumults, which in the end led to Perez's escape across the Pyrenees, but unfortunately also furnished Philip with a pretext for sending an army into Aragon and suppressing the ancient "fueros" altogether (1591). From the court of Catherine de Bourbon, at Pau, where he was well received, Perez passed to that of Henry IV. of France, and both there and in England his talents and diplomatic experience, as well as his well-grounded eminence to Philip, secured him much popularity. While in England he became the "intimate coach-companion and bed- companion" of Francis Bacon, and was also much in the society of the earl of Essex. The peace of Vervins in 1598 greatly reduced his apparent importance abroad, and Perez now tried to obtain the pardon of Philip III., that he might return to his native country. His efforts, however, proved vain, and he died in comparative obscurity in Paris on the 3rd of November 1611.

Perez's earliest publication was a small quarto, dedicated to the earl of Essex, written and apparently printed in England about 1594, entitled *Pedacos de historia*, and professedly published at his request. This book, of which two scattered tracts by him also appeared in 1601, published his Relaciones, including the Memorial hecho de su causa, drawn up in 1590, and many of his letters. Much has been done, by Mignet (Antonio Perez a Philip II., 1845, 4th ed., 1874) and others, to establish Perez's fame, and his works -- "An Up and Down Historical Tour in Spain" (1839) among others, towards the elucidation of various difficult points in Perez's somewhat perplexing story. For the murder of Escovedo, see Andrew Lang's discussion of it in his *Historical Mysteries* (1904); and the Espaňoles e ingleses (1903) of Sir Martin Hume, who had access to various newly discovered MSS.

**PÉREZ GALDÓS, BENITO** (1843–1920), was born at Las Palmas, in the Canary Islands, on the 10th of May 1843. In 1863 he was sent to Madrid to study law, drifted into literature, and was speedily recognized as one of the most promising recruits on the Liberal side. Shortly after the Revolution of 1868 he abandoned journalism, and employed fiction as the vehicle for propagating advanced opinions. His first novel, *La Fontana de oro*, was printed in 1871, and later in the same year appeared *El Audaz*. The reception given to these early essays encouraged the writer to adopt novel-writing as a profession. He had already determined upon the scheme of his *Episodios nacionales*, a series which might combine with the *Comedia humana* a rich collection of charters, old letters, old newspapers were collected by him with the minuteness of a German archivist; no novelist was ever more thoroughly equipped as regards the details of his period. *Trafalgar*, the first volume of the *Episodios nacionales*, appeared in 1879; the remaining books of this first series are entitled *La Cort de Carlos IV.*, *El 19 de marzo y el 2 de mayo*, *Batallón, Napoleón en Chamartín, Zaragoza, Gerona*, *Cadiz, Juan Martín el Empecinado y La Batalla de Arapiles*. As the titles suffice to show, the author's aim was to write the national epic of the 19th century in prose; and he so completely succeeded that, long before the first series ended in 1881, he took rank among the foremost novelists of his time. A second series of *Episodios nacionales*, beginning with *El Equipaje del rey José*, ended with a tenth volume, *Un Faccioso más y algunas faibles menos*, was brought to a close in 1883, and was, like its predecessor, a monument of industry and exact knowledge, of realism and romantic conception; and he carried on the *Episodios nacionales* into a fourth series, raising the total of volumes to forty. In fecundity and in the power of creating characters, Pérez Galdós vies with Balzac. Parallel with his immense achievement in historical fiction, Pérez Galdós published a collection of romances dealing with contemporary life, its social problems and religious difficulties. Of these the best known, and perhaps the best, are *Doña Perfecta* (1870); *Gloria* (1877); *La Familia de Leon Roch* (1878); *Martirio* (1878); *Fortuna* (1879); *Episodios* (1887); and *Angel Guerra* (1891). Nor does this exhaust his prodigious activity. Besides adapting several of his novels for stage purposes, he wrote original dramas such as *La Loca de la casa* (1893), *San Quintín* (1894), *Electra* (1900) and *Marrucha* (1904); but his diffuse, exuberant genius
PERFUMERY

The preparation of perfumes, or substances which are pleasing to the sense of smell. Perfumes may be divided into two classes, the first of which includes all primitive or simple odoriferous bodies derived from the animal or vegetable kingdom, as well as the definite chemical compounds specially manufactured, while the second comprises the various “bouquets” or “mélanges” made by blending two or more of the foregoing in varying proportions—tallow powders, dentrifices, sachets, &c. To the former class belong (1) the animal products, ambergris, castor, civet, musk; (2) the essential oils (also called attars), mostly procured by the distillation of the stems, leaves, flowers and other parts of plants; (3) the phialicome butters or oils, which are either solid or liquid fats charged with odours by the processes of inflowing or maceration; (4) the odoriferous gum-resins or balsams which exude naturally or from wounds in the trunks of various trees and shrubs, such as benzoin, opomponax, Peru, Tolu, storax, myrrh; (5) the large number of synthetic perfumes which simulate the odour of the natural scents. The second class contains the endless combination of tinctures sold under fancy names which may or may not afford a clue to their composition, such as “comédie française,” “eau de senteur,” “eau de Cologne,” “lavendre ambrée,” “blumengeist.” In general, they are mixtures of a number of perfumes dissolved in alcohol. Strictly speaking, most of the perfumes on the market belong to the second class, since, in most cases, they are prepared by blending various natural or artificial odoriferous principles.

Natural Perfumes.—The animal perfumes are extremely limited in number. Ambergris (q.v.), one of the most important, is secreted by the sperm whale; musk (q.v.), the best known scent of this class, is secreted by the male musk-deer and other animals—musk-ox, musk-rat, &c.; civet (q.v.) is a musky scent named from the animal which secretes it; and castor or castoreum is a somewhat similar secretion of the beaver (q.v.). More important are the scents yielded by flowering plants. As a general rule fragrant flowers flourish in hot climates, but the more delicate perfumes are yielded by plants having a colder habitat; it must be remembered, however, that some costly perfumes are obtained from the plants of Ceylon, the East Indies, Mexico and Peru. In Europe, Grasse, Cannes and Nice are the centres of the natural perfume industry. Cannes is famous for its rose, acacia, jasmine and neroli oil; Nîmes for its thyme, rosemary and lavender; and Nice for its violets. Citron and orange oil come from Sicily; iris and bergamot from Italy; and roses are extensively cultivated in Bulgaria, and in European Turkey. England is unsurpassed for its lavender and peppermint, which flourish at Mitcham and Hitchin.

The odours of the balsams or essential oils are the different parts of the plants which yield them—the wood (lign, aloe, santal, cedar), the bark (cinnamon, caracalla), the leaves (patchouli, bay, thyme), the flowers (rose, lavender, orange-blossom), the fruit (nutmeg, citron), or the seeds (caraway, almond). Some plants yield more than one, such as lemon and bergamot. They are mostly obtained by distilling that part of the plant in which they are contained with water, or with high-pressure or superheated steam; but some few, as those from the rind of bergamot (from Citrus bergamia), lemon (citron zeste, from C. Limonum), lime (C. Limeta), by “expression.” The outer layer of the cortex is rapped off from the unripe fruits, the raspings placed in a muslin bag, and squeezed in a screw or hydraulic press. The attars so obtained are separated from the admixed water by a tap-funnel, and are then filtered. Certain flowers, such as jasmine, tuberoze, violet, cissia, either do not yield their attars by distillation at all, or do it so sparingly as not to admit of its collection for commercial purposes; and sometimes the attar, as in the case of orange (neroli), has an odour quite different from that of the fresh blossoms. In these cases the odours are secured by the processes of inflowing (enfluerage) or by maceration. Both depend upon the remarkable property which fats and oils possess of absorbing odours. Enfluerage consists in laying the leaves or flowers on plates covered with a little layer of fat. The flowers are renewed every morning, and when the fat has sufficient odour it is scraped off, melted and strained. Maceration consists in soaking the flowers in heated fat; in due time they are strained off and replaced by fresh ones, as in the enfluerage process. The whole of the necessary meltings and heatings of the perfumed greases are effected by means of water-baths, whereby the temperature is kept from rising too high. For the manufacture of perfumes the handkerchief the greases now known as pomades, butters or phliocons are treated with rectified spirit of wine 60° over-proof, i.e. containing as much as 95% of absolute alcohol by volume, which practically completely abstracts the odour.

The gum-resins and resins have been employed as perfumes from the earliest times. The most important are incense, frankincense and myrrh (q.v.). They are largely used in the manufacture of perfumes, both for burning as pastilles, ribbon of Bruges, incenses, &c., and in tinctures, to which they impart their characteristic odours, affording, at the same time, a certain fixity to other perfumes of a more fleeting nature with which they are combined.

Synthetic Perfumes.—Under this heading are included all perfumes in which artificial substances are odorous ingredients. Although the earliest perfumes of this class were introduced in about the beginning of the 19th century, the Important industry which now prevails is to be regarded as dating from the 'seventies and 'eighties. Three main lines of development may be distinguished: (1) the chance discovery of substances which have odours similar to natural perfumes; (2) the elucidation of the composition of the natural scents, and the chemical constitution of their ingredients, followed by the synthetic preparation of the substances so determined; and (3), which may be regarded as connected with (2), the extraction and separation of the essential oils yielded by less valuable plants, and their reblending to form marketable perfumes.

The first synthetic perfume was the “essence de Mirban” introduced by Collas in about 1850; this substance was the nitro-hydrocarbon nitro-phenyl nitrobenzene. Afterwards many esters of the fatty acids simulating the odours of fruits were introduced; and in 1888 Baur discovered the “artificial musks,” which are derivatives of κ-trinitrobenzene. The above are instances of the first line of progress. The second line has for early examples the cases of artificial oil of wintergreen, which followed Cabour’s discovery that the natural oil owed its odour, in the main, to methyl salicylate, and of artificial oil of bitter almonds which followed the preparation of benzaldehyde from benzal chloride in 1868. The synthesis of coumarin, the odorous principle of hay and woodruff, by Sir W. H. Perkin in 1869; of vanillin, the odorous principle of vanilla, by F. Tiemann and W. Haarmann in 1875; and of ionone, almost identical with the natural odorous principle of vanilla, by Mitscherlich, Tiemann and P. Krüger in 1898, are to be regarded as of the highest importance. Equally important are the immense strides made in the elucidation of the constitution and syntheses of the terpenes (q.v.), a group of compounds which are exceptionally abundant as odorous principles in the essential oils.

The present state of our knowledge does not permit a strict correlation of odour and chemical constitution. One theory regards odour as due to “osmophores,” or odour-producing groups, in much the same way as colour is associated with chromophores. Such osmophores are hydroxyl (OH), aldehyde (CHO), ketone (CO), ether (O), nitrile (CN), nitro (NO), &c.; we may also notice the isonicotine group (NCON) associated with an unpleasant odour, and the iso-thiocyanate group (NCS) to which the mustard oils owe their characteristic smell. The same group, however, is not invariably associated with the same odour, or even any odour at all, as, for instance, in such closely related
compounds as the members of a homologous series. For example, the lower fatty aldehydes have unpleasant odours, those with ten carbon atoms (and also double linked while in itself may affect odour) form some of the most delicate scents, while the higher members are odourless. The absence of odour in the higher members may be possibly associated with the low volatility exhibited by compounds of high molecular weight. Certain osmophores have practically equal effects; for example, benzaldehyde, nitrobenzene, benzonitrile, and phenyl azoméride have practically identical odours, and among the "artificial musks," a nitro group may be replaced by the azoméride group without the odour being modified. As a general rule, homologues have similar odours, but many exceptions are known. For example, the ethyl ester of the dipropyl, benzyl, and C-naphthyl have the odour of neroli; on the other hand, the esters of propionic acid, the methyl has the odour of orange blossoms, the ethyl has a slight odour, and the isobutyl is odourless. The introduction of a methyl group into the benzene ring generally involves little or no change in odour; but when it (and more especially higher alkyl radicals) is introduced into side chains the odour may be entirely changed. For example, benzene and its homologues have similar odours; phthalide is odourless, but the isopropyl and butyl phthalides, in which substitution occurs in the side chain, smell of celery. Especially characteristic are the derivatives of phenylacetophenone. This hydrocarbon is distinctly unpleasant on the one hand, but ethyl and para-methyl phenylacetophenone smell of anise. While the primary carbon system is generally associated with strong and unpleasant odours, the doubly linked system gives pleasant odors. Thus the unpleasant phenylacetophenone, C<sub>6</sub>H<sub>5</sub>-C-H:C-CH<sub>3</sub>, is contrasted with styrene, C<sub>6</sub>H<sub>4</sub>-C-H:CH<sub>3</sub>, which occurs in starch, and phenyl-propiolic aldehyde with cinnamic aldehyde, C<sub>6</sub>H<sub>4</sub>-C:CH-CHO, which occurs in cassis and cinnamon. The reduction of a double to a single linkage may not destroy odour. Thus hydrocinnamaldehyde, the reduction product of cinnamic aldehyde, smells of jasmine and lilac, and melilotin, which occurs in yellow melilot (Melilotus officinalis), has the same odour (jasmine) as its oxidation product coumarin. The orientation of the substituent groups in the benzene nucleus also affects odour. In general, the meta compounds are odourless, while the ortho and para may have odour. Thus the methoxyaceto-phenone has a pleasant odour, the meta compound is odourless, ethoxyaceto-phenone, ethoxybenzaldehyde, and ethoxyphenol have strong odours, while the meta and para bodies are odourless. Of the three trinitrobenzenes only the symmetrical form gives origin to perfumes.

The concentration and even the solvent has considerable effect on the odour of a substance. Many of the artificial principles—vanillin, heliotropine, ionone, &c.—have very different odours in strong and in dilute solution; phenyl acetic acid and phenyl ethylamine are odourless when solid, but have disagreeable odours when dissolved. Traces of impurities often have the effect of making odourless or pleasant-smelling compounds quite intolerable. Acetone as generated from calcium carbide, and carbon disulphide prepared from its elements are quite intolerable, though when pure they are, at least, not unpleasant; artificial benzaldehyde must be very carefully purified before it can be used in the preparation of the more delicate scents. In all cases the natural scents are complex mixtures of many ingredients, and a variation in the amount of any one may completely alter the scent. Such mixtures would be difficult to reproduce economically; the perfume is content with a product having practically an identical odour, with or without the natural substance which it is designed to compete with.

We now give an account of the artificial scents, principally arranged according to their chemical relations. The fatty esters are interesting as providing many of the fruit essences; in fact, by appropriate blending, any fruit odour can be reproduced. Their use, however, is inhibited by the fact that they irritate the respiratory organs, producing coughing and headaches. Isobutyl carbinol acetic ester (amyl acetate), (CH<sub>3</sub>)<sub>2</sub>-CH-CH<sub>2</sub>-CH<sub>2</sub>-OC-CH<sub>3</sub>, forms when in dilute alcoholic solution the artificial pear oil; a similar odour is possessed by isomyl-n-butyrate, C<sub>6</sub>H<sub>11</sub>-CO-CH<sub>3</sub>-n-Octyl acetate, C<sub>8</sub>H<sub>17</sub>-OC-CH<sub>3</sub>, has the odour of oranges. Isoamyl propionate, C<sub>6</sub>H<sub>11</sub>-OC-CH=CH<sub>2</sub>, and ethyl-n-butyrate, C<sub>6</sub>H<sub>15</sub>-OC-CH=CH<sub>2</sub>, have the odour of pineapple, the latter constituting the artificial pineapple oil of commerce. Isoamyl isovalerate, C<sub>8</sub>H<sub>17</sub>-OC-C(CH<sub>3</sub>)=CH<sub>2</sub>, is the artificial apple oil. Oil of the fatty ketones, methyl nonyl ketone, CH<sub>3</sub>-CO-C(CH<sub>3</sub>)=CH<sub>2</sub>, which is the scent of oil of rue, and methyl-ethyl acetone, CH<sub>3</sub>-CO-CH(CH<sub>3</sub>)(CH<sub>3</sub>), which has the odour of peppermint, receive commercial application. Of exceptional importance in the chemistry of perfumery are the unsaturated open chain compounds containing at least eight carbon atoms. These are chemically considered, along with the related cyclic compounds, in the article Terpenes; here we notice their odours and occurrence in perfumes. Of the aldehydes, linalol is in oil of lavender, bergamot, and orange; d-linalol inorris; citronellol and geraniol in rose, geranium and pelargonium oils. Of the aldehydes, citral or geraniol has the odour of lemons; citronellal in the chief constituent citronella. Oil of anise is doubly linked with acetic and treating the product with dilute sulphuric acid, the valuable violet substitute ionone results. This substance is a hydroaromatic ketone, and closely resembles the natural principle anise. By successive treatment with acetic anhydride (to form isopulegol), oxidation to isopulegone, and treatment with baryta citronellal yields the cyclic compound pulegone, the chief constituent of oil of pennyroyal. The oleic terpenes are generally convertible into methyl heptenone, (CH<sub>3</sub>)<sub>3</sub>-C-CH(CH<sub>3</sub>)(CH<sub>3</sub>)=CH-CH<sub>3</sub>, which has been synthesized from sodium acetylacetone and amylen dibromide; this ketone occurs in several essential oils, and has the odour of the occurrence of cyclic terpenes in the essential oils reference should be made to the tables. The names, sources and ingredients of the many important essential oils. The terpenes are printed in italics, the aliphatic and benzenoid compounds in ordinary type.

### Note
The chief benzenoid compounds used as perfumes are aldehydes, oxyaldehydes, phenols, and phenol ethers. Benzaldehyde has the odor of almonds, cinnamic aldehyde that of a little vinegar, and salicyl alcohol that of coffee. Of oxyaldehydes salicylaldehyde gives the odor to spiraeea oil, and vanillin is the active ingredient of vanilla (q.v.). Anisaldehyde smells like Havana, and methyl salicylate is used for tooth powder. Extracts. Carvacrol and thymol are isomeric methyl propyl phenols; both have the odor of thyme. Phenol ethers eugenol (guaiacol) has the odor of cloves, and anethole (allyl phenyl methyl ether) that of anise. The compounds of which perfume is prepared are obtained in the manufacture of liquors. Several piperonyl compounds are of commercial importance. The aldehyde, CH₂OH:C₆H₅:CH-CH₃(1,2,4), piperonal, has the odor of heliotrope; an allyl salicylate has the odor of clove. While alope or dimethoxy salol has the odor of parsley oil. Of other synthetic perfumes amyl salicylate is used under the names of orchide or trichlor (to be the basis of clove scent); methyl antranilate occurs in the natural neroli and other oils, and has come into considerable use in the preparation of artificial bergamot, neroli, jasmine and other perfumes (the Taren, Marcel and Manhal of the Actien Gesellschaft für Anilin Fabrication have this substance as a base); the "artificial muscles" are derivatives of t-s-trinitrobenzene; coumarin is the principle of wood-ruff; and β-naphthol methyl ether is used for the preparation of artificial ambergris.

The Odpophone.—The most important element in the perfumer's art is the blending of the odorous principles to form a mixture which gratifies the sense of smell. The compounds used for this purpose are thus the second or third degree in the overcoming of the odor of the perfume. The odors used are divided into several classes for the same general purpose. One class of odor consists of the odors of the flowers; a second of the odors of the woods; a third of the odors of the fruits; and so on. The names of the odors are given in the table below.

Other Branches of Perfumery.—As a natural outcome of the development of the perfume industry, scented articles for toilet and other uses are now manufactured in large quantities. Soaps, toilet powders, toilet waters, cosmetics, and toiletteries, and note-paper have provided material on which the perfumer works. For the preparation of scented soaps two methods are in use; both start with a basis either of fine yellow soap (which owes its odor to the presence of a substance called curail) or of pure white, hard, white and odorless, and is prepared without resin). In one process the soap is melted by superheated steam, and while still hot mixed with the oil desired by adding powdered iron cross-bar, technically called a "crutch," with the attar and coloring matter. It is then removed from the melting pan to a rectangular iron mould or box, the sides of which can be removed by uncovering the epidermis chaff; hold them in position; when cold the mass is cut into slabs and bars with a thin brass wire. In the other or cold process the soap is first cut into chips or shavings by a plane or crumbling machine, then the colouring matters are added and thoroughly incorporated by passing the soap between rollers; the tinted soap emerges in a continuous sheet but little thicker than paper. The perfumes are then added, and after standing in the mould, the bars are broken down through the rolling machine. It is next transferred to a perforating machine from which it emerges as a continuous bar almost as hard as wood. Soap thus worked contains less than 10% of water; that prepared by the cold process contains about 20%. The name "cramon" added depends upon its nature, and amounts usually to about 7 or 8%. The finest soaps are always manufactured by the cold process.

Tooth Powders are of various sorts. They consist of rice-starch or wheat-starch, with powdered orris-root in varying proportions, and with or without the addition of zinc oxide, bismuth oxide or French chalk. The constituent powders, after the addition of the perfume, are ground together, and the mass being placed in a sieve. Violet powder for the nursery should consist entirely of powdered violet root (Iris florentina), from the odour of which the perfume is prepared by adding a yellow gum, soft and pleasant to the touch. The white common so-called "violet powder" is of starch scented with bergamot, and are in every sense inferior.

Tooth Powders consist for the most part of mixtures of powdered oranges, orris-root, or some other substance that is destined to particularize it as to properties or flavour. Such as charcoal, finely powdered pumice, quassia, sugar, camphor, &c. The perfume of the contained orris-root is modified, if required, by placing the powder with the addition of a little glycerine or sugar. Each of the same constituents of the powders, and are worked into a paste by the addition of a little honey or glucose syrup, which substances are usually believed ultimately to have an injurious effect on the teeth.

PERGA (mod. Murtana), an ancient city of Pamphylia, situated about 8 m. inland, at the junction of a small stream (Sari Su) with the Cestrus. It was a centre of native influences as contrasted with the Greek, which were predominant in Attalia, and it was a great seat of the worship of "Queen" Artemis, here represented as a human-headed cone and a purely Anatolian nature goddess. There Paul and Barnabas began their first mission in Asia Minor (Acts ix. 13). A much frequented route into Phrygia and the Maeander valley began at Perga, and Alexander made it the starting-point of his invasion of inner Asia Minor. Long the metropolis of Pamphylia Secunda, Perga decided in Byzantium in 386. The city became a metropolis in 1804. The extensive ruins all lie in the plain south of the Acropolis. The walls are well preserved, but of late Roman or Byzantine reconstruction. The lines of interesting streets can be easily made out, and there are ruins of two sets of baths, two basilicas and a forum. But the most notable monument is the theatre, which lies outside the walls on the south-west, near the stadium. This is as perfect as those of Myra and Patara, but larger than either, and yields the palm only to those of Aspendos and Side. Modern Murtana is a large village, long under the dominion of the Dere Beys of the Tekke Oghl family.

PEGAMENOUS (Lat. pergamen, parchment), a technical term used of anything of the texture of parchment, as in zoology of the wing-covers of insects.

PERGAMUM, or Pergamus (mod. Bergama), an ancient city of Teuthania, a district in Mysia. It is usually named Πέργαμος by Greek writers, but Ptolemy has the form Πέργαμος. The name, which is related to the German berg, is appropriate to the site of the city on a lofty ridge, rising 300 ft. above the plain, and more than 15 m. from the mouth of the Caymus. According to the belief of its inhabitants, the town was founded by Arcadian colonists, led by Telephus, son of Hercules. Auge, mother of...

Telephus, was princess of Athena Alea at Tegea, and daughter of Aleus; fleeing from Tegea, she became the wife of Teuthras, the eponymous king of Teuthania, and her son Telephus succeeded him. Athena Polias was the patron-goddess of Pergamum, and the legend combines the ethnohistorical record of the connexion claimed between Arcadia and Pergamum with the usual belief that the hero of the city was son of its guardian deity, or at least of her priestess. Nothing more is recorded of the city till the time of Xenophon, when it was a small fortified town on the summit of the hill; but it had been striking coins since 420 B.C. at latest. Its importance began under Lysimachus, who deposited his treasures, 9,000 talents, in this strong fortress under the charge of a eunuch, Philletaserus of Tium. In 283 B.C. Philletaserus rebelled, Lysimachus died without being able to put down the revolt, and Pergamum became the capital of a little principality. Partly by clever diplomacy, partly through the troubles caused by the Gaulish invasion and by the disensions among the rival kings, Philletaserus contrived to keep on good terms with his neighbours on all sides (283-263 B.C.). His nephew Eumenes (263-241) succeeded him, increased his power, and even defeated Antioco II. of Syria in a pitched battle near Sardis. His successor Attalus I. (241-197) won a great battle over the Gauls, and assumed the title of king. The other Greek kings who aimed at power in Asia Minor were his natural enemies, and about 222 reduced Pergamian power to a very low ebb. On the other hand, the influence of the Romans was beginning to make itself felt in the East. Attalus prudently connected himself with them and shared in their continuous success. Pergamum thus became the capital of a considerable territory and a centre of art and regal magnificence. The wealth of the state and the king's desire to celebrate his victories by monuments of art led to the rise of the "Pergamian school" in sculpture. The splendour of Pergamum was at its height under Eumenes II. (197-159). He continued true to the Romans during their wars with Antioco and Perses, and his kingdom spread over the greater part of western Asia Minor, including Mysia, Lydia, great part of Phrygia, Ionia and Caria. To celebrate the great achievement of his reign, the defeat of the barbarian Gauls, he built in the agora a vast altar to Zeus Soter (see below). He left an infant son, Attalus III., and a brother, Attalus II. (Philadephus), who ruled 159-138, and was succeeded by his nephew, Attalus III. (Philometor). The latter died in 133, and bequeathed his kingdom to the Romans, who erected part of it (excluding Great Phrygia, which they gave to Mithradates of Pontus) into a province under the name of Asia. Pergamum continued to rank for two centuries as the capital, and subsequently, with Ephesus and Smyrna, as one of the three great cities of the province; and the devotion of its former kings to the Roman cause was continued by its citizens, who erected on the Acropolis a magnificent temple to Augustus. It was the seat of a conventus, including the cities of the Calcus valley and some of those in the northern part of the Hermus valley. Under the Roman Empire Pergamum was one of the chief seats of the worship of Asclepius "the Saviour"; invalids came from distant parts of the country to ask advice from the god and his priests. The temple and the curative establishment of the god were situated outside the city. Pergamum was the chief centre of the imperial cult under the early empire, and, in W. M. Ramsay's opinion, was for that reason referred to in Rev. ii. 13 as the place of "Satan's throne." It was also an early seat of Christianity, and one of the Seven Churches. The place, re-fortified by the Byzantines, and still retaining its name as Bergama, passed into Moslem hands early in the 14th century. The town was rebuilt in 1426-1428, and in the 18th century became a chief seat of the great Dey family of Kara Osman Oglu (see MANISA), which did not resign it to direct Ottoman control until about 1825. It is still an administrative and commercial centre of importance, having some 20,000 inhabitants.

Excavations.—The site of the ancient city has been the scene of extensive excavations promoted by the Berlin museum since 1878, and directed first by K. Humann and A. Conze, and afterwards by W. Dörpfeld. The first impulse to them was given in 1873 by the reception in Berlin of certain relics, extracted by Humann from the walls of Bergama. These probably came from parts of the Great Altar of Zeus erected by Eumenes II. in 180 B.C. and decorated with a combat of gods and giants, symbolic of the struggle between the Pergamian Greeks and the Gaulish barbarians. Excavation at the south end of the Acropolis led to the discovery of the Altar itself and the rest of its surviving reliefs, which, now restored and mounted in Berlin, form one of the glories of that city. In very high relief and representing furious action, these sculptures are the finest which survive from the Pergamian school, which replaced the repose and breadth of earlier schools by excess of emphasis and detail. The separate pieces of the Altar crowded with public buildings, between the market place, which lies at the southern point, and the Royal Gardens on the north. In the interval are the Zeus altar; the great hexastyle Doric temple of Athena flanked by the palace on the east, by the theatre and its long terrace on the west, and by a library on the north; and a large Corinthian temple of Trajan. The residential part of the Greek, and practically all the Roman city lay below the Acropolis on ground now mostly occupied by modern Bergama; but west of the river Selinus, on rising ground facing the Acropolis, are to be seen notable remains of a Roman theatre, an amphitheatre and a circus.

PERGOLA (Lat. pergula, a projecting roof, shed, from pergere, to reach forward, project), a term adopted from the Italian for an armour of trellis-work over which are trained creeping plants, vines, &c., and especially for a trellis-work covering a path, walk or balcony in a garden.

PERGOLESI (or PEROLOSE), GIOVANNI BATTISTA (1710-1736), Italian musical composer, was born at Jesi near Ancona on the 3rd of January 1710, and after studying music under local masters until he was sixteen was sent by a noble patron to complete his education at Naples, where he became a pupil of Greco, Durante and Feo for composition and of Domenico de Matteis for the violin. His earliest known composition was a sacred drama, La Conversione di S. Guglielmo d' Aquitania, between the acts of which was the comic intermezzo Il Maestro di musica. These works were performed in 1731, probably by fellow pupils, at the monastery of St Agnellino Maggiore. Through the influence of the prince of Stigliano and other patrons, including the duke of Maddaloni, Pergolesi was commissioned to write an opera for the court theatre, and in the winter of 1731 successfully produced La Sollastie, followed in 1732 by Ricinoco, which was a failure. Both operas had comic intermezzi, but in neither case were they successful. After this disappointment he abandoned the theatre for a time and wrote thirty sonatas for two violins and bass for the prince of Stigliano. He was also invited to compose a mass on the occasion of the earthquake of 1731, and a second mass, also for two choirs and orchestra, is said to have been praised by Leo XI. In September 1732 he returned to the stage with a comic opera in Neapolitan dialect, Lo Fratello inamorato, which was well received; and in 1733 he produced a serious opera, Il Prigionier, to which the celebrated Seren da prudonna furnished the intermezzi. There seems, however, no ground for supposing that this work made any impression, and there is little doubt that the difference to the composer's already established reputation as a writer of operas. The last opera, called Fede, was performed in 1733-1734 Pergolesi entered the service of the duke of Maddaloni, and accompanied him to Rome, where he conducted a mass for five voices and orchestra in the church of St Lorenzo in Lucina (May 1734). There is no foundation for the statement that he was appointed maestro di cappella at the Holy House of Loreto; he was, in fact, organist of the royal chapel at Naples in 1735. The complete failure of L'Olimpia at Rome in January 1735
PERGOLESI, M. A.—PERIANDER

is said to have broken his health, and determined him to abandon the theatre for the Church; this statement is, however, incompatible with the fact that his comic opera Il Flaminio was produced in Naples in September of the same year with undoubted success. His ill health was more probably due to his notorious profligacy. In 1736 he was sent by the duke of Maddaloni to the Capuchin monastery at Pozzuoli, the air of the place being considered beneficial to cases of consumption. Here he is commonly supposed to have written the celebrated Statat Mater. Paisiello, however, stated that this work was written soon after he left the Conservatorio dei poveri di Gesù Cristo in 1739. We may at any rate safely attribute to this period the Scherzo falso ai Cappuccini di Pozzuoli, a musical jest of a somewhat indecent nature. He died on the 17th of March 1736, and was buried in the cathedral of Pozzuoli.

Pergolesi’s posthumous reputation has been exaggerated beyond all reason. This was due partly to his early death, and largely to the success of La Sera pradora when performed by the Bonsfons Italiens at Paris in 1755. Charming as this little piece undoubtedly is, it is inferior both for music and for humour to the more popular and more robust comic operas in dialect, which are remembered now only by the air “Ogni pena più spietata” from Lo Frate inamorato. As a composer of sacred music Pergolesi is effective, but essentially commonplace and superficial, and the frivolous style of the Statat Mater was rightly censured by Paisiello and Padre Martini. His best quality is a certain sentimental charm, which is very conspicuous in the cantata L’orfeo and in the genuinely beautiful duets “Se cerca, se dice” and “Ne’ giorni tuoi felici” of the serious opera L’Olimpiade; the latter number was transferred unaltered from his early sacred drama S. Guglielmo. We can thus see that his natural talent underwent hardly any development during the five years of his musical activity. On the whole, however, Pergolesi is in no way superior to his contemporaries of the same school, and it is purely accidental that a later age should have regarded him as its greatest representative.

BIBLIOGRAPHY.—The most complete life of Pergolesi is that by E. Faustinis Fasini (Gazzetta musicale di Milano, 31st of August 1899, &c., published by Ricordi in book form, 1900); G. Annibaldi’s II Pergolesi in Pozzuoli, cita inima (Jesi, 1890) gives some interesting additional details derived from documents at Jesi, but is cast in the form of a romantic novel. H. M. Schletterer’s lecture in the Supplemento del Archivio, 1890, and M. P. von Waldersee’s, generally inaccurate and uncritical, but gives a good account of later performances of Pergolesi’s works in Italy and elsewhere. Various portraits are reproduced in the Gazz. mus. di Milano for the 17th of April 1899, and in Musica e musicisti, December 1905. Complete lists of his compositions are given in Etiner’s Quellen-Lexicon and in Grove’s Dictionary (new ed.). (E. J. D.)

PERGOLESI, MICHAEL ANGELO, an 18th-century Italian decorative artist, who worked chiefly in England. Biographical details are almost entirely lacking, but like Cipriani he was brought, or attracted, to England by Robert Adam after his famous continental tour. He worked so extensively for the Adams and his designs are so closely typical of much upon which their reputation rests, that it is impossible to doubt his influence upon their style. It is ranged, like theirs, celeris vir, celeris artis. He designed furniture, mantelpieces, ceilings, chandeliers, doors and mural ornament with equal felicity, and as an artist in plaster work in low relief he was unapproached in his day. He delighted in urns and sphinxes and interlaced gryphons, in amorini with bows and torches, in trophies of musical instruments and martial weapons, and in flowering arabesques which were always graceful if sometimes rather thin. The centre panels of his walls and ceilings were often occupied by classical and pastoral subjects painted by Cipriani, Angelica Kauffmann, Antonio Zucchi, her husband, and sometimes by himself. These nymphs and amorini, with their disengaged and riant air and classic grace, were often used as copies for painting wood or satinwood furniture of the last quarter of the 18th century which has never been surpassed for dainty elegance, and for the popularity of which Pergolesi was in large measure responsible; they were even reproduced in marquetry. Some of this painted work was, apparently, executed by his own hand; most of the pieces attributed to him are remarkable examples of artistic taste and technical skill. His satin-wood table-topps, china cabinets and side-tables are the last word in a daintiness which here and there perhaps is mere prettiness. Pergolesi likewise designed silver plate, and many of his patterns are almost instinctively attributed to him. His brothers Adam by the masons and plumbers of modern reproductions. There is, moreover, a reason to believe that he aided the Adam firm in purely architectural work. In later life Pergolesi appears, like Angelica Kauffmann, to have returned to Italy.

Our chief source of information upon his works is his own publication, Designs for Various Ornaments on Seventy Plates, a series of folio sheets, without text, published between 1777 and 1801.

PERI, JACOPO (1561–16?? ?), Italian musical composer, was born at Florence on the 20th of August 1561, of a noble family. After studying under Cristoforo Malvezzi of Lucca, he became maestro di cappella, first to Ferdinand, duke of Tuscany, and later to Cosimo II. He was an important member of the literary and artistic circle which frequented the house of Giovanni Bardì, conte de Vernio, where the revival of Greek tragedy with its appropriate musical declaration was a favourite subject of discussion. With this end in view the poet Ottavio Rinuccini supplied a drama with the title of Dafne, to which Peri composed music, and this first attempt at opera was performed privately in 1597 in the Palazzo Corsi at Florence. This work was so much admired that in 1600 Rinuccini and Peri were commissioned to produce an opera on the occasion of the marriage of Henry IV. of France with Maria di’ Medici. This work (L’Euridice) attracted a great deal of attention, and the type once publicly established, the musical drama was set on its way. Peri’s work is, of course primitive in the extreme, but it is by no means without beauty, and there are many scenes in Euridice which show a considerable dramatic power.

PERIANDER (Gr. Περιάνδρος), the second tyrant of Corinth (625–585 B.C.). In contrast with his father Cepyselus, the founder of the dynasty, he is generally represented as a cruel despot, or at any rate as having used all possible devices for keeping his city in subjection. Among numerous anecdotes the following is characteristic. Periander, on being consulted by the tyrant Thrasybulus of Miletus as to the best device for maintaining himself in power, by way of reply led the messenger through a luxuriant cornfield, and as he walked struck off the tallest and best-grown ears (a legend applied to Roman circumstances in Livy i. 54). It seems, however, that the prevalent Greek tradition concerning him was derived from the versions of the Corinthian aristocracy, who had good reasons for giving a prejudiced account, and the conflicting character of the various legends further shows that their historical value is slight. A careful siftin of the available evidence would rather tend to represent Periander as a ruler of unusual probity and insight, and the exceptional firmness and activity of his government is beyond dispute. His home administration was so successful that he was able to dispense with direct taxation. He fostered wealth by the steady encouragement of industry and by drastic legislation against idleness, and the highest prosperity of the Corinthian handicrafts may be assigned to the period of his rule (see CORINTH). At the same time he sought to check excessive accumulation of wealth in individual hands and restricted the influx of population into the town. Employment was found
PERICLES

for the proletariat in the erection of temples and of public works. Periander further appears as a patron of literature, for it was by his invitation that the poet Arion came to Corinth to organize the Athenians. He devoted no less attention to the increasing of Corinthian commerce, which in his days plied lustily on both eastern and western seas. With this end in view he established colonies at Potidaea and Apollonia in Macedonia, at Anastouria and Leucas in north-western Greece, and he is said to have projected a canal through the Isthmus. In Greece proper he conquered Epidaurus, and with the help of his fleet of triremes brought the important trading centre of Corcyra under his control, while his interest in the Olympic festival is perhaps attested by a dedication which may be ascribed to him—the famous "chest of Cypselus." He cultivated friendly relations with the tyrants of Milletus and Mytilene, and maintained a bound with Perdicca of Lydia; Egypt and, possibly, of Phrygia. In spite of these varied achievements Periander never entirely conciliated his subjects, for he could not trust himself without a bodyguard. Moreover his family life, according to all accounts, was unfortunate. His sons all died or were estranged from him, and the murder of his last remaining child Lycomphron, the governor of Corcyra, is said to have broken his spirit and hastened his death.

Periander was reckoned one of the seven sages of Greece, and was the reputed author of a collection of maxims (Τροποιςia) in 2000 verses. The letters ascribed to him by Diogenes Laërtius are undoubtedly spurious.

Lucian, ii. 92; Aristotle, Politics, v. 6, 10-12; Heracleides Ponticus in C. Müller's Ιταγ. hist. graec. ii. 212; Nicolaus Damascenus, ibid., iii. 393; Diogenes Laërtius, De vitis clarorum philosophorum, i. ch. 7.

PERICLES (490-429 B.C.), Athenian statesman, was born about 490 B.C., the son of Xanthippus and Agarate. His father1 took a prominent part in Athenian politics; and in 479 held high command in the Greek squadron which annihilated the remnants of Xerxes' fleet at Mycale; through his mother, the niece of Cleisthenes, he was connected with the former tyrants of Sicyon and the family of the Alcmaeonidae. His early training was committed to the ablest and most advanced teachers of the day: Damon instructed him in music, Zeno the Eleatic revealed to him the powers of dialectic; the philosopher Anaxagoras, who lived in close friendship with Pericles, had great influence on his cast of thought and was commonly held responsible for that calm and undaunted attitude of mind which he preserved in the midst of all his labours.

The first important recorded act of Pericles falls in 463, when he helped to prosecute Cimon on a charge of bribery, after the latter's Thasian campaign; but as the accusation could hardly have been meant seriously Pericles was perhaps put forward only as a lay-figure. Undue prominence has commonly been assigned to him in the attack upon the Areopagus in 462 or 461 (see Areopagus, Cimon). The Aristotelian Constitution of Athens shows conclusively that Pericles was not the leader of this campaign, for it expressly attributes the bulk of the reforms to Ephialtes (ch. 25), and mentions Ephialtes and Archestratus as the authors of the laws which the reactionaries of 404 sought to repeal (ch. 35): moreover, it was Ephialtes,2 not Pericles, on whose control the exiles of 407 took charge as the author of their discomfiture. To Ephialtes likewise we must ascribe the renunciation of the Spartan alliance and the new league with Argos and Thessaly (461).

Not long after, however, when Ephialtes fell by the dagger, Pericles undoubtedly assumed the leading position in the state. He must have been born before 485-484, in which years his father was ostracized. On the other hand, Plutarch describes him as a youth of 20 in 465.3

1 He must have been born before 485-484, in which years his father was ostracized. On the other hand, Plutarch describes him as a youth of 20 in 465.

2 The later eminence of Pericles has probably misled historians into exaggerating his influence at this time. Even the Const. Ath. (ch. 27) says that Pericles took "some prerogatives from the Areopagus; this looks like a conjecture based on Arist. Pol. ii. 9 (12), 1273; τὸν ἣν Αρείῳ πάγω κατὰ Διήθες ἐνδοσαν καὶ Περιλεχθη, a passage which really proves nothing. Plutarch, who is clearly biased by Pericles' subsequent brilliance, makes him suddenly burst into prominence and hold the highest place for 40 years (i.e. from 469); he degrades Ephialtes into a tool of Pericles.

The beginning of his ascendancy is marked by an unprecedented outward expansion of Athenian power. In continuation of the policy, which had been sent to support the Egyptian insurgents against Persia (459)4 while detachments operated against Cyprus and Phoenicia. At the same time Athens embarked on several wars in Greece Proper. An alliance with the Megarians, who were being hard pressed by their neighbours of Corinth, led to enmity with this latter power, and before long Epidaurus and Aegina were drawn into the struggle. On sea the Athenians, after two minor engagements, gained a decisive victory which enabled them to blockade Aegina. On land their general Myronides beat off two Corinthian attacks on Megara, which had been further secured by long walls drawn between the capital and its port Nisaean, nearly a mile distant. In 457 the Athenians and their allies ventured to intercept a Spartan force which was returning home from central Greece. At Tanagra in Boeotia a pitched battle was fought, in which both Pericles and the partisans of Cimon distinguished themselves. The Spartans were successful but did not pursue their advantage, and soon afterwards the Athenians, seizing their opportunity, sallied forth again, and, after a victory under Myronides at Oenophyta, obtained the submission of all Boeotia, save Thebes, and of Phocis and Locri. In 455 Tolmides ravaged Laconia and secured Nauactus on the Corinthian gulf; in 454 Pericles himself defeated the Sicyones, and made a descent upon Oeniadae at the mouth of the gulf, and in 453 conducted a cleruchy to the Thracian Chersonese. These years were memorable for the great Athenian expedition to the island of Sicily, an attempt to dominate the country's strength was severe, and when news arrived in 453 that the whole of the Egyptian armament, together with a reserve fleet, had been destroyed by the Persians, a reaction set in, and Cimon, who was recalled on Pericles' motion (but see Cimon), was empowered to make peace with Sparta on the basis of the status quo. For a while the old anti-Persian policy again found favour in Athens, and Cimon led a great expedition against Cyprus; but on Cimon's death hostilities were suspended, and a lasting arrangement with Persia was brought about.5 It was probably in order to mark the definite conclusion of the Persian War and to obtain recognition for Athens' work in punishing the Mede that Pericles now proposed a pan-Hellenic congress at Athens to consult about the rebuilding of the ruined temples and the policing of the seas; but owing to the refusal of Sparta the project fell through.

Pericles may now have hoped to resume his aggressive policy in Greece Proper, but the events of the following years completely disillusioned him. In 447 an Athenian army, which had marched into Boeotia to quell an insurrection, had to surrender in a body at Coronea, and the price of their ransom was the evacuation of Boeotia. Upon news of this disaster Phocis, Locri and Euboea revolted, and the Megarians massacred their Athenian garrison, while a Spartan army penetrated into Attica as far as Eleusis. In this crisis Pericles induced the Spartan leaders to keep the peace by means of a bribe, and hastened to reconquer Euboea; but the other land possessions could not be recovered, and in a thirty years' truce which was arranged in 445 Athens definitely renounced her predomiance in Greece Proper. Pericles' foreign policy henceforward underwent a profound change—to consolidate the naval supremacy, or to extend it by a cautious advance, remained his only ambition.

6 The chronology of these years down to 449 is not quite certain.

An abortive expedition to reinstate a Thessalian prince probably also fell to this period. The Athenians offered in a war between Selinus and Segesta in Sicily about this time.

The "peace of Callias" is perhaps a fiction of the 4th century orators. All the earlier evidence goes to show that no influential understanding was arrived at, based on the de facto inability of either power to cripple the other (see Cimon).

448 seems the most likely date. Before 460 Pericles' influence was perhaps not 20 years of age. After 448 Athens was hardly in a position to summon such a congress, and would not have sent 10 envoys out of 20 to northern and central Greece, where she had just lost all her influence; nor is it likely that the building of the Parthenon (begun not later than 447) was entered on before the congress.
While scouting the projects of the extreme Radicals for interfering in distant countries, he occasionally made a display of Athens' power abroad, as in his expedition to the Black Sea, and in the colonisation of Thrillus, which marks the resumption of a Western policy.

The peaceful development of Athenian power was interrupted by the revolt of Samos in 440. Pericles himself led out a fleet against the seceders and, after winning a first engagement, unwisely divided his armament and allowed one squadron to be routed. In a subsequent battle he retrieved this disaster, and after a long blockade reduced the town itself. A demand for help which the Samians sent to Sparta was rejected at the instance of the Corinthians.

Turning to Pericles' policy towards the members of the Delian League, we find that he frankly endeavoured to turn the allies into subjects (see DELIAN LEAGUE). A special feature of his rule was the sending out of numerous cleruchs (q.v.), which served the double purpose of securing strategic points to Athens and converting the needy proletariate of the capital into owners of real property. The land was acquired either by confiscation from disaffected states or in exchange for a lowering of the tribute. The chief cleruchies of Pericles are: Thracian Chersonese (453-452), Lemnos and Imbros, Andros, Naxos and Eretria (before 447); ¹ Brea in Thrace (446); Oreus (445); Amisus and Astacus in the Black Sea (after 440); Aegina (431).

In his home policy Pericles carried out more fully Ephialtes' project of making the Athenian people truly self-governing. His chief innovation was the introduction of payment from the public treasury to those serving at any station. Chief of all, he provided a remuneration of 1 to 2 obols a day for the jurymen, probably in 451. ² Similarly he created a "theicon" fund which enabled poor citizens to attend the dramatic representations of the Dionysia. To him we may also attribute the 3 obols pay which the soldiers received during the Peloponnesian War in addition to the old-established provision-money. The archons and members of the boule, who certainly received remuneration in 411, and also some minor magistrates, were perhaps paid for the first time by Pericles. In connexion with this system of salaries should be mentioned a somewhat reactionary law carried by Pericles in 451, by which an Athenian parentage on both sides was made an express condition of retaining the franchise and with it the right of sitting on paid juries. The measure by which the archonship was opened to the third and (practically) to the fourth class of citizens (the Zeugitae and Thetes) may also be due to Pericles; the date is now known to be 457 (Const. Ath. 26; and see ARCHON).

The last years of his life were troubled by a new period of storm and stress which called for his highest powers of calculation and self-control. A conflict between Corcyra and Corinth, the second and third naval powers of Greece, led to the simultaneous appearance in Athens of an embassy from either combatant (433). Pericles had, as it seems, resumed of late a plan of Western expansion by forming alliances with Rhgium and Leontini, and the favourable position of Corcyra on the trade-route to Sicily and Italy, as well as its powerful fleet, no doubt helped to induce him to secure an alliance with that island, and so to commit an unfriendly act towards a leading representative of the Peloponnesian League. Pericles now seemed to have made up his mind that war with Sparta, the head of that League, had become inevitable. In the following spring he fastened a quarrel upon Potidaea, a town in Chalcidice, which was attached by ancient bonds to Corinth, and in the campaign which followed Athenian and Corinthian troops came to blows. The Thrasyboulus bell was provided by a decree forbidding the importation of Megarian goods into the Athenian Empire presumably in order to punish Megara for her alliance with Corinth (spring 432). The combined complaints of the injured parties led Sparta to summon a Peloponnesian congress which decided on war against Athens, failing a concession to Megara and Corinth (autumn 432). In this crisis Pericles persuaded the warring assembly that compromise was useless, because Sparta was resolved to precipitate a war in any case. A further embassy calling upon the Athenians to expel the accursed family of the Alcmaeonidae, clearly aimed at Pericles himself as its chief representative, was left unheeded, and early in 431 hostilities began again. When Athens and Sparta and their respective allies (see PELOPONNESIAN WAR).

At the same time, Pericles was being sorely hampered by his adversaries at home. The orthodox Conservatives and some democrats who were jealous of his influence, while afraid to bear the great statesman himself, combined to assail his nearest friends. The sculptor Phidias (q.v.) was prosecuted on two vexatious charges (probably in 433), and before he could disprove the second he died under arrest. Anaxagoras was threatened with a law against atheists, and felt compelled to leave Athens. A scandalous charge against his mistress Aspasia, which he defeated by his personal intercession before the court, was taken very much to heart by Pericles. His position at home scarcely improved during the winter. His policy of abandoning the land defence was unpopular with the land-owning section of the people, who from the walls of Athens could see their own property destroyed by the invaders. At the end of the first year of war (early in 430) Pericles made a great appeal to the pride of his countrymen in his well-known funeral speech. But in the ensuing summer, after a terrible outbreak of plague had ravaged the crowded city, the people became thoroughly demoralized. Pericles led a large squadron to harry the coasts of the Peloponnesian, but met with little success. On his return the Athenians sued for peace, though without success, and a speech by Pericles had little effect on their spirits. Late in 430 they deposed him from his magistracy. In addition to this they prosecuted him on a charge of embezzlement, and imposed a fine of 30 talents. A revulsion of feeling soon led to his reinvestment, apparently with extraordinary powers. But the plague, which had carried off two of his sons and a sister, had left its mark also on Pericles himself. In the autumn of 429 he died ³ and was buried near the Academia, where Pausanias (150 A.D.) saw his tomb. A slightly idealized portrait of Pericles as strategus is preserved to us in the British Museum bust, No. 549, which is a good copy of the well-known bronze original by Cresilas.

If we now endeavour to give a general estimate of Pericles' character and achievements, it will be well to consider the many departments of his activity one by one. In his foreign policy Pericles differs from those statesmen of previous generations who sought above all the welfare of Greece as a whole. His standpoint was at all times purely Athenian. Nor did he combine great statesmanlike qualities with exceptional ability in the field. We may clearly distinguish two periods in his administration of foreign affairs. At first, joining to Cimon's anti-Persian ambitions and Themistocles' schemes of Western expansion a new policy of aggression on the mainland, he endeavoured to push forward Athenian power in every direction, and engaged himself alike in Greece Proper, in the Levant and in Sicily. At Dr. Cimon's death he renounced the war against Persia, and the collapse of 447-445 had the effect of completing his change.

The general impression in Greece was that this decree was the proximate cause of the war. The scurrilous motives which Aristophanes suggests for this measure can be entirely disregarded.

4 His dying boast, that "no Athenian had put on mourning through his doing," Pericles refers to his forbearance towards his political rivals, whom he refused to ruin by prosecution.

1 The date can hardly be fixed; probably it was after 440.
2 It has been doubted whether Pericles favored the enterprise, but among its chief promoters were two of his friends, Lampon the soothsayer and Hippodamus the architect. The oligarch Criatus (in a frag. of the Θεοδομος) violently attacks the whole project.
3 These dates are suggested by the decree of tribute which the inscriptions prove for this year.
4 This is the Const. Ath., which also mentions a διανειμερσης των δικαιωματων (Blass' restoration) in frag. c. 18. The confused story of Philochorus and Plutarch, by which 470 citizens were disfranchised or even sold into slavery in 445, when an Egyptian prince sent a largess of corn, may refer to a subsequent application of Pericles' law, though probably on a much milder scale than is here represented.
of attitude. Henceforward he repressed all projects of reckless enterprise, and confined himself to the gradual expansion and consolidation of the empire. It is not quite easy to see why he abandoned this successful policy in order to hasten on a war with Sparta, and neither the Corcyrean alliance nor the Megarian decree seem justified by the facts as known to us, though commercial motives may have played a part which we cannot now gauge. In his adoption of a purely defensive policy at the beginning of the Peloponnesian War, he miscalculated the temper of the Athenians, whose moral would have been better sustained by a greater show of activity. But in the main his policy in 431-429 was sound, and the disasters of the war cannot fairly be laid to his charge. The foundation of churcheus was an admirable device, which in many ways anticipated the colonial system of the Romans.

In his attitude towards the members of the Delian League Pericles likewise maintained a purely Athenian point of view. But he could hardly be said seriously to have oppressed the subject cities, and technically all the League money was spent on League business, for Athens, to whom the chief munitions in Athens were reared, was the patron goddess of the League. Under Pericles Athens also attained her greatest measure of commercial prosperity, and the activity of her traders all over the Levant, the Black Sea and the West, is attested not only by literary authority, but also by numerous Attic coins, vases, &c.

Pericles' home policy has been much debated since ancient times. His chief enactments relate to the payment of citizens for State service. These measures have been interpreted as an appeal to the baser instincts of the mob, but this assumption is entirely out of keeping with all we know of Pericles' general attitude towards the people, over whom Thucydides says he practically ruled as a king. We must, then, admit that Pericles sincerely contemplated the good of his fellow-countrymen, and we may believe that he endeavoured to realize that ideal Athens which Thucydides sketches in the Funeral Speech — an Athens where free and intelligent obedience is rendered to an equitable code of laws, where merit finds its way to the front, where military efficiency is found along with a free development in other directions and strangles neither commerce nor art. In accordance with this scheme Pericles sought to educate the whole community with political wisdom by giving all an equal share in the government, and to train their aesthetic tastes by making accessible the best drama and music. It was most unfortunate that the Peloponnesian War ruined this great project by diverting the large supplies of money which were essential to it, and confronting the remodelled Athenian democracy, before it could dispense with his tutelage, with a series of intricate questions of foreign policy which, in view of its experience, it could hardly have been expected to grapple with successfully.

Pericles also incurred unpopularity because of his rationalism in religious matters; yet Athens in his time was becoming ripe for the new culture, and would have done better to receive it from men of his circle — Anaxagoras, Zeno, Protagoras and Melan — than from the more irresponsible sophists. The influence of Aspasia on Athenian thought, though denounced unsparingly by most critics, may indeed have been beneficial, inasmuch as it tended towards the emancipation of the Attic woman from the over-strict tutelage in which she was kept. As a patron of art Pericles was a still greater force. His policy in encouraging the drama has already been mentioned: among his friends he could count three of the greatest Greek writers—the poet Sophocles and the historians Herodotus and Thucydides. Pericles likewise is responsible for the epoch-making splendour of Attic art in his time, for had he not so fully appreciated and given a free scope to the genius of Phidias, Athens would hardly have witnessed the triumphs of Pericles. Many of the glorious structures, and Attic art could not have boasted a legion of first-rate sculptors of whom Alcamenes, Agoracritus and Paionius are only the chief names. (See also GREEK ART.)

Of Pericles' personal characteristics we have a peculiarly full and interesting record. He was commonly compared to Olympian Zeus, partly because of his serene and dignified bearing, partly by reason of the majestic roll of the thundering eloquence, with its bold poetical imagery, with which he held friend and foe spellbound. The same dignity appeared in the regard for his features, though the abnormal height of his cranium afforded him no small share of ridicule to which the comedians made full use. In spite of an apparently insatiable appetite of scandals about him we cannot but believe that he bore an honourable character, and his integrity is vouched for by Thucydides in such strong terms as to exclude all further doubt on the question.

ANCIENT AUTHORITIES. — Our chief source must always remain Thucydides (i. and ii. 1-69), whose insight into the character and ideals of Athens places him far above all other ancient historians. The speeches which he puts into his mouth are of special value in disclosing to us Pericles' inmost thoughts and aspirations (i. 140-144; 3: 145-146). B. 60-64. Thucydides also shows sympathy with Pericles, though, as J. B. Bury points out (Ancient Greek History, 1909, pp. 133 seq.), he was by no means a blind admirer. Of other 5th-century sources, Aristophanes is obviously a caricaturist, and Plutarch (Pericles, De vita et moribus) shows much sympathy with Pericles' personal bearing, home life, and patronage of art, literature and philosophy, derived in part from the old Athenian tradition. He quotes Aristotle, Heracides Ponticus, Aeschines Socraticus, Idomeneus of Lampascus and Duris of Samos, and is also indebted through some Alexandrine interpolations to Ephorus and Theopompus. Diodorus (xi. and xii.), who copied Ephorus' works, must be doubted.

MODERN WORKS. — Historians are agreed that Pericles was one of the most powerful personalities of ancient times, and generally hold that he has been fairly characterized by Droysen in Griech. Gesch. vols. i. and ii. (Strassburg and Bonn, 1893-1896), and Morey in his Hellenistic Politik seit Perikles (Leipzig, 1884) takes the most disparaging view; E. Abbott, Greek Hist., vol. ii. (London, 1892), and M. Duncker, Gesch. d. Athen, vols. viii., ix. (Leipzig, 1893-1896) accept the same view. Plutarch (Pericles) gives many interesting details as to Pericles' personal bearing, home life, and patronage of art, literature and philosophy, derived in part from the old Athenian tradition. He quotes Aristotle, Heracides Ponticus, Aeschines Socraticus, Idomeneus of Lampascus and Duris of Samos, and is also indebted through some Alexandrine interpolations to Ephorus and Theopompus. Diodorus (xi. and xii.), who copied Ephorus' works, must be doubted.

PERIDOT, sometimes written peridot, a name applied by jewelers to "noble olivine," or that kind of olivine which can be used as a gem-stone (see OLIVINE). The word peridot is an old trade-name, of unknown origin, used by French jewelers and introduced into science by J. R. Hafy. Peridot is practically the same stone as chrysolite (q.v.), though it is convenient to restrict that term to transparent olivine of pale yellowish green colour, and to apply the term peridot to those kinds which are darker and decidedly green: the colour, which is due to the presence of ferrous iron, is never vivid, like that of emerald, but is usually some shade of olive-, pistachio- or leek-green. Although the stone is sometimes cut en cabochon, and in rose-form, the cutting best adapted to display the colour is that of a table or a step-cut stone. Fortunately the hardness of peridot is only about 6-5, or but little above that of glass, so that the polished stone readily suffers abrasion by wear. In order to harden the peridot which is given on a copper wheel moistened with sulphuric acid.

Although olivine has a fairly wide distribution in nature, the varieties used as gem-stones are of very limited occurrence. Much mystery for a long time surrounded the locality which
PERIDOTITE—PERIÉR

yields most of the peridot of commerce but it is now identified with the island of St John, or Isle Zeboget, in the Red Sea, where it occurs, as shown by M. J. Couyat, in an altered dunite, or olivine rock (Bull soc. franç. min., 1908). This is probably the Topaz Isle, rodiijos viros, of the ancients. It is generally held that the mineral now called topaz was unknown to ancient and mediaeval writers, and that their rodiijos was our peridot. Such was probably the Hebrew ὑδᾶς, translated topaz in the Old Testament. Dr. G. F. Kunz has suggested that the peridots of modern trade are largely derived from old topaz. The famous shrine of the Three Kings in Cologne Cathedral contains a large peridot, which has commonly been regarded as an emerald. It is notable that pebbles of transparent olivine, fit for cutting, are found in the United States in Montana, Arizona and New Mexico; in consequence of their shape and curiously pitted surface they are known as Job's tears." (F. W. R.)*

PERIDOTITE, a plutonic holo-crystalline rock composed in large part of olivine, and almost or entirely free from feldspar. The rocks are the most basic, or least siliceous plutonic rocks, and contain much iron oxide and magnesia. Hence they have dark colour and a high specific gravity (3.0 and over). They weather readily and are changed to serpentine, in which process water is absorbed and enters into chemical combination with the silicates of magnesia and iron. In some peridotites, such as the dunites, olivine greatly preponderates over all other minerals. It is always in small, rather rounded crystals without good crystalline form, and pale green in colour. Most of the rocks of this group, however, contain other silicates such as augite, hornblende, biotite or rhombic pyroxene, and often two or three of these are present. By the various mineral combinations different species are produced, e.g., mica-peridotite, hornblende-peridotite, catstite-peridotite. Of the accessory minerals the commonest are iron oxides and chromite or picotite. In some peridotites these form segregations or irregular masses which are of importance as sources of the ores of chromite. Corundum occurs in small crystals in many North American peridotites and platinum and the nickel-iron compound awaruite are found in rocks of this class in New Zealand. Red garnet (pyrope) characterizes the peridotites of Bohemia. The diamond mines of South Africa are situated in pipes or volcanic necks occupied by a peridotite breccia which has been called kirinite. In this rock in addition to diamond the following minerals are found, hypersthen, garnet, biotite, pyroxene (chrome-diope), and olivine.

Some peridotites have a granular structure, e.g., the dunite; all the crystal grains being of rounded shape and nearly equal size; a few are porphyritic with large individuals of diaspore, augite or hornblende. Some are banded with parallel bands of dissimilar composition, the result probably of fluxion in a magma which was not quite homogeneous. The great majority of the rocks of this group are poikilitic, that is to say, they contain olivine in small rounded crystals embedded in large irregular masses of pyroxene or hornblende. The structure is not unlike that known as opilitic in the dolerites, and arises from the olivine having first separated out of the liquid magma which then solidified around the grains. The olivine may occur in its crystals. In hand specimens of the rocks the smooth and shining cleavage surfaces of hornblende and augite are dotted over with dull blackish green spots of olivine; to this appearance the name "lustre-mottling" has been given.

Mica-peridotites are not of frequent occurrence. A well-known rock from Kaltes Thal, Harzburg, contains much biotite, deep brown in this section. Other examples are found in India and in Australia. Mica-peridotites have been developed in a series of the ultrabasic rocks. The "blue-ground" of Kimberley which contains the diamonds is a brecciaform biotite-hypersthen-peridotite with augite. In the north of Scotland, in several places in Sutherland and Ross, thomsonite and peridotites with yellow green biotites and large plates of pale green hornblende: these have been called scyelles. In the hornblende-peridotites lustre-mottling is often very striking. The amphibole may be colourless tremolite in small prisms, as in some varieties of serpentine from the Lizard (Cornwall); or pale green hornblende as in scyelle. In both these cases there is some probability that the hornblende has developed, partly at least, from olivine or augite. In sheared peridotites tremolite and actinolite are very frequent. Other rocks contain dark brown hornblende, with much olivine; there may also be augite which is often intergrown peripherally with the hornblende. Examples of this kind are found in the Old Walds and in the novel rocks of New York, and many other localities. A well-known peridotite from Schlesheim Tal in the Odenwald contains brownish green amphibole and small amounts of minerals filled in by pale green hornblende which are mostly serpentinitized. Very often primary brown hornblende in this type is surrounded by fringes and outgrowths of colourless tremolite which has formed as a secondary mineral after olivine. Combining the pseudomorphic after olivine composed of a matrix of lacy talc and chlorite crossed by a network of tremolite needles, it is also very common in some peridotites, especially those which have undergone pressure or shearing; these aggregates are known as pitted.

The peridotites which contain monoclinic pyroxene may be divided into two classes, those rich in diaspore and those in which there is much augite. The diaspore-peridotites have been called wehlrites after the Rhine district in which the diaspore is commonest. They may be porphyritic, or may form a coarsely crystalline matrix enclosing innumerable olivine grains, and then Lustre-mottling is as a rule very well shown.

The dunites are rocks, first described from Lherz in the Pyrenees, consisting of olivine, chrome-diope and catstite, and accessory picotite or chromite. They are fine-grained, bright green in colour, often very fresh, and may be somewhat granulitic. The dunites are peridotites, similar to the rock of Dun Mountain, New Zealand, composed essentially of olivine in a finely granular condition. Many examples of this type are known in different parts of the world; they are often facies of gabbroic dunite. In the rocks of the Tertiary age in the Rhine district small nodules of green olivine occur frequently. They are of rounded shapes and may be a foot in diameter. The structure is granular and generally so olivine is intergrown with serpentine, chlorite, magnetite, catstite and chrome-diope. Some geologists believe these to be fragments of dunite detached from masses of that rock not exposed at the surface; others consider that they are aggregations of the early minerals of the basalt magma, which were already crystallized before the liquid rock was emitted.

The great majority of stony or lithoidal meteorites (aerolites) are rich in olivine and present many analogies to the terrestrial peridotites. Amongst their minerals are hypersthen (enstatite), augite and chrome-diope, chromite, pyrite and troilite, nickeliferous iron and basic plagioclase feldspar. The structure of these meteorites is described as chondritic; their minerals often occur as •

PÉRIÉR, CASIMIR PIERRE (1777–1832), French statesman, was born at Grenoble on the 11th of October 1777, the fourth son of a rich banker and manufacturer, Claude Périer (1742–1801), in whose house the estates of Dauphiny met in 1788. Claude Périer was one of the first directors of the Bank of France; of his eight sons, Augustin (1773–1833), Antoine Scipion (1776–1821), Casimir Pierre and Camille (1781–1844), all distinguished themselves in industry and in politics. The family removed to Paris after the revolution of Thermidor, and Casimir joined the army of Italy in 1798. On his father's death he left the
army and with his brother Scipion founded a bank in Paris, the speculations of which he directed while Scipion occupied himself with its administration. He opposed the ruinous methods by which the duc de Richelieu sought to raise the war indemnity demanded by the Allies, in a pamphlet Réflexions sur le projet d'emprunt (1817), followed in the same year by Dernières réflexions... in answer to an inspired article in the Moniteur. In the same year he entered the chamber of deputies for Paris, taking his seat in the Left Centre with the moderate opposition, and making his first speech in defence of the freedom of the press. Re-elected for Paris in 1822 and 1824, and in 1829 for Paris and for Troyes, he elected to represent Troyes, and sat for that constituency until his death. Périé's violence in debate was not associated with any disloyalty to the monarchy, and he held resolutely aloof from the republican conspiracies and intrigues which prepared the way for the revolution of 1830. Under the Martignac ministry there was some prospect of a reconciliation with the court, and in January 1820 he was nominated a candidate for the presidency of the chamber; but in August with the elevation to power of Polignac the truce ceased, and on the 15th of March 1830 he was one of the 221 deputies who repudiated the pretensions put forward by Charles X. Averse by instinct and by interest to popular revolution he nevertheless sat on the provisory commission of five at the hôtel-de-ville during the days of July, but he refused to sign the declaration of Charles X.'s dethronement. Périé reluctantly recognized in the government of Louis Philippe the only alternative to the peremptoriness of the revolution; but he had no favour with the new king, whom he scorned for his truckling to the mob. He became president of the chamber of deputies, and sat for a few months in the cabinet, though without a portfolio. On the fall of the weak and discredited ministry of Laffitte, Casimir Périé, who had drifted more and more to the Right, was summoned to power (March 13, 1831), and in the short space of a year he restored civic order in France and re-established her credit in Europe. Paris was in a constant state of disturbance from March to September, and was only held in check by the premier's determination; the workmen's revolt at Lyons was suppressed after hard fighting; and at Grenoble, in face of the quarrels between the military and the inhabitants, Périé declined to make any concession to the townsfolk. The minister refused to be dragged into armed intervention in favour of the revolutionary government of Warsaw, but his policy of peace did not exclude energetic demonstrations in support of French interests. He constituted France the protector of Belgium by the prompt expedition of the army of the north against the Dutch in August 1831; French influence in Italy was asserted by the audacious occupation of Ancona (Feb. 23, 1832); and the refusal of compensation for injuries to French residents by the Portuguese government was followed by a naval demonstration at Lisbon. Périé had undertaken the premiership with many forebodings, and overwork and anxiety prepared the way for disease. In the spring of 1832 during the cholera outbreak in Paris, he visited the hospitals in company with the duke of Orleans. He fell ill the next day of a violent fever, and died six weeks later, on the 16th of May 1832.

His Opinions et discours were edited by A. Lesieu (2 vols., 1838); C. Nicoulaut published in 1894 the first part (Casimir-Périé, député de l'opposition, 1817-1830) of a study of his life and policy; and his ministry is exhaustively treated by Thureau-Dangin in vol. III. (1842) of l'Histoire de la monarchie de juillet.

His eldest son, AUGUSTE VICTOR LAURENT CASIMIR PÉRIÉ (1817-1872), the father of President Casimir-Périer (see Casimir-Périer), entered the diplomatic service in 1838, successively to the London, Brussels and St. Petersburg embassies, and in 1843 became minister plenipotentiary at Hanover. In 1846 he resigned from the service to enter the legislature as deputy for the department of Seine, a constituency which he exchanged for Aube after the Revolution of 1848. On the establishment of the Second Empire he retired temporarily from public life, and devoted himself to economic questions on which he published a series of works, notably Les Finances et la politique (1863), dealing with the interaction of political institutions and finance. He contested Grenoble unsuccessfully in 1863 against the imperial candidate, Casimir Royer; and failed again for Aube in 1869. In 1871 he was returned by three departments to the National Assembly, and elected to sit for Aube. He was minister of the interior for a few months in 1871-1872, and his retirement deprived Thiers of one of the strongest elements in his cabinet. He also joined the short-lived ministry of May 1873. He consistently opposed all efforts in the direction of a monarchical restoration, but on the definite constitution of the republic became a life senator, declining MacMahon's invitation to form the first cabinet under the new constitution. He died in Paris on the 6th of June 1876.

For the family in general see E. Choulet, La Famille Casimir-Périer (Grenoble, 1894).

PERIGORD, one of the old provinces of France, formed part of the military government of Guienne and Gascony, and was bounded on the N. by Angoumois, on the E. by Limousin and Quercy, on the S. by Agenais and Béarnais, and on the W. by the Pyrenees. It is now represented by the departments of Dordogne and part of Lot-et-Garonne. Périgord was in two divisions: Périgord blanc (cap. Périgueux) and Périgord noir (cap. Sarlat). In the time of Caesar it formed the civitas Ptercoriorum, with Vauxoune (Périgueux) as its capital. It became later part of Aquitania secunda and formed the gauus petrosagrius, afterwards the diocese of Périgueux. Since the 8th century it had its own counts (see the Histoire généalogique of P. Anselme, tome iii.), who were feudatories of the dukes of Aquitaine and in the 13th century were the vassals of the king of England. In the 15th century the county passed into the hands of the dukes of Orleans, and in the 16th came to the family of d'Albret, becoming Crown land again on the accession of Henry IV.

See Dessalles, Histoire du Périgord (1889), the Bulletin of the Société historique et archéologique du Périgord (1974 seq.), l'Inventaire sommaire de la "Collection de Périgord" in the Bibliothèque nationale (1874); the Dictionnaire toponymique du département de la Dordogne by the Vicomte de Gourgues (1873).

PÉRIGUEUX, a town of south-western France, formerly capital of the old province of Périgord, now chief town of the department of Dordogne, 70 m. E.N.E. of Bordeaux, on the railway between that city and Limoges. Pop. (1906), 28,100. The town, situated on an eminence on the right bank of the Isle, is divided into three parts. On the slope of the hill is the medieval town, bordered south-east by the river and on the other three sides by esplanades and promenades; to the west is the modern town, which stretches to the station; to the south of the modern town is the old Roman town or cité, now traversed by the railway.

Three bridges connect Périgueux with the left bank of the Isle, where stood Vauxoune, the capital of the Ptecocorii. Hardly a trace of this old Gallic town remains, but not far off, on the Plateau de la Boissière, the rampart of the old Roman camp can still be traced. On the right bank of the Isle, in the Roman city, there have been discovered some baths of the 1st or 2nd century, supplied by an aqueduct four miles long, which spanned the Isle. A circular building, called the "Tower of Vauxoune," 68 ft. in diameter and 89 ft. in height, stands at what was formerly the centre of the city, where all the chief streets met. It is believed to have been originally the cela or main part of a temple, probably dedicated to the tutelary deities of Vauxoune. Of the amphitheatre there still remain huge fragments of wall and vaulting. The building had a diameter of 1312 ft., that of the arena being 870 ft.; and, judging from its construction,
must be as old as the 3rd or even the 2nd century. The counts of Périgueux used it for their château, and lived in it from the 12th to the end of the 14th century. In 1644 it was given over by the town to the Order of the Visitatio, and the sisters took it from the stones required for the construction of their nunnery. The most remarkable, however, of the ruins of the cité is the Château Barrière, an example of the fortified houses formerly common there. Two of its towers date from the 3rd or 4th century, and formed part of the fortified enceinte; the highest tower is of the 10th century; and the gate now inhabited is of the 11th or 13th century, and was formerly used as a burial chapel. The bulk of the château is of the 12th, and some of the windows of the 16th century.

The chief medieval building in the cité is the church of St Étienne, once the cathedral. It dates from the 11th and 12th centuries, but suffered much injury at the hands of the Protestants in the religious wars when the tower and two of the three cupolas were destroyed. The choir and its cupola were skillfully restored in the 17th century. A fine carved wooden reredos of the 17th century and a tomb of a bishop of the 12th century are to be seen in the interior. In the medieval town of Périgueux there is a remarkable building, the cathedral of St Front, which, till its restoration, or rather rebuilding, in the latter half of the 19th century when the old features were to a great extent lost, was of unique architectural value. It bears a striking resemblance to the Byzantine churches and to St Mark's at Venice, and according to one theory was built from 984 to 1047, contemporaneously with the latter (977-1085). It consists of five great cupolas, arranged in the form of a Greek cross, and conspicuous from the outside. The arms of the cross are 60 ft. in width, and the whole is 184 ft. long. These cupolas, 80 ft. high from the keystone to the ground, are supported on a vaulted roof with pointed arches after the manner characteristic of Byzantine architecture. The pointed arches imitated from it prepared the way for the introduction of the Gothic style. Adjoining St Front on the west are the remains of an old basilica of the 6th century, above which rises the belfry, the only one in the Byzantine style now extant. It dates from the 11th century, and is composed of two massive cubes, placed the one above the other in retreat, with a circular colonnade surmounted by a dome. To the south-west of St Front, the buildings of an old abbey (11th to 16th century) surround a cloister dating chiefly from the 13th century. Of the fortifications of Puy St Front, the chief relic is the 13th century tower of the 3rd century.

Périgueux is seat of a bishop, prefect and court of assizes, and has tribunals of first instance and of commerce, a chamber of commerce and a branch of the Bank of France. Its educational establishments include a lycée for boys, training colleges for both sexes and a school of drawing. The trade of the town is in pigs, truffles, flour, brandy, poultry and pies known as pâtés de Périgord.

Vesunna was the capital of the Petcorii, allies of Vercingetorix when Caesar invaded Gaul. The country was afterwards occupied by the Romans, who built a second city of Vesunna on the site of the old town of the Isle opposite the site of the Gallic town. The battle of Vesunna was fought in about 53 B.C. near the town. St Front preached Christianity here in the 4th century and over his tomb there was raised a monastery, which became the centre of the new town called Le Puy St Front. The cité was pillaged by the Saracens about 731, and in 844 the Normans devastated both quarters. The new town soon began to rival the old city in importance, and it was not until 1240 that the attempts of the counts of Périgord and the bishops to infringe on their municipal privileges brought about a treaty of union. During the Hundred Years' War, Périgueux was twice attacked by the English, who took the cité in 1356; and the whole town was captured by the Treaty of Bretigny. The Treaty of Bretigny returned to the French Crown in the reign of Charles V. The county passed by marriage into the hands of Anthony of Bourbon, father of Henry IV., and was converted by the latter into royal domain. During the Huguenot wars Périgueux was frequently a stronghold of the Calvinists, who in 1575 did great destruction there, and it also suffered during the troubles of the Frondes.

PERIHÉLION—PERINO DEL VAGA

A British island in the strait of Bab-el-Mandeh, at the entrance to the Red Sea, and 66 m. W. by S. of Aden. Perim is 2 m. from the Arabian shore, is about 56 m. long with an average breadth of over a mile and covers some 7 sq. m. There is a good harbour with easy entrance on the south side with a depth of water from 25 to 30 ft. It is largely used by mercantile vessels as a coaling-station and for taking in stores, including fresh water and ice. Perim, the Diodoros island of the Periplus, was, in consequence of the French occupation of Egypt, garrisoned from 1799 to 1801 by a British force. In view of the construction of the Suez Canal and the increasing importance of the Red Sea route to India the island was annexed to Great Britain in 1857, fortified and placed under the charge of the Aden residency. In 1861 a lighthouse was built at its eastern end. Submarine cables connect the island with Aden, Egypt and Zanzibar. Population, including a garrison of 50 sepoys, about 200.

PERINO DEL VAGA (1500-1547), a painter of the Roman school, whose true name was PERINO (or PIERO) BUONACCORSI. He was born near Florence on the 28th of June 1500. His father ruined himself by gambling, and became a soldier in the invading army of Charles VIII. His mother dying when he was but two months old, he was suckled by a she-goat; but shortly afterwards he was taken up by his father's second wife. Perino was first apprenticed to a druggist, but soon passed into the hands of a mediocre painter, Andrea da Ceri, and, when eleven years of age, of Ridolfo Ghirlandajo. Perino rapidly surpassed his fellow-pupils, applying himself especially to the study of Michelangelo's great cartoon. Another mediocre painter, Vaga from Toscanna, undertook to settle the boy in Rome, but first set him to work in Toscanna. Perino, when he at last reached Rome, was utterly poor, and with no clear prospect beyond journey-work for trading decorators. He, however, studied with great severity and spirit from Michelangelo and the antique, and was eventually entrusted with some of the subordinate work undertaken by Raphael in the Vatican. He assisted Giovanni da Udine in the stucco and arabesque decorations of the loggie of the Vatican, and executed some of the subjects but failed in the grandiose and archaistic subjects which go by the name of "Raphael's Bible." Raphael himself furnishing the designs. Perino's examples are: "Abraham about to sacrifice Isaac," "Jacob wrestling with the Angel," "Joseph and his Brethren," the "Hebrews crossing the Jordan," the "Fall and Capture of Jericho," "Joshua commanding the Sun to stand still," the "Birth of Christ," "His Baptism" and the "Last Supper." Some of these are in bronze-tint, while others are in full colour. He also painted, after Raphael's drawings, the figures of the planets in the great hall of the Appartamenti Borgia. Perino exhibited very uncommon faculty in these works and was soon regarded as second only to Giulio Romano among the great painter's assistants. To Raphael he was always exceedingly respectful and attentive, and the master loved him almost as a son. He executed many other works about Rome, always displaying a certain mixture of the Florentine with the Roman style.

After Raphael's death in 1520 a troublesome period ensued for Perino, with a plague which ravaged Rome in 1523, and again with the sack of that city in 1527. Then he accepted an invitation to Genoa, where he was employed in decorating the Doria Palace, and rapidly founded a quasi-Roman school of art in the Ligurian city. He ornamented the palace in a style similar to that of Giulio Romano in the Mantuan Palazzo del Tè, and frescoed historical and mythological subjects in the apartments, and with a facility and gracefulness in work, sculptural and architectural details—in short, whatever came to hand. Among the principal works are: the "War between the Gods and Giants," "Horatius Coclès defending the Bridge," and the "Fortitude
of Mutius Scævola." The most important work of all, the "Shipwreck of Aeneas," is no longer extant. From Genoa to the Pope of Pisa, and began some work, particularly on the cathedral. Finally he returned to Rome, where Paul III. allowed him a regular salary till the painter's death. He too much of the works of Raphael, and laboured hard on his own account, undertaking all sorts of jobs, important or trivial. Working for any price, he made large gains, but fell into mechanical negligence. Perino was engaged in the general decoration of the Sala Reale, begun by Paul III., when his health, undermined by constant work and as constant irregularities, gave way, and he fell down dead on the 19th of October 1547. He is buried in the Pantheon.

Perino produced some excellent portraits, and his smaller oil pictures showed the manner of Raphael something of that of Adrea del Sarto. Many of his works were engraved, even in his own lifetime. Daniele Ricciarel! Girolamo S socialist da Sermoneta, Luca Romano and Marcello Venusti (Mannetje) were among his principal assistants.

PERINTHUS (Turk. Eski Eregli, old Heraclea), an ancient town of Thrace, on the Propontis, 22 m. W. of Selymbria, strongly situated on a small peninsula on the bay of that name. It is said to have been a Samian colony, founded about 590 B.C. According to Tzetzes, its original name was Mygdonia; later it was called Heraclea (Heraclea Thrace, Heraclea Perintus). It is famous chiefly for its stubborn and successful resistance to Philip II. of Macedon in 340; at that time it seems to have been more important than Byzantium itself.

PERIOD (Gr. περίοδος, a going or way round, circuit, περιδρόμεσσαν, way; road), a circuit or course, of time, a cycle; particularly the duration of time in which a planet, it revolves round its sun, or a satellite round its primary, a definite or indefinite recurring interval of time marked by some special or peculiar character, e.g. in history, literature, art, &c.; it is so used of a division of geological time. Particular uses of the word are for the various periods through which a disease passes, the termination or conclusion of any course of events, the pause at the end of a completed sentence, and the mark (.) used to signify the same (see PUNCTUATION).

PERIODICALS, a general term for literary publications which appear in numbers or parts at regular intervals of time— as a rule, weekly, monthly or quarterly. The term strictly includes "newspapers" (q.v.), but in the narrower sense usually intended it is distinguished as a convenient expression for periodical publications which differ from newspapers in not being primarily for the circulation of news or information of ephemeral interest, and in being issued at longer intervals. In modern times the weekly journal has become so much of the nature of a newspaper that it seldom can be called a periodical in this sense. The present article chiefly deals with publications devoted to general literature, literary and critical reviews and magazines for the supply of miscellaneous reading. In the article SOCIETIES (q.v.) an account is separately given of the transactions and proceedings of learned and scientific bodies. Year-books, almanacs, directories and other annuals belong to a distinct type of publication, and are not referred to here.

BRITISH

The first literary periodical in English was the Mercurius librarius, or a Faithful Account of all Books and Pamphlets (1660), a mere catalogue, published weekly or fortnightly in London, followed by Weekly Memorials for the Ingenious (June 16, 1681—Aug. 1683), which was more of the type of the Journal des Savants (see under France below), whence it borrowed many contributions. Of the History of Learning (1691)—another with the same title came out in 1703—there is no authentic number. In the revival of the La Crose, started the monthly Works of the Learned (Aug. 1691—April 1692), devoted principally to continental scholarship. The monthly Complete Library (1692 to 1694) was a venture of John Dunton; the monthly Memoirs for the Ingenious (1690) was started by J. de la Crose, ran for 12 months, and another with the same title appeared in the following year, only to enjoy a briefer career. The first periodical of merit and influence was the History of the Works of the Learned (1709). Large numbers of descriptive and critical books on English literature. The Memoirs of Literature, the first English review consisting entirely of original matter, published in London from 1710 to 1714, had for editor Michel de la Roche, a French Protestant refugee, who also edited at Amsterdam the Bibliothéque anglaise (1717—1719), and subsequently Mémoires littéraires de la Grande Bretagne (1720—1724). Returning to England in 1725, he recommenced his Memoirs of Literature (1725—1728), a monthly, and afterwards the Literary Journal (1729—1734), the Literary and Universal Journal (1729—1734), a periodical of the learned, and was carried on without interruption until 1743, when its place was taken by A Literary Journal (Dublin, [1744—1751]), the first English periodical in Ireland. The Museum (1746) of R. Dodsley united the character of a few of both, with that of a literary magazine. It came out fortnightly to the 12th of September 1747. Although England can show nothing like the Journal des savants, which has flourished almost without a break for two and a half centuries, a nearly complete series of reviews of English literature may be made up from 1681 to the present day.

After the close of the first quarter of the 18th century the literary periodical began to assume more of the style of the modern review, and in 1749 the title and the chief features were united in the Monthly Review, established by Ralph Griffiths, who conducted it until 1755. This it went on with much success till its close in 1773, an end in 1845. From its commencement the Review dealt with science and literature, as well as with literary criticism. It was Whig in politics and Nonconformist in theology. The first series ran from 1749 to December 1780, 81; the second from 1781 to 1815, 108 vols.; the third or new series from 1826 to 1830, 15 vols.; and the fourth from 1831 to 1845, 45 vols.; when the magazine stopped, there was a general index (1749—1799) 3 vols., and another (1790—1816), 2 vols.

The Tory party and the established church were defended in the Critical Review (1755—1781), founded by Archibald Hamilton and Sir Rowland, by Smellie and Alexander Johnston. Johnston contributed to fifteen numbers of the Literary Magazine (1758—1763). The reviews rapidly increased in number towards the end of the century. Among the principal were the London Review (1775—1780), the Critical Review (1780—1800), The Critical Quarterly Review, published in 1797 with the Analytical Review (1798—1799), the Anti-Jacobin Review and Magazine (1798—1821), and the British Critic (1793—1833), the organ of the High Church party, and first edited by Archdeacon Nares and Belove.

These periodicals have now become extremely numerous, and many of the leading London publishers found it convenient to maintain their own particular organs. It is not a surprise to find that the reviews should have fallen somewhat in public estimation. The time was ripe for one which should be quite independent of the booksellers, and which should also aim at a higher degree of excellence. In back numbers of the Quarterly of 1807 there are, and others had produced an Edinburgh Review which only ran to two numbers, and in 1773 Gilbert Stuart and William Smellie issued during three years an Edinburgh Magazine and Review. To Edinburgh is also due the first high-class critical journal, the Quarterly Review, established in October 1800 by Jeffrey, Scott, Horner, Brougham and Sydney Smith. It created a new era in periodical criticism, and assumed from the commencement a tone and style which had not existed in any of its predecessors. The first editor was Sydney Smith, then Jeffrey for many years, and later editors were Macveay, Napier, William Empson, Sir G. C. Grattan, Sir John Reeves, W. Allen, and others. An article on it was adopted from the colours of the Whig party whose political principles it advocated. Among its more famous contributors were Lord Brougham, Sir Walter Scott, Carlyle, Hazlitt and Macaulay. Scott, being dissatisfied with the new review, persuaded a new one to be started by John Murray, his London publisher, to start its brilliant Tony competitor, the Quarterly Review (Feb. 1809), first edited by William Gifford, then by Sir J. T. Coleridge, and subsequently by J. G. Lockhart, Dugald Stewart, Sir John Herschel, John Stuart Mill, W. F. Lucas, Prothero and G. W. Prothero. Among the contributors in successive years were Canning, Scott (who reviewed himself), Robert Southey, 1 Archibald Bower (1685—1766) was educated at Douai, and became a Jesuit. He subsequently professed himself a convert to the Anglican Church, and published a number of works, but was more esteemed for his ability than for his moral character.

The Quarterly Review was succeeded by the New Quarterly, established in 1809 by Samuel Smutt and Thomas Hinnom, with the name of Griffiths (1720—1803), the prosperous publisher, with his diploma of LL.D. granted by an American university, and with the quarrels between him and the poet.
Sir John Barrow, J. Wilson Croker, Isaac Disraeli, A. W. Kingslake, Lord Salisbury and W. E. Gladstone. The Westminster Review (1828) conducted itself with religious toleration, and the other radicals in church, state and legislation. In 1836 it joined to the London Review (1829), founded by Sir William Moresworth, and then bore the name of the London and Westminster Review (1828-1829). Original periodical reviews worth mentioning are the Eclectic Review (1805-1868), edited down to 1834 by Josiah Conder (1789-1855) and supported by the Dissenters; the British Review (1828), a successor to the British and Foreign Review (1835-1844); the Quarterly Review (1822-1896); the Irish Quarterly Review (1851-1891), founded in Dublin; the Home and Foreign Review (1862-1864); the Fine Arts Review (1863-1864); the New Quarterly Magazine (1872-1873); the Catholic Union Review (1865-1874); the Anglican Church Quarterly Review (1879); Mind (1876), dealing with mental philosophy; the Modern Review (1880-1884); the Scottish Repository (1882); the Irish Quarterly Review (1886); and the Jewish Quarterly Review.

The monthly reviews include the Christian Observer (1802-1857), conducted itself with religious toleration, and the establishment of signatory principles, with Zachary Macaulay as the first editor; the Monthly Repository (1806-1837), originally purely theological, but after coming into the hands of the Rev. W. C. Hazlitt was a little more popular; the Quarterly Review (1811-1896), edited successively by G. H. Leves, John Morley, T. H. S. Escott, Frank Harris, Oswald Crawford and W. L. Courtney, was intended as a kind of English Review des deux mondes; and theibl to 1866 it has appeared monthly. The Contemporary Review (1866), long edited by Sir Percy Bunting, and the Nineteenth Century (1877), founded and edited by Sir James Knowles (q.v.), and renamed Modern Church in 1883 and the Westminster Review in 1889, consisting of signed articles by men of mark of all opinions upon questions of the day. The National Review (1883), edited successively by Alfred Austin, W. Earl Hodgson, and L. J. Maxey, is alone in taking editorially a pronounced party line in politics as a Conservative organ. Modern Thought (1879-1884), for the free discussion of political, religious and social subjects, and the Modern Review (1892-1894) may also be mentioned. Other monthly reviews are the Edinburgh Review (1802), the Irish Catholic Magazine, the Irish Catholic Monthly, the Irish Quarterly (Dublin, 1845); the Gaelic Journal (Dublin, 1882); the African Review (1892) and the Empire Review (1900). The Monthly Review (1900-1908), edited till 1907 by J. D. Newbold, was for some years a notable addition to the high class literary monthly.

The weekly reviews dealing generally with literature, science and art are the Literary Gazette (1871-1882), first edited by William Carstairs, and then by J. R. and A. M. Carstairs, who continued it till 1891, and the Academy (1869). Among those which also include political and social topics, and are more particularly dealt with under newspapers, may be mentioned, the Examiner (1808-1881), the Spectator (1828), the Saturday Review (1853), the Scots or National Observer (1888-1897), Outlook (1898), Pall Mall Gazette (1900-1901), and Speaker (1898), which became the Nation.

Soon after the introduction of the literary journal in England, one of a more familiar tone was started by the eccentric John Dunton in 1695, called The Athenian Mercury, consisting of news and notes, being a weekly sheet, with a quarterly critical commentary. Dunton had the idea of starting the Club which it will be continued as soon as ever the glee of news is a little over. Dunton was assisted by Richard Sault and Samuel Wesley. Defoe's Review (1704-1713) dealt chiefly with politics and commerce, but the interesting periodical which edited the London Club was another step nearer the papers of Steele and the periodical essayists, the first attempts to create an organized popular opinion in matters of taste and manners. These little papers, rapidly thrown off for a temporary purpose, were desired to form a very important part of the literature of the 18th century, and in some respects its most marked feature. Although the frequences of the clubs and London Club were for the most part confined to the Tory and Whig, the papers which were mainly written, a proof of the increasing refinement of the age is to be found in the fact that now for the first time socially and academically, the clubs were taken seriously in the public. The London Club was commenced by Richard Steele in 1710. It issued twice a week until 1711. The idea was at once extremely popular, and a dozen similar papers were started within a short time, and even beyond that, the twelve numbers of Addison contributed to the Taller, and together with Steele established and carried on the Spectator (1709-1714), and subsequently the Guardian (1713). The newspaper tax enforced in 1712 dealt a blow to these, and during this time the daily issue of the Spectator had reached 3000 copies; it then fell to 600; the paper was raised from a penny to twopence, but the paper came to an end in 1714. Dr. Drake (Essays of the Rambler, etc., ii. 490) drew up an account of Steele's and Addison's papers, and the latter took his tone to Johnson's Rambler, during a period of forty-one years, 100 papers of this description were published. Dr. Drake continued the list down to 1786, or altogether 221 which had appeared within a hundred years. The following is a list of the most considerable, with their dates, founders and chief contributors:—

**Taller** (April 12, 1709 to Jan. 2, 1710-1711), Steele, Addison, Swift, Hughes, etc.; **Spectator** (March 1, 1710-1711 to Dec. 20, 1714), Addison, Steele, Budgell, Hughes, Grove, Pope, Parnell, Swift, etc.; **Guardian** (March 12, 1713 to Oct. 1, 1713), Steele, Addison, Berkeley, Pope, Tickell, Budgell, etc.; **Rambler** (March 20, 1750 to March 14, 1759), Johnson, Lowel, Rann, Augustus, Boswell, Johnson, show, Bathurst, Warton, Chapone; **World** (Jan. 4, 1753 to Dec. 30, 1756), E. Moore, earl of Chesterfield, K. O. Cambridge, earl of Orford, Soane Jenyns, etc.; **Connoisseur** (Jan. 31, 1754 to Dec. 20, 1758), Johnson, K. O. Cambridge, O. Brown, Cowper, Johnson, O. Brown, Johnson, Johnson, John, Reynolds and Bennet Langton; **Bee** (Oct. 6, 1759 to Nov. 24, 1759), O. Goldsmith; **Mirror** (Jan. 23, 1779 to May 27, 1780), MacKenzie, Craig, Abercomby, Cruickshank, Innes, The Gentleman's Magazine, **Taller** (1785-1790), Mackenzie, Craig, Abercomby, Tyrrell, **Observer** (1785 to 1790), Cumberland; **Looker-on** (March 10, 1792 to Feb. 1, 1794), W. Roberts, Benjamin Franklin, Chalmers, etc.

As from the "pamphlet of news" arose the weekly paper wholly devoted to the circulation of news, so from the general newspaper was specialized the weekly or monthly review of literature. This was in a way due to the increasing popularity of the essay-papers, made up the magazine or miscellaneous repository of matter for information and amusement. Several monthly publications had come into existence since 1681, but perhaps the first germ of the magazine was the Handel in the Gentleman's Journal (1691-1694) of Peter Motteux, which, besides the news of the month, contained miscellaneous prose and poetry. Dr. Samuel Jebb included antiquarian notices as well as literary reviews in his Monthly Review (1741-1757), which was the parent of the Gentleman's Magazine, founded in 1731, fully established, through the tact and energy of the publisher Edward Cave (q.v.), the type of the magazine, from that time so marked a feature of English literature, that in the 19th century the name "magazine" came to be used by the title, motto and general plan were borrowed. The chief feature in the new venture at first consisted of the analysis of the journals, was the main interest. The first issue, dated 1732, appeared in May. In April 1732 the leading metropolitan publishers, jealous of the interloper Cave, started the London Magazine, or Gentleman's Monthly Intelligencer (1732-1754), which had a long and prosperous current. The new magazine closely copied The Gentleman's Journal, by adding the columns of society news, the most important feature, for which it was chiefly destined, and to which its greatest success was the addition of Samuel Johnson (q.v.) to the regular staff. This took place in 1738, when the latter engaged to preface the volume for that year, observing that the magazine would be only a "monthly discourse" or review of the world, and once again he was to see that all dead or very little regarded. The plan was also imitated in Denmark, Sweden and Germany. The Gentleman's Magazine was continued by Cave's brother-in-law, David Henry, afterwards by John Nichols and his son. Cave appears to have been the first

---

1 The centenary of the Edinburgh Review was celebrated in an article in October 1902, and that of the Quarterly Review in two articles April and July 1909. See also On the Authorship of the First Hundred Numbers of the Edinburgh Review (1893), by W. A. Copinger, and The First Edinburgh Reviewers in Literary Studies (1897), vol. i., by W. Bagehot.
to use the word magazine in the sense of a periodical of miscellaneous literature. The specialty, antiquarian, biographical and historical features, which make this magazine so valuable a store-house for information for the period it covers, were dropped in 1868, when an editorial policy was adopted which subsequently was successively edited by Gowing, Joseph Hatton and Joseph Knight.

Many other magazines were produced in consequence of the success of these two. It will be sufficient to mention the following: The Smith's Repository of Useful and Entertaining Knowledge (1817-1826) was styled the Edinburgh Magazine. The Universal Magazine (1747) had a short, brilliant, career, but the European Magazine, founded by James Perry in 1752, lasted down to 1826. Of more importance than these, or than the Royal Magazine (1755-1771) was the Monthly Magazine (1796-1843), with which Priestley and Godwin were originally connected. During thirty years the Monthly was conducted by Sir Richard Phillips, under whom it became a scientific organ. It was followed, or more properly were represented by the Edinburgh Former's Magazine (1800-1835) and the Philosophical Magazine (1798), established in London by Alexander Talloch; the latter at first consisted chiefly of translations of scientific papers from the French. The following periodicals, a few of which date from the 18th century, are still published: the Gospel Magazine (1766, with which is incorporated the British Protestant), the Wesleyan Methodist Magazine (1790), Curtis's Botanical Magazine (1786), Evangelical Magazine (1793, since 1905 the Evangelical British Missionary), the Philosophical Magazine (1798), now known as the London, Edinburgh and Dublin Philosophical Magazine.

Many of these periodicals were founded on the loose religious and theological opinion was first apparent in Blackwood's Edinburgh Magazine, founded in 1817 by the publisher of that name, and carried to a high degree of excellence by the contributions of Scott, Lockhart, Hogg, and Girling. At the same time monthly magazines founded by John Galt and Samuel Warren. It has always remained Liberal in literature and Conservative in politics. The New Monthly Magazine is somewhat earlier in date. It was founded in 1814 by the London publisher, Colburn, and was edited in turn by Campbell, Theodore Hook, Bulwer-Lytton and Ainsworth. Many of Carlyle's and Thackeray's pieces first appeared in Fraser's Magazine (1830), long famous for its personalities and its gallery of literary portraits, which spread over several pages. The New Monthly Magazine was taken over by Fraser and was first edited by Campbell, who had left its rival, it subsequently came into the hands of Captain Marryat, who printed in it many of his sea-tales. The British Magazine (1832-1835) was a monthly miscellany of miscellaneous and ecclesiastical information. In Ireland came the Dublin University Magazine (1833). The regular price of these magazines was half a crown; the first of the cheaper ones was the Birmingham Magazine (1836). See also the Monthly Magazine, the British Magazine and the Monthly Miscellany, which was Radical in politics, and had Roebuck as one of its founders. Bentley's Miscellany (1837-1868) was exclusively devoted to novels, light literature and travels. Several of Ainsworth's romances, illustrated by Cruikshank, first saw the light in Bentley. The Nautical Magazine (1832) was addressed specially to sailors, and Colburn's United Service Journal (1829) to both services. The Atlantic Journal (1816) dealt with Oriental subjects.

The adoption of similar departments in a great number of newspapers and periodicals, and, besides several imitators in England, there are now parallel journals in Holland, France, and Italy.

Shilling monthly began with Macmilian (1859), the Cornelius (1860), and the Good Word (1861). The latter, founded in 1861 by James's Magazine (1861), Belgravia (1866), St Paul's (1867-1874), London Society (1862), and Tinsley's (1867) were devoted chiefly to novels and light reading. Sixpenny illustrated magazines came in 1867, such as The Graphic (1867) and after an interval of three years The Graphic (1877), successively.
United States

The two earliest Americanmiscellanies were produced almost simultaneously. The Gentleman's Magazine in England Benjamin Franklin founded the General Magazine (1741) at Philadelphia, but it expired after six monthly numbers had appeared. Franklin’s rival, Andrew Bradford, founded another with the title American Monthly Magazine (1741-1742), edited by John Weeb, which ran only to two numbers. Further attempts at monthly magazines in Philadelphia in 1759 and 1769 to revive periodicals with the same name were both fruitless. The earliest surviving periodical was the American Magazine (1733-1734), in imitation of the London Magazine; the Boston Weekly Magazine (1734); the Christian History (1734-1742); the New York Independent Reflector (1810), the New England Magazine, a collection of fugitive pieces; the Boston Royal American Magazine (1744-1775); and the Pennsylvania Magazine (1775-1776), founded by Robert Ritten, with the help of Thomas Paine. The Columbian Magazine (1790-1792). Matthew Carey brought out the American Museum in 1787, and it lasted until 1792. Among the other magazines which ran out a brief existence before the end of the century was the Philadelphia Political Censor or Monthly Review (1796-1797) edited by William Cobbett. One of the most successful was the Farmer’s Weekly Museum (1790-1799), supported by perhaps the most brilliant staff of writers. American periodical literature had yet to show its teeth, and was edited by Joseph Denksi, who in 1801 began the publication of the Portfolio, carried on to 1817 at Philadelphia. For five years it was a weekly miscellany in quarto, and afterwards an annual. It was one of the first periodicals to boast of so long an existence. Charles Brockden Brown established the New York Monthly Magazine (1799), which, changing its title to The American Review, was continued to 1802. Brown founded at the same time the New York Magazine of Archeology, which may be considered as having been the first American professional men of letters. The Anthology Club was established at Boston in 1803 by Phineas Adams for the cultivation of literature and the discussion of literary topics. The Literary Messenger and Boston Miscellany were among the members, and were contributors to the organ of the club, the monthly Anthology and Boston Review (1803-1811), the forerunner of the North American Review. In the year 1810 (Prize Poems in America, II, 292) informs us that 27 periodicals were then published in the United States. The first serious rival of the Portfolio was the American Magazine (1813-1820), founded at Philadelphia by Judge John Tayler as a competitor of the Review. The editors of both were at some time (the editor), Paulding, and the ornithologist Wilson. In spite of a large subscription list it came to an end on account of the costly style of its production. The first southern serial was then the Atlantic Monthly, which possessed no periodical worth of the city until 1824, when the Atlantic Magazine appeared, which changed its name shortly afterwards to the New York Monthly Review, and which was supported by R. C. Sand and E. B. T. Show. N. A. Willis was the editor of the editor. The New York Mirror (1823-1842). Between 1840 and 1850 Graham’s Magazine was the leading popular miscellany in the country, reaching at one time a circulation of about 35,000 copies. The first western periodical was The Pilot (1830-1832), owned, edited and almost entirely written by James Hall, who followed with his Western Monthly Magazine (1833-1836), produced in western United States. The Western Monthly Magazine was established at New York the Knickerbocker (1833-1860), which soon passed under the control of Timothy Flint and became extremely successful. Among the leading native writers of the next twenty years having been contributors. Equally popular was Putnam’s Monthly Magazine (1853-1857, 1867-1869). It was revived in 1906-1910. The Dial (1840-1844), Boston, the organ of the transcendentalists, was first edited by Margaret Fuller, and subsequently by R. W. Emerson and G. R. Ripley. Other magazines were the American Monthly Magazine (1833-1838), the Southern Literary Messenger (1834), Richmond, the Gentleman’s Magazine (1837-1839), and the International Monthly Magazine (1850-1852), edited by R. W. Criswold. The Yale Literary Magazine dated from 1837-1844. The most successful of all the illustrated American serial, then the Boston Atlantic Monthly (1857), with which was incorporated the Galaxy (1860), was for its editors Lowell, Howells and T. B. Aldrich, and its contributors O. W. Holmes, Longfellow, Peirce, Kingsley, locally, and H. G. Bohn, Howells (1868) from Philadelphia, and the Cosmopolitan (1868) and Scribner’s Monthly (1870), known as the Century Illustrated Magazine since 1881) from New York. These were followed by Scribner’s Magazine (1868), with the American Magazine (1869), McClure’s Magazine (1893), the Bookman (1895), the World’s Work (1902), the American Magazine (1905) succeeding Frank Leslie’s Popular Monthly, and Munsey’s Magazine (1885). All were in competition with Harper’s, carried the art of wood-engraving to a high standard of excellence.

The attempt to carry on an American review was made by Robert Walsh in 1811 at Philadelphia with the quarterly American Review of History and Politics; which lasted only a couple of years. More still brief was the existence of the General Repository and Monthly Magazine (1812). The New York Review of 1812 was carried on under the auspices of the University of Pennsylvania, the help of the professors of the university, but of which only four numbers appeared. Niles’s Weekly Register (1811-1848) was the oldest American historical and political. The oldest and most famous of all the American reviews, dates from 1815, and was founded by William Tudor, a member of the previously mentioned Anthology Club. After two years’ control Tudor handed over the editorial control to the New York Review of 1812. Amongst the most active members were E. T. Channing, R. H. Dana and Jared Sparks. In 1819 E. Everett became the editor; his brother Alexander acquired the property in 1829. The roll of contributors numbered most of the leaders of the day. The New York Review has been published monthly (except in Sept. 1906-Sept. 1907, when it appeared semi-monthly). The American Quarterly Review (1827-1837), established at Philadelphia by Robert Walth, came to an end on his death. The Literary Review of England (1832), conducted by H. Legard, S. Elliot and G. W. Simms in defence of the politics and finance of the South, enjoyed a shorter career. It was suscribed in 1842, and lived another thirteen years. Two of these were followed by the Democratic Review (1838-1852), the American Review (1845-1849), afterwards the American Whig Review (1850-1852), the Massachusetts Quarterly Review (1847-1850), and a few more. These was the New Englander (1843-1846), the Biblical Repertory and Princeton Review (1825), the National Quarterly Review (1860) and the New York Review (1874-1883), also may be mentioned. The critical weeklies of the past include the New Literary Gazette, which was published from 1814-1815. The American Scientific World (1847-1853), the Criterion (1853-1856), the Round Table (1863-1864), the Citizen (1864-1875), and Appleton’s Journal (1860). The leading current monthlies include the New York Forum (1860), (Ararat), Current Opinion (1893), and Overland Monthly (1880). The Dial (1880), and the Greenwich, Connecticut, Literary Collector. Foremost among the weeklies comes the New York Nation (1865). Religious periodicals have been mostly with the Methodists, Presbyterians, and various denominations in the United States. The earliest was the Theological Magazine (1795-1798). The Christian Examiner dates from 1824 and lasted down to 1870. The Panepistle (1805) changed its name to the Missionary Herald, representing the American Board of Missions. The Methodist Magazine dates from 1810 and the Christian Disciple from 1813. The American Biblical Repository (1831-1830), a quarterly, was united with the Andover Bibliotheca Sacra (1847) and with the Theological Magazine of Boston (1847). The American Journal of Theology and the Oberlin Bibliotheca Sacra. The Chicago Biblical World is published monthly. A. E. S. American Historical Review may be numbered the American Register (1806-1811), Stryker’s American Quarterly Register (1848-1851), Edwards’s American Quarterly Register (1829-1843), the New England Historical and Genealogical Register (1847), Folsom’s Historical Magazine (1846-1861), the American Journal of Theology and the Oberlin Bibliotheca Sacra. There is also the Lancaster, Pennsylvania, American Historical Review issued quarterly.

Other serial publications have been almost entirely made up of extracts from English sources. Perhaps earliest example is to be found in Select Views of Literature (1811-1812), The Eccentric Magazine (1814) and Littleton’s Living Age (1844) may be mentioned. In 1817 America possessed only one scientific periodical, the Journal of Mineralogy. Professor Stillman established the journal known by his name in 1818. Since then the American Journal of Science has enjoyed unceasing favour. The special periodicals of the period are very numerous, but the most prominent are: the Popular Science Monthly, New York; the monthly Boston Journal of Education; the quarterly American Journal of Mathematics, Baltimore; the monthly Cassier’s Magazine (1861), New York; the monthly American Engineer (1851), New York; the monthly House and Garden, Philadelphia; the monthly Astrophysical Journal, commenced as Sideral Messenger (1882), Chicago; the monthly American Chemical Journal, Boston; the monthly Smithsonian Institution’s Monthly Memoir, Washington, D.C.; the monthly Naturalist, Boston; the monthly American Journal of Medical Science, Philadelphia; the monthly Outing, New York; the weekly American Agriculturist, New York; the quarterly Metaphysical Magazine, New York; the monthly American Sociological Journal, Chicago; the bi-monthly American Law Review, St Louis; the monthly Banker’s Magazine, New York; the quarterly American Journal of Philology (1880), Baltimore; the monthly Library Journal for the Western States, New York; the Central Review of the Physical and Literary Sciences, New York; the monthly Scientific American, New York; the quarterly American Journal of Archaeology (1885), New York.

The number of periodicals devoted to light literature and to female readers has been, and still remains, extremely large. The earliest
PERIODICALS

in the latter class was the "Lady's Magazine" (1792) of Philadelphia. The "Lovelock Offering" (1841) was written by factory girls of Lowell (Mass.), Mass. Godsey's "Lady's Book" was long popular, and the "Ladies Home Journal" (1869) and the "Woman's Home Companion" (1893) are monthly journals. The Chicago Commercial (1831-1839), a Chicago newspaper, was included with "Misses' Magazine" (1806) of Brooklyn; the New York St Nicholas (monthly) and the Boston Youth's Companion (weekly) are prominent journals. The total of American periodicals mentioned in the "Guide" by H. O. Severance and C. H. Walsh (1909, Ann Arbor), is 5436 for the year 1908.

CANADA

Canadian periodicals have reached a higher standard than in any other British self-governing colony. Like that of South Africa, the press is bi-lingual. The first Canadian review, the "Quebec Magazine" (1791-1793), was published quarterly in French and English. It was followed by the "British American Register" (1800-1803), by H. Meziere, the "Canadian Magazine" (Montreal, 1823-1825), the "Canadian Review" (Montreal, 1824-1836), La Bibliothèque canadienne (Montreal, 1823-1836), continued as L'Observateur (1830-1831), and as the "Canadian Magazine" (1835-1840), and later as the "American and Canadian Magazine" (Montreal, 1840-1845). The latter were edited by Michel Biaud. The Literary Garland (Montreal, 1838-1850), edited by John Gibson, was for some time the only English magazine published in Canada. Later magazines were L'Echo du cabinet du lecture parishial (Montreal, 1859), 15 vols.; Le Foyer canadien (Quebec, 1853-1866), one of the most interesting French-Canadian reviews; La Revue canadienne, which was started at Montreal in 1864, and contained the best writings of the Canadian literati of the day; La Revue canadienne, 1877-1881, edited by the abbé T. A. Chadidon; the Canadian Journal (Toronto), commenced in 1852 under Henry Yulee Hind and continued by Daniel Wilson, L'Abeille (Quebec, 1848-1881), and later by the Montreal Star (Montreal, 1882). The "Toronto Magazine" (Toronto, 1830-1838), was edited by Goldsmith Smith. Le Canada français (Quebec, 1888-1891), edited by the staff of the Laval University, and Canadiana (1895-1890), were important historical and bibliographical works. La Revue canadienne (Montreal, 1893), the "Westminster", both produced at Toronto, La Nouvelle-France (Quebec), the "Canadian Monthly" (London, Ontario), Good Hope Literary Gazette (1893-1898), and the "Canadian Magazine", edited by Professor Macphail, of the McGill University.

SOUTH AFRICA

The earliest magazine was the "South African Journal", issued by the poet Pringle and John Fairbairn in 1824. It was followed by the South African Quarterly Journal (1829-1834), the Cape of Good Hope Literary Gazette (1830-1833), edited by A. J. Jardine, the Cape of Good Hope Literary Magazine (1847-1848), edited by J. L. Fitzpatrick, and the Eastern Province Monthly Magazine, published at Grahamstown in 1857-1858. A Dutch periodical called Elpis, algemeen intelligentie-stoornis, founded in 1857-1861, appeared to the farming community. The Eastern Province Monthly Magazine was issued in Elizabeth in 1861-1862, and the South African Magazine appeared in 1867-1868. The Orange Free State Magazine, the only English monthly magazine published in the Orange Free State, and the E. P. Magazine was published at Grahamstown in 1892-1897. The Cape Monthly Magazine, the most important of the periodicals, was issued from 1857 to 1862, and was again continued as the Cape Monthly Review (1862-1866), and was followed by the "Cape Illustrated Magazine" (1890-1899) edited by Professor J. Gill. In Durban the "Present Century" was started in 1903, and the Natal Magazine was issued at Pietermaritzburg in 1877. The "Australasian Magazine" (1856) was issued at Sydney, and the "South Australian Penny Journal" (1896-1907) were both edited by C. H. Crane. The "African Monthly" (Grahamstown, 1907) and the "South African Magazine" (Cape Town, 1909) are monthly reviews, while the "South African Literary Magazine" (1897) is of wider interest than its name indicates.

AUSTRALIA AND NEW ZEALAND

New South Wales.—The "Australasian Magazine" was published monthly at Sydney in 1821-1822. This was followed by the "South Australian Register" (1827), the "Australian Quarterly Journal" (1829), followed by the "New South Wales Magazine" (1853), the "New South Wales Literary, Political and Commercial Advertiser" (1835), edited by the eccentric Dr Lhotsky, the "Cape Monthly Magazine" (1836), the "Australian Magazine" (1858), the "South Australian Lady's Magazine" (1898), and many others. The "Sydney University Review" (1854), again published in 1878-1879, and continued as the "Sydney University Review", is the first magazine of a high literary standard. The "Australasian Quarterly (1857) was short-lived. Of later magazines the "Australasian" (1878-1881), Aurora australis (1868), and the "Sydney Magazine" (1878), were the most noteworthy. Of contemporary magazines Dalgety's Review is mainly agricultural, the "Australasian" (1873-1881), and the "Loneland" (1897) are popular, and the Science of Man is an anthropological review.

New Zealand.—The "New Zealand Magazine" was published at Melbourne (1855), and the "Australasian Quarterly Review" published at Geelong, the "Illustrated Australian Magazine" (1850-1852), the "Australian Gold-Digger's Monthly Magazine" (1852-1855), edited by James Bonwick, and the "Melbourne Monthly Magazine" (1855-1866). The "Journal of Australasia" (1856-1858), the "Australasian Monthly Magazine" (1865-1867), which contained contributions from Marcus Clarke and was continued to the "Australasian Quarterly Review" and the "Victorian Review" (1876-1885) and the "Victorian Review" (1879-1886) may also be mentioned. The "Imperial Review", apparently the work of one pen, has been published since 1879; the "Pastoralists' Review" appeals directly to its readers. The "Library Record of Australasia" was published in 1901-1902. An Australian edition of the "Library Record of Australasia" was published at Melbourne.

INDIA AND CEYLON

The

Indian periodical was the Asiatick Mis
cellany (Calcutta, 1785-1789), probably edited by F. Gladwin
The Calcutta Monthly Register was published in 1790, and the CalCalcutta.

first

Louis Auguste de Bourbon, sovereign prince of Dombes,
having
transferred his parliament to
Treyoux, set up a printing press, and
was persuaded by two Jesuits, Michel le Tellier and Philippe Lalleritan, to establish the Memoires pour servir a I'histoire des sciences
et des arts (1701-1767), more
familiarly known as the Journal des
Trevoux, long the best-informed and best-written journal in France.
One feature of its career was its constant appeal for the
literary
assistance of outsiders. It was continued in a more
popular style
as Journal des sciences et des beaux-arts
the
abbe
(1768-1775) by
Aubert and by the brothers Castilhon (1776-1778), and as Journal
de litlerature, des sciences, et des arts
the
abbe
(1779-1782) by
Grosier.

The first legal periodical was the Journal du palais (1672) of Claude
Blondeau and Gabriel Gueret, and the first devoted to medicine the
Nouvelles decouvertes dans toutes les
parties de la medecine (1670)
of Nicolas de Blegny, frequently spoken of as a
charlatan, a term
which sometimes means simply a man of many ideas.
Religious

FRANCE

We

owe the literary journal to France, where it soon attained
to a degree of importance unapproached in
any other country.
The first idea may be traced in the Bureau d'adresse (1633-1642)
of
Theophraste Renaudot, giving the proceedings of his conferences
upon literary and scientific matters.
About the year 1663
Mezeray obtained a privilege for a regular literary periodical, which
came to nothing, and it was left to Denis de Sallo. counsellor of
the parliament of Paris and a man of rare merit and
learning, to
actually carry the project into effect.
The first number of the
Journal des savants appeared on the 5th of
January 1665, under
the assumed name of the sieur d'Hedouville.
The prospectus
promised to give an account of the chief books published throughout
Europe, obituary notices, a review of the progress of science,
besides legal and ecclesiastical information and other matters of
interest to cultivated persons.
The criticisms, however, wounded
alike authors and the clergy, and the
journal was suppressed after
a career of three months. Colbert, seeing the
of such
public
a periodical, ordered the abbe Gallois, a contributor utility
of De Sallo's,
to re-establish it, an event which took
place on the 4th of January
1666. It lingered nine years under the new
editor, who was replaced in 1675 by the abbe de la Roque, and the latter in his turn
by the president Cousin, in 1686. From 1701 commenced a new
era for the Journal, which was then
acquired by the chancellor de
Fontchartram for the state and placed under the direction of a
commission of learned men. Just before the Revolution it developed tresh activity, but the troubles of 1792 caused it to be
discontinued until 1796, when it again failed to
appear after twelve
numbers had been issued. In 1816 it was
definitely re-established
and replaced under government
patronage, remaining subject
to the chancellor or garde-des-sceaux until
1857, when it was transferred to the control of the minister of
public instruction. Since
the
1903
organization of the publication has changed. The state
subsidy having been withdrawn, the Institute voted a yearly
subscription of 10,000 francs and nominated a commission of five
members, one for each section, who managed the Journal. Since
1909, however, the various sections have left to the Academic des
inscriptions et Belles Lettres the entire direction of the Journal
while still paying the annual
It now restricts itself to
subsidy.
publishing contributions relating to antiquities and the middle
ages and Oriental studies.

method was followed in an equally meritorious
periodical, the
Histotre des ouvrages des Savants
(1687-1704) of H. Basnage de
Beauval. Another continuator of Bayle was
Jean Leclerc, one of
the most learned and acute critics of the i8th
who carried
on three reviews the Bibliotheque universelle century,
et historique (16861693), the Bibliotheque choisie (1703-1713), and the Bibliotheque

ancienne et moderne (1714-1727).
They form one series, and,
besides valuable estimates of new
books, include original dissertaUons, articles and biographies like our modern learned magazines
I he Journal litteraire
(1713-1722, 1729-1736) was founded by a
society of young men, who made it a rule to discuss their contributions in

common.

Specially devoted to English literature were
(1716-1728), the Memoires litteraires de
(1720-1724), the Bibliotheque britannique
l
and
1
the Journal britannique (1750-1757) of
^733- 734),
Maty,
who took for his principle, " pour penser avec

seul.
One of these Dutch-printed reviews was L'Europe savante
(1718-1720), founded chiefly by Themiseul de Saint-Hyacinthe,
with the intention of placing each
separate department under the
care of a specialist.
The Bibliotheque germanique (1720-1740)
was established by Jacques Lenfant to do for northern
Europe
what the Bibhotheque britannique did for England. It was followed
jy the Nouvelle bibliotheque germanique (1746-1759).
The Biblioheque raisonnee des ouvrages des savants (1728-1758) was supplementary to Leclerc, and was succeeded by the Bibliotheque des
sciences et des beaux-arts
(1754-1780). Nearly all of the preceding
were produced either at Amsterdam or Rotterdam,
and, although
out of place in a precise geographical
arrangement, really belong
o France by the close ties of
language and of blood.
Taking up the exact chronological order again, we find the
uccess of the English essay-papers led to their
prompt introduction
the Continent. An incomplete translation of the
Spectator was
published at Amsterdam in 1714, and
many volumes of extracts
rom the Taller, Spectator and Guardian were issued in France
early in the i8th century.
Marivaux brought out a Spectateur
Franfais (1722), which was coldly received; it was followed by
ourteen or fifteen others, under the titles of La
Spectatrice (1728730), Le Radoteur (1775), Le Babillard (1778-1779), &c.
Of a
imilar character was Le Pour et le centre
(1723-1740) of the abbe
Prevost, which contained anecdotes and criticism, with special
eterence to Great Britain. Throughout the i8th
century, in France
a
n
V- England, a favourite literary method was to write of social
ubjects under the assumed character of a foreigner, generally an

Oriental, with the title of *Turkish Spy*, *Lettres chinoises*, &c. These productions were usually issued in periodical form, and, besides an immense amount of worthless title-tattle, contain some valuable materials.

During the first half of the century France has little of importance to show in periodical literature. The *Nouvelles ecclésiastiques* (1728-1803) were first printed and circulated secretly by the Jansenists under the title of *Correspondance* (1728). The publication of the *Nouvelles* was retaliated with the *Supplément des nouvelles ecclésiastiques* (1734-1748). The promising title may have had something to do with the temporary success of the *Mémoires secrets de la république des lettres* (1744-1748) of the marquis d'Argens. In the *Encyclopédie* we find *Sur les écrits modernes* (1755-1763), which continued the tone of the *Nouvelles* and Desfontaines held the gates of Philistia for eight years against the Encyclopedists, and even the redoubtable Voltaire himself. It was continued by the *Jugemens sur les écrivains modernes* (1766-1768) in his hands. The French, perhaps the most vigorous enemy Voltaire ever encountered, was long connected with *Lettres sur quelques écrivains de ce temps* (1749-1758), followed by *L'Année littéraire* (1754-1790). Among the critics, the most outstanding was probably *Observations sur les littératures modernes* (1760-1761). The year 1762 saw the appearance of the *Néologie des hommes célèbres de France* (1764-1765); the political economists established the *Éphémérides du citoyen* in 1765; the first *Journal d'éducation* was founded in 1768, and the *Courrier de la monarchie* and *Le théâtre français* (1770); the *Lettres littéraires* were published in 1770; in the same year was produced a *Journal de musique* and the *Encyclopédie militaire*; the sister service was supplied with a *Journal de marine* in 1778. We have already noted the appearance of the *Magazine de l'Érmitage* (1775-1776), which had Voltaire, Diderot, and D'Alembert among its editors, was intended to swamp the small fry by criticism; the *Journal des dames* (1759-1778) was a light magazine class; and the *Journal du monsieur* (1776-1783) had three principal personalities: Joseph-Philoctète Emmanuel, Bénigne Béroul, and Jean-Jacques Rousseau. The *Mémoires secrets pour servir à l'histoire de la république des lettres* (1766-1764), better known as *Mémoires de Bachaumont*, from them, another anti-Jansenist furnished a count of the social and literary history for a period of twenty-six years. Of a similar character was the *Correspondance littéraire secrète* (1774-1793), to which M tells was the chief contributor. *L'Esprit des Journaux* (1772-1818) forms an important literary and historical collection, which is rarely to be found complete.

The movement of ideas at the close of the century may best be traced in the *Annales politiques, civiles, et littéraires* (1777-1792) of *L'Outre-mer* (1786-1789), and *Philoctète* (1789-1790), founded by Gignuné, is the first periodical of the magazine class which appeared after the storm of the Revolution. It was the Armistice of 1800, a slow, steady, and by a decree of the Directory the consulates closed the number of Parisian journals to thirteen, of which the *Décade* was one; all the others, with the exception of those dealing solely with science, art, commerce and advertise- ment, were suppressed. A report addressed to Bonaparte by Fieule1 in the year XI (1802-1803) furnishes a list of fifty-one of these periodicals. In the year XIII (1804-1805) only seven non-political serials were permitted to appear.

Between 1818 and 1829 there was a constant struggle between freedom of thought on the one hand and the censorship, the police and the law officers on the other. This oppression led to the development of periodical publications, of which *La Minerve française* (1818-1820) is an instance. The *Minerve* was suppressed by the government and, and was brought out about four times a year at irregular intervals. Of the same class was the *Bibliothèque historique* (1818-1820), which was an organ of the property of a censorship was re-established in 1820 and abolished in 1828 with the triumph of the Restored. It has always seemed impossible to carry on successfully in France a review upon the lines of those which have become so numerous and important in England. The *Revue britannique* (1825-1901) had, however, a long career. The short-lived *Revue française* (1828-1830), founded by Guizot, Rémusat, De Broglie, and the doctrinaires, was an attempt in this direction. The well-known *Revue des deux mondes* was established in 1833; it is no longer published. *La Revue des deux mondes* appeared at the end of the year, and its actual existence dates from its acquisition in 1831 by François Buloz,2 a masterful editor, under whose energetic management it soon achieved a world-wide reputation. The most distinguished names in French periodicals have been among its contributors, for whom it has been styled the *Journal of the Century*. The French preceding a few months by the *Revue de Paris* (1829-1849), founded by Véron, who introduced the novel to periodical literature. In 1834 this was purchased by Buloz, and brought out concurrently with his other publication. In 1836 the *Revue des deux mondes* and the latter dealt more with philosophy. The *Revue indépendante* (1841-1848) was founded by Pierre Leroux, George Sand and Viardot for the democracy. The times of the consulate and the empire were the most promising periods for periodical literature. *La Correspondant* (1843), established by Montalembert and De Falloux, the Catholics and Legitimists had a valuable supporter. The *Revue contemporaine* (1852), founded by the comte de Belval as a semi-periodical in 1844, but was transferred to the *Revue de Paris* in 1849; it appeared quarterly, and succeeded to the *Magazine de l'Érmitage* (1858).

The number of French periodicals, reviews and magazines has enormously increased, not only in Paris but in the provinces. In Paris the number of periodicals published in 1883 was 1372; at the end of 1908 there were more than 3300 of all kinds. The chief periodicals are arranged in the following order.

1 *Theoretique* (1852-1879), devoted to literary and antiquarian questions.
2 *Astronomie.*—Annaire astronomique et météorologique (1901); Bulletin astronomique (1884), formerly published under the title *Revue des sciences mathématiques et astronomiques.*
3 *Bibliography.*—Annales de bibliographie théologique (1888); Le bibliographic moderne (1897); Bibliographie anatolique (1893); Bibliographie scientifique française (1902); Bulletin des bibliothèques (1898); Bulletin des bibliothèques publiques (1900); Courrier des bibliothécaires (1910); Répertoire méthodique de l'histoire moderne et contemporaine de la France (1898); Répertoire méthodique du moyen âge français (1894); Revue bibliographique et critique des lettres et des littératures romanes (1886); Revue des bibliothèques (1891); Polybiblion: revue bibliographique universelle, monthly; Revue générale de bibliographie française, bi-monthly.
4 *Children's Magazines.*—L'Ami de la jeunesse; Le Journal de la jeunesse, weekly.
5 *Fashion.*—Le Mode illustrée; Les Modes, monthly.
6 *Fine Arts.*—Les Arts (1902); Gazette des beaux-arts (1895), monthly; Revue des monographies de l'art (1898-1899); Art et décoration, monthly; Art pour tous, monthly; La Décoraation, monthly; L'Architecture, monthly; La Vie du monde (1903); Le Moniteur de l'art (1896).
7 *Geography and Colonies.*—Bulletin de géographie historique; Annales de géographie (1891), with useful quarterly bibliography; Nouvelles géographies supplément to the *Tour du monde* (1881); La Vie coloniale (1903); La Geographie, monthly, 1903; Revue de géographie, monthly; Revue géographie internationale, monthly.
8 *History.*—For long the chief organs for history and archaeological work have been the *Bibliothèque de l'école des chartes* (1835), appearing every two months and dealing with the middle ages, and the *Cabinet historique* (1856, 1885), a monthly devoted to MSS. and unprinted documents. The *Revue historique* (1807) appears bi-monthly; there is also the *Annales d'histoire et de géographie* (1839).
9 *Law and Jurisprudence.*—Annales de droit commercial (1887); Revue algérienne et tunisienne de législation et de jurisprudence (1885), Revue du droit public et de la science politique (1894); Revue générale du droit international public (1904).
10 *Literary Reviews.*—La Revue des deux mondes and the Correspondant have almost been already mentioned. One of the first of European wide-spread reviews is the *Revue critique* (1849), and the *Correspondant* (1849), a monthly greatly valued in literary circles; La Revue de Paris, fortnightly (1894), and the *Newelle Revue* (1879)—a composer, and by translating from the English earned sufficient to purchase the moribund *Revue des deux mondes*, which acquired its subsequent position in spite of the tyrannical editorial behaviour of the proprietor. Buloz is said to have eventually enjoyed an income of 350,000 francs from the *Revue*.

1 *The novelists and publicist Joseph Fieule (1757-1839), known for his relations with Napoleon I, has been made the subject for a study by Saint-Beuve (Cesurettes, v. 172).
2 François Buloz (1804-1877), began life as a shepherd. Educated through the charity of M. de Nevilhe, he came to Paris as
the first number appeared in 1682, under the title of Acta eruditorum.

Greece

The earliest trace of the literary journal in Germany is to be found in the Erbäubische Monatsunterredungen (1663) of the poet Johann Theodor von Schratt. The Physico-literarisches Journal (1704) of the Academia naturae curiosorum Lepoldina-Carolina, the first scientific annual, uniting the features of the Journal des savants and of the Philosophical Transactions. D. G. Morhoth, the editor of the Neues Amtsblatt, the idea of a monthly serial to be devoted to the history of modern books and learning, which came to nothing. While professor of morals at Leipzig, Otto Mencle planned the Acta eruditorum, with a view to making known, by means of analyses, extracts and reviews, the new works published throughout Europe. In 1680 he travelled in England and Holland in order to obtain literary assistance, and

both serious rivals of the Revue des deux mondes; Revue franzaise d'Edimbourg (1857); Revue germanique (1905); Le Livre (1880), dealing with bibliography and literary history, and La Revue latine (1902), no longer published; La Revue, monthly.

Mathematics.—Bulletin des sciences mathématiques (1894); Revue de mathématiques spéciales (1896); Journal de mathématiques purs et appliquées, quarterly.

Medicine.—Revue de médecine (1881); Annales de l'École de médecine (1879); Bulletin de l'Institut de Paris (1893); Bulletin de l'Institut de France (1894); Bulletin biologique, bi-monthly; La Semaine médicale, weekly; Journal d'hygiène, monthly.

Military.—Revue des troupes coloniales, monthly; La Revue d'infanterie, monthly.

Music.—Musique (1902); Revue et de critique musicale

(1901); Annales de la musique, Le Ménestrel, weekly.

Philology.—Annales linguistiques de l'Institut de France (1894); Bulletin de l'Institut de France (1894); Bulletin biéspanique (1890); Bulletin italien (1901); Lou-Gui-Sabé-Antoulonio proemencia (1905); Le Mistral phonétique (1886); Le Mistral metaphorique et de verification (1894-1895); Revue des études grecques (1888); Revue des études rabelaisiennes (1903); Revue des parlers populaires (1902); Revue des palois (1887); Revue histique (1894); Revue cyclique, quadriennale, bi-mensuelle

Philosophy and Psychology.—Revue philosophique (1876), monthly; Annales des sciences psychiques (1891); L'Année philosophe (1890), critical and analytical review of all philosophical works; Revue de Psychologie (1894); Journal de psychologie normale et pathologique (1904); Bulletin de l'institut général de psychologie (1903); Revue de l'hypnotisme et de la psychologie physiologique (1896); Revue de métaphysique et de morale (1893); Revue de philosophie (1900); Revue de psychiatrie (1897).

Physics and Chemistry.—Bulletin des sciences physiques (1888); L'Éclairage électrique de la science et de la médecine (1900); Revue de physique et de chimie (1890); Revue de chemie et de physique (1890); Revue de science et d'industrie (1890).

Popular and Family Reviews.—Le traver monde (1889); Femina (1903); Le sais tout (1905); La Lecture moderne (1901); La Revue hebdomadaire (1892); Les Lectures pour tous (1898); Mon bonheur (1902); La Vie heurtée (1902).

Science (General).—La Nature, weekly; Revue scientifique (1876), weekly exercise of the medical college; Science (Nouvelle): Les inventions illustres, weekly; Revue industrielle, weekly.

Science (Natural): Archives de biologie; Journal de botanique (1887); L'Année biologique (1895); Revue des sciences naturelles de l'ouest (1901); Revue générale de botanique (1893); La Précis littéraire; Science (Politique, Sociologique et Statistiques): Annales économiques (founded as La France commerciale in 1885); L'Année sociologique (1890-1897); Bulletin de l'office du travail (1904); Revue de statistique et d'industrie (1890).

Sports.—L'Aérophile (1883); L'Aéronautique (1902); L'Aérostation (1904); La Vie au grand air (1898); La Vie automobile (1901); Revue de l'aéronautique (1888).

Austria

The subject of French periodicals has been exhaustively treated in the valuable works of Eugène Hatin—Histoire de la presse en France (8 vols., 1859-1861), Les Gazettes de Hollande et la presse clandestine aux 17e et 18e siècles (1865), and Bibliographie historique de la presse (1857-1879), Catalogue de l'historique de France (1834-1849), V. Cébe, Catalogue des journaux, &c., publié à Paris (1879); Brunet, Manuel du libraire, avec supplément (6 vols., 1860-1868); F. Mège, Les Journals et périodiques fixe la Basse Autriche (1893), les sommiers des journaux (1888); D. Jordelli, Répertoire bibliographique des principales revues françaises (3 vols., 1897-1899), indexes about 350 periodicals; Annaire de la presse française (1848); H. Soudi, Le Catalogue des journaux, revues et publications périodiques parisiens & Paris jusqu'en 1909 (1910). For lists of general indexes consult Stein, Manuel de bibliographie générale (1897), pp. 637-710.

Austria

The most notable periodicals of a general character have been the Wiener Zeitschrift für die Geschichte der Literatur (1818-1848) and the Österreichische Nachrichten (1863-1867).

PERIODICALS

Austria

The Nova literaria helvetica (1703-1715) of Zurich is the earliest literary periodical which Switzerland can show. From 1728 to 1734 a Bibliothéque italique, and towards the end of the century the Bibliothèque britannique (1796-1815), dealing with publications in English literature, and science, in three separate series, were published at Geneva. The latter was followed by the leading periodical

of Lessing, Mendelssohn and Abbt. To Nicolai is also due the Allgemeine deutsche Bibliothek (1765-1806), which embraced a much wider field and soon became extremely influential. Herder founded the Kritische Wälder in 1766. Der deutsche Merkur (1773-1799), reviewed during his lifetime at Dessau and for another 20 years by the French school of criticism. A new era in German periodical literature began when Borthu brought out at Jena in 1785 the Annalen der Literatur in which the leading writers of the country were contributors. On being transferred to Leipzig, the Annalen were published under the title der allgemein Europa, under which it was replaced by the Jenaische allgemeine Literaturzeitung, founded by Eichstädt. Both reviews enjoyed a prosperous career down to 1819.

At the beginning of the 19th century we find the Erlanger Literaturzeitung (1799-1810), which had replaced a Gelehrte Zeitung (1746); the Leipziger Literaturzeitung (1803-1834); the Heidelberger Journal der Wissenschaften (1808-1816) and the Leipziger Der Literatur (1813-1816), followed by the Wiener Jahrbücher der Literatur (1818-1848), both of which received government support and resembled the English Quarterly Review in their conservative political and literary commentaries. The periodical was founded in 1819 by W. T. Krug, was distinguished for its erudition, and came out down to 1831. One of the most remarkable periodicals of this class was the Jahrbücher für wissenschaftliche Kritik (1827-1846), first published by Cotta. The Holistic Jahrbücher (1828-1842) was founded by Ruge and Echtermeyer, and supported by the government. The Repertorium der gesammten deutschen Literatur, established in 1823 and continued down to 1837, was a monthly edition of the Jahrbücher. The weekly Leipziger Repertorium der deutschen und ausländischen Literatur, existed to 1860. Buchner founded the Literarische Zeitung at Berlin in 1834. It was continued by Brandes down to 1849. The political tone of the periodical was moderate, and it became one of the first literary and miscellaneous periodicals. Gerdes's Repertorium, the Gelehrte Anzeigen of Göttingen and of Munich, and the Heidelberger Journal der Wissenschaften, were all the work of the same author, and the same editor, and the same kind of material, and the same kind of review, that is to say, the allgemeine Nachrichten, the allgemeine Kritik, and the allgemeine Literaturzeitung. The last-named appeared under the title der allgemeine Literaturzeitung in 1827, and was continued down to 1854; the Literarische Centralblatt (1850) is still published. The Blätter für literarische Unterhaltung (1847) was the Allgemeine Wochenblatt (1818), founded by Kotzebue; after 1868 it was edited by W. Cohen, with considerable success. Many of the literary journals did not disdain to occupy themselves with the fashions, but the first periodical of any merit specially devoted to the subject was the Blätter für das deutsche Mahl in 1834, followed by the Blätter für die Wahrheit (1838) and the Echo der Wahrheit (1839). The latter was published by a group of students, and, with its supplement, the Deutschen Abendtümern (1840), endeavoured to serve as a modern periodical of the kind, while the Deutsche Zeitschrift für die Wahrheit (1841) weekly serials for popular reading, known as "Sonntagsblatter," of which the Gartenlaube (1858) and Dachau (1864) are surviving examples. In course of time a large number of similar publications were issued, some illustrated, for instance: Illustrirte Zeitung (Leipzig, 1843), Berliner Illustrirte Zeitung (1842), Die Woche (1890) the last the most widely circulated of the kind, 500,000 being printed in each weekly issue. At a somewhat earlier date commenced a long series of weekly and monthly periodicals of a more solid character, of which the following list contains the most important, and is divided into three parts: Friedrich Westfalen (1803), weekly; Emanuel Geibel's Allgemeine Almanach (1804), monthly; Die Grenzboten (1862), weekly; the Deutsches Morgenblatt (1818), weekly; the Prutz and Frenzel Berliner Revue (1855-1873); Westermann's Monatshefte (1856), monthly; Unsere Zeit (1857-1891), beginning as a feuilleton paper and finally a review of books of the Prussische Jahrbücher (1858), monthly; Deutsches Magazin (1861-1863); Die Gegenwart (1873), weekly; Konservative Monatschrift (1875), preceded by the Volksblatt für Stadt und Land (1843); Deutsche Rundschau (1874), fortnightly, conducted upon the method of the Revue des deux mondes; Deutsche Revue (1876), monthly; Nord und Süd (1877), monthly; Das Echo (1882), weekly; Die Zukunft (1882), weekly; Die neue Zeit (1883), weekly; Recitals Umsicht (1884), weekly; Felkel's Wochenblatt (1885), monthly; Die Grenzboten (1886), monthly; Die deutsche Rundschau (1890), monthly; Die Wahrheit (1893-1897); Kritik (1894-1902); Die Umschau (1897), weekly; Das literarische Echo (1898), fortnightly; Kynast (1898-1902); Die Umschau (1897), weekly; Verzeichnis der Jahrbücher der Literatur (1903-1905); Der Täumer (1908), monthly; Die Warte (1900), weekly; Deutsch-Russland (1902-1907); Deutsche Monatshefte (1902-1907); Hansken (1902), monthly; Choren (1904), monthly; Südliche Monatshefte (1904); Der Deutsche Rundschau (1905-1908); Arena (1906), monthly; Das Blaubuch (1906), weekly; Eckart (1906), monthly; Die Standarte (1906), weekly; Märts (1907), fortnightly; Internationale Wochenblatt für Wissenschaft, Kunst, und Technik (1907), weekly supplement to the Münchener allgemeine Zeitung; Wissen (1907), weekly; Unsere Zeit (1907), monthly; Hyperion (1908), monthly; Das neue Jahrhunder (1909), monthly; Die Tafel (1909), monthly.

Periodicals have been specialized in Germany to an extent perhaps unequalled in any other country. No subject of human interest is now without one or indeed several organs. Full details of these serials are supplied by a special class of periodical with which every department of science, art and literature in German-speaking countries is equipped, the Jahrbücher und Bibliographien, which give each year a full account of the literature of the subject with which they are concerned. The chief of these are:

Bibliography and Librarianship: Bibliographie des Buch- und Bibliothekswesens (see Jahrbücher für die Bibliothekswesen); Der Rundschau der Chemie (1847); Classical Archaeology and Philology: Jahrbücher über die Fortschritte der klassischen Altertumswissenschaft (1873); Education: Jahrbuch der pädagogischen Literatur (1842); Geographical: Die Gesellschaft der Geographen-geographischen (1901); History: Jahrbücher der Geschichtswissenschaft (1878); Fine Arts: Internationale Bibliographie der Kunst- und Grassius's Umbruch (1868) and of the gesamt-staats- und rechtswissenschaftlichen Literatur (1868); Jurisprudentia Germanicae (1903); Bibliographie des bürgerlichen Rechts (1888); Bibliographie der Sozialwissenschaften (1905); Bibliographie der deutschen Philologie (1899); Bibliographie der Zeitschriften der Genossenschaften (1897); euhors der gesamt-staats- und rechtswissenschaftlichen Literatur (1868); Literatur and Languages: Bibliographie der vergleichenden Literaturgeschichte (1905); Jahrbücher für neuere deutsche Literaturgeschichte (1890); Musik: Jahrbücher der Musikwissenschaften (1900); Periodicals in the field of the philologie (1879); Übersicht über die auf dem Gebiete der englischen Philologie erschienenen Bücher, Schriften, und Aufsätze (1878); Kritische Jahrbücher über die Fortschritte der romanischen Philologie (1897, 1903); Bibliographie für romanische Philologie: Die Zeitschr. f. roman. Philologie (1875); Orientalische Bibliographie (1888); Mathematics: Jahrbuch über die Fortschritte der Mathematik und die Staatswissenschaften (1893); Jahrbücher der gesamt-medizinischen Literatur (1866); Jahrbücher über die Leistungen auf dem Gebiete der Veterinärmedizin (1881); Military: Jahrbücher über Veränderungen und Fortschritte im Militärszen (1892); Jahrbücher der gesamt-medizinischen Literatur (1866); Jahrbücher über die Leistungen auf dem Gebiete des Militärs (1873); Die Fortschriften der Physik (1847); Technology: Repertorium der technischen Journalalliteratur (1874); Theology: Theologischer Jahrbücher (1881); Bibliographie der Kirchengeschichtlichen Literatur (1877).

Switzerland

The Nova literaria helvetica (1703-1715) of Zurich is the earliest literary periodical which Switzerland can show. From 1728 to 1734 a Bibliothéque italique, and towards the end of the century the Bibliothèque britannique (1796-1815), dealing with publications in English literature, and science, in three separate series, were published at Geneva. The latter was followed by the leading periodical.
PERIODICALS

i6o

of French-speaking Switzerland, the Bibliotheque universelle (1816),
which has also had a scientific and a literary series. The Revue
suisse (1838) was produced at Neuchatel.
These two have been
amalgamated and appear as the Bibliotheque universette et revue
suisse.
La Suisse rpmande (1885) only lasted twelve months.
Theologie et philosophic (1868-1872), an account of foreign literature
on those subjects, was continued as Revue de theologie et de philosophic (1873) at Lausanne. Among current serials may be mentioned
Archives de psychologie de la Suisse romande (1901) edited by Flournoy
and Claparede; Jahresverzeichnis der schweizerischen Universitatsschriften (1897-1898); Untersuchungen zur neueren Sprach- und
Literaturgeschichte (1903); Zwingliana: Mitteilungen zur Ceschichte
Zwingli und der Reformation (1897).

ITALY
Prompted by M. A.

Francesco Nazzari, the future cardinal,
established in 1668 the Giornale de' letterati upon the plan of the
French Journal des savants. His collaborateurs each agreed to
undertake the criticism of a separate literature while Nazzari retained the general editorship and the analysis of the French books.
The journal was continued to 1675, and another series was carried
on to 1769. Bacchini brought out at Parma (1688-1690) and at
Modena (1692-1697) a periodical with a similar title. A much better
known Giornale was that of Apostolo Zeno, founded with the help
of Maffei and Muratori (1710), continued after 1718 by Pietro Zeno,
and after 1728 by Mastraca and Paitoni. Another Giornale, to
which Fabroni contributed, was published at Pisa from 1771 onwards.
The Gatteria di Minerva was-first published at Venice in 1696. One
of the many merits of the antiquary Lami was his connexion with
the Novelle letterarie (1740-1770), founded by him, and after the
first two years almost entirely written by him.
Its learning and
impartiality gave it much authority. The Frusta letteraria (17631 7(>S) was brought out at Venice by Giuseppe Baretti under the
pseudonym of Aristarco Scannabue. The next that deserve mention
are the Giornale enciclopedico (1806) of Naples, followed by the
Progresso delle scienze (1833-1848) and the Museo di scienze e
Ricci,

same city, and the Giornale arcadico (1819) of
the contributors to the Poligrafo (1811) of Milan
were Monti, Perticari, and some of the first names in Italian literature.
The Biblioteca ital-iana (1816-1840) was founded at Milan
by the favour of the Austrian government, and the editorship was
offered to and declined by Ugp Foscolo.
It rendered service to
Italian literature by its opposition to the Della-Cruscan tyranny.
Another Milanese serial was the Conciliatore (1818-1820), which
although it only lived two years, will be remembered for the endeavours made by Silvio Pellico, Camillo Ugoni and its other contributors to introduce a more dignified and courageous method of
criticism.
After its suppression and the falling off in interest of
the Biblioteca italiana the next of
any merit to appear was the
Antologia, a monthly periodical brought out at Florence in 1820
by Gino Capponi and Giampetro Vieusseux, but suppressed in
1833 on account of an epigram of Tommaseo, a principal writer.
Some striking papers were contributed by Giuseppe Mazzini.
Naples had in 1832 Il^Progresso of Carlo Trpya, helped by Tommaseo
and Centofanti, and Palermo owned the Giornale di statistica (1834),
suppressed eight years later. The Archivio storico, consisting of
reprints of documents with historical dissertations, dates from 1842,
lelteratura of the

Rome.

Among

and was founded by Vieusseux and Gino Capponi.

The

Civilla

the organ of the Jesuits. The
Rivista contemporanea (1852) was founded at Turin in emulation
of the French Revue des deux mondes, which ha? been the
type
followed by so many continental periodicals.
The Politecnico
of
Milan
was
(1839)
suppressed in 1844 and revived in 1859. The
Nuova antologia (1866) soon acquired a well-deserved reputation
as a high-class review and magazine; its rival, the Rivista europea,
The
being the special organ of the Florentine men of letters.
cattolica (1850), fortnightly, is still

Rassegna settimanale was a weekly political and literary review,
which after eight years of existence gave place to a daily newspaper,
the Rassegna.
The Archivio trenlino (1882) was the organ of
"
Italia Irredenta."
The Rassegna nazionale, conducted by the
marchese Manfredo di Passanp, a chief of the moderate clerical
party, the Nuova rivista of Turin, the Fanfulla della Domenica, and
the Gazzetta letteraria may also be mentioned.
Some of the following are still published: Annali di matematica
(1867); Annuario di giurisprudenza (1883); Archivio di statistica
(1876); Archivio storico lombardo (1874); Archivio veneto (1871);
Archivio per lo studio delle tradizioni popolari; Archivio per la

zoologia; II Bibliofilo; II Filangieri (1876); La Natura (1884);
Nuovo giornale botanico (1869) ; Giornale degli eruditi (1883) ; Giornale
difilologia romanza; Nuova rivista Internazionale (1879) ; La Rassegna
italiana (1881); Revue Internationale (1883).
In more recent years

a great expansion has been witnessed.

Local reviews have largely
increased, as well as those devoted to history, science and university
undertakings.
Among representative serials are the following
Archaeology: Museo italiano di antichita classica (1885) with atlas
in folio; Oriens christianus (1901); Nuovo bolleltino di
archeologia
cristiana, quarterly at Rome (1895).
Bibliography: Rivista delle
biblioteche e degli archivi (1888), published monthly at Rome and
Florence, the official organ of librarians and archivists; Giornale

della libreria della tippgrafia (1888),
supplement to the Bibliografia
italiana; Bollettino di bibliografia e stor^a delle scienze matematiche

La

Bibliofilia (1899), Florence, monthly; Raccolta Vinciana
Philology: Bollettino difilologia classica (1894); Giornale
italiano di filologia e linguistica classica (1886); Studi di filologia
romanza (1885) Studi italiani difilologia classica (1893) Bessarione,
bi-monthly. No class has developed more usefully than the historical, among them being: Bollettino dell' instituto storico italiano
(1886) Nuovo archivio veneto (1890) Rivista di storia antica e scienze
New literary and
affini (1895); Rivista storica italiana (1884).
scientific reviews are: L'Alighieri, rivista di cose dantesche
(1889);
Giornale dantesco (1894); Giornale storico della letter atur a italiana
(1883); Studi di letteratura italiana (1899); Studi medievali (1904);

BELGIUM
The Journal encyclopedique (1756-1793) founded by P. Rousseau,
made Liege a propagandist centre for the philosophical party.

In the same city, was also first established L Esprit des journaux
"
cette considerable et ex(1772-1818), styled by Sainte-Beuve
"
cellente collection," but
voleur
et compilateur."
The
journal
Journal historique et litteraire (1788-1790) was founded at Luxemburg by the Jesuit De Feller; having been suppressed there, it was
transferred to Liege, and subsequently to Maestricht. It is one of
the most curious of the Belgian
periodicals of the l8th century,
and contains most precious materials for the national history. A
complete set is very rare and much sought after. The Revue beige
(1835-1843), in spite of the support of the best writers of the kingdom,
as well as its successor the Revue de Liege (1844-1847), the Tresor
national (1842-1843),
published at Brussels, and the Revue de Belgique
(1846-1851) were all short-lived. The Revue deBruxelles (1837-1848),
supported by the nobility and the clergy, had a longer career.
The Revue nationale was the champion of Liberalism, and came

to an end in 1847.
The Messager des sciences historiques (1833),
at Ghent, was in repute on account of its .historical and antiquarian
character.
The Revue catholique, the organ of the professors of
the university of Louyain, began in 1846 a controversy with the
Journal historique et litteraire of Kersten (1834) upon the origin
of human knowledge, which lasted for many
years and excited
The Annales des \travaux publics (1843), the
great attention.
Bulletin de I'industrie (1842), the Journal des beaux-arts (1858),
and the Catholic Precis historiques (1852), the Protestant Chretien
The Revue trimestrielle was
(1850), are other examples.
founded at Brussels by Van Bemmel in 1854. The Athenaeum
beige (1868) did not last long.
Among current periodicals in. French are the following Bibliography: Bulletin bibliographique et pedagogique du musee beige
(1897); La Revue des bibliothbques et archives de Belgique (1903);
Le Glaneur litteraire, musical et bibliographic (1901); Archives des
arts et de la bibliographic de Belgique (Tables
1833-1853 and 1875and ecclesiastical history: Revue neo-schola1894).
Philosophy
la
societe philosophique de Louvain (1894); Revue
stique publiee par
d'histmre eccUsiastique (1900), the organ of the Catholic university of
Revue
benedictine
Louvain;
(1884); Analecles pour seruir a I'histoire
e
seYie (1881-1904) and 3" sdrie
eccUsiastique de la Belgique, 2
Science: Archives inter1905); with an Annexe for Cartularies.
nationales de physiologic (1902), published by L6on Fredericq; La
Cellule, recueil de cytologie et d'histologie generale (1884); Le Museon
(1882); Le Mpuvement geographique (1884); Le Musee beige (1897);
Revue chirurgicale beige et du nord de la France (1901). Annales des
mines belgiques appears quarterly, and L'Art moderne weekly at
Brussels.

Flemish serials may be mentioned the Nederduitsche
the Belgisch Museum (1836-1846), edited by
Willems; the Broederhand, which did not appear after 1846; the
Taalverbund of Antwerp; the Kunst- en Letterblad (1840-1843); and
the Vlaemsche Rederyker (1844). Current Flemish periodicals include: Onze kunst ge'illustreea maandschrift voor beeldende kunst
(1900); Averbode's weekblad Godsdienst huisgezin mpedertaal (1907);
De Raadselbode talk van den vlamschen raadselliefhebber
(1901);
Rechtskundig tijdschrift voor vlamsch Belgie (1901).
It has been calculated that in 1860 there were 51
periodicals
aublished in Belgium.
In 1884 the number had increased to 412,
and in 1908 to 1701.

HOLLAND
The

Dutch was the Boekzaal van Europa
(1692-1708, and 1715-1748), which had several changes of name
first

serial written in


PERIODICALS

during its long life. The next to any note was the Republik der Geschichte (1827-1848), the Algemeene Koninklijke Bibliothek (1788) was long the leading review of Holland; in 1860 it was joined to the Nederlandsche Spectator (1833-1873), and in Dutch. An important serial was the long-lived Vaderlandsche Letteroefeningen (1805-1840). The Algemeene Koneiklijke Bibliotheek (1789) was long the leading review of Holland; in 1860 it was joined to the Nederlandsche Spectator (1833-1873), and in Dutch. An important serial was the long-lived Vaderlandsche Letteroefeningen (1805-1840).

Spain

Spain owes her intellectual emancipation to the monk Benito Féjóo, who in 1726 produced a volume of dissertation somewhat after the fashion of the Spectator, but on graver subjects, entitled Teatro critico, which was continued down to 1739. His Cartas de los sabios a los ignorantes (1776-1804), a series of letters containing critical and moral maxims, was translated into French and a number of English and German editions were published. The most important of these was the English edition, issued in 1826-1840. A second series, called The Spectator, was issued in 1776-1804. The Spectator was continued by its editor, and the two series were published together as the Spectator and the Spectator, or the Gentleman's Magazine (1776-1840). The Spectator was continued by its editor, and the two series were published together as the Spectator and the Spectator, or the Gentleman's Magazine (1776-1840). The Spectator was continued by its editor, and the two series were published together as the Spectator and the Spectator, or the Gentleman's Magazine (1776-1840). The Spectator was continued by its editor, and the two series were published together as the Spectator and the Spectator, or the Gentleman's Magazine (1776-1840).
Sochtienyō (1755-1764), or "Monthly Works." In 1759 Sumarokov founded the Trudolubnyaya Pischel', or "Industrial Bee," giving translations from the Spectator, and, for the first time, critical essays, which brought him into conflict with Vostok. His most important review with Liberal tendencies, The Conservative. Russkii V'yestnik (1808) was revoked at Moscow in 1868 by Kattkov.

The two last named are still published, each month. The romantic school is represented by Novyj Sl. Obshchestvo (1815), Sc. Obshchestvo (1815), "Social Obshchestvo of the Land," unincorporated in 1825 to the Sevornoi Arkhiv (1822), which dwindled and came to an end soon after 1839. One of the most successful Russian reviews has been the Bol'shoy Sotsialist (1854), monthly; V'yestnik vospitaniya (for education); Mir iskusstva (for fine art); Russkoe bogatstvo (for literature); Russkii arkhiv (archives); Mir Boi, monthly; Istoričesky v'yestnik (history); Literature of the Byzantine). In Finland Suomi (1841), written in Swedish, is still published.

Other Countries

Bohemia has the Casopis musea brdovsko-leské (1827), quarterly, founded by Palacky; Náu dech, monthly; Gechsche Kerc (1907) quarterly. Hungary can show the Ungarische Magazin (1781-1787, 1791), published at Pressburg, and the Magyar Museum (1788).

The Tudomanyos gyzıletjelyém (1871-1874), and the Tudomanyos (1874), U Magyar Museum is a scientific magazine, and the Budapesti Szemle (1857) of a more general character. Among current Hungarian periodicals are: Magyar Kézönyestem (1876), and Magyar Kézönyestem (1876). The has been commencing periods of the Magazin, Pamietnik Worszawski of Lach Szyma.

Among other Polish reviews may be mentioned the Dziennik Litascki of Lemberg; the Biblioteka Worszawska (1841), monthly; Przyczyw. Worszawski, monthly, and Przyczyw. Worszawski (1872), monthly; Przeczyw. bibliograficzny (1878), monthly; Przeglap powaszychny (1884), monthly. Rumunia commenced with the Magazinul istorico pentru Dacia (1845), containing valuable historical documents; and Moldavia with Dica Literaria (1849) and Archita Romaneasa (1841). Rumunia now has the Convorbiri literare (1886), monthly, and Romanul, revista literară ilustrată septemnului. The best literary review.Servia has had the Wochenschrift der VR.B.C.

Japan now possesses native periodicals of the European type, of which the following are representative examples: Fudokō-Kai (native customs); The Kokka (art); Togyu-Gakujitō-Zasshi (science); Jogaku-Zasshi (domestic economy); Taisa-hen-Zasshi (philosophy); Keisai-Zasshi (political economy); Taisyo (literature).

General Indexes to Periodicals.—The most complete collection of periodicals in all languages brought together is that preserved in the British Museum, and the exepet from the printed catalogue of the library, entitled Periodical Publications (London, 1899-1900, 2nd ed. 6 parts, with index), includes journals, reviews, and other works of a periodical character, except transactions and proceedings of learned societies and of British and Colonial newspapers later than 1700. The titles of these periodicals, which number about 23,000, are arranged under the following classification (for bibliographies). The Edinburgh and Quarterly Reviews, the Revue des deux mondes, the Revue historique, Deutsche Rundschau and others issue from time to time general indexes of their contents, while the periodical literature of special departments of study and research are noted in the various Jahresberichte published in Germany, and indexed monthly in such English and American magazines as the Engineering Magazine, the Geographical Journal, English Historical Review, American Historical Review, Economic Journal, and the Historical Library Journal and Library Association Record (for bibliography) and the Educational Review. The Cat. of Scientific Papers (1800—1900) of the Royal Society (1867-1906), and the Bibliothèque Nationale, are specimens of indexes of special periodicals. There are also annual indexes such as those in the Zoological Record and Annuaire de l’Institut de France, issued by the British Museum. (G. B. A. H. B. A. H., 1877; G. B. A. H. B. A. H., 1877; G. B. A. H. B. A. H., 1877). See also Bibliography of Books reviewed in American Periodicals, by G. F. Dianforth (1902-1903); Book Review Digest (1900-1901), issued by the Library of Congress, and the American Periodicals 1665-1895, Smithonian Inst. (2nd ed., 1897); Harrison's Int. of Scientific Lit. (1903-1904); S. H. Schmider's Cat. of Scientific Serials, 1633-1870 (Camb., Harvard Univ., 1876); Cat. of Periodicals (1904); Cat. of American Periodicals, issued by the American Historical Association and the Bibliothèque nationale, Liste des périodiques étrangers (1866). A useful select list, including all languages, is J. D. Brown's Classified List of Periodicals (1904). (H. R. T.)

PERIOECI (περιόεκα), those who dwell around, in the neighborhood. In the ancient Laconia the class intermediate between the Spartan citizens and the serfs or helots (εὐρός). Ephorus says (Strabo viii. 364 seq.) that they were the original Achaean inhabitants of the country, that for the first generation after the Dorian invasion they shared in the franchise of the invaders, but that this was afterwards taken from them and they were reduced to a subject condition and forced to pay tribute. The term, however, came to denote not a nationality but a political status, and though the main body of the perioeci may have been Achaeans in origin, yet they afterwards included Arcadians on the northern frontier of Laconia, Dorians, especially in Cythera and in Messenia, and Ionians in Cynuria. They inhabited a large number of settlements, varying in size from important towns like Gymnion to insignificant hamlets (Isocrates xii. 179); the names of these, so far as they are known, have been collected by Clonin (Fasti hellenici, 2nd ed. i. 401 sqq.)

They possessed personal freedom and some measure of communal independence, but were apparently under the immediate supervision of Spartan harmosts (governors) and subject to the general control of the ephors, though Isocrates is probably too far in saying (xii. 181) that the ephors might put to death without trial as many of the perioeci as they pleased. Certain it is that they were excluded not merely from all Spartan offices of state, but even from the assembly, that they were nevertheless not allowed to vote, and, yet, mere citizens, and only two of their cities joined the insurgent helots in 464 B.C. (Thuc. i. 101).

The reason of this was that, though the land which they cultivated was very unproductive, yet the prohibition which shut out every Spartan from manufacture and commerce left the industry and trade of Laconia entirely in the hands of the perioeci. Unlike the Spartiates they might, and did, possess gold and silver and the iron and steel wares from the mines of Mt Taygetus, the shoes and woolen stuffs of Amycla, and the import and export trade of Laconia and Messenia probably enabled some at least of them to live in an ease and comfort unknown to their Spartan lords.

PERIPATETICS (from Gr. περιπατείς, to walk about), the name given in antiquity to the followers of Aristotle (q.v.), either from his habit of walking up and down as he lectured to his pupils, or from the περιπατός (covered walk) of the Lyceum.

Aristotle's immediate successors, Theophrastus and Eudemus of Rhodes, were eleven in number, but of the former, the Rhetorician, the Epistemologus, the Megarian, the Pythagorean, and the Pyrrhonian, list of scholars rather than original thinkers. They made no innovations upon the main doctrines of their master, and their industry is chiefly directed to supplementing his works in minor particulars. Thus they amplified the Aristotelian logic by the theory of the hypothetical and disjunctive syllogism, and added to the first figure of the categorical syllogism the five moods out of which the fourth figure was afterwards constructed. The impulse towards natural science and the systematizing of empirical details which distinguished Aristotle from Plato was shared by Theophrastus (q.v.). The same turn for detail is observable in his ethics, where, to judge from the imperfect evidence of the Characteres, he elaborated still farther Aristotle's portraiture of the virtues 1

1 See Gellius, Noct. Att. xii. 5, for the story of how Aristotle chose Theophrastus as his successor
and their relative vices. In his doctrine of virtue the distinctive Peripatetic position regarding the importance of external goods was defended by him with emphasis against the assaults of the Stoics. He appears to have laid even more stress on this point than Aristotle himself, being doubtless led to do so, partly by the heat of controversy and partly by the importance which leisure and freedom from harassing cares naturally assumed to a man of his studious temperament. The metaphysical ἀπορία of Theophrastus which have come down to us show that he was fully alive to the difficulties that beset many of the Aristotelian definitions. But we are ignorant how he proposed to meet his own criticisms; and they do not appear to have suggested to him an actual departure from his master's doctrine, much less any radical transformation of it. In the difficulties which he raises we may perhaps detect a leaning towards a naturalistic interpretation. The tendency of Eudemus, on the other hand, is more towards the theological Eudemos or Rhodes, or Platonic side of Aristotle's philosophy. The Eudemonian Ethics (which, with the possible exception of the three books common to this treatise and the Nicomachean Ethics, there need be no hesitation in ascribing to Eudemus) expressly identify Aristotle's ultimate ethical ideal of theoria with the knowledge and contemplation of God. And this supplies Eudemus with a standard for the determination of the mean by reason, which Aristotle demanded, but himself left vague. Whatever furthers us in our progress towards a knowledge of God is good; every hindrance is evil. The same spirit may be traced in the author of the chapters which appear as an appendix to book i. of Aristotle's Metaphysics. They have been attributed to Pasicles, the nephew of Eudemus. For the rest, Eudemus shows even less philosophical independence than Theophrastus. Among the Peripatetics of the first generation who had been personal disciples of Aristotle, the other chief names are those of Aristoxenus (q.v.) of Tarentum and Dicaearchus (q.v.) of Messene. Aristoxenus, who had formerly belonged to the Pythagorean school, maintained the position, already combated by Plato in the Phaedo, that the soul is to be regarded as nothing more than the harmony of the body. Dicaearchus agreed with his friend in this naturalistic rendering of the Aristotelian entelechy, and is recorded to have argued formally against the immortality of the soul.

The naturalistic tendency of the school reached its full expression in Strato of Lampscus, the most independent, and probably the ablest, of the earlier Peripatetics. His system is based upon the formal denial of a transcendent deity. Cicero attributes to him the saying that he did not require the aid of the gods in the construction of the universe; in other words, he reduced the formation of the world to the operation of natural forces. We have evidence that he did not substitute an immanent world-soul for Aristotle's extra-mundane deity; he recognized nothing beyond natural necessity. He was at issue, however, with the atomistic materialism of Democritus in regard to its twin assumptions of absolute atoms and infinite space. His own speculations led him rather to lay stress on the qualitative aspect of the world. The true explanation of things was to be found, according to Strato, in the forces which produced their attributes, and he followed Aristotle in deducing all phenomena from the fundamental attributes or elements of heat and cold. His psychological doctrine explained all the functions of the soul as modes of motion, and denied any separation of the reason from the faculties of sense-perception. He appealed in this connexion to the statement of Aristotle that we are unable to think without a sense-image.

The successors of Strato in the headship of the Lyceum were Lycon, Aristocles of Ceos, Critolaus (q.v.), Diodorus of Tyre, and Erymenus, who brings the philosophic succession down to about 100 B.C. Other Peripatetics belonging to this period are Hieronymus of Rhodes, Pytanes and Phrornus of Ephesus, the delirus senex who attempted to instruct Hannibal in the art of war (Cic. De orat. ii. 18). Sotion, Hermippus and Satyrus were historians rather than philosophers. Heraclides Lembus, Agatharchides and Antisthenes of Rhodes are names to us and nothing more. The fact is that, after Strato, the Peripatetic school has no thinker of any note for about 200 years.

Early in the 1st century B.C. all the philosophic schools began to be invaded by a spirit of eclecticism. This was partly due to the influence of the practical Roman spirit. This influence is illustrated by the proconsul Lucius Gellius Publicola (about 70 B.C.), who proposed to the representatives of the schools in Athens that he should help them to settle their differences (Cic. De leg. i. 20). This atmosphere of indifference imperceptibly influenced the attitude of the contending schools to one another, and we find various movements towards unity in the views of Boethus the Stoic, Panaetius and Antiochus of Ascalon, founder of the so-called "Fifth Academy." Meanwhile the Peripatetic school may be said to have taken a new departure and a new lease of life. The impulse was due to Andronicus of Rhodes. His critical edition of Aristotle indicated to the later Peripatetics the direction in which they could profitably work, and the school devoted itself henceforth almost exclusively to the writing of commentaries on Aristotle, e.g. those of Boethus of Sidon, Aristote of Alexandria, Sotades, Cratippus, and Nicolaus of Damascus. The most interesting Peripatetic work of the period is the treatise De mundo, which is a good example within the Peripatetic school of the eclectic tendency which was then in the air. The admixture of Stoic elements is so great that some critics have attributed the work to a Stoic author; but the writer's Peripateticism seems to be the more fundamental constituent of his doctrine.

Our knowledge of the Peripatetic school during the first two centuries of the Christian era is very fragmentary; but those of its representatives of whom anything is known confined themselves entirely to commenting upon the different treatises of Aristotle. Thus Alexander of Aegae, the teacher of Nero, commented on the Categories and the De caelo. In the 2nd century Aspasius (q.v.) and Adrastus of Aphrodisias wrote numerous commentaries. The latter also treated of the order of the Aristotelian writings in a separate work. Somewhat later, Herminius, Achaeus and Sosigemes commented on the logical treatises. Aristocles of Messene, the teacher of Alexander of Aphrodisias, was the author of a complete critical history of Greek philosophy. This second phase of the activity of the school closes with the comprehensive labours of Alexander of Aphrodisias (Scholarch, c. 200), the exegete par excellence, called sometimes the second Aristotle. Alexander's interpretation proceeds throughout upon the naturalistic lines which have already become familiar to us. Aristotle had maintained that the individual soul is alone, and had nevertheless asserted that the universal is the proper object of knowledge. Alexander seeks consistency by holding to the first position alone. The individual is prior to the universal, he says, not only "for us," but also in itself, and universals are abstractions which have merely a subjective existence in the intelligence which abstracts them. Even the deity must be brought under the conception of individual substance. Such an interpretation enables us to understand how it was possible, at a later date, for Aristotle to be regarded as the father of Nominalism. Form, Alexander proceeds, is everywhere indivisible from matter. Hence the soul is inseparable from the body whose soul or form it is. Reason or intellect is bound up with the other faculties. Alexander's commentaries formed the foundation of the Arabian and Scholastic study of Aristotle. Soon after Alexander's death the Peripatetic school was merged, like all others, in Neoplatonism (q.v.).

PERIPATUS, a genus of animals belonging to the air-breathing division of the phylum Arthropoda. It differs, however, from all other Arthropoda in such important respects that a special class, equivalent in rank to the old-established Arthropod classes, had been created for its sole occupancy. This class has been named the Prototracheata or Onychophora (see ARTHROPODA), and may be most appropriately placed in the system in the
neighbourhood of the Myriapoda, though it must not be forgotten that it differs from the Myriapoda more than the Myriapoda differ from other Arthropoda, and that in some respects it presents features which recall the segmented worms (Annelida).

The genus has a wide distribution (see below), but it has not been found in Europe or in North America. There is a little variety in the structure in the genus, and the species are limited in number. They live beneath the bark of trees, in the crevices of rock and of rotten stumps of trees, and beneath stones. They require a moist atmosphere, and are exceedingly susceptible to drought. They avoid light, and are therefore rarely seen. They move slowly, picking their course by means of their antennae.

When irritated they eject with considerable force the contents of their slime reservoirs by means of the sudden contraction of the muscular body-wall. The slime, which appears to be harmless, is extremely sticky, but it easily comes away from the skin of the animal itself. Locomotion is effected by means of the legs, with the body fully extended. Hutton describes his specimens as sucking the juices of flies, which they had stuck down with their slime, and they have been observed in captivity to devour the entrails which have been removed from their fellows, and to eat raw sheep's liver. They move their mouths in a sectorial manner, tearing the food with their jaws. They have the power of extruding their jaws from the mouth, and of working them alternately backwards and forwards. They are viviparous; the young are fully formed at birth, and differ from the adult only in size and colour. The mother does not appear to pay any special attention to her offspring, which wander away and get their own living. It has lately been stated that some of the Australian species are normally oviparous, but this has not been fully proved. Sexual differences are not strongly marked, and are sometimes absent. There does not appear to be any true copulation. In some species the male deposits small oval spermatophores indiscriminately on any part of the body of the female. It seems probable that in such cases the spermatooza make their way from the adherent spermatophore through the body-wall into the body, and so by traversing the tissues reach the ovary. In other species which possess receptacula seminis it is probable that fertilization is effected once only in early life before any ova pass into the uterus.

External Features.—The anterior part of the body may be called the head, though it is not sharply marked off from the rest of the body (fig. 1). The head carries three pairs of appendages, a pair of simple eyes, and a ventrally placed mouth. The body is elongated and veriform; it bears a number of paired appendages, each terminating in a pair of claws, and all very much alike. The number varies in the different species. The anus is always at the posterior end of the body, and the generative opening is on the ventral surface, just in front of the anus; it may be between the legs of the penultimate pair, or between the legs of the last pair, or it may be subterminal. The colour varies considerably in the different species, and even in different individuals of the same species. The general colour varies from yellow to brown, and in some species it is thrown into a number of transverse ridges, along which wart-like papillae are placed. These papillae, which are found everywhere, are the primary papillae; they are covered with small, scale-like projections called secondary papillae, and are especially developed on the dorsal surface, less so on the ventral. Each papilla carries at its extremity a well-marked spine. Among the primary papillae smaller accessory papillae are sometimes present.

The appendages of the head are the antennae, the jaws and the oral papillae. The mouth is at the hinder end of a depression called the buccal cavity, and is surrounded by an annular tumid lip, raised into papiliform ridges and bearing a few spines (fig. 2). Within the buccal cavity are the two jaws. They are short, stump-like, muscular structures, armed at their free extremities by a pair of cutting blades or claws, and are placed one on each side of the mouth. In the median line of the buccal cavity in front is placed a thick muscular protrubrance, which may be called the tongue, though attached to the dorsal instead of to the ventral wall of the mouth (fig. 2). The tongue bears a row of small, piniform teeth. The jaw-claws (figs. 3 and 4), which resemble in the essential points the claws borne by the feet, and, like these, are thickenings of the cuticle, are sickle-shaped. They have their convex edges directed forwards, and their concave, or cutting edge, turned backwards. The inner edge of the cutting plate (fig. 3) usually bears a number of cutting teeth. The oral papillae are placed at the sides of the head (fig. 2). The ducts of the slime-glands open at their free end. They possess two main rings of projecting tissue, and their extremities bear papillae irregularly arranged. The ambulatory appendages vary in number.

There are seventeen pairs in *P. capensis* and eighteen in *P. balfouri*, while in *P. jamaisensis* the number varies from twenty-nine to forty-three. They consist of two main divisions, which we may call the leg and the foot (fig. 5). The leg (l) has the form of a truncated cone, the broad end of which is attached to the ventro-lateral wall of the body, of which it is a prolongation. It is marked by a number of rings of papillae placed transversely to its long axis, the dorsal of which are pigmented like the dorsal surface of the body, and the ventral like the ventral surface. At the narrow distal end of the leg there are on the ventral surface three or four (rarely five) spiniferous pads, each of which is continued dorsally into a row of papillae. The foot is attached to the distal end of the leg. It is slightly narrower at its attached extremity than at its free end. It bears two sickle-shaped claws, and at its distal end three (rarely four) papillae. The part of the foot which carries the claws is especially retractile, and is generally found more or less telescoped into the proximal part. The legs of the fourth and fifth pairs differ from the others in the fact that the third pad (counting from the distal end of the leg) carries the opening of the enlarged nephridia and genital segments. In some species certain of the legs bear on their ventral sides furrows with tumid lips and lined by smooth non-tuberculate organs, and it appears that they can be everted. The males are generally rather smaller and less numerous than the females. In some species in which the number of legs varies the male has a smaller number of legs than the female.
Breeding.—As already stated, Peripatus is viviparous. The Australasian species come nearest to laying eggs, inasmuch as the eggs are large, full of yolk, and enclosed in a shell; but development normally takes place in the uterus, though abnormally, inclosed developed eggs are extruded. The uterus always contains several young, which are usually at different stages of development and are born at different times of the year. In most of the European species, however, the embryos of the uterus are almost of the same age and are born at a definite season. The young of P. capensis are born in April and May. They are almost colourless at birth, excepting the integument, which are green, and their length is 10 to 15 mm. A large female will produce thirty to forty young in one year. The period of gestation is thirteen months, that is to say, the ova pass into the oviducts about one month before the young of the preceding year are born.

Anatomy.—The alimentary canal (fig. 6). The buccal cavity, as explained above, is a secondary formation around the true mouth, which is at its dorsal posterior end. It contains the tongue and the jaws, which have already been described, and into the hind end of it there open ventrally by a median opening the salivary glands. The mouth leads into a muscular pharynx, which is connected by a short oesophagus with the stomach. The stomach forms by far the largest part of the alimentary canal. It is a dilated tube, soft-walled and tubular, and leads behind into the short narrow rectum, which opens at the anus.

There are no glands opening into the alimentary canal. The tracheal nervous system, the anterior part of which is shown in fig. 7, is of the “rope-ladder” type, and the ventral cords meet over the rectum. The cuticle is a thin layer, of which the spines, jaws and claws are special developments. Its surface is not, however, smooth but is everywhere, with the exception of the perioral region, raised into minute secondary papillae, which in most instances bear at their free extremity a somewhat prominent spine. The epidermis, placed immediately within the cuticle, is composed of a single row of cells. The pigment which gives the characteristic colour to the skin is deposited in the proplasm of the outer ends of the cells in the form of small granules. Beneath the epidermis is a thin cutis, which is followed by the muscular layers (external circular and internal longitudinal). The muscular fibre of the jaws are transversely striated, the other muscles are unstriated.

The apertures of the tracheal system are placed in the depressions between the papilla or ridges of the skin. Each of them leads into a tube, which may be called the tracheal pit (fig. 8); the walls of the median lips; a posterior lobe of brain; pn, nerves to feet; sy, sympathetic nerves.

Fig. 7.—Brain and anterior part of the ventral nerve-cords of Peripatus capensis enlarged and viewed from the ventral surface.

Antennary nerves; ca, commissures between ventral cords; d, ventral appendages of brain; E, eye; en, nerves passing outwards from ventral cord; F.t., ganglionic enlargements from which nerves to feet pass off; jn, nerves to jaws; OR, ganglionic enlargement from which nerves to oral papillae pass off; om, nerves to oral papillae; pc, posterior lobe of brain; pn, nerves to feet; sy, sympathetic nerves.

Fig. 8.—Section through a tracheal pit and diverging bundles of tracheal tubes taken transversely to the long axis of the body. In, Trachea; tr, rudimentary spiral fibre; tr.a, Cells resembling those lining the tracheal pits, which occur at intervals along the course of the tracheae; tr.o, Tracheal stigma; tr.p, Tracheal pit of this are formed of epithelial cells, bounded towards the lumen of the pit by a very delicate cuticular membrane continuous with the cuticle covering the surface of the body. Internally it expands in the transverse plane, and from the expanded portion the tracheal tube arises in diverging bundles. The tracheae are minute tubes exhibiting a faint transverse striation which is probably the indication of a spiral fibre. They appear to branch, but only exceptionally. The tracheal apertures are covered over the surface of the body, but are especially developed in certain regions.

The vascular system consists of a dorsal tubular heart with paired ostia leading into it from the pericardium, of the pericardium, and the various other divisions of the pericervical cavity (fig. 12, D). As in all Arthropoda, the pericervical cavity is a haemocele, i.e., contains blood, and forms part of the vascular system. It is divided by septa into chambers (fig. 12, D), of which the most important are the central chamber containing the alimentary canal and the dorsal chamber or pericardium. Nephridia are present in all the legs. In all of them (except the first three) the following parts may be recognized (fig. 9): (1) a vesicular portion of the nephridium into the body cavity (lateral compartment). s, Vesicle of segmental organ.

Fig. 9.—Nephridium from the ninth pair of legs of P. capensis. s.o.t, External opening of segmental organ. s.o., Internal opening of nephridium. s.c., Successive regions of coiled portion of nephridium.

Fig. 10.—S. p.f, Internal opening of nephridium broken off at s.p.f from the internal vesicle, which is not shown.

Opening to the exterior on the ventral surface of the legs by a narrow passage (s.d); (2) a coiled portion, which is again subdivided into several sections (s.c); (3) a section with closely-packed nuclei ending by a somewhat enlarged opening (p.f); (4) the terminal portion, which consists of a thin-walled vesicle. The nephridia of the first three pairs of legs are smaller than the rest, consisting only of a vesicle and duct. The fourth and fifth pairs are larger than those behind, and are in other respects peculiar; for instance, they open on the third pad (counting from the distal end of the
PERIPATUS

The development has been worked out in *P. capensis*, to which species the following description refers. The segmentation is peculiar, and leads to the formation of a solid gastrula, consisting of a cavity of ectoderm nuclei surrounding a central endodermal mass, which is exposed at one point—the blastopore. The enteron arises as a space in the endoderm, and an opacity—the primitive streak—appears at the hind end of the blastopore (fig. 11, B). The elongation of the embryo is accelerated by the elongation of the blastopore, which soon becomes dumb-bell shaped (fig. 11, C). At the same time the mesoblastic somites (embryonic segments or mesoderm) make their appearance in pairs at the hind end, and gradually travel forwards on each side of the blastopore to the front end, where the somites of the anterior pair soon meet in front of the blastopore (fig. 11, D). Meanwhile the narrow middle part of the blastopore has closed by a fusion of its lips, so that the blastopore is represented by two openings, the future mouth and anus. A primitive groove makes its appearance behind the blastopore (fig. 11, D). At this stage the hind end of the body becomes closely applied to the head, and the appendages begin to appear as hollow processes of the body-wall, a mesoblastic somite being prolonged into each of them. The first to appear are the antennae, into which the praeoral somites are prolonged. The remainder appear from before backwards in regular order, viz. jaw, oral papilae, legs 1-17. The full number of somites and their appendages is not, however, completed until a later stage. The nervous system is formed as an annular thickening of ectoderm passing in front of the mouth and behind the anus and lying on each side of the blastopore along the lines of the somites. The praeoral part of this thickening, which gives rise to the cerebral ganglia, becomes divided into several lines on each side (fig. 11, E). These pits are eventually closed, and form the hollow ventral appendages of the suprapharyngeal ganglia of the adult (fig. 7, d). The lips are formed as folds of the side wall of the body, extending from the praeoral part of the mouth, and appearing in the early development as small papillae, some of which project through the ovarian wall into the body cavity. The nervous system is formed as a oval cavity surrounded by a thin wall, opening into the oviducts. Each oviduct, after a short course, becomes dilated into the uterus. The two uteri join behind and open to the exterior by a median opening. The ovaries are divided into a series of annular arches, each one containing a spermatophore, and some of which project through the ovarian wall into the body cavity. Spermatophores are not found in the uterus and oviducts, and it appears probable, as we have said, that they reach the ovary directly by boring through the skin and traversing the body cavity. In all the species except the African species there is a globular receptaculum seminis opening by two short ducts close together into the oviduct, and in the neotropical species there is in addition a small accessory ovum, with extremely thin walls, opening into the oviduct by a short duct just in front of the receptaculum seminis. The epithelium of the latter structure is ciliated with actively moving cilia. There appear to be present in most, if not all, of the legs some accessory glandular structures opening just externally to the nephridia. They are called the crural glands.

**Development.**—*Peripatus* is found in Africa, in Australasia, in South America and the West Indies, in New Britain, and in the Malay Peninsula and Sumatra. The species found in these various localities are closely similar in their anatomical characters, the principal differences relating to the structure of the female reproductive organs and the number of the legs. They, however, differ in the most striking manner in the structure of the ovum and the early development. In all the Australian species the egg is large and heavily charged with food-yolk, and is surrounded by a tough membrane. In the Cape species the eggs are smaller, though still of considerable size; the yolk is much less developed, and the egg membrane is thinner though dense. In the New Britain species the egg is still smaller (-1 mm.), and there is a large trophic vesicle. In the neotropical species the egg is minute, and almost entirely devoid of yolk. The unsegmented uterine ovum of *P. nova zealandiae* measures 1-5 mm. in length by -8 mm. in breadth; that of *P. capensis* is -56 mm. in length; and that of *P. trinidadensis* -04 mm. in diameter. In correspondence with these differences in the ovum there are differences in the early development, though the later stages are closely similar.

The development of *P. capensis* is illustrated in figs. 11, A-C. The first pair of somites has moved to the front end of the body. A, side view of later embryo. B, Ventrail view of embryo with three pairs of mesoblastic somites, dumb-bell shaped blastopore, and primitive streak. C, Ventrail view of embryo, in which the blastopore has completely closed in its middle portion. The anterior pair of somites have moved to the front end of the body. A, Gastrula stage, ventral view, showing blastopore. B, Older gastrula stage, ventral view, showing elongated blastopore and primitive streak. C, Ventrail view of embryo with three pairs of mesoblastic somites, dumb-bell shaped blastopore, and primitive streak. D, Ventrail view of embryo, in which the blastopore has completely closed in its middle portion. The anterior pair of somites have moved to the front end of the body.
and becomes entirely transformed into a nephridium (fig. 12, D, 2). The dorsal part shifts dorsally and diminishes relatively in size (fig. 12, C). Its fate differs in the different parts of the body. In the anterior somites it dwindles and disappears, but in the posterior part it unites with the dorsal divisions of contiguous somites of the same side, and forms a tube—the generative tube (fig. 12, D, 2). The last section of this tube retains its connection with the ventral portion of the somite, and so acquires an external opening, which is at first lateral, but soon shifts to the middle line, and fuses with its fellow, to form the single generative opening. The praeoral somite develops the rudiment of a nephridium, but eventually entirely disappears. The jaw somite also disappears; the oral papilla somite forms ventrally the salivary glands, which are thus serially homologous with nephridia. The various divisions of the perivisceral cavity develop as a series of

Fig. 12.—A series of diagrams of transverse sections through Peripatus embryos to show the relations of the coelom at successive stages.

A, Early stage; no trace of the vascular space; endoderm and ectoderm in contact.
B, Endoderm has separated from the dorsal and ventral ectoderm. The somite is represented as having divided on the left side into a dorsal and ventral portion.
C, The haemocoel (3) has become divided up into a number of spaces, the arrangement of which is unimportant. The dorsal part of the somite has travelled dorsally, and now constitutes a small space (triangular in section) just dorsal to the gut. The ventral portion (2) has assumed a tubular character, and has acquired an external opening. The internal vesicle is already indicated, and is shown in the diagram by the thinner black line: 4, gut; 2, somite; 3, nephridial part of coelom; 3, haemocoel, 5, part of haemocoel which will form the heart—of the part of the haemocoel on each side of this will form the pericardium; 4, nerve-cord; 4, slime glands.
D represents the conditions at the time of birth. The coelom is represented as surrounded by a thick black line, except in the part which forms the internal vesicle of the nephridium.

spaces between the ectoderm and endoderm, and later in the mesoderm. The mesoderm seems to be formed entirely from the proliferation of the cells of the mesoblastic somites. It thus appears that in Peripatus the coelom does not develop a perivisceral portion, but gives rise only to the renal and reproductive organs.

The genus Peripatus was established in 1866 by L. Guilding, who first obtained specimens of it from St Vincent in the Antilles. He regarded it as a mollusc, being no doubt deceived by the slug-like appearance given by the antennae. Specimens were subsequently obtained from other parts of the neotropical region, and from South Africa and Australia, and the animal was variously assigned by the zoologists of the day to the Annelida and Myriapoda. Its true place in the system, as a primitive member of the group Arthropoda, was first established in 1874 by H. N. Moseley, who discovered the tracheae. Peripatus is an Arthropod, as shown by (1) the presence of appendages modified as jaws; (2) the presence of paired lateral ostia perforating the wall of heart and putting its cavity in communication with the pericardium; (3) the presence of a vascular body cavity and pericardium (haemocoelic body cavity); (4) absence of a perivisceral section of the coelom. Finally, the tracheae, though not characteristic of all the classes of the Arthropoda, are found nowhere outside that group, and constitute a very important additional reason for uniting Peripatus with it. Peripatus, though indubitably an Arthropod, differs in such important respects from all the old-established Arthropod classes, that a special class, equivalent in rank to the others, and called Prototracheata or Onychophora, has had, as we have seen, to be created for its sole occupancy. This unlikelihood to other Arthropoda is mainly due to the Annelidan affinities which it presents, but in part to the presence of the following peculiar features: (1) the number and disposition of the tracheal appendages; (2) the restriction of the jaws to a single pair; (3) the disposition of the generative organs; (4) the texture of the skin; and (5) the simplicity and similarity of all the segments of the body behind the head. The Annelidan affinities are superficially indicated in so marked a manner by the thinness of the cuticle, the dermo-muscular body-wall, the hollow appendages, that, as already stated, many of the earlier zoologists who examined Peripatus placed it among the segmented worms; and the discovery that there is some solid morphological basis for this determination constitutes one of the most interesting points of the recent researches on the genus. The Annelidan features are: (1) the paired nephridia in every segment of the body behind the first two; (2) the presence of cilia in the generative tracts (Gaffron). It is true that neither of these features is absolutely distinctive of the Annelida, but when taken in conjunction with the Annelidan disposition of the chief systems of organs, viz. the central nervous system, and the main vascular trunk or heart, they may be considered as indicating affinities in that direction.

Synopsis of Species.

Peripatus (Guilding).—Soft-bodied vermiform animals, with one pair of ringed antennae, one pair of jaws, one pair of ovipositors, and a pair of ventral coiled or straight without abdominal legs. Dorsal surface arched and more deeply pigmented than the flat ventral surface. Skin transversely ridged and beset with wart-like spiniferous papillae. Mouth anterior, ventral; anus posterior, terminal. Generative opening single, median, ventral and posterior. One pair of simple eyes. Brain large, with two ventral hollow appendages; ventral cords widely divervicated, with trunk displacing a number of distinct somites. Body-wall with papillae. Tracheal system throughout the body tubular, with paired ostia. Nephridia. Dioecious; males smaller and generally less numerous than females. Generative glands tubular, continuous with the ducts. Viviparous. Young born fully developed. Distribution: Africa (Cape Colony, Natal, and the Gaboon), New Zealand, Australia and Tasmania, New Britain, South and Central America and the West Indies, the Malay Peninsula and in Sumatra.

The genus Peripatus, so far as adult conformation is concerned, is very homogeneous one. It is true, as was pointed out by Sedgwick, that the species from the same part of the world resemble one another more closely than those from other regions, but recent researches have shown that the line between them cannot be so sharply drawn as was at first supposed, and it is certainly not desirable in the present state of our knowledge to divide them into genera or subgenera groups, as has been done by some zoologists. (The following genera have been proposed: Peripatus for the neotropical species, Peripatoides for the Australianian, Peripatosoma and Opisthophas for the African, Peripatus for the New Zealand species, and Oesoporus for the supposed ovisperous species of Australia and New Zealand.) The colour is highly variable in species from all regions; it is perhaps more constant in the species from the neotropical region than in those from other regions. The number of legs tends to be variable whenever it exceeds 19 pregenital pairs; when the number is less than 19 that it is usually, though not always, constant. More constant points of difference are the form of the jaws, the position of the generative opening, the presence of a receptaculum seminis and a receptaculum ovorum, the arrangement of the primary papillae on the distal end of the feet; and above all the early development.

South African Species.—With three spinous pads on the legs,
and feet with two primary papillae on the anterior side and one on the posterior side; outer jaw with one minor tooth at the base of the main tooth, inner jaw with no interval between the large tooth and the series of small ones; last fully developed leg of the male with a well-developed pair of legs on its ventral surface; coxal organs absent; the nephridial openings of the 4th and 5th legs are placed in the proximal spinous pads; genital glands are present behind the last pair of legs; oviparous; the terminal portion of the genital opening is without receptaculum seminis or receptaculum ovorum; the terminal unpaired portion of vas deferens short. Of considerable size, but with only a small quantity of fat.-The embryos in the uterus of all nearly one month age, except for a month or two before birth, when two broods overlap.

The following species are aberrant in respect of their characters: Peripatus Mic., "P. chelicera," Peripatus Crees (Cayman Colony and Natal), presents a few Australasian features; there is a small receptaculum seminis on each oviduct, some of the legs are provided with well-developed coxal organs, the feet have one anterior, one posterior and one dorsal papilla, and the successive difference in the ages of the embryos in the uterus, though nothing like that found in the neotropical species, is slightly greater than that found in other races of the Peripatus genus. Several pairs of legs in the middle region of the body, and provided with enlarged crural glands which open on a large papilla. Male with four accessory glands, opening on each side of and behind the genital aperture. P. tholomi, Bouvier, (Ecuador), is of a similar type; there are 24 to 25 pairs of legs, the genital opening is between the penultimate legs, and though there are only three spinous pads on the nephridial openings of the 4th and 5th legs are proximal to the 3rd and 4th, there are certain differences in the legs of the tropical type; the oviducts have receptaculum seminis. The following South African species may be mentioned: P. capensis (Grube), with 17 (rarely 18) pairs of claw-bearing legs; P. holstii (Sedgw.) with 18 (rarely 19) pairs; P. mosteyi (Wood-M.), with 20 to 24 pairs.

Australasian Species.—With 14, 15 or 16 pairs of claw-bearing abdominal legs, with three spinous pads on the legs, and nephridial opening of the 4th and 5th legs on the proximal pad; feet with one anterior, one posterior and one dorsal primary papilla; inner jaw without diastema, outer with or without a minor tooth. Last leg of some species from Australia, New Zealand, Gambia, has a second papilla on a smooth surface for the opening of a gland, and marked papillae for the crural glands are sometimes present on other legs of the male; well-developed coxal glands absent. Genital opening between the legs of the penultimate pair, has in the three species, as far as is known, without receptaculum ovorum; the terminal portion of the vas deferens long and complicated; the accessory male glands open between the genital aperture and the anus, near the latter. Ova large and heavily charged with yolk, and provided with a stoutish shell. The uterus appears to contain embryos of different ages. Specimens are recorded from West Australia, Queensland, New South Wales, Victoria and Tasmania. The number varies from 14 to 16 pairs, but the number most often found is 15. Whether the number varies in the same species is not clear. There appears to be no constant number of pairs of glands on the male, and in the supposed oviscaparous species the oviduct opens at the end of a papilla called from its supposed function an ovipositor, but the ovipositor has not yet been certainly proved as a normal occurrence. P. fletcheri (Saenger), P. insignis (Denny), P. osipurus (Denny), P. viridimaculatus (Denny), P. novaeseelandiae (Hutton), but it is by no means certain that future research will maintain these. Mr J. J. Fletcher, indeed, is of opinion that the Australian forms are all varieties of one species, P. tuckartii.

Neotropical Species.—With three to five spinous pads on the legs, nephridial opening of the 4th and 5th legs generally proximal to the 3rd pair, and feet either with two primary papillae on the anterior side and one on the posterior, or with two on the anterior and two on the posterior; outer jaw with small minor tooth or toothless; inner jaw with or without a minor tooth; variable number of posterior legs of the males anterior to the genital opening with one or two large papillae carrying the openings of the crural glands; well-developed coxal organs present on all legs; with or without a diastema; with two or three spinous papillae; without receptaculum ovorum. Genital opening between the legs of the penultimate pair; oviduct provided with receptaculum semenis and ovorum; unpaired part of vas deferens long; male accessory glands two, opening medially between the legs of the last pair. Ova large, with much yolk and thick membrane, like those of Australasian species; embryos with slitt-like blastopore and of very different ages in the same uterus, probably not representing different species. P. moseleyi, Bouvier, (Willie); P. horsti (Evans) and P. buhleri (Evans). It will thus be seen that the Malay species, while resembling the neotropical species in the generative organs, differ from these in many features of the legs and feet, in the important characters distinguished by the size and structure of the ovum, and by their early development.

PERIPTERAL—PERISSODACTYLA

PERIPTERAL (Gr. πτερ, round, and πτερω, a wing), in architecture, the term applied to a temple or other structure where the columns of the front portico are returned along its sides as wings at the distance of one or two intercolumniations from the walls of the naos or cella. Almost all the Greek temples were peripteral, whether Doric, Ionic, or Corinthian (see Temple).

PERISSODACTYLA (i.e. odd-toed), the name proposed by Sir R. Owen for that division of ungulate mammals in which the toe corresponding to the middle (third) digit of the human hand and foot is symmetrical in itself, and larger than those on either side (when such are present). The Perissodactyla have been brigaded with the Artiodactyla (q.v.) to form the typical group of the ungulates, under the name of Diplastrha, or Ungulata Vera, and the features distinguishing the combined group from the less specialized members of the order Ungulata will be found under the heading of that order.

The following are the leading characteristics by means of which the sub-order Perissodactyla is distinguished from the Artiodactyla. The cheek-teeth (premolars and molars) form a continuous series, with massive, quadrate, transversely ridged or complex crowns—the posterior premolars usually resembling the molars in structure. Crown of the last lower molar commonly bilobed. Dorso-lumbar vertebrae never fewer than twenty-two, usually twenty-three in the existing species. Nasal bones expanded posteriorly. An alisphenoid canal. Femur with a third trochanter. The middle or third digit on both fore and hind feet larger than any of the others, and symmetrical in itself, the free border of the terminal phalanx being evenly rounded (see fig. 1). This may be the only functional toe, or the second and fourth may be subequally developed on each side. In the tapirs and many extinct forms the fifth toe also remains on the fore-limb, but its presence does not interfere with the symmetrical arrangement of the remainder of the foot on each side of the median line of the third or middle digit. The astragali has a pulley-like surface above for articulation into the tibia, but its lower surface is flattened and similar to a much greater extent with the navicular than with the cuboid, which bone is of comparatively less importance than in the Artiodactyla. In existing forms the calcaneum does not articulate with the lower end of the fibula. The stomach is simple, the caecum large and capacious, the placenta diffused, and the teats inguinal.

The Perissodactyla may be divided into the four following sections, namely the extinct Titanotheriidae, the Hippoidea, represented by the horse tribe and their ancestors, the Tapiridea, typified by the tapirs, and the Rhinocerotoidae, which includes the modern rhinoceroses and their forerunners.

1. Titanotheres.—In the Titanotheriidae the dentition may be expressed by the formula $\text{c}_{1}\text{p}^{3}_{2} \text{m}_{1}^{3} \text{m}_{2}^{3}$. There is usually a short gap between the canine and first premolar; the upper molar is a short-crowned flat-cusped tooth, and there is an alisphenoid canal. There are four functional toes in front and three behind; while the calcaneum, unlike that of the other three groups, articulates with the fibula.

The group is represented by the families Palaeohippopodae and Palaeotheriidae. Both families are described under the heading Titanotheriidae.

2. Horse Group.—In the Hippoidea there is generally the full series of 44 teeth, but the first premolar, which is always small, is often deciduous or even absent in the lower or in both jaws. The incisors are chisel-shaped, and the canines tend to become isolated, so as in the more specialized forms to occupy a more or less middle position in a longer or shorter gap between the teeth and premolars. In the upper molars the two outer columns or tubercles of the primitive tubercular molar coalesce to form an outer wall, from which proceed two crescentic transverse crests, the connexion between the crests and the wall being either perfect, and the crests themselves sometimes tubercular. Each of the lower molars carries two crescentic ridges. In the earlier forms the cheek-teeth are low-crowned, but in the higher types they become high-crowned; the number of from three to four, from four to one, and of hind ones from three to one. The post-glenoidal, post-typanic and paroccipital processes of the skull are large; the second of these being always distinct. Nasals long, nearly straight, without transverse flexure.

The section is divisible into the families Equidae and Palaeotheriidae, of which the latter is extinct.

In the Equidae the premolars are generally $\text{c}_{1}$ or $\text{c}_{1}$ $\text{p}^{3}_{2}$ $\text{m}_{1}^{3} \text{m}_{2}^{3}$, and the incisors are chisel-shaped, with the canines simplified. The incisors are shortened, and the canines are much reduced, thus the first premolar is also often smaller than the second. The incisors are chisel-shaped, and (unlike the early Hippoidea) there is no gap between the first premolar, when present, and the second. The upper cheek-teeth are short-crowned and without crests, and the lower cheek-teeth are generally small, the number of from three to one.

In the Palaeotheriidae the premolars may be $\text{c}_{1} \text{p}^{3}_{2} \text{m}_{1}^{3} \text{m}_{2}^{3}$, or generally molar-like, while the first (when present) is always close to the second; all the cheek-teeth short-crowned and rooted, with or without cement. Outer walls of upper cheek-teeth W-shaped, and the outer crests oblique. Orbit open behind. The number of lower cheek-teeth generally terminating in small loops. Feet always 3-toed. (See Palaeotherium.)

3. Tapir Group.—In the Tapiridea the dentition may be either the full series of 44 teeth or a simpler one, with the first premolar in the lower or the lower premolar and molars are quite similar, the hinder ones not flattened; ridges of lower molars oblique or directly transverse, a third ridge to the last molar in the earlier forms. The Lophiodontidae, which date from the Eocene, come very close to Hyracotherium in the horse-line; and it is solely on the authority of American palaeontologists that the division of these early forms into equoids and tapiroids is attempted. In North America the earliest representative of the group is Systemodon from the Eocene, where the upper premolars are quite similar, while the molars are of a type which would readily develop into that of the modern tapirs, both outer columns being conical and of equal size. The absence of a gap between the lower canine and first premolar is a characteristic of the Eocene and becomes a feature in the Lophiodontidae, which is regarded as an essentially tapir-like feature. Lophiodonohares apparently represents this stage in the European Lower Eocene; Ictidolophus, of the American Middle Eocene, represents a distinct advance, the last upper premolar becoming molar-like, while a second species from the Upper Eocene is still more advanced; the third lobe is, however, retained in the last lower molar. In the
Oligocene of both hemispheres appears Prototapirus, which ranges well into the Miocene, and is essentially a tapir, having lost the third lobe of the last lower molar, and being in process of acquiring molar-like upper premolars, although none of these teeth have two conical cusps. In the Miocene, finally, the whole series of the upper incisors, the first and second are nearly equal, with short, broad crowns, the third is large and conical, considerably larger than the canine, which is separated from it by an interval. Lower incisors diminished in size. The canines, large and conical, projecting against (and behind) the canine-like third upper incisor. In both jaws there is a long space between the canine and its predecessor, the only tooth of the series that is not of the cheek-tooth type. The transverse processes of the cervical vertebrae are continuous, also the post-glenoid processes of the skull are broad; the whole skull being depressed with a shortened facial portion. The fore-foot is five-toed and spreading; indicating that the members of the family were still dwelling in the forest.

We have then the family Rhinocerotidae, which includes the existing representatives of the group. In this family the dentition has undergone considerable reduction, and may be represented inclusive of all the variations, by the formula $i_1^p + 5^p$ $c_1^p + 3^p$ $m_1^p + 4^p$. The incisors tend to become lateral, the canines are enlarged, and the last upper molar is sub-quadangular. The upper molars have a crist a but no crochet ($c_2$). As in the last family, the post-glenoid process of the skull is broad; the whole skull being depressed with a shortened facial portion. The fore-foot is five-toed and spreading; indicating that the members of the family were still dwelling in the forest.

Finally, we have the family Rhinocerotidae, which includes the existing representatives of the group. In this family the dentition has undergone considerable reduction, and may be represented inclusive of all the variations, by the formula $i_1^p + 5^p$ $c_1^p + 3^p$ $m_1^p + 4^p$. The incisors tend to become lateral, the canines are enlarged, and the last upper molar is sub-quadangular. The upper molars have a crist a but no crochet ($c_2$). As in the last family, the post-glenoid process of the skull is broad; the whole skull being depressed with a shortened facial portion. The fore-foot is five-toed and spreading; indicating that the members of the family were still dwelling in the forest.

A large number of representatives of the group are known from both the Old and the New World; specialization displaying itself in the typicalus in the Oligocene of America. The dental distribution has become greatly restricted, at least five well-marked species survive. The group is unknown in South America.

As regards the dentition of the existing species, the cheek-series consists of the first four molars below and above, all in contact and closely resembling each other, except the first, which is much smaller than the rest and often deciduous; the
PERISTYLE—PERITONITIS

Limbs stout, and of moderate length. Three completely developed toes, with distinct broad rounded hoofs on each foot. Teats two, inguinal. Eyes small. Ears of moderate size, oval, but pointed out. Skin short, thick, in many species thrown into massive folds. Hair covering scanty. One or two median horns on the face. When one is present it is situated on the forehead between the horns carried by the front of the forehead. These horns, which are of a more or less conical form and usually recurved, and often grow to a great length (three or even four feet), are composed of a solid mass of hardened epidermis, derived from a cluster of long dermal papillae.

The cells formed on each papilla constitute a distinct horny fibre, as thick a hair, and the whole is cemented together by an intermediate mass of cells which grow up from the interstices between the papillae. This mass is covered with a mass of agglutinated hairs, which, in the newly growing part at the base, readily fray out on destruction of the softer intermediate substance; but the fibres differ from true hairs in growing from a free papilla of the derm, and not within a follicular involution by the same. Considerable difference of opinion exists with regard to the best classification of the family, some authorities including most of the species in the type genus, Elasmotherium, which recognize quite a number of sub-families and still more genera. Here the family is divided into two groups Rhinocerotinae and Elasmotheriinae, the latter including only Elasmotherium, and the former the Lower Miocene and in that of America Lateraltherium (Trigonias), which were primitive species with persistent upper canines and three-toed fore-feet. Possibly they belonged to the Amynodontidae, but they are very closely related to the African genus Ceratotherium, in which the nasal bones formed a transverse pair; this genus being common to Europe and North America. Caenopods is an allied American type. Hemiceratopods, with five front toes, from the Lower Miocene to the Lower Pliocene, represent the genus Aceratherium, which may also occur in America, as it certainly does in India. With the short-skulled, short-toed, toothless rhinoceroses of Europe, France, and America from the Lower Miocene to the Lower Pliocene, typified by the European R. goldfussi and R. brazchonus, we may consider the genus Rhinoceros to commence; these species constituting the subgenus Téneos. The living R. (Dicerorhinus) sumatranus of south-eastern Asia indicates another subgenus, represented in the European Miocene by R. sansaniensis and in the Indian Pliocene by R. platyrhinos, in which two horns are combined with the presence of canines. Next we have the widely living African species, representing the subgenus Dicerorhinus, in which there are two horns but no front teeth. To this group belongs the extinct European and Asiatic woolly rhinoceros Rhinocerus (Dicerorhinus antiquitatis) of Pleistocene age, of which the frozen bodies are sometimes found in Siberia, and R. (D.) pachycephalus of the Lower Pliocene of Greece. Finally the Great Indian rhinoceros R. unicornis, the Javan R. sumatranus, and the Lower Pliocene Indian R. (C.) tecticeps are the last in this group, in which front teeth are present, but there is only one horn. (See Rhinoceroses.)

Elasmotheriinae is represented only by the huge E. stibiurs of the Siberian Pleistocene, in which the premolars were reduced to 3/4 while front-teeth were probably wanting, and the cheek teeth developed tall crowns, without roots, but with considerable buccal enamel, the enamel being more compactly arranged. A hump on the forehead probably indicates the existence of a large frontal horn.

PERISTYLE (Gr. πτερώ, and στόλον, column), in architecture, a range of columns (whether rectangular or circular on plan) in one or two rows, enclosing the sanctuary of a temple; the term is also applied to the same feature when built round the court in which the temple is situated and in Roman houses to the court in the rear, round which the private rooms of the family were arranged, which were entered from the covered colonnade round the court.

PERITONITIS, inflammation of the peritoneum— the serous membrane which lines the abdominal and pelvic cavities and gives a covering to their viscera. It may exist in an acute or a chronic form, and may be either localized or diffused. Acute peritonitis may be brought on, like other inflammations, by exposure to wet, cold, or in connexion with injury to, or disease of, some abdominal organ, or with general feebleness of health. It is an occasional result of injuries and of obstruction of the bowels, of wounds penetrating the abdomen, of the perforation of visceras, as in ulcer of the stomach, and of the intestine in typhoid fever, of the bursting of abscesses or cysts into the abdominal cavity, and also of the extensions of inflammatory action from some abdominal or pelvic organ, such as the appendix, the uterus, or bladder. At first localized, it may afterwards become general. The changes effected in the peritoneum are similar to those of the serous membranes elsewhere when irritated.

Thus, there are congestion; exudation of lymph in greater or less abundance, at first greyish and soft, thereafter yellow, becoming tough and causing the folds of the intestine to adhere together; effusion of fluid, either clear, turbid, bloody or purulent. The tough, plastic lymph connecting adjacent folds of intestine is sometimes drawn out like spun-glass by the movements of the intestines, forming bands and loops through or beneath which a piece of bowel may become fatally snared.

The symptoms of acute peritonitis usually begin by a shivering fit or rigor, together with vomiting, and with pain in the abdomen of a peculiarly severe and sickening character, accompanied with extreme tenderness, so that pressure, even of the bladder, causes aggravation of suffering. The patient lies on the back with the knees drawn up so as to relax the abdominal muscles; the breathing becomes rapid and shallow, and is performed by movements of the chest only, the abdominal muscles remaining quiescent—unlike what takes place in healthy respiration. The abdomen becomes swollen by flatulent distension of the intestines, which increases the distress. There is usually constipation. The skin is hot, although there may be perspiration; the pulse is small, hard and wiry; the urine is scanty and highly coloured, and is passed with pain. The face is pinched and anxious. These symptoms may pass off in a day or two; if they do not the case is apt to go on to a fatal termination. In such event the abdomen becomes more distended; hiccup, and the vomiting of brown or blood-coloured matter occur; the temperature falls, the face becomes cold and clammy; the pulse is exceedingly rapid and feeble, and death takes place from collapse, the mental faculties remaining clear till the close. When the peritonitis is due to perforation—as may happen in the case of gastric ulcer or of ulcers of typhoid fever, or in the giving way of a loop of strangulated bowel—the above-mentioned symptoms and the fatal collapse may all take place in from twelve to twenty-four hours. The puerperal form of this disease, which comes on within a day or two after childbirth, is often rapidly fatal. The actual cause of death is the absorption of the poisonous inflammatory products which have been poured out into the peritoneal cavity, as well as of the toxic fluids which have remained stagnant in the paralysed bowel.

Perhaps the commonest cause of septic peritonitis is the escape of micro-organisms (bacillus colli) from the ulcerated, mortified or inflamed appendix (see APPENDICITIS). A generation or so ago deaths from this cause were generally placed under the single heading of "peritonitis," but at the present time the primary disease is shown upon the certificate which too often runs thus: appendicitis five days, acute peritonitis two days. Chronic peritonitis may occur as a result of the acute attack, or as a tuberculous disease. In the former case, the gravest symptoms having subsided, some abdominal pain continues, the poisonous inflammatory products which have been poured out into the peritoneal cavity, and to the presence of fluid in the peritoneal cavity. This kind of peritonitis may also develop slowly without there having been any preceding acute attack. There is a gradual loss of strength and flesh. The disease is essentially a chronic one; it is not usually fatal.

Tuberculous peritonitis occurs either alone or in association with tuberculous disease of a joint or of the lungs. The chief symptoms are abdominal discomfort, or pain, and distension of the bowels. The patient may suffer from either constipation or diarrhœa, or each alternately. Along with these local manifestations there may exist the usual phenomena of tuberculous disease, viz. high fever, with rapid emaciation and loss of strength. But some cases of tuberculous peritonitis present symptoms which are not only obscure, but actually misleading.
PERIZONIUS—PERJURY

There may be no abdominal distension, and no pain or tenderness. The patient may lie quietly in bed, flat on his back, with the legs down straight, and he may have no marked elevation of temperature. There may be no vomiting and no constipation or diarrhoea. In some cases, the neighbouring coils of intestine having been glued together, a collection of serous fluid takes its place in the midst of the mass, and, being walled in by the adhesions, forms a rounded tumour, dull on percussion, but not tender or painful. Such cases, especially when occurring in women, are apt to be mistaken for cystic disease of the ovary.

As regards the treatment of acute peritonitis, the first thing that the surgeon has to do is to assure himself that the disease is not due to some cause which itself should be dealt with, to a septic disease of appendix or Fallopian tube, for instance, or to a toxic condition, which may be due to an abscess, to appendicitis, abortion, or to a perforated ulcer of stomach or intestine. In many obscure cases the safest treatment is likely to be afforded by an exploratory abdominal section. If the medical attendant has made up his mind that the question of exploration is not to be entertained—a decision which should be arrived at only after most deliberate consultation—the best thing will be to apply fomentations to the abdomen, and to administer small and repeated doses of castor oil or other laxative, till its passage is assured by peristalsis or so until the physiological effect is produced. As regards other drugs, it may be a question as to whether calomel or Epsom salts should be given, as remedies for this disease. It is to be safely recommended is a little hot water taken in sips. A bed-cradle should be placed over the patient in order to keep the weight of the bed-clothes from the abdomen.

PERIZONIUS (or ACCINCTES), the name of JAKOB VOORBRUIK (1621–1715), Dutch classical scholar, who was born at Appingedam in Groningen on the 26th of October 1621. He was the son of Anton Perizonius (1626–1672), the author of a well-known treatise, De ratione studii theologici. Having studied at the university of Utrecht, he was appointed in 1681 to the chair of eloquence and history at Frankfort through the influence of J. G. Graevius and Nicolas Heinsius. In 1693 he was promoted to the corresponding chair at Leiden, where he died on the 6th of April 1715. The numerous works of Perizonius entitle him to a very high place among the scholars of his age. Special interest attaches to his edition of the Minerva of Francesco Sanchez or Sanctius of Salamanca (1st ed. 1637; ed. C. L. Bauer, 1792–1801), one of the last developments of the study of Latin grammar in its pre-scientific stage, when the phenomena of language were still regarded as for the most part disconnected, conventional or fortuitous. Mention should also be made of his Animadversiones historiarum (1662), which may be considered standard works of historical criticism, and of his treatises on the Roman republic, alluded to by Niebuhr as marking the beginning of that new era of historical study with which his own name is so closely associated.

The article on Perizonius in Van der Aa’s Biographisch Woordenboek der Nederlands contains full biographical and bibliographical particulars; see also F. A. Eckstein in Ersch and Gruber’s Allgemeine Encyklopädie.

PERJURY (through the Anglo-Fr. perjurie, modern perjury, Lat. perjurium, a false oath, perjurare, to swear falsely), an assertion upon an oath duly administered in a judicial proceeding before a competent court of the truth of some matter of fact, material to the question depending in that proceeding, which assertion the assessor does not believe to be true when he makes it, or on which he knows himself to be ignorant (Stephen, Digest of the Criminal Law, art. 135). In the early stages of legal history perjury seems to have been regarded rather as a sin than as a crime, and so subject only to supernatural penalties. The injury caused by a false oath was supposed to be done not so much to society as to the Divine Being in whose name the oath was taken (see OATH). In Roman law, even in the time of the empire, the perjuriae fell simply under divine reprobation, and was not dealt with as a criminal, except where he had been bribed to withhold true or give false evidence, or where the oath was by the genius of the emperor. In the latter case punishment was no doubt inflicted more for the insult to the emperor than for the perjury. False testimony leading to the conviction of a person for a crime punishable with death constituted the offence of homicide rather than of perjury. In England, perjury, as being a sin, was originally a matter of ecclesiastical cognisance. At a later period, when it had become a crime, the jurisdiction of the spiritual courts became gradually confined to such perjury as was committed in ecclesiastical proceedings, and did not extend to perjury committed in a temporal court. The only perjury which was for a long time noticed at common law was the perjury of jurors. Attainder of jurors (see ATTAINT, WALT 02) who were originally rather in the position of witnesses than of judges of事实, and incidentally subjected them to punishment for perjury. Criminal jurisdiction over perjury by persons other than jurors seems to have been first assumed by the Star Chamber, acting under the powers supposed to have been conferred by an act of Henry VII. (1487). After the abolition of the Star Chamber by the Long Parliament in 1641 and the gradual diminution of the authority of the spiritual courts, perjury (whether in the strict sense of the word or the taking of a false oath in non-judicial proceedings) practically fell entirely within the jurisdiction of the ordinary criminal tribunals. At common law only a false oath in judicial proceedings is perjury. But by statute the taking of a false oath in other cases of felony has been made punishable, e.g. false declarations made for the purpose of procuring marriage (The Marriage and Registration Act 1856), and false affidavits under the Bills of Sale Act 1858. False affirmation by a person permitted by law to affirm is perjury (The Evidence Further Amendment Act 1869; The Evidence Amendment Act 1870).

In order to support an indictment for perjury the prosecution must prove the authority to administer the oath, the occasion of administering it, the taking of the oath, the substance of the oath, the materiality of the matter sworn, the falsity of the matter sworn, and the corrupt intention of the defendant. The indictment must allege that the perjury was willful and corrupt, and must set out the false statement or statements on which perjury is assigned, subject to the provisions of the Prosecutions for Perjury Act 1749 (which also applies to subornation of perjury). By that act it is sufficient to set out the substance of the offence, without setting forth the bill, answer, &c., or any part of the record and without setting forth the commission or authority of the court before whom the perjury was committed. The matter sworn to must be one of fact and not of mere belief or opinion. It is not homicide, as in Roman law, to procure the death of another by false evidence, but the Criminal Code, ss. 118, 164, proposed to make such an offence a substantive crime of greater gravity than ordinary perjury, and punishable by penal servitude for life. It is a rule of evidence, founded upon obvious reasons, that the testimony of a single witness is insufficient to convict on a charge of perjury. There must be corroboration of his evidence in some material particular. Perjury is a common law misdemeanour, not triable at quarter-sessions. Most persons in a judicial position have the right of directing the prosecution of any witness, if it appears to them that he has been guilty of perjury (The Criminal Procedure Act 1851). The provisions of the Vexatious Indictments Act 1859 extend to perjury and subornation of perjury. By that Act no indictment for either of such offences can be preferred unless the prosecutor or accused is bound by recognisance, or the accused is in custody, or the consent of a judge is obtained, or (in the case of perjury) a prosecution is directed under the act of 1851.

Subornation of perjury is procuring a person to commit a perjury which he actually commits in consequence of such procurement. If the person attempted to be suborned do not take the oath, the person inciting him, though not guilty of subornation, is liable to fine and corporal punishment. Perjury and subornation of perjury are punishable at common law with fine and imprisonment. By the combined operation of the Perjury Act 1728 and later statutes, the punishment at present appears to be penal servitude for any term, or imprisonment with or without hard labour for a term not exceeding seven years (see Stephen, Digest, art. 148). The punishment at common law was whipping, imprisonment, fine and pillory.
PERKIN—PERLEBERG

Perjury or prevation committed before a committee of either House of Parliament may be dealt with as a contempt or breach of privilege as well as by prosecution. As to false oaths not perjury, it is a misdemeanor at common law, punishable by fine and imprisonment, to swear falsely before any person authorized to administer an oath upon a matter of common concern, under such circumstances that the false swearing, if committed in judicial proceedings, would have amounted to perjury. There are some cases of making false declarations, which are punishable on summary conviction, e.g. certain declarations under the Registration of Births and Deaths Act 1874, and the Customs Consolidation Act 1876.

In Scotland the law, as a general rule, agrees with that of England. Perjury may be committed by a party on reference to oath as well as by one who has given false evidence on false suspicion of guilt of perjury (The Affirmation [Scotland] Act, 1862). The acts of 1851 and 1859 do not extend to Scotland. The trial, though usually by the court of justiciary, may be by the court of session if the perjury is committed in the course of an action before that court. The punishment is penal servitude or imprisonment at the discretion of the court. Formerly a person convicted of perjury was disqualified from giving evidence in future; this disability was abolished by the Evidence (Miscellaneous Provisions) Act 1879.

In the United States the common law has been extended by most states to embrace false affirmations and false evidence in proceedings not judicial. Perjury in a United States court is dealt with by an act of 1862, by which the maximum punishment for perjury or subornation of perjury is a fine of $2000 or imprisonment for not more than five years. Jurisdiction to punish perjury in the states is not clearly defined, but belongs to the courts of general jurisdiction. The Federal Constitution did not give it to the Federal government. Statutory provisions founded upon the English act of 1749, have been adopted in some states. In the states which have not adopted such provisions, the indictment must set out the offence with the particularity necessary at common law.

On the continent of Europe perjury is also regarded as an offence of gravity punishable by imprisonment for varying periods. In Germany, as in England, it was at one time a matter for the spiritual courts. In Austria it is treated as a form of fraud, and the punishment is proportioned to the estimated amount of damage done to the party aggrieved. In France the term perjury (perjure) is specifically applied only to the making of false oaths by parties in a civil suit.

PERKIN, SIR WILLIAM HENRY (1838-1907), English chemist, was born in London on the 12th of March 1838. From an early age he determined to adopt chemistry as his profession, although his father, who was a builder, would have preferred him to be an architect. Attending the City of London School he devoted all his spare time to chemistry, and on leaving, in 1853, entered the College of Chemistry, then the name of the direction of A. W. Hofmann, in whose chemical laboratory he was in the course of a year or two promoted to be an assistant. Devoting his evenings to private investigations in a research laboratory fitted up at his home, Perkin was fired by some remarks of Hofmann's to undertake the artificial production of quinine. In this attempt he was unsuccessful, but the observations he made in the course of his experiments induced him, early in 1856, to try the effect of treating aniline sulphate with bichromate of potash. The result was a precipitate, aniline black, from which he obtained the colouring matter subsequently known as aniline blue or mauve. He lost no time in bringing this substance before the managers of Pullar's dye-works, Perth, and he was employed as assistant to the chief, if only to prove too expensive in use. Thus encouraged, he took out a patent for his process, and leaving the College of Chemistry, a boy of eighteen, he proceeded, with the aid of his father and brother, to erect works at Greenford Green, near Harrow, for the manufacture of the newly discovered colouring matter, and by the end of 1857 the works were in operation. That date may therefore be reckoned as that of the foundation of the coal-tar colour industry, which has since attained such important dimensions—in Germany, however, rather than in England, the country where it originated. Perkin also had a large share in the introduction of artificial alizarin (q.v.), the red dye of the madder plant, by the aid of C. Graebe and C. T. Liebmann in 1868 prepared that substance synthetically from anthrachene, but their process was not practicable on a large scale, and it was left to him to patent a method that was commercially valuable. This he did in 1869, thus securing for the Greenford Green works a monopoly of alizarin manufacture for several years. About the same time he also carried out a series of investigations into kindred substances, such as anthraropurpurin. About 1874 he abandoned the manufacture of coal-tar colours and devoted himself exclusively to research in pure chemistry, and among the discoveries he made in this field was that of the reaction known by his name, depending on the condensation of aldehydes with fatty acids (see CINNAMIC ACID). Later still he engaged in the study of the relations between chemical constitution and rotation of the plane of polarization in a magnetic field, and enunciated a law expressing the variation of such rotation in bodies belonging to homologous series. For this work he was in 1889 awarded a Davy medal by the Royal Society, which ten years previously had bestowed upon him a Royal medal in recognition of his investigations in the coal-tar colours. The Chemical Society, of which he became secretary in 1869 and president in 1883, presented him with its Longstaff medal in 1889, and in 1890 he received the Albert medal of the Society of Arts. In 1906 an international celebration of the fiftieth anniversary of his invention of mauve was held in London, and in the same year he was made a knave. He died near Harrow on the 14th of July 1907.

His eldest son, WILLIAM HENRY PERKIN, was born at Sudbury, near Harrow, on the 17th of June 1860, and was educated at the City of London School, the Royal College of Science, and the universities of Würzburg and Munich, became professor of chemistry at the Heriot-Watt College, Edinburgh, in 1887, and professor of organic chemistry at Owens College, Manchester, in 1892. His chief researches deal with the polymethylene compounds, the alkaloids, in particular hydralazine and berberine, and the camphors and terpenes (q.v.). He received the Davy medal from the Royal Society in 1904.

PERKINS, CHARLES CALLAHAN (1823-1886), American artist and author, was born in Boston and educated at Harvard, subsequently studying art in Rome and Paris. Returning to Boston, he helped to found the Museum of Fine Arts, of which he was honorary director, and for many years he played a leading part in artistic circles as a cultured critic and writer. His chief publications were Tuscan Sculptors (1864) and Italian Sculptors (1868)—replaced in 1883 by The Historical Handbook of Italian Sculptors—Art in Education (1870), and Sepulchral Monuments in Italy (1888).

PERKINS, JACOB (1666-1849), American inventor and philanthropist, was born at Newburyport, Massachusetts, in 1776, and was apprenticed to a goldsmith. He soon made himself known by a variety of useful mechanical inventions, and in 1818 came over to England with a plan for engraving bank-notes on steel, which ultimately proved a signal success, and was carried out by Perkins in partnership with the English engraver Heath. His chief contribution to physics lay in the experiments by which he proved the compressibility of water and measured it by a piezometer of his own invention (see Phil. Trans., 1820, 1826). He retired in 1834, and died in London on the 30th of July 1849.

His second son, ANGER MARCH PERKINS (1837-1881), also born at Newburyport, went to England in 1837, and was the author of a system of warming buildings by means of high-pressure steam. His grandson, LOFTUS PERKINS (1834-1891), most of whose life was spent in England, experimented with the application to steam engines of steam at very high pressures, constructing in 1880 a yacht, the "Anthracite," whose engines worked with a pressure of 500 lb. to the sq. in.

PERLEBERG, a town of Germany, in the Prussian province of Brandenburg, on the Stepenitz, 6 m. N.E. from Wittenberge by the railway to Neustrelitz. Pop. (1905), 9502. It contains a fine Gothic Evangelical church, a Roman Catholic church, a synagogue and several schools, and has a town-hall, dating from the 15th century, and a Roland column. Its chief manufactures are machinery, soap, blacking and clogs.

See Hopfner, Perleberger Reimchronik. Perleberg von 1200 bis 1700 (Perleberg, 1876).
PERLES—PERM

PERLES, JOSEPH (1835–1894), Jewish rabbi, was born in Hungary in 1835, and died at Munich in 1894. He was one of the first rabbis trained at the new type of seminary (Breslau).

Perles’ most important essays were on folk-lore and customs. There is much that is striking and original in his history of marriage (Die Hochzeit im nachthindischen Zeitalter, 1860), and of mourning customs (Die Leichenfeierlichkeiten im nachthindischen Judenland, 1861), his contributions to the sources of the Arabian Nights (Zur rabbinischen Sprach- und Sagenkunde, 1873), and his notes on rabbinic antiquities (Beiträge zur rabbinischen Sprach- und Altertumskunde, 1893). Perles’ essays are rich in suggestive-ness, and have been the starting-point of much fruitful research. He also wrote an essay on Nachmanides, and a biography and critical appreciation of Rashba (1863).

PERLITE, or PEARLSTONE, a glassy volcanic rock which, when struck with a hammer, breaks up into small round or polygonal fragments that often have a pearly lustre. The reason for this peculiarity is obvious in microscopic sections of the rock, for many small cracks may be seen traversing the glassy substance. These mostly take a circular course, and often occur in groups, one within another. The circular cracks bound the little spheres into which the rock falls when it is struck, and the concentric fissures are the cause of the pearly lustre, by the reflection of light from enclosed films of air. Longer straight cracks run across the sections separating areas in which the circular fissures preponderate. By decomposition the fissures may be occupied by deposits of limonite, which make them more obvious, or by other secondary minerals. The glass itself often undergoes change along the cracks by becoming finely crystalline or devitrified, dull in appearance and slightly opaque in section. In polarized light the perlitic glass is usually quite isotropic, but sometimes the internal part of some of the spheres has a slight double refraction which is apparently due to strain. The glass found on the waste-heaps of glass-furnaces is sometimes very coarsely perlitic.

Perlitic structure is not confined to glass, but may be seen also in that variety of opal which is called hyalite. This forms small transparent rounded masses like drops of gum, and in microscopic section exhibits concentric systems of cracks. Hyalite, like perlitic obsidian, is amorphous or non-crystalline. It is easy to imitate perlitic structure by taking a little Canada balsam and heating it on a slip of glass till most of the volatile matters are driven out; then drop it in a basin of cold water and typical perlitic structure will be produced. The reason is apparently the sudden contraction when the mass is chilled. In the glaze on tiles and china rounded or polygonal systems of cracks may often be seen which somewhat resemble perlitic structure but are less perfect and regular. Many rocks which are cryptocrystalline or felsitic, and not glassy, have perfect perlitic structure, and it seems probable that these were originally vitreous obsidians or pitchstones and have in process of time been changed to a finely crystalline state by devitrification. Occasionally in olivine and quartz rounded cracks not unlike perlitic structure may be observed.

Many perlitic rocks contain well-developed crystals of quartz, feldspar, augite or magnetite, &c., usually more or less corroded or rounded, and in the fine glassy base minute crystals often abound. Some of the rocks have the resinos lustre and the high percentages of combined water which distinguish the pitchstones; others are bright and fresh obsidians, and nearly all the older examples are dull, cryptocrystalline felsites. According to their chemical compositions they range from very acid thyloliths to trachytes and andesites, and the dark basaltic glasses or tachylites have sometimes, as in obsidian, a distinct cryptocrystalline felsitic character. These are of intrusive origin, and the general absence of steam cavities in these rocks would support this conclusion, but some perlitic Hungarian rhyolites are believed to be lavas.

Very well known rocks of this kind are found in Meissen, Saxony, as dikes of greenish and brownish pitchstone. Other examples are furnished by the Tertiary igneous rocks of Hungary (Tokai, &c.), the Euganean Hills (Italy) and Ponza Island (in the Mediterranean).

In mineralogical collections rounded nodules of brown glass varying from the size of a pea to that of an orange may often be seen labelled Marekanite. They have long been known to geologists and are found at Ockotsk, Siberia, in association with a large mass of perlitic obsidian. These globular bodies are, in fact, the more compact portions of a perlitic; the rest of the rock falls down in a fine powdery, setting free the glassy spheres. They are subject to considerable internal strain, as is shown by the fact that when struck with a hammer or sledged with a lapidary’s saw they often burst, fragments of which, when examined, resemble the balls of rapidly cooled, unannealed glass which are called Prince Rupert’s drops. In their natural condition the marekanite spheres are doubly refracting, but when they have been boiled and washed lose this property and no longer exhibit any tendency to sudden disintegration.

In Great Britain Tertiary vitreous rocks are not common, but the pitchstone which forms the Scirg of Elgin is a dark andesitic pitchstone with perlitic structure in Hungary, but a slight exception, however, is provided by a perlitic dactitic pitchstone porphyry that occurs near the Tay Bridge in Fife, Scotland. The trachytic basalt dikes of Mull are occasionally highly perlitic. At Sandy Braes in Antrim a perlitic obsidian has been found, and the Lea Rock, near Wellington in Shropshire, is a devitrified obsidian which shows perlitic cracks and the remains of spherulites.

PERM, a government of east Russia, bounded S. by the governments of Orenburg and Ufa, W. by Vyatka, N.W. by Vologda, and E. by Tobolsk (Siberia). It has an area of 128,173 sq. m. Though administratively it belongs entirely to Russia in Europe, its eastern part (about 57,000 sq. m.) is situated in Siberia, in the basin of the Ob. The government is traversed from north to south by the Ural Mountains, 30 to 45 m. in width, thickly clothed with forests, and deeply excavated by rivers. The hills, or mountain ranges, are a part of the section of the range (the Vogulian Ural); in the central portion, between 59° and 68° 30’ N., they once or twice exceed 5000 ft. (Denezhkin, 5360 ft.), but the chain soon sinks towards the south, where it barely attains an elevation of 3000 ft. The great Siberian road crosses it at the highest point is 1400 ft.

The government is very well drained by rivers belonging to the Pechora, Tobol (affluent of the Ob) and Kama systems. The Pechora itself rises in the northern corner of the government, and its tributary the Volosnitsa is separated by a distance of less than 3 m. from the navigable Vogulka, a tributary of the Kama, a circumstance of some commercial importance. The chief river of Perm, however, is the Kama, whose navigable tributaries the Syva and the Kolva are important channels for the export of heavy iron goods to Russia. The government is dotted with a great number of lakes of comparatively tripling size, their total area being 730 m., and with marshes, which are extensive in the hilly tracts of the north. Granite, diorites, porphyries, serpentines and Laurentian gneisses and limestones, containing iron, copper and zinc ores, constitute the main axis of the Ural chain; their western slope is covered by a narrow strip of Huronian crystalline slates, which disappear in the east under the Post-Tertiary deposits of the Siberian lowlands, while on the west narrow strips of Silurian limestones, quartzites and slates, and separate islands of Devonian deposits, appear on the surface. The Permian deposits extend as a regular strip, parallel to the main ridge, over these last, and are covered with the so-called “variegated marls,” which are considered as Triassic, and appear only in the western corner of the territory. Perm is the chief mining region of Russia, owing to its wealth in iron, silver, platinum, copper, nickel, lead, chrome ore, manganese and auriferous alluvial deposits. Many rare metals, such as iridium, osmium, rhodium and ruthenium, are found along with the above, as also a great variety of precious stones, such as diamonds, sapphires, jasper, topaz, aquamarines, topazes, amethysts, jades, malachite. Salt-springs occur in the west; and the mineral waters, though still little known, are worthy of mention. No less than 70% of the total area is occupied with forest; but the forests are distributed very unequally, covering 95% of the area in the north and only 25% in the south-east. Firs, the pine, cedar, larch, birch, alder and lime are the most common; the oak appears only in the south-west. The flora of
Perm presents a mixture of Siberian and Russian species, several of which have their north-eastern or south-western limits within the government. The climate is severe, the average temperature at different places being as follows:

The estimated population in 1906 was 3,487,100, and consists chiefly of Great Russians, besides Bashkirs (including Meshcheriks and Teypyars). Permavsk or Permians, Tatars, Czecho-Slovaks, Syrzenians, Votyaks and Voguls. Agriculture is the general occupation; rye, oats, barley and hemp are raised in all parts, and wheat, millet, buckwheat, potatoes and flax in the south. Cattle-breeding is specially developed in the south-east among the Bashkirs, who have large numbers of horses. Mining is developing steadily though slowly. The ironworks employ nearly 200,000 hands (12,000 being in the Imperial ironworks), and their aggregate output reaches an estimated value of £6,000,000 annually. The annual production of gold is valued at nearly half a million sterling, and of platinum at approximately a quarter of a million, the output of platinum being equal to 95% of the world's total output. Coal and coke to the extent of 300,000 to 500,000 tons, salt to 300,000 tons, asbestos and other minerals are also obtained. The first place among the manufacturing industries is taken by flour-mills. The cutting of precious stones is extensively carried on throughout the villages on the eastern slope of the Ural Mountains, the chief market for them being at Ekaterinburg. An active trade, greatly favoured by the easy communication of the chief centres of the mining industry with the market of Nizhniy Novgorod on the one side and with the network of Siberian rivers on the other, is carried on in metals and metal wares, minerals, timber and wooden wares, tallow, skins, cattle, furs, corn and linseed. Large caravans descend the affluents of the Kama every spring, and reach the fairs of Laishev and Nizhniy Novgorod, or descend the Volga to Samara and Astrakhan; while Ekaterinburg is an important centre for the trade with Siberia. The fairs at Iribit, second in importance only to that of Nizhniy Novgorod, and Ivanov (in the district of Shadrinsk) are centres for supplying Siberia with groceries and manufactured wares, as also for the purchase of tea, of furs for Russia, and of corn and cattle for the mining districts. The chief commercial centres are Ekaterinburg, Iribit, Perm, Kamyshev, Shadrinsk and Cherdyn.

Perm is more largely provided with educational institutions and primary schools than most of the governments of central Russia. Besides the ecclesiastical seminary at Perm there is a mining school at Ekaterinburg. The Perm zemstvo or provincial council is one of the most active in Russia in promoting the spread of education and agricultural knowledge among the peasants.

The government is intersected by a railway from Perm eastwards across the Urals, and thence southwards along their eastern slope to Ekaterinburg, Chelyabinsk (main Siberian trunk line) and Tyumen; also by a railway from Perm to Kotlas, at the head of the Northern Divina.

History.—Remains of palaeolithic man, everywhere very scarce in Russia, have not yet been discovered in the upper basins of the Kama and Ob, with the exception, perhaps, of a single human skull found in a cavern on the Chanza (basin of Kama), together with a skull of Ursus moschifrons. Numerous remains of mammoths have been found in immediate vicinity on both Ural slopes. Still larger quantities of implements belonging to an early Finnish, or rather Ugrian, civilization are found everywhere in the basins of the Kama. Herodotus speaks of the richness of this country inhabited by the Ugrians, who kept up a brisk traffic with the Greek colony of Olbia near the mouth of the Dnieper, and with the Bosphorus by way of the Sea of Azov and the Volga. The precise period at which the Ugrians left the district for the southern steppes of Russia (the Lebedin of Constantine Porphyrogenitus) is not known. In the 9th century, if not earlier, the Norsemen were acquainted with the country as Bjarmeland, and Byzantine annalists knew it as Permia. Nestor describes it as a territory of the Perm or Permians, a Finnish people.

The Russians penetrated into this region at an early date. In the 11th century Novgorod levied tribute from the Finnish inhabitants, and undertook the colonization of the country, which in the treaties of the 13th century is dealt with as a separate territory of Novgorod. In 1471 the Novgorod colonies in Perm were annexed to Moscow, which in the following year erected a fort to protect the Russian settlers and traders against the Voguls, Ostiaks and Samoyedes. The mineral wealth of the country attracted the attention of the Moscow princes, and in the 16th century Ivan III. sent two Germans to search for ores; these they succeeded in finding south of the upper Pechora. The Stroganovs in the 16th century founded the first salt- and iron-works, built forts, and colonized the Ural region. The rapidly-growing trade with Siberia gave a new impulse to the development of the country. This trade had its centres at Perm and Solikamsk, and later at Iribit.

PERM, a town of Russia, capital of the government of the same name, stands on the left bank of the Kama, on the great highway to Siberia, 1,130 m. by rail and river N.E. from Moscow. Pop. (1879), 32,530; (1897), 45,493. During summer it has regular steam communication with Kazan, 605 m. distant, and it is connected by rail (311 m.) with Ekaterinburg on the east side of the Urals. The town is mostly built of wood, with broad streets and wide squares, and has a somewhat poor aspect, especially when compared with Ekaterinburg. It is the seat of a bishop of the Orthodox Church, and has an ecclesiastical seminary and a military school, besides several scientific institutions (the Ural society of natural sciences, archives committee, technical society), and a scientific museum. Its industries develop but slowly, the chief works being ship-building yards, tanneries, chemical works, saw-mills, brickfields, copper foundries, machinery works, soap and candle factories and rope-works. The government has a manufactory of steel guns and munitions of war in the immediate neighbourhood of the town.

The present site of Perm was occupied, as early as 1568, by a settlement named Brukhanovo, founded by one of the Stroganovs; this settlement seems to have received the name of Perm in the 17th century. A copperworks was founded in the immediate neighbourhood in 1723, and in 1781 it received officially the name of Perm, and became an administrative centre both for the country and for the mining region.

PERMEABILITY, MAGNETIC, the ratio of the magnetic induction or flux-density in any medium to the inducing magnetic force. In the C.G.S. electromagnetic system of units the permeability is regarded as a pure number, and its value in empty space is taken as unity. The permeability of a metal belonging to the ferromagnetic class—iron, nickel, cobalt and some of their alloys—is a function of the magnetic force, and also depends upon the previous magnetic history of the specimen. As the force increases from zero the permeability of a given specimen rises to a maximum, which may amount to several thousands, and then gradually falls off, tending to become unity when the force is increased without limit. Every other substance has a constant permeability, which differs from unity only by a very small fraction; if the substance is paramagnetic, its permeability is a little greater than 1; if diamagnetic, a little less. The conception of permeability (Lat. per, through, and measure, to wander), is due to Faraday, who spoke of it as "conducting power for magnetism" (Experimental Researches, xxvi.), and the term now in use was introduced by W. Thomson (Lord Kelvin), in 1872, having been suggested by a hydrokinetic analogy (Reprint of Papers on Electrostatics and Magnetism, xxxi., xiii.). It is generally of importance that the iron employed in the construction of electrical machinery should possess high permeability under the magnetic force to which it is to be subjected. (See ELECTROMAGNETISM and Magnetism.)
PERMEAMETER, an instrument for rapidly measuring the permeability of a sample of iron or steel with sufficient accuracy for many commercial purposes. The name was first applied by S. P. Thompson to an apparatus devised by himself in 1890, which indicates the mechanical force required to detach one end of the sample, arranged as the core of a straight electromagnet, from an iron yoke of special form; when this force is known, the permeability can be easily calculated. (See MAGNETISM.)

PERMIAN, in geology, the youngest and uppermost system of strata of the Palaeozoic series, situated above the Carboniferous and below the Trias. The term "Permian" (derived from the Russian province of Perm, where the rocks are extensively developed) was introduced in 1841 by Sir R. J. Murchison. In England the series of red sandstones, conglomerates, breccias and marls which overlie the Coal Measures were at one time grouped together in one great formation as the "New Red Sandstone" in contradistinction to the Old Red Sandstone below the Carboniferous: they were likewise known as the Poikilitic series (from Gr. ποικίλος, mottled) from their mottled or variegated colour. They are now divided into two systems or groups of formations; the lower portion being included in the Palaeozoic series under the name Permian, the upper portion being relegated to the Mesozoic series and termed Trias. In Germany the name Duyer was proposed by J. Marcou for the rocks of this age on account of the twofold nature of the series in Thuringia, Saxony, &c. The intimate stratigraphical relationship that exists in many quarters between the Permian rocks and the Carboniferous beds, and the practical difficulties in the way of drawing a satisfactory base-line to the system, have led to the adoption of the term Permicoarboniferous in South Africa, southern Asia, America, Australia and Russia, for strata upon this horizon: C. W. von Gümabel used "Post-carbon" in this sense. In a similar manner Permio-triasic has been employed in cases where a stratigraphical passage from rocks with Permian fossils to others bearing a Triassic fauna is apparent.

The Permian system in England consists of the following subdivisions:

<table>
<thead>
<tr>

<td>Reddish-brown and purple sandstones and marls, with calcareous conglomerates and breccias of volcanic rocks</td>
</tr>
</tbody>
</table>

From the thicknesses here given it is evident that the Permian rocks have a very different development on the two sides of England. On the east side, from the coast of Northumberland southwards to the plains of the Trent, they consist chiefly of a great central mass of limestone. But on the west side of the Pennine Chain, and extending southwards into the central counties, the calcareous zone disappears, and we have a great accumulation of red, arenaceous and gravelly rocks.

The lower subdivision attains its greatest development in the vale of the Eden, where it consists of brick-red sandstones, the Penrith sandstone series, with some beds of calcareous conglomerate or breccia, locally known as "brockram," derived from the waste Carboniferous Limestone. These breccias extend across the Solway into the valleys of the Nith and Annan, in the south of Scotland, where they lie unconformably on the Lower Silurian rocks. Their breccias consist of fragments of the adjacent wackes and shales, but near the Dunglass sandstones or "brockram" occur. These brecciated masses have evidently accumulated in small lakes or narrow fiords. Much farther south, in Somersetshire, and in the districts of the Clent and Malvern Hills, the brecciated conglomerates in the Permian series attain a thickness of 400 ft. They have been shown by Sir A. C. Ramsay to consist in large measure of volcanic rocks, grits, slates and limestones which can be identified with rocks on the border of the Fens. Some of the stones are 3 ft. in diameter and show distinct striation. The same writer pointed out that these Permian drift-beds cannot be distinguished by any essential character from modern glacial drifts; on the other hand, W. W. King and others have opposed this view.

The middle subdivision is the chief repository of fossils in the Permian system. Its strata are not red, but consist of a lower zone of hard brown shale with occasional thin limestone bands (M. Slate) and an upper thick mass of dolomitic (Magnesian Limestone). The latter is the chief feature in the Permian development of the east of England. It corresponds with the Zechstein of Germany, as the Middle slate does with the Kapfenberg. It is a very variable rock in its lithological character, being sometimes dull, earthy, fine-grained and fossiliferous, in other places quite crystalline, and composed of globular, reniform, botryoidal, or other regular concretions of crystalline and radiated dolomite. Though the Magnesian Limestone runs as a thick persistent zone down the east of England, it is represented on the Lancashire and Cheshire side by bright red and variegated sandstone which may be said to cover a thin red mantle with a number of thin courses of limestone, containing Schistosus, Bakelia and other characteristic fossils of the Magnesian Limestone.

Concerning the rocks classed as Permian in the central counties of England there exists some doubt; for recent work tends to show that the lower parts are clearly related to the Carboniferous rocks by their fossils; while there is little evidence to warrant the exclusion of the higher beds from the Trias. Similarly in south Devon, where red sandstones and conglomerates are well exposed, it has been found difficult to say whether the series should be regarded as Triassic or Permian, though the prevailing tendency is to retain them in the latter system. The "Pierre" type of the system is found in enormous masses of strata flanking the Harz Mountains, and also in the Rhine provinces, Saxony, Thuringia, Bavaria and Bohemia. In general form it may be said to consist of a lower mudstone-conglomeratic sub-division with an upper one more calcareous; the former is known as the Rotliegende, the latter as the Zechstein group. On the south side of the Harz Mountains the following subdivisions are recognized:

| Upper | Red sandstones (Kreuznach beds), red shales (Montig beds) with sheets of melaphyre tuff, and quartz-porphyry conglomerate (Wadern, Oberhof, Sibert und Tambach beds). |
| Middle | Zechstein-limestone, an argillaceous, thin-bedded conglomerate, limestone 15 to 90 ft. thick. |
| Lower | Kupfer-schiefer, a black bituminous copper-bearing shale, not more than 2 ft. thick, often much less, but very rich in copper. |
| Zechstein-limestone, an argillaceous, thin-bedded conglomerate. |
| Rehhofstein Group. | Red sandstones and calcareous sandstones. |
| Upper | Red sandstones (Kreuznach beds), red shales (Montig beds) with sheets of melaphyre tuff, and quartz-porphyry conglomerate (Wadern, Oberhof, Sibert und Tambach beds). |
| Lower | Sandstones and conglomerates (Tholayer beds) on black shales with poor coal seams and clay ironstones (Lebach and Goldstauer beds). |
| Rehhofstein Group. | Sandstones and conglomerates (Tholayer beds) on black shales with poor coal seams and clay ironstones (Lebach and Goldstauer beds). |

The name Rotliegende or Rothliegende (red-dead-layer) was given by the miners because their ores disappeared in the red rocks below the copper-bearing Kupfer-schiefer. The Kupfer-schiefer, although so thin, has been worked in the Mannheim district, and is composed of a quartz-porphyry, and of fish (Palaeoniscus, Platyosomus) and plants (Ulmannia). The beds of rock-salt in the German Zechstein are of the greatest importance; at Sperenberg near Berlin it has been penetrated to a depth of 4000 ft. Associated with the salt, gypsum and chalophyrite are numerous
PERMIAN

dioxide and magnesium salts, including carnallite, kieserite and polyhalite, which are exploited at Stassfurt and are the only important potash deposits in Germany. The Permian rocks of the Rothliegende type are scattered over a wide area in France, where the lower beds are usually conformable with the Coal Measures. In the upper beds occur the bituminous or Boghead shale of Scotland. The formation is a massive, hard coal which is mined and included in addition some deposits of the more open sea. The general sequence begins with the Arinisk beds, sandy and marly or conglomeratic beds in close connexion with the Carboniferous. Above these are the Permian rocks of the Salt Range of India, where the Productus limestone may be taken as representative of the normal marine plan of Permian times. Southwards, however, the Nerburda River, the Transvaal and the Kumbuzgirt Formation of the Armenian region, have been taken as the distinct continental assemblage of deposits that hold the ground, viz. the lower portion of the great fresh-water Gondwana system. The coarse Tachil congglomerates at the base are succeeded by the sandstones and limestones of the Karachog and Boghead beds; these are followed by red fresh-water sandstones, over which comes an important series of coal-bearing sandstones and conglomerates. Above this, in Kostroma, Vyatka and Krasnoyarsk there is a calcareous and dolomitic series, the so-called "Russian Zechstein" with marine fossils; the uppermost beds are red marls, with fresh-water fossils, the Tarkian beds.

The character of the fossils in the Permian of the Mediterranean- and east-south-east Europe—well exemplified in the deposits of Sicily—go together with their more generally calcareous nature, indicate a more open sea and more stable marine conditions than obtained farther north. This sea is traceable across south-east Korea into the middle of Asia, through Turkestan and Persia to the Salt Range of India, where the Productus limestone may be taken as representative of the normal marine plan of Permian times. Southwards, however, the Nerburda River, the Transvaal and the Kumbuzgirt Formation of the Armenian region, have been taken as the distinct continental assemblage of deposits that hold the ground, viz. the lower portion of the great fresh-water Gondwana system. Table of Permian Strata, showing approximate corrs.
PERNAMBUCO—PERNE

Pernambuco was first settled in 1526 by Christóvão Jacques who founded a settlement on the Rio Iguaçuassú that was afterwards abandoned. The first permanent settlement was made by Duarte Coelho Pereira at Olinda in 1530, and four years later he was granted a capitania of 30 leagues extending from the mouth of the São Francisco northward to that of the Iguaçuassú. Adjacent to this grant on the north was the capitania of Itamaracá, granted to Pero Lopes de Souza, which covered the remainder of the present state. The capitania of Pernambuco was ably governed and took an active part in the expulsion of the French from the trading posts established along the coast northward to Maranhão, and in establishing Portuguese colonies in their places. In 1630 Pernambuco was occupied by the Dutch and continued under their rule until 1654. Although an active guerrilla warfare was waged against the Dutch during a large part of that period, they did much to promote the agricultural and commercial interests of the colony, especially under the wise administration of Maurice of Nassau. In 1817 Pernambuco was the scene of a revolutionary outbreak, which resulted in the separation of the present states of Alagoas and Rio Grande do Norte, Corá and Parahyba having been detached in 1799. There was another insurrection in 1822 when the Portuguese captain-general, Luiz de Rego, and his garrison was expelled, and in 1824 dissatisfaction with the arbitrary proceedings of Dom Pedro I. at Rio de Janeiro led to a separatist revolution for the formation of a new state, to be called the Federação do Equador. There was another outbreak in 1831 and frequent disorders down to 1848, when they culminated in another unsuccessful revolution. The population of the Pernambuco seridão has always been noted for its turbulent, lawless character, due partly to distance from the old capitals, and partly to its nature as a land of shifting tribes, partly to difficult means of communication, and partly to the fact that this remote region has long been the refuge of crimals from the coast towns.

PERNANU (in Russ. Pernav and in Estonian Pernalin), a seaport and watering-place of western Russia, in the government of Livonia, 155 m. N. of Riga, on the left bank of the Pernan or Pernova, which about half a mile farther down enters the Bay of Pernan, the northern arm of the Gulf of Riga. Pop., 12,856. The harbour is usually free from ice from the end of April to the middle of December.

Founded on the right side of the river in 1255 by one of the bishop's vessels, Pernanu soon became a flourishing place. In the 17th century it was occupied in succession by the Swedes, the Poles and the Teutonic Knights. After 1599 the Poles transferred the town to the left side of the river; and in 1642 the Swedes, who had been in possession since 1617, strengthened it with regular fortifications. In 1710 it was taken by the Russians, and the fortress is now demolished.

PERNE, ANDREW (c. 1519-1580), vice-chancellor of Cambridge University and dean of Ely, born about 1591, was son of John Perne of East Bilney, Norfolk. He was educated at St John's college, Cambridge, graduating B.A. in 1539, B.D. in 1547 and D.D. in 1552. He was elected fellow of Queens' in 1541, vice-chancellor of Cambridge University in 1541, and was five times vice-chancellor; but he owes his notoriety to his remarkable versatility, and, like the vicar of Bray, he was always faithful to the national religion, whatever it might be. In April 1547 he advocated Catholic doctrines, but recanted two months later, and his
Protestant faith was strengthened during Edward VI.'s reign; he was appointed a royal chaplain and canon of Windsor. Soon after Mary's accession, however, he perceived the error of his ways and was made master of Peterhouse in 1554 and dean of Ely in 1557. He preached the sermon in 1556 when the bodies of Bucer and Fagius were disinterred and burnt for heresy, and also in 1560 when these proceedings were reversed and the dead heretics were rehabilitated. In Elizabeth's reign he subscribed the Thirty-nine Articles, denounced the pope and tried to convert Abbot Feckenham to Protestantism; and in 1584 Whitgift in vain recommended him for a bishopric. He died on the 26th of April 1589. He was selected as the type of Anglican prelate by the authors of the Martin Mar-prelate tract and other Puritans, who nicknamed him "Old Andrew Turncoat." "Andrew Ambo." "Old Father Palinode." Cambridge wits, it was said, translated "perno" by "I turn, I rat, I change often"; and a coat that had often been turned was said to have been "perned." (A. F. P.)

PERÓNNE, a town of northern France, capital of an arrondissement of the department of Somme, on the right bank of the Somme at its confluence with the Cologne, 35 m. E. by N. of Amiens by rail. Pop. (1906), 3698. The church of St Jean (1569-1572) was greatly damaged during the bombardment of 1870-71, but has since been restored. The castle of Péronne still retains four large conical-roofed towers dating from the middle ages, one of which is said to have been the prison of Louis XI. in 1468, when he was forced to agree to the "Treaty of Péronne." Péronne has a sub-prefecture, a tribunal of first instance and a communal college. Its trade and industry are of little importance.

The Frankish kings had a villa at Péronne, which Clovis II. gave to Eurchinaldus, mayor of the palace. The latter founded a monastery here, and raised in honour of St Fursy a collegiate church, which was a wealthy establishment until the Revolution; it is the burial-place of Charles the Simple, who died of starvation in a dungeon in Péronne, into which he had been thrown by the count of Vermandois (929). After the death of Philip of Alsace, Péronne, which he had inherited through his wife, escheated to the French Crown in the reign of Philip Augustus, from whom in 1200 it received a charter. By the treaty of Arras (1435) it was given to the Burgundians; bought back by Louis XI., it passed again into the hands of Charles the Bold in 1465. On the death of Charles, however, in 1477, Louis XI. resumed possession. In 1536 the emperor Charles V. besieged Péronne, but without success; in its defence a woman called Marie Fouré greatly distinguished herself. A statute of her stands in the town; and the anniversary of the raising of the siege is still celebrated annually. It was the first town after Paris at which the League was proclaimed in 1577. Péronne's greatest misfortunes occurred during the Franco-German War. It was invested on the 27th of December 1870, and bombarded from the 28th to the 9th of the following January, upon which date, on account of the sufferings of the civil population, among whom small-pox had broken out, it was compelled to capitulate.

PEROVSKITE, or Perowskite, a mineral consisting of calcium titanate, CaTiO₃, usually with a small proportion of the calcium replaced by iron. The crystals found in schisostatic rocks have the form of cubes, which are sometimes modified on the edges and corners by numerous small plates; on the other hand, the crystals occurring as an accessory constituent of eruptive rocks are octahedral in form and microscopic in size. Although geometrically cubic the crystals are always doubly refracting and they sometimes show evidence of complex mimetic twinning; their structure as shown in polarized light is very similar to that of the mineral barolite, and they are therefore described as pseudo-cubic. There are distinct cleavages parallel to the faces of the cube. The colour varies from pale yellow to blackish-brown and the lustre is adamantine to metallic; the crystals are transparent to opaque. The index of refraction is high, the hardness 5½ and the specific gravity 4.0. The mineral was discovered at Achmatovsk near Zhotost in the Urals by G. Rose in 1839, and named in honour of Count L. A. Perovsky; at this locality large cubes occur with calcite and magnetite in a chlorite-schist. Similar crystals are also found in talc-schist at Zermatt in Switzerland. The microscopic octahedral crystals are characteristic of melilite basalt and nepheline basalt; they have also been found in peridotite and serpentine.

(PEROWNE, John James Stewart (1823-1904), English bishop, was born, of Huguenot ancestry, at Burdwan, Bengal, on the 13th of March 1823. He was educated at Norwich and at Corpus Christi College, Cambridge, becoming a fellow in 1849. After holding a chair in King's College, London, he was appointed vice-principal, at St David's College, Lampeter (1862-1872). In 1868 he was Hulsean lecturer, taking as his subject Immortality. He was elected canon of Llandaff in 1866, dean of Peterborough 1878, and in 1891 succeeded Henry Philpott as bishop of Worcester. Perowne was a good Hebrew scholar of the old type and sat on the Old Testament Revision Committee. He is best remembered as the general editor of the Cambridge Bible for Schools and Colleges. His chief works were a Commentary on the Book of Psalms (2 vols., 1864-1868) and a life of Bishop Thirlwall (1877-1878). He resigned his see in 1901, and died on the 6th of November 1904.

PERÖZ (Péroses, Priscus, fr. 33; Peraos, Procop. Pers. i. 3 and Agath. v. 27. The Romans called him Perovy or Perov, cf. Perovzabad), Sassanian king of Persia, A.D. 457-484, son of Yazdegard II. He rebelled against his brother Homizd III., and in 459 defeated and killed him with the help of the Ephthalites, or White Huns, who had invaded Bactria. He also killed most of his other relatives, and persecuted the Christians. But he favoured the introduction of Nestorianism, in opposition to the orthodox creed of Byzantium. With the Romans he maintained peace, but he tried to keep down the Ephthalites, who began to conquer eastern Iran. The Romans supported him with subsidies; but all his wars were disastrous. Once he was himself taken prisoner and had to give his son Kavadh as hostage till after two years he was able to pay a heavy ransom. Then he broke the treaty again and advanced with a large army. But he lost his way in the eastern desert and perished with his whole army (484). The Ephthalites invaded and plundered Persia for two years, till at last a noble Persian from the old family of Karen, Zarmihir (or Sokhra), restored some degree of order. He raised Balash, a brother of Përöz, to the throne.

(Ed. M.)

PERPENDICULAR PERIOD, the term given by Thomas Rickman to the third period of Gothic architecture in England, in consequence of the great predominance of perpendicular lines. In the later examples of the Decorated period the omission of the circles in the tracery had led to the abandonment of centres of double curvature which developed into flamelike tracery; and the introduction of the perpendicular lines was a reaction in the contrary direction. The Mullions of the windows (which are sometimes of immense size, so as to give greater space for the stained glass) are carried up into the arch mould of the windows, and the upper portion is subdivided by additional mullions. The buttresses and wall surface are likewise divided up into vertical panels. The doorways are frequently enclosed within a square head over the arch mouldings, the spandrils being fitted with quatrefoils or tracery. Inside the church the triforium disappears, or its place is filled with panelling, and greater importance is given to the clerestory windows which constitute the finest features in the churches of this period. The mouldings are flatter and less effective than those of the earlier periods, and one of the chief characteristics is the introduction of large elliptical hollows. The finest features of this period are the magnificent timber roofs, such as those of Westminster Hall (1395), Christ Church Hall, Oxford, and Crosby Hall.

The earliest examples of the Perpendicular period, dating from 1360, are found at Gloucester, where the masons of the cathedral would seem to have been far in advance of those in other towns. Among other buildings of note are the choir and tower of York Cathedral (1389-1427); the nave and western transepts of Canterbury Cathedral (1378-1411), and the tower
PERPETUAL—PERPETUAL MOTION

(towards the end of the 15th century); New College, Oxford (1380–1386); the Beauchamp Chapel, Warwick (1381–1391); the nave and aisles of Winchester Cathedral (1390–1419); the transept and tower of Merton College, Oxford (1424–1450); Manchester Cathedral (1422); the central tower of Gloucester Cathedral (1454–1457), and that of Magdalen College, Oxford (1475–1480). To those examples should be added the towers at Wrexham, Coventry, Evesham, and St Mary's at Taunton, the first being of exceptional magnificence.

PERPETU or PERPETUAL STONES, in architecture, bond or through stones, the baric or of the Greeks and Romans, long stones going right through walls, and tying them together from face to face. The O. Fr. partage or parpart, or a part, or a part from which this word is derived, is obscure in origin. It may be from a supposed Lat. pertago, perpaginis, formed like compage or a joint, from the root of pangere, to fasten, and meaning something fastened together, or from some popular corruption of Lat. perpendiculum, plummet or plumbine (pir or pendere, to hang), referring to the smooth perpendicular faces of the stone.

PERPETUAL MOTION, or PERPETUAL MACHINE, in its usual significance, not simply a machine which will go on moving for ever, but a machine which, once set in motion, will go on doing useful work without drawing on any external source of energy, or a machine which in every complete cycle of its operation will give forth more energy than it has absorbed. Briefly, a perpetual motion usually means a machine which will create energy.

The earlier seekers after the "perpetual motion" did not always appreciate the exact nature of their quest; for we find among their ideals a clock that would periodically rewind itself, and thus go without human interference as long as its machinery would last. The energy created by such a machine would simply be the work done in overcoming the friction of its parts, so that its projectors might be held merely to have been ignorant of the laws of friction and of the dynamic theory of heat. Most of the perpetual motionists, however, had more practical views, and explicitly declared the object of their inventions to be the doing of useful work, such as raising water, grinding corn, and so on. Like the exact quadrature of the circle, the transmutation of metals and other famous problems of antiquity, the perpetual motion has now become a venerable paradox. Still, like these others, it retains a great historical interest. Just as some of the most interesting branches of modern pure mathematics sprang from the progress of squaring the circle, as the researches of the chemists developed into the science of modern chemistry, so, as the result of the vain search after the perpetual motion, there grew up the greatest of all the generalizations of physical science, the principle of the conservation of energy.

There was a time when the problem of the perpetual motion was one worthy of the attention of a philosopher. Before that analysis of the action of ordinary machines which led to the laws of dynamics, and the discussion of the dynamical interdependence of natural phenomena which accompanied the establishment of the dynamical theory of heat, there was nothing plainly unreasonable in the idea that work might be done by the mere concatenation of machinery. It had not then been proved that energy is uncreateable and indestructible in the ordinary course of nature; even now that proof has only been given by induction from long observation of facts. There was a time when wise men believed that a spirit, whose maintenance would cost nothing, could by magic art be summoned from the deep to do his master's work; and it was just as reasonable to suppose that a structure of wood, brass and iron could be found to work under like conditions. The disproof is in both cases alike. No such spirit has ever existed, save in the imagination of his describer, and no such machine has ever been known to act, save in the fancy of its inventor.

The principle of the conservation of energy, which in one sense is simply denial of the possibility of a perpetual motion, rests on facts drawn from every branch of physical science; and, although its full establishment only dates from the middle of the 19th century, yet so numerous are the cases in which it has been tested, so various the deductions from it that have been proved to accord with experience, that it is now regarded as one of the best-established laws of nature. Consequently, on any one who calls it in question is thrown the burden of proving his case. If any machine were produced whose source of energy could not at once be traced, a man of science (complete freedom of investigation being supposed) would in the first place try to trace its power to some hidden source of a kind already known; or in the last resort he would seek for a source of energy of a new kind and give it a new name. Any assertion of creation of energy by means of a mere machine would have to be authenticated in many instances, and established by long investigation, before it could be received in modern science. The case is precisely as with the law of gravitation; if any apparent exception to this were observed in the case of some heavenly body, astronomers, instead of denying the law, would immediately seek to explain the occurrence by a wider application of it, say by including in their calculations the effect of some disturbing body hitherto neglected. If a man likes to indulge the notion that, after all, an exception to the law of the conservation of energy may be found, and, provided he submits his idea to the test of experiment at his own charges without annoying his neighbours, all that can be said is that he is engaged in an unpromising enterprise. The case is otherwise with the projector who comes forward with some machine which claims by the mere ingenuity of its contrivance to multiply the energy supplied to it from some of the ordinary sources of nature and sets to work to pester scientific men to examine his supposed discovery, or attempts therewith to induce the credulous to waste their money. This is by far the largest class of perpetual-motion-mongers nowadays. The interest of such cases is that attaching to the morbid anatomy of the human mind. Perhaps the most striking feature about them is the woful sameness of the symptoms of their madness. As a body perpetual-motion seekers are ambitious, lovers of the short path to wealth and fame, but wholly superficial. Their inventions are very rarely characterized even by mechanical ingenuity. Sometimes indeed the inventor has simply bewilder him by the complexity of his device; but in most cases the machines of the perpetual motionist are of child-like simplicity, remarkable only for the extraordinary assertions of the inventor concerning them. Wealth of ideas there is none; simply assertions that such and such a machine solves the problem, although an identical contrivance has been shown to do no such thing by the brutal test of standing still in the hands of many previous inventors. Hosts of the seekers for the perpetual motion have attacked their insoluble problem with less than a schoolboy's share of the requisite knowledge; and their confidence as a rule is in proportion to their ignorance. Very often they get no further than a mere prospectus, on the strength of which they claim some imaginary reward, or offer their precious discovery for sale; sometimes they get the length of a model which wants only the last perfection (already in the inventor's brain) to solve the great problem; sometimes fraud is made to supply the motive power which their real or pretended efforts have failed to discover.

It was no doubt the barefaced fallacy of most of the plans for perpetual motion that led the majority of scientific men to conclude at a very early date that the "perpetual motion" was an impossibility. We find the Paris Academy of Sciences refusing, as early as 1775, to receive schemes for the perpetual motion, which they classed with solutions of the duplication of the cube, the trisection of an angle and the quadrature of the circle. Stevinus and Leibnitz seem to have regarded its impossibility as axiomatic; and Newton at the beginning of his Principia states, so far as ordinary mechanics are concerned, a principle which virtually amounts to the same thing.

The famous proof of P. de La Hire simply refers to some of the more common gravitational perpetual motions. The truth is, as we have said already, that, if proof is to be given, or considered necessary, it must proceed by induction from all physical phenomena.
**PERPETUAL MOTION**

It would serve no useful purpose here to give an exhaustive historical account of the vagaries of mankind in pursuit of the "perpetual mobile." The reader may refer to Henry Dirck's *Perpetuum Mobile* (2 vols., 1861 and 1870), from which, for the most part, we select the following facts concerning.

By far the most numerous class of perpetual motions is that which seeks to utilize the action of gravity upon rigid solids. We have not read of any actual proposal of the kind, but the most obvious that we can imagine in this way is to procure some substance which intercepts gravitational attraction and, if it be had, then, by introducing a plate of it underneath a body while it was raised, we could elevate the body without doing work; then remove the plate, and vau exort himself dissatisfied, by the proofs theretofore given of the impossibility of perpetual motion, and indicates his opinion that the invention of **Orffyreus** is worthy of investigation. He himself, however, was not allowed to examine the interior of the machine. The inventor seems to have destroyed it himself. The story is that he did so on account of difficulties with the landgrave's government as to a licence for it; another that he was annoyed at **Gravesande's**, and wrote on the wall of the room containing the fragments of his model, and over this again destroyed it because of the impertinent curiosity of **Gravesande**.

The overbalancing wheel perpetual motion seems to be as old as the 17th century. Dircks quotes an account of an invention by Wilars de Hencort, an architect whose sketchbook is still preserved in the Ecoles des Chartrres at Paris. De Hencort says, "Many a time have skilful workmen tried to contrive a wheel that shall grow heavier as it travels over an uneven number of wheels, or by quicksilver." He thereupon gives a rude sketch of a wheel with wheels jointed to its circumference. It would appear from some of the manuscripts of Leonardo da Vinci that he had a model of a Perpetual Motion.

Another scheme of the perpetual motionist is a water-wheel which shall feed its own mill-stream. This notion is probably as old as the first miller who experienced the difficulty of a dry season. One form is figured in the *Mathematical Magic* (1648) of Bishop Wilkins (1614-1672); the essential part of it is the water-wheel of Archimedes, which appears in many of the earlier machines of this class. Some of these devices dispense with even the subtilty of the water-wheel, and boldly represent a wheel-water pumping the water upon its own buckets.

Perpetual motions founded on the hydrostatical paradox are not unduly impertinent; for, if an object can be made to float by adding weight, the object will rise, and the weight will fall. Several devices of this sort are in the Philosophical Transactions for 1685. The most naive of these devices is that illustrated in fig. 2, the idea of which is that of raising a quantity of water in the vessel weighing more will overbalance the smaller quantity in the narrower part, so that the water will run over at C, and so on continually.

Capillary attraction has also been a favourite held for the vain quest; for, if a capillary action fluids can be made to disobey the law of gravity, what a simple affair it would be to raise water by its capillary action on one side than on the other, have been proposed. The most celebrated is that of Sir William Congreve (1772-1828), EFG (fig. 3) is an inclined plane over pulleys; at the top and bottom travels an endless band of sponge or cloth. The water which had risen again an endless band of heavy weights jointed together. The whole stands over the surface of still water. The capillary action raises the water in ab, whereas the same thing cannot happen in the part ad, since the weights squeeze the water out. Hence, in ad, ab is heavier than ad; but we know that if ab were only just to cover the water, as heavy inch for inch as ad there would be equilibrium, if the heavy chain be also uniform. Therefore the extra weight of ab will cause the chain to move round in the circle, and the water will fall into the arrow, and this will go on continually.

The more recondite wave theories, such as electricity and magnetism, are more seldom drawn upon by perpetual-motion inventors than might perhaps be expected. William Gilbert, in his treatise *De Magnete*, alludes to some of them, and Bishop Wilkins mentions among others a machine "wherein a loadstone is so disposed".
that it shall draw unto it a reclining plane a bullet of steel, which, still, as it ascends near to the loadstone, may be contrived to fall through some hole in the plane and so to return unto the place whence at first it began to move, and being there, the loadstone will again attract the filter, and if still, and round a small hole, it will fall down again, and so the motion shall be perpetual."

The fact that screens do exist whereby electrical and magnetic action can be cut off without opening a door for the perpetuity motion seeker. Unfortunately the bringing up and removing of these screens involves in all cases just that gain or loss of work which is demanded by the law of the conservation of energy. A shoemaker of Linlithgow called Spence pretended he had invented a substance which intercepted magnetic attraction and repulsion, and he produced two machines which were moved, as he asserted, by the agency of permanent magnets, thanks to the black substance. The fact was disproved, however, by Mr. Playfair in his Demonstration. Sir David Brewster thought the thing worth mentioning in a letter to the *Annales de chimie* (1818), wherein he states "that Mr Playfair and Captain Kater have inspected both of these machines and are satisfied that they resolve the problem.

The present writer once was sent an elaborate drawing of a locomotive engine which was to be worked by the agency of permanent magnets. He forgets the details, but it was not so simple as the plan represented in fig. 4, where M and N are permanent magnets, whose attraction is "screened" by the wooden blocks A and B, placed in the upper left and lower right quadrants of the soft iron wheel W, which consequently is attracted round in the same direction by both M and N, and moved on for ever.

One more page from this chapter of the book of human folly; the author is the famous Jean Bernouilli the elder. He translates his Latin, as far as possible, into modern phræsology. In the first place we must premise the following (see fig. 5).

(1) If there be two fluids of different densities wherein Q, R, and S are the diameters of these cylinders, and AB be in the ratio to the height EF of the other liquid, which is in a tube open at both ends, the liquids so placed will remain at rest. (3) Wherefore, if AC be to EF in a greater ratio than L to G, the liquid in the tube will ascend; or if the tube be not sufficiently long the liquid will overflow at the orifice E (this follows from hydrostatic principles). (4) It is possible to have two liquids of different density that will mix. (5) It is possible to have a filter, colander, or other separator of means whereby lighter liquid mixed with the heavier may be separated again therefrom.

**Construction.**—These things being presupposed (says Bernouilli), I thus construct a perpetual motion. As there may be taken two quantities of the first kind, namely EF > 2L; G+L; and the orifice F of this tube be stopped, or rather covered with the filter or other material separating the lighter liquid from the heavier (which may also be had by hypothesis), let the tube thus prepared be immersed to the bottom of the vessel CD; I say that the liquid will continually ascend through the orifice F, and overflow by the orifice E upon the liquid below.

**Demonstration.**—Because the orifice F of the tube is covered by the filter (by const.) which separates the two liquids, and it is observed from the foregoing that it follows that, if the tube be immersed to the bottom of the vessel, the lighter liquid alone which is mixed with the heavier ought to rise through the filter into the tube, and that, too, higher than the surface of the other liquid (by hyp. 1), then: AS:EF > 2L; G+L; but since by const. AC:EF > 2L; G+L; it necessarily follows (by hyp. 3) that the lighter liquid will flow over the orifice E in the vessel CD, there where it is lighter, and be again mixed with it; and will then penetrate the filter, again ascend the tube, and be a second time driven through the upper orifice. Thus, therefore, will the flow be continued to the Q E D.

Bernoulli then proceeds to apply this theory to explain the perpetual rise of water to the mountains, and its flow in rivers toward the sea, which others had falsely attributed to capillary action—his idea being that it was an effect of the different densities of salt and fresh water.

Perpetuity is at a loss with Bernoulli’s wonderful theory, whether to admire most the conscientious statement of the hypothesis, the prim logic of the demonstration, so carefully cut according to the pattern of the ancients, or the weighty superstructure built on so nice a foundation of perpetual motions were clearly the result of too little learning; surely this one was the poorest of too much.

**PERPETUITY** (Lat. *perpetuus*, continuous), the state of being perpetual or continuing for an indefinite time; in law the tying-up of an estate for a lengthened period, for the purpose of preventing or restricting alienation. As being opposed to the interest of the state and individual effort, the creation of perpetuities has been considerably curtailed, and the rule against perpetuities in the United Kingdom now forbids the making of an executory interest unless beginning within the period of any fixed number of existing lives and an addition period of twenty-one years (with a few months added, if necessary, for the period of gestation).

This rule applies to dispositions of personal property (see Accumulation) as well as of real property. There are certain exceptions to the rule, as in the case of limited tenancies for life, to charitable uses, and also in the case of a perpetuity created by act of parliament (e.g. the estate of Blenheim, settled on the duke of Marlborough, and Strathfieldssy on the duke of Wellington). In the United States the English common-law rule against perpetuities obtains in many of the states; in others it has been replaced or reinforced by statutory rules (see Gray on *Alienation*, § 42). Charities may be established in perpetuity, and provision may be made for an accumulation of the funds for a reasonable time, e.g. for 100 years (Woodruff v. Marsh, 63 Conn. Rep. 125; 38 Amer. St. Rep. 346). The general tendency of American legislation is to favour tying up estates to a greater extent than was formerly approved.

**PERPIGNAN**, a town of south-western France, capital of the department of Pyrénées-Orientales, on the right bank of the Têt, 7 m. from the Mediterranean and 42 m. S. by W. of Narbonne by rail. *Pop.* (1906), town, 32,683; commune, 38,808. The north-west quarter of the town is traversed by the Basse, a tributary of the Têt, while to the south it is overlooked by a citadel enclosing a castle (17th century) of the kings of Majorca. The chapel is remarkable as being a mixture of the Romanesque, Pointed and Moorish styles. The rampsarts surrounding the castle and the work of Louis XI., Charles V. and Vauban. The sculptures and engravings still in the possession of the citadel were placed there by the duke of Alva. The cathedral of St Jean was begun in 1324 and finished in 1509. The most noteworthy feature in the building is an immense reredos of white marble (early 17th century) by Bartholomew Soler of Barcelona.

In the north of the town commanding the gateway of Notre-Dame (1487) there stands a curious machicolated stronghold known as the Castillet (14th and 15th centuries), now used as a prison. The buildings of the old university (18th century) contain the library and the museum, the latter possessing the first photographic pictures executed by Daguerre and a collection of sculptures and paintings. Statues of François Arago, the astronomer, and Hyacinthe Rigou, the painter, stand in the squares named after them.

Perpignan is a fortified place of the first class, and seat of a prefect, a bishop and a court of assizes, and has tribunals of first instance and of commerce, a branch of the Bank of France, a commercial college for boys, a school of music and training colleges for both sexes. The higher tribunal of Andoci sits at Perpignan. Trade is in wine, iron, wool, oil, coals and leather.

Perpignan dates at least from the 10th century. In the 11th and 12th centuries it was a capital of the county of Roussillon, from whom it passed in 1172 to the kings of Aragon. Philip the Bold, king of France, died there in 1285, as he was returning from an unsuccessful expedition into Aragon. At that time it belonged to the kingdom of Majorca, and its sovereigns resided there until, in 1344, that small state reverted to the possession of the
kings of Aragon, who in 1349 founded a university at Perpignan. When Louis XI. occupied Roussillon as security for money advanced by him to the king of Aragon, Perpignan resisted the French arms for a considerable time, and only yielded through stress of famine (March 15, 1475). Roussillon was restored to Aragon by Charles VIII. and Perpignan was again besieged in 1542 under Francis I., but without success. Later on, however, the inhabitants, angered by the tyranny and cruelty of the Spanish governor, surrendered the town to Louis XIII. The citadel held out until the 3d of September 1642, and the place had ever since belonged to France, to which it was formally ceded by the treaty of the Pyrenees (1659). In 1662 the bishopric of Elne was transferred to Perpignan.

PERRAULT, CHARLES (1628-1703), French author, was born in Paris on the 12th of January 1628. His father, Pierre Perrault, was a barrister, all of whose four sons were men of some distinction: Claude (1613-1688), the second, was by profession a physician, but became the architect of the Louvre, and translated Vitruvius (1673). Charles was brought up at the Collège de Beauvais, until he chose to quarrel with his masters, after which he was allowed to follow his own bent in the way of study. He took his degree of licencié en droit at Orléans in 1651, and was almost immediately called to the Paris bar, where, however, he practised for a very short time. In 1654 his brother became receiver-general of Paris, and made Charles his clerk. After nearly ten years of this employment he was, in 1663, chosen by Colbert as his secretary to assist and advise him in matters relating to the arts and sciences, not forgetting literature. He was controller-general of the department of public works, member of the commission that afterwards developed into the Academy of the inscriptions, and in 1671 he was admitted to the Académie française. Perrault justified his election in several ways. One was the orderly arrangement of the business affairs of the Academy, another was the suggestion of the custom of holding public lectures on the inauguration day. Colbert's death in 1683 put an end to Perrault's official career, and he then gave himself up to literature, beginning with *Saint Paulin époque de Nole, avec une épître chrétienne sur la pénitence, et une ode aux nouveaux convertis*. The famous dispute of the ancients and moderns arose from a poem on the *Sicile de Louis le Grand* (1687), read before the Academy by Perrault, on which Boileau commented in violent terms. Perrault had ideas and a will of his own, and he published (4 vols., 1688-1696) his *Paralléle des anciens et des modernes*. The controversy that followed in its train raged hotly in France, passed thence to England, and in the days of Antoine Houdart de la Motte and Pélisson broke out again in the country of its origin. As far as Perrault is concerned he was inferior to his adversaries in learning, but decidedly superior to them in wit and politeness.

It is not known what drew Perrault to the composition of the only works of his which are still read, but the taste for fairy stories and Oriental tales at court is noticed by Mme de Sévigné in 1676, and at the end of the 17th century gave rise to the fairy stories of Mlle L'Héritier de Villlaudon, whose *Bigarrures ingénieuses* appeared in 1696, of Mme d'Aulnoy and others, while Antoine Galland's translation of the *Thousand-and-One Nights* belongs to the early years of the 18th century. The first of Perrault's contes, *Grisélidis*, which is in verse, appeared in 1691, and was reprinted with *Pêne d'eau* and *Les Soirouts ridicules*, also in verse, in a *Recueil de pièces curieuses*—published at the Hague in 1694. But Perrault was no poet, and the merit of these pieces is entirely obscured by that of the prose tales, *La Belle au bois dormant, Petit chaperon rouge, La Barbe bleue, Le Chat botté, Les Fées, Cendrillon, Riquet à la houppe* and *Le Petit poucet*, which appeared in a volume with 1697 on the title-page, and with the general title of *Histoires ou contes du temps passé avec des moralités*. The frontispiece contained a placard with the inscription, *Contes de ma mère l'Oye*. In 1765 Paul Lacroix attributed the stories to the authorship of Perrault's son, P. Darmancour, who signed the dedication, and was then, according to Lacoix, nineteen years old. Andrew Lang has suggested that the son was a child, not a young man of nineteen, that he really wrote down the stories as he heard them, and that they were then edited by his father. This supposition would explain the mixture of naïveté and satire in the text. Perrault's other works include his *Mémoires* (in which he was assisted by his brother Claude), giving much valuable information on Colbert's ministry; an *Entée travestie* written in collaboration with his two brothers, and *Les Hommes illustres qui ont paru en France pendant ce siècle* (2 vols., 1696-1700). He died on the 16th of May 1703, in Paris. His son, Perrault d'Arma-Court, was the author of a well-known book, *Contes des fées*, containing the story of Cinderella, &c.

Except the tales, Perrault's works have not recently been reprinted. Of these there are many modern editions, e.g. by Paul Lacroix (1876), and by A. Lefèbvre (" Nouvelle collection Jannet," 1873); also Perrault's *Popular Tales* (Oxford, 1888), which contains his complete text edited from the ext ed of the New Lacroix with an introduction and an examination of the sources of each story. See also Hippolyte Rigault, *Histoire de la querelle des anciens et des modernes* (1860).

PERRERS (of DE WINDSOR), ALICE (d. 1400), mistress of the English king Edward III., belonged probably to the Hertfordshire family of Perras, although it is also stated that she was of more humble birth. In 1360 she had entered the service of Edward's queen, Philippa, and she is said to have been the wife of Sir William de Windsor, deputy of Ireland (d. 1384). Her intimacy with the king began about 1366, and during the next few years she received from him several grants of land and gifts of jewels. Not content with the great influence which she obtained over Edward, Alice interfered in the proceedings of the courts of law to secure sentences in favour of her friends, or of those who had purchased her favour; actions which induced the parliament of 1376 to forbid all women from practising in the law courts. Alice was banished, but John of Gaunt, duke of Lancaster, allowed her to return to court after the death of Edward the Black Prince in June 1376, and the parliament of 1377 had declared that ‘whatsoever sentence or judgment of law Alice had given to pervert the course of justice, she was tried by the peers and banished after the death of Edward III. In June 1377; but this sentence was annulled two years later, and Alice regained some influence at court. Her time, however, was mainly spent in lawsuits, one being with William of Wykeham, bishop of Winchester, and another with her dead husband's nephew and heir, John de Windsor.

PERRON, PIERRE CUILLIER (1755-1834), French military adventurer in India, whose name was originally Pierre Cuiller, was born in 1755 at Château du Loire in France, the son of a cloth merchant. In 1780 he went out to India as a sailor on a French frigate, deserted on the Malabar coast, and made his way to Upper India, where he enlisted in the rangers of Gohad's corps under a Scotsman named Sangster. In 1790 he took service under De Boigne, and was appointed to the command of his second brigade. In 1795 he assisted to win the battle of Kardla against the nizam of Hyderabad, and on De Boigne's retirement became commander-in-chief of Sindhiya's army. At the battle of Malpura (1800) he defeated the Rajput forces. After the defeat of Ujjaion (1804) he refused to send his troops to the aid of Sindhiya. His treachery on this occasion shook his position, and on the outbreak of war between Sindhiya and the British in 1803 Perron was superseded and fled to the British camp. In the battles of Delhi, Laswari and Assaye, Perron's battalions were completely destroyed by Lord Lake and
Sir Arthur Wellesley. He returned to France with a large fortune, and died in 1834.

See H. Compton, European Military Adventurers of Hindustan (1892).

PERRON (a French word meaning properly a "large stone," It. petrone, from Lat. petra, Fr. pierre, stone), in architecture, a term applied to a raised platform reached by steps in front of the entrance to a building. The grand flight of external steps entering the mansions of the medieval nobility or high officials was considered in itself a mark of jurisdiction, as it is said that sentence was there pronounced against criminals, who were afterwards executed at the foot of the steps—as at the Giant's Stairs of the Doge's palace at Venice.

PERRONE, GIOVANNI (1794-1876), Italian theologian, was born at Chieri (Piedmont) in 1794. He studied theology at Turin, and in his twenty-first year went to Rome, where he joined the Society of Jesus. In 1816 he was sent as professor of theology to Orvieto, and in 1823 was appointed to a similar post in the Collegium Romanaum. From Ferrara, where he was rector of the Jesuit College after 1830, he returned to his teaching work in Rome, being made head of his old college in 1850. He took a leading part in the discussions which led up to the promulgation of the dogma of the Immaculate Conception (1854), and in 1869 was prominent on the Ultramontane side in the Vatican Council. His numerous dogmatic works are characteristic of orthodox modern Roman theology. They include Praelectiones theologicae (4 vols., Rome, 1835 sq.), Praelectiones theologicae in compendium redactae (4 vols., Rome, 1845), II Hermesianismi (Rome, 1838), II Protestantismo e la regola di fede (3 vols., 1853), De divinitate D. N. Jesu Christi (3 vols., Turin, 1870). He died on the 26th of August 1876.

PERROT, SIR JOHN (c. 1527-1592), lord deputy of Ireland, was the son of Mary Berkeley, who afterwards married Thomas Perrot, a Pembroke shire gentleman. He was generally reputed to be a son of Henry VIII., and was attached to the household of William Paulet, 1st marquis of Winchester. He was in this way brought to the notice of Henry VIII., who died, however, before fulfilling his promises of advancement, but Perrot was knighted at the coronation of Edward VI. During Mary's reign he suffered a short imprisonmen on the charge of harbouring his uncle, Robert Perrot, and other heretics. In spite of his Protestantism he received the castle and lordship of Carew in Pembroke shire, and at the beginning of Elizabeth's reign he was entrusted with the naval defence of South Wales. In 1570 Perrot reluctantly accepted the newly created post of lord president of Munster. He landed at Waterford in February of the next year, and energetically set about the reduction of thepiracy of the Scoto-Irish and the reduction of the town and castle of Kinsale by Sir John Fitzmaurice Fitzgerald, whose submission he received in 1572. Perrot resented the reinstatement of Gerald Fitzgerald, 13th earl of Desmond, and after vainly seeking his own recall left Ireland without leave in July 1573, and presenting himself at court was allowed to resign his office, in which he was succeeded by Sir William Drury. He returned to his Welsh home, where he was fully occupied with his duties as vice-admiral of the Welsh seas and a member of the council of the marches. Although in 1578 he was accused by the deputy-admiral, Richard Vaughan, of tyranny, subversion of justice and of dealings with the pirates, he evidently retained the royal confidence, for he was made commissioner for piracy in Pembroke shire in 1578, and in the next year was put in command of a squadron charged to intercept Spanish ships on the Irish coast.

The recall of Arthur Grey, Lord Grey de Wilton, in 1582, left vacant the office of lord deputy of Ireland, and Perrot was appointed to it early in 1584. Sir John Norris became lord president of Munster and Sir Richard Bingham went to Connaught. Perrot's chief instructions concerned the plantation of Munster, where the confiscated estates, some 600,000 acres in extent, of the earl of Desmond were to be given to English landlords at a nominal rent, provided that they brought with them English farmers and labourers. Before he had had time to embark on this enterprise he heard that the Highland clans of Maclean and MacDonnell were raiding Ulster at the invitation of Sorley Boy MacDonnell, the Scoto-Irish constable of Dunluce Castle. He marched into Ulster, but Sorley Boy escaped him, and crossed to Scotland, only to return later with reinforcements. The lord deputy was roundly abused by Elizabeth for undertaking "a rash, unadvised journey," but Sorley Boy was reduced to submission in 1586. In 1585 Perrot succeeded in completing the "composition of Connaught," a scheme for a contract between Elizabeth and the landholders of the province by which the queen should receive a small quitrent. During his career as lord deputy he had established peace, and had deserved well of Elizabeth. But a rash and violent temper, coupled with unspiring criticism, not to say abuse, of his associates, had made him numerous enemies. A hastily conceived plan for the conversion of the revenues of St Patrick's Cathedral, Dublin, to provide funds for the erection of two colleges, led to a violent quarrel with Adam Loftus, archbishop of Armagh. Perrot had interfered in Bingham's government of Connaught, and in May 1587 he actually struck Sir Nicholas Bagenal, the knight marshal, in the council chamber. Elizabeth decided to supersede him in January 1588, but it was only six months later that his successor, Sir William Fitzwilliam, arrived in Dublin. After his return to England his enemies combined to work for his ruin, and a forged letter purporting to be from him to Philip II. of Spain gave colour to an accusation of treasonable correspondence with the queen's enemies, but when he was tried before a special commission in 1592 the charge of high treason was chiefly based on his alleged contemptuous remarks about Elizabeth. He was found guilty, but died in the Tower in September 1592. Elizabeth was said to have intended his pardon.

A life of Sir John Perrot from a MS. dating from the end of Elizabeth's reign was printed in 1728. Sir James Perrot (1571-1637), writer and politician, was his illegitimate son.

PERRY, MATTHEW CALBRAITH (1794-1858), American naval officer, was born in South Kingston, Rhode Island, on the 10th of April 1814. He became a midshipman in 1809, and served successively in the schooner "Revenge" (then commanded by his brother, Oliver H. Perry) and the frigate "President." In 1813 he became a lieutenant, and during the War of 1812 served in the frigate "United States" (which, when abandoned by Perry, was blockaded in the harbour of New London, Connecticut), the "President" and the "Chippewa." Soon after the war Perry was assigned to the Brooklyn (New York) navy yard, where he served till 1819. He became a commander in 1816, and during 1826-1830 was in the recruiting service at Boston, where he took a leading part in organizing the first naval apprentice system of the United States navy. He was promoted in 1837 to the rank of captain (then the highest actual rank in the United States navy), and in 1838-1840 commanded the "Fulton II.," the first American steam war vessel. He also planned the "Missouri" and the "Mississippi," the first steam frigates of the United States navy, and was in command of the Brooklyn navy yard from June 1841 until March 1843, when he assumed command of a squadron sent to the African coast by the United States, under the Webster-Ashburton treaty, to aid in suppressing the slave trade. This command of a squadron entitled him to the honorary rank of commodore. On the 23rd of October 1846, during the Mexican War, Perry, in command of the steam vessels "Vixen" and "McLane," and four schooners, attacked and captured Frontera, at the mouth of the Tocasob river, then pushed up on the river and (on the 24th) captured the town of Tocasob, thereby cutting off Mexico from Yucatan. He relieved Commodore David Conner at Vera Cruz on the 21st of March 1847, and after a two days' bombardment by a battery landed from the ships the city wall was breached sufficiently to admit the entrance of troops. Commodore Perry's distinctive achievement, however, was his negotiation in 1854 of the treaty between the United States and Japan, which opened Japan to the influences of western civilization. Perry sailed from Norfolk, Virginia, on the 24th of November 1852, in the "Mississippi." He reached Hong-Kong.
on the 7th of April and on the 8th of July dropped anchor off the city of Urage, on the western shore of the Bay of Yedo with the "Susquehanna," his flagship, the "Mississippi," and the sloops-of-war "Saratoga" and "Plymouth." On the 14th of July, accompanied by his officers and escorted by a body of armed constables (in all about 120 men), he went ashore and presented to commissioners especially appointed by the shōgun to receive them, President Fillmore's letters to the emperor, and his own credentials. A few days later the American fleet sailed for Hong-Kong with the understanding that Perry would return in the following spring to receive the emperor's reply. On the 11th of February, accordingly, he reappeared in the Bay of Yedo with his fleet—this time composed of the "Susquehanna," "Powhatan" and "Mississippi," and the sailing vessels "Vandalia," "Lexington" and "Southampton," and despite the protests of the Japanese selected an anchorage about 12 m. farther up the bay, nearly opposite the present site of Yokohama, and within about 10 m. of Yedo (Tokyo). Here, on the 21st of March 1854, was concluded the first treaty (at Simoda, on the 21st of February 1855, and proclaimed on the 22d of June following) between the United States and Japan. The more important articles of this treaty provided that the port of Simoda, in the principality of Idzu, and the port of Hakodate, in the principality of Matsmai, were constituted as ports for the reception of American ships, where they could buy such supplies as they needed; that Japanese vessels should assist American vessels driven ashore on the coasts of Japan, and that the crews of such vessels should be properly cared for at one of the two treaty ports; that shipwrecked and other American citizens in Japan should be as free as in other countries, within certain prescribed limits; that ships of the United States should be permitted to trade at the two treaty ports under temporary regulations prescribed by the Japanese, that American ships should use only the ports named, except under stress of weather, and that privileges granted to other nations thereafter must also be extended to the United States. Commodore Perry died in New York City on the 4th of March 1858. A complete and readable account of this expedition, and its results, scientific as well as political, compiled from the journals and reports of Commodore Perry and his officers, was published in the United States government under the title, Narrative of the Expedition of an American Squadron to the China Seas and Japan (3 vols., Washington, 1856). The first volume of this work, containing Commodore Perry'sNarrative, was published separately. A brief biography of Perry is included in Charles Morris's Heroes of the Navy in America (Philadelphia and London, 1907). See also William Heriot Coste, Calhoun Perry, a Typical American Naval Officer (Boston, 1887).

PERCY, OLIVER HAZARD (1785-1810), American naval officer, was born at South Kingston, Rhode Island, on the 23rd of August 1785. He entered the navy as midshipman (1799) with his father, Christopher Raymond Perry (1761-1818), a captain in the navy, and saw service against the Barbary pirates. At the beginning of the War of 1812 he was in command of a frigate at Newport, but was transferred (Feb. 1813) to the Lakes. He served with Commodore Chauncey, and then was sent from Lake Ontario to Lake Erie, where he took part in the battle of the Iroquois, fought at Chippewa, where, with the help of a strong detachment of officers and men from the Atlantic coast he equipped a squadron consisting of one brig, six fine schooners and one sloop. Other vessels were laid down at Presque Isle (now Erie), where he concentrated the Lake Erie fleet in July. When Captain Perry appeared off Amherstburg, where Captain Robert Heriot Barclay (d. 1837), the British commander, was lying with his squadron, he had a very marked superiority. Captain Barclay, after a hot engagement—the battle of Lake Erie—in which Captain Perry's flagship the "Lawrence," a brig, was so severely shattered that he had to leave her, was completely defeated. Perry commanded the "Java" in the Mediterranean expedition of 1815-1816, and he died at Port of Spain in Trinidad on the 23rd of August 1819, of yellow fever contracted on the coast of Brazil.

PERSEPOLIS, a city and the county-seat of Noble county, Oklahoma, U.S.A., 30 m. N. by E. of Guthrie. Pop. (1900), 3351 (399 negroes); (1910) 3133. Perry is served by the Atchison, Topeka & Santa Fe railway and by the St Louis & San Francisco system. It is the commercial centre of a large agricultural and stock-raising region, which produces cotton and grain. Perry was settled in 1880.

PERSEPOLIS, an ancient city of Persia, situated some 40 m. N.E. of Shiraz, not far from where the small river Pulwar flows into the Kur (Kyrus). The site is marked by a large terrace with its east side leaning on Kuli Rahmet ("the Mount of Grace"). The other three sides are formed by a retaining wall, varying in height with the slope of the ground from 14 to 41 ft.; on the west side a magnificent double stair, of very easy steps, dominates the scene. On this terrace are the ruins of a number of colossal buildings, all constructed of dark-grey marble from the adjacent mountain. The stones were laid without mortar, and many of them are still in situ. Especially striking are the huge pillars, of which a number still stand erect. Several of the buildings were never finished. F. Stolze has shown that in some cases even the mason's rubbish has not been removed.1 These ruins, for which the name Zisti minare or Chihil minare ("the forty columns or minarets"), can be traced back to the 13th century, are now known as Takhti Jamshid ("the throne of Jamshid"). That they represent the Persepolis captured and partly destroyed by Alexander the Great has been beyond dispute at least since the time of Pietro della Valle.2 Recent work has shown that the buildings are arranged on a main axis running out of the rock in the hillside, the façades, one of which is incomplete, being richly ornamented with reliefs. About 8 m. N.N.E., on the opposite side of the Pulwar, rises a perpendicular wall of rock, in which four similar tombs are cut, at a considerable height from the bottom of the valley. The modern Persians call this place Nakhki Rustam ("the picture of Rustam") from the Sassanian relics beneath the opening, which they take to be a representation of the mythical hero Rustam. That the

1 Cf. J. Chardin, E. Kaempfer, C. Niebuhr and W. Ouseley. Niebuhr's drawings, though good, are, for the purposes of the architectural student, inferior to the great work of C. Texier, and still more to that of E. Flandin and J. Coste. Good sketches, chiefly after Flandin, are given by C. Kossowicz, Inscriptions polies de Perse-Persia (St Petersburg, 1872). In addition to these we have the photographic plates in F. Stolze's Persepolis (2 vols., Berlin, 1882).

2 Lettera XV. (ed. Brighton, 1843), ii. 246 seq.
occupants of these seven tombs were kings might be inferred from the sculptures, and one of those at Nakshi Rustam is expressly declared in its inscription to be the tomb of Darius Hystaspis, concerning whom Ctesias relates that his grave was in the face of a rock, and could only be reached by means of an apparatus of ropes. Ctesias mentions further, with regard to a number of Persians kings, either that their remains were brought "to the Persians," or that they died there. 1 Now we know that Cyrus was buried at Pasargadae (q.v.) and if there is any truth in the statement that the body of Cambyses was brought home "to the Persians" his burying-place must be sought somewhere beside that of his father. In order to identify the graves of Persepolis we must bear in mind that Ctesias assumes that it was the custom for a king to prepare his own tomb during his lifetime. Hence the kings buried at Nakshi Rustam are probably, besides Darius, Xerxes I., Artaxerxes I. and Darius II. Xerxes II., who reigned for a very short time, could scarcely have obtained so splendid a monument, and still less could the usurper Sagdianus (Sacydianus). The two completed graves behind Takhti Jamshid would then belong to Artaxerxes II. and Artaxerxes III. The unfinished one is perhaps that of Arses, who reigned at the very latest two years, or not more than that of Darius III. (Cyrus II.). 2

1 This statement is not made in Ctesias as his own city, and since, to judge from the inscriptions, the buildings of Persepolis commenced with Darius I., it was probably under this king, with whom the sceptre passed to a new branch of the royal house, that Persepolis became the capital (see PERSIA: Ancient History, V. 2) of Persia proper. As a residence, however, for the rulers of the empire, a remote place in a difficult alpine region was far from convenient, and the real capitals were Susa, Babylon and Ecbatana. This accounts for the fact that the Greeks were not acquainted with the city until it was taken and plundered by Alexander the Great. Ctesias must certainly have known of it, and it is possible that he may have named it simply Pèrhoς, after the people, as is undoubtedly done by certain writers of a somewhat later date. 4 But whether the city really bore the name of the people and the country is another question. And it is extremely hard to assume, with Sir H. Rawlinson and J. Oppert, that the words anā Pārsa, "in this Persia," which occur in an inscription on the gateway built by Xerxes (D. I. 14), signify "in this city of Pārsa," and consequently prove that the name of the city is identical with the name of the country. The form Persepolis (with a play on περίος, destruction) appears first in Cleitarchus, one of the earliest, but unfortunately one of the most imaginative annalists of the exploits of Alexander. It has been universally admitted that "the palaces" or "the palace" (ρά βασιλέα) burned down by Alexander are those now in ruins at Takhti Jamshid. From Stolze's investigations it appears that at least one of these, the castle built by Xerxes, bears evident traces of having been destroyed by fire. The statement that Diodorus after Cleitarchus corresponds in important particulars with Takhti Jamshid, for example, in being supported by the mountain on the east. 4 There is, however, one formidable difficulty. Diodorus says that the rock at the back of the palace containing the royal sepulchres is so steep that the bodies could be raised to their last resting-place only by mechanical appliances. This is not true of the graves behind Takhti Jamshid, to which, as F. Stolze expressely observes, one can easily ride up; on the other hand, it is strictly true of the graves at Nakshi Rustam. Stolze accordingly starts with the supposition that the royal palace of Persepolis stood close to one of those three steep crags which rise from time to shapeless heaps of earth, under which the remains may be concealed. The vast ruins, however, of Takhti Jamshid, and the terrace constructed with so much labour, can hardly be anything else than the ruins of palaces; as for temples, the Persians had no such thing, at least in the time of Darius and Xerxes. Moreover, Persian tradition at a very remote period knew of only three architectural wonders in that region, which it attributed to the fabulous queen Humâi (Khânum)—the grave of Cyrus at Murghab, the building at Hájjâbâd, and those on the great terrace. 5 It is safest therefore to identify these last with the royal palaces destroyed by Alexander. Cleitarchus, who can scarcely have visited the place himself, says of his personal recklessness of statement, confounded the tombs behind the palaces with those of Nakshi Rustam; indeed he appears to imagine that all the royal sepulchres were at the same place. 6

In 316 B.C. Persepolis was still the capital of Persia as a province of the great Macedonian Empire (see Diod. xix, 21 seq.; Ptolemy. 7) and was probably after Hieronymus of Cardia, who lived about 316. The city must have gradually declined in the course of time; but the ruins of the Achaemenidae remained as a witness to its ancient glory. It is probable that the principal town of the country, or at least of the district, was always in this neighbourhood. About A.D. 200 we find there the city Istakhr (properly Stolke) as the seat of the local governors. There the foundations of the city of great Persian Empire were laid, and Istakhr acquired special importance as the centre of priestly wisdom and orthodoxy. The Sassanian kings have covered the face of the rocks in this neighbourhood, and in part even the Achaemenian ruins, with their sculptures and inscriptions, and must themselves have built largely here, although never on the same scale of magnificence as their ancient predecessors. The Romans knew as little about Istakhr as the Greeks had done about Persepolis—and this in spite of the fact that for four hundred years the Sassanians maintained relations, friendly or hostile, with the empire. At the time of the Arabian conquest Istakhr offered a desperate resistance, but the city was still a place of considerable importance in the 1st century of Islam (see CALIPHATE), although its greatness was speedily eclipsed by the new metropolis Shiraz. In the 10th century Istakhr had become an utterly insignificant place, as may be seen from the descriptions of Istakhr, a native (c. 950), and of Mukaddasi (c. 983). During the following centuries Istakhr gradually declines, until, as a city, it ceased to exist. This fruitful region, however, was covered with villages till the frightful devastations of the 18th century; and even now it is, comparatively speaking, well cultivated. The "castle of Istakhr" played a conspicuous part several times during the Mahommedan period as a strong fortress. It was the middle-station of the caravans going to the highest of the three spurs, which rise from the valley of the Kür, at some distance to the west or north-west of Nakshi Rustam. We learn from Oriental writers that one of the Buyid (Buwaibid) sultans in the 10th century of the Flight constructed the great cisterns, which may yet be seen, and have been visited, amongst others, by James Morier and E. Flandin. W. Ouseley points out that this castle was still used in the 16th century, at least as a state prison. But when Pietro della Valle was there in 1621 it was already in ruins.

2 The name of this mountain too, βασιλεός βωρος, is identical with Shâbâb (τάβαρ), which is at least tolerably well established by W. Ouseley (B. iv. 417) as a synonym of Khâneh. 8

3 See especially Hamza Isl., 38; Tabari, i. 690, 816 (cf. T. Nödlke, Geschichte der Perser ... usw.; Tabari, p. 8). The ruins at Takhti Jamshid are alluded to as the work of Humâi, in connexion with an event which occurred shortly after A.D. 200.
PERSEUS—PERSIA

PERSEUS, in Greek legend, son of Danaë and Zeus. When Perseus was grown to manhood Polydectes, king of Seriphus, cast his eye on Danaë; and, in order to rid himself of the son, exacted of him a promise that he would bring him the head of the Gorgon Medusa. The Gorgons dwelt with their sisters the Graeae (the grey women) by the great ocean, far away in the west. Guided by Hermes and Athena, Perseus came to the Graeae. They were three hags, with but one eye and one tooth between them. Perseus stole the eye and the tooth, and would not restore them till the Graeae had guided him to the Nymphs, from whom he received the winged horse (αἴδιας, resembling a gamekeeper’s bag) and the helmet of Hades, which rendered him invisible. Thus equipped and armed by Hermes with a sharp sword like a sickle, he came upon the Gorgons as they slept, and cut off Medusa’s head, while with averted eyes he looked at her reflection which Athena showed him in the mirror of her shield. Perseus put the Gorgon’s head in his wet cell and fled, pursued by Medusa’s sisters, to Ethiopia, where he delivered and married Andromeda (q.v.). With her he returned to Seriphus in time to rescue his mother and Dictys from Polydectes, whom he turned to stone with all his court by showing them the Gorgon’s head. The island itself was turned to stone, and the very frogs of Seriphus (so ran the proverb) were drowned (Aelian, Nat. anim. iii. 37). Perseus then gave the head of Medusa to Athena, and, with Danaë and Andromeda, hastened to Argos to see his grandson, Acrisius, once more. Before his own arrival Acrisius, fearing the oracle, had fled to Larissa in Thessaly. Thither Perseus followed him, and at some funeral games held in honour of the king of that country unwittingly slew his grandfather by the throw of a quoit, which struck him on the foot. Ashamed to return to Argos, Perseus gave his kingdom to Megapenthes (Acrisius’ nephew), and received from him Tiryns in exchange. There he reigned and founded Midea and Mycenae, and became the ancestor of the Persians, amongst whom were Eurytheues and Heracles.

The legend of Perseus was localized in various places. Italy claimed that the chest containing Danaë and Perseus drifted ashore on the Italian coast (Virgil, Aen. vii. 372, 410). The Persian kings were said to have been descended from Perseus a son of Perseus, and, according to Pausanias of Damascus,1 he taught the Persians to worship fire, and founded the Magian priesthood. His cult was transferred to the kings of Pontus, for on coins of Amisus he is represented with the features of Mithradates Eupator. Like Andromeda, Hesione, the daughter of Laomedon, king of Troy, was rescued by Heracles from a sea-monster, and both stories have been interpreted of the sun slaying the darkness, Andromeda and Hesione being the moon, which the darkness is about to devour. In one version of the story of Hesione, Heracles is said to have spent three days, like Jonah, in the belly of the beast, and it is noteworthy that the Greek representations of Andromeda’s monster were the models for Jonah’s fish in early Christian art. Its bones and Andromeda’s chains were shown on a rock at Joppa. Perseus appears on coins of Pontus and Cappadocia, and of Tarsus in Cilicia, which he was said to have founded. The legend of St George was influenced by the traditions current regarding Perseus in Syria and Asia Minor.2

For the slaying of the Medusa, see F. H. Knatza, Quomodo Perseu fabulam artifices graecet romani tractauerint (1893); and, on the whole story, E. S. Hartland, The Legend of Perseus (1894–1896).

PERSEUS, in astronomy, a constellation of the northern hemisphere, called after the Greek legendary hero, it is mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.); 1Author of a history of Antioch; he is quoted by John Malalas, Chronography, pp. 37–38, (1831). Nothing further is known of him (see C. W. Müller, Fragmenta historica graecorum, iv. 467). 2Ptolemy and Tycho Brahe catalogued 29 stars, Hevelius 46. The most important member of this constellation is β Persei or Algol (q.v.), a famous variable star. θ Persei is a triple star, comprising of one 4th magnitude star and two of the 6th magnitude; ρ Persei is an irregular variable, with a range in magnitude of 3.4 to 4.1. Nova Persei is a “new” star discovered in 1887 and subsequently recognized on Harvard plates by Mrs Fleming in 1895; another new star was discovered by Anderson on the 21st of February 1901, which, after increasing in magnitude, gradually became fainter and ultimately disappeared. There is a nebula surrounding Nova Persei (1901) which was photographed at Yerkes observatory in September 1901; a pair of star clusters, appearing as a bright patch in the Milky Way; and the meteoric swarm named the Perseids, which appear in August and have their radiant in Perseus. (See Meteor.)

PERSEUS, of MACEDONIA (b. c. 212 B.C.), the last king of Macedonia, eldest son of Philip V. He had his brother Demetrius killed, and thus cleared his way to the throne in 179. War broke out with Rome in 171 B.C. when P. Licinius Crassus was sent to attack him. Perseus defeated Crassus at Callinicus in Thessaly, but in 168 he was annihilated at Pydna by L. Aemilius Paulus. He was led in triumph through Rome, and died in captivity at Alba Fucens. (See Macedon.)

PERSHORE, a market town in the Evesham parliamentary division of Worcestershire, England, 113 m. N.W. of London and 7 S.E. of Worcester by the Great Western railway. Pop. (1801), 3348. The station is 13 m. from the town. Market gardening and fruit-growing (especially plums) are carried on and agricultural implements are manufactured. The churches of the two parishes of Holy Cross and St Andrew face one another across a road. Holy Cross is a remnant of a mitred abbey of Benedictines, said to have been founded about 970 by King Edgar, on the site of a Mercian religious settlement. There remain only the fine Early English choir, with Decorated additions, the Norman south transept and the majestic Decorated tower; while slight fragments of a Norman nave are seen.

PERSIA, a kingdom of western Asia, bounded on the N. by the Caspian Sea and the Russian Transcaucasan and Transcaspian territories, on the E. by Afghanistan and Baluchistan, on the S. by the Arabian Sea and the Persian Gulf, and on the W. by Turkish territory. Long before the Christian era the satrapies of Darius comprehended roughly an immense range of territory, from the Mediterranean to the Indus and from the Caucasian chain and Jaxartes to the Persian Gulf and Arabian Ocean. In the 17th and 18th centuries A.D. the conquests of ‘Abbas and Nadir kept up these boundaries more or less on the east, but failed to secure them on the west, and were limited to the Caucasus and Oxus on the north. Persia of the present day is not only, in the matter of geographical definition, far from the vast empire of Sacred Writ and remote history, but it is not even the less extensive dominion of the Safawi kings and Nadir Shah. It may be said, however, to comprise now quite as much settled and consolidated territory as at any period of its political existence of which we can speak with authority.

Boundaries.—The region of Ararat presents a good starting point for the definition of the western and northern frontiers of Persia. A line 20 m. in length, from a point on the river Aras, in 39° 45’ N. and 44° 40’ E. to Mt Ararat, in the south-westerly direction, divides Persia from Russia. Southwards from Mt Ararat the Persian-Turkish frontier extends about 700 m. to the mouth of the Shatt el Arab in the Persian Gulf in 30° N. and 48° 40’ E. but is undefined with the exception of the western boundary of the district of Shatt el Arab, which was appointed in 1843 for the settlement of the Perso-Turkish frontier. The labours of this commission resulted in the Erzerum treaty of 1847, by which both powers abandoned some lands and agreed to appoint commissioners to define the frontier. The commissioners met in 1849, 1850 and 1851 at Bagdad and Muhamarah without arriving at any result. In 1851 Lord Palmerston proposed that the general line of frontier should be traced by the agents of Turkey and Persia at Constantinople, assisted by the
commissioners, in conformity with the treaty of Erzerum, leaving doubtful localities to be settled in future. The Russian government agreed to this proposal, and the work of surveying the country from Mt Ararat to the Persian Gulf was then undertaken. When this was done the preparation of a map, embracing territory 700 m. in length by 20 to 40 m. broad, was unsettled, and disputes have frequently arisen between the Turkish and Persian governments with regard to their respective claims to land (Hertslet, Persian Treaties). In the autumn of 1907 Turkish troops occupied not only “doubtful localities” but also adjoining lands which were indisputably Persian territory. The want of a determined line of demarcation
PERSIA

PHYSICAL FEATURES

is formed by the space of the Caspian until it touches the Bay of Hadsan Kuh north of As arabad. East of the Caspian Sea and beginning at Has Kili Bay the river Atrek serves as the frontier as far as Chah. It then extends east and south-east to Serrakhs on the Tejen River in 36° 40' N. and 61° 38' E. The distance from Mt. Ararat to Serrakhs in a straight line is about 300 m. The frontier between Persia and Armenia was defined by the treaty of Turkmanchay (Feb. 22, 1828), and a convention of the 8th of July 1853. The frontier east of the Caspian was defined by the Akhal-Khorasan Boundary Convention of the 21st of December 1881 and the frontier convention of the 8th of July 1893.

The eastern frontier extends from Serrakhs to near Gwetters on the Arabian Sea in 25° N. and 61° 38' E., a distance of about 300 m. From Serrakhs to near Kuhans the boundary is formed by the Tejen River (called Hari Rud, or river of Herat). In its upper course; it then runs almost due south to the Arabian Sea in 25° 30' N., and then through Seistan follows the line fixed by Sir Frederick Goldsmid and Sir Henry McMahon's commissions in 1872 and 1903-1905 to Kuh i Malik Siah. From this point to the sea the frontier separates Persian territory from British Baluchistan and runs south-east to Kuhak and then south-west to Gwetters. This last section was determined by Sir Frederick Goldsmid's commission in 1871.

The southern boundary is the coast line of the Arabian Sea and the Persian Gulf from Gwetters to the mouth of the Shatt el Arab, a distance of about 870 m., comprised between 48° 40' E. and 61° 38' E. The islands situated close to the northern shore of the Persian Gulf are Persian territory, for the line of demarcation from Hormuz southward through Larak, Kishm, Hengam, Furur, Kish (Kain), Hindarabi, Shaikh-Shu' alib, Jebrin, Kharak, Kharaku (Khorgu).

Physical Geography.—Modern Persia occupies the western and larger half of the great Iranian plateau which, rising to a height of from 4000 to 8000 ft. between the valleys of the Indus and Tigris, covers more than a million square miles. Taking the Kacem Dagh or Khar Dagh to form the northern scarp of this plateau east of the Caspian, we find a prolongation of it in the highlands north of the political frontier on the Aras, and even in the Caucasus itself. On the north-west Persia is united by the highlands of Armenia to the mountains of Asia Minor; on the north-west the Paropamisus and Hindu Kushe connect it with the Himalayas. The lines of boundary on the western and eastern faces are to be traced amid high ranges of mountains broken here and there by deserts and valleys, such as the Daristan, and the east, as do those in the interior, with a marked exception between Teheran and Bujnumur, and in Baluchistan, where they lie rather north-east and south-west, or, in the latter case, sometimes east and west. A few of the mountain ranges and cliffs belonging to the forest-clad provinces of the Caspian in the north and the shores of the Persian Gulf below Basra and elsewhere. The Persians have no special names for the great ranges. Mountains and valleys are known only by local names which frequently cover but a few miles. Even the name Elburz, which European geographers apply to the chains and ranges that extend for a length of over 500 miles from Tabriz in the west to Khorasan in the east stands with the Persians only for the 60 or 70 m. of mountains north and north-east of Teheran, including the cone of Demavend. The great central range, which extends, almost unbroken, for nearly 800 miles, from the mountains of the north to the mountains of south-east, may aptly be called the Central Range. It has many peaks 9000 to 10,000 ft. in height, and some of its summits rise to an elevation of 11,000 ft. and near Kermán of nearly 13,000 ft. (Koh-e-cawah). The 10,500 ft. high Astarabad, the Kuh-i-Basman, the Koh I-Noor, the Kuh-i-Asir, the Anak Kuh, the Kuh-i-Rang, all in the Bakhchis country west of Isfahan, are 12,000 to 13,000 ft. in height; and the Kuh-i-Jazool more than 14,000 ft. west of Isfahan. Still farther south, towards Kermán, there are several peaks (Bid-Khan, Kuh-i-Shah, Kuh-i-Malir, &c), which rise to an elevation of about 10,000 ft., and between them is the Kuh-i-Kuh of some 14,700 ft. in height. Beginning near Ardebil in Azerbaijan, where the cone of Savelan rises to an elevation of 15,792 ft. (Russian trigonometrical survey), and ending in Khorasan, the great Elburz chain runs along its south, or inward, face, forming a scarp rising above immense gravel slopes, and reaches in some of its summits a height of nearly 13,000 ft.; and the peak of Demavend, north-west of Teheran, has an elevation of at least 18,000 ft. There are other high mountains in the Sistan and Kirman depression, such as the Numan Kuh, Binalud, west of Meshed and north of Nishapur, has several peaks of 11,000 to 12,000 ft. in height. In south-eastern Persia the Kuh-i-Basman, a dormant volcano, 11,000 to 12,000 ft. in height, in the Senneh district, and the Kuh-i-Nushdar, more than 14,000 ft. mountain (also called Kuh-i-Nushdar from the "sal ammoniac, nushadar, found on its slopes), an active triple-peak volcano in the Sarakhd district and 12,681 ft. in height (Captain Jennings, are notables features.

Taking the area of Persia at 628,000 sq. m. the drainage may thus be distributed: (1) into the Arabian Sea and Persian Gulf, 500,000 sq. m. and Caspian, 128,000 sq. m.; (2) into the Caspian depression, 43,000 sq. m.; (3) into the Urma Lake, 20,000; (4) into the interior of Persia, 330,000. The first district comprises most of the south-western provinces and the whole of the coast region east as far as the entrance to the Caspian, the tracts west, south and east of the southern part of the Caspian Sea. The tracts south of the Caspian are not more than 20 to 50 m. wide; those on the west widen out to a depth of 250 m., meeting the watershed of the Tigris on the one side and that of the Urma to Lake Van on the other, and embracing between the two the basin of Lake Urmia. On the east the watershed of the Caspian gradually increases in breadth, the foot of the scarp extending considerably to the south, and as the Ipshid and the Aras form three degrees east of which it turns to the south-east, parallel to the axis of the Kopet Dagh. The third drainage area comprises the country with all the Kuhistan (south-western Caspian) and the considerable tract adjoining it on the west. The fourth is a comparatively small area on the western frontier containing the basin of Lake Urmia, shut off from the rest of the inland drainage, and fed by the Urma and the Isfahan, and the water of the Shatt al Arab in a part of Fars, all Yezid, Isfahan, Kashan, Imrak, Krakeh, Kazeri, Teheran, Samnan, Damghan, Shahrud, Khorasan and the central desert regions.

Four rivers belonging essentially to Persia, in reference to the Caspian watershed, are the Seafid Rud or Kizil Uzain on the south-west, the Herbaz on the south and the Guran and Atrek at the south-eastern corner of that inland sea. The Seafid Rud rises near the Caspian sea about 60 miles from the western Caspian, and enters into the sea by a long, winding course of some 500 m. far from its source to the Caspian, 57 m. east of Resht, is only 210 m. in a straight line. The Kizil Uzain takes its rise in the south-east of the Caspian in some 320 m. far from the mouth near the city of Astara, and it enters the Caspian in 37° 4' N., north-west of Astabad, after a course of about 200 m. The Atrek rises a few miles from Kuchan and enters the Caspian at the Bay Taghip, flowing in a straight line after a course of about 300 m. The Shatt al Arab passes through the Elburz to the sea, a distance of about 70 m. It drains 25,000 to 30,000 sq. m. of the country. The Herbaz, though not important in length of course or drainage, also like the Elburz, rises from the inner southern scarp to the north. It rises on the slopes of the Kasik Kuh, a peak 12,000 ft. in height within the Elburz, and about 25 m. north of Tabriz, flows easterly through the Lar plateau, where it is known as the Lar River, and takes up several affluent; turns to the north-east at the foot of Demavend, leaving that mountain to the left, and flows due north past Amol to the Caspian. Its length is about 200 m. The Shatt al Arab and the Kizil Uzain rise in the east of Astarabad, and enter the Caspian in 37° 4' N., north-west of Astabad, after a course of about 200 m. The Atrek rises a few miles from Kuchan and enters the Caspian at the Bay Taghip, flowing in a straight line after a course of about 300 m. From the Sea to the Russian frontier post of Chat the river forms the frontier between Persia and the Russian Transcaucasian region.

The drainage of the rivers which have no outlet to the sea and flow down the slopes in the northern part of the country may be estimated at 350,000 sq. m., including the drainage of Lake Urmia, which is about 20,000 sq. m. Fourteen rivers flow into the lake: the Aji Chai, Soh Chai, Murdi Chai and Jaghauti from the east, the Tato (Tatau) from the south, and the Astarabad and Shatt al Arab from the west. During heavy rains and when the snows on the hills melt, thousands of streams flow from all directions into the innumerable depressions of inner Persia, or help to fill the tracts that may be estimated at 350,000 sq. m., and of them barely suffice for purposes of agricultural irrigation, and in summer dwindle down to small rills. The perennial streams which help to form the kavirs (swamps) east of Kun and Kashan are the Hameh-rud, rising east of Demavend, the Jadrud,
rushing north of Teheran, the Kand and Kerej rivers, rising north-west of Lake Elburz and the Alborz range near Sultani-e-Ab in the lowlands near Sultani-e-Ab in the lowlands and the Kara-su, which rises near Hamadan and is joined by the Zarin-rod (also known as Do-ab), the Reza Chal (also called Mazdakan-rod) from the Jaleh and the Kurn-rod. The river of Isfahan, Zendeh-rod, i.e. "the great river" (from Persian Zendeh Pahlavi, Zendeh, great), but now generally known as Zayandeh-rod, i.e. the life-giving river, runs into the Gavkhan or Gavkhaneh river near the lake of Bakhtegan (also known as Lake of Niriz), and in its lower course, is generally called Bandamir (made famous by Tappeh Jaleh). From the band (dam) constructed by the (king) Asad-ed-dowleh in the 10th century. (Note on the Kur River in Fars, Proc. Royal Geog. Soc., London, 1891.) The rivers flowing into the Persian Gulf and Arabian Sea diminish in importance except for one, the Karoon, which flows into the Kerkeh river from the hills of Kurdistan; the Ab i Diz and Karun which unite below Shushter, and reach the Shatt el Arab at Mahmoudabad; and the Jaz and Tarab, which with the Kardasht river form the Aruzan stream from which the Aruzan estuary, the Tigris and the Karun is the most important among all. (Wych-elm) River (cf. "Notes on the River Mand in Southern Persia," Royal Geog. Soc., London, December 1883).)

The sea has two outlets into the Persian Gulf, one the Khor-i-Minab, a salt marsh, and the other the Jezireh el-Daraj, the beds of which are the most promising among the Dead Desert. (vol. ii. pp. 247-248.) On the course of the Jezireh el-Daraj, the Karain, and of the Trajans, the Gavkhan, a branch of the Isfahan river (tributary of the Karoon), the Minab, and the Minab estuary were to be seen. (Geog. W. Kush. Arid bed, Nearchus, 300 BC.) The Sea of the Caspian Sea, which the ancients called the Sea of Armania was, according to Pliny the Elder (Hist. Nat.), Sultanieh and the islands of the Caspian Sea, which the ancients called the Sea of Armania was, according to Pliny the Elder (Hist. Nat.), 300 BC.)

The Cretaceous system is very widely spread in Persia. It is one of the most conspicuous formations in the Zagros and in the central ranges, and probably forms a large part of the plateau, beneath the surface. The limestones are followed by sandstones and shales with occasional seams of coal. The plants which have been found in these beds indicate a Rhantic or Liassic age. (Pliny the Elder (Hist. Nat.), Sultanieh and the islands of the Caspian Sea, which the ancients called the Sea of Armania was, according to Pliny the Elder (Hist. Nat.).) Observations for temperature have been taken for many years at the stations of the Indo-European Telegraph, and for a few years at the British consulate in Meshed, and the monthly and annual means shown in the following table have been derived from the indications of maximum and minimum thermometers in degrees Fahrenheit.

Very few hymograpical observations have been taken, and only those of the British residency at Bushire are more or less trustworthy, and have been regularly registered for a number of years. In inner Persia the air is exceptionally dry, and in many districts polished steel may be exposed in the open during a great part of the year without becoming tarnished. Along the shores of the Caspian, particularly in Gilan and Mazendaran, and of the Persian Gulf from the mouth of the Shatt el Arab down to Bander Abbas, the air during a great part of the year contains much moisture—dry and wet-bulb thermometers at times indicating the same temperature—and at nights there are heavy falls of dew. In Gilan and Mazendaran the air contains much moisture up to considerable elevations and as far as 30 to 40 m. away from the sea; but along the Persian Gulf, where vegetation is very scanty, stations one or two miles away from the coast and not more than 20 or 30 ft. above the sea-level have a comparatively dry climate.

![Image of FAUNA AND FLORA](image)

Fauna.—Mr W. T. Blanford has described with great care and minute detail the zoology of Persia. In company with Major St John, R.E., he made a large collection of the vertebrate fauna in a journey from Gwetrer to Teheran in 1872. Having added to this a previous collection made by the same officer with the assistance of a native from Caucutta, he had before him the principal materials for his work. Before commencing his analysis he advertised to his predecessors in the same field, i.e. Gmelin (whose works were published in 1774-1784), Olivier (1807), Pallas (1811), Ménérès (1832), Belanger (1841), Eichwald (1845-1846), Baweiler (1847), and Boissier, the French Consul at Filippi (1865), Hume (1873), and Professor Stutchard of St Petersburg. All of these had, more or less, contributed something to the knowledge of the subject, whether as writers or as collectors, or in both capacities, and to all the due meed of credit was assigned. Blanford divided Persia into five zoological provinces: (1) the Persian plateau, or that part of the Kopet Dagh southwards to nearly 38° N. lat., including all Khorasan to the Perse-Afghan border, its western limit being indicated by a long line to the northeast of Teheran; (2) the province north of the Elburz, the mountain range that forms the natural frontier between the Persian Gulf and the Russian frontier and the Elburz; (3) the provinces south and south-west of the Caspian; (4) a narrow strip of wooded country south-west of the Zagros range, from the Deyrabad to the Shatt el Arab; (5) the Persian side of the Shatt el-Arab, and Aralistan, east of the Tigris; and (6) the shores of the Persian Gulf and Baluchistan. The fauna of the Persian plateau he described as ²Palaearctic, with a great prevalence of desert forms; or, perhaps more correctly,

as being of the desert type with Palaearctic species in the more fertile regions. In the Caspian provinces he found the fauna, on the whole, very similar to that of Central Asia, with a certain amount of faunas which have ²been described as "Palaearctic, with a great prevalence of desert forms; or, perhaps more correctly,"

country, have arrived at such distinction in Europe. Nor are these to be obtained, as supposed, at Angora in Asia Minor. Van or cobalt-coloured hair, a rarity not to be found in Persia, is called by the Turks "Van kedia," has a certain local reputation. Among the wild animals are the lion, leopard, lynx, brown bear, hyena, hog, badger, porcupine, polecat, weasel, marten, weaverbird, black and white, and a wild cat, whose fur is used for goat, gazelle and deer. The tiger is peculiar to the Caspian provinces. Lovett says they are plentiful in Abraceh; he measured two specimens, one 10 ft. 6 in., the other 8 ft. 10 in. from the tip of the tail to the end of the bead. They are found in the same vicinity, and the wild pig was both numerous and destructive.

To return to Blanford there are about four hundred known species of birds in Persia. The game birds have admirable representatives in the pheasant, "karkaval" (Phasianus colchicus, L.); snowcock or royal partridge, "kebki-dari" (Tetraogallus Capensis, Gmel.); the blue hale, "halep" (Gallus domesticus sulfuris); red-legged partridge, "kebki" (Cacatua chukar, Gray); sandpartridge or seecce, "tuhe" (Ammodopterus bonkami, Gray); Indian grey partridge, "irufii" (Ortygornis ponticerianus, Gmel.); quail, "belder" (Coturnix communis, L.); the pheasant, "parak" (Pheorus arvanius, Fall.); bustard, "hubareh" (Otis tetrax, L. and O. McQueeni, Gray); woodcock, snipe, pigeon, many kinds of goose, duck, &c. The flamingo comes up from the south when the sea is high and the streams in the Persian province, "abool," are abounding. Poultry is good and plentiful. A large kind of fowl known as "Lari" (from the province Lar, in southern Persia) is said to be descendant of fowls brought to Persia by the Portuguese in the 16th century.

The fish particularly caught along the southern shore of the Caspian are the sturgeon, "sagamali," dogfish (Actipenser ruthenus and A. glanis); "sabzeh" (A. ruthenus glanis); salmon, "azad mahi" (Salmo salar); trout, "masheh" (Salmo trutta); carp, "tupur" (Cyprinus bellerius and C. carpio); "zamm" (Abramis brama); "perchike," "mahi sadf" (Perea leucopsarus and Leuciscus sandre sardus). There is also a berring which frequents only the southern half of the Caspian, not passing over the shallow part of the sea which extends from Baku eastwards. As it was first observed near the mouth of the river Kur it has been named the Kurfish. In summer Persia, salmon, trout and mud-trout are plentiful in some of the mountain streams. Many underground canals are frequent by carp and roach. The shiie has also been observed in some streams which flow into the Urmia lake, and in Kurdistan.

Flora.—In the provinces of Gilan, Mazandaran and Astarabad on the Caspian, from the shore to an altitude of about 3000 ft. on the northern shore and about 6000 ft. on the southern shore, which are the provinces from the highlands of Persia, the flora is similar to that of Grisebach's "mediterranean region." At higher altitudes many forms of a more northern flora appear. As we approach interior Persia the number of species predominates in the plains, while the mediterranean flora predominates in the hills. The steppe vegetation extends in the south to the outer range of the hills which separate Inner Persia from the Persian Gulf and the Indo-Arabian desert. The observation of this contrast is not only a confirmation of the sea that the flora is that of the "Sahara region," which extends eastwards to Sind.

Generally speaking, everywhere, excepting in the northern lowlands, in which it is favored, there is a very small number of species; and where cultivation is scanty. In inner Persia the hills and plains are bare of trees, and steppe and desert plants. The date-palm thrives well as far north as Tabbas in latitude 33° 30' and at an altitude of 2000 ft., and in the south extensive date-groves, producing excellent fruit, exist at altitudes of 2000 to 5000 ft. The olive is cultivated at Rudbar south of Resht in Gilan, and a few isolated olive-trees have been observed in central and southern Persia.

Of fruits the variety is great, and nearly all the fruits of Europe are well represented. The common, yet excellent melons, watermelons, grapes, apricots, cherries, peaches, plums, apples, are within the reach of every one. Common vegetables are grown, particularly so when cost of transport has to be considered; for instance, a good orange costs 2d. or 3d. in Teheran, while in Mazandaran (only 100 m. distant), where the oranges are brought, it costs 3d. Some fruits are famous and vie in excellence with any that European orchards produce; such are the peaches of Tabriz and Meshed, the sugar melons of Kashan and Isfahan, the apples of Demavend, pears of Natanz, figs of Kermanshah, &c. The strawberry, "sagh," is not only esteemed in Persia, but has been cultivated in the gardens of Teheran and neighbouring districts; the raspberry was introduced at about the same time, but is not much appreciated. Grapes and gooseberries are now also grown. The common vegetables are plentiful and cheap, but only a few, such as the broad-bean, egg-plant (Solanum melongena), onion, carrot, beetroot, black turnip, are appreciated by the natives, who generally live mainly on the coarsest breads. Rice, a new product to Persia, was imported in 1860, but is now grown in the more elevated parts of the province of Shahrizor. It has been introduced in the irrigated gardens of Persia since about 1750, has not yet found favour, and the same may be said of the tomato, asparagus, celery and others. Flowers are abundant, but it is only since the beginning of Nauser ed Din Shah's reign (1848), when European gardeners were employed in Persia, that they were rationally cultivated. Nearly all the European garden flowers, even the roses, are cultivated in the parks and gardens of the rich and well-to-do but in many unpretentious courtyards with only a few square yards of surface.

Population.—In 1881 the present writer estimated the population of Persia at 7,633,600; 1,963,500 urban, 3,780,000 rural and 1,909,500 wandering ("Bevölkerung der Erde," p. 28; Ency. Brit. 9th ed. p. 628); and, allowing for an increase of about 1% per annum the population for 1910 may be estimated at 10,000,000. No statistics whatever being kept, nothing precise is known of the movements of the population. During the ninth decade of the 19th century many Persian subjects emigrated, and many Persian villages were deserted and fell to ruin; since then a small immigration has set in and new villages have been founded. Persians say that the females exceed the males by 10 to 20%, but wherever the present writer has been able to obtain trustworthy information he found the excess to be less than 2%. Of the deaths in any place the only check obtainable is from the public body-washers, but many corpses are buried without the aid of the public body-washers; and the population of the place not being accurately known, the number of deaths, however correct, is useless for statistical purposes. Medical men have found that the number of deaths, in times when there are no epidemics, amounts to 10 to 15 per thousand, and the number of births to 25 to 40 per thousand.

The prices of the staple articles of food and all necessary articles of life have risen considerably since 1880, and, particularly in the large cities, are now very high. As salaries and wages have not increased commensurate with the increase of prices, many servants and officials are not so well off as formerly. By dismissing their servants in order to reduce expenditure, they have thrown great numbers of men out of employment, while many labourers and workmen are living very poorly and often suffer want. Traders have been affected, because they can sell the articles which they manufacture at values which are more in proportion with the increased prices of food. In 1880 a labourer earning 25 kranas, or 1½ sterling a month, could afford to buy all he needed, but now he can only double what he did in 1880, but his wage, expressed in sterling, was the same, and wherever the prices of food have risen more than his wages, he could not afford to keep a family. In many districts and cities the number of the poor is very large, and the same time the mortality, in consequence of bad and often insufficient food, is considerably increased.

The description of the Persian character by C. J. Wills, in his "In the Land of the Lion and Sun" (1883), is still worth quoting:—

"The character of the Persian is that of an easy-going man with a wish to make things pleasant generally. He is hospitable, cool-headed, and very particular regarding questions of personal favour. His relations with his wife are peculiarly intimate and affectionate; his father and mother are his especial objects of gratitude and worship. The mother-in-law is more than an object of respect; she is venerated as a "master." The full stream of his love and reverence is reserved for his mother; he never leaves her to starve, and her wishes are laws to him. The mother is always the most important member of the household, and the grandmother is treated with veneration. The presence of the mother-in-law is coveted by their sons-in-law, who look on them as the guardians of the virtue of their children. Their paternal uncle is a much nearer tie than with us; while men look on their first cousins on their father's side as their most natural wives.

"Black slaves and men-nurses or "lallahs" are much respected; they are the especial objects of the love and affection of both mother and usual provided for for life. Persians are very particular in their servants; a master will often be addressed by his servant as his father, and the servant will hold his master's property as he would his own. A servant is invariably spoken to as "bacha" (child). The servants expect that their master will never allow them to be wronged. The slaves in Persia have a good time; well fed, well clothed, treated as spoiled children, given the finest clothes, and generally all things are given to them. The master, who is called in Persia "saghe" or concubine by the master himself, slaves have the certainty of a well-cared-for old age. They are looked on as confidential servants, are entrusted with large sums of money, and the master does not bother the slave in any affair; and seldom abuse their trust. The greatest punishment to an untrustworthy slave is to give him his liberty and let him earn his living. They vary in price and value; the 'Habashi' or Abyssinian is the most valued; the Shehali or Somali, next in blackness, is next in price; the Bengali, bassee, or coal-black negro of the interior, being of much less price, and usually only used as a cook. The prices of slaves in Shiraz are, a good Habashi girl of twelve to fourteen £40, a good Somali
same age, half as much; while a Bombassi is to be got for £4, being chosen merely for physical strength. They are never sold, save on immediate service. They may, however, have been seen a Persian unkind to his own horse or his slave, and when overtaken by poverty he will first sell his shirt, then his slave.

In common with the rest of the pen-clothes, they are not unfrequently dealt with by the European generally. . . . To the poor, Persians are unostentatiously generous; most of the rich have regular pensioners, old servants, or poor relations who live on their bounty, often for the larger part of their lives. With a handle, a servant is generally kept; and in the case of many wealthy merchants and the Armenians at times wear the hat very tall. (The waist of the Persian is generally small, and he is very proud of his fine figure and broad shoulders.)

The hair is generally shaved at the crown, or the entire head is shaved; a "kakul," or long thin lock, being sometimes left, or even cut long, from the middle of the crown. This is to enable the broker Mahomet to draw up the idea of what, in Europe. The hair is generally shaved at the crown, or the entire head is shaved; a "kakul," or long thin lock, being sometimes left, or even cut long, from the middle of the crown. This is to enable the broker Mahomet to draw up the idea of what, in Europe.

The costume of the Persians may be shortly described as fitted to their active habits. The men invariably wear an unstarched shirt of cotton, sewn with white silk, often, particularly in the north, with open sleeves. In Persia the shirt (it fastens in front by a flap, having two small buttons or knots at the shoulder, and seldom comes below the hips. It has no collar, and the sleeves are loose. The lower orders often have it dyed blue, but it is very unbecoming, though fit for forty and fifty years. Silk shirts are now seldom seen on men. Among the very religious during the mourning month ("Muharram") the shirt is at times of silk, black. The "pir jamah," or trowsers, are of identical quality and in the higher classes, particularly those of the military order, who affect a garment of a tightness approaching that worn by Europeans. The ordinary "arjamah" is of white, blue or red cloth, and is the most common of the Persian garments worn by Europeans in India. They are held up by a thin cord of red or green silk or cotton round the waist, and the labouring classes, when engaged in heavy or dirty work, or when running, generally tie the garments under the cord, which leaves their legs bare and free to the middle of the thigh. The amplitude of this part of his attire enables the Persian to sit without discomfort on his heels; chairs are only used by the rich, great or Europeanized.

One of the chief distinctions of the Persian is worn by the "jikha," a square piece of quilted chintz or print, a closely-fitting garment, collarless, with tight sleeves to the elbow, whence, to the wrist, are a number of little metal buttons, fastened in winter, but not in summer. A kind of this is usually carried by Persian shopkeepers, Kashmir or Kermán shawl, silk, satin or velvet (gold embroidered, or otherwise), according to the time of the year and the purse and position of the wearer. This, like the "arkhlik," is the national quilted coat, but is of a smaller standing collar, and is double-breasted. It has a pocket-hole on either side, giving access to the pockets, which are always in the "arkhlik," where also is the breast-pocket in which watch, money, jewels, etc., are kept, and do not treat badly them when their own property.

"Cruelty is not a Persian vice; torture and punishments of an unusual and painful nature being part of their judicial system. There are no vindictive punishments, such as public confinement, pen servitude for long terms of years, &c. Seldom, indeed, is a man imprisoned more than twelve months, the rule being that there is a general jail delivery at the New Year. Royal clemency is usually exercised generally. . . ."

The costume of the women has undergone considerable change in the last century. It is now, when carried to the extreme of fashion, highly indecent and must be very uncomfortable. The garment doing duty as a chemise is called a "pirahmân"; it is, with the lower orders, of white or blue calico, and comes down to the middle of the thigh, leaving the leg naked. Among the upper classes it is frequently of silk. At Shiraz it is often of fine cotton, and elaborately ornamented with black embroidery. With the rich it is often of gauze, and much embroidered with gold thread, pearls, &c. The head is usually covered with a "char-kadd," or large square piece of muslin, or silk, of the same kind as that of the hair, and fastened under the chin by a brooch. It is often of considerable value, being of Kashmir shawl, embroidered gauze, &c. A "jika," a jewelled feather-like ornament, is often worn at the side of the head, while the front hair, cut to a level with the mouth, is brought up in love-locks on either cheek. Beneath the "char-kadd" is generally a small kerchief of dark material, only the edge of which is visible. The undergarment of the "pirahmân" is quite transparent. A profusion of jewellery is worn of the most solid description, none hollow; silver is worn only by the very poor, coral only by négresses. Necklaces and bracelets are much worn, and the arms are covered with clanking glass bangles called "alangu," some twenty even of these being on one arm. Jewelled "bazzubands," containing talismans, are often worn on the upper arm, while among the poorest women the arms and hands are bare. Women's rings are not uncommon, and bangles and anklets of beads.
The face on important occasions is usually much painted, save by young ladies in the heyday of beauty. The colour is very freely applied, the cheeks being as much raddled as a clown's, and the nose is lined, while the lips are usually reddened, with "kohl." This is supposed to be beneficial to the eyes, and almost every woman uses it. The eyebrows are widened and painted till they appear to meet, while shin moles or stars are painted on the cheeks. The cheeks are put on so thick as to be seen through the chin and forehead. Tattooing is common among the poor and in villages, and is seen in the upper classes. The hair, though generally hidden by the "char-kadi," is at times exposed and pinned up, sometimes with little skull-cap of embroidery, or shawl, or coloured silk is worn. False hair is common. The Persian ladies' hair is very luxuriant and never cut; it is nearly always dyed red with henna or orange-yellow, the result being that the head, and often the shoulders, are seen. The top of the costume is composed of the "tumbum" or "shalwar," short skirts of great width, held by a running string—the outer one being usually of silk, velvet, or Kashmir shawl, often trimmed with gold lace. The inner, in the case of the poor, of land-patterned chintz or print. Beneath are innumerable other garments of the same shape, varying in texture from silk and satin to print. The whole is very short, among the women of fashion coming to the knee. It is worn over an ordinary like the "kujlah," or coat of the man, with short sleeves, lined and trimmed with furs, is worn. Leg-coverings are now being introduced. In ancient days the Persian ladies always wore them, as may be seen by the pictures in the South Kensington Museum. Then the two embroidered legs, now so fashionable as Persian embroideries ("nahš"), occupied a girl from childhood to marriage in making; they are all seen in elaborate patterns of great beauty, worked on muslin in silk. The outdoor costume of the Persian women is quite another thing. Enveloped in a huge blue sheet, with a yard of linen as a veil perforated for two inches square with minute holes, the feet thrust into bangle-shaped shoes, the shod foot being, however, quite respectable, even by her husband, when out of doors. The dress of all is the same; and, save in quality or costliness, the effect is similar.

As for the children, they are always when infants swaddled; when they can walk they are dressed as little men and women, and with the dress they generally ape the manners. It is a strange custom with the Persian ladies to dress little girls as boys, and little boys as girls, till they reach the age of seven or eight years; this is a thing for fun, or on account of some vow—often to avert the evil eye.

Towns.—The principal cities of Persia with their populations as estimated in 1908 are: Teheran (280,000); Tabriz (200,000); Isfahan (100,000); Meshed (80,000); Kerman, Resht, Shiraz (60,000); Barfurush, Kazvin, Yazd (50,000); Hamadan, Kermanshah (40,000); Kerman, Khoz, Urmia (35,000); Birjend, Bursheh, Shusheh, Dizful, Kum, Senendj (Sinan, Zenjan (25,000 to 30,000); Amol, Ardalil, Ardistan, Arasabzad, Ahekb, Ban, Bander, Abbasi, Bander Lingah, Damghan, Dilmun, Istabanabat, Jahrum, Khonar, Kishmahis, Kuchan, Marand, Maragha, Nishapur, Sari, Sabzevar, Samnan, Shahroud, Shushter (50,000 to 20,000).

Political and Administrative Divisions.—The empire of Persia, officially known as "Mamalik i Mahrush i Iran," "the protected kingdoms of Persia," is divided into a number of provinces, which, when large, and containing important sub-provinces and districts, are called mamelik, "kingdom," when smaller, vidayat and ayalat, and are ruled by governors-general and governors appointed by and directly responsible to the Crown. These provinces are subdivided into districts, sub-districts and parishes, bulak, nakhiye, nahl, and towns, cities, parishes and villages, shehr, kassabeh, mahaleth, dih, which are ruled by lieutenant-governors and other functionaries appointed by and responsible to the governors. All governors are called hakim, or hakmen, but those of large provinces generally have the title of vali, and sometimes firman-firnma. A governor of a small district is a sobit; a deputy-governor is called naib el hukumeh, or naib el ayalah; an administrative division is a kalamro, or hukumat. Until recently the principal governments were conferred upon the shah's sons, brothers, uncles and other near relatives, but now many of them are held by men who have little if any connexion with the royal family. Also, the governors are now, as a rule, resident in their provinces instead of being absentees at the capital. There are also some small districts or dependencies generally held in fief, turyd, by princes or high functionaries who take the revenues in lieu of salaries, pensions, allowances, &c., and either themselves govern or appoint others to do so.

Every town has a mayor, or chief magistrate, called beglerbegi, "officer of lords," kalostar, "the greatest," or sometimes daregh, "oversee," or chief of police; every ward or parish, mabellah, of a town and every village has a head-man called ked khdou, "house-lord." These officers are responsible to the governor for the collection of the taxes and the orderly state of their towns, parishes and villages. In the important provinces and sub-provinces the governors are assisted by a man of experience, to whom the accounts and details of the government are entrusted. This person, called visir, or paishkar, is often nominated by the shah, and his functions in the provincial government are similar to those of the grand vizir in the central government, and comprise very extended administrative powers, including at times the handling of the military forces in his province. Among the nomads a different system of titles is in force. The chiefs are responsible for the taxes and the orderly conduct of their tribes and clans being known as ikhhan, ilbegi, (both meaning "tribe-lord," but the latter being considered an inferior title to the former), khan, rais, amir, mir, shahkh, tushkal, &c.

The governors and chiefs, excepting those possessing hereditary rights, are frequently changed; appointments are for one year only and are sometimes renewed, but it does not often occur that an official holds the same government for longer than that period, while it happens rarely that a province is governed by the same person for two or three years. This was not so formerly, when not infrequently an official, generally a near relation of the shah, held the same government for five or even more years. The governorship of the province of Azerbaijan was an exception until the end of 1906, being always held by the Valiad, "heir apparent," or crown prince.

The political divisions of Persia, provinces, sub-provinces, districts, &c., ruled by hakimss number over 200 (cf. the statement in Noldeke's Geschichte des Artachth Ppdkdn, "after Alexander's death there were in Iran 240 local governors"), but the administrative divisions, amirs and governors appointed by the Crown and responsible to it for the revenues, have been under fifty for sixty-five years or more. In 1840 there were twenty-nine administrative divisions, in 1868 twenty-two, in 1875 twenty-nine, in 1884 nineteen, in 1890 forty-six, and in 1908 thirty-five, as follows:—

Roads.—With the exception of five short roads, having an aggregate length of less than 900 m., all the roads of the country are mere trackless, carriageable in the plains and during the dry season, but totally unfit for continuous wheeled traffic during all seasons, and in the hilly districts often so difficult as to be much damaged to goods and the animals carrying them. There are a few miles of roads in the immediate neighbourhood of Teheran leading from the city to royal palaces, but not of any commercial
importance. The five exceptions are: (1) Resht—Kazvin—Teheran, 280 m., with a double track; (2) Shahrizor—Bushire, 160 m.; (3) Meshel—Kuchan—Askabad, 150 m.; 30 of which are on Russian territory; (5) Isfahan—Ahvaz, 280 m. The first of these roads consists of two sections: Resht—Kazvin, 135 m., and Kazvin—Teheran, 45 m. The first section was constructed by a Russian company, in virtue of a concession which the Persian government granted in 1893; and the second section was constructed in 1879—1879 by the Persian government at a cost of about $1,000,000. The second section was opened to traffic on March 11, 1895, and repaired and partly reconstructed by the Russian company in 1895—1899.

Both sections were officially opened to traffic in August 1899. The capital of the company is $3,000,000, and during the first year of operation the company obtained $1,500,000 in debentures taken by the Russian government, which also guarantees 5% on the shares. About two-thirds of the capital has been advanced by the government. The remaining two-thirds have been derived from tolls levied on vehicles and animals using the road. These tolls were at first very high but were reduced by 15% in 1904, and by another 10% in 1909. If all the trade between Russia and India were to pass through the road, the company would pay a fair dividend on the capital, but much of it goes by way of the Teheran—Meshel—i—Sar route, which is much shorter and has no tolls. The second road, Julfa—Tabriz, 80 m., was constructed by the same company, and is 120 m. long. It consists of two sections: the first, Teheran—Kum, 92 m., the other, Kum—Sultanabad, 68 m. The first section was constructed by the Persian government in 1883 at a cost of about $300,000. The second section was opened to traffic on January 13, 1896, and reconstructed at a cost of about $45,000. The second section formed part of the Ahvaz road concession which was concluded in 1891. It was opened to traffic on January 27, 1897, as an object of connecting Teheran with Ahvaz on the Karun by a direct cart road via Sultanabad, Burujird, Khorramabad (Luristan), Dizful and Shush. The concession was ceded to Messrs. Lynch, of London, the Persian Road and Transport Company, in 1895. The four cart-road, Meshel—Askabad, 120 m. to the Persian frontier, was constructed by the Persian government in 1889—1892 in accordance with art. y. of the Khorasan Boundary Convention between Persia and Russia of December 1881. The Persian section cost £13,000. The fifth road, Isfahan—Ahvaz, 280 m., is the old mule track provided with some bridges, and improved by freeing it of boulders and stones, &c., at a total cost of £5500. The concession for the telegraphic and telephonic wire, was granted to the same firm, and is ceded to Messrs. Lynch, of London, who advanced the necessary capital at 6% interest and later formed the Persian Road and Telephone Company, to construct and operate the traffic in the autumn of 1900. The revenue is derived from tolls levied on animals passing with loads. The tolls collected in 1901 amounted to £3100.

Railways.—Persia possesses only 8 m. of railway and 64 m. of tramway, both worked by a Belgian company. The railway consists of a single line, one-metre gauge, from Teheran to Shah-abad, 95 m. south of Teheran, and of two branches which connect the main line with some limestone quarries in the hills south-east of the city. The railway from Resht to Emden, 240 m., is used by cotton and oil and the main line is 315 m. long, and is constructed by the same company, but the general operation is in the hands of the British government. The length of the main railway line is 51 m., that of the branches 24. The main line was opened in 1888, the branches were constructed in 1891. The line belongs to the British government, but is worked by a Belgian company, and is largely subscribed for by Russian capitalists, amounts to £320,000. There are also ordinary shares to the amount of £200,000 put down in the company's annual balance-sheets as required by the general convention. It is not known whether the company has not been interested in the enterprise the company could have liquidated long ago. (On railways in Persia, the many concessions granted by the Persian government, and only one having a result, ch. xviii. of Lord Curzon's Persia [l. 613—630], and on the Belgian enterprise, Lorin's La Persia economica [pp. 157—158] may be consulted.)

Down to 1874 the postal system was in the hands of an official called chaparchi bashi, who was the head farmer of the post, or chajars, and letters and small parcels were conveyed by him and his agents at high and arbitrary rates and without any responsibility. The establishment of a post office on 1st November 1878 marked the beginning of the Post Office. It was opened on 1st November 1878, and admitted the use of the same rate as applied to letters and small parcels on the lines of the company, and open to all the inhabitants of the Persian empire. The principal points of the Persian service were linked up by a regular daily service, and the time was limited. The rate was 2½. of 2½d. per letter, 8d. per 4 oz., and 1s. per 4 oz. for newspapers and包裹 post, which was the same as that charged by the Austrian company, but was increased until 1890, when it was fixed at 3½d. per letter, 8d. per 4 oz., and 1s. per 4 oz. for newspapers and包裹 post. The inland rates were a little less. There are now a Persian and foreign countries a bi-weekly service via Russia (Resht—Baku), and the India post weekly service via India (Bushire—Bombay). On the land lines, with the exception of that between Teheran and Tabriz, the service is weekly. There are reported to be 140 post offices, 22,355 postmen, 7,421 first-class letters, 7,421 second-class letters, and 7,421 newspapers and包裹 post delivered, and newspapers and包裹 post received at the post offices, with 7,421 packages and parcels, about 7,421 postal orders, 7,421 cheques, 7,421 savings bank orders, 7,421 letters, 7,421 postcards, newspapers, &c., conveyed are kept, but not published after 1888, when a liberal-minded director communicated those for the year 1884—1885 to the present writer, no others, although many others have been published, with the exception of those for 1884 and 1885, when the traffic was much reduced. These statistics show that 1,368,835 letters, 2,050 postcards, 7,421 letters, 7,421 parcels, and 9,305,923 parcels, having a value of £32,470, and the receipts exceeded the expenditure by £66. Since then the traffic has much increased, and the postal statistics for 1890—1899 show that the service was operated by the Post Office, and that the number of letters,包裹 post, newspapers, &c., delivered at the Persian post offices was 9,305,923 letters, 2,050包裹 post, 7,421 newspapers and包裹 post, 7,421 packages and parcels, and 7,421 cheques, 7,421 postal orders, and 7,421 savings bank orders. Under the most favourable conditions letters from London via Russia are delivered at Tabriz in 18 days, and via India, at Bushire in 26 days, at Shiraz in 41, at Isfahan in 40, and at Teheran in 40; but during the winter letters between London and Teheran sometimes take a month. In the interior of Persia over 20,000 letters and包裹 post were collected, and in 1896, 25,000 packages made soft leather bags, are frequently damaged through careless packing and wet. The first Persian postage stamps were issued in 1873 and roughly printed in Persia. Since then there have been various changes in the design and color of stamps. Authentic specimens of the early ones are much valued by stamp collectors. (For information on the postal system of Persia, see G. Niederer, "Ausz Persien, Vienna, 1882; Fr. Schueller, Die post. Zeitschr. und die philat. Welt, 1890; and the authorities.)
Manufactures, etc.—The handbook on Persian art published by Colonel Murdoch Smith, R.E., in 1876, with reference to the collection purchased and sent home by him for the Victoria and Albert Museum, has an instructive account of the more common manufactures of Persia. It gives figures and descriptive heads of "porcelain and earthenware," "tiles," "army and armour," "textile fabrics," "needlework and embroidery," "metal-work," "wood carving and mosaic-painting," "manuscripts," "jewelry," and "musical instruments." Specimens of the greater number are not only to be procured in England, but are almost familiar to the ordinary Londoner. It need scarcely be said that this handbook is not without its defects, but that it is not without its advantages. The PERSIAN lines are the only ones with which there is any possibility of a connoisseur, that the ornamentation of metal-work, wood carving and inlaying, gem and seal engraving, are exquisite of their kind, and that the carpets manufactured by skilled workmen, when led to increased efforts, will not be found inferior to those of the greatest manufacturers. The Persian, as well as other Indian, localities, where a British firm has been established for many years, great quantities, valued in some years at $100,000, find their way to European markets. Even in the years when the Persian manufactures were in the hands of the English, the export of $30,000 per annum is exported from the Persian Gulf ports. Of the second kind, gitim (used in Europe for curtains, hangings, and chair-covers), considerable quantities are exported from Shushur and Kurdistan. In 1897, the quantity of gitim exported was 1,300,000, and the value of the produce exported was $50,000, and of that exported to Turkey and Italy, the value was $30,000. The traditions of the Persians, principally those manufactured in Persia, principally in Khorasan, Kahan, and about $100,000 per annum is expected.
reached a maximum in 1900 and 1901, as will be seen from the following table:—

Timber and Timber.—Timber from the forests of Mazandaran and Gilan has been a valuable article of export for many years, and since about 1870 large quantities of oak, maple, and boxwood exported thence; in some years the value of the timber and boxwood exported has exceeded 50,000. This value represented about 200,000 box trees and 12,000 oak trees. Much timber is used for charcoal-burning, and occasionally large parts of forest are burned by the people in order to obtain clearings for the cultivation of rice. The destruction of the forests by timber-cutting and charcoal-burning has been allowed to go on unchecked; no plantations have been laid out, and nothing has been done for forest conservation. Indiscriminate cutting has occasionally been confined within certain bounds, but such restrictions were generally rather of short duration for the convenience and profit of local governors. The oak forests of Kurdistan, Luristan, and the Bakhtiari district are also being rapidly thinned. A step in the right direction was made in 1900 by engaging the services of an official of the Prussian forest service as a consultant, and, unfortunately, beyond sending him to inspect the Mazandaran forests belonging to the Crown, and employing him to lay out a small plantation in the Jezrud valley, east of Teheran, nothing was done. The monopoly for cutting and exporting the timber of the Mazandaran forests was leased to European firms, principally for box and oak. Boxwood has become scarce. There are many kinds of good timber-yielding trees, the best known being alder (A lbus glutinosus), Wild, A. barbata, A. glutinosus, and Fraxinus angustifolia, and sycamore, elm (Ulmus campestris, U. effusa, U. poudranum), wych elm (Ulmus montana), hornbeam (Carpinus betulus), juniper (Juniperus communis), and maple (Acer insignis, Boiss., A. campestre, A. pseudo-platanus, L.), oak (Quercus lobata, Q. castaneofoelia, Q. sessilifolia, Q. poudranum), walnut, nettle tree (Celtis australis), Siberian elm (Zelkova crenata, Spach.), and various kinds of poplar. Pipe-sticks, from the wild cherry trees, are exported to Turkey.

Fisheries.—Fish is a staple food along the shores of the Persian Gulf, but the Crown derives no revenue from fisheries there. The fisheries of the Persian Gulf and the Caspian are not considered rich, but the absence of cheap and easy means of transport, and the scarcity of fuel and water which prevents almost everywhere, make any exploitation on a remunerative scale impossible, and the attempts to make use of them have so far been unavailing. A few millions of capital and under European superintendence have been financially unsuccessful.

While the value of the trade between Great Britain and Persia in 1906-1907 was almost the same as in 1897, that of the trade with Russia had increased from 31 millions to 81 or 137 %. The average yearly value of the trade between Great Britain and Persia during the six years 1892-1898 was £3,052,185 (imports £2,435,076, exports £517,169), between Russia and Persia £6,475,866 (imports £3,350,072, exports £3,125,794). The average values of the trade with other countries were: France £666,000, Austria £24,000, Germany £24,000, Italy £79,000, United States £66,000, Switzerland £26,000, Turkey £36,000, China £12,000, South Africa £10,000, India £12,000, Nepal £59,000.

The principal imports into Persia in approximate order of value are: cottons, sugar, tea, woollens, cotton yarn, petroleum, stuffs, silk, cotton, linen, mixed, wool, hardware, ironmongery, matches and oil, iron and steel, dyes, wines and spirits, tea, cocoa, beans, tropical exports are: fruits (dried and fresh), carpets, cotton, fish, rice, gums, wool, opium, silk, cocoons, skins, live animals, silks, cottons, wheat, beans, rice, sugar, cardamoms, and tobacco.

Shipping and Navigation.—Shipping under the Persian flag is restricted to vessels belonging to the Persian Gulf ports. Some of the larger craft, which are called baglah, and vary from 50 to 300 tons, carry merchandise to and from Bombay, the Dalbar
kept in dinars, formerly a gold piece, now an imaginary coin of ten thousand, or 10 krans silver, and 50 dinars are one shah.

Gold coins are 1, 2, 5, and 10 toman pieces, but they are not in circulation as current money because of their ever-varying value. A New krans, which depends up on the exchange on London.

The unit of weight is the miskal (71 grains), subdivided into 24 nakhods (2.96 grains), a nakhod being further subdivided into 4 gandum (0.74 grains). Larger weights, again, are the sir (16 miskals) and the shahr (32 miskals), which are sold and bought by weight called batman, or man, of which there are several kinds, the principal being:

Man-i-Tabriz—8 abbas = 640 miskals = 640 lb
Man-Noh abbas = 8 abbas = 720  720
Man-i-Koheh (the old man) = 1000  1000
Man-i-Shah = 2 Tabriz mans = 1280  1280
Man-i-Hose = 1000  1000
Man-i-Bander abbas = 840  840
Man-i-Hamsheni = 16 mans of  1160  1160

Corn, straw, coal, &c., are sold by kharvar = 100 Tabriz mans = 639 lb.

The unit of measure is the zar or guz, of which, in the case of the man, there are several variants. 40-95 in. is the most common length for the zar, but in Azerbaijan the length is 44-09 in.

Distances are calculated in farsaks, a farsak being equal to 6000 zar or 2648 nakhods. An approximately straight line distance from the Caspian to the farsak is 3-87 m., but the other length of the zar is sometimes used, when the farsak becomes 4-17 m. Areas are measured in jirbas from 1000 to 1006 square zar of 40-95 in., the surface unit therefore is a square jirba from 129 to 131.3 sq. m.

Constitution and Government.—Up to the year 1906 the government of Persia was an absolute monarchy, and resembled in its principal features that of the Ottoman Empire, with the exception, however, that the monarch was not the religious head of the community. The powers of the Shah (Shahanshah, or "king of kings") over his subjects and their property were absolute, but only in so far as they were not opposed to the shari', or "divine law," which consists of the doctrines of the Mahomedan religion, as laid down in the Koran, the oral commentaries and sayings of the Prophet, and the interpretations by his successors and the high priesthood. In 1905, however, the Persian began to demand freedom to vote and to be cired out for representative institutions and a constitution. By a rescript dated the 5th of August Muzaffar-ud-Din Shah gave his assent to the formation of a national council (Majilis i shora i milli), to be composed of the representatives of the various classes: princes, clergy, members of the Kajar family and tribe—chiefs and nobles, landowners, agriculturists, merchants and tradesmen. By an ordinance of the 10th of September the number of members was fixed at 162 (60 for Teheran, 102 for the provinces) to be raised to 200 if necessary, and elections were held soon after. Electors must be males and Persian subjects of not less than 25 years of age and of good repute. Landowners must possess land of at least 1000 tomanes (£200) in value, merchants and tradesmen must have a fixed and well-known place of business or shop with an annual value of not less than the average values in the localities where they are established. Soldiers and persons convicted of any criminal offence are not entitled to vote. The qualifications for membership are knowledge of the Persian language and ability to read and write it and good repute in the constituency. No person can be elected who is an alien, is under the age of 30 years or over the age of 70 years, is in the employ of the government, is in the active service of the army or navy, has been convicted of any criminal offence, or is a bankrupt.

On the 7th of October the national council, or as many members of it as could be got together, was welcomed by the shah at a banquet. The constitution of Persia is the same as the abolition and formal opening of parliament. An ordinance signed

1 By article v. of the Treaty of Gulistan of 1813, confirmed by article viii. of the Treaty of Turkmanchay of 1828, it was declared that Russia alone should have the right of maintaining vessels of war on the Caspian, and that no other Power should fly the military flag and have warships therein; and by decision of the Congress of the Persian Empire, published on the 24th of November 1869, the establishment of companies for the navigation of the Caspian, except by Russian subjects, and the purchase of shares of such companies by foreigners were prohibited. (Slade Papers, vol. III., p. 255.)
by Muhammad-ud-Din Shah, Mahommed Ali Mirza (his successor) and the grand vizir, on the 30th of December 1906, deals with the rescript of the 5th of August, states the powers and duties of the national council and makes provision for the regulation of its general procedure by the council itself. The members have immunity from prosecution except with the knowledge of the national council. The publicity of their proceedings except under conditions accepted by the council is secured. Ministers, or their delegates may appear and speak in the national council and are responsible to that body, which also has special control of financial affairs and internal administration. Its sanction is required for all territorial changes, for the alteration of state property, for the granting of concessions for the contracting of loans, for the construction of roads and railways, for the ratification of treaties, &c. There was to be a senate of 60 members of whom 30 were to be appointed to represent the shah and 30 to be elected on behalf of the national council, 15 of each class being from Teheran and 15 from the provinces (the senate, however, was not immediately formed).

By a rescript dated February 2, 1907, Mahommed Ali Shah confirmed the ordinance of the 30th of December, and on the 8th of October 1907 he signed the final revised constitution, and took the oath which it prescribes on the 12th of November in the presence of the council of ministers.

According to the constitution the shah must belong to the Shia faith, and his successor must be his eldest son, or next male in succession, whose mother was a Kajar princess. The shah's civil list amounts to 500,000 tomans ($100,000).

The executive government is carried on under a cabinet composed of seven or eight vizirs (ministers), of whom one, besides holding a portfolio, is vizir azam, prime minister. The vizirs are the ministers of the interior, foreign affairs, war, justice, finance, commerce, education, public works.

Until 1906 the shah was assisted in the task of government by the sadr azam (grand vizir), a number of vizirs, ministers or heads of departments somewhat on European lines, and a "grand council of state," composed of some ministers and other members nominated by the shah himself as occasion required. Many of the "ministers" would have been considered in Europe merely as chiefs of departments of a ministry, as, for instance, the minister for Crown buildings, that for Crown domains, the minister of ceremonies, those for arsenals, army accounts, &c.; also an accumulation of special offices without any connexion between their functions, in the hands of a ministar, or a vizir according to a clever departure from the European model. The ministers were not responsible to the Crown in a way that ministers of a European government are; they have no income, and generally referred their affairs to the grand vizir or to the shah for final decision.

There were twenty-seven vizirs (ministers), but only some of them held separate portfolios. Their departments of state, that had a vizir at their head were the following: court, ceremonies, shah's secretarial department, interior, correspondence between court and governors, revenue accounts and budget, finance, treasury, outstanding accounts, foreign affairs, war, army accounts, military stores, arsenals, justice, commerce, mines and industries, agriculture and Crown domains, Crown buildings, public works, public instruction, telegraphs, posts, mint, religious endowments and pensions, customs, press. In addition to these twenty-seven vizirs with portfolios, there were some titular vizirs at court, like Vizir i Husein i Humayun (minister of the imperial presence), Vizir i mohkasa (extraordinary minister), &c., and a number in the provinces assisting the governors in the same way as the grand vizir assists the shah. Most of these ministers were abolished under the new constitution, and the heads of subsidiary departments are entitled mudir or razi, and are placed under the responsible ministers.

Religion.—About 9,000,000 of the population are Mahomedans of the Shia faith, and 800,000 or 900,000, principally Kurds in north-western Persia, are said to belong to the other great branch of Islam, the Sunni, which differs from the former in religious doctrine and historical belief, and is the state religion of the Turkish Empire and other Mahomedan countries.

Other religions are represented in Persia by about 80,000 to 90,000 Christians (Armenians, Nestorians, Greek Orthodox and Roman Catholics, Protestants), 36,000 Jews, and 9000 Zoroastrians.

Society in Persia, being based almost exclusively on religious law, is much as it was in Biblical times among the Jews, with this difference, however, that there exists no sacerdotal caste. In Persia any person capable of reading the Koran and interpreting its laws may act as a priest (mu'allah), and as soon as such a priest becomes known for his just interpretation of the shari' and his superior knowledge of the traditions and articles of faith, he becomes a mujahid, literally meaning "one who strives" (to acquire knowledge), and is a chief priest. The mulkhas are referred to in questions concerning religious law, hold religious assemblies, preach in mosques, teach in colleges, and are appointed by the government as judges, head-preachers, &c. Thus the dignitaries, whose character seems to us specially a religious one, in reality doctors, or expounders and interpreters of the law, and officiating ministers charged with the ordinary accomplishment of certain ceremonies, which every other Mussulman, "true believer," has an equal right to fulfil. Formerly there were only four or five mujahids in Persia, now there are many, sometimes several in one city—Teheran, for instance, has ten; but there are only a few whose decisions are accepted as final and without appeal. The highest authority of all is vested in the mujahid who resides at Kerbela, or Najef, near Bagdad, and is considered by many Shi'ites as the vicegerent of the Prophet and representative of the imams.

The shah and the government have no voice whatever in the matter of appointing mujahids, who are appointed freely by the mu'azzin, vizirs, and occasionally chief priests of mosques that receive important subsidies out of government funds. The chief priest of the principal mosque of a city, the masjid i jam'a, is called imam jum'a, and he, or a representative appointed by him, reads the khatta, "Friday oration," and also preaches. The reader of the khatta is also called khatib. The leader of the prayers in a mosque is the pishanmaz, and the crier to prayers is the mu'azam. Many priests are appointed guardians of shrines and tombs of members of the Prophet's family (imams and imamoodehs) and are responsible for the proper administration of the property and funds with which the establishments are endued.

The lower judge among the clergy is called mutawalli, or, if the shrine is an important one with much money and many attendants, mutawalli-bashi, and is not necessarily an ecclesiastic, for instance, the guardianship of the great shrine of Imam Reza in Meshed is generally given to a high court functionary or minister as a reward for long services to the state. In the precincts of a great shrine a malefactor finds a safe refuge from his pursuers and is lodged and fed, and from the security of his retreat he can arrange the ransom which is to purchase his immunity when he comes out.

Formerly all cases, civil and criminal, were referred to the clergy, and until the 17th century the clergy were subordinate to a kind of chief pontiff, named sadr-us-soudar, who possessed a vassalage of his own, the jurisdiction in shrines, and, with the exception of the vilayet of Isfahan, was the sole judge, and managed all the religious endowments of the mosques, colleges, and abbeys. Shah Safi (1629-1642), in order to diminish the influence of the clergy, appointed two such pontiffs, one for the court and nobility the other for the people. Nadir Shah (1736-1747) abolished these offices altogether, and seized most of the endowments of the ecclesiastical establishments in order to pay his troops, and, the lands appropriated by him not having been restored, the clergy have never regained the power they once possessed. Many members of the clergy, particularly those of the higher ranks, have very liberal ideas and are in favour of progress and reforms so long as they are not against the shari', or divine law, but, unfortunately, they form the minority.

The Armenians of Persia, in so far as regards their ecclesiastical state, are divided into the two dioceses of Azerbaijan and Isfahan, and, since the late troubles in Turkey, which caused so many taking refuge in Persia, are said to number over 50,000. About three-fifths of this number belong to the diocese of Azerbaijan, with a bishop at Tabriz, and reside in the cities of Tabriz, Khor, Selm, Urmiya and Maragha, and in about thirty villages close to the north-western frontier; the other two-fifths, under the diocese of Isfahan, with a bishop in Jufa, reside in Teheran, Hamadan, Pol-e, Shiraz, Bushire, Zanali and other towns, and in some villages in the districts of Chahar Mahal, Ferizan, Barbarud, Kamareh, Kazak, Khurak, &c. Many Persian Armenians are engaged in trade and commerce, and some of
The Nesterians in Persia, all living in cities and villages close to the Turkish frontier, numbered about 25,000 to 30,000 but many of this number sold themselves out. In 1875, however, while in London, went over to the Greek Orthodox (Russian) Church, in consequence of the unsatisfactory protection afforded them by their patriarch, who was the 'Jew' which was established at Tehran in 1876. The Nestorians are cared for by an archimandrite of Russian nationality and some Russian priests.

The Greek Orthodox Catholici are represented by Russians, who reside in northern Persia; they have a church at the Russian legation in Tehran, and the Russians consult in Tabriz.

The Roman Catholics in Persia, Europeans and natives (mostly Armenians), number about three or four thousand, and have churches in Tehran, Julfa and Azerbaijan, served by members of the Nestorian and the Russian Nestorian Mission. The former mission has 24 churches, 118 schools, 2 hospitals and 4 dispensaries; the latter has 4 churches, 11 schools, 2 hospitals and 4 dispensaries. (2) The Church Missionary Society, established in Persia since 1809. In June 1866 a mission of 50 missionaries and 100 teachers was placed at Julfa, Isfahan, Yezd, Kermand and Shiraz. There are also hospitals and dispensaries for men and women at Julfa, Isfahan, Yezd and Kermand, as well as schools. Julfa and Isfahan have 300 pupils each, and are sometimes full to overflowing; the dispensaries are generally overcrowded. The establishment of the Church Missionary Society is under the care of the bishop, who resides at Julfa and is under the bishop of London. (3) The Anglican mission, which was established by Dr. Benson, archbishop of Canterbury, and has its work among the Nestorians in Azerbaijan. (4) The London Society for promoting Christianity among the Persians. The missionary and instruction schools at Isfahan and Hamadan in 1889. It has in Tehran a church and a school, at Isfahan a school and at Hamadan a small school. (5) The British and Foreign Bible Society has been represented at Isfahan since 1885. The Jews in Persia number about 36,000, and are found in nearly all the cities of the country, but communities with synagogues and priests are only in the larger cities like Tehran, Isfahan, Yezd, Shiraz, Hamadan, &c.

The Zoroastrians, commonly called "gabrs," numbering about 9000, reside principally in the cities and villages of Yezd and Kermand. Julfa and Tehran have about 2000, and Isfahan and Shiraz, some engaged in trade and commerce, but most of them employed in agricultural work and gardening. Their interests are attended to by a delegate who is appointed by the Bishop of London, at Tehran. The Persian government, after the establishment of Isfahani and Hamadan, also assisted the Zoroastrians with 25,000 rupees, and in 1890, and the French government, in 1898.

The non-Muslim Persian subjects, particularly those in the provinces, were formerly much persecuted, but since 1873, when Nasru'd-Din Shah returned to Persia from his first journey to Europe, they have been treated more liberally. In cities where many non-Musulman subjects reside a special official is appointed to protect them; and the ministry of justice has a special section to look after them and see that they are protected against fanaticism and injustice.

Instruction.—Primary schools, maktab (where Persian and a little Arabic, sufficient for reading the Koran, and sometimes also a little arithmetic, are taught to boys between the ages of seven and twelve), are very numerous. These schools are private establishments, and are under no supervision whatever. The payment for tuition varies from fourpence or fivepence to tenpence a month for each child. Colleges, madrasah (where young men are instructed, fed, and frequently also lodged gratuitously), exist in nearly every town. Most of these are attached to mosques, and the teachers are members of the clergy, and receive fixed salaries out of the college funds. The students are instructed in Arabic and Persian literature, religion, interpretation of the Koran, Mussulman law, logic, rhetoric, philosophy and other subjects necessary for admittance to the clergy, for doctors of law, &c., while modern sciences are neglected. Families who have means and do not desire their children to become members of the clergy, employ private tutors, and several have lately obtained the services of English and French professors to educate their children, while others send their boys to school in England, France, Germany and Russia. At the beginning of Nasru'd-Din Shah's reign, a public school on the lines of a French lycée was opened in Tehran, principally with the object of educating officers for the army, but also of introducing a knowledge of Western science and languages, and a ministry of public instruction was created at the same time. Military and civilian teachers were obtained from Europe, and the state granted a large sum of money for the support of the institution. The tuition is gratuitous, and the pupils are clothed and partly fed at government expense. Some years later a similar school, but on a much smaller scale, was opened in Tabriz. After a time the annual grant for the support of these two schools was reduced, and during the years 1890–1896 the Persian government, with great good fortune, had already about 250, and until the beginning of 1899 these two schools were the only establishments under the supervision of the minister of public instruction. Soon after his accession in 1896 Muzaffar-ud-Din Shah expressed a desire that something more should be done for public instruction, and in the following year a number of Persian notables formed a committee and opened some schools in Tehran and other places in the beginning of 1898. A year later the new schools, until then private establishments, were placed under the minister of public instruction. The new schools at Tehran have from 1000 to 1400 pupils.

A German school with an annual grant of £2400 from Persia and of £1000 from Germany was opened at Tehran in 1887. There is also established a French school under the auspices of the Alliance Française. Much has been and is being done for education by the Armenians and the Protestant and Roman Catholic missions in Persia, and a large percentage of the pupils is composed of Musulmans. The Alliance Israélite has opened a school in Tehran. In 1897 the American Protestant mission had 129 schools with 3423 pupils, the English Protestant missions had 5 schools with 425 pupils, the Roman Catholic mission (Lazaristes) had 3 schools with 400 pupils, and the Armenians had 4 schools and 646 pupils. All these schools are supported by voluntary subscriptions and donations, and are open to boys and girls of all nationalities.

Army.—Persia had no regular army until 1807, when some regiments of regular infantry (saro'bes) were embodied and drilled by the first French military mission to Persia under General Gardane. Since then other seven military regiments (two British, two French, two Austrian, and one Russian) have come to Persia at the request of the Persian government, and many officers and non-commissioned officers, and even civilians, of various nationalities, have been engaged as army instructors.

The last serious attempt to reorganize the Persian army was made in 1879, when the second Austrian mission formed the "Austrian corps" of seven new battalions of 800 men each. These new battalions were disbanded in 1882. The Russian mission of 1883 declared that they would form a "Cossack brigade," which it formed has always been managed by Russian officers. The brigade has a strength of about 1800 men and costs £50,000 per annum. The total annual expenditure for the army amounts to about a third of the total revenues of the government.

According to statistics published for 1905 the Persian army has an effective force of about 97,000 men, but the number of men actually serving with the colours does not exceed 35,000—

Navy.—The Persian government possesses nine steamers. One is the "Nasru'd-Din," an old yacht of about 120 tons, presented in the 'seventies by the emperor of Russia, and stationed at Enzeli, the port of Resht. The others, all employed in the customs service in the Persian Gulf, are the following: The "Persepolis," built 1884, 600 tons, 450 h.p., with three 7½ cm. and one 8½ cm. Krupp. The "Susa," built 1884, 36 tons, with one Krupp. An old Belgian yacht "Seltka," purchased 1903 and renamed "Muzafir," with two Hotchkiss guns. Five launches built in the Royal Indian Marine Docks, Bombay, in 1905, at a cost of 60,000 rupees each, of about 80 tons.
PERSIA

The total revenue of Persia, from all sources, amounted in 1876 to 58,700,000 kranis, in 1884 to 50,800,000 in 1890 to 60,000,000; and in 1907-1908 to about 80,000,000 kranis. This would seem to show a steady decline, but the figures taken in the year 1892, in which the kron was nearly 8½ décaires per kran, has fallen in consequence of the great depreciation of silver to only 4½ décaires, the total revenue really decreased from £1,900,000 in 1876 to £1,600,000 in 1907-1908.

The total cost of finance 250,000 is represented by customs and £110,000 by rents and leases of state monopolies, leaving 599,000 for maliat and revenues of Crown lands. In 1876, the costs of finance were nearly £500,000 more than the total revenue, the expenses of the Crown being then nearly £3,000,000, of which the two former were only £350,000 instead of £510,000 in 1907-1908. While the prices in kranis of agricultural produce, and hence the profits of the landowners and the wages and profits of artisans and workmen, have of course increased, the number of taxpayers has been decreased, and the Crown has lost the revenue once yielded by seignories and courtesy rights. By the agreement between the Persian and British governments, the Crown has received only 12,000,000 roubles, and the nominal value of the real property tax, known as the "maliat," has been reduced from seven to five percent. The total revenue of the Crown has therefore fallen from £1,000,000 in 1876 to £750,000 in 1907-1908, and the Crown revenue has been reduced from £1,500,000 to about £750,000. In 1876, the Crown had power to demand maliat kranis for the privilege of trading in or visiting the land, but this has been reduced to 2½ kranis per head, and the Crown revenue has nearly fallen to zero.

The state and municipal debt is less than the national income, but the current expenses of the government are not sufficient to cover the deficit, and many payments fell in arrear in spite of emptying the treasury of its reserve and contracting numerous loans.

The total debt, including the various loans contracted with the Imperial Bank of Persia, established by British royal charter in 1889, for a loan of £500,000 at 6 %, repayable in the course of forty years, and guaranteed by the customs of Fars and the Persian Gulf ports, was £1,100,000. This loan was £24,000,000 in 1892 at 5 % interest, but, owing to the falling value of gold, the rate of interest has been raised to 5½ %, and the foreign exchanges are back to 2½ kranis per £1. The government has also contracted with the Banque des Prêts de Persia, a Russian institution connected with the Swedish state bank, and established in 1890. This loan was for 24,000,000 roubles (£2,400,000) at 5 % interest, guaranteed by the customs of Fars and the Persian Gulf ports, and repayable in the course of seventy-five years. In the contract, which was signed at St Petersburg at the end of November 1890, the Persian government undertook to pay redeemable half-yearly installments, and in the event of default the Russian bank will have the right to exercise effective control of the customs with a maximum number of twenty-five European employees. The sum of £24,000,000 was the maximum amount which the government agreed to pay for the services of the Persian Bank for the balance of the 1892 loan (about £435,000), temporary loans from various banks, arrears of pays and salaries, and other arrears, amounting to over £5,500,000, so that the total debt of Persia is now greater than the one-time cost of the exchequer about £5,000,000. It is expected that the expenditure will exceed the receipts, even if the shah undertook a third voyage in Europe in 1907, and the national assembly or council demanded a budget and made inquiries as to the financial position, it was found that the expenditure for
some years past had been half a million sterling per annum in excess of the receipts and that considerable sums were owing to banks and commercial firms who had lent money. Most of the money borrowed is at 12 to 15% interest.

In 1888, a bank, the New Oriental Bank Corporation, Limited, established itself in Persia and modern ideas of banking were introduced into the country. Until then the banking was done by the more ancient banks—120% Jewish—of Persian—whom exceptionally undertook special outside transactions. In 1889 the shah granted a concession to Baron Julius de Reuter for the formation of a state bank in Persia, exclusive right of issuing bank-notes

By the end of the month, modern alien banks had occupied nearly a million, without special assent of the Persian government—on the basis of the local currency, the silver kran. With the title of "The Imperial Bank of Persia" the bank was founded, the same year, and incorpored by royal charter granted by Queen Victoria and dated the 2nd of September 1889. The authorized capital was four millions sterling, but the bank started with a capital of one million, and began its business in Persia in October 1889. In April 1900 it took over the Persian branch of the New Oriental Bank Corporation, shortly afterwards opened branches and agencies at the principal towns, and issued notes in the same year. During the first two years the bank paid on demand, and its business in Persia at the then prevailing exchange, and received for every pound sterling 32 to 34 kran; but in consequence of the great fall in silver in 1893 and 1894, the exchange rose to 40 per cent, and depredatory practices employed in Persia being reduced in value by more than one-third—100 kran, which at the beginning represented £3, then being worth only £2 or less—the original capital of one million sterling was only £500,000, or 25% of the original issue. In December 1890 the bank had made steady progress in spite of innumerable difficulties, and paid a fair dividend to its shareholders. In his paper on "Banking in Persia" (Journal of the Institute of Bankers), Mr. Black states that the capital out of which the difficulties were made the easy distribution of funds—that is, the providing them when and where required—a matter of impossibility in Persia, and gives this fact as one reason why the Imperial Bank of Persia has local issues of money payable at the issuing branches only, for, in a country like Persia, where movements of specie are so costly, slow and difficult as to become impracticable except on a small scale, the value of which becomes less than the paper as soon as it is out of sight. On the 20th of September 1907 the value of the notes in circulation was £395,000, and the bank held £550,000 deposits in Persia.

In the summer, the shah also granted a concession to Jaques de Pollakov of St Petersburg for the establishment of a "loan bank," or, as the original concession said, "mont-de-piete," with exclusive rights of holding public holdings. A company was formed in the same year and the business was carried on at Teheran in 1890 as the "Banque des Prêts de Perse." After confining its operations for some years to ordinary pawnbroking, without profits, it obtained the aid of the Russian State Bank, andlarged its operations. In 1895 it was owned by the Persean government (since 1898), and in January 1900 and March 1902 financed the loans of £2,400,000 and £1,000,000 to Persia. It has branches at Tabriz, Rehsh, Mesohe and other towns.

Various Armenian firms, one with branches at many places in Persia and Russian also, do banking business, while various European firms at Tabriz, Teheran, Isfahan, Shiraz and Bushire, facilitate remittances between Europe and Persia.

The chief business of the native sarafs (money-changers, bankers, &c.) is to discount bills at high rates, hardly ever less than 12%, and remit money from place to place in Persia for a commission amounting to from 1 to 5, or even 6%, on each transaction. In spite of the European banks giving lower rates of discount and remitting money at par, the majority of the people and mercantile classes still deal with the natives. For advances with good security a native saraf will lend at least 12% interest per annum; for advances with poor security diminishes in value the rate of interest increases, and transactions at 10% a month, or more than 120% per annum, are not infrequent. To the Persian view of money at less than 12% considers that he gets money "for nothing."

(H. A. H.)

**History**

A. Ancient, to the Fall of the Sassanian Dynasty.

I. The Name. — "Persia," in the strict significance of the word, denotes the country inhabited by the people designated as Persians, i.e. the district known in antiquity as Persis (q.v.), the modern Fars. Custom, however, has extended the name to the whole Iranian plateau; and it is in this sense that the term Persia is here employed.

II. Ancient Ethnography.—In historical times we find the major portion of Iran occupied by peoples of Indo-European origin, terming themselves Aryans (Arya; Zend, Araya) and their language Aryan—in the inscriptions of Darius—the same name, which is used by the consanguineous tribes of India who were their nearest relations. The whole country is designated Ariana (Zend, Aryan)—"the land of the Aryans"—the original of the Middle-Persian Eran and the modern Iran; the Greek geographers Eratosthenes and Strabo were in error when they limited the name to the eastern districts of Iran. Thus the name of Iranians is understood to comprehend all these peoples. Aryans is translated thither a few centuries ago, the ethnologically and philologically distinct race of the Bravi, who are probably connected with the Dravidians of India. In them we may trace the original population of these districts; and to the same original population may be assigned the tribes here settled in antiquity: the Parni and Gedrosii (Gadrosi), and the Myci (Herod. i. 93, vii. 68; the Maka of Darius, the modern Mekran), to whom the name "Aethiopians" is also occasionally applied (Herod. i. 94, vii. 70). In Media the Greek geographers mention a people of Arianae (Strabo x. 598, 514; Pliny, Nat. Hist. vi. 48; Ptolem. v. 5. 2; Diod. xi. 64; Justin, vii. 25) in the north of Persia, or, more probably, the Tapurs, Amdari, Caspi, and especially the Caluseni or Galasi—situated in Khuzistan on the Caspian—probably belonged. Presumably they were also related to the tribes of Armenia and the Caucasus. In the chains of Zagros we find, in Babylonian and Assyrian times, no trace of Iranians; but partly Semitic peoples—the Gutaeae, Lulubaeae, &c.—partly tribes that we can refer to no known ethnological group, e.g. the Cossaei (see below), and in Elamian or Susiana the Elymaeae (Elamites).

That the Iranians must have come from the East to their later home, is sufficiently proved by their close relationship to the Indians, in conjunction with whom they previously formed a single people, bearing the name Iran. Arya. Their residence must have lain chiefly in the great steppe which stretches north of the Black Sea and the Caspian, through South Russia, to Turan (Turkestan) and the Oxus and Jaxartes. For here we continually discover traces of Iranian nationality. The names and words of the Scythians (Scytoi) in South Russia, which Herodotus has preserved, are for the most part perfectly transparent Iranian formations, identified by Zeuss and Mulfenhoff; among them are many proper names in Arie—(Ates)—and aspa (horse-aspa; Zend, aspa). The predatory tribes of Turan (e.g. the Massa, or, more properly, the Massagetae) are constantly referred to as being occupied with horse and to have lived on the back of their horses. These tribes are distinguished by the Iranian peasants as Daha (Gr. Δάαας), "enemies," "robbers"; by the Persians as Sacae; and by the Greeks generally as Scythians.

From the region of the steppes the Aryans must have penetrated into the cultivable land of Eastern Iran: thence one part spread over the district of the Indus, then on again to the Ganges; another moved westward to Zagros and the borders of the Semitic world.

The date of this migration cannot yet be determined with certainty. We know only that the Aryans of India already occupied the Punjab in the Vedic era, c. 1600 B.C. On the other hand, about the same period a number of names, undoubtedly Iranian, made their appearance in Western Asia, (cf. Edward Meyer, "Zur ältesten Geschichte der Iraner," in Zeitschrift für vergleichende Sprachforschung, 1907). In the cuneiform letters from Tell el-Amarna in Egypt (1460 B.C.), we find among the princes of Syria and Palestine names like Aramanyu, Aryanu, Shuwarda, a name terminating in -wurama, &c.; while the kings of Mitanni on the Euphrates are Arilatama, Shuratana, Arisumara, and Dushratatu—names too numerous and too genuinely Iranian to allow of the hypothesis of coincidence. Later still, in the Assyrian inscriptions we occasionally meet with Iranian names borne by North-Syrian princes—e.g. Kundaspi and...
HISTORY: ANCIENT

PERSIA

Kustaspi (= Hystaspis). Their subjects, on the contrary, speak absolutely different tongues: for the attempts to explain the languages of the Caspaeans, Mitanniands, and Arzapanians as Indo-European (Iranian) have ended in failure (cf. Blomfield in the American Journal of Philology, xxv. p. 1 sqq.).

It appears, then, that towards the middle of the second millennium before Christ, the Iranians made a great forward movement to the West, and that certain of their princes—at first, probably in the rôle of mercenary leaders—reached Mesopotamia and Syria and there founded principalities of their own, much as did the Germans under the Roman Empire, the Normans, Turks, &c. With this we may probably connect the well-known fact that horses first appear, this very period (1700 B.C. approximately), that the horse made its appearance in Babylonia, Egypt and Greece, where for centuries subsequently its use was confined to war and the war-chariot. Before this it was as foreign to the Babylonians, even in the time of Khammurabi, as to the Egyptians under the XIIth Dynasty. On the other hand, it had been familiar to the Aryans from time immemorial: indeed they have always been peculiarly a people of riders. Thus it is quite conceivable that they brought it with them into Western Asia: and the quarter from which it came is sufficiently indicated by the fact that the Babylonians write the word "horse" with a group of signs denoting "an ass of the land." That the Assyrians have only the word for the wild ass (Assarhaddon), shows that the horse was not known to them until after the time of Akkadian. They stretched far into the midst of the nomadic tribes.

Of the Assyrian kings, Shalmaneser (Salmanasar) II. was the first to take the field against the Medes in 836 B.C., and from that period onwards they are frequently mentioned in the Assyrian annals. Sargon penetrated farthest, receiving in 715 B.C. the tribute of numerous Median town-princes. He gives a list of their names, twenty-three of which are preserved either wholly or in part, and almost all are unmistakably Iranian; as is also the case with those preserved by Esar-haddun (Assurhaddon) and elsewhere.

The Medes, then, were an Iranian nation, already occupying in the 9th century B.C. their later home in the centre of the Median highland. On the other hand, among their neighbours in Zagros and the north—corresponding to the Aryan tribes (Non-Aryans) of the Greeks—Iranian names are at best isolated phenomena. With other Iranian tribes the Assyrians never came in contact: for the oft-repeated assertion, that the Parsua, so prominent in their annals, were the Persians or the Parthians, is quite untenable. The Parsua of the Assyrians are located south of Lake Urmi, and can hardly have been Iranians.

None the less, the Assyrian statements with regard to the Medes demonstrate that the Iranians must have reached the west of Iran before 900 B.C. It is probable that at this period the Persians also were domiciled in their later home, even though we have no direct evidence to adduce. If this reasoning is correct, then the Persians must be assigned to the first half of the second pre-Christian millennium.

The Aryans of Iran are divided into numerous tribes; these, again, being subdivided into minor tribes and clans. The principal, according to the inscriptions of Darius—I—which closely agree with Herodotus—are the following, several of them being also enumerated in the Avesta—

1. The Medes (Meda) in the north-west (see Media).
2. The Persians (Parthes) in the north (see Persis). To these belong the Carmanians and the Utians (Yutia), who are mentioned expressly by Darius as inhabiting a district in Persis (Beh. III. 40).
3. The Hyrcanian (Varkana in Darius, Zend Vehrkan in the eastern corner of the Caspian, in the fertile district of Arasabad).
4. The Parthians (Parthvaheti; Pers. PArthavah) in Khorasan (see Partia).
5. The Arians (Aria, Pers. Harvaseh) in the vicinity of the river Araxes (Heroyr), which derived its name from them. This name, which survives in the modern Herat, has of course no connexion with that of the Aryans.
6. The Drangians (Zaranis in Darius, Sarangians in Herod. iii. 187) in north-west Afghanistan (Arachosia), and the southern Afghan tribes, which extend to the present Balistan.
7. Anarch the Persis (Hermagis), in the district of the Helmand and its tributaries, round Kandahar. They are mentioned in the lists of Darius, also by the Greeks after Alexander. In Herodotus their place is taken by the Pactyans, whose name survives to the present day in the word Pushitu, with which the Afghans denote their language (Herod. iii. 102, iv. 44, vii. 67, 85). Probably it was the old tribal name; Arachosia being the local designation. The Thracians, who appear in Herodotus (iii. 93, 117), must be classed with them.
8. The Bactrians (Pers. Bakhtri), on the northern declivity of the Hindu Kush, as far as the Oxus. Their capital was Bactra, or more accurately Balkh (Arr. Ind. 21), which is still held by the modern Afghans.
9. The Sogdians (Pers. Sugadu), in the mountainous district between the Oxus and Jaxartes.
10. The Chorasmians (Khwarismians, Pers. Uvarumiyu), in the place of Bactria, and still held by them. These are the Khwarizmians. They stretched far into the midst of the nomadic tribes.
11. The Margians (Pers. Margu), on the river Margus (Murgab): chiefly inhabiting the oasis of Merv, which has preserved their name. Shalmaneser the Third mentions them in his list of peoples, and omits them from his list of peoples; so that ethnographically they are perhaps to be assigned to the Aryans.

The Sogdians (Pers. Assaguria): according to Herodotus (vii. 85), a nomadic tribe of horsemen; speaking, as he expressly declares, the Persian language. Hence he describes them as a subordinate nomad clan of the Persians. They, with the Drangians, Utians, and Myci, formed a single satrapy (Herod. iii. 93). 

12. The Sagartians (Pers. Assaguria): according to Herodotus (vii. 85), a nomadic tribe of horsemen; speaking, as he expressly declares, the Persian language. Hence he describes them as a subordinate nomad clan of the Persians. They, with the Drangians, Utians, and Myci, formed a single satrapy (Herod. iii. 93). 

13. We have already touched on the nomadic peoples (Daha, Dabaida), who inhabited Iran, and occupied, or were the descendants of, the Turkestans as far as the Sarmatians and Scythians of South Russia. That these were of Iranian origin is proved by the names Arianists and Ariapetes borne by Scythian (Scotoi) kings (Herod. ii. 96, 97). There are also more than a dozen references to Darius and the Persians. To the settled peasantry, these nomads of the steppe were always "the enemy" (dana, daha, Daha). Side by side with the "Dara" and "Turiana"; a designation applied both by the later Persians and by modern writers to this region. The origin of the word is obscure, derived perhaps from an obsolete tribal name. It has no connexion whatever with the much later Türk (Turan) nation, being of Indo-European, and dating back at least to the 6th century after Christ. Though found neither in the inscriptions of Darius nor in the Greek authors, the name Turan must nevertheless be of great antiquity: for not merely is it repeatedly found in the Zendavesta, under the name Tur, but it occurs also in Herodotus and Ctesias, in the hymn, which, without doubt, originates from Zoroaster himself, and in which "the Turanian Fryāna" and his descendants are commemorated as faithful adherents of the prophet (Yasa 146, 42).

14. The dividing line between Iranian and Indian is drawn by the Hindu Kush and the Sogdian mountains of the Oxus district. The valley of the Kabul (Cophen) is already occupied by Indian tribes, especially the Gandarians; and the Satagayda (Pers. Thalaga) there resident were presumably also of Indian stock. The non-Aryan population of Iran itself has been discussed above. Of its other neighbours, we must here mention the Sacae, a warlike equestrian people in the mountains of the Pamir plateau and northward; who are probably of Mongol origin. Herodotus relates that the Persians distinguished "all the Scythians"—i.e. all the northern nomads—as Sacae; and this statement is confirmed by the inscriptions of Darius. The Babylonians employ the name Gimiri (i.e. Chimerians) in the same sense.

III. Civilization and Religion of the Iranians.—In the period when the ancestors of Indian and Iranian alike still formed a single nation—that of the Aryans—they developed a very marked characteristic, which can still be distinctly traced, not only in their language, but also in their religion and in many views common to both peoples. A great number of gods—Asura, Mithras, the Dragon-slayer Verethragna (the Indra of the Indians), the Water-shoot Apam napat (the lightning), &c.—date from this era. So, too, fire-worship, especially of the sacrificial flame; the preparation of the intoxicating soma, which fills man with divine strength and uplifts him to a sublime and divinised vision; the good thoughts and good works, imposed on the pious by Vedic and Avesta alike: the belief in an unwavering order (rola)—a law controlling gods and men and dominating them all; yet with this, a belief in the power of magical formulae (mantra), excommunications and prayers, to whose compulsion not merely demons (the evil spirits of deception—drugh) but even the gods (daena) must submit; and, lastly, the institution of a priesthood of fire-keepers (abhravan), who are at once the repositories of all sacred traditions and the mediators in all intercourse between earth and heaven. The transition, moreover, to settled life and agriculture belongs to the Aryan...
period; and to it may be traced the peculiar sanctity of the cow in India and Persia. For the cow is the animal which voluntarily yields nourishment to man and aids him in his daily labours, and on it depends the industry of the peasant as contrasted with the wild desert barbarian to whom the cow is unknown.

Very numerous are the legends common to both nations. These, in part, are rooted in the primeval Indo-European days, though their ultimate form dates only from the Aryan epoch. Foremost among these is the myth relating the battle of a sun-god (Ind. \textit{Trīla}, generally replaced by \textit{Indra}, \textit{Iran.\ Thraetōna}) against a fearful serpent (Ind. \textit{Aki}, Iranian. \textit{Ashā}; known moreover as \textit{Vṛtra}); also, the legend of Yama, the first man, son of Vivas- vana; and \textit{Thraetōna}. This Arabian philosophy, beginning, was seized by death and now rules in the kingdom of the departed. Then come a host of other tales of old-world heroes; as the "Glorious One" (Ind. \textit{Sūkhrava}, Pers. \textit{Husrava, Chosrau or Chosroes}), or the Son who goes on a journey to seek his father, and, unknown, meets his end at his hands.

These legends have lived and flourished in Iran at every period of its history; and neither the religion of Zoroaster, nor yet Islam, has availed to suppress them. Zoroastrianism—at least in that form in which it became the dominant creed of the Iranians—legitimized not only the old gods, but the old heroes also; and transformed them into protectors and servants of Ahuramazda; while the creator of the great national epic of Persia, Firdousi (\textit{A.D. 935-1020}), displayed astonishing skill in combining the ancient tradition with Islam. Through his poem, this tradition is perfectly familiar to every Persian at the present day; and the primitive features of tales, whose origin must be dated \textit{4000} years ago, are still preserved with fidelity. This tenacity of the Saga stands in the sharpest contrast with the fact that the historical memory of the Persian is extremely defective. Even the stories of the Achaemenid Empire faded rapidly, and all but completely, from recollection; so also the conquest of Alexander, and the Hellenistic and Parthian eras. In Firdousi, the legendary princes are followed, almost without a break, by Ardeshir, the founder of the Sassanid dynasty: the intervening episode of Darius and Alexander is not drawn from native tradition, but borrowed from Greek literature (the Alexander-romance of the Pseudo-Callisthenes) in precisely the same way as among the nations of the Christian East in the middle ages.\footnote{1}

Needless to say, however, this long period saw the Saga much recast and expanded. Many new characters—Siyaush, Rustam, &c.—have swelled the original list: among them is King Gushatap (Vishtasp), the patron of Zoroaster, who was known from the poems of the prophet and is placed at the close of the legendary age. The old gods and mythical figures reappear as heroes and kings, and their battles are fought no longer in heaven but upon earth, where they are localized for the most part in the east of Iran. In other words, the war of the gods has degenerated to the war between Iranian civilization and the Turanians. Only the evil serpent Azhi Dahaka (Azhdahak) is domiciled by the \textit{Avesta} in Babylon (\textit{Bauri}) and depicted on the model of Babylonian gods and demons: he is a king in human form with a serpent growing from either shoulder and feeding on the brains of men. In these traits are engrained the general conditions of history and culture, under which the Iranians lived: on the one hand, the contrast between Iranian and Turanian; on the other, the dominating position of Babylon, which influenced most strongly the civilization and religion of Iran. It is idle, however, to read definite historical events into such traits, or to attempt, with some scholars, to convert them into history itself. We cannot deduce from them a conquest of Iran from Babylon: for the Babylonians never set foot in Iran, and even the Assyrians merely conquered the western portion of Media. Nor yet can we make the favourite assumption of a great empire in Bactria. On the contrary, it is historically evident that before the Achaemenids there were in Bactria only small local principalities of which Vishtasp’s was one: and it is possible that the primeval empire of the Saga is only a reflection of the Achaemenid and Sassanid empires of reality, whose existence legend dates back to the beginning of the world, simply because legend is pervaded by the assumption that the conditions obtaining in the present are the natural conditions, and, as such, valid for all time.

Closely connected as are the Mythology and Religion of Indian and Iranian, no less clearly marked is the fundamental difference of intellectual and moral standpoint, which has led the two nations into opposite paths of history and culture. The tendency to religious speculation and to a speculative philosophy, comprehending the world as a whole, is shared by both and is doubtless an inheritance from the Aryan period. But with the Indians this speculation leads to the complete abolition of all barriers between God and man, to a mystic pantheism, and to absorption in the universal ego, in contrast with which the world becomes an unsubstantial phantasm and sinks into nothingness. For the Iranian, on the contrary, practical life, the real world, and with them the moral commandment, fill the foreground. The new gods created by Iran are ethical powers; those of India, abstractions of worship (\textit{brahman}) or of philosophy (\textit{atman}). These fundamental features of Iranian sentiment encounter us not only in the doctrine of Zoroaster and the religions of Darius, but also in that magnificent product of the Persia of Islam—the Sufi mysticism. This is pantheistic, like the Brahman philosophy. But the pantheism of the Persian is always positive,—affirming the world and life, taking joy in them, and seeking its ideal in union with a creative god: the pantheism of the Indian is negative—denying world and life, and describing its ideal in the cessation of existence.

This contrast in intellectual and religious life must have developed very early. Probably, in the remote past violent religious disputes and feuds broke out: for otherwise it is almost inexplicable that the old Indo-European word, which in India also, denotes the gods—\textit{deva}—should be applied by the Iranians to the malignant demons or devils (\textit{dæva; mod. dīs}); while they denote the gods by the name \textit{bhaga}. Conversely the Asuras, whose name in Iran is the title of the supreme god (\textit{ahura, aura}), have in India degenerated to evil spirits. It is of great importance that among the Slavonic peoples the same word \textit{bogu} distinguishes the deity; since this points to ancient cultural influences on which we have yet no more precise information. Otherwise, the name is only found among the Phrygians, who, according to Hesychius, called the Heaven-god (\textit{Zeus}) Bagæus; there, however, it may have been borrowed from the Iranians. We possess no other evidence for these events; the only document we possess for the history of Iranian religion is the sacred writing, containing the doctrines of the prophet who gave that religion a new form. This is the \textit{Avesta}, the Bible of the modern Parsee, which comprises the revelation of Zoroaster.

As to the home and time of Zoroaster, the Parsee tradition yields us no sort of information which could possibly be of historical service. Its contents, even if they go back to lost parts of the \textit{Avesta}, are merely a late patchwork, based on the legendary tradition and devoid of historical foundation. The attempts of West (\textit{Pahlavi Texts Translated}, vol. v.) to turn to historical account the statements of the \textit{Bundestōosh} and other Parsee books, which date Zoroaster at 258 years before Alexander, are in the present writer’s opinion, a complete failure. Jackson (Zoroaster, the Prophet of Ancient Iran, 1901) sides with West. The Greek theory, which relegates Zoroaster to the mists of antiquity, or even to the period of the fabulous Ninus and Semiramis, is equally valueless. Even the statement that he came from the north-west of Media (the later Atropatene), and his mother from Rai (Rhagae) in eastern Media, must be considered as problematic in the extreme. Our only trustworthy information is to be gleaned from his own testimony and from the history of his religion. And here we may take it as certain that the scene of his activity was laid in

\textit{The Iranian Saga.}

\textit{ANCIENT PERSIA.}

\textit{HISTORY: ANCIENT
the east of Iran, in Bactria and its neighbouring regions. The contrast there existing between peasant and nomad is of vital consequence for the whole position of his creed. Among the adherents whom he gained was numbered, as already mentioned, a Turanian, one Fryana and his household. The west of Iran is scarcely ever regarded in the Avesta, while the districts and rivers of the east are often named. The language, even, is markedly different from the Persian; and the fire-priests are not stately Magi, as in Persia, but are a race of wonder-workers and never occurs in the Avesta, except in a single late passage—but albramans, identical with the altahran of India (πράσινοι, "fire-kindlers," in Strabo xv. 733). Thus it cannot be doubted that the king Vaitapasa, who received Zoroaster's doctrine and protected him, must have ruled in eastern Iran: though strangely enough scholars can still be found to identify him with the homonymous Persian Hystaspes, the father of Darius. The possibility that Zoroaster himself was not a native of East Iran, but had immigrated thither (from Rhagaez?), is of course always to be considered; and this theory has been used to explain the phenomenon that the Gathas, of his own composition, are written in a dialect which the Eslam Peredn of the Avesta. On this hypothesis, the former would be his mother-tongue: the latter, the speech of eastern Iran.

This district is again indicated as the starting-point of Zoroastrianism, by the fact that dead bodies are not embalmed and then interred, as was usual, for instance, in Persia, but cast out to the dogs and birds (cf. Herod. i. 140), a practice, as is well known, strictly enjoined in the Avesta, ruthlessly executed under the Sassanids, and followed to the present day by the Parsees. The motive of this, indeed, is to be found in the sanctity of Earth, which must not be polluted by a corpse; but its origin is evidently to be traced in a barbaric custom of nomadic or semi-nomadic tribes who leave the dead to die on the steppe; and we know from Greek sources that this custom was widely diffused among the tribes of eastern Iran.

The next clue towards determining the period of Zoroaster is, that Darius I. and all his successors, as proved by their inscriptions and by Greek testimony, were zealous adherents of the true word of Zoroastrianism; which consequently must already have been accepted in the west of Iran. That Cyrus too owned allegiance to the creed, cannot be doubted by an unprejudiced mind, although in the dearth of contemporary monuments we possess no proof at first hand. The Assyrian inscriptions demonstrate, however, that Zoroaster's teaching was already current in Media two centuries before Cyrus. For in the list of Median deities, which already includes, and are two bearing the name of Mazdaks—evidently after the god Mazda. Now this name was the invention of Zoroaster himself, and he who names himself after Mazda thereby makes a confession of faith in the religion of Zoroaster whose followers, as we know, termed themselves Mazdayasans, "worshippers of Mazda."

Thus, if the doctrine of Zoroaster predominated in Media in 714 B.C., obviously his appearance in the rôle of prophet must have been much earlier. A more definite date cannot be deduced from the evidence at our disposal, but his era may safely be placed as far back as 1000 B.C.

The religion which Zoroaster preached was the creation of a single man, who, having pondered long and deeply the problems of existence and the world, propounded the solution he found as a divine revelation. Naturally he starts from the old views, and is indebted to them. His ideas of good and evil out of this material he builds a uniform system which bears throughout the impress of his own intellect. In this world, two groups of powers contend, each other in a righteous war, with the powers of Good, of Light, of creative Strength, of Life and of Truth, and the powers of Evil, of Darkness, Destruction, Death and Deceit. In the van of the first stands the Holy Spirit (spenta mainyu) or the "Great Wise One," the "Good Word," and in the second the powers of the Good Thought (sohu manu, ūsavē), of Right Order (ashta, Ind., ira, Pers. arta, "lawfulness"), of the Excellent Kingdom (khshathra sārya), of Holy Character (spenta ārmaiti), of Health (haurvat), and of Immortality (amarta). These are comprised under the general title of "undying holy ones" (amesha spenta, amshaspanda); and a host of subordinate angels (yasaata) are ranked with them. The powers of evil are in all points the opposite of the good; at their head being the Evil Spirit (angra mainyu, Ahriman). These evil demons are identical with the old gods of the popular faith—the Zoroastrian avatars of the Iranian Mithra, while under the name of Ahriman, above discussed; whence Ahuramazda (Ormuzd).

From this it will be manifest that the figures of Zoroaster's religion are purely abstractions; the concrete gods of vulgar belief become mere attributes. All beings, then, whether gods, demons, men, or non-human beings, might be recognized as inferior servants of Ahuramazda: chief among them being the Sun-god Mithras (see Mithras); the goddess of the water-streams, Anahita (Panis); the Dragon, for the Greeks (see Artanes, Artagnes, or Artanesus), with the god of the intoxicating Haoma (the Indian Soma). In the religion of the people, these divinities always present the personified form of the powers possessed by the numerous Aryan proper names thence derived (Mithra, Mithridae, Anaitis, and the Dragongods). Among the educated community who had embraced the pure doctrine in its completeness scarcely recognized them, and the inscriptions of Darius ignore them. Only once he speaks of "the gods of the clans," and once of "the other gods which there are besides these." While the time of Artaxerxes II. were Mithra and Anaitis received into the official religion of the Persian kings. But they always played a leading part in the propaganda of the Persian cults in the West.

Only one element in the old Aryan belief was preserved by Zoroaster in all its sanctity: that of Fire—the purest manifestation of Ahuramazda and the powers of Good. Thus fire-altars were everywhere venerated, and the word Ahuramazda was both the name of the Eslam Peredn and evocative of the fires, and was the name of the god, when he spoke the Eslam Peredn word and combated the lie. And this is fulfilled when he obeys the commands of law and the true order; when he tends his cattle and fields, in contrast with the lawless and predatory nomad (Dahae); when he subdues the evil spirit that subverts even on earth those of the kindlers of holy fire; when he keeps free from pollution the pure creations of Ahuramazda—fire foremost, but also earth and water; and, What he had to do was, to filter through the Fire, and combat the lie. And as his deeds are, so shall be his end. He will stand forth on the Day of Judgment; when he must cross the Bridge Simāt, which, according to his works, will either guide him to the Paradise of the Good or precipitate him into the Hell of Ahriman. Obviously, it was through this preaching of a judgment to come and a direct moral responsibility of the individual man, that, like Mahomet among the Arabs, Zoroaster and his disciples gained their adherents and exercised their greatest influence.

In this creed of Zoroastrianism three important points are especially to be emphasized: for on them depend its peculiar historical development and its historical significance:—

1. The exposition of the relation of the human race, its creations and their creations, are not products of metaphysical speculation, as in India, but rather the ethical forces which dominate human life. They impose a duty upon man, and enjoin him on a positive line of action—a definite activity in the world. This world, in this way, becomes a battlefield, in which the Buddha speaks, to be worked in, enjoying existence and life to the full. Thus a man's birthday is counted the highest festival (Herod. i. 133); and thus the jote de vie, rich banquets and carousals are prescribed to the Aryans, and to the Parsees, only on the eve of the birth of Ahriman. Obvi-

ously, it was through this preaching of a judgment to come and a direct moral responsibility of the individual man, that, like Mahomet among the Persians, Zoroaster and his disciples gained their adherents and exercised their greatest influence.

2. The religion grew up in the midst of a settled peasant population, whose mode of life and views it regards as the natural and normal disposition of things. Consequently, it is at once a product of, and a main factor in civilization; and is thereby sharply differentiated from the Oriental religion, with whose moral precepts it is least in common coincides so frequently.

3. The preaching of Zoroaster is directed to each individual man, and requires of him that he shall choose his position with regard to the fundamental problems of life and religion. Thus, although it arose as a moral and religious force, it is not national (as, for instance, the Israelite creed), but individualistic, and at the same time universal. From the first, it aims at propagating a creed; and the nationality of the convert is a matter of indifference. So that, for himself and his successors, it is a creed, and not a church, and thereby in the higher sense (see above); and the same tendency to proselytize alien peoples survived in his religion. Zoroastrianism, in fact, is the first creed to work by missions or to lay claim to universality of acceptance. It is, in truth, only an ideal which the Great Wise One (see above) addressed to the Angarak, to the multitudes of the multitude, and chiefly, among the countrymen of the prophet, and its further success in gaining over all the Iranian tribes gave it a national stamp. So the Susan translation of Darius's Behistun inscription

1 These ideas are strongly exposed in a polemic against the Zoroastrians by Mihr Narseh, the vizier of Yazdegird II. (about A.D. 450), preserved by the Armenian historian, Elisha.
The beginnings of the Median monarchy can scarcely go farther back than 640 B.C. To all appearance, the insurrection against Assyria must have proceeded from the desert tribe of the Manda, mentioned by Sargon; for Nabonidus invariably describes the Median kings as "kings of the Manda." According to the account of Herodotus, the dynasty was derived from Deioces, the captive of Sargon, whose descendants may have found refuge in the desert. The first historical king would so far have been Phraortes, who is only succeeded in subduing the small local princes of Media and in rendering himself independent of Assyria. Further development was arrested by the Scythian invasion described by Herodotus. We know from Zephyniah and Jeremiah that these northern barbarians, in 626 B.C., overran and harried Syria and Palestine (cf. CYAXARES; JEWS). With these inroads of the Cimmerians and Scyths (see CYTHIA), we must doubtless connect the great ethnographical revolution in the north of anterior Asia; the Indo-European Armenians (Halti), displacing the old Alarodians (Urariu, Ararut), in the country which has since borne their name; and the entry of the Cappadocians—first mentioned in the Persian period—into the heart of Asia Minor. The Scythian invasion evidently contributed largely to the eventual fall of the Assyrian Empire: for in the same year the Chaldaean Nabopolassar founded the New-Babylonian empire; and in 606 B.C. Cyaxares captured and destroyed Nineveh and the other Assyrian cities. Syria and the south he abandoned to Nabopolassar and his son Nebuchadrezzar; while, on the other hand, Assyria proper, east of the Tigris, the north of Mesopotamia with the town of Harran (Carhae) and the mountains of Armenia were annexed by the Medes. Cappadocia also fell before Cyaxares; in a war with the Lydian Empire the decisive battle was broken off by the celebrated eclipse of the sun on the 28th of May 585 B.C., foretold by Thales (Herod. i. 74). After this peace was arranged by Nebuchadrezzar of Babylon and Syennesis of Cilicia, recognizing the Halys as the borderline. To the east, the Median Empire extended far over Iran, even the Persians owning its sway. Ecbatana (q.v.) became the capital. Of the states which arose out of the shattered Assyrian Empire (Media, Babylon, Egypt, Cilicia and Lydia), Media was by far the strongest. In Babylon the kings feared, and the exiled Jews hoped, an attack from the Medes (cf. Isa. xii., xiv., xxii.; Jer. l., li.); and Nebuchadrezzar sought by every means—great fortifications, canals and so forth—to secure his empire against the menace from the north. He succeeded in maintaining the status quo practically unimpaired, additional security being found in intermarriage between the two dynasties. In this state of equilibrium the great powers of anterior Asia remained during the first half of the 6th century.

V. The Persian Empire of the Achaemenids.—The balance, however, was disturbed in 553 B.C., when the Persian Cyrus, king of Anshan in Elam (Susiana), revolted against his suzerain Astyages, the son of Cyaxares, and three years later defeated him at Pasargadca (q.v.).1 Shortly afterwards Astyages was taken prisoner, Ecbatana reduced, and the Median Empire replaced by the Persian. The Persian tribes were wedded by Cyrus into a single nation, and now became the foremost people in the world (see PERSIA and CYRUS). At first Nabonidus of Babylon hindered the fall of the Median Empire, but the Median power was cut down and finally destroyed by occupying Harran (Carhae). But before long he recognized the danger threatened from that quarter. Cyrus and his Persians paid little heed to the treaties which the Median king had concluded with the other powers; and the result was a great coalition against him, embracing Nabonidus of Babylon, Ahasis of Egypt, Croesus of Lydia, and the Spartans, whose highly efficient army seemed to the Oriental states of great value. In the spring of 546 B.C., Croesus opened the attack. Cyrus

1 See further, BABYLONIA AND ASSYRIA: v. History.
flung himself upon him, beat him at Pteria in Cappadocia and pursued him to Lydia. A second victory followed on the banks of the Pactolus; by the autumn of 529 Sardis had already fallen and the Persian power advanced at a bound to the Mediterranean. In the course of the next few years the Greek littoral from the Danubian Gates to the Persian Gulf, including Thrace, the Black Sea, Carmania and Lydia, was brought under Persian sway.

The king of Cilicia (Syenceeis) voluntarily acknowledged the Persian suzerainty. In 539 Nabonidus was defeated and Babylon occupied, while, with the Chaldean Empire, Syria and Palestine also became Persian (see Jews). The east of Iran was further subdued, and, after Cyrus met his end (528 B.C.) in a war against the eastern Nomads (Dahae, Massagetae), his son Cambyses conquered Egypt (525 B.C.). Cyrus and the Greek islands on the coast of Asia Minor also submitted, Samos being taken by Darius. On the other hand, an expedition by Cambyses against the Ethiopian kingdom of Napata and Meroe came to grief in Nubia. Smerdis (522 B.C.) and his death at the hands of Darius was the signal for numerous insurrections in Babylon, Susiana, Persis, Media, Armenia and many of the Eastern provinces. But, within two years (521-520), they were all crushed by Darius and his generals.

The causes of this astonishing success, which, in the brief space of a single generation, raised a previously obscure and secluded people to the mastery of the whole Orient, can only be approached from the evidence at our disposal. The Persians, as of all Iranians, the bow, which accordingly the king himself holds in his portraits, e.g., on the Behistun rock and the coins (darics), in addition to the bow, the Persians carried short lances and short daggers. But it was not by these weapons, nor by hand to hand fighting, that the Persian victories were won. They overwhelmed their enemies not by a direct impact of arrows, but by a purse mediante; and, as in the case of the Persians, the archers never allowed him to close quarters. While the infantry opposed to him, the cavalry swarmed round the hostile squadrons, threw their lines into confusion, and culminated by a vigorous charge. In the charge the infantry also might employ lance and dagger; but the essential point was that the archers should be mobile and their use of the bow unhampered.

Cambyses found few distinguished warriors wore shirts of mail. For purposes of defence the rank and file merely carried a light hide-covered shield; which the infantry, in shooting, planted before them as a sort of barrier against the enemy's missiles. Thus the Persian army was lost, if heavy-armed hoplites succeeded in gaining their lines. In spite of all their bravery, they succumbed to the Greek phalanx, when once the generalship of a Miltiades or a Pausanias had brought matters to a hand to hand contest; and they were especially in danger when they were off the Greek mainland, for the Persians likened their battles against the Persian as a contest between spear and bow. None the less, till Marathon the Persians were successful in discomfiting every enemy before he could close, whether they be Persians or Medes, or, in the case of the Greeks and Lacedaemonians, when they were vanquished by a mixture of cavalry armed with the lance (as the Lydians), or of heavily armoured warriors (as the Babylonians, Egyptians and Greeks).

To all this should be added the superiority of their leaders; Cyrus especially must have been an exceedingly able general. Obviously, also, he must have understood the art of organizing his people and arousing the feeling of nationality and the courage of self-sacrifice. In his time the Persians were a strong and prosperous people, domiciled in a healthy climate and habituated to all hardships—a point repeatedly emphasized, in the tales preserved by Herodotus, as the cause of their successes (e.g. Herod. i. 122). Here, however, are also recorded (r. 122) that the Persians were "of all mankind the readiest to adopt foreign customs, good or bad," a sentence which is equally applicable to the Romans, and which in the case of both nations goes far to explain, not merely their successes, but also the character of their empire.

The fundamental features of the imperial organization must have been due to Cyrus himself. Darius followed in his steps and completed the vast structure. His rôle, indeed, was that of an able administrator of the work of his great predecessor. The organization of the empire is planned throughout on broad, free lines; there is nothing mean and tenuous in it. The great god Ahuramazda, whom king and people alike acknowledge, has given them dominion "over this earth afar, over many peoples and tongues;" and the consciousness is strong in them that they are masters of the world. Thus their sovereign styles himself "the king of kings" and "the king of the lands"—that is to say, of the whole civilized world. For the provinces remaining unsubdued on the extreme frontiers to the west, the north and the east are in their view almost negligible quantities. And far removed as the Persians are from disavowing their proud sense of nationality ("I, Persian," he says from an Arvanian stock " says Darius of himself in the inscription on his tomb); yet equally vivid is the feeling that they rule the whole civilized world, that their task is to reduce it to unity, and that by the will of Ahuramazda they are pledged to govern it aright.

This is most clearly seen in the treatment of the subject races. In contrast with the Assyrians and the Romans the Persians invariably conducted their wars with great humanity. The vanquished kings were honourably dealt with, the enemy's towns were spared, except when grave offences and insurrections, as at Miletus and Athens, rendered punishment imperative; and their inhabitants were treated with mildness. Like Cyrus, all his successors welcomed members of the conquered nationalities to their service, employed them as administrators or generals and made them grants of land: and this not only in the case of Medes, but also of Armenians, Lydians, Jews and Greeks. The whole population of the empire was alike bound to military service. The subject-contingents stood side by side with the native Persian troops; and the garrisons—in Egypt, for instance—were composed of the most varied nationalities.

Among the subject races the Medes particularly stood high in favour. Darius in his inscriptions always names them immediately after the Persians. They were the predecessors of the Persians in the empire and the more civilized people. Their institutions, court ceremonial and dress were all adopted by the Achaemenids. Thus the tribal distinctions began to recede, and the ground was prepared for that amalgamation of the Iranians into a single, uniform nation, which under the Sassanids was completely perfected—at least for west of Iran.

The lion's share, indeed, falls to the dominant race itself. The inhabitants of Persis proper—from which the eastern tribes of Carmatians, Utians, &c., were excluded and formed into a separate satrapy—pay no taxes. Instead, they bring the best of their possessions (e.g. a particularly fine fruit) as a gift to their king on festival days; peasants meeting him on his excursions do the same (Plut. Artax. 4. 5; Dion ap. Aelian. nar. hist. i. 31; Xen. Cyr. vii. 5. 21, 7, 1). In compensation for this, he distributes on his return rich presents to every Persian man and woman—the women of Persis, who are members of Cyrus' tribe, each receiving a piece of gold (Nic. Dam. fr. 66. Plut. Alex. 60). In relation to his Persians, he is always the people's king. At his accession he is consecrated in the temple of a warrior-goddess (A特产?) at Pasargadæ, and partakes of the simple meal of the old peasant days—a mess of figs, terebinths and sour milk (Plut. Artax. 3). The Persians swear allegiance to him and pray to Ahuramazda for his life and the welfare of the people, while he vows to protect them against every attack, and to judge and govern them as did his fathers before him (Herod. i. 132; Xen. Cyr. xviii. 5. 24, 27). For helpers he has at his side the "law-bearers" (databaro Dan. iii. 2, and in Babylon, documents; cf. Herod. iii. 31, v. 25, vii. 194; Esther i. 13, &c.). These—the Persian judges—are nominated by the king for life, and generally bequeath their office to their sons. The royal decision is based on consultation with the great ones of his people: and such is the case with his officials and governors everywhere (cf. the Book of Ezra).

Every Persian able to bear arms is bound to serve the king; the great landowners on horseback, the commonalty on foot. They are bound to serve the king, who is sworn to protect the citizens of his kingdom are pledged to appear at court as frequently as possible. Their children are brought up in company with the princes "at the gates of the king," instructed in the handling of arms, in riding and hunting, and introduced to the service of the state and the knowledge of the law, as well as the commandments of religion. Then such as prove their worth are called to high office and rewarded, generally with grants of land.
The highest rank was held by the descendants of the six great families, whose heads stood by Darius at the killing of the Magian. The Greeks class them and the king together, under the name of "the seven Persians." These enjoyed the right of entering the presence unannounced, and possessed princely estates in the provinces. Besides these, however, numbers of other Persians were despatched to the provinces, settled there, and endowed with lands. There existed, in fact, under the Achaemenids a few colonizing movements, diffused through the whole empire; traces of this policy occur more especially in Armenia, Cappadocia and Lycaia, but also in the rest of Asia Minor, and not rarely in Syria and Egypt. These colonists formed the nucleus of the provincial military levy, and were a tower of strength to the Persian dominion. They composed, moreover, the Persian council, and vice-regal household of the Sattars, exactly as the Persians of the home-country composed that of the king.

Though the world-empire of Persia was thus deeply impressed by a national character, care was nevertheless exercised that the general duties and interests of the subject races should receive due consideration. We find their representatives, side by side with the Persians, occupying every sort of position in the regal and vice-regal courts. They take their part in the councils of the satraps, precisely as they do in military service (cf. the evidence of Ezra); and they, too, are rewarded by bounties and estates. To wield a peaceful authority over all the subjects of the empire, to reward merit, and to punish transgression—such is the highest task of king and officials.

Royal Residences.

On his native soil Cyrus built himself a town, with a palace and a tomb, in the district of Pasargadae (now the ruins of Murghab). This Darius replaced by a new capital, deeper in the centre of the country, which bore the name "Persian" (Pârsa), the Persepolis (g.s.) of the later Greeks. But the district of Persis was too remote to be the administrative centre of a world-empire. The natural centre lay, rather, in the ancient fertile tract on the lower Tigris and Euphrates. The actual capital of the empire was therefore Susa, where Darius I. and Artaxerxes II. erected their magnificently-palaced palaces. The winter months the kings chiefly spent in Babylon: the hot summer, in the cooler situation of Ecbatana, where Darius and Xerxes built a residence on Mt. Elyma, south of the city.

From a palace of Artaxerxes II. in Ecbatana itself, the fragments of a cuneiform inscription of the time of Xerxes, styled by Lindo Myers and published by Evetts in the Zeitschr. f. Assyri. V. 1857, have been preserved. To Persis and Persepolis the kings paid only occasional visits especially at their coronations.

Within the empire, the two great civilized states incorporated by Cyrus and Cambyses, Babylon and Egypt, occupied a position of their own. After his defeat of Nabonidus, Cyrus proclaimed himself "king of Babylon;" and the same title was born by Cambyses, Smerdis and Darius. So, in Egypt, Cambyses adopted in full the titles of the Pharaohs. In this we may trace a desire to conciliate the native population, with the object of maintaining the fiction that the old state still continued. Darius was still farther encouraged in his efforts by the enlightened policy of the Egyptian priesthood in every way, built temples, and enacted new laws in continuance of the old order. In Babylon his procedure was presumably similar, though here we possess no local evidence. But he lived to see that his policy had missed its goal. In 486 B.C. Egypt revolted and was only reduced by Xerxes in 484. It was this, probably, that induced him in 484 to renounce his title of "king of Babylon," and to remove from its temple the golden statue of Bel-Marduk (Mero- dach), whose hands the king was bound to clap on the first day of each year. This proceeding led to two insurrections in Babylon (probably in 484 and 479 B.C.), which were speedily repressed. After that the "kingship of Babylone" was definitely abolished. In Egypt the Persian kings still retained the style of the Pharaohs; but we hear no more of concessions to the priesthood or to the old institutions, and, apart from the great oasis of el-Kharga, no more temples were erected (see EGYPT: History).

At the head of the court and the imperial administration stands the commandant of the body-guard—the ten thousand "Immortals," often depicted in the sculptures of Persepolis with lances surmounted by golden apples. This grandee, whom the Greeks termed "Chilarch," corresponds to the modern vizier. In addition to him, we find the "opton," or council, of which the king was the acknowledged head. In the other officials, the "Eye of the King" is frequently mentioned. To him was entrusted the control of the whole empire and the superintendence of all officials.

The orders of the court were issued in a very simple form of the cuneiform script, probably invented by the Medes. This comprised 36 signs, almost all of which denote single sounds. In the inscriptions on inscriptions in cuneiform script, Aramaic (Arabic) and Babylonian was always appended to the Persian text. In Egypt one in hieroglyphics was added, as in the inscriptions of the Suez canal; in the Grecian provinces, the official languages were Aramaic and Greek. In all places, the Persian language rapidly declined, and, in the inscriptions of Artaxerxes III., only appears in an extremely neglected guise (see CUNEIFORM INSCRIPTIONS, ALPHABET).

Side by side with the Persian, the Aramaic, which had long been widely diffused as the speech of commerce, enjoyed currency in all the western provinces of the empire as a second language. Thus all deeds, enactments and records designed for these provinces were composed in cuneiform script, while the more precious documents in this tongue, dating from the Persian period, have been discovered in Egypt (cf. Sayce and Cowley, Aramaic Papiri discovered at Assuan 1906), and the coins minted by the satraps and generals usually bear an Aramaic inscription. (So, also, a lion-weight from Abydos, in the British Museum.) The Demotic in Egypt was employed in private documents alone. On the other hand, the Persian, being almost unknown to the Greeks, was the only official language, and the writing was limited to a few persons—mostly of the higher classes (see EGYPT: History: Ancient).

Darius I. divided the Persian Empire into twenty great provinces, satraps, with a "guardian of the country" (khsikhtahapavan; see SATRAP) at the head of each. A list is preserved in Herodotus (iii. 89 sqq.); but the boundaries were frequently changed. Each satrap was again subdivided into several minor governorships. The satrap is the head of the whole administration of his province. He levies the taxes, controls the legal procedure, is responsible for the security of roads and property, and superintends the subordinate districts. The heads of the great military centres of the empire and the commandants of the royal fortresses are outside his jurisdiction: yet the satraps are entitled to a body of troops of their own, an army and an administration of such men as they may employ. The satrap's duties were not fixed, and varied to a great extent from province to province in later periods. The satrap is held in his position as a subject by the controlling machinery of the empire, especially the "Eye of the King;" by the council of Persians in his province with
whom he is bound to debate all matters of importance; and by the army: while in the hands of the messengers (Pers. astvādας or άγγελοι—a Babylonian word; see Anarhia) the government despatches traveled "swifter than the crane" along the great imperial highways, which are all provided with regular postal stations (cf. the description of the route from Susa to Sardis in Herod. v. 32).

Within the satrapies the subject races and communities occupied a tolerably independent position; for instance, the Jews, under their elders and priests, who were even subject communities able to convene a popular assembly in Jerusalem (cf. the Books of Ezra and Nehemiah). Obviously also, they enjoyed, as a rule, the privilege of deciding law-suits among themselves; their general situation being similar to that of the Christian nationalities under the Ottomans, or to that of many tribes in the Russian Empire at the present day. The pressure of despotism was manifest, not so much in that the king and his officials consistently interfered in individual cases, but that they did so on isolated and arbitrary occasions, and then swept aside the privileges of the subject, who was impotent to resist.

For the rest, the subject population falls into a number of distinct groups. In the desert (as among the Arabian and Turanian nomads), in wild and sequestered mountains (as in Zagros in north Media, and Mysia, Pisidia, Paphlagonia and Bithynia in Asia Minor), and also in many Iranian tribes, the old tribal constitution, with the chieftain as its head, was left intact even under the imperial suzerainty. The great majority of the civilized provinces were subdivided into local administrative districts governed by officials of the king and his satraps. These the Greeks named θηρια "people." Within these, again, there might lie large town settlements whose internal affairs were controlled by the elders or the officials of the community: as, for instance, Babylon, Jerusalem, the Egyptian cities, Tarsus, Sardis and others. On the same footing were the spiritual principalities, with their great temple-property; as Bambye in Syria, the two Comans in Cappadocia, and so forth. Besides these, however, vast districts were either converted into royal domains (σαραδεστα) with great parks and hunting grounds under royal supervision, or else bestowed by the king on Persians or deserving members of the subject-races (the "benefactors") as their personal property. The estates formed respectable principalities: e.g. those of the house of Otanes in Cappadocia, of Hydarnes in Armenia, Pharnabazus in Phrygia, Demaratus in Teuthrania, Themistocles in Magnesia and Lamprocas. They were absolute private property, handed down from father to son for centuries, and in the Hellenistic period not rarely became independent kingdoms. These potentates were styled by the Greeks ἄρχοντες or μήκαρχοι.

The last class, quite distinct from all these organizations, was formed by the city-states (tēles) with an independent constitution—whether a monarchy (as in Phoenicia), an aristocracy (as in Lycia), or a republic with council and popular assembly (as in the Greek towns). The essential features were that they enjoyed a separate legal organization (autonomy). This was only to be seen in the extreme western provinces of the empire among the Phoenicians, Greeks and Lycians, whose cities were essentially distinct from those of the east; which, indeed, to Greek eyes, were only great villages (κοινωνίαι). It is readily intelligible that their character should have proved practically incomprehensible to the Persians, with whom they came into perpetual collision. These sought, as a rule, to cope with the difficulty by transferring the government to individual persons who enjoyed their confidence; the "tyrants" of the Greek towns. Mardonius, alone, after his suppression of the Ionian revolt—which had originated with these very tyrants—made an attempt to govern them by the assistance of the democracy (492 B.C.).

The provinces of the Persian Empire differed as materially in economy as in organization. In the extreme west, a money currency in its most highly developed form—that of coinage minted by the state, or an autonomous community—had developed since the 5th century B.C. in the Rhodian and Carthaginian provinces. Commerce was at that time the principal source of revenue, however, of the Oriental world—Egypt, and Finance. Syria, Phoenicia and Babylonia—the old model of commerce was still in vogue, conducted by means of gold and silver bars, which circulated as bullion or in the form of currency only began to make headway in these districts in the 4th century B.C. In the eastern provinces, on the other hand, the primitive method of exchange by barter still held the field. Only in the sparsely inhabited and frontier districts of India (the Punjab) did a system of coinage find early acceptance. There the Persian and Attic money was widely distributed, and imitations of it struck, in the fifth and fourth pre-Christian centuries.

In the empire was compiled to grapple with all these varied conditions and to reconcile them as best it might. At the court, "natural economy" was still the rule. The officials and Oriental troops received their payment in kind. They were fed by the table of the "Persian" (cf. Herod. iv. 194, &c.); from which distinctions of rank were made (cf. Herod. vi. 301), and were rewarded by gifts and assignments of land. The Greek mercenaries, on the contrary, had to be paid in currency; nor could the satraps of the west dispense with hard cash. The king, again, needed the precious metals, not merely for bounties and rewards, but for important enterprises in which money payment was imperative. Consequently, the royal revenues and taxes were paid partly in the precious metals, partly in natural produce—horses and cattle, grain, clothing and its materials, furniture, and articles of industry (cf. Theopomp. fr. 124, 125, &c.). The satraps, also, in addition to money payments, were required to contribute "for their table," at which the officials ate (Nehem. v. 14).

The precious metals brought into the tribute were collected in the great treasure-houses at Susa, Persepolis, Pasargad and Ecbatana; where generally a single table was set apart for each province, and, especially, of gold, were stored in bullion or partially coined into vessels (Herod. iii. 95; Strabo xv. 731, 735; Arrian iii. 16, &c.); exactly as is the case to-day in the shah's treasure-chamber (Čar sinister). The Persian system of taxation (q.v.) was such that the conjunction of payments in kind and money taxes still exists. The province of Khurasan, for instance, with some half million inhabitants, paid in 1865 £154,000 in gold, and in addition material tribute to the value of £43,000 (Curzon, op. cit. i. 181, ii. 380). When the king required money he minted as much as was necessary. A reform in the coinage was effected by Darius, who struck the Dac (Pers. Zariz. D. 1. 2.); pieces of gold, which, however, has nothing to do with the name of Darius, a gold piece of 130 grains (value about 23½; this being equivalent to 20 silver pieces ("Median shekels," σίλβας) of 8½ grains (value according to the then rate of silver—13½ silver to 1 gold—about 19 d.). The coinage of gold was the exclusive prerogative of the king; silver could be coined by the satraps, generals, independent communities and dynasts.

The extent of the Persian Empire was, in essentials, defined by the great arishtes (a Cyrus and Darius). Darius was no "conqueror" like Augustus. Rather, the task he set himself was to round off the empire and secure its borders: and for this purpose in Asia Minor and Armenia he subdued the mountain-tribes and advanced the frontier as far as the Caucasus; Colchis alone remaining an independent kingdom under the imperial suzerainty. So, too, he annexed the Indus valley and the auriferous hill-country of Kafiristan and Cashmir (Kāštān or Κασταρός, Herod. iii. 93, iv. 76, 86; Steph. Byz.,) as well as the Dardae in Dardistan on the Indus (Ctesias, Ind. fr. 12. 70, &c.). From this point he directed several campaigns against the Amyrgian Sace, on the Pamir Plateau and the lands whom he called "the barbarians of the steppe" and whom mounted archers formed a main division of the armies despatched against the Greeks. It was obviously an attempt to take the nomads of the Turanian steppe in the rear and to reduce them to quiescence, which led to his unfortunate expedition against the Scythians of the Russian steppes (c. 512 B.C.; cf. Darius).

Side by side, however, with these wars, we can read, even in the scanty tradition at our disposal, a consistent effort to further the great civilizing mission imposed on the empire. In the district of Herat, Darius established a great water-basin, designed to facilitate the cultivation of the steppe (Herod. iii. 177). He had the course of the Indus explored, and when Scylax, the Greek Envoy of Cambyses, went up the Persian Gulf to Suez (Herod. iv. 44) and wrote an account of his voyage in Greek. The desire to create a direct communication between the seclusion of Persia and the commerce of the world is evident
in his foundation of several harbours, described by Nearcous, on the Persian coast. But this design is still more patent in his completion of a great canal, already begun by Nehro, from the Nile to Susa, along which several monuments of Darius have been preserved. Thus it was possible, as says the remnant of an hieroglyphic inscription there discovered, "for ships to sail direct from the Nile to Persia, over Saha." In the time of Herodotus the canal was in constant use (i. 158, iv. 59); afterwards, when Egypt regained her independence, it decayed, and sank entirely out of the Persian annals, till restored by the second Persians when the circumnavigation of Africa was attempted under Xerxes (Herod. iv. 43).

It has already been mentioned, that, in his efforts to conciliate the Egyptians, Darius placed his chief reliance on the priesthood; and the same tendency runs throughout the imperial policy toward the conquered races. Thus Cyrus himself gave the exiled Jews in Babylon permission to return and rebuild Jerusalem. Darius allowed the restoration of the Temple; and Artaxerxes I., by the protection accorded to Ezra and Nehemiah, made the foundation of Judaism possible (see Jews: § 19 sqq.). Analogously in an edict, of which a later copy is preserved in an inscription (see above), Cyrus recognized the Greek Gataas, the governor of a part of Asia Minor (Magnesia on the Maeander, to observe scrupulously the privileges of the Apollo-sanctuary.

With all the Greek oracles—even those in the mother-country—the Persians were on the best of terms. And since these might reasonably expect an enormous extension of their influence from the establishment of a Persian dominion, we find them all zealously mediating during the expedition of Xerxes.

For the development of the Asiatic religions, the Persian Empire was of prime importance. The disintegrating power of a single, vast, world-empire cost them their original connexion with the state, and compelled them in future to address themselves, not to the community at large, but to individuals, to the priesthood alone, to the people of the neighbouring orient, but the welfare of the man. Thus they became at once universal and capable of extension by propaganda; and, with this, entering into keen competition with the Jews, they laboured in these three chief respects: first, as Jews and Judaisms; but, after the Achaemenid period, they are common to all oriental creeds, though our information as to most is scanty in the extreme.

The surname of the religions of Iran played a most spirited part. The Persian kings—none more so than Darius, whose religious convictions are enshrined in their inscriptions—and, with the kings, their people, were ardent professors of the pseudo-heresy of Zoroaster; and the Persians gained in this and diffused his creed throughout the whole empire. Thus a strong Persian propaganda arose especially in Armenia and Cappadocia, where the religion took deep root among the people, but also in India, where the Asiatic, and, above all, the Greek important modifications were introduced. In contrast with Judaism, Zoroastrianism did not enter the lists against all gods save its own, but found no difficulty in recognizing them as subordinate, powerless, helpers and servants, and the foreign gods often reacted upon the Persian. In Cappadocia, Aramaic inscriptions have been discovered (1900), in which the indigenous god, there termed Bel the king, recognized the "Mazdayasian Religion" (Din Manyamszig).—i.e. the religion of Ahuramazda personified as a woman—as his sister and wife (Liddzbarksi, Ephemer. f. semit. Epigr. i. 50 sqq.).

The most devout of the gods of civilization (especially of Babylon), with their host of temples, images and festivals, exercised a corresponding influence on the mother-country. Moreover, the unadulterated doctrine of Zoroaster could no more become a permanent and indisputable religion of Persia than can Greek philosophy. They can make little of abstractions and an omnipotent, omnipresent deity; they need concrete divine powers, standing nearer to themselves and their lot. Thus the old figures of the Aryan folk-religion return to the foreground, there to be amalgamated with the Babylonian divinities. The goddess of springs and streams (of the Oxus in particular) and of all fertility—Arduvaxr Anahita, Anaitis—is endowed with the form of the Babylonian Ishtar and Belit. She is a goddess of fertility and of all the arts of woman, of breasts, a golden crown of stars and golden raiment. She is worshipped as the goddess of marriage and all sexual life (cf. Herod. i. 131, where the names of Mithras and Anaitis are interchanged); and she is the protector of the service and of the service of the sun-god. At her side stands the sun-god Mithras, who is represented as a young and victorious hero. Both deities occupy the very first rank in the popular creed, and they are ascribed to the women; they are the most potent of the good powers—Mithras being the herald and propagator of the service of Light and the mediator betwixt man and Ahuramazda, who now lades more into the background. Thus, in the subsequent period, the Persian religion appears purely as the religion of Mithras. The festival of Mithras is the chief festival of the empire, at which the king drinks and retired, and dances the national dance (cf. Darius, II. 39.

This development culminated under Artaxerxes II., who, according to Berosus (fr. 16 sp. Clem. Alex. prot. i. 5, 68), first erected statues to Anaitis and Mithras in the temple of Bacchus, near Susa, and in Ctesiphon. The truth of this account is proved by the fact that Artaxerxes II. and Artaxerxes III. are the only Achaemenids who, in their inscriptions, invoke Anaitis and Mithras. Of the Achaemenid kings, these deities were considered so prominent, are the dragon-slayer Verethraghas (Artagnas) and the Good Thought (Vohunamo, Omanon); and even the Sacaean festival is adopted from Babylon (Berosus fr. 3; Cos. fr. 16; 19; Hist. fr. 6, &c.). The chief centres were Ctesiphon and Susa; the west were the district of Acli, in Armenia (Strabo xi. 532, &c.), the town of Zela in Cappadocia (Strabo xii. 559), and several cities in Lydia.

For the organization and character of the Persian Empire, see Barnabas Brissin, De regio Persarum principatu libri iii. (1596); Heeren, Ideen über Politik, Handel und Verkehr der alten Welt, i.; Rawlinson, History of Herodotus, ii. 555 sqq.; Five Eastern Mon- archies, ii.; E. Meyer, Geschichte des Altertums, iii. On the Satrapies, cf. Krumholz, De Asiae minoris satrapiae persici (1885). See also Mittiras.

3. History of the Achaemenid Empire.—The history of the Persian Empire was often written by the Greeks. The most ancient work preserved is that of Herodotus (q.v.), who supplies rich and valuable materials for the period ending in 470 B.C. These materials are drawn partly from sound tradition, partly from original knowledge—as in the account of the satrapies and their distribution, the royal highway, the nations in Xerxes' army and their equipment. They also contain much that is admittedly fabulous: for instance, the stories of Cyrus and Croesus, the conquest of Babylon, &c. Forty years later (c. 390 B.C.), the physician Ctesias of Cnidus, who lived between (413-380 B.C.), wrote a history of Great King Cyrus, containing a great work on the Persian history, known to us from an extract in Ptolemy and numerous fragments. Ctesias (q.v.) possesses a more precise acquaintance with Persian views and institutions than Herodotus; and, where he deals with matters that came under his own cognizance, he gives much useful information. For the early period, on the other hand, he only proves how rapidly the tradition had degenerated since Herodotus; and here his narrations can only be utilized in isolated cases, and that with the greatest caution. Of more value was the great work of Dyon of Colophon (c. 346), which we know from numerous excellent fragments; and on the history of Persia, where a few statements from Herodotus of Cyprus, which afford specially important evidence on Persian institutions. To these must be added the testimony of the other Greek historians (Thucydides, Ephorus, Theopompus, &c., with the histories of Alexander), and, before all, that of Xenophon in the Anabasis and Hellenica. The Cyropaedia is a didactic romance, written with a view to Greek institutions and rarely preserving genuine information on the Persian Empire. Of Oriental sources, only the contemporary books of Ezra and Nehemiah are of much importance: also, a few statements in the much later Esther romance. Berosus' history of Babylon contained much valuable and trustworthy information, but next to nothing has survived. The native tradition almost entirely left the Achaemenid Empire, has been mentioned above. For a more detailed account
of the empire; that the centre of gravity in the world's history had shifted from Susa and Babylon to the Aegean Sea; and that the Persians were conscious that in spite of all their courage they were henceforward in the presence of an enemy, superior in arms as well as in intellect, whom they could not hope to subdue by their own strength.

Thus the great empire was reduced to immobility and stagnation—a process which was assisted by the deteriorating influences of civilization and world-dominion upon the character of the ruling race. True, the Persians continued to produce brave and honourable men. But the influences of the harem, the eunuchs, and similar court officials, made appalling progress, and men of energy began to find the temptations of power stronger than their patriotism and devotion to the king. Thus the satraps aspired to independence, not merely owing to unjust treatment, but also to avarice or favourable conditions. As early as 465 B.C., Xerxes was assassinated by his powerful vizier (chilarch) Artabanus, who attempted to seize the reins of empire in fact, if not in name. A similar instance may be found in Bagoas (q.ti.), after the murder of Artaxerxes III. (438 B.C.). To these factors must be added the degeneracy of the royal line—a degeneration inevitable in Oriental states. Kings like Xerxes, although, especially Artaxerxes I. and Artaxerxes II., so far from being gloomy despots, were good-natured potentates, but weak, capricious and readily accessible to personal influences. The only really brutal tyrants were Darius II., who was completely dominated by his bloodthirsty wife Parysatis, and Artaxerxes III. who, though he shed rivers of blood and all but exterminated his whole family, was successful in once more uniting the empire, which under the feeble sway of his father had been threatened with dissolution.

The upshot of these conditions was, that the empire never again undertook an important enterprise, but neglected more and more its great civilizing mission. In considering, however, the subsequent disorders and wars, it must be borne in mind that they affected only individual portions of the empire, and only on isolated occasions involved more extensive areas in long and serious strife. To most of the provinces the Achaemenid dominion was synonymous with two centuries of peace and order. Naturally, however, the wild tribes of the mountains and deserts, who could be curbed only by strict imperial control, asserted their independence and harassed the neighbouring provinces. Among these tribes were the Carduchians in Zagros, the Maxyans and Usians in the interior of Elam, the Cadusians and other non-Aryan tribes in northern Media, the Pisidians, Iasirians and Lycoianians in the Taurus, and the Mysians in Olympus. All efforts to restore order in these districts were fruitless; and when the kings removed their court to Ecbatana, they were actually obliged to purchase a free passage from the mountain tribes (Strabo xi. 524; Arrian iii. 17, 1). The kings (e.g. Artaxerxes II.) repeatedly took the field in great force against the Cadusians, but unsuccessfully. When, in 400 B.C., Xenophon marched with the mercenaries of Cyrus from the Tigris to the Black Sea, the authority of the king was non-existent north of Armenia, and the tribes of the Pontic mountains, with the Greek cities on the coast, were completely independent. In Pamphylia, the native dynasts founded a powerful though short-lived kingdom, and the chieftains of the Bithynians were absolutely their own masters. The frontier provinces of India were also lost. Egypt, which had already revolted under Libyan princes in the years 486-484, and again with Athenian help in 460-454, finally asserted its independence in 404. Henceforward the native dynasties repelled every attack, till they succumbed once more before Artaxerxes III. and Mentor of Rhodes.

In the other civilized countries, indeed, the old passion for freedom had been completely obliterated; and after the days of Darius I.—apart from the Greek, Lycean and Phoenician towns—not a single people in all these provinces dreamed of shaking off the foreign dominion. All the more clearly, then, was the inner weakness of the empire revealed by the revolts
of the satraps. These were facilitated by the custom—quite contrary to the original imperial organization—which entrusted the provincial military commands to the satraps, who began to receive great masses of Greek mercenaries into their service. Under Artaxerxes I. and Darius II., these insurrections were still rare. But when the revolt of the younger Cyrus against his brother (401 B.C.) had demonstrated the surprising ease and rapidity with which a courageous army could penetrate into the heart of the empire—when the whole force of that empire had proved powerless, not only to prevent but to suppress, 12,000 Greek troops, completely surrounded, cut off from their communications, and deprived through treachery of their leaders, from escaping to the coast, but even to make a serious attack on them—then, indeed, the imperial impotence became manifest. After that, revolts of the satraps in Asia Minor and Syria were of everyday occurrence, and the task of suppressing them was complicated by the foreign wars which the empire had to sustain against Greece and Egypt.

At this very period, however, the foreign policy of the empire gained a brilliant success. The collapse of the Athenian power before Syracuse (413 B.C.) induced Darius II. to disband Tissaphernes and Pharnabazus, in Asia Minor, to collect the tribute due from all the Greek cities. In alliance with Sparta (see Peloponnesian War), Persia intervened in the conflict against Athens, and it was Persian gold that made it possible for Lysander to complete her overthrow (404 B.C.). True, war with Sparta followed immediately, over the division of the spoils, and the campaigns of the Spartan generals in Asia Minor (399–395) were all the more dangerous as they gave occasion to numerous rebellions. But Persia joined the Greek league against Sparta, and in 394 Pharnabazus and Conon annihilated the Lacedaemonian fleet at Chios. Thus the Persian power of offence was crippled; and the upshot of the long-protracted war was that Sparta ruefully returned to the Persian alliance, and by the Peace of Antalcidas (386 B.C.), concluded with the king in 387 B.C., not only renounced all claims to the Asiatic possessions, but officially proclaimed the Persian suzerainty over Greece. Ninety years after Salamis and Plataea, the goal for which Xerxes had striven was actually attained, and the king's will was law in Greece. In the following decades, no Hellenic state ventured to violate the king's peace, and all the feuds that followed centred round the efforts of the combatants—Sparta, Thibes, Athens and Argos—to draw the reins of power more (see § 259, the battle of Athens).

But, for these successes, the empire had to bear the ironic strain of its own strength, rather than of its own strength. Its feebleness, when thrown on its own resources, is evident from the fact that, during the next years, it failed both to reconquer Egypt and to suppress completely King Evagoras of Salamis in Cyprus. The satrap revolts, moreover, assumed more and more formidable proportions, and the Greek states began once more to tamper with them. Thus the reign of Artaxerxes II. ended, in 339 B.C., with a complete dissolution of the imperial authority in the west. His successor, Artaxerxes Ochus, succeeded yet again in restoring the empire in its full extent. In 335 B.C., he spoke the fatal word, which, a second—or rather a third—time, demolished the essentially unstable power of Athens. In 334 he reduced Egypt, and his generals Mentor and Memnon, with his vizier Bagas (q.v.), crushed once and for all the resistance in Asia Minor. At his death in 338, immediately after the final catastrophe, the empire to all appearances was more powerful and more firmly established than it had been since the days of Xerxes.

These successes, however, were won only by means of Greek armies and Greek generals. And simultaneously the Greek civilization—diffused by mercenaries, traders, artists, prostitutes and slaves—advanced in ever greater proportions, in Asia Minor and Phoenicia we can clearly trace the progress of Hellenism (q.v.), especially by the coinage. The stamp is cut by Greek hands and the Greek tongue predominates more and more in the inscription. We can see that the victory of Greek civilization had long been prepared on every side. But the vital point is that the absolute superiority of the Hellenes was recognized as incontestable on both hands. The Persian sought to protect himself against danger, by employing Greeks in the national service and turning Greek policy to the interests of the empire. In the Greek world itself the dis-
an autocrat, above them and above the law, realizing the theoretical doctrines of Plato and Aristotle, as the true king, who is a god among men, bound no more than Zeus by a law, because "he himself is the law." Thus the divine kingship of Alexander derives in direct line, not from the Oriental politics—which (Egypt apart) know nothing of royal apotheosis—but from these Hellenic theories of the state. Henceforward it becomes the form of every absolute monarchy in a civilized land, being formally mitigated only in Christian states by the assumption that the king is not God, but king "by the grace of God."

23 The expedition of 332 B.C. to the shrine of Ammon was a preliminary to this procedure, which, in 344, was sealed by his official elevation to divine rank in all the republics of Greece. To this corresponds the fact, instead of acting on the doctrines of Aristotle and Callisthenes, and treating the Macedonians and Greeks as masters, the Asiatics as servants, Alexander had impartial recourse to the powers of all his subjects and strove to amalgamate them. In the Persians particularly he sought a second pillar for his world-empire. Therefore, as early as 330 B.C., he drafted 30,000 young Persians, educated them in Greek customs, and trained them to war on the Macedonian model. The Indian campaign showed that his Macedonian troops were in fact inadequate to the conquest of the world, and in the summer of 326 they compelled him to turn back from the banks of the Hyphasis. On his return to Persia, he consummated at Susa (Feb. 324 B.C.) the union of Persian and Macedonian by the great marriage-feast, at which all his superior officers, with some 10,000 more Macedonians, were wedded to Persian wives. The Macedonian veterans were then disbanded, and the Persians taken into his army. Simultaneously, at the Olympic festival of 324, the command was issued to all the cities of Greece to recognize him as god and to receive the exiles home. In 323 B.C. the preparations for the circum-navigation and subjection of Arabia were complete: the next enterprise being the conquest of the West, and the battle for Hellenic culture against Carthage and the Italian tribes. At that point Alexander died in Babylon on the 13th of June 323 B.C.

Alexander left no heir. Consequently, his death not only ended the scheme of universal conquest, but led to an immediate Macedonian reaction. The army, which was considered as the representative of the people, took over the government under the direction of its generals. The Persian viceroys were practically all discarded and the Persian satraps removed—at least from all important provinces. But the attempt to maintain the empire in its unity proved impracticable; and almost immediately there began the embittered war, waged for several decades by the generals (diadochi), for the inheritance of the great king. It was soon obvious that the eastern rulers, at all events, could not dispense with the native element. Ptolemaeus, the governor of Persia, there played the rôle of Alexander and won the Persians completely to his side; for which he was dismissed by Antigonus in 315 (Diod. xix. 48). A similar position was attained by Seleucus—the only one of the diadochi, who had not divorced his Persians—by the Peace of Babylon in 320. From 319 to 316 and regained in the autumn of 312. While Antigonus, who, since 315, had striven to win the kingdom of Alexander for himself—was detained by the war with his rivals in the west, Seleucus, with Babylon as his head-quarters, conquered the whole of Iran as far as the Indus. In northern Media alone, which lay outside the main scene of operations and had only been partially subject to the latter Achaemenids, the Persian satrap Artopates, appointed by Alexander, maintained his independence and bequeathed his province to his successors. His name is borne by north Media to the present day—Artopatene, modern Azerbaijan or Adherbeijan (see Media). So, too, in Armenia the Persian dynasty of the

HISTORY: ANCIENT

PERSIA

The discussion of these events by Hogarth "The Deification of Alexander the Great," in the Historical Review, ii. (1887), is quite unsatisfactory.

PERSIA

Thus an active Hellenic life soon arose in the East; and Greek settlers must have come in numbers and founded new cities, which afterwards formed the basis of the Graeco-Bactrian kingdom. Antiochus's general Demodamas crossed the Jaxartes and set up an altar to the Didymaean Apollo (Plin. vi. 49). Another general, Patrocles, took up the investigation of the Caspian, already begun by Alexander. In contrast with the better knowledge of an older period, he came to the conclusion that the Caspian was connected with the ocean, and that it was possible to reach India on ship-board by that route (Strabo, ii. 74, xi. 518; Plin. vi. 38). A project of Seleucus to connect the Caspian with the Sea of Azov by means of a canal is thought to have been suggested by Pliny (vi. 31). To Patrocles is due the information that an active commerce in Indian wares was carried on with the shores of the Black Sea, via the Caspian (Strabo, xi. 509).

While Hellenism was thus gaining a firm footing in all the East, the native population remained absolutely passive. Apart from the rude mountain tribes, no national resistance was dreamed of for centuries. The Iranians quietly accepted the foreign yoke, and the higher classes adopted the external forms of the alien civilization (cf. the dedication of a Bactrian, Hypaspines, son of Mithroaxes, in the inventory of the temple of Apollo in Delos, Dittenberger, Syllag. 588, l. 109) even though they were unable to renounce their innate characteristics. Eratosthenes, for instance, speaks (hp. Strabo i. 66) in high terms of the Iranians (Arians), ranking them (as well as the Indians, Romans and Carthaginians) on a level with the Greeks, as regards their capacity for adopting city civilization. The later Parsee tradition contends that Alexander burned the sacred books of Zoroaster, the Avesta, and that only a few fragments were saved and afterwards reconstructed by the Arsacids and Sassanids. This is absolutely unhistorical. The Persian religion was never attacked by the Macedonians and Greeks. Under their dominion, on the contrary, it expanded with great vigour, not only in the west (Armenia, north Syria and Asia Minor, where it was the official religion of the kings of Pontus and Cappadocia), but also in the east, in the countries of the Indian frontier. That the popular gods—Mithras, Anaitis, &c.—had come to the forefront has already been mentioned. This propaganda, however, was void of all national character, and ran on precisely the same lines as the propaganda of the Syrian, Jewish and Egyptian cults. Only in Persia itself, so far as we can judge from a few scanty traces, the national character of the religion seems to have survived among the people side by side with the memory of their old imperial position.

In 228 B.C. Seleucus took the field against Lysimachus, and annexed his dominions in Asia Minor and Thrace. In 281 he was assassinated in crossing to Europe, and his son Antiochus I. was left supreme over the whole empire. From that time onward the Seleucid Empire was never at rest. Its gigantic extent, from the Aegean to the Indus, everywhere offered points of attack to the enemy. The Lagidæ, especially, with their much more compact and effective empire, employed every means to weaken their Asiatic rivals; and auxiliaries were found in the minor states on the frontier—Atropatæ, Armenia, Cappadocia, Pontus and Bithynia, the Galatians, Pergamum, Rhodes and other Greek states. Moreover, the promotion of Greek civilization and city life had created numerous local centres, with separate interests and centrifugal tendencies, struggling to attain complete independence, and perpetually forcing new concessions from the empire. Thus the Seleucid kings, courageous as many of them were, were always battling for existence (see Seleucid Dynasty).

These disturbances severely affected the borders of Iran. While the Seleucid Empire, under Antiochus II. Theos (264—247), was being harried by Ptolemy II. Philadelphus, and the king's attention was wholly engaged in the defence of the western provinces, the Greeks revolted in Bactria, under their governor Diodotus (q.v.). Obviously, it was principally the need of protection against the nomadic tribes which led to the foundation of an independent kingdom; and Diodotus soon attained considerable power over the provinces north of the Hindu-Kush. In other provinces, too, insurrection broke out (Strabo xi. 575, Justin xii. 4); and Arsaces, a chief of the Parni or Aparmi—an Iranian nomad tribe (therefore often called Dahan Scythians), inhabiting the steppe east of the Caspian—made himself master of the district of Parthia (q.v.) in 248 B.C. He and his brother Tiridates (q.v.) were the founders of the Parthian kingdom, which, however, was confined within very modest limits during the following decades. Seleucus II. Callinicus (247—226) successfully opposed the founded Arsaces (or Tiridates), and even expelled him (c. 238); but new risings recalled Seleucus to Syria, and Arsaces was enabled to return to Parthia.

Greater success attended Antiochus III., the Great (229—187). At the beginning of his reign (220) he subdued, with the help of his minister Hermias, an insurrection of the satrap Molon of Media, who had assumed the royal title and was supported by his brother Alexander, satrap of Persis (Polyb. v. 40 sqq.). He further seized the opportunity of extorting an advantageous peace from King Artabazanes of Atropatene, who had considerably extended his power (Polyb. v. 55). After waging an unsuccessful war with Ptolemy IV. for the conquest of Cœle-Syria, but suppressing the revolt of Achaues in Asia Minor, and recovering the former provinces of the empire in that quarter, Antiochus led a great expedition into the East, designing to restore the imperial authority in its full extent. He first removed (211) the Armenian king Xerxes by treachery (Polyb. viii. 25; John of Antioch, fr. 53), and appointed two governors, Artaxias and Zariadris, in his place (Strabo xi. 531). During the next year he reduced the affairs of Media to order (Polyb. x. 27); he then conducted a successful campaign against Arsaces of Parthia (209), and against Euthydemos (q.v.) of Bactria (208—206), who had overthrown the dynasty of Diodotus (Polyb. x. 28 sqq., 48 sqq., xi. 24; Justin xii. 5). In spite of his successes he concluded peace with both kingdoms, rightly considering that it would be impossible to retain these remote frontier provinces permanently. He next renewed his old friendship with the Indian king Sophagasesus (Subhagasena), and received from him 150 elephants (206 B.C.). Through Arachosia and Drangiana, in the valley of the Eymander (Helmand), he marched to Carmania and Persis (Polyb. xi. 34). Both here and in Babylon he re-established the imperial authority, and in 205 undertook a voyage from the mouth of the Tigris, through the Arabian gulf to the flourishing mercantile town of Gerrha in Arabia (now Bahrein) (Polyb. xiii. 6). Soon afterwards, however, his successful campaign against Ptolemy V. Epiphanes led to a war with Rome in which the power of the Seleucid Empire was shattered (190 B.C.). Decay of the Seleucid Empire. In order to raise money he plundered a wealthy temple of Bel in Elam, but was killed by the inhabitants, 187 B.C. (Diod. xxxii. 3, xix. 15; Strabo xvi. 744; Justin xxii. 2; S. Jerome (Hieronymus) on Don. xi. 10; Euseb. Chron. i. 253). The consequence of this enfeeblement of the empire was that the governors of Armenia asserted their independence. Artaxias founded the kingdom of Great Armenia; Zariadris, that of Sophene on the Euphrates and the sources of the Tigris (Strabo xi. 531). In other districts, also, rebellions occurred; and in the east, Euthydemos and his successors (Demetrius, Eucratidas, &c.) began the conquest of the Indus region and the Iranian borderland (Arachosia, Aria). (See BACTRIA; EUHYDYMUS; EUCRATIDAS; DEMETRIUS; MENANDER.)

But the energetic Seleucids fought desperately against their fate. Antiochus IV. Epiphanes (176—163) restored once more the Eastern dominion, defeated Artaxias of Armenia (Appian, Syr. 45; Diod. xxxi. 174; S. Jerome on Don. xi. 40), restored several towns in Babylonia and subdued the Elymaeans. His attempt, however, to plunder the sanctuary of Anaitis failed (Polyb. xxxi. 11; cf. Maccab. i. 6, ii. 1, 13; App. Syr. 66). Persis, also, and...
Media were still subject to him. But after his death at Tabae in Persis (163 B.C.; cf. Polyb. xxxi. 11; Maccab. i. 6, II. 9; Jos. Ant. Jud. xii. 9, 1), the Romans took advantage of the dynastic broils to destroy the Seleucid Empire. They reduced its army and fleet, and favoured every rebellion: among others, that of the Jews. In spite of all, Demetrius I. Soter (161-150) succeeded in suppressing (150) a revolt of Timarchus of Miletus, governor of Babylon, who had occupied Media, assumed the title of "great king," and had been recognized by the Romans (Appian, Syr. 45-57; Trogus, ProL. 34; Diod. xxxi. 27 A: cf. the coins of Timarchus).1

VII. The Parthian Empire of the Arsacids.—Meanwhile, in the east, the Arsacids had begun their expansion. Phraates I. (c. 175-170) subdued the Mardsians in Elburz. His brother Mithradates I. (c. 170-138) had to sustain a difficult war with Eucretides of Bactria, but eventually succeeded in wresting from him a few districts on the Turanian frontier.

Indeed, he penetrated as far as, and farther than, the Indus (Diod. xiii. 18; Oros. v. 4, 16). In the west he conquered Media, and thence subdued Babylonia. He further reduced the Elymaeans, sacked their temple in the mountains, and captured the Greek city of Seleucia on the Hedynphon (Strabo xvi. 744; Justin xii. 6). The Seleucids, meanwhile, were harassed by aggravated disorders and insurrections. Nevertheless, in 140, Demetrius II. Nicator took the field in order to fight the east, but was defeated and captured. Shortly afterwards Mithradates I. died. His son Phraates II. (c. 138-127) was attacked in 130 by Antiochus VII. Sidetes, the brother of Demetrius II., on which the Parthian king released the latter. Antiochus pressed successfully on, and once more recovered Babylon, but in 120 was defeated in Media and fell in a desperate struggle. With this battle the Seleucid dominion over the countries east of the Euphrates was definitely lost. The Babylonian towns, especially Seleucia (g.x.), were handed over by Phraates to his favourite, the Hircanian Himerus, who punished them severely for their resistance.

During these wars great changes had taken place in eastern Iran. In 159 Mongolian tribes, whom the Chinese call Yue-chi and the Greeks Scythians, forced their way into Sogdiana, and, in 139, conquered Bactria (Strabo xi. 571; Justin xii. 1; Trog. ProL. 41; see BACTRIA). From Bactria they tried to advance farther into India and in 138, under the command of their ruler, had an alliance with Antiochus VII. In 128-127, they assailed the Parthian Empire, Phraates II. marched to encounter him, but was himself defeated and slain, and his country ravaged far and wide. His successor Artabanus I. (c. 127-124), the uncle of Phraates, also fell in battle against the Tocharians, the principal Scythian tribe (Justin xiii. 1, 2; Jos. Ant. fr. 66); but his son Mithradates II., surnamed "The Great" (c. 124-88), defeated the Scythians and restored for a while the power of the Arsacid. He also defeated Artavasdes, the king of Great Armenia; his son Tigranes, a hostage in the hands of the Parthians, was only redeemed by the cession of 70 valleys (Strabo xi. 532). When Tigranes attempted to seize Cappadoctia, and the Roman praetor P. Cornelius Sulla advanced against him, Mithradates in 92 B.C. concluded the first treaty between Parthia and Rome (Plut. Sulla, v.; Liv. epit. 70). The dynastic troubles of the Seleucids in Syria gave him an opportunity for successful intervention (Jos. Ant. Jud. xii. 13, 4; 14, 3). Shortly afterwards he died; and, with his death, the Arsacid power collapsed for the second time. The possession of the western provinces and the dominant position in western Asia passed to the Armenian Tigranids (g.x.), who wrested from the Parthians Mesopotamia and the suzerainty of Atropatene, Gordyene, Adiabene, Osroene. Simultaneously began a new and severe conflict with the Scythians. Parthian coins, probably dating from this period (Wroth, Catalog. of the Coins of Parthia, 1890, xxxix. and cr. 90), mention victory after victory in Parthian campaigns of Parthian kings and a conquest of the provinces of Asia, Trachiane (cf. Strabo xi. 905). But how

Conflicts with the Romans.

The Parthian Empire, as founded by the conquerors of Mithridates I. and restored, once by Mithridates II. and again by Phraates III., was, to all exterior appearance, a continuation of the Achaemenid dominion. Thus the Arsacids now began to assume the old title "king of kings" (the shahanshah of modern Persia), though previously their sphere of power was not the legal successor of the old Parthian kingdom. The official version, preserved by Arrian in his Parthica (ap. Phot. cod. 68; see PARTHA), derives the line of these chieftains of the Parthian nomads from Artaxerxes II. In reality, however, the Parthian Empire was totally different from its predecessor, both externally and internally. It was anything rather than a world-empire. The countries west of the Euphrates never owned its dominion, and even of Iran itself not one half was subject to the Arsacids. There were indeed vassal states on every hand, but the actual possessions of the kings—the provinces governed by their satraps—consisted of a rather narrow strip of land, stretching from the Euphrates and north Babylonia through southern Media and Parthia as far as Arachosia (north-west Afghanistan) and following the course of the great trade-route which from time immemorial had carried the traffic between the west of Asia and India. We still possess a description of this route by Isidore of Charax, probably dating from the Augustan period (in C. Müller, Geographia greecor minoras, vol. i.), in which is contained a list of the 18 imperial provinces, known also to Pliny (vi. 112; cf. 41). Isidore, indeed, enumerates nineteen; but, of these, Sacastene formed no part of the Parthian Empire, as has been shown by von Gutschmid.

The provinces of the districts west of Parthia are: (1) Mesopotamia, with northern Babylonia, from the Euphrates bridge at Zeugma to Seleucia on the Tigris; (2) Apolloniatis, the plain east of the Tigris, with Artemita; (3) Chalontis, the northernmost part of Zabata; (4) Mesopotamia, the mountainous portions of Media (cf. Bagistana—Beshistan) the mountainous portions of Media; (6) Upper Media, with Ecbatana; (7) Rhagiane or Eastern Media. Then with the Caspian Gates—the pass between Elburz and the central desert, through which lay the route from west Iran to east Iran—the upper provinces begin; (8) Chaorean and (9)

For the whole of this period see further ANTIQUE; ANTIQUUS I-IV; SELEUCID DYNASTY; HELLENISM.
Comisene, the districts on the verge of the desert; (10) Hyrcania; (11) Astabene, with the royal town Assac on the Attruck (see PArtHIA); (12) Parthiene with Parthiania, where the royal residence was. Originally, now Abkhwaz, with the capital Kelat; (14) Margiane (Merv); (15) Arias (Herat); (16) Anauon, the southern portion of Arta; (17) Zarangiane, the country of the Zarangian, the Sassanian kings generally have been of this name. (18) Bactra, the district of the Etymanides (Helmand), called by the Parthians "White India," extending as far as Alexandria (Kandahar), the frontier city of the Parthian Empire.

On the lower Helmander, the Sacae had established themselves—obviously on the inroad of the Scythian tribes—and after them the country was named Sacastene (now Seistan, Seistan). Through it lay the route to Kandahar; and for this reason the district is described by Isidore, though it formed no part of the Parthian Empire.

Round these provinces lay a ring of numerous minor states, which as a rule were dependent on the Arsacids, and in one case, namely that of the king Mithra, were actually subject to him. The whole list of kings, which it gives, is totally unhistorical; only the names of one Balash (Vologaeses) and of the last Arwedan (Arta-Balash) have been preserved. The period, from the death of Artaxerxes III. to the foundation of the Arsacids in 266 BC; which was afterwards corrected, after Syro-Greco-evidence, to 532 years. The actual number is 548 years (i.e. 323 B.C. to A.D. 229). The statements of the Armenian histories are also inaccurate in most particulars.

The ten most important of the vassal states were:

1. The kingdom of Osroene (q.v.) in the north-east of Mesopotamia, with Edessa as capital, founded about 320 B.C. by the chieftain of the Arabiel tribe, the first vassal state of the Parthian Empire.

2. To this must be added the numerous Arabian tribes of the Mosopatamian desert, under their chieftains, among whom one Achaemenus was for some time a vassal of the Parthian kings.

3. Their settlement in Mesopotamia was encouraged by Tigranes, according to Plutarch (Luc. 21) and Pliny (vi. 142), in later times the Arabic tribe Atra in an oasis on the west of the Tigris and Euphrates, who for a long time, though independent, paid vassalage to the Parthians.

4 and 5. To the east of the Tigris lay two kingdoms: Gordyene (or Cordyene), the country of the Carduchians (now Bohtan), a wild, mountainous district south of Armenia; and Adiabene (Hadyab), the ancient Assyria, on either side of the Zab (Lycus).

5. On the farther side of Zagros, adjoining Adiabene on the east, was the kingdom of Artopotane in north Media, now often simply called Media (q.v.).

The land of Armenia was at its height under Tigranes (86-59 B.C.) all these states owned his rule. After the victories of Pompey, however, the Romans claimed the suzerainty, so that, during the next decades and the expeditions of Crassus and Antony, those states remained independent, as was generally the case with the Orontes, which was generally to the latter. For they were all Orientals and, consciously or unconsciously, representatives of a reaction against that Hellenism which had become the heritage of Rome. At the same time the three organized tribes of the Parthian Empire, afforded them a greater measure of independence than they could hope to enjoy under Roman suzerainty.

The kingdom of Babylon, in the district of Mesene (the modern Massign), after the fall of Antiochus Sidetes (129 B.C.), an Arabian prince, was reoccupied by Spasines or Spasines (in a cuneiform inscription on 17 tablets dated after this year, he is called Arhabal), a kingdom which existed till the 2nd century of our era, on the Sasanian Empire. Its capital was a city (mod. Mohammerah), first founded by Alexander an artificial hill by the junction of the Eulaeus (Karun) with the Tigris, and peopled by his veterans. The kings of Tigris and Eulaeus (Karun), originally founded by Antiochus I. as Antiochia, was reformed with dikes by Spasines, and christened Spasini Charax ("the wall of Spasines"), or simply Charax (Phin., vi. 138 seq.). In the following centuries it was the main mercantile centre on the Tigris estuary.

The kingdom of Mesene, also called Characene, is known to us from occasional references in various authors, especially Lucian (Macrobi), 16, as well as from numerous coins, dated by the Seleucid era, which have been discovered in the region.

The Arabian dynasty speedily assimilated itself to the native population; and most of the kings bear Babylonian—in a few cases, Parthian—names. The official language was Greek, till, on the fall of the Parthian Empire (31 B.C.), and the coins were struck in Parthian and the Arabian dynasty then passed to the Arabians. Another Babylonian dynasty must have been Hadadnadianaches (c. 100 B.C.), who built in Tello the fortified palace which has been excavated by de Sarzec.

The city of Babylon was called the Tigris, or the Eulaeus (Elam), to which belonged Susa and its modern representative Alwaz, farther down on the Eulaeus. The Elamites, who had already offered a repeated resistance to the Seleucids, were subdued by Mithra; the Romans have been more or less content, as the province of Arabia (Arabia Felix), was a vassal state, which often rebelled against the Arsacids (Strabo xvi. 744; cf. Plut. Pomp. 36; Tac. Ann. vi. 50). Of the kings who apparently belonged to a Parthian dynasty, several bearing the name Cammas cides are known to us from coins dated 91 and 82 B.C. Of these is designated by Lucian (Macrobi, 16), "king of the Parthians"; while the coinage of another, Orodus, displays Aramaic script (Strabo, de la cire 8. 2). The kingdom, which is seldom mentioned, survived till Ardashir I. In its neighbourhood Strabo mentions "the minor dynasties of the Sagapanes and Silanaeans" (xvi. 745). The three principal vassal states of the Parthians, which have maintained their independence exactly as under the Achaemenid dynasty (Strabo xvi. 744; Plin. vi. 135).

8. The district of Peræa, also, became independent soon after the time of Antiochus IV., and was ruled by its own kings, who perpetuated the Achaemenian traditions, and on their coins—which bear the Persian language in Aramaic characters, i.e. the so-called Pahlavi—appear as zealous adherents of Zoroastrianism and the kings of Parthia. In the 2nd century the suzerainty of Parthia, to which they stood in the same position as the Persians of Cyrus and his forefathers to the Median Empire (cf. Strabo xv. 728, 735, 736; Lucian, Macrobr. 15). In later times, the position of the kings of Peræa was confirmed, and they were integrated into numerous small local states. Even in Carmania we find independent kings, one of whom gave his name to a town called Vologesocara (Balashter).

9. The kingdom of Bactria with Sagdiana, Eastern Arachosia and Gedrosia—was never subject to the Arsacids. Here the Graeco-Bactrian and Graeco-Indian kings held their own, till, in 159 B.C., they succumbed before the invading Mongol army, which established itself in Bactria. But in the Indus district the Greek kings held their ground for an appreciably longer period and, for a while, extended their power eastward to the Jumna and Ganges. The Indo-Scythian kings, who came into possession of certain territories, particularly those in the Scythians, who had occupied them, had no power over the kings, who were known to us from their coins, there appears a dynasty of Iranian and sometimes particularly Parthian names which seems to have reigned in the Punjab and Arachosia. Its best-known representatives are the kings of Bohtan, to whom legend makes the apostle Thomas write, reigned over Arachosia and the Indus district about A.D. 20. Further, about A.D. 70, the Peripatus of the Erythraean Sea mentions that the great commercial town of Minnagar in the Indus Delta was under Parthian kings, "who spent their time in expelling one another." Here, then, it would seem there existed a Parthian dynasty, which probably went back to the conquests of Mithridates I. (cf. Vincent A. Smith, "The Historical Dynasties of the Seleucid Kingdom," vol. i. of the "Zeitschr. der deutschen morgenl. Gesell. 60, 1906"). Naturally, such a dynasty would not long have recognized the suzerainty of the Arsacids. It succumbed to the Indo-Scythian Empire of the second and third centuries, and to the rise of the Empire of the Kushans, established about A.D. 50, and thence pressed onward into India. In the period of the Peripatus (c. A.D. 70) the Scythians were already settled in the Indus valley (pp. 38, 41, 48), their dominion reaching its zenith under Kaniska (c. A.D. 125-153).

This empire of the Kushana merits special mention here, on account of its peculiar religious attitude, which we may gather from the coins of its kings, particularly those of Kaniska, and his immediate successor Huvishka, on which an alphabetic form of the Greek is employed (cf. Aurel Stein, "Zoroastrian Deities on Indo-Scythian Coins," in The Babylonian and Oriental Record, vol. i, 1887). Kaniska, the well-known head of the sect of "Histerian" Buddhism, is the image of the founder of the sect of Buddhism. Iranian divinities, however, predominate on his currency: Mithras (Mihro or Helios); the Moon Man (also Selene); Athra, the Fire; Ohrangava (Vereghazana); the Sun (previously the image of the Sun); Tisra ("theGirra"); Nana (Nana); and others. Here, then, we have a perfect example of syncretism; as in the Mithraic cult in Armenia, Asia Minor, and still further in the Roman Empire. Buddhism and Zoroastrianism have been wedded in the state religions, and, in characteristic Indian fashion, are on the best of terms with one another, precisely as, in the Chinese Empire at the present day, we find the most varied religions, side by side, and on an equal footing.

1. See Saint-Martin, Recherches sur la Mésopotamie et la Characène (1838); Reinaud, Mémoires sur le royaume de la Mésopotamie (1861); E. Bébél, "Numism. et chronol. des dynasties de la Characène," in Journ. de la Soc. archéol. numism., vol. i. (1898).
PERSIA

create a great and unified domain, such as existed under the Achaemenids and was afterwards restored by the Sassanids. This fact is the clearest symptom of the inner weakness of their empire and of the small power wielded by the "king of kings." In contrast with the Parthians, the Sassanids were not a race of conquerors. Arsalan's dominion was peculiarly a chance formation—a state which had come into existence through fortuitous external circumstances, and had no firm foundation within itself, or any intrinsic raison d'être.

Three elements, of widely different kinds, contributed to its origin and defined its character. It was sprung from a predatory nomad tribe (the Parthian Dahae, Scythians) which had established itself in Khorsabad in the eleventh century, and from which it gradually spread to further districts as the political situation or the weakness of its neighbours allowed. Consequently, these nomads were the main pillar of the empire, and from them were obviously the highest authorities. They were the military officers, who composed the imperial council, led the armies, governed the provinces and made and unmade the kings (Strabo xi. 515; Justin xii. 2; the former terming them οἰκογενεῖς, 'kinsmen' of the king, the latter, θυγατέρες, 'daughters' of the king). Of these great families that of Surenas held the privilege of setting the diadem on the head of the new king (Plut. Crass. 21; Tac. Ann. vi. 42).

The military organization, moreover, was wholly nomadic in character. The army was formed of armed horsemen, excellently practised for long-distance fighting with bow and javelin, but totally unable to venture on a hand-to-hand conflict, their tactics being rather to scatter the enemy's forces, and reconquer the ground under a hail of missiles. When attacked they broke up, as it seemed, in hasty and complete flight, and having thus led the hostile army to break its formation, they themselves rallied, and were re-formed. Thus it was the infantry to hold their own against these mounted squadrons was demonstrated by the Roman campaigns, especially in broad plains like those of Mesopotamia. In winter, however, the Parthians were powerless, as was evident from the fact that, in civil wars, the deposed kings consistently took refuge among the Dahae or Scythians. Thus these nomads were amalgamated with the native peasantry, and, with their religion, had adopted their dress and manners. Even the kings, after the first two or three, wear their hair and beards; but their ancestors, the Iranian fathers of the new dynasty, were beardless. Although the Arsacids are strangers to any deep religious interest (in contrast to the Achaemenids and Sassanids), they acknowledge the Persian gods and the leading tenets of Zoroastrianism, and even wore the sacred red and white horse trappings, and the crown of the nobility, there is a second council of "Magians and wise men" (Strabo xi. 515).

Again, they perpetuate the traditions of the Achaemenid Empire. The Sassanids assume the title of "king of kings" and derive their origins from Artaxerxes and Artaxerxes II. Further, the royal apotheosis, so common among them and recurring under the Sassanids, is probably not so much of Greek origin as a development of Iranian views. For at the time of the Persian conquests, when the Persian monarchs claimed divine authority and traced their descent from Zoroaster, their monarchs were deified, and their sumptuous shrines were to be visited in the same manner as the temples of the Egyptian pharaohs. For the art of the Persian Empire changes not, even when the Achaemenids are succeeded by the Sassanids, as is proved by the fact that the subsequent Iranian traditions, and Ferdousi in particular, apply the name of the "Parthian magistrates (Pahlavus)" to the glorious heroes of the legendary epic, and to the Sassanid monarchs, who reigned at the beginning of the Sassanid period, which are retained under the Sassanids, the name Pahlavi, i.e. "Parthian." The script was derived from the Aramaic.

But to these Oriental elements must be added that of religion. The Sassanids recognized not only Zoroastrianism, but the fire-worship introduced into Parthia by the Magi, and later the importation of Parseeism by India and Micia. It was indispensable to every state which hoped to play some part in the world and was not so utterly secluded as those behind the deserts of Mongo. Arslans entertained the less thought of opposition as they were destine of an independent national basis. All their external institutions were borrowed from the Sassanid Empire; their coinage with its Greek inscriptions and nomenclature; their Attic standard of currency; and, doubtless, a great part of their administration also. In the towns Greek merchants were everywhere recognized as the leaders. Mithradates II founded Seleucia in the new city, Arasica, which replaced the ancient Rhaeae (Rai, Europus) in Media. The further the Arsacids expanded the deeper they penetrated into the province of Hellenism; and of these Rhodes and other Greek cities, the chief being that of the title Philelthen, "the protector of Hellenism," which was retained by almost all his successors. Then follow the surnames Epiphanes ("the revealed god," Dicaearchus "the just," Euergetes ("the benefactor," all of whom, although essentially Parthian, were also the heads of the art and sciences, and regularly bome by all the kings. After the conquest of the Euniphtes and Tigris provinces it was imperative that the royal residence should be fixed outside the royal border and army, with its hordes of wild horsemen, to the Greek town of Seleucia, and thus disorganize its commerce, the Parthians set up their abode in the great city of Ctesiphon, which, since the days of Mithradates, had become the arts capital of the eastern world, and which, accordingly retained its free Hellenic constitution, (see Ctesiphon and Seleucia). So, also, Orodos I. spoke good Greek, and Greek tragedies were staged at his court (Plut. Crass. 33).

In spite of this, however, the rise of the Arsacids marks the beginning of a reaction against Hellenism—not, indeed, a conscious or official reaction, but a reaction which was all the more effective because it depended on the insuperable handicaps of the workmanship and the power of the Greek force. The essential point is that the East is completely divorced from the Mediterranean and the Hellenic world, that it can derive no fresh powers from that quarter, and that, consequently, the course of events in the East followed a process may be only traced in the coins—almost the sole memorials that the Parthian Empire has left. From reign to reign the portraits grew more and more attenuated until, after Vologases I. (51-77), the Aramaic script is occasionally employed. The political opposition to the western empires, the Seleucids first, then the Romans, precipitated this development. Naturally enough the Greek cities held out to the new overlords, that they did not overthrow the reigning monarch, and that they were ready to cast in their lot with such—a disposition for which the subsequent penalty was not lacking. The Parthian magnates, on the other hand, with the army, would have little to do, with Greek culture and Greek modes of life, which they contemptuously regarded as effeminate and unmanly. Moreover, they required of their rulers that they should live in the fashion of their country, practice the arts and the chase, and appear as Oriental satraps, not as Greek kings.

These tendencies taken together explain the radical weakness of the Parthian Empire. It was too strong to be a great army, and the Parthian star was destined to set. If, therefore, the Parthians are to be compared with the Romans, it seems very likely that at the time of Vologases I., the Parthian army was ready to hold the army together for any longer period, or to conduct a regular campaign. The Parthians proved incapable of creating a firm, united organization, such as the Achaemenids before them, and the Sassanids after them. The Parthian army was merely a collection of elements, which were toys in the hands of the magnates and the army who, tenaciously as they clung to the anointed dynasty of the Arsacids, were utterly indifferent to the person of the individual Arsacid. Every moment they were ready to overthrow the reigning monarch in order to seat another on his throne. The kings, for their part, sought protection in craft, treachery and cruelty, and only succeeded in aggravating the situation. More especially was this the case in every crisis, and the worse of enemies in their own sons. Sanguinary crimes were thus of everyday occurrence in the royal household; and frequently it was merely a matter of chance whether the father anticipated his son, or the son his father. When his office was: as obtained subsequently under the Mahomedan Caliphate (g.a.) and the empire of the Ottomans. The internal history of the Parthian dominion is an unbroken sequence of civil war. The external relations with the Parthian Empire and numismatics, see PARTHIA, under which heading will be found a complete list of the kings, so far as we are able to reconstitute it.

These conditions elucidate the fact that the Parthian Empire, though founded on annexation and perpetually menaced by hostile arms in both the East and the West, yet never took a strong offensive after the days of the Mithradates II. It was bound to protect itself against Scythian aggression in the East and Roman aggression in the West. To maintain, or regain, the suzerainty over Mesopotamia and the vassal states of that region, as also over Atropatene and Armenia, was its most imperative task. Yet it always remained on the defensive and even so was
lacking in energy. Whenever it made an effort to enforce its claims, it retreated so soon as it was confronted by a resolution foe.

Thus the wars between Parthia and Rome proceeded, not from the Parthians—deeply injured though they were by the machinations of Pompey—but from Rome herself. Persia was always an obstacle which came in the way of Rome, and the war with Persia was an integral part of the policy of Rome. But Persia was not to be underestimated, and the idea of conquering her was as absurd as it was impracticable. The Persians were a formidable foe, and the war was to be fought with care and skill. But the Persians were not to be trusted, and the war was to be fought with caution and prudence. But Persia was to be conquered, and the war was to be fought with determination and perseverance. But Persia was to be conquered, and the war was to be fought with determination and perseverance. But Persia was to be conquered, and the war was to be fought with determination and perseverance.
son Sanatruces II. (115; and Parthamaspates 116-117). Obviously the empire can never have been at peace during these years, a fact which materially assisted the aggressive campaigns of Trajan and his old projects of Ctesiphon and Caesar, by which the Persic empire of Alexander as far as India was to be won for Western civilization. In pursuance of this plan he reduced Armenia, Mesopotamia and Babylonia to the position of imperial provinces. On his death, however, Hadrian immediately reverted to the Augustan policy and restored the coterminous empire. Simultaneously there arose in the East the powerful Indo-Scythian Empire of the Kushana, which doubtless limited still further the Parthian possessions in eastern Iran.

An era of quiet seems to have returned with Vologaeses III. (147-191), and we hear no more of rival kings. With the Roman Empire a profound peace had reigned since Hadrian (117), which was first disturbed by the attack of Marcus Aurelius and Aelius Verus in 162. This war, which broke out on the question of Armenia and Osrhoene, proved of decisive significance for the future development of the East, for, in its course, Seleucia was destroyed by the Romans under Avidius Cassius (164). The downfall of the great Greek city sealed the fate of Hellenism in the countries of the Euphrates. Henceforward Greek culture practically vanishes and gives place to Aramaic; it is significant that in future the kings of Mesene stamped their coinage with Aramaic legends. This Aramaic victory was powerfully aided by the ever-increasing progress of Christianity, which soon created, as is well known, an Aramaic literature of which the language was the dialect of Edessa, a city in which the last king of Osrhoene, Abgar IX. (179-214), had been converted to the faith. After that Greek culture and Greek literature were only accessible to the Orientals in an Aramaic dress. Vologaeses III. is probably also the king Valgash, who, according to a native tradition, preserved in the Dinkar, began a collection of the sacred writings of the Zoroaster—the origin of the Avesta which has come down to us. This would show how the national Iranian element in the Parthian Empire was continually gathering strength.

The Roman war was closed in 165 by a peace which coded north-west Mesopotamia to Rome. Similar conflicts took place in 195-202 between Vologaeses IV. (191-209) and Septimius Severus, and again in 216-217 between Ardashir I. (209-226) and Caracalla. They failed, however, to affect materially the position of the two empires.

VIII. The Sassanian Empire. That the Arsacid Empire should have endured some 350 years after its foundation by Artaxerxes II. was a result, not of internal strength, but of chance working in its external development. It might equally well have so existed for centuries more. But under Ardashir I. the catastrophe came. In his days there arose in Persia—precisely as Cyrus had arisen under Astyages the Mede—a great personality, Ardashir (Artaxerxes) I., son of Papak (Babeck), the descendant of Sasan, was the sovereign of one of the small states into which Persia had gradually fallen. His father Papak had taken possession of the district of Istakhr, which had replaced the old Persepolis, long a mass of ruins. Thence Ardashir I., who reigned from about a.d. 222, subdued the neighbouring potentates—disposing of his own brothers among the rest. This proceeding quickly led to war with his suzerain Artabanus IV.

The conflict was protracted through several years, and the Parthians were worsted in three battles. The last of these witnessed the fall of Artabanus (a.d. 226), though a Parthian king, Artavasdes—perhaps a son of Artabanus IV.—who is only known to us from his own coins, appears to have retained a portion of the empire for some time longer. The members of the Arsacid line who fell into the hands of the victor were put to death; a number of the princes found refuge in Armenia, where the Arsacid dynasty maintained itself till a.d. 429. The remainder of the vassal states—Carmania, Susiana, Mesene—were ended by Ardashir; and the autonomous desert fortress of Hatra in Mesopotamia was destroyed by his son Shapur (Sapor I.), according to the Persian and Arabian traditions, which, in this point, are deserving of credence. The victorious Ardashir then took possession of the palace of Ctesiphon and assumed the title "King of the kings of the Iranians" (βασιλεύς βασιλέων 'Αραμών).

The new empire founded by Ardashir I.—the Sassanian, or Neo-Persian Empire—is essentially different from that of his Arsacid predecessors. It is, rather, a continuation of the Achaemenid traditions which were still alive on their native soil. Consequently the national impulse—already clearly revealed in the title of the new sovereign—again becomes strikingly manifest. The Sassanian Empire, in fact, is once more a national Persian or Iranian Empire. The religious element is, of course, inseparable from the national, and Ardashir, like all the dynasts of Persis, was an ardent devotee of the Zoroastrian doctrine, and closely connected with the priesthood. In his royal style he assumed the designation "Mazdayasaniyan" (Μαζδανάςαν), and the fire-cult was everywhere vigorously disseminated. Simultaneously the old claims to world dominion made their reappearance. After the defeat of Artabanus, Ardashir, as heir of the Achaemenids, formulated his pretensions to the dominion of western Iran (in Cas. 80, 2; 82, 5). The Roman army under Shapur II.: Ammian. Mar. xvii. 5. 5. He attacked Armenia, though without permanent success (cf. von Gutschmidt in Zeitschr. d. d. morgen. Ges. xxxi. 47, on the fabulous Armenian account of these wars), and despatched his armies against Roman Mesopotamia. They stayed as far as Syria and Cappadocia. The inner decay of the Roman Empire, and the widespread tendency of its troops to mutiny and usurpation, favoured his enterprise. Nevertheless, the armies of Alexander Severus, supported by the king of Armenia, succeeded in compelling the Persians, though the Romans sustained severe losses (231-233). Towards the end of his reign Ardashir resumed the attack; while his son Shapur I. (242) reduced Nisibis and Carrhae and penetrated into Syria, but was defeated by Gordian III. atressa (243). Soon afterwards, however, the Roman Empire seemed to collapse utterly. The Goths defeated Decius (251) and harried the Balkan Peninsula and Asia Minor, but insurrections broke out everywhere and the legions created one Caesar after the other. Then Shapur resumed the war, subdued Armenia and plundered Antioch. The emperor Valerian, who marched to encounter him, was overthrown at Edessa and taken prisoner (260). The Persian armies advanced into Cappadocia; but here Ballista or Balista (d. 260) beat back, and Odenathus (Odhainath), prince of Palmyra (p.n.), rose in their rear, defeated Shapur, captured his harem, and twice forced his way to Ctesiphon (263-265).

Shapur I., in contrast to his father, assumed the title "King of the kings of the Iranians and non-Iranians" (βασιλεύς βασιλέων 'Αραμών καί 'Αραμωνῶν; shah an shah Irān ve Amīrān), thus emphasizing his claim to world dominion. His successors retained the designation, little as it corresponded to the facts, for the single non-Iranian land governed by the Sassanids was, as under the Parthians, the district of the Figris and Euphrates as far as the Mesopotamian desert; western and northern Mesopotamia remained Roman.

The Sassanian ruler is the representative of the "Kingly Majesty," derived from Ormuzd, which appears in the Avesta as the angel Kaituma. The "kingship," "the royal glory," and, according to the legend, once beamed in the Iranian kings, unattainable to all but those of royal blood. A picture, which frequently recurs in the rock-reliefs of Ardashir I. and Shapur I., represents the king and the god Ormuzd both on horseback, the kheri in the act of handing to his companion the ring of sovereignty. Thus it is explicable that all the Sassanids, as many of the Arsacids before them, bore the designation of "king" or "emperor" as a style. From this developed (as already under the Arsacids) that strict principle of legitimacy which is still vigorous in Firdousi. It applies, however, to the whole royal house, precisely as in the Ottoman Empire of to-day. The person of the individual ruler
is, on the other hand, a matter of indifference. He can readily be removed and replaced by another; but no usurper who was not of the legitimate blood can hope to become the genuine king. Therefore the native tradition carries the Sassanian line back to the Achaemenian one. This accounts for the legitimacy of the Sassanian kings.

Officially the king is all-powerful, and his will, which is guided by God and bound up in His law, unlettered. Thus, externally, he is surrounded by a body of dervishes, who claim to be the spiritual protoments of the king could deal with as scant consideration as he pleased, and that he had the power or understood the art of making himself feared. But to break through the system or replace it by another would be as much as to admit the possibility of death or eternity, as much as to suggest the idea that he was not in control even of his own destinies. If the king could not prevent even the thought of his death, there was little danger in the caution whenever he wished to elevate a favourite of humble origin to an office which custom reserved for the nobility. Thus it is all the more worthy of recognition that the Sassanian Empire in the early Christian centuries was an externally weak state and that the later sovereigns did their utmost to repress the encroachments of the nobility, to protect the commonalty, and, above all, to carry out a just system of taxation.

In the end the Sassanian emperors, now a far more powerful body than under the Arsacids. Every larger district had its upper Magian (Magipat, nobed, i.e. "Lord of the Magians"). At their head was the supreme Nobed, probably regarded as the successor of Zoroaster. In the new empire, of which the king and people were alike zealous professors of the true faith, their influence was naturally strong (cf. Agaebias ii. 26)—comparable to the influence of the Church in later Egypt, and especially in Byzantine and medieval Christendom. As has already been indicated, it was in their religious attitudes that the Sassanian emperors were most strongly dependent upon the Iranian states. But, in details, the fluctuations were so manifold that it is necessary at this point to enter more fully into the history of Persian religion (cf. especially E. Gerz, "Eznik u. d. Entwickelt.

Military Achievements.

The Nobility.

Pers. i. 6, 13 sqq.) In the last of these positions we frequently find princes of the blood, who then bear the royal title (shah). Some only—those who are the offspring of the kings—derive from the house of Tandar (i.e. Vistaspas), the protege of Zoroaster; Zeisc. d. d. morgen., Ges. xiii. 635 sqq.), already existed under the Sassacids, e.g. the Suren (Surens, vide supra, p. 798) and Karen (Gelzer, Die Luräische, ii. 142 sqq.). Here also the name of Ormuzd, a name long enjoyed official validity, and the theocratic power of the Zervanites was pronounced heretical.1 But, above all, the title and the doctrine of purity were elaborated and expanded, and there was evolved a complete and detailed system of casuistry, which, as with all things Iranian, was concerned with the expiation for each, &c., which, in its arid and spiritless monotony vividly recalls the similar prescriptions in the Pentateuch.

The consequences of this development were that orthodoxy and piety were prolonged to the limit of what they could bear, the exaction being inevitably greater than previously; henceforward, great command-

under the Arsacids the empire was subdivided into a host of small provinces, at the head of each being a Marban ("boundary-lord," "lord of the marches"). These were again comprised in four great military districts. Within each of these districts a male potentate under whose control the king could deal with as scant consideration as he pleased, and that he had the power or understood the art of making himself feared. But to break through the system or replace it by another would be as much as to admit the possibility of death or eternity, as much as to suggest the idea that he was not in control even of his own destinies. If the king could not prevent even the thought of his death, there was little danger in the caution whenever he wished to elevate a favourite of humble origin to an office which custom reserved for the nobility. Thus it is all the more worthy of recognition that the Sassanian Empire in the early Christian centuries was an externally weak state and that the later sovereigns did their utmost to repress the encroachments of the nobility, to protect the commonalty, and, above all, to carry out a just system of taxation.

Religious Development.

1 It may be observed that this innovation was also known to the Mithraic cult of the West, where Zervan appears as sol.
of the heathen, a movement which had already had an energetic representative in the prophet himself. Heathenish cults and forbidden manners and customs are a pollution to the land and a deep injury to the heart. Therefore the king was to take the first step of the combat and destroy the unbeliever and the heretic. In short, the tolerance of the Achaemenids and the indifference of the Arsacids are now replaced by intolerance and religious persecution.

Ardashir, the son of Shapur I, came to the throne at the age of 13, and in their energetic prosecution he found a potent instrument for the building up of his empire. It has previously been mentioned that Vologases III, had already begun a collection of the holy writings; and the task was assumed under Ardashir. At his order, the orthodox doctrines and texts were compiled by the high priest Jansar; all divergent theories were prohibited and their adherents proscribed. Thus arose the Avesta, the sacred book of the Parsees. Above all, the king wished to establish, over all the people, the spirit of the Sassanian period, in its intolerance, its casuistry degenerating into absurdity, and its soulless monotony. Subscription to the restored orthodox doctrine was to the Iranian a mark of fidelity and favor. In the empire, the Persian language was the official vehicle of administration.

Relation to Christianity.

The Persian theocracy was also influenced by the fact that, meanwhile, a powerful opponent of Zoroastrianism had arisen with an equally zealous propaganda and an equal exclusiveness and intolerance. More especially, in Arabia, during the first centuries of the Christian Dispersion, the sect sought to introduce the orthodox religion, destroyed the heathen images—even those of the Iranian gods which were here considered heathen—and turned the shrines into fire-altars (Gelzer, Ber. Gesch., p. 564). After the fall of the Sassanids, and the spread of the Christian faith, the fire-altars still remained, an admissure of other elements, principally Babylonian and Gnostic. Mani, perhaps a Persian from Babylonia, is said to have made his first appearance as a teacher on the coronation day of the Persian king Shapur II, and as such he was at once condemned to death by the empire. Shapur, however, was not disposed to execute his own laws, and though he was unable to punish Mani, his administration gave the opportunity to substitute in the mosques, and especially in the three Persian monasteries of Istakhr, Firuzabad, and Persepolis, the names of the chief chief men. The Christianisation of Persia was thus, in a way, lying in the watchwords of the Persian kings.

Manichaeanism.

Mani, a Persian from Babylonia, was succeeded by his disciples, and the religious sect that he formed was spread over Persia and the neighboring parts of the Eastern Empire. It was a heretical movement from the first, and was therefore suppressed by the imperial government. It was not long, however, before the Manichean sect was established in the empire, and its adherents were allowed to hold meetings under the sanction of the government. A Manichaean was elected as the ruler of the empire, but the sect was not yet able to dreadly the empire.

Yet it maintained itself not merely in the west, where its head resided at Babylon—propagating thence far into the Roman Empire—but also in the east, in Khurasan and beyond the borders of the empire, and especially among the nomads of the desert. The sect was well established, in fact, at the head of the enemy, and its discipline, the teachings of the Persian Manichaean school, found its way to the chief man of the desert, and the sect was spread far and wide. Its adherents were allowed to hold meetings under the sanction of the government, and the sect was encouraged to propagate its doctrines.

Like the Arsacids the kings resided in Ctesiphon, where, out of the vast palace built by Chosroes I., a portion at least of the great hall is still erect. On the ruins of Seleucia, on the mouth of the Euphrates, are the ruins of the ancient city. The city was called Ardashir ("good is Ardashir"), to which the later kings added new towns, or rather new quarters. In Susiana Shapur I. built the great city of Gondye-Shapur, which succeeded the ancient capital of the Persian Empire. At the same time the mother-country again gained importance; especially the capital of Persis, Istakhr, which had replaced the former Persepolis (now the ruins of Haji-abad), farther in the south-east, Ardashir I. built Ctesiphon (now Firuzabad), under the name of Chosroes I. ("the glory of Ardashir"). At these places and in Sarwistan, near Shiraz and elsewhere, lie ruins of the Sassanid palaces, which in their turn go back to the Achaemenian architecture, blending Egyptian and Persian elements, but often showing the influence of the Phoenician architecure: the structures of the Caliphs (see Architecture: § Sassanian). After its long quiescence under the Arsacids native art underwent a general renaissance, which, though not aspiring to the heights of the Sassanid period, was, at the same time, considerably influenced. Of the Sassanian rock-sculptures some have already been mentioned; besides these, numerous engraved signet-stones have been preserved. The metal-work, carpets and fabrics of this period enjoyed a high reputation; they were widely distributed and even influenced western art.

In the intellectual life and literature of the Sassanid era the most prominent figure was the prophet Mani, whose own works and the Greek language. Ardashir I. and Shapur I. still appealed Greek translations to some of their inscriptions; but all of later date are drawn up in Pahlavi alone. The so-called Manichaean inscriptions of the Sassanian Empire are probably a head with his name and title; on the reverse, a fire-altar (generally with the inscription "the glory of Ardashir, Shapur, &c., etc., the fire of the royal palace), and the name of the place of coinage, usually herem or haram. The first is not always influenced by the second. The second is often the work of the astrologers, the last of the magicians. The bulk of the inscriptions are of the 6th-7th centuries, and are usually found in the的钱 Chronicle of the Tabari, (1879, trans. with notes and excursus chiefly on the chronology and organization of the empire), and on this basis is Nöldeke's Aufstieg und Niedergang der römischen Welt, vol. i. (I., 1879). The inscriptions it is a difficulty to translate; the only author in authority on the subject is G. Hiddemann, Der rosh von Sassaniden; or the other style is that of the Greek language. Ardashir I. and Shapur I. still appe

1 For the propagation and history of the Christians in the Sassanian Empire, cf. Labourot, Le Christianisme dans l'Empire perse sous la dynastie sassanide (1904); Harnack, Die Mission und Ausbreitung der Christenheit in den ersten drei Jahrhunderten, 2. Aufl. (1897), Bd. II. p. 121 seq.; Chabot, Synodicon orientale (1902) (a collection of the acts of the Nestorian synods held under the rule of the Sassanids).

2 List of kings (after Nöldeke, Tabari, p. 435):

Ardashir I., 226-241
Shapur I., 241-272
Bahram II., 272-276
Bahram III., 276-279
Shapur II., 279-303

Bahram III., 420-438
Shapur III., 438-459
Ahriman, 459-479
Peroz, 479-484
Bahalas, 484-488.
remained as of old, the defence and, when possible, the expansion of the eastern and western frontiers. In the first two centuries of the Sassanid Empire we hear practically nothing of its relations with the East. Only occasional notices show that the inroads of the Oriental nomads had not ceased, and that the extent of the empire had by no means exceeded the bounds of the Parthian dominion—Sacastene (Seistan) and western Afghanistan. Far to the east, on both sides of the Indus, the Kushana Empire was still in existence, though it was already hastening to decay, and about A.D. 320 was displaced from its position in India by the Gupta dynasty. In the west the old conflict for Osrhoene and northern Mesopotamia (now Roman province), with the fortresses of Edessa, Carrhae and Nisibis, still smoulder. Armenia the Sassanids were all the more eager to regain, since there the Arsacid dynasty still survived and turned for protection to Rome, with whom, in consequence, new wars perpetually broke out. In the reign of Bahram II. (276–293), the emperor Carus, burning to avenge the disaster of Valerian, penetrated into Mesopotamia without meeting opposition, and reduced Coche (near Seleucia) and Ctesiphon; but his sudden death, in December of 283, precluded further success, and the Roman army returned home. Bahram, however, was unable to effect anything as his brother Hormizd IV. was dethroned by the Sacae and other tribes. (Mamertin, Panegyr. Maximin. 7, 10; Genahl. Maximin. 5, 17.) He chose, consequently, to buy peace with Diocletian by means of presents. Some years later his uncle and successor, Nares, after subduing his rival Bahram III., occupied Armenia and defeated the emperor Galerius at Callinicum (296). But in the following year he sustained a severe reverse in Armenia, in which he lost his war-chest and harem. He then concluded a peace, by the terms of which Armenia remained under Roman suzerainty, and the steppes of northern Mesopotamia, with Singara and the hill-country on the left bank of the Tigris as far as Gordyene, were ceded to the victor (Ammian. Marc. xxv. 7, 9; Pettr. Patr. fr. 13, 14; Rufus brev. 25). In return Nares regained his household. This peace, ratified in 297 and completely expelling the Sassanids from the disputed districts, lasted for forty years.

For the rest, practically nothing is known of the history of the first six successors of Shapur I. After the death of Hormizd II. (302–310), the son of Nares, the magnates imprisoned or put to death his adult sons, one of whom, Hormisdas, later escaped to the Romans, who used him as a pretender in their wars. Shapur II., a posthumous child of the late king, was then raised to the throne, a proof that the great magnates held the sovereignty in their own hands and attempted to regulate matters at their own pleasure. Shapur, however, when he came to manhood proved himself an independent and energetic ruler.

Meanwhile the Roman Empire had become Christian, the sequel of which was that the Syro-Christian population of Mesopotamia and Babylonia—even more than the Hellenic cities in former times—gravitated to the west and looked to Rome for deliverance from the infidel yoke. On similar grounds Christianity, as opposed to the Mazdaism enforced officially by the Sassanids, became predominant in Armenia. Between these two great creeds the old Armenian religion was unable to hold its own; as early as A.D. 204 King Tiridates was converted by Gregory the Illuminator and adopted the Christian faith. For this very reason the Sassanid Empire was the more constrained to champion Zoroastrianism. It was under Shapur II. that the compilation of the Avesta was completed and the state orthodoxy perfected by the chief mobed, Aturpad. All heresy was proscribed by the state, defecction from the true faith pronounced a capital crime, and the persecution of the heterodox—particularly the Christians—began (cf. Sachall, "Die rechtlichen Verhältnisse der Christen in Sassanideneihe," in Mitteilungen des Seminars für orientalische Sprachen für Berlin, Bd. X., Abt. 2, 1907). Thus the duel between the two great empires now becomes simultaneously a duel between the two religions.

In such a position of affairs a fresh war with Rome was inevitable.1 It was begun by Shapur in A.D. 337, the year that saw the death of Constantine the Great. The conflict centred round the Mesopotamian fortresses; Shapur thrice besieged Nisibis with success, but reduced several others, as Amidra (350) and Singara (360), and transplanted great masses of inhabitants into Susiana. The emperor Constantius conducted the war feebly and was consistently beaten in the field. But, in spite of all, Shapur found it impossible to penetrate deeper into the Roman territory. He was hampered by the attack of nomadic tribes in the east, among whom the Chionites now begin to be mentioned. Year after year he took the field against them (335–338), till finally he compelled them to support him with auxiliaries (Ammian. Marc. 14, 3; 16, 9; 17, 5; 18, 4, 6). With this war is evidently connected the foundation of the great town New-Shapur (Nishapur) in Khorasan.

By the resolution of Julian (363) to begin an energetic attack on the Persian Empire, the conflict, after the lapse of a quarter of a century, assumed a new phase. Julian pressed forward to Ctesiphon but succumbed to a wound: and his successor Jovian soon found himself in such straits, that he could only extricate himself and his army by a disgraceful peace at the close of 363, which ceded the possessions on the Tigris and the great fortress of Nisibis, and pledged Rome to abandon Armenia and her Arsacid protégé, Arsaces III., to the Persian.

Shapur endeavoured to occupy Armenia and introduce the Zoroastrian orthodoxy. He captured Arsaces III. by treachery and compelled him to commit suicide; but the Armenian masses placed the Amorite Pap on the throne, and found secret support among the Romans. This all led but to a new war; but in 374 Valens sacrificed Pap and had him killed in Tarsus. The subsequent invasions of the Goths, in battle with whom Valens fell at Adrianople (375), definitely precluded Roman intervention; and the end of the Armenian troubles was that (c. 390) Bahram IV. and Theodosius the Great concluded a treaty which abandoned the extreme west of Armenia to the Romans and confirmed the remainder in the Persian possession. Thus peace and friendship could at last exist with Rome; and in 408 Yazdegird I. contracted an alliance with Theodosius II. In Armenia the Persians immediately removed the last kings of the house of Arsaces (390), and therewithward the Amorite Pap on the throne, and found secret support among the Romans. This of the country remained a Persian province under the control of a marzban, though the Armenian nobles still made repeated attempts at insurrection. The introduction of Zoroastrianism was abandoned; Christianity was already far too deeply rooted. But the sequel to the Roman sacrifice of Armenian interests was that the Armenian Christians now seceded from the orthodoxy of Rome and Constantinople, and organized themselves into an independent national church. This church was due, before all, to the efforts of the Catholics Sahak (390–439), whose colleague Mesrob, by his translation of the Bible, laid the foundations of an Armenian literature (see ARABIAN CHURCH). Without its existence, the interior of the Sassanian Empire the old troubles broke out anew on the death of Shapur II. (379). At first the magnates raised his aged brother Ardashir II. to the throne, then in 383 deposed him and enthroned Shapur's son as Shapur III. In 388, however, he was assassinated, Yazdegird I. as was also his brother, Bahram IV., in 390. But the son of the latter, Yazdegird I. (390–420), was an energetic and intelligent sovereign, who held the magnates within bounds and severely chastised their attempts at encroachment. He even sought to emancipate himself from the Magian Church,

1 For the succeeding events see also under Rome: Ancient History; and articles on the Roman emperors and Persian kings.
put an end to the persecutions, and allowed the Persian Christians an individual organization. In the Persian tradition he is consequently known as "the sinner." In the end he was probably sincerely悔恨。So great was the bitterness against him that the magnates would admit none of his sons to the throne. One of them, however, Bahram V., found an auxiliary in the Arab chief Mondhir, who had founded a principality in Hira, west of the lower Euphrates; and, as he pleaded himself to govern otherwise than his father, he received general recognition. This pledge he redeemed, and he is, in consequence, the darling of Persian tradition, which bestows on him the title of Ger ("the wild ass"), and is eloquent on his adventures in the chase and in love. This reversal of policy led to a Christian persecution and a new war with Rome. Bahram, however, was worsted; and in the peace of 422 Persia agreed to allow the Christians free exercise of their religion in the empire, while the same privilege was accorded Zoroastrianism by Rome. Under his son, Yazdegerd II. (438-457), who once more revived the persecutions of the Christians and the Jews, a short conflict with Rome again ensued (441): while at the same time war prevailed in the east against the remnants of the Kuswan Empire and the tribe of Kidarties, also named Huns.

New here a foe soon arose in the shape of the Ephthalites (Hailab), also known as the "White Huns," a barbaric tribe which shortly after A.D. 450 raided Bactria and terminated the Kushana dominion (Procop. Pers. i. 3). These Ephthalite attacks harassed and weakened the Sassanids, exactly as the Tocharians had harassed and weakened the Arsacid kings after Phraates II. Peroz (457-484) fell in battle against them; his treasures and family were captured and the country devastated far and near. His brother Balash (484-488), being unable to repel them, was deposed and blinded, and the crown was bestowed on Kavadh I. (488-531), the son of Peroz. As the external and internal distress still continued he was dethroned and imprisoned, but took refuge among the Ephthalites and was restored in 499 by their assistance—like so many Arsacids by the arms of the Dahae and Sacae. These struggles obviously must be attributed mainly to the fact that in the whole of this period no Roman war broke out. But, at the same time, the religious duel had lost in intensity, since, among the Persian Christians, the Nestorian doctrine was now predominant. Peroz had already favoured the diffusion of Nestorianism, and in 483 it was officially adopted by a synod, after which it remained the Christian Church of the Persian Empire, its head being the patriarch of Seleucia—Ctesiphon.

Kavadh proved himself a vigorous ruler. On his return he restored order in the interior. In 502 he attacked the Romans and captured and destroyed Amida (mod. Diarbekr), but was compelled to ratify a peace owing to an inroad of the Huns. Toward the close of his reign (527) he resumed the war, defeating Belisarius at Callinicum (531), with the zealous support of the wild Arab Mondhir II. of Hira. On his death his son Chosroes I. concluded a peace with Justinian (532), pledging the Romans to an annual subsidy for the maintenance of the Caucasian fortresses. In his home policy Kavadh is reminiscent of Yazdegerd I. Like him he had little inclination to the orthodox church, and favoured Mazdak, the founder of a communist sect which had made headway among the people and might be used as a weapon against the nobles, of whom Mazdak demanded that they should cut down their luxury and distribute their superfluous wealth. Another feature of his programme was the community of wives. The crown princes, who were now not only endowed but also orthodox; and, towards the close of his father's reign, in conjunction with the chief Magian, he carried through a sacrifice of the Mazdakites, who were butchered in a great massacre (528). Chosroes I. (531-579), surnamed Anushirvan ("the blessed"), then restored the orthodox doctrine in full, publishing his decision in a religious edict.

At the same time he produced the official exposition of the Avesta, an exegetical translation in the popular tongue (Pahlavi), and declared its contents binding. Detection from Zoroastrianism was punished with death, and therefore also the persecution of the Christians, though the Syrian martyr-oboloes prove that the king at first tolerated these proceedings so long as it was at all possible to do so.

Chosroes I. was one of the most illustrious sovereigns of the Sassanian Empire. From him dates a new and equitable adjustment of the imperial taxation, which was later adopted by the Arabs. His reputation as an enlightened ruler stood so high that when Justinian, in 529, closed the school of Athens, the last Neoplatonists bent their steps to him in hopes of finding in him the true philosopher-king. Their disillusionment, indeed, was speedy and complete, and their gratitude was great, when, by the conditions of the armistice of 549, he allowed their return. From 549 onward he conducted a great war against Byzantium (527-565), which, though interrupted by several armistices, lasted till the fifty years' peace of 562. The net result, indeed, was merely to restore the status quo; but during the campaign Chosroes sacked Antioch and transplanted the population to a new quarter of Ctesiphon (540). He also extended his power to the Black Sea and the Caucasus; on the other hand, a siege of Edessa failed (544). A second war broke out in 577, chiefly on the question of Armenia and the Caucasian territory. In this Chosroes ravaged Cappadocia in 575; but the campaign in Mesopotamia was unsuccessful. In the interval between these two struggles (570) he despatched assistance to the Arabs of Yemen, who had been assailed and subdued by the Abyssian Christians; after which period Yemen remained nominally under Persian suzerainty till its fate was sealed by the conquests of Mahomet and Islam.

Meanwhile, about A.D. 560, a new nation had sprung up in the East, the Turks. Chosroes concluded an alliance with them against the Ephthalites and so conquered Bactria south of the Oxus, with its capital Balkh. Thus this province, which, since the insurrection of Diodotus in 250 B.C., had undergone entirely different vicissitudes from the rest of Iran, was once more united to an Iranian Empire, and the Sassanian dominions, for the first time, passed the frontiers of the Arsacids. This, however, was the limit of their expansion. Neither the territories north of the Oxus, nor eastern Afghanistan and the Indus provinces, were ever subject to them. That the alliance with the Turks should soon change to hostility and mutual attack was inevitable from the nature of the case; in the second Roman war the Turkish Khan was leagued with Rome.

Chosroes bequeathed this war to his son Hormizd IV. (579-590), who, in spite of repeated negotiations, failed to re-establish peace. Hormizd had not the ability to retain the authority of his father, and he further alienated the Magian priesthood by declining to proceed against the Christians and by requiring that, in his empire, both religions should dwell together in peace. Eventually he succumbed to a conspiracy of his magnates, at whose head stood the general Bahram Cobin, who had defeated the Turks, but afterwards was beaten by the Romans. Hormizd's son, Chosroes II., was set up against his father and forced to acquiesce in his execution. But immediately new risings broke out, in which Bahram Cobin—though not of the royal line—attempted to secure the crown, while simultaneously a Prince Chosroes II. Bistam entered the lists. Chosroes fled to the Romans and the emperor Maurice undertook his restoration at the head of a great army. The people flocked to his standard; Bahram Cobin was routed (591) and fled to the Turks, who slew him. Maurice then more assuredly ascended the throne of Ctesiphon; Bistam held out in Media till 596. Maurice made no attempt to turn the opportunity to Roman advantage, and in the peace then concluded he even abandoned Nisibis to the Persians.

Chosroes II. (590-628) is distinguished by the surname of PARES ("the conqueror"), though, in point of fact, he was immeasurably inferior to a powerful sovereign like his grandfather, or even to a competent general. He lived, however, to witness unparalleled vicissitudes of fortune. The assassination
of Maurice in 602 impelled him to a war of revenge against Rome, in the course of which his armies—in 608 and, again, in 622—attacked and occupied districts as far as Chalcedon opposite Constantinople, ravaged Syria, reduced Antioch (612), Damascus (613), and Jerusalem (614), and carried off the holy cross to Ctesiphon; in 619 Egypt was occupied. Meanwhile, the Roman Empire was at the lowest ebb. The great emperor Heraclius, who assumed the crown in 610, took years to create the nucleus of a new military power. This done, however, he took the field in 625, and repaid the Persians with interest. Their armies were everywhere defeated. In 624 he penetrated into Atropatene (Azerbaijan), and there destroyed the great fire-temple; in 627 he advanced into the Tigris provinces. Chosroes attempted to retreat, but fled from his residence at Damascus to Ctesiphon. These proceedings, in conjunction with the avarice and licence of the king, led to revolution. Chosroes was deposed and slain by his son Kavadh II. (628); but the parricide died in a few months and absolute chaos resulted. A whole list of kings and pretenders—among them the General Shahrbaraz and Boran, a daughter of Chosroes—followed rapidly on one another; till finally the magnates united and, in 632, elevated a child to the throne, Yazdegerd III., grandson of Chosroes. In the interval—presumably during the reign of Queen Boran—peace was concluded with Heraclius, the old frontier being apparently restored. The cross had already been given back to the emperor.

Thus the hundred years' struggle between Rome and Persia, which had begun in 527 with the attack of the first Kavadh on Justinian, had run its fruitless course, utterly enfeebling both empires and consuming their powers. So it was that room was given to a new enemy who now arose between either state and either religion—the Arabs and Islam. In the same year that saw the coronation of Yazdegerd III.—the beginning of 633—the first Arab squadrons made their entry into Persian territory. After several encounters there ensued (637) the battle of Kadsia (Qadisiya, Cadesia), fought on one of the Euphrates canals, where the fate of the Sassanian Empire was decided. A little previously, in the August of 636, Syria had fallen in a battle on the Yarmuk (Hieromax), and in 639 the Arabs penetrated into Egypt. The field of Kadsia lay Ctesiphon, with all its treasures, at the mercy of the victor. The king fled to Media, where his generals attempted to organize the resistance; but the battle of Nehavend (7641) decided matters there. Yazdegerd sought refuge in one province after the other, till, at last, in 631, he was assassinated in Merv (see CALIPHATE: § A, § 1).

Thus ended the empire of the Sassanids, no less precipitately and ingloriously than that of the Achaemenids. By 650 the Arabs had accomplished their work; and the remaining Persians, a few insignificant tribes and the Sassanian nobility, took refuge in the mountainous districts of the north (Tabaristan), and the "generals" of the house of Karden (Spahpat, Ispahhab) maintained themselves for a century as vassals of the caliphs—exactly as Atropatians and his dynasty had done before them. The fall of the empire sealed the fate of its religion. The Moslems officially tolerated the Zoroastrian creed, though occasional persecutions were not lacking. But little by little it vanished from Iran, with the exception of a few remnants (chiefly in the oasis of Yazd), the faithful finding a refuge in India at Bombay. These Parsees have preserved but a small part of the sacred writings; but to-day they still number their clergy by the thousand, and in the 16th of June A.D. 632, with the accession of Yazdegerd III., the last king of their faith and the last lawful sovereign of Iran, on whom rested the god-given Royal Glory of Omrund.

**B.—Transition Period:** from the Fall of the Sassanian Dynasty to the Death of Timur (1405).

With the final defeat of the Sassanids under Yazdegerd III. at the battle of Kadsia (Kadesia) (637) and Nehavend (641), Persia ceased to exist as a single political unit. The country passed under a succession of alien masters who cared nothing for its ancient institutions or its religion. For about 150 years it was governed, first from Medina and afterwards from Bagdad, by officers of the Mahomedan caliphs whose principal aim it was to destroy the old nationality by the suppression of its religion. The success of this policy was, however, only apparent, especially in Iran, the inhabitants of which adopted Islam only in the most superficial manner, and it was from Persia that the blow fell which destroyed the Omayyad caliphate and set up the Abbasids in its place (see CALIPHATE). Even before this event adventurers and dissatisfied Moslems had stirred up the hostility of the Persian peoples to aid them in attacks on the caliphs (e.g. Ziyad, son of Abu Sofan, in the reign of Moawiya I.), and the policy of eastern expansion brought the Arab armies perpetually into the Persian provinces.

In the reign of Merwan I. the Persians (who were mostly Shi'ites) under a Moslem officer named Mokhtar (Mukhtar), whom they regarded as their mahdi, vainly attempted to assert their independence in Kufa, but were soon defeated. This rising was followed by many more (see CALIPHATE: § B) in which the caliphs were generally successful, and Abdalmalki (d. 705) considerably strengthened the Moslem power by instituting a thorough system of Moslem coins and enforcing Arabic as the official language throughout the empire. In the succeeding reign Persia was further subdued by the great conqueror Qutaiba (Qotaiba) b. Moslim, the Arabic governor of Khorasan. Omar II., however, extended to non-Arabic Moslems immunity from all taxes except the zakat (poor-rate), with the result that a large number of Persians, who still smarted under their defeat under Mokhtar, embraced Islam and drifted into the towns to form a nucleus of sedition under the Shi'ite preachers. In the reign of Yazid II. (720-724) serious risings took place in Khorasan, and in spite of the wise administration of his successor Hisham (d. 743), the disorder continued to spread, fanned by the Abbasids and the Shi'ite preachers. Ultimately, in the reign of Merwan II. the non-Arabic Moslems founded a leader in Abu Moslim, a *maula* (client) of Persian origin and a henchman of Ibrahim b. Mabommed b. Ali, the Shi'ite imam, who raised a great army, drove the caliph's general Nasr b. Sayyar into headlong flight, and finally expelled Merwan. Thus the Abbasids became masters of Persia and also of the Arab Empire. They had gained their success largely by the aid of the Persians, who began thenceforward to recover their lost sense of nationality; according to the Spanish author Ibn Hazm the Abbasids were a Persian dynasty which destroyed the old tribal system of the Arabs and ruled despotsically as Chosroes had done. At the same time the Khorasansians had fought for the old Alid family, not for the Abbasids, and with the murder of Abu Moslim discontent again began to grow among the Shi'ites (q.v.). In the reign of Harun al-Rashid disturbances broke out in Khorasan which were temporarily appeased by a visit from Harun himself. Immediately afterwards Rabi' b. Laith, grandson of the Omayyad general Nasr b. Sayyar, revolted in Samarkand, and Harun on his way to attack him died at Tus (809). Harun's sons Amin and Mamun quarrelled over the succession; Amin became caliph, but Mamun by the aid of Tahir b. Hosain Dhu l-Yamanin ("the man with two right hands") and others succeeded in depositing and killing him. Tahir ultimately (818) received the governorship of Khorasan, where he succeeded in establishing
a practically independent Moslem dynasty (the Tahirids)\(^1\) which ruled until about 873 in nominal obedience to Bagdad. From 825 to about 808 a similar dynasty, the Dulafids\(^2\) or Dolafids reigned nominally as governors under the caliphs till they were put down by Motadid. In the reign of the caliph Motasim a serious revolt of Persian Mazdakite sectaries (the Khorrari) in alliance with Byzantium was with difficulty suppressed, as also a rising of Tabaristan under an hereditary chief Maziyar who was secretly supported by the Turkish mercenaries (\textit{e.g.}, Afşin) whom the caliph had invited to his court. To another of this ilk, the caliph Wathiq gave a titular authority over all the eastern provinces. In the reign of the tenth caliph Motawakkil the Buyids fell under Yakub b. Laih al-Saffar, who with the approbation of the caliph founded a dynasty, the Sa'drid (\textit{q.v.}), in Seistan.

It is convenient at this point to mention several other minor dynasties founded by nominal governors in various parts of Persia and its borderland. From 879 to about 930 the Sajids ruled in Azerbaijan, while in Tabaristan an Alid dynasty (the Zaidides) was independent from 864 to 938, when it fell before the Samanids. Subsequently descendant of the Buyids, the Tahirids, who now ascended the Dauladdainid, through out this period the caliphate was falling completely under the power of the Turkish officers. Mohtadi, the fourteenth Abbasid caliph, endeavoured vainly to replace them by Persians (the Abna). His successor Motamid was attacked by the Sa'drid Yakub who however was compelled to flee (see \textit{CALIPHATE:} § C, § 15). Yakub's brother Amr (reigned 878-900) received the vacant position, but was taken prisoner by Isma'\(l\) b. Ahmad, the Samanid, and the Sa'drids were henceforth a merely nominal dynasty under the Samanids (900-1219). The Sa'dids (\textit{q.v.}) were the first really important non-Arabic Persian dynasty since the fall of Yezdegerd III. They held sway over most of Persia and Transoxiana, and under their rule scholarship and the arts flourished exceedingly in spite of numerous civil wars. Ultimately they fell before the Ghaznevid dynasty of Bagdad.

In the reign of Motadid (\textit{CALIPHATE:} § C, § 16) who, as we have seen, put down the Dolafids, and also checked the Sajids of Azerbaijan in their designs on Syria and Egypt, the Kharijites of Mesopotamia were put down by the aid of the Hamadanites of Mosul, who were to become an important dynasty (see below). Subsequently the caliphate, which had temporarily recovered some of its authority, resumed its downward course, and the great families of Persia once again asserted themselves. In the reign of Qahir (d. 934), a new dynasty arose in Persia, that of the Buyids (Buwayhids). This family was descended from one Abu Shaja Buya, who claimed to be of the old Sassanian house and had become a chieftain in Dailam. He had successively fought for the Samanids and the Ziyarids,\(^3\) a dynasty of Jorjan, and his son Imad addaula (ed-dowle, originally Abu'l Hassan Ali) received from Mardawij the latter house the governorship of Karaj; his second son Rokn addaula (Abu Ali Hassan) subsequently held Rai and Isfahan, while the third, Moizz addaula (Abu'l Hosain Ahmad) secured Kermân, Ahvaz and even Bagdad.

The reign of the caliph Mottaqi (\textit{CALIPHATE:} § C, § 21) was a period of perpetual strife between the Turks and the Buyids, which latter ascended the Abd al-Malik (Buwayhids). In the next reign Moizz addaula took Bagdad (945) and was recognized by the caliph Mostafã as sultan\(^4\) and amir al-omara. It was at this time that the three brothers took the titles Imad, Rukn (Rokn), and Moizz addaula. The authority of the family was absolute, though they paid outward respect to the caliphs. Moizz addaula repelled an attack of the Hamdanids of Mosul. The Buyids, and especially Adid addaula (Azad-ed-Dowleh, and similar forms), ruled Bagdad wisely and improved the city by great public works such as the great dikes, still known as the Bend Amir on the Kur (Cyros) near Persepolis. Their sway extended from the Persian Gulf to the Caspian Sea (\textit{CALIPHATE:} § C, § 24).

Ultimately, however, the Buyid dynasty grew weaker under the quarrels of its members and fell an easy prey to the Ghaznevids. In the meantime (999) the Samanids fell before the Ilekhans of Turkestan, to the great advantage of the Ghaznevid princes.

For these and other minor dynasties such as the Hasaniyakhs of Kurdistan (c. 999-1015) and the Khalwakhyids of Kurdistan (1007-1051), see Stockwell, \textit{Manuel d'histoire,} i. 113 sqq. (Leiden, 1888).

The centre of force in Persian politics now changes from west to east. Hither to the ultimate power, at least nominally, had resided in the caliphate at Bagdad, and all the dynasties which have been noticed derived their authority formerly from that source. With the rise of the Ghaznevids and later the Seljukids, the Abbasid caliphate ceased to count as an independent power. As we have seen, the Ghaznevids armies in a brief space destroyed most of the native dynasties of Persia. The first of the house was Alptagin, a Turkish slave of the Samanid Mansur I., who, having quarrelled with his master, took refuge in Afghanistan and founded a semi-independent authority. After his death three unimportant governors of his house held sway, but in 977 the power fell to another slave, Sabuktakin, who was recognized by the Samanid Nuh II. His son and successor Mahmud (q.v.) was attacked by a brother, Isma'il, and retired from Khorasan (of which he had been governor). The Samanids then fell under the power of the Tatar Ikhans, but Mahmud returned, triumphed over both the Samanids and the Tatars, and assumed the independent title of sultan with authority over Khorasan, Transoxiana and parts of north-west India. Mahmud was a great conqueror, and wherever he went he replaced the existing religion by Mahomedanism. He is described as the patron (if a somewhat ungenerous one) of literature; it was under his auspices that Firdousi collected the ancient myths of Persia and produced the great epic \textit{Shahname} (Book of the Kings). His descendants held a nominal rule till 1187, but in 1152 they lost all their extra-Indian territories to the Ghurids, and during the last thirty years reigning in Persia they had lost all their provinces. Even before this time, however, the supremacy which they enjoyed under Mahmud in Persia had fallen into the hands of the Seljuks who, in the reign of Mas'ud I., son of Mahmud, conquered Khorasan. In 1037 Seljuk princes were recognized in Merv and Nishapur, and in the ensuing eighteen years the Seljuks conquered Balkh, Jorjan, Tabaristan, Khwarizm, Hamadan, Rai, Isfahan, and finally Bagdad (1055).

The Abbasid caliphs, who still enjoyed a precarious and shadowy authority at the pleasure of Turkish viziers, gladly surrendered themselves to the protection of the Mahomedan Seljucks, who paid them all outward respect.

Thus for the first time since the Arab conquest of the Sassanian realm Persia was ruled by a single authority, which extended its conquests westward into Asia Minor, where it checked the rulers of Byzantium, and eastward to India and Central Asia. The history of this period is treated at length in the articles \textit{CALIPHATE:} § C, §§ 26 sqq.; \textit{SELJUKS.} A bare outline only is required here.

The first three Seljuk rulers were Toghrul Beg, Alp Arslan and Malik Shah. On the death of the last the empire was distracted by civil war between his sons Barkiyaroq, Mahomed and Sinjar, with the result that, although the Seljuks of the direct line maintained nominal supremacy till the death of Sinjar (1157), other branches of the family established themselves in various parts of the empire—Syria, Rum (Asia Minor),

---

1. Tahir died 822 or 824; Talha d. 828; Abdallah, 828-844; Tahir II, 844-862; Mahomed, 862-873; Abu Dalaf Qasim b. Idris b. 'Ali (825); 'Abdalazid (842); Dolaf (873); Ahmad (878); Omar 893-898.
2. The Ziyarid dynasty was founded by Mardawij b. Ziyar (928-935). His successors were Zahir addaula (ed-daula, ed-dowle) Abu Mansur Washmaq (935-967), Bistun (967-976), Shamsh al Ma'ali Qabus (976-1012), Falak al Ma'ali Manushahr (1012-1029), Anushirwan (1059-1090). They were Aylete in religion. They were of progressively less importance under the Samanids, and were ultimately expelled by the Ghaznevids.
3. This is denied by S. Lane Poole, who points out that they did not use the title on their coins.
4. \textit{Poole,} \textit{Dictionary of Asia Minor,} s. v. 'Addaula.'
Kermān, and Irak with Kurdistan. Sinjar himself lost all his
declensions except Khorasan in wars with the Karakātī. The
sultans of Kermān were rarely independent in the full sense,
but they enjoyed comparative peace and prosperity till the
death of Toghrul Shah (1170), after which their power fell
before the Ghuzz tribes; Kermān was finally captured in 1195
by the Khwarizm shahs. Meanwhile an independent dynasty
was formed about 1186 in Azerbaijan by the governors (atabegs)
appointed by the Seljuks; this dynasty was overthrown by the
Khwarizm shahs in 1225. Similar dynasties existed in Laristān and
Fars.

The empire of the Seljuks was essentially military. Their
authority over their own successors was so precarious that they
preferred to entrust the command to Turkish slaves. These
officers, however, were far from loyal to their lords. In every
part of the empire they gradually superseded the Seljuk princes,and
the minor dynasties above mentioned all owed their existence
to the ambition of the Turkish regents or atabegs. The last
important dynasty in Persia prior to the Mongol invasion was
that of the Salgharids in Fars, founded by the descendants of
a Turkish general Salaghūr, who had formerly been a Turkoman
leader and ultimately became chamberlain to Toghrul Beg.
The first ruler was Sonkor b. Modūd, who made himself indepen-
dent in Fars in 1148. The fourth, Sa'd, became tributary to the
Khwarizm shahs in 1175, and the fifth acknowledged
allegiance to the Mongol Ogotai and received the title Kutb-ābā Khan.
His successors were vassals of the Mongols, and the last,
the Princess 'Abish (d. 1287), was the wife of Hulagu's son
Mangū Timur.

Before passing on to the Mongol conquerors of Persia it is
necessary briefly to notice the shahs of Khwarizm, who have

Khwarizm.

frequently been mentioned as overthrowing the minor
dynasties which arose with the decay of the
Seljuks. These rulers were descended from Anushatjan, a
Turkish slave of Ghaznū, who became cupbearer to the Seljuk
Malik Shah, and afterwards governor of Khwarizm. Khuldu
in 1077. In 1138 the third of the line, Atsās, revolted but
was defeated and expelled by Sinjar. Shortly afterwards he returned,
firmly established his power, and extended the Khwarizm
Empire as far as Jand on the Shihun. The brief reigns of Il-Ārsil
and Sultan Shah Mahmūd were succeeded by that of Tukush
(1172-1190) and Ala ḍdin Mahommed 1 (1190-1220).
The former of these subdued Khurasan, Raš and Isfahān, while
the latter brought practically all Persia under his sway, conquered
Bokhara, Samarkand and Otrar, capital of the Karakātī, and
had even made himself master of Ghaznī when his career was
stopped by the hordes of the Mongol Jenghiz Khan. In 1213
the last of the line, Īsā (Jand), under whom Hulagu, or
Mango-berti, was banished, and thus the empire of the Khwarizm
shahs, which for a brief period had included practically all the
lands conquered by the Seljuks, passed away.

Thus from the fall of the Samanids to the invasion of the
Mongols five or at most six important dynasties held sway over Persia,
while some forty small dynasties enjoyed a measure of local
autonomy. During the whole of this period the Abbasid Caliphate
had been nominally reigning throughout the Mahomedan world
with their capital at Baghdad. But with hardly any exceptions
they had been the merest puppets, now in the hands of Turkish
ministers, now under the protection of practically independent
dynasts. The real rulers of Persia during the years 874-1231 were,
as we have seen, the Samanids, the Buyids, the Ghaznevids, the
Seljuks, the Salgharids and the Khwarizm shahs. We now come
to a new period in Persian history, when the numerous petty
dynasties which succeeded the Seljuks were all swallowed up in the
great Mongol invasion.

In the later years of the 12th century the Mongols began
their westward march and, after the conquest of the ancient

Mongols.

kingdom of the Kajakātī, reached the borders of the
territory of the Khwarizm shahs, which was at
once overthrown. Jenghiz Khan died in 1227, and the Mongol

1 It was this prince who destroyed the Ghorid dynasty, which
claimed descent from the legendary Persian monarch Zohák.
Except for a brief period of submission to the Ghaznevids (1009-
1099) they ruled at Ghur until 1215, when they were conquered
after a fierce struggle.

Empire stretching from the Caspian to the Yellow Sea was
divided up among his sons. Persia itself fell partly in the
domain of Jagatai and partly in that of the Golden Horde.

The actual governor of Persia was Tului or Tului, whose son
Hulagu or Hulu-ku was the first who can be rightly regarded as
the sovereign of Persia. His accession occurred in 1256, and
henceforward Persia becomes after 600 years of spasmodic
government a national unit. Hulagu at once proceeded to
destroy a number of nascent dynasties which endeavoured to
establish themselves on the ruins of the Khwarizm Empire;

2 The dynasty of the Assassins or Isma'illites was founded in
1090 and extended its rule over much of western Persia and Syria
(for the rulers see Stockvis, op. cit. l. 131, and article Assas-sin).

was a man of great ability. He established a permanent staff to deal with legal, financial and military affairs, put on a firm basis the monetary system and the system of weights and measures, and perfected the mounted postal service. Gha'zan fought with success against Egypt (which country had already from 1293 to December 1294 been ruled by a Mongol usurper Kibogo), and even held Damascus for a few months. In 1353, however, his troops were defeated at Merj al-Saffar, and Mongol claims on Syria were definitely abandoned. It was even suggested that the titular Aiblabi caliphs (who retained an empty title in Cairo under Mameluke protection) should be reinstated at Bagdad, but this proposal was not carried into effect. Gha'zan is historically important, however, mainly as the first Mongol ruler who definitely adopted Islam with a large number of his subjects. He died in 1340, traditionally of anger at the Syrian fiasco, and was succeeded by his brother Uljaytu (Ueljjetu). The chief events of his reign were a successful war against Tatar invaders and the substitution of the new city of Sultaniah as capital for Tabriz, which had been Gha'zan's headquarters. Uljaytu was a Shi'ite and even stamped his colic horse in memory of the two Shi'ite imams. He died in 1356, and was succeeded by Abu Sa'id, his son. The prince, under whom a definite peace was made with Malik al-Nasir, the Mameluke ruler of Egypt, had great trouble with powerful vassals and generals which he accentuated by his passion for Bagdad-Khatun, wife of the amir Hosain and daughter of the amir Chupan. This lady he eventually married, with the result that Chupan headed a revolt of his tribe, the Selduz. Abu Sa'id died of fever in 1355, and with him the first Mongol or Ilkhan dynasty of Persia practically came to an end. The real power was divided between Chupan and Hosain the Jelair (or Jalair), or the Ilkhanian, and their sons, known respectively as the Little Hasun (Hasan Kuchuk) and the great Hasan (Hasan Buzurg). Two Tadjik kinds of kings, Khwaja Buzurg and Husain's grandson, were eventually divided between Uljaitu's brother Arikhunha, and Musa Khan, a descendant of Baidu, nominally reigned for a few months each. Then Hasan Kuchuk set up one Sati-beg, Abu Sa'id's daughter, and wife successively of Chupan, Arfa Khan and one Suleiman, the last of whom was Khan from 1339 to 1433; in the same time Hasan Buzurg set up successively Mohammed, Tughra-Timur and Jahan-Timur. A sixth sonniet, Nushirwan, was a Chupani nominee in 1344, after which time Hasan Buzurg definitely installed himself as the first khan of the Jelairid or Ilkhanian-Jelairid dynasty.

Practically from the reign of Abu Sa'id Persia was divided under five minor dynasties, (1) the Jelairids, (2) the Mozaffarids, (3) the Sarhadarids (Serbedwarids), (4) the Beni Dynasties. Kurd, and (5) the Jabinians, all of which ultimately fell before the armies of Timur.

1. The Jelairid rulers were Hasan Buzurg (1336, strictly 1346-1356), Ovais (1356-1374), Hosain (1374-1382), Sultan Ahmad (1382-1410), Shah Walad (1410-1411). Their capital was Bagdad, and their dominion was increased under Hasan. Ovais added Azerbijan, Tabriz, and even Mosul and Diarbekr. Hosain fought with the Mozaffarids of Shiraz and the Black Sheep Turkomans (Kara Kuyandi) of Armenia, with the latter of whom he ultimately entered into alliance. On his death Azerbaijan and the Transoxiana fell to his grandson, Shah Walad. His brother Barkun was governor of the country for a few months in part of Kurdistan. It was about this time that Timur (c. 1346) began his great career of conquest, under which the new power of the Jelairid dynasty collapsed. In 1353, which action had conquered northern Persia and Armenia, Bagdad, Mesopotamia, Diarbekr and Van, and Ahmad fled to Egypt, where he was received by Barkun (Farqu) the Mameluke sultan. Barkun, was unable to hold the country, and only sent out ensigns, espoused Ahmed's cause, and restored him to Bagdad after Timur's return to his normal capital Samarqand. Timur retaliated and until his death Ahmad ruled only from time to time. In 1406 Ahmad was killed in a quarrel with Kara Yusuuf, leader of the Black Sheep Turkomans (Kara Kuyandi), who defeated and killed him in 1410. His nephew Shah Walad reigned for a few months only and the throne was occupied by his widow Tandu, formerly wife of Barkun, who ruled over Basra, Wasit and Shuster till 1416, paying allegiance to Shah Rukh, the second Timurid ruler. Walad's sons Mahommed, Ovais and Mahommmed, and Hosain, grandson of Sultan Ahmad, successively occupied the throne. The last of these was killed by the Kara

Kuyundi, who had established a dynasty in western Persia after Kara Yusuf's victory in 1410.

2. The Mozaffarids were ruled roughly from 1313 to 1339 in Fars, Kermán and Khorasan. They were descended from the Amir Mozaffar, or Muzaffar, who held a post as governor under the Ilkhan ruler. His son Mobariz ud-din Mahommied, who followed him, became governor in Fars under Abu Sa'id in Khorasan in 1340, and subsequently made himself independent at Fars and Shiruz (1353) and in Isfahan (1356). In 1357 he was deposed and blinded, and though restored was exiled again and died in 1358. His descendant, except for Jelair ud-din (Jaladuddin), Shah Shuja', the patron of the poet Hafiz, were unimportant, and the dynasty was wiped out by Timur about 1392.

3. The Sarhadarids (so called from their motto Sar-lad, 1409-1446), descended of Abi al-Razzak, who rebelled in Khorsan about 1337, enjoyed some measure of independence under twelve rulers till they also were destroyed by Timur (c. 1380).

4. The Beni Kurot (or Kart), who had governed in Khorsan from 1332 and were independent in the early 14th century; they were abolished by Timur (c. 1383).

5. The Jabinians had some power in Azerbaijan from 1337 to 1355, when they were dethroned by the Kipchaks of the house of Jenghiz Khan.

The authority of Timur, which, as we have seen, was dominant, throughout Persia from as early as at least as 1355 till his death in 1405, was never challenged. He passed from one victory to another, but the conquered districts were never really settled under his administration. Fresh risings of the defeated dynasties followed each new enterprise, and he had also to deal with the Mongol hordes whose territory marched with northern Persia. His descendants were for a brief period the overlords of Persia, but after Shah Rukh (reigned 1409-1446) and Ala addau (1447), the so-called Timurid dynasty ceased to have any authority over Persia. There were Timurid governors of Fars under Shah Rukh, Fir Mahommed (1409-1409), Iskendar (1409-1414), Ibrahim (1415-1434) and Abdallah (1434); in other parts of Persia many of the Timurid family held governorships of greater or less importance.

AUTHORITIES.—The works relating to Persia will be found under articles on the main dynasties (CALIPHATE; SELJUC; MONGOLS), and the great rulers (JENGHIZ KHAN; MAHOMED OF GAIZHTZ; TIMUR). For general information and chronology see S. Lane Poole, Mohammedan Dynasties (London, 1864); Stocke, Manuel d'histoire, vol. i. (Leiden, 1888); Sir H. Howorth, History of the Mongols (1876-1888). (J. M. M.)

C.—From the Death of Timur to the Fall of the Safavid Dynasty, 1415-1736.

Timur died in 1405, within the seventh-tenth of his age and about to invade China. Besides exercising sovereignty over Transoxiana and those vast regions round the Aral Sea, Timur was nearly absorbed in Asiatic Russia of the 15th century, ruled the whole inclusive of the Caucasus, Astrakhan and the lower Volga, and overrunning Mesopotamia, Syria, Asia Minor, Afghanistan and India, he had at this time left his indelible mark upon the chief cities and provinces of Persia, Khorasan and Mazandaran had submitted to him in 1381, Azerbaijan had shortly after followed their example, and Isfahan was seized in 1387. From Isfahan he passed on to Shiraz, and thence returned in triumph to his own capital of Samarqand. Five years later he subdue Mazandaran, and after still he was again at Shiraz, having effectuated the subjugation of Khorasan and other provinces. It may be said that from north to south, or from Astrabad to Hormuz, the whole country had been brought within his dominion.

The third son of Timur, Miran Shah, had ruled over part of Persia in his father's lifetime; but he was said to be insane, and his incapacity for government had caused the loss of Bagdad and revolt in other provinces. His claim to succession had been put aside by Timur in favour of Pir Mahommed, the son of a deceased son, but Khalil Shah, a son of the discarded prince, won the day. His waste of time and treasure upon a fascinating mistress named Shado l-Mulk, the "delight of the kingdom," soon brought about his deposition, and in 1408 he gave way to Shah Rukh, who, with the exception of Miran Shah, was the only surviving son of Timur. In fact the uncle and nephew changed places—the one quitting his government of Khorasan
and, a little later, that "Uzun Hasan, after he had made himself master of Persia, turned his arms in the direction of Turkey"; but the reader is left to infer for himself what the real empire of Hosain Mirza, and what the limit of the "Persia" of Uzun Hasan. The second could not well be included in the first, because the Turkomans were in possession of the greater part of the Persian plateau, while the "sultan" was in Herat, to which Khorasan belonged. It may be assumed that an empire like that acquired by Timur could not long be maintained by his descendants in its integrity.

The Turkish adjective uzun, عین "long," applied to Hasan, the Turkoman monarch of Persia (called also by the Arabs Ḥasanu 't-Tawil), is precisely the qualifying Persian word ژین used in the compound designation of Artaxerxes Longimanus; and Malcolm quotes the statement of a Venetian envoy in evidence that Uzun Ḥasan was "a tall thin man, of a very open and engaging countenance." This reference, and a further notice in Markham's history, supply the clue to a store of valuable information made available by the publications of the Hakluyt Society. The narratives of Caterino Zeno, Barbaro and Contarini, envoy, from Venice to the court of Uzun Hasan, are in this respect especially interesting. Zeno was sent in 1471 to incite this warlike ruler against the Ottoman sultan, and succeeded in his mission. That the result was disastrous to the shah is not surprising, but the war seems to hold a comparatively unimportant place in the annals of Turkey.

Uzun Hasan had married Despina (Gr. Δεσπώνα), daughter of the emperor of Trebizond, Calo Johannes of the house of the Commeni; and Zeno's wife was sister to this Christian princess. The relationship naturally strengthened the envoy's position at the court, and he was permitted to visit the queen in the name of the republic which he represented. Barbaro and Contarini met at Isfahan in 1474, and there paid their respects to the shah together. Cum and Tauris or Tabriz (then the capital) were also visited by the Italian envoys following in the royal suite; and the incidental notice of these cities, added to Contarini's formal statement that "the extensive country of Usun-cassan [sic] is bounded by the Ottoman Empire and by Cara-mania," and that Shiraz (Shiraz) is comprehended in it, proves that at least Azerbaijan, Irak, and the main part of the provinces to the south, inclusive of Fars, were within the dominions of the reigning monarch.

There is good reason to suppose that Jahān Shah, the Black Sheep Turkoman, before his defeat by Uzun Hasan, had set up the standard of royalty; and Zeno, at the outset of his travels, calls him "king of Persia" ١ in 1450. Chardin alludes to him in the same sense; but Hasan the Long is a far more prominent figure, and has hardly received justice at the hands of the historian. Indeed, his identity seems to have been lost in the various modes of spelling his name adopted by the older chroniclers, who call him indiscriminately ٢ Alymbeius, Asicbeius, Asembeck, Assimeo, or Usan Cassano. He is said to have performed the character of a wise and valiant monarch, to have reigned eleven years, to have lived to the age of seventy, and, on his death in 1477 or (according to Krušinski and Zeno) 1478, to have been succeeded on the throne of Persia by his son Ya'qub. This prince, who had slain an elder brother, died by poison (1485), after a reign of seven years. The body was offered to him by his wife, who had been unfaithful to him and sought to set her paramour on his throne.

Writers differ as to the succession to Ya'qub. Zeno's account is that a son named Allamar (called also, Alamat, Alvante, El-wand and Alwung Bey) was the next king, who, Anarchy besides Persia, possessed Diarbekr and part of eastern Armenia near the Euphrates. On the other hand, Krušinski states that, Ya'qub dying childless, his relative, Julaver, one of the grandees of the kingdom, seized the throne, and held possession of it for three years. Basingar, it is added, succeeded him in 1488 and reigned till 1490, when a young nobleman named Rustam (Rustam?) obtained the sovereign power and exercised it for seven years. This account is confirmed by ٣ See also Ramusio's preface. ٤ Knolles, Purchas, Zeno.

Persia

[^1]: Hosain Mirza.

[^2]: Sir John Malcolm states that at the death of Abu Sa'id, Sultan Hosain Mirza "made himself master of the empire," but this is an error, since there was a deadly feud. Both were composed of settlers in Asia Minor, "Black Sheep," having consolidated their power at Van, the "White." ١ Sir John Malcolm.

[^3]: They were commonly called Kara Kuyun-lu and the "White Sheep." Turkomans Ak Kuyun-lu, the suffix "lu" signifying possession, i.e. possession of a standard bearing the image of a black or white sheep.

[^4]: According to Erskine, this chief killed Miran Shah, whose dwelling-place was Tabriz.
Angiolollo, a traveller who followed his countrymen Barbaro and Contarini to Persia; and from the two authorities combined may be gathered the further narration of the murder of Rustam and usurpation of the throne by a certain Ahmad, whose death, under torture, six months afterwards, made way for Alamut, the young son of Hasan. These discrepancies can be reconciled on reference to yet another record bound up with the narratives of the four Italians aforesaid, and of much the same period. In the Travels of a Merchant in Persia the story of Ya'qub's death is supplemented by the statement that "the great lords, hearing of his king's decease, had quarrels among themselves, so that for six years all Persia was in a state of civil war, first one and then another of the nobles becoming sultans. At last a youth named Alamut, aged fourteen years, was raised to the throne, which he held till the succession of Sheikh Isma'il." Who this young man was is not specified; but other writers call Alamut and his brother Murad the sons of Ya'qub, as though the relationship were unquestionable.

Now little is known, save incidentally, of Julaver or Rustam; but Baisinger is the name of a nephew of Omar Sheikh, king of Ferghana and contemporary of Uzun Hasan. There was no doubt much anarchy and confusion in the interval between the death of Ya'qub and the restoration, for two years, of the dynasty of the White Sheep. But the tender age of Alamut would, even in civilized countries, have necessitated a regency; and it may be assumed that he was the next legitimate and more generally recognized sovereign. Markham, in designating this prince the last of his house, states that he was dethroned by the renowned founder of the Safawi dynasty. This event brings us to one of the most interesting periods of Persian history, any account of which must be defective without a prefatory sketch of Isma'il Sufi.

The Safi or Safawid (Safawi) Dynasty (1499–1736).—Sheikh Saffu 'd-Din Izhak—lineally descended from Musa, the seventh Imam—was a resident at Ardebil (Ardabil) southwards of the Caspian, some time during the 14th century. It is said that his reputation for sanctity attracted the attention of Timur, who sought him out in his abode, and was so charmed by the visit that he released, at the holy man's request, a number of captives of Turkish origin, or Georgians, taken in the wars with Bayezid. The act ensured to the Sheikh the constant devotion and gratitude of these men—a feeling which was loyally maintained by their descendants for the members of his family in successive generations.

His son Sadru'd-Din and grandson Kwa'a 'Ali (who visited Mecca and died at Jerusalem) retained the high reputation of their pious predecessor. Juna'il, a grandson of the last, married a sister of Uzun Hasan, and by her had a son named Sheikh Haidar, who married his cousin Martha, daughter of Uzun Hasan and Queen Despina. Three sons were the issue of this marriage, Sultan 'Ali, Ibrahim Mirza, and the youngest, Isma'il, the date of whose birth is put down as 1480 for reasons which will appear hereafter. So great was the influence of Sheikh Haidar, and so earnestly did he carry out the principles of conduct which had characterized his family for five generations, that his name has become, as it were, inseparable from the dynasty of his son Isma'il; and the term "Haidari" (leoni) is applied by many persons to indicate generally the Safawids of Persia. The outcome of his teaching was a division of Mahomedanism vital momentous to the world of Islam. The Persian mind was peculiarly adapted to receive the form of religion prepared for it by the philosophers of Ardebil. The doctrines presented were dreamy and mystic; they rejected the infallibility of human wisdom, and threw suspicion on the order and arrangement of human orthodoxy. There was free scope given for the indulgence of that political imagination which reels in revolution and chafes at prescriptive bondage. As Malcolm remarks, "the very essence of Sufi-ism is poetry." 1

Those authorities who maintain that Ya'qub Shah left no son to succeed him consider valid the claim to the vacant throne of Sheikh Haidar Sufi. Purchas says that Ya'qub himself, "jealous of the multitude of A'idar's disciples and the greatness of his fame, caused him to be secretly murthered"; but Krusinski attributes the act to Rustam a few years later. Zeno, the anonymous merchant and Angiolollo affirm that the devotee was defeated and killed in battle—the first making his conqueror to be Alamut, the second a general of Alamut's, and the third an officer sent by Rustam named Suleiman Bey. Malcolm, following the Zubdatu 'l-Mawarih, relates that Sheikh Haidar was massacred and slain by the governor of Shirvan. The subsequent statement that his son, Sultan 'Ali, was seized, in company with two younger brothers, by Ya'qub, 2 of the descendants of their grandfather Uzun Hasan, who, jealous of the numerous disciples that resorted to Ardebil, confined them to the hill fort of Istakh in Fars, 3 seems to indicate a second interpretation of the passage just extracted from Purchas, and that there is confusion of persons and incident somewhere. One of the sons here alluded to was Isma'il, whom Malcolm makes to have been only seven years of age when he fled to Gilan in 1492. Zeno states that he was then thirteen, which is much more probable, 4 and the several data available for reference are in favour of this supposition.

The life of the young Sufi from this period to his assumption of royalty in 1499 was full of stirring adventure; and his career as Isma'il I. was a brilliant one. According to Zeno, who seems to have carefully recorded the events of the time, he left his temporary home on an island of Lake Van before he was eighteen, and, passing into Karabakh, 5 between the Aras and Kur, turned in a south-easterly direction into Gilan. Here he was enabled, through the assistance of a friend of his father, to raise a small force with which to take possession of Baku on the Caspian, and thence to march upon Shemakha in Shirvan, a town abandoned to him without a struggle. Hearing, however, that Alamut was advancing to meet him, he was compelled to seek new levies from among the Jengi Christians and others. At the head of 16,000 men, he thoroughly routed his opponents, and, having cleared the way before him, marched straight upon Tabriz, which at once surrendered. He was soon after proclaimed shah of Persia (1499), under the designation which marked the family school of thought.

Alamut had taken refuge at Diarbekr; but his brother Murad, at the head of an army strengthened by Turkish auxiliaries, was still in the field with the object of contesting the paternal crown. Isma'il lost no time in moving against him, and won a new victory on the plains of Tabriz. Murad fled with a small remnant of his soldiers to Diarbekr, the rallying-point of the White Sheep Turkomans. Zeno states that in the following year Isma'il entered upon a new campaign in Kurdistan and Asia Minor, but that he returned to Tabriz without accomplishing his object, having been harassed by the tactics of Ala ud-Daula, a beylerbey, or governor in Armenia and parts of Syria. Another writer says that he marched against Murad Khan in Irak-i-Ajami and Shiraz. This last account is extremely probable, and would show that the young Turkomand wished to make one grand effort to save Isfahan and Shiraz (with Kazvin and the neighbouring country), those being, after the capital Tabriz, the most important cities of Uzun Hasan's Persia. His men, however, apparently dismayed at the growing prestige of the enemy, did not support him, and he was defeated and probably slain. There is similar evidence of the death of Alamut, who, it is alleged, was treacherously handed over to be killed by the shah's own hands.

Isma'il returned again to Tabriz (1501) "and caused great rejoicings to be made on account of his victory." In 1503 he had added to his conquests Bagdad, Mosul and Jezira on the Tigris. The next year he was called to the province of

---

1 According to Langles, the annotator of Chardin, his real designation was Abu 'l-Fath Izhak, the Sheikh Saffu 'l-Hakk wu 'd-Din or "pure one of truth and religion."

2 So thinks the editor and annotator of the Italian Travels in Persia, Charles Grey.

3 Possibly Kara-dagh, as being the more direct road.
Gilan to chastise a refractory ruler. Having accomplished his end, he came back to his capital and remained there in comparative quiet till 1507.\footnote{Angidello.} Malcolm's dates are somewhat at variance with the above, for he infers that Bagdad was subdued in that particular year; but the facts remain. All writers seem to agree that in 1508 the king's attention was drawn to an invasion of Khorasan by Shabani, or Shahi Beg, the Uzbek, a descendant of Jenghiz and the most formidable opponent of Babar, from whom he had, seven years before, wrested the city of Samarkand, and whom he had driven from Turkestan to Kabul. Since these exploits he had obtained great successes in Tashkent, Ferghana, Hissar, Kunduz, and Khwarizm (Kharazm), and, at the time referred to, had left Samarkand intent upon mischief south and west of the Oxus, had passed the Murghab, and had reached Sarakhs (Sarakhs). Isma'il encamped on this occasion at Isafahan, and there concentrated the bulk of his army—strengthening his northern (and probably north-eastern) frontier with large bodies of cavalry, but maintaining an attitude of simple watchfulness. In 1510, when Shabani had invaded Khorasan the second time, and had ravaged the Persian provinces of Kerman, Shah Isma'il asked for a conference, referring to the land encroached on as "hereditary," and Shabani replied that he did not understand on what was founded the claim "to inherit." Eventually the Persian troops were put in movement, and the Uzbegs, having been divided into small detachments scattered over the country, fell back and retreated to Herat. Their leader repaired to Merv, but Isma'il quickly followed him and enticed him out to battle by taunt and reproach. Shabani was defeated and fled, but was overtaken in his flight, and put to the sword, together with numerous relatives and companions.

The next remarkable event in Isma'il's reign is his war with Sultan Selim. Its origin may be traced to the Ottoman emperor's hatred and persecution of all heretical Moslems in his dominions, and the shah's anger at the fanaticism which had urged him to the slaughter of 40,000 Turks suspected to have thrown off the orthodox Sunniite doctrines. The sultan's army advanced into Azerbaijan and western Persia through Tokat and Erzinger. Isma'il had at this time the greater number of his soldiers employed in his newly-conquered province of Khorasan and was driven to raise new levies in Kurdistân to obtain a sufficient force to resist the invasion. It is asserted by some that his frontier then extended westward to Sivas, a city situated in a large high plain washed by the rivers of Sakik and Orum. From this, and so far as the sultan was able to Khorasan, and towards Tabriz, he followed the approved and often successful tactics of ravaging and retreating, so as to deprive his advancing enemy of supplies. There is good evidence to show that the Turkish janissaries were within an ace of open revolt, and that but for extraordinary firmness in dealing with them they would have abandoned their leader in his intended march upon Tabriz. In fine, at or near Khoi, the frontier-town of Azerbaijan, the battle (1514) was fought between the two rival monarchs, ending in the defeat of the Persians and the triumphant entry of Selim into their capital.

There are striking accounts of that action and of the gallant deeds performed by Selim and Isma'il, both personally engaged in it, as well as by their generals.\footnote{Knolles, Malcolm, Creasy, Markham, &c.} Others maintain that Isma'il was not present at all.\footnote{Zeno. Angidello says that the Sophi monarch had left for Tabriz [Tahrib] in order to assemble more troops. Kruisinski infers much to the same effect, for he notes that "Selim came in person and took Taurus from Isma'il, but at the noise of his approach was obliged to retreat with precipitation. The battle must thus have been fought and the victory gained when he Shah was himself absent." Yet Markham quotes a journal which thus records his feats of prowess: "It was in vain that the brave Shah, with a blow of his saber, seared a chain with which the Turkish guns were fastened together to resist the shock of the Persian cavalry."} It is tolerably certain that the Turks won the day by better organization, superiority of numbers, and more especially the use of artillery. On the side of the Persians the force consisted of little more than cavalry.

Selim remained at Tabriz no more than eight days. Levying a contribution at that city of a large number of its skilled artisans whom he sent off to Constantinople, he marched thence towards Karabagh with intent to fix his winter quarters in those parts and newly invade Persia in the spring, but the insubordination of his troops rendered necessary his speedy return to Turkey. His expedition, if not very glorious, had not been unproductive of visible fruits. Besides humbling the power of an arrogant enemy, and had contributed to his dominions the provinces of Diarbekr and Kurdistan.\footnote{Angidello's Character.}

From 1514 to 1524, although the hostile feeling between the two countries was very strong, there was no serious nor open warfare. Selim's attention was diverted from Persia to Egypt; Isma'il took advantage of the sultan's death in 1519 to overrun and subdue unfortunate Georgia, as Jahan Shah of the "Black Sheep" had done before him; but Suleiman, who succeeded Selim, was too strong to admit of retaliatory invasion being carried out with impunity at the cost of Turkey. In 1524 Isma'il died\footnote{1} at Ardebil when on a pilgrimage to the tomb of his father.\footnote{2} The Persians dwell with rapture on his character, Sir John Malcolm, for they declare of him "not only the founder of a great empire, but the person to whom that faith in which they glory owes its establishment as a national religion." And he quotes a note handed down by Purchas from a contemporary European traveller which reports of him thus: "His subjects deemed him a saint, and made use of his name in their prayers. Many disdained to wear armour when they fought under Isma'il; and so enthusiastic were his soldiers in their new faith that they used to bare their breasts to their enemies and court death, claiming 'Shah! Shahi! to mark the holy cause for which they fought.'"\footnote{Isma'il's Character.} Shah Tahmasp,\footnote{Shah Tahmasp.} the eldest of the four sons of Isma'il, succeeded to the throne on the death of his father.\footnote{The principal occurrences in his reign, placed as nearly as possible in their historical order, were a renewal of war with the Uzbegs, who had again invaded Khorasan, and the overthrow of their army (1527); the recovery of Bagdad from a Kurdish usurper (1528); the settlement of an internal feud between Kizil-bash tribes (Shamlu and Tukultu), continuing for the custody of the royal person, by the slaughter of the more unruly of the disputants (1526); the rescue of Khorasan from a fresh irruption, and of Herat from a besieging army of Uzbegs (1530); a new invasion of the Ottomans, from which Persia was saved rather by the severity of her climate than by the prowess of her warriors (1533); the wrestling of Bagdad from Persia by the sultan Suleiman (1534); the king's youngest brother's rebellion (1535).} of the second and third line.\footnote{1} It was about this time that Persia again entered into direct relations with one of the states of western Europe. In 1516 Uzbeg 1514 Alphonso d'Albuquerque, the governor of Portuguese India, sent envoys to Isma'il, seeking an alliance. In 1515, after occupying Hormuz, he despatched a third embassy under Fernão Gomes de Lemos. His object was to utilize the Shi'ite armies in conjunction with the Portuguese fleet for an attack upon the Sunnite powers—Egypt and Turkey—which were then at war with Portugal in the East. See, for further details and authorities, K. G. Jayne, "Vasco da Gama and his Successors," pp. 108-110 and App. A. (London, 1910).—Ed.

Malcolm says 1523, Kruisinski 1525; Angidello heard of his death in Cairo in August 1524. Kruisinski adds that he was forty-five years of age.

Angidello calls him "Shia'tehmen." As an instance of the absurd transliterating current in France as in England the word "Ach-tacon" may be mentioned, it is explained in Chardin's text to mean "les hôpitaux à Tadear: c'est-à-dire, chez où l'on professe de vivres." Chardin's editor's note, "La derniere partie de ce mot est méconnaissable, et je ne puis deviner quel mot Persan significait." Thus the Angidello's rendering than qu'il a dit ici. In other words, the first syllable "ach" (Anglice ash) was understood in its common acceptance for "food" or "victuals"; but "tacan" was naturally a puzzler. The solution of the word is a little difficult. It is clear that it was composed of two words, the second of which, "konah," is the Persian for man; but what was the first? It seems that the word was a popularized form of the Persian word for the "good man" or "friend," "khanah," which is itself a corruption of the Persian term for "honorable," "hokhamah." The word is used in the Persian sense of "khanah"—"bustan khanah, pronounced by Turks lasta kona, or more vulgarly asta kheen and even to a French ear ash-tacon, a hospital, literally a sick house. This word is undoubtedly current at Tabriz and throughout northern Persia.

The other brothers were Ililhas, Bahram and Sam Mirza, each having his particular appellation assigned him.
and the actual seizure of Herat, necessitating the recovery of that city and a march to Kandahar (1535); the temporary loss of Kandahar in the following year (1537), when the governor ceded it to Prince Kamran, son of Babar; the hospitable reception accorded to the Indian emperor Humayun (1543); the rebellion of the shah's brother next in age, Ilkhas, who, by his alliance with the sultan, brought on a war with Turkey (1548); and finally a fresh expedition to Georgia, followed by a revengeful incursion which resulted in the enforced bondage of thousands of the inhabitants (1552).

Bayazed, a son of the Turkish emperor, rebelled, and his army was beaten in 1559 by the imperial troops at Konia in Asia Minor. He fled to Persia and took refuge with Shah Tahmasp, who pledged himself to give him a permanent asylum. Suleiman's demand, however, for extradition or execution was too peremptory for refusal, and the prince was delivered up to the messengers sent to take him. Whatever the motive, the act itself was highly appreciated by Suleiman, and became the means of cementing a recently concluded peace between the two monarchs. Perhaps the domestic affliction of the emperor and the anarchy which in his later years had spread in his dominions had, however, more to do with it. The interference of tranquillity that inspired the act was personal feeling. At this time not only was there religious fanaticism at work to stir up the mutual hatred ever existing between Sunni and Shi'ah, but the intrigue of European courts was probably directed towards the maintenance of an hostility which deterred the sultan from aggressive operations north and west of Constantinople. "'Tis only the Persian stands between us and ruin," is the reported saying of Busbecq, ambassador at Suleiman's court on the part of Ferdinand of Austria; "the Turk would fain be upon us, but he keeps him back."

In 1561 Anthony Jenkinson arrived in Persia with a letter from Queen Elizabeth to the shah. He was to treat with his majesty, son of "Traffique and Commerce for our English Merchants," but his reception was not encouraging, and led to no result of importance.

Tahmasp died in 1576, after a reign of about fifty-two years. He must have been some sixty-six years of age, having come to the throne at fourteen. Writers describe him as a robust man, of middle stature, wide-hipped, and of tawny complexion. He was not wanting in soldierly qualities; but his virtues were rather negative than decided. The deceased shah had a numerous progeny, and on his death his fifth son, Ilaidar Mirza, proclaimed himself king, supported in his pretensions by the Kizil-bash tribe of Ushtujul. Another tribe, the Afshar, insisted on the succession of the fourth son. Ilaidar Mahomed, the Persian sultan, had it not been that there were two candidates in the field, the contention would have resembled that which arose shortly after Tahmasp's accession. Finally Isma'il, profiting from his brother's weak character and the intrigues set on foot against him, obtained his object, and was brought from a prison to receive the crown.

The reign of Isma'il II. lasted less than two years. He was found dead in the house of a confectioner in Kazvin, having left the world either drunk, drugged or poisoned. Isma'il II. No steps were taken to verify the circumstances, for the event itself was a cause of general relief and joy. He was succeeded by his eldest brother, Mahommed Mirza, otherwise called Mahommed Khudabanda, whose claim to the bandar, ground of physical infirmity. He had the good sense to trust his state affairs almost wholly to an able minister; but he was cowardly enough to 'deliver up that minister into the hands of his enemies. His kingdom was distracted by intestine divisions and rebellion, and the foe appeared also from without. On the east his youngest son, Abbas, held possession of Khorasan; on the west the sultan's troops again entered Azerbaijan and took Tabriz. His eldest son, Hamza Mirza, upheld his fortunes to the utmost of his power, reduced the rebel chieftains, and forced the Turks to make peace and retire; but he was stabbed to death by an assassin. On the news of his death reaching Khorasan, Murshid Kuli Khan, leader of the Ustujul Kizil-bash, who had made good in fight his claims to the guardianship of 'Abbas, at once conducted the young prince from that province to Kazvin, and occupied the royal city. The object was evident, and it accorded well with the popular feeling. 'Abbas, who had been proclaimed king by the nobles at Nishapur some two or three years before this occurrence, may be said to have now undertaken in earnest the cares of sovereignty. His ill-starred father, at no time more than a nominal ruler, was at Shiraz, apparently deserted by soldiers and people. Malcolm infers that he died a natural death, but when or where is not stated.

Shah 'Abbas the Great commenced his long and glorious reign (1586) by retracing his steps towards Khorasan, which had been invaded by the Uzbek's almost immediately after his departure thence with the Kizil-bash chief. They had besieged and taken Herat, killed the governor, plundered the town, and laid waste the surrounding country. Abbas advanced to Meshed, but owing to internal troubles he was compelled to return to Kazvin without going farther east. In his absence 'Abd-ul-Mumin Khan, the Uzbek commander, attacked the sacred city, obtained possession of it while the shah lay hopelessly ill at Teheran, and allowed his savage soldiers full licence to kill and plunder. The whole kingdom was perplexed, and 'Abbas had much work to restore confidence and tranquillity. But circumstances rendered impossible his immediate renewal of the Khorasan warfare. He was summoned to Shiraz to put down rebellion in Fars; and before he could drive out the Uzbeks, he had to secure himself against Turkish intrusions threatening from the west. He had been engaged in a war with Murad III. in Georgia. Peace was concluded between the two sovereigns in 1590; but the terms were unfavourable to Persia, who lost thereby Tabriz and one or more of the Caspian ports. A stipulation was included in the treaty to the effect that Persians were not to curse any longer the first three caliphs,—a sort of privilege previously enjoyed by Shi'ites as part and parcel of their religious faith.

In 1597 'Abbas renewed operations against the Uzbeks, and succeeded in recovering from them Herat and Khorasan. Eastward he extended his dominions to Balkh, and in the south his generals made the conquest of Bahrain (Bahrin), on the Arabian side of the Persian Gulf. This time the Uzbek prince gave up the Persian seaboard, inclusive of the mountainous province of Lar. He strengthened his position in Khorasan by planting colonies of Kurdish horsemen on the frontier, or along what is called the "atak" or skirt of the Turkoman mountains north of Persia. In 1601 the war with the Ottoman Empire, which had been partially renewed prior to the death of Sultan Murad in 1595, with little success on the Turkish side, was now entered upon by 'Abbas with more vigour. Taking advantage of the weakness of his ancient enemy in the days of the poor voluptuary Mahommed III., he began rapidly to recover the provinces which Persia had lost in preceding reigns, and continued to reap his advantages in succeeding campaigns under Ahmed I., until under Ochman II. a peace was signed restoring to Persia the boundaries which she had obtained under the first Isma'il. On the other side Kandahar, which Tahmasp's lieutenant had yielded to the Great Mogul, was recovered from that potentate in 1609.

At the age of seventy, after a reign of forty-two years, 'Abbas died at his favourite palace of Farahabad, on the coast of Mazandaran, on the night of the 27th of January 1628. Perhaps the most distinguished of all Persian kings, his fame was not merely local but world-wide. At his court were ambassadors from England, Russia, Spain, Portugal, Holland and India.1

1 Kruinski says in 1585.
To his Christian subjects he was a kind and tolerant ruler. The establishment of internal tranquillity, the expulsion of interlopers and murderers like Turks and Uzbegs, the introduction of salutary laws and the promotion of public works of utility—these alone would render remarkable this two-score years of enlightened government. With a fine face, "of which the most remarkable features were a high nose and a keen and piercing eye," 18 he is said to have been below the middle height, robust, active, a sportsman, and capable of much endurance. It is, however, to be regretted that this monarch's memory is tarnished by more than one dark deed. The murder of his eldest son, Šuř, Mirza, and the cruel treatment of the two younger brothers, were stains which could not be obliterated by an after-repentance. All that can be now said or done in the matter is to repeat the testimony of historians that his grief for the loss of Šuř Mirza was profound, and that, on his death-bed, he nominated that prince's son (his own grandson) his successor.

Sam Mirza was seventeen years of age when the nobles, in fulfilment of the charge committed to them, proclaimed him王者, Šuř Mirza, and he reigned fourteen years, and his reign was a succession of barbarities, which can only be attributed to an evil disposition acted upon by an education void of all civilizing influences. When left to his own devices he became a drunkard and a murderer, and is accused of the death of his mother, sister and favourite queen. Among many other sufferers Imam Kuli Khan, conqueror of Lar and Hormuz, the son of one of 'Abbas's most famous generals, founder of a college at Shiraz, and otherwise a public benefactor, fell a victim to his savage cruelty. During his reign the Uzbegs were driven back from Khorasan, and a rebellion was suppressed in Gilan; but Kandahar was again handed over to the Moguls of Delhi, and Bagdad retaken from Persia by Sultan Murad—both serious national losses. Tavernier, without charging the shah with injustice to Christians, mentions the circumstance that "the first and only European ever publicly executed in Persia was in his reign." He was a watchmaker named Rodolph Stader, who had slain a Persian on suspicion of intrigue with his wife. Offered his life if he became a Moslem, he resolutely declined the proposal, and was decapitated. His tomb is to be recognized at Isfahan by the words "Cygit Rodolphine" on a long wide slab. Shah Šuř died (1641) at Kashan and was buried at Kum. His son, 'Abbas II., succeeded him. Beyond regaining Kandahar, an operation which he was said to have directed in person when barely sixteen, there is not much to mark his life to the outer world. As to foreign relations, he received embassies from Europe and a deputation from the French East India Company; he sought to conciliate the Uzbegs by treating their refugee chiefs with unusual honour and sumptuous hospitality; he kept on good terms with Turkey; he forgave the hostility of a Georgian prince when brought to him a captive; and he was tolerant to all religions—always regarding Christians with especial favour. But he was a drunkard and a debauchee, and chroniclers are divided in opinion as to whether he died from the effects of drink or licentious living. That he changed the system of indemnity, relative from passing a hot metal over the open eye to an extraction of the whole pupil is indicative of gross brutality. 'Abbas II. died (1668) at the age of thirty-eight, after a reign of twenty-seven years, and was buried at Kum in the same mosque as his father.

'Abbas was succeeded by his son, Shah Šuř II., crowned a second time under the name of Shah Suleiman. Though weak, Suleiman, dissolve and cruel, Suleiman is not without his panegyrist. Chardin, whose testimony is all the more valuable from the fact that he was contemporary with him, relates that the characteristic of his temper and habits. He kept up a court at Isfahan, which surprised and delighted his foreign visitors, among whom were ambassadors from European states; and one learned writer, Kaempfer, credits him with wisdom and good policy. During his reign Khorasan was invaded by the ever-enroaching Uzbegs, the Kipchak Tatars plundered the shores of the Caspian, and the island of Kishm was taken by the Dutch; but the kingdom suffered otherwise no material loss. He died in 1664, in the forty-ninth year of his age and twenty-sixth of his reign.

About a year before his death, he is described by Sanson, 2 a missionary from the French king Louis XIV., as tall, strong and active, "a fine prince—a little too effeminate for a monarch," with "a Roman nose very well proportioned and out of his head," very large blue eyes, and "a midling mouth, a beard painted black, shav'd round, and well turn'd, even to his ears." The same writer greatly praises him for his kindness to Christian missionaries.

Krusinski's memoir is full of particulars regarding Shah Ḥosain, the successor of Suleiman. He had an elder and a younger brother, sons of the same mother, but the eldest had been put to death by his father's orders, 3 and the youngest secreted by maternal precaution lest a similar fate should overtake him. There was, however, a second candidate for the throne; the son of the previous monarch's half-brother 'Abbas. The latter prince was the worshiper of the throne, but the latter better suited the policy of the eunuchs and those noblemen who had the right of election. Indeed Suleiman himself is reported to have told the grandees around him, in his last days, that "if they were for a martial king that would always keep his foot in the stirrup they ought to choose Mirza 'Abbas, but that if they wished for a peaceable reign and a pacific king they ought to fix their eyes upon Ḥosain." But he himself made no definite choice.

Ḥosain was selected, as might have been anticipated. On his accession (1694) he displayed an attachment to religious observance by his appointment of a Sufi to fill the high office; and, through the intervention of the French ambassador in the very time—causing all wine-vessels to be brought out of the royal cellars and destroyed, and forbidding the Armenians to sell any more of their stock in Isfahan. The shah's grandmother, by feigning herself sick and dependent upon wine only for cure, obtained reversal of the edict. For the following account of Shah Ḥosain and his successors to the accession of Nadir Shah, Sir Clements Markham's account has been mainly utilized.

The new king fell soon under the influence of mullihs, and was led so far to forget his own origin as to persecute the Sufis. Though professing orthodoxy he was himself believed to fall into the hands of the fanatical party he became ensured by women and entangled in harem intrigues. For twenty years a profound peace prevailed throughout the empire, but it was the precursor of a terrible storm destined to destroy the Safavid dynasty and partially to calomny broadcast over Persia. In the mountainous districts of Kandahar and Kabul the hardy tribes of Afghans had for centuries lived in peace and skill, and when the Shah's government had been divided into two great branches—the Ghilzais of Ghazni and Kabul and the Saduzais of Kandahar and Herat. In 1702 a newly-appointed governor, one Shah Nawaz, called Gurji Khan from having been "wali" or ruler of Georgia, arrived at Kandahar with a tolerably large force. He was a clever and energetic man, and had been instructed to take severe measures with the Afghans, some of whom were suspected of intriguing to restore the city to the Delhi emperor. At this time Kandahar had been for sixty years unfortified and in the shah's possession. The governor appears to have given great offence by the harshness of his proceedings, and a Ghilzai chief named Mir Waiz, who had complained of his tyranny, was sent a prisoner to Isfahan. The shah neither overruled him nor interfered with him. He was permitted to go on a pilgrimage to Mecca, and on his return in 1708 he so gained upon the confidence of the Persian court that he was allowed to go back to his country. At Kandahar he planned a conspiracy against the government, slew Gurji Khan and his retinue, seized the city, defeated two Persian armies sent against him, and died a natural death in 1715. His son, named 'Abdallah, succeeded him in the government of the Afghans; but after a few months, Mahmud, the third son of Mir Waiz, a very young man, murdered his uncle and assumed the title of a sovereign prince.

The meanwhile the Saduzai tribe revolted at Herat, and declared itself independent in 1717; the Kurds overran the country round Hamadan; the Uzbegs desolated Khorasan; and the Arabs of Muscat seized the island of Bahrein and threatened Bandar Abbas. Thus surrounded by dangers on all sides the wretched shah was bewildered. He made one vain attempt to regain his possessions in the Persian

3 In 1695 another coup was made, and the son of Shah Şuř II., named Sultan, was put on the throne; but he died a few months after his accession.
PERSIA

Gulf; but the Portuguese fleet which had promised to transport his troops was not ready, and with Ali Khan, having easily appeased the shah, received the command of the royal army. In 1729 Asafah became alarmed, and led an Afghan army into Khorasan, where Mahmud, after he was defeated by Nadir at Dushima, and forced to retreat by Persian troops, assembled in his rear, and again defeated him outside Isfahan in November of the same year. The Afghans fled through the town; and Asafah, murdering the poor old shah Hosain on his way, hurled with the wreck of his army to the Caspian. On the 19th of July, 1732, the Afghan and Persian armies met again near Isfahan, and was soon followed by the young shah Tahmassip II., who burst into tears when he beheld the ruined palace of his ancestors. His mother, who had escaped the numerous massacres by disguise herself as a slave and performing the most degrading offices, was not repulsed by him and thrown herself into his arms. Nadir did not give his enemies time to recover from their defeat. He followed them up, and again utterly routed them in January 1730. He again tried the Thames and Khorasan, and was murdered by a party of Baluch robbers; and thus, by the genius of Nadir, his native land was delivered from the terrible Afghan invaders.

The ambition of Nadir, however, was far greater than his loyalty. On pretext of incapacity, he de-throned Tahmassip II. in 1732, and sent him a prisoner into Khorasan, where he was murdered some years afterwards by Nadir's son while the conqueror was absent on his Indian expedition. For a short time the wily usurper placed Tahmassip's son on the throne, a little child, with the title of 'Abbas III., while he continued his brilliant career. At a very convenient time, in the year 1736, and Nadir then threw off the mask. He was proclaimed shah of Persia by a vast assemblage on the plain of Mohgan.

By the fall of the Safavid dynasty Persia lost her race of monarchs by a race of national monarchs, considered not only in respect of origin and biographical descent, but in essence and spirit. Isfahans 'Abbas, whatever their faults and failings, were Persian and peculiar to Persians. Regarded in a sober English spirit, the reign of the great 'Abbas is rendered mythical by crime. But something liberal in the philosophy of their progenitors threw an attractiveness over the earlier Safavid kings which was wanting in those who came after them. The fact is that, two centuries after Shah Isma'il's accession to the throne, the Safavid race of kings was effete; and it became necessary to make room for a more vigorous if not a more lasting rule. Nadir was the strong man for the hour and occasion. He had been designated a "robber chief"; but his antecedents, like those of many others who have filled the position, have redeeming points of moral and political interest.

A map attached to Krusinski's volumes illustrates the extent of Persian territory in 1728, or one year before Asafah was finally defeated by Nadir, and some eight years prior to the date on which Nadir was himself proclaimed king. It shows, during the reign of the Safawids, Tiflis, Erivan, Khoi and Bagdad to have been within the limits of Persia on the west, and in like manner Balkh and Kandahar to have been included within the eastern border. There is, however, also shown, as a result of the Afghan intrusion and the impotency of the later Safavid kings, a long broad strip of country to the west, including Tabriz and Hamadan, marked "conquests of the Turks," and the whole west shore of the Caspian from Astrakhan to Mazandaran marked "conquests of the czar of Muscovy." Makran, written Mecran, is designated "a warlike independent nation." If further allowance be made for the district held by the Afghan invaders as part of their own country, it will be seen how greatly the extent of Persia proper was reduced, and what a work Nadir had before him to restore the kingdom to its former proportions.

But the former proportions had been partly reverted to, and would doubtless have been in some respects exceeded, both in Afghanistan and the Ottoman dominions and on the shores of the Caspian, by the action of this indestructible grand, had not Tahmassip II. been led into a premature treaty with the Turks. Nadir's anger and indignation had been at this weak pretender: indeed, he had made it the ostensible cause of the shah's deposition. He had addressed letters to all the military chiefs of the country, calling upon them for support; he had sent an envoy to Constantinople insisting upon the sultan's restoration of the Persian provinces still in his possession—that is,
Georgia and part of Azerbaijan—and he had threatened Bagdad with assault. As regent, he had failed twice in taking the city of the caliphs, but on the second occasion he had defeated and killed its garrison, Topal² Othman, and he had succeeded in regaining Tilsis, Karak and Erivan.¹

Russia and Turkey, naturally hostile to one another, had taken occasion of the weakness of Persia to forget their mutual quarrels and unite to plunder the tottering kingdom of the Safavid kings. A partition treaty had been signed between these two powers in 1723, by which the cazar was to take Astrabad, Mazendaran, Gilan, part of Shirvan and Daghistan, while the acquisitions of the Porte were to be traced out by a line drawn from the junction of the Aras and Kur rivers, and passing along by Ardebil, Tabriz and Hamadan, and thence to Kermanshah. Tahmasp was to retain the rest of his paternal kingdom on condition of his recognizing the treaty. The ingenious diplomacy of Russia in this transaction was manifested in the fact that she had already acquired the greater part of the territory allotted to her, while Turkey had to obtain her share by further conquest. But the combination to despoil a feeble neighbour was outwitted by the energy of a military commander of a remarkable type.

D.—From the Accession of Nadir Shah, in 1736, to 1884.

Nadir, it has been said, was proclaimed shah in the plains of Moghan in 1736. Mirza Mahdi relates how this event was brought about by his address to the assembled nobles and officers on the morning of the "Nau-rus," or Persian New-Year's Day, the response to that appeal being the offer of the crown. The conditions were that the crown should be hereditary in his family, that the claim of the Safawids was to be held for ever extinct, and that measures should be taken to bring the Shi`ites to accept uniformity of worship with the Sunnites. The mulla bashi (or high priest) objecting to the last, Nadir ordered him to be strangled, a command which was carried out on the spot. On the day following, the agreement having been ratified between sovereign and people, he was proclaimed emperor of Persia. At Kazvin the ceremony of inauguration took place. The edict expressing the royal will on the religious question is dated in June, but the date of coronation is uncertain. From Kazvin Nadir moved to Isfahan, where he organized an expedition against Kandahar, then in the possession of a brother of Mahmud, the conqueror of Shah Hosain. But before setting out for Afghanistan he took measures to secure the internal quiet of Persia, attacking and seizing in his stronghold the chief of the marauding Bakhtiaris, whom he put to death, retaining many of his men for service as soldiers. With an army of 80,000 men he marched through Khurasan and Seistan to Kandahar, which city he blockaded ineffectually for a year; but it finally capitulated on the loss of the citadel. Balkh fell to Riza Kuli, the king's son, who, moreover, crossed the Oxus and defeated the Uzbek in battle. Besides tracing out the lines of Nadirabad, a town since merged in modern Kandahar, Nadir had taken advantage of the time available and of opportunities presented to enlist large number of men from the Abdali and Gilizai tribes. It is said that as many as 16,000 were at his disposal. His rejection of the Shi`ite tenets as a state religion seems to have propitiated the Sunnite Afghans.

Nadir had sent an ambassador into Hindustan requesting the Mogul emperor to order the surrender of certain unruly Afghan who had taken refuge within Indian territory, but no satisfactory reply was given, and obstacles were thrown in the way of the return of the embassy. The Persian monarch, not sorry perhaps to find a plausible pretext for encroachment in a quarter so full of promise to booty and of opportunities presented to enlist large number of men from the Abdali and Gilizai tribes. It is said that as many as 16,000 were at his disposal. His rejection of the Shi`ite tenets as a state religion seems to have propitiated the Sunnite Afghans.

long been considered not only an integral part but also one of the main gates of the Indian Empire; notwithstanding a stout resistance on the part of its commandant, Shir or Shizrah Khan, the place was stormed and carried (1736) by Nadir, who moved on eastward. Mirza Mahdi relates that from the Kabul plain he addressed a new remonstrance to the Delhi court, but that his mission was arrested and killed, and his escort compelled to return by the governor of Jalalabad. The same account notes the occupation of the latter place by Persian troops and the march thither from Gandamak. It was probably through the Khabur (Khyber) Pass that he passed into the Peshawar plain, for it was there that he first defeated the Imperial forces.

The invasion of India had now fairly commenced, and its successful progress and consummation were mere questions of time. The prestige of this Eastern Napoleon was immense. It had not only reached but had been very keenly felt at Delhi before the conquering army had arrived. There was no actual religious war; all sectarian distinction had been dissolved; the contest was between vigorous Mahomedans and effete Mahomedans. Nadir's way had been prepared by circumstances, and as he progressed from day to day his army increased. There must have been larger ascensions by voluntary recruits than losses by death or desertion. The victory on the plain of Karnal, whether accomplished by sheer fighting or the intervention of treachery, was the natural outcome of the previous situation, and the submission of the emperor followed as a matter of course.

Delhi must have experienced a sense of relief at the departure of its conqueror, whose residence there had been rendered painfully memorable by carnage and riot. The marriage of his son to the granddaughter of Aurangzeb and the formal restoration of the crown to the dethroned emperor were doubtless politic, but the descendant of Babar could not easily forget how humiliating a chapter in history would remain to be written against him. The return march of Nadir to Persia is not recorded with precision. On the 5th of May 1739 he left the gardens of Shalamar, and proceeded by way of Lahore and Peshawar through the passes to Kabul. Thence he seems to have returned to Kandahar, and in May 1740—just one year after his departure from Delhi—he was in Herat displaying the imperial throne and other costly trophies to the gaze of the admiring inhabitants. Sind was certainly included in the territory that was then transferred to him by the Sur, "the territories westward of the river Attock," but only that portion of it, such as Thatta (Tatta), situated on the right bank of the Indus.

From Herat he moved upon Balkh and Bokhara, and received the submission of Abul'Faiz Khan, the Uzbek ruler, whom he restored to his throne on condition that the Oxus should be the acknowledged boundary between the two empires. The khan of Khwarizm, who had made repeated depredations in Persian territory, was taken prisoner and executed. Nadir then visited the strong fortress of Kela, to which he was greatly attached as the scene of his boyish exploits, and Meshed, which he constituted the capital of his empire. He had extended his boundary on the east to the Indus, and to the Oxus on the north.

On the south he was restricted by the Arabian Ocean and Persian Gulf; but the west remained open to his further progress. He had in the first place to revenge the death of his brother Ibrahim Khan, slain by the Lesghians; and a campaign against the Turks might follow in due course. The first movement was unsuccessful, and indirectly attended with disastrous consequences. Nadir, when hastening to the support of some Afghan levies who were doing good service, was fired at and wounded by a stray assailant; suffering his son, Riza Kuli, of complicity, he commanded the unfortunate prince to be seized and deprived of sight. From that time the heroism of the monarch appeared to die out. He became morose, tyrannical and suspicious. An easy victory over the Turks gave him but little additional glory; and he rapidly concluded a peace with the sultan which brought but

² Topal.
insignificant gain to Persia. 1 Another battle won from the Ottoman troops near Diarbekr by Naṣr ʿUllah Mirza, the young prince who had married a princess of Delhi, left matters much the same as before.

The last years of Nadir's life were full of internal trouble. On the part of the sovereign, murders and executions; on that of his subjects, revolt and conspiracy. Such a state of things could not last, and certain proscribed persons plotted the destruction of the half-demented tyrant. He was despatched by Salah Bey, captain of his guards (1747). He was some sixty years of age, and had reigned eleven years. About the time of setting out on his Indian expedition he was described as a most comely man, upwards of 6 ft., tall, well-proportioned, of robust make and constitution; inclined to be fat, but prevented by the fatigue he underwent; with fine, large black eyes and eyebrows; of sanguine complexion, made more manly by the influence of sun and weather; a loud, strong voice; a moderate wine-drinker; fond of simple diet, such as pilaf and plain dishes, but often neglectful of meals altogether, and satisfied, if occasion required, with parched peas and water, always to be procured. 2

During the reign of Nadir an attempt was made to establish a British Caspian trade with Persia. The names of Jonas Hanway and John Elton were honourably connected with this undertaking; and the former has left most valuable records of the time and country.

From Nadir Shah to the Kajar Dynasty. 3—After the death of Nadir Shah something like anarchy prevailed for thirteen years in the greater part of Persia as it existed under Shaḥ ʿAbbās. No sooner had the crime become known than Aḥmad Khan, chief of the Abdali Afghans, took possession of Kandahar and a certain amount of treasure. By the action of Aḥmad Abdali, Afghanistan was at once lost to the Persian crown, for this leader was strong enough to found an independent kingdom. The chief of the Bakhtrāri, Rashid, also with treasure, fled to the mountains, and the conspirators invited ʿAlī, a nephew of the deceased monarch, to ascend the vacant throne. The Bakhtrāri encouraged his brother, ʿAli Mardan, to compete for the succession to Nadir. The prince was welcomed by his subjects; he told them that the murder of his uncle was due to his own instigation, and, in order to conciliate them, remitted the revenues of the current year and all extraordinary taxes for the two years following.

"Taking the title of ʿAdil Shah, or the "just" king, he commenced his reign by putting to death the two princes Rīza Kuli and Naṣr ʿUllah, as well as all relatives whom he considered his competitors, with the exception of Shah Rukh, son of Rīza Kuli, whom he spared in case a lineal descendant of Nadir should at any time be required. But he had not removed all dangerous members of the royal house, nor had he gauged the temper of the times or people. ʿAdil Shah was soon dethroned by his own brother, Ibrahim, and he in his turn was defeated by the adherents of Shah Rukh, who made their leader king.

This young prince had a better and more legitimate title than that of the grandson of Nadir, for he was also grandson, as it were, of Shah ʿAbbās. He was robust, of superior mind, and of prepossessing exterior, he proved to be a popular prince. But he was neither of an age nor character to rule over a people led by turbulent and disaffected chiefs, ever divided by the conflicting interests of personal ambition. Saʿīd Mahomed, son of Mirza Daud, a chief mullah at Meshed, whose mother was the reputed daughter of Suleiman, declared himself king, and imprisoned and blinded Shah Rukh. Yūsuf ʿAli, the general commanding the royal troops, defeated and slew Suleiman, and replaced his master on the throne, reserving to himself the protectorship or regency. A new combination of chiefs, of which ʿAlīšāh the Kurd and Mir ʿAlam the Arab are the principal names handed down, brought about the death of Yūsuf ʿAli and the second imprisonment of Shah Rukh. These events were followed by a quarrel terminating in the supremacy of the Arab. At this juncture Aḥmad Shah Abdali reappeared in Persian Khorasan from Herat; he attacked and took possession of Meshed, slew Mir ʿAlam, and, pledging the local chiefs to support the blinded prince in retaining the kingdom of his grandfather, returned to Afghanistan. But none too soon: this unfortunate young man was a mere shadow of royalty, and his purely local power and prestige had no further influence whatever on Persia as a country.

The land was partitioned among several distinguished persons, who had of old been biding their opportunities, or were born of the occasion. Foremost among these was Mahommed Hasan Khan, hereditary chief of those Kajars who were established in the south-east corner of the Caspian. His father, Fath ʿAlī Khan, after sheltering Shah Tahmasp II. at his home in Astarabad, and long acting as one of his most loyal supporters, had been put to death by Nadir, who had appointed a successor to his chieftaindom from the "Yukari," or "upper," Kajars, instead of from his own, the "Ashagha," or "lower." 4 Mahomed, with his brother, had fled to the Turkomans, by whose aid he had attempted the recovery of Astarabad, but had not succeeded in regaining a permanent footing there until Nadir had been removed. On the murder of the tyrant he had raised the standard of independence, successfully resisted Aḥmad Shah and his Afghans, who sought to check his progress in the interests of Shah Rukh, and eventually brought under his own sway the valuable provinces of Gilan, Mazandaran and Astarabad—quite a little kingdom in itself. In the large important province of Azerbaidzhan, Aḥmad Khan, one of Nadir's generals, had established a hereditary government; and ʿAli Mardan, brother of the Bakhtrāri chief, took forcible possession of Isfahan, empowering Shah Rukh's governor, Abu-l-Fath Khan, to act for the new master instead of the old.

Had ʿAli Mardan declared himself an independent ruler he would have been far the most important of the three persons named. But such usurpation at the old Safavid capital would have been too flagrant an act for general assent; so he put forward Isfāmī, a nephew of Shah Ḥusain, as the representative of sovereignty, and himself as one of his two ministers—the other being Karim Khan. 5 But Isfāmī, who was a chief of the Bakhtrārs, it need scarcely be said, possessed no real authority; but the ministers were strong men in their way, and the Zend especially had many high and excellent qualities. After a time ʿAli Mardan was assassinated, and Karim Khan became the sole living power at Isfahan. The story of the period is thus told by R. G. Watson:

"The three rivals, Karim, Azad and Muhammad Hasam, proceeded to settle, by means of the sword, the question as to which of them was to be the sole master of Persia. A three-sided war then ensued, in the course of which each of the combatants in turn seemed at one time sure to be the final conqueror. Karim, when he had arranged matters at Isphahan, marched to the borders of Mazandaran, where the governor of that province was ready to meet him. After a closely contested battle victory remained with Muhammad Hasam; who, however, was unable to follow up the foe, as he had been in order to encounter Azad. That leader had invaded Gilan, but, on the news reaching him of the victory which the governor of Mazandaran had gained, he thought it prudent to retrace his steps to Sultaniyeh. Karim reunited his shattered forces at Tehran, and retired to Isphahan to prepare for a fresh campaign. When he again took the field it was not to measure himself once more with the Kajar chief, but to put down the pretensions of Azad. The wary Afghan, however, shut himself up in Kerā, a fort in Firdawsi's Zend, which was enabled to inflict much injury on the army of Karim, while his own troops remained unharmed, behind the walls of the town. Karim retired a second time to

3 There were three branches of the Kajar tribe, i.e. the Situd, Tungut and Jalayir. The last, according to Watson, became settled in Iran and Turan, and seem at first to have given their name to all the tribe.

4 Watson, Malcolm says that Gilan was under one of its own chiefs, Hidayat Khan.
of that city awaiting intelligence of the old king's decease, and, hearing it, instantly escaped to Mazandaran, there to gather his tribesmen together and compete for the crown of Persia. Taken prisoner by Nadir and barbarously mutilated by 'Adil Shah, he had afterwards found means to reinstate his people, but had afterwards returned himself to Karim Khan when his father was killed in battle. On the other hand, Sadik, brother to Zaki, who had won considerable and deserved repute by the capture of Basra from the Turkish governor, abandoned his hold of the conquered town on hearing of the death of Karim, and appeared with his army before Shiraz. To provide against the intended action of the first, Zaki detached his nephew, 'Ali Murad, at the head of his best troops to proceed with all speed to the north; and, as to the second, the seizure of such families of Sadik's followers as were then within the walls of the town, and other violent measures, struck such dismay into the hearts of the besieging soldiers that they dispersed and abandoned their leader to his fate. From Kermān, however, where he found an asylum, the latter addressed an urgent appeal for assistance to 'Ali Murad. This chief, encamped at Teherān when the communication reached him, submitted the matter to his men, who decided against Zaki, but put forward their own captain as the only master they would acknowledge. 'Ali Murad, leaving the pursuit of Aga Mahomed, then returned to Isfahan, where he was received with satisfaction, on the declaration that his one object was to restore to his lawful inheritance the eldest son of Karim Khan, whom Zaki had set aside in favour of a younger brother. The sequel is full of dramatic interest. Zaki died at his nephew's desertion, marched out of Shiraz towards Isfahan. On his way he came to the town of Yezdikhat, where he demanded a sum of money from the inhabitants, claiming it as part of secreted revenue; the demand was refused, and eighteen of the head men were thrown down the precipice beneath his window; a "saiyid," or holy man, was the next victim, and his wife and daughter were to be given over to the soldiery, when a suddenly-formed conspiracy took effect, and Zaki's own life was taken in retribution for his guilt (1779).

When intelligence of these events reached Kermān, Sadik Khan hastened to Shiraz, proclaimed himself king in place of Abu 'l-Fath Khan, whom he declared incompetent to reign, and put out the eyes of the young prince. He despatched his son Jai'ār to assume the government of Isfahan, and watch the movements of 'Ali Murad, who appears to have been then absent from that city; and he gave a younger son, 'Ali Naki, command of an army in the field. The campaign ended in the capture of Shiraz and assumption of sovereignty by 'Ali Murad, who caused Sadik Khan to be put to death.

From this period up to the accession of Aga Mahomed Khan the summarized history of Markham will supply the principal facts required.

'Ali Murad reigned over Persia until 1785, and carried on a successful war with Aga Mahomed in Mazandaran, defeating him in several engagements, and occupying Teherān and Sari. He died on his way from the former place to Isfahan, and was succeeded by Jai'ār, son of Sadik,1 who reigned at Shiraz, assisted in the government by an old friend of his named Hajji Ibrahim. This ruler was poisoned by the agency of conspirators, one of whom, Saiyid Murad, succeeded to the throne. Hajji Ibrahim, however, contriving to maintain the loyalty of the citizens towards the Zend reigning family, the usurper was killed, and Lutf 'Ali Khan, son of Jai'ār, proclaimed Lutf 'Ali Khan. He had hastened to Shiraz on hearing of his father's death and received a warm welcome from the inhabitants. Hajji Ibrahim, weary of war, proposed to resign, and a new minister was found for him in Mirza Hosain Shirazi. At the time of his accession Lutf 'Ali Khan was only in his twentieth year, very handsome, tall, graceful, and an excellent horseman. While differing widely in character from his predecessor, Karim Khan, the great founder of the Zend dynasty. Lutf 'Ali Khan had not been many months on the throne when Aga Mahomed advanced to attack him, and invested the city of Shiraz, but retreated soon afterwards to Teherān, which he had made the capital of his dominions. The young king then enjoyed a short period of peace.

1 A five days' usurpation of Bakir Khan, governor of Isfahan, is not taken into account.
in the bay of that name, erected instead a fort with eighteen guns. Aga Mahommeh, learning the particulars, visited the spot, expressed great pleasure at the work done, invited the officers to dine with him, imprisoned them, and only spared their lives when they had removed the whole of the cannon and razed the fort to the ground. This occurrence must have taken place about 1782.

The early part of this host was travelling homeward by the southern shores of the Caspian in January 1784, and from him we gather many interesting details of the locality and period. He tells us Aga Mahommeh chief of Mazandaran, as also of Astarabak, and "some districts in Khurasan," and describes his tribe the Kajar, to be, like the Indian Rajput, usually devoted to the profession of arms. Whatever hold his father may have had on Gilan, it is certain that this province was not then in the son's possession, for his brother, Jafir Kuli, governor of Balfrash (Balrosh), had made a recent incursion into it and driven Hidaiyat Khan, its ruler, from Resht to Enzeli, and Aga Mahommeh was himself meditating another attack on the same quarter. The latter's palace was at Sari, then a small and partly fortified town, thickly inhabited, and with a plentifully-supplied market. As "the most powerful chief in Persia" since the death of Karim Khan, the Russians were seeking to put their yoke upon him.

As Aga Mahommeh's power increased, his dislike and jealousy of the Muscovite assumed a more practical shape. His victory over Lutf Ali was immediately followed by an expedition into Georgia. After the death of Nadir against Georgia.

them to revenge their loss of that of wall that country had looked around him for the safest means of shaking off the yoke of Persia; and in course of time an opportunity had offered of a promising kind. In 1783, when the strength of the Persian monarchy was concentrated upon Isfahan and Shiraz, the Georgian ter ened into an agreement with the empress Catherine by which all connexion with the shah was disavowed, and a quasi-vassalage to Russia substituted—the said empire extending her aegis of protection over her new ally. Aga Mahommeh now demanded that Heraclius should return to his position of tributary and vassal to Persia, and, as his demand was rejected, prepared for war. Dividing an army of 60,000 men into three corps, he sent one of these into Daghestan, another was to attack Erivan, and with the third he himself laid siege to Shusha in the province of Karabakh. The stubborn resistance offered at the last-named place caused him to leave there a small investing force, only, and to move with the remainder of his soldiers to join the corps d'armée at Erivan. Here, again, the difficulties presented caused him to repeat the same process and to effect a junction with his first corps at Ganja, the modern Elizavetpol. At this place he encountered the Georgian army under Heraclius, defeated it, and marched upon Tiflis, which he pillaged, massacring and enslaving the inhabitants. Then he returned triumphant to Teheran, where (or at Ardebel on the way) he was publicly crowned shah of Persia. Erivan surrendered, but Shusha continued to hold out. These proceedings caused Russia to enter the field. Derbent was taken possessed of, Baku and Shumakhy were occupied and Gilan was threatened. The desire of the empress, however, caused the issue of an order to retire, and Derbent and Baku remained the only trophies of the campaign.

In the meantime Aga Mahommeh's attention had been called away to the east. Khurasan could hardly be called an integral part of the shah's kingdom so long as it was under even the nominal rule of the blind grandson of Nadir. But the eastern division of the province in Khorasan, and its outlying parts were actually in the hands of the Afghans, and Meshed was not Persian in 1796 in the sense that Delhi was British at the outbreak of the Indian Mutiny. Shah Rukh held his position, such as it was, rather under Aymad

1 Markham. Morier says of Karim Khan's family, "it was a low branch of an obscure tribe in Kurdistan."

2 Journey from Bengal to England (1798), ii. 201; see also Markham, pp. 341-342.

3 Lady Sheil says (1849): "I saw a few of these unhappy captives who all had to embrace Mahommedanism, and many of whom had risen to the highest stations, just as the Circassian slaves in Constantiopolis."
Shah and his successors in Afghanistan than under any other sovereign power. Aga Mahommed determined to restore the whole province to Persia, and, after a brief residence in Teheran on his return from the Georgian expedition, he set out for Meshed. It is important to note that on the occasion of his coronation he had girded on the sabre consecrated at the tomb of the founder of the Safavid—thus openly pledging himself to support the Shi‘ite faith.

But there had been continual dissatisfaction in the capital of Khorasan, and constant inroads upon it from without, which the royal puppet was unable to prevent. His popularity was real, but never seemed to have effect outside the limited sphere of personal sympathy and regard. Owing to the frequent revolutions in the holy city the generals of Timur Shah, king of the Afghans, had made three expeditions on Shah Rukh’s behalf. Meshed had been taken and retaken as though he were not a resident in it, much less its de jure king. Moreover, his two sons Nadir Mirza and Wali N‘amat had long been fighting, and the former was in 1796 the actual ruler of the place. Three years before Timur had died, and his third son, Zaman Shah, by the intrigues of an influential sirdar, Pailyanda Khan, and had been proclaimed his successor at Kabul.

Aga Mahommed’s entry into Meshed was effected without a stir from the part of those in possession. The Kajar shah walked on foot to the tomb of Imam Riza, before which he knelt and kissed the ground in token of devotion, and was recognized as a Shi‘ite of Shi‘ites. Shah Rukh submissively followed in his train. Then began the last act of the local tragedy. The blind king’s gradual revelation, under horrible torture, of the place of concealment of his several jewels and treasures, and his deportation and death (of the injuries thus received, at Damghan, en route to Mazendaran, must be classed among the darkest records of Oriental history.

From Meshed Aga Mahommed sent an envoy to Zaman Shah, asking for the cession of Balkh, and explaining his intention of Khorasan; but on Aga Mahommed’s return wealth with the troubles in his own country and his own insecure position to do more than send an unmeaning reply. It is not shown what was the understood boundary between the two countries at this particular period; but Watson states that on the shah’s departure he had received the submission of the whole of Khorasan, and left in Meshed a garrison of 12,000 men.

Aga Mahommed had now fairly established his capital at Teheran. On his return thither in September 1796 he dismissed his troops for the winter, directing their reassembly in the following spring. The re-invasion by Russia in the spring of 1797, as he had anticipated was soon preceded by the French, and Aga Mahommed was soon deprived of most of his revenues. He had recently wrested from her west of the Caspian had made great progress, but the circumstance does not seem to have changed his plans for the army. Although, when the spring arrived and the shah led his forces to the Aras, the Russians had, it is true, retreated, yet territory had been regained by them as far south as the Talysh. Aga Mahommed had now arrived at the close of his career. He was enabled, with some difficulty, to get his troops across the river, and take possession of Shusha, which had given them so much trouble a year or two before. There, in camp, he was murdered (1797) by his own personal attendants—one, who were under sentence of death, but allowed to be at large. He was then fifty-seven years of age, and had ruled over part of Persia for more than eighteen years—over the kingdom generally for about three years, and from his coronation for about one year only.

The brutal treatment he had experienced in boyhood under the orders of ‘Adil Shah, and the opprobrious name of “eunuch” with which he was taunted by his enemies, no doubt contributed to embitter his nature. His contempt of luxury, his avoidance of hyperbole and dislike of excessive ceremony, his protection to commerce and consideration for his soldiers, the reluctance with which he assumed the crown almost at the close of his reign—all these would have been praised in another man, but on his death the memory of his atrocious tyranny alone survived. Those who have seen his portrait once will recognize the face wherever presented. “Beardless and shrivelled,” writes Sir John Malcolm, “it resembled that of an aged and wrinkled woman, and the expression of his countenance, at no time pleasant, was horrible when clouded, as it very often was, with indignation. He was sensible of this, and could not bear that any one should look at him.”

Aga Mahommed had made up his mind that he should be succeeded by his nephew Fath ‘Ali Shah, son of his full brother, Hosain Kuli Khan, governor of Fars. There was a short interval of confusion after the murder. The remains of the sovereign were exposed to insult, the provinces and districts which had been disturbed, the recently captured and some left bank of the Aras was abandoned; but the wisdom and resolution of the minister, Hajji Ibrahim, and of Mirza Mahommed Khan Kajar secured order and acceptance of the duly appointed heir. The first, proclaiming his own allegiance, put himself at the head of a large body of troops and marched towards the capital. The second closed the gates of Teheran to all comers until Fath ‘Ali Shah came himself from Shiraz. Though instantly proclaimed on arrival, the new monarch was not crowned until the spring of the following year (1798).

The so-called rebellions which followed were many, but not of any magnitude. Such as belong to local history are three in number. These, as far as Soltani Shahr, the general whose possession of the crown jewels enabled him, after the defeat of his army at Kazvin, to secure his personal safety and obtain a government; of Hosain Kuli Khan, the shah’s brother, which was compromised by the mother’s intervention; and of Mahommed, son of Zaki Khan, Zend, who was defeated on more than one occasion in battle, and fled into Turkish territory. Later, Sadik Khan, having again incurred the royal displeasure, was seized, confined and mercilessly bricked up in his dungeon to die of starvation.

Another adversary presented himself in the person of Nadir Mirza Fath ‘Ali Shah. Who, when Aga Mahommed appeared before Meshed, had taken some steps with the Afghans. Fath ‘Ali sent to warn him of the consequences, but without the desired effect. Finally, he advanced into Khorasan with an army which appears to have met with no opposition save at Nishapur and Turbet, both of which places were taken, and when it reached Meshed, Nadir Mirza tendered his submission, which was accepted. Peace having been further cemented by an alliance between a Kajar general and the prince’s daughter, the shah returned to Teheran.

Now that the narrative of Persian kings has been brought up to the period of the consolidation of the Kajar dynasty and commence-
PERSIA

Relations with England, India and France.

A certain Mahdi 'Ali Khan had landed at Bushire, entrusted by the governor of Bombay with a letter to the shah, and he was followed shortly by an English envoy from the Persian government, Captain Malcolm, to establish closer relations. He had not only to talk about the Afghans but about the French, and the trade of the Persian Gulf. The results were a political and commercial treaty, and a return mission to India from Fath 'Ali Shah. France next sent her message. In 1801 an Armenian merchant from Bagdad had appeared as the bearer of credentials from Napoleon, but his mission was mistrusted and came to nothing. Some five years afterwards Jaubert, after detention and imprisonment on the road, arrived at Teheran and went back to Europe with a duly accredited Persian ambassador, who concluded a treaty with Bonaparte. But Firishteh, the Persian diplomatist, a mission of many officers under General Gardane to instruct and drill the local army was sent from France. Hence arose the counter-mission of Sir Harford Jones from England. It was the inscription of a new era. In April 1808, found that it had been anticipated by a previously sent mission from the governor-general of India, under Malcolm again, then holding the rank of brigadier-general.

On the 31st of October the force was surprised by an attack of the enemy, and retreated; the next night they were again attacked and routed at Aslanduz. Christie fell bravely fighting at the head of his brigade; Lieutenant Ross, one of the serving officers, and Captain Stirling were killed, and the other officers severely wounded. The ranking men was responsible for the disaster. Lenkoran was taken by Persia, but retaken by Russia during the next three months; and on the 13th of October 1813, durch Sir Gore Ouseley's intervention, Russia, Persia, and Persia put an end to all hostilities and returned to India. The next year Sir Harford Jones was relieved as envoy by Sir Gore Ouseley.

Meanwhile hostilities had been resumed with Russia, and in 1813 the British had used his good offices for the restoration of peace, but the endeavour failed. To add to the Persian difficulty, in July of this year a treaty was concluded between Persia and England. The latter, however, the second of the two English envoys who was in 1810 again despatched as their own private envoy. He brought with him Captains Lindsay and Chrissie to assist the Persians in the war, and presented the shah with some serviceable field-pieces. He was welcomed in camp at Ujan, and took the lead of all Russian troops towards the mouth of the Oxus, and returned to India. The next year Sir Harford Jones was relieved as envoy by Sir Gore Ouseley.

Meanwhile hostilities had been resumed with Russia, and in 1815 the British had used his good offices for the restoration of peace, but the endeavour failed. To add to the Persian difficulty, in July of this year a treaty was concluded between Persia and England. The latter, however, the second of the two English envoys who was in 1810 again despatched as their own private envoy. He brought with him Captains Lindsay and Chrissie to assist the Persians in the war, and presented the shah with some serviceable field-pieces. He was welcomed in camp at Ujan, and took the lead of all Russian troops towards the mouth of the Oxus, and returned to India. The next year Sir Harford Jones was relieved as envoy by Sir Gore Ouseley.

 Renewal of War.

On the death of the emperor Alexander in December 1825 Prince Menshikov was sent to Teheran to settle a dispute which had arisen between the two governments regarding the prescribed frontier. But, as the claim of Persia to a particular district then occupied by Russia could not be admitted, the special envoy was given his commission with the usual threatening terms. Persia put an end to all hostilities, and the Afghan question. Fath 'Ali Shah was fortunate in having to deal with a less dangerous neighbour than the Muscovite of persistent policy and the Turk of precarious friendship. The Afghan, though equal to the Persian in physical force and prowess, was inferior in worldly knowledge and experience. Moreover, the family divisions among the ruling houses of Afghanistan grew from day to day. On the death of the prince who had so long been the head of the house of Ghurikhan, and had on several occasions been restored at Meshed by the presence of the royal camp, fresh grounds of complaint were urged against the rash but powerless prince, and recourse was had in the natural way. The chieftain who was appointed by Mihmandar to carry out the arrangements for the king, a man of quick temper, although quiet had for the moment been restored at Meshed by the presence of the royal camp, fresh grounds of complaint were urged against the rash but powerless prince, and recourse was had in the natural way. The chieftain who was appointed by Mihmandar to carry out the arrangements for the king, a man of quick temper,
that Fath 'Ali Shah's claim to Meshed, as belonging to the Persian crown, was actively resisted. But the large Province of Khorasan, of which Meshed was the capital, had never been other than a nominal dependency of the crown since Nadir; and in the year 1795 the Shah Amirkhan, who had been appointed by the powerful and advanced Mirdad Khan had sent a large force, under the command of Colonel Shae, sometimes called the 'British detachment,' which accompanied the French troops. Thus far regards Yezd, Kerman and Shiraz.

Haji Firuzu'd-Din, son of Timur Shah, reigned undisturbed in that city from 1800 to 1816. Since Fath 'Ali Shah's accession and his brother Mahmud had been, as it were, under Persian protection and retained in the capital, a claim to the empire of Nadir, but her pretensions had been satisfied by payments of tribute or evasive replies. Now, however, that she marched her army against the place, Firuzu'd-Din called in the aid of his brother Shah of Kabul, who sent him the famous viceroy Khan Barakzai. The latter, intriguing on his own account, got possession of the town and its citadel; and then rallied for the Persian forces, and forced them to pull into the fortress of Perspolis. In November, 1816, Mahmod Khan who had got temporary hold of Herat, more troops were despatched thither, but, by the use of money or bribes, their departure was purchased. Some eight or nine thousand, however, fled in alarm and continued their journey towards the empire of the Safavid dynasty. The advice of the British envoy was dissuasive in this respect, and therefore distasteful.

Sir John Campbell, in less than a year after the sovereign's instructions successively endorsed by the British ministers of England and France, had left for the Afghan frontier. He was joined by a regiment of the 24th Foot and a detachment of the 60th Regiment. The change in personnel signified also a transfer of superintendence of the Persian legation, which passed from the government in India to the authorities in England. The expedition was thus a most auspicious beginning of the new year 1817, and of the new reign that Henry Martyn was in Persia, and completed his able translation of the New Testament into the language of that country. Little more remains to be here narrated of the days of Fath 'Ali Shah. Among the remarkable occurrences may be noted the murder of K launched in 1828 at M. Grebayodav, the Russian envoy, whose conduct in forcibly retaining two women of Erivan provoked the interference of the mullahs and people. To repair the evil consequences of this innovation, Fath 'Ali Shah, son of the crown prince and some high officers of the state, was despatched to St Petersburg. Shortly afterwards the alliance with Russia was strengthened, and that with England slackened in part.

Fath 'Ali Shah had a numerous family. Agreeably to the Persian custom, asserted by his predecessors, of nominating the heir-apparent for the throne, his father's death, for it was necessary to clear the way for the son, was not even announced to the public. He had passed over the eldest, Mahomed 'Ali, in favour of a junior, 'Abbas; but, as the nominee died in the lifetime of his father, the old king had proclaimed Mahomed Mirza, the son of 'Abbas, and his own grandson, to be his successor. Why a younger son had been originally selected, to the prejudice of his elder brother, is differently stated by different writers. The true probability is probably the superior rank of his mother.

Five or twenty-eight years old when he came to the throne in 1834. He died at the age of forty-two, after a reign of about thirteen and a half years. His accession was not publicly notified for some months after his grandeur, and his excellence was appreciated by all competitors, and there were two on this occasion—one 'Ali Mirza, governor of Teheran, who actually assumed a royal title, and another, Colonel Owing, who commanded in the road from Teheran. The expedition was taken by the British envoy, Sir John Campbell, assisted by Colonel Bethune, at the head of a considerable force, supplied with artillery, the opposition of the first was neutralized, and Mahomed Shah, evidently out of mind of the result of the engagement, the 31st of the same month. It cost more time and trouble to bring the second to book. Hasan 'Ali, the farman-farma, or commander-in-chief, and his brother and abettor, had an army at their disposal, and removed with some difficulty the old governor of Isfahan to Isfahan to ready to meet them. An engagement which took place near Kumiush, on the road between Isfahan and Shiraz, having been successful, the English commander pushed on to the latter town, where the two rebel princes were seized and imprisoned, Forwarded under escort to Teheran, they were, according to Watson, ordered to be sent on thence as state prisoners to Ardebil, but the
The 9th of September Mahommed Shah had "mounted his horse" and gone from before the walls of the beleaguered city.

The siege of Herat, which lasted for nearly ten months, was the great event in the reign of Mahommed Shah. The British expedition in 1736-1737 was but a fragment of a conspiracy, otherwise known as the chief of the Assassins; a new rupture with Turkey; the banishment of the asafu' d-daula, governor of Khorasan, followed by the insurrection and defeat of his son; and the rise of British influence in Persia.

In the demands of the British Government was included the cession by Persia of places such as Farah and Sabzwar, which had been taken during the war from the Afghans, as well as a renewal of the British officers lent to the shah to proceed towards Baghdad en route to India, and retired to Erzerum with the members of his mission.

On the Persian side, charges were made against M'Neill, and a special envoy was sent to England to support them. An endeavor was at the same time made to interest the cabinets of Europe in influencing the British government on behalf of Persia. The envoy managed to obtain an interview with the minister of foreign affairs, and claimed that a British officer, Lt. Watson (afterwards Sir John M'Neill), to renew his demand of the Îlia Mirza's province of Kish, had landed in the province of Jizda, and as one of its immediate results, Kharak was evacuated by the British-Indian troops.

There had been a long diplomatic correspondence in Europe on the subject of the Count Simonich and other Russian officers at Herat. Among the papers is a very important letter from Count Nesseof to Count Pozzo di Borgo in which Russia declares herself satisfied, and says that the shah shall be granted in the same position and power as before, and that no demands are made upon him, because she found "justice on the side of England" and "wrong on the side of Persia." She withdrew her agent from Kandahar and would not have with the Afghans any relations but those made in the name of her country and government.

Aga Khan's rebellion was fostered by the defection to his cause of a large portion of the force sent against him; but he yielded at last to the local authorities of Kerman and fled the province and country. He afterwards resided many years at Bombay, where, while maintaining among natives a quasi-spiritual character, he was better known among Europeans for his doings on the turf.

The quarrel with Turkey was generally about frontier questions. But there was another point which disquieted the British Government, viz., the continued inactivity of the British officers lent to the shah to proceed towards Baghdad en route to India, and retired to Erzerum with the members of his mission.

The queen-mother, as president of the council, showed much judgment and capacity in conciliating adverse parties. But the six or seven weeks which passed after the death of the one king and the coronation of the other proved a disturbed interval, and full power was not in the hands of the minister whom the shah himself up in the royal palace with 1200 followers, and had to take refuge in the sanctuary of Shah 'Abdul-'Azim near Teheran. On the 13th of October 1736, Wadi Khuran, a partisan of the asafu' d-daula, and himself an ex-minister of the shah's, on whose behalf the battle of Tarkhan was lost, was banished, was welcomed back to the capital. At Isfahah, Shiraz and Kerman serious riots took place, which were with difficulty suppressed.

The first four months of the reign were eventful. He had gained possession of Meshed itself, driving the prince-governor, Hamza Mirza, into the citadel; and so firm was his attitude that Yar Mahommed of Herat, who had come to help the government troops to expel him, was forced to leave. The shah was relatively independent of the prince-governor also. The solar now defied Murad Mirza, Nasru 'd-Din's uncle, who was besieging the city. In April 1780, after a siege of more than eighteen months, fortune turned against the shah, and two others were captured by the royal authorities; the fourth jumped in a well. The existence of a conspiracy was then discovered in which forty persons were implicated; of the conspirators put to death—some under cruel torture.

Mirza Taki, the amiru 'n-nizam (vulgarly amir ziam), or commander-in-chief, was a good specimen of the self-made man of Persia. When England was in the Crimean War of 1854-55 her alliance with a Mahommedan power in no way added to her

E. — Persia from 1884 to 1901.

In 1865 the Shah had mooted the idea of a Persian naval flotilla in the Persian Gulf, to consist of two or three steamers manned by Arabs and commanded by English naval officers; but the idea was disowned by the British government, to whom it was known that the project really conformed aggressive designs upon the independence of the islands and pearl fisheries of Bahrein (Curzon, Persia, ii. 294). Fifteen years later it was repeatedly pointed out to the authorities that the revenues from the customs of the Persian Gulf would be much increased if control were exercised at all ports, particularly the small ones where smuggling was being carried on on a large scale, and in 1883 the Shah decided upon the acquisition of four or five steamers, one to be purchased yearly, and instructed the late Ali Kuli Khan, Mukber ad-daulah, minister of telegraphs, to obtain designs and estimates from British and German firms. The tender of a well-known German firm at Bremerhaven was finally accepted, and one of the minister's sons then residing in London had the necessary contracts for the first steamer. Sir Ronald Thomson, the British representative in Persia, having at the same time induced the Shah to consider the advantages of Persia of opening the Karun River and connecting it with Teheran by a carriageable road, a small river steamer for controlling the shipping on the Karun was ordered as well, and the construction of the road was decided upon. Two steamers, the "Susa" and the "Persepolis", were completed in January 1885 at a cost of £32,000, and despatched with German officers and crew to the Persian Gulf. When the steamers were ready to do the work they had been intended for, the farmer, or farmers, of the Gulf customs raised difficulties and objected to pay the "levies". The Persian government would not allow any interference with what he considered his hereditary rights of the shipping monopoly on the Karun, and the objects for which the steamers had been brought were not attained. The "Persepolis" remained idle at Bushire, and the "Susa" was tied up in the Failileh creek, near Mahommed Husain Khan, the Karun sultan, in May 1886. The question of opening the Karun and of constructing a carriageable road from Ahvaz to Teheran was also abandoned.

The scheme of opening the Karun and of constructing a carriageable road from Ahvaz to Teheran was also abandoned.

Frequent interruptions occurred on the telegraph line between Teheran and Meshid in 1885, at the time of the "Panjdeh incident. When the Russians were advancing towards Afghanistan and Sir Peter Lumsden was on the Afghan frontier; and Sir Ronald Thomson concluded an agreement with the Persian government for the line to be kept in working order by an English inspector, the Indian government paying 60 per cent. of the cost of maintenance, and an English signaler being stationed at Meshid. Shortly afterwards Sir Ronald Thomson left Persia (he died on the 15th of November 1888), and Arthur (afterwards Sir Arthur) Nicolson was appointed chargé d'affaires. During the latter's tenure of office an agreement was concluded between the Persian and British governments regarding the British telegraphic settlement at Jask, and the telegraphic conventions of 1868 and 1872 for the laying of undersea telegraphic cable across the Strait of Hormuz and the Persian Gulf, which was laid down through Persia, in force until the 1st of January 1895, were prolonged until the 31st of January 1905 by two conventions dated the 3rd of July 1887. Since then these conventions have been prolonged to 1925.

Ayub Khan, son of Shir 'Ali (Shere Ali) of Afghanistan, who had taken refuge in Persia in October 1881, and was kept interned in the capital under an agreement, concluded on the 17th of April 1884, between Great Britain and Persia, with a pension of 8,000 annas per annum from the British government escaped on the 14th of August 1887. After a futile attempt to enter Afghan territory and raise a revolt
against the Amir Abdur Rahman, he gave himself up to the British consul-general at Meshed in the beginning of November, and was sent under escort to the Turkish frontier and thence via Baghdad to India. Yahya Khan, Mashir-ad-daulah, the Persian minister for foreign affairs, who professed to order the lady to be burned, or to be thrown into the river by Ayub Khan's escape in order to please his Russian friends, was dismissed from office.

In December 1887 Sir Henry Drummond Wolff was appointed minister plenipotentiary to Persia, and his appointment greatly pleased the Persian court, and the shah lent a willing ear to his advocacy for the development of trade and commerce, construction of roads, abolition of various restrictions upon Persian merchants, &c. Sir Henry Drummond Wolff (May 22, 1888) proclaimed, issuing freedom of life and property to all his subjects, and (Oct. 30) declared the Karun river open to international navigation up to Ahvaz. In February 1889 the Russian ambassador to Persia, who had been prime-minister since 1884, Grand Vizier Sadir 'azim, was dismissed. In the same year (June 25) the first railway in Persia, a small line of 3 miles from Teheran to Shah-abdul-Azim, was opened under the orders of the tobacco concession and an account of the events which followed (July 9, 1889) Baron Julius de Reuter—in consideration of giving up the rights which he held by his concession obtained in 1873—became the owner of a concession for the formation of a Persian State Bank, with exclusive rights of issuing bank-notes and working the mines of iron, copper, lead, mercury, coal, petroleum, manganese, borax, and asbestos in Persia. Russia now insisted upon what she considered a corresponding advantage; and Prince Dolgoruki, the Russian ambassador to Persia, on February 13, 1889, demanded the shah which gave to Russia the refusal of any railway concession in Persia for a period of five years. The Persian State Bank was established by British royal charter, dated the 2nd of September 1896, under the name of "The Bank of Persia." The railway agreement with Russia was changed in November 1896 into one interdicting all railways whatsoever in Persia.

In April 1889 the shah set out upon his third voyage to Europe. After a visit to the principal courts, including a stay of a month in England, where he was accompanied by Sir Henry Drummond Wolff, he returned to his capital (Oct. 1889). Sir Henry returned to Persia soon afterwards, and in March of the following year the Persian government granted another important concession, that of a tobacco monopoly, which after the British minister to leave Persia. It was during his stay in England that the shah, for two or three days without his grand vizier, who was mourning for the death of his brother, listened to bad advice and granted a concession for the monopoly of lotteries in Persia to a Persian subject. The latter ceded the concession to a British syndicate for 404,000. Very soon afterwards the shah was made aware of the evil results of this monopoly, and withdrew the concession, but the syndicate did not get the money paid for it returned. This unfortunate affair had the effect of greatly discriminating Persia on the London Stock Exchange for a long time. The concession for the tobacco monopoly was taken up by the Imperial Tobacco Company, and a corporation was chartered in England, which, fostered by the clergy, and after a serious riot at Teheran (Jan. 4, 1892) the Persian government withdrew the concession and agreed to pay an indemnity of 500,000 (April 5, 1892). In order to pay this indemnity the shah issued 400,000, which he deposited in the Imperial Bank of Persia, which was redeemed in 1900 out of the proceeds of the Russian 5% loan of that year. (For details of the tobacco concession and an account of the events which followed, see E. Lorin, La Persia economica, Rome, 1900, pp. 164-169; and Dr Feuvrier, Trois ans à la cour de Perse, Paris, 1889, ch. v., the latter ascribing the failure of the tobacco monopoly to "some intrigue."

In November 1889 Malcolm Khan, Nizam-ul-Mulk, who had been representative to the court of Great Britain since October 1872, was recalled, and Mirza Mohammed 'Ali Khan, consul-general at Bouchikhi, was enabled to take his place. In the following March. In 1890 the scheme of a carriageway road from Teheran to Ahvaz was taken up again; the Imperial Bank of Persia obtained a concession, and work of construction was begun in the south, while the northern portion was ceded to the British government. The mining rights of the Imperial Bank of Persia were ceded to the Persian Bank Mining Rights Corporation, and a number of engineers were sent out to Persia. The total absence of easy means of communication and the difficulties of travel made the value of the mineral products and water in the mineral districts made profitable operations impossible, and the corporation liquidated in 1894, after having expended a large sum of money.

Kate Greenfield Case. The British authorites demanded the girl's restitution, which was promptly settled by her declaring that she had left her mother's house of her own accord, and was the wife of the Kurd. It also became known that she was the daughter of a British-protected Hungarian named Grünfeld, who had died some years since, and an old correspondence was discovered between her mother and Ayub Khan. Sir Frank Lascelles, who had been appointed minister to Persia in July, arrived at Teheran in the late autumn of 1891. In the following year Persia had a visitation of cholera. In Teheran and its environs some 40,000 have died, or about 8% of the population. In 1893 the epidemic appeared again, but in a milder form. In June 1893 Persia ceded to Russia the little village of Shiraz, giving Russia in return a strip of desert ground near Abshih, on the frontiers of Persian and Russian territory in 1828, according to the Treaty of Turkmanchay.

Sir Frank Lascelles left Persia in the early part of 1894, and was succeeded by Sir Mortimer Durand, who was appointed in July and arrived in Teheran in the November. In the following year the shah, by a firman dated the 12th of May 1895 gave the exclusive right of exploring ancient sites in Persia to the French government, with the stipulation that one-half of the discovered antiquities, excepting those of gold and silver and precious stones, should belong to the French government, which also had the preferential right of acquiring by purchase the other half and any of the other antiquities not claimed within a reasonable time. In 1897 M. J. de Morgan, who had been on a scientific mission in Persia some years before and later in Egypt, was appointed chief of a mission to Persia, and began work at Susa in December.
In the autumn of 1896 the grand vizier (Amin-es-Sultan) encountered much hostility from some members of the shah's entourage and various high personages. Amin-ad-daulah was appointed minister of foreign affairs, and sent to Tabriz. Shortly afterwards the grand vizier found it impossible to carry on his work, resigned, and retired to Kerm (Nov. 24), and the shah formed a new cabinet, under an absolutely new prime minister, with the object of opposing the grand vizier. After three months of the new regime affairs of state fell into arrears, and the most important department, that of the interior, was completely disorganized. The shah, however, recalled Amin-es-Sultan (July 30), and appointed him minister president (rais-i-vuzara) and minister of the interior. In June Amin-ad-daulah was made prince minister of finance, and in August raised to the dignity of grand vizier (sadr 'azim), Nairo 'l-Mulk was appointed minister of finance (Feb. 1898), and made an attempt to introduce a simple system of accounts, a budget, reorganize the revenue department, made a new assessment of the land-tax, &c.; but resistance on the part of the officials rendered it abortive.

In the latter part of 1897 E. Graves, the inspector of the English telegraph line from Jask eastwards, was brutally murdered by Baluchi, and the agents of the Persian government sent to seize the murderers were resisted by the tribes. A considerable district broke out into open revolt, troops under the command of the government were thus needed to quell it, and in August raised to the dignity of grand vizier (sadr 'azim), Nairo 'l-Mulk was appointed minister of finance (Feb. 1898), and made an attempt to introduce a simple system of accounts, a budget, reorganize the revenue department, made a new assessment of the land-tax, &c.; but resistance on the part of the officials rendered it abortive.

Abductive
Negotiations
for British
Loan
1896.

The British government had been during the previous year, but with the sole result of discrediting the

Persian government in Europe. In the beginning of 1896 the shah's medical advisers strongly recommended a change of ministers. Amin-es-Sultan was appointed minister president, as his departure from Persia without paying the arrears to the army and to thousands of functionaries, or providing a sufficient sum for carrying on the government during his absence, would have caused great consequence. Several negotiations for a loan were entered upon. It was estimated that £1,000,000 would be required to pay all debts, including the balance due on the £2,400,000 loan, and leave a surplus sufficient for paying the government until the shah's return. London capitalists offered to float a loan for £1,250,000 at 5% and on the custom of Fars and the Persian Gulf ports, and to give £250,000 for the Persian Gulf canal. The shah, however, stipulated for a kind of control over the custom-houses by placing their own agents as cashiers in them. This stipulation was agreed to in principle by the grand vizier, Amin-ad-daulah, who, in March, in order to meet some pressing demands on the treasury borrowed £50,000, on the customs receipts of Kermanshah and Bushire, and agreed to the lenders, the Imperial Bank of Persia's agents, being placed as cashiers in the custom-houses of both cities. He encountered, however, difficulties of interfering with the system of revenue, and found that the province estimate of the money required for paying its debts was about 50% below the mark, now asked for double the amount offered by the London capitalists, without, however, proportionately increasing the guarantee. This disorganized all previous arrangements, and the negotiations for a London loan came to an end for a time at the end of July, leaving in the minds of the Persian government the unfortunate impression that the British government had done nothing for them.

On the 9th of July the former grand vizier, Amin-es-Sultan, was recalled from Kerm, where he had remained since November 1896, arrived at Téhéran, and was reinstated as grand vizier on the 10th of August. His immense popularity, his friendly relations with the clergy, and some temporary advances from the banks, tided over difficulties for some time. The reform of the Kermanshah government was not, however, carried out, and the three Belgian custom-house officials who had been engaged by Amin-ad-daulah in the beginning of the year were instructed to collect information and devise a scheme for the reorganization of the system, and to report before 10th December. While these systems were in progress in 1898 the custom-houses of the provinces of Azerbaijan and Kermanshah were given over to the Belgians. The results of this step were not satisfactory, and the government was induced to abolish the custom system and set up one of its own. In March 1900, a number of other Belgian custom-house officials were engaged.

In December, when renewed negotiations for a loan from London were not appearing to progress favourably, the long-looked-for visit to Europe was considered to be absolutely necessary; in the following year, the shah issued a firman authorizing the Russian Banque des Fréres de Perse to float a loan. Shortly after this it was said that the London capitalists were willing to lend £1,250,000 without insisting upon the objectionable control clause; but the proposal came too late, and on the 30th of January 1900, the Russian government had offered a loan in the sum of £2,231,000, with a guarantee of £2,400,000 at 5%, secured by all the customs receipts of Persia, excepting those for Fars and the Persian Gulf ports. Only in the case of failure of paying instalments and interest was the bank to be given control of the custom-houses. Persia received 85% of the nominal capital, and the Russian government guaranteed the bonds held. Mortimer was immediately remitted to Téhéran, and nearly all the arrears were paid, while the balance of the 1892 London 6% loan was paid off by direct remittance to London.

At the end of 1896 Amin-ad-daulah was made president, and the shah's government had as ministers, under the presidency of his second son, Europe, Malik Mansur Mirza, Shus-es-Sultan, who had made a long stay on the Continent the year before.

After a residence of a month at Contrexéville, the shah proceeded (July 14) to St Petersburg, and thence to Paris (July 29), intending to go to London on the 8th of August. But on account of the mourning during which several courts were thrown through the death of the King of Italy (July 29) and the duke of Sussex-Coburg-Gotha (July 30), the visits to England, Germany and Italy were abandoned. On the 2nd of August an anarchist made an attempt upon the shah's life in Paris.

F.—Russo-British Rivalry (1902-1907) and the Persian Revolution (1906-1909).

In 1902 Muzaffar-ad-Din Shah revisited the principal European capitals, and was received by King Edward VII. at Portsmouth in August. A mission headed by Viscount Downe was afterwards despatched to Persia, to invest the shah with the order of the Garter, a ceremony which took place in Téhéran on the 2nd of February 1903. A week later, a new commercial treaty was concluded between Great Britain and Persia, which instituted various reforms in the customs service, secured to both countries the right to import and export their manufactures, and substituted a new body for the old, in the shape of a commission, open to the commercial representatives of any nation. The British commission was provided for in the treaty of 1857. These provisions to some extent counterbalanced the losses inflicted on British trade by the Russo-Persian commercial treaty signed in 1902, which had seriously damaged the Indian tea trade, and had led to a rapid extension of Russian influence. Between 1899 and 1903 the Russian Bank had lent Persia £5,000,000, of which fully half was paid to the shah for his personal requirements. Russian concessionnaires were given the right to build roads from Tabriz to Téhéran (1902) and from Tabriz to Kazvin (1903); and the Russian Bank opened new branches in Seistan—an example which was followed in 1909 by the Bank of Persia. It was, however, in the Persian Gulf that the most important provision of the treaty was felt. The shah's government in 1898, had agreed to give the British the right of a port on the Gulf, but Russia threatened to become dangerous. Great Britain had almost a monopoly of maritime commerce in the Gulf, and was alone responsible for buoying, lighting and policing its waters. The British claim to political supremacy in this region had thus a solid economic basis; it had been emphasized by the British action at Kuwait (q.v.) in 1899, and by the declaration made in the House of Lords by Lord Lansdowne, as secretary of state for foreign affairs, to the effect that Great Britain would resist by all means in its power the attempt of any other nation to establish itself in force on the shores of the Gulf. On the 16th of November 1903, Lord Curzon, the viceroy of India, sailed from Karachi for the Persian Gulf. His ship, the "Hardinge," was escorted by four cruisers, and the voyage was regarded as a political demonstration, to be interpreted in connexion with Lord Lansdowne's declaration. At Bushire, on the 1st of December, the Persian government of Fars, Ala-ad-daula, submitted a breach of diplomatic etiquette which induced Lord Curzon to sail away without landing. This incident was considered by some British observers to have been brought about by Russian intrigue, and the fact that Ala-ad-daula was dismissed in 1904, after the Japanese had achieved several initial successes in the Russo-Japanese war, was held to confirm this opinion. But Russian financial and commercial influence in
Persia continued to increase; in December 1904 a special mission under Mirza Riza Khan was received in audience by the tsar; and in May 1905 Muzaffar-ud-Din Shah himself left Persia to visit the courts of Vienna and St Petersburg.

The Seistan Mission of 1902-1905.—A dispute as to the frontier between Afghanistan and Seistan arose in 1902. The boundary delimited by the Seistan mission of 1870-1872, and known as the "Goldsmid line," was drawn along the course of the river Helmund. Between 1872 and 1902 the Helmund took a more westerly direction; no boundary marks had been erected, and a wide strip of territory remained in dispute. The Persians claimed that the boundary was the old bed of the river, the Afghans that it was the new bed; and in accordance with the treaty of 1872 both parties asked the British government to arbitrate. In January 1903, Colonel Arthur Henry MacMahon, who had previously delimited the frontier between Afghanistan and British India, was despatched from Quetta. The Persian officials were at first hostile, but their opposition, which was attributed to Russian influence at Tehran, was eventually overcome, and Colonel MacMahon (who was knighted in 1906) delivered his final award, sustaining the Persian contention, in February 1905.

British Commercial Missions.—Owing to the success of the Maclean mission, which visited and reported upon the markets and trade-routes of north-western Persia in 1903, under the direction of the Board of Trade, a similar mission was sent to southern Persia in 1904, under the auspices of the Upper India Chamber of Commerce, the Bengal Chamber and the Indian Tea Cess Company. The report of this mission (by Gleadowe-Newcomen) was published in 1906. After showing that civilized government was practically non-existent in the regions visited, it suggested as the chief remedy the conclusion of a Russo-British convention, and the division of Persia into "spheres of influence."

Russo-British Convention of 1907.—The political situation caused by the Russo-Japanese War and by an internal crisis in Persia itself rendered possible such an agreement between the two rival powers, and a Russo-British convention was signed on the 31st of August 1907. Its chief provisions, in regard to Persia, are as follows: (1) north of a line drawn from Kasr-i-Shirin, Isfahan, Yezd and Kakh to the junction of the Persian, and Afghan frontiers Great Britain undertook to seek no political or commercial concession, and to refrain from opposing the acquisition of any such concession by Russia or Russian subjects; (2) Russia gave to Great Britain a like undertaking in respect of the territory south of a line extending from the Afghan frontier to Gazik, Birjend, Kermán and Bander Abbas; (3) the territory between the lines above-mentioned was to be regarded as a neutral zone in which either country might obtain concessions; (4) all existing concessions in any part of Persia were to be respected; (5) should Persia fail to meet its liabilities in respect of loans contracted, before the signature of the convention, with the Persian Banque d'Escompte and de Frêts, or with the Imperial Bank of Persia, Great Britain and Russia reserved the right to assume control over the Persian revenues payable within their respective spheres of influence. With this convention was published a letter from the British secretary of state for foreign affairs (Sir E. Grey), stating (1) that the Persian Gulf lay outside the scope of the convention, (2) that Russia admitted the special interests of Great Britain in the Gulf, and (3) that these interests were to be maintained by Great Britain as before.

The Persian Constitution.—The misgovernment and disorder which were revealed to Europe by the Gleadowe-Newcomen report, and by such sporadic outbreaks as the massacre of the Babis in Yezd (1903), had caused widespread discontent in Persia. In 1905, partly owing to the example shown by the revolutionary parties in Russia, this discontent took the form of a demand for representative institutions. On the 5th of August 1906, Muzaffar-ud-Din Shah issued a rescript in which he undertook to form a national council (Majlis) representing the whole people (see above, Constitution). The Majlis was duly elected, and was opened by the shah in person on the 7th of October 1906. In January 1907 the shah died, and was succeeded by his eldest son, Mahomed 'Ali Mirza, who on the 11th of February published a message to his people, pleading himself to adhere to the new constitution.

The Revolution.—On the 12th of November the shah visited the Majlis, and repeated his pledge, but during December a riot in Tehran developed into a political crisis, in which the shah's troops were employed against the civil population. The Majlis issued a manifesto to the powers, declaring that the shah intended to overthrow the constitution, and demanding intervention. The Russian and British ministers in Tehran urged the shah to withdraw the manifesto, and sent a message to the Majlis, promising compliance with its demands and agreeing to place the whole army under the control of the ministry of war. These concessions alleviated the prevailing unrest for a time, but the Royalist and Nationalist parties continued secretly to intrigue against one another, and in February 1908, while the shah was driving in Tehran, two bombs were exploded under his motor-car. Two persons were killed, but the shah was unhurt, and the Majlis formally congratulated him on his escape. A prolonged ministerial crisis, in April and May, was attributed by the Nationalists to the influence of reactionary courtiers, and by the Royalists to the influence of the Anjumans, or political clubs, which were alleged to control the Nationalist majority in the Majlis. Early in June the Majlis urged the shah to dismiss the courtiers under suspicion. Mahomed 'Ali consented, but withdrew from Tehran; and on his departure the royal bodyguard of so-called "Cossacks"—Persian soldiers officered by Russians in the shah's service—at once came into conflict with the Nationalists. The house of parliament was bombarded, and when the Majlis appointed commissioners to discuss terms, the shah issued a manifesto dissolving the Majlis, and entrusted the restoration of order in Tehran to military administrators. He also proposed to substitute for the elected Majlis a council of forty members, nominated by himself; but under pressure from Great Britain and Russia he promised to abandon this scheme and to order another general election. Meanwhile, civil war had broken out in the provinces; Kurdish raiders had sacked many villages near Tabriz; Persian brigands had attacked the Russian frontier-guards on the borders of Transcaucasia, and the indemnity demanded by the tsar's government was not paid until several Persian villages had been burned by Russian troops. This incident, combined with the employment of the so-called Cossacks, evoked a protest from the Nationalists, who asserted that Russia was aiding the Royalists; the accusation was true only in so far as it referred to the conduct of certain anjumans, but it was used by the Government to entrench the government. Early in 1909, indeed, a Russian force of 2000 men was sent to watch events near Tabriz, and if necessary to intervene in favour of the Nationalists who held the town, and had for some months been besieged by the shah's troops. The presence of the Russians ultimately induced the Royalists to abandon the siege. In January of the same year the revolution spread to Isfahan, where the Bakhtiari chiefs made common cause with the Nationalists, deposed the Royalist governor and marched on the capital. In May and June the shah issued proclamations declaring his fidelity to the constitution, and promising an amnesty to all political offenders; but he was powerless to stay the advance of the combined Bakhtiari and Nationalist troops, who entered Tehran on the 13th of July. After severe street fighting the Cossacks deserted to the rebels, and the shah took refuge in the Russian legation (July 13). This was interpreted as an act of abdication; on the same day the national council met, and chose Mahomed 'Ali's son, Sultan Ahmad Mirza, aged thirteen, as his successor. Asad Ul-Mulk, head of the Kajar tribe, was appointed regent. On the 9th of September 1909, the ex-shah departed for his place of exile in the Crimea, escorted by Russian Cossacks and Indian sowars. On the 15th of November a newly elected Majlis was formally opened by the shah.

   New Persian: \( \text{dzh} \)

LANGUAGE AND LITERATURE

1. Persian (Iranian) Languages.—Under the name of Persian is included the whole of that great family of languages occupying a field nearly coincident with the modern Iran, of which true Persian is simply the western division. Persian is therefore common and more correct to speak of the Iranian family. The original native name of the race which spoke these tongues was Aryan. King Darius is called on an inscription a "Persian, son of an Aryan, an Aryan of Aryan rase"; and the followers of the Zoroastrian religion in their earliest records never give themselves any other title but Aryan dāngkhāvāt, that is to say, "Aryan races." The province of the Iranian language is bounded on the west by the Semitic, on the north and north-east by the Ural-atic or Turanian, and on the south-east by the kindred language of India.

The Iranian languages form one of the great branches of the Indo-European stem, first recognized as such by Sir William Jones and Friedrich Schlegel. The Indo-European or Indo-Germanic languages are divided by Brugmann into (1) Aryan, with sub-branches (a) Indian, (b) Iranian; (2) Armenian; (3) Greek; (4) Albanian; (5) Italic; (6) Celtic; (7) Germanic, with sub-branches (a) Gothic, (b) Scandinavian, (c) West Germanic; and (8) Balto-Slavonic. (See Indo-European.) The Aryan family (called by Professor Sievers the "Asiatic base-language") is subdivided into (1) Iranian (Eranian, or Erano-Aryan) languages, (2) Pisacha, or non-Sanskritic Indo-Aryan languages, (3) Indo-Aryan, or Sanskrit Indo-Aryan languages (for the last two see Indo-Aryan); (4) Iranian being also grouped into Persian and non-Persian.

The common characteristics of all Iranian languages, which distinguish them especially from Sanskrit, are as follows:

1. The change of the original \( s \) into the spirant \( h \). Thus—
   Sanskrit: \( s, sh \) 
   Zend: \( zh \) 
   Old Persian: \( z \) 
   New Persian: \( dz \)

2. The change of the original \( s \) into the spirant \( h \). Thus—
   Sanskrit: \( s, sh \) 
   Zend: \( zh \) 
   Old Persian: \( z \) 
   New Persian: \( dz \)

3. The change of the original \( s \) into the spirant \( kh \). Thus—
   Sanskrit: \( s, sh \) 
   Zend: \( zh \) 
   Old Persian: \( z \) 
   New Persian: \( dz \)

4. Name of the supreme god of the Persians. 
   5. The Zend-Avesta is the correct title for the original text of the Persian Bible. 
   6. The Avesta is divided into three parts: (1) Yasna, with an appendix, Visparad, a collection of prayers and forms for divine service; (2) Vendidad, a divided work, known as a manual of the penal code of the ancient Persians; (3) Khordah-Avesta, or the Small Avesta, containing the Yasht, the contents of which are for the most part mythological, with shorter prayers for private devotion.
the clearness of the exchange of the language of the gathās is its striking resemblance to the oldest Sanskrit, the language of the Vedic poems. The gathā language (much more than the later Zend) and the language of the Veda has a close resemblance, except that the Zend language, for reasons of time, is more than two dialects of one tongue. Whole strophes of the gathās can be turned into good old Sanskrit by the application of certain phonetic laws; for example—

"mat vao padāhā yā frāsrūtā izhāyā
paśca yā izhāyā ushnānā
at vāo asārādhyācā nemāngā
at vāo vang'hush manbhāng hunāretāt," becomes in Sanskrit—

"mana vah padāhā yā prācrūtā ihāyā
paśca yā ihāyā uttāntā
at vāo asārādhyācā nemāngā
at vāo vāsor manasāh sūnāretā."  

1

The language of the other parts of the Avesta is more modern, but not all of one date, so that we can follow the gradual decline of Zend in the Avesta itself. The later the date of a text, the simpler is the grammar: the more lax the use of the cases. We have no chronological points by which to fix the date when Zend ceased to be a living language; no part of the Avesta can well be placed before the 5th century B.C. Before the under-growth of Zend, it is said to have been already written out on dressed cow-hides and preserved in the state archives at Persepolis.

The followers of Zoroaster soon ceased to understand Zend. For this reason, all that has survived of the Zend version is translated into Middle Persian or Pahlavi (q.v.) under the Sassanians. This translation, though still regarded as canonical by the Parsees, shows a very imperfect knowledge of the original language. Its value for modern philology has been the subject of much needless controversy amongst European scholars. It is only a secondary means towards the comprehension of the ancient text, and must be used with discrimination. A logical system of comparative auxiliaries, aided by reference to Sanskrit, assists us here, especially with the gatha texts.

The phonetic system of Zend consists of simple signs which express the fundamental characters of sound in the language, with great precision. In the vowel-system a notable feature is the presence of the short vowels e and o, which are not found in Sanskrit and Old Persian; thus the Sanskrit sansi, Old Persian hanti, becomes zend in Zend. The use of the vowels is complicated by a tendency to combinations of vowels and to epenthesis, i.e. the transposition of weak vowels into the next syllable; e.g. Sanskrit bharat, Zend bharatii (he carries); Old Persian varva, Zend mowra (Merv); Sanskrit nimbon, Zend nimbo (heroes); Sanskrit aeyekahva (dative plural of aey, a horse) is in Zend aspaeykiiu; Sanskrit krotvai (he does), Zend keranatii. Zend has also a system of nasal vowels and liquids; owing to this the words seem rather inflated; e.g. saya (on the left) becomes in Zend shahniiu; bhratii (it glitters), Zend bardattii, ged (you), Zend gendh. In the consonantal system we are struck with the suddenness, in three forms of modification, of and nasals (five in number), and by the complete absence of l. A characteristic phonetic change is that of ri into sh; e.g. Zend ashii for Sanskrit rī, Old Persian rī (in Arizorxos); frrashi for Pahlavi frewarzin, New Persian jīer (the spirits of the dead). The verb displays a large abundance of primary forms with Sanskrit, but the conjugation by periphrasis is only slightly developed. The noun has the same eight cases as in Sanskrit. In Zend there is a special ablative, limited, as in Sanskrit, to the "a" stems, whilst in later Zend the ablative is extended to all the stems indiscriminately. We do not know in what character Zend was written before the time of Alexander; the Sogdian of Dastān we find an alphabetic and very legible character in use, derived from Sasanian Pahlavi, and closely resembling the younger Pahlavi found in books. The oldest known manuscripts are of the 14th century A.D.

Although the existence of the Zend language was known to the Oxford scholar Thomas Hyde, the Frenchman Anquetil Duperron, who went to the East Indies in 1755 to visit the Parsee priests, was the first to draw the attention of the learned world to the subject. Scientific work on Zend began with Burnouf, and has 1 "With whom of my making which is now heard, and with prayerful hands, I come before the Mazda, and with the sincere humility of the upright man and with the believer's song of praise."

2 Grammars by F. Spiegel (Leipzig, 1867) and A. V. W. Jackson (Stuttgart, 1862); Dictionary by F. Justi (Leipzig, 1864); ed. of the Zend Avesta by E. G. West (London, 1876); by C. F. Geldner (Stuttgart, 1886-1895; also in English); translation into German by Spiegel (Leipzig, 1852), and into English by Darmesteter (Oxford, 1880) in Max Müller's Sacred Books of the East.

since then made rapid strides, especially since the Vedas have opened to us a knowledge of the oldest Sanskrit.

2. Old Persian.—This is the language of the ancient Persians properly so-called, in all probability the mother-tongue of Middle Persian of the Pahlavi text and of Old Persian. We know Old Persian from the rock-inscriptions of the Achaemenians, now fully deciphered. Most of them, and these the latest of them, date from the 6th century B.C., but we have speciments as late as Artaxerxes Ochus. In the main the language is already much degraded; but on the whole it is almost as antique as Zend, with which it has many points in common. In this case, if we take a sentence from an inscription of Darius as—

"Aramazdāh yā imām būmim adāh yā avar amānām adāh yā martiyam adāh yā sīyātīm adāh yā martiya-yāhī yā Daśraveya kahāvatīyatam akhun akhun parvunum kahāvatīyam," it would be in Zend—

"Ahrūr mazdā yō imām būmim adāh yō avar amānām adāh yō martiyam adāh yō sīyātīm adāh yō martiya-yāhī yō Daśraveya kahāvatīyatam akhun akhun parvunum kahāvatīyam,"

The phonetic system in Old Persian is much simplier than in Zend. The vowels e and o are wanting; in their place the old "a" sound still appears as in Sanskrit, e.g. Zend bagem, Old Persian bagam; Sanskrit bhagam; Old Persian haraman, Zend haramera, Sanskrit samaranā. As regards consonants, it is noticeable that the old z (s s) still preserved in Zend passes into d—a rule that still holds in New Persian; compare—

hasta (hand) zasta dasta dast
jraya (sea) zraya draya dray
abham (l) azem adam...  

Also Old Persian has no special l. Final consonants are almost entirely wanting. In this respect Old Persian goes much farther than the Zend idioms, e.g. Old Persian abhari, Sanskrit abhārāt, Zend abarot, teqeh: nominative baha, root-form baga-s, Sanskrit bhaga. The differences in declension between Old Persian and Zend are unimportant.

Old Persian inscriptions are written in the cuneiform character of the simplest form, known as the "first class." Most of the inscriptions have besides two translations into the more complicated kinds of cuneiform character of two other languages of the Persian Empire. For the oldest of these Zend; the second is still a mystery. The interpretation of the Persian cuneiform, the character and dialect of which are equally unknown, was begun by G. F. Grotefend, who was followed by E. Burnouf, Sir Henry Rawlinson and J. Oppert. The ancient Persian inscriptions have been collected in a Latin translation with grammar and glossaries by F. Spiegel (Leipzig, 1862: new and enlarged ed., 1881). The other ancient tongues and dialects of this period are known as Aryan, the real language of which is in the period of peculiar idioms in Sogdiana, Zabolistan, Herat, &c. It is doubtful whether the languages of the Scythians, the Lyceans and the Lydians, of which hardly anything remains, are Persians or not.

After the fall of the Achaemenians there is a period of five centuries, from which no document of the Persian language has come down to us. 1

1 The Arzakiins Persian nationality rapidly declined; all that remains to us from that period—namely, the inscriptions on coins—is in the Greek tongue. Only towards the end of the Parthian dynasty and after the rise of the Sassanians, under whom the national traditions were again cultivated in Persia, do we recover the lost traces of the Persian language in the Pahlavi inscriptions and literature.

3. Middle Persian.—The singular phenomena presented by Pahlavi writing have been discussed in a separate article (PAHLAVI). The languages which it disguises rather than expresses—Middle Persian, as we may call it—presents many changes as compared with the Old Persian of the Achaemenian epoch. The simplest forms of the ancient language are much reduced in number; the case-ending is lost; the noun has only two inflexions, the singular and the plural; the cases are expressed by prepositions—e.g. ráhā (the soul), nom. and acc. sing., plur. ráhāt; dat. sing. or ab. ráhit; ráhāt. Even distinctive forms for gender are entirely abandoned, e.g. the pronoun are signifies "he," "she," "it." In the verb compound forms predominate. In this respect Middle Persian is more accurately Persian than previously. 2

And perhaps of the Medes. Although we have no record of the Median language we cannot regard it as differing to any great extent from the Persian. The Medes and Persians were two closely-connected races. There is nothing to justify us in looking for the Medo-Persian tongue either in the cuneiform writings of the second class or in Zend.

Ormuzd, who created this earth and heaven, who created man and man's dwelling-place, who made Darius king, the one and only king of many."
4. New Persian.—The last step in the development of the language is New Persian, represented in its oldest form by Firdausi.

In grammatical forms it is still poorer than Middle Persian; except English, no Indo-European language has the number of inflections, but this is made up for by the subtle development of the syntax. The structure of New Persian has hardly altered at all since the Shāhnāma; but the original purism of Firdausi, who made every effort to keep the language free from neighboring admixture, is no longer maintained. Arabic literature and speech exercised so powerful an influence on New Persian, especially on the written language, that it could not withstand the admission of an immense number of Semitic words. These words were never included in the vocabulary, which would be refused acceptance in good Persian. But, nevertheless, New Persian has remained a language of genuine Iranian stock.

Among the changes of the sound system in New Persian, as compared with the Old Persian, especially Old Persia, the first that claims mention is the change of the tenues ⟨b⟩, ⟨p⟩, ⟨t⟩, ⟨d⟩, ⟨g⟩, ⟨z⟩. Thus we have—

<table>

<tr>
<td>baďdaka (slave)</td>
<td>bandak</td>
</tr>
<tr>
<td>spāda</td>
<td>sipāh</td>
</tr>
</tbody>
</table>

Old ⟨y⟩ often appears as ⟨j⟩; Zend yāma (glass), New Persian jāmā (a youth). New Persian jāvān (youth). Two consonants are not allowed to stand together at the beginning of a word; vowels are frequently inserted or prefixed, e.g. New Persian sidān or sidān (to stand), root sī|dā |dār (brother), Zend and Pahlavi brādā.

Amongst modern languages and dialects other than Persian which must be also assigned to the Iranian family may be mentioned:

Modern Dialects.
1. Kurdish, a language nearly akin to New Persian, with which it has important characteristics. It is chiefly distinguished from it by a marked tendency to shorten words and to replace ⟨k⟩, ⟨d⟩, ⟨g⟩ by ⟨c⟩, ⟨b⟩, ⟨h⟩. New Persian bārdar; Kurd. bērd (brother) = New Persian bārād. Kurd. dim (I give) = New Persian dihām; Kurd. spī (white) = New Persian sipād.

2. Baluchi, the language of Baluchistan, also very closely akin to New Persian, but especially distinguished from it in that all the old spurious have been changed into explosives, e.g. Baluch rāb (sleep) = Zend rebnva; Baluch kāp (slime) = Zend kafa, New Persian ko|f |

3. Ossetic, true Iranian, in spite of its resemblance in sound to the Georgian.

4. Pushtu (less accurately Afghan), which has certainly been increasingly influenced by the neighboring Indian languages in inflexion, syntax and vocabulary, but is still at bottom a pure Iranian language, not merely intermediate between Iranian and Indian.

The position of Armenian remains doubtful. Some scholars attribute it to the Iranian family; others prefer to regard it as a separate and independent member of the Indo-European group. Many words of the first sight seem to prove its Iranian origin are only adopted from the Persian. 

II. Modern Persian Literature.—Persian scholars are greatly at variance about the origin of their nation's poetry. Most of them go back to the 5th century and mention Avesta,

II. Modern Persian Literature.—Persian scholars are greatly at variance about the origin of their nation's poetry. Most of them go back to the 5th century and mention Avesta,
PERSIA

astronomer; and Kišá', a native of the same town, a man of stern and ascetic manners, who sang in melodious rhythm the praise of 'Ali and the twelve imáms. All these poets flourished under the patronage of the Sámanid princes, who also fostered the growing desire of their nation for historical and antiquarian researches, for exegetical and medical studies. Manşúr I., the grandson of Rádáqí's patron, ordered (963; 352 A.H.) his vizier Ba'llámí to translate the famous universal history of Tabarlī (838-923 A.D.) from Arabic into Persian; and this

Tabarlī, "Ta'rikh-i-Tabarlī", the oldest prose work in modern Persian, is not merely remarkable from a philological point of view, it is also the classic model of an easy and simple style (French trans. by L. Dubieux and H. Zotenber, 1857-1874). The same prince employed the most learned among the ulema of Transoxiana for a translation of Tabarlī's second great work, the Ta'farī, or commentary on the Koran, and accepted the dedication of the first Persian book on medicine, a pharmacoedia by the physician Abu Mašuṣ Muwaßa b. 'Ali of Herát (edited by Seligmann, Vienna, 1859), which forms a kind of connecting link between Greek and Indian medicine. It was soon after further developed by the great Avicenna (d. 1037; 428 A.H.), himself a Persian by birth and author of pretty wine-songs, moral maxims, psychological tracts, and a manual of philosophic science, the Dānishmānā-i-Álā's, in his native tongue.

A still greater impulse was given, both to the patriotic feelings and the national poetry of the Persians, by Mašuṣ's son and successor, Prince Núh II., who ascended the throne in 976 (356 A.H.). Full of enthusiasm for the glorious past of the old Iranian kingdom, he charged his court poet Daḵšī (Daqjej), who openly praised in his ghazals the Zoroastrian creed, to turn the Khodá'tvāma, or "Book of Kings," into Persian verse. Shortly after commencing this work Daḵšī was murdered in the pride of life; his death was soon followed by the fall of the Sámanid dynasty itself. But Daḵšī's great enterprise was not abandoned; a stronger hand, a higher genius, was to continue and to complete it, and this genius was found in Firdousi (940-1020; 339-411 A.H.), with whom we enter the golden age of the national epic in Persia (see Firdousi).

In 1011, after thirty-five years of unremittent labour, he accomplished his gigantic task, and wrote the last distichs of the immortal Šahânwāna, that "glorious monument of Eastern genius and learning," as Sir W. Jones calls it, "which, if ever it should be generally understood in its original language, will contest the merit of invention with Homer itself." The Šahân-

Imitations of Homer, the "Šábeštānāma," exercised such an irresistible fascination upon all minds that there was soon a keen competition among the younger poets as to who should produce the most successful imitation of that classic model; and this competition has gone on under different forms through all the following centuries, even to the most recent times. First of all, the old popular traditions, as they had not yet been extinguished by Firdousi, were ransacked for new epic themes, and a regular cycle of national epopees gathered round the Book of Kings, drawn almost exclusively from the archives of the princes of Sejistán, the family of Firdousi's greatest hero, Rustam. The first and most ambitious of these competitors seems to have been Asádi's own son, 'Ali b. Ahmad al-Asádi, the author of the oldest Persian glossary, who completed in 1066 (458 A.H.), in upwards of 9000 distichs, the Garšāhpāna, or marvellous story of the warlike feats and love adventures of Garšāhp, one of Rustam's ancestors. The heroic deeds of Rustam's grandfather were celebrated in the Šāmānā, which almost equals at length in size those of Rustam: two famous of the Jahāgabāštānā and the Parāmārshāna; those of his daughter, an aman, in the Brunhild style of the German Nibelunge, in the Bātān Gushāhpāna; those of his grandson in the Barāsānima; those of his great-grandson in the Shahrīyārānama (ascribed to Mukhtār and dedicated to Mas'ūd Shah, who is probably identical with Mas'ūd b. Ibrāhīm, Sultan Maḥmūd's great-grandson, 1090-1114; 492-508 A.H.); and the wonderful exploits of a son of Isfandiyār, another hero of the Šāhānāma, in the Bahmannāma.

When these old Iranian sources were almost exhausted, the difficulty was met in various ingenious ways. While some slight historical records of the heroic age were still obtainable poetical imagination seized upon them at once; where no traditions at all were forthcoming fiction pure and simple asserted its right; and thus the national epopee gave way to the epic story, and—substituting prose for verse—to the novel and the fairy tale. Models of the former class are the various Iskandarnaşmas, or "Books of Alexander the Great," the oldest and most original of which is that of Niñāmī of Ganja, the modern Elizavetpol (completed about 1202; 599 A.H.); the latter begins with the Kitāb-i-Samak 'īyār, a novel in three volumes (about 1185; 585 A.H.), and reaches its climax in the Bāstān-i-Khaward, or "Garden of Imagination," a prose romance of fabulous large volumes, by Maḥmòd Taḵī Khāyāl, written between 1742 and 1756 (1155 and 1160 A.H.). Some writers, both in prose and verse, turned from the exhausted fields of the national glory of Persia, and chose their subjects from the chivalrous times of their own Bedouin conquerors, or even from the Jewish legends of the Koran. Of this description are the Anbīyānāma, or history of the pre-Mahomedan prophets, by Ḥasan Abshībāri 'Ayānī (before the 8th century of the Hegira); Ibn Ḥusam's Khwārānāma, (1427; 830 A.H.), of the deeds of 'Alī; Badhīl's Ḥaṁma-i-Ḥaḍārāi, which was completed by Nafā' (1723; 1325 A.H.), or the life of Mahomed and the first four caliphs; Kā'im's Fārāmbānama-i-Pāshā, the book of joy of Fātima, Mahomet's daughter (1737; 1150 A.H.); all four in the epic metre of the Šāhānāma; and the prose stories of Ḥātim Tāl, the famous model of liberality and generosity in pre-Islamic times; of Amīr Ḥasan, the uncle of Mahomet; and of the Muḥādāt-i-Musawat, or the miraculous deeds of Moses, by Mu'in-almirkī (died about 1501; 907 A.H.).

Quite a different turn was taken by the ambition of another class of imitators of Firdousi, especially during the last four centuries of the Hegira, who tried to create a new heroic epopee by celebrating in rhythm and rhyme stirring events of recent date. The gigantic figure of Timūr inspired Hāfee (d. 1524; 927 A.H.) with his Timārānama; the stormy epoch of the first Šafawī rulers, who succeeded at last in reuniting for some time the various provinces of the old Persian realm into one great monarchy, furnished Kā'im (died after 1560; 967 A.H.) with the materials of his Šāhānāma, a poetical history of Shāh Isma'īl and Shāh Ṭahmāsp. Another Šāhānāma, celebrating Shāh 'Abbās the Great, was written by Kamāl of Sabzvār; and even the cruelties of Nādir Shāh were duly chronicled in a pompous epic style in Ishratī's Šāhānāma-i-Ṭādir (1746; 1162 A.H.). But all these poems are surpassed in length by the 33,000 distichs of the Šāhānānāma by the poet-laureate of Faith 'Ali Shāh of Persia (1707-1834), and the 40,000 distichs of the Georganāma, a poetical history of India from its discovery by the Portuguese to the conquest of Poonja by the English in 1817. In India this kind of epic versification has flourished since the beginning of Humāyūn's reign (1530-1560); e.g. the Zafarrānāma-i-Shahjahānī by Kūsi (d. 1646; 1056 A.H.); the Šāhānānāma by Tālib Kalm (d. 1651; 1061 A.H.), another panegyrist of Shāh Jahān; Atāshī's Šādīlāna, in honour of Shāh Mahomed 'Adil of Bījār, who ascended the throne in 1629 (1039 A.H.) or 1627; the Tavārīkh-i-Kull K̄h̄b̄h̄ā (1784; 1189 A.H.)

But the national epic was not only the bequest not the only great Firdousi left to his nation. This rich genius gave also the first impulse to romantic, didactic and mystical poetry; and even his own age produced powerful co-operators in these three most conspicuous departments of Persian literature.

LITERATURE

Encomiastic poems that lyrical romanticism rose to the highest pitch.

What Ferdowsi and the court-poets of Sultan Mahmud and Satraps had commenced, what Abū 'l-Faraṣ Rūmī of Lahore and Mas'ud b. Sa'd b. Salmān (under Sultan Ibrāhīm, 1095–1099) had successfully continued, reached its perfection in the famous group of panegyrist who gathered in the first half of the 9th century of the Hegira round the throne of Sultan Sinjar, and partly also round that of his great antagonist, Atṣīz, shah of Khwārizm. This group included Adīb Shahīr, who was drowned by order of the prince in the Oxus about 1143 (540 A.H.), and his pupil Jāhārī, the goldsmith of Bokhārā; Amīr Muʿizzī, the king of poets at Sinjar's court, killed by a stray arrow in 1147 (542 A.H.), Rashīd Waṭwāṭ (the Swallow) who died in 1182 (578 A.H.), and left, besides his ḵaṣṣāds, a valuable treatise on poetry (Ḥadīth-ḵessārī) and a metrical translation of the sentences of 'Ali, 'Abdal-wālī)'s Jabāli, who sang at first, like his contemporary Hasan Ghaznavī (d. 1190; 595 A.H.), the praise of the Ghaznevid shāh Bahrām, but afterwards bestowed his eulogies upon Sinjar, the conqueror of Ghazni; and Aḥṣād-udān Anwarī, the most celebrated ḵaṣṣā-writer of the whole Persian literature. Anwarī (died between 1180 and 1191; 585 and 587 A.H.) who in early life had pursued scientific studies in the madrasa of Tūs, and who ranked among the foremost astronomers of his time, owes his renown as much to the inexhaustible store of poetical similes and epitheta orna{nita which he showered upon Sinjar and other royal and princely personages, as to his cutting sar\0s\0moms, which he was careful to direct, not against individuals, but against whole classes of society and the cruel wrong worked by an inexorable fate—thus disregarding the example of Ferdowsī, whose attack upon Sultan Mahmūd for having cheated him out of the reward for his epos is the oldest and most finished specimen of personal satire. This legitimate branch of high art, however, soon degenerated either into the lower forms of parody and travesty—for which, for instance, a whole group of Translations of foreign stories gained, (d. 1174; 560 A.H.) and his contemporaries, Abū ʿAlī Shahrizārī of the Būrān town, Lāmī of Bokhara, and others gained a certain literary reputation—or into mere comic pieces and jocular poems like the "Pleasant Poems" (Hadīthīyyāt) and the humorous stories of the "Mouse and Cat" and the "Stone-cutter" (Sangtarash) by ʿUbayd Zākānī (d. 1370; 772 A.H.). Anwarī's greatest rival was Khaḵānī (d. 1190; 595 A.H.), the son of a carpenter in Shirvān, and panegyrist of the shāhs of Shirvān, usually called the Findar of the East. To European taste only the shorter epigrams and the double-rhymed poem Tusfīnāt-irāqānī, in which Khāḵāni describes his journey to Mecca and back, give full satisfaction. Among his numerous contemporaries and followers may be noticed Muṣṭāfī d. Alī d. 1196; 594 A.H.), Zāhir Fāżlī (d. 1202; 598 A.H.) and Aḥṭīr Aḥḵakī (d. 1217; 610 A.H.)—three panegyrist of the Il-Khans and of the shahs of Persia, and especially of Sultan Ḵezīl Ārānī—Kamāl-udīn Iṣfāhānī, tortured to death by the Moguls in 1337 (635 A.H.), who sang, like his father Ṣamīl-udīn, the praise of the governors of Iṣfāhān, and gained the epithet of the "creator of fine thoughts" (Ḵhāḵāl-ūlamānī); and Ṣafī-udīn Isfārānī (d. 1267; 666 A.H.), a favourite of the shāhs of Khwārizm.

Flourish in the 6th and 7th centuries of the Hegira were in panegyrics, they attained an equally high standard in didactic and mystical poetry. The origin of both can again be traced to Ferdowsī and his time. In the ethical and Mystical reflections, wise maxims and moral exhortations, Poetry, scattered throughout the Shāhnāma the didactic element is plainly visible, and equally plain in it are the traces of that mystical tendency which was soon to pervade almost all the literary productions of Persian genius. But the most characteristic passage of the epos is the mysterious disappearance of Shāh ʿAlī Khakhosrau, who suddenly, when at the height of earthly fame and splendour, renounces the world in utter disgust, and, carried away by his fervent longing for an abode of everlasting tranquillity, vanishes for ever from the midst of his companions.

The first Persian who employed poetry exclusively for the illustration of Sufi doctrines was Ferdowsī's contemporary, the renowned Sheikh Abū Saʿīd b. Abā Jelāl-ḵayrī of Mahān in Khorāsān (968–1049; 527–604 A.H.), the founder of that specific form of the rubā'ī which gives the most concise expression to religious and philosophic aphorisms—a form which was further developed by the great free-thinker 'Omar b. Khayyām (q.v.), and Aḥṣād-udīn Kīsh (d. 1307; 707 A.H.). The year of Abū Saʿīd's death is most likely that of the first great didactic mathnavī, the Raḵšān, aḏīnāma, or "Book of Enlightenment," by Nāṣīr Khosrau (q.v.), a poem full of sound moral and ethical maxims with slightly mystical tendencies. About twenty-five years later the first theoretical handbook of Ṣūfīs in Persian was composed by 'Ali b. ʿUthmān al-Jallābī al-Hujwī, the Kāshf al-ʿālaḵābī, or "Revelation of Hidden Things," which treats of the various schools of Ṣūfīs, their teachings and observances. A great saint of the same period, Sheikh Abdallāh Asgārī of Herāt (999–1089; 540–621 A.H.), assisted in spreading the pantheistic movement by his Munāfīd or "Invocations to God," by several prose tracts, and by an important collection of biographies of eminent Ṣūfīs, based on an older Arabic compilation, and serving in its turn as groundwork for Jamāl's excellent Nafṣuḥāt-ul-awls (completed in 1478; 883 A.H.). He thus paved the way for the publication of one of the earliest textbooks of the whole sect, the Ḥadīth-ul-ulbābīkī, or "Garden of Truth" (1350; 552 A.H.), by Ḥasan Sanaʾī of Ghazni, to whom all the latter Sufi poets refer as their unrivalled master in spiritual knowledge. As the most uncompromising Ṣūfīs appear the greatest pantheistic writer of all ages, Jelāl ud-dīn Rūmī (1207–1273; 604–672 A.H.; see RūM), and his scarcely less renowned predecessor Fārīd ud-dīn Aṭṭār, who was slain by the Moguls at the age of 114 lunar years in 1230 (627 A.H.). This prolific writer, having performed the pilgrimage to Mecca, devoted himself to a stern ascetic life, and to the composition of Sufi works, partly in prose, as in his valuable "Biography of Eminent Mystic Divine," but mostly in the form of mathnavīs (upwards of twenty in number), among which the following are the most famous: "Book of Counsels," and the Month-ul-affaar, or "Speeches of Bina, the first rank. In the latter an allegorical poem, interspersed with moral tales and pious contemptations, the final absorption of the Sufi in the deity is most ingeniously illustrated.

In strong contrast to these advanced Ṣūfīs stands the greatest moral teacher of Persia, Sheikh Saʿīd of Shirvān (died about 110 lunar years old in 1293; 691 A.H.; see Saʿīd), whose two best known works are the Bāstān, or "Fruit-garden," and
the Gulsân, or "Rose-garden." However, both have found comparatively few imitations—the former in the Dastûr-nâmâ, and the Book of Examinations of Niṣâm-I Memú, to which the Qâmil and the Shahshâh refer in their Persian poems, with a few exceptions. The most famous of these is Rûmî, whose "Bhâshâ" (d. 1320; 770 A.H.) in the Duk Bâkh or "Ten Letters," of Kâtîb (d. 1343; 883 A.H.), and in the Gulât, or "Rose-hower," of Hairât (murdered 1354; 961 A.H.); the latter in Mu'in-uddin Juwâni's Nûgâristân, or "Picture-gallery" (1335; 735 A.H.) and Jâmi's Bahârîstân, or "Spring-garden" (1487; 802 A.H.), wherein an innumerable host of purely Sûfî compositions followed in the wake of Sanâyî's, 'Attâr's and Jâlî's ud-dîn Rumi's mathnâwîs. It will suffice to name a few of the most conspicuous. The Further Shâh Works. Lâmâtî, or "Sparks," of 'Irâqî (d. between 1328 and 1352; 697 and 709 A.H.), the Êd-ul-imâmârîn, or "Store of the Weavers" by Husûnî (d. 1318; 738 A.H.), the Gulsân-e-Râz, or "Rose-bed of Mystery," by Mâhmûd Shâhistanî (d. 1320; 770 A.H.), the Jâmî-I-jâmî, or "Cup of Jamshîd," by Aûbâdî (d. 1338; 778 A.H.), the inâs-ul-árîfîn, or "Friend of the Mystics," by Kâsîm (Qâsim)-I-Anwâr (d. 1434; 877 A.H.), and others; 'Arîfî's Gâh-e Ghvâgîân, or "The Ball and the Bat" (1438; 842 A.H.), Fuzûn u Dîl, or "Beauty and Heart," by Fâtâhî of Nishâpûr (d. 1448; 852 A.H.), Shâhâr u Pâsrwâna, or "The Candle and the Moth," by Ahîf of Shâhraz (1489; 844 A.H.), Shâh u Gâdâ, or "King and Dervish," by Hâfîl (put to death 1352; 950 A.H.) Bahâ-ud-dîn 'Amâlî's (d. 1621; 1050 A.H.) Nûs u 'âbâd, or "Bread and Sweetness," Shêr u Shâkar, or "Milk and Sugar," and many more.

During all these periods of literary activity, lyric poetry, pure and simple, had by no means been neglected; almost all the Lyric Poetry. renowned poets since the time of Rûdâghat had sung in endless strains the pleasures of love and wine, the beauties of nature, and the almighty power of the Creator; but it was left to the incomparable genius of Hâfiz (d. 1380; 791 A.H.; see Hâfiz) to give to the world the most perfect models of lyric composition; and the lines he had laid down were more or less strictly followed by all the ghazal-writers of the 15th and 16th centuries of the Hâfiz's second reign, of his five emperors of Delhi, 'Allâ-ud-dîn Khîlji (1296-1310), his predecessor Feroz Shah and his successor Kûthû-ud-dîn Mâburk, the "Rûmî" of the Khâns, or "Key of Victorics," the Khâns' Shab-i-khânsî, or "The Conversation of the Two Lucky Planets," the Nuh Sîpîr, or "Nine Spheres," and the love-story of Khâdîkhân u Dovulânî. His other five mathnawis formed the first attempt ever made to imitate Niṣâm-I Memú's famous Khamsah, or five romance epopees, and this attempt turned out so well that henceforth almost all epic poets wrote quintuplets of a similar description. Khwâjâ Kirmânî (d. 1352; 773 A.H.) was the next aspirant to Niṣâm-I Memú's fame, with five mathnawis, among which Humâûl u Humâyûn is the most popular, but he had to yield the palm to 'Abîd ar-Râmîn Jâmi (1414-1492; 871-868 A.H.), the last classic poet of Persia, in whose genius were summed all the best qualities of his great predecessors. Many poets followed in Jâmî's footsteps, first of all his nephew Hâjîf (see above), and either wrote whole khamsahs or imitated at least one or other of Niṣâm-I Memú's epopees; thus we have a Lâilâ u Majnûn, for instance, by Maktabh (1490), Hâlî (see above), and Rûh-ulamân (d. 1637). But their efforts could not stop the growing corruption of taste, and it was only at the court of the Mogul emperors, particularly of the great Akbar (1556-1605), who revived Sultan Mâhmûd's "round table," that Persian literature still enjoyed some kind of "Indian summer" in poets like Ghazâlî of Mashhad or Meshed (d. 1572); Urîf of Shâhraz (d. 1591), who wrote spirited kâshâdas, and, like his contemporaries Waṣâshi and Kauâthâr, a mathnawi, Forkhâd u Shârinî; and Fâdî (d. 1595), the author of the romantic poem, Nîl u Dûman, who also imparted new life into the rubâ'î. In Persia proper only Zâûlî, whose clever romance of "Sultan Mâhmûd and his favourite Abyâd" (1592) is widely read in the East, 'Sâîb (d. 1677), who is commonly called the creator of a new style in lyric poetry, and, among the most modern, Hâfîl of Işfâhân, the singer of sweet and tasteful odes (died about 1785), deserve a passing notice.

But we cannot conclude our brief survey of the national literature of Persia without calling attention to the rise of the drama, which has only sprung up in the beginning of the nineteenth century. Like the Greek drama and the mysteries of the European middle ages, it is the offspring of a purely religious ceremony, which for centuries has been performed annually during the first ten days of the month Muharram—the recital of mournful lamentations in memory of the tragic fate of the house of the caliph 'Alî, the hero of the Shi'ît Persian. Most of these passion-plays deal with the slaughter of 'Alî's son 'Ilî and his family in the battle of Kârbâla. But lately this narrow range of dramatic subjects has been considerably widened, Biblical stories and even Christian legends have been brought upon the Persian stage; and there is a fair prospect of a further development of this most interesting and important movement. (See further DRAMA: Persia.)

In the various departments of general Persian literature not touched upon in the foregoing pages the same wonderful activity has prevailed as in the realm of poetry and fiction, since the first books on history and medicine appeared under the Sâmâns (see above). The most important section is that of historical works, which, although deficient in sound criticism and often spoiled by a highly artificial style, supply us with most valuable materials for our own research. Quite unique in this respect are the numerous histories of India, from the first invasion of Sultan Mâhmûd of Ghazni to the English conquest, and even to the first decades of the present century, most of which have been described and partly translated in the Historical Works. work of J. H. M. E. (later H. W. A. K.) on "History of India" (1865-1879). Persian writers have given us, besides, an immense variety of universal histories of the world, with many curious and noteworthy data (see, among others, Mîrkândî's and Khvândamîrî's works under Mîrkhândî; histories of Mahomet and the first caliphs, partly translated from Arabic originals, which have been lost; detailed accounts of all the Persian dynasties, from the Ghaznevides to the still reigning Kâjar, of Jenghiz Khân and the Moguls (in Juwâni's and Waṣâšî's elaborate Tâvîkâh), and...
of Timur and his successors (see an account of the Zafarnamah under Persepolis); histories of sects and creeds, especially the famous Dastubâh, or "School of Manners" (translated by Sheh and Troyer, Paris 1843); and many local chronicles of Iran and Turkey. Next in importance to history rank geography, cosmographic and topographical works, and the several vast books or biographies of Sûfîs and poets, with selections in prose and verse, from the oldest of A'fûf (about 1220) to the last and largest of all, the Makhzan-ul-khûrâb, or "Treasure of Marvelous Matters" (completed 1883), which contains biographies and scriptures of more than 3000 poets. We pass over the well-stocked sections of philosophy, ethics and politics, of theology, law and Sûfism, of mathematics and astronomy, of medicine (the oldest treatise of which is the "Treasure of the shah of Khwârimân in 1710), of Arabic, Persian and Indian, and the lexicography, and only cast a parting glance at the rich collection of old Indian folk-lore and fables preserved in the Persian version of Kalilah u Dimnah (see Rûdâgî, of the Sindbâd-Folk-lore, nâmâ, the Tûvînâmâ, or "Tales of a Parrot," and other works, and, at the translations of standard works of Sanskrit literature, the epoques of the Râma-yana and Mahâbhârata, the Bhagavat-Gîta, the Yoga-Vasishtha, and numerous Purânas and Ûpanîihads, for which we are mostly indebted to the emperor Akbar's indefatigable zeal.

PERSIGNY, JEAN GILBERT VICTOR FIALIN, DUCHE (1808-1872), French statesman, was born at Saint-Germain Lèsponsasse (Loire) on the 11th of January 1808, the son of a receiver of taxes. He was educated at Limoges, and entered the cavalry school at Saumur in 1826, becoming maréchal des logis in the 4th Hussars two years later. The share taken by his regiment in supporting the revolution of 1830 was regarded as insubordination, and next year Fialin was dismissed from the army. He became a journalist, and in 1837 became a strong Bonapartist, and was appointed to the title of comte de Persigny, said to be dormant in his family. He planned the attempt on Strasbourg in 1836 and that on Boulogne in 1840. At Boulogne he was arrested and condemned to twenty years' imprisonment in a fortress, shortly afterwards commuted into mild detention at Versailles, where he wrote a book to prove that the Pyramids were built to prevent the Nile from silting up. This was published in 1845 under the title, De la Destination et de l'utilité permanente des Pyramides. At the revolution of 1848 he was arrested by the provisional government, and on his release took a prominent part in securing the election of Louis Napoleon to the presidency. With Morny and the marshal Saint-Arnaud he plotted the restoration of the empire, and was a devoted servant of Napoleon III. He succeeded Morny as minister of the interior in January 1852, and later in the year became senator. He resigned office in 1854, being appointed next year to the London embassy, which he occupied with a short interval (1858-1859) until 1860, when he resumed the portfolio of the interior. But the growing influence of his rival Rouher provoked his resignation in 1863, when he received the title of duke. A more dangerous enemy than Rouher was the empress Eugénie, whose marriage he had opposed and whose presence in the council chamber he deprecated in a memorandum which fell into the empress's hands. He sought in vain to see Napoleon before he started to take over the command in 1870, and the breach was further widened when master and servant were in exile. Persigny returned to France in 1871, and died at Nice on the 11th of January 1872.

See Mémôires du duc de Persigny (2nd ed., 1896), edited by H. de Lair Eespagnay, his former secretary; an eulogistic Life, Le Duc de Persigny (1865), by Delaros; and Eme Ollivier's Empire libéral (1893, &c.)

PERSSIMMON, the name given to the fruits of Diospyros virginiana in the United States. The tree which bears them belongs to the order Ebenaceae, is usually from 30 to 50 ft. in height, and has oval entire leaves, and unisexual flowers on short stalks. In the male flowers, which are numerous, the stamens are sixteen in number and arranged in four opposite pairs. The flowers are solitary, with traces of stamens, and a smooth ovary with one ovule in each of the eight cells—the ovary is surmounted by four styles, which are hairy at the base. The fruit-stalk is very small, bearing a subglobose fruit an inch or rather more in diameter, of an orange-yellow colour, and with a sweetish astringent pulp. The astringency renders the fruit somewhat unpalatable, but after it has been subjected to the action of frost, or has become partially rotted or "bletted" like a medlar, its flavour is improved. The fruit is eaten in great quantities in the southern states of America, and is also fermented with hops, corn-meal or wheat-bran into a sort of beer or made into brains. The wood is heavy, strong and very close-grained and used in turnery. The tree is very common in the South Atlantic and Gulf states, and attains its largest size in the basin of the Mississippi. It was brought to England before 1629 and is cultivated, but rarely if ever ripens its fruit. It is easily raised from seed and can also be propagated from stolons, which are often produced in great quantity. The Chinese and Japanese cultivate another species, the Diospyros Kaki, of which there exist numerous ill-defined varieties. The fruits are larger than those of the American kind, variable in shape and size, and have similar properties. An astringent fluid, known as shibu, rich in tannin, is expressed from the green fruit and used in various industries. The tree is hardy in the south of England and in the Channel Islands.

PERSIS (mod. Faras, q.v.), the south-western part of Iran (Persia), named from the inhabitants, the Iranian people of the Parsa (Fars); their name was pronounced by the Ionians Persis, with change from o to e, and this form has become dominant
in Greek and in the modern European languages. The natural features of Persis are described very exactly by Nearchus, the admiral of Alexander the Great (preserved by Arrian Indic. 40 and Strabo xv. 727). The country is divided into three parts, of very different character and climate: the coast is sandy and very marshy, the interior mountains have no good harbours, and the climate is very unhealthy; the population is scanty. About 50 m. from the coast rise the chains of the mountains, through which some steep passes lead into the interior valleys (called Κοίλα Ἡπείρος, Strabo xv. 720), which lie about 5000 ft. above the sea. Here the climate is temperate, the country watered by many rivers and lakes, the soil fertile, the vegetation rich, the cattle numerous. These regions, which were thickly populated, form the real Persis of history. "This land Persis," says Darius, in an inscription at Persepolis, "which Ahuramazda has given to me, which is beautiful and rich in horses and men, according to the will of Ahuramazda and myself it trembles before no enemy." The third part is the north, which belongs to the central plateau, still much higher, and therefore rough and very cold in the winter. Towards the north-west it borders on the Median district of Paræacene (about Isfahan); towards the north and north-east it soon passes into the great desert, of which only the oasis of Yezd (Isatikast in Ptolem. vi. 4, 2) is inhabitable. In the east, Persis proper is separated by a desert (Laristan) from the fertile province of Carmania (Kerman), a mountainous region inhabited by a Persian tribe. To Carmania belonged also the coast, with the islands and harbours of Hormuz and Bushire, and the western part of the desert, inhabited by the Turanian tribes. The limits of the desert are fixed by Darius II. at the south-west point, on the coast of the Persian Gulf, and of the plains of Elam or Susiana. For the ancient topography cf. Tomaseck. "Beiträge zur historischen Topographie von Persien" in Sitzungsber. der Wiener Akademie, phil. Cl. cii. xvii. xxii.

The Persians are not mentioned in history before the time of Cyrus; the attempt to identify them with the Parsua, a district in the Zagros chains south of Lake Urmia, often mentioned by the Assyrians, is not tenable. The Parsua are perhaps the non-Arian tribe Ἡπείρος in northern Media, Strabo xi. 506. Herodotus i. 125, gives a list of Persian tribes: the Pasargadæ (at Murgab), Maraphii, Maspri, Panthilaæi (in western Carmania), Deruæae, Germantii (i.e. the Carmanians) are husbandmen, the Dahan (i.e. the "enemies," a general name of the rapacious nomads, used also for the Turanian tribes), Mardi, Dropici, Sagarti (called by Darius Asagarta, in the central desert; cf. Herod. vii. 85) are nomads. The kings of the Pasargadæ, from the clan of the Achaemenidae, have become kings of the Elamitic district Anshan (probably in 596, cf. Cyrus). When, in 553, Cyrus, king of Anshan, rebelled against Astyages, the Maraphians and Masprians joined with the Pasargadæ; after his victory over Astyages all the Persian tribes acknowledged him, and he took the title of "king of Persia." But from then only the inhabitants of Persis proper were considered as the rulers of the empire, and remained therefore in the organization of Darius free from taxes (Herod. iii. 97). But Carmania, with the Sagartians, the Utians (called by Darius Vautiya), and other tribes, formed a satrapy and paid tribute (Herod. iii. 93); the later authors therefore always distinguished between Carmania and Persis. Names of other Persian tribes, partly of very doubtful authority, are given by Strabo xv. 727, and Ptolem. vi. 4 and 8.

The Persians of Cyrus (see Persia: Ancient History) were a vigorous race of husbandmen, living in a healthy climate, accustomed to hard labour and hardship; many stories in Herodotus (especially lx. 122) point the contrast between their simple life and the effeminate nations of the civilized countries of Asia. They were firmly attached to the pure creed of Zoroaster (cf. Herod. i. 131 sqq. and the inscriptions of Darius). When Darius had killed the usurper Smerdis and gained the crown, a new usurper, Vahyazdaita, who likewise pretended to the Pateiskhoreis belongs the lance-bearers of Darius, "Gobryas (Gaubaruva) the Patishuvat," mentioned in his tomb-inscription; they occur also in an inscription of Esarhaddan as Patish-ara, eastwards of Media, and at the extreme at the Caspian gate; the Kyrtiil are the Kurds.

he Smerdis, the son of Cyrus, rose in Yautiya, but was defeated in two battles by Darius's generals and put to death (Behistun inscription). Cyrus had built his capital with his palace and tomb, in Pasargadæ (q.v.). Darius founded a new city about 30 m. farther south on the left bank of the Pulwar, near its confluence with the Sarab, which was a large terrace, on which his magnificent palace and that of his son Xerxes were built. As Pasargadæ was named after the tribe in whose district it lay, so the new capital is by the Persians and Greeks simply called "the Persians"; later authors call it Persopolis (q.v.), "the Persian city." Another Persian palace lay in Taoke, near the coast (Strabo xv. 724; Arrian Ind. 38; Dionys. Perig. 1050); Gabae, which Strabo mentions besides, is Isfahan in Paræacene and belonged already to Media.

Both in Persepolis and Pasargadæ large masses of gold and silver from the tribute of the subject nations were treasured, as in Susa and Ecbatana. But Persis lies too far off from the centre of the Asiatic world to be the seat of government. Like Arabia and similar countries, it could exercise a great momentary influence in history and produce a sudden change throughout the world; but afterwards it would sink into local insignificance. So the Persian kings fixed their residence at Susa, which is always considered as the capital of the empire (therefore Aeschylos wrongly considers it as a Persian town and places the tomb of Darius here). After the reign of Xerxes, Persis and Persepolis became utterly neglected, in spite of occasional visits, and even the palaces of Persepolis remained in part unfinished. But the national feeling of the Persians remained strong. When Alexander had won the victory of Arbela, and occupied Babylon and Susa, he met (in the spring of 331) with strong resistance in Persia, where the satrap Ariebarzanes tried to stop his progress at the "Persian gates," the pass leading up to Persepolis. Here he set fire to the cedar roof of the palace of Xerxes as a symbol that the Greek war of revenge against the Persians had come to an end. Our best information tells us that he soon had the fire extinguished (Plut. Alex. 38); the story of Thisis is a pure fiction, and we may well believe that he repented the damage he had done (Arrian vi. 30, 1).

Alexander had planned to amalgamate the former rulers of the world with his Macedonians; but his death was followed by a Macedonian reaction. Peucætes, the new satrap of Persis, followed the example of Alexander, and thus acquired a strong hold on his subjects (Diod. xix. 48); nor did Seleucus, to whom the dominion of the east ultimately passed (from 311 onwards), disdain the aid of the Persians; he is the only one among the Diadochi who retained his Persian wife, Apame, daughter of Spitamenes. At the same time Seleucus and his son Antiochus I. Soter tried to introduce Hellenism into Persis. Of Greek towns which they founded here we know Alexandria in Carmania (Plin. vi. 177; Ptole. vi. 8, 14; Ammian. Marc. 23, 6, 49). Laodice in the east of Persis (Plin. 6, 113), Stasias, "a Persian town on a great rock, which Antiochus, the son of Seleucus, possessed" (Steph. Byz. s. a.), Antiochia in Persis, founded apparently by Seleucus I. and peopled by Antiochus I. with immigrants called together from all Greece, as we learn from a psphismos passed by "boulé and demos" of this town in 206 in honour of Magnesia on the Maeander (Kern, Inschriften von Magnesia am Maeander, No. 61 = Dittenberger, Orientis gr. inscr. 233, where they are mentioned together with a great many Seleucid towns in Susiana and Babylonia, and compare Kern, No. 18 = Dittenberger, No. 231). An insurrection of the Persians against Seleucus (II.) is mentioned in two strageties of Polybaenus (vii. 39. 40). When in 221 Molon, the satrap of Media, rebelled against Antiochus III., his brother Alexander, satrap of Persis, joined him, but they were defeated and killed in the battle. Persis remains for a part of the Seleucid empire down to Antiochus IV. Epiphanes, who at the end of his reign restored once more the authority of the empire in Babylonia, Susiana and Persis; perhaps a battle, in which the satrap Numerius of Mesene (southern Babylonia) defeated the Persians on the shore of Carmania on sea and land (Plin. vi. 152), belongs to this time. But after the death of Antiochus IV. (164) the
Persius, in full Aulus Persius Flaccus (A.D. 34-62), Roman poet and satirist. According to the Life contained in the MSS., Persius was a native of Volaterrae, of good stock on both parents' side. When six years old he lost his father, and his step-father died in a few years. At the age of twelve Persius came to Rome, where he was taught by Remmius Palaemon, and the rhetor Verginius Flavus. Four years later began a close intimacy with the Stoic Cornutus. In this philosopher's pupil Lucan, Persius found a generous admirer of all he wrote. Still in early youth he became the friend of the lyric poet Caesius Bassus, and whilst with Thrasea Pautus (whose wife Arria was a relative) he had a close friendship of ten years' duration and shared some travels. Seneca met later, and was not attracted by his genius. In his boyhood Persius wrote a tragedy dealing with an episode of Roman history, and a work, the title of which is rendered uncertain by corruption in our MSS. Pithou's generally accepted reading makes the subject that of travel; the excursions with Thrasea however must have taken place after boyhood. The perusal of Lucilius revealed to Persius his vocation, and he set to work upon a book of satires. But he wrote seldom and slowly; a premature death (aeditio stomachi) prevented the completion of his task. He is described as possessed of a gentle disposition, glibbous modesty and personal beauty, and living a life of exemplary devotion towards his mother Fulvia Sisenna, his sister and his aunt. To his mother and sister he left a considerable fortune. Cornutus suppressed all his work except the book of satires in which he made some slight alternations and then handed it over to Bassus for editing. It proved an immediate success. The reader may add a few words on what authority is, as generally with such sources, very doubtful. The Life itself, though not free from the suspicion of interpolation and undoubtedly corrupt and disordered in places, is probably trustworthy. The MSS. say it cannot be connected with one of Valerius Probus, no doubt a learned edition of Persius like those of Virgil and Horace by such famous "grammarians" of Berytus, the poet's contemporary. The only case in which it seems to conflict with the Saturae, however, is in its statement as to the death of Persius's father. The declaiming of a swasoria in his presence (Sat. 3. 4 seq.) implies a more mature age than that of six in the performer. But pater might here mean "step-father," or Persius may have forgotten his own autobiography, may be simply reproducing one of his models. The mere fact that the Life and the Satires agree so closely does not of course prove the authenticity of the former. One of the points in which it differs, however, is in its account of the alterations which have been made in the works of Persius. It requires indeed a thoughtful reading of the Life before we realize how distinct is the impression which is given of a "bookish" youth, who has never strayed far, at least not critically, from the path laid out for him, whereas the course of this is notoriously the picture drawn by the Satires. So much better does Persius know his books than the world that he draws the names of his characters from Horace. A keen observer of what he in his own language calls "the other side of life" (e.g. "such hints as Sat. iii. 110; he shows, however, none of Juvenal's undue stress on unsavoury detail or Horace's exaggeration, so spiced of the silence of the Life, hardly known that against Persius. Not only characters, as noted above, but whole phrases, thoughts and situations come direct from him. The resemblance only emphasizes the difference between the caricaturist of Stoicism and its preacher. Persius strikes the highest note that Roman satire reached; in earnestness and moral purpose rising far superior to the political rancour or good natured purrs of his predecessors and the rhetorical indignation of Juvenal, he seems a forerunner of the great Christian Apologists. From him we learn a lesson Seneca never taught, how that wonderful philosophy could work on minds that still preserved the depth and purity of the old Roman gravitas. When the Life speaks of Seneca's genius most attracting Persius, it presumably refers to Seneca the philosopher. Some of the parallel passages in the works of the two are very close, and hardly admit of explanation by assuming the use of a common source. With Seneca, Persius censures the style of the day, and imitates it. Indeed in some of its worst failings, straining of expression, excess of detail, exaggeration, he outbids Seneca, whilst the obscurity, which makes his little book of not seven hundred lines so difficult to read and is in no way due to great depth of thought, compares very ill with the terse clearness of the Epistolae morales. A curious contrast to this tendency is presented by his free use of "popular" words. Of Plato, so of Persius we hear that he imitated Sophocles; the latter is a late satyrus (Lucian, De mu. 1. 41), but we can at least recognize in the scene that opens Sat. 3. kinship with such work as Theocritus' Adonisiacae and the Mimes of Herodas.

Persius's satires are composed in hexameters, except for the scansion of the short prologue above referred to, in which he half ironically asserts that he writes to earn his bread, not because he is inspired. The first satyrus (Saturae, De mu. 1.41), but we can at least recognize in the scene that opens Sat. 3. kinship with such work as Theocritus' Adonisiacae and the Mimes of Herodas.
and the languishing style is greatly spoiled by the difficulty of appreciating the points involved and indeed of distributing the dialogue (a not uncommon crux in Persius). The remaining satires handle in order (2) the question as to what we may justly and properly regard as the good life; (3) the general question of having a definite aim in life, (4) the necessity of self-knowledge for public men (cf. Plato’s first Alcibiades), (5) the Stoic doctrine of liberty (introduced by generous allusions to Cornutus teaching), and (6) the absolute value of death. The Life tells us that the MSS. were not left complete; some lines were taken (presumably by Cornutus or Bassus) from the end of the book so that it might be quasi finitas. This perhaps means that a sentence in which Persius had laid special emphasis for a paragraph which he had not completed, had to be omitted. The same authority says that Cornutus definitely blacked out an offensive allusion to the emperor’s literary taste and so mutilated the MSS. in Sat. i. 121, —"auriculas autem quis non [for Mida regis habet]!" Traces of lack of revision are, however, still visible; cf. e.g. v. 176 (sudden transition from ambition to superstition) and vi. 37 (where criticism of Greek doctors has nothing to do with the context). The parallels to passages of Horace and Seneca are recorded in the commentaries: in view of what the Life says about Lucan, the verbal resemblance of Sat. iii. 3 to Pers. x. 163 is interesting. Examples of bold language or metaphor: i. 25, ripu te loci vectis capit; iii. 25, titus palaeit, si silentia resurit; v. 92, veteres aquae de pulmone renello. Passages like iii. 87, 100 sqq. show elaboration carried beyond the rules of good taste. Popular words and phrases: caelum addita, gloria mundi,马拉穆, palpo, uloppos. Fine lines, &c., in i. 116 sqq., ii. 6 sqq., 61 sqq., 73 sqq., iii. 39 sqq.

AUTHORSHIP. The MSS. of Persius fall into two groups, the one represented by two of the best of them, the other by that of Pithocean, so important for the Juvenal. Since the publication of J. Biegele's Der Persius, cod. path. recte aestimando (Berlin, 1890) the text of Persius is generally accepted by them.

The important editions are: (1) with explanatory notes: Casaubon (Paris, 1605, enlarged edition by Dübner, Leipzig, 1833); O. Jahn (with the scholia and valuable prologen, Leipzig, 1843; Coning- toos (with translation; 3rd ed., Osler, 1893); H. L. Gelderwa (New York, 1875); G. Némethy (Buda-Pesth, 1903); (2) with critical notes: Jahn-Bücheler (3rd ed., Berlin, 1893); S. G. Owen (with Juvenal, Oxford, 1902). Translations into English by Dryden (c. 1670), by H. U. Owen and H. E. Draper (1900), &c., in Marta, Les Moralités sous l’empire romain (5th ed., Paris, 1886); Nisard, Petites latines de la décadence (Paris, 1834); Hirzel, Der Dialog (Leipzig, 1893); Stainton, History of Criticism, i. 248; H. U. Owen, and H. E. Draper, Persius, A Commentary (London, 1903); and the histories of Roman literature (especially Schanz, §§ 328 sqq.). A Bibliography of Persius, by M. H. Morgan (Cam- bridge, U.S.A., 1893). (W. C. Sc.)

PERSON, OFFENCES AGAINST THE. This expression is used in English law to classify crimes involving some form of assault or personal violence or physical injury, i.e. offences affecting the life, liberty or safety of an individual: but it is also extended to certain offences against morality which cannot technically be described as assaults. The bulk of the offences thus classified, so far as their definition or punishment depends upon statute law, are included in the Offences Against the Person Act 1861 (24 & 25 Vict. c. 100), and in the Criminal Law Amendment Acts of 1882 and 1885, and the Prevention of Cruelty to Children Act 1904. The classification in these statutes is not scientific: e.g. bigamy is within the act of 1861 (s. 57), and certain offences involving assault, e.g. robbery, are to be found in other statutes. The particular offences dealt with by the acts above named are discussed under their appropriate titles, e.g. abortion, assault, bigamy, homicide, rape, &c. In the Indian penal code most of the offences above referred to fall under the head “offences against the human body” (ch. xvi.). In his Digest of the Criminal Law Sir James Stephen includes most of these offences under the title “offences against the person, the conjugal and parental rights, and the reputation of or dishonour of a person” and he also includes them in the Scottish draft code of 1880 and adopted in the Queensland code of 1890. In working out this classification offences not involving assault are relegated to another and perhaps more appropriate title, “offences against morality.”

PERSONALITY (from Lat. persona, originally an actor’s mask, from personare, to sound through), a term applied in philosophy and also in common speech to the identity or individuality which makes a being (person) what he is, or marks him off from all the rest. The term “person,” which is technically used not only in philosophy but also in theology, in law (Gr. προσωπος) and in the three hypostases of the Trinity. It was first introduced by Tertullian, who applied it to a single individual; the Father, the Son and the Holy Ghost were three personae though of one and the same substance (unias substantiae). The nature of this unity in difference exercised the minds of the early Christian theologians, and was the subject of many councils and official pronouncements, according as emphasis was laid on the unity or on the separateness of the persons. There was perpetual schism between the Unitarians and Trinitarians (see for example Sabellius). The natural sense of the word “person” is undoubtedly individuality; hence those who found a difficulty in the philosophic conception of the three-in-one naturally tended to lay emphasis on the distinctions between the members of the Trinity (see HEBESY; MONARCHIANISM; Logos, &c.). A further theological question arises in connexion with the doctrine of immortality (q.v.), and it is argued that immortality is meaningless unless the soul of the dead man is self-conscious throughout.

In philosophy the term has an important ethical significance. The Greek moralists, attaching little importance to individual citizens as such, found the highest moral perfection in the subordination of the individual to the state. Man, as προσωπος, is good only when he is a good ἄρης. Subsequent ethical systems of the oriental type laid stress on the moral worth of personality, finding the summum bonum in the highest realization of the self. This view is specially characteristic of the Neo-hegelian school (e.g. T. H. Green), but it belongs also in various degrees to all intuitional and idealistic systems. Utilitarian universalism, general moral and evolutionist ethics so far resemble the Greek theory that they tend to minimize the importance of personality, by introducing ulterior reasons (e.g. the perfection of the social organism, of humanity) as the ultimate sanctions of moral principles, whereas the intuitionists, by making the criterion abstract and absolute limit goodness to personal obedience to the a priori moral law.

Still more important problems are connected with the psychological significance of personality. What is the origin and character of the consciousness of the self? The consciousness of the identity of another person is comparatively simple; but one’s own individuality consists partly in being aware of that individuality; a man cannot use the word “I” unless he is conscious of the unity of his “self,” and yet there is involved in the word “I” something more than this consciousness. In what does the unity of the “self” consist prior to its being recognized in consciousness; how does the consciousness arise? The answer to this problem is to be found—in so far as it can be found—in the subject-object relation, in the distinction between the external world and the subjective processes of knowing and willing which that relation involves. I will something, and afterwards perceive a corresponding change within the unity of my external world. Hence, we may suppose, arises the consciousness of a permanent self and not-self. It should be observed that self-consciousness varies according to the intellectual development, and the term “personality” is usually connected only with the self-consciousness of an advanced type, not, for example, with that of an animal. Even among human beings there is considerable difference. The most elementary form of human self-consciousness includes in the self not only the soul but also the body, while to the developed self the soul is appended. In the midst of the external objective world. Finally it is necessary to refer to the Kantian distinction of the pure and the empirical ego, the latter ("the Me known") being an object of thought to the former ("the I knowing").

From the use of the term “person” as distinguishing the Latinisches etymologisches Wörterbuch (1906), suggests a derivation from Greek πρόσωπος, a zone. In Roman law persona was one who had civil rights. For the ecclesiastical persona ecclesiae, see PARSON.
PERSONAL PROPERTY—PERSONATION

self from the not-self arises the phrase "personal equation" for those peculiar characteristics or idiocynacies which have to be taken into account in estimating the value of an individual judgment or observation. This phrase, which I have used in my previous writings, was first applied to the errors detected in the astronomical observations of a Greenwich observer named Kinnebrook in 1795. The recognized fact that the greater or less inaccuracy is habitual to individual observers has been investigated, e.g. by Bessel (Abhandlungen, iii. 300) and by Wundt (Physiol. Psychol.), and machines have been devised which make allowance for the error caused by the personal equation (see MICROMETER).

For the psychological problem, see PSYCHOLOGY. For the problems connected with subconscious action, &c., see SUBLIMINAL SELF; TRANCE; HYPONOTISM; TELEPATHY.

PERSONAL PROPERTY, one branch of the main division of the English law of property, the other being "real property." The division of property into real and personal represents a great measure the division into immovable and movable property. It is incidentally recognized in Roman law and generally adopted since.

"Things personal," according to Blackstone, "are goods, money, and all other movables which may attend the owner wherever he thinks proper to go" (Comm. ii. 16). This identification of things personal with movables, though logical in theory, does not, as will be seen, perfectly express the English law, owing to the somewhat anomalous position of chattels real. In England real property is supposed to be superior in dignity to personal property, which was originally of little importance from a legal point of view. This view is the result of feudal ideas, and had no place in the Roman system, in which immovables and movables were dealt with as far as possible in the same manner, and descended according to the rules. The main differences between real and personal property which still exist in England are these.

1. In real property there can be nothing more than limited ownership; there can be no estate property so called in personal property, and it may be held in complete ownership. There is nothing corresponding to an estate-tenancy in personal property; words which in real property would create an estate-tenancy will give an absolute interest in personality. A life-interest may, however, be given in personally, except in articles quae ipso suo consummatur. Limitations of personal property, equally with those of real property, fall within the rule against perpetuities.

2. Personal property is not subject to various incidents of real property, such as rent, dower or escheat.

3. On the death of the owner intestate real property descends to the heir; personal property is divided according to the Statute of Distributions.

4. Real property as a general rule must be transferred by deed; personal property does not need so solemn a mode of transfer.

5. Contracts relating to financial property must be in writing by the Statute of Frauds, 1677, c. 3, s. 4; contracts relating to personal property need only be in writing when it is expressly so provided by statute, as, for instance, in the cases falling under s. 17 of the Statute of Frauds. (6) A will of lands need not be proved, but a will of personality or of personal and real property together must be proved in order to give a title to those claiming under it.

7. Devises of real estate fall as a rule within the Mortmain Acts (see CHARITY AND CHARITIES; CORPORATION); bequests of personal property, other than chattels real, are not within the act.

8. Mortgages of real property need not generally be registered; mortgages of personal property for the most part require registration under the Bills of Sale Acts (see PLEDGE, and BILL OF SALE).

Personal estate was divided in English law into chattels real and chattels personal; the latter are again divided in choses in possession and choses in action (see CHATTLE; CHOICE).

Interest in personal property may be either absolute or qualified. The latter case is illustrated by animals ferae naturae, in which property is only coextensive with detention. Personal property may be acquired by occupancy (including the accessio, commissio, and confusio of Roman law), by invention, as patent and copyright, or by transfer, either by the act of the law (as in bankruptcy, judgment and intestacy), or by the act of the party (as in gift, contract and will).

There are several cases in which, by statute or otherwise, property is taken out of the class of real or personal to which it seems naturally to belong. By the operation of the equitable doctrine of conversion money directed to be employed in the purchase of land, or land directed to be turned into money, is in general regarded as that species of property into which it is directed to be converted. An example of property prima facie real which is treated as personal is an estate pur autre vie, which, since 14 Geo. II. c. 26, s. 9, 1740-1741 (now replaced by the Wills Act 1837, s. 6) is distributable as personal property in the absence of a special occupant. Examples of property prima facie personal which is treated as real are fixtures, heirlooms, such as the personal estate of family portraits, &c., and shares in some of the other companies, as the New River Company, which are real estate by statute. In ordinary cases shares in companies are personal property, unless the shareholders have individually some interest in the land as land.

The terms heritable and movable of Scots law to a great extent correspond with the real and personal of English law. The main points of difference are these. (1) Leases are heritable as to the estate but not as to the term; so do leases for life. (2) The right to rent, as distinct from the right to occupy, is seen in Scotland to be personal.

The law in the United States agrees in most respects with that of England. Heirlooms are unknown, a reason being, no doubt, that the importance of title-deeds is much less than it is in England, owing to the operation of the Registration Acts. Long terms in some states have annexed to them the properties of freehold estates. In some states estates pur autre vie descend like real property; in others an estate pur autre vie is deemed a freehold only during the life of the grantee; after his death it becomes a chattel real. In yet other states the heir has a scintilla of interest as special occupant (Kent, Comm. iv. 27). In some states railway-rolling-stock is considered as purely personal, in others it has been held to be a fixture; in America to property rights in land are granted even in some of the early American corporations were, like New River shares in England, made real estate by statute, as in the case of the Cape Sable Company in Maryland (Schouler, Law of Personal Property, 296); in Louisiana real estate shares in mines and slaves, were regarded as immovables. Pews in churches are generally real property, but in some states they are made personal property by statute. The assignment of choses in action is generally permitted, and is in most states regulated by statute (J. W.)

PERSONATION, in English law, a form of fraud consisting in a false representation by one person (by words or conduct) that he is another person living or dead. It is not an offence by the common law unless the representation is made on oath under circumstances constituting the offence of perjury, or unless the representation if not made on oath is made under circumstances amounting to a common law cheat. Personation has been made an offence by statute in the following cases: (1) where it amounts to a false pretence by words or conduct, and is done with intent to defraud, and property is by such false pretence obtained, 24 & 25 Vict. c. 96 ss. 88-90 (see FALSE PRETENCES); (2) in the case of false and deceitful personation of any person or of the heir, executor, administrator, widow, widower or relative of any property, or for the purpose of defrauding any person by the fraudulent use of any name, to obtain any land, estate, chattel, money, valuable security or property (37 & 38 Vict. c. 36 s. 1); (3) in the case of personation of votes at elections (see CORRUPT PRACTICES).

The first of these offences is a misdemeanour only; the second is a felony punishable by penal servitude for life. The second offence was created in 1874 in consequence of the Tickborne case, in which under the law as it then stood it had been necessary
to prosecute the claimant for perjury. Besides the enactments above referred to there are also a number of provisions for dealing with the perscion of sailors, soldiers, pensioners and owners of stock in the public funds or shares in joint-stock companies, and of persons who falsely acknowledge in the name of another recognizances, deeds or instruments. Before a court or person authorized to take the acknowledgment,

**PERSPECTIVE** (Lat. perspicere, to see through), in mathematics the name given to the art of representing solid objects by a plane drawing which affects the eye as does the object itself. In the article Projection it is shown that if all points in a figure be projected from a fixed centre to a plane, each point on the projection will be the projection of all points on the projecting ray. A complete representation by a single projection is therefore possible only when there is but one point to be projected on each ray. This is the case by projecting from one plane to another, but it is also the case if we project the visible parts of objects in nature; for every ray of light meeting the eye starts from that point in which the ray, if we follow its course from the eye backward, meets for the first time any object. Thus, if we project from a fixed centre the visible part of objects to a plane or other surface, then the outlines of the projection would give the same impression to the eye as the outlines of the things projected, provided that one eye only be used and that this be at the centre of projection. If at the same time the light emanating from the different points in the picture could be made to be of the same kind—that is, of the same colour and intensity and of the same kind of polarization—as that coming from the objects themselves, then the projection would give sensibly the same impression as the objects themselves. The art of obtaining this result constitutes a chief part of the technique of a painter, who includes the rules which guide him under the name of perspective, distinguishing between *linear* and *aerial* perspective—the former relating to the projection, to the *drawing* of the outlines, the latter to the colouring and the shading off of the colours in order to give the appearance of distance. Here we deal only with the former, which is in fact a branch of geometry consisting in the applications of the rules of projection.

§ 1. Our problem is the following: There is given a figure in space, the plane of a picture, and a point as centre of projection; it is required to project the figure from the point to the plane.

From what has been stated about projection (q.v.) in general it follows at once that the projection of a point is a point, that of a line a line. Further, the projection of a point at infinity in a line is in general a finite point. Hence parallel lines are projected into a pencil of lines meeting at some finite point. This point is called the vanishing point of the direction to which it belongs. To find it, we project the point at infinity in any of the parallel lines; that is, we draw through the eye a line in the given direction. This cuts the picture plane in the point required.

Similarly all points at infinity in a plane are projected to a line (see Projection; § 6) which is called the vanishing line of the plane and which is common to all parallel planes.

All lines parallel to the picture plane have their vanishing points at infinity in the picture plane; hence parallel lines which are parallel to the picture plane are projected to parallel lines in their true direction.

The projection of a line is determined by the projection of two points in it, these being very often its vanishing point and its trace on the picture plane. Further, the projection of a point is determined by the projection of two lines through it.

These are the general rules which we now apply. We suppose the picture plane to be vertical.

Let (fig. 1) S be the centre of projection, where the eye is situated, and which in perspective is called the point of sight, ABKL the picture plane, ADMN a horizontal line on which we suppose the objects to rest of which a perspective drawing is to be made. The lowest point contained within a figure that is to appear in the picture is generally selected for this purpose, and is therefore called the ground plane, or sometimes the geometrical plane. It cuts the picture plane in a horizontal line AB called the ground line or base line of the perspective. Consider a horizontal line SV drawn through the eye S perpendicular to the picture, cuts the latter at a point V called the centre of the picture or the centre of vision. The distance SV of the eye from the picture is often called the distance of sight and is the height of the eye above the ground plane. The vanishing line of the ground plane, and hence of every horizontal plane, is got by drawing the projecting rays from S to the points at infinity of the ground plane—in other words, by drawing all horizontal rays through S. These lie in a horizontal plane which cuts the picture plane in a horizontal line DD' through the centre of the picture. This representation contains all of horizontal lines in the picture. It contains the vanishing points of all horizontal lines, the centre of vision V being the vanishing point of all lines parallel to SV, that is, perpendicular to the picture plane. To find the vanishing point of any horizontal line PQ we draw through the point in the picture plane at which the line vanishes, at once determines a line through the eye parallel to the line PQ, and then determine the line where this ray cuts the picture plane. If the line is given in its plane, on the picture plane, then its vanishing point can at once be determined; it is the vertical trace of a line parallel to it through the eye (cf. Geometry; § Descriptive, § 6).

§ 2. Let there be given a horizontal plane in which will be projected the objects of the figure, and at right angles to this plane we project the point in the ground plane to which the objects be brought to the eye. Then it will be found that the horizontal plane through the eye which cuts this plane in the horizon DD' be turned down about its own horizon until it comes to the point S, where VS equals the distance of the eye.

To find the vanishing point of any line in a horizontal plane, we have to draw through S a line in the given direction and see where it cuts the horizon DD'. This distance of VS is also found by making VA and VF equal to each other at a distance S. The two points D, D' are therefore called the distance points.

§ 4. Let it now be required to find the perspective P of a point P' (figs. 1 and 2) in the ground plane. We draw through P' two lines in which the points can easily be found. The most convenient lines are the perpendicular to the base line, and a line making an angle of 45° with the picture plane. These lines in the ground plane are HP' and VP'. The first cuts the picture at Q, or P', and has the vanishing point QV. The other cuts the picture in Q, or rather in R, and has the vanishing point D; its perspective is RD. These two lines meet at P, which is the point required. If QR = QV, R gives the distance of the point P behind the picture plane. Hence if we know the point Q where a perpendicular from a point to the picture plane cuts the latter, and also the distance of the point Q from the picture plane, we can find its perspective. We join Q to V, set off QR to the right equal to the distance of the point behind the picture plane, and join R to the distance to the left; where RD cuts QV is the point F required. Or we set off Q'K to the left equal to the distance and join K' to the distance point D' to the right.

If the distance of the point from the picture should be very great, the point R might fall at too great a distance from Q to be on the ground plane. In this case we might set off QW equal to the 4th part of the distance and join it to a point E, so that VE equals the 8th part of VD. Thus if QW = 4QR and VE = 4VD, then VE will again pass through P'. It is thus possible to find for every point in the ground plane, or in fact in any horizontal plane, the perspective;
for the construction will not be altered if the ground plane be replaced by any other horizontal plane. We can in fact show that the perspective of every point outside as we know the foot of the perpendicular drawn from it to the picture plane, that is, if we know its elevation on the picture plane, and its distance behind it. For this reason it is often convenient to draw in slight outlines the elevation of the figure on the picture plane.

Instead of drawing the elevation of the figure we may also proceed as follows. Suppose (fig. 3) A2 to be the projection of the point of a vertical line 2 parallel to the picture plane. One method adopted in this connection is to draw vertical lines in the perspective as vertical lines (§1). If then the line VA2 cuts the figure plane at Q, and we erect at Q a perpendicular in the picture plane to its base and set off on it QA2 equal to the real height of the point A above the ground plane, then the point A2 is the elevation of A and hence the line A2V will pass through the point A. The latter thus is determined by the intersection of the vertical line through A2 and the line A2V.

This process may be simplified by choosing the point of view so that the construction for finding the point is not made in the horizontal plane in which it lies, but that its plan is constructed in the ground plane. But this has a great advantage. The perspective of a horizontal plane from the picture to the line at infinity occupies in the picture the space between the line where the plane cuts the picture and the horizon, and this space is the greater the farther the plane is from the eye, that is, the farther its trace on the picture plane lies from the horizon. The horizontal plane through the eye is projected into a line, the horizon; hence no construction can be performed in it. The ground plane on the other hand is the lowest horizontal plane used. Hence it offers a large space for constructions, which consequently will allow of greater accuracy.

§ 5. The process is the same if we know the co-ordinates of the point, viz. we take in the base line a point O as origin, and we take the base line, the line OV, and the perpendicular OZ as axes of co-ordinates. If we then know the co-ordinates x, y, z measured in these directions, we make OQ = x, set off on OV a distance QA such that its real length QA2 = y, make QA2 = z, and we find A as before. This process might be simplified by setting off to begin with along OQ and OZ scales in their true dimensions and along OV a scale obtained by projecting the scale on OQ from D to the line OV.

This gives us the undeniable greater advantage of a perspective of any point in space. If lines have to be found, we may determine the perspective of two points in them and join these, and this is in many cases the most convenient process. Often, however, it will be advantageous to find the point of intersection of a line directly by finding the shadow of the point. This is especially to be recommended when a number of parallel lines have to be drawn.

The perspective of any curve is in general a curve. The projection of a conic is a conic, or in special cases a line. If the perspective of a circle is any conic, not necessarily an ellipse. Similarly the perspective of the shadow of a circle on a plane is some conic.

§ 7. A few words must be said about the determination of shadows in perspective. The theory of their construction is very simple. We have given, say, a figure and a point L as source of light. We join the points of the object with the light and thus get the shadow. We then find the line which cuts the surface on which the shadow falls. These constructions must in many cases first be performed in plan and elevation, and then the point in the shadow to be found is projected from it. The construction is different according as we take as the source of light a finite point (say, the flame of a lamp, or the sun, which we may suppose to be at an infinite distance.

For instance, in fig. 3, A is a source of light, EHG a vertical wall, and C the point of which the shadow has to be determined, then the shadow must lie on the line joining A to C. To see where this ray meets the floor we draw through the source of light and the point C a horizontal line; this will cut the floor in a line which contains the feet A1, C1 of the perpendiculars drawn from the points A, C to the floor, or the plans of these points. At C1, where the line AC1 cuts AC, will be the shadow of C on the floor. If the wall EHGF prevents the shadow from falling on the floor, we determine the intersection K of the line AC1 with the base EF of the wall and draw a vertical through it, this gives the intersection of the wall with the vertical plane through A and C. Where it cuts AC is the shadow C1 of C on the wall.

If the shadow of a screen CDDcG has to be found we find the shadow D1 of D which falls on the floor; then D1D’ is the shadow of D,D and D’C’ is the shadow on the floor of the line DC. The shadow of D,D, however, is intercepted by the wall at L. Here then the wall takes up the shadow, which must extend to D’ as the shadow of a line on a plane is a line. Thus the shadow of the screen is found in the shaded part of the figure.

§ 8. If the shadows are due to the sun, we have to find first the perspective of the sun, that is, the vanishing point of its rays. This will always be a point in the picture plane, but we have to distinguish between the cases where the sun is in the front of the picture, and so behind the spectator, or behind the picture plane, and so in front of the spectator. In the second case only does the vanishing point of the rays of the sun actually represent the sun itself. It will be a point above the horizon. In the other case the vanishing point of the rays will lie below the horizon. It is the point where a ray of the sun cuts the plane of the picture plane, or it will be the shadow of the eye on the picture plane.

If the eye is below the point of the sun’s rays, L is that of their projection in a horizontal plane, and let it be required to find the shadow of the vertical column AH. We draw AL and EF; they meet at E’, which is the vanishing point of AH. Since the shadow of the cylinder is a cone, or a frustum, E’F’G’H’ will be the shadow of the quadrilateral EFGH. For the shadow of the column itself we join E’ to A, &c., but only mark the outlines; F’B, the shadow of BF, does not appear as such in the figure.

If the shadow E has to be found when falling on any other surface we use the vertical plane through E, determine its intersection with the surface, and find the point where this intersection is cut by the line EL, then L will be the required shadow of E.

§ 9. If the picture is not to be drawn on a vertical but on another plane—say, the ceiling of a room—the rules given have to be slightly modified. The general principles will remain true. But if the picture is to be on a curved surface the constructions become somewhat more complicated. In the most general case conceivable it would be necessary to have a representation in plan and elevation of the figure required and of the surface on which the projection has to be made. A number of points might also be found by calculation, using co-ordinate geometry. But into this we do not enter. As an example we take the case of a panorama, where the surface is a vertical cylinder of revolution, the eye being in the axis. The ray projecting a point A cuts the cylinder in two points on opposite sides of the eye, hence geometrically speaking every point has two projections; of these only the one lying on the half ray from the eye to the point can be used in the picture. But the other has sometimes to be used in constructions, as the projection of a line has to pass through both. Parallel lines have two vanishing points which are found by drawing a line of the given direction through the ends of the given lines. For the vanishing points required in this operation may be performed by drawing on the ground the plan of the ray through the foot of the axis, and through the point where it cuts the cylinder a vertical, on which the point required lies. Its height above is then found by making a drawing of a vertical section on a reduced scale.

Parallel planes have in the same manner a vanishing curve. This will be for horizontal planes a horizontal circle of the height of the eye above the ground. For vertical planes it will be a circle of generators of the cylinder. For other planes the vanishing curves will be ellipses having their centre at the eye.

The projections of vertical lines will be vertical lines on the
cylinder. Of all other lines they will be ellipses with the centre at the end of the cylinder. If the cylinder be developed into a plane, then the ellipses will be changed into curves of sines. Parallel lines are thus represented by curves of sines which have two points in common. There is no difficulty in making all the constructions on a sheet of paper on the drawing board and then transferring them to the cylinder.

§ 10. A variety of instruments have been proposed to facilitate perspective drawing; the principal method is, to draw a figure from the model, then a camera obscura or, better, Wollaston's camera lucida may be used. Other instruments are made for the construction of perspective drawings. It will often happen that the vanishing point of some direction which would be very useful in the construction falls at a great distance off the paper, and various methods have been proposed of drawing lines through such a point. For some of these see Stanley's Descriptive Treatise on Mathematical Drawing Instruments. (O.J.H.)

PERSPIRATION (Lat. per, through, and spirare, to breathe), the excretion of sweat from the sweat-glands of the skin. Sweat is a clear colourless neutral or slightly alkaline fluid containing 2% of solids. Under pathological conditions, sugar ura and other substances are found. The secretion of sweat is constantly going on, the activity of the sweat-glands being under control of the central nervous system. The only function of sweat is the regulation of the heat discharge from the body. The chief morbid conditions of the sweat-glands are excessive sweating (Hyperhidrosis) and footed sweating (Bromhidrosis). Excessive sweating is a symptom observed in various diseases, such as tuberculosis and rheumatic fever, but it may exist apart from such conditions, and either be general, affecting the whole body, or confined to a part, such as the axillae, head, hands, feet, or, as in some rare instances, the one half of the body. Excessive perspiration may often be prevented by the cold bath, and by tonics, such as iron, quinine, strychnia, &c. Locally, the use of astringent lotions of vinegar or a weak solution of lead will also be of service. Foetid sweating most frequently affects the feet, specially in those who have much fatigue, and is apparently due to rapid decomposition in the perspiration which has saturated the stockings; these should be frequently changed and the feet washed several times a day, dried carefully, and dusted with some antiseptic powder.

PERTAB (or Parbat) SINGH, Sir, maharaja of Idar (1844-1904), native Indian soldier and statesman, belonging to the Rahtor Rajputs of the Jodhla class, was born in 1844, being the son of Maharaja Takhi Singh, ruler of Marwar (or Jodhpur). In 1878 and again in 1879 he was chief minister of Jodhpur. In the following year he accompanied the British mission to Afghanistan, and on his return he carried out many judicious reforms and administered Jodhpur with remarkable success. He visited England to take part in the celebration of the 1887 Jubilee of Queen Victoria's reign. He served on the staffs of Sir William Lockhart and General Elles in the Tirah and Mannon expeditions in 1897-98, was slightly wounded, was mentioned in despatches, and promoted to the rank of full colonel. He won the reputation of being one of the keenest sportsmen and the best riders that even Rajputana has produced. When it was decided to send a force from India to China in 1900 to relieve the foreign embassies besieged in Peking, Sir Pertab Singh at once offered the services of the Jodhpur Lancers, and himself accompanied them. His father rendered good services to the British government in the Mutiny, and Pertab Singh always cherished the memory of the protection given to Jodhpur by the East India Company in 1818. His services to the empire in India were universally recognized. From Queen Victoria he received the honour of knighthood and the Bath and the Star of India; from King Edward VII. the distinction of "aide-de-camp"; and the university of Cambridge gave him the degree of LL.D. From his own state of Jodhpur he obtained the title of Maharaja-Deran. In 1901 he succeeded to the rulership of the state of Idar.

PERTH, EARLS AND DUKES OF. The Scottish title of earl of Perth was bestowed upon James, 4th Lord Drummond (d. 1611) in 1605. His ancestor Sir John Drummond (d. 1595) had been created Lord Drummond in 1488. The 1st earl's great-nephew, James, 4th earl and 1st duke of Perth (1648-1710), was a son of James, the 3rd earl (c. 1615-1705). When John Maitland, duke of Lauderdale, was virtually the dictator of Scotland, Perth was among his opponents, and after Lauderdale's retirement in 1690 he was one of the committee of seven which made Scottish affairs. He rose to be a justice-general and extraordinary lord of session; died in 1692, and was governor of Scotland from 1684 to 1688. As a convert to Roman Catholicism after the death of Charles II., he stood high in the favour of James II. Perth, who is credited with the introduction of the thumb screw, was very unpopular with the Scottish people, and during the Revolution of 1688 he was imprisoned at Stirling. Released from captivity in 1693 he joined James II. at St Germain, and was made duke of Perth, a titular dignity only after the exiled king's death in 1701. His son James (c. 1675-1726) was with James II. in Ireland, and led the cavalry at the battle of Sheriffmuir. He was attainted in 1715, but claimed the dukedom of Perth after his father's death. His son James (1715-1746), regarded by friends and dependants as the 3rd duke of Perth, fought for the Young Pretender at Prestonpans and Culloden. His brother and heir, John, the 4th duke (c. 1716-1747), also joined Charles Edward, and fought at Falkirk and Culloden. The titular dukedom became extinct when the sixth holder, Edward, another son of the 1st duke, died in 1760.

The earldom was then claimed by Edward's cousin, James Lundin (1707-1781), a grandson of the 1st titular duke of Melfort, who was a brother of the 1st duke of Perth and took the name of Drummond. His son James (1744-1800) secured the Drummond estates in 1753, and was created a British peer as Lord Perth and Baron Drummond in 1797. On his death without sons in July 1800 his barony became extinct, but the claim to the earldom of Perth was inherited by his kinsman, the 4th titular duke of Melfort, and his descendants (see below). The Drummond estates, however, passed to the baron's daughter Clementina (d. 1865), afterwards the wife of Peter Robert, 20th Lord Willoughby de Eresby, and thence to her descendant the earl of Ancaster.

The 1st duke's brother, John (c. 1650-1712), earl of Melfort, rose to favour under Charles II. about the same time as his brother; like him, too, he became a Roman Catholic in 1686. In 1684 he was made secretary of state for Scotland; in 1686 he was created earl of Melfort by James II., and during his reign he took a leading part in Scottish affairs. After the Revolution of 1688 his great influence with James II. and with Mary of Modena drew upon him the hatred both of the French and of the Irish. He was with James II. at St Germain, but lost his former ascendency, and died in Paris on the 25th of January 1715. In 1694 he was made duke of Melfort, and all his titles were held under the singular condition that they should descend to the children of his second wife, Euphemia (d. 1743), daughter of Sir Thomas Wallace, in preference to his children by his first wife, Sophia Lundin, who were Protestants. In 1701 Melfort was recognized as a French peer, the duc de Melfort, by Louis XIV. In 1695 he had been attainted, but his titles were claimed by John (1682-1754), his eldest son by his second wife, who shared in the rising of 1715. In 1700 John's grandson, James Louis, 4th titular duke of Melfort, claimed the earldom of Perth. This claim was unsuccessful, but in 1853 George (1807-1902), nominally 6th duke of Melfort, obtained a reversal of the various attendant's, and his own recognition as earl of Perth and Melfort. The succeeding earl was his kinsman, William Huntly Drummond, Viscount Strathallan (1871- ).

PERTH, the capital of Western Australia, situated on the Swan River, 12 m. by rail from the sea at Fremantle, and about 1700 m. W.N.W. of Melbourne. It is the seat of both Anglican and Roman Catholic bishops, and has two cathedrals. The fashionable street is St George's Terrace; in it are situated the public library, the government boys' school, the stock exchange, the town-hall, the government offices and the parliament buildings. Between it and the broad reach of the river known as Perth Water lie the governor's residence and domain. The
